2. Allow and facilitate inspection of joints by CM before applying insitu concrete topping to the semi-precast slabs.

CON7.W1330.7 TEMPORARY SUPPORT
1. During fixing the precast concrete walls, prop adjacent insitu structural members adequately to avoid excessive deflection or adverse stresses;
2. Maintain all temporary supports, props and restraints in position during applying insitu concrete topping to the semi-precast slabs. Remove temporary supports, props and restraints upon satisfactory testing and calculation to Approval;
3. The precast concrete walls are of non-structural elements. Do not use them as temporary or permanent supports for other structural and non-structural members.

CON7.W1340.7 PROTECTIVE MEASURE FOR ERECTING UNITS
Provide protective measures to avoid cracking and chipping of the precast walls and damage to the applied finishes and to the built-in items such as fabricated U-channels and embedded steel plates.

CON7.W1350.7 BEDDING AND JOINTING
Locate embedded steel plates of precast concrete wall over cast-in locking steel plates. Bed and joint precast concrete walls in non-shrink cement mortar where shown on Drawings.

CON7.W1360.7 APPROVAL FOR PERMANENT FIXING
Do not carry out permanent jointing or connection between any precast concrete walls and another, or to any part of the insitu structure, without prior Approval.

CON7.W1370.7 CONDUIT INSTALLATION
Supply and install conceal rigid plain PVC conduit system complete with steel draw wires for precast concrete walls as indicated on the Drawings.

CON7.W1380.7 SHOP DRAWINGS OF CONDUITS
Prepare shop drawings, co-ordinate and agree with the Nominated Sub-contractor for Electrical Installation and the Supplier for precast concrete wall before submitting shop drawings for approval.
CON7.W1390.7 SUBMISSION AND APPROVAL OF CONDUITS

CON7.W1400.7 CONDUIT BENDS
Internal radius: at least 4 times the outside diameter of the conduit.

CON7.W1410.7 BENDING, JOINTING AND TERMINATING OF CONDUITS
Follow conduit manufacturers' recommendation for:
1. Method of carrying out the conduit bends and conduit joints;
2. Method of fixing conduits to boxes without spouts;
3. Use of tools and materials.

CON7.W1420.7 COMPLETION CERTIFICATION FOR ELECTRICAL CONDUIT SYSTEM INSTALLATION
1. All conduits and accessories installed have to be certified by at least Grade A2 of Registered Electrical Workers (REW);
2. Where delivered to Site, the precast concrete components must be accompanied with a Work Completion Certificate Form WR1(A) specified by Electrical and Mechanical Services Department which shall be duly signed by a Registered Electrical Contractor and a REW certifying that the conduit system installation is in full compliance with the Specification and the Code of Practice for the Electricity (Wiring) Regulations;
3. A single certificate can be issued for delivered lots of precast concrete components which are produced in each production lot. The certificate shall also carry information e.g. reference number etc. for traceability purpose;
4. Provide CM and the Nominated Sub-contractor for Electrical Installation each a copy of the Work Completion Certificate for record.
TESTING

SAMPLING AND TESTING GENERALLY

CON7.T010.7 RECORDS
1. Keep a complete record of all sampling and testing, in a form agreed with the CM;
2. Submit test reports and certificates to the CM within 14 days from the date of test.

CON7.T020.7 WITNESSING SAMPLING AND TESTING BY THE CM
The CM will witness any sampling and testing carried out under the Quality Assurance Scheme:
1. Make the records of sampling and testing available for inspection by CM or CM’s Representative resident at manufacturer’s factory;
2. The CM or CM’s Representative resident at manufacturer’s factory is entitled to reject individual precast concrete components represented by any failed test result on the precast concrete component.

CON7.T030.7 TESTS AT MANUFACTURER’S FACTORY
Provide samples, all necessary facilities and attendance to the CM or CMR resident at manufacturer’s factory to carry out the following tests:
1. Schmidt hammer tests and covermeter tests on the construction quality of precast concrete components in accordance with PRE.B10.490;
2. Concrete constituent tests and concrete cube compression tests and bar and fabric reinforcement tests by HDMTL.

COMPRESSION TESTING

CON7.T110.7 GENERAL
Testing arrangements:
1. Carry out compression tests on concrete cubes, made from the concrete used for casting the precast concrete components, by a testing laboratory erected on Site in accordance with PRE.B9.520 for on-Site casting or by an Approved testing laboratory appointed by the Contractor/manufacturer for off-Site casting;
2. All details, including sampling frequency, of the concrete cubes tests must be in accordance with Worksection CON1.

CON7.T115.7 REPORT AND ANALYSIS ON CUBE TEST RESULTS FOR GGBS CONCRETE IN FACADE
In addition to the compliance with clause CON7.T110, the Contractor shall:
1. Submit 2 copies of the test reports issued by the Approved testing laboratory within 14 days after carrying out the 28-day compressive strength tests;
2. Carry out the following analysis and submit a report bi-weekly issued by the Approved testing laboratory, in a format as agreed by the CM, on cube compression test results:
a. Acceptance Analysis of the test results in accordance with CON1.T630 to CON1.T660;
b. Statistical Analysis on overall results and moving consecutive 40 results including the following:
   i. Summation of results;
   ii. Summation of square of results;
   iii. Mean;
   iv. Standard deviation;
   v. Coefficient of variance;
   vi. Estimated characteristic strength; and
   vii. Probability of result falling in specified strength interval.
3. Notify the CM immediately by e-mail and by facsimile in the event of any sign of non-compliance of the test results.

CON7.T120.7 FACILITIES FOR TESTING
Provide all necessary facilities and attendance as specified in clause PRE.B12.210 for concrete cores taken out from the completed precast concrete components and tested by the Approved testing laboratory.

CON7.T130.7 SIZE AND NUMBER OF CORE SAMPLES
1. Testing samples:
   a. When Instructed, take 3 No. 100 mm diameter cores respectively from the following for each casting day, at the location selected by the CM:
      i. Precast facades (including precast roof parapet);
      ii. Semi-precast slab with insitu concrete topping;
      iii. Precast stairs.
   b. When instructed, take 3 No. 75 mm diameter cores respectively from the precast concrete walls for each casting day, in the location selected by the CM. Compliance shall be in accordance with CON 1 Worksection.
2. Non-compliance:
   a. In the event that any of the cores taken from item a.1.ii debonds between the semi-precast slab and insitu concrete topping, the core is deemed to be unacceptable for compression test. Take core from another slab of the same concreting day of insitu topping for compression test;
   b. For the semi-precast slab panel at which the core taken has debonded, the slab panel is deemed to be unacceptable. In addition, to confirm that debonding will not occur in other semi-precast slab panel of the same concreting day of insitu topping, take further cores according to the following formula:
      Nos. of further cores = (n²-2n+3).
      Where n is equal to the total number of unsuccessful cores, progressively until all cores are satisfactory (i.e. no debonding occurs). All semi-precast slab panels at which the cores debond shall be demolished and recast to the satisfaction of the CM all at contractor's own expense.

CON7.T140.7 CORE TESTING FOR SEMI-PRECAST SLAB
In respect of semi-precast slab, the concrete represented by the cores is to include:
1. The insitu concrete for the same concreting day;
2. The precast concrete slabs manufactured in the casting yard within the same casting day.

CON7.T150.7 REQUIREMENT FOR FURTHER CORE SAMPLES
As CON1.T750.

CON7.T160.7 ASSESSING COMpressive TESTS ON CoRES
As CON1.T760.

CON7.T170.7 CORE TESTING FOR SEMI-PRECAST SLAB BEFORE INSTALLATION
When Instructed, take 3 No.75 mm diameter cores from the semi-precast slab prior to installation (i.e. before casting the insitu concrete topping). Test for 28 days strengths and report the result to CM.

SITE WATERTIGHTNESS TESTS TO FACADE

CON7.T210.7 TESTING TRIAL UNIT
Testing arrangements:
1. Carry out watertightness tests to the jointing system of the full size trial samples specified in CON7.W710 in accordance with the procedures set out in CON7.T230;
2. Extend the watertightness tests to cover testing on joints of windows fixed to the full size trial sample all to the requirements specified in COM2.T210.

CON7.T220.7 TESTING INSTALLED JOINTS
Testing samples:
1. Carry out watertightness tests in accordance with the procedures set out in CON7.T230 to all joints of the properly installed facade units not connected monolithically to in-situ concrete at the rate of 50% of each particular type in locations as instructed by CM or CM's representatives.

CON7.T230.7 TEST PROCEDURE
Test joints of each selected facade unit according to the procedures as follows:
1. Construct working platforms where necessary for carrying out water test safely;
2. Working from the exterior, wet the facade unit selectively, starting from the lowest horizontal joint, followed by the vertical joints and then the horizontal joint above;
3. Spray a continuous jet of water from a nozzle at a water pressure of 210 to 240 kPa at the nozzle inlet to the joint and perpendicular to the face of the facade unit. Move the nozzle slowly along the joint, at a distance of 300 mm from it, for a period of 5 minutes in every 1.5 metre of joint length while an observer carefully inspects on the interior side of the facade unit with the assistance of adequate lighting where necessary;
4. Unless otherwise Approved, use a nozzle to the requirements of the Architectural Aluminium Manufacturer's Association (AAMA) 501.2-83;
5. Repeat the process specified in sub-clause (3) above on all joints and joint intersections using increments of exposed joint length not exceeding 1.5 metres upward until all the joints are covered.
WITNESSES TO TEST

All watertightness tests carried out on Site must be witnessed and certified both by the CM and the Contractor's representative.

FAILURE OF UNITS

The facade units and joints are deemed to have failed if signs of water seeping through the joints or through the facade unit, including signs of damp patches, are observed during the test and within the subsequent 2 hours after the test.

REMEDIAL WORK TO UNITS FOR RE-TEST AND ADDITIONAL TESTING

Non-compliance:
1. Carry out remedial work to facade units and joints which have failed the watertightness test. Methods of carrying out the remedial work are subject to Approval;
2. After the remedial work is completed, re-test the facade units and joints in accordance with the procedures set out in CON7.T230;
3. Repeat sub-clauses (1) & (2) above until the facade unit and joint comply with the specified criteria of watertightness;
4. For any one facade unit fails the watertightness test, carry out additional tests as follows:
   a. Select three additional samples as instructed by CM or CM's representatives for testing. Each sample shall comprise three facade units of the same type as the failed facade unit;
   b. Carry out watertightness test to the additional samples in accordance with the procedures set out in CON7.T230;
   c. When any facade unit fails the test, repeat sub-clauses (1) & (2) above until the facade unit and joint comply with the specified criteria of watertightness.
5. Repeat sub-clause (4) above until all testing facade units and joints have complied with specified criteria of watertightness;
6. Bear all associated costs for the re-tests and additional tests as specified in the above sub-clauses. No extension of time will be allowed.

CORE TEST AND CRACK INSPECTION FOR SEMI-PRECAST SLAB

CORE TEST IN SAMPLE FLAT UNIT

Testing samples:

The CM may select 3 Nos. of samples of standard cores through the roof slab at Trial Panels in CON7.W710 to determine the cleansing standard of semi-precast slab.

Non-compliance:

If debonding is observed at the interface between the semi-precast slab and topping concrete, the cleansing standard under CON7.W1120 should be reviewed and the roof slab at Trial Panels recast for further core testing to the satisfaction of the CM.
SURVEILLANCE INSPECTION

CON7.T510.7 JOINT INSPECTION AT MANUFACTURER'S FACTORY AND BREAKING UP TEST

For off-site casting:

1. Arrange transportation for and carry out joint inspections between the Contractor and the CM at the manufacturer's factory at the notice of the CM;

2. Carry out up to 4 breaking-up tests:
   a. Provide samples of precast concrete component randomly selected by CM's Representative, break up the component for inspection and remove the broken component after inspection;
   b. Carry out the following inspection in the presence of CM's Representative:
      i. Reinforcement details including total number of bars and bar size in accordance with standard design drawings;
      ii. Bar pattern of the reinforcement used against the Mill Certificate and the requirements of purchaser test in CS2:1995;
      iii. The installation, markings and brand name of concealed electrical conduits, fittings and conduit accessories etc. when pre-installed electrical conduit system is installed.

3. In the event of samples of a type of components failing to meet any one of the requirements in the breaking-up inspection above, take further precast concrete components of that particular type according to the following formula until all precast concrete components satisfy the requirements as above:
   Nos. of further samples = \( n^2 - 2n + 3 \)
   where \( n \) is equal to the total number of unsuccessful components;

4. Bear all costs of any further breaking-up inspections that are instructed by CM and no extension of time will be allowed.

CON7.T520.7 OPEN-UP INSPECTION ON SITE

Before installation of the component on site, carry out open-up inspection up to 4 nos. per block for facade and semi-precast slab or other types of precast component as directed:

1. Open up the cover of precast concrete component for a minimum area of 100 mm x 300 mm, at locations selected by CM's Representative, to expose reinforcement underneath for inspection of bar size, spacing, and where possible bar pattern, all in accordance with CON7.T510;

2. Reinstall the cover of the component by an Approved non-shrink grout after inspection.

LIFTING ANCHOR

CON7.T610.7 DEFINITION OF BATCH

In this Specification, a batch is defined as any quantity of lifting anchor of the same type and same working load capacity, delivered to the casting yard as one consignment and covered by the same test certificate issued by the lifting anchor manufacturer.
**CON7.T620.7 TYPE AND LOAD CAPACITY**

Unless otherwise specified on Drawings, lifting anchors shall be either eye anchor type or foot anchor type, and with a working load of 0.25 times the ultimate load capacity.

**CON7.T630.7 RATE OF SAMPLING**

1. The rate of sampling for ultimate load capacity for each batch of lifting anchor shall be a minimum of one sample, which comprises three test specimens, for every 3,000 anchors or part thereof;

2. When Instructed, provide an additional sample comprising three test specimens for testing by DTC.

**CON7.T640.7 COMPLIANCE CRITERION**

No test result of ultimate load capacity of individual test specimen shall be less than 4 times the working load as stipulated in CON7.T620.

**CON7.T650.7 SUBMISSION**

Prior to the production of precast concrete components, provide test certificates issued by:

1. The lifting anchor manufacturer/agent supplier; and

2. An Approved testing laboratory employed by the manufacturer of precast concrete component on the ultimate load capacity of lifting anchors for each batch under the Quality Assurance System as stipulated in CON7.W040.
CON8 VOLUMETRIC PRECAST CONCRETE COMPONENTS FOR DOMESTIC BLOCKS

DESIGN

GENERAL

CON8.D010.7 DEFINITION OF VOLUMETRIC PRECAST CONCRETE (VPC) CONSTRUCTION
Construction of three-dimensional precast concrete building components or units, with fixtures, fittings and finishes, but excluding the following precast concrete components:
1. Precast concrete facade with window installation (refer to CON7);
2. Semi-precast slabs (refer to CON7);
3. Precast stairs (refer to CON7);
4. Precast concrete walls (refer to CON7);
5. Refuse chute (refer to CON4).

CON8.D020.7 USE OF VOLUMETRIC PRECAST CONCRETE COMPONENTS
VPC components, including but not limited to the following, are covered by the specification in this Worksection:
1. Lift lobby;
2. Kitchen;
3. Lift shaft;

CON8.D030.7 RELEVANCE OF OTHER SPECIFICATION WORKSECTIONS
1. Comply with the requirements of this Worksection and relevant provisions of the Specification, in particular, the following Worksections:
   a. CON1, In-situ Concrete;
   b. CON2, Formwork;
   c. CON3, Reinforcement;
   d. CON4, Precast Concrete;
   e. CON6, Movement Joints;
   f. CON7, Precast Concrete Components for Standard Domestic;
   g. COM6, Aluminium Windows and Louvres;
   h. COM8, Doorsets for Standard Domestic;
   i. COM13, uPVC Windows for Standard Domestic;
   j. DRA1, Drainage Above Ground;
   k. FIN1, Plastered and Rendered Finishes;
VOLUMETRIC PRECAST CONCRETE......

CON8 > DESIGN

1. FIN3, Screeds;
2. FIN5, Floor and Wall Tiles and Slabs;
3. FIN6, Flexible Sheet and Tile Finishes;
4. FIN7, Painting;
5. MAS1, Brickwork, Blockwork and Panel Partitions;
6. MAS3, Mortar;
7. MET1, General Metalwork;
8. STR1, Structural Steel;
9. PLU1, Water Supply;
10. PLU2, Sanitary Appliances;
11. WAT5, Sealants;
12. WAT6, Proprietary Tanking and Waterproofing Systems.

2. Where building services installations are associated with VPC components, comply with the requirements and relevant provisions of the following Worksections:
   a. ELE1 - ELE3, Electrical Installation;
   b. FWP1 - FWP14, Fire Services & Water Pump Installation;
   c. LTE1 - LTE2, Lift Installation.

3. Where any ambiguity, discrepancy or conflict arises between this Worksection and any clauses in any other Worksections, the provisions of this Worksection prevail.

CON8.D040.7 DESIGN STANDARDS

1. For reinforced concrete structures, comply with CON1.M010;
2. For precast concrete, comply with CON4.D010 and Code of Practice for Precast Concrete Construction 2003 published by Buildings Department;
3. For structural joint design, comply with CON4.D020;
4. Where any ambiguity, discrepancy or conflict arises between this Worksection and any clauses in any other Worksections or standards, the most onerous conditions shall apply. Agree with the CM on the interpretation in advance of design.

SCOPE OF WORK

CON8.D110.7 GENERAL (ENGINEER'S DESIGN)

1. Refer to the Drawings for the extent of VPC components including the identification of parts of the component that will function as facades;
2. Refer to the Drawings for the extent of fixtures, finishing, fittings and building services installations associated with VPC components.

CON8.D120.7 SCOPE OF THE DESIGN (CONTRACTOR'S DESIGN)

Design the VPC components in accordance with the requirements specified in this Worksection, Worksections CON4 and CON7 as appropriate. Include the following in the scope of the design of those components:
1. The structural design of the VPC components;
2. The design of permanent structural connections between VPC components and/or building structure;
3. The design of the waterproof joints between VPC components functioning as a facade and/or the building structure;
4. The design of the installation of fixtures and finishes, including the finishing textures, associated with VPC components;
5. Building services installations as required and included in the fabrication of VPC components as a whole module;
6. Inspection method.

DESIGN PARAMETERS (CONTRACTOR'S DESIGN)

CON8.D210.7 STABILITY
Design the VPC components to be stable at all times. Provide designs for both the component and for any necessary temporary props, ties and supports.

CON8.D220.7 RESISTANCE TO PROGRESSIVE COLLAPSE
Design a VPC component in two ways, both as an assembly of individual walls and floors, and also as a complete unit in a progressive collapse design situation, providing additional ties to the rest of the structure for each case.

CON8.D230.7 DEFORMATIONS
Design the VPC component to be located in the structure without deforming excessively before all of the joints and permanent structural connections are made. Include consideration of any temporary stiffening, support jigs or frames in the design.

CON8.D240.7 INTERFACE WITH OTHER STRUCTURAL COMPONENTS
Design the VPC component so that all interfaces between other VPC components or the rest of the structure can be made neatly to the required standards of finish and tolerance.

CON8.D250.7 EXTERNAL FACES
Design the VPC components so that any external faces can be inspected before erection and the main jointing can be made safely from within the structural envelope.

CON8.D260.7 LOADING
1. Design the VPC components to be either load bearing or non load bearing to sustain all possible loading acting upon them;
2. If load bearing, then design the component to carry the loads placed on it in both the temporary and permanent situations taking into consideration of any creep on vertical shortening of walls which may be more highly stressed than outer adjacent precast or in-situ vertical load bearing elements;
3. Submit calculations to demonstrate that in-situ structural members are not subject to excessive stresses arising from the erection method of the VPC component and to demonstrate the adequacy of any temporary supports which may be required;
4. Where VPC components include a facade element, the loading conditions should be determined in accordance with CON5.D250.
MINIMUM CONCRETE GRADE
Where VPC components include a facade element, the minimum concrete grade shall be Grade 35/20.

CONCRETE COVER TO REINFORCEMENT
Minimum cover to reinforcing bars in the facade elements of a VPC component:
1. External face: 30 mm;
2. Internal face: 25 mm.

CONCRETE COVER TO PVC CONDUIT
Minimum cover to PVC conduits concealed within VPC components: 30 mm.

CONCEALMENT OF FIXINGS
Conceal all permanent fixing connections by Approved methods.

JOINTS

GASKETS
Gaskets may be used in weatherproofing joints provided that:
1. The joint is horizontal; and
2. The gasket is always under compression.

MORTAR STOPS
Use backing rods or other Approved methods as mortar stops in grouting panel joints when necessary.

WEATHERPROOF JOINTS (CONTRACTOR'S DESIGN)

JOINT DESIGN
Design weatherproof external joints to be maintenance free, and ensure airtightness and watertightness in accordance with BS 6093:1993.

TYPES OF JOINT
Use one of the following types of weatherproof joints in accordance with BS 6093:1993:
1. Sealed joint (one-stage joint);
2. Drained joint (two-stage joint).

DESIGN WIDTH OF JOINTS
Design the joint width in accordance with BS 6093:1993 and BS 6213:1982.
PERMANENT STRUCTURAL CONNECTIONS

CON8.D610.7 GENERAL (CONTRACTOR'S DESIGN)
Design the permanent structural connections:
1. To withstand the stresses induced by the VPC components described in CON8.D260;
2. To be watertight;
3. To be of the same grade of concrete as that for the VPC components.

CON8.D620.7 REINFORCEMENT, SHEAR CONNECTORS ETC
Ensure reinforcement, shear connectors, etc used for the permanent structural connections are adequately embedded or anchored into the building structure.

CON8.D630.7 VERTICAL PERMANENT STRUCTURAL CONNECTIONS
At the vertical permanent structural connections between VPC components that are to be infilled,
1. Use non-shrink grout or concrete with non-shrinking additives if the minimum dimension is more than 150 mm;
2. Use only non-shrink grout if the minimum dimension is less than 150 mm.

CON8.D640.7 HORIZONTAL PERMANENT STRUCTURAL CONNECTIONS
For horizontal permanent structural connections, concrete with non-shrinking additives in lieu of non-shrink grout may be permitted subject to the provisions of CON4.M270.

DESIGN TOLERANCES

CON8.D710.7 OVERALL TOLERANCES (CONTRACTOR'S DESIGN)
1. Design the VPC component and the associated joints/connections to the in-situ structure, other VPC components, precast concrete components, architectural and building services installations, including all cast in elements, to conform with the relevant tolerances given in Appendix H and the CoP for Precast Concrete Construction;
2. Where any ambiguity, discrepancy or conflict arises between the tolerances given in Appendix H and the CoP for Precast Concrete Construction, the provisions given in Appendix H shall prevail.

CON8.D720.7 VPC MANUFACTURE TOLERANCE (CONTRACTOR'S DESIGN)
Design the VPC component and propose the manufacture tolerances in order to satisfy the overall tolerances given in Appendix H and CoP for Precast Concrete Construction, taking into account the erection tolerances.

CON8.D730.7 VPC ERECTION TOLERANCE
Propose a set of erection tolerances that is in compliance with the overall tolerance allowed when taken together with the set of manufacture tolerances proposed taking into consideration all possible interfaces with adjacent precast units or in situ elements.
LIFTING OF VPC COMPONENTS

CON8.D810.7 LIFTING DESIGN
1. Ensure that the design of the lifting mechanism for VPC component provides a safe and robust means of lifting and holds the component in a truly vertical position and is adjustable to ensure verticality if necessary;
2. Submit for Approval the proposed lifting positions and any points of attachments on the components for lifting slings if not shown on the drawings.

CON8.D820.7 STEEL LIFTING FRAMES
Design and construct steel lifting frames in accordance with the Code of Practice for the Structural Use of Steel 2011 issued by the Buildings Department.

CON8.D830.7 LIFTING METHOD
Ensure that:
1. The design for lifting takes into account all loads on the component, friction against mould faces, snatch, impact and self weight of all fittings, lifting frame and equipment with an appropriate factor of safety;
2. Any lifting system that has a number of bolts, chains or ropes that work in parallel, is either designed such that all internal loads are calculable and statically determinate or, if not, that each bolt, chain, or rope possesses sufficient reserve of strength for any likely load distribution;
3. The equipment is capable of supporting the component if any single individual fastening, chain or bolt fails, taking into account any realignment of the component as it moves to place the centre of gravity under the new lifting arrangement.

SUBMISSIONS

CON8.D910.7 TENDER DESIGN PROPOSAL
Submit for Approval, full details of tender design proposals including drawings, specifications, layouts, details, calculations and any other information required.

CON8.D920.7 REGISTERED STRUCTURAL ENGINEER
All structural drawings, layouts, details and calculations submitted, including those submitted with tender, must be prepared and signed by a Registered Structural Engineer registered under Buildings Department of the Government of Hong Kong Special Administrative Region.

CON8.D930.7 PROGRAMME FOR SUBMISSIONS
1. Agree with CM a programme for all submissions during the Contract prior to the notified date for commencement of Works;
2. Agree with CM a programme for all ICU submissions for building works prior to the notified date for commencement of Works;
3. Within one month of the notified date for the commencement of Works, submit for approval by the CM, a programme for the design, planning and coordination with NSCs, ICU approval, manufacturing, erection and testing of a study mock up of the VPC components;
4. No extension of time will be allowed for any delay related to ICU’s approval.
CON8.D940.7 DRAWS AND METHOD STATEMENT (CONTRACTOR'S DESIGN)

Within two months of the notified date for commencement of Works, submit, for review and comment, the following items:

1. 5 sets of design drawings;
2. 5 sets of shop drawings including, but not limited to, coordinated services drawings, combined builder's works drawings, building services drawings, fixtures and fittings drawings. All shop drawings shall be fully dimensioned with tolerances and properly coordinated;
3. Calculations and any other information indicating the location of the VPC components and any changes resulting from the use of VPC;
4. Calculations which show all loading imposed on the VPC components due to lifting, handling, stacking, shock or any other reason, complies with the relevant standards, unless specified otherwise;
5. Jointing details and/or permanent structural connections, which can accommodate building movements, between the proposed VPC components and insitu concrete;
6. Design of moulds with tolerance, layout arrangements, casting methods (horizontal or vertical), tilting mechanism, demoulding methods and the provision for attachments of openings for door and/or window fixing;
7. The complete procedures for fabrication, curing, demoulding, application of finishes, lifting, transporting, storage, erection of VPC components, installation of weatherproof joints, and its associated temporary works;
8. Method for identifying and recording the daily production of VPC components and their final position after installation;
9. Method of protecting the VPC components, including all building services installations and associated equipment fabricated within the units, from damage at all times;
10. Minimum concrete strength required for the VPC components for demoulding, handling, storage, transportation and erection;
11. Position and design of lifting points with tolerances;
12. Calculated weight and size, including projections beyond transportation vehicles, of each type of VPC component.

CON8.D950.7 DRAWS AND METHOD STATEMENT (ENGINEER'S DESIGN)

Within two months of the notified date for commencement of Works, submit, for review and comment, the following items:

1. Design of moulds with tolerance, layout arrangements, casting methods (horizontal or vertical), tilting mechanism, demoulding methods and the provision for attachments of openings for door and/or window fixing;
2. The complete procedures for fabrication, curing, demoulding, application of finishes, lifting, transporting, storage, erection of VPC components, installation of weatherproof joints and its associated temporary works;
3. Method for identifying and recording the daily production of VPC components and their final position after installation;
4. Method of protecting the VPC units, including all building services installations and associated equipment fabricated within the units, from damage at all times.
STRUCTURAL MODIFICATIONS TO THE BUILDING STRUCTURE (ENGINEER'S DESIGN)

CON8.D1010.7 CONTRACTOR'S RESPONSIBILITY (ENGINEER'S DESIGN)
The Contractor's responsibility for the design of his proposed modification is covered under GCC Clauses 5.15 and 11.8 and the Appendix E to the Specification.

CON8.D1020.7 COMPLIANCE WITH GUIDELINES AND REGULATIONS (ENGINEER'S DESIGN)
Any proposed structural modifications to the building structure must comply with the following:

1. The structural design guidelines as appropriate to the building structure published by the Housing Department and included as Appendix E to this Specification;
2. The relevant Regulations, PNAP, CoP, etc. currently in use.

CON8.D1030.7 REINFORCEMENT CHANGES (ENGINEER'S DESIGN)
Obtain CM's Approval for any proposed changes to reinforcement details, as shown on the Drawings, required to suit the proposed method of casting and installation.

STUDY MOCK-UP

CON8.D1110.7 GENERAL
1. Set up a study mock-up in order to demonstrate, prior to mass production, that the use of the proposed VPC components is feasible and that the VPC components are constructable, structurally safe, architecturally and functionally satisfactory when gauging against the following aspects:
   a. Buildability - speed, safety, structural & building services connections & interfaces, safe system of working;
   b. Tolerances, accuracy;
   c. Quality;
   d. Manufacturing process;
   e. Joint integrity;
   f. Testing on watertightness, strength and, structural integrity.
2. Implement any improvements shown to be necessary to the proposed VPC component in a timely manner to ensure that mass production of such components will meet the required standards and to minimise risk associated with new construction processes and methods.

CON8.D1120.7 LOCATION OF CASTING YARD
Within one month of the notified date for the awarded tender, state the location of the casting yard for the manufacture of the study mock-up for CM's approval.

CON8.D1130.7 SIZE OF STUDY MOCK-UP
1. Unless otherwise agreed by the CM, the study mock-up should be at least 2 storeys high, comprising all the different types of VPC components that will be adopted for construction in a typical floor with modular layout, for demonstrating all interfaces and joints with adjacent units, either in-situ or precast elements;
2. The study mock-up shall be in accordance with the overall size, shape, layout and external envelope of the typical floor. for Engineer's design, the actual extent of the study mock up is as shown on Drawings.

CON8.D1140.7 EXTENT OF COVERAGE OF STUDY MOCK-UP

Unless otherwise agreed by the CM, the study mock-up should include all internal and external finishes, doors and windows, electrical lighting, fittings, sockets, concealed conduits, sanitary fittings, internal and external services, plumbing and drainage, and any other accessories required for the proper functioning of the VPC components.

CON8.D1150.7 RESPONSIBILITIES OF THE CONTRACTOR

1. Be responsible for the design, submission, manufacture, transportation and installation of the proposed VPC components for the study mock-up;

2. All structural submissions, such as design principles, calculation and construction details, etc. shall be prepared and endorsed by a Registered Structural Engineer (RSE), registered with the Buildings Department as mentioned in CON8.D920;

3. Demonstrate that the design of the study mock-up can sustain the required dead, imposed, wind load and any other loads;

4. Design and execute any temporary works for the safe erection of the study mock-up;

5. Coordinate the interfacing works of the building services installation contained within the proposed VPC components of the study mock-up;

6. Allow adequate time for the application of design approval from the ICU prior to mass production of the VPC components;

7. Acquire the necessary approval from the relevant Authorities related to the following aspects:
   a. Architectural;
   b. Structural;
   c. Building services;
   d. Safety;
   e. Environmental.

8. Submit a method statement, together with all necessary shop drawings, for the study mock-up for review and comment by the CM prior to its execution. The method statement shall contain details on the manufacturing and transportation of the VPC components as well as their construction methodology, construction cycle, labour force required, major machineries and plants to be employed, and detailed work program;

9. Construct the study mock-up in strict accordance with the commented shop drawings and all methods of the study mock-up joint assembly are to faithfully represent actual job conditions. Do not use special measures or techniques that are not representative of those to be used on the building;

10. After the completion of the erection of the study mock-up, submit a report detailing the following:
    a. Assessment of the performance of the study mock-up and identification of any deficiencies or defects, conflicts or interface with building services;
    b. Proposed improvement measures, covering the design, manufacture, transportation and erection aspects of the study mock-up;
    c. Dimensional checking results;
    d. Test results;
e. RSE’s appraisal of the jointing system;
f. Digital photographs and video records of the erection procedures, in particular the fixing of the jointing system, and any in-situ testing.

11. Bear all costs for any required laboratory and field tests, including any additional fees, penalties or retest costs, and no extension of time will be allowed for any delay related to ICU’s approval.

CON8.D1160.7 SHOP DRAWINGS
1. Coordinate the study mock-up drawings in order to construct the mock-up including adjacent interfacing elements, either in-situ or other precast components;
2. Submit 2 sets of shop drawings of the study mock-up, which include plans, elevations, sections and jointing details for review and comment by the CM prior to its manufacturing;
3. Submit 2 sets of Coordinated Services Drawings (CSD) and/or Combined Builders Work (CBW) Drawings of the study mock-up, demonstrating the proper coordination of interfacing works of the building services installation, for review and comment by the CM prior to its manufacturing.

CON8.D1170.7 CM’S COMMENT AND INSPECTION OF STUDY MOCK-UP
1. Do not commence the manufacturing and erection of the study mock-up until the comments from CM on the submitted shop drawings and proposed method statement had been received;
2. Alter or revise the study mock-up as directed upon CM’s inspection.

CON8.D1180.7 AS-BUILT DRAWINGS FOR APPROVAL
1. Submit one set of as-built drawings, including as-built CSD and/or CBW, immediately upon completion of the study mock-up for Approval;
2. Incorporate and clearly shown on the as-built drawings any changes made to the study mock-up or deviations from the previously commented shop drawings.

CON8.D1190.7 MAINTENANCE MANUAL
Submit a maintenance manual for the replaceable structural items of the VPC components. This should be developed in parallel with the study mock-up and should include, but not be limited to, the following information:

1. Name, address and telephone number of each firm and/or Sub-contractor involved in the supply of materials, components and/or assemblies of the replaceable structural items;
2. A clear and concise description of the method used to construct the concerned replaceable structural items;
3. Copies of certification and test reports of the material and/or component of the replaceable structural items;
4. A method statement covering the procedures for replacement of damaged or otherwise defective materials or components of the structural items, and materials and components that have a design life less than the design life of the VPC components and will therefore require replacement during the life of the VPC components;
5. Recommendations for routine maintenance, cleaning, suitable cleaning agents and any special inspection method of the materials and/or components of the replaceable structural items;
6. A full set of Approved as-built drawings, described in CON8.D1180, with particular emphasis on the details of the replaceable structural items;
7. The terms and conditions of any guarantees or warranties associated with the installed materials or components of the replaceable structural items.

CON8.D1200.7 CM’S APPROVAL TO PROCEED
Obtain CM’s Approval to proceed with the mass production of VPC components.

CON8.D1210.7 VALIDATION OF DESIGN ON STUDY MOCK-UP
1. Conduct testing to the study mock-up in accordance with the relevant clauses of Worksections CON4, CON7 and CON8, subject to CM’s agreement;
2. All joints and permanent structural connections, as demonstrated on the study mock-up which are designed to withstand any loadings, shall be tested in a HOKLAS laboratory to demonstrate their effectiveness in the transfer of loadings;
3. Carry out watertightness test to all external vertical and horizontal joints and permanent structural connections, as demonstrated on the study mock-up, in accordance with the procedures set out in CON8.T320;
4. Where a joint or permanent structural connection, as demonstrated on the study mock-up, is designed in combination with joint sealing compound specified in WAT5.M180, carry out the watertightness test prior to the application of the sealing compound to test the watertightness of the joint or permanent structural connection;
5. Conduct all necessary tests to the study mock-up in the presence of CM or his/her representatives.

CON8.D1310.7 CORE TEST TO STUDY MOCK-UP
1. Upon completion of grouting of joints and permanent structural connections, with large box out, of the study mock-up, provide all necessary facilities and attendance for concrete cores to be taken out from the grouted joints and permanent structural connections;
2. Take 3 nos. 100 mm diameter cores from selected grouted joints or permanent structural connections, as demonstrated on the study mock-up, to validate the effectiveness of the proposed grouting procedure for the joints or permanent structural connections;
3. In the event that any of the cores taken show any signs of irregularity or voids, such core and grouting procedure are deemed to be unacceptable. Review and revise the grouting procedures accordingly;
4. Replace and re-grout all such joints or permanent structural connections on the study mock-up, at which the cores show signs of irregularity or voids, and repeat the core test as described in sub-clause (2) above to the satisfaction of the CM;
5. Bear all costs of any further cores and no extension of time will be allowed.
MATERIALS

GENERAL

CON8.M010.7 RELEVANCE OF OTHER SPECIFICATION WORKSECTIONS
1. Construct VPC components in accordance with this Worksection and the relevant provisions of the following Worksections:
   a. CON1, In-situ Concrete;
   b. CON2, Formwork;
   c. CON3, Reinforcement;
   d. CON4, Precast Concrete;
   e. CON6, Movement Joints;
   f. CON7, Precast Concrete Components for Standard Domestic.
2. Construct architectural, plumbing & drainage and structural works in accordance with the Worksections listed in CON8.D030;
3. Construct building services installations in accordance with the Worksections listed in CON8.D030;
4. Where any ambiguity, discrepancy or conflict arises between this Worksection and any clauses in any other Worksections of this specification, the provisions of this Worksection shall prevail.

SUBMISSIONS

CON8.M110.7 CONCRETE MIX
As CON1.

CON8.M120.7 DETAILS OF WEATHERPROOFING
Within two months of the notified date for the commencement of Works, submit details of weatherproofing materials in accordance with CON4.M310 and CON4.M320 for Approval, including technical information, samples, test reports and proven performance records of proposed materials.

CON8.M130.7 CONDUIT SYSTEM
Submit technical details and samples of the conduit system for Approval before commencement of works.

CONCRETE

CON8.M210.7 CONCRETE MIX
CON8.M220.7 CONCRETE STRENGTH
Design the mix to have a sufficient compressive and tensile strength. The compressive strength of the mix in load bearing components shall be compatible with the strength of other adjacent load bearing components.

CON8.M230.7 DURABILITY
Use the appropriate concrete mix for VPC components which is compatible with the defined exposure conditions of the internal and external faces of the components.

CON8.M240.7 NON-SHRINK GROUT AND CONCRETE WITH NON-SHRINK ADDITIVES

JOINTS

CON8.M310.7 WEATHERPROOF JOINTS

PERMANENT STRUCTURAL CONNECTIONS

CON8.M410.7 RESISTANCE TO CORROSION
All metal parts of permanent structural connections must either be:
1. Corrosion resistant, being constructed of non-ferrous metal or stainless steel but avoiding any contact of such materials with the reinforcement; or
2. Protected against corrosion by an Approved method.

CONDUIT SYSTEMS

CON8.M510.7 GENERAL
Conduit systems incorporated into VPC components shall comply in general with the requirements of clauses CON7.M110 to CON7.M430 inclusive.

DIMENSIONS AND TOLERANCES

CON8.M610.7 DIMENSIONAL CHECK
1. Ensure that manufacture tolerances are met by checking the VPC components using suitably designed jigs and gauges;
2. Provide a means of checking the jigs and gauges which cannot be damaged.

ON SITE DELIVERY VERIFICATION

CON8.M710.7 INSPECTION
1. Carry out the following verifications for VPC components upon delivery on Site in the presence of CM's representatives:
   a. Method:
<table>
<thead>
<tr>
<th>Verification Items</th>
<th>Method</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date of manufacture and unique reference number</td>
<td>Visual inspection, document check against master register</td>
<td>No anomalies, evidence of QA checks</td>
</tr>
<tr>
<td>Required finishes (both internal and external), provisions and fixtures</td>
<td>Visual inspection</td>
<td>Full compliance with Approved as-built drawings for the study mock-up, no damage, no substandard repair</td>
</tr>
<tr>
<td>Sharp corners</td>
<td>Visual inspection</td>
<td>No damage, no substandard repair</td>
</tr>
<tr>
<td>Embedded conduits</td>
<td>Visual inspection</td>
<td>Open ends properly plugged; availability of draw wire inside conduits, correct brand name, size, alignment and setting out as per Approved as-built drawings of the study mock-up</td>
</tr>
<tr>
<td>Conduit boxes</td>
<td>Visual inspection</td>
<td>Properly sealed, no signs of inflow of concrete</td>
</tr>
<tr>
<td>Socket / switch boxes</td>
<td>Visual inspection</td>
<td>No damages, correct brand name and size as per Approved as-built drawings of the study mock-up</td>
</tr>
<tr>
<td>Starter bars</td>
<td>Visual inspection</td>
<td>Correct size and numbers as per Approved as-built drawings of the study mock-up</td>
</tr>
</tbody>
</table>

b. Frequency:

<table>
<thead>
<tr>
<th>Verification Items</th>
<th>Sampling Frequency</th>
<th>Representative Consignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date of manufacture and unique reference number</td>
<td>100%</td>
<td>All VPC components delivered to Site</td>
</tr>
<tr>
<td>Required finishes (both internal and external), provisions and fixtures</td>
<td>100%</td>
<td>All VPC components delivered to Site</td>
</tr>
<tr>
<td>Sharp corners</td>
<td>100%</td>
<td>All VPC components delivered to Site</td>
</tr>
<tr>
<td>Embedded conduits</td>
<td>100%</td>
<td>All VPC components delivered to Site</td>

<tr>
<td>Conduit boxes</td>
<td>100%</td>
<td>All VPC components delivered to Site</td>
</tr>
<tr>
<td>Socket / switch boxes</td>
<td>100%</td>
<td>All VPC components delivered to Site</td>
</tr>
<tr>
<td>Starter bars</td>
<td>100%</td>
<td>All VPC components delivered to Site</td>
</tr>
</tbody>
</table>

c. Keep proper record of inspections, together with photographs, for CM's inspection at any time.

2. Non-compliance:
a. In case of non-compliance, identify clearly such VPC components;

b. Repair such identified VPC components in accordance with the Approved repair methods/procedures as per CON8.W420.

**CON8.M720.7 BREAKING-UP INSPECTION**

1. When instructed, provide a sample of VPC component randomly selected by CM’s representatives upon delivery on Site, break up the component, carry out the following verifications in the presence of CM’s representatives and remove the broken component after verification:

   a. Method:

<table>
<thead>
<tr>
<th>Verification Items</th>
<th>Method</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reinforcement details including total no. of bars and</td>
<td>Visual inspection</td>
<td>Full compliance with Approved as-built drawings for the study mock-up</td>
</tr>
<tr>
<td>bar size</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Bar pattern of reinforcement</td>
<td>Visual inspection</td>
<td>Compliance with Mill Certificate and the requirements of purchaser test in CS2:1995</td>
</tr>
<tr>
<td>Cover to reinforcement</td>
<td>By measurement</td>
<td>Full compliance with Approved as-built drawings of the study mock-up</td>
</tr>
<tr>
<td>Concrete strength</td>
<td>Coring and compressive</td>
<td>Compressive strength in compliance with required concrete strength</td>
</tr>
<tr>
<td>Embedded conduit cover and bends</td>
<td>By measurement</td>
<td>Full compliance with Approved as-built drawings of the study mock-up</td>
</tr>
<tr>
<td>Sizes and routing of embedded conduit</td>
<td>By measurement</td>
<td>Full compliance with Approved as-built drawings of the study mock-up</td>
</tr>
<tr>
<td>Embedded conduits, accessories and adaptable boxes</td>
<td>Visual inspection</td>
<td>Bearing the same marking, brand name or standard as per Approved sample</td>
</tr>
<tr>
<td>Embedded conduits and/or connections with accessories</td>
<td>Visual inspection</td>
<td>Connections are properly jointed in compliance with Approved sample</td>
</tr>
<tr>
<td>Conduits and accessories</td>
<td>Visual inspection</td>
<td>Properly fixed to reinforcement in compliance with Approved sample</td>
</tr>
</tbody>
</table>

   b. Frequency:

<table>
<thead>
<tr>
<th>Verification Items</th>
<th>Sampling Frequency</th>
<th>Representative Consignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reinforcement details including total no. of bars and</td>
<td>1 no. per type of VPC</td>
<td>All VPC components delivered to Site</td>
</tr>
<tr>
<td>bar size</td>
<td>component per domestic</td>
<td></td>
</tr>
<tr>
<td>Bar pattern of reinforcement</td>
<td>1 no. per type of VPC</td>
<td>All VPC components delivered to Site</td>
</tr>
<tr>
<td></td>
<td>component per domestic</td>
<td></td>
</tr>
<tr>
<td></td>
<td>block</td>
<td></td>
</tr>
</tbody>
</table>
2. Non-compliance:
   a. In the event of samples failing to meet any of the requirements given above:
      i. Remove the broken VPC components off Site;
      ii. Take further VPC component as sample for re-test progressively according to the formula \( n^2 - 2n + 3 \) where \( n \) = total number of unsuccessful VPC component and the maximum value of \( n \) is limited to 3; until all samples satisfy the requirements as above;
      iii. In the event that \( n = 3 \) and not all samples satisfy the above requirements, all VPC components of the same type cast on the same date as per those samples that failed the breaking-up inspection shall be condemned and removed off Site.
   
b. Bear all associated costs of any further breaking-up inspections that are instructed by CM and no extension of time will be allowed.
WORKMANSHIP

GENERAL

CON8.W010.7 OFF SITE CASTING YARD

Unless otherwise specified in this Worksection, comply with the requirements of CON7.W010 to CON7.W090 pertaining to off-site casting.

CON8.W020.7 ARCHITECTURAL WORKS

Comply with the relevant requirements of architectural works as given in the Worksections in CON8.D030 unless specified otherwise in this Worksection.

CON8.W030.7 BUILDING SERVICES INSTALLATION

Comply with the relevant requirements of building services installation as given in the Worksections listed in CON8.D030.

SUBMISSIONS

CON8.W110.7 MOULDS

1. Submit for CM's approval details of the mould for VPC construction showing its support and design to fulfil the functional requirements. Comply with the provisions given in CON7.W210;
2. Obtain CM's approval before casting any components.

CON8.W120.7 METHOD STATEMENT

Submit a method statement, covering the followings, for CM's approval:
1. Mould set up, inspection, approved mix, demoulding, curing, finishing and lifting;
2. Method of fixing window frames or windows, in accordance with CON7.W840, before casting of the VPC components commences;
3. Repair methods / procedures to typical defective components likely to be encountered;
4. Method to rectify starter bars which are out of position but within tolerances;
5. Details of the proposed means of support and storage of VPC components in the casting yard;
6. A layout of the storage yard which allows any components to be removed without disturbing other components on demand and minimises the need to sequence stacking and removal;
7. Erection of VPC components at their final locations in the structure.

CON8.W130.7 CONDUIT SYSTEM SHOP DRAWINGS

Prepare shop drawings, co-ordinate and agree on the interfacing and connection method with the Nominated Sub-contractor for electrical installation before submitting shop drawings for Approval.
CON8.W140.7 PROGRAMMES

Within one month of the notified date for the commencement of Works, submit, for Approval, the following:

1. Programme for manufacturing VPC components showing the rate of manufacture for each month and the dates for clearing the area of casting yard and associated plant upon completion of the manufacture of the components;

2. Programme for the erection of the VPC components showing the rate of erection for each month. Make due allowance for all restrictions on the age of concrete in the VPC components for handling, storage, transportation and erection.

CON8.W150.7 QUALITY ASSURANCE SCHEME FOR MANUFACTURE OF VPC COMPONENTS

Within two months of the notified date for the commencement of the Works, submit details of the Quality Assurance Scheme for manufacturing the VPC components, in accordance with CON7.W040 to CON7.W060 as applicable, for Approval.

CON8.W160.7 QUALITY CONTROL PROCEDURES FOR ERECTING VPC COMPONENTS

Within three months from the notified date of commencement of Works, submit for Approval, details of erection of the VPC components under Approved quality control procedures covering the following:

1. Protective measures to avoid cracking and chipping;

2. Checking the accuracy of the insitu structural members receiving the VPC components, including location and level of all bearing surfaces, joints, bolts, horizontal and vertical restraining devices and adjustment devices. Carry out checking by means of a template or measurement frame or a similar Approved method;

3. Checking of erection tolerances;

4. Provision and removal of temporary works;

5. Procedure for grouting of permanent structural connections with details to prevent air lock.

MOULD ASSEMBLY

CON8.W210.7 TOLERANCE

Ensure that the mould is capable of manufacturing a component that, after erection, will be within the overall tolerances and manufacture tolerances for VPC components.

CON8.W220.7 GROUT SEALS

Ensure that:

1. The mould has grout seals appropriate to avoid leakage, or

2. If the concrete is to be vibrated, the seal design is appropriate to the means of filling and vibration.

CON8.W230.7 GAUGES

Provide details of gauges and fittings to check the correct set up of the mould before casting.
VOLUMETRIC PRECAST CONCRETE......

CON8.W240.7 FITTINGS
Ensure that the means of securing fittings to the mould is robust, suitable for repeated use, and will result in achieving the required tolerances without damage to the component.

CON8.W250.7 EXTERNAL FACES
Ensure that any concrete surfaces that will be external to the structure have, after casting, no metal fixings exposed and any holes have been filled.

CON8.W260.7 DEFECTIVE MOULDS
Replace any part of the mould system that fails to manufacture VPC components within the permitted tolerance limits.

CON8.W270.7 USE OF RELEASE AGENTS
Apply mould release agent, in accordance with CON2.M210, to the surfaces of moulds either by brush or by spraying before the fixing of steel reinforcement at a rate in accordance with the manufacturer’s recommendations.

MANUFACTURING OF VPC COMPONENTS

CON8.W310.7 GENERAL
Unless otherwise specified in this Worksection, comply with the provisions for manufacturing VPC components as given in Worksection CON7.

CON8.W320.7 CONCRETE MIX
1. Provide concrete in quantities such that casting is continuous using the Approved mix and method statement;
2. Arrange back up supplies for large VPC components if breaks in main supply are possible.

CON8.W330.7 CONCRETING, COMPACTION AND CURING GENERALLY
As CON1.

CON8.W340.7 CONSTRUCTION JOINTS
Demonstrate, for CM’s approval, that if the VPC component has construction joints within it, the detail and form of those joints will satisfy the requirements for the finishes requirement.

CON8.W350.7 EXTERNAL VIBRATORS
Obtain Approval for the use of external vibrators.

CON8.W360.7 CURING BY APPLICATION OF HEAT
Obtain Approval for heat curing by means of steam, hot air, etc. and:
1. Ensure that the total chloride content of the concrete mix for VPC components, subject to heat curing, is less than 0.1% by weight of that of the cement;
2. Carry out a trial to demonstrate the adequacy of the proposed method to the satisfaction of the CM.
DEMoulding AND STRIPPING MOULDS
Demould by means of an Approved method:
1. Do not use crowbars;
2. Do not subject the mould to any form of impact;
3. Fully, or partially, strip moulds when the concrete has gained sufficient strength, measured on specimens kept with the mould after casting;
4. Prove the stripping strength by test as given in CON8.W380 and check against the method statement.

CONCRETE STRENGTH BEFORE DEMouldING
1. Demould the VPC components only after concrete has achieved the required strength;
2. To determine if the concrete has achieved the strength required for demoulding or handling:
   a. Make the necessary concrete cubes in pairs from the same batch of concrete used for casting the VPC components and cure the concrete cubes under the same conditions as the concrete in the VPC components;
   b. Specially identify the cubes and do not use them for normal quality control or for compliance testing;
   c. Determine the concrete cube strength by compression test as CON7.T110 and satisfy the CM that the concrete cubes have acquired the required strength before the demoulding or handling the VPC components.

IDENTIFICATION AND RECORDS
1. Mark all VPC components with date of manufacture and a unique reference number;
2. Record in a master register the dates of casting, the concrete grades and the final locations of all VPC components;
3. Where required by the CM, each VPC component is to be delivered to Site with an appropriate QA certificate endorsed by the Quality Control Engineer.

REQUIREMENTS OF OTHER TRADES AND COMPONENTS
Incorporate the requirements of all trades such as blockouts, recesses, notches, embedded metal works, building services installations or any other items etc. before casting the VPC components.

SCOPE OF MINOR REPAIR
1. Use suitable filler to fill blow holes, small voids and repair non structural damage in accordance with the Approved procedures as given in the method statement required under CON8.W120;
2. Test those procedures and, if required by the CM, demonstrate the procedures on the study mock-up.

DEFECTIVE COMPONENTS
1. Any VPC component that falls outside the manufacture tolerance is considered defective and must be rejected. Apply indelible mark on rejected units for identification purposes;
2. For other defects, including but not limited to minor chipping, damages to finishes or exposed conduits, etc., quarantine for inspection in accordance with the Approved QA scheme within the casting yard. Agree with the CM special repair methods or rejection of any defective VPC components that cannot be repaired and finished by the Approved repair methods / procedures as required under CON8.W120;

3. In the event of the CM agreeing to accept any quarantined VPC components, execute all necessary remedial and modification work to the CM's satisfaction.

CON8.W430.7 CLEANING
1. Ensure that all fittings that will be used to make connections in-situ are cleaned and checked prior to delivery of the VPC component to Site;
2. Ensure that all internal surfaces of the VPC components are cleaned to the standard agreed with the CM before the components are delivered to Site.

CON8.W440.7 PROTECTION
Protect VPC components to ensure that no damage is done during and after storage, lifting, transportation or erection.

CON8.W450.7 LIFTING
1. Lift VPC components only when the concrete has achieved the required lifting strength, measured on specimens kept with the VPC components in accordance with the Approved method statement required under CON8.D940 and CON8.W380;
2. Lift VPC components within the yard by means of a lifting system designed in accordance with CON8.D810 to CON8.D830;
3. Ensure that lifting plant and equipment complies with the requirements of CON7.W540.

CON8.W460.7 SIZE AND WEIGHT OF VPC COMPONENTS FOR TRANSPORTATION AND CRANEAGE
1. Indicate, in the method statement required under CON8.D940, the maximum projected horizontal and vertical dimensions of the component, including any protection, packing or protruding steel, beyond transportation vehicles, to ensure compliance with the limitations stipulated by local legislation;
2. Indicate, in the method statement required under CON8.D940, the maximum weight of the component including the weight of any props, supporting frame, protection or packing. Make clear any lifting or other components that are not included in this value. This weight shall not be exceeded;
3. Weigh each type of VPC prototype component and any subsequent components as required by the CM.

CON8.W470.7 TEMPORARY STORAGE SUPPORT
1. Provide temporary support for storage of VPC components that does not place excessive bearing, compressive, tensile or flexural stresses on the component or cause spalling, cracking or unintended deformations;
2. Provide calculations to demonstrate that the likely deformation of VPC components, temporarily supported in the storage yard, is not detrimental to the manufacture tolerances, and, after erection, to the overall tolerance;
3. Ensure that stacking of VPC components does not generate unintended bearing, compressive, tensile or flexural stresses on the component or cause spalling, cracking or unintended deformations;
4. Store VPC components in the vertical plane on a levelled, well-drained and maintained concrete surface and protect against staining or physical damage.

**CON8.W480.7 TRANSPORTATION**

1. Provide a transportation system, complying with CON7.W510 to CON7.W560, such that damage to the component is prevented preferably without reliance on any protection cover;

2. Maintain lorries or wagons used for the transportation of the VPC components in a good condition. Ensure wagons are equipped with suspension systems to minimize shock loading;

3. Ensure all lifting of VPC components during transportation, including loading and unloading from lorries or wagons, comply with the lifting method as per CON8.W450.

**ERECTION VPC COMPONENTS**

**CON8.W510.7 SITE RECORDS**

Provide, at the end of each week during erection of the VPC components, records in a form to be agreed with the CM, showing:

1. Delivery and installation dates, and the locations of joints and permanent structural connections completed on a location plan for each floor;

2. Dates of removal and locations of any props and temporary supports to the VPC components.

**CON8.W520.7 CM'S INSPECTION**

Allow and facilitate inspection of the VPC components at any time before and after erection.

**CON8.W530.7 LIFTING UNITS INTO POSITION**

1. Prove, by demonstration, that the lifting method is capable of meeting the design requirements given in CON8.D810 to CON8.D830;

2. Lift the VPC components using the lifting system complying with CON8.W450;

3. Maintain all cables connecting the lifting frame and the lifting points of the VPC components in a vertical direction. Provide the cables with devices for the adjustment of their length;

4. Do not allow devices such as sockets or bolts for lifting purposes to be used for fixing the VPC components to the main structure.

**CON8.W540.7 UNITS DAMAGED ON TRANSPORTATION, LIFTING OR ERECTION**

Repair or replace as agreed with the CM any VPC component which has been damaged on transportation, lifting or erection in accordance with the Approved repair methods / procedures as required under CON8.W120.
JOINTS AND PERMANENT STRUCTURAL CONNECTIONS

CON8.W610.7 GENERAL
Prepare and construct joints strictly in accordance with the Approved drawing details and in accordance with the relevant manufacturer's recommendations so as to provide continuous weather-tightness of buildings and give a neat, uniform and smooth appearance.

CON8.W620.7 GROUTING OF PERMANENT STRUCTURAL CONNECTION
Clean the connection by methods approved by the CM before the grout is placed. Take measures to prevent the accumulation of dirt and other material at the connection and the presence of air lock.

CON8.W630.7 JOINT WIDTH
Unless otherwise Approved, the installed joint width must not be less than 6 mm nor greater than 30 mm.

CONDUIT SYSTEM

CON8.W710.7 APPLICATION
Supply and install concealed rigid plain PVC conduit system complete with steel draw wires for VPC components as indicated on the Drawings.

CON8.W720.7 COMPLETION CERTIFICATION
Comply with CON7.W1010.

CONDUIT AND WIRING INSTALLATION

CON8.W810.7 CONDUIT BENDS
As CON7.W990.

CON8.W820.7 BENDING, JOINTING AND TERMINATING OF CONDUITS
As CON7.W1000.

PROTOTYPE MOCK-UP

CON8.W910.7 PROTOTYPE MOCK-UP
1. Erect a prototype mock-up on Site, in full accordance with the Approved as-built drawings of the study mock-up;
2. If proposed by the Contractor and approved by CM, the prototype mock-up can be part of the permanent works;
3. Obtain Approval from CM upon inspection of the completed prototype mock-up to set the standard and quality of workmanship necessary for all VPC components;
4. Do not alter, move, or destroy the Approved prototype mock-up unless permitted by the CM.
CON8.W920.7  REMOVAL OF PROTOTYPE MOCK-UP
Subject to the CM's approval, remove the prototype mock-up as well as the surrounding structural frames upon completion of erection of all the VPC components.

CON8.W930.7  VERIFICATION OF PROTOTYPE MOCK-UP
1. Carry out watertightness tests on the jointing system of the full size prototype mock-up specified in CON8.W910 in accordance with the procedures set out in CON8.T320;
2. Extend the watertightness tests to cover testing on joints of windows fixed to the full size prototype mock-up all to the requirements specified in COM2.T210;
3. Conduct tests to finishes in accordance with the relevant clauses in Worksections FIN1 to FIN7 as referred to in CON8.D030.
TESTING

SAMPLING AND TESTING

CON8.T010.7 RECORDS
1. Keep a complete record of all sampling and testing, in a form agreed with the CM;
2. Submit test reports and certificates to the CM within 14 days from the date of test.

CON8.T020.7 POWERS OF THE CM
The CM may witness any sampling and testing carried out under the Quality Assurance Scheme:
1. Make the records of sampling and testing available for inspection by CM;
2. The CM is entitled to reject individual VPC components represented by any failed test result on that component.

MIX TESTS

CON8.T110.7 GENERAL
Unless otherwise specified in this Worksection, comply with the requirements for trial concrete mixes and associated tests of both concrete and grout as given in Worksections CON1, CON4 and CON7.

TESTING FIXINGS

CON8.T210.7 TENSILE AND SHEAR TESTING
As CON4.T110 and CON4.T120.

SITE WATERTIGHTNESS TESTS TO EXTERNAL FACES ELEMENT OF A VPC COMPONENT

CON8.T310.7 TESTING INSTALLED JOINTS
Carry out watertightness tests to the jointing system of the external faces of the properly installed VPC components at the rate of 100% of each particular type in accordance with the procedures set out in CON8.T320.

CON8.T320.7 TEST PROCEDURE
Test joints on each selected external face of a VPC component according to the procedures as follows:
1. Construct working platforms where necessary for carrying out water test safely;
2. Working from the exterior, wet the external face of the VPC component selectively, starting from the lowest horizontal joint, followed by the vertical joints and then the horizontal joint above;
3. Spray a continuous jet of water from a nozzle at a water pressure of 210 to 240 kPa at the nozzle inlet to the joint and perpendicular to the external face of the VPC component. Move the nozzle slowly along the joint, at a distance of 300 mm from it, for a period of 5 minutes in every 1.5 metre of joint length while an observer carefully inspects on the interior side of the external face of the VPC component with the assistance of adequate lighting where necessary;

4. Unless otherwise Approved, use a nozzle to the requirements of the Architectural Aluminium Manufacturer's Association (AAMA) 501.2-83;

5. Repeat the process specified in sub-clause (3) above on all joints and joint intersections using increments of exposed joint length not exceeding 1.5 metres upward until all the joints are covered.

CON8.T330.7 WITNESSES TO TEST
All watertightness tests carried out on Site must be witnessed and certified both by the CM and the Contractor's representative.

CON8.T340.7 FAILURE OF UNITS
The VPC components and joints are deemed to have failed if signs of water seeping through the joints or through the external face of the VPC component, including signs of damp patches, are observed during the test and within the subsequent 2 hours after the test.

CON8.T350.7 REMEDIAL WORK TO VPC COMPONENTS FOR RE-TEST
Carry out remedial work to VPC components and joints which fail in the watertightness test. Methods of carrying out the remedial work are subject to Approval. After the remedial work is completed, re-test the external face of the VPC components and joints as CON8.T320 until all specified criteria have been satisfied.

SITE TESTING OF JOINTS AND PERMANENT STRUCTURAL CONNECTIONS

CON8.T410.7 SITE TESTING OF JOINTS AND PERMANENT STRUCTURAL CONNECTIONS
1. When instructed, carry out the following tests on Site in the presence of CM's representatives:
   a. Prior to grouting the joints or permanent structural connections:
      i. Check integrity of welds of any structural steelworks, for connection purpose, present at the permanent structural connections in accordance with STR1.T120, as appropriate, against the acceptance criteria as stipulated in STR1.T130.
   b. Upon completion of grouting:
      i. Check location and cover of rebars, with the use of Approved steel reinforcement detector or cover meter, against Approved drawings.
2. Non-compliance:
   a. In the event that any test result on a weld does not comply with the acceptance criteria, conduct further weld test in accordance with STR1.T120 (5);
   b. Cut out and repair all defective welds in accordance with STR1.T140 and re-test the welds in accordance with STR1.T120;
   c. Bear all costs of any further tests and no extension of time will be allowed.
LIFTING ANCHOR

CON8.T510.7 DEFINITION OF BATCH
In this Specification, a batch is defined as any quantity of lifting anchor of the same type and same working load capacity, delivered to the casting yard as one consignment and covered by the same test certificate issued by the lifting anchor manufacturer.

CON8.T520.7 TYPE AND LOAD CAPACITY
Unless otherwise specified on Drawings, lifting anchors shall be either eye anchor type or foot anchor type, and with a working load of 0.25 times the ultimate load capacity.

CON8.T530.7 RATE OF SAMPLING
1. The rate of sampling for ultimate load capacity for each batch of lifting anchor shall be a minimum of one sample, which comprises three test specimens, for every 3,000 anchors or part thereof;
2. When Instructed, provide an additional sample comprising three test specimens for testing by DTC.

CON8.T540.7 COMPLIANCE CRITERION
No test result of ultimate load capacity of individual test specimen shall be less than 4 times the working load as stipulated in CON8.T520.

CON8.T550.7 SUBMISSION
Prior to the production of precast concrete components, provide test certificates issued by:
1. The lifting anchor manufacturer/agent supplier; and
2. An Approved testing laboratory employed by the manufacturer of precast concrete component on the ultimate load capacity of lifting anchors for each batch under the Quality Assurance System as stipulated in CON7.W040.

**TOLERANCES** .......................................................................................................... 60
| EAR2.W510.7      | GENERAL........................................... 60 |
1. Submit for Approval, within 7 days of the notified date for commencement of the Works, the name and particulars of the Registered Structural Engineer (RSE) and Registered Geotechnical Engineer (RGE) who will be employed on the Project in accordance with the Preliminaries Worksection. The RSE and RGE must have relevant experience to design, supervise and control all temporary works, excavation, dewatering and any specified design and built items. Comply with PNAP APP-141 for the division of responsibilities between RSE and RGE in connection with the excavation and lateral support works;

2. Prior to the notified date for commencement of the Works, the CM has provided reference design for the Excavation and Lateral Support Works (ELSW) for permanent works construction as specified in sub-clause (2) of EAR1.D030. The Contractor shall review and decide whether to dispense with, adopt in full or modify the reference design provided by the CM;

3. Should the Contractor choose to adopt in full the reference design provided by the CM, the procedures for submitting the Excavation and Lateral Support Plan (ELSP) to the CM as stipulated in sub-clause (3) of EAR1.D030 shall be followed;

4. Should the Contractor choose to dispense with or modify the reference design provided by the CM, the procedures for obtaining the CM’s approval of the Contractor’s design or the modified design as stipulated in sub-clause (4) of EAR1.D030 shall be followed;

5. If the reference design provided by the CM is adopted in full by the Contractor, the Contractor shall assume full design responsibility for the said ELSW in sub-clause (2);

6. If the Contractor decides to dispense with or modify the reference design provided by the CM, the Contractor shall be solely responsible for the design of ELSW or the modified design (including submission of ELSP).

1. Prior to commencement of the temporary work submit a method statement which takes account of geotechnical considerations and gives full details of all materials, plant and timing and sequence of operations involved in the construction of the temporary work, for the structures as specified in the Project Specific Specification;

2. As part of the information provided with the method statement submit for Approval full details of the temporary earth support systems it is proposed to use associated with the construction of the structures listed above;

3. Give due considerations to any drainage pipe works and existing retaining walls nearby along any Estate Roads;

4. Ensure particulars include, but are not limited to, the following:
    a. A detailed programme for the works showing phases of construction with associated traffic arrangements and provision for the existing utility services necessitated by the method of construction;
b. Details of construction method including:
   i. Plant, equipment and labour to be deployed;
   ii. Sequence for temporary works installation and excavation;
   iii. Sequence for temporary works removal and backfilling;
   iv. Temporary drainage measures to prevent flooding during rainstorms.

c. The workmanship submission requirements specified at EAR1.W050.

5. Allow adequate time in the construction programme for the CM's processing of the specified submissions. The time allowed must be in no circumstances less than 42 days. Do not commence the temporary work without the CM's consent.

**EAR1.D030.7 EXCAVATION AND LATERAL SUPPORT PLAN (ELSP)**

1. Submit ELSP for CM's approval at least 45 days before commencement of ELSW. The structural calculations and drawings submitted are prepared and signed by the RSE referred to in sub-clause (1) of EAR1.D010. The geotechnical report/supporting documentation for the ELSP shall be prepared and signed by the RGE appointed in accordance with the Preliminaries Worksection in case of having excavation depth deeper than 4.5 m and/or involving significant geotechnical elements. Allow for a further 45 days for granting of approval by CM before commencement of ELSW for each ELSP re-submission. ELSP submission is required where the excavation is one of the following types:

   a. Deeper than 2.5 m and greater than 5 m in length;
   b. Liable to affect any road, building, structure, slope steeper than 30 degrees or water main 75 mm in diameter or greater, the affected area being defined as within the 45 degree line up from the base of the excavation to the ground surface;
   c. Of substantial depth, the collapse of which would cause serious consequences to public safety as per PNAP APP-57;
   d. Any other ELSW requiring ELSP submission as specified by CM.

2. The reference design for the ELSW is provided for .................. with details in reference drawing nos. ................ listed in Appendix U to this Specification. The reference drawings are given in good faith for the Contractor's information and reference only, and are by no means exhaustive nor represent the design provided therein or any part thereof being in compliance with the Specification. Notwithstanding these reference drawings which the Contractor is free to adopt or not, or to modify in whole or in part, the Contractor shall be solely responsible for the design (including submission of ELSP) and construction of the ELSW. The provision of these reference drawings shall not prejudice the Contractor's obligations and liabilities under the Contract;

3. Where the Contractor chooses to adopt in full the said reference design of the ELSW referred to in sub-clause (3) of EAR1.D010, submit ELSP based on the said reference design of the ELSW duly signed by the RSE and/or RGE as appropriate appointed in accordance with the Preliminaries Worksection for CM's record at least ........ days before commencement of the ELSW. Notwithstanding submitting the ELSP, the commencement of the ELSW shall be subject to the CM's written permission referred to in PRE.B4.050;
4. Where the Contractor chooses to dispense with or modify the said reference design of the ELSW referred to in sub-clause (4) of **EAR1.D010**, the Contractor shall submit ELSP for CM's approval at least 45 days before commencement of the ELSW. The structural calculations and drawings submitted are prepared and signed by the RSE referred to in sub-clause (1) of **EAR1.D010**. The geotechnical report/supporting documentation for the ELSP shall be prepared and signed by the RGE appointed in accordance with the Preliminaries Worksection in case of having excavation depth deeper than 4.5 m and/or involving significant geotechnical elements. Allow for a further 45 days for granting of approval by the CM before commencement of ELSW for each ELSP re-submission. ELSP submission is required where the excavation is one of the following types:

   a. Deeper than 2.5 m and greater than 5 m in length;
   b. Liable to affect any road, building, structure, slope steeper than 30 degrees or water main 75 mm in diameter or greater, the affected area being defined as within the 45 degree line up from the base of the excavation to the ground surface;
   c. Of substantial depth, the collapse of which would cause serious consequences to public safety as per PNAP APP-57;
   d. Any other ELSW requiring ELSP submission as specified by CM.

5. The ELSP submission shall include information as specified in the **Project Specific Specification**;

6. For ELSW with pile walls and bulk excavation, comply with the following:

   a. Refer to the **Project Specific Specification** on restrictions on commencement for pile walls driving work;
   b. Comply with the requirements of the Approved ELSP;
   c. At the completion of pile walls driving works, submit record plans showing the actual penetration depth of the pile walls to CM for approval. Allow at least of 22 days for granting of approval by CM on:
      i. Certification of completion of the works using Form ICU 14;
      ii. Commencement of bulk excavation works.
   d. Allow sufficient time in the programme of Works for obtaining the said Approvals. Do not commence driving of pile walls and bulk excavations without written Approval for commencement from the CM.

7. For ELSW with bulk excavation only, comply with the following:

   a. Refer to the **Project Specific Specification** on restrictions on commencement on bulk excavation works;
   b. Allow sufficient time in the programme of Works for obtaining the said Approvals. Do not commence ELSW without written Approval for commencement from the CM;
   c. Comply with the requirements under the Approved ELSP.

**EAR1.D040.7 SHORING AND EXCAVATION PROCEDURE DETAILS**

1. Submit 'Shoring and Excavation Procedure Details' to CM at least 22 days before commencement of bulk excavation works at the locations as specified in **Project Specific Specification**;

2. Comply with the requirements under the submitted 'Shoring and Excavation Procedure Details'.
1. Design temporary works, excavation and dewatering methods and submit proposals for review and Approval. Include in the submission of the details of the temporary earth support systems the following:
   a. Design philosophy; bearing in mind that design is such that the risk of failure is not more than that which would be adopted if the temporary works were to be permanent. Allowance may be made in the design for the shorter design life and for the risk to persons and property and the surface water and ground water conditions which are likely to occur during construction;
   b. Detailed design calculations and drawings;
   c. Specification for the works including procedures for installation and removal;
   d. Prediction of deformation of the temporary works and ground settlement and horizontal movement;
   e. Assessment of ground vibrations resulting from the temporary works that must not exceed the limits set down in EAR2.W200. In case where the temporary works involve installation of pile walls by percussive or vibratory methods, assessment of ground vibrations resulting from such works that must not exceed the limits set down in Appendix A of PNAP APP-137;
   f. Precautionary measures to safeguard the integrity of the existing drainage pipe work and retaining wall in vicinity of the temporary works.
2. Refer to EAR1.D030 on the design requirement and method of construction of the ELSW;
3. Include in the design contingency measures to be adopted should site conditions deviate from the design assumptions;
4. Ensure all calculations and drawings submitted are certified and signed by the Registered Structural Engineer referred to at EAR1.D010 and ensure all geotechnical reports and supporting documents are certified and signed by the Registered Geotechnical Engineer referred to in EAR1.D010;
5. Allow in the design for the subsequent removal of the temporary works while maintaining the stability of the excavation upon completion of the Works;
6. Make a detailed submission to the CM to provide design parameters and design ground water levels with supporting document/calculation/justification for the design and:
   a. Verify the proposed design parameters and design ground water levels by carrying out necessary Approved laboratory tests and monitoring. The CM reserves the right to reject any proposed design parameters and design ground water levels that are not to the CM's satisfaction;
   b. Submit details of all required tests to the CM's satisfaction. Arrange for sufficient number of laboratory tests and investigation to establish the design parameters for each major stratum with sufficient independent results for that stratum. Carry out all laboratory tests and investigation for this purpose at the expense of the Contractor and bear all the time involved.
7. Where the Contractor chooses to adopt in full the reference design of ELSW for permanent works construction referred to in sub-clause (2) of EAR1.D030:
   a. Refer to EAR1.D030 on the design requirement and method of construction of the ELSW;
   b. Include in the design contingency measures to be adopted should site conditions deviate from the design assumptions;
   c. Submit details of all required tests to the CM's satisfaction. Arrange for sufficient number of laboratory tests and investigation to establish the design parameters for each major stratum with sufficient independent results for that stratum. Carry out all laboratory tests and investigation for this purpose at the expense of the Contractor and bear all the time involved.
8. Where the Contractor chooses to dispense with or modify the reference design of ELSW for permanent works construction referred to in sub-clause (2) of EAR1.D030:

a. Design temporary works, excavation and dewatering methods and submit proposals for review and Approval. Include in the submission of the details of the temporary earth support systems the following:

i. Design philosophy; bearing in mind that design is such that the risk of failure is not more than that which would be adopted if the temporary works were to be permanent. Allowance may be made in the design for the shorter design life and for the risk to persons and property and the surface water and ground water conditions which are likely to occur during construction;

ii. Detailed design calculations and drawings;

iii. Specification for the works including procedures for installation and removal;

iv. Prediction of deformation of the temporary works and ground settlement and horizontal movement;

v. Assessment of ground vibrations resulting from the temporary works that must not exceed the limits set down in EAR2.W200. In case where the temporary works involve installation of pile walls by percussive or vibratory methods, assessment of ground vibrations resulting from such works that must not exceed the limits set down in Appendix A of PNAP APP-137;

vi. Precautionary measures to safeguard the integrity of the existing drainage pipe work and retaining wall in vicinity of the temporary works.

b. Refer to EAR1.D030 on the design requirement and method of construction of the ELSW;

c. Include in the design contingency measures to be adopted should site conditions deviate from the design assumptions;

d. Ensure all calculations and drawings submitted are certified and signed by the Registered Structural Engineer referred to at EAR1.D010 and ensure all geotechnical reports and supporting documents are certified and signed by the Registered Geotechnical Engineer referred to in EAR1.D010;

e. Allow in the design for the subsequent removal of the temporary works while maintaining the stability of the excavation upon completion of the Works;

f. Make a detailed submission to the CM to provide design parameters and design ground water levels with supporting document/calculation/justification for the design and:

i. Verify the proposed design parameters and design ground water levels by carrying out necessary Approved laboratory tests and monitoring. The CM reserves the right to reject any proposed design parameters and design ground water levels that are not to the CM's satisfaction;

ii. Submit details of all required tests to the CM's satisfaction. Arrange for sufficient number of laboratory tests and investigation to establish the design parameters for each major stratum with sufficient independent results for that stratum. Carry out all laboratory tests and investigation for this purpose at the expense of the Contractor and bear all the time involved.
EFFECT OF WORKS ON OTHERS

1. Where temporary work, ELSW and dewatering proposals could have an effect on the properties of others, the CM may require submission of the design proposals to be presented to the Geotechnical Engineering Office (GEO), Technical Services Division of Civil Engineering Development Department, Highways Department, Mass Transit Railway Corporation, Kowloon Canton Railway Corporation, Water Supplies Department and Drainage Services Department, etc. for comments and / or acceptance;

2. When Instructed abide by such requirements;

3. Where this is the case allow sufficient time in the programme for comment by various Government Departments. Incorporate all comments and requirements from various Government Departments into the ELSP prior to submission to CM in accordance with EAR1.D030;

4. Address all queries raised by the various Government Departments;

5. Do not commence construction works until formal Approval has been given.

INFORMATION PROVIDED BY THE AUTHORITY

1. Drillhole data, laboratory testing data, structural design criteria and any other information relevant to the Works may be viewed at the Authority's office by appointment at any time during normal office hours;

2. Information provided thus is given in good faith and expressly without guarantee;

3. Accept responsibility as to the extent to which the information given represents the conditions to be encountered;

4. Any departure from recorded information regarding the strata throughout the Site for the proposed works will not result in extra payment or deduction from the tendered amount.

GEOTECHNICAL STUDY AND GROUND INVESTIGATION

1. In addition to the general responsibilities provided under the Contract, carry out a geotechnical study and any necessary ground investigation so as to become fully aware of the geotechnical characteristics of the design of temporary works or the execution of the works;

2. Comply with the requirements as specified in Project Specific Specification.

BUILDING REGULATIONS

Carry out calculations for temporary works in accordance with the relevant Building Regulations made under the Building Ordinance, slope manual, geoguide and model specification of Geotechnical Engineering Office and the relevant British Standards. Wherever there is conflict between British Standards and Building Regulations, the latter shall take precedence.

DESIGN OF LOAD CARRYING ELEMENTS

Ensure all materials used as load carrying elements conform to the relevant British Standards in respect of quality, and that the design conforms with the safe working stresses laid down in those Standards.

TRENCH EXCAVATION

Without prejudice to other provisions in the Contract, comply with the provisions in the "Guide to Trench Excavations (Shoring Support and Drainage Measures)" published jointly by the Highways Department and the Civil Engineering and Development Department, Hong Kong Government or its updates as may be promulgated from time to time in the design of temporary support to trench excavations.
MATERIALS

DEFINITIONS

EAR1.M005.7 INERT CONSTRUCTION AND DEMOLITION MATERIAL
Rock, rubble, earth, soil, concrete, asphalt, brick, tile and masonry generated from construction and demolition works.

EAR1.M010.7 EARTHWORKS MATERIAL
Soil, rock, or inert construction and demolition material on or below the Site at the commencement of the Works, or which is imported to the Site to carry out the Works.

EAR1.M020.7 OWNERSHIP OF EARTHWORKS MATERIAL
1. Ownership of the Employer - earthworks material within the Site at the commencement of the Works, except as in sub-clause (2) below;
2. Ownership of the Contractor - earthworks material which is required to be disposed of by the Contractor is the property of the Contractor when it is removed from the Site. Dispose of in tips provided by the Contractor, unless otherwise stated in the Contract.

EAR1.M030.7 SUITABLE MATERIAL
1. Naturally occurring or processed material, or inert construction and demolition material, which at the time of deposition is capable of being compacted in accordance with the specified requirements to form stable areas of fill;
2. Grade 200 Recycled Rock Fill as EAR1.M045 where specified in the Drawings or approved by CM;
3. Do not use unsuitable materials as listed in EAR1.M050.

EAR1.M040.7 PUBLIC FILL
1. Public fill shall mean the inert material arising from construction and demolition activities such as site clearance, excavation, construction, refurbishment, renovation, demolition and roadworks. Public fill comprises material including stone, rock, masonry, brick, concrete, soil and other inert material. There is no size limitation on the public fill, and a small amount of timber mixed with otherwise suitable material is permissible. The public fill may also consist of wet soil;
2. The use of public fill as fill material for earthwork may be permitted and the size limitation, transportation, stockpiling, deposit, spreading, compaction and any particular requirements of such material shall be as stated in the Contract.

EAR1.M045.7 GRADE 200 RECYCLED ROCK FILL
1. Grade 200 Recycled Rock Fill (RR 200) shall mean a type of recycled rock or inert construction and demolition material which is hard and durable, and free from cracks, veins, and other evidence of decomposition;
2. RR 200 shall be collected from the recycling facilities managed by the Fill Management Division of Civil Engineering and Development Department as specified in the Project Specific Specification;
3. In the event that RR200 is used in the Works, comply with the following:
a. Comply with the relevant ordering and collection procedures of RR 200 as specified by the CEDD;

b. Complete and submit the order form to the CM at least 10 days before the collection of RR 200 from the recycling facilities. The ordering and collection procedures together with the order form can be obtained from the CEDD web-site;

c. Make due allowance in the works programme for the time associated with ordering and collection of RR200 and bear all associated costs, and no extension of time will be allowed.

**EAR1.M050.7** **UNSUITABLE MATERIAL**

Other than Suitable Material and Grade 200 Recycled Rock Fill, and including the following:

1. Peat, vegetation, timber, organic, soluble or perishable material, or rubbish;

2. Swelling clays or collapsible soils;

3. Dangerous or toxic material or material susceptible to combustion;

4. Material susceptible to volume change, including marine mud, materials from swamps, nullahs, stream courses and culverts, or soil with a liquid limit exceeding 65% or a plasticity index exceeding 35%; and

5. Metal, rubber, plastic or synthetic material.

**EAR1.M055.7** **MARINE MUD**

The term "mud" shall be as defined in Table 11 of 'Geoguide 3:Guide to Rock and Soil Descriptions' GEO, which is broadly classified as marine deposits with fine soils of over 35% by mass of silts and clays of particle sizes up to 0.06 mm.

**EAR1.M060.7** **ROCK**

1. Naturally occurring hard material which in the opinion of the CM can only be removed by:
   a. Blasting;
   b. Pneumatic tools other than clay spades;
   c. Wedges and sledge hammers;
   d. Drilling and the use of mechanical bursting;
   e. Drilling and the use of expanding agents.

2. Any isolated, solid boulder or detached piece of rock exceeding 0.2 m³.

**EAR1.M070.7** **TOPSOIL**

Soil capable of supporting vegetable growth.

**EAR1.M080.7** **EMBANKMENT**

An area on the Site, other than a foreshore or sea-bed, where the ground level is to be raised by filling in layers as part of the Works.

**EAR1.M090.7** **TRENCH EXCAVATION**

Excavation starting at ground level and not exceeding 5 m in width at the surface.

**EAR1.M100.7** **BULK EXCAVATION**

Excavation in the open, other than trench excavation.
FILL MATERIALS

EAR1.M210.7 GENERAL

1. Use only suitable material as previously defined;
2. Unless otherwise specified, form areas of fill by general fill material;
3. Obtain fill material from excavation within the Site. If there is insufficient fill material of the required types within the Site, provide imported fill material from sources outside the Site subject to approval by the CM.

EAR1.M220.7 PARTICLE SIZE DISTRIBUTION AND TYPES OF FILL MATERIAL

For different types of fill material, keep particle size distribution within the following table:

<table>
<thead>
<tr>
<th>Type of fill material</th>
<th>Percentage by mass passing</th>
<th>BS Test Sieve</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>400 mm 200 mm 75 mm 20 mm 600 µm 63 µm</td>
<td></td>
</tr>
<tr>
<td>Fine fill</td>
<td>-     -     100   -     -     -</td>
<td></td>
</tr>
<tr>
<td>General fill</td>
<td>-     100   75 - 100 -     -     -</td>
<td></td>
</tr>
<tr>
<td>Special fill</td>
<td>-     -     100   -     -     0 - 45</td>
<td></td>
</tr>
<tr>
<td>Granular fill</td>
<td>-     -     100   -     0 - 5   -</td>
<td></td>
</tr>
<tr>
<td>Rock fill (Grade 200)</td>
<td>-     100   20 - 75 0 - 50 -     -</td>
<td></td>
</tr>
<tr>
<td>Recycled rock fill (Grade 200)</td>
<td>-     100   20 - 75 0 - 50 -     -</td>
<td></td>
</tr>
<tr>
<td>Rock fill (Grade 400)</td>
<td>100   20 - 75 10 - 30 0 - 25 -     -</td>
<td></td>
</tr>
</tbody>
</table>

Notes to table:

1. Special fill material is to consist of material which has a liquid limit not exceeding 45%, a plasticity index not exceeding 20% and a coefficient of uniformity exceeding 50. For those special fill material which contains less than 30% by weight of particles less than 63 µm, testing on the liquid limit and plasticity index of the material is not required;
2. Granular fill material is to consist of clean, hard, durable material including recycled aggregates, rock and concrete;
3. Rock fill material is to consist of pieces of hard and durable rock of which the maximum size shall not be greater than three times the minimum dimension of individual pieces and in the opinion of the CM not more than 30% by mass is discoloured or shows other evidence of decomposition. Crushed rock or crushed concrete may be permitted subject to approval by the CM;
4. The soluble sulphate content of fill material placed within 500 mm of concrete, cement bound material or cementitious material must not exceed 1.9 grams of sulphate, expressed as SO₃, per litre;
5. The total sulphate content, expressed as SO₃, of fill material placed within 500 mm of metalwork must not exceed 0.5% by mass;
6. Well-graded material to consist of material which has a coefficient of uniformity exceeding 10;
7. Uniform-graded material to consist of material which has a coefficient of uniformity of 10 or less.
**EAR1.M230.7 FILTER MATERIAL**

1. Hard, durable, inert material. When placed and compacted this material, either:
   - (a) Conforms with the grading limits specified; or
   - (b) Other limits separately designed by the Contractor to suit the type of adjacent material in accordance with filter rules acceptable to the GEO, as agreed by the CM; and
   - (c) Submitted to the CM at least 4 weeks prior to actual incorporation into the Works; and
   - (d) Graded - in accordance with Test Method 8.2 of Geospec 3: Model Specification for Soil Testing, GEO, and free from organic or other impurities.

**EAR1.M240.7 HARDCORE**

To comprise either:

1. Rock fill, or;

2. Broken stone, hard brick, concrete or other comparable hard, inert material, free from dust, rubbish or deleterious foreign matter and capable of passing through a 150 mm diameter ring in every direction.

**EAR1.M250.7 HYDROSEEDING**

Refer to Project Specific Specification.

**EAR1.M260.7 SOFT LANDSCAPING**

Refer to Project Specific Specification.
WORKMANSHP

DEFINITIONS AND SUBMISSIONS

EAR1.W010.7 AREAS OF FILL
Areas within the Site, including areas in embankments, platforms and slopes and in excavations for structures, pits and trenches, in which fill material is deposited and compacted as part of the permanent work.

EAR1.W020.7 EARTHWORKS FINAL SURFACE
The surface to which the work included in this Worksection is finished.

EAR1.W030.7 FORMATION
That part of the earthworks final surface on which a pavement, structure or utility, is constructed, or on which the blinding or bedding for a pavement, structure or utility is placed.

EAR1.W040.7 INTERMEDIATE AREAS OF FILL
Areas of fill in which fill material is deposited and compacted directly into shallow water or onto naturally occurring soft ground.

EAR1.W050.7 SUBMISSION OF PARTICULARS
Submit the following particulars of proposed methods of construction for earthworks to the CM at least 14 days before relevant work starts:
1. Details of constructional plant and haulage vehicles;
2. Methods of excavation and of deposition and compaction of fill material;
3. Use of different type of excavated material and sources of imported fill material;
4. Arrangements for stockpiling, sorting and separating excavated material, earthworks material and fill material and for reusing and disposing of such materials;
5. Methods of controlling the moisture content of fill material;
6. Methods of controlling surface water and groundwater and of protecting earthworks and earthworks material from damage due to water and from weather conditions which may affect the earthworks or earthworks material;
7. Methods of monitoring groundwater levels;
8. Methods of monitoring the ground and structures for movements;
9. Methods, with detailed design of supporting excavations adjacent to slopes, retaining walls, structures, roads, private developments or other properties;
10. Stability calculations of unsupported excavations adjacent to slopes, retaining walls, structures, roads, private developments or other properties.

USE OF BLASTING

EAR1.W110.7 USE OF BLASTING METHOD
Refer to Project Specific Specification.
SURVEYS

**EAR1.W210.7 DATUM**

Spot levels and contours shown on the Drawings are, unless otherwise specified, reduced to Hong Kong Principal Datum for levels and the latest edition of Hong Kong Geodetic Datum for co-ordinate locations.

**EAR1.W220.7 COMMENCEMENT SURVEY**

1. Upon possession of the Site, and before any work is carried out, carry out and record a topographical survey of the whole of the Site in the presence of the representatives of the CM;
2. Obtain Approval to the method of survey and the instrument to be used from the CM before the commencement of the survey;
3. Submit the survey drawings to the CM within 14 days after commencement of the survey for endorsement and adopt the endorsed survey drawings as the true record of the Site at commencement;
4. Use the endorsed survey drawings for measurement of earthwork quantities as applicable;
5. Do not start earthworks on any location prior to the endorsement of the survey drawings;
6. When instructed by the CM, carry out a joint survey of the Site with the previous piling contractor immediately upon award of the Contract in the presence of the CM or his representatives as specified in PRE.B3.080.

**EAR1.W230.7 INTERIM AND FINAL SURVEYS**

1. Carry out interim surveys at intervals requested by the CM;
2. Carry out final topographical survey upon completion of the works;
3. Follow instructions of the CM for any extra surveys required to resolve any doubts on the correctness of survey records;
4. Adopt the same process for interim, final, and extra surveys as specified in EAR1.W220;
5. When instructed by the CM, carry out a joint survey with the subsequent building contractor after completion of the Works and upon award of the subsequent building contract to record the site topography and the works to be handed over to the subsequent building contractor in the presence of the CM or his representatives as specified in PRE.B9.130.

**EAR1.W240.7 SURVEY INFORMATION**

All topographical surveys:
1. Must be reduced to Hong Kong Principal Datum and co-ordinate locations to be to the latest edition of the Hong Kong Geodetic Datum;
2. Must include plans and sections;
3. Must be reproduced on transparent film of dimensionally stable material to scale of 1:200 (or as Instructed);
4. Must be signed by the Contractor and the responsible party involved in case of a joint survey and the CM as being a true record of the Site.
TEMPORARY WORKS, SLOPES AND GROUND DRAINAGE

EAR1.W310.7 TEMPORARY DRAINAGE SYSTEM
Rapidly disperse water, whether shed on to the excavation or earthwork or arising from any other source, including flowing into the Site from elsewhere and:

1. Obtain Approval to the discharge points of the temporary drainage and pumping systems;
2. Make all arrangements with and obtain necessary approvals and inspections from the relevant authorities for discharging water to drains, watercourses or the sea;
3. Do not start the work until the Approved arrangements for disposal of the water have been implemented;
4. Take measures to prevent floatation of new and existing structures;
5. Provide temporary watercourses, ditches, catchpits, drains, pumping or other means of maintaining the excavations and earthworks free from water;
6. Discharge the water into the permanent outfall of the piped drainage system whenever possible;
7. Provide Approved means of trapping silt on temporary systems discharging into the permanent drainage systems;
8. Ensure that temporary and permanent drainage systems are adequately maintained and clear of rubbish and debris.

EAR1.W320.7 TEMPORARY SUPPORTS TO EARTHWORKS
1. Use temporary supports or other methods to maintain excavations in a stable condition and to prevent settlement of structures or utilities due to excavation or dewatering;
2. Do not operate or park construction plant or other vehicles adjacent to excavations unless this has been allowed for in the design of the temporary works for the support of the excavation. Erect barriers at a distance from excavations not less than the depth of excavations, or where space is not permitted, at a shorter distance from excavations as agreed with the CM;
3. Do not place earthworks material or other materials adjacent to excavations unless this has been allowed for in the design of the temporary works for the support of the excavation;
4. Securely support all sides of trenches, pits, excavations, slopes or stockpiles exceeding 1.2 m vertical height/depth unless formed to a safe batter substantiated by design calculation agreed with the CM.

EAR1.W330.7 GENERAL SAFETY PRECAUTIONS
1. Carry out excavations and earthworks in such a manner to prevent erosion or slips;
2. Do not stockpile material where it might cause a landslide;
3. Do not store excavated materials adjacent to the top edge of mass excavations, slopes or stockpiles exceeding 1.2 m high unless otherwise agreed;
4. When Instructed trim and seal final faces of excavations to remove all loose rocks to prevent falling which might cause injury to workmen;
5. Limit working surfaces to safe slopes and height.
SAFETY PRECAUTIONS FOR OPEN EXCAVATION EARTHWORKS

1. Provide open board fencing, or equivalent, and warning signs to:
   a. Excavations, slopes or stockpiles exceeding the following heights:
      i. Vertical slope face: 2 m
      ii. Battered slope face: 3 m
   b. Trenches or pits exceeding 2 m deep.

2. Provide temporary fencing or warning ribbons to excavations, slopes, stockpiles, trenches or pits less than the heights/depth given in sub-clause (1) above but exceeding 1.2 m.

GENERAL

EXCAVATION AND EARTHWORKS

1. Carry out excavations and earthworks in dry conditions unless otherwise permitted by the CM, except where the excavations and earthworks are required to be carried out in or with water or other fluids;

2. Suppress dust generation during excavation and earthworks operations by spraying the work area of any excavation or earth moving equipment operation with water or a dust suppression chemical immediately before, during and immediately after the operation so as to maintain the entire surface wet. Dispose cement, pulverized fuel ash or any other dusty materials collected by fabric filters or other air pollution control system or equipment in totally enclosed containers;

3. Control height from which excavated materials are dropped to a practical minimum;

4. Carry out the formation of cuttings and filling in such a manner that the surfaces have at all times a sufficient minimum crossfall and, where practicable a sufficient longitudinal gradient to enable them to shed water and prevent ponding;

5. Adopt a method of working which minimises the area of exposed soil across the Site;

6. Carry out excavation to the lines, levels, dimensions and slopes specified;

7. Carefully level the bottom of excavation and step or bench horizontally as specified.

PROTECTION FROM WATER AND WEATHER

1. Keep earthworks after site clearance, excavation or filling and earthworks material after excavation free of water and:
   a. Protect from damage due to water;
   b. Protect from exposure to weather conditions which may affect the earthworks or earthworks material.

2. Take measures including but not limited to the followings:
   a. Use temporary drainage, pumping systems or other effective measures approved by the CM. Intercept silt and debris with traps before water is discharged from the Site;
b. Obtain Approval from the CM for the discharge points of temporary drainage and pumping systems. Make all arrangement with and obtain the necessary approvals and inspections from the relevant authorities for discharging water to drains, watercourses or the sea. Do not start the relevant works until the approved arrangements for disposal of the water have been implemented;

c. Do not carry out works in weather conditions that may adversely affect the works unless protection by methods agreed by the CM is provided;

d. Maintain surfaces in a stable condition;

e. Form surfaces to falls to shed water and to prevent ponding;

f. Keep the area of exposed surfaces to a minimum;

g. Seal or cover with impermeable sheeting or protect by other Approved methods surfaces which are temporarily exposed.

EAR1.W430.7 WORK NEAR SLOPES

Do not carry out excavations on or adjacent to slopes unless measures are taken to drain the excavation and to prevent water from the excavation entering the slopes.

EAR1.W440.7 UNSUITABLE EARTHWORKS MATERIAL

1. Replace the following materials or deal with by the methods agreed by the CM:

   a. Earthworks material which has been used, or is required for use, in the permanent work and which is allowed to become unsuitable such that in the opinion of the CM it no longer complies with the specified requirements for that type of material;

   b. Earthworks material which is not specified to be excavated and which the Contractor causes or allows to deteriorate such that in the opinion of the CM the permanent work will be affected.

2. Dispose of all unsuitable material;

3. Material provided to replace earthworks material, which has been allowed to become unsuitable, or which the Contractor causes or allows to deteriorate, shall be an equivalent material approved by the CM. The replacement material shall have the same volume after compaction as the material replaced.

EAR1.W450.7 ADDITIONAL EXCAVATION AND STABILIZATION

When Instructed, carry out additional excavation to remove earthworks material which in the opinion of the CM has inadequate strength, durability or stability and treat the voids as follows:

1. Deposit and compact general fill, fine fill, or special fill material below areas of fill and below formations other than in rock;

2. Place and compact Grade 10 concrete as specified in Worksection CON1 below formations in rock;

3. Deposit granular fill material below standing water;

4. In other circumstances where the CM requires stabilisation of existing material, use rock fill material (Grade 400) deposited directly into the original material and compacted to form a stable foundation on which to construct the subsequent work.

EAR1.W460.7 HANDLING AND STORAGE OF EARTHWORKS MATERIAL

1. Do not handle or store in a manner which will result in segregation, deterioration, erosion or instability of the material;
2. Keep different types of earthworks material separate from each other. Maintain earthworks material which is suitable for use as fill material in a suitable condition and free from contamination by other materials;

3. Stockpile excavated materials away from nullahs, stream courses and covered culverts at a point convenient for direct loading onto transport in such a manner as to cause the minimum nuisance to the public;

4. Remove topsoil when required before starting excavation or filling and, unless otherwise specified, deposit on Site in temporary heaps not greater than 2 m in height for re-use. Ensure the soil is kept free from contamination and undue compaction;

5. Temporary spoil heaps will not be allowed in certain areas. Obtain CM's permission for location;

6. Level and drain properly the material handling and storage areas. Spray stockpiles of material with water or a dust suppression chemical to minimize dust generation.

EAR1.W470.7 EXISTING DRAINS AND SERVICES
During excavation and earthworks:
1. Take all precautions to prevent damage and excessive settlement to existing drains and services;
2. Notify the CM and the Authority of any damage and any settlement in excess of the limits allowed by relevant authority immediately and make good;
3. Temporarily divert ditches, land drains and other waterways found in excavation and subsequently reinstate to Approval;
4. Excavate by hand adjacent to utilities that are known, proven or suspected to exist.

EAR1.W480.7 EXCAVATION ADJACENT EXISTING STRUCTURES
Excavate by hand unless otherwise permitted by the CM.

EAR1.W490.7 TRIMMING
Neatly trim the face of excavations. Do not trim the side faces of excavation for at least 24 hours after placing any blinding concrete.

EAR1.W500.7 EXCAVATION OF TRENCHES FOR UTILITIES
1. The length of trench excavation left open at any one time shall not exceed that agreed by the CM;
2. Unless otherwise permitted by the CM, do not excavate trenches for utilities in areas of fill until the fill material has been deposited and compacted up to the earthworks final surface or formation or up to 1 m above the top of the utility, whichever is lower.

OBSTRUCTIONS

EAR1.W610.7 BURIED OBSTRUCTIONS
Notify the CM without delay of the location and nature of any unforeseen obstruction encountered during excavation.
DISUSED DRAINS AND MANHOLES
If required by the CM, take up disused drains encountered during the excavation, clear away and:
1. Remove any contaminated earth;
2. Disinfect as necessary and seal off ends with concrete;
3. Break up and remove disused manholes and backfill where required, properly compacted;
4. Submit details of filling materials to be used for Approval.

OLD UNDERGROUND STRUCTURES
1. If required by the CM, break out and remove old walls, foundations, piles and other underground structures encountered during the excavation and backfill where required, properly compacted;
2. Submit details of filling materials to be used for Approval.

BOULDERs
Treat boulders that intersect the earthworks final surface or formation as excavation proceeds by methods agreed by the CM. Do not leave boulders protruding unless permitted by the CM.

PILED FOUNDATIONS
Take necessary precautions to prevent damage to tops of piles during excavation.

SURFACES OF CUTTINGS
Remove the following from surfaces as required by the CM:
1. Inferior stone or soft material occurring between layers of compact rock;
2. Rock which the CM considers will not withstand weather sufficiently;
3. Rock fragments which move when prised with a crow-bar.

DEPTH OF REMOVAL
Comply with the CM's instructions on the depth from the face of cuttings to which material is to be removed.

MAKING GOOD
Build up to required profile with Grade 15/20 concrete as specified in Worksection CON1 or masonry laid with cement mortar finishing in "rock texture" similar to adjoining natural rock faces.

DISPOSAL OF EXCAVATED MATERIAL

UNSUITABLE AND SURPLUS MATERIAL
1. Unless otherwise stated in the Contract:
   a. Take measures to sort and separate excavated material on Site for use in the permanent works according to the Environmental Management Plan;
b. Dispose of the excavated material, which in the opinion of the CM cannot be selected, processed or mixed in a practical manner to make it suitable for use in the permanent work;  
c. Dispose of excavated material that is surplus to the requirements of the permanent works. Take measures to sort and separate the surplus material according to the Environmental Management Plan before disposal.

2. Take possession of unsuitable material and surplus material, unless otherwise provided for in the Contract.

**EAR1.W820.7**  
**SUITABLE MATERIAL**  
Do not remove suitable material from Site without the permission of the CM, unless surplus to the requirements of the Contract.

**EAR1.W830.7**  
**DUMPING OF UNSUITABLE AND SURPLUS MATERIALS**  
Inform the CM of the proposed dumping areas and take responsibility for making arrangements for disposal of these materials. Notwithstanding the foregoing, the CM retains the right to direct the manner in which the dumping is carried out.

**EAR1.W835.7**  
**DISPOSAL OR REUSE OF MARINE MUD**  
Refer to Project Specific Specification.

**EAR1.W840.7**  
**ON SITE SORTING OF CONSTRUCTION AND DEMOLITION MATERIALS**  
1. All construction and demolition (C&D) materials arising from or in connection with the works shall be sorted on-site and be separated into different groups for disposal at landfills, public filling areas, in filling areas within the Site, in filling areas outside the Site provided by the Contractor, or recycling as appropriate. The inert portion of the C&D material is the public fill. All public fills to be disposed of at public filling areas shall be sorted and broken down according to the Dumping Licence conditions. The non-inert portion of the C&D material is the C&D waste which shall be disposed of at the landfill;  
2. Unless otherwise stated in the Contract, all C&D material arising from or in connection with the works shall become the property of the Contractor when it is removed from the Site. Promptly remove all sorted and processed materials arising from or in connection with the works from the Site on a regular basis as the works proceed;  
3. A method statement for the sorting, processing and disposal of C&D materials arising from or in connection with the works shall be submitted to the CM's Representative for approval 14 days before the commencement of any sections of the Works.

**EAR1.W845.7**  
**TRIP-TICKET SYSTEM**  
Comply with the Trip-ticket System as specified in Preliminaries Specification for the disposal of construction and demolition (C&D) materials generated from the Works.
RETAINING WALLS, SHALLOW FOUNDATIONS AND OTHER STRUCTURES

EAR1.W910.7 SIZE OF EXCAVATIONS

1. When excavating for structures, pits, and trenches keep to the minimum size necessary to construct the permanent work. Keep the sides of excavations vertical unless otherwise permitted by the CM;

2. Obtain Approval for the length of trench excavation left open at any one time and do not exceed that amount.

EAR1.W920.7 APPROVAL OF EXCAVATION BOTTOMS

Bottoms of excavations are to be Approved before any new work is laid on them. Inform the CM when the excavation is ready for inspection.

EAR1.W930.7 FOUNDBING OF SHALLOW FOUNDATIONS

1. All shallow foundations (rafts or pads) of the structures specified in Project Specific Specification shall be founded on material of the type and/or bearing capacity specified and at the founding levels shown on the drawings unless otherwise instructed by the CM;

2. The founding bases of shallow foundations shall be free of unsuitable materials. If the base lies below the groundwater table and where necessary, proper means shall be provided to divert and/or lower the groundwater such that the integrity of the exposed founding material(s) and the subsequent concrete casting will be ensured;

3. Sink drillholes for carrying out Standard Penetration tests (SPT) in accordance with BS EN ISO 22476-3:2005, modified by Geoguide 2 as necessary, to the founding materials (except for foundations on rock). The SPT shall be carried out by a contractor on the Housing Authority List of Ground Investigation Contractors. The minimum number and depth of the drillholes shall be as specified in Project Specific Specification. Unless otherwise Instructed, commence the drillhole at existing ground level before excavation for the foundations and carry out the SPT at intervals as specified in Project Specific Specification. Submit to the CM the preliminary test reports within 2 days and the final test reports within 2 weeks upon completion of the SPT;

4. If Instructed, carry out Plate Load Test for shallow foundations (except for foundations on rock) in accordance with GIN.T109 and the Code of Practice for Foundations issued by the Buildings Department;

5. If Instructed, take down the excavations for founding of shallow foundations (except for foundations on rock) first to not less than 300 mm above the designed founding level and carry out dynamic probe tests or other tests. The dynamic probe tests shall be in accordance with Appendix 7.1 of the 'General Specification for Civil Engineering Works', The Government of the Hong Kong Special Administrative Region, 2006 Edition. Submit the test results within 2 days and a record plan showing all the locations and levels of the dynamic probe tests within 1 week upon completion of the tests;

6. If considered necessary after examining the actual ground exposures and/or test results, the CM may order further excavation to deepen the founding level of the foundations and/or other measures to ensure a satisfactory foundation. The bases shall be inspected and approved by the CM before concreting;
7. If considered necessary the CM may order compaction of the whole or parts of the founding bases of shallow foundations by at least 12 passes of a vibratory roller, or other accepted construction plant, with a minimum static load per 100 mm width of roll of 2kN or 4kN. In areas adjacent to structures and utilities, which are existing or constructed as part of the permanent works, compaction shall be carried out by hand-rammers or manually operated power equipment in a manner that these structures and utilities are not disturbed or damaged.

**EAR1.W940.7 PROVING BEDROCK FOR FOOTINGS (RAFTS AND PADS)**

1. Where footings (rafts/pads) are specified to be founded on bedrock, carry out proving of bedrock in accordance with the following sub-clauses as directed by the CM. Clear completed excavations for footings of all soils and loose materials;

2. Footings shall be founded on bedrock of minimum bearing capacity as specified in **Project Specific Specification**;

3. When Instructed, upon excavation reaching bedrock, take NX size cores for a depth of 5000 mm into the bedrock and provide rock core samples and records of bores for the CM’s inspection; cores to be taken at the frequency as specified in **Project Specific Specification**;

4. When Instructed, carry out laboratory compression tests or field point load tests on recovered cores to determine rock strength;

5. Fill core holes for the full depth with 1:3 cement and sand grout with water/cement ratio of 0.6;

6. When Instructed, upon excavation reaching bedrock, proving test at the frequency as specified in the **Project Specific Specification** shall be conducted with a percussive air rock drill to be supplied by the Contractor, of not less than 35 kg in weight and fitted with newly sharpened 40 mm diameter steel drilling bit. The proving test shall be performed with 25 mm diameter steel drilling rods. At the completion of each 1.5 m of drilling, the drilling bit shall be replaced with a newly sharpened 40 mm diameter bit. Additional lengths of drilling rock shall be fitted at that time as appropriate. The rock drill shall be at all times free to penetrate under its own weight and in a vertical direction. Perform the proving test by drilling minimum 5.0 m below the founding level. The results of each proving test shall be recorded by the Contractor, and he shall plot the time in minutes taken to drill each 300 mm on a graph. A 20 mm diameter steel rod 5.5 m long shall be placed in each completed drillhole for the CM’s inspection. Fill drill holes for the full depth with 1:3 cement and sand grout with water/cement ratio of 0.6.

**REMEDIAL WORKS**

**EAR1.W1010.7 EXCAVATION BOTTOMS DAMAGED AFTER APPROVAL**

If, due to water or other causes, the bottom of the excavation becomes unsuitable after Approval, excavate further to a new Approved level, and backfill with Grade 15/20 concrete as specified in Worksection CON1.

**EAR1.W1020.7 OVER EXCAVATION**

Backfill and compact in accordance with this Specification or other Approved means those areas where the Contractor’s method involves excavation in excess of that specified.
DAMAGED SURFACES
1. Make good surfaces after excavation which, due to exposure to weather conditions, flooding or other cause, have been allowed to deteriorate to a condition unacceptable to the CM;
2. Where this is the case carry out additional excavation and filling in accordance with this Specification, or by waiting until the condition of the exposed material is, in the opinion of the CM, fit to receive the backfill.

FILLING GENERALLY

USE OF ROCK CRUSHING PLANT
Do not use rock crushing plant on the Site unless permitted by the CM to do so.

USE OF GRADE 200 RECYCLED ROCK FILL
Where the use of Grade 200 Recycled Rock Fill (RR 200) is specified in the Contract, comply with the requirements stated in EAR1.W1720 to EAR1.W1750 and EAR1.W1910 to EAR1.W1930 in respect of the deposition and compaction of this material.

HAULAGE OF FILL MATERIAL
Do not haul fill material to the area of fill until compaction plant operating at the area of fill is sufficient to achieve the specified requirements for relative compaction of the fill material.

REMOVAL OF EARTHWORKS MATERIAL
Do not remove from the Site any earthworks material that is required for use in the permanent work as fill material without prior Approval. Notify the CM before any earthworks material is removed from the Site.

PREPARATION FOR FILLING

EXISTING GROUND
Prepare the surfaces on which fill material is to be deposited after site clearance in accordance with the following requirements:
1. Remove topsoil, grass, and other organic matter;
2. Remove soft spots, boulders, and other materials, which in the opinion of the CM are unsuitable or unstable;
3. Deal with voids as stated in the Contract or Instructed.

WATER-COURSES
Do not place fill material until watercourses have been diverted or under-drained.

SLOPING GROUND
1. Cut benches and install sub-soil drainage system as stated in the Contract;
2. Do not place fill material on sloping ground until benches have been completed at the area receiving the fill material.
EAR1.W1240.7 **AVAILABILITY OF PLANT**
Commence filling works only when sufficient compaction plant is in operation at the place of deposition to ensure compliance with the requirements of this Specification and when the CM's permission has been obtained.

EAR1.W1250.7 **SCARIFYING**
Scarify surfaces other than rock to a depth of 200 mm and compact to the same standard as the fill material which is to be deposited.

**FILLING OPERATIONS**

EAR1.W1310.7 **DISPOSAL OF WATER**
1. Keep the fill area free of water;
2. Leave surfaces with no area that can retain water at the end of each day's work and, if necessary, cut ditches to achieve this.

EAR1.W1320.7 **APPROVAL**
Obtain Approval before deposition of fill material starts and before any fill layer is covered.

EAR1.W1330.7 **ADVERSE WEATHER CONDITIONS**
Stop work when the state of the weather is such that, in the opinion of the CM, it will adversely affect the placing and compacting of fill.

EAR1.W1340.7 **APPROVAL OF REMEDIAL MEASURES**
Obtain Approval for and prior to carrying out remedial measures.

EAR1.W1350.7 **REMEDIAL MEASURES FOR DAMAGED FILL AREAS**
Adopt one of the following procedures when material placed and compacted or awaiting compaction reaches a condition which, in the opinion of the CM does not comply with this Specification or has been damaged either by weather or in any other way:
1. Remove the material from Site, replacing it with equivalent suitable material;
2. Remove the material to stockpile until it is in a condition suitable for re-use;
3. Make good the material by mechanical or chemical means;
4. Cease work on the material until it is in a suitable physical condition for re-use.

**REMEDIAL MEASURES WHERE FILL OVERLAID**
Remove, and adopt sub-clause (1) or (2) in EAR1.W1350 for any material not complying with this Specification that has been overlaid by more recently laid material.

EAR1.W1370.7 **RESTRICTIONS ON USE OF FILL MATERIAL**
1. Do not use excavated material required for use in the permanent works which is capable of being selected, processed and mixed to make it suitable for use as fill material for any other purposes unless permitted by the CM;
2. Replace any such excavated material which the CM permits to be removed from the Site or used for other purposes by an equivalent Approved material of the same volume after compaction as the material replaced.
MIX PROPORTIONS, MIXING AND PLACING RECONSTITUTED SOIL

1. For reconstituted soil use 1:3:12 cement, sand, special filling material by weight;
2. Mix in a concrete mixer with sufficient water to ensure the mix is just damp enough to enable it to be properly mixed and compacted;
3. Place each batch in its final position and compact within 30 minutes of the water being added. Mixed material not placed and compacted within this time limit will be rejected;
4. Hand mixing of small quantities may be permitted by the CM.

SETTLEMENT

Make good, to the satisfaction of the CM, settlement in filling and backfilling and any consequential damage that may occur up to the end of the Maintenance Period.

FILLING FOUNDATION PITS AND TRENCHES ETC

ADJACENT UTILITIES OR STRUCTURES

1. Within 500 mm of a structure or utility except as stated in EAR1.W1420, deposit fill material of:
   a. Fine fill material, unless otherwise stated in the Contract;
   b. The fine fill material may contain no more than 5% by weight of fresh, slightly decomposed or moderately decomposed rock fragments of up to 200 mm maximum size provided that these rock fragments do not cause any damage to the structures or utilities and do not interfere with compaction requirements.
2. Do not deposit fill material adjacent to or above structures or utilities until the construction of the structure or utility is sufficiently advanced to accept the imposed forces without disturbance or damage;
3. Deposit evenly on all sides of structures or utilities and in such a manner that the structure or utility is not disturbed or damaged;
4. Compact the fill material in such a manner that the structure or utility is not disturbed or damaged;
5. Where sheet piling, timbering or other temporary supports to the excavations are not to be left in place, remove the sheet piling, timbering or other temporary supports as deposition of fill material proceeds, in such a manner that the stability of the adjacent ground is maintained and the compacted fill material is not disturbed.

FILLING AROUND WATER, SEWERAGE AND DRAINAGE PIPES

Where these have been laid as part of the permanent works:

1. Use special filling material unless otherwise stated in the Contract;
2. Deposit the fill material in layers not exceeding 100 mm thick to a level of 300 mm above the top of the pipe;
3. Deposit the fill material in such a manner that the layer on one side of the pipe is not more than 100 mm higher than the layer on the other side;
4. Compact the fill material by hand rammers or manually operated power equipment;
5. Compact the fill material within 300 mm above the top of sewage and drainage pipes to obtain a relative compaction of at least 85% throughout.
EAR1.W1430.7 BACKFILLING TO FOUNDATIONS
Backfill to top of foundations with general filling materials.

EAR1.W1440.7 BACKFILLING TO TRENCHES FOR AUTOMATED REFUSE COLLECTION SYSTEM (ARCS)
Backfill to top of trenches with excavated or Approved general filling materials. Cover to ARCS conveyance pipe to be minimum 600 mm generally and 800 mm in vehicle circulation areas.

FILLING EXISTING WATERCOURSES

EAR1.W1510.7 PREPARATION
Divert existing watercourses and channels as required and clear the same of all vegetation growth and unsuitable material.

EAR1.W1520.7 FILLING
Filling materials and method of construction to be used are specified in Project Specific Specification.

BACKFILLING BEHIND RETAINING WALLS

EAR1.W1610.7 PLACING FILTER MATERIAL
1. Carefully place filter material to avoid contamination and damage;
2. Bed in layers simultaneously with the filling material and compact.

EAR1.W1620.7 FILLING
Unless otherwise specified place special filling material as backfilling and compact by the Performance Specification method of compaction: EAR1.W1810 - EAR1.W1860. Compaction plant is to be of such a size as to ensure that no undue stress is placed on the wall during compaction.

FORMING EMBANKMENTS AND PLATFORMS

EAR1.W1710.7 MATERIAL SELECTION
Form embankments with special fill material unless otherwise specified.

EAR1.W1720.7 DEPOSITION OF FILL MATERIAL
1. Deposit fill material obtained from excavation within the Site in its final location as soon as practicable after it has been excavated;
2. Build up embankments evenly over the full width;
3. Control the construction method to ensure that any compaction of the fill material resulting from the passage of construction plant or haulage vehicles is uniform;
4. In areas of fill formed of fill material other than rock fill material, form earthworks final surfaces sloping at a gradient exceeding 1 to 3 (vertical to horizontal) by over-filling and cutting back after compaction. Extend the over-filling beyond the earthworks final surface by a horizontal distance of 500 mm or three times the thickness of the compacted layer, whichever is greater;
5. Deposit fill material in layers of a thickness appropriate to the compaction method to be used. In deposition of fill material, ensure that a good bonding is achieved between layers of fill, and unless otherwise directed by the CM, do not place fill material on previously compacted layers unless the surface has been scarified or otherwise broken up and, if necessary, watered.

6. Unless otherwise permitted by the CM, construct layers of fill material horizontally, except for any gradient required for drainage, and keep the thickness of each layer uniform over the area to be filled. Bring up the fill material from the bottom in uniform horizontal layers, with the top of each layer graded to enable surface water to drain readily.

7. If the difference in level between adjacent areas to be filled exceeds 1 m, bench the edge of the higher area before fill material is placed against it.

8. Except for intermediate fill area, do not deposit fill material by end-tipping, by pushing loose material down slope faces or by other methods which may result in segregation or inadequate compaction of the fill material.

9. Make good damage to compacted layers caused by construction traffic.

EAR1.W1730.7 COMPACTION
1. Compact filling material, other than rock fill and material as stated in EAR1.W1940 in accordance with the Compaction by Performance Specification: EAR1.W1810 - EAR1.W1860 unless otherwise specified;

3. Compact general fill material with a large portion of coarse material in accordance with EAR1.W1940.

EAR1.W1740.7 ROCK FILL EMBANKMENTS AND PLATFORMS
1. Place rock fill material so that the final compacted thickness of each layer exceeds 1.5 times and does not exceed twice the nominal Grade size of the rock fill material;

2. Spread and level the fill material by a crawler tractor weighing not less than 15 tonnes and compact the fill material in accordance with the Compaction by Method Specification: EAR1.W1910 - EAR1.W1930;

3. Ensure each layer consists of reasonably graded rock and fill the surface voids with fragments of rock before the next layer is deposited.

EAR1.W1750.7 BLINDING ROCK FILL EMBANKMENTS AND PLATFORM
1. Blind the top surface and side slopes with fine fill material to seal the surface;

2. Top soil may be used to blind side slopes and verges.

EAR1.W1760.7 ISOLATED BOULDERS
At the discretion of the CM isolated boulders, each within the range 0.015 m³ to 0.1 m³ in volume, may be incorporated into embankments not of rock fill, provided that the specified compaction requirements are met. Any boulders exceeding 0.015 m³ must be placed at a minimum of 2 m below formation level of carriageways or hard shoulders.

EAR1.W1770.7 CULVERTS AND DRAINS ETC
Form embankments equally on both sides of culverts or drain pipes and the like.
SURFACES USED BY CONSTRUCTION TRAFFIC

1. Where surfaces of embankments are required for use by construction traffic, build up and maintain at a minimum of 300 mm above formation level, the area between extremities of carriageways, including any central reserve and hard shoulders before subsequently trimming to formation level;

2. Make good surface damage;

3. Ensure that no construction traffic uses the area once trimming to final formation level has commenced, with the exception of constructional plant necessary for such trimming and ensure that no damage is caused to the surface by such constructional plant.

REUSE OF MARINE MUD FOR BACKFILLING

1. Where specified to reuse marine mud for backfilling, at least 28 days before commencement of excavation works, obtain CM's approval for backfilling with cement-stabilized marine mud, which shall have undergone an approved cement-stabilization process to avoid undue ground settlement in future, and comply with the following requirements:

   1. Submit a detailed method statement of the proposed cement-stabilization and backfilling processes, which shall include but not be limited to the method and procedure of the proposed cement-stabilization process, the sorting and temporary storage of the materials to prevent cross-contamination with other materials, the mix proportion with cement, granular soil, water and other approved additives, the methods of mixing, backfilling, compacting, curing, sampling and testing of the cement-stabilized materials to achieve 7-day cube test of 100 kN/m² minimum in accordance with CS1;

   2. Prepare sufficient test samples on Site and test the cement-stabilized materials at 7-day in accordance with CS1 for determination of the 7-day cube strength to demonstrate the suitability of the proposed mix proportion and method of construction. Appoint a HOKLAS accredited testing laboratory approved by the CM to carry out the test;

   3. Carry out trials on Site and all necessary testing to demonstrate the suitability of the proposed cement-stabilization and backfilling processes for the Works to the satisfaction of the CM;

   4. Backfill with and compact the cement-stabilized materials in accordance with the approved method statement and in layers of not greater than 300 mm thick to achieve a standard of compaction as stipulated in EAR1.W1850 and EAR1.W1860, unless otherwise approved by the CM;

   5. All areas backfilled with cement-stabilized marine mud should be covered on top by suitable materials all in accordance with Worksection EAR1 and/or other specified materials for a minimum thickness of 500 mm;

   6. For piling works, do not backfill the fill areas between future ground level and 1.5 m below the future ground level with cement-stabilized marine mud unless otherwise approved by the CM;

   7. Do not backfill the fill areas between top of pile caps and underside of ground slabs of domestic blocks with cement-stabilized marine mud without CM's prior approval. Restrictions on backfilling of cement-stabilized marine mud for external areas are as follow:
### Pipes/ducts

<table>
<thead>
<tr>
<th>Range in level at carriageway where ducts/pipes are located with which no backfilling of Cement–Stabilized Marine Mud is allowed</th>
<th>Range in level at locations other than carriageway where ducts/pipes are located with which no backfilling of Cement–Stabilized Marine Mud is allowed</th>
<th>Drainage for Cable /valve pit required</th>
</tr>

</tr>
</tbody>
</table>

(FGL = Finished Ground Level)

Backfilling by cement-stabilized marine mud directly underneath the cable pits or valve pits is not allowed for proper drainage of water from the pits. Water pipes and gas pipes are not allowed to be directly surrounded by backfilled cement-stabilized marine mud for ease of maintenance. Cable ducts are allowed to be surrounded by cement-stabilized marine mud subject to proper coordination of works sequence with utility undertakings and sub-contractors.

8. Sink drillholes for carrying out Standard Penetration Tests (SPT) in accordance with BS1377:Part 9:1990 (Test 3.3), modified by Geoguide 2 at 1.5 m intervals to below the backfilled material to demonstrate that the relative strength of the stabilized material is achieved. Appoint a contractor on the Housing Authority List of Ground Investigation Contractors to carry out the SPT 7 days after backfilling. The minimum number of the drillholes shall be one drillhole for 100 m³ of the backfilling or part thereof in each foundation base on each operation day, and to a depth and location as directed by the CM;

9. Submit to the CM preliminary test reports within 1 day and final test reports within 1 week upon completion of the SPT;

10. In any situation, a SPT N-value of less than 10 shall render the backfilling unsuccessful. In this situation, submit a remedial proposal, which shall include but not be limited to excavation of the backfilled material, adjustment of the mix proportion and method of construction, and re-execution of the Works, to the CM for approval. Bear all costs and no extension of time is allowed for the remedial works and all associated consequences;

11. Obtain EPD’s permit for disposal of all surplus cement-stabilized materials to a suitable dumping facility and dispose the materials accordingly after the backfilling. Make reference to ETWB Technical Circular (Works) No. 34/2002 and 19/2005 and other relevant regulations and guidelines for obtaining the permit;

12. Refer to the drawing in Appendix APC to this Specification for the profile of backfilling around foundations.

13. Provide adequate personal protective equipments to the workers to protect them against direct contact with contaminated marine mud.
COMPACATION BY PERFORMANCE SPECIFICATION

EAR1.W1810.7 PROCEDURE
1. Compact fill material in areas of fill in uniform layers to a stable condition as soon as practicable after deposition and in a manner appropriate to the location and to the material to be compacted;
2. Obtain the permission of the CM before the next layer is deposited on each layer of compact fill material;
3. Agree with the CM the thickness of each layer which is to be compatible with the compaction plant used. Carry out carefully controlled tests to determine the optimum placing thickness for the particular fill and the number of passes to achieve the required density with the compaction plant provided;
4. Do not place any permanent fill until such tests have been agreed with the CM. Earthmoving plant will not be accepted as compaction equipment.

EAR1.W1820.7 TESTING
Test each class of material to be compacted in accordance with the compaction tests specified in the Testing section of this Worksection.

EAR1.W1830.7 MOISTURE CONTENT
Other than rock fill material and the material as stated in EAR1.W1940, the moisture content of the fill material during compaction shall be within ±3% of the optimum moisture content determined in accordance with the test methods specified in the Testing section of this Worksection, provided that the fill material is still capable of being compacted in accordance with the specified requirements to form stable areas of fill. Take all necessary measures to achieve and maintain the specified moisture content.

EAR1.W1840.7 FIELD DENSITY
After compaction carry out insitu field density tests in accordance with the compaction tests specified in the Testing section of this Worksection. Test each layer and obtain Approval before placing of the next layer.

EAR1.W1850.7 STANDARD OF COMPACTION
Unless specified otherwise, compact fill material to obtain a relative compaction of at least 95% of the maximum dry density in general and at least 98% for fill within 200 mm of any formation level or slope profile.

EAR1.W1860.7 STANDARD OF COMPACTION BETWEEN PILE CAPS AND SUSPENDED SLABS AND AROUND PILE CAPS
The relative compaction of compacted material in the fill areas between top of pile cap and underside of suspended slab to be minimum 90% of the maximum dry density. Compact fill material around pile caps to achieve a relative compaction of at least 95%.

COMPACATION BY METHOD SPECIFICATION

EAR1.W1910.7 ADOPTION
Use for rock fill material and in exceptional circumstances for other suitable material when Approved.
**EAR1.W1920.7** **ROLLERS**

Use vibratory rollers having a static load of at least 2 kN per 100 mm width of roll for layers with a compacted thickness not exceeding 500 mm, and at least 4 kN for layers with a compacted thickness exceeding 500 mm.

**EAR1.W1930.7** **COMPACTION METHOD**

1. Compact each layer of rock fill material by at least eight passes of a vibrating roller, or by other Approved equivalent compaction method;

2. Compact the final surface of rock fill material by at least two additional passes of a vibrating roller or by other Approved equivalent method;

3. Fill voids as compaction proceeds.

**EAR1.W1940.7** **COMPACTION OF GENERAL FILL MATERIAL WITH A LARGE PORTION OF COARSE MATERIAL**

1. For general fill material of which less than 90% passes a 20 mm BS test sieve, it will be difficult to permit determination of the moisture content and maximum dry density according to EAR1.T350, EAR1.T420 and EAR1.T540. This type of material shall be compacted to the requirements of sub-clauses (2), (3) and (4);

2. Spread and level each horizontal layer of general fill material with a thickness not less than 1.5 times of the maximum size of the general fill material and not exceeding the maximum depth of compacted layer in accordance with the following Table. If this criterion is not met due to the presence of over-sized coarse material in the general fill, remove and break down the over-sized coarse material to sizes acceptable to the CM. Compact each layer systematically by a vibratory roller with the stipulated minimum number of passes corresponding to the minimum static load per 100 mm width of the roller;

<table>

</tbody>
</table>

3. Count only the number of passes of the roller when the roller is travelled on the material to be compacted at a speed of not more than 2 km per hour with full vibration. Disregard plant other than vibratory roller carrying out material spreading or providing some preliminary compaction, to assist the use of heavier plant in counting the number of passes;
4. Variation from the method or the use of plant different from that specified in sub-clause (2) will be permitted only if the Contractor demonstrates at site trials that equivalent compaction is achieved by the alternative method or plant. Agree with CM and obtain CM's approval on the procedure to be adopted for these site trials;

5. Without prejudice to the provision of the Conditions of Contract and in order that the CM may take proper provision for the supervision of compaction in the permanent work, apply in writing to the CM for permission to carry out compaction not less than 24 hours before the compaction process;

6. When materials of widely divergent grading are used in embankments and fill areas, spread and compact the materials in separate clearly defined areas;

7. If more than one class of material is being used in such a way that in the opinion of the CM, it is not practicable to define the areas in which each class occurs, operate the compaction plant as if only the material which requires the greatest compaction effort is being compacted.

**INTERMEDIATE AREAS OF FILL**

**EAR1.W2010.7 DEPOSITING**

Fill material may be deposited in intermediate areas of fill by end-tipping or by pushing into position until, in the opinion of the CM, it is sufficient to form a stable foundation on which to construct the subsequent work.

**EAR1.W2020.7 COMPACTION**

Except in areas of fill formed of rock fill material or fill material as stated in EAR1.W1940, compact fill material in intermediate areas of fill to a degree which in the opinion of the CM is practicable. Compact fill material above the level stated in clause EAR1.W2010 to obtain a relative compaction of at least:

1. 90% throughout;
2. 95% within 1500 mm of earthworks final surfaces and formations; and
3. 98% within 200 mm of formations.

**COMPLETION OF GENERAL EARTHWORKS SURFACES**

**EAR1.W2110.7 GENERAL**

1. Complete earthworks final surfaces to a stable condition as soon as practicable after excavation or after deposition and compaction of fill material has been completed;
2. Carry out the subsequent permanent work or surface protection as soon as practicable after the earthworks final surface has been completed;
3. Properly treat exposed earth by compaction, turfing, hydroseeding, vegetable planting or sealing with latex, vinyl, bitumen, shotcrete or other suitable surface stabilizer within six months after the last construction activity on the exposed earth;
4. Complete earthworks final surfaces to smooth alignments without abrupt irregularities unless otherwise stated in the Contract;
5. Complete formations above structures or utilities after construction of the structure or utility.
EAR1.W2120.7  COMPACTION
Compact formations to obtain a relative compaction of at least 98% to a depth of 200 mm below the formation.

EAR1.W2130.7  PROOF ROLLING
1. Unless otherwise agreed by the CM, carry out proof rolling on formations;
2. Roll the formation in the presence of the CM by at least two passes of a non-vibrating rubber tyred roller;
3. The roller must have a static load per 100 mm width of roll of at least 4 kN and travel at a speed not exceeding 2 km/h.

EAR1.W2140.7  MAKING GOOD DEFECTS
Make good to Approval any defect in the formation which is revealed during proof rolling by deformation of the formation which in the opinion of the CM is excessive.

EAR1.W2150.7  PAVEMENT FORMATIONS
After all other formation work and testing have been completed and damage caused by testing reinstated, roll any pavement formation with one pass of a smooth steel-wheeled non-vibrating roller. The roller must have a load per 100 mm width of roll of at least 2 kN.

EAR1.W2160.7  PROTECTION OF FORMATIONS
Carry out the following procedures:
1. Unless otherwise permitted by the CM, protect formation surfaces which will not be immediately covered by the subsequent permanent work by methods agreed by the CM;
2. Maintain earthworks final surfaces and formations in a stable condition and protect from damage due to water or other causes and from exposure to conditions which may adversely affect the surface;
3. Do not allow formations to be used by construction plant or vehicles other than those which, in the opinion of the CM, are essential to construct the subsequent work.

EAR1.W2170.7  HYDROSEEDING
Refer to Project Specific Specification.

**ADDITIONAL REQUIREMENTS FOR SOFT LANDSCAPING**

EAR1.W2210.7  GENERAL
Refer to Project Specific Specification.
ADDITIONAL REQUIREMENTS FOR SURFACE PREPARATION OF ROAD FORMATIONS

EAR1.W2310.7 SEQUENCE
Carry out preparation and surface treatment of the road formation after completion of any specified sub-grade drainage and, unless otherwise agreed by the CM, immediately prior to laying the sub-base or the road-base where no sub-base is required.

EAR1.W2320.7 FORMATIONS OTHER THAN ROCK FILL
Carry out the following sequence of operations:
1. Remove all mud and slurry from surfaces below carriageways, lay-bys, cycle tracks, footpaths and hard shoulders after general reinstatement of any soft areas;
2. Unless otherwise permitted by the CM to carry out proof rolling on the road formation. Roll in the presence of the CM by at least 2 passes of a non-vibrating roller with rubber tyres. Roller to have a static load per 100 mm width of at least 4 kN and travel at speeds not exceeding 2 km/h;
3. Make good any defect in the formation during proof rolling where required by the CM;
4. Trim the formation after testing and when any damaged reinstatement has been carried out;
5. Roll the trimmed formation by one pass of a smooth steel-wheeled non-vibrating roller having a minimum load per 100 mm of 2 kN.

EAR1.W2330.7 ROCK FILL FORMATIONS
Carry out the following sequence of operations:
1. Trim and blind the formation as EAR1.W1740 and EAR1.W1750;
2. Roll the trimmed formation as EAR1.W2320 (5);
3. Make good with Grade 15/20 concrete as specified in Worksection CON1 any surface irregularities under the formation which remain after trimming the rock excavation.

ADDITIONAL REQUIREMENTS FOR FILL SLOPES

EAR1.W2410.7 GENERAL
1. Comply with the following sub-clauses for the fill slopes as specified in the Drawings and submit to the CM the date of commencement of the filling works for these slopes;
2. Notwithstanding the requirements on filling works as specified in other clauses of this Worksection, comply with the "Standards for Filling Works" specified in Appendix A of PNAP APP-15;
3. During construction, submit monthly reports to the CM giving records of tests on compaction of fill slopes together with a covering assessment on the adequacy of compaction. Submit the format of the report to the CM for prior approval. The reports shall be prepared and signed by the TCP Grade T4 and the AS of RSC(SF) (provided in accordance with the Preliminaries Worksection);
4. Incorporate in the report all the test results determined in accordance with this clause and the Testing section of this Worksection, including those tests carried out by the Direct Testing Contractor(s). Keep records on drawings the soil type, plan location and elevation reference to Principal Datum of each test. Graphs of dry density vs. moisture content, laboratory test record sheets, field sheets, calculation sheets and a complete soil description are to be kept in a companion folder;

5. Carry out all tests under the supervision of the TCP Grade T4 as mentioned in sub-clause (3);

6. Include in the contents of the covering assessment:
   a. A summary of the results of insitu density tests and laboratory compaction tests of the fill, highlighting areas of non-compliance with the specified compaction standards;
   b. Details of any corrective measures taken to rectify areas of inadequate compaction; and
   c. An overall assessment to all the filling works completed at the time of assessment.

7. Keep records of compaction tests also on site for inspection by the CM, ICU and the officers of Geotechnical Engineering Office (GEO). The costs of providing the monthly reports are deemed to be included in the Contract rates of the filling works;

8. Where there is reason to believe that the placed fill may be loose, or if the CM from time to time directs, carry out field checks under the CM's direction, initially by dynamic probe tests (supplemented by observations of fill materials in trial pits if an appreciable cobble and boulder content in the fill is suspected). Provide the necessary equipment, apparatus and labourers for the dynamic probe tests and trial pit excavation. Carry out dynamic probe tests in accordance with Appendix 7.1 of the 'General Specification for Civil Engineering Works', The Government of the Hong Kong Special Administrative Region, 2006;

9. If loose fill is detected, arrange for the Approved Laboratory to carry out insitu density tests of the loose layer in accordance with the Testing section of this Worksection in the presence of the CM or his representatives. Carry out the tests within seven days after the detection of the loose fill. If the test results fail to comply with the Contract requirements, rectify the filling works to the satisfaction of the CM as a matter of urgency. Where extensive loose fill is found which could pose a significant threat if not rectified, the CM may issue an order to suspend the progress of the Works in accordance with GCC Clause 9.2;

10. If the filling work has been done after compliance with the requirements of GCC Clause 7.3, and is found to be executed in accordance with the Contract, the expense of investigation, testing, reinstating and making good the same shall be valued at the relevant Contract rates but in any other case the expense shall be borne by the Contractor;

11. Upon completion of the filling work, submit to the CM:
   a. "As-built" plans and sections of the work showing its relationship to existing and proposed structures; and
   b. Records of insitu density tests and laboratory compaction tests of the fill.

The costs of providing as-built records are deemed to be included in the Contract rates of the filling works;

12. Bear all associated costs and make due allowance in the programme of the Works for the provisions as stated in the above sub-clauses. No claim for extension of time will be entertained in connection therewith.
REMOVAL OF TEMPORARY WORKS

EAR1.W2510.7 DISMANTLING AND REMOVAL
Dismantle and remove temporary works after completion of the permanent works unless otherwise agreed by the CM.

TOLERANCES

EAR1.W2610.7 GENERAL
Refer to Appendix H 'Schedule of Tolerances' to this Specification.
TESTING

FILL MATERIAL - GENERAL REQUIREMENTS

EAR1.T020.7 BATCH
A batch of fill material is any quantity of fill material of the same type and which, in the opinion of the CM, has similar properties throughout. For the purpose of testing for moisture content and relative compaction, a batch is also any fill material which is deposited in a single layer in any area of fill presented by the Contractor for testing on one occasion.

EAR1.T030.7 SAMPLES
Each sample of fill material must consist of at least four increments taken from different parts of the batch. Combine the increments and thoroughly mix and divide by quartering or by using a riffle box to obtain specimens of an appropriate size to carry out the individual tests.

EAR1.T040.7 SAMPLE SIZE
Take the size of samples of fill material, other than rock fill, in accordance with Clauses 2.5.1, 4.2 and Table 2.1 of 'Geospec 3: Model Specification for Soil Testing', GEO, 2001. Each sample of rock fill material of grade size not exceeding 200 is to have a mass of at least 250 kg and each sample of rock fill material of grade size exceeding 200 must have a mass of at least 1000 kg.

SITE TESTS FOR SOIL AND GROUNDWATER

EAR1.T110.7 GENERAL
1. Arrange for an independent laboratory to carry out the tests described in 'Geospec 3: Model Specification for Soil Testing', GEO, 2001;
2. Select the laboratory from one of those listed on the Development Bureau's List of Approved Suppliers of Materials and Specialist Contractors for Public Works: Soil and Rock Testing and Approved. In addition, the laboratory must be accredited by HOKLAS for the said tests.

EAR1.T115.7 COMPACTATION TEST FOR FILL SLOPES
1. Arrange for independent laboratories as stated in EAR1.T110 on a roster system to carry out compaction tests stated in EAR1.T510 to EAR1.T550 for all fill slopes specified in the Drawings. No independent laboratories shall carry out compaction tests for a cumulative period longer than 3 months within any twelve-month period;
2. Instruct the independent laboratories to deliver directly to the CM in a sealed envelope or by other means agreed by the CM, without routing through the Contractor, a copy of all test reports including preliminary testing results compiled by the independent laboratories, not later than the copy sent to the Contractor;
3. In addition, where considered necessary, the CM will order Direct Testing Contractor(s) (DTC) to carry out the same tests as mentioned in sub-clause (1) above;
4. Provide attendance on the DTC and render all necessary assistance to the DTC including:
a. Provision of all facilities for the DTC in the taking of samples;
b. Provision of information for the preparation of the report, all as required by the DTC; and
c. Reinstatement and making good of the sampled areas to its original condition where Instructed.

5. Carry out additional tests for relative compaction in accordance with EAR1.T550 if the result of any test for relative compaction of fill material does not comply with the specified requirements;

6. Investigate and report findings on any non-compliance or irregularities identified by the compaction tests and carry out rectification as necessary to the satisfaction of the CM before proceeding to the next stage of the filling works;

7. Bear all associated costs and allow sufficient time in the programming of the filling works for the compliance with this clause. No claim whatsoever will be entertained for the interruption, if any, due to the DTC's works.

FILL MATERIAL - PARTICLE SIZE DISTRIBUTION, LIQUID LIMIT, PLASTICITY INDEX, COEFFICIENT OF UNIFORMITY AND SULPHATE CONTENT

EAR1.T210.7 GENERAL

The size of sample and method of sampling to be in accordance with "Geospec 3: Model Specification for Soil Testing published by GEO". Where required test samples of fill material for particle size distribution, liquid limit, plasticity index coefficient of uniformity and sulphate content and deliver results at least 14 days, or such shorter period agreed by the CM, before deposition of the fill material starts. Provide samples from each batch as stated in the following table:

<table>
<thead>
<tr>
<th>Description</th>
<th>Size of Batch</th>
<th>No. of samples per Batch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Special fill material</td>
<td>0 - 3,000 m³</td>
<td>3</td>
</tr>
<tr>
<td></td>
<td>Exceeding 3,000 m³</td>
<td>1 for each 1,000 m³ or part thereof</td>
</tr>
<tr>
<td>Fill material other than special fill material</td>
<td>0 - 15,000 m³</td>
<td>3</td>
</tr>
<tr>
<td></td>
<td>Exceeding 15,000 m³</td>
<td>1 for each 5,000 m³ or part thereof</td>
</tr>
</tbody>
</table>

EAR1.T220.7 TESTING CRITERIA

For samples of fill material in the table to EAR1.T210:

1. Particle size distribution: test as EAR1.T230 (1);
2. Special fill material: test for the coefficient of uniformity as EAR1.T230 (2);
3. Liquid limit: test all samples other than rock fill material (unless otherwise agreed by the CM) as EAR1.T230 (3);
4. Plasticity index: as sub-clause (3) above and EAR1.T230 (4);
5. Soluble sulphate: test each sample of fill that will be deposited within 500 mm of concrete, cement bound, or cementitious material, or metalwork as EAR1.T230 (5).

EAR1.T230.7 TEST METHODS

Test in accordance with 'Geospec 3: Model Specification for Soil Testing', GEO, 2001 as follows:
1. Particle size: test as Test Method 8.1 or 8.2 whichever is instructed for particles passing a 75 mm BS Test Sieve. Take the size of particles of fill material which do not pass a 75 mm BS test Sieve as the largest dimension measured in any plane;

2. Coefficient of uniformity: calculate the coefficient of uniformity (Cu) from the equation:
   
   \[ Cu = \frac{D_{60}}{D_{10}} \]

   where:

   \( D_{60} \) and \( D_{10} \) are the equivalent sieve sizes in millimetres, interpolated from the particle size distribution curve, through which 60% and 10% of the fill material would pass respectively;

3. Liquid limit: test in accordance with Test Method 6.1 for that proportion of fill passing a 425 micron BS Test Sieve;

4. Plasticity index: test in accordance with Test Method 6.1 for that proportion of fill passing a 425 micron BS Test Sieve;

5. Soluble sulphate: test as Test Method 9.3;

6. Total sulphate: test as Test Method 9.3.

**EAR1.T240.7 NON-COMPLIANCE WITH TESTS**

Where the tests show non-compliance, adopt the following procedures:

1. Soluble sulphate content: test each sample to determine the total sulphate content as in Test Method 9.3 of 'Geospec 3: Model Specification for Soil Testing', GEO, 2001;

2. Particle size distribution, liquid limit, plasticity index, coefficient of uniformity or total sulphate content: provide additional samples, in numbers as stated in the table to **EAR1.T210**, from same batch and retest as before.

**FILL MATERIAL - OPTIMUM MOISTURE CONTENT AND MAXIMUM DRY DENSITY**

**EAR1.T310.7 GENERAL**

Where required, test samples of fill material for optimum moisture content and maximum dry density and deliver results at least 72 hours, or such shorter period agreed by the CM, before deposition of the fill material starts. Provide samples from each batch as specified in the table to **EAR1.T210**.

**EAR1.T320.7 LOCATION**

Inform the CM of the exact location in which the fill material from which each sample is taken is to be deposited.

**EAR1.T330.7 ADDITIONAL SAMPLES**

Take additional samples to test for optimum moisture content and maximum dry density after the fill material has been deposited in its final position, at intervals of not more than 28 days.

**EAR1.T340.7 MATERIALS NOT FOR SAMPLING**

Do not take samples from the following material:
1. Fill material including rock fill material which contains an insufficient proportion of particles passing a 20 mm BS Test Sieve to permit determination of the moisture content and maximum dry density; and

2. Fill material which is to be deposited as intermediate areas of fill, as specified under EAR1.W2010.

**EAR1.T350.7 TESTING METHODS**

1. Test each sample for:
   a. Optimum moisture content, as Test Method 10.1, 10.2, 10.3, 10.4, 10.5, 10.6, 10.7 or 10.8 of 'Geospec 3: Model Specification for Soil Testing', GEO, whichever is Instructed;
   b. Maximum dry density, as for sub-clause (1)(a) above and whichever is Instructed.

2. If agreed by the CM, use the Hilf method as specified in EAR1.T860 to EAR1.T900 instead of the methods stipulated in sub-clause (1) above to determine the optimum moisture content and maximum dry density;

3. If in the opinion of the CM that there is any undue discrepancy between the results of tests for optimum moisture content of fill material using methods as stipulated in sub-clause (1)(a) above and the results of tests using the Hilf method, adopt only the results of tests using methods stipulated in sub-clause (1)(a) above.

**EAR1.T370.7 INCONSISTENT MATERIALS**

Where tests for optimum moisture content or maximum dry density indicate inconsistencies in the fill material and are likely, in the opinion of the CM, to affect subsequent relative compaction tests:

1. Divide the batch into smaller batches of material with similar properties throughout;

2. Provide additional samples from each of the smaller batches, the number of samples being as in accordance with the table to EAR1.T210;

3. Carry out additional tests for optimum moisture content and maximum dry density, of each sample.

**FILL MATERIAL - MOISTURE CONTENT**

**EAR1.T410.7 SAMPLES**

1. Test samples of fill material for moisture content during deposition and compaction and not more than 1 hour after the fill material has been deposited in its final position;

2. Provide the number of samples from each batch in accordance with the table to EAR1.T440. Do not provide samples if, in accordance with EAR1.T340 (1) or EAR1.T340 (2), the optimum moisture content has not been determined.

**EAR1.T420.7 TESTING METHODS**

Test each sample to determine moisture content by Method 1, or by Method 2 if agreed by the CM, as follows:

1. Method 1: Test Method 5.1 or 5.2 of 'Geospec 3: Model Specification for Soil Testing', GEO, whichever is Instructed;

**EAR1.T430.7 MOISTURE CONTENT COMPLIANCE CRITERIA**

If, in the opinion of the CM, there is any undue discrepancy between the results of tests for moisture content of fill material using Method 1 and the results of tests using Method 2, adopt only the results using Method 1.

**EAR1.T440.7 DIFFERENCES BETWEEN MOISTURE CONTENT AND OPTIMUM MOISTURE CONTENT RESULTS**

1. If the result of any test for moisture content of fill material differs from the optimum moisture content by more than the specified amount and, if Instructed, adjust the moisture content of the whole of the batch of fill material;

2. Provide additional samples from the same batch and undertake additional tests for moisture content;

3. Take the number of additional samples as stated in the following table:

<table>
<thead>
<tr>
<th>Description</th>
<th>Size of area of fill in batch</th>
<th>No. of samples/ tests per batch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Areas of fill in excavations for structures pits and trenches and on formation</td>

**FILL MATERIAL - RELATIVE COMPACTION**

**EAR1.T510.7 REQUIREMENT FOR TESTING**

1. Unless otherwise agreed by the CM, test each batch of fill material to determine relative compaction;

2. Carry out each test after the fill material has been deposited and compacted in its final position;

3. The number of tests will be in accordance with the requirements of the table to EAR1.T440;

4. Do not test the following:
   a. Fill material including rock fill materials which contain an insufficient proportion of particles passing a 20 mm BS test sieve to permit determination of the relative compaction; and
   b. Fill material which has been deposited as intermediate areas of fill as EAR1.W2010.

**EAR1.T520.7 LOCATION OF TESTS**

Carry out tests at positions which, in the opinion of the CM, are representative of the batch of compacted fill material as a whole.
METHODS

1. Adopt Method 1, or adopt Method 2 if agreed by the CM, to determine the relative compaction of fill material as follows:
   a. Method 1: Test Method 11.4, Geospec 3, GEO
      Determine the relative compaction (RC) of fill material from the equation:
      \[ RC = \frac{IDD}{MDD} \times 100\% \]
      where:
      IDD is the in-situ dry density determined as \text{EAR1.T540};
      MDD is the maximum dry density determined as \text{EAR1.T350 (1)(b)};
   b. Method 2: The relative compaction (RC) shall be calculated from the equation:
      \[ RC = \frac{IBulkD}{MCBulkD} \times 100\% \]
      where:
      IBulkD is the in-situ bulk density determined as \text{EAR1.T540};
      MCBulkD is the maximum converted bulk density determined by Hilf method as \text{EAR1.T350 (2)}. If the amount of material retained on a 20 mm BS test sieve is more than 5% of the mass of the sample, adjust the maximum converted bulk density (MCBulkD) of fill material in accordance with \text{EAR1.T910 to EAR1.T950}.

2. If in the opinion of the CM that there is any undue discrepancy between the results of tests for relative compaction of fill using Method 1 stipulated in sub-clause (1)(a) above and the results of tests using Method 2 stipulated in sub-clause (1)(b), adopt only the results of tests using the Method 1.

IN-SITU BULK DENSITY AND IN-SITU DRY DENSITY

Adopt Method 1, or adopt Method 2 if agreed by the CM, to determine in-situ bulk density and in-situ dry density as follows:

1. Method 1: Test Method 11.1 or 11.2 of 'Geospec 3: Model Specification for Soil Testing', GEO, as appropriate to the grain size of the fill material;

NON-COMPLIANCE OF RELATIVE COMPACTION TEST

If the result of any test for relative compaction of fill material does not comply with the specified requirements for relative compaction, carry out additional tests for relative compaction on the same batch. The number of additional tests are stated in the table to \text{EAR1.T440}.

TEST METHODS FOR FILL MATERIALS

GENERAL

The definitions, terms, abbreviations symbols, and grouping of materials stated in the relevant parts of 'Geospec 3: Model Specification for Soil Testing', GEO, apply except as stated in \text{EAR1.T720} and \text{EAR1.T730}.

ABBREVIATIONS AND SYMBOLS

Terms used in this Worksection and in the relevant parts of 'Geospec 3: Model Specification for Soil Testing', GEO, are identified by the following abbreviations and symbols:

**EAR1.T730.7 GROUPING OF MATERIALS**

1. Fine grained material is material of which at least 90% passes a 2 mm BS Test Sieve;
2. Medium grained material is material of which at least 90% passes a 20 mm BS Test Sieve and more than 10% is retained on a 2 mm BS Test Sieve.

**DETERMINATION OF THE MOISTURE CONTENT OF FINE GRAINED AND MEDIUM GRAINED MATERIAL BY THE MICROWAVE OVEN DRYING METHOD**

**EAR1.T810.7 SCOPE**

This method covers the determination of the moisture content of fine grained and medium grained material as a percentage of the mass of the dry material.

**EAR1.T820.7 APPARATUS**

Use the following apparatus:

1. A microwave oven with a timer and an adjustable power setting;
2. An airtight container of microwave safe and non-reflective material;
3. A balance readable and accurate to 0.01 g;
4. A desiccator containing anhydrous silica gel.

**EAR1.T830.7 PROCEDURE**

Adopt the following procedure:

1. The container must be clean, dry and weighed to the nearest 0.01 g (m₁);
2. Crumble a specimen and place loosely in the container and replace the lid. Ensure each specimen of fine grained material is at least 30 g and each specimen of medium grained material at least 300 g. Specimens of medium grained material may be tested in several parts each less than 300 g and the results aggregated;
3. Weigh the container and contents to the nearest 0.01 g (m₂);
4. Remove the lid of the specimen container and place the container with its lid and content in the microwave oven and dry. Consider the specimen to be dry when, after an initial drying period, successive weighing at intervals of 1 minute produce results which are the same to the nearest 0.01 g. Alternatively, the oven may be set to an appropriate time and power setting to dry the specimen as determined by calibration of the oven on soil of a similar type;

5. After drying, remove the container and contents from the microwave oven and place in the desiccator to cool;

6. Replace the lid and weigh the container and contents to the nearest 0.01 g (m₃).

**CALCULATION**

Calculate the moisture content of the material (w) as a percentage of the dry mass of the material from the equation:

\[ w = \frac{(m₂ - m₃)}{(m₃ - m₁)} \times 100\% \]

where:
- \( m₁ \) is the mass of the container (g)
- \( m₂ \) is the mass of the container and contents before drying (g)
- \( m₃ \) is the mass of the container and contents after drying (g).

**REPORTING**

Report on the following:

1. Source and identification of the soil;
2. The moisture content of the material to the nearest 0.1%;
3. That the test method used was in accordance with this Specification.

**DETERMINATION OF THE MAXIMUM CONVERTED BULK DENSITY BY THE HILF METHOD**

**SCOPE**

This method covers the determination of the maximum converted bulk density and the difference between the optimum moisture content and the in-situ moisture content of a material by relating the converted bulk density and the moisture content added.

**APPARATUS**

Use the following apparatus:

1. Apparatus in accordance with Geospec 3, Test Method 10.1 or 10.2, whichever as Instructed by the CM;
2. Apparatus for determination of the moisture content in accordance with either Geospec 3, Test Method 5.1 or 5.2 or EAR1.T820, whichever as Instructed by the CM;
3. Apparatus to extract specimen from the mould;
4. Apparatus, such as a warm air blower, for rapid drying of the material.

**PROCEDURE**

Adopt the following procedures:
1. Take a sample of material immediately after completing the in-situ bulk density test at the same location as the test. The sample shall be obtained by digging to the same depth as that of the in-situ bulk density test, keeping the sides of the excavation vertical and bottom level. The size of the sample shall be sufficient to yield a maximum of 10 kg after screening over a 20 mm BS test sieve;

2. Weigh the sample to the nearest 0.01 g;

3. Screen the sample over a 20 mm BS test sieve, ensuring that moisture loss is kept to a minimum and that any free moisture appearing in the container is worked back into the sample;

4. Weigh the amount retained on the sieve to the nearest 0.01 g and express as a percentage of the mass of the sample. If the percentage exceeds 5%, adjust for coarse material in accordance with EAR1.T910 to EAR1.T950. If the percentage does not exceed 5%, no adjustment is required;

5. Mix the material to be tested thoroughly and divide by quartering or by using a riffle box to obtain a maximum of four specimens of at least 2,500 g each, ensuring that the moisture loss is kept to a minimum. Alternatively, if it has previously been ascertained that the material is not susceptible to crushing, use a single specimen of at least 2,500 g for repeating the testing;

6. Weigh each specimen to the nearest 0.01 g and take the result as the mass of the specimen at the in-situ moisture content;

7. Place and seal each specimen and any remaining material in separate moisture-tight containers;

8. Plot the converted bulk density of at least three specimens against the amount of water added or removed as a percentage of the mass of the specimen at the in-situ moisture content (z) on a graph as shown in Civil Engineering and Development Department Standard Drawing No. C2006, in accordance with the procedure stated in sub-clauses (9) to (15) below;

9. Obtain the first point on the graph as follows:
   a. Compact a specimen at its in-situ moisture content in accordance with GeoSpec 3, Test Method 10.1, Clause 10.1.5 or Test Method 10.2, Clause 10.2.5, whichever is Instructed by the CM;
   b. Cut a diametrical slice of approximately 400 g to 500 g from the specimen along its entire length. Determine the in-situ moisture content of the slice (w_s) in accordance with either GeoSpec 3, Test Method 5.1 or 5.2 or EAR1.T810 to EAR1.T850, whichever as Instructed by the CM;
   c. Calculate the bulk density (BulkD_1) as stated in EAR1.T890 (1) and plot on the 0% ordinate of the graph as the converted bulk density (CBulkD_1).

10. Obtain the second point on the graph as follows:
   a. Examine a second specimen and, if the in-situ moisture content obviously exceeds the optimum moisture content, follow the procedure stated in sub-clause (11) below;
   b. Increase the moisture content of the specimen by adding an amount of water equal to 2% of the mass of the specimen. Mix the specimen thoroughly and compact in accordance with the method stipulated in sub-clause (9) above;
   c. Calculate the bulk density (BulkD_2) as stated in EAR1.T890 (1), adjust to converted bulk density (CBulkD_2) as stated in EAR1.T890 (2) and plot on the +2% ordinate of the graph.
11. If the in-situ moisture content of the second specimen obviously exceeds the optimum moisture content, dry and cool the specimen until the amount of water removed is approximately 2% of the mass of the specimen. Mix the specimen thoroughly and compact in accordance with the method stipulated in sub-clause (9) above. Determine the amount of water removed. Calculate the bulk density (BulkD₂) as stated in EAR1.T890 (1), adjust to converted bulk density (CBulkD₂) as stated in EAR1.T890 (2) and plot on the negative ordinate of the graph at a point which corresponds to the amount of water removed;

12. Obtain the third point on the graph as follows:
   a. If the plotted value of CBulkD₂ is equal to or greater than the plotted value of CBulkD₁, increase the moisture content of the third specimen by adding an amount of water equal to 4% of the mass of the specimen. Alternatively, if the procedure of sub-clause (11) above has been followed, dry and cool the specimen until the amount of water removed is approximately 4% of the specimen after cooling;
   b. If the plotted value of the CBulkD₂ is less than the plotted value of CBulkD₁, dry and cool the third specimen until the amount of water removed is approximately 2% of the specimen after cooling. Alternatively, if the procedure of sub-clause (11) above has been followed, increase the moisture content by adding an amount of water equal to 2% of the mass of the specimen;
   c. Mix the specimen thoroughly and compact in accordance with the method stipulated in sub-clause (9) above. Determine the amount of water removed if applicable;
   d. Calculate the bulk density (BulkD₃) as stated in EAR1.T890 (1), adjust to converted bulk density (CBulkD₃) as stated in EAR1.T890 (2) and plot on the graph at a point corresponds to the amount of water added or removed.

13. If the centre point of the three points plotted is lower than one of the other two points, or is higher than one point and equal to the other, obtain an additional point or points by proceeding in 2% increments or decrements as appropriate;

14. If it is apparent that the moisture condition of the material is such that a total five points will not result in the determination of the optimum moisture content, adopt increments or decrements of 3% moisture content for the entire procedure;

15. Draw a smooth parabolic curve to the plotted points. Determine the peak of the curve as the maximum converted bulk density (MCBulkD);

16. Determine the amount of water added of removed as a percentage of the mass of the specimen at the in-situ moisture content corresponding to the maximum converted bulk density (zₘ);

17. Determine the value of moisture correction curve passing through the peak value of the plotted parabolic curve (zₙ). If there is no moisture correction curve passing through the peak value of the curve, draw a moisture correction curve through the peak by interpolating to the nearest 0.1%.

**EAR1.T890.7 CALCULATION**

1. Calculate the bulk density (BulkD) from the equation:

   \[ \text{BulkD} = \frac{(m_2 - m_1)}{V} \text{ Mg/m}^3 \]

   where:
   - \(m_1\) is the mass of the mould and base (g)
   - \(m_2\) is the mass of the mould and base and wet material (g)
   - \(V\) is the mass of the volume of the mould (mL).

2. Calculate the converted bulk density (CBulkD) from the equation:

   \[ \text{CBulkD} = \frac{\text{BulkD}}{1 + \frac{z}{100}} \text{ Mg/m}^3 \]
where:

$z$ is the amount of water added or removed as a percentage of mass of the specimen at the in-situ moisture content (%)

$z$ is negative for values below the in-situ moisture content.

3. Calculate the difference between the optimum moisture content ($w_o$) and the in-situ moisture content ($w_i$) of the material from the equation:

$$w_o - w_i = z_m + z_c \%
$$

where:

$z_m$ is the amount of water added or removed as a percentage of mass of the specimen at the in-situ moisture content corresponding to the maximum converted bulk density (%)

$z_c$ is the value of the moisture correction curve passing through the peak value of the plotted parabolic curve (%).

4. Calculate the optimum moisture content ($w_o$) from the equation:

$$w_o = w_i + (1 + w_i/100)z_m \%
$$

where:

$w_i$ is the in-situ moisture content of the material (%).

5. Calculate the maximum dry density (MDD) from the equation:

$$MDD = \frac{MC_{BulkD}}{(1 + w_i/100)} \text{ Mg/m}^3
$$

where:

$MC_{BulkD}$ is the maximum converted bulk density of the material (Mg/m$^3$).

6. Calculate the relative compaction (RC), if required, from the equation:

$$RC = \frac{IBulkD}{MC_{BulkD}} \times 100\%
$$

where:

$IBulkD$ is the in-situ bulk density of the material determined in accordance with Geospec 3, Test Method 11.1 or 11.2 as appropriate to the grain size of the material.

**EAR1.T900.7 REPORTING**

Report on the following:

1. Source and identification of the soil;
2. The graph showing the plotted points and the parabolic curve passing through them;
3. The maximum converted bulk density to the nearest 0.01 Mg/m$^3$;
4. The optimum moisture content to the nearest 0.1%;
5. The maximum dry density to the nearest 0.01 Mg/m$^3$;
6. The relative compaction to the nearest 0.1 %, if determined;
7. The percentage retained on the 20 mm BS test sieve and the percentage retained on the 37.5 mm BS test sieve to the nearest 1%;
8. Whether the test was carried out using individual specimens or repeat testing of a single specimen;
9. Whether a manual or an automatic compaction rammer was used;
10. That the test method used was in accordance with this Specification.
ADJUSTMENT OF THE MAXIMUM CONVERTED BULK DENSITY FOR DETERMINATION OF RELATIVE COMPACTION

EAR1.T910.7 SCOPE
This method covers the adjustment of the maximum converted bulk density determined in accordance with EAR1.T860 to EAR1.T900 for the determination of relative compaction of a material containing more than 5% of the mass of the material at the in-situ moisture content retained on a 20 mm BS test sieve.

EAR1.T920.7 APPARATUS
Use the following apparatus:
1. Apparatus in accordance with EAR1.T870;
2. A 20 mm and a 37.5 mm BS test sieve;
3. A mould with collar as used for determination of the California Bearing Ratio (CBR mould);
4. An extrusion device as used for determination of the California Bearing Ratio.

EAR1.T930.7 PROCEDURE
Adopt the following procedures:
1. If the amount of material retained on the 20 mm BS test sieve exceeds 5% and does not exceeds 20%, compact the material passing the sieve in accordance with EAR1.T860 to EAR1.T900. Determine and adjust the maximum converted bulk density (MCBulkD) as stated in EAR1.T940;
2. If the amount of material retained on the 20 mm BS test sieve exceeds 20%, screen the retained material over the 37.5 mm BS test sieve. Follow the procedure stated in either sub-clause (3) or (4) below as appropriate;
3. If the amount of material retained on the 37.5 mm BS test sieve does not exceed 5%, follow the procedure stated in sub-clause (5);
4. If the amount of material retained on the 37.5 mm BS test sieve exceeds 5% and does not exceed 20%, replace the retained material with an equal mass of material which is of similar nature and which is retained on a 20 mm BS test sieve but passes a 37.5 mm BS test sieve. Follow the procedure stated in sub-clause (5) below;
5. Follow the procedure in EAR1.T860 to EAR1.T900 except that the material shall be compacted into the CBR mould and each layer shall be subject to 62 blows of the rammer.

EAR1.T940.7 CALCULATION
Calculate the maximum converted bulk density (MCBulkD) from the equation:
\[
MC_{BulkD} = MC_{BulkD_{20}}[1 + m(1 - MC_{BulkD_{20}}/G_s)/(1 + z/100)] \quad \text{Mg/m}^3
\]
where:
- \(MC_{BulkD_{20}}\) is the maximum converted bulk density of the material passing 20 mm BS test sieve (Mg/m³)
- \(m\) is the mass of material not passing the 20 mm BS test sieve expressed as a fraction of the mass of the material at the in-situ moisture content
- \(G_s\) is the specific gravity of the material not passing 20 mm BS test sieve
- \(z\) is the amount of water added as a percentage of the mass of the specimen at the in-situ moisture content corresponding to the maximum converted bulk density (%)
REPORTING

Report on the following:

1. Source and identification of the soil;
2. The results in accordance with EAR1.T900;
3. The mass of the original material not passing the 20 mm BS test sieve and 37.5 mm BS test sieve as a percentage of the mass of the material at the in-situ moisture content to the nearest 0.1%;
4. The type of mould used;
5. The number of blows per layer;
6. Whether the specific gravity was measured or assumed and, if measured, the method used;
7. That the test method used and the results adjusted were in accordance with this Specification.
EAR2 BLASTING MATERIALS

EXPLOSIVES

EAR2.M010.7 NITRO-GLYCERINE BASED EXPLOSIVES
Do not use.

EAR2.M020.7 PRE-SPLIT BLASTING EXPLOSIVES
Only use explosives for pre-split blasting that are specifically recommended by the explosives manufacturer for pre-splitting.
WORKMANSHIP

GENERALLY

EAR2.W010.7 STATUTORY REQUIREMENTS
1. Comply with conditions and restrictions imposed by the Commissioner of Mines for:
   a. Blasting operations;
   b. Supply, transportation, storage, use and disposal of explosives.
2. Make all arrangements with and obtain all licences and permits from the Commissioner of Mines in connection with blasting operations;
3. Ensure that the Mines and Quarries Division, Civil Engineering Development Department is given adequate notice to arrange visits to the site to consider blasting conditions, and thereafter comply promptly and fully with any instruction issued by the Commissioner of Mines, or his representative, in connection with blasting;
4. Allow access to the Site by the staff of the Mines and Quarries Division at all times;
5. Employ at least one registered shotfirer who holds a valid Hong Kong Mine Blasting Certificate and is approved by the Mines and Quarries Division and the CM.

EAR2.W020.7 TRAFFIC CONTROL
Liaise with the Hong Kong Police Force in respect of traffic control on adjacent roads during blasting operations.

EAR2.W030.7 RESTRICTIONS ON TIMING
Do not carry out blasting at the following times:
1. General holidays;
2. Before 8:30 am or after 5:30 pm on any day;
3. When a Hong Kong Observatory thunderstorm warning is in force (unless permitted by the Commissioner of Mines);
4. When strong wind signal or tropical cyclone warning No. 3 or higher is hoisted (unless permitted by the Commissioner of Mines).

EAR2.W040.7 PARTICULARS OF BLASTING
Submit the following particulars to the CM at least 48 hours before blasting starts:
1. Any conditions or restrictions imposed by the Commissioner of Mines, including copies of applications, licences, permits and correspondence;
2. Names, qualifications and experience of the persons responsible for the design and supervision of blasting operations;
3. Location, diameter, inclination and depth of holes to be charged with explosive;
4. Type and total mass of explosive to be used and its mass and distribution in each hole;
5. Dimensions of stemming and decking;
6. Initiation sequence, delay periods and mass of explosive per delay;
7. Burden and bench height;
8. Ratio of diameter of explosive to diameter of hole;
9. Arrangements for and methods of instrumentation and monitoring the effects of blasting;
10. Details of velocity seismographs, including manufacturer's literature;
11. Method of controlled blasting;
12. Details of blasting trials; and
13. Protective measures.

**EAR2.W050.7 PARTICULARS OF PRE-SPLIT BLASTING**

In addition to the data required by clause EAR2.W040 submit to the CM the following information at least 48 hours before pre-split blasting starts:

1. Plan showing proposed method of working;
2. Pre-split burden;
3. No of pre-split holes to be fired at each delay;
4. Distance from the pre-split face to the nearest primary blast drillholes;
5. Decoupling ratio;
6. Delay arrangements between pre-split and primary blasts.

**EAR2.W060.7 BLASTING ASSESSMENT**

Prior to carrying out blasting works, submit to the Geotechnical Engineering Office a Blasting Assessment containing the following information:

1. Assessment of site geology and the condition of existing structures, slopes, retaining walls and services;
2. Assessment of the stability of existing structures, slopes and retaining walls under the effects of blasting;
3. Proposals for preventive and precautionary measures to be implemented to ensure stability and integrity of the affected structures, slopes, retaining walls and services both during blasting and in the long term;
4. Outline blast design to demonstrate the practicability of satisfying any constraints imposed under sub-clause (3) above;
5. Proposals for instrumentation and monitoring of the effects of blasting;
6. Details of site supervision to ensure professional input during the blasting work by the Blasting Control Engineer; and
7. Curriculum vitae of the Blasting Control Engineer who prepared the Blasting Assessment.

**EAR2.W070.7 GEOTECHNICAL ENGINEERING OFFICE (GEO) REQUIREMENTS**

Comply with all requirements, comments and conditions imposed on the blasting works by the GEO in respect of the submitted Blasting Assessment.
SAFETY PRECAUTIONS, RESTRICTIONS AND BLASTING PROCEDURES

SAFETY PRECAUTIONS AND RESTRICTIONS

1. The CM may regulate, restrict or prohibit blasting if, in his opinion, it is necessary to do so for the safety of persons or property, to limit noise or to safeguard the Works. Notify the CM, by not later than noon of the previous day, any intention to bring any Explosives to the Site or to carry out any blasting;

2. Store, transport and use explosives at all times in accordance with the Dangerous Goods Ordinance (Cap 295) and such other Statutory Regulations concerned with the possession and use of explosives which may be in force. Do not store explosives and detonators on the Site overnight unless permitted by the Commissioner of Mines;

3. Safeguard, and relocate if necessary, any structures or services within the Site;

4. Consult Power Companies when blasting near high voltage underground or overhead cables and observe restrictions imposed by these Companies; make good any damage caused by, or consequential to, blasting operations;

5. Provide a system approved by the CM for warning and preparing the general public and all site personnel of an impending blast, both by audible and visual means, and ensure that the blasting area is cleared of all personnel immediately prior to blasting. This warning system is to comply with all statutory requirements;

6. Take all necessary precautions to prevent accident, injury or loss to persons and damage to works or property, within and outside the Site, resulting from the use or handling of explosives. Obtain agreement from the CM of such precautions and the method of handling and using explosives;

7. Blasting will be allowed only within the area outlined on the site plan attached to the Commissioner of Mines permit;

8. Do not use ANFO or emulsion, that is not in cartridged form, for blasting within 5 m from an excavation free face;

9. Dispose of unused explosives and detonators at the end of each day as stipulated by the Commissioner of Mines.

GENERAL PROCEDURES

1. Wet areas within 30 m from the blasting area with water prior to blasting;

2. Clear all loose materials to expose the final rock face as soon as practicable after the blast and scale all final rock faces to remove loose rock fragments;

3. Do not blast to form drainage channel, cascade, catchpit and the like, on the final rock face;

4. Utilise uncharged guide holes to form any corner in the final slope profile. When the final profile design includes the provision of berms between slopes, exercise extreme care to ensure no drilling below berm level and in the selection of toe charging details to produce the required profile.

SURFACE PREPARATION

Before assessments of blasting safety precautions are made, remove all vegetation, overburden, and soft or loose materials, and expose the rock that is to be blasted.
EAR2.W140.7 PROTECTIVE SCREENS
Unless otherwise permitted by the Commissioner of Mines, erect screens and other protective covers to prevent the projection of flying fragments of material resulting from blasting. Construct screens using wire mesh securely supported on steel frames; use wire of nominal diameter at least 3.5 mm and wire mesh size not exceeding 25 mm.

EAR2.W150.7 PLASTER BLASTING
Do not use plaster blasting unless permitted by the Commissioner of Mines.

EAR2.W160.7 BLAST HOLES
Unless otherwise permitted by the Commissioner of Mines provide blast holes stemmed and decked using free-flowing granular materials. Cover charges with thick gunny sacking and 2 m by 2 m square of steel fabric reinforcement weighted down with filled sandbags. Except on slopes cover surface detonating cords, knots, detonating relay conductors and initiating detonators with a 300 mm thickness of sand or soil.

EAR2.W170.7 DETONATORS
Do not use electrical detonators within 60 m of overhead power lines unless permitted by the Commissioner of Mines. When using electrical detonators in the vicinity of static or mobile radios transmitters comply with BS 6657:1991.

EAR2.W180.7 DELAY BLASTING
Use delay-blasting at all times with millisecond delays unless otherwise permitted by the Commissioner of Mines, or as specified under pre-splitting.

EAR2.W190.7 PROXIMITY TO CERTAIN STRUCTURES
Unless permitted by the CM, do not carry out blasting within a distance of:
1. 60 m from water retaining structure or water tunnels; and
2. 6 m from water mains or other water supply structures or installations.

EAR2.W200.7 VIBRATIONS TO INSTALLATIONS OR STRUCTURES
Unless permitted by the CM the vibrations at structures and installations due to blasting, measured in terms of peak particle velocity and vibrational amplitude, must not exceed the values stated in the following table:

<table>
<thead>
<tr>
<th>Type of structure or installation</th>
<th>Peak particle velocity (mm/s)</th>
<th>Vibrational amplitude (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Water retaining structures.</td>
<td>13</td>
<td>0.1</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>Water mains.</td>
<td>25</td>
<td>0.2</td>
</tr>
<tr>
<td>Other structures and pipes.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

EAR2.W210.7 VIBRATIONS TO ADJOINING LAND
Unless otherwise permitted by the CM, the vibration at adjoining slopes and land due to blasting measured in terms of peak particle acceleration and peak particle velocity must not exceed the values stated in the Contract.
RECORDING VIBRATIONS

1. Take measurements of vibrations due to blasting at locations stated in the Contract, or instructed by the CM, at all times when blasting is carried out. Keep records of vibrations on the Site and provide a copy for the CM. Make any arrangements for installing instruments and taking measurements both inside and outside the Site;

2. Measure vibrations due to blasting in terms of peak particle velocity, peak particle acceleration and vibration amplitude. Take peak values as the maximum resultant calculated by vector summation of the three components of velocity and amplitude respectively, measured as instantaneously as the resolution of the recording instrument permits;

3. Take measurements with velocity seismographs, which have operating instructions in English of a type agreed by the CM. Seismographs must be capable of:
   a. Recording vibrations in terms of peak particle velocity and vibration amplitude over a frequency of 0 - 200 Hz in three mutually perpendicular directions; and
   b. Producing a permanent record of vibrations by tracing an ultra-violet light beam on sensitised paper, or by other methods agreed by the CM;

4. Check the accuracy of seismographs at regular intervals agreed with the CM.

PRE-SPLIT BLASTING

FORMING FINAL SURFACES

1. Form earthworks final surfaces and formations, which are to be formed by blasting, and which slope at a gradient exceeding 2 vertical to 1 horizontal and exceed 3 m in height by pre-splitting. Do not use other methods of controlled blasting unless permitted by the CM;

2. Ensure that:
   a. Other blast holes are located at a sufficient distance from the earthwork final surface to avoid damaging the surface; and
   b. The row of blast holes nearest to that surface is inclined parallel to the slope face.

METHODOLOGY

1. Carry out pre-splitting and other methods of controlled blasting in such a manner that the rock mass is cleanly split on the required plane and that rock outside the earthworks final surface is not shattered or loosened;

2. Faces formed by pre-splitting or other methods of controlled blasting must not exceed 15 m in height in any one blasting operation unless permitted by the CM.

HOLES FOR PRE-SPLITTING

1. Drill a single row of holes at the appropriate inclination along the line of the earthworks final surface. Load holes with explosives not exceeding half the diameter of the hole. Detonate the explosives simultaneously or with the minimum amount of delay necessary to reduce ground vibrations;

2. Drill holes for pre-splitting at least 50 mm in diameter with the ratio of the distance between the centre of the holes and the diameter of the hole not exceeding 10;

3. Form the holes so that they are within a distance of 0.015 times the length of the hole from their designed position;
4. Do not drill holes for pre-splitting into the sub-grade below berm levels. Remove rock which remains in position on berms after blasting by method other than blasting.

TRIAL BLASTS

EAR2.W410.7 REASON FOR TRIAL BLASTS
Carry out trial blasts to demonstrate that:
1. The procedure is safe;
2. The resulting ground vibrations at locations stated in the Contract or instructed by the CM can be satisfactorily predicted, recorded and are within acceptable limits, do not adversely affect the safety and stability of adjoining structures, installations, slopes and land.

EAR2.W420.7 PARTICULARS OF TRIAL BLASTING
Submit to the CM details of blasting trials in accordance with EAR2.W040 at least 14 days in advance of blasting.

EAR2.W430.7 PRE-SPLIT BLASTING TRIALS
Carry out the blasting trials for pre-splitting and other methods of controlled blasting to form a face at least 6 m wide by 6 m high, on rock which has similar properties to that of the earthwork final surface and which is at least 6 m away from the earthwork final surface.

EAR2.W440.7 RESULTS OF BLAST TRIALS
If in the opinion of the CM any aspect of the proposed blasting procedures as demonstrated by blasting trials is unsatisfactory, submit details of proposed changes in the procedure to the CM. Carry out further blasting trials until the procedure is satisfactory.

EAR2.W450.7 CHANGES IN PROCEDURE
Do not vary the satisfactorily Approved blasting procedure. Demonstrate any proposed changes in procedure by further blast trials, unless otherwise permitted by the CM.

EAR2.W460.7 COMPLETION OF TRIAL BLASTS
1. Complete all trials at least 7 days before the related blasting is due to start;
2. Carry out blasting trials in accordance with the trial procedure submitted to and agreed by the CM. The location and size of blasting trials shall be as agreed by the CM.

EAR2.W470.7 COMMENCEMENT OF BLASTING
Do not proceed with blasting until in the opinion of the CM the procedure as demonstrated by the relevant blasting trials is satisfactory.

TOLERANCES

EAR2.W510.7 GENERAL
Refer to Appendix H 'Schedule of Tolerances' to this Specification.

STR1 STRUCTURAL STEEL

GENERAL

STANDARDS

STR1.G010.7 CODE OF PRACTICE AND STANDARDS
1. Comply with the Code of Practice for the Structural Use of Steel 2011 issued by the Buildings Department;

2. Unless otherwise approved, comply with the British Standards stated in this Specification. Where the Contractor proposes to substitute any other standard or code of practice either in its entirety or in part, for any of those specified, submit details of such together with two complete copies for Approval. Generally, Approval will only be given where the CM considers the proposals to give at least an equivalent standard of the finished work;

3. In the case of any conflict, ambiguity or contradiction between the Code of Practice for the Structural Use of Steel 2011 and the British Standards or other Approved Standards, unless expressly stated otherwise in this Specification, the conditions of the Code of Practice for the Structural Use of Steel 2011 shall prevail.

STR1.G020.7 STATUS OF THE SPECIFICATION
Where this Specification includes provisions additional to, or more stringent than those of the aforementioned Code of Practice for the Structural Use of Steel 2011 and the British Standards, the provisions of this Specification shall prevail overall.

STR1.G030.7 RESPONSIBLE ENGINEER
Employ a Registered Structural Engineer as specified in PRE.B6.060 to take up the role of Responsible Engineer stated in the Code of Practice for the Structural Use of Steel 2011. The Responsible Engineer shall take responsibility for the design, erection and construction of all permanent and/or temporary works and falsework for the construction of major structural steelwork. No consent or dissent of the CM will relieve the Contractor of his sole responsibility for the design, construction and obtaining Approval.

STR1.G040.7 MINOR STEEL STRUCTURES
1. The list of minor steel structures is given in the Project Specific Specification;

2. Specification clauses not applicable to the minor steel structures are listed in the Project Specific Specification.
DESIGN

GENERAL

STR1.D010.7  STRUCTURAL STEEL DESIGN
Comply with the information given on the Drawings and the following information. In general member sizes on the Drawings will be given as serial sizes and loads will be indicated under dead and superimposed live loads only. Wind loading, seismic loading and thermal loading will not generally be shown.

STR1.D020.7  DESIGN STANDARDS
Ensure compliance of the design with the requirements of Code of Practice for the Structural Use of Steel 2011 for all building works. For steel bridges the design must also comply with BS 5400 and the Structure Design Manual for Highways and Railways issued by the Highways Department.

STR1.D030.7  WIND LOADING
Calculate the wind load in accordance with the Code of Practice on Wind Effects in Hong Kong 2004 issued by the Buildings Department.

STR1.D040.7  SEISMIC LOADING
Ensure that seismic loading, (where this needs to be considered) is in compliance with the appropriate national standard for the design of structures in relation to earthquakes.

STR1.D050.7  ALTERNATIVE DESIGN
Loading tests in accordance with Chapter 16 of the Code of Practice for the Structural Use of Steel 2011 may be used to verify alternative design or construction that is not entirely in accordance with the design requirements of the same Code.

STR1.D060.7  DESIGN SUBMISSION FOR MINOR STEEL STRUCTURE
1. Notwithstanding the submission requirements stated in PRE.B6.085, submit for CM’s approval calculation and drawings, which have been certified by a Registered Structural Engineer, to demonstrate that the design of minor steel structure, including the details of the materials of the structure, shown on the manufacturer’s drawings, manuals or catalogues complied with the Specification and the Code of Practice for Structural Use of Steel 2011;

2. Agree with CM the programme for submission.

FABRICATION AND ERECTION DOCUMENTS

STR1.D110.7  FABRICATION DOCUMENTS
1. Prepare and submit to the CM at least six weeks before starting fabrication, complete details of fabrication to include the following:
   a. All connections including relevant calculations;
   b. Methods of fabrication;
   c. Welding process and procedure, see STR1.T090 and STR1.T100;
   d. Temporary guys and bracing for use during the erection;
e. Details of holding down bolts and fittings to be built into the concrete or masonry.

2. Do not commence fabrication or deviate from the Drawings prior to receiving Approval.

**STR1.D120.7** ERECTION DOCUMENTS

1. Prepare and submit to the CM at least six weeks before starting to erect steelwork, details of the following:
   a. Method of erection;
   b. Type of craneage;
   c. Calculations of erection stresses;
   d. Temporary guys and bracing for use during the erection.

2. Do not commence erection or deviate from the Drawings prior to receiving Approval.

**STR1.D150.7** WELDING SYMBOLS

Show welding on the drawings using welding symbols to the Code of Practice for the Structural Use of Steel 2011.

**STR1.D160.7** DRAWINGS RESPONSIBILITY

Accept responsibility for any errors in fabrication drawings subsequently found whether or not Approval to the drawings has been obtained.

**STR1.D170.7** RECORD DRAWINGS

On completion of the erection, revise or redraw fabrication drawings to show any agreed modifications made during the course of the Contract. Submit one copy negative or velograph of each drawing to the CM for record purposes.

**DESIGN OF SPACE FRAMES**

**STR1.D210.7** GENERAL

This Specification and the Drawings show the works for the purpose of defining the design intent and performance requirements. Details show the preferred arrangements to other building elements and do not provide solutions to structural and thermal movements, fixings and anchorages etc.

**STR1.D220.7** DESIGN RESPONSIBILITY

Accept responsibility for the complete suitability of the design. Approval to the design does not relieve the Contractor from this responsibility.

**STR1.D230.7** SCOPE OF WORKS

The space frame works comprise the design, supply and erection of the whole of the space frame structure in accordance with this Specification including delivery to the site, all testing as required by this Specification, assembling, erecting in position and painting.

**STR1.D240.7** DESCRIPTION OF WORKS

Design the space structure with dimensions as indicated in the Project Specific Specification. General Layout, structural supports and all other relevant information pertaining to the space frame are depicted in Project Specific Specification.
STR1.D250.7 SPACE FRAME SYSTEM

1. Propose a specialist supplier/contractor on the Hong Kong Special Administrative Region Development Bureau's 'List of Approved Suppliers of Materials and Specialist Contractors for Public Works' in the category of Space Frame System for the CM's approval and obtain the space frame from the Approved specialist supplier/contractor;

2. Design the space frame which shall be a proprietary system complying with the details as specified in the Project Specific Specification.

STR1.D260.7 TENDER INFORMATION

Provide the following information with return of Tender:

1. The manufacturer's certificate of origin, certificates of chemical composition and physical tests;

2. A complete design calculation of the space frame structure certified by a Registered Structural Engineer;

3. The approximate total weight, loads on each supports, anchorages/anchor bolts required for the fixing of the space frame structure;

STR1.D270.7 DESIGN

Design proprietary space frame system:

1. To comply with the Code of Practice for the Structural Use of Steel 2011 for steel or BS 8118 for aluminium, as appropriate;

2. To be capable of withstanding thermal movement and induced stresses under a temperature variation ranging from 0º C to 40º C and other loads as shown on Drawings.

STR1.D280.7 ERECTION INFORMATION

1. Submit for the CM's consent at least one month before the proposed erection of the space frame:
   a. Organization chart and details of the erection supervisory staff;
   b. Detail programme for erection;
   c. Method and procedure of erection with the system employed complete with sketches, drawings, or photographs;
   d. Details including capacities of all lifting equipment to be used;
   e. A quality control & assurance system for the verification of the compliance of specification in all materials and workmanship;
   f. A copy of full set of design calculations including those for the erection stage, certified by the Responsible Engineer;
   g. Four copies of a full set of shop drawings of the space frame structure and the supporting parts complete with bearings, required for the proper execution of works, certified by the same Responsible Engineer; and
   h. Manufacturer's certificates of origin and chemical composition of, and certificates of results of physical tests for, structural elements showing compliance with the specification.

2. The CM undertakes to reply to the Contractor's submissions and re-submissions within 42 days.
MATERIALS FOR AND FABRICATION OF SPACE FRAMES

STR1.D310.7 MATERIALS STANDARDS
Design with materials of standard hollow section complying with Code of Practice for the Structural Use of Steel 2011 for steel, and BS 1471:1972 or BS EN 755 part 1-2:1997, Part 3-6:1996, part 7-8:1998, Part 9:2001 as appropriate for aluminium. Use members of circular section connected by spherical nodes of the same material. Make the configuration of the nodes such that all resultant forces from members coincide with the centroid of nodes. Where a proprietary space frame is proposed based on other recognized international standards, submit the relevant material specification for Approval.

STR1.D320.7 ROOF FALLS
Design the finished roof with a minimum fall as specified in the Project Specific Specification. Fall to be effected by the space frame structure and/or the purlin systems, after being loaded with all roofing materials.

STR1.D330.7 SIZE OF MEMBERS
Give consideration to providing an aesthetic proportion and balance between members when selecting member sizes.

STR1.D340.7 FABRICATION
Ensure all members are free from twist, true to profile and dead straight or truly curved as shown on the Drawings. Materials damaged whilst being straightened or curved to be rectified or rejected as the CM directs.

STR1.D350.7 CUTTING AND FITTING
Cut to exact lengths the ends of members and other parts abutting against or upon other parts, true and square, so as to provide a good bed or joints as the case may be. Proper cover plates must be provided where necessary.

STR1.D360.7 FASTENERS
1. Provide and fit all bolts with washers, splayed if necessary, to give a level and even bearing on the nuts;
2. Washers to be minimum of 2.4 mm thick;
3. When required by the CM, provide tapered washers for connections with a difference in slope of 3 degrees or greater. Tapered washers are to be used with bolts through flanges. As far as possible, fix the bolt heads to the upper side of the connections.

STR1.D370.7 LIGHT FITTINGS
Provide supports for all light fittings and as shown on drawings and as specified in the Project Specific Specification. Derive support from nodal joints and not from chords, unless otherwise Approved.
STR1.D380.7 ACCESS CATWALKS
Provide internal catwalks together with catladders to the layout shown on the Drawings. Number of catladders required are as specified in the Project Specific Specification. Design catwalks to fit within the depth of the space frame structure and be minimum 600 mm wide unless otherwise stated. Catwalks to be maximum 400 mm from each light fitting. The position of each light fitting may be adjusted from the position shown on the Drawings by up to maximum of 200 mm in any direction to accommodate the design and construction method of the space frame structure and the catwalks.

STR1.D390.7 SECURITY GATE
Allow for provision of a 600 mm wide hinged, opening inward, lockable gate at location as shown on Drawings and specified in the Project Specific Specification.

STR1.D400.7 ELECTRICAL CONNECTIONS
Allow for provision of screw holes or other suitable connection points for the purpose of connection, by the Nominated Sub-contractor for electrical installation and of equipotential bonding conductors as required by the IEE Wiring Regulations.

TREATMENTS AND FINISHES TO SPACE FRAMES

STR1.D510.7 ELECTROPLATING
Electroplate spherical nodes with zinc layer 25 microns minimum.

STR1.D520.7 HOT DIP GALVANIZING
Hot dip galvanize all other components (both inside and outside of tube members) to BS EN ISO 1461:2009 with minimum mean coating thickness of 45 microns to 85 microns depending on thickness of tube walls as stipulated in Table 3 of BS EN ISO 1461:2009, unless otherwise specified.

STR1.D530.7 POWDER COATINGS
Apply finishing coat to space frame members of factory applied polyester powder. Coat of minimum dry film thickness of 80 microns. Colour to be selected from Standard colour chart.

ERECTION OF SPACE FRAMES

STR1.D610.7 ERECTION SUBMISSION
Submit for the CM's consent the proposed method and procedure of erection of the space frame prior to installation. Ensure compatibility with the requirements of the proposed construction programme and the site conditions. Demonstrate to the satisfaction of the CM that the effects of the forces and stresses imposed in the structure during erection of the space frame shall not exceed the originally allowed for in the design of the structure.

STR1.D620.7 TEMPORARY SUPPORTS
Allow for the provision and the CM's consent of all necessary temporary bracing and supports prior to final fixing.
STR1.D630.7  FIXINGS
Provide installation details of all anchorages/anchor bolts, that must avoid conflicting with the reinforcement of supporting elements.

STR1.D640.7  PROTECTION
Allow for taking necessary precautions to prevent damage to the existing structure and finishes thereof if applicable, during erection. Protect floors when cranes or other plant are to be used internally for erection.

STR1.D650.7  CONTRACTOR'S SUPERVISION
Provide a suitable experienced engineer full time on Site to supervise the erection of the space frame structure until physical completion of the works. The engineer must have previous experience in space frame construction. Submit for Approval the name and qualifications of the engineer who may be the employee of the Specialist Sub-contractor.

DESIGN OF PEDESTRIAN FOOTBRIDGES

STR1.D710.7  GENERAL
Design steel footbridges using structural steelwork to Code of Practice for the Structural Use of Steel 2011, BS 5400 and the Structure Design Manual for Highways and Railways issued by the Highways Department unless otherwise particularly specified.

STR1.D720.7  DRAWINGS AND DETAILS
Submit to the CM, at least 42 days before fabrication, two copies of all detailed working drawings and calculations for the erection and for temporary works and, where applicable, the following information:
1. Specification of materials used in the temporary works;
2. Locations, sizes, lengths and form of joint, angle between fusion faces, gap between parts of all welds. Symbols conforming to Code of Practice for the Structural Use of Steel 2011 should be used for standard weld forms, but full details must be given of any non-standard welds;
3. Where welds are to be made in the shop or elsewhere;
4. Details of stress relieving;
5. Details of testing and inspection methods.

STR1.D730.7  FABRICATION APPROVALS
Do not commence fabrication until Approval to the proposals has been received. Such Approval does not relieve the Contractor of any obligation under the Contract.

STR1.D740.7  APPROVED FIRMS
1. Select a specialist contractor from the Development Bureau's "List of Approved Suppliers of Materials and Specialist Contractors for Public Works" in the category of Structural Steelwork for CM's approval;
2. Employ the Approved specialist contractor and accept all normal obligations under the Contract including responsibility for works carried out by the specialist contractor.
**STR1.D750.7 ERECTION APPROVALS**

Before commencing erection of footbridges:

1. Obtain approvals from Highways Department, Commissioner of Police, and Commissioner for Transport for proposed method of erection of footbridges;

2. Comply with all requirements of the Highways Department and the Commissioners at Contractor's own expense and without any claim for extension of time.

**STR1.D760.7 ERECTION PROPOSALS**

1. Prepare and submit the erection proposal at an appropriate time having regard to the programme of work and the time taken for checking by the CM, obtaining replies and Approvals from the Highways Department and the Commissioners, and making any necessary amendments as required by the Highways Department, the Commissioners and the CM. Details of the erection proposal submitted must include:
   a. A method statement including the type of plant and equipment to be used;
   b. Drawings and calculations of any proposed temporary falsework system;
   c. All drawings properly numbered, fully detailed and dimensioned. All calculations and drawings submitted certified and signed by a Registered Structural Engineer, stating that the design is adequately safe.

2. Amend details as necessary to meet the CM's requirements and then submit through the Authority, to the aforesaid authorities for obtaining their approvals;

3. The giving of consent by the CM to the proposal does not relieve the Contractor of any of his duties or responsibilities under the Contract including his responsibility to obtain the necessary approvals from the aforesaid authorities. Allow a minimum of four weeks for comments from various Government Departments on the erection proposal.

**STR1.D770.7 ERECTION PROCEDURE**

1. Ensure that all falsework used does not interfere with normal traffic flow, and not reduce the width of the traffic lanes. Comply with the minimum clearance restriction imposed by relevant authorities for falsework spanning across carriageways and footways;

2. Assemble, fit and temporarily bolt or tack weld members to Approval prior to final riveting or welding;

3. Submit records of inspection of the completed formwork and falsework to the CM for information before carrying out any further works that may affect the stability of the formwork and falsework. Such records are to be certified by a contractor's superintendent holding qualification equivalent to TCP Grade T4 in civil or structural engineering discipline;

4. Monitor falsework levels and make any necessary adjustments for settlement, or other deflection or movements.

**STR1.D780.7 BRIDGE BEARINGS**

1. Prepare bearing surfaces for bridge bearings by removing all oil and grease by use of a suitable solvent all mill scale, rust and dirt removed by shot blasting;

2. Protect the proposed surface by covering with tape or similar material. The surfaces must not be primed or painted at any time prior to application of the bonding agent.
MATERIALS

GENERAL

STR1.M020.7 MATERIALS AND WORKMANSHIP
Ensure that all structural steelwork is in accordance with the Code of Practice for the Structural Use of Steel 2011 for building and general work and in accordance with BS 5400 and the Structure Design Manual for Highways and Railways issued by the Highways Department for bridge works except where specified otherwise.

STR1.M030.7 APPROVALS
Prior to commencing construction, submit for Approval any details required of the welding plant, techniques and procedures, jigs, workshop facilities and construction devices e.g. cranes, scaffolding etc, which the Contractor proposes using for the fabrication and erection of the steelwork. The information must be in sufficient detail to enable the CM to approve or otherwise.

STR1.M040.7 SAFETY
Comply with safety recommendation contained in BS EN 1011-1:2009 and with the Factories and Industrial Undertakings Ordinance throughout the fabrication, transport, handling and erection of structural steelwork.

STR1.M050.7 METHOD OF MANUFACTURE
Do not use the following method of steel manufacture:
1. Steel made by the Bessemer process;
2. Rimming steel.

STR1.M060.7 STEEL GRADES
Structural steelwork to comprise weldable structural steel in accordance with the following standards as appropriate:
1. Hot rolled sections (excluding hollow sections) and plates:
   BS EN 10025 Part 1-6:2004 Grade S275, S275JR, S355JR, S355J0, S450J0;
2. Hot finished hollow sections:
   BS EN 10210-1:2006, Grade S275J0H, S355J0H, S450J0;
3. Cold formed hollow sections:
   BS EN 10219-1:2006: Grade S275J0H, S355J0H;
4. Cold rolled galvanized sections:
   either BS 2989:1992 Grade Z35, coating type G600, surface finish N, or Hot dipped coated steel sheets to BS EN 10147:1992 Grade FE E3509, coating type G600, surface finish N.

STR1.M070.7 HOT ROLLED SECTIONS
Dimensions, mass, tolerances and rolling margins for:
1. Universal beams, columns, joists, tees and channels to BS 4:Part 1:2005;
2. Hollow sections to BS EN 10210-2:2006;
STR1.M080.7  COLD ROLLED SECTIONS
1. Dimension, mass and tolerances of cold rolled sections to BS 2994:1976 (1987);
2. Do not use cold rolled sections without Approval.

STR1.M090.7  COLD ROLLED HOLLOW SECTIONS
1. Dimension, mass and tolerances of cold rolled hollow sections to BS EN 10219-2:2006;
2. Do not use as substitute for hot finished hollow sections.

STR1.M100.7  PLATES, FLATS AND BARS
1. Comply with the standards as follows:
   a. For plates dimensions and mass tolerances to BS EN 10029:2010;
   b. For wide flats dimensions and mass tolerances to Euronorm 91 Class II thicknesses tolerances;
   c. For bars dimensions and mass tolerances to Euronorm 59 - Square bars, Euronorm 60 - Round bars, Euronorm 61 - Hexagonal bars.
2. Ensure tolerances on thickness are wholly over that shown on the drawings unless otherwise specified.

STR1.M110.7  SURFACE QUALITY
Surface quality of steel to be in accordance with the following:
2. Plates and wide flats: BS EN 10163 Part 2:2004 Class A.

STR1.M120.7  SURFACE DEFECTS AND REPAIR
1. Steel with surface defects within the limits of the following may be repaired and used:
   b. Plates and wide flats: BS EN 10163 Part 2:2004 Class A.
2. Obtain Approval to carry out surface defect repairs by welding.

STR1.M130.7  SURFACE RUSTING
Use only steel with Grade A, B or C surface rusting in accordance with BS 7079: Part A1:1989 (1994).

STR1.M140.7  MAXIMUM CARBON EQUIVALENT
Steel used in built-up welded assemblies or at welded connections must have a carbon equivalent value not exceeding that appropriate to the grade of steel given in Annex D1.1 of the Code of Practice for the Structural Use of Steel 2011 where this may be required for the avoidance of hydrogen cracking in welds unless the Contractor's proposed welding procedures are such to make this requirement unnecessary.

STR1.M150.7  MARKING STEELWORK
Clearly mark all steelwork for identification and erection purposes as follows:
1. Identification: ensure that all steel elements are identified in accordance with BS EN 10025:2004, indicating grade, cast number and manufacturer's identification mark. Where indicated on the Drawings as being unmarked, tag steelwork and leave free of all other marking or hard stamping;
2. Grade S355 and S450 steel: in addition to marking in accordance with BS EN 10025:2004 mark steel with a continuous pale blue water paint line. Mark immediately, with light blue water painting any part cut from S355 and S450 steel which does not have a light blue marking;

3. Cold work steel: mark cold worked areas of member with orange water paint;

4. Marking for erection purposes: tag, hard stamp or pencil weld each member with an individual identification mark, which can not be obliterated by surface coatings. Prepare a marking drawing identifying markings and indicating position of member in structure;

5. Permanent identification: supply and fix to structure after erection, a brass identification plate. Plate to indicate with lettering not less than 15 mm high, etched or punched to a depth not less than 1.5 mm, the following:
   a. Steelwork Contractor's name;
   b. Grade of steel in structure;
   c. Date of fabrication.

STR1.M160.7 NON-AVAILABLE MATERIALS
Obtain Approval for any equivalent alternative required when the specified material is not available.

STR1.M170.7 MANUFACTURERS CERTIFICATES
Provide the manufacturer's certificates for all steel sections, rivets, bolts, screws, nuts and washers delivered to Site.

STR1.M180.7 CLASS OF STEEL
Use only the Class of steel as stated in the Project Specific Specification, unless otherwise shown on the Drawings and/or Approved.

BOLTS, ACCESSORIES, CONNECTIONS AND FITTINGS

STR1.M210.7 STEEL GRADE FOR CONNECTIONS AND FITTINGS
Use Grade S275 steel as a minimum, subject to design suitability, unless otherwise specified.

STR1.M220.7 HIGH STRENGTH BOLTS AND NUTS
1. To BS 3692:2001:Grade 8.8;
2. To the strength of BS 3692:2001:Grade 8.8 and the tolerances of BS 4190:2001;

STR1.M230.7 BS 4190 HOLDING DOWN BOLTS AND NUTS
Holding down bolts and nuts to BS 4190:2001:Grade 4.6. Unless otherwise agreed by the CM, holding down bolts shall be encased in concrete or grout and with either one of the following:
1. Normal bolt head at the exposed end;
2. Screwed ends with two nuts at the exposed end.
STR1.M240.7   BS 3692 HOLDING DOWN BOLTS AND NUTS
Holding down bolts and nuts to BS 3692:2001:Grade 8.8. Unless otherwise agreed by the CM, holding down bolts shall be encased in concrete or grout and with either one of the following:
1. Normal bolt head at the exposed end;
2. Screwed ends with two nuts at the exposed end.

STR1.M250.7   BLACK BOLTS AND NUTS
To BS 4190:2001:Grade 4.6.

STR1.M260.7   DRIVE SCREWS
Use self-tapping metallic drive screws to BS 4174:1972.

STR1.M270.7   PLAIN WASHERS FOR BLACK BOLTS
Round washers to be to BS 4320:1968, Form A made from cold rolled strip in the hardened condition to BS 1449:Part 1:1991:Section 1.15, Grade CS4 chamfered on one outside edge.

STR1.M280.7   SPRING WASHERS FOR BLACK BOLTS
Washers to be single coil square or rectangular steel spring washers to BS 4464:1969 (1990).

STR1.M290.7   TAPERED WASHERS
Made from cold formed strip in the hard condition to BS 1449:Part 1:1991:Section 1.15, Grade CS4 to similar dimensions and tolerances as shown in BS EN 14399:2005.

STR1.M300.7   BOLT LENGTHS
Ensure threaded portion of each bolt projects through the nut by at least one thread.

STR1.M310.7   HIGH STRENGTH FRICTION GRIP BOLTS
Use bolts and associated nuts and washers to BS EN 14399:2005 unless otherwise specified.

STR1.M320.7   RIVETS

STR1.M330.7   TURNBUCKLES OR SIMILAR
Obtain Approval for specially made elements and components such as turnbuckles.

STR1.M340.7   MARKING BOLTS AND ACCESSORIES
Clearly mark all bolts, screws, nuts and washers by either embossed or indented markings identifying the relevant British Standard. (See also STR1.W040).

WELDING CONSUMABLES

STR1.M410.7   QUALITY OF ELECTRODES, RODS AND WIRES
Select to give weld metal properties not less than the minimum specified for the grade of steel being welded.
STR1.M420.7  CONSUMABLES FOR WELDING STEELS TO BS EN 10025
To BS EN 1011-1:2009.

STR1.M430.7  ELECTRODES FOR WELDING GRADE S355 AND S450 STEELS
To be capable of depositing no more than 15 ml of diffusible hydrogen per 100 g of deposited weld metal, as defined in BS EN ISO 2560:2009.

STR1.M440.7  COVERED ELECTRODES FOR MANUAL METAL ARC WELDING
To BS EN ISO 2560:2009.

STR1.M450.7  FILLER WIRES FOR GAS-SHIELDED WELDING
To BS EN 440:1995.

STR1.M460.7  CORED ELECTRODES
To BS EN 758:1997.

STR1.M470.7  FILLER WIRES AND FLUXES FOR SUBMERGED ARC WELDING
To BS EN 756:2004.

STR1.M480.7  CONTINUOUS COVERED ELECTRODES
Of an Approved manufacture.

STR1.M490.7  MANUFACTURER'S TEST CERTIFICATES
Provide CM with relevant manufacturer’s certificates for each batch of electrodes/rods/coils of wire.

STR1.M500.7  STORAGE OF ELECTRODES
Keep electrodes in unbroken packets in accordance with BS EN 1011-1:2009. Any drying or baking of consumables before issue shall be carried out in accordance with the manufacturers recommendations.
WORKMANSHIP

TRANSPORTATION AND STORAGE

STR1.W010.7 GENERAL
Make all necessary arrangements for transport of steel from the fabrication yard to the site.

STR1.W020.7 HANDLING
Carefully load, stack, and unload to avoid damage of any description. Replace damaged items at Contractor's own expense unless the CM permits rectification of damage.

STR1.W030.7 SPECIAL HANDLING
1. Where necessary; use, special slings or lifting points or both for handling, loading and unloading in fabrication shops, during transit and on Site;
2. Provide special supports, packings and lashings on vehicles, trucks and on ship (if appropriate) to prevent chafing;
3. Ensure small components receive special handling and stacking;
4. Ensure unpainted components, e.g. high strength friction grip bolts and associated nuts and washers are adequately protected against corrosion.

STR1.W040.7 BOLTS, NUTS, WASHERS, AND SCREWS
1. Transport and store in sealed or wire clipped bags labelled to identify:
   a. Contents;
   b. Number;
   c. Grade;
   d. Standard;
   e. Manufacturer;
   f. Batch or cast number.
2. Store in a dry area dedicated to the purpose;
3. Do not mix contents of opened bags.

STR1.W050.7 EXPOSURE TO POLLUTANTS
1. Take precautions to minimise exposure of steelwork to atmospheric or chemical pollution before and after fabrication;
2. Store and stack steel members in such a manner that markings are clearly visible;
3. Either one of the following:
   a. For superstructure works:
      i. Store steelwork awaiting erection clear of a levelled, well-drained and maintained hard-standing ground and keep different members separate. Lay or stack to avoid accumulation of water or dirt on or against any of the surfaces. Provide suitable packings between layers of stacked steelwork. Ventilate covered steelwork sufficiently to preclude condensation.
b. For works other than that in sub-clause (3)(a):
   i. Store steelwork awaiting erection clear of the ground and keep different members separate. Lay or stack to avoid accumulation of water or dirt on or against any of the surfaces. Provide suitable packings between layers of stacked steelwork. Ventilate covered steelwork sufficiently to preclude condensation.

STR1.W060.7 ROAD TRANSPORT
1. Use vehicles long enough to carry components with permitted overhang at either end;
2. Provide intermediate supports to which a component can be tied with strops to prevent oscillation;
3. Sit components on softwood supports covered with soft clean pads;
4. Ensure buckles to strops do not touch components.

STR1.W070.7 SEA TRANSPORT
1. Containerise steelwork destined to be shipped overseas;
2. Do not ship steelwork as deck cargo unless in containers;
3. Ensure containers can be handled at ports of exist and entry if vehicle cannot be ferried;
4. Pack containers so that no components touch. Use softwood with soft padding and man-made fibre ropes and strops to prevent movement and contract;
5. Bag fasteners and accessories;
6. Bundle small components and prevent contact;
7. Chromate dip galvanized steel, which is not to be overcoated, when it is to be containerised for longer than three weeks or when going to go through the tropics.

STR1.W080.7 REPAIR OF DAMAGE INCURRED IN TRANSPORT
1. Inspect steelwork after transportation;
2. Set aside components with damage to steel or coatings;
3. Report damaged steel to the CM;
4. If damaged component is not rejected by the CM repair by agreed method;
5. Repair coatings as specified immediately.

FABRICATION

STR1.W110.7 ACCESS
Provide access for the CM at all reasonable times to all places where work is being carried out, with all necessary facilities for inspection during fabrication and off-site assembly.

STR1.W120.7 GEOMETRIC FORM
Keep all material, before and after fabrication, straight unless required to be of curvilinear form. Keep free from twists. Avoid excessive stack-up of sections to prevent damage and distortion.
STR1.W130.7 IDENTIFICATION
Identify at all stages of fabrication, structural steel as described in STR1.M150.

STR1.W140.7 SURFACE PREPARATION
Before fabrication remove all oil and grease by use of a suitable solvent from all bare surfaces and remove all mill scale, rust and dirt by either:
1. Shot blasting to surface finish designation Sa 2 to BS 7079:Part A1:1989 (1994);

STR1.W150.7 POST CLEANING
After cleaning adopt one of the following methods:
1. Apply a coat of blast primer, not greater than 20 microns DFT. Where subsequent welding is to be carried out ensure that a weld through blast primer is used which will not give off noxious fumes during welding. Ensure compatibility with final protective system; or
2. Fabricate steelwork within four hours of cleaning and apply protective system primer (See STR1.W1220); or
3. Reclean steel after fabrication by shot blasting or mechanical wire brushing to standard required for protective coating and apply protective system primer (See STR1.W1220).

STR1.W160.7 EXECUTION
1. Carry out all fabrication to:
   a. The Code of Practice for the Structural Use of Steel 2011 for hot rolled sections and cold formed sections in building;
2. Conform with the requirements for accuracy of construction with respect to levels, dimensions, alignment and fabrication tolerances of members and joints given in the above Code of Practice and British Standard.

STR1.W170.7 SETTING OUT
Set out all holes and cuts along the length of a member from one datum line perpendicular to its longitudinal axis. Mark centres of all holes at standard back marks/cross centre unless otherwise shown on the Drawings.

STR1.W180.7 TEMPORARY ATTACHMENTS
Design and fabricate all temporary attachments for use as assembly/erection aids to ensure their use will not damage the structure of its surface protection.

STR1.W190.7 END PLATES
1. For flexible end plate connections:
   a. To be not less than 12 mm thick;
   b. To extend across, but not be connected to the top flange;
2. For sealing hollow sections:
   a. Suspend suitable desiccant (Silica-gel) in bags in each void prior to sealing up;
   b. Weld sealing plate over end.
**STR1.W200.7**  **JIGS**  
Use jigs for repetitive, interchangeable or complicated work.

**STR1.W210.7**  **MEASUREMENT AND SETTING OUT MARKS**  
Make all measurements by steel tape or bands calibrated at 20°C and used at the correct tension.

**STR1.W220.7**  **CONTINUOUS STRUCTURES**  
Make allowance in setting out continuous structures for dimensional variations due to temperature variations.

**STR1.W230.7**  **STRAIGHTENING BENDING AND CAMBERING OF STEEL SECTIONS**  
Submit proposals to the CM where steel sections are required to be straightened, bent to a specified radius or precambered and methods to be adopted to perform these operations, for his approval in each case. Ensure that the adopted method does not weaken or deface the member.

**STR1.W240.7**  **POST FABRICATION MAKING GOOD**  
Clean and prepare all mechanical damage, weld burns and welded surfaces as follows:
1. By shot blasting; or
2. Mechanical or hand wire brushing;
3. All bare and welded surfaces must also be made good and primed in accordance with **STR1.W150**;
4. Plates over 25 mm that are to be connected by high strength friction grip bolts and found to be bowed or rippled must be machined flat before the steel leaves the fabrication works.

**STR1.W250.7**  **CUTTING STEEL**  
1. Cut by sawing, shearing, cropping, nibbling, laser or machine flame cutting, unless otherwise instructed. Do not use manual gas cutting without Approval;
2. Shearing must not distort steelwork;
3. Saw cut slightly oversize to allow for machining and/or grinding;
4. Flame cut oversize where necessary to allow for removal of notches by machining.

**STR1.W260.7**  **CUT EDGES**  
1. Remove burrs, sharp arrises and slag from edges of all cut members;
2. Dress machine sheared or cropped edges to a neat finish, free from distortion.

**STR1.W270.7**  **MACHINING GENERALLY**  
1. Grind stiffeners, plates and the like to fit the profile of the parent member with diagonal cuts to clear the root radius;
2. Machine stanchion splices and butt joints of compression members true and square;
3. Splay cut projecting corners of cleats, plates, etc and machine the edges and ends of all flanges and end plates of girders or other members except where Universal beams or flats with reasonably square edges are used;
4. Machine the edges of all web and flange plates of welded girders square unless specified otherwise. Where plates are specified to be planed, cut to sufficient size to permit 3 mm to be planed off all edges. The edges of floor plates, gutter plates, and trough flooring may be sheared;

5. Machine square all butt ends of compression members and those in close contact throughout so that applied loads are evenly transmitted over the entire area of the section.

**STR1.W280.7 FLAME CUTTING**
Grind off heat affected metal or notches where gas cutting is used. Where gas cutting is applied to Grade S275 steel over 25 mm thick or to Grade S355 & S450 steel of all thicknesses, machine any gas cut edge which is to be subject to fluctuating stresses along its length but not subsequently incorporated in a weld so as to remove not less than 3 mm of the flame cut profile.

**STR1.W290.7 FORMING HOLES FOR BOLTS AND RIVETS**
1. Form holes by any of the following methods:
   a. Drilling full size;
   b. For plate less than 15 mm thick: punching 2 mm less in diameter than the required size and subsequently reaming out to the required diameter;
   c. Punching full size and meeting the following conditions:
      i. The punching operations must not in the opinion of the CM unduly distort the material;
      ii. The holes must be free from burrs which would prevent solid seating of the parts when tightened;
      iii. The thickness of the material through which the hole is punched must not exceed the diameter of the hole;
      iv. The thickness of the material must not be greater than 12 mm unless Approved;
      v. In spliced connections the holes in the mating surfaces must be punched from the same direction.
   d. Holes must not to be punched full size in any of the following conditions:
      i. In tension flanges at locations where plastic hinges have been assumed in the design analysis;
      ii. In elements of rigid connections in which local yield lines have been assumed;
      iii. Where repetition of loading makes fatigue critical in the member design.
2. Comply with clause 14.2.5 of the Code of Practice for the Structural Use of Steel 2011.

**STR1.W300.7 BUILT-UP SECTIONS**
1. Drill after the members have been assembled and tightly clamped together;
2. Where not practicable, drill the holes to a diameter at least 2 mm less than the required size and ream after assembly to the full diameter.

**STR1.W310.7 REMOVING BURRS**
Remove all burrs from holes from assembly. Parts which have been drilled to receive black bolts need not be separated to remove burrs. Parts drilled to receive HSFG bolts to be separated and the surfaces cleaned of all burrs and drilling fluid to ensure the coefficient of friction is not compromised.
STR1.W320.7 HOLES FOR BLACK BOLTS
Finished holes for black bolts must not be more than 2 mm in diameter larger than the diameter of the bolt passing through them for bolt diameters up to 24 mm, and not more than 3 mm larger than the diameter of the bolts for bolt diameters over 24 mm, unless otherwise specified or required by the design.

STR1.W330.7 HOLES FOR HIGH STRENGTH FRICITION GRIP BOLTS
Use hole sizes specified in STR1.W320 where the number of plies in the grip does not exceed three, if the number of plies exceed three, form the holes in the two outer plies as before and the diameter of the hole in the inner plies not more than 3 mm larger than that of the bolt.

STR1.W340.7 FITTED BOLTS, PINS OR RIVETS
1. Holes for rivets:
   a. All matching holes for rivets to register with each other so that a gauge 2 mm less in diameter than the diameter of hole will pass freely through the assembled members in a direction at right angles to such members;
   b. Finished holes to be more than 2 mm in diameter larger than the diameter of the rivet passing through them, for rivet diameters up to 24 mm, and not more than 3 mm greater than the diameter of the rivet for rivet diameters over 24 mm, unless otherwise specified;
   c. Holes for rivets must not be formed by a gas cutting process.
2. Holes for fitted bolts:
   a. Drill holes for fitted bolts to a diameter equal to the nominal diameter of the shank subject to a tolerance of +0.15 mm and -0 mm;
   b. Use tacking bolts or cramps on parts connected together with fitted bolts. Drill through all the thicknesses at one operation and ream to size;
   c. All holes not drilled through a thicknesses at one operation are to be drilled to a smaller size and reamed out after assembly. Where this is not practicable, drill and ream the parts separately through hard bushed steel jigs.

STR1.W350.7 SLOTTED HOLES
Drill first then ream out smooth to required size.

STR1.W360.7 PREVENT MOISTURE INGRESS
Make provision to prevent moisture ingress to sealed hollow members where these are holed for bolts.

MECHANICAL JOINTING

STR1.W410.7 SURFACE PREPARATION
Prepare and prime the contact surfaces at riveted, bolted and screwed joints. If the contact surfaces are specified to be coated or otherwise treated, e.g. machined surface finish, obtain Approval to the joint before assembly.

STR1.W420.7 USE OF HIGH STRENGTH FRICITION GRIP BOLTS
1. Clean the interface of members jointed with high strength friction grip bolts to the specified surface preparation and leave unpainted;
2. Use high strength friction grip bolts in accordance with BS 4604:Part 1:1970. Tighten the bolts and nuts by the torque-control method using a calibrated power-operated or a hand-operated torque wrench to achieve the proof loads set out below:

<table>
<thead>
<tr>
<th>Nominal size</th>
<th>Proof Load, kN (minimum shank tension)</th>
</tr>
</thead>
<tbody>
<tr>
<td>M12</td>
<td>49.4</td>
</tr>
<tr>
<td>M16</td>
<td>92.1</td>
</tr>
<tr>
<td>M20</td>
<td>144</td>
</tr>
<tr>
<td>M22</td>
<td>177</td>
</tr>
<tr>
<td>M24</td>
<td>207</td>
</tr>
<tr>
<td>M27</td>
<td>234</td>
</tr>
<tr>
<td>M30</td>
<td>286</td>
</tr>
</tbody>
</table>

3. Use tapered washers on surfaces with a slope >3°.

**STR1.W430.7  WRENCH CALIBRATION**

1. Maintain the wrench in a proper working condition in accordance with the manufacturer’s recommendations. Calibrate the wrench regularly using a calibrated bolt load meter and using a bolt from the batch of bolts to be used in the works as follows:
   a. At the commencement of each new working day or shift;
   b. With each change of bolt diameter;
   c. With each change of bolt grip length in excess of 1/5th of the length used in the calibration of the wrench in accordance with BS 4604:Part 1:1970.

2. Re-apply the wrench to bolts previously tightened in a multi-bolt connection to ensure all bolts have the correct torque;

3. Ensure that the bolt used in the calibration is, as far as is practicable, representative of bolts to be used in the works. No additional lubrication should be applied unless it is to be applied to bolts incorporated in the permanent works.

**STR1.W440.7  CALIBRATION OF BOLT LOAD METER**

The bolt load meter for measuring bolt shank tension must be calibrated by an Approved laboratory before tightening of bolts and nuts commences and at regular intervals agreed by the CM. During re-calibration, a replacement calibrated bolt load meter must be provided on the Site. Submit calibration results to the CM at least one week before the bolt load meter is used.

**STR1.W450.7  BLACK OR PRECISION BOLTED CONNECTIONS**

1. Keep all bolts, nuts and washers free from rust and dip in linseed oil immediately before connections;

2. Provide each bolt with at least one steel washer placed under the nut or bolt head, whichever element is to be rotated during the tightening operation;

3. Tighten all bolt heads and nuts against surfaces normal to the bolt axes. Use tapered washers as necessary to meet this requirement. Where bolted connections are subject to vibration provide the nuts with lock nuts or castle nuts and split pins.
**ALIGNMENT, TEMPORARY CONNECTIONS AND PERMANENT FIXINGS**

1. Do not distort holes or members during alignment;
2. Do not enlarge holes without prior Approval;
3. Drifts used during the fabrication or erection of the steelwork must be of such shape and dimensions as to locate the work accurately. Drifts must not cause any damage to or deformation of the component parts, nor alter in any way the sizes of the holes provided for the permanent bolts;
4. Temporary bolts used for the initial or trial assembly of any part of the steelwork must have the same hole clearances as the permanent bolts;
5. Tighten all bolts securely in the finished work so that the length of each bolt after tightening projects at least one thread beyond the other face of the secured nut.

**BOLTED CONNECTIONS WITH PROVISION FOR SLIDING**

Provide slotted hole through one member and a round hole in the other. Connect with shouldered bolts, spring washers, flat washers, castle nuts and splits pins. Form round holes with a diameter less than the width of the slot and place the shoulder of the bolt against the faying surface of the unslotted member enabling the bolt to be tightened on this member. Locate the spring washer under the head of the bolt and the flat washer under the castle nut.

**WELDING**

**GENERAL**

1. Prior to fabrication of bridgework carry out welding and flame cutting trials using representative samples of materials to be used in the work in accordance with BS 5400:Part 6:1980;
2. Provide an experienced and competent operative to supervise welding. Submit evidence that all welders are capable in accordance with STR1.T080;
3. When directed by the CM, keep a site record that identifies the welders responsible for major welds.

**USE OF WELDING EQUIPMENT AND ACCESSORIES**

1. Use welding plant, equipment and accessories that comply with the requirements of BS 638;
2. Use individual transformers or motor generator that are fitted with a current density control and situated close to the welder so that he may adjust the current;
3. Store and use welding consumables in accordance with BS EN 1011-1:2009, BS EN ISO 2560:2009 and the manufacturers recommendations;
4. Store electrodes in dry conditions and where necessary keep in heated quivers while in use;
5. Use covered electrodes to BS EN ISO 2560:2009;
6. Regularly calibrate, using an ammeter, the transformers or motor generators to ensure that current is kept within the range specified by the manufacturers for electrodes;
7. Do not open packets except for sampling or when electrodes are to be used;
8. Reject electrodes with broken, damp or damaged coatings.
PREPARATION FOR WELDING

1. Submit in writing, for Approval, details of proposed welding procedure for each type of welded connection in accordance with STR1.T100;

2. Keep the surfaces to be welded free from all scale, grease, paint, rust and other matter. Prepare all parts to be welded in a manner that ensures a close fit;

3. Prepare fusion surfaces to BS EN 1011-1:2009. Dry surfaces and warm as necessary, to remove any condensation.

ADDITIONAL REQUIREMENTS FOR SITE WELDING

1. Surfaces to be welded must be clean, free from paint, grease, contaminants dry and free from condensation. Where the steel is damp or the temperature is low then warming with a low temperature flame may be used. Thermal indicating crayons may be used to determine the plate temperature and the area pre-heated;

2. Protection from the weather: provide adequate protection to shield the welding from the weather. Tent type structures made from fireproof and waterproof material may be used to shield the weldment from the wind and rain. Such temporary structures to be mounted on stable scaffolding supports, and a stable platform to be provided for the welder. Where welding to hollow sections is required ensure draughts are prevented from blowing through the section;

3. Electrodes: bake on site at a temperature between 100°C and 150°C and where necessary store in heated quivers for use at the welders convenience;

4. Power supply: may be from a transformer or generator to provide a three phase power supply of the required voltage. Locate the generator or transformer as close as possible to the welder to prevent a drop in voltage along the cables length. Ensure all the cables are as short as possible, routed away from the path of construction vehicles, and adequately protected;

5. Earth run: adequately earth all electrical plant. Ensure the welding return from the weldment is adequate in cross section and correctly connected and earthed;

6. Weld detail: ensure the welded joint is of the correct profile and fit up. As a general guide do not carry out welding where the gap is less than 1 mm or more than 3 mm unless a backing strip is provided. Where a backing strip is provided the weld gap is not to exceed the greater of 5 mm or the thickness of the material being welded. Adequately support all welded joints with props or restraints that ensure relative movement of the fusion faces is prevented;

7. Work in confined spaces: provide adequate ventilation and formulate plans of evacuation and escape before the work commences.

METHOD OF WELDING

1. Carry out welding in accordance with the requirements of BS EN 1011-1:2009. Manual metal-arc weld unless otherwise specified;

2. Execute welding in a flat or horizontal position wherever possible. Do not weld overhead without Approval;

3. Ensure electrodes used in conjunction with fluxes give a weld deposit having mechanical properties at least equal to the minimum specified for the parent metal. Use electrodes and fluxes strictly in accordance with the manufacturer's recommendations.

REMOVAL OF SLAG

Remove welding slag by chipping before depositing subsequent runs, and thoroughly wire brush the surfaces.
STR.W570.7 **TACK WELDS**

Do not use tack welding unless Approved. Tack welds to be minimum 50 mm long. Form location welds, where Approved, of the same quality and size as the first run of the main weld which when completed, fuse completely with the ends of the location welds and form a reasonably regular finished profile. Do not weld temporary attachments to principle joints. Obtain Approval of the position of welds for temporary attachments.

STR.W580.7 **WELD DEFECTS**

1. Welds will be rejected if they do not meet the acceptance criteria of welds stipulated in clause 14.3.6.7 of the Code of Practice for the Structural Use of Steel 2011;
2. Take particular care when welding hollow sections, plates and angles to avoid distortion by using correct sequences and speeds.

STR.W590.7 **FILLET WELDS**

Deposit fillet welds to the required length, throat thicknesses and with partial or full penetration as specified.

STR.W600.7 **BUTT WELDS**

1. Form butt welds as full penetration welds between prepared fusion faces, unless otherwise directed;
2. Carry out back chipping, grinding or gouging of the deposited weld as required to obviate imperfections in the root run such that the root edges or root faces are not out of alignment by more that 1/8 of the thickness of the thinner material for material up to 12 mm thick or by more than 1.5 mm for thicker material;
3. Grind butt welds flush without loss of parent metal;
4. In the fabrication of built-up assemblies ensure, all butt welds in each component are completed, wherever possible, before the final assembly.

STR.W610.7 **STUD SHEAR CONNECTORS**

Weld stud shear connectors by automatic stud welding gun strictly in accordance with the manufacturer's recommendations unless specified otherwise.

**ERECTION OF STEELWORK**

STR.W710.7 **ERECTION**

1. Carry out all erection to:
   a. The Code of Practice for the Structural Use of Steel 2011 for hot rolled sections and cold formed sections in building;
2. Conform with the requirements for accuracy of construction in respect of levels, dimensions and alignment given in the above Code of Practice and British Standard and those contained in the "Schedule of Tolerances" in Appendix H to this Specification.

STR.W720.7 **ERECTORS**

Carry out all work employing trained and experienced erectors. Provide evidence of the erector's competence when directed by the CM.
STR1.W730.7 SAFETY
Comply with the relevant regulations on safety including the 'Factories and Industrial Undertakings Ordinance', the recommendations of BS 5531:1988 as applicable and:

1. Use only recently tested equipment for lifting and remove from site any damaged equipment;
2. Do not carry out complex operations at a height except from safe platforms large enough to take operators and equipment. Maintain platforms and safe access until work has been accepted and any added protection completed.

STR1.W740.7 STABILITY
Ensure stability of structure at all stages of construction.

STR1.W750.7 SEQUENCE OF OPERATIONS
Prepare and submit details of the proposed method of erection for the CM's consent. Details submitted must include type of plant and equipment to be used and if necessary drawings and calculations of any temporary work. The giving of consent by the CM will not in any way relieve the Contractor of his responsibility for safe erection of permanent work or the safe erection and subsequent dismantling of temporary work.

STR1.W760.7 PLANT AND EQUIPMENT
Do not employ any plant or equipment which is, or in the CM's opinion likely to be, unsuitable, unsafe, or likely to cause damage to the structure during erection or damage to existing buildings etc.

STR1.W770.7 PREVENTION OF DISTORTION
Do not distort steelwork or exceed the stresses specified in the Code of Practice for the Structural Use of Steel 2011 or BS 5400:Part 3:1982 for bridgework during erection.

STR1.W780.7 APPROVED SEQUENCE
Erect structural steel according to the sequence agreed with the CM.

STR1.W790.7 FALSEWORK
When specified, design, construct and dismantle falsework to BS 5975:1982. Supply all staging and all labour, tools, erection plant, lifts, services, nuts and washers and other necessary materials. Provide temporary bracings and guys to ensure adequate resistance to wind and stability against collapse during construction.

1. Submit records of inspection of the completed formwork and falsework to the CM for information before carrying out any further works that may affect the stability of the formwork and falsework. Such records are to be certified by a contractor's superintendent holding qualification equivalent to TCP Grade T4 in civil or structural engineering discipline;
2. Monitor falsework levels and make any necessary adjustments for settlement, or other deflection or movements.

STR1.W800.7 SETTING OUT, LEVELLING AND LOCATION
Set out, level and position:

1. Using steel tapes or bands for setting out that are calibrated at 20°C and used at the correct tension;
2. To a level that is levelled to a datum point and aligned to a base line during erection. Agree both datum point and setting out lines before commencement;
3. That ensures all steelwork is accurately and securely located to the correct profile and camber, if any, before assembly;
4. That ensures the structural steelwork is not subjected to stresses in excess of those for which it was designed.

**STR1.W810.7 ERECTION OF STEELWORK**

1. Do not erect fabricated steelwork until all welded joints and specified protective coatings have been inspected, tested where required, and Approved;
2. Align structural members accurately to the specified tolerances and obtain Approval before any permanent welding or tightening of bolts is carried out;
3. Do not bed stanchion bases or grout anchor bolts until the steelwork has been plumbed, levelled, aligned and Approved.

**STR1.W820.7 STEELWORK BY SUB-CONTRACTOR**

1. Take responsibility for checking all the work prepared by others that may be incorporated into the work or the dimensions of any structure affecting steel erection. As a result of the check report any discrepancies or shortfalls to the CM immediately;
2. Ensure that the Sub-Contractor supplies any items required to be cast into concrete. Cast in such items using templates provided by the Sub-Contractor where these are necessary.

**CLEANING, SURFACE PREPARATION AND PROTECTION (POST FABRICATION)**

**STR1.W910.7 CLEANING AND COATING IN THE SUPPLIERS WORKSHOP**

Ensure that the supplier provides sufficient covered and enclosed workshop space to enable blast cleaning, priming coat and undercoat painting to be carried out in close sequence. The blast cleaning section of the workshop must be fitted with extractors and filters to prevent and deposition of dust on metal surfaces to be painted.

**STR1.W920.7 CLEANING SURFACES OF BARE METAL**

Thoroughly clean down to remove all dirt, grease and the like, using a suitable solvent and thoroughly chip, scrape, wire-brush flame clean or grit blast to remove all loose scale back to clean metal.

**STR1.W930.7 CONTAMINATED SURFACES**

1. Weld spatter: clean of all surfaces, keep paint films free of embedded foreign metallic particles;
2. Concrete deposits etc: wash or clean off immediately they occur and if necessary make the surfaces good to the satisfaction of the CM;
3. Oil or grease: clean with white spirit.

**STR1.W940.7 PAINTED AND OTHER COATED SURFACES**

Unless otherwise directed by the CM clean the final workshop applied coating to the external surfaces on site by:
1. Washing with a solution of an Approved liquid detergent followed by rinsing with clean fresh water and allowed to dry thoroughly before overcoating;
2. Thoroughly cleaning rivet heads, bolts heads and the surfaces surrounding them;
3. Removing all loose particles, dust and debris immediately prior to application of paint.

STR1.W950.7 ATMOSPHERIC CORROSION

Do not apply protective coating to surfaces bearing atmospheric corrosion products or other chemicals which may be harmful to the coating or succeeding coating. Clean off these contaminants, which may include any remaining after surface preparation as specified in this Worksection and any produced by welding, to an Approved extent that is compatible with the specified protective system.

STR1.W960.7 BLAST CLEANING

1. Carry out blast cleaning in accordance with BS 7079:Part A1:1989 (1994) and that produces surface qualities as follows:
   a. For surfaces to be galvanized to 140 microns: Sa 2 (prior to pickling).
      Note: Surfaces to be galvanized to 85 microns do not require blast cleaning;
   b. For surfaces to be metal sprayed: as specified in BS EN ISO 2063:2005;
   c. For surfaces to be painted: Sa 2½.
2. Non-metallic abrasive should be free from contamination and recovered material is to be cleaned to the satisfaction of the CM before re-use;
3. Do not exceed a maximum amplitude (peak to trough) of the blast-cleaned surface of 0.1 mm;
4. Clean blasted surfaces by brush or vacuum. Do not touch by hand. Do not contaminate in any other way;
5. Apply protective coating within 4 hours of blast cleaning;
6. Before commencing any follow on operations submit, for Approval, a sample blast cleaned steel panel measuring not less than 150 mm x 150 mm x 6 mm thick adequately protected by sealed clean polythene wrapping. The Approved sample will be retained by the CM for comparison with the prepared steelwork.

STR1.W970.7 MECHANICAL CLEANING

Carry out mechanical cleaning to surface quality designation St 2 of BS 7079:Part A1:1989 (1994) by power driven tools, such as carborundum grinding discs, chipping hammers and needle guns, followed by steel-wire brushing and dusting to remove all loosened material. Avoid excessive brushing of the metal through prolonged application to rotary wire brushes. Protect surfaces within 48 hours of mechanical cleaning.

STR1.W980.7 PICKLING

Carry out pickling of steel by the "Footner" process as specified in BS 5493:1977. Apply the first priming coat of paint as soon as the steel has dried and is still warm.

STR1.W990.7 FLAME CLEANING

Plan and control the sequence of operations for flame cleaning steelwork to avoid the risk of distortion and buckling. Clean the flame cleaned surfaces of all loosened material. Apply priming coat while the steel is still warm. Control the heat input so that no harmful distortion of the steelwork occurs.

STR1.W1000.7 NEW GALVANIZED SURFACES

Thoroughly clean to remove all dirt, oil and grease and pre-treat with either an etching primer or Approved etching compound.
PREVIOUSLY PAINTED GALVANIZED SURFACES

Thoroughly degrease previously painted galvanized surfaces. Where corrosion has spread under the paint film, remove old paint with an organic solvent type paint remover.

CLEANED OR COATED MEMBERS

1. Ensure that, unless specified otherwise, exposure times for blast cleaned, wire brushed or coated surfaces (other than at joints) are not longer than those given in the following table:

<table>
<thead>
<tr>
<th>Surface</th>
<th>Enclosed Workshop</th>
<th>Outside</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Blast cleaned</td>
<td>4 hours</td>
<td>Nil</td>
</tr>
<tr>
<td>b. Metal Sprayed</td>
<td>4 hours</td>
<td>Nil</td>
</tr>
<tr>
<td>c. Mechanically Cleaned</td>
<td>48 hours</td>
<td>Nil</td>
</tr>
<tr>
<td>d. Blast Primer on ‘a’</td>
<td>Maximum exposure of 8 weeks with up to 2 weeks of this time outside</td>
<td>Nil</td>
</tr>
<tr>
<td>e. Etch primer on ‘b’</td>
<td>24 hours</td>
<td>Nil</td>
</tr>
<tr>
<td>f. Primer on ‘c’</td>
<td>48 hours</td>
<td>Nil</td>
</tr>
<tr>
<td>g. 1st Undercoat on ‘d’, ‘e’ or ‘f’</td>
<td>48 hours</td>
<td>Nil</td>
</tr>
<tr>
<td>h. Subsequent Undercoats</td>
<td>As agreed by the CM</td>
<td></td>
</tr>
</tbody>
</table>

Note: 'Outside' refers to any area outside a fully enclosed workshop.

2. The tabulated exposure times refer to any part of the surface being blast or mechanically cleaned, metal sprayed or painted;

3. For surface condition 'd' where blast primed steelwork is exposed outside, the minimum dry paint film thickness over the peaks of the blast cleaned steel must not be less than 13 microns;

4. Zinc rich coated steelwork may only be exposed outside for the minimum period to allow movement at the fabricator's works. Such movement to be under the supervision of the CM or his representative and unless the weather conditions are favourable the sections are to be covered;

5. Where it is necessary to overcoat two pack paints of the epoxide or polyurethane type, re-coat within 48 hours of application. Where it is not possible to overcoat within this time the paint film to be abraded to produce a roughened surface, given a flash coat of suitable primer, and allowed to dry for at least 4 hours before application of the next coat of the system;

6. No steelwork to be loaded for transport until the paint system has been Approved as being sufficiently dry for handling;

7. Keep steelwork to be site painted clean and dry. Where necessary provide temporary shelters to simulate, as far as is practicable, workshops conditions.

APPLICATION OF METAL COATINGS

HOT DIP GALVANIZING

1. To BS EN ISO 1461:2009: minimum mean coating thickness of 45 microns to 85 microns depending on thickness of steel sections as stipulated in Table 3 of BS EN ISO 1461:2009, unless otherwise specified;

2. Apply metal coatings to BS EN ISO 1461:2009 only to components of a tensile strength up to and including that of general grade high strength friction grip bolts unless otherwise specified;
3. Make good small areas of galvanized coating damaged by welding, cutting or by rough treatment during transit or erection either by the use of low melting point zinc alloy repair rods, powders made specifically for this purpose, or by the use of at least two coats of zinc rich paint to BS 4652:1995. Apply sufficient material to provide a zinc coating at least equal in thickness to the galvanized coating.

STR1.W1120.7 SPRADED METAL COATING
To BS EN ISO 2063:2005. The nominal thickness of coating to be 100 microns. Apply one flood coat of polyurethane (or similar approved) sealer immediately after spraying.

STR1.W1130.7 ELECTROPLATING
1. To BS 3382:Parts 1 and 2:1961;
2. Coating thickness: 5 microns minimum.

STR1.W1140.7 CHROMIUM PLATING
To BS 4641:1986 (1996). Ensure that the protection offered is at least the same as that provided for the adjacent main structural steel element.

STR1.W1150.7 METAL COATING ON PART ONLY OF ASSEMBLED SECTION
Apply the metal coating before the remainder receives its priming coat.

STR1.W1160.7 PROTECTION OF HSFG BOLTED JOINTS
1. Zinc or aluminium sprayed steelwork: where the metal spray is carried over the interfaces of the HSFG bolted joints, take the etch primer on the parent metal between 10 mm and 20 mm inside the perimeter of the joint area. The outer surfaces and edges of the joint material may also be given a coat of the same primer in order to reduce surface preparation required after the joint has been made;
2. Painted steelwork: where metal spray is specified only at the interfaces of HSFG bolted joints, carry the metal spray between 10 mm and 20 mm outside the perimeter of the joint area and the blast primer taken between 10 mm and 20 mm inside the perimeter. If the outer surfaces and edges of the joint materials are metal sprayed, these may be given a coat of the same primer in order to reduce subsequent surface preparation;
3. Painted steelwork: where the interfaces of HSFG bolted joints are bare steel, take the blast primer between 10 mm and 20 mm inside the perimeter of the joint area. The outer edges and surfaces of the joint material may also be given a coat of blast primer in order to reduce subsequent surfaces preparation.

STR1.W1170.7 PROTECTION OF OTHER BOLTED JOINTS
1. Shop joints: apply metal spray plus etch primer or blast primer alone to parent and joint material. Assemble the joint immediately after the first undercoat of the parent system has been applied to the contact surfaces;
2. Site joints: apply to all surfaces, excepting those of fasteners, the same painting system in the shop as is to be applied to the parent metal surfaces, unless otherwise specified.

STR1.W1180.7 PROTECTION OF NON-BOLTED JOINTS
1. Riveted joints: shop and site joints: apply metal spray plus etch primer or blast primer alone, to parent and joint material. Assemble the joint immediately after the first undercoat of the parent system has been applied to the contact surfaces;
2. Welded joints: unless otherwise specified, treat welds and surfaces which have been affected by welding with the protective system which is applied to the parent surfaces.

STR1.W1190.7 SURFACES ADJACENT TO TREATED JOINTS
1. Keep metal spray at least 15 mm clear of areas to be welded and mask off these areas during spraying;
2. Where paints other than blast primers are to be applied to the parent surfaces before the making of a joint they must be stepped back at 30 mm intervals commencing at 80 mm from welded joints and at 10 mm from the perimeter of all other joints.

STR1.W1200.7 PAINTING AND SEALING OF JOINTS
1. As soon as possible after joints have been Approved, paint the parent and joint material, exposed parts of bolts, nuts and washers, weld and affected areas to bring them up to the same state of preparation and painting as the adjoining surfaces;
2. Seal all bolted joints against the ingress of water. Before painting commences and, subject to Approval, plug gaps at joints with an Approved filler. Seal the perimeter of all joints with subsequent coats of paint.

STR1.W1210.7 APPLICATION OF PAINT
1. Types of paint and painting generally to be as specified at STR1.W1220 and STR1.W1230 as appropriate for application to steelwork;
2. Only apply to surfaces which have been prepared and cleaned in accordance with this Worksection;
3. Do not apply in the following conditions:
   a. When the ambient temperature falls below 4°C or the relative humidity rises above 90%;
   b. For external works: during period of inclement weather, e.g. rain, fog or mist or when condensation has occurred or is likely to occur on steel;
   c. When the surface temperature of the metal to be painted is less than 3°C above the dew point of the ambient air;
   d. When, in the opinion of the CM, the amount of dust in the atmosphere and/or on the surface of the material is such that the application of the paint would be unsatisfactory;
   e. For two pack paints of the epoxide resin type: when the temperate is below 5°C or as recommended by the paint manufacturer, nor when the temperature is likely to fall below the specified minimum during the curing period.

STR1.W1220.7 PAINTING STEELWORK
Apply the appropriate paint system as detailed in the following table at the locations as specified in the Project Specific Specification.

<table>
<thead>
<tr>
<th>System A:</th>
<th>- primer :</th>
<th>1 coat of high build zinc phosphate paint;</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- undercoat :</td>
<td>2 coats of oil based with micaceous iron oxide phenolic paint;</td>
</tr>
<tr>
<td></td>
<td>- finish :</td>
<td>1 coat of alkyd resin paint;</td>
</tr>
<tr>
<td></td>
<td>- minimum total DFT :</td>
<td>250 microns</td>
</tr>
</tbody>
</table>
### System B:
- ** primer:** 1 coat of epoxy resin with aluminium mastic paint;
- ** undercoat:** 1 coat of epoxy resin paint;
- ** finish:** 1 coat of epoxy resin paint;
- ** minimum total DFT:** 280 microns

### System C:
- ** primer:** 1 coat of inorganic zinc silicate paint, DFT 75 microns;
- ** undercoat:** 2 coats of high build micaceous iron oxide epoxy paint;
- ** finish:** 1 coat of high build amine adduct cure epoxy paint;
- ** minimum total DFT:** 320 microns

### System D:
- ** primer:** 1 coat of two pack wash primer, DFT 5 microns;
- ** undercoat:** 1 coat of epoxy resin paint;
- ** finish:** 1 coat of epoxy resin paint or 2 coats of polyurethane paint;
- ** minimum total DFT:** 180 microns

### System E:
- ** Inhibitor:** ‘Rustoleum’ or other rust inhibitor paint approved by the CM;
- ** primer:** Zinc phosphate or, for hot-dip galvanized or GI surface, ‘T’ wash as specified in BS 5493:1977, Section 2, Clause 11.3.2;
- ** undercoat:** 2 coats of micaceous iron oxide paint;
- ** finish:** 1 coat of oil based paint or 1 coat of micaceous iron oxide paint;
- ** DFT of each coat:** as recommended by the manufacturer.

#### Notes:
1. The different types of paints within each painting system to be compatible with each other and manufactured by the same manufacturer. Successive coats in a painting system, including stripe coats, to be in contrasting colours to aid identification;
2. DFT is the dry film thickness.

### STR1.W1230.7 PAINT FOR STEELWORK PROTECTION SYSTEMS
1. In accordance with BS 5493:1977, Section 2, Table 4 unless specified otherwise. Organic zinc-rich paint to comply with BS 4652:1995. Do not use lead-based paint for finishing coats;
2. To be supplied in sealed containers of not more than 5 litres capacity. Each container shall show the following information:
   a. The name of the manufacturer;
   b. The paint manufacturer's reference number;
   c. Intended purposes, type of pigment and binder;
   d. Batch number, date of manufacture, expiry date and pot life; and
e. Colour, gloss, drying times and flash point.
3. To be in compliance with the prescribed limits of VOC content as set out in the Air Pollution Control (Volatile Organic Compounds) Regulation;
4. Submit written confirmation from paints suppliers and manufacturers for the following:
   a. The VOC contents of the proposed paints are complied with the Air Pollution Control (Volatile Organic Compounds) Regulation;
   b. The types of regulated paints that the proposed paints belong; and
   c. The VOC contents of the proposed paints.

**ACCURACY AND TOLERANCES**

**STR1.W1310.7 GENERAL**

Refer to Chapter 15 of the Code of Practice for the Structural Use of Steel 2011 and Appendix H, "Schedule of Tolerances" to this Specification.

**OFF-SITE FABRICATION**

**STR1.W1410.7 SUBMISSIONS**

Where structural steelwork is to be fabricated off-site, submit the following items for Approval within a period from the notified date for commencement of Works as specified in the Project Specific Specification:

1. The name, fabrication yard address with street maps and job reference of the fabricator and the followings:
   a. A quality assurance (QA) scheme and testing regime on fabrication of the structural steelwork with the items as stipulated in STR1.W1420; and
   b. A fabrication and delivery schedule.
2. An RSE appointed by the Contractor/fabrication yard who shall carry out the duties as stipulated in STR1.W1430;
3. A laboratory for carrying out the tests and issuing test certificates in the QA scheme (except for those tests specified in STR1.T520 (2)), which shall be accredited either by Hong Kong Accreditation Scheme (HKAS) under the Hong Kong Laboratory Accreditation Scheme (HOKLAS), or an equivalent organization which has signed a mutual recognition agreement with HOKLAS.

**STR1.W1415.7 SUBMISSIONS FOR MINOR STEEL STRUCTURES FABRICATED OFF-SITE**

1. Prior to fabrication, submit for Approval proposal of a laboratory for carrying out tests and issuing test certificates for minor steel structures excepting the following tests:
   a. Tests specified in STR1.T520 (2);
   b. Tests concerned are not applicable to minor steel structure as stated in STR1.G040 (2).
2. The laboratory proposed in sub-clause (1) above shall be accredited either by Hong Kong Accreditation Service (HKAS) under the Hong Kong Laboratory Accreditation Scheme (HOKLAS), or an equivalent organization which has signed a mutual recognition agreement with HKAS.
STR1.W1420.7 QUALITY ASSURANCE (QA) SCHEME

Ensure that the steelwork is fabricated under a quality assurance scheme which covers the following items and is certified under ISO 9001:

1. Organisation chart of the fabrication yard with the qualification and experience of key technical personnel clearly stated;
2. Responsibility of the management in respect of the fabrication process;
3. Material purchasing and delivery procedures;
4. Material/product identification, traceability process and control;
5. Fabrication and inspection process;
6. Designated welders who shall be tested to and comply with the requirements of this Specification;
7. Quality control testing regime including welding procedural test;
8. Control on non-conforming materials and works;
9. Transportation and storage process.

STR1.W1430.7 REGISTERED STRUCTURAL ENGINEER

1. Appoint an Registered Structural Engineer (RSE) registered under Buildings Department for ensuring and certifying the fabrication works are in compliance with the drawings and Specification;
2. The duties and roles of the RSE include but not limited to:
   a. Pay regular site visits for proper control of the works and submit reports after each visit;
   b. Carry out inspection on all activities which, in his professional judgement, are critical and require close supervision;
3. The frequency of RSE's visits shall be a minimum of two visits per month.
TESTING

GENERAL REQUIREMENTS

STR1.T010.7 GENERAL
Allow sufficient time in the Works programme for the testing specified below. Do not incorporate materials until relevant tests have been carried out and Approval obtained.

STR1.T020.7 TESTING BY MANUFACTURER
Carry out inspection and testing on BS EN 10025:2004 products by cast and documentation supplied in accordance with Euronorm 21. Specific testing and documentation to include chemical analysis; tensile tests and impact tests.

STR1.T030.7 TESTING OF BOLTS, NUTS AND WASHERS
1. Testing arrangement:
   Provide test specimens and carry out testing of bolts and associated nuts and washers in accordance with the relevant BS in an Approved Laboratory employed and paid for directly by the Contractor, when so directed by the CM;
2. Testing samples:
   Rate of sampling to be one bolt per identifiable batch or 1% whichever is the lesser unless otherwise specified.

STR1.T040.7 TEST CERTIFICATES
Submission requirements:
1. Submit a manufacturer's certificate of tests in accordance with the appropriate standard for each steel batch relating to steel to be used in the works. Documentation to include chemical analysis impact test and tensile test.

STR1.T050.7 TESTING OF SECTIONS
Testing samples:
1. Provide specimens for testing which shall be in accordance with the requirements stipulated in the Code of Practice for the Structural Use of Steel 2011. In addition, provide further specimens for testing when otherwise stated in the Project Specific Specification or as Instructed. For minor steel structures, further test specimens for Class 1 Steel are not required. Test specimens to be taken from sections selected at random on Site by the CM;
2. Prepare the test specimens to BS EN 10025:2004 or BS EN 10210:2006 as directed and appropriately mark and deliver them to a Direct Testing Contractor employed and paid direct by the Authority for testing. Testing and documentation to include tensile tests and impact tests;
3. For steel sections used for construction of hoardings and associated covered walkways and gantries, the frequency of sampling stated in the sub-clauses (1) above may be reduced at the discretion of the CM.

STR1.T060.7 FAILURE OF TESTS
Non-compliance:
1. If any test specimens do not comply with the relevant BS, the CM may require further tests at the Contractor's expense or reject the whole or part of the particular consignment, which must be removed from Site forthwith.

STR1.T070.7 ULTRASONIC TESTING
When plates are subjected to through thickness tension by virtue of the type of connection, test quality grade steel plates and flats which may, as a result of welding be subject to lamellar tearing, using ultrasonic testing using equipment as described in Section 2 of BS 5996:1993 and, unless otherwise specified or agreed, be of quality LC3 as defined in Section 3 of that document.

STR1.T080.7 ABILITY OF WELDERS
1. All welders must be capable of passing the training tests to BS 1295:1987;
2. Where specified, carry out approval testing of welders by either one of the following:
   a. For welds where welding procedure approval is required to BS EN ISO 15614-1:2004: carry out approval testing of welders to BS EN 287: Part 1:2004 for steel and stainless steel and to BS EN 287:Part 2:1992 for aluminium as appropriate;
3. Submit evidence to show that all welders satisfy the requirements as stated in sub-clause (1) above.

STR1.T090.7 PARTICULARS OF INSPECTING AUTHORITY
Submit to the CM the name of the proposed inspecting authority endorsing welder certificates and records of approval tests for welding procedures. The proposed inspecting authority must be accredited by the Hong Kong Accreditation Service (HKAS) under the Hong Kong Inspection Body Accreditation Scheme (HKIAS) for welding inspection or by other accreditation bodies which have reached mutual recognition agreement for inspection body accreditation with HKAS. The name to be submitted at least 3 weeks before approval tests start or, if approval tests are not required, at the same time as the welder certificates are submitted.

STR1.T100.7 STANDARD OF WELD PROCEDURE TESTING
Testing arrangement:
1. Unless acceptable documentation relating to the welding of similar connections is available, carry out approval testing of each welding procedure in accordance with BS EN ISO 15614-1:2004 for steel and BS EN ISO 15614-2:2005 for aluminium.

STR1.T110.7 ADDITIONAL DESTRUCTIVE WELD TESTS AS SELECTED BY THE CM
Testing arrangement:
1. Prepare specimen welds and subject to one or more of the following tests as required:
   a. Butt welds:
      i. Transverse tensile test to BS EN 895:1995;
      ii. Transverse bend tests to BS EN 910:1996 or BS 709:1983 as appropriate with the root of the weld in tension and compression respectively;
      iii. Side bend tests to BS EN 910:1996 or BS 709:1983 as appropriate;
iv. Macro-examinations to BS 709:1983 or BS EN 1321:1997 as appropriate.

b. Fillet welds:
   i. Fracture tests to BS 709:1983;
   ii. Macro-examinations to BS 709:1983 or BS EN 1321:1997 as appropriate.

c. For destructive weld test, comply with the same hold time as stipulated in clause 14.3.6.4 of the Code of Practice for the Structural Use of Steel 2011;

d. If any test specimens do not comply with the relevant BS, the CM may require further tests at the Contractor's expense or reject the whole or part of the particular consignment, which must be removed from Site forthwith.

2. Strictly follow the procedures of welding established in the successful Approval test for the Works. Carry out further Approval tests if either the material or procedure changes.

STR1.T120.7 ADDITIONAL NON-DESTRUCTIVE TESTING OF STEEL, STAINLESS STEEL AND ALUMINIUM

1. Testing arrangement:
   a. Arrange for a percentage of each welder work to be selected by the CM and subjected to non-destructive testing as follows:
      i. Visual inspection in accordance with BS EN 970:1997;
      ii. Ultrasonic in accordance with BS EN 1714:1998; or magnetic particle inspection in accordance with BS EN 1290:1998. (Not for stainless steel and aluminium);
      iii. The scope and frequency of test shall be in accordance with clause 14.3.6.1 of the Code of Practice for the Structural Use of Steel 2011;
      iv. For welds on steelworks of hoardings and associated covered walkways and gantries, the percentages of tests stated in the sub-clause (1)(a)(iii) above may be reduced at the discretion of the CM.
   b. Comply with clause 14.3.6.4 of the Code of Practice for the Structural Use of Steel 2011 for hold time before final non-destructive testing.

2. Non-compliance:
   Where any weld is judged to be unsatisfactory by the CM, a further 10% of that welder's work is to be tested. If further defects are found, then all weld in the group should be tested by the same method.

STR1.T130.7 ACCEPTANCE CRITERIA

Non-compliance:

1. Welds on steel will be rejected if they do not meet the acceptance criteria for welds stipulated in clause 14.3.6.7 of the Code of Practice for the Structural Use of Steel 2011;

2. Welds on aluminium will be rejected if they do not meet the acceptance level for welds stated in BS 8118:Part 2:1991.

STR1.T140.7 WELD REPAIR

Cut out and repair all defective welds in accordance with the Code of Practice for the Structural Use of Steel 2011 for steel or BS 8118:Part 2:1991 for aluminium.
**ENGAGEMENT OF SPECIALIST TESTING CONTRACTOR (FOR FABRICATION ON SITE)**

1. Carry out tests required to satisfy the requirements of BS 4872, BS EN 287-1:2004 and BS EN ISO 15614-1:2004 by an Approved Laboratory employed and paid for directly by the Contractor;

2. Provide samples required by the CM (STR1.T050, STR1.T110, STR1.T120 and STR1.T140) for tests by a Direct Testing Contractor employed and paid for directly by the Authority.

**TESTING OF PAINTS**

**SAMPLING AND TESTING**

Permit authorized sampling of materials on site. Set aside unopened sealed containers of materials for testing when directed by the CM.

**PAINT SAMPLES**

Testing samples:

**TESTING PAINTS**

Testing method:

1. Carry out the following tests on each sample as directed by the CM in STR1.T240:

<table>
<thead>
<tr>
<th>Standard/Part</th>
<th>Test Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>BS 3900: Part C2:1994</td>
<td>Surface drying test</td>
</tr>
<tr>
<td>BS 3900: Part C3:1990</td>
<td>Through dry test</td>
</tr>
<tr>
<td>BS 3900: Part E1:1970</td>
<td>Bend test</td>
</tr>
<tr>
<td>BS 3900: Part E2:1992</td>
<td>Scratch test</td>
</tr>
<tr>
<td>BS 3900: Part F8:1993</td>
<td>Resistance to humid atmospheres containing sulphur dioxides</td>
</tr>
</tbody>
</table>

**TESTING LABORATORY**

Submission requirements and testing arrangement:

1. Test certificates to be submitted to the CM before painting starts;

2. Where manufacturer's test certificates are available these may be accepted in lieu of a retest at the CM's discretion;

3. Tests for paints in STR1.T230 to be carried out by an Approved Laboratory employed and paid for directly by the Contractor.

**GLOSS FINISH**

Prepare a sample panel to indicate the standard of gloss finish and obtain Approval. Ensure application matches agreed sample.
SPACE FRAMES - WARRANTIES AND TESTING

STR1.T310.7 SUITABILITY WARRANTY
If required, submit a warranty as specified in the Project Specific Specification.

STR1.T340.7 TESTING OF SECTIONS
Testing arrangement:
1. Undertake testing of steel and aluminium sections as clauses STR1.T010, STR1.T030, STR1.T050 and STR1.T060 except as specified at sub-clause (2) below;
2. Provide at least two full length samples for every aluminium section of same thickness to be used in the Works for testing to BS EN 10002-1:2001, as appropriate.

STR1.T350.7 WELDING TESTS
1. Testing of welds for steel and aluminium will be required;
2. Clauses STR1.T080 to STR1.T140 apply equally to welding of aluminium.

STR1.T360.7 PROOF LOAD TESTING
1. If in the opinion of the CM the relevant British Standards are not appropriate for the welding configuration proposed, the CM may order not more than 10% of the welded components for proof load tests at the Contractor's expense;
2. Provide suitable equipment to carry out proof load tests on welded components. Apply a tensile load uniaxially in opposite directions of a magnitude equal to the resultant of the worst combination of factored design loads multiplied by a factor of 1.3. and on removal of the test load, the deflection shall be reduced by at least 20%;
3. The weld shall be deemed to comply the requirements of this Specification when under the proof load test the weld shall exhibit no sign of crack. If any one test of a group of welded components fails to meet this Specification, then 2 additional welded components for the same group are to be subject to proof load tests. If any of these two further welded components continue to fail the test, then each welded component of the group is to be subject to proof load tests. Any cracks identified in any stage of the test are to be repaired and retested until they all satisfy the requirements;
4. A group of welded components is defined as the welds done by the particular welder within a specified period of time as decided by the CM.

STR1.T370.7 NODAL JOINTS OF SPACE FRAMES
Testing samples:
1. Provide one test specimen for every 100 or part thereof of each type of nodal joint for tensile test. The test load shall be a tensile load applied uniaxially in opposite directions of a magnitude equal to the resultant of the worst combination of factored design loads of the possible heaviest connecting member multiplied by a factor of safety of 1.3 acting on the nodal joints.

STR1.T380.7 ACCEPTANCE CRITERIA FOR NODAL JOINT TESTS
The test specimen in STR1.T370 is deemed to comply with the requirement of this Specification under the test loading if there is no sign of crack, no deformation at thread, buckling or rupture of any part of the nodal joint. On removal of the test load the deflection should reduce by at least 20%.
STR1.T390.7  FAILURE AND RE-TESTING OF NODAL JOINTS

Non-compliance:
1. The CM will reject any test specimens which do not comply with the requirements. In addition, the CM may require further tests at the Contractor's expense or reject the whole or part of the particular consignment, which must be removed from Site forthwith;
2. Carry out further tests if directed, provided the results of these further tests fulfil the test requirements, all the nodal joints represented by these tests are deemed to comply with this Specification;
3. If the result of any of these additional tests fail to fulfil the test requirements, the part of the particular consignment represented by these nodal joints must be removed from Site forthwith.

STR1.T400.7  LOADING TESTS

If in the opinion of the CM that loading tests on parts of the space frame are necessary, the CM may order proof tests in accordance with the Code of Practice for the Structural Use of Steel 2011, by an Approved Laboratory employed and paid for directly by the Contractor.

OFF-SITE FABRICATION

STR1.T510.7  TESTING AND SURVEILLANCE VISITS AT FABRICATION YARD

For off-site fabrication in Guangdong province of China, comply with the following:
1. Provide all necessary facilities and attendance required by the CM and Consultant employed for inspection and surveillance visits and the Direct Testing Contractors for carrying out the tests as stated in STR1.T520 (2) at the fabrication yard;
2. Make all necessary arrangement including providing transportation to CM and Consultant employed for inspection and surveillance visits to the fabrication yards and to take the staff of the Direct Testing Contractors to the locations of the testing works for the first visit to the fabrication yards for the testing and parallel testing works. The Direct Testing Contractors shall arrange their own transportation for subsequent visits to the same locations of the fabrication yard.

STR1.T520.7  ENGAGEMENT OF SPECIALIST TESTING CONTRACTOR (FOR OFF-SITE FABRICATION)

For off-site fabrication, testing arrangement shall comply with the Approved quality assurance scheme and testing regime submitted in accordance with STR1.W1410. The engagement of specialist testing contractor shall comply with the following requirements:
1. Except for the testing arrangement as stated in sub-clause (2) below, all testing shall be carried out by the Approved laboratory proposed in STR1.W1410 (3), employed and paid for directly by the Contractor;
2. For off-site fabrication carried out in Guangdong province of China, comply with the following:
   a. The following tests shall be carried out by the Direct Testing Contractor employed and paid for directly by the Authority:
      i. Tensile tests and impact tests of steel sections;
      ii. Visual inspection of welds;
      iii. Ultrasonic inspection of welds;
      iv. Magnetic particle inspection of welds.
b. Provide specimens for testing, which shall be selected from sections at random in the fabrication yard by the Direct Testing Contractor. The preparation and delivery of the test specimens from the fabrication yard to the laboratory for testing shall be carried out by the Direct Testing Contractor;

c. Welds for testing shall be selected and tested by the Direct Testing Contractors in the fabrication yard.

APE1 SCOPE OF APPENDIX

APE1.A010.7 APPLICATION
1. All terms and requirements set out in this Appendix shall only be applicable to contracts with the construction of superstructure of domestic blocks.
2. All terms and requirements set out in this Appendix shall be applicable to permitted modifications or proposals for modifications to design and/or Specification for the domestic blocks.
3. Where any terms and requirements in Worksection APE4 of this Appendix are at variance with those in Worksections APE2 and APE3 of this Appendix, the terms and requirements of Worksection APE4 shall prevail.

APE1.A020.7 TERMS AND REQUIREMENTS ON PERMITTED MODIFICATIONS PROPOSED IN TENDER STAGE
Terms and requirements applicable to permitted modifications to design and/or Specification for the domestic blocks proposed by the Contractor in tender stage are specified in Worksection APE2 of this Appendix.

APE1.A030.7 TERMS AND REQUIREMENTS ON PROPOSALS FOR MODIFICATIONS IN POST-CONTRACT STAGE
Terms and requirements applicable to modifications to design and/or Specification for the domestic blocks proposed by the Contractor in post-contract stage after the notified date for commencement of the Works are specified in Worksection APE3 of this Appendix.

APE1.A040.7 ACCEPTANCE CRITERIA FOR PROPOSED MODIFICATIONS
The acceptance criteria for permitted modifications to design and/or Specification proposed by the Contractor in tender stage and for modifications to design and/or Specification for domestic blocks proposed by the Contractor in post-contract stage after the notified date for commencement of the Works are specified in Worksection APE4 of this Appendix.
APE2 TERMS AND REQUIREMENTS ON PERMITTED MODIFICATIONS PROPOSED IN TENDER STAGE

GENERAL

APE2.A010.7 APPLICATION
All terms and requirements included in Worksection APE2 hereunder apply to permitted modifications to design and/or Specification for domestic blocks proposed by the Contractor in tender stage.

SCOPE OF MODIFICATIONS

APE2.A020.7 LIMITATIONS
1. Only modifications to design and/or Specification for domestic blocks arising as a result of complying with Items APE2.A030 to APE2.A070 inclusive are permitted in tender stage.

2. Permitted modifications proposed and submitted by the Contractor with the tender shall be in accordance with the Special Conditions of Tender and shall comply with all the requirements as specified in Worksections APE2 and APE4 of this Appendix.

APE2.A030.7 LARGE PANEL FORMWORK SYSTEM
The further use of large panel formwork system for constructing the structural walls (see CON2.D310 to CON2.D450).

APE2.A040.7 NON-MANDATORY PRECAST EXTERNAL FACADES
The use of precasting method for constructing the external facades of the domestic flat units (see Worksection CON5).

APE2.A050.7 NON-MANDATORY SEMI-PRECAST SLABS
The use of semi-precasting method for constructing the slabs to areas other than domestic flat units (see Worksection CON7).

APE2.A060.7 NON-MANDATORY PRECAST STAIRS
The use of precasting method for constructing the stairs of the domestic blocks (see Worksection CON7).

APE2.A070.7 MECHANISED CONSTRUCTION METHODS
The use of any Approved mechanised method of construction.
SUBMISSIONS

APE2.A110.7 SUBMISSIONS - GENERALLY
Submit a schedule listing any permitted modifications to the design and/or Specification for domestic blocks proposed by the Contractor in a letter attached to the Form of Tender.

APE2.A120.7 CONFLICT WITH SPECIFICATION
Submit with the tender a list of all items contained in the Specification which may conflict with the tenderer’s design, and full details of proposals for any amendments or additions to the Specification.

APE2.A130.7 MECHANISED CONSTRUCTION METHODS
Submit with the tender details of any mechanised method of construction that it is intended to use.

APE2.A140.7 PROPOSED STRUCTURAL MODIFICATIONS
Submit details with the tender showing:
1. The principles of any incidental structural design modifications proposed which shall be prepared by a Registered Structural Engineer registered with the Buildings Department; and
2. Proposals for supervision of all aspects of the concrete work by Contractor’s own staff and the CM.

APE2.A150.7 PROGRAMME FOR FURTHER SUBMISSIONS IN POST CONTRACT STAGE
Agree programme for submission of design calculations, framing plans, reinforcement details, etc. with the CM prior to the notified date for commencement of the Works. No change to the design principles submitted with the tender documents will be permitted.

DESIGN RESPONSIBILITY

APE2.A210.7 DESIGN RESPONSIBILITY
Notwithstanding Clause 5.15 of the General Conditions of Contract, the Contractor shall, with respect to the Contractor’s proposed modification to the design and/or Specification, be responsible for the satisfactory performance of the Works as modified by the Contractor’s proposed modifications to the design and/or Specification and shall guarantee the same to the Employer. The Contractor shall indemnify and keep indemnified the Employer, his agents and employees against any liability, claims, demands, proceedings, damages, costs, charges and expenses whatsoever in respect thereof or in relation thereto, and shall compensate the Employer for any loss or expense arising therefrom.
BILLS OF QUANTITIES

APE2.A310.7 AMENDMENTS
1. Subject to compliance with sub-clause (2) of this clause, the Contractor may, at time of tender, insert, delete or revise the description and/or quantity of the measured items within the Bills of Quantities to suit any modifications to design and/or Specification for domestic blocks proposed by him. Such insertion, deletion or revision shall be made in accordance with the Method of Measurement stated in the Preliminaries to the Bills of Quantities. The Contractor shall include a schedule in his tender showing all such revisions to the Bills of Quantities.

2. a. No insertion, deletion or revision shall be made to the Preliminaries to the Bills of Quantities.

b. No insertion, deletion or revision to any provisional quantities contained in the Bills of Quantities shall be allowed to be made, although the work or works to which the provisional quantities refer may be modified by the Contractor in accordance with Worksection APE2 of this Appendix.

APE2.A320.7 PREPARATORY WORKS FOR FINISHES
Where items, such as plastering, rendering and screeding, have been deleted from the Bills of Quantities as a result of the operation of sub-clause (1) of Item APE2.A310, the cost of all preparatory work, including keying, or the use of special bonding agent, etc., as required by the CM, to receive any subsequent finish is deemed to have been included in the tender.

PRELIMINARIES ITEMS

APE2.A410.7 ON-SITE PLANT AND EQUIPMENT
1. For domestic blocks, where the precast concrete facade system involves early capital cost of major and necessary items of on-Site plant and equipment which are used intimately in association with the precast facade construction, the Contractor may make a request for special terms of payment in respect of these items and is advised to make known to the Employer at time of tender, by submitting proposals in a separate letter with his tender.

2. In this connection, the Contractor is to note that any special terms of payment proposal must be restricted to only the on-Site items of plant and equipment as described in Clause SCT10 of the Special Conditions of Tender and the amounts of these items must have been tendered in Bill No 1 - Preliminaries. The acceptance of any special terms of payment proposals shall be at the discretion of the Employer.

3. All other Preliminaries items not related to the special terms of payment proposal shall be paid in accordance with the provisions set out in Bill No 1 Preliminaries.
INFORMATION TO TENDERERS FOR NOMINATED SUB-CONTACT AND SPECIALIST WORKS

APE2.A510.7 INFORMATION TO TENDERERS FOR NOMINATED SUB-CONTACT AND SPECIALIST WORKS

1. The Contractor shall give full information and assistance to tenderers tendering for any Nominated Sub-contract or Specialist Works on any permitted modifications to design and/or Specification for domestic blocks which may affect the submission of a tender for any such Nominated Sub-contract or Specialist Works.

2. The Contractor shall be responsible for any additional costs, claims or expenses whatsoever and howsoever arising on Nominated Sub-contracts or Specialist Works as a result of any permitted modification to design and/or Specification for domestic blocks and the Final Contract Sum shall not be adjusted in respect of any such claims.
APE3 TERMS AND REQUIREMENTS ON PROPOSALS FOR MODIFICATIONS IN POST-CONTRACT STAGE

GENERALLY

APE3.A010.7 APPLICATION
All terms and requirements included in Worksection APE3 hereunder apply to modifications to design and/or Specification for domestic blocks proposed by the Contractor in post-contract stage after the notified date for commencement of the Works.

APE3.A020.7 TERMS AND CONDITIONS
1. Any modifications proposed by the Contractor in post-contract stage after the notified date for commencement of the Works shall be submitted to the CM in accordance with Clause 11.8 of the General Conditions of Contract. Such proposals shall be treated as Requested Variation Proposals and subject to the CM’s agreement under Clause 11.8 of the General Conditions of Contract.

2. The proposed modifications shall comply with all the requirements as specified in Worksections APE3 and APE4 of this Appendix.

SUBMISSIONS

APE3.A110.7 SUBMISSIONS - GENERALLY
Any modifications proposed by the Contractor shall be submitted in accordance with Clause 11.8(2) of the General Conditions of Contract. Submit with the proposal a report identifying the principles of any proposed structural modifications which shall be prepared by a Registered Structural Engineer registered with the Buildings Department.
APE4 ACCEPTANCE CRITERIA FOR PROPOSED MODIFICATIONS TO DESIGN AND/OR SPECIFICATION FOR DOMESTIC BLOCKS

APCI A010.7 COMPLIANCE WITH REGULATIONS

1. Any permitted modifications to design and/or Specification for domestic blocks including any incidental structural design modifications proposed by the Contractor in tender stage, and any modifications to design and/or Specification for domestic blocks proposed by the Contractor in post-contract stage after the notified date for commencement of the Works shall comply with the Hong Kong Buildings Ordinance and its subsidiary Regulations.

2. The structural design of any modifications to domestic blocks shall comply with the Building (Construction) Regulations, Codes of Practices, Practice Notes for Authorized Persons, Registered Structural Engineers and Registered Geotechnical Engineers (PNAPs), and the Hong Kong Housing Authority Specification Library, currently in use.

3. In the event that any element of the design of modifications is not covered by the requirements in the Ordinance, Regulations and documents specified in sub-clauses (1) and (2) above or any British Standards, when instructed by the CM, the Contractor shall demonstrate by design calculation or experiment at his own expense the suitability of any such element to comply with any other proposed standard.

CONSTRUCTION

APE4.A110.7 INSPECTION OF WORK

Any proposal that may require the CM or his representative to carry out inspection of any work outside normal office hours will not be considered.

APE4.A120.7 OPENINGS THROUGH STRUCTURAL MEMBERS

Ensure that all proposed modifications allow for all openings, sleeves, etc., through structural members as shown in the Contract drawings or where necessary.

APE4.A130.7 INSTALLATION OF CONCEALED SERVICES

Ensure that all proposed modifications allow for installation of all concealed building services provisions in concrete, brickwork and blockwork where required under the Contract.
ACCEPTABILITY OF STRUCTURAL MODIFICATIONS

APE4.A210.7 CONDITIONS OF ACCEPTABILITY
The following clauses in this sub-section are subject to all the conditions stated elsewhere in the Appendix.

APE4.A220.7 REDESIGN OF FOUNDATIONS
Redesign of the foundation is not permitted.

APE4.A230.7 STRUCTURAL MEMBER SIZES
Reduction to structural member sizes is not permitted. Increase to structural member sizes shall be subject to Approval.

APE4.A240.7 CONCRETE DESIGN
Change to lower concrete grades and/or smaller concrete covers to reinforcing bars are not permitted.

APE4.A250.7 REINFORCEMENT DESIGN
Modification to reinforcement design, except to suit any permitted modification to structural concrete design, is not permitted.

APE4.A260.7 USE OF FABRIC REINFORCEMENT
Fabric reinforcement may be substituted for bar reinforcement providing that the fabric reinforcement complies with all requirements of the Specification. In the event that a change to design is required to suit a proprietary mesh, the cross sectional area of the reinforcement in the fabric shall not, in any location, be less than the designed area of steel/m² for bar reinforcement for that location.

APE4.A270.7 PRECAST CONCRETE STAIRS
Where a staircase flight is required to be constructed as precast concrete, a redesign of the staircase flight to insitu concrete is not permitted. However, modifications to the joints between the precast concrete flight and the insitu concrete landing may be made but such modifications will be subject to Approval.

APE4.A280.7 NON-STRUCTURAL CONCRETE ELEMENTS
In accordance with CON4.M010 to CON4.M030, non-structural concrete elements which are not shown on the Structural Framing Plans may be substituted with precast concrete providing that such precast concrete complies with all requirements of the Specification.

ACCEPTABILITY OF ARCHITECTURAL MODIFICATIONS

APE4.A310.7 CONDITIONS OF ACCEPTABILITY
The following clauses in this sub-section are subject to all the conditions stated elsewhere in this Appendix.
APE4.A320.7  FLOOR LAYOUTS AND ELEVATIONS

Unless otherwise specified in the Contract, modification to floor layouts and elevations is not permitted.

APE4.A330.7  MODIFICATIONS TO BUILDING STRUCTURE

Internal non-structural walls may be constructed as a later separate operation, and may be constructed of precast concrete, or solid concrete blocks plastered both sides. For any proposed design changes to internal non-structural walls provide at least the same performance standards as the walls shown on the tender drawings.

APE4.A340.7  UTILITY SERVICE ROOMS

Notwithstanding the provisions of Item APE4.A330 above, no modification or change to utility service rooms will be permitted.

APE4.A350.7  RENDER COAT TO WALLS

For domestic blocks, all walls receiving a tile or paint finish include a 10 mm render coat unless otherwise specified. Under no circumstances is this render coat to be omitted. Pay special attention to spatterdash in accordance with the Specification to ensure adequate key for this render coat.

APE4.A360.7  CONCEALMENT OF ELECTRICAL WIRING

For domestic blocks, electrical wiring is all by concealed conduit in walls and slabs and shall comply with the requirements of the Code of Practice for the Electricity (Wiring) Regulations published by the Electrical and Mechanical Services Department. No modifications to the layout will be permitted without prior Approval.

APE4.A370.7  EXTERNAL BUILDING FEATURES

Do not omit any external building features. Any non-structural external elements may be constructed later as a separate operation.

APE4.A380.7  DIMENSIONS OF OPENINGS

Do not vary the dimensions shown on the tender drawings for all doors, windows and other openings.

APE4.A390.7  MONOLITHIC SLAB AND SCREED FINISH

Monolithic slab and screed finish is acceptable subject to the following conditions:

1. Floor level and falls being maintained as shown on the tender drawings;
2. The removal of any stains, marks, scratches or foreign matter left on the cast floors and making good to the satisfaction of the CM. Should there be any floors which, in the opinion of the CM, were not properly prepared or which were left with a bowed floor surface with a surface which is excessively marked, cut back the entire floor surface by 25 mm and lay a 25 mm cement sand screeding at no extra cost; and
3. Permission to use a monolithic floor finish will be withdrawn should the CM consider, at any time, that the general standard of floor finish is unacceptable. No monetary claims whatsoever will be entertained or extensions of time granted in the event of such a withdrawal of permission.

APPENDIX H - SCHEDULE OF TOLERANCES

INTRODUCTION

1. FORMAT: This Schedule is prepared as an Appendix so that it is in a convenient form to use as a reference document by those concerned with site quality control during the construction stage of HKHA projects. However the Schedule is divided into the same Worksections as those used in the main body of the Specification; this facilitates easy division and attachment to Specification Worksections by main contractors for sub-contract tendering purposes.

2. PRECEDENCE: This Schedule shall not take precedence over any conflicting or variation tolerances given in other parts of this Specification or shown on the Drawings;

3. DEFINITIONS: The following are definitions of terms used in this Schedule of Tolerances:
   a. MASTER BENCH MARK (MBM): The level datum from which all levels on site are derived;
   b. TRANSFERRED BENCH MARK (TBM): Subsidiary level datum derived from the master bench mark;
   c. BOW: Curvature of the length or width of the component expressed as a deviation from a straight line connecting the extremities;
   d. DEVIATION: Difference between a size or position (actual, limit etc) and a specified size or position;
   e. PERMISSIBLE DEVIATION (PD): Specified limit(s) of deviation;
   f. TOLERANCE: Difference between the limits within which a size or position must lie. The tolerance is an absolute value without sign but the dimension or axis is to which it applies must be stated.
TOL.BRI - BRIDGE WORKS

TOL.BRI.010.7  BRIDGE BEARINGS

1. The centreline of bridge bearings shall be within 3 mm of the specified position;
2. The level of bridge bearings shall be within 0.0001 times the adjacent span or the lesser of the adjacent spans or with 5 mm of the specified level, whichever is less;
3. The inclination of bridge bearings shall be within 1 in 200 of the specified inclination;
4. The horizontal axis of bridge bearings shall be within 0.005 radian of the specified alignment;
5. Departure from the common plane between twin or multiple bridge bearings shall be within the tolerances stated on the Drawings.

TOL.BRI.020.7  VEHICULAR PARAPETS

Vehicular parapets shall be within 10 mm of the specified position and height.

TOL.BRI.030.7  FABRICATED MOVEMENT JOINTS

The surface of fabricated movement joints shall be at least 1 mm, and not more than 3 mm, below the surrounding road surface.
TOL.BSW - WORK FOR ELECTRICAL AND MECHANICAL INSTALLATIONS

TOL.BSW.010.7  FLOORS OF SWITCHGEAR ROOMS
The tolerance in floor levels for switchgear rooms shall be as follows:
1. ±2 mm in 1000 mm for high voltage switchgear rooms;
2. ±4 mm in 1000 mm for medium voltage switchgear rooms.

TOL.BSW.020.7  LAMP STANDARDS
Lamp standards shall be within 0.1 degrees of the vertical.
TOL.COM1 - STAINLESS STEEL
WINDOWS, DOORS AND LOUVRES

TOL.COM1.010.7 DESIGN CLEARANCE
PD of the clearance between the frame and the structure opening at the:
1. Jamb ................................................................. +5 mm : -10 mm
2. Head ................................................................. +8 mm : -10 mm
3. Sill ................................................................. +2 mm : -3 mm

TOL.COM1.020.7 VERTICALITY
PD of frame from plumb in any 1.2 m length ........... ±3 mm
**TOL.COM2 - ALUMINIUM WINDOWS AND LOUVRES**

**TOL.COM2.010.7 DIMENSION**

1. PD for peripheral dimensions:
   a. Length <2 m: ±1.0 mm
   b. Ditto ≥2 m <3.5 m: ±1.5 mm
   c. Ditto ≥3.5 m <5 m: ±2.0 mm
   d. Ditto ≥5 m: ±3.0 mm

2. PD for step joint: +0.5 mm : 0 mm

3. PD for diagonal dimensions:
   a. Length <2 m: ±1.5 mm
   b. Ditto ≥2 m <3.5 m: ±2.5 mm
   c. Ditto ≥3.5 m: ±3.5 mm

4. Aluminum wall thickness:
   a. Structural members: +0.16 mm : 0 mm
   b. Non-structural members: +0.16 mm : 0 mm
   c. Glazing bead ±0.1 mm

**TOL.COM2.020.7 VERTICALITY**

PD from plumb in any 1.2 m length ....................... ±3 mm
# TOL.COM5 - TIMBER DOORSETS

**NOTE:** 1. Read the tolerances given in this section in conjunction with the dimensional requirements specified in BS 4787:Part 1:1980 unless otherwise specified on the Drawings. Dimension references given in brackets relate to these used in this BS;
2. Where smoke seals are to be used, other clearance sizes and related permissible deviations between door leaf and jamb, head, transom and sill may be specified.

## DOORSETS

### TOL.COM5.010.7 WORKSIZES

PD from doorset worksizes specified in BS 4787:Part 1:1980:

<table>
<thead>
<tr>
<th>TOLERANCE</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>+2.5 mm : -2.5 mm</td>
<td></td>
</tr>
<tr>
<td>+2.5 mm : -2.5 mm</td>
<td></td>
</tr>
</tbody>
</table>

## DOOR LEAVES

### TOL.COM5.110.7 HEIGHT

PD for leaves in all doorsets (d3) ........................................ +2.5 mm : -2.5 mm

### TOL.COM5.120.7 WIDTH

PD for leaves in single or double equal leaf doorsets (e3) ........................................ +2.5 mm : -2.5 mm

### TOL.COM5.130.7 THICKNESS

PD for all leaf thicknesses (f3):

<table>
<thead>
<tr>
<th>TOLERANCE</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>+1.0 mm : -2.0 mm</td>
<td></td>
</tr>
<tr>
<td>+1.5 mm : -1.5 mm</td>

</tr>
</tbody>
</table>

### TOL.COM5.140.7 DOORSTOP WIDTH

<table>
<thead>
<tr>
<th>TOLERANCE</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>+2.0 mm : -2.0 mm</td>
<td></td>
</tr>
<tr>
<td>+2.0 mm : -0 mm</td>
<td></td>
</tr>
</tbody>
</table>

### TOL.COM5.150.7 REBATE DEPTH

PD (f2) ........................................ +1.0 mm : -1.0 mm

### TOL.COM5.160.7 CLEARANCES

PD from clearances specified in BS 4787:Part 1:1980 or shown on drawings for:

1. Non fire resisting doors ........................................ +2.0 mm : -1.0 mm
2. Fire resisting doors without smoke seals ............ +1.0 mm : -0.5 mm
3. Fire resisting door with smoke seals ............ See Note 2 Above
TOL.COM5.170.7 SQUARENESS

PD when measured in accordance with BS 5278:1976 at a point 500 mm from any corner .................................................. 2.0 mm

TOL.COM5.180.7 FLATNESS

PD when measured in accordance with BS 5278:1976, due to:

1. Bending:
   a. Measured horizontally .................................... 2.0 mm
   b. Measured vertically ....................................... 4.0 mm

2. Twisting of any corner in relation to the other three:
   a. Doors of type '2' construction ......................... 6.0 mm
   b. Doors of types '1' and '3' construction ............. 3.0 mm

TOL.COM5.190.7 SMOOTHNESS

For any door type:

1. PD in any position:
   a. When measured with a 50 mm bridge ............... 0.2 mm
   b. When measured with a 200 mm bridge ............ 1.0 mm

2. PD for doors of type '2' construction, when measured with a 200 mm bridge, at not more than 3 points along the 4 horizontal lines and 3 points along the 2 vertical lines of each face ...... 0.5 mm

3. PD for doors of type '1' and '3' construction, when measured with a 200 mm bridge, at not more than 4 points along the 2 vertical lines and 4 points along the 4 horizontal lines of each face ......................................................... 0.5 mm

DOOR FRAMES

TOL.COM5.210.7 BOW

PD in the thickness of hardwood framing members in any 2 m length:

1. Member thickness ≤50 mm ............................... 2.0 mm
2. Member thickness >50 mm .............................. 6.0 mm

TOL.COM5.220.7 SPRING

PD in the width of hardwood framing members in any 2 m length:

1. Member thickness ≤100 mm ............................. 4.0 mm
2. Member thickness >100 mm ........................... 6.0 mm
INSTALLATION OF FRAMES AND SUB-FRAMES

TOL.COM5.230.7  PD FROM LEVEL OR VERTICALITY

In any 1.2 m length ................................................................. 3.0 mm
## TOL.COM6 - METAL DOORS

TOL.CON1 - INSITU CONCRETE

Note: Tolerances given in this section should be read in conjunction with additional tolerances given in TOL.CON2.

UNREINFORCED/REINFORCED CONCRETE FOUNDATION (INCLUDING RAFTS, GROUND BEAMS, COLUMN BASES, PILE CAPS AND STRIP FOUNDATIONS)

TOL.CON1.010.7 POSITION ON PLAN
PD in plan of any point measured from the nearest building grid line, for elements of dimensions ........................................
1. ≤1500 mm                           ±35 mm
2. >1500 mm                            ±50 mm

TOL.CON1.020.7 DIMENSION ON PLAN
1. PD per 300 mm: ...........................................  ±10 mm
2. Maximum PD:  ........................................... +50 mm : -35 mm

TOL.CON1.030.7 UPPER SURFACE LEVEL
PD in level of upper surface with reference to the nearest TBM ................................................................. ±20 mm

TOL.CON1.040.7 CAST-IN FOUNDATION BOLTS
PD from specified position .................. ±25 mm

ELEMENTS OR COMPONENTS ABOVE FOUNDATIONS (EXCEPT LIFTWELLS AND STAIRS)

TOL.CON1.110.7 POSITION ON PLAN
PD in plan of any point measured from the nearest building grid line: ............................................. ±15 mm

TOL.CON1.120.7 SIZE AND SHAPE OF ELEMENT
PD for elements of dimensions:
1. ≤500 mm: .................................................... ±10 mm
2. >500 ≤3000 mm: ............................................ ±20 mm
3. >3000 mm: .................................................... ±30 mm
**APPENDIX H - SCHEDULE OF TOLERANCES**

**TOL.CON1.130.7 VERTICALITY OF WALL AND COLUMNS**

1. Plumbness in height \( \leq 500 \) mm: .................. \( \pm 10 \) mm
2. Ditto \( > 500 \) mm \( \leq 3000 \) mm: .................. \( \pm 15 \) mm
3. Ditto \( > 3000 \) mm \( \leq 30 \) m: .................. \( \pm 20 \) mm
4. \( > 30 \) m: Pro-rata on \( \pm 20 \) mm per 30 m to the nearest 5 mm.

Note: When separated by another plane or member use the thickness of the plane or member for checking verticality.

**TOL.CON1.140.7 SURFACE PROFILE OF WALLS AND SLAB SOFFITS**

PD from mean of surface profile across the whole element (from extremities):

1. Surface profile \( \leq 3000 \) mm: .................. \( \pm 10 \) mm
2. Ditto \( > 3000 \) mm \( \leq 15 \) m: .................. \( \pm 15 \) mm
3. Ditto \( > 15 \) m: .......................... \( \pm 20 \) mm

Notes: Measure deviations in two directions.

**TOL.CON1.150.7 GRADUALLY IRREGULARITIES**

PD from 3000 mm straight edge:

1. Formwork type A: Rough board .................. \( \pm 10 \) mm
2. Formwork type B: Fairfaced .................. \( \pm 10 \) mm

**TOL.CON1.160.7 ABRUPT IRREGULARITIES**

Abrupt changes of a continuous finished concrete surface:

1. Formwork type A: .......................... \( \pm 4 \) mm
2. Formwork type B: .......................... \( \pm 3 \) mm

Note: This also applies to displacement of successive lifts for columns and walls within one storey height.

**TOL.CON1.170.7 TWIST**

The distance of any one corner from the plane containing the other three corners, i.e. a variation from the target plane:

1. For diagonal \( \leq 3000 \) mm:
   a. Formwork type A: .......................... 10 mm
   b. Formwork type B: .......................... 5 mm
2. For diagonal \( > 3000 \) mm \( \leq 15 \) m:
   a. Formwork type A: .......................... 20 mm
   b. Formwork type B: .......................... 10 mm
3. For each further 10 m of diagonal:
   a. Formwork type A: .......................... 10 mm
   b. Formwork type B: .......................... 5 mm
TOL.CON1.180.7 SQUARENESS OF CORNERS

Where the longer of two adjacent sides is taken as the base line and the PD of the shorter side, from a perpendicular to the base line, is related to the length of the shorter side:

1. Short side ≤250 mm: ........................................ ±10 mm
2. Ditto >250 mm ≤500 mm: ......................... ±10 mm
3. Ditto >500 mm ≤3000 mm: ....................... ±20 mm
4. Ditto for every additional 2500 mm (to nearest 5 mm): ........................................ ±20 mm x L/3

TOL.CON1.200.7 LEVEL

PD from designed level with reference to the nearest TBM of the upper or lower surface, as may be specified of any slab or other element or component:

1. Length ≤8 m: .............................................. ±10 mm
2. Length >8 m ≤15 m: .............................. ±15 mm
3. Length >15 m ≤30 m: .............................. ±20 mm

TOL.CON1.210.7 ITEMS CAST IN

The position of, or provision for, components fixings and holes cast in: PD from its designed position of centre line of component, fixing or hole: ................................................................. ±15 mm

LIFTWELLS

TOL.CON1.310.7 POSITION ON PLAN

Position on plan at bottom of well of any point of each wall. PD of internal face from the designed position in relation to the nearest parallel reference line at the same level (distance between the two points being not more than 15 m): ................................................................. ±10 mm

TOL.CON1.320.7 STRUCTURAL LIMITS OF WELL ACCURACY AT ANY LEVEL

Comply with Section 3 of BS 5655:Part 6:1990 including Table 1 which is extended as follows:

<table>
<thead>
<tr>
<th>Well height (m)</th>
<th>Limits of accuracy (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>+</td>
</tr>
<tr>
<td>1. ≤30</td>
<td>25</td>
</tr>
<tr>
<td>2. &gt;30 ≤60</td>
<td>35</td>
</tr>
<tr>
<td>3. &gt;60 ≤90</td>
<td>50</td>
</tr>
</tbody>
</table>
Read Table 1 in conjunction with figure 1 of Section 3 of BS 5655.

**TOL.CON1.330.7 LANDING DOOR OPENINGS**

1. Position of landing door openings in relation to design position: ........................................... ±15 mm

   Note: It is important that landing doors come one above another PD of actual centre line of structural opening (to receive lift doors) from the design position.

2. Plumbness of jamb: PD from the vertical:
   a. For every 1000 mm of height: ............... ±5 mm
   b. Up to a maximum of: ......................... ±15 mm

**TOL.CON1.340.7 ABRUPT IRREGULARITIES OF WALLS**

Abrupt changes of inner surfaces of walls: ................................................................. Not to exceed 5 mm

**INSITU STAIRS (FLIGHT FROM LANDING TO LANDING)**

**TOL.CON1.410.7 POSITION ON PLAN**

PD on plan of any point in relation to the nearest reference point at the same level, the distance between the points being no more than 15 m: ................................................................. ±15 mm

**TOL.CON1.420.7 LENGTH**

Length on plan of clear span (excluding landings): ............................................................. ±15 mm

**TOL.CON1.430.7 WIDTH OF FLIGHT**

................................................................................................................................. ±10 mm

**TOL.CON1.440.7 HEIGHT**

Vertical height measured between either top surfaces or soffit surfaces of any flight of stairs: ................................................................. ±15 mm

**TOL.CON1.450.7 WAIST THICKNESS**

Thickness of waist measured at right angles to the slope of the flight: ................................. ±10 mm

**TOL.CON1.460.7 RISE**

Difference in the rise of two consecutive steps: ...................................................................... ±5 mm
APPENDIX H - SCHEDULE OF TOLERANCES

TOL.CON1.470.7 GOING
Difference in width of tread of two consecutive steps: .............................. ±10 mm

TOL.CON1.480.7 TREAD LEVEL
Difference in level of tread:
1. Across the going: ............................... ±4 mm
2. Across width of stairs per 1000 mm width (measured between extremities of tread): ..... ±5 mm
3. Other widths: Pro-rata with a maximum of: .............................................. ±10 mm

OPENINGS (EXCLUDING LIFT OPENINGS) - ALL BLOCK TYPES

TOL.CON1.510.7 POSITION ON ELEVATION
PD on elevation from its designed position of centre line with reference to the nearest building grid line: .............................. ±15 m

TOL.CON1.520.7 POSITION ON PLAN
PD on plan of any point measured from the nearest building grid line: ......................... ±15 mm

OPENINGS (EXCLUDING LIFT OPENINGS) - HARMONY BLOCKS ONLY

TOL.CON1.610.7 FAIRFACED CONCRETE WALL OPENING IN FLAT 2B, 3B AND 1P
1. Height: .............................. ±6 mm
2. Width: .............................. ±6 mm
3. Plumb: .............................. ±3 mm/1.2 m
4. Level: .............................. ±3 mm/1.2 m

TOL.CON1.620.7 DOOR, WINDOW AND OTHER OPENINGS
Width and height:
1. ≤500 mm: .............................................. ±15 mm
2. >500 mm ≤3000 mm: .............................. ±20 mm

Specification Library 2014 Edition
OPENINGS (EXCLUDING LIFT OPENINGS) - BLOCK TYPES EXCEPT HARMONY

TOL.CON1.710.7  DOOR, WINDOW AND OTHER OPENINGS

Width and height:
1. \( \leq 500 \text{ mm} \): ............................................. \( \pm 15 \text{ mm} \)
2. \( >500 \text{ mm} \leq 3000 \text{ mm} \): .......................... \( \pm 20 \text{ mm} \)

TOL.CON1.720.7  PLUMBNESS OF JAMBS

PD from the vertical:
1. For every 1000 mm of height: .................. \( \pm 5 \text{ mm} \)
2. With a maximum of: .............................. \( \pm 15 \text{ mm} \)

TOL.CON1.730.7  LEVEL OF SILL OR SOFFIT

PD:
1. For every 1000 mm of length: ............... \( \pm 5 \text{ mm} \)
2. With a maximum of: .............................. \( \pm 15 \text{ mm} \)

OVERALL DIMENSIONS OF A CONCRETE FRAMED BUILDING

TOL.CON1.810.7  LENGTH AND WIDTH

1. \( \leq 15 \text{ m} \): .................................................. \( \pm 25 \text{ mm} \)
2. \( >15 \text{ m} \leq 30 \text{ m} \): ................................. \( \pm 50 \text{ mm} \)
3. Each subsequent 30 m: ......................... \( \pm 20 \text{ mm} \)

Note: Measure dimensions at lowest floor level or, if not practicable, as otherwise specified or agreed.

TOL.CON1.820.7  HEIGHT

To structural roof level with reference to the TBM:
1. \( \leq 30 \text{ m} \): .................................................. \( \pm 40 \text{ mm} \)
2. Each subsequent 30 m: ......................... \( \pm 15 \text{ mm} \)
# TOL.CON2 - FORMWORK

3. Ditto >500 mm ≤3000 mm: ..................................... ±20 mm
4. Ditto for every additional 2500 mm: (to nearest 5 mm) ±20 mm x L/3
APPENDIX H - SCHEDULE OF TOLERANCES

TOL.CON3 - REINFORCEMENT

TOL.CON3.020.7 TOLERANCES TO CONCRETE COVER - GENERALLY
PD from nominal cover: ........................................... ±5 mm

TOL.CON3.030.7 TOLERANCES TO CONCRETE COVER - STARTER BARS
Starters in walls and column spots of horizontal lift: .............................................................. +5 mm + \( \Phi \), -5 mm
\( \Phi \) = diameter of starter bar

TOL.CON3.040.7 SPACING
The lesser of: ............................................. +50 mm or 20% of specified spacing

TOL.CON3.050.7 ANCHORAGE, LAP LENGTH AND CURTAILMENT
PD from specified length: ................................. -25 mm

TOL.CON3.060.7 CUTTING AND BENDING
Comply with the cutting and/or bending tolerances defined in Table 4 of BS 8666 : 2000 as follows:

1. Cutting of straight lengths (including reinforcement for subsequent bending): ........... ±25 mm

2. Bent bars:
   a. Dimension of bent bars \( \leq 1000 \) mm: ............ ±5 mm
   b. Ditto \( > 1000 \) mm to \( \leq 2000 \) mm: .................. +5 mm : -10 mm
   c. Ditto \( > 2000 \) mm: ........................................... +5 mm : -25 mm

3. Length of wires in fabric: ................................. ±25 mm or 0.5 % of the length (whichever is greater)
TOL.CON4 - PRECAST CONCRETE

TOL.CON4.010.7 ALL ELEMENTS (UNLESS OTHERWISE SPECIFIED)

1. Length up to 2000 mm: .................................. ±6 mm
2. Width or height up to 250 mm: ......................... ±4 mm
3. Thickness or depth up to 500 mm: ................. ±6 mm

STAIRS TO STANDARD DOMESTIC (FLIGHT FROM LANDING TO LANDING)

TOL.CON4.110.7 POSITION ON PLAN

PD on plan of any point in relation to the nearest reference point at the same level, the distance between the points being not more than 15 m: ...
.................................................. ±10 mm

TOL.CON4.120.7 LENGTH

Length on plan of clear span (excluding landings): .................................................. ±12 mm

TOL.CON4.130.7 WIDTH OF FLIGHT

.................................................. ±6 mm

TOL.CON4.140.7 HEIGHT

Vertical height measured between either top surfaces or soffit surfaces of any flight of stairs:
.................................................. ±10 mm

TOL.CON4.150.7 WAIST THICKNESS

Thickness of waist measured at right angles to the slope of the flight: ......................... +6 mm : -3 mm

TOL.CON4.160.7 RISE

Difference in the rise of two consecutive steps:
.................................................. ±5 mm

TOL.CON4.170.7 GOING

Difference in width of tread of two consecutive steps: .................................................. ±8 mm

TOL.CON4.180.7 TREAD LEVEL

Difference in level of tread:
1. Across the going: ................................. ±4 mm
2. Across width of stair: .............................. ±5 mm
TOL.CON5 - PRECAST FACADE UNITS

CASTING FACADE UNITS

TOL.CON5.010.7 DEVIATIONS FROM DESIGN DIMENSIONS

Manufacture the facade units within the dimensional tolerances set out below:

1. Length and height:
   a. Up to 2 m: ...........................................  +0 : -3 mm
   b. 2 m to 3 m: ...........................................  +0 : -6 mm
   c. 3 m to 4.5 m: ........................................  +0 : -9 mm
   d. 4.5 m to 6 m or more: .............................  +0 : -12 mm

2. Thickness:
   a. Up to 500 mm: .................................  +6 mm : -3 mm
   b. 500 mm to 750 mm: ...............................  +8 mm : -5 mm

3. Straightness or bow (deviation from intended line):
   a. Up to 3 m: ...........................................  6 mm
   b. 3 m to 6 m: ...........................................  9 mm
   c. 6 m to 12 m: ...........................................  12 mm

TOL.CON5.020.7 SQUARENESS

When assessing the squareness of a corner:

1. Take the longer of the two adjacent sides being checked as the base-line;

2. Ensure that the shorter side does not vary in its distance from a perpendicular so that the difference between the greatest and shortest dimensions exceeds:

   Length of shorter sides:
   a. Up to and including 1000 mm: ..............  3 mm
   b. Over 1000 mm to 2000 mm: ..................  5 mm
   c. Over 2000 mm: ...................................  6 mm

TOL.CON5.030.7 TWIST

Ensure that no corner is more than the dimension stated from the plane containing the other three corners:

1. Up to and including 3 m: .........................  6 mm
2. Over 3 m to 6 m: ..................................  9 mm
3. Over 6 m to 12 m: ..................................  12 mm
TOL.CON5.040.7  POSITION OF CAST-IN WINDOW FRAMES

PD from design dimensions on plan:  ...............  ±6 mm

INSTALLING FACADE UNITS

TOL.CON5.110.7  ERECTION TOLERANCES

1. Install the facade units within the erection tolerances set out below:
   a. Horizontal position: In x and y directions:
      ..............................................................  ±5 mm
   b. Plumb: per element:  .........................  ±6 mm
   c. Width of joint: On a nominal joint of 20 m:
      ..............................................................  ±5 mm

2. In addition, respect the prescribed dimensions for height, width and length, of the completed building to within 0.1%;

3. Respect the theoretical line, both horizontal and vertical, with the same tolerance of 0.1%, for each storey when seen from the front. Deviations in profile must not exceed ±10 mm.
## APPENDIX H - SCHEDULE OF TOLERANCES

### APH > TOL.CON7 - PRECAST CONCRETE COMPONENTS

#### CASTING FACADE AND PRECAST CONCRETE WALL UNITS

**TOL.CON7.010.7 DEVIATIONS FROM DESIGN DIMENSIONS**

Manufacture the facade and precast concrete wall units within the dimensional tolerances set out below:

1. **Length and height:**
   - a. Up to 2 m: ...........................................  \[+3 \text{ mm} : -3 \text{ mm}\]
   - b. 2 m to 3 m: ....................................... \[+6 \text{ mm} : -6 \text{ mm}\]
   - c. 3 m to 4.5 m: ..................................... \[+9 \text{ mm} : -9 \text{ mm}\]
   - d. 4.5 m to 6 m or ore: ........................... \[+10 \text{ mm} : -12 \text{ mm}\]

2. **Thickness:**
   - a. Up to 500 mm: ................................. \[+6 \text{ mm} : -3 \text{ mm}\]
   - b. 500 mm to 750 mm: ............................ \[+8 \text{ mm} : -5 \text{ mm}\]

3. **Straightness or bow (deviation from intended line):**
   - a. Up to 3 m: .............................. \[6 \text{ mm}\]
   - b. 3 m to 6 m: .............................. \[9 \text{ mm}\]
   - c. 6 m to 12 m: .............................. \[12 \text{ mm}\]

**TOL.CON7.020.7 SQUARENESS**

When assessing the squareness of a corner:

1. Take the longer of the two adjacent sides being checked as the base-line;

2. Ensure that the shorter side does not vary in its distance from a perpendicular so that the difference between the greatest and shortest dimensions exceeds:

   Length of shorter sides:
   - a. Up to and including 1000 mm: ................. \[3 \text{ mm}\]
   - b. Over 1000 mm to 2000 mm: .................... \[5 \text{ mm}\]
   - c. Over 200 mm: .................................. \[6 \text{ mm}\]
TOL.CON7.030.7  TWIST

Ensure that no corner is more than the dimension stated from the plane containing the other three corners:

1. Up to and including 3: ................................. 6 mm
2. Over 3 to 6: ........................................... 9 mm
3. Over 6 to 12: ........................................... 12 mm

TOL.CON7.040.7  POSITION OF CAST-IN WINDOW FRAMES

PD from design dimensions on plan: ............... ±6 mm

INSTALLING FACADE AND PRECAST CONCRETE WALL UNITS

TOL.CON7.110.7  ERECTION TOLERANCES

1. Install the facade and precast concrete wall units within the erection tolerances set out below:
   a. Horizontal position: In x and y directions: ........................................... ±5 mm
   b. Plumb: per element: ............................... ±6 mm
   c. Width of joint: On a nominal joint of 20 mm: ........................................... ±5 mm

2. In addition, respect the prescribed dimensions for height, width and length, of the completed building to within 0.1%.

3. Respect the theoretical line, both horizontal and vertical, with the same tolerance of 0.1%, for each storey when seen from the front. Deviations in profile must not exceed ±10 mm.

STAIRS TO STANDARD DOMESTIC (FLIGHT FROM LANDING TO LANDING)

TOL.CON7.210.7  POSITION ON PLAN

PD on plan of any point in relation to the nearest reference point at the same level, the distance between the points being not more than 15: ....................................................... ±10 mm

TOL.CON7.220.7  LENGTH

Length on plan of clear span (excluding landings): ........................................... ±12 mm

APPENDIX H - SCHEDULE OF TOLERANCES

TOL.CON8.060.7 TWIST

The distance of any one corner from the plane containing the other three corners, i.e., a variation from the target plane:

1. For diagonal ≤15 m: .............................. 20 mm
2. For each further 10 m of diagonal: .............................. 10 mm

TOL.CON8.070.7 SQUARENESS OF CORNERS

Where the longer of two adjacent sides is taken as the base line and the Permissible Deviation (PD) of the shorter side, from a perpendicular to the base line, is related to the length of the shorter side:

1. Short side ≤3000 mm: .............................. ±20 mm
2. Short side for every additional 2500 mm (to nearest 5 mm): .............................. ±20 mm x L/3

TOL.CON8.080.7 LEVEL

Permissible Deviation (PD) from designed level with reference to the nearest Transferred Bench Mark (TBM) of the upper or lower surface, as may be specified of any slab or other element or component:

Length ≤8 m: .............................. ±10 mm
Length >8 m ≤15 m: .............................. ±15 mm
Length >15 m ≤30 m: .............................. ±20 mm

OVERALL TOLERANCES - LIFTWELLS

TOL.CON8.110.7 POSITION ON PLAN

Position on plan at bottom of well of any point of each wall. Permissible Deviation (PD) of internal face from the designed position in relation to the nearest parallel reference line at the same level (distance between the two points being not more than 15 m): .............................. ±10 mm

TOL.CON8.120.7 STRUCTURAL LIMITS OF WELL ACCURACY AT ANY LEVEL

Comply with Section 3 of BS 5655:Part 6:1990 including Table 1 which is extended as follows:

<table>
<thead>
<tr>
<th>Well height (m)</th>
<th>Limits of accuracy (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>+</td>
</tr>
<tr>
<td>1. ≤30</td>
<td>25</td>
</tr>
<tr>
<td>2. &gt;30 ≤60</td>
<td>35</td>
</tr>
</tbody>
</table>

Specification Library 2014 Edition

APH /37
Read Table 1 in conjunction with figure 1 of Section 3 of BS 5655.

### TOL.CON8.130.7 LANDING DOOR OPENINGS

1. Position of landing door openings in relation to design position: ........................................... ±15 mm

   Note: It is important that landing doors come one above another Permissible Deviation (PD) of actual centre line of structural opening (to receive lift doors) from the design position.

2. Plumbness of jamb: Permissible Deviation (PD) from the vertical:
   a. For every 1000 mm of height: ..................... ±5 mm
   b. Up to a maximum of: ................................. ±15 mm

TOL.DRA1 - DRAINAGE ABOVE GROUND

**TOL.DRA1.010.7 VERTICALITY**

PD of pipes from plumb when measured with a 1.2 m straight edge ........................................... ±3 mm
**TOL.DRA2 - DRAINAGE BELOW GROUND**

### PIPELINES (EXCLUDING TERMINATIONPIPES)

#### TOL.DRA2.010.7 GRAVITY PIPELINES

PD from lines and levels shown on the Drawings:

1. Line .................................................. ±20 mm
2. Invert level (providing there is no backfall at any point) ........................................ +6 mm : -6 mm

#### TOL.DRA2.020.7 PRESSURE PIPELINES

PD from lines and levels shown on the Drawings:

1. Line .................................................. ±50 mm
2. Invert level ......................................... ±20 mm

### TERMINATION PIPES

#### TOL.DRA2.110.7 TERMINATION PIPES

PD for termination pipes which are designed to connect to pipes and fittings laid by others from the positions, gradients and levels shown on the Drawings:

1. Position of the centre of the termination face in the longitudinal direction .................. ±10 mm
2. Position of the centre of the termination face in the lateral direction ......................... ±3 mm
3. Gradient ............................................... ±0.5°
4. Invert level of the termination face ................... ±3 mm

### MANHOLES

#### TOL.DRA2.210.7 MANHOLE COVERS

PD from specified level unless a more accurate level is defined for adjacent surfaces in this schedule:

1. Concrete road ........................................ +10 mm : -0 mm
2. Bituminous paving ................................... +5 mm : -0 mm
3. Paving blocks, tiles or granolithic finish on soft base ........................................... +10 mm : -0 mm
4. Paving blocks, tiles or granolithic finish on hard base ............................................. +5 mm : -0 mm
TOL.EAR1 - EXCAVATION AND FILLING

EARTHWORKS FINAL SURFACE TOLERANCES

TOL.EAR1.010.7 GENERAL
1. Keep earthworks final surfaces and formations within the tolerances of the specified lines and levels tabulated in TOL.EAR1.020, TOL.EAR1.030 and TOL.EAR1.040 below;
2. The tolerances for formations do not apply to pipes or preformed structures which require to be supported over their complete length or area;
3. Excavation: A positive (+) tolerance refers to insufficient excavation and a negative (-) tolerance refers to excess excavation;
4. Filling: A positive (+) tolerance refers to excess fill material and a negative (-) tolerance refers to insufficient fill material.

TOL.EAR2 - BLASTING

PRE-SPLIT BLASTING

TOL.EAR2.010.7 FINAL SURFACE TOLERANCES
A tolerance of +100 - 200 mm from the design profile.

Notes:
1. Redrill any pre-split hole which, before firing, is found to be outside this tolerance;
2. A positive (+) tolerance refers to insufficient blasted material and a negative (-) tolerance refers to excess blasted material.
TOL.EXT1 - SUB-BASES, BITUMINOUS ROADWAYS AND RELATED FOOTPATHS

**TOL.EXT1.010.7 ALIGNMENT**

PD of edgelines from the dimensions indicated on the Drawings:

1. Generally ................................................................. +25 mm : -25 mm
2. Adjacent edges of structure ............................... +6 mm : -6 mm

**TOL.EXT1.020.7 MEASUREMENT OF LEVELS**

Determine the levels of the surface of each layer of sub-base, roadbase, base course, wearing and friction courses on a grid at 10 m centres in the longitudinal direction and at 2 m centres in the transverse direction.

**TOL.EXT1.030.7 TOLERANCES IN LEVELS FOR EACH TYPE OF LAYER**

PD from the level of the surface of each layer of sub-base, roadbase base course, wearing and friction courses:

1. Sub-base ................................................................. +10 mm : -20 mm
2. Road-base course .................................................. +8 mm : -15 mm
3. Base course ............................................................ +6 mm : -6 mm
4. Wearing course ....................................................... +6 mm : -6 mm
5. Friction course ......................................................... +6 mm : -6 mm

**TOL.EXT1.040.7 SURFACE LEVELS AT JOINTS**

PD in level of the surface of wearing course and friction course across joints .................................. 3 mm

**TOL.EXT1.050.7 COMBINATION OF TOLERANCES**

Maximum reduction in thickness from specified thickness:

1. Pavement (excluding sub-base) .............................. 15 mm
2. Bituminous wearing course ................................. 5 mm

**TOL.EXT1.060.7 LEVELS OF GULLY GRATINGS**

PD of gully frame from level of adjacent finished surface ............................................. +0 mm : -5 mm

**TOL.EXT1.070.7 LEVELS OF COVERS, FRAMES AND OTHER HARDWARE**

PD of hardware from level of adjacent finished surface ............................................. +5 mm : -0 mm
TOL.EXT1.080.7  SURFACE REGULARITY

Limits of irregularity as specified in EXT1.T610
and EXT1.T620 .............................................................. - : -
TOL.EXT2 - CONCRETE CARRIAGEWAYS

TOL.EXT2.010.7 STRAIGHT ALIGNMENT

1. PD of best fit straight line of straight joints and of straight edges from that shown on the Drawings ................................................................. +25 mm : -25 mm

2. PD of line of straight joints and straight edges from the best fit straight line ........................................... +10 mm : -10 mm

TOL.EXT2.020.7 CURVED ALIGNMENT

1. PD of the best fit curved line of curved joints and of curved edges from that Approved and shown on the Drawings ................................................. +25 mm : -25 mm

2. PD of line of curved joints and curved edges from the best fit curved line ............................................... +10 mm : -10 mm

TOL.EXT2.030.7 ALIGNMENT OF JOINTS

PD of joint continuity across intersections of joints from the best fit straight lines or best fit curved line of each joint ................................................................. +5 mm : -5 mm

TOL.EXT2.040.7 LEVEL OF SUB-BASE

PD from level shown on Drawings .................... +10 mm : -20 mm

TOL.EXT2.050.7 FORMWORK

1. PD of line of formwork from that shown on Drawings ............................................................................... +10 mm : -10 mm

2. PD of level of formwork from that shown on Drawings ............................................................................... +3 mm : -3 mm

3. PD of abrupt irregularities in line and level of formwork ............................................................................ 3 mm

TOL.EXT2.060.7 COVER TO REINFORCEMENT

PD from cover specified or shown on Drawings ................................................................................................. +10 mm : -10 mm

TOL.EXT2.070.7 DOWEL BARS

1. PD of dowel bars at joints from mid-depth of slab ............................................................................................... +20 mm : -20 mm

2. PD of half the length of dowel bars from parallel to:
   a. The longitudinal joint or axis of the carriageway where there is no longitudinal joint ............................................................... 3 mm
   b. The top surface of the slab ........................................... 3 mm
   c. Adjacent dowel bars ................................................... 3 mm
### Appendix H - Schedule of Tolerances

**TOL.EXT2.080.7 Groove Depth**

PD of groove depth from that shown on the Drawings unless otherwise recommended by the sealant manufacturer ............................ +3 mm : -3 mm

**TOL.EXT2.090.7 Levels**

When the levels of the concrete carriageway are determined 200 mm from the edges of each bay, at 10 m centres in the longitudinal direction and 2 m centres in the transverse direction:

1. PD of surface fall from that shown on Drawings ......................... (Providing that falls shall always be in the specified direction without backfall). +6 mm : -6 mm

2. Maximum difference in level across joint ...........

3 mm

**TOL.EXT2.100.7 Slab Thickness**

PD from specified thickness ................................. - : -10 mm

**TOL.EXT2.110.7 Level of Covers, Frames and Other Hardware**

PD from surface of adjacent carriageway .................. +0 mm : -3 mm

Surface regularity: The tolerances specified in this section should be read in conjunction with the compliance criteria for surface regularity specified in EXT2 Testing.

APH / 47
TOL.EXT3 - PATHS AND PAVED AREAS

MATERIALS

TOL.EXT3.010.7 INTERLOCKING CONCRETE BLOCKS
PD on size ................................................................. +3 mm : -3 mm

TOL.EXT3.020.7 PRECAST CONCRETE PAVING SLABS
PD as defined at 11.2.1 of BS 7263:Part 1:1994 measured in accordance with Annex A to this BS:
1. Thickness ......................................................... +3 mm : -3 mm
2. Length and width .............................................. +2 mm : -2 mm
3. Squareness on plan (difference between diagonals) according to flag type defined in BS:
   a. Flag types A, B, C and D; 6 mm
   b. Flag types E, F and G. 3 mm
4. Flatness, winding and bowing:
   a. Measured over 550 mm to 850 mm; +2 mm : -2 mm
   b. Measured over 250 mm to 400 mm. +1 mm : -1 mm

TOL.EXT3.030.7 CLAY PAVERS
Limits of overall measurement defined in Table 2 of BS 6677:Part 1:1986. - : -

WORKMANSHP

TOL.EXT3.110.7 INTERLOCKING CONCRETE BLOCKS, PRECAST CONCRETE PAVING SLABS AND CLAY PAVERS
1. PD from surface level specified ......................... +3 mm : -3 mm
2. PD between adjacent slabs ............................... 2 mm
3. PD of drainage channels and gratings from level of adjacent finished surface .................. +0 mm : -5 mm
4. PD of covers, frames and other hardware from level of adjacent finished surface ............... +5 mm : -0 mm
TOL.EXT3.120.7  INSITU CONCRETE SURFACE FINISH

1. Abrupt irregularities: Maximum .......................... 3 mm
2. Gradual irregularities: Maximum in any 2 m length .................................................................. 10 mm
3. PD of drainage channels and gratings from level of adjacent finished surface .......................... +0 mm : -5 mm
4. PD of covers, frames and other hardware from level of adjacent finished surface ...................... +5 mm : -0 mm

TOL.FIN8 - PROPRIETARY SUSPENDED CEILINGS

INSTALLED CEILING SYSTEM

TOL.FIN8.010.7 LINE AND LEVEL
PD from true plane when measured with a 1.2 m straight edge in any direction ............................. ±3 mm

TOL.FIN8.020.7 ALIGNMENT OF JOINTS
PD in width of joints between panels or strips .......
.............................................................................. ±3 mm

TOL.FIN8.030.7 DEFLECTION OF MAIN MEMBERS
Maximum deflection between points of suspension:
1. Spans up to 1200 mm ................................................. Span x 1/400
2. Spans from 1200 mm to 1800 mm ............................. Span x 1/500
3. Spans over 1800 mm .................................................. Span x 1/600

CEILING COMPONENTS

TOL.FIN8.110.7 STRUCTURAL MEMBERS AND GRIDS
Tolerances not to exceed these specified in Section 2.5 of BS 8290:Part 2:1991 with particular reference to Table 1 for Steel Sections ........................................ As stated

TOL.FIN8.120.7 INFILL UNITS
PD from manufacturers stated dimensions as specified in BS 8290:Part 2:1991:
1. Generally: As Table 3 ........................................... As stated
2. Mineral fibre: As Table 4 ........................................ As stated
3. Steel tiles and panels formed by means other than pressing: As Table 5 ........................................ As stated
4. Steel and aluminium linear strip: As Table 6 ...... As stated
TOL.GIN - GROUND INVESTIGATION,
INSTRUMENTATION AND SOIL TESTING

TOL.GIN.010.7 DEPTHS OF EXPLORATION
1. A tolerance of ±100 mm in length will be permitted on the drilled length of a drill hole;

TOL.GIN.020.7 VERTICAL TOLERANCE
1. No nominally vertical hole shall deviate from the vertical direction by more than 1% of the vertical depth below ground level except that in underwater boreholes or underwater drillholes the tolerance shall be 5%;
2. For inclined drillhole, the inclination shall not deviate from the instructed inclination by more than 2° throughout the length of the hole;
3. Where required by the CM, the verticality and inclination of any hole shall be measured by an approved method.
TOL.GWD - GROUND WATER DRAINAGE AND CONTROL

TOL.GWD.010.7 DRILLING

1. The drillhole entry point shall be positioned within a tolerance of ±75 mm. Deviation in alignment shall not exceed 1 in 20. Deviation from straight shall not exceed 20 mm in any 3 m length of drillhole.
TOL.MAR - MARINE WORKS

TOL.MAR.010.7 DREDGING
The final surface of dredging shall be within 300 mm of the specified surface.

TOL.MAR.020.7 DEPOSITION OF FILL MATERIAL
1. The final surface of deposition and compaction of fill material, measured perpendicular to the specified surface, shall comply with the following requirements:
   a. Top surfaces to receive levelling stones shall not be more than 75 mm above, and not more than 250 mm below, the level shown on the Drawings;
   b. Top surfaces of levelling stones shall be within 25 mm of the specified surface for foundations of structures and shall be within 50 mm of the level shown on the Drawings for submarine outfalls;
   c. Other top surfaces shall be within 250 mm of the level shown on the Drawings;
2. There shall be no abrupt change in level of the finished surface of reclamation and levelling stones.

TOL.MAR.030.7 PRECAST CONCRETE SEAWALL BLOCKS AND COPINGS
Precast concrete seawall blocks and copings shall be within 25 mm of the position shown on the Drawings. The gaps between adjacent blocks and between successive layers of blocks shall not exceed 20 mm.

TOL.MAR.040.7 TIMBER FENDERING SYSTEMS
1. The dimensions of members of timber fendering systems shall be within 5 mm of the dimensions shown on the Drawings;
2. The levels and positions of timber fendering systems shall comply with the following requirements:
   a. The top level of blocks for landings and steps shall be within 5 mm of the level shown on the Drawings;
   b. The top level of other members shall be within 10 mm of the level shown on the Drawings;
   c. The horizontal position perpendicular to the berthing face of the fendering system shall be within 10 mm of the position shown on the Drawings;
   d. The horizontal position parallel to the berthing face of the fendering system shall be within 25 mm of the position shown on the Drawings.

TOL.MAR.050.7 RUBBER FENDERS
1. The dimensions of rubber fenders and bolt holes shall comply with the following requirements:
   a. The bolt hole diameter shall be within 2 mm of the diameter shown on the Drawings;
   b. The bolt pitch shall be within 4 mm of the pitch shown on the Drawings;
   c. The height, length and width of rubber fenders shall be within +4% and -2% of the dimensions shown on the Drawings;
   d. The thickness of fender sections shall be within +8% and -5% of the thickness shown on the Drawings;
2. The positions of rubber fenders shall comply with the following requirements:
   a. The centrelines shall be within 25 mm of the positions on the face of the supporting structures shown on the Drawings;
   b. The inclination shall not deviate by more than 1 in 50 from the inclination shown on the Drawings.

TOL.MAR.060.7 SUBMARINE OUTFALLS
1. The horizontal alignment of submarine pipelines shall be within 250 mm of the alignment shown on the Drawings;
2. The invert level of submarine outfalls shall be within 50 mm of the level shown on the Drawings;
3. There shall be no abrupt change in alignment or level of the submarine outfall.
TOL.MAS1 - BRICKWORK, BLOCKWORK AND PANEL PARTITIONS

BRICKWORK

TOL.MAS1.010.7 GENERALLY
Comply with Table 2 Section 3 of BS 8000:Part 3:1989.

**TOL.MAS1.180.7  SETTING-OUT OF PRE-INSTALLED JUNCTION/BS 4662 BOXES ON WALLS**

The deviation of the installed position of pre-installed junction/BS 4662 boxes from the specified position as shown on the Drawings with the following considerations:

1. In general, the sockets outlets and lighting switches etc. shall be at the same level in the same room. PD for vertical levels of boxes designed at the same level on the same panel wall: ........................................... ±3 mm

2. The installed position of boxes after taking the above tolerance into consideration shall not contravene the requirements of the position of switches/sockets as stipulated in the Design Manual - Barrier Free Access 1997; nor have conflict with other installations such as skirting, door frame, etc.;

3. Deviations exceeding the tolerance under special site condition shall be subject to the approval of the CM.

TOL.MAS2.370.7  WINDOW AND DOOR OPENINGS

1. Width along wall: PD up to 3 m ....................... ±6 mm
2. Height: PD up to 3 m .................................. ±6 mm
TOL.MEW - METALWORK

TOL.MEW.010.7 GENERAL

Handrailing, ladders, stairs and flooring shall comply with the following requirements:

1. The position and height of handrailing shall be within 10 mm of the specified position and height;
2. The level of the top rung of ladders and the top tread of stairs shall be within 75 mm of the specified level;
3. The level of flooring and curbs shall be within 3 mm of the specified level.
TOL.MRY - MASONRY WALLING

TOL.MRY.010.7 GENERAL

1. Rubble stone walling shall comply with the following requirements:
   a. The position on plan shall be within 25 mm of the specified position;
   b. The length shall be within 25 mm of the specified length;
   c. The height shall be within 25 mm of the specified height;
   d. The level of bed joints shall be within 25 mm of the specified level in any 5 m length;
   e. The walling shall be straight to within 25 mm in any 5 m length;
   f. The walling shall be vertical to within 20 mm in any 3 m height.

2. Ashlar stone walling shall comply with the following requirements:
   a. The position on plan shall be within 15 mm of the specified position;
   b. The length shall be within 15 mm of the specified length;
   c. The height shall be within 10 mm of the specified height;
   d. The level of bed joints shall be within 10 mm of the specified level in any 5 m length;
   e. The walling shall be straight to within 15 mm in any 5 m length;
   f. The walling shall be vertical to within 15 mm in any 3 m height.

TOL.PSC - PRESTRESSING CONCRETE

TOL.PSC.010.7  TOLERANCES

The lines of prestressing sheaths shall be within 5 mm of the specified line.
TOL.SLO - SLOPE TREATMENT WORKS

SOIL-CEMENT FILLING

TOL.SLO.010.7 COMPACTATION

1. The tolerance on the optimum moisture content percentage shall be ±3.

SOIL NAILING

TOL.SLO.110.7 GENERAL

The installation of soil nails shall comply with the following dimensional tolerances:

1. The permitted deviation of drillholes shall be within ±2º to the specified vertical and horizontal alignments;

2. The nominal diameter of the centralizers shall not differ from the specified diameter of the drillhole by more than 10mm.
TOL.STR1 - STRUCTURAL STEEL

FABRICATION OF STEELWORK

TOL.STR1.010.7 CRITICAL DIMENSIONS AFFECTING REPETITION OR INTERCHANGEABILITY OF UNITS

Carry out fabrication so that the critical dimensions, when measured by a tape calibrated at 20°C, comply with the tolerances given in the Table below:

<table>
<thead>
<tr>
<th>Dimension Measured</th>
<th>Tolerance for Single Element</th>
<th>Tolerance on overall dimension of assembled system of more than one</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not exceeding 5 m</td>
<td>±3 mm</td>

<tr>
<td>Exceeding 10 m but not exceeding 15 m</td>
<td>±5 mm</td>
<td>±10 mm</td>
</tr>
<tr>
<td>Exceeding 15 m</td>
<td>±10 mm</td>
<td>±10 mm</td>
</tr>
</tbody>
</table>

TOL.STR1.020.7 DETAILED DIMENSIONS

Comply with the fabrication tolerances in the following British Standard and Code of Practice:

1. BS 5400:Part 6:1980 for plates and sections in bridgework;
2. The Code of Practice for the Structural Use of Steel 2011 for hot rolled sections and cold rolled sections in building.

ERECTION OF STEELWORK

TOL.STR1.110.7 CAST-IN FOUNDATION BOLTS

Tilt of bolts to be not more than 1 in 40 from specified line.

TOL.STR1.120.7 ERECTION TOLERANCES

After lining, levelling, plumbing and making the permanent connections:

1. Level of the top of base plates and level of the lower end of vertical or raking components in a pocket: PD from specified levels: ......................... ±10 mm
2. PD from line of vertical or raking components other than portal frames:
   a. .............................................................. 1 in 600
   or
   b. From specified line in every direction: ........... 10 mm
3. PD from line of vertical or raking components in portal frames:
   a. ................................................................. 1 in 600
   or
   b. From specified line normal to the plane of the frame: ................................... ±10 mm

4. The position and level of components connected with other components: PD from the specified position and level at point of connect: ............... 5 mm

5. The difference in level between adjacent sloping or horizontal components connected by a deck slab: PD from specified difference in level: ........... ±10 mm
TOL.STW - STEELWORK

TOL.STW.010.7  FABRICATION TOLERANCES GENERALLY
Fabrication tolerances for steelwork shall comply with BS 5950:Part 2:1992, Sub-section 7.2 as appropriate.

TOL.STW.020.7  FABRICATION TOLERANCES FOR BRIDGEWORKS
Fabrication tolerances shall comply with BS 5400:Part 6:1980, Clause 4.2.

TOL.STW.030.7  FOUNDATION BOLTS
The position of cast-in foundation bolts at the top of base plates shall be within 3 mm of the specified position. The position of foundation bolts in bolt pockets at the top of base plates shall be within 5 mm of the specified position. The line of bolts shall not be tilted from the specified line by more than 1 in 40.

TOL.STW.040.7  ERECTION TOLERANCES
After lining, levelling, plumbing and making the permanent connections, steelwork shall be erected to within the following tolerances:
1. The position in plan of vertical components at the base shall be within 10 mm of the specified position;
2. The level of the top of base plates and the level of the lower end of vertical or raking components in a pocket based shall be within 10 mm of the specified level;
3. The thickness of bedding shall be within one-third of the nominal thickness or 10 mm, whichever is less, of the specified nominal thickness;
4. The line of vertical or raking components other than in portal frames shall be within 1 in 600 and within 10 mm of the specified line in every direction;
5. The line of vertical or raking components in portal frames shall be with 1 in 600 and within 10 mm of the specified line normal to the plane of the frame;
6. The position and level of components connected with other components shall be within 5 mm of the specified position and level relative to the other components at the point of connection;
7. The position of components supported on a bearing shall be within 5 mm of the specified position relative to the bearing along both principal axes of the bearing;
8. The difference in level between adjacent slopping or horizontal components connected by a deck slab shall be within 10 mm of the specified difference in level.
TOL.WSP - WATER SUPPLY PIPEWORK

TOL.WSP.010.7  LINE AND LEVEL

The line and level of pipelines for water supply pipeworks shall be within 25 mm of the specified line and level.

DEMOLISHING STRUCTURES

GENERAL

DEMOLITION SUB-CONTRACTOR

INFORMATION ON DEMOLITION SUB-CONTRACT

In the event that parts of the demolition works are to be sub-contracted in accordance with PRE.B6.035, submit with the tender the following information:

1. Letter of intent from the proposed sub-contractor whom the tenderer intends to employ for the Contract should the tenderer be awarded the Contract, indicating his willingness to carry out the proposed parts of the demolition works;
2. The names of the directors or sole proprietor and site representatives of the proposed sub-contractor;
3. The activity and the scope of the proposed sub-contract.

CONDITIONS ON DEMOLITION SUB-CONTRACT

1. In the event that parts of demolition works are to be sub-contracted in accordance with PRE.B6.035, incorporate the following conditions into the sub-contract:
   a. The activity and the scope of the sub-contract;
   b. The sub-contractor is not allowed to sub-contract the demolition works;
   c. The sub-contractor is not allowed to sub-contract more than one tier the following works:
      i. Scaffolding;
      ii. Mechanical handling and lifting (for tower crane only);
      iii. Mechanical plant and equipment for demolition works.
   d. A probity clause shall be included in the sub-contract such that:
      "If the sub-contractor or any of his agents or employees are found to have offered or given advantage, gratuity, bonus, discount, bribe or loan of any sort to any agent or employee of the Contractor, Hong Kong Housing Authority or Housing Department, the Contractor shall at liberty forthwith terminate the employment of the sub-contractor under the sub-contract. The Contractor, Hong Kong Housing Authority or Housing Department shall hold the sub-contractor liable for any loss or damage which the Contractor, Hong Kong Housing Authority or Housing Department may thereby sustain."
2. Before execution of the sub-contract works, submit to the CM a signed copy of the sub-contract or written confirmation signed by the Contractor and the sub-contractor confirming that the conditions stated in sub-clause (1) above have been included into the sub-contract.
DESIGN

GENERAL

DEM1.D010.7 EXISTING INFORMATION
1. The information on the structure to be demolished as contained in the Contract is given in good faith and without prejudice to the Contractor's liability under the Contract;
2. The demolition plan for the preparation of the method statements, which is issued as a reference for adoption or proposed deviation as per DEM1.D220, is specified in Project Specific Specification.

DEM1.D020.7 CONTRACTOR'S RESPONSIBILITY
Accept sole responsibility for the execution of the demolition works including but not limited to the preparation of the method statements as specified in DEM1.D220 notwithstanding that such method statements may have followed the demolition plan which is for reference only.

DEM1.D030.7 STANDARDS AND STATUTORY REQUIREMENTS
1. Comply with all requirements relevant to demolition works issued by the Government of HKSAR and/or statutory authorities;
2. Where this Specification includes provisions additional to, or more stringent than those of the Building Regulations, the provisions of this Specification will prevail overall.

DEM1.D040.7 NON-COMPLIANCE
1. In the event of non-compliance with the restrictions specified regarding the method of demolition to be employed and the sequence of operations to be followed, an Instruction to cease work may be issued by the CM;
2. Bear any extra time or cost compensation in respect of or resulting from such Instruction to cease work.

DEM1.D050.7 REGISTERED STRUCTURAL ENGINEER & REGISTERED GEOTECHNICAL ENGINEER
1. Appoint a Registered Structural Engineer (RSE) registered under Buildings Department for the preparation and endorsement of the method statements, with drawings and design calculation, and any other submissions as required by this Specification;
2. The duties and roles of the RSE include but not limited to:
   a. Take up the full design responsibility for method statements and all related drawings and calculation as required under this Specification;
   b. Take up the role of Contractor's Representative and the highest grade TCP in the Contractor's Stream under SSP;
   c. Check that assumptions made in the design of temporary works and method statements are validated on Site;
   d. Prepare a risk assessment report with the Safety Officer including an inspection schedule for all staff such as RSE, site engineer, Safety Officer, site agent, site supervisor/foreman on all critical activities in demolition work;
e. Pay regular site visits for proper control of the works and submit reports after each visit to certify the work is safe;

f. Carry out inspection on other activities which, in his professional judgement, are critical and require close supervision.

3. The frequency of RSE’s visits shall be a minimum of two visits per each month;

4. In case of change of RSE, the new RSE has to endorse and re-submit the method statements prepared by the former RSE and take up the role of Contractor’s Representative and the highest grade TCP in the Contractor’s Stream under SSP;

5. Appoint a Registered Geotechnical Engineer (RGE) registered under Buildings Department for the preparation and endorsement of the geotechnical report/supporting documentation for the submissions as mentioned in above sub-clause (1).

SURVEY AND PREPARATORY WORK

DEM1.D110.7 SURVEY
Prior to commencement of Work,

1. Visit the Site and inspect the appropriate drawings and demolition plan as issued by the CM to ascertain the extent and scope of the demolition works required;

2. Identify demolition procedures for any unconventional structural elements.

DEM1.D120.7 EXISTING SERVICES
Before commencement of demolition works,

1. Locate and identify position of existing services affected by the works;

2. Ensure all statutory authority's installations have been safely disconnected and associated fittings and equipment have been removed;

3. Be responsible for liaison with the relevant Government Departments and utilities companies for disconnecting existing utilities and services within the Site. Allow sufficient time in the programme for the utilities and services disconnections.

DEM1.D130.7 SURVEY ON MATERIALS WITH POTENTIAL DANGER

1. Within 14 days following the notified date for the commencement of the Works, carry out survey on the presence of wastewater, hazardous materials, matters arising from toxic chemicals, etc. and possible presence of materials which can contribute to contaminations on the environment;

2. Submit method of removal for CM's approval within 14 days in case of any of these materials being identified.

DEM1.D140.7 SURVEY ON MATERIALS TO BE COLLECTED/RECYCLED

1. Carry out a survey before the demolition process to ascertain the types and quantities of materials to be collected/recycled as specified in DEM1.M025;

2. Identify also the recovery/recycling companies or organizations for recovery and recycling of the materials other than those specified in DEM1.M025;

3. Submit the survey record for CM's approval within 21 days from the notified date for the commencement of the Works.
SUBMISSIONS

DEM1.D210.7 SUBMISSIONS PRIOR TO CONSENT APPLICATION
1. Submit three sets of the following documents to CM for approval at such date which shall be a date within 14 days after the notified date for commencement of the Works and minimum 42 days before application for consent of demolition works under DEM1.D230:
   a. SSP for the Contractor's Stream as specified in DEM1.W110;
   b. Method statements as specified in DEM1.D220.
2. Allow a minimum of 42 days for the first submission and a minimum of 37 days for any subsequent re-submission required for obtaining the Approval;
3. Allow sufficient time in the programme of Works for obtaining the said Approval and subsequent re-submissions.

DEM1.D220.7 METHOD STATEMENTS
1. Submit the method statements prepared and endorsed by the RSE and RGE according to DEM1.D050 for CM's approval. Details of the method statements shall be as specified in Project Specific Specification;
2. The method statements shall comply with this Specification and all statutory requirements relevant to demolition works;
3. The method statements shall also comply with the following codes:
   a. Code of Practice for Demolition of Buildings 2004 (CoPDem) issued by Buildings Department;
   b. Code of Practice for Bamboo Scaffolding Safety (CoPScaffold) issued by Labour Department;
   c. Code of Practice for Site Supervision 2009 (CoPSS) issued by Buildings Department.

DEM1.D230.7 CONSENT TO COMMENCE DEMOLITION WORKS
1. Submit the supporting documents specified in Project Specific Specification and allow a minimum of 21 days for granting the consent to commence demolition works;
2. Do not commence demolition works without a written consent from the CM and until all precautionary measures as stated in DEM1.W210 are complete.

DEM1.D240.7 COMMENCEMENT OF DEMOLITION WORKS
Notify the CM and submit Form ICU 10 after obtaining the consent and before commencing the demolition works.

DEM1.D250.7 COMPLETION OF DEMOLITION WORKS
1. For Contract without phased completion, submit Form ICU 14A to notify the CM of the completion of the demolition works as detailed in the demolition plan at least 18 days prior to the completion of the demolition works;
2. For Contract with phased completion and for each Section as per PRE.B4.080, submit Form ICU 14A to notify the CM of the completion of the demolition works as detailed in the demolition plan at least 18 days prior to the completion of the demolition works in that Section.
MATERIALS

MATERIALS ARISING FROM THE DEMOLITION WORKS

DEM1.M010.7 MATERIALS NOT REQUIRED FOR RE-USE

Unless otherwise specified at DEM1.M020, all materials arising from demolition including electric light fittings, fans, water heaters etc. and all playground equipment, which are to be removed from Site as work proceeds, are property of the Contractor.

DEM1.M020.7 MATERIALS REQUIRED BY THE AUTHORITY

Materials which are remained the property of the Authority are specified in the Project Specific Specification.

DEM1.M025.7 MATERIAL TO BE COLLECTED/RECYCLED

Materials to be collected/recycled are specified in the Project Specific Specification.

DEM1.M030.7 HARDCORE

Brick rubble or other hard materials as sub-clause (2) of EAR1.M240 arising from the demolition may be re-used as hardcore.

DEM1.M040.7 EXCAVATED MATERIALS SUITABLE FOR FILLING

1. Unless certified otherwise by the CM, all materials excavated are deemed suitable for filling purposes;

2. The CM's decision regarding the suitability of excavated materials for filling purposes applies only to this Contract and only to the extent that such opinion is not subsequently changed.
WORKMANSHIP

GENERAL

DEM1.W010.7 SEQUENCE
1. Do not proceed with the demolition of the building and associated structures before all reusable and recyclable materials as specified in DEM1.M025 are removed from the building or the structure;
2. Unless otherwise approved by the CM, carry out demolition work on a floor to floor basis commencing at roof/top floor level as applicable;
3. Do not dismantle any existing steel props forming part of the structural strengthening works in a floor prior to the demolition of that floor;
4. Ensure all operators and workers involved understand clearly the method and sequence of demolition. Draw sketches with explanation in Chinese illustrating the work sequences and post them in a conspicuous position on Site.

DEM1.W020.7 METHODS OF DEMOLITION
1. Use only hand held equipment for the salvage of reusable and recyclable materials from structures;
2. Use of the following demolition methods will not be permitted:
   a. 'Swinging ball';
   b. 'Drop ball';
   c. 'Blasting'.

SUPERVISION

DEM1.W110.7 SITE SUPERVISION PLAN
1. The SSP shall comply in all respects with the requirements stated in the TMSP and CoPSS;
2. Complete and submit Form ICU206 for the SSP for demolition works under the Contractor's Stream in accordance with TMSP, and the CoPSS;
3. The submitted SSP shall include the following additional safety supervision requirements at critical stages of the works unless otherwise approved by the CM:

<table>
<thead>
<tr>
<th>Critical Stages of the Works</th>
<th>Contractor's Stream</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>AS</td>
</tr>
<tr>
<td>Cantilevered Structures</td>
<td>Bi-weekly</td>
</tr>
<tr>
<td>Factory Block</td>
<td>Bi-weekly</td>
</tr>
</tbody>
</table>

Note: As specified in DEM1.D050, the RSE shall take up the role of Contractor's Representative (CR) and the highest grade TCP in Contractor's Stream under SSP.
DEM1.W120.7  **TECHNICALLY COMPETENT PERSONS**

1. Appoint TCPs under the Contractor's Stream for demolition works as per the submitted Site Supervision Plan required in DEM1.W110 for the duration of the Contract;

2. The appointed TCP shall oversee the entire process of demolition works and whose duties include but not limited to:
   a. Inspect precautionary measures;
   b. Ensure effectiveness of propping system; and;
   c. Prevent overloading of floors;

3. Post details of appointed TCPs in the specified Form ICU20 in a prominent position adjacent the Works.

DEM1.W130.7  **FLAGMAN**

During removal of demolition material arrange for a flagman to be in attendance at each site entrance and exit used for this purpose.

DEM1.W140.7  **SITE VIDEO RECORDING SYSTEM**

1. Provide, operate and maintain, including all necessary cables, wirings, lightings and other accessories, a video recording system to record the entire demolition process with the following essential features:
   a. The video cameras used in the system should be of high resolution, lowlight and colour type;
   b. Power backup should be provided to cater for accidental breakdown of the power supply to the system;
   c. Videos captured by the system shall be recorded continuously without break unless agreed by the CM; and
   d. Videos shall be captured in a format acceptable to CM.

2. Install a minimum number of video cameras per block at strategic locations as specified in Project Specific Specification. Re-locate the video cameras from time to time to suit the progress of the demolition works as instructed by the CM;

3. Securely protect the video cameras from being damaged or blocked so that the entire demolition process including movement of debris and the overall sequences of demolition can be recorded;

4. Design and construct all necessary temporary works, including any supporting frames and protections, for the video cameras and their accessories, even at high level;

5. Provide the software and hardware for CM's viewing the recorded videos and keep the videos for at least 14 days;

6. Post sufficient notices at conspicuous positions to notify the workers and staff about the purpose of video recording system in accordance with Data Protection Principles set out in the Personal Data (Privacy) Ordinance.

**SAFETY AND PROTECTION**

DEM1.W210.7  **PRECAUTIONARY MEASURES**

1. Carry out necessary surveys as the demolition proceeds to detect hazards resulting from the activities and inform the CM forthwith;
2. In the salvage of reusable and recyclable materials, do not use cutting torches until the work area is cleared of flammable materials. Maintain portable fire-suppression devices during flame-cutting operations, and maintain adequate ventilation when using cutting torches;

3. Do not commence demolition works until the following procedures and works are complete:
   a. Removal of the reusable and recyclable materials as specified in DEM1.M025 from structures;
   b. Granting of written consent by the CM as specified in DEM1.D230;
   c. Erection of hoardings, covered walkways, etc as specified in PRE.B10.710 to PRE.B10.730;
   d. Erection of shoring, strutting, protective screening etc as specified in PRE.B8.875, DEM1.W220 and DEM1.W230;
   e. Removal of all asbestos containing materials and provision of associated protective works as specified in Worksection DEM2 in individual building blocks or structures prior to the demolition of those individual building blocks or structures;
   f. Provision of water supply at points of demolition works action as specified in PRE.B8 and to CM's satisfaction;
   g. Installation of debris chutes outlet enclosures as specified in PRE.B8 and to CM's satisfaction;
   h. Disconnection and termination of all utility services as specified in DEM1.D120;
   i. Sealing all sewers and drainage connection to prevent building debris, soil and etc. from entering public sewers and drains.

DEM1.W220.7   SHORING AND STRUTTING
1. Provide, maintain, alter and adapt all temporary supports and strutting of adequate strength to support walls, floors, roofs etc and ensure safety of the public, operatives and adjoining property;
2. Submit details of the proposed methods of support designed by Registered Structural Engineer for CM's approval unless specified otherwise by the CM;
3. Remove all temporary supports on completion and make good to works disturbed.

DEM1.W230.7   PROTECTION OF ADJOINING AREAS
1. Protect adjoining areas from the risk of falling debris with a protective screen enclosure encasing the whole building to be demolished;
2. Protect adjoining areas from the risk of fire by the followings:
   a. Provide and properly maintain a sufficient number of portable fire fighting appliances during the course of demolition works: minimum 1 fire extinguisher and 2 buckets of sand in each staircase on each floor;
   b. Provide and maintain the water supply including the installation of water tank, pump or apparatus as necessary for sprinkling the working floor continually to suppress risk of fire when flame cutting is carried out within 5 m from the scaffolding; and
   c. Provide full time supervision by a competent supervisor when flame cutting is carried out within 5 m from the scaffolding.
3. Employ a Registered Structural Engineer to prepare design and method statement for scaffolding, catch platform, covered walkway with steel catch platform, protective canopy, etc. for submission to CM's approval. Their design and construction shall include but not limited to:

a. 
   i. Unless otherwise specified in Project Specific Specification, construct screen with ordinary tarpaulin sheets supported by adequately sized bamboo scaffolding or other framework and erected according to the Construction Sites (Safety) Regulations and the Code of Practice for Bamboo Scaffolding Safety (CoPScaffold);
   ii. Provide fire-retardant tarpaulin sheets instead of ordinary tarpaulin sheets to the faces of the blocks as specified in Project Specific Specification;
   iii. The fire-retardant tarpaulin sheets shall be light weight and constructed of fire retardant materials meeting one of the following requirements:
      - Class B material as specified in BS 5867; or
      - Flame retardant test for certain items, light weight cloths methods, provided by the Fire Retardant Regulations for Protective Canvas for Construction, Japan Ministerial Ordinance of the Ministry of Home Affair; or
      - Any equivalent standard criteria or testing approved by the CM.

b. 
   i. Unless otherwise specified in the Project Specific Specification, construct bamboo scaffolding in single row;
   ii. Construct bamboo scaffolding in double row for the faces of the blocks as specified in Project Specific Specification.

c. Maintain height of screen at a minimum level of 1000 mm above the structure being demolished;

d. Construct screen in 3 layers, with minimum overlapping width of 300 mm, and fix screen to the frame at regular intervals - the innermost net of minimum 3.5 mm diameter heavy duty nylon (maximum mesh grid opening 50 mm), tarpaulin sheet and the outermost nylon net of minimum 1.0 mm diameter (maximum mesh grid opening 20 mm), all materials use shall resist ultra-violet light deterioration;

e. For scaffoldings higher than 15 m above the ground floor level, provide steel brackets anchored to the existing structure or other support system at interval of not more than 15 m to support the scaffolding;

f. Tie scaffolding to the buildings at intervals of not more than 4 m in both horizontal and vertical directions to firm supports to guard against storms/typhoon. Check ties effectively restraining scaffolding at all times, particularly before and after storms/typhoons;

g. Dismantling of the scaffolds shall coincide with the demolition progress. When the wall ties are disconnected due to the demolition of the building structure, the unsecured section of the scaffoldings shall be removed accordingly. In all times, the unbraced sections shall not be higher than 2 m from the nearest anchor;

h. Inspect and reinstate the ties for scaffolding if any of the ties are fixed onto materials or fixtures specified in DEM1.M025.

4. Provide additional protective canopy for blocks close to the streets as specified in Project Specific Specification;

5. Carry out vibration monitoring at locations specified by the CM during demolition and the peak particle velocities at these locations specified shall not exceed 15 mm/sec for prolonged vibration caused by mechanical demolition;
6. Maintain safe ingress and egress for adjoining properties at all the times.

**DEM1.W240.7 CATCHFAN**

1. Construct catchfan as specified in Project Specific Specification to prevent fall of demolition debris around perimeter of building under demolition;
2. Construct catchfan at a vertical distance of not more than 10 m below the working floor;
3. Erect sloping catchfan with a horizontal extension of at least 1500 mm from the exterior face of the scaffold;
4. The typical angle of inclination shall be 20° to 45° from the horizontal plane.

**DEM1.W250.7 SUPPORTING EXISTING STRUCTURES**

1. Support existing structures as necessary during cutting of new openings or replacement of structural members;
2. Prior to commencement of works, submit details of all intended arrangements for structural support designed by Registered Structural Engineer for CM's approval;
3. Do not remove supports until new work is capable of carrying all loads.

**DEM1.W260.7 PARTLY DEMOLISHED STRUCTURES**

Leave the Site and partly demolished structures in a safe condition at the end of each day's work. No accumulation of debris, particularly at working floors and at ground floor, which causes excessive pressure on the floors, slopes, retaining structures, hoardings/covered walkways and walls of adjoining buildings.

**DEM1.W270.7 WEATHERPROOFING RETAINED AREAS OF PARTIALLY DEMOLISHED BUILDINGS**

1. Protect retained building structure and interiors exposed during course of demolition works with a temporary weather-tight screen erected 1000 mm back from perimeter edge of floor;
2. Construct screens with close boarding fixed to framing and faced outside with roofing felt of an Approved type;
3. Cover the exposed floor beyond the screening with roofing felt of similar type to that used to face screens;
4. Form a waterproof seal between floor and screen;
5. Construct doors in the screens and fix with secure fastenings and hanging devices as necessary to provide authorised access.

**DEM1.W280.7 PREVENTION OF OVERLOADING**

1. Do not overload the structure under demolition with the reusable and recyclable materials, demolition plant and/or resulting debris;
2. Provide temporary shoring and strutting in accordance with the demolition plan or Approved method statement;
3. Bear all costs of temporary shoring or strutting required;
4. Maximum weight of mobile equipment on suspended floors is not to exceed 11,600 kg. The use of plants heavier than 11,600 kg are subject to the requirements of sub-clause (2) above and CM's approval;
5. Unless approved by the CM, the minimum number of consecutive floors required to distribute mobile equipment loading through popping is 5;
6. Unless approved by the CM, the minimum number of consecutive floors required to distribute localize loading from temporary ramp through propping is 5;

7. Maximum spacing of steel props in each direction is 1.2 m;

8. Use steel props of minimum bearing capacity 25 kN (45 kN for local area under temporary ramp);

9. Secure and wedge tight top and bottom supports of props. Fix bracings/ties to the props to provide lateral restraints in at least two directions;

10. Do not allow mobile equipment to move to within 2 m of the building edge, 1 m of any floor opening or on to any cantilevered structures;

11. Provide adequate spreader for props bearing on ground, where necessary, to avoid any undue settlement.

DEM1.W290.7 OVERHEAD WIRES
Prevent damage to overhead wires during demolition operations.

DEM1.W300.7 RISK OF FIRE OR EXPLOSION
Take precautions to prevent fire or explosion from gas or vapour release, electricity or any other source, especially when removing tanks or pipes which may have contained flammable liquids or gases.

DEM1.W310.7 DAILY SITE INSPECTION IN THE MORNING
1. Do not commence any demolition works on each day unless the daily morning site inspection has been carried out by the Safety Officer and the TCP(s) specified in the SSP;

2. Submit to CM a plan, including the inspection route(s), check list(s) and the name of Safety Officer and TCP(s), for carrying out the daily morning site inspection;

3. Revise the plan from time to time to suit the actual site progress and resource.

DEM1.W320.7 INDUCTION TRAINING
1. Implement a site specific induction training system to ensure that all workers and machine operators fully understand the demolition sequences and precautionary measures before allowing them to work on Site;

2. Keep a proper record of the trained workers/operators and submit to CM monthly.

DEM1.W330.7 CLEAR EMERGENCY ACCESS
Maintain at all times at least one clear emergency access at the working floor during demolition for the safe passage of all personnel.

DEM1.W340.7 ROUTINE DAILY SITE INSPECTION BY CM
During demolition works, CM may carry out routine site inspection at any time during each working day. For safety reason, the demolition works, in particular those on working floors, may be required to be temporarily suspended if instructed by CM. Allow time and cost for the routine site inspection of CM. No claim whatsoever will be entertained for the interruption, if any, of the demolition works.
DEMOLITION WORKS

DEM1.W410.7 SORTING PROCESSING AND REMOVAL OF DEMOLITION MATERIAL
1. Submit a method statement to the CM indicating proposed sorting and processing method;
2. Unless specified otherwise, sort and process the materials to be collected or recycled arising from the demolition works;
3. Separate out all timber, steel, rubbish, materials to be collected/recycled as specified in DEM1.M025 and other decomposable material;
4. Arrange for collection and removal of the materials to be collected/recycled off site in accordance with their types as specified in DEM1.M025;
5. Break down large sized demolition fragments of building debris to 250 mm maximum size all round;
6. Remove materials arising from demolition from site as work proceeds; and
7. Submit the name of recycle collection companies and their collection receipt for record.

DEM1.W420.7 DISMANTLING AND STORAGE OF MATERIALS REQUIRED BY THE AUTHORITY
Carefully dismantle and remove to store materials specified at DEM1.M020.

DEM1.W430.7 UNDERGROUND FEATURES
Report to CM details of any underground tanks, wells etc discovered during demolition works and await his Instructions.

DEM1.W440.7 DISUSED DRAIN AND MANHOLES
Allow disused drains to vent built-up gases before proceeding with works below ground level as follows:
1. Pipework: plug ends of disused drains by filling bore with 15/20 grade concrete 150 mm or diameter of pipe if greater;
2. Manholes: plug ends of pipes as sub-clause (1) above. Break up top 300 mm of chamber and fill void with hardcore.

DEM1.W450.7 SORTING AND REMOVAL OF EXCAVATED MATERIAL
1. Sort suitable and unsuitable materials into separate temporary spoil heaps in locations agreed with the CM;
2. Remove unsuitable materials from site as work proceeds.

DEM1.W460.7 FILLING voids
1. After excavation, backfill and compact voids with suitable material such as Approved excavated material and/or general filling material as specified in EAR1;
2. Level to adjacent paving level with compacted hardcore 100 mm thick;
3. Do not use unsuitable materials such as salvaged materials or debris arising from demolition for backfilling;
4. The opinion of the CM as to the suitability of filling materials applies to the Contract only and only to the extent that such opinion is not subsequently changed.
DEM1.W470.7 LEVELLING

Unless otherwise instructed, level off the site to the satisfaction of CM on completion of the work.

DEM1.W480.7 REQUIREMENT FOR STUDIES DURING CONTRACT PERIOD

1. Carry out as instructed structural monitoring, non-destructive testing, concrete cores extraction, concrete sampling and exposures, and partial or full cutting of reinforcement bars;
2. Provide adequate water, electricity supply and temporary falsework;
3. Construct temporary falsework capable of sustaining the self-weight of the canopy for designated area underneath first floor canopy, as instructed by CM.

DEM1.W490.7 STRUCTURE SUPPORTING GROUND

1. Where adjacent land or building may be affected, submit temporary support details prepared by Registered Structural Engineer for CM’s approval;
2. Submit detailed temporary support system prepared by Registered Structural Engineer for CM’s approval where the retaining structure is:
   a. Higher than 3 m in height; and
   b. Liable to affect any road, building, structure, slope steeper than 30° or water mains 75 mm in diameter or greater, the affected area being defined as within the 45° line up from the retaining wall base to the ground surface at wall crest.

DEM1.W500.7 OPERATION OF POWERED MECHANICAL PLANT OR EQUIPMENT

1. Operate mechanical plant or equipment for demolition work by competent operators under the immediate supervision of a TCP as specified in DEM1.W120;
2. Submit full details including names, addresses, qualifications and experience of these operators for applying the consent to commence demolition works under DEM1.D220;
3. The operators of powered mechanical plant or equipment used in demolition works shall meet the requirements as specified in Building (Demolition Works) Regulations, Clause 9 (3);
4. The operators shall have completed a training course in "Demolition of Building Course for Plant Operators" organized by the Construction Industry Training Authority (CITA) and obtained the relevant certificate and shall have at least three years experience in operating the particular plant or equipment. Equivalent training and certificates issued by a recognised examining body may also be favourably considered by the CM for meeting the requirement;
5. Notify the CM within 7 days of the change in the appointment of the operator and provide the personal particulars, qualifications and experience of the new operator.

DEM1.W510.7 REMOVAL OF PART OF A BUILDING

Where the removal of a part of a building or structure may result in another part of the building, adjoining slope, retaining wall or land becoming unsafe, submit a temporary support proposal prepared by Registered Structural Engineer. Support external features, enclosure walls, parapets and cantilevered construction such as canopies, cornices and balconies before the anchorage or holding down load is removed.
DISPOSAL OF MATERIALS TO BE COLLECTED/RECYCLED OFF SITE

1. Provide sufficient space within the Site for the storage of the materials to be collected/recycled specified in DEM1.M025 before removing them from the Site;

2. Produce a Material for Salvage Form (MSF) for each and every vehicular trip transporting reusable and recyclable materials as follows:
   a. Propose the format of the MSF for CM’s agreement;
   b. The MSF shall contain the following information:
      i. Contract title, Name of Contractor, Contract No.;
      ii. Location of Site;
      iii. The name of the recovery/recycling company;
      iv. The vehicle registration number;
      v. Approximate load;
      vi. Type of salvaged materials;
      vii. Time of departure.
   c. Complete the MSF in duplicate except for the entry of the "time of departure" before leaving the Site.

3. Prior to the vehicle leaving the Site, present to the site supervisory staff of the CM the completed Form for inserting the time of departure and signing. Forward a copy of the MSF to the site supervisory staff for record;

4. Employ a contractor, who shall be a recovery/recycling company listed in the "Directory of Recovery/Recycling Companies in Hong Kong” maintained by the Environmental Protection Department of the Government of the Hong Kong Special Administrative Region, to salvage the reusable and recyclable materials; and

5. All materials to be collected/recycled shall become the property of the Contractor when they are removed from the site.
ASBESTOS REMOVAL

MATERIALS

DEFINITIONS

GENERAL

Where used in this Worksection the following definitions apply. Words in upper case italics within the definitions indicate that a separated definition is provided.

DEFINITIONS AND EXPLANATORY NOTES

1. ABATEMENT: all procedures taken to control fibre release during removal, encapsulation, enclosure and repair of ASBESTOS CONTAINING MATERIALS;

2. AGGRESSIVE SAMPLING: method of sampling in which the individual collecting the air sample uses mechanical equipment to stir settled dust and simulate normal activity in the sample area;

3. AIRLOCK: a system permitting entrance and exit whilst restricting air movement between contaminated and uncontaminated areas. Consisting of two curtained doorways at least 1 m apart to allow the doorway sheeting to overlap and close off the opening before proceeding through the second doorway, thereby preventing flow-through contamination. (See also HYGIENE UNIT);

4. AIR MONITORING: the measurement or determination of airborne ASBESTOS fibre concentrations in the air at specific locations;

5. AIR MOVER: a portable exhaust system equipped with HEPA filter capable of creating a negative pressure differential of at least 15 Pa and 6 air changes per hour between the outside and inside of the CONTAINMENT;

6. AIR SAMPLING: the process of measuring the fibre content of a known volume of air during a specific period of time, complying with the NIOSH Standard Analytical Method, the UK EH10 coupled with MDHS 39/3 or an updated method specified by the Authority; or methods accredited under HOKLAS which are laid down in the laboratory manual;

7. AMBIENT AIR MONITORING: the measurement or determination of airborne ASBESTOS fibre concentrations within the vicinity of the Site;

8. AMENDED WATER: water to which a saturated solution of a WETTING AGENT has been added;

9. AREA AIR SAMPLING: the method of AIR SAMPLING where the sampling equipment is situated at a stationary location within the contaminated WORK AREA;

10. ASBESTOS CONTAINING MATERIAL (ACM): ASBESTOS or any material/product containing greater than 1% asbestos by weight;

11. ASBESTOS CONTAINING WASTE MATERIAL: ACM or materials contaminated with asbestos which requires disposal;

12. ASBESTOS: the minerals chrysotile, amosite, crocidolite, fibrous tremolite, fibrous anthophyllite and fibrous actinolite or substances containing such minerals;

13. BACKGROUND MONITORING: the measurement or determination of airborne ASBESTOS fibre concentrations within the Site and outside the building prior to commencement of the work as follows:
a. Sampler: an air sampling pump fitted with an Approved type cowl;

b. Filter: 25 mm cellulose ester filter of pore size 0.8 - 1.2 µm;

c. Sampling pump: a battery-run or mains-run pump capable of maintaining a low rate of at least 2 litres per minute for at least 4 hours;

d. Sampling point:
   i. A minimum of 2 samples, or as specified in the individual air monitoring strategy (depending on the size of the site), taken on different sides of the contained/segregated work area;
   ii. Samples taken as close to the work site as possible, of the area where those not involved in the abatement works are likely to pass or occupy;
   iii. Sampling locations shall be as far as possible the same as the ENVIRONMENT SAMPLES.

e. Sampling rate: a minimum of 2 litres per minute taken with a calibrated pump and checked with a calibrated rotameter equivalent flow measurement device regularly during the sampling period;

f. Sampling time: not less than 4 hours.

14. BACKGROUND SAMPLE: a sample taken prior to commencement of the asbestos removal works;

15. CLEAN ROOM/END: an uncontaminated area or room within the HYGIENE UNIT with the provision for storage of personal clothing and protective equipment;

16. CLEARANCE AIR MONITORING: the employment of AGGRESSIVE SAMPLING techniques with a volume of air, collected to determine the airborne concentration of residual fibres, performed as the final abatement activity, using the following:
   a. Sampler: an air sampling pump with an Approved type of cowl;
   b. Filter: 25 mm cellulose ester filter of pore size 0.8-1.2 µm;
   c. Sampling pump: battery-run or mains-run pump capable of maintaining a flow of at least 4 litres per minute for 4 hours;
   d. Sampling point:
      i. Static;
      ii. A minimum of 1 sample for an area up to 8 m² and 2 samples for an area between 8-25 m²;
      iii. One further sample for each additional 25 m²;
      iv. If the enclosure is higher than 2 m, the above should be converted to a volume criteria e.g.:
         2 samples for the first 75 m³ and one further sample for each additional 75 m³;
      v. If the contained space is further subdivided by larger pieces of equipment or walls take more samples than specified above;
      vi. Position sampler 1-2 m above the floor with the cowl pointing downwards;
      vii. Sampling is to be aggressive, see item (2) above;
      viii. Do not proceed with air sampling if debris is visible within the work area.

(The sampling point and number of samples required are dependent upon the site layout and the Air Monitoring Strategy agreed by the CM. The Guidelines on Air Monitoring included in each removal method of the ACM's are for reference only.)
e. Sampling rate: minimum of 4 litres per minute taken with a calibrated pump and checked, with a calibrated rotometer equivalent flow measurement device, regularly during the sampling period;

f. Sampling time: to be set to give a total sampling volume of a minimum of 480 litres;

g. Reporting: if more than 1 sample is taken, obtain results by pooling a minimum of 2 samples of at least 240 litres each, taken within 4 m of each other. Results may be taken simultaneously or one after another. At the evaluation state the same number of graticule areas are inspected on each filter and the counts combined to give one measurement based on at least 480 litres. If the total volume is 480 litres for two or more samples, 200 graticule areas must be examined on each filter. For larger volumes reduce the number of graticule areas to be counted proportionally.

17. CLEARANCE TEST SAMPLE: a sample taken after ASBESTOS has been removed to ascertain whether WORKING ZONE has been thoroughly decontaminated. A visual inspection to detect gross contamination must be carried out before one or more static samples are taken to establish the fibre level in the WORKING ZONE. Disturbance of surface dust is essential during the sampling period. When the clearance indicator shows a fibre level of 0.01 fibre/ml or below, the Working Zone can be declared fit for re-occupation. Where results exceed the clearance indicator, thoroughly re-clean the Working Zone and re-sample;

18. CONTAINMENT: a temporary timber or metal framed structure lined with 3 layers of 0.15 mm thick polythene sheeting to floors and walls, completely sealing off the work area. All sheet joints to be overlapping and properly sealed, with the innermost floor sheeting extending at least 500 mm up each wall surface;

19. CURTAINED DOORWAY: a device consisting of a minimum of 3 overlapping plastic sheets over an existing or temporarily framed doorway. The first sheet is fixed at the top and left side, the second at the top and right side and the third at the top and left side. Weights are to be attached to the bottom of all sheets to ensure that the sheets hang straight and maintain a seal over the doorway when not in use;

20. DECONTAMINATION FACILITIES: a series of connected rooms, separated from the WORK AREA and from each other by AIRLOCKS, used for the decontamination of operatives, materials, waste containers and equipment;

21. DEMOLITION: the dismantling or razing of a building, including all incidental operations (except asbestos removal);

22. DIRECT TESTING CONTRACTOR: a laboratory appointed by the CM and paid by the Authority to carry out asbestos associated tests;

23. DIRTY END: a contaminated area or room, which is part of the HYGIENE UNIT, with the provision to store contaminated clothing and equipment;

24. DISTURB: any action taken which may alter, change or stir, such as, but not limited to, the removal, encapsulation, enclosure or repair of any ASBESTOS CONTAINING MATERIAL;

25. ENCAPSULANT (SEALANT) OR ENCAPSULATING AGENT: a material applied to the ACM which temporarily controls the possible release of asbestos fibres from the material either by creating a membrane over the surface (bridging encapsulant) or by penetrating into the material and binding its components together (penetrating encapsulant). This may also be used to seal surfaces from which the ACM has been removed;

26. ENCAPSULATION: concealing the ACM either with a sealant, by cementitious rendering or by cladding, to prevent the release of asbestos fibres;

27. ENCLOSURE: the construction of airtight walls and ceilings between the ACM and the facility environment, around surfaces coated with ACM or any other appropriate procedure which prevents the release of asbestos fibres;
28. ENVIRONMENTAL SAMPLE: a sample taken in the vicinity of the asbestos work area, especially within occupied areas where the fibre levels may be higher than the general ambient level as a consequence of a failure of precautionary measures taken in the asbestos work area. Without any established ambient level standard, environmental samples are often compared to the clearance indicator in deciding whether significant environmental pollution has occurred around the work site. A flow rate of up to 8 litre/min may be used to achieve the desired fibre density on the filter:

a. Sampler: an air sampling pump with an Approved type of cowl;

b. Filter: 25 mm cellulose ester filter of pore size 0.8-1.2 µm;

c. Sampling pump: battery-run or mains-run pump capable of maintaining a flow rate of 2 litres per minute for a minimum of 4 hours;

d. Sampling point:
   i. A minimum of 2 samples, or as specified in the individual air monitoring strategy, taken on different sides of the contained/segregated work area;
   ii. Samples taken, as close to the work site as possible, of the area where those not involved in the abatement works are likely to pass or occupy.

e. Sampling rate: minimum of 2 litres per minute taken with a calibrated pump and checked, with a calibrated rotameter equivalent flow measurement device, regularly during the sampling period;

f. Sampling time: not less than 4 hours.

29. EQUIPMENT ROOM: see DIRTY END;

30. FIBRE: an acicular single crystal or a similarly elongated polycrystalline aggregate which displays resemblance to organic fibres, with properties such as flexibility, high aspect ratio, silky lustre, axial lineation and which has attained its shape primarily through growth rather than cleavage;

31. FIXED OBJECT: equipment or furniture within the WORK AREA which may not be removed;

32. FOAM METHOD: a method, used by the Housing Department, to remove asbestos-containing balcony grilles where the grilles are sandwiched between two plywood boards, the space between the two boards is injected with quick setting polyurethane foam allowing the grille to remain intact whilst being removed by chiselling the surrounding concrete;

33. FRIABLE ASBESTOS MATERIAL: any ASBESTOS or ACM which can be crumbled, pulverized or reduced when dry, by hand or a similar mechanical pressure;

34. GLOVE BAG METHOD: a method for removing friable asbestos-containing material from heating, ventilation and air conditioning ducts, short piping runs, valves, joints, elbows and other non-planar surfaces in a non-contained work area. The glove bag assembly is a manufactured device consisting of a glove bag (constructed of at least 0.15 mm thick transparent plastic), two inward-projecting long-sleeve gloves, one inward-projecting waterwand sleeve, an internal tool punch and an attached labelled receptacle for asbestos waste. The glove bag is constructed and installed in such a manner that it surrounds the object or area to be decontaminated and contains all asbestos fibres released during the removal process;

35. GLOVE METHOD: any method whereby a transparent, soft PVC structure equipped with integral gloves is used as mini-containment for small-scale asbestos removal. The glove method can be applied in the removal of balcony grille panels;

37. HEPA VACUUM EQUIPMENT: vacuuming equipment with HEPA;

38. HYGIENE UNIT:
   a. A 3 compartment, air-locked chamber comprising a DIRTY END, a shower area and a CLEAN END, constructed with timber frames, 0.15 mm thick opaque polythene sheeting and sealed with 75 mm adhesive tape;
   b. The Dirty End is separated from the shower area by a door. A further door separates the entry point. The Dirty End may be used as a temporary store for soiled equipment and footwear;
   c. The Clean End is separated from the shower area by a door. A further door separates the exit. The Clean End may be used as a temporary store for personal clothing. A mirror should be provided to ensure workers obtain a good facefit with the Respiratory Protective Equipment;
   d. All waste water must pass through an approved aquarium type or similar filter for removal of particles down to 5 microns in suspension before being discharged into the soil and waste drainage system;
   e. An induced draft should be introduced inside the Hygiene Unit to achieve an air flow from the Clean End to the Dirty End;
   f. A pre-fabricated Hygiene Unit may also be used to perform the same function;
   g. The Hygiene Unit and AIRLOCK are similar, although their names are derived from their different specific functions.

39. ISOLATION BARRIER: the construction of partitions, the placement of solid materials and the sealing of apertures to isolate the WORK AREA from the surrounding area, containing asbestos fibre release;

40. LEAK SAMPLE: static samples taken immediately outside the contained WORK AREA to ensure that dust generated within the contained area is not released into the surrounding environment.
   Criterion for leakage detection is generally the same as for the CLEARANCE INDICATOR and immediate remedial action must be taken should a leakage occur:
   a. Sampler: air sampling pump with an Approved type of cowl;
   b. Filter: 25 mm cellulose ester filter of pore size 0.8-1.2 µm;
   c. Sampling pump: battery-run or mains-run, capable of maintaining a minimum flow of 4 litres per minute for up to 4 hours;
   d. Sampling point: to be located in at least one of the following:
      i. 2 area samples outside CONTAINMENT in uncontaminated area of the premises but remote from the decontamination unit;
      ii. 1 area sample inside the clean room of the decontamination unit;
      iii. 1 area sample within 1500 mm from the unobstructed exhausted of the HEPA air mover.
   e. Sampling rate: 1 to 4 litres per minute taken, with a calibrated rotameter or equivalent flow measurement device, regularly during the sampling period;
   f. Sampling time: set to give a total sample volume of at least 480 litres.

41. LOG: a record of all activities that have occurred during the project also identifying the building owner, agent, Contractor, operatives and other information such as equipment malfunctions, contamination beyond the work area etc;
42. MATERIAL LOCK: a compartment attached to the CONTAINMENT provided for temporary storage and transit of asbestos abatement equipment and asbestos waste;

43. NEGATIVE AIR PRESSURE EQUIPMENT: see AIR MOVER;

44. NEGATIVE PRESSURE MONITOR: a monitoring device with an alarm setting and continuous print-outs and permanent record facility for monitoring of the negative pressure inside the CONTAINMENT;

45. OCCUPIED AREA: an area of the work site where no abatement work is taking place and where the use of PERSONAL PROTECTIVE EQUIPMENT is not required;

46. PENULTIMATE TEST SAMPLE: take air sample after final cleaning, when the innermost plastic layer, upon drying from the spraying of PVA, is removed and the second plastic sheeting HEPA vacuumed and wet-wiped. Employ an aggressive sampling technique and the acceptance limit is 0.01 fibre/ml;

47. PERSONAL AIR MONITORING: a method used to determine employees' exposure to airborne fibres. Samples are collected outside the respirator in the operative's breathing zone:
   a. Sampler: air sampling pump fitted with an approved cowl;
   b. Filter: 25 mm cellulose ester filter of pore size 0.8-1.2 µm;
   c. Sampling pump: battery-run, sampling pump to be carried on the operatives belt;
   d. Sampling point: sampler, fixed to operative's clothing and within the breathing zone (200 mm from nose and mouth). The cowl of the sample must point downwards;
   e. Sampling rate: 1 - 4 litres per minute checked, with a calibrated rotameter or equivalent flow measurement device, regularly during the sampling period;
   f. Sampling time: to be set according to the following criteria:
      i. To be a period of 4 hours. Where the level is higher, a shorter period must be used to avoid filter over-loading. This period must be long enough to be representative of the 4 hour period. Samples taken over several separate periods may also be used to calculate the 4 hour TWA value;
      ii. Minimum sampling time: 10 minutes; adjust the sampling time such that fibre density on the filter lies within 100 - 400 fibre/m²;
      iii. In order to test the respiratory protective equipment is adequate for the asbestos dust exposure, liaise with the Direct Testing Contractor to conduct the personal samples to measure the representative asbestos dust exposure, including the periods when the asbestos dust exposure are expected to be maximum.

48. PERSONAL PROTECTIVE EQUIPMENT: appropriate protective clothing e.g. gloves, eye protection, footwear, headgear and Approved respiratory equipment acceptable to the CM;

49. PERSONAL SAMPLES: an air sample taken as close to the breathing zone of an operative as possible, to indicate the ambient level of exposure. An appropriate amount of the work period should be covered either by continuous sampling or by short term samples. For known procedures which have been thoroughly evaluated before, such extensive sampling is not required but minimal batch samples can be taken to ensure that the levels of fibre release are indeed comparable:
   Sampling rate: 1 litre per minute;

50. RE-ASSURANCE SAMPLE: a sample taken in areas where Containment is not required or where it has been removed. See also CLEARANCE TEST;
51. REMOVAL: the stripping of any ACM from surfaces or components of a facility or taking out structural components;

52. REPLACEMENT MATERIAL: any material used to replace an ACM that does not contain ASBESTOS;

53. SECURE STORE: a buffer store for asbestos waste used prior to transportation to a dumping site. The store must be located close to the asbestos removal works, be weather-proof and structurally strong enough to withstand strong winds and accidental disturbances, with a lockable door/cover and posted with appropriate warning labels. It is preferable that a permanent space inside a building be converted into the Secure Store e.g. a refuse room, empty flat, empty bay with a temporary lockable door free of debris, dirt, objects and water accumulations. If located externally it may be a lockable metal skip adjacent to the building block and covered with tarpaulin sheets to keep water out or an area hoarded with plywood of at least 18 mm thick with no floor clearance and a water-proof slanting canopy where practicable; or use tarpaulin sheets as the cover for large hoarded area;

54. SHIFT: an operative's daily term of work;

55. SHOWER ROOM: a room between the CLEAN END and the DIRTY END in the HYGIENE UNIT, equipped with controllable hot and cold water for showering purposes, a shower tray and of a minimum size of 2000 mm (height) x 1000 mm (width) x 1000 mm (length). Provide at a ratio of 1 Shower Room for every 6 operatives engaged in asbestos removal works;

56. SMOKE TEST: a test carried out using non-toxic smoke to ensure airtightness of the CONTAINMENT before commencement of work. Following a successful test, switch on the AIR MOVER to exhaust smoke from the CONTAINMENT and check the absolute filter to ascertain whether the smoke has been screened effectively. The CM must be notified of test and be present whilst the test is carried out;

57. SPECIALIST ASBESTOS REMOVAL CONTRACTOR: any Sub-contractor employed by the Contractor to execute the asbestos removal works chosen from the Approved list;

58. SURFACTANT: a chemical wetting agent added to water to improve penetration;

59. VIEWING PANEL: a 2 mm thick, clear acrylic sheet, size 600 mm x 600 mm per layer of polythene sheeting built into the CONTAINMENT at a designated area to enable work inside the Containment to be viewed. A hinged wooden door may be installed for the Viewing Panel should the Containment be housed within a hoarding;

60. VISIBLE EMISSIONS: any emissions containing particulate material which can be visually detected without the aid of instruments;

61. WASHROOM: a room between the WORK AREA and the holding area in the equipment decontamination enclosure where equipment and waste containers are WET CLEANED and/or HEPA vacuumed prior to disposal;

62. WASTE DECONTAMINATION ENCLOSURE SYSTEM: an area designated for the controlled transfer of materials and equipment, consisting of a buffer zone and a holding area;

63. WET CLEANING: the removal of ASBESTOS fibres from building surfaces using cloths or cleaning tools dampened with water;

64. WET METHODS: AMENDED WATER or removal encapsulants used to minimize the generation of fibres during disturbance of ACM;

65. WETTING AGENT: a chemical to be added to water to improve penetration;

66. WORK AREA: designated rooms, spaces or areas of the building or structure where asbestos abatement activities are taking place;
67. WORKING ZONE: the zone where asbestos removal is being, or has been, undertaken which includes the WORK AREA and all access routes (before passing the CLEARANCE TEST). All operatives, equipment and bagged waste withdrawing from the Working Zone must undergo thorough decontamination through a MATERIAL LOCK. Only in the event of it being impracticable to install a Material Lock may a HYGIENE UNIT be used.

ASBESTOS REMOVAL PLANT AND EQUIPMENT

DEM2.M110.7 GENERAL

1. Ensure all plant, including scaffolding and mechanical hoisting equipment, tools and vehicles to be used during the asbestos removal works is uncontaminated, well maintained and in good working order;

2. Provide for the inspection of the CM certified records that all plant and equipment including HEPA filters and respirators have been regularly maintained;

3. Decontaminate all plant, scaffolding and equipment prior to removal from site.

DEM2.M120.7 PROVISION

Provide all plant, equipment and materials, including the following, for the execution of the asbestos removal works. Ensure their suitability for the particular application and of sufficient quantity for the scope and extent of the asbestos removal works:

1. Hygiene unit (as defined in DEM2.M020);

2. Heavy duty vacuum cleaner: an Approved type suitable for use on asbestos removal and fitted, on site, with a HEPA filter (as defined in DEM2.M020);

3. Small vacuum unit for personal cleaning:
   a. Fitted on site just prior to use, with a HEPA filter;

4. Negative pressure monitor (as defined at DEM2.M020): for use when full containment approach is adopted to give a continuous, permanent record of the negative pressure measured. An audible alarm must be fitted to give warning of insufficient pressure differential;

5. Asbestos waste containers: complying with the Code of Practice on the Handling, Transportation and Disposal of Asbestos Wastes issued by the Environmental Protection Department. Nylon woven sacks may be used as the innermost bag (i.e. triple bagging) when the debris contains sharp edges and/or proves to be too heavy for the plastic waste bags;

6. Air movers: (as defined in DEM2.M020):
   a. An Approved type;

7. Polyvinyl acetate emulsion adhesive (PVA): aqueous solution and expanded foam in aerosol cans;

8. Cleaning and personal hygiene consumables;

9. Water spray equipment for damping the asbestos element to minimize the release of air borne particles;
10. Wetting agent: 50% polyoxyethylene ester and 50% polyoxyethylene ether at a ratio of 1:1 or equivalent;

11. Amended water (as defined in DEM2.M020).

DEM2.M130.7 VIEWING PANEL
1. Location: within the screening to the work area and in a position where all or most of the asbestos removal works can be viewed;
2. Size: 600 mm x 600 mm;
3. Construction: 2 mm thick clear acrylic sheet per layer of polythene sheeting with 50 mm minimum lap affixed and sealed with 50 mm wide vinyl tape to sheeting.

PERSONAL PROTECTIVE EQUIPMENT AND CLOTHING

DEM2.M210.7 CLOTHING
1. Provide the following protective clothing for use by operatives:
   a. Disposable, impervious protective overalls with zipper fastening, integral hoods, elastics cuffs and ankles;
   b. Rubber knee length boots with non-slip soles, or shoe covers;
   c. Eye protection and hard hats, where their use is appropriate;
   d. Disposable gloves.
2. Provide the above protective clothing for use by the Authority's staff;
3. Use of other items of disposable clothing e.g. woven fabric overalls, or shorts and hair covers may be permitted where heat stress or discomfort are factors. Prior approval must be obtained from the Labour Department.

DEM2.M220.7 RESPIRATORS
1. Provide for all persons on site the appropriate respiratory protective equipment:
   a. Type approved under the Factories and Industrial Undertakings (Asbestos) Special Regulations for the specific use;
   b. Ori-nasal half face mask type fitted with HEPA filter: for use under all circumstances;
   c. Full face positive pressure respirator: for use when required by this Specification.
2. Provide each operative with own face piece. Ensure face piece is cleaned before each re-use as a minimum requirement.

DEM2.M230.7 RESPIRATOR FILTERS
Ensure that:
1. Filters are removed from respirators under wet conditions and are treated as contaminated waste;
2. New filters are placed in the respirator prior to re-use;
3. Sufficient spare filters are held on site at all time.
WORKMANSHIP

GENERAL

DEM2.W010.7 ASBESTOS REMOVAL WORK
1. Carry out the asbestos removal work as specified in Project Specific Specification;
2. The information provided on the extents of asbestos removal work are known to be in existence to the best knowledge of the Housing Authority but may not be exhaustive.

DEM2.W020.7 SPECIALIST ASBESTOS REMOVAL CONTRACTOR
1. Employ a firm whose name is included in the Register of Asbestos Contractors kept by Environment Protection Department to carry out the asbestos removal works;
2. Such firm shall be a Sub-contractor to the Main Contractor and employed at his own expense;
3. Submit with tender a letter of intent from the Specialist Asbestos Removal Contractor indicating their willingness to carry out the asbestos removal works, which includes a Method Statement as specified.

DEM2.W030.7 SITE VISIT AND INSPECTION
Before tendering, visit the site and inspect the appropriate drawings to ascertain the full extent of the asbestos removal work and the conditions affecting its execution.

DEM2.W040.7 SURVEY AND REPORT
Within 14 days of notification of the start of the contract, a confirmatory survey for the whole site is carried out by a Registered Asbestos Consultant employed by the Contractor under Air Pollution Control Ordinance to Submit the Asbestos Investigation Report to CM and Environmental Protection Department. The survey covers the whole site and materials, rubbish lying on the ground to establish the presence of asbestos containing materials other than those already identified in this Specification or shown on the drawings.

DEM2.W050.7 SUPERVISION BY REGISTERED ASBESTOS CONSULTANT
If asbestos containing materials which are to be removed are not materials under the exemption list published by Environmental Protection Department (EPD), employ a Registered Asbestos Consultant to submit Asbestos Abatement Plan to EPD and control the abatement of all asbestos containing materials, all in accordance with Air Pollution Control Ordinance.

DEM2.W060.7 METHOD STATEMENT
Submit for Approval, 2 weeks prior to commencement of the asbestos removal works, a Method Statement containing:
1. Details of the ACM to be removed and the proposed zoning and sequence of the asbestos removal works;
2. Method of removal of ACM and control of air-borne dust to be employed;
3. Method of disposal of contaminated materials from the point of action to the secure store;
4. Description of the hygiene unit and decontamination facilities, including waste water treatment to be used, prior to discharge off site.

DEM2.W070.7 SITE SUPERVISOR

Submit to the Authority within 7 days of notification of commencement of the asbestos removal works, details of the Site Supervisor to be employed, including name, qualifications and experience:

1. Site Supervisor to:
   a. Register with Environmental Protection Department;
   b. Posses at least 2 years relevant supervisory experience, capable to make decisions in case of emergency;
   c. Be conversant with the Authority's requirement for the removal of ACM. Hold a relevant certificate issued by the Occupational Safety and Health Council, or equivalent, indicating competence in the safe handling of asbestos and be trained in asbestos removal work;
   d. Be present full time on site every day during the course of asbestos removal work;
   e. Ensure that the asbestos removal work complies with the requirements of this Specification and oversee all safety procedures;
   f. Liaise with the Direct Testing Contractor and ensure the works continue with the DTC in attendance at a suitable time.

DEM2.W080.7 PREVENTION OF NUISANCE

1. Occupied premises: proceed with the minimum of inconvenience and nuisance to occupants of premises in the vicinity of the asbestos removal works;
2. Prevent dust arising by frequent water spraying, or other Approved methods;
3. Erect dust barriers where directed by the CM to prevent air borne dust affecting adjacent, occupied blocks.

DEM2.W090.7 SITE ORGANISATION CHART

Post a site organisation chart identifying the Specialist Asbestos Removal Contractor in a prominent location adjacent to the asbestos removal works.

DEM2.W100.7 NOTIFICATIONS

At least 28 days prior to asbestos removal, give notice to the Environmental Protection Department (EPD) and the Labour Department (LD).

DEM2.W110.7 INSPECTION OF PREPARATORY WORKS

24 Hours prior to commencement of the asbestos removal works, notify the CM that air monitoring arrangements and preparatory works are made and precautionary measures are ready for inspection and request consent from the CM before proceeding with removal.

STATUTORY OBLIGATIONS, CODES OF PRACTICE AND OTHER REQUIREMENTS

DEM2.W310.7 SAFETY, HEALTH AND WELFARE

Comply with the provisions of the following:
1. Factories and Industrial Undertakings (Asbestos) Regulation made under the Factories and Industrial Undertaking Ordinance (CAP 59);

2. Construction Sites (Safety) Regulations made under the Factories and Industrial Undertaking Ordinance (CAP 59);

3. Factories and Industrial Undertakings (Notification of Occupational Diseases) Regulations made under the Factories and Industrial Undertaking Ordinance (CAP 59);

4. Code of Practice on Safety and Health at Work with Asbestos, issued by the Labour Department;

5. Code of Practice on Handling, Transportation and Disposal of Asbestos Waste, issued by the Environmental Protection Department;

6. Guidance Notes on Health Hazards in Construction, issued by the Labour Department;

7. Health Hazards of Asbestos, issued by the Labour Department;

8. Guide to Occupational Diseases Prescribed for Compensation Purposes, issued by the Labour Department;

9. Air Pollution Control Ordinance (CAP 311);

10. Pneumoconiosis and Mesothelioma (Compensation) Ordinance (CAP 360);

11. Waste Disposal Ordinance (CAP 354);

12. Code of Practice on Asbestos Control: Safe Handling of Low Risk Asbestos Containing Material, issued under Section 37 of the Air Pollution Control Ordinance (CAP 311);

13. Code of Practice on Asbestos Control: Asbestos Work Using Full Containment or Mini Containment Method, issued under Section 37 of the Air Pollution Control Ordinance (CAP 311);

14. Code of Practice on Asbestos Control: Asbestos Work Using Glove Bag Method, issued under Section 37 of the Air Pollution Control Ordinance (CAP 311);

PROTECTIVE ENCLOSURES

DEM2.W410.7 ERECTION OF TARPALOIN ENCLOSURE

1. Erect tarpaulin enclosure in accordance with the following requirements:
   a. Prior to commencement of asbestos removal work;
   b. Constructed from tarpaulin sheeting supported by substantial bamboo scaffolding or similar;
   c. Enclosure to encase entire block, extending from ground level to 1000 mm above roof parapet of block being demolished;
   d. Overlap tarpaulin sheets on all four sides by 200 mm minimum. Ensure airborne dust is retained within enclosure during asbestos removal;
   e. Do not disturb or damage asbestos containing material during erection of enclosure.

2. Submit details of protective enclosure to CM prior to erection. Do not disturb asbestos containing materials. If disturbed, stop work and propose remedial actions.
**ASBESTOS REMOVAL**

**DEM2.W420.7  DAMAGE TO ENCLOSURE**

1. Upon discovery of any damage to enclosure, immediately make good to the satisfaction of the CM;

2. Allow for time and additional costs incurred for repairing any damage to enclosure.

**ASBESTOS REMOVAL**

**DEM2.W510.7  METHODOLOGY**

The removal and disposal of asbestos containing materials are from top down on a zone by zone basis unless otherwise approved by the CM. Consider the following methods and procedures for asbestos removal as minimum requirements. Adoption does not release the Contractor from any responsibilities or liabilities under the terms of the Contract. Alternative methods of working may be employed, subject to Approval and submission of details provided that all regulations and restrictions imposed by the Environmental Protection Department and the Labour Department are complied with.

**DEM2.W520.7  GENERAL PREPARATION PROCEDURES**

1. Ensure all access points between the working zone and non-working zone are sealed with 2 sheets of polythene sheet or similar;

2. Post warning notices on the non-working zone side prohibiting access to the works of non-authorized personnel;

**DEM2.W530.7  GENERAL PRECAUTIONARY PROCEDURES**

Where the presence of amosite or crocidolite asbestos fibres is known or discovered in the asbestos containing materials being removed, ensure operatives wear full-face positive pressure respirators as at DEM2.M220 and DEM2.M230.

**DEM2.W540.7  REMOVAL OF BALCONY GRILLE PANELS (INCLUDING PANELS ENCAPSULATED ON ONE SIDE)**

1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520:
   
   a. Access balconies from the living room area of each domestic unit through a designated route and a hygiene unit;
   
   b. Removal operators in the working zone are to wear or nasal half face masks fitted with Approved air filters, Approved disposable coveralls and knee length rubber boots with non-slip soles. Wear gloves if it is considered necessary;
   
   c. Ensure operatives working on the external face of the balcony panel use a safety harness attached to a secure anchorage or life line;
   
   d. Ensure operatives on the external face secure all tools and equipment to a safety line;
   
   e. Remove all existing metal guard grilles, glazing, toilet walls and bases, cooking benches and other fittings or furniture which may obstruct access to the balcony grille panels. Transport all debris from the removal works by an Approved route.

2. Removal:
   
   a. Clear up as work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed;
b. During the removal operation, continuously spray panels and surrounding concrete surfaces with water containing a wetting agent;

c. Place a primary, 5 mm thick, pre-cut and drilled plywood panel against the external face of each grille panel. Fit in position by four set screws retained by locknuts protruding through the grille panel. If panels are encapsulated on one side, the plywood board on the encapsulated side may be waived if approved by CM;

d. Position a secondary, 5 mm thick, plywood panel against the internal face of the grille panel, fixed in position by the wing nuts on the bolts from the primary panel;

e. Fix a third 5 mm thick, plywood panel against the external face of the balcony. Fit with non-intercellular nitrile, neoprene rubber seals, contoured to ensure no leakage of debris or dust occurs during removal of the grille panel. Cover the internal face and seals of the panel with a double layer of 0.15 mm polythene, secured by waterproof self-adhesive vinyl tape;

f. Where panels are encapsulated on one side, the use of plywood board on the encapsulated side may be waived if Approved;

 g. Fill the cavity space between the primary and secondary boards with high density polyurethane foam to encapsulate the grille panels. If isocyanate foam is used provide an appropriate respirator for use by operatives;

h. Cover the balcony floor with a double layer of 0.15 mm thick polythene sheeting, secured by waterproof self adhesive vinyl tape;

i. Install a screen in the space above the spandrel beam and the underside of the upper balcony beam. Construct frame using a timber framework supporting a woven, nylon tarpaulin sheet;

j. Using a powered, low voltage chisel or hand chisel, chip away concrete spandrel beams and posts to the top and sides of the grille panel to expose the full extent of grille panel reinforcement bar fixings, leaving the grille panel unrestrained. Cut all exposed grille panel reinforcing bars with bolt cutters. Ensure eye protectors are worn by operatives during this operation;

k. Remove the base ledge of the balcony wall adjoining the panel with a hand chisel;

l. Free the grille panel from the surrounding concrete and reinforcing bars and lift clear of the balcony wall cavity. Secure a tie wire fitted with a turnbuckle to the exposed spigot and the nearer floor-mounted eye bolt;

m. Vacuum and wet clean the encapsulated grille panel after removal from the wall cavity;

n. Secure the exposed edges of the grille panel with 2 layers of 0.15 mm thick polythene, secured in place by waterproof, self-adhesive tape.

**DEM2.W550.7 REMOVAL OF BALCONY GRILLE PANELS (ENCAPSULATED ON BOTH SIDES)**

1. Preparation procedures: in addition to the general preparation procedures as **DEM2.W520**:

   a. Access balconies from the living room area of each domestic unit through a designated route and a hygiene unit;

   b. Removal operatives in the working zone are to wear Approved oronasal half face masks fitted with air filters, Approved disposable coveralls and knee length rubber boots with non-slip soles. Wear gloves if it is considered necessary;

   c. Ensure operatives working on the external face of the balcony panel use a safety harness attached to a secure anchorage or life line;
d. Ensure operatives on the external face secure all tools and equipment to a safety line;

e. Remove all existing metal guard grilles, glazing, toilet walls and bases, cooking benches and other fittings or furniture which may obstruct access to the balcony grille panels. Transport all debris from the removal works by an Approved route.

2. Removal:

a. Clear up as work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed;

b. During the removal operation, continuously spray panels and surrounding concrete surfaces with water containing a wetting agent;

c. Fix a 5 mm thick, plywood panel against the external face of the balcony wall. Fit with non-intercellular nitrile neoprene rubber seals, contoured to ensure no leakage of dust. Cover the internal face and seals of the panel and the floor of the balcony with a double layer of 0.15 mm thick, polythene sheeting, secured by waterproof, self adhesive vinyl tape;

d. Install a screen in the space above the spandrel beam and the underside of the upper balcony beam. Construct screen using a timber framework, supporting a woven, nylon tarpaulin sheet;

e. Using a powered, low-voltage chisel or hand chisel, chip away the concrete on the spandrel beams and posts to the top and sides of the grille panel to expose the full extent of grille panel reinforcement bar fixings, leaving the grille panel unrestrained. Cut all exposed grille panel reinforcing bars with bolt cutters. Ensure eye protectors are worn by operatives during this operation;

f. Remove the base ledge of the balcony wall adjoining the panel with a hand chisel;

g. Free the grille panel from the surrounding concrete and reinforcing bars and lift clear of the balcony wall cavity. Secure a tie wire fitted with a turnbuckle to the exposed spigot and the nearer floor-mounted eye bolt;

h. Vacuum and wet clean the encapsulated grille panel after removal from the wall cavity;

i. Secure the exposed edges of the grille panel with 2 layer of 0.15 mm thick polythene, secured in place by waterproof, self-adhesive tape.

**DEM2.W560.7 REMOVAL OF STAIRCASE GRILLE PANELS**

1. Preparation procedures: in addition to the general preparation procedures as **DEM2.W520**:

a. Access staircases from the inside of the building through the designated route and a hygiene unit as **DEM2.W540**;

b. Removal operators in the working zone are to wear oris-nasal half face masks fitted with Approved air filters, Approved disposable coveralls and knee length rubber boots and non-slip soles. Wear gloves if it is considered necessary;

c. Position a full height screen across the staircase landing and linking lobby to prevent the escape of debris. Construct screen using a timber framework supporting 0.15 mm thick polythene sheeting. The timber frame if well-covered and cleaned up can be re-used. Erect partial screening where necessary to avoid cross contamination of other work areas;

d. Remove any demolition debris from stairwells or lobbies prior to commencement of asbestos removal work;
e. Cover the floor areas between the grille block panels and the screen with a double layer of 0.15 mm thick polythene sheeting secured by waterproof, self adhesive vinyl tape;

f. Secure, using direct fastening anchor bolts, a purpose made plywood screen, maintained in good condition for re-use, to cover the external face of the grille block panel. Fix a double layer of 0.15 mm thick polythene sheeting to the internal face of the screen.

2. Removal:
   a. Clear up as work proceeds. Prevent debris accumulating on the floor where it may be further broken or crushed;
   b. Prior to removal, spray working area and panels with water containing a wetting agent;
   c. Use hand tools to remove panels. Spray water containing a wetting agent to working area and exposed edges of the panel;
   d. Chase out grooves in the panel openings to remove all visible traces of the panels;
   e. Position a vacuum cleaner (as DEM2.M120) near the panel, enabling the suction hose to be as near as is practical to the work area. Ensure that during the asbestos removal works the vacuum unit is in continuous operation;
   f. Remove panels block by block, avoiding fragmentation;
   g. Place blocks inside 0.15 mm thick polythene disposal sacks and seal with waterproof, self adhesive tape. Additional sacks may be required if deemed necessary by the CM;
   h. Remove all remaining debris at the end of each work shift.

DEM2.W570.7 REMOVAL OF ROOF INSULATION TILES

1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520:
   a. Access asbestos removal work area through a designated route and the hygiene unit;
   b. Isolate asbestos removal work area from internal spaces with 0.15 mm thick polythene sheeting;
   c. Exclude all personnel not directly involved with the work. Post warning notices prohibiting access and alert others not involved in the work of the presence of asbestos;
   d. All removal operatives are to wear Approved oris-nasal half masks fitted with Approved air filters, Approved disposable coveralls and knee length rubber boots with non-slip soles. Wear full face positive pressure respirator if asbestos other than chrysotile is present. Wear gloves if it is considered necessary;
   e. Take full account of prevailing weather conditions, and the following, to avoid dispersion of asbestos fibres to adjoining buildings:
      i. Under normal conditions: schedule asbestos removal works on a daily basis to allow for preparation, removal, bagging and cleaning up of debris;
      ii. During windy conditions: seek Approval to continue prior to commencement of the asbestos removal works. Erect a suitable 1000 mm high wind break of tarpaulin sheeting supported on a substantial bamboo framework;
iii. Special circumstances (e.g. working immediately adjacent adjoining residential accommodation): prevent entry of asbestos dust by erecting a 2000 mm high screen, fabricated from tarpaulin sheets supported on a bamboo frame. Extend the screen on both sides by 2000 mm minimum beyond the edge of the block to be demolished. Ensure all screens are secured against the wind.

2. Removal:
   a. Clear up as asbestos removal works proceed bagging all resulting debris on removal of tiles. Prevent debris accumulating on the floor and becoming further broken or crushed. Remove all remaining debris at the end of each workshift;
   b. Spray amended water using a low pressure water spray onto the roof tiles during the course of the removal works;
   c. Use hand tools for the removal operation. Take care whilst lifting the tiles to ensure breakage is kept to a minimum;
   d. Use hand chisels to remove all the remaining portions of tiles from the cement screed.

**DELM.W580.7 REMOVAL OF REFUSE CHUTES**

1. Preparation procedures: in addition to the general preparation procedures as **DELM.W520**:
   a. Be aware of the potential high risk to nearby residents of this type of removal work and pay particular attention to minimizing the release of dust from the asbestos removal works;
   b. Removal operators in the working zone are to wear ori-nasal half faced masks fitted with Approved HEPA filters, Approved disposable coveralls and shoe covers. Full face positive pressure respirators fitted with HEPA filters are worn if amosite or crocidolite are present;
   c. Carry out removal under total containment and negative pressure of 15 Pa and 6 nos. of air changes per hour minimum. Reliance on air monitoring outside the containment will not be considered sufficient;
   d. Ensure the construction of the containment conforms to the following:
      i. Unless a two floor containment zone is Approved, each floor constitutes a separate containment zone;
      ii. Each zone, including the chute aperture at each zone boundary, is completely sealed from the next. No debris is allowed to fall to the zone below the rough chute opening;
      iii. The vent pipe at roof level and the portion at ground level are included within the containment;
      iv. Removal work commences from the top working downwards;
      v. Each containment is treated as a separate entity, with a hygiene unit, an air mover and a viewing panel for external inspection of the asbestos removal works. Leave a sufficient clear space from the flue to enable the whole section of flue to be removed and manoeuvred inside the containment zone;
      vi. Construct using a timber framework faced with 2 layers of 0.15 mm thick polythene sheeting. Make airtight by sealing all joints with Approved foam sealant, spray glue and tape.
   e. Prior to commencement of asbestos removal work:
      i. Carry out a visual inspection and a smoke test with non-toxic smoke to ensure air-tightness of the containment;
ii. On completion of successful test: switch the air-mover to exhaust smoke from the containment and carry out a visual test to ensure that the absolute filter screens out the smoke effectively and the pressure gauge indicates normal.

f. If the test is unsuccessful: seal the air-mover and remove from site for servicing.

2. Removal:
   a. Run air movers continuously throughout the removal works and until satisfactory clearance test results are obtained;
   b. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed. Minimize fibre release by wetting with amended water and HEPA vacuuming to remove debris as it is created;
   c. Take down chute sections within the work zone using non-power hand tools. Do not disturb the seal between the zone below;
   d. Cover and seal both sides of the short chute section passing through floor. Construct seal from timber framing faced both sides with polythene sheeting;
   e. Carry out visual inspection and clearance test in the containment zone of that part of the chute removed; then
   f. Repeat removal operations in next zone down, removing small section left in the upper zone from the zone below without disturbing the enclosure. The inside of the enclosing structure left on the upper zone must be decontaminated from below.

DEM2.W590.7 REMOVAL OF INTERNAL CHIMNEY FLUES

1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520:
   a. Carry out removal of asbestos lagging under total containment and a negative pressure of 15 Pa minimum. Make efforts to minimize fibre release within the containment, reliance on air monitoring outside the containment will not be considered sufficient;
   b. Ensure the construction of the containment conforms to the following:
      i. Each floor constitutes a separate containment zone. Provide separate containments for the portions at the roof and kitchen level (ground floor level);
      ii. Removal work commences from the top working downwards;
      iii. Each containment is treated as a separate entity, with a hygiene unit, an air mover and a viewing panel for external inspection of the asbestos removal works. Leave a clear space of 1500 mm minimum from the flue to enable the whole section of flue to be removed and manoeuvred inside the containment zone;
      iv. Construct using a timber framework faced with 3 layers of 0.15 mm thick polythene sheeting. Make airtight by sealing all joints with an approved foam sealant, spray glue and tape.
   c. Prior to commencement of asbestos removal work:
      i. Carry out a smoke test with non-toxic smoke to ensure air-tightness of the containment;
      ii. On completion of successful test: switch the air-mover to exhaust smoke from the containment and carry out a visual test to ensure that the absolute filter screens out the smoke effectively and the pressure gauge indicates normal;
ii. If the test is unsuccessful: seal the air-mover and remove from site for servicing.

d. Removal operators are to wear Approved full face positive pressure respirators fitted with HEPA filters, Approved disposable coverall and shoe cover.

2. Removal:

a. Run air movers continuously to provide at least 6 air changes per hour throughout the removal works and until satisfactory clearance tests are obtained;

b. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed. Minimize fibre release by wetting with amended water and HEPA vacuuming to remove debris as it is created;

c. Carry out asbestos removal to a maximum of two adjoining vertical zones at any one time. Treat each horizontal as a separate zone;

d. Where only surface lagging is to be removed from the chimney flue, apply wetting agent in accordance with the manufacturer’s recommendations to all surfaces of the internal chimney flue lagging as the works proceed. Ensure complete penetration of the lagging material before removing. Completely de-lagg the section of the flue within a zone using non-power hand tools, decontaminate and carry out a clearance test prior to commencing asbestos removal work on any further zone;

e. Where the flues are of asbestos cement or in a poor condition carry out the following:

   i. Within each containment zone: double wrap flue section in polythene sheeting and remove with the lagging using non-power hand tools. Double wrap flue sections in polythene sheeting before removal from containment;

   ii. Remove the portion of the flue that passes through the floor slab once the containment zone on the floor below has been constructed and its air mover has been switched on. The holes left are completely sealed;

   iii. Removal work in 2 adjoining zones may be carried out at one time if containment zone has been built below and its air mover switched on.

DEM2.W600.7  REMOVAL OF EXTERNAL CHIMNEY FLUES WITH SURFACE LAGGING

1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520:

   a. Carry out the removal of asbestos lagging under total containment and a negative pressure of 15 Pa minimum. Make efforts to minimize fibre release within the containment, reliance on air monitoring outside the containment will not be considered sufficient;

   b. Design and construct containment in a manner which minimizes risk of exposure;

   c. When designing and constructing the external containment structure, consider the following:

      i. Asbestos removal work method to be employed;

      ii. Safety aspects of working at height;

      iii. Maintaining the weatherproof integrity of the structure.

   d. Erect a suitable double scaffolding, comprising the following:
ASBESTOS REMOVAL

Dem2 > Workmanship

i. An access staircase outside the containment. Where the staircase is constructed of bamboo or similar, ensure gaps between steps do not exceed 300 mm and landings have supports at 300 mm maximum centres, sturdy enough to support a fully laden man plus equipment;

ii. A work platform every two floors inside the containment;

iii. A safe internal access within the containment;

iv. A hoist system for transportation of waste;

v. A tarpaulin cover to encase the structure externally, securely fixed to withstand wind conditions.

e. Dismantle existing installations including ventilation ducts that obstruct access to the flue. Do not disturb the flue during this operation and the erection of the scaffolding;

f. Ensure the construction of the containment conforms to the following:

i. Line the platform inside the containment with 18 mm thick plywood covered with 2 layers of 0.15 mm thick polythene sheeting. Support all joints in the plywood lining;

ii. Construct using a timber framework faced with 3 layers of 0.15 mm thick polythene sheeting securely fixed to battens tied to the scaffolding structure. Make airtight by sealing all joints with an Approved foam sealant, spray glue and tape;

iii. Install florescent tubing or similar non-heat producing lighting inside the containment to provide adequate illumination;

iv. Treat each containment zone as a separate entity, with a hygiene unit, an air mover and a viewing panel for external inspection of the asbestos removal works.

g. Prior to commencement of asbestos removal work:

i. Carry out a smoke test with non-toxic smoke to ensure air-tightness of the containment;

ii. On completion of a successful test: switch the air-mover to exhaust smoke from the containment and carry out a visual test to ensure that the absolute filter screens out the smoke effectively and the pressure gauge indicates normal;

iii. If the test is unsuccessful: seal the air-mover and remove from site for servicing.

h. Removal operators are to wear Approved full face positive pressure respirators fitted with HEPA filters, Approved disposable overalls and shoe cover.

2. Removal:

a. Run air movers continuously throughout the asbestos removal works and until satisfactory clearance tests are obtained;

b. Clear up asbestos proceeding from top to bottom zone by zone as the removal work proceeds. Each zone is approximately 2 floors in height. Prevent debris accumulating on the floor and becoming further broken or crushed. Minimize fibre release by wetting with amended water and HEPA vacuuming to remove debris as it is created;

c. Carry out asbestos removal to a maximum of two adjoining vertical zones at any one time. Treat each horizontal section as a separate zone;

d. Keep fibre release to a minimum by wetting with amended water and a HEPA vacuum to remove debris as it is created. Completely de-lagg the section of the flue within a zone using non-power hand tools, decontaminate and carry out a clearance test prior to commencing asbestos removal work on any further zone;
e. Where the external flue is in a poor condition, remove flue section with lagging to a maximum of 2000 mm in length, using non-powered hand tools. Double wrap flue sections in polythene sheeting prior to removal from containment.

DEM2.W610.7  REMOVAL OF SANDWICHED FLUES

1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520:
   a. Carry out the asbestos removal work under total containment and a negative pressure of 15Pa minimum. Make efforts to minimize fibre release within the containment. Ensure containment is large enough to allow manoeuvring of the floor sections but not greater than eight floors in height;
   b. Remove the whole flue to get rid of asbestos lagging. Ensure fibre release within the containment is minimized. Reliance on air monitoring outside the containment will not be considered sufficient;
   c. Design and construct the containment to minimize the risk of exposure to asbestos containing materials;
   d. When designing and constructing the external containment structure, consider the following:
      i. Asbestos removal work method to be employed;
      ii. Safety aspects of working at height;
      iii. Maintaining the weatherproof integrity of the structure.
   e. Erect a suitable double scaffolding, comprising the following:
      i. An access staircase outside the containment.
      ii. A work platform every two floors inside the containment;
      iii. A safe internal access within the containment;
      iv. A hoist system for transportation of waste;
      v. A tarpaulin cover to encase the structure externally, securely fixed to withstand wind conditions.
   f. Dismantle existing installations including ventilation ducts that obstruct access to the flue. Do not disturb the flue during this operation and the erection of the scaffolding;
   g. Ensure the construction of the containment conforms to the following:
      i. Construct using a scaffolding framework, faced with 2 layers of 0.15 mm thick polythene sheeting fixed to battens. Make airtight by sealing all joints with an Approved foam sealant, spray glue and tape.
   h. Treat each containment zone as a full height separate entity, with a hygiene unit, an air mover and a viewing panel for external inspection of the asbestos removal works;
   i. Prior to commencement of asbestos removal work:
      i. Carry out a smoke test with non-toxic smoke to ensure air-tightness of the containment;
      ii. On completion of successful test: switch the air-mover to exhaust smoke from the containment and carry out a visual test to ensure that the absolute filter screens out the smoke effectively and the pressure gauge indicates normal;
      iii. If the test is unsuccessful: seal the air-mover and remove from site for servicing.

2. Removal:
a. Run air movers continuously throughout the asbestos removal works to provide at least 6 air changes per hour and maintain a negative pressure of at least 15 Pa and until satisfactory clearance tests are obtained;

b. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed. Minimize fibre release by wetting with amended water and HEPA vacuuming to remove debris as it is created;

c. Remove whole flue complete to ensure removal of all asbestos lagging;

d. Treat each horizontal section as a separate zone. Commence removal work from the top working downwards. Wet exposed lagging and insulation with Amended Water and keep them damp all the time;

e. Dismantle the flue in sections by unbolting the flanged joints, preventing where possible damage to the flue walls. Seal both ends of the flue with PVC tape before transferring by hoist to ground level.

DEM2.W620.7 REMOVAL OF ASBESTOS-CONTAINING CORRUGATED SHEET ROOFING

1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520:

a. Access the asbestos removal work area through a designated route and the hygiene unit;

b. Clean area beneath the roofing and lay 2 layers of plastic sheeting over the floor area to collect debris;

c. Treat asbestos cement sheets being removed as asbestos waste;

d. Fix suitable signs;

e. All workers must wear Approved half-face or-nasal respirators and disposable coveralls with a hood during the removal work.

2. Removal:

a. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor or ground and becoming further broken or crushed;

b. During the asbestos removal operation continuously spray roofing sheets and surrounding roof surface with amended water to keep them wet all the time;

c. Remove and dispose of asbestos cement roofing sheets with care, avoiding free fall of asbestos containing debris from a height above 500 mm;

d. Remove sheets intact as far as is practicable using non-power hand tools. Keep unavoidable breakage to a minimum;

e. Wrap all removed sheets in 2 layers of 0.15 mm thick polythene and label as asbestos waste. Collect the debris into the labelled asbestos waste bags and seal securely with PVC tape.

DEM2.W630.7 REMOVAL OF CEMENT COVERED CORRUGATED ASBESTOS SHEET ROOFING

1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520:

a. Access the asbestos removal work area through a designated route and the hygiene unit;

b. All workers must wear Approved half face or-nasal respirators and disposable coveralls during the removal work.

2. Removal:
a. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed;

b. During the removal operation continuously spray roofing sheets and surrounding roof sheets with amended water;

c. Remove and dispose of asbestos cement roofing sheets with care, avoiding free fall of asbestos containing debris from a height above 500 mm. Where a hazard of falling debris above this height exists, carry out the following, or similar Approved operation ensuring no free falling of asbestos debris:
   i. Securely connect a steel lifting frame of sufficient strength onto and across the underside for subsequent lifting of the roof;
   ii. Fix four wire slings of sufficient strength to the four upturns of the steel beams with the free ends fixed to a crane. Avoid staying directly below;
   iii. Once the complete roof is suspended from above by the crane, cut and remove all supports lower down onto the floor and disconnect the wire slings.

d. Remove sheets intact as far as is practicable using non-power hand tools. Keep unavoidable breakage to a minimum;

e. Wrap all removed sheets in 2 layers of 0.15 mm thick polythene and label as asbestos waste.

**DEM2.W640.7**  
**REMOVAL OF CHALKBOARDS CONTAINING ASBESTOS**

1. Preparation procedures: in addition to the general preparation procedures as **DEM2.W520**;
   a. Access the asbestos removal work area through a designated route and the hygiene unit. Fix a suitable sign;
   b. Removal operators in the working zone are to wear ori-nasal half face masks fitted with Approved air filters, Approved disposable coveralls and knee length rubber boots with non-slip soles. Wear gloves if it is considered necessary;
   c. Dispose contaminated clothing and used respirator filters after each shift;
   d. Line the floor of the classroom within 2000 mm of the chalkboard with 2 layers of polythene sheeting.

2. Removal:
   a. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed;
   b. Remove the chalkboard in one piece using hand tools, wrap in 2 layers of 0.15 mm thick polythene sheeting and seal with PVC tape and label;
   c. Use a mist spray during the removal process to suppress dust release. Remove any dust or debris generated immediately by vacuuming and wet-wiping;
   d. Wet wipe and clean walls and floors within 2 metres with HEPA vacuum cleaner.

**DEM2.W650.7**  
**REMOVAL OF BUILDING SERVICES INSTALLATION**

1. Preparation procedures: comply with the general preparation procedures as **DEM2.W520**;
   a. Removal operators in the working zone are to wear ori-nasal half face masks fitted with Approved air filters, Approved disposable gloves.

2. Removal:
a. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed;

b. Do not disturb the ACM whilst dismantling or dismounting any building services installation;

c. Where part of an installation containing asbestos is required to be detached, carefully remove in tact;

d. Continually spray amended water onto the installations during the whole period of the removal;

e. Wrap the removed installation in 2 layers of 0.15 mm thick polythene sheeting, seal with PVC tape and label.

DEM2.W660.7 REMOVAL OF BUSBAR RISER TRUNKING

1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520:
   a. All Workers must wear Approved half face ori-nasal respirators fitted with Approved air filters, Approved disposable coveralls and gloves;
   b. Use polythene sheeting to line the floor around the busbar riser trunking to collect any scattered debris;
   c. Line caulking on the ceiling of the floor below with a polythene bag or sheet, fitted with a HEPA vacuum cleaner to draw any fibre generated in the removal of caulking from above. Dispose of as asbestos waste.

2. Removal:
   a. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further crushed or broken;
   b. Carefully chisel off all caulking with minimum generation of dust. Remove all asbestos fibres by thoroughly vacuuming and wiping with a clean, dry cloth the outside of the busbar riser trunking, the concrete kerb and the ceiling of the floor below;
   c. Remove the whole section of busbar riser trunking without disturbing the fire barrier or breaking the concrete kerb and wrap in 0.15 mm thick polythene sheeting, seal with tape and dispose of as asbestos waste. Wrap both ends of the trunking to prevent dropping any accessory of the fire barrier;
   d. Handle caulking for underground cable, conduit or trunking through floor slab in a similar manner.

DEM2.W670.7 REMOVAL OF FLEXIBLE JOINT OR CAULKING TO CONDUIT OR TRUNKING THROUGH FLOOR SLABS

1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520:
   a. Use polythene sheeting to line the area of floor adjacent to caulking removal works to collect any scattered debris;
   b. Wet the flexible joint/gasket or caulking with wetting agent.

2. Removal:
   a. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further crushed or broken;
   b. Vacuum clean the flexible joint/gasket or caulking and the adjacent ducting with HEPA vacuum cleaner;
   c. Wet the flexible joint/gasket or caulking with wetting agent and wrap it with 2 layers of plastics;
d. Carefully chisel off all caulking. Spray the flexible joint with amended water to keep it wet. Remove all asbestos fibres by thoroughly vacuuming and wiping with a clean, dry cloth the outside of the trunking;

e. Wrap the flexible joint/gasket or caulking in double layers of 0.15 mm polythene sheets for disposal.

WORK ON COMPLETION

DEM2.W710.7 GENERAL

Carry out the following operations on completion of the asbestos removal work:

1. Designate a secure area located at ground level to use as a secure area to receive bagged asbestos waste;

2. Install a closed hoist to transport the bagged asbestos waste to ground level;

3. Collect debris into labelled asbestos waste bags and seal securely with PVC tape;

4. Double bag all labelled asbestos waste in an airlock before transferring to the hoist area. Take care at all times when handling the bags to avoid damage;

5. Remove all plastic, protective sheeting and timber framing and dispose of as contaminated waste. Where permitted by the CM, well covered and cleaned timber frame and external cover panels may be re-used;

6. Wrap all items too large to fit normal waste disposal sacks using 0.15 mm thick polythene sheeting, secured by vinyl tape and label clearly as asbestos waste;

7. Take all sacks and wrapped debris to a designated collection point through an Approved route, vacuum and wet clean and place in a further 0.15 mm thick polythene bag or wrap in a second layer of 0.15 mm thick polythene, sealed using waterproof, self adhesive vinyl tape;

8. Metal drums may be used as an alternative to polythene bags, provided the following is complied with:

   a. Conform with EPD disposal requirements;

   b. Do not place or roll drums directly onto asbestos roof tiles, or cause crushing of tiles;

   c. Make available a cleared area for the storage of drums containing asbestos debris;

   d. Seal and remove all drums, whether or not filled, from the work area to the storage area at the end of each day's work and ensure that the drums undergo decontamination prior to removal;

   e. Sack barrows may be used in the Work Area for transportation of drums;

   f. Take steps to prevent dust releasing from drums.

9. Vacuum and wet clean nylon tarpaulin screen, and all tools and equipment for re-use after a satisfactory re-assurance test has been carried out. Tools and equipment are secured inside polythene bags before taken off the site;

10. Ensure each asbestos removal working zone/containment is clean and dust free before the workmen leave site at the end of each day's work;

11. Remove all dust and debris from operators' clothing and footwear after a work shift or on leaving the site;

12. Arrange for a clearance/reassurance test and an inspection by the CM to be carried out for the whole working zone after the area is vacuumed and wet cleaned. If the test result indicates fibre levels in excess of 0.01 fibres per ml, reclean the working zone and carry out a further test, at the Contractor's own expense and with no claim for any extension of time;
13. Number all bags containing asbestos waste using a waterproof pen. The Authority's site staff will keep a record of the waste;

14. Pass all waste water through an Approved filter to remove all particles to a level of 5 microns in suspension before discharging into the drainage system.

**DEM2.W720.7 BALCONY AND STAIRCASE GRILLE PANELS**

In addition to the relevant general requirements as DEM2.W710 carry out the following:

1. Vacuum and wet clean walls and floor of the balcony and any areas within the asbestos removal working zone. The polythene sheeting on the floor of the balcony is placed in asbestos disposal bags and disposed of as contaminated waste;

2. Vacuum and wet clean the area surrounding the grille panel cavity;

3. Seal filled sacks with waterproof, self adhesive vinyl tape. Large or unweidy items may be wrapped in 0.15 mm thick polythene sheet, secured by vinyl tape and labelled as asbestos waste;

4. On satisfactory completion of the clearance test, spray PVA on polythene covering to the panels at the external face of the balcony wall and the polythene sheeting before dismantling the containment and dispose as contaminated waste;

5. At the end of each day's work, allow for the complete removal of the grille panel and the clearing up of the debris in a flat.

**DEM2.W730.7 ROOF INSULATION TILES**

In addition to the relevant general requirements as DEM2.W710 carry out the following:

1. Thoroughly clean the roof screed, all containmented surfaces and equipment with a vacuum cleaner and wet cloths as soon as debris is produced;

2. Transfer labelled asbestos waste bags to a clean area outside the Work Area where they are wiped clean and double-bagged.

**DEM2.W740.7 REFUSE CHUTES**

In addition to the relevant general requirements as DEM2.W710 carry out the following:

1. Double wrap chute sections in polythene sheets before passing out of the containment;

2. On satisfactory completion of the clearance test, spray PVA on the polythene sheeting before dismantling the containment;

3. Remove timber frame and dispose of as asbestos waste. Re-use timber shuttering if it has been well covered during the asbestos removal works and has been thoroughly cleaned;

4. Number bags and wrapped chute sections and provide record to HD site staff. Provide a certificate from the dump site to HD site staff.

**DEM2.W750.7 INTERNAL CHIMNEY FLUES**

In addition to the relevant general requirements as DEM2.W710 carry out the following:

1. Double bag all asbestos waste bags in the middle chamber of the airlock before transferring to the ground level secure store;

2. On completion of removal of the lagging, wire brush the surfaces of the flue to remove any remaining debris;
3. Arrange for a Penultimate Tests after inspection by CM that the area is free of debris and dust. If test results exceed 0.01 fibres/ml, reclean the area and carry out further Penultimate Test. If test results satisfactory, wet wipe and vacuum the area and arrange for a final clearance test;

4. Number bags and wrapped flue sections and provide record to HD site staff. Provide a certificate from the dump site to HD site staff;

5. On satisfactory completion of the final clearance test, spray PVA on the polythene sheeting before dismantling the containment.

DEM2.W760.7 EXTERNAL CHIMNEY FLUES WITH SURFACE LAGGING

In addition to the relevant general requirements as DEM2.W710 carry out the following:

1. On completion of removal of the lagging, wire brush the surfaces of the flue to remove any remaining debris;

2. Install a hoist system within the tarpaulin enclosure for transportation of the bagged asbestos waste to ground level. The hoist is closed cage type;

3. Arrange for a Penultimate Tests after inspection by CM that the area is free of debris and dust. If test results exceed 0.01 fibres/ml, reclean the area and carry out further Penultimate Test. If test results satisfactory, wet wipe and vacuum the area and arrange for a final clearance test;

4. Number bags and wrapped flue sections and provide record to HD site staff. Provide a certificate from the dump site to HD site staff;

5. On satisfactory completion of the clearance test, spray PVA on the polythene sheeting before dismantling the containment.

DEM2.W770.7 SANDWICHED FLUES

In addition to the relevant general requirements as DEM2.W710 carry out the following:

1. Wipe clean flue sections and wrap in polythene before removing from the containment;

2. Install a hoist system within the tarpaulin enclosure for transportation of the bagged asbestos waste to ground level. The hoist is closed cage type;

3. Arrange for a Penultimate Tests after inspection by CM that the area is free of debris and dust. If test results exceed 0.01 fibres/ml, reclean the area and carry out further Penultimate Test. If test results satisfactory, wet wipe and vacuum the area and arrange for a final clearance test;

4. Number bags and wrapped flue sections and provide record to HD site staff. Provide a certificate from the dump site to HD site staff;

5. On satisfactory completion of the clearance test, spray PVA on the polythene sheeting before dismantling the containment.

DEM2.W780.7 CORRUGATED SHEETS AND CEMENT COVERED CORRUGATED SHEETS

In addition to the relevant general requirements as DEM2.W710 carry out the following:

1. Thoroughly clean by wet wiping, HEPA vacuuming and manual scraping any debris adhering to the floor, the steel structure and the steel runners etc.;

2. Clean Work Area before the end of the day;

3. Number bags and wrapped flue sections and provide record to HD site staff. Provide a certificate from the dump site to HD site staff.
DEM2.W790.7  BUSBAR RISER TRUNKING AND BUILDING SERVICES
INSTALLATION
In addition to the relevant general requirements as DEM2.W710 carry out the following:

1. Vacuum and wipe with clean, dry cloth all surfaces within the rooms to both floors to remove any asbestos fibres. Only contaminated tools may be cleaned with a damp cloth;

2. Wet wipe outer surface of the bagged waste and wrapped ACM. Wrap in another polythene sheet or bag and label outside the working area.

DEM2.W800.7  CHALKBOARDS
In addition to the relevant general requirements as DEM2.W710 carry out the following:

1. Vacuum and wipe clean the area adjacent to the asbestos removal works to a distance of 2000 mm;

2. Wet wipe outer surface of the bagged waste and wrapped ACM. Wrap in another polythene sheet or bag and label outside the working area.

DEM2.W810.7  DISPOSAL OF WASTE
1. Dispose of all asbestos waste in a designated site and in strict accordance with the ‘Code of Practice on the Handling, Transport and Disposal of Asbestos Waste’, issued by the Environmental Protection Department (EPD);

2. Temporarily store all asbestos waste in sealed bags in a secure Approved store. Remove waste from store commencing from the top working downwards unless otherwise instructed;

3. On completion of asbestos removal to an entire floor invite the CM to inspect the works and check the number of waste bags for that zone prior to removing the bags to the secure store;

4. To avoid over accumulation of waste at the appointed site, provide information to EPD stating the proposed schedule for disposal of asbestos waste;

5. Provide transport and all necessary equipment required for disposal of asbestos waste;

6. Collect all water used within the asbestos removal works, including that used in washing facilities, by means of sumps and pumps and pass through an aquarium type filter or similar Approved to remove particles down to 5 microns in suspension before discharging into the drainage system;

7. Inform the CM at least 7 days prior to disposal of waste from site. Inform the CM the type of waste and the number and location of packages to be disposed prior to removing from site. Submit a signed copy of each delivery note to the CM;

8. Asbestos removal work will not be permitted to proceed to more than two floors below a level if provisional acceptance of the asbestos removal work has not been obtained from the CM;

9. Upon satisfactory visual inspection of the works by the CM on completion of one entire floor, arrange for Clearance/Reassurance Tests to be carried out by the Direct Testing Contractor.
EMERGENCY PROCEDURES

DEM2.W910.7 GENERAL
If during the course of the asbestos removal works any of the following situations occur, inform the CM and carry out the following specified procedures immediately. Any stoppage or reduction in output resulting in compliance with this clause will not result in any extension of time for completion or to any additional costs claimed.

DEM2.W920.7 SPILLAGE OF ASBESTOS DEBRIS
1. Stop all processes which may result in the production of asbestos dust;
2. Spray all surfaces and debris within the asbestos removal work area with amended water in a fine mist spray, using airless spray equipment;
3. Bag all loose asbestos debris present in the asbestos removal work area and remove to a secure store. Wipe clean and vacuum all surfaces when the surface is dry;
4. Prepare the site of the remedial work for inspection by the CM and air testing prior to recommencing removal work.

DEM2.W940.7 FIRE
1. Spray all surfaces and debris within the asbestos removal work area with amended water in a fine mist spray, using airless spray equipment on ce the fire has been extinguished and the Site is safe for re-entry;
2. Bag all loose asbestos debris present in the asbestos removal work area and remove to a secure store. Wipe clean and vacuum all surfaces when the surface is dry;
3. Prepare the Site for inspection by the CM and air testing prior to recommencing removal work.

DEM2.W950.7 ACCIDENT
1. Stop all work and if necessary remove worker(s) to a safe area;
2. If a worker has collapsed remove face mask (in all other cases the face mask should be left in place), carry out normal emergency first aid procedures and arrange to transfer the worker to hospital. Personal decontamination should be carried out if possible;
3. Where it is impossible to carry out decontamination procedures on the worker, inform the medical team to enable them to take the appropriate safety measures;
4. Bag all loose asbestos debris present in the asbestos removal work area and remove to a secure store. Wipe clean and vacuum all surfaces and any adjoining area contaminated during the emergency;
5. Prepare the Site for inspection by the CM and air testing prior to recommencing removal work.

DEM2.W960.7 TYPHOON SIGNAL NUMBER 3 AND ABOVE
1. Stop all processes which may result in the production of asbestos dust;
2. Spray all surfaces and debris within the asbestos removal work area with amended water in a fine mist spray, using airless spray equipment;
3. Bag all loose asbestos debris present in the asbestos removal work area and remove to a secure store. Wipe clean and vacuum all surfaces;
4. Cut off all power and water supplies and secure all loose equipment against typhoon damage;
5. Arrange a revised inspection by the CM before the workers leave Site;

6. Recomence the removal works once the No 3 typhoon signal has been lowered, the necessary cleaning up work and repairs to containment have been completed and permission has been given by the CM.

**DEM2.W970.7 PERSONAL PROTECTION DECONTAMINATION**

Prior to leaving the site ensure all operatives:

1. Are provided with showering facilities and all items including sponge and brush necessary to clean respiratory equipment and protective clothing;

2. Wet and remove all dust and debris from working clothing and footwear using an Approved vacuum cleaner before going out of the working area;

3. Follow the designated route to the hygiene unit. On entering the dirty end wet their respirators and protective clothing, contaminated equipments are stored in labelled waste disposal receptacle in the dirty area;

4. Remove clothing after wetting thoroughly in the dirty area of the hygiene unit, and place into a labelled disposal bin. Remove footwear and leave for cleaning and decontamination;

5. Pass into the shower area, wash thoroughly particularly hair and finger nails, discarding the respirator filter in a designated bin;

6. Do not remove respiratory protective equipment until in the shower and the respirator has been washed;

7. Place respirators in a drying compartment of the clean area of the unit after washing, change cloths in the clean area;

8. Vacuum, wet clean and secure inside polythene bags all tools and equipment prior to removal from the asbestos removal work site.

**DEM2.W980.7 ACCEPTANCE OF ASBESTOS REMOVAL WORK**

1. Provisional acceptance is based on visual inspection by the CM together with air test results of Penultimate Tests within the acceptance limit;

2. Upon completion of asbestos removal and clearance of asbestos waste and equipment, the CM conducts a final inspection;

3. Final acceptance is based on visual inspection by the CM together with Final Clearance Test results within the acceptance limit;

4. After final acceptance, the site is safe to continue with demolition work.
TESTING

AIR MONITORING TEST

DEM2.T010.7 AIR MONITORING TESTS BORNE BY EMPLOYER

The Authority will employ at its own expense a Direct Testing Contractor to carry out air monitoring test as follows to measure the asbestos fibre content in the air outside and within the site during the asbestos removal works. The Authority will keep a record of all air monitoring test results for tests carried out by the Direct Testing Contractor on Site for inspection by the Contractor:

1. Prior to commencement of the asbestos removal work: air sampling tests (environmental test) shall be carried out to ascertain the background level of air quality in the vicinity of the block at locations outside the hoarding in a convenient open area, within the adjacent blocks and on the edge of the estate, and at other locations as agreed;

2. During asbestos removal work: air sampling tests (environmental test) shall be carried out daily at regular sampling points to establish the fibre level of airborne dust at the closest sensitive receptor and around the demolition site; and

3. On completion of the asbestos removal works: air sampling tests shall be carried out to ascertain the air quality for clearance and reassurance (clearance test and reassurance test) in accordance with the following table:

<table>
<thead>
<tr>
<th>Items</th>
<th>Clearance/Reassurance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Balcony grille</td>
<td>1 in 10 flats (min. 2 per zone)</td>
</tr>
<tr>
<td>Stair grille</td>
<td>1 in 5 grille (min. 1 per zone)</td>
</tr>
<tr>
<td>Roof tile</td>
<td>min. 3 per roof</td>
</tr>
<tr>
<td>Refuse chute</td>
<td>1 per zone (3 for the first 10 m³ of containment size)</td>
</tr>
<tr>
<td>Chimney</td>
<td>1 per zone (3 for the first 10 m³ of containment size)</td>
</tr>
<tr>
<td>Corrugated sheet</td>
<td>1 per zone</td>
</tr>
<tr>
<td>Chalk board</td>
<td>1 per 10 nos. (min. 1 per zone)</td>
</tr>
</tbody>
</table>

DEM2.T020.7 AIR MONITORING TESTS BORNE BY CONTRACTOR

Appoint an Approved independent asbestos laboratory registered under Air Pollution Control Ordinance to carry out air monitoring tests, except those tests stated in DEM2.T010 which are to be carried out by the Direct Testing Contractor, to ensure conformity with the requirements of this Specification.

DEM2.T030.7 SURVEILLANCE TESTS BY DIRECT TESTING CONTRACTOR

For air monitoring tests that are carried out by the Approved independent laboratory, CM may employ Direct Testing Contractor to carry out parallel tests.
DEM2.T040.7 AIR MONITORING TESTS

1. Testing arrangements:
   a. Comply with the air monitoring requirements in the Asbestos Abatement Plan as approved by EPD;
   b. Arrange and allow for co-ordination of the air monitoring operations within the programme for the asbestos removal works;
   c. Arrange a representative to present at all stages of the air monitoring tests if possible. Non-attendance at test will not invalidate test results.

2. Testing methods:
   a. As DEM2.M020;
   b. Do not exceed the following levels during and on completion of the asbestos removal works and provide the appropriate respiratory protective equipment for personnel involved:
      i. During asbestos removal works:
         - Amosite or crocidolite: 0.2 fibre per millilitre;
         - Other types of asbestos: 0.5 fibre per millilitre.
      ii. On completion of asbestos removal works (final clearance test/reassurance test) when no visible debris is apparent: 0.01 fibre per millilitre. If the limit is exceeded, reclean the working zone and repeat final clearance/reassurance test after 24 hours, all extra time and costs are to be borne by the contractor;
      iii. Environmental air level outside tarpaulin/hoarding must not differ significantly from background level and in any case must not exceed Environmental Control Level of 0.01 fibre per millilitre.

3. Non-compliance:
   a. Where the fibre count exceeds the acceptable limit:
      i. Stop all processes which may result in the production of asbestos dust;
      ii. Spray all surfaces and debris within the asbestos removal work area with amended water in a fine mist spray, using airless spray equipment;
      iii. Bag all loose asbestos debris present in the asbestos removal work area and remove to a secure store. Wipe clean and vacuum all surfaces;
      iv. Together with CM, investigate the integrity of the containment, identify the cause of the limit exceedance and take immediate measures, as directed by the CM, to rectify the situation.
   b. In the event of air monitoring test result failures resulting from the Contractor's non-compliance with the workmanship requirements of this Worksection, bear all costs in relation to tests carried out and those tests required subsequent to rectification of the works to confirm compliance.

PILING AND FOOTING

GENERAL

DEFINITIONS

DEFINITIONS

In this Worksection, the following definitions are used:

1. "Piling Contract" shall mean a foundation contract for which the scope of works includes construction of foundation and does not include the construction of superstructure;

2. "Combined Piling and Building Contract" shall mean a contract for which the scope of works includes the construction of both the foundation and the superstructure;

3. "Contractor's Design Piling Contract / Combined Piling and Building Contract" shall mean a Piling Contract / Combined Piling and Building Contract for which the scope of works includes design of piles and/or pile caps and/or footings;

4. "Engineer's Design Piling Contract / Combined Piling and Building Contract" shall mean a Piling Contract / Combined Piling and Building Contract for which the scope of works does not include design of piles and/or pile caps and/or footings and the design of such works is provided by the CM.

CODE OF PRACTICE FOR FOUNDATIONS

In this Specification, the Code of Practice for Foundations shall mean the Code of Practice for Foundations issued in October 2004 by the Buildings Department of the Hong Kong Special Administrative Region.

DESIGN RESPONSIBILITY

DESIGN RESPONSIBILITY

The design responsibility for piles, pile caps and footings is to be specified in the Project Specific Specification.

STANDARDS

PILING

Comply with the Code of Practice for Foundations and the relevant Building Regulations of Hong Kong.

PILE CAPS AND FOOTINGS

Comply with the 'Concrete Works' Worksection of this Specification in respect of all materials and workmanship for footings, reinforced concrete pile caps and for structural concrete above piles, unless otherwise specified.
PILING AND FOOTING

PIL1.G230.7 STATUS OF THE SPECIFICATION
Where this Specification includes provisions additional to, or more stringent than those of the aforementioned British Standards, Code of Practice for Foundations or Building Regulations, the provisions of this Specification shall prevail overall.

PIL1.G240.7 OTHER WORKSECTIONS
Comply with the relevant provisions of other Worksections of this Specification and in particular with the following:
1. EAR1 Excavation and Filling;
2. CON1 Insitu Concrete;
3. CON2 or FOR Formwork;
4. CON3 Reinforcement;
5. STR1 Structural Steel.

PIL1.G250.7 CONTRACTOR'S DESIGN FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
In the event of any conflict, contradiction or ambiguity between the Contractor's design and this Specification, the provisions of this Specification shall prevail.

PILE TYPES

PIL1.G310.7 GENERAL
1. This Specification applies to pile types 1 to 7 as defined in clauses PIL1.G320 to PIL1.G375 below;
2. Where relevant, this Specification applies equally to any other type of pile.

PIL1.G320.7 TYPE 1 PILES
1. Type 1a piles shall mean precast reinforced concrete piles complying with the requirements stated in clause 5.4.3 of the Code of Practice for Foundations;
2. Type 1b piles shall mean precast prestressed spun concrete piles complying with the requirements stated in clause 5.4.4 of the Code of Practice for Foundations;
3. Type 1c piles shall mean driven cast-in-place concrete piles complying with the requirements stated in clause 5.4.5 of the Code of Practice for Foundations.

PIL1.G330.7 TYPE 2 PILES
Driven steel tube with detachable toe and precast concrete pile insert (steel tube to be withdrawn).

PIL1.G340.7 TYPE 3 PILES
Large diameter bored cast insitu concrete piles:
1. Cast with inserted precast concrete annuli; or
2. Cast with left-in-place lining; or
3. Cast with temporary lining.

PIL1.G350.7 TYPE 4 PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
Driven steel H-piles of sizes, masses, grades and material properties to the standards as specified in the Drawings.
PILING AND FOOTING

PIL1.G355.7 TYPE 4 PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
Driven steel piles of types and brands recognized by BD. Submit the recognition documentation of the proposed piles issued by BD with the tender.

PIL1.G360.7 TYPE 5 PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
Minipiles, being defined as piles with a diameter (excluding casing) of not more than 400 mm and taking up vertical loads by one or more steel reinforcement bars encased in grout.

PIL1.G365.7 TYPE 5 PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
Minipiles, being defined as piles with a diameter (excluding casing) of not more than 400 mm and taking up vertical loads by one or more steel reinforcement bars encased in grout. Derive the structural capacity of the piles solely from the steel reinforcement bars.

PIL1.G370.7 TYPE 6 PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
Socketed steel H-piles, being defined as piles installed by inserting steel H-piles, which their sizes, masses, grades and material properties are to the standards as specified in the Drawings, in pre-bored holes sunk into bedrock as defined in PIL1.G450 and subsequently grouting the pre-bored hole.

PIL1.G372.7 TYPE 6 PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
Socketed steel H-piles, being defined as piles installed by inserting steel H-piles of types and brands recognized by BD in pre-bored holes sunk into bedrock as defined in PIL1.G450 and subsequently grouting the pre-bored hole. Submit the recognition documentation of the proposed piles issued by BD with the tender.

PIL1.G375.7 TYPE 7 PILES
Pakt-In-Place (PIP) or piles formed by similar techniques, being defined as non-percussive cast in-situ concrete piles with diameters not exceeding 610 mm and formed by boring with a continuous flight auger without temporary steel casing. The bored hole is filled with grout placed by pumping through the hollow orifice of the auger pipe at the pile base while withdrawing the auger from the hole.

PIL1.G380.7 ALTERNATIVE TYPES OF PILE - FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
Where the Contractor proposes a type of pile other than the types specified in clauses PIL1.G320 to PIL1.G375, he must submit, with his tender, the testing regime and the acceptance standard of the quality of the piles for Approval.

SITE INVESTIGATION

PIL1.G410.7 PRELIMINARY INVESTIGATIONS
1. Tenderers may make preliminary investigations or sink test piles as they require and at their own cost. Arrangements for access to the Site can be made, on application to the CM, at least seven days in advance;
2. The period for carrying out site investigation by tenderers is scheduled to be between ................... and .........................

PIL1.G420.7 EXISTING BOREHOLE INFORMATION
 Certain logs of exploratory boreholes made on Site and reports of laboratory soil test results are available for inspection by appointment at the CM's office during normal working hours. Copies of the drillhole logs and reports may also be made available to tenderers who have previously applied to the CM in writing and subject to payment of a charge for photocopying. Such information as is contained in the drillhole logs and reports is given in good faith and without prejudice to the Contractor's liabilities under the Contract.

PIL1.G430.7 CONTRACTOR'S RESPONSIBILITY
 The onus is on the Contractor to satisfy himself as to the nature of the Site sub-soil conditions and to make any site investigation to obtain all information which may affect the Works.

PIL1.G440.7 ADDITIONAL INVESTIGATIONS
 1. The Contractor may make such other site investigations during the Contract as he deems necessary and at his own expense;
 2. The CM may order such other site investigation during the Contract as he deems necessary.

PIL1.G450.7 DEFINITION OF "BEDROCK"
 1. In this Specification, "bedrock" is defined as:
    a. Rock mass of at least 5 m thick measured downwards from the pile base for Types 1, 2, 3 and 4 piles;
    b. Rock mass of at least 5 m thick or of thickness not less than the designed length of the rock socket, whichever is the greater, measured downwards from the rockhead of the specified category of rock for Type 5 and 6 piles.
 2. The 'rock mass' used in sub-clause (1) shall refer to the following category of rock:
    a. For Types 1, 2, 3 and 4 piles: Rock not inferior to category 1(d) rock as described in Table 2.1 of the Code of Practice for Foundations;
    b. For Types 5 and 6 piles: Category 1(a), 1(b) or 1(c) rock as described in Table 2.1 of the Code of Practice for Foundations.
 3. The Uniaxial Compressive Strength (UCS) and point load index strength stated in Table 2.1 of the Code of Practice for Foundations shall be determined by the following tests:
 4. Refer to EAR1.W940 sub-clause (2) for definition of "bedrock" for footings;
 5. In this Specification, the definition of "total core recovery" shall follow Notes (4) of Table 2.1 of the Code of Practice for Foundations.
PILING AND FOOTING

WORKS REQUIRED TO BE CARRIED OUT BY A RSC(GIFW) UNDER THE CONTRACT

1. All works required to be carried out by a RSC (GIFW) under the CoPSS, including the sampling and testing founding levels to pile Types 3 to 7 inclusive as described in PIL1.T210 to PIL1.T240 inclusive and PIL1.T260 and confirmatory core testing of founding strata of Type 3 piles as described in PIL1.T1710 to PIL1.T1750 inclusive, shall be considered as ground investigation works under the contract;

2. Comply with the requirements of clause PRE.B9.250 for all works stated in sub-clause (1) of this clause.

BACKFILLING OF DRILLHOLES

1. Unless otherwise instructed by the CM or unless the method or materials of backfilling of drillholes is specifically stated in other parts of the Specification, fill all drillholes with granular material (or with 4:1 cement bentonite grout where instructed) and compact to the original density of the ground or a higher density;

2. Fill in and compact any subsequent depression of the ground;

3. Do not fill drillholes without the CM's permission.

APPROVED CONTRACTORS AND SUBCONTRACTORS

APPROVED CONTRACTORS FOR PILING WORKS - FOR ENGINEER'S DESIGN PILING CONTRACT

1. a. Contractor must be on the following Category of Housing Authority List of Piling Contractors:
   i. Type 1, 2, & 4 Piles - Percussive Piles Category;
   ii. Type 3 Pile - Large Diameter Bored Piles Category;
   iii. Any acceptable pile types other than Type 1, 2, 3 & 4 Piles - Large Diameter Bored Piles Category or Percussive Piles Category.

   b. In the event that more than one type of piles are used in the Contract, the Contractor must be on the appropriate Categories of Housing Authority List of Piling Contractors for all the pile types used.

2. In the event that the Contractor employ a Piling Sub-contractor to carry out the following piling activities, select the Piling Sub-contractor from the list given in sub-clause (3) below:
   a. Pile driving of Type 1, 2, & 4 Piles;
   b. Excavation and concreting of Type 3 Pile;
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles.

3. The Piling Sub-contractor must be on the following list:
   a. Appropriate Category of Housing Authority List of Piling Contractors; or
   b. Buildings Department List of Registered Specialist Contractors (Foundation) who has undertaken in the past five years at least one contract in relevant piling works under ICU’s procedures or BD’s control and of contract value not less than $10M.

4. Piling Sub-contractor for pile types other than Type 3 not on the lists in sub-clause (3) above may be considered and subject to CM's approval.
PIL1.G512.7  APPROVED CONTRACTORS FOR PILING WORKS - FOR CONTRACTOR'S DESIGN PILING CONTRACT

1. Contractor must be on the following Category of Housing Authority List of Piling Contractors:
   i. Type 1, 2, & 4 Piles - Percussive Piles Category;
   ii. Type 3 Pile - Large Diameter Bored Piles Category;
   iii. Any acceptable pile types other than Type 1, 2, 3 & 4 Piles - Large Diameter Bored Piles Category or Percussive Piles Category.

b. In the event that more than one type of piles are used in the Contract, the Contractor must be on the appropriate Categories of Housing Authority List of Piling Contractors for all the pile types used.

2. In the event that the Contractor employ a Piling Sub-contractor to carry out the following piling activities, select the Piling Sub-contractor from the list given in sub-clause (3) below:
   a. Pile driving of Type 1, 2, & 4 Piles;
   b. Excavation and concreting of Type 3 Pile;
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles;
   d. Foundation design.

3. The Piling Sub-contractor must be on the following list:
   a. Appropriate Category of Housing Authority List of Piling Contractors; or
   b. Buildings Department List of Registered Specialist Contractors (Foundation) who has undertaken in the past five years at least one contract in relevant piling works under ICU’s procedures or BD’s control and of contract value not less than $10M.

4. Piling Sub-contractor for pile types other than Type 3 not on the lists in sub-clause (3) above may be considered and subject to CM's approval.

PIL1.G515.7  APPROVED CONTRACTORS FOR PILING WORKS - FOR ENGINEER'S DESIGN COMBINED PILING AND BUILDING CONTRACT

1. The Contractor must employ a Piling Sub-contractor to carry out the following piling activities unless the Contractor is on the relevant Category of the Housing Authority List of Piling Contractors and takes up the role of Piling Sub-contractor in carrying out the respective piling activities:
   a. Pile driving of Type 1, 2, & 4 Piles;
   b. Excavation and concreting of Type 3 Pile;
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles.

2. Requirements on Piling Sub-contractor:
   a. The Piling Sub-contractor must be on the following Category of the Housing Authority List of Piling Contractors:
      i. Type 1, 2, & 4 Piles - Percussive Piles Category;
      ii. Type 3 Pile - Large Diameter Bored Piles Category;
      iii. Any acceptable pile types other than Type 1, 2, 3 & 4 Piles - Large Diameter Bored Piles Category or Percussive Piles Category.

b. In the event that more than one type of piles are used in the Contract, the Piling Sub-contractor must be on the appropriate Categories of Housing Authority List of Piling Contractors for all the pile types used.
3. In the event that the Piling Sub-contractor employ a Piling Sub-sub-contractor to carry out the piling activities stated in sub-clauses (1)(a) to (1)(c) above, the Piling Sub-sub-contractor must be on the following list:
   a. Appropriate Category of Housing Authority List of Piling Contractors; or
   b. Buildings Department List of Registered Specialist Contractors (Foundation) who has undertaken in the past five years at least one contract in relevant piling works under ICU’s procedures or BD’s control and of contract value not less than $10M.

4. Piling Sub-sub-contractor for pile types other than Type 3 not on the lists in sub-clause (3) above may be considered and subject to CM’s approval.

PIL1.G517.7 APPROVED CONTRACTORS FOR PILING WORKS - FOR CONTRACTOR’S DESIGN COMBINED PILING AND BUILDING CONTRACT

1. The Contractor must employ a Piling Sub-contractor to carry out the following piling activities unless the Contractor is on the relevant Category of the Housing Authority List of Piling Contractors and takes up the role of Piling Sub-contractor in carrying out the respective piling activities:
   a. Pile driving of Type 1, 2, & 4 Piles;
   b. Excavation and concreting of Type 3 Pile;
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles;
   d. Foundation design.

2. Requirements on Piling Sub-contractor:
   a. The Piling Sub-contractor must be on the following Category of the Housing Authority List of Piling Contractors:
      i. Type 1, 2, & 4 Piles - Percussive Piles Category;
      ii. Type 3 Pile - Large Diameter Bored Piles Category;
      iii. Any acceptable pile types other than Type 1, 2, 3 & 4 Piles - Large Diameter Bored Piles Category or Percussive Piles Category.
   b. In the event that more than one type of piles are used in the Contract, the Piling Sub-contractor must be on the appropriate Categories of Housing Authority List of Piling Contractors for all the pile types used.

3. In the event that the Piling Sub-contractor employ a Piling Sub-sub-contractor to carry out the piling activities stated in sub-clauses (1)(a) to (1)(d) above, the Piling Sub-sub-contractor must be on the following list:
   a. Appropriate Category of Housing Authority List of Piling Contractors; or
   b. Buildings Department List of Registered Specialist Contractors (Foundation) who has undertaken in the past five years at least one contract in relevant piling works under ICU’s procedures or BD’s control and of contract value not less than $10M.

4. Piling Sub-sub-contractor for pile types other than Type 3 not on the lists in sub-clause (3) above may be considered and subject to CM’s approval.

PIL1.G520.7 SUB-CONTRACTOR FOR CONSTRUCTION OF FOOTING - FOR BUILDING CONTRACT WITH FOOTING CONSTRUCTION

1. In the event that the Contractor employs sub-contractor to carry out construction of footings, the sub-contractor must be on the following list:
   a. Buildings Department List of Registered General Building Contractors; or
   b. Buildings Department List of Registered Specialist Contractors (Foundation).
2. In this specification, construction of footing shall mean construction of spread and/or raft footing and include fixing of starter bars, if any.

PIL1.G530.7 DEFINITION OF "PILING SUBCONTRACTOR" FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. In this specification, Piling Subcontractor shall mean the subcontractor employed by the Contractor for the following piling activities:
   a. Pile driving of Type 1, 2, & 4 Piles; and/or
   b. Excavation and/or concreting of Type 3 Pile; and/or
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles.

2. Such contract between the Contractor and the Piling Subcontractor shall be termed the Piling Subcontract.

PIL1.G535.7 DEFINITION OF "PILING SUBCONTRACTOR" FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. In this specification, Piling Subcontractor shall mean the subcontractor employed by the Contractor for the following piling activities:
   a. Pile driving of Type 1, 2, & 4 Piles; and/or
   b. Excavation and/or concreting of Type 3 Pile; and/or
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles; and/or
   d. Foundation design.

2. Such contract between the Contractor and the Piling Subcontractor shall be termed the Piling Subcontract.

PIL1.G540.7 DEFINITION OF "PILING SUB-SUBCONTRACTOR" FOR ENGINEER'S DESIGN COMBINED PILING AND BUILDING CONTRACT ONLY

1. In this specification, Piling Sub-subcontractor shall mean the subcontractor employed by the Piling Subcontractor for the following piling activities:
   a. Pile driving of Type 1, 2, & 4 Piles; and/or
   b. Excavation and/or concreting of Type 3 Pile; and/or
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles.

2. Such contract between the Piling Subcontractor and the Piling Sub-subcontractor shall be termed the Piling Sub-subcontract.

PIL1.G545.7 DEFINITION OF "PILING SUB-SUBCONTRACTOR" FOR CONTRACTOR'S DESIGN COMBINED PILING AND BUILDING CONTRACT ONLY

1. In this specification, Piling Sub-subcontractor shall mean the subcontractor employed by the Piling Subcontractor for the following piling activities:
   a. Pile driving of Type 1, 2, & 4 Piles; and/or
   b. Excavation and/or concreting of Type 3 Pile; and/or
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles; and/or
   d. Foundation design.
2. Such contract between the Piling Subcontractor and the Piling Sub-subcontractor shall be termed the Piling Sub-subcontract.

PIL1.G550.7  
**RESTRICTION ON PILING SUBCONTRACT**  
The number of Piling Subcontractor shall be limited to one per each type of piles unless otherwise approved by the CM.

PIL1.G560.7  
**RESTRICTION ON PILING SUB-SUBCONTRACT - FOR COMBINED PILING AND BUILDING CONTRACT ONLY**  
The number of Piling Sub-subcontractor shall be limited to one per each type of piles unless otherwise approved by the CM.

PIL1.G570.7  
**INFORMATION ON PILING SUBCONTRACT**  
Submit with the tender the following information:
1. Letter of intent from the proposed Piling Subcontractor whom the tenderer intends to employ for the Contract should the tenderer be awarded the Contract, indicating his willingness to carry out the proposed Piling Subcontract;
2. The names of the directors or sole proprietor and site representatives of the proposed Piling Subcontractor;
3. The piling activity and the scope of the proposed Piling Subcontract;
4. The minimum numbers of self owned piling plants and directly employed piling plant operators to be provided by the tenderer;
5. The minimum numbers of self owned piling plants and directly employed piling plant operators to be provided by the proposed Piling Subcontractor.

PIL1.G580.7  
**INFORMATION ON PILING SUB-SUBCONTRACT - FOR COMBINED PILING AND BUILDING CONTRACT ONLY**  
Submit with the tender the following information:
1. Letter of intent from the proposed Piling Sub-subcontractor whom the proposed Piling Subcontractor intends to employ for the subcontract should the proposed Piling Subcontractor be awarded the subcontract, indicating his willingness to carry out the proposed Piling Sub-subcontract;
2. The names of the directors or sole proprietor and site representatives of the proposed Piling Sub-subcontractor;
3. The piling activity and the scope of the proposed Piling Sub-subcontract;
4. The minimum numbers of self owned piling plants and directly employed piling plant operators to be provided by the proposed Piling Subcontractor;
5. The minimum numbers of self owned piling plants and directly employed piling plant operators to be provided by the proposed Piling Sub-subcontractor.

PIL1.G590.7  
**CONDITIONS ON PILING SUBCONTRACT - FOR ENGINEER'S DESIGN PILING CONTRACT ONLY**  
Incorporate the following conditions into the Piling Sub-contract:
1. The piling activity and the scope of the Piling Sub-contract;
2. The Piling Sub-contractor is not allowed to sublet the following piling activities:
   a. Pile driving of Type 1, 2, & 4 Piles; and/or
   b. Excavation and/or concreting of Type 3 Pile; and/or
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles.
3. For the types of plants listed below which are required to be used on Site, the Piling Sub-contractor shall deploy and use only his self-owned plants save when necessary, he may use Contractor's self-owned plants deployed in accordance with PIL1.W380:
   a. Crawler crane;
   b. Oscillator or rotator;
   c. Reverse circulation drill (RCD);
   d. Pile driving hammer;
   e. Pile driving rig.
4. The Piling Sub-contractor shall comply with the following in deploying self-owned plants listed in sub-clauses (3)(a) to (3)(e) above:
   a. Self-owned plants of the Piling Sub-contractor shall mean plants owned by the Piling Sub-contractor or by the Piling Sub-contractor's parent, sister or subsidiary company for the exclusive use of the Piling Sub-contractor;
   b. All the plants deployed to Site shall be in good working conditions;
   c. Deploy at least one number of self-owned plant that are required to be used on Site;
   d. Submit documents to prove his ownership of the plants and, if applicable, the relationship between the Piling Sub-contractor and the Piling Sub-contractor's parent, sister or subsidiary company;
   e. Submit document to confirm no further subletting of his part of the works.
5. The Contractor shall supply piling materials, which form whole or part of permanent works, to the Piling Sub-contractor;
6. A probity clause shall be included in the Piling Sub-contract such that:
   "If the Piling Sub-contractor or any of his agents or employees are found to have offered or given advantage, gratuity, bonus, discount, bribe or loan of any sort to any agent or employee of the Contractor, Hong Kong Housing Authority or Housing Department, the Contractor shall at liberty forthwith terminate the employment of the Piling Sub-contractor under the Piling Subcontract. The Contractor, Hong Kong Housing Authority or Housing Department shall hold the Piling Sub-contractor liable for any loss or damage which the Contractor, Hong Kong Housing Authority or Housing Department may thereby sustain."

**CONDITIONS ON PILING SUBCONTRACT - FOR CONTRACTOR'S DESIGN PILING CONTRACT ONLY**

Incorporate the following conditions into the Piling Sub-contract:
1. The piling activity and the scope of the Piling Sub-contract;
2. The Piling Sub-contractor is not allowed to sublet the following piling activities:
   a. Pile driving of Type 1, 2, & 4 Piles; and/or
   b. Excavation and/or concreting of Type 3 Pile; and/or
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles; and/or
   d. Foundation design.
3. For the types of plants listed below which are required to be used on Site, the Piling Sub-contractor shall deploy and use only his self-owned plants save when necessary, he may use Contractor's self-owned plants deployed in accordance with PIL1.W380:
   a. Crawler crane;
   b. Oscillator or rotator;
c. Reverse circulation drill (RCD);
d. Pile driving hammer;
e. Pile driving rig.

4. The Piling Sub-contractor shall comply with the following in deploying self-owned plants listed in sub-clauses (3)(a) to (3)(e) above:
   a. Self-owned plants of the Piling Sub-contractor shall mean plants owned by the Piling Sub-contractor or by the Piling Sub-contractor's parent, sister or subsidiary company for the exclusive use of the Piling Sub-contractor;
   b. All the plants deployed to Site shall be in good working conditions;
   c. Deploy at least one number of self-owned plant that are required to be used on Site;
   d. Submit documents to prove his ownership of the plants and, if applicable, the relationship between the Piling Sub-contractor and the Piling Sub-contractor's parent, sister or subsidiary company;
   e. Submit document to confirm no further subletting of his part of the works.

5. The Contractor shall supply piling materials, which form whole or part of permanent works, to the Piling Sub-contractor;

6. A probity clause shall be included in the Piling Sub-contract such that:
   "If the Piling Sub-contractor or any of his agents or employees are found to have offered or given advantage, gratuity, bonus, discount, bribe or loan of any sort to any agent or employee of the Contractor, Hong Kong Housing Authority or Housing Department, the Contractor shall at liberty forthwith terminate the employment of the Piling Sub-contractor under the Piling Subcontract. The Contractor, Hong Kong Housing Authority or Housing Department shall hold the Piling Sub-contractor liable for any loss or damage which the Contractor, Hong Kong Housing Authority or Housing Department may thereby sustain."

PIL1.G600.7 CONDITIONS ON PILING SUBCONTRACT - FOR ENGINEER'S DESIGN COMBINED PILING AND BUILDING CONTRACT ONLY

Incorporate the following conditions into the Piling Sub-contract:

1. The piling activity and the scope of the Piling Sub-contract;

2. The Piling Sub-contractor is not allowed to sublet the following piling activities to more than one Piling Sub-subcontractor:
   a. Pile driving of Type 1, 2, & 4 Piles; and/or
   b. Excavation and/or concreting of Type 3 Pile; and/or
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles.

3. For the types of plants listed below which are required to be used on Site, the Piling Sub-contractor shall deploy at least one number of self-owned plant for each type of the plants, unless otherwise allowed by CM:
   a. Crawler crane;
   b. Oscillator or rotator;
   c. Reverse circulation drill (RCD);
   d. Pile driving hammer;
   e. Pile driving rig.

4. The Piling Sub-contractor shall comply with the following in deploying self-owned plants listed in sub-clauses (3)(a) to (3)(e) above:
   a. Self-owned plants of the Piling Sub-contractor shall mean plants owned by the Piling Sub-contractor or by the Piling Sub-contractor's parent, sister or subsidiary company for the exclusive use of the Piling Sub-contractor;
b. All the plants deployed to Site shall be in good working conditions;

c. Submit documents to prove the plant ownership and, if applicable, the relationship between the Piling Sub-contractor and the Piling Sub-contractor's parent, sister or subsidiary company;

d. For piling works undertaken by Piling Sub-subcontractor, deployment of self-owned plants of the Piling Sub-subcontractor to Site shall comply with the requirements stated in PIL1.G610;

e. The self-owned plants deployed to Site according to sub-clauses (3)(a) to (3)(e) may be used by the Piling Sub-subcontractor when necessary.

5. A probity clause shall be included in the Piling Subcontract such that:
"If the Piling Sub-contractor or any of his agents or employees are found to have offered or given advantage, gratuity, bonus, discount, bribe or loan of any sort to any agent or employee of the Contractor, Hong Kong Housing Authority or Housing Department, the Contractor shall at liberty forthwith terminate the employment of the Piling Sub-contractor under the Piling Subcontract. The Contractor, Hong Kong Housing Authority or Housing Department shall hold the Piling Sub-contractor liable for any loss or damage which the Contractor, Hong Kong Housing Authority or Housing Department may thereby sustain."

PIL1.G605.7 CONDITIONS ON PILING SUBCONTRACT - FOR CONTRACTOR'S DESIGN COMBINED PILING AND BUILDING CONTRACT ONLY

Incorporate the following conditions into the Piling Sub-contract:

1. The piling activity and the scope of the Piling Sub-contract;

2. The Piling Sub-contractor is not allowed to sublet the following piling activities to more than one Piling Sub-subcontractor:
   a. Pile driving of Type 1, 2, & 4 Piles; and/or
   b. Excavation and/or concreting of Type 3 Pile; and/or
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles; and/or
   d. Foundation design.

3. For the types of plants listed below which are required to be used on Site, the Piling Sub-contractor shall deploy at least one number of self-owned plant for each type of the plants, unless otherwise allowed by CM:
   a. Crawler crane;
   b. Oscillator or rotator;
   c. Reverse circulation drill (RCD);
   d. Pile driving hammer;
   e. Pile driving rig.

4. The Piling Sub-contractor shall comply with the following in deploying self-owned plants listed in sub-clauses (3)(a) to (3)(e) above:
   a. Self-owned plants of the Piling Sub-contractor shall mean plants owned by the Piling Sub-contractor or by the Piling Sub-contractor's parent, sister or subsidiary company for the exclusive use of the Piling Sub-contractor;
   b. All the plants deployed to Site shall be in good working conditions;
   c. Submit documents to prove the plant ownership and, if applicable, the relationship between the Piling Sub-contractor and the Piling Sub-contractor's parent, sister or subsidiary company;
   d. For piling works undertaken by Piling Sub-subcontractor, deployment of self-owned plants of the Piling Sub-subcontractor to Site shall comply with the requirements stated in PIL1.G610;
e. The self-owned plants deployed to Site according to sub-clauses (3)(a) to (3)(e) may be used by the Piling Sub-subcontractor when necessary.

5. A probity clause shall be included in the Piling Subcontract such that:

"If the Piling Sub-contractor or any of his agents or employees are found to have offered or given advantage, gratuity, bonus, discount, bribe or loan of any sort to any agent or employee of the Contractor, Hong Kong Housing Authority or Housing Department, the Contractor shall at liberty forthwith terminate the employment of the Piling Sub-contractor under the Piling Subcontract. The Contractor, Hong Kong Housing Authority or Housing Department shall hold the Piling Sub-contractor liable for any loss or damage which the Contractor, Hong Kong Housing Authority or Housing Department may thereby sustain."

PIL1.G610.7 CONDITIONS ON PILING SUB-SUBCONTRACT - FOR ENGINEER'S DESIGN COMBINED PILING AND BUILDING CONTRACT ONLY

Incorporate the following conditions into the Piling Sub-subcontract:

1. The piling activity and the scope of the Piling Sub-subcontract;

2. The Piling Sub-subcontractor is not allowed to sublet the following piling activities:
   a. Pile driving of Type 1, 2, & 4 Piles; and/or
   b. Excavation and/or concreting of Type 3 Pile; and/or
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles.

3. For the types of plants listed below which are required to be used on Site, the Piling Sub-subcontractor shall deploy and use only his self-owned plants save when necessary, he may use the Piling Sub-contractor's self-owned plants deployed in accordance with PIL1.G600:
   a. Crawler crane;
   b. Oscillator or rotator;
   c. Reverse circulation drill (RCD);
   d. Pile driving hammer;
   e. Pile driving rig.

4. The Piling Sub-subcontractor shall comply with the following in deploying self-owned plants listed in sub-clauses (3)(a) to (3)(e) above:
   a. Self-owned plants of the Piling Sub-subcontractor shall mean plants owned by the Piling Sub-subcontractor or by the Piling Sub-subcontractor's parent, sister or subsidiary company for the exclusive use of the Piling Sub-subcontractor;
   b. All the plants deployed to Site shall be in good working conditions;
   c. Deploy at least one number of self-owned plant that are required to be used on Site;
   d. Submit documents to prove his ownership of the plants and, if applicable, the relationship between the Piling Sub-subcontractor and the Piling Sub-subcontractor's parent, sister or subsidiary company;
   e. Submit document to confirm no further subletting of his part of the works.

5. The Piling Sub-contractor shall supply piling materials, which form whole or part of permanent works, to the Piling Sub-subcontractor;

6. A probity clause shall be included in the Piling Sub-subcontract such that:
"If the Piling Sub-subcontractor or any of his agents or employees are found to have offered or given advantage, gratuity, bonus, discount, bribe or loan of any sort to any agent or employee of the Piling Sub-contractor, the Contractor, Hong Kong Housing Authority or Housing Department, the Piling Sub-contractor shall at liberty forthwith terminate the employment of the Piling Sub-subcontractor under the Piling Sub-subcontract. The Piling Sub-contractor, the Contractor, Hong Kong Housing Authority or Housing Department shall hold the Piling Sub-subcontractor liable for any loss or damage which the Piling Sub-contractor, the Contractor, Hong Kong Housing Authority or Housing Department may thereby sustain."

PIL1.G615.7 CONDITIONS ON PILING SUB-SUBCONTRACT - FOR CONTRACTOR'S DESIGN COMBINED PILING AND BUILDING CONTRACT ONLY

Incorporate the following conditions into the Piling Sub-subcontract:

1. The piling activity and the scope of the Piling Sub-subcontract;

2. The Piling Sub-subcontractor is not allowed to sublet the following piling activities:
   a. Pile driving of Type 1, 2, & 4 Piles; and/or
   b. Excavation and/or concreting of Type 3 Pile; and/or
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles; and/or
   d. Foundation design.

3. For the types of plants listed below which are required to be used on Site, the Piling Sub-subcontractor shall deploy and use only his self-owned plants save when necessary, he may use the Piling Sub-contractor’s self-owned plants deployed in accordance with PIL1.G600:
   a. Crawler crane;
   b. Oscillator or rotator;
   c. Reverse circulation drill (RCD);
   d. Pile driving hammer;
   e. Pile driving rig.

4. The Piling Sub-subcontractor shall comply with the following in deploying self-owned plants listed in sub-clauses (3)(a) to (3)(e) above:
   a. Self-owned plants of the Piling Sub-subcontractor shall mean plants owned by the Piling Sub-subcontractor or by the Piling Sub-subcontractor's parent, sister or subsidiary company for the exclusive use of the Piling Sub-subcontractor;
   b. All the plants deployed to Site shall be in good working conditions;
   c. Deploy at least one number of self-owned plant that are required to be used on Site;
   d. Submit documents to prove his ownership of the plants and, if applicable, the relationship between the Piling Sub-subcontractor and the Piling Sub-subcontractor's parent, sister or subsidiary company;
   e. Submit document to confirm no further subletting of his part of the works.

5. The Piling Sub-contractor shall supply piling materials, which form whole or part of permanent works, to the Piling Sub-subcontractor;

6. A probity clause shall be included in the Piling Sub-subcontract such that:
"If the Piling Sub-subcontractor or any of his agents or employees are found to have offered or given advantage, gratuity, bonus, discount, bribe or loan of any sort to any agent or employee of the Piling Sub-contractor, the Contractor, Hong Kong Housing Authority or Housing Department, the Piling Sub-contractor shall at liberty forthwith terminate the employment of the Piling Sub-subcontractor under the Piling Sub-subcontract. The Piling Sub-contractor, the Contractor, Hong Kong Housing Authority or Housing Department shall hold the Piling Sub-subcontractor liable for any loss or damage which the Piling Sub-contractor, the Contractor, Hong Kong Housing Authority or Housing Department may thereby sustain."

**PIL1.G620.7**  
**SUBMISSION OF CONTRACT DOCUMENTS OF PILING SUB-CONTRACT**

1. Before execution of the Piling Sub-contract works, submit to the CM a written confirmation signed by the Contractor and the Piling Sub-contractor confirming that the conditions stated in PIL1.G590 or PIL1.G600, as appropriate, have been included into the Piling Sub-contract;

2. In the event that the Contractor takes up the role of Piling Sub-contractor as allowed in PIL1.G515 for Combined Piling and Building Contract, submit to CM a written confirmation signed by the Contractor confirming that he shall take up the role of Piling Sub-contractor and act as if he is the Piling Sub-contractor in addition to his capacity.

**PIL1.G630.7**  
**SUBMISSION OF CONTRACT DOCUMENTS OF PILING SUB-SUBCONTRACT - FOR COMBINED PILING AND BUILDING CONTRACT ONLY**

Before execution of the Piling Sub-subcontract works, submit to the CM a written confirmation signed by the Piling Sub-contractor and the Piling Sub-subcontractor confirming that the conditions stated in PIL1.G610 have been included into the Piling Sub-subcontract.
DESIGN

GENERAL

PIL1.D010.7  GENERAL
All specification clauses in this section shall be applied to Contractor's Design Piling Contract / Combined Piling and Building Contract only unless otherwise stated.

PIL1.D020.7  ACCEPTABLE PILE TYPES
1. Only the type or types of piles specified in the Project Specific Specification shall be acceptable to be used in this Contract unless otherwise proposed by the Contractor and subsequently Approved by the CM in accordance with sub-clause (2) below;
2. Notwithstanding sub-clause (1) above, the Contractor may propose any other alternative types of pile as in clause PIL1.G380. The proposed alternative types of pile must be accepted by the Buildings Department of the Hong Kong Special Administrative Region;
3. Do not base the design on a system of hand dug caissons.

PIL1.D030.7  ACCEPTANCE OF THE DESIGN
Acceptance of the Contractor's design, whether prior to or during the contract period, will not relieve the Contractor's responsibility to comply with this Specification.

PIL1.D040.7  DESIGN CERTIFYING CONSULTANT
A director of the Design Certifying Consultant, who must be a Registered Structural Engineer registered with the Building Authority, must certify and sign all layouts, details and calculations submitted to the CM, including those for tendering purposes.

INFORMATION TO BE SUPPLIED WITH TENDER

PIL1.D110.7  SUBMISSIONS
Submit three copies of each of the following with the tender:
1. Fully detailed design and specification proposals for the Works;
2. Complete set of calculations;
3. Drawings showing the number and positions of the piles;
4. The estimated average, maximum and minimum net lengths of the piles below cut-off level;
5. Drawings showing the layout, details and founding levels of footings, if any;
6. Any other requirement as detailed elsewhere in this Specification.

PIL1.D120.7  ADDITIONAL REQUIREMENTS FOR TYPES 5, 6 AND 7 PILES
Submit also:
1. Details of grout mix as PIL1.M410 and PIL1.M420;
2. Sequence and timing of grouting, including details of secondary pressure grouting;
3. Details of drilling method and equipment;
4. Details of reinforcement (including area of reinforcement at root of screw to coupler), pipe section, spacers, couplings and related test reports for Type 5 piles only;

5. Fabrication details of steel reinforcement cage (including installation details of single sonic access tube) for Type 7 piles only.

DESIGN SUBMISSIONS

PIL1.D210.7  
SUBMISSIONS OF PILING AND/OR FOOTING DESIGN AT COMMENCEMENT OF THE WORKS
Submit four copies of drawings, calculations and any other relevant documents related to piling and/or footing design for Approval not later than 7 days from the notified date for commencement of the Works. The submissions shall include relevant foundation plans and supporting documents as described in clause 2.7 and clause 5.4.1, as appropriate, of the Code of Practice for Foundations. Any submission not to the satisfaction of the CM shall be re-submitted. Allow 37 days for each submission and re-submission for the checking of the CM.

PIL1.D220.7  
SUBMISSIONS OF AMENDMENT OF PILING AND/OR FOOTING DESIGN
In the event that amendment of piling and/or footing design is required, submit four copies of drawings, calculations and any other relevant documents related to the amendment for Approval. Any submission not to the satisfaction of the CM shall be re-submitted. Allow 42 days for each submission and re-submission for the checking of the CM.

DESIGN PARAMETERS

PIL1.D320.7  
DESIGN LOAD
All loads shown on the CM's drawings are deemed dead loads and imposed loads as defined in the Building (Construction) Regulations, irrespective of whether they are indicated on the drawings as characteristic or designed loads. Such loads have not been multiplied by the partial safety load factors.

PIL1.D330.7  
TYPES OF PILE IN ONE CAP
Allow only one type of pile in each pile cap.

PIL1.D340.7  
PILE SPACING
Comply with clause 5.1.3 of the Code of Practice for Foundations.

PIL1.D350.7  
STRESS IN STEEL FOR PILING DESIGN
1. For Type 4 piles, comply with clause 2.5.5(3) and 5.4.11(2)(a) & (b), as appropriate, of the Code of Practice for Foundations;

2. For Type 5 piles, comply with clause 5.4.8(a) of the Code of Practice for Foundations;

3. For Type 6 piles, comply with sub-clause (a) regarding Design Principles of clause 5.4.2 of the Code of Practice for Foundations;

4. For the combined effects of dead, imposed and wind loads, the allowable stress in sub-clauses (1), (2) & (3) above may be increased by not more than 25% where such increase is solely due to wind loads.
PIL1.D360.7 STRESS IN CONCRETE FOR PILING DESIGN
1. For Types 1a and 2 piles, comply with Regulation 26 of Building (Construction) Regulations and clause 2.5.5(2) of the Code of Practice for Foundations;
2. For Types 1c and 3 piles, comply with Regulation 27 of Building (Construction) Regulations and clause 2.5.5(2) of the Code of Practice for Foundations.

PIL1.D370.7 WIND EFFECT
Design the foundations to comply with the "Code of Practice on Wind Effects in Hong Kong 2004 " issued in December 2004 by the Buildings Department of the Hong Kong Special Administrative Region.

PIL1.D380.7 RESISTANCE TO SLIDING, UPLIFT, OVERTURNING AND BUOYANCY
1. Design the foundations to comply with Section 15 of the Building (Construction) Regulations of Hong Kong and clause 2.5.3, 2.5.4 & 5.1.6 of the Code of Practice for Foundations;
2. Comply also with clause 5.3.3 of the Code of Practice for Foundations regarding uplift resistance of piles.

PIL1.D390.7 SAFE LOAD CARRYING CAPACITY
1. The combined effects of dead, imposed and wind loads including negative skin friction shall not exceed the safe load carrying capacity of an individual pile times the group reduction factor, if necessary, in accordance with PIL1.D400;
2. The safe load carrying capacity of an individual pile shall not exceed the allowable structural capacity of the pile based on the allowable stresses in steel and concrete stipulated in PIL1.D350 and PIL1.D360, respectively;
3. The compressive safe load carrying capacity of an individual Type 3 pile founded on Category 1(a), 1(b), 1(c) or 1(d) rock defined in PIL1.G450 shall not exceed the area of the designed pile base times 10 MPa, 7.5 MPa, 5 MPa or 3 MPa respectively;
4. The safe load carrying capacity of an individual Type 5 and Type 6 pile shall be derived according to the design principles stated in clause 5.4.8 and 5.4.2 respectively of the Code of Practice for Foundations;
5. For piles in compression designed not to rest on bedrock defined in PIL1.G450, base the pile design, in addition to the driving formula if the pile is a driven pile, on static formulae to achieve the required embedded length of the piles in the bearing stratum by using one of the following references:
6. Propose the driving formula and the associated parameters for the CM's approval. Where hydraulic hammers are used, adopt the modified Hiley formula:

\[
Q = \frac{K_h E}{(2s + c_1 + c_2 + c_3)}
\]

where

- \(Q\) = safe compressive load carrying capacity (kN);
- \(E\) = Driving energy of the hammer immediately before impact (KNmm);
- \(s\) = set per blow (mm);
c₁ = temporary compression allowance for pile head and cap (mm);
c₂+c₃ = elastic rebound (mm); and

Kₕ = Hydraulic Hammer Factor that, in any event should not be greater than the following values:

Kₕ = 0.6 where a pile cushion is used; and
Kₕ = 0.7 where no pile cushion is used; and

Appropriate adjustment should be made to the Kₕ value if a lower value is obtained from load testing results as stated in sub-clause (7) below;

7. Demonstrate the adequacy of the proposed driving formula or the modified Hiley formula and the associated parameters stated in sub-clause (6) in the determination of safe load carrying capacity of the pile by conducting load test(s) stipulated in PIL1.T810 to PIL1.T880. Verify the value of E in the modified Hiley formula by a method agreed by the CM;

8. The overall length of each pile must be the greater of those derived from the following formulae:
   a. The driving formula or the modified Hiley formula as stated in sub-clause (6) above; or
   b. The static formula as stated in sub-clause (5).

9. Adopt an installation method that will ensure that the required embedded length is achieved;

10. For the purpose of design calculations for the safe load carrying capacity of piles in compression, the design soil parameters (bulk unit weight, effective cohesion and effective friction angle) of different soil type shall not exceed the values given in the Project Specific Specification.

11. Design ground water level shall be as given in the Project Specific Specification;

12. Make a detailed submission to the CM to substantiate any proposed modification to the soil parameters stated in sub-clause (10) above and:
   a. Verify the proposed values by carrying out necessary Approved laboratory tests. The CM reserves the right to reject any proposed modification which is not to his entire satisfaction;
   b. Submit, with the tender, details of the proposed tests all to the CM’s satisfaction. Arrange for a sufficient number of laboratory tests to establish the lower bound design values for each major stratum with sufficient independent results for that stratum. Have all laboratory tests for this purpose carried out at own cost and without any extension of time.

13. Notwithstanding sub-clause (10) above, in relation to the design, the Contractor may establish unit side resistance and unit tip resistance of the driven piles to be used in the Contract for various ground conditions and depths by preliminary pile loading tests in addition to those described in PIL1.T110 or separate side resistance and tip resistance tests. If design parameters derived from loading tests are to be used, submit the locations and instrumentation details of the proposed preliminary piles for such verification purpose, and a testing programme all to the satisfaction of the CM with the tender. The number of preliminary piles shall be sufficient to establish the lower bound design value for each major stratum with sufficient independent results for that stratum. Carry out all loading tests for this purpose at own cost, without any extension of time and complete them within two months of the notified date for the commencement of the Works. In the event of any failure to complete the above loading tests within two months of the notified date for the commencement of the Works, then no piling work, except for the loading tests, will be permitted to proceed any further until the completion of the loading tests, unless otherwise Approved. Bear the cost of any delay in this connection. No claim for additional costs or any extension of time will be considered by the CM.
14. In checking the allowable buckling capacity of Types 5 and 6 piles, the lateral restraints from the grout, steel casing if permanent and the surrounding soil may be allowed. Do not apply sub-clause (5) above to Types 5 and 6 piles.

**PIL1.D395.7 SAFE LOAD CARRYING CAPACITY - TYPE 7 PILES FOR CONTRACTOR'S DESIGN**

1. The theoretical safe compressive load carrying capacity \(Q_p\) in kN of Type 7 pile shall be the sum of allowable skin friction capacity \(q_s\) along the whole pile shaft and allowable end bearing capacity \(q_b\) of the pile base:

\[Q_p = q_s + q_b = \mu \sum N_{av} P L_i + 5 N A\]

where

- \(\mu\) = designed friction coefficient in kN/m² per SPT "N" value and to be verified by trial pile (maximum value to be used is limited to 1.6);
- \(N_{av}\) = average SPT "N" value along the pile shaft in blows / 300 mm (maximum value to be used is limited to 40);
- \(P\) = perimeter of the pile in m;
- \(L_i\) = length of the pile shaft section i in m;
- \(N\) = SPT value at the pile base in blows / 300 mm (maximum value to be used is limited to 200);
- \(A\) = cross sectional area of the pile in m²;

Shaft friction in filling materials and marine deposits shall be ignored;

2. Notwithstanding sub-clause (1) above, the Contractor shall build in a greater margin of safety in his design where necessary and subject to the CM's approval, having regard to the sub-soil conditions of the site and his method of pile installation;

3. The allowable compressive stress of grout shall be 5 N/mm² and may be increased by 25% where such increase is solely due to wind loads;

4. For axially loaded piles designed to take tension, provide reinforcement with tension lap length along the full length of the pile. For piles designed to take vertical and lateral loads, provide sufficient reinforcement to resist all actions including bending moment. Allow a minimum cover of 75 mm to reinforcement.

**PIL1.D400.7 GROUP REDUCTION FACTOR**

Allow for the reduction of bearing capacity of individual piles in a group in accordance with the requirements stated in clause 5.1.2 of the Code of Practice for Foundations.

**PIL1.D410.7 PILES FOUND ON BEDROCK**

Do no apply any group reduction factor where the piles are designed to found on bedrock defined in PIL1.G450. Driven piles shall have pile bases at or below the rockhead unless otherwise agreed by the CM. Submit details indicating the levels of pile bases for safe bearing of the proposed piles with the tender. For Type 4 Piles driven to bedrock, comply with clause 5.4.11 of the Code of Practice for Foundations.

**PIL1.D420.7 CASING THICKNESS**

Ensure that the thickness of casing to pile shaft for piles types 2 and 3 is sufficient to withstand soil and water pressure. If directed by the CM, increase the thickness of the casing at no extra cost to the Authority.
PILING AND FOOTING

PIL1.D430.7 BOND STRENGTH IN TYPES 5 AND 6 PILES

The rock socket must be founded in bedrock as PIL1.G450 and:

1. Design bond strength between rock and grout: not exceeding the value of the presumed allowable bond or friction between rock and concrete or grout for piles as stated in Table 2.2 of clause 2.2.2 of the Code of Practice for Foundations;

2. Design bond strength between grout and steel H-pile for Type 6 piles: not exceeding the allowable value stated in clause 2.5.5(3) of the Code of Practice for Foundations;

3. If a different bond strength value is proposed, submit with the tender, details of the proposed founding method, design parameters, proposed testing methods to be applied to the trial pile (including loading test), design calculations, testing programme and proof of the validity of the parameters to the CM's satisfaction before applying them to the design. Issue all the tests for this purpose without any extension of time and bear all associated costs;

4. Ignore the contribution of the grout to the structural capacity of the piles.

PIL1.D440.7 UNDERGROUND OBSTRUCTIONS IN TYPE 7 PILES FOR CONTRACTOR’S DESIGN

1. For the underground obstruction encountered in the top few metres of the ground, subject to the CM's approval, remove the underground obstruction by some suitable forms of excavation and re-install the pile at its design location. Ignore the positive shaft friction above the bottom level of the obstruction in calculation of the allowable skin friction capacity of the pile;

2. For the underground obstruction encountered at greater depths causing auger refusal, follow the procedures below:

   a. The CM has the discretion to grout the bored hole above the obstruction and re-locate the pile ensuring no adverse impact on the subsoil conditions adjacent to the pile or previously placed pile;

   b. For a pile with a centre to centre distance greater than 6 pile diameters from any completed pile, subject to the CM's approval, remove the obstruction by a method approved by the CM, backfill the bored hole with sand before re-installation of the pile. Ignore the positive shaft friction above the bottom level of the obstruction in calculation of the allowable skin friction capacity of the pile.

SETTLEMENT ANALYSIS

PIL1.D510.7 REQUIREMENT

Design piles and/or footings which are not to be completely resting on bedrock to include settlement calculations based on the design layout and depths of piles to be installed and/or footings to be constructed.

PIL1.D520.7 BLOCK SETTLEMENT AND DIFFERENTIAL SETTLEMENT

1. Consider the effects of block and differential settlements on the performance of buildings or structures in the design;

2. Design the foundation to satisfy the following requirements:

   a. The gradient of the horizontal load-bearing surface of the pile cap and/or footing at any location under working load will not exceed the value given in the Project Specific Specification throughout its design life; and
b. The differential settlement between any adjacent pile caps and/or footings within the same building or structure under working load will not exceed the value given in the Project Specific Specification throughout their design lives.

PIL1.D530.7 SCOPE OF CALCULATIONS
Clearly show in the calculations, the total and differential settlement at the end of the construction period of building structures and also in the long term. Demonstrate also in the design calculations, that the differential settlement criterion for the structure, set out in PIL1.D520 above, will not be exceeded. The following may be considered in the design to minimize differential settlement:

1. Stiffness and layout of pile cap;
2. Pile location and pile size;
3. Any additional factors which the Contractor considers appropriate.

PIL1.D540.7 BASIS OF ANALYSIS
Base the settlement analysis on one of the following publications:

PIL1.D550.7 SCHEDULE
Include, in the design, a separate schedule of basic principles, procedures and assumptions citing the source reference, page numbers and, in addition, the method of deriving rock mass and/or soil mass properties used in the design.

PIL1.D560.7 ELASTICITY MODULUS
For the assessment of foundation settlement, do not choose an elasticity modulus of soil greater than FN and in no case greater than 200 MN/m²:

where:

\[ E = \text{elasticity modulus of soil in MN/m}^2; \]
\[ N = \text{Standard Penetration Test (SPT) results prior to pile installation}; \]
\[ F = 0.8 \text{ for } N \text{ less than 100, and } 1.0 \text{ for } N \text{ equal to or greater than 100.} \]

PIL1.D570.7 SUBMISSION - ACTUAL CONDITIONS OF INSTALLATION
Submit a settlement analysis based on the actual conditions of piles installed before commencement of construction of pile caps and:

1. Consider the effect of block settlement;
2. Verify the assumed parameters and bear the cost of such verification.
RESISTANCE TO HORIZONTAL FORCES

PIL1.D610.7 GENERAL
1. Piles (either vertical or raking), or pilecaps or both may be designed to resist horizontal forces and tenderers must submit with their tenders, detailed calculations which demonstrate that the design is both structurally and geotechnically acceptable. Make calculations in accordance with the criteria set out in PIL1.D620 to PIL1.D670;
2. Footings may be designed to resist horizontal forces and tenderers must submit with their tenders, detailed calculations which demonstrate that the design is both structurally and geotechnically acceptable;
3. The formulae and publications given in this sub-section are for reference only. The designer may use data from other publications, but in this event, he must demonstrate that the publication proposed is applicable to the loading, building structures and founding material in this Contract. The publication proposed must be wholly compatible with the basic source data of this site. If the references in the publication proposed are derived from overseas, produce precedent cases to demonstrate that the design methods and procedures have been successfully applied in Hong Kong. No matter what publication is used in the Contractor’s design, the Contractor will not be relieved of his design responsibilities under the Contract.

PIL1.D620.7 TYPE 5 PILES
Do not design Type 5 piles to resist horizontal loads unless they are designed as raking piles.

PIL1.D630.7 HORIZONTAL RESISTANCE BY PILE CAPS ONLY
1. Maximum horizontal displacement of pilecaps: 25 mm;
2. Design piles to resist any effect of pile cap movement due to horizontal forces;
3. Do not permit the allowable stresses in the piles to be exceeded.

PIL1.D640.7 HORIZONTAL RESISTANCE BY PILES ONLY WITH PILE TOPS FIXED AGAINST ROTATION
1. Use the following formulae to determine the deflections and moments of the piles:
   a. \( T = \left( \frac{EI}{n_h} \right)^{1/5} \)
   b. \( M_p = F_m(PT) \)
   c. \( D_p = F_d \left( \frac{PT^3}{EI} \right) \)
   where:
   E = elastic modulus of pile material in kN/m².
   I = moment of inertia of pile cross section in m⁴.
\( n_h = \) coefficient of variation of sub-grade reaction in kN/m\(^3\). For the purpose of calculation, a suggested value of \( n_h \) is given in the Project Specific Specification. Take responsibility to ensure that the assumed value of \( n_h \) on which the design is based is adequate for this Contract. Carry out boreholes, soil tests and other tests to verify to the satisfaction of the CM, the assumed value of \( n_h \). Should the values of \( n_h \) so verified require more piles and/or pile cap quantities, carry out any necessary redesign, extra piling work etc. at own expense and without any extension of time.

\[ T = \text{relative stiffness of pile soil system, m.} \]
\[ M_p = \text{moment at depth } z, \text{ KNm.} \]
\[ D_p = \text{deflection at depth } z, \text{ m (25 mm maximum).} \]
\[ F_m = \text{moment coefficient at depth } z, \text{ as given in page 7.2 - 239 Fig. 12 of "FOUNDATIONS AND EARTH STRUCTURES, DESIGN MANUAL 7.2", May 1982 Edition, published by the Department of the Navy, Naval Facilities Engineering Command.} \]
\[ F_d = \text{deflection coefficient at depth } z \text{ as given in page 7.2 - 239 Fig 12 of "FOUNDATIONS AND EARTH STRUCTURES, DESIGN MANUAL 7.2", May 1982 Edition, published by the Department of the Navy, Naval Facilities Engineering Command.} \]
\[ P = \text{horizontal load in kN.} \]

2. Check the combined effect due to horizontal forces and vertical forces;

3. For a group of piles, reduce the coefficient of variation of sub-grade reaction \( (n_h) \), which is a function of pile spacing in the direction of loading, as below:

<table>
<thead>
<tr>
<th>Spacing</th>
<th>( n_h ) group</th>
<th>Spacing</th>
<th>( n_h ) group</th>
</tr>
</thead>
<tbody>
<tr>
<td>8D</td>
<td>1.00( n_h )</td>
<td>4D</td>
<td>0.40( n_h )</td>
</tr>
<tr>
<td>6D</td>
<td>0.70( n_h )</td>
<td>3D</td>
<td>0.25( n_h )</td>
</tr>
</tbody>
</table>

\( D = \) pile diameter or diagonal width. Pile spacing normal to the direction of loading has no influence provided it is greater than 2.50D.

**PIL1.D650.7 HORIZONTAL RESISTANCE BY PILES ONLY WITH FLEXIBLE PILE CAPS OR HINGED END CONDITIONS**

All as PIL1.D640 above, except that the coefficients symbolized by the terms \( F_m \) and \( F_d \) are as given in page 7.2 - 238, Fig 11 of "FOUNDATIONS AND EARTH STRUCTURES, DESIGN MANUAL 7.2", May 1982 Edition, published by Department of the Navy, Naval Facilities Engineering Command.

**PIL1.D660.7 HORIZONTAL RESISTANCE BY PILES AND PILE CAPS TOGETHER**

1. Utilise a rational soil mechanics approach in the design and demonstrate the compatibility of the method chosen with the sub-soil conditions and the method and result of testing. The derivation of parameters and the method of computations must be mutually compatible and consistent;

2. Maximum design displacement of pile caps and piles: 25 mm;

3. The following publications may be used for reference:
   a. Section 4.2, chapter 4 of "ELASTIC SOLUTIONS FOR SOIL AND ROCK MECHANICS" by H.G. Poulos and E. H. Davis, 1974 for relating the displacement and forces in the cap:

   Maximum values for E (Young's Modulus for soil) shall be as given in the Project Specific Specification.
Suggested values of V (Poisson's ratio for soil) shall be as given in the Project Specific Specification.

It is the Contractor's responsibility to ensure that the values of E and V taken are adequate. The Contractor is to carry out boreholes, soil tests and other tests as necessary to verify his assumed values of E and V. If the values of E and V so verified require more piles and/or pile cap quantities, then the Contractor is to carry out any necessary redesign, extra piling work etc at his own expense and without any extension of time;

HORIZONTAL RESISTANCE BY ROCK SOCKET

Check for any additional stresses induced in the rock socket when the piles are designed with rock socket to resist horizontal loads. Comply with the requirements stated in clause 5.3.4 of the Code of Practice for Foundations.

NEGATIVE SKIN FRICTION

GENERAL

Make allowance in design calculations for negative skin friction and comply with clause 5.2 of the Code of Practice for Foundations.

BASIC FORMULA

1. The negative skin friction (NSF) caused by the settlement of the soil mass, is estimated by means of the equation in clause 5.2.2 of the Code of Practice for Foundations;

2. The minimum depth of the consolidation strata, l, for different blocks / structures shall be as given in the Project Specific Specification;

3. Take responsibility to ensure that the assumed value of l on which the design is based is adequate for this Contract. Carry out boreholes, to the satisfaction of the CM, to verify the assumed value of l. Should the values of l so verified be greater than those on which the design is based, carry out any necessary redesign, extra piling work etc based on the greater values of l so verified at own expense and without any extension of time. Should the values of l so verified be less than the minimum values stated above, use the minimum values stated above in the design. In no case must l be longer than the length of the pile, measuring from ground level;

4. Water table level shall be as given in the Project Specific Specification;

5. Ground level shall be as given in the Project Specific Specification;

6. The at-rest earth pressure coefficient, \(K_0\), shall be as given in the Project Specific Specification;

7. Make allowance for the effect of NSF between ground level and the soffit of the pile cap.

AVERAGE SOIL PROPERTIES

For the purposes of calculating negative skin friction, apply the average soil properties below ground as given in the Project Specific Specification.
GROUPING EFFECT

Calculate the effect on negative skin friction of grouping effect based on the proposed design and the principles stated in clause 5.2.2 of the Code of Practice for Foundations. Submit all calculations with the tender.

REDUCTION OF NEGATIVE SKIN FRICTION

The design negative skin friction may be reduced in the case of tenders based on piles coated with a bitumen slip layer, provided that such material is acceptable to BD and provided that the proposed reduction in the design negative skin friction can be substantiated by reliable full scale field tests, preferably carried out locally under similar soil conditions. No reduction in negative skin friction due to grouping and boundary effects is permitted for bitumen coated piles. Tenders on this basis must include:

1. Proposed methods for proving that the slip layer is undamaged during pile driving and for determining the design reduction;

2. A guarantee that sufficient quantity of the material proposed for the slip layer will be available to enable the Works to be executed within the Contract period and that if it is not, the Contractor will redesign the piling system and execute it at no extra cost to the Authority and with no extension of time claimed.

PILE CAP DESIGN

STANDARDS

Comply with Code of Practice for Structural Use of Concrete 2004 issued by the Buildings Department in respect of all design for reinforced concrete pile caps and for structural concrete above piles.

SUBMISSIONS (CONSTRUCTION OF PILE CAP IS NOT PART OF THE CONTRACT)

1. Prepare and submit a layout design of the pile caps with the tender, together with the schedule of pile cap quantities required by the Special Conditions of Tender;

2. Within two months following the notified date for commencement of the Works, complete the design of pile caps and submit four copies of working drawings and design calculations for Approval. Submit for further Approval any revisions made subsequent to this Approval within fourteen days following the completion of all piling works to each block/structure. Submit to the CM a complete set of the negatives for all working drawings of pile caps within fourteen days after the certified completion of the Contract;

3. Submit, with the tender, design calculations and details of reinforcement for pile caps for structural members specified in the Project Specific Specification.

SUBMISSIONS (CONSTRUCTION OF PILE CAP IS PART OF THE CONTRACT)

Submit the following:

1. With the tender: drawings showing the layout and details of all the pile caps, together with all design calculations etc;

2. Within two months following the notified date for the commencement of the Works and before the commencement of any pile cap works on Site: four copies of working drawings for the pile caps for Approval. Submit, for Approval, any revisions made subsequent to this Approval.
DESIGN GUIDELINES

PIL1.D910.7  MANDATORY GUIDELINES
Comply with the mandatory design guidelines as given in the Project Specific Specification.

PIL1.D920.7  RECOMMENDED GUIDELINES
Recommended design guidelines which are considered suitable for the purpose of this Contract are included in the Project Specific Specification but the Contractor may propose a different design method for this part of the work.

PIL1.D930.7  CONTRACTOR'S RESPONSIBILITY
The provision of the mandatory and/or recommended guidelines in PIL1.D910 and PIL1.D920 above does not relieve the Contractor of any of his design responsibilities under the Contract.
MATERIALS

GENERAL

PIL1.M010.7 INFORMATION TO BE SUPPLIED WITH TENDER
Submit information of major materials proposed to be used in the piling works with the tender.

PIL1.M020.7 SAMPLES
Test representative samples of all materials being incorporated into the permanent works to show compliance with this Specification.

PIL1.M030.7 TEST CERTIFICATES
On Site delivery verification:
1. Submit to the CM the manufacturer's test certificates for each batch of piles delivered to Site;
2. Where piles Types 1(a), 1(b) and/or 2 are used in this Contract, and when the piles are not cast on the Site, submit the manufacturer's certificate signed by the manufacturer's engineer who should hold the qualification of MICE or MStructE or MHKIE for each delivery of piles to Site stating:
   a. That the piles have been manufactured in accordance with the manufacturer's standards Approved by the Authority;
   b. That the piles are satisfactory for the purpose intended;
   c. What mix proportion and admixtures have been used in the concrete;
   d. The results of all cube and core tests.
3. Where piles Types 4 and/or 6 are used in this Contract, submit the test certificates endorsed by the manufacturer for each delivery of steel H-piles to Site stating the results of chemical composition analysis, tensile tests and impact tests in accordance with the requirements of BS EN 10025 Part 1-6:2004.

PIL1.M040.7 QUALITY ASSURANCE
Carry out and conduct quality assurance on the production of pile Types 1a, 1b and 2 and/or Approved special proprietary types of piles under an Approved quality assurance scheme. The scheme must be inspected and certified by an independent engineer who should also hold the qualification as MHKIE, MICE or MStructE.

STEEL PILES

PIL1.M110.7 'H' PILES AND PLATES
Quality requirements:
1. Complying with BS EN 10025 Part 1-6:2004; and
2. Use steel H-piles of types and brands recognized by BD. Material properties shall comply with the requirements stated in the recognition documentation issued by BD. Each section shall contain manufacturer's identification marked on it by means of engraving or similar techniques approved by the CM.
PILING AND FOOTING

Peachtree

PILING AND FOOTING

PIL1 > MATERIALS

PIL1.M120.7 STEEL PIPE PILES

Quality requirements:
1. Complying with BS 3601:1987 or BS 6323:Parts 1 and 2:1982, except as regards the requirements of hydraulic pressure tests.

PERMANENT CASINGS

PIL1.M210.7 TYPE 5 PILES

1. Material: Grade S275 to BS EN 10025 Part 1-6:2004;
2. Minimum thickness: 4.5 mm;
3. Internal diameter: not less than the finished pile diameter shown or scheduled on the Drawings;
4. Free from:
   a. Significant distortion and of uniform cross-section throughout the whole length;
   b. Internal projections which might prevent the proper formation of the piles.

PILE SHOES

PIL1.M310.7 GENERAL

1. Submit full details of pile shoes together with the tender when specified in the Project Specific Specification;
2. Take all necessary precautions including, where appropriate, or if required in the Project Specific Specification, the provision of specially designed pile shoes to protect the ends of the piles during driving.

PIL1.M320.7 TYPES 1A AND 1B PILES

Provide flat or pointed co-axial shoes and:
1. Steel pile shoes: manufactured from steel complying with Grade S275 to BS EN 10025:2004;
2. Cast steel pile shoes: manufactured from steel complying with BS 3100:1991, grade A;
3. Cast steel pile shoes: manufactured from chill hardened iron, as used for making grey iron castings, complying with BS 1452:1996, grade 150 and free from major blow holes and other surface defects.

PIL1.M330.7 STRAPS AND FASTENINGS FOR CAST PILE SHOES FOR TYPES 1A AND 1B PILES

Manufactured from steel complying with Grade S275 to BS EN 10025:2004, cast into the point of the shoe to form an integral part of the shoe.

PIL1.M340.7 TYPE 1c PILES

1. Manufactured from durable materials Approved by the CM and capable of withstanding driving stresses without damage;
2. Designed to provide a watertight joint with permanent casings.
PILING AND FOOTING

PIL1 > MATERIALS

PIL1.M350.7  TYPE 4 PILES
Fit piles with Approved toe protection. The protection must be adequate to resist the driving stress.

GROUT AND CONCRETE

PIL1.M410.7  GROUT
Consisting of ordinary Portland cement and water and:
1. Containing sand, PFA and admixtures only when Approved;
2. With a minimum cementitious content of 600 kg/m³;
3. When used to fill core holes, having a minimum characteristic compressive strength at 28 days of not less than the specified grade strength of the concrete surrounding the core hole;
4. With a maximum amount of bleeding of 2% in the first 3 hours and not exceeding 4% in total. The water must be reabsorbed by the grout during the 24 hours after mixing;
5. With a maximum free expansion of 10% at the nominal temperature;
6. With any Approved admixtures being chloride-free;
7. With a maximum total chloride content, expressed as a percentage relationship between the chloride ion and the cementitious content by mass in the grout, of 0.1%.

PIL1.M420.7  GROUT FOR TYPES 5, 6 AND 7 PILES
In addition to the requirements of PIL1.M410 above, ensure that grout for Types 5, 6 and 7 piles complies with the following:
1. Water used in the grout must be clean and fresh with a temperature not exceeding 30°C nor less than 5°C;
2. Additives and admixtures complying with BS 5075:1982 and only used with the prior agreement of the CM;
3. Non-shrink and having a minimum characteristic compressive strength of 30 N/mm² at 28 days;
4. For Type 7 piles,
   a. Maximum grout temperature shall not exceed 38°C;
   b. Sample each truckload of grout by using a 225 to 350 ml capacity disposable glass or cup to evaluate premature setting or initial set of the grout mix. Reject the use of the grout if the initial set has occurred under the condition of the grout starting forming the shape of the container when tilted.

PIL1.M430.7  FILLING TO STEEL PIPE PILES
Fill for:
1. The uppermost 3 m from cut off level: concrete grade 10/20;
2. The remainder: Approved decomposed rock fill.

PIL1.M440.7  CONCRETE FOR PILE CAPS AND FOOTINGS
1. For Contractor's Design Piling Contract / Combined Piling and Building Contract: use Grade 30/20;
2. For Engineer's Design Piling Contract / Combined Piling and Building Contract: concrete grade is specified in Drawings;

ANCILLARY MATERIALS

PIL1.M510.7 PAINT FOR STEEL PILES AND STEEL OR CAST IRON COMPONENTS
Approved proprietary epoxy based paint.

PIL1.M520.7 WELDING ELECTRODES
As Worksection STR1.

PIL1.M540.7 EARTH FILLING
General Fill Material and Special Fill Material as EAR1.M220.

MECHANICAL COUPLER FOR TYPE 5 PILES

PIL1.M610.7 TYPE OF MECHANICAL COUPLER
The quality requirements of mechanical coupler shall be in accordance with CON3.M310.

PIL1.M620.7 SUBMISSION
Submission of the details of the mechanical coupler shall be in accordance with CON3.M320.

PIL1.M630.7 QUALITY ASSURANCE SCHEME FOR MECHANICAL COUPLER
Details of quality assurance scheme for mechanical coupler shall be in accordance with the Project Specific Specification.
WORKMANSHIP

GENERAL

PIL1.W010.7 REQUIREMENTS OF THE CONTRACT
Construct the works in a manner such as to satisfy the requirements of the Contract. In the event of any failure to comply with this requirement, rectify as necessary, until the requirements of this Specification are met.

PIL1.W020.7 REQUIREMENTS OF THE CONTRACTOR'S DESIGN
For Contractor's design piling contract / combined piling and building contract, the specification for design applies equally to construction. In the event of any failure to comply with this requirement, redesign and construct as necessary, until the requirements of this Specification are met.

PIL1.W030.7 DELIVERY, HANDLING AND STORAGE OF PILES
Carry out delivery, handling and lifting with due care and to Approval. Stack piles neatly, off the ground.

PROTECTION

PIL1.W110.7 COATING STEEL PILES AND COMPONENTS
Protect all steel piles from cut off level to a level as given in the Project Specific Specification and all steel and cast iron components in contact with soil of all other types of pile from corrosion by coating with at least two coats of an Approved coal tar epoxy paint. Apply the paint to a sufficient thickness to be suitable for resistance to damage during the driving process and be durable without deteriorating in the substrata environment. Prepare steel or metal surfaces and apply paint in accordance with the manufacturer's instructions.

ACCURACY AND TOLERANCES

PIL1.W210.7 GENERAL
1. Carefully set out the foundations, locate the piles in the correct positions and spacing and install the piles either plumb positions or to exact inclinations all in accordance with Drawings;
2. For manufacturing and installation tolerances, refer to Appendix H "Schedule of Tolerances" to this Specification.

PIL1.W220.7 EXCESSIVE DEVIATION
In the event of any pile varying from its correct position by more than either of the permitted tolerances for out of plumb and eccentricity, the CM may, if he deems it necessary, require the Contractor, to drive an additional pile or piles or to provide beams or other such works as are necessary to make good this or any other deviation.
PLANT AND EQUIPMENT

PIL1.W310.7 APPROVAL
Obtain Approval for plant and equipment before use.

PIL1.W320.7 SUBMISSIONS
1. Submit full details of plant, driving rig and hammer proposed to be used, with the tender;
2. For Type 7 piles, submit full details of plant, piling rig and auger proposed to be used, with the tender.

PIL1.W330.7 PILE HAMMER
1. Use a steel pile hammer capable of driving the pile to the required depth without overstressing or damage. For driven piles, ensure the weight of the hammer is at least half that of the pile and sufficient to achieve the required efficiency;
2. Where hydraulic hammers are used, submit technical details of both the hammer mechanism and instrumentation system. All hydraulic hammers should have on-board instrumentation capable of reporting the following data both for individual blows and for variable-sized groups of blows:
   a. Hammer model and serial no. (header only);
   b. Time and date (header only);
   c. Blow number;
   d. Blow-rate;
   e. Impact energy;
   f. Stroke height (single-acting only).

PIL1.W340.7 FOLLOWERS
Where followers are used, make allowance for a reduction of the efficiency of the pile hammers and the followers when calculating the driving resistance.

PIL1.W350.7 VERIFICATION OF EFFICIENCY
Verify the efficiency of the pile hammers and the followers by calculation and insitu demonstration.

PIL1.W360.7 VIBRATION CONTROL
1. Measure the peak particle velocity arising from piling and rock excavation machines and processes for foundation work;
2. Provide Approved equipment for measuring peak particle velocity for the exclusive use of the CM's representative and provide any necessary attendance during the course of the Contract;
3. Unless otherwise specified in the Project Specific Specification, comply with the requirements regarding peak particle velocity stated in Appendix A of PNAP APP-137 and clause 7.2.5 of the Code of Practice for Foundations;
4. Comply with any other requirements specified in the Project Specific Specification.

PIL1.W370.7 EXCESSIVE VIBRATION
Where the peak particle velocity is found to exceed the limits given in PIL1.W360 above, stop the machines or piling operations immediately:
1. Do not recommence work so suspended until effective means, or replacement machines, have been employed to reduce the peak particle velocity to within the acceptable limits;

2. Bear the cost of any stoppage under the terms of this clause and complete the Works without any consequent extension of time.

PIL1.W380.7 DEPLOYMENT OF SELF-OWNED PILING PLANTS FOR PILING CONTRACT

1. For the types of plants listed below which are required to be used on Site, deploy at least one number of self-owned plant for each type of the plants, unless otherwise allowed by CM:
   a. Crawler crane;
   b. Oscillator or rotator;
   c. Reverse circulation drill (RCD);
   d. Pile driving hammer;
   e. Pile driving rig.

2. Comply with the following in deploying self-owned plants listed in sub-clauses (1)(a) to (1)(e) above:
   a. Self-owned plants shall mean plants owned by the Contractor or by the Contractor’s parent, sister or subsidiary company for the exclusive use of the Contractor;
   b. All the plants deployed to Site shall be in good working conditions;
   c. Submit documents to prove the ownership of the plants and, if applicable, the relationship between the Contractor and the Contractor’s parent, sister or subsidiary company;
   d. The self-owned plants deployed to Site in accordance with sub-clauses (1)(a) to (1)(e) may be used by the Piling Sub-contractor when necessary.

3. For piling works undertaken by Piling Sub-contractor, deployment of self-owned plants of the Piling Sub-contractor to Site shall comply with the requirements stated in PIL1.G590.

PIL1.W390.7 DEPLOYMENT OF SELF-OWNED PILING PLANTS FOR COMBINED PILING AND BUILDING CONTRACT

For piling works undertaken by Piling Sub-contractor, deployment of self-owned plants of the Piling Sub-contractor to Site shall comply with the requirements stated in PIL1.G600.

DRIVING

PIL1.W410.7 LENGTH OF DRIVEN PILES
Drive to a minimum net length below cut off level of 4500 mm.

PIL1.W420.7 PROXIMITY TO CAST INSITU PILES
Do not carry out driving within 3 m radius of any cast insitu pile within 48 hours of its being concreted.

PIL1.W430.7 DRIVING STRESSES FOR STEEL PILES
Do not exceed calculated driving stresses of \(0.9 \times \text{yield stress}\) unless Approved.
PILING AND FOOTING

PIL1.W440.7 TEMPORARY BRACING FOR DRIVEN PILES
Provide such temporary bracings as may be required during construction that are capable of keeping each pile accurately in its correct position. The method of bracing must be acceptable to the CM and must not be removed without prior Approval.

PIL1.W450.7 BITUMEN SLIP LAYER FOR DRIVEN PILES
Choose from either of the following methods and submit, with the tender, details of the method it is intended to adopt:
1. Case driven piles with bitumen slip layer for the depth over which the bitumen slip layer is to be provided; or
2. Excavate the ground within the depth over which the bitumen slip layer is to be provided prior to piling, and return and well ram the excavated material to a density not less than that of the surrounding soil on completion of the piling.

PIL1.W460.7 PROPRIETARY PILES WITH PROTECTIVE COATING
Proprietary pile types incorporating a protective coating without the requirement of casing or excavation, may be accepted subject to demonstration of the coating's effectiveness under site conditions and to spot checks on site.

PIL1.W470.7 DRIVING PILES DESIGNED NOT TO REST ON BEDROCK - FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
Drive each pile to such layer or level as may be determined by a pile driving formula or static formula as PIL1.D390, whichever is the deeper, proposed by the Contractor and Approved by the CM.

PIL1.W480.7 DRIVING PILES DESIGNED NOT TO REST ON BEDROCK - FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
Drive each pile to the level as may be determined by the following, whichever is the deeper, and adopt an installation method that will ensure the required embedded length is achieved:
1. Designed pile lengths as indicated on the Drawings;
2. An Approved pile driving formula to withstand the maximum working load with an Approved factor of safety.

PIL1.W490.7 DRIVING PILES DESIGNED TO REST ON BEDROCK
Drive piles designed without allowance for group reduction factor and based on founding on bedrock as defined in PIL1.G450 to refusal or to a final set not less than 10 blows per 10 mm with a hammer capacity adequate to allow twice of the safe load carrying capacity of the piles to be developed. Propose a pile hammer with details of the hammer, hammer efficiency and hammer capacity to be used, support the proposed hammer efficiency and hammer capacity by pile driving analyser tests and obtain approval from the CM before pile driving commences. For Type 4 piles designed to rest on bedrock, comply with clause 5.4.11 of the Code of Practice for Foundations and carry out test driving on at least two number of piles selected by the CM prior to commencement of pile installation.

PIL1.W500.7 FOUNDING LEVEL OF DRIVEN PILES
For foundation designed to rest on bedrock, carry all foundations down to the insitu decomposed rock or bedrock as defined in PIL1.G450, and do not allow founding on boulders.
PILING AND FOOTING

PIL.1.W510.7 PENETRATION OF DRIVEN PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

In addition to the requirements specified elsewhere in this Specification, ensure penetration of driven piles into insitu decomposed rock is adequate to allow the pile to develop twice the allowable bearing capacity specified in the Drawings.

PIL.1.W515.7 PENETRATION OF DRIVEN PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

In addition to the requirements specified elsewhere in this Specification, ensure penetration of driven piles into insitu decomposed rock is adequate to allow the pile to develop twice the safe load carrying capacity stipulated in PIL.1.D390.

PIL.1.W520.7 FINAL SETS OF DRIVEN PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Use either of the following methods to drive the piles to final sets:

1. Use hydraulic hammers to drive the piles to final sets according to the modified Hiley formula specified in the Drawings;
2. Use drop hammers or other Approved types of hammers to drive the piles to final sets according to an Approved driving formula.

PIL.1.W525.7 FINAL SETS OF DRIVEN PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Use either of the following methods to drive the piles to final sets:

1. Use hydraulic hammers to drive the piles to final sets according to the modified Hiley formula stated in PIL.1.D390;
2. Use drop hammers or other Approved types of hammers to drive the piles to final sets according to an Approved driving formula.

PIL.1.W530.7 STEEL SET CHAIR

Propose a steel set chair with a slot for CM’s agreement to restrict the vertical movement of pencil for recording the final set:

1. A schematic sketch of a conceptual design of the steel set chair is given by Drawing No. CPT/SC/S/SK001 in Appendix C to this Specification;
2. The sketch is for reference only and given in good faith without prejudice to the Contractor's responsibilities and liabilities under the Contract.

INSTALLATION OF TYPE 3 PILES

PIL.1.W610.7 BELL-OUT

1. Form bell-out, if any, using an expandable drill bit mounted onto a reverse circulation drill rig or other means approved by CM;
2. Ensure that the size of the bell-out tools is checked and calibrated on ground before construction of the bell-out;
3. For Contractor's Design Piling Contract / Combined Piling and Building Contract, size of bell-out shall comply with clause 5.4.7 of the Code of Practice for Foundations.
INSTALLATION OF TYPES 5 AND 6 PILES

PIL1.W710.7 GENERAL
Install piles without the use of bentonite slurry or other drilling muds.

PIL1.W720.7 TRIAL PILES
1. For Types 5 and 6 piles, install one vertical trial pile:
   a. At a location agreed by the CM before the installation of any pile;
   b. To demonstrate that the Contractor's proposed installation method will give piles complying with this Specification; and
   c. To carry out loading test according to the load testing requirements for working piles as and when Instructed.
2. For Type 7 piles, install at least two trial piles:
   a. The lengths of these two trial piles shall be calculated using two μ values agreed by the CM, taking into account the Contractor's capability and equipment to be used in pile installation, for the safe load carrying capacity;
   b. At a location agreed by the CM before the installation of any pile;
   c. To demonstrate that the Contractor's proposed installation method will give piles complying with this Specification; and
   d. To carry out loading test according to the load testing requirements for working piles as and when Instructed in order to validate the design and method of construction and to determine an appropriate μ value for the design of piles.
3. Subject to CM's approval, a working pile may be selected as the trial pile;
4. For Types 6 and 7 piles, prior to installation of any other piles, submit a trial pile test installation report including the anticipated rates of advancement of boring operation in different soil/rock strata for the remaining piles upon satisfactory completion of trial pile installation.

PIL1.W730.7 INCLINATION OF PILES
1. For Types 5 and 6 piles, check the inclination of piles, during installation, at every pile location. Arrange for a number of piles, as directed by the CM, to be checked by the use of an inclinometer or other Approved method before grouting and record the inclinations and orientations of the holes;
2. For Type 7 piles, check the inclination of piles, during installation, at every pile location. Arrange for a number of piles, as directed by the CM, to be checked by the use of an Approved method before grouting and record the inclinations and orientations of the holes.

PIL1.W740.7 CHANGE IN SUB-SOIL CONDITIONS FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
If, during the installation of the piles, the excavated materials are found to be different from those specified in this Specification / the Drawings, or if such a situation is suspected, notify the CM.

PIL1.W745.7 CHANGE IN SUB-SOIL CONDITIONS FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
If, during the installation of the piles, the sub-soil conditions prove to be different from those in the submitted design, or if such a situation is suspected, notify the CM and submit proposals to cope with the revealed sub-soil conditions.
**PIL1.W750.7 PREBORED HOLE AND COVER FOR TYPE 6 PILES**
Ensure that the prebored hole shall be large enough to enable the installation of the steel H-pile and to allow a minimum cover of 40 mm to the steel H-pile (except at the base). Before inserting the steel H-pile in the prebored hole, ensure that the hole shall be cleaned and free from debris and soil.

**PIL1.W760.7 TEST BORING PROPOSAL FOR TYPE 6 PILES**
Provide test boring proposal giving details of the actual boring system to be used on Site, operating mechanism of the drill bit, maximum volume of air supply and pressure to be applied in different soil and rock strata, minimum rate of advancement of drill bit, ground and piezometer monitoring arrangement, criteria for satisfactory performance of the boring operation, monitoring procedures for checking the rates of boring operation and any necessary precautionary measures to prevent excessive overbreak or ground loss and undue disturbance to sub-soil.

**PIL1.W770.7 TEST BORING PROPOSAL - TYPE 7 PILES FOR CONTRACTOR’S DESIGN**
Prior to installation of trial piles and working piles, submit test boring proposal for the installation of Type 7 piles, which shall include but not be limited to the following information for the CM's approval:
1. Full technical details of the piles including grout strength, reinforcement details, cover to reinforcement, pile diameters and lengths;
2. Method statements for pile installation including equipment to be used, sequences of operation, drilling method, grouting method and installation of reinforcement cage;
3. All temporary works and precautionary measures required for prevention of settlement of adjacent ground during piling operation;
4. Ground settlement monitoring proposal;
5. Method of overcoming underground obstructions;
6. Grout mix and admixture;
7. Grout rate and pressure;
8. Minimum grout head to be maintained;
9. Testing regime and quality control for grouting;
10. Contingency plan for inclement weather during grouting and back-up plant and grout pump in case of breakdown.

**PIL1.W775.7 TEST BORING PROPOSAL - TYPE 7 PILES FOR ENGINEER’S DESIGN**
Prior to installation of trial piles and working piles, submit test boring proposal for the installation of Type 7 piles, which shall include but not be limited to the following information for the CM's approval:
1. Method statements for pile installation including equipment to be used, sequences of operation, drilling method, grouting method and installation of reinforcement cage;
2. All temporary works and precautionary measures required for prevention of settlement of adjacent ground during piling operation;
3. Ground settlement monitoring proposal;
4. Method of overcoming underground obstructions;
5. Grout mix and admixture;
6. Grout rate and pressure;
7. Minimum grout head to be maintained;
8. Testing regime and quality control for grouting;
9. Contingency plan for inclement weather during grouting and back-up plant and grout pump in case of breakdown.

**PIL1.W780.7 INSTALLATION PROCEDURES FOR TYPE 7 PILES**

1. In this clause, the following definitions are used:
   a. Incremental grout factor for 1.5 m increment - Actual grout volume placed divided by theoretical grout volume for the 1.5 m increment;
   b. Total grout factor - Actual grout volume placed divided by theoretical grout volume of pile;
   c. Grout-return depth - The depth of the auger tip when the grout on the auger flight reaches the ground surface;
   d. Auger refusal - The rate of auger penetration is less than 300 mm per minute of drilling.
2. Ensure that the size of the auger is checked and verified on ground before excavation of the piles. Advance the auger at a continuous rate preventing removal of excessive soil. Stop advancement after reaching the required embedment depth;
3. Prior to raising the auger, maintain a minimum grout head of 2 m. Determine the grout quantity by counting pump strokes and using the pre-determined grout volume per pump stroke. Maintain positive (clockwise) rotation of the auger at all times during placement of the grout. Co-ordinate the rate of grout injection and auger withdrawal so as to maintain:
   a. Sufficient grout head at all times;
   b. The incremental grout factor for each 1.5 m increment shall be not less than the smallest value obtained in the trial pile installation and in no case less than 1.15;
   c. The total grout factor shall be not less than the value established in the trial pile installation and in no case less than 1.4;
   d. The grout-return depth shall be equal to or greater than the grout head pumped at the bottom of the pile and shall be at least 2 m.
4. If grout pumping is interrupted for any reason, or if discontinued grout or slurry return at the ground surface is observed, or when grout pumping is interrupted or discontinued during pumping each truckload of grout, lower the auger at least 1.5 m below the level where the interruption occurred while pumping grout continuously;
5. If the volume of grout placed in any 1.5 m increment resulting in the incremental grout factor less than the minimum value observed in the trial pile installation, lower the auger 1.5 m or to the bottom of the pile if that is less, followed by controlled auger withdrawal while maintaining grout injection;
6. Provide auger turning and hoisting equipment enabling the auger to be rotated continuously in a positive (clockwise) direction while being withdrawn at a steady and continuous rate while pumping grout;
7. Clear away promptly the excess spoil accumulated around the auger due to the drilling process and grout injection;
8. Reinforcement cages to be free of soil, auger spoil or other deleterious materials prior to insertion into the grouted shafts;
9. Upon completion of the grouting operation and before the grout reaching its initial set, install the reinforcement cage immediately by lowering the reinforcement cage under its own weight to the specified level within the pile shaft. Prohibit vibrating or pushing the cage with equipment;
10. Pile excavation shall not be carried out within a centre to centre distance of 6 pile diameters from any pile under excavation or any newly cast pile with completion time elapsed not more than 24 hours.

PIL1.W790.7 REVIEW LOADING TEST RESULTS AND PROPOSED PILE LENGTHS - TYPE 7 PILES FOR CONTRACTOR'S DESIGN

1. After completion of loading tests of trial piles with satisfactory results, review and revise the method statements and proposed pile lengths submitted under PIL1.W770 as necessary. Prior to commencement of working piles, submit the revised method statements and proposed lengths of working piles with technical justifications to the CM for approval;

2. The proposed pile lengths in sub-clause (1) above shall in no case be less than the design pile lengths specified in the Contract. Bear all costs and time so incurred for any extra pile lengths installed beyond those specified in the Contract.

PIL1.W795.7 REVIEW LOADING TEST RESULTS - TYPE 7 PILES FOR ENGINEER'S DESIGN

After completion of loading tests of trial piles with satisfactory results, review and revise the method statements as necessary. Prior to commencement of working piles, submit the revised method statements with technical justifications to the CM for approval.

FOUNDING OF BORED PILES

PIL1.W810.7 FOUNDING OF TYPE 3 PILES

1. Comply with the following requirements for Contractor's Design Piling Contract / Combined Piling and Building Contract:

   a. Excavate to form foundation for Type 3 piles so that the pile bases are socketed into bedrock as previously described in PIL1.G450 and the socket depth shall comply with Note (3) of Table 2.1 of the Code of Practice for Foundations, or such other depths specified by the CM;

   b. If the centre to centre spacing of two adjacent Type 3 piles is less than 2.5 times the diameter of the larger pile base and the difference in founding levels of these two piles is greater than the clear distance between their bases on plan, justify to the CM's satisfaction by an elastic analysis that:

      i. The compressive stress in the longer pile, including any additional stress induced by the shorter pile and/or any additional stress induced by any unfavorable ground conditions, will not exceed the limiting value set in PIL1.D360; and

      ii. The bearing stress on the founding material supporting the longer pile, including any additional stress induced by the shorter pile and/or any additional stress induced by any unfavorable ground conditions, will not exceed the safe load carrying capacity set in PIL1.D390;

      iii. When Instructed, carry out additional ground investigation works to justify the subsurface conditions assumed in his analysis to the CM's satisfaction at no additional cost and time.

   c. Notwithstanding the requirements of sub-clause (b) above, comply also the requirements stated in the last paragraph of clause 5.4.7 of the Code of Practice for Foundations, where steep bedrock profile is identified;

2. Comply with the following requirements for Engineer's Design Piling Contract / Combined Piling and Building Contract:
Excavate to form foundation for Type 3 piles so that the pile bases are socketed into bedrock as previously described in PIL1.G450 and the socket depth shall comply with Note (3) of Table 2.1 of the Code of Practice for Foundations, or such other depths specified by the CM.

PIL1.W820.7  
**FOUNDING OF TYPES 5 AND 6 PILES**

Found the rock socket in bedrock as PIL1.G450.

PIL1.W830.7  
**PROVING BEDROCK**

1. See PIL1.T220 for Type 3 piles; and  
2. See PIL1.T230 and PIL1.T250 for Types 5 and 6 piles.

**UNDERGROUND OBSTRUCTIONS**

PIL1.W910.7  
**OBSTRUCTIONS TO PILES FOR CONTRACTOR'S DESIGN**

1. When underground obstructions are encountered at any depth during piling operations, propose full details of the intended means of overcoming underground obstructions (the "intended means") for Approval prior to the works being put in hand, which Approval shall not relieve the Contractor of the responsibility for designing, constructing and completing the Works in accordance with the Contract;  
2. The intended means shall not cause any adverse impact including, but not limited to, considerations of lateral stability, safe load carrying capacity and/or structural integrity, on the pile to be constructed and the piles already constructed; and  
3. The Approved intended means shall be implemented and the obstructions shall be overcome by the Contractor at his own risk in respect of cost and time including the cost and time necessary to obtain Approval.

PIL1.W915.7  
**OBSTRUCTIONS TO PILES FOR ENGINEER'S DESIGN**

1. When underground obstructions are encountered at any depth during piling operations, propose full details of the intended means of overcoming underground obstructions (the "intended means") for Approval prior to the works being put in hand, which Approval shall not relieve the Contractor of the responsibility for constructing and completing the Works in accordance with the Contract; and  
2. The intended means shall not cause any adverse impact including, but not limited to, considerations of lateral stability, safe load carrying capacity and/or structural integrity, on the pile to be constructed and the piles already constructed.

PIL1.W920.7  
**INTENDED MEANS OF OVERCOMING UNDERGROUND OBSTRUCTIONS TO PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**

Subject to Approval, the intended means stated in PIL1.W910 may include, but are not limited to, the following:  
1. For Type 1, 2 and 4 piles,  
   a. Re-design of piles and/or pile caps;  
   b. Extraction and re-driving of piles;  
   c. Abandonment of piles and provision of replacement piles; and/or  
   d. Removal of underground obstructions by excavation and/or pre-boring through the underground obstructions.
2. For Type 3 piles,
   a. Re-design of piles and/or pile caps;
   b. Abandonment of piles and provision of replacement piles; and/or
   c. Removal of underground obstructions by excavation and/or chiseling.

3. For Type 5, 6 and 7 piles,
   a. Re-design of piles and/or pile caps;
   b. Abandonment of piles and provision of replacement piles; and/or
   c. Removal of underground obstructions by excavation and/or coring through the underground obstructions.

PIL1.W930.7

INTENDED MEANS OF OVERCOMING UNDERGROUND OBSTRUCTIONS TO PILES FOR ENGINEER’S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Subject to Approval, the intended means stated in PIL1.W910 may include, but are not limited to, the following:

1. For Type 1, 2 and 4 piles,
   a. Extraction and re-driving of piles; and/or
   b. Removal of underground obstructions by excavation and/or pre-boring through the underground obstructions.

2. For Type 3 piles, removal of underground obstructions by excavation and/or chiselling;

3. For Type 5, 6 and 7 piles, removal of underground obstructions by excavation and/or coring through the underground obstructions.

PIL1.W940.7

DESIGN CHANGES FOR CONTRACTOR’S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Where the intended means of overcoming obstructions involve any changes to the design of the piles and pile caps accepted by the Employer at the date of acceptance of the Tender, any reduction in cost as may have resulted from the changes shall be subject to reduction in accordance with the provision of the Contract.

PIL1.W950.7

EXCAVATION OR PRE-BORING

Where underground obstructions are removed by excavation or pre-boring, cart away the excavated materials and backfill the boreholes or voids with Special Fill Material or other materials approved by the CM, well compacted, all to Approval.

PILE SHAFT CASINGS

PIL1.W1010.7

LININGS TO INSITU PILES

1. For Contractor's Design Piling Contract / Combined Piling and Building Contract, provide left-in-place steel linings wherever cast insitu piles are used and:
   a. Extend the lining from cut-off level down to a level as given in the Project Specific Specification;
   b. Ensure that the length of the lining is adequate for the purpose;
   c. Increase the depth of the lining to suit actual site conditions, to prevent necking and bear the cost of such lengthening;
d. Ensure that the lining does not protrude above the cut-off level or down into the bellout.

2. For Engineer’s Design Piling Contract / Combined Piling and Building Contract, provide left-in-place steel linings as shown in the Drawings wherever cast insitu piles are used.

**PIL1.W1020.7 PILE TYPE 2**

Until insertion of precast concrete units, case the pile shafts for their entire length or for such length acceptable to the CM. Ensure casing is watertight and of sufficient strength to withstand soil pressure. Obtain Approval for details of casing.

**PIL1.W1024.7 PILE TYPE 3**

Until concreting, case the pile shafts for their entire length above the inferred rockhead level of bedrock or for such length acceptable to the CM. Ensure casing is watertight and of sufficient strength to withstand soil pressure. Obtain Approval for details of casing.

**PIL1.W1030.7 TYPE 5 PILES**

Case pile shafts for their entire length except for that section in bedrock and ensure:

1. Casings are joined, where necessary, with watertight joints;
2. Casings are clean and free of any material adhering to them when first inserted into the pile position;
3. Dents in the casings do not exceed 5 mm in depression;
4. The gap between the casing and soil is filled with grout or other Approved material.

**PIL1.W1040.7 TEMPORARY CASING FOR TYPE 6 PILES**

1. Ensure that temporary casing shall be lowered at the same time when the hole is made and that the casing must be seating on rock head or top of rock socket before the rock socket hole is formed;
2. Ensure also that the temporary casing shall be free from distortion, internal projection and hardened grout.

**GROUTING PILE TYPES 2 AND 3**

**PIL1.W1110.7 PRESSURE GROUTING**

Where pressure grouting is required for the type of piling system proposed for this Contract, submit proposals for and details of the grouting with the tender.

**PIL1.W1120.7 BASE OF TYPE 3 PILES**

Grout the base of large diameter bored piles if soft material, debris, mud etc is found between the bottom of the concrete and the bearing stratum by test and:

1. Obtain Approval for the proposal and details of the grouting.

**GROUTING TYPES 5, 6 AND 7 PILES**

**PIL1.W1210.7 BATCHING**

1. Batch dry materials by weight;
2. Measure the amount of water used by use of a calibrated flowmeter or a measuring tank.

**PIL1.W1220.7 USE OF ADMIXTURES**

State the use of admixtures prior to the commencement of trial piling and give evidence that the admixtures:

1. Will allow pumping to be carried out successfully;
2. Will yield concrete or grout of the required strength and durability;
3. Have been used successfully in previous practice.

**PIL1.W1230.7 MIXING AND SIEVING**

1. Mix grout by adding approximately two thirds of the cement to the water, followed by the additive, if any, then followed by the remaining third of the cement;
2. Use a high speed colloidal grout mixer with a minimum speed of 1000 rpm and mix for a sufficient time to produce a grout of uniform consistency;
3. Obtain Approval for the use of any alternative mixing procedures;
4. After mixing, keep the grout continuously agitated and, prior to injection, pass the grout through a nominal 2.36 mm sieve;
5. Use the grout as soon as possible after mixing and, in any case, within 30 minutes of the addition of cement unless special retarding agents are used.

**PIL1.W1240.7 TESTING**

Test after mixing and sieving and before injection as PIL1.T330.

**PIL1.W1250.7 PREPARATION (FOR TYPES 5 AND 6 PILES)**

Before steel reinforcement and/or steel H-pile is inserted in the pre-bored hole, clean the hole to ensure that it is free from debris and soil by a method approved by the CM.

**PIL1.W1260.7 INJECTION**

Obtain prior Approval for the method of placing the grout and:

1. Use an injection pump of the positive displacement type;
2. Measure the grout intake volume by a method agreed by the CM. Calibrate the measuring device and submit a calibration report to the CM 7 days before trial mix of grout is made;
3. Fill the entire shaft, inside the casing, solidly with grout, without voids, honeycombing or other defects; and
4. Cast each pile in one continuous operation and under no circumstances leave a pile partially grouted even if this involves working beyond normal hours and rates are to allow for such circumstances.

**CONCRETING**

**PIL1.W1310.7 GENERAL**

1. Obtain Approval for the method of placing concrete;
2. Ensure that the entire shaft is solidly filled with concrete without voids, honeycombing or other defects.
PILING AND FOOTING

PILING AND FOOTING

PIL1.W1320.7 TYPE 3 PILES
For Type 3 piles, concrete may be placed under water subject to Approval and on submission of details. Clean the base of the excavation by using air lifting equipment or other Approved method, all subject to Approval.

PIL1.W1330.7 CONTINUITY FOR TYPES 1c, 3 AND 5 PILES
Cast each pile in one continuous operation. In no case will it be permissible for a pile to be left partly concreted, even if this means working beyond normal working hours.

PIL1.W1340.7 REINFORCEMENT TO PILE TYPES 1 AND 2
Distribute reinforcement for pile types 1 and 2 uniformly. Ensure reinforcement is sufficient to withstand handling and driving stresses without fracture or cracking of the concrete.

PIL1.W1350.7 REINFORCEMENT TO TYPE 5 PILES
Lengthen the reinforcement by staggering the couplers using Approved methods. Separate each reinforcement bar by spacers at regular intervals.

FINISHING OFF PILE HEADS

PIL1.W1410.7 CAST INSITU PILES
Cast insitu piles to a level of 750 mm above cut off levels.

PIL1.W1420.7 CUT OFF LEVELS
The top of pile cap levels shown on tender Drawings are provisional and may be altered if so required by the CM. It follows that the cut off levels of piles may also be varied. However, the extent of the variations will be limited to ±1 metre of the levels shown on the tender Drawings.

PIL1.W1430.7 CUTTING AND TRIMMING
1. For Type 7 pile, a minimum period of 7 days has to elapse after completion of pile casting prior to cutting and trimming of pile head;
2. Excavate to expose, cut off and trim pile heads to the required levels, backfill with General Filling Material and import Special Filling Material to make up voids, and remove debris from Site.

PIL1.W1440.7 PRELIMINARY AND ABANDONED PILES
Excavate to expose, cut off and trim pile heads of any non-working preliminary piles to 2000 mm below finished ground level and of any abandoned piles to a level as given in the Project Specific Specification and backfill with General Filling Material, importing Special Filling Material to make up voids, and remove debris from Site.

PIL1.W1450.7 DOWEL BARS
For concrete piles, provide dowel bars. Straighten dowel bars subsequent to trimming pile head.

PIL1.W1460.7 CUTTING OFF STEEL PILES
For steel piles, execute cutting by Approved means. In the event of damage being done to the head of the pile, cut off the defective parts and make good the pile to the satisfaction of the CM.
PILING AND FOOTING

BEARING PLATES FOR STEEL PILES FOR ENGINEER'S DESIGN
PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. Weld a bearing plate to the top of each steel pile and ensure bearing plates are installed in accordance with the Drawings so that the imposed loads on bearing plates do not exceed the capacities of bearing plates as allowed in the Code of Practice for the Structural Use of Steel 2011.

BEARING PLATES FOR STEEL PILES FOR CONTRACTOR'S DESIGN
PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. Weld a bearing plate to the top of each steel pile, sufficient to transfer the required load all to Approval;
2. Ensure bearing plates are proportioned so that the imposed loads on bearing plates do not exceed the capacities of bearing plates as allowed in the Code of Practice for the Structural Use of Steel 2011.

ALTERNATIVE LOAD TRANSFER DETAILS FOR STEEL PILES

Obtain Approval for alternative load transfer details.

WORK AT COMPLETION (WHERE CONSTRUCTION OF PILE CAP DOES NOT FORM PART OF THE CONTRACT)

At completion of the Works, where the method of working gives rise to changes in the levels from those agreed at the commencement of the Works, level off the Site to remove all high spots and fill in all hollows.

PILING RECORDS

GENERAL

Keep accurate and comprehensive records of each pile installed and submit daily a copy of these records signed by the site representative, to the CM, of each pile installation to its final position.

STANDARD FORM

Keep each record on standard forms as shown in Appendices III and IV to this Worksection showing, as appropriate to pile type, the following:

1. Pile reference number;
2. Date pile driven or installed;
3. Position of pile in the works and ground level at pile position;
4. Type and size of hammer and stroke;
5. Set throughout penetration of pile including the set for the last ten blows;
6. Measurements of temporary compression in the pile;
7. Details of any interruption in driving of the pile;
8. Details of obstructions and delays;
9. Level of tip of pile after completion of driving;
10. Length of pile;
11. Volume of concrete or grout placed in pile;
12. Length and toe level of casing;
13. Drilling rate and materials encountered;
14. Inclination of pile as installed per metre depth of pile;
15. Any other data requested by the CM;
16. Penetration of pile into bedrock.

PIL1.W1525.7 **PILING RECORDS FOR TYPE 7 PILES**
Keep each pile installation record in an approved format for the following:
1. Pile reference number;
2. Weather conditions and temperature;
3. Date pile installed;
4. Position of pile in the works and ground level at pile position;
5. Grout truck number, arrival time on-site, batch time and batch volume;
6. Grout sampling time and time of initial set;
7. Grout cubes made by the Contractor;
8. Flow cone test results;
9. Auger diameter (actual diameter each time measured in field);
10. Time period for drilling of pile;
11. Rate of penetration of auger (revolution per auger pitch);
12. Abnormal drilling behaviour;
13. Details of obstructions and delay;
14. Pile drilled length/pile tip and top elevation;
15. Theoretical pile volume;
16. Time period for grouting of pile;
17. Range in pressure observed during grouting;
18. Grout return depth;
19. Grout volume pumped per 1.5 m increment of pile length;
20. Total number of pump strokes to complete pile (actual grout volume);
21. Total grout factor;
22. Reinforcing steel cage installed in the pile;
23. Special remarks (e.g. time of and reason for interruptions during grouting, extra grout cubes made);
24. Any other data requested by the CM.

PIL1.W1530.7 **RECORDS OF TEMPORARY COMPRESSION FOR DRIVEN PILE**
Keep and submit to the CM records of field measurements of temporary compression during the driving of the piles to the final set stages by recording same on a card or graph paper attached to the face of the pile.

PIL1.W1540.7 **SUBMISSION OF RECORD PLAN**
After completing all piling works of a block/structure or part of a block/structure as agreed by the CM, furnish to the CM four copies of a piling record plan showing, as appropriate, the position, identity number, length and final set of all the piles installed for that block/structure or that part of the block/structure. The piling record plan should not contain any amendments which have not been Approved. Submit four copies of a record plan showing offset of piles, if any. In addition, submit electronic copies of the record plans in a format as required by the CM.
PILING AND FOOTING

PIL.1.W1550.7 FOUNDING LEVEL RECORD
Provide a record of the founding level of the bedrock, for Approval.

PIL.1.W1560.7 BORING RECORDS FOR TYPES 6 AND 7 PILES
Provide boring records in accordance with PIL.1.W1510, PIL.1.W1520, PIL.1.W1525, PIL.1.W1540 and PIL.1.W1550 and including the advancement rate of drill bit, air/grout pressure used, volume of air/grout supply, flushing medium, settlement and groundwater drawdown records, as appropriate to pile type.

REMEDIAL MEASURES

PIL.1.W1610.7 PILES DESIGNED TO REST ON BEDROCK FOR CONTRACTOR’S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
When piles originally designed in accordance with PIL.1.D410 do not satisfy the founding conditions stated in that clause or the workmanship requirement stated in PIL.1.W490, the original design would be rejected. In this case, redesign the pile(s) in the same pile cap already installed and to be installed, as piles not found on bedrock in accordance with all the requirements for piles not found on bedrock.

PIL.1.W1620.7 RISING PILES (FOR DRIVEN PILE)
1. Measure the top level of each pile immediately after driving to such a layer or level as is required;
2. Carry out further levelling checks for pile rising as and when directed by the CM;
3. Re-drive piles which have risen for any reason, to the original level (or to such other level as the CM may determine) unless otherwise directed by the CM.

PIL.1.W1630.7 DEFECTIVE PILES
If in the opinion of the CM, any pile is defective because of the pile having been constructed or driven outside the specified tolerances or having been damaged during driving or by the construction of another pile nearby or otherwise failing to conform to this Specification:
1. Pull out and replace the pile with a sound pile complying in all respects with the requirements of this Specification;
2. If the pile cannot be pulled out, carry out Approved remedial measures.

PIL.1.W1640.7 NON-COMPLIANCE (FOR TYPE 7 PILES)
For Type 7 piles not complying with the specified requirements stated in PIL.1.W780:
1. Lower the auger to the bottom of the pile while the grout is still fluid and re-grout the bored hole; or otherwise,
2. Demonstrate to the CM by tests that the piles in doubt can sustain the design loading. Bear all costs and no extension of time is allowed for such tests as a consequence of the above non-compliance; and
3. If the test results indicate that the piles in doubt fail to sustain the design loading, bear all costs and no extension of time is allowed for the execution of remedial measures, including but not limited to the installation of additional piles and modifications of tie beams and pile caps.
SPLICING PILES

PIL1.W1710.7 GENERAL
Where lengthening of a pile becomes necessary, or is directed by the CM, carry it out by the method directed or by any other Approved method. Do not resume the driving of a lengthened pile without the permission of the CM.

PIL1.W1720.7 STRENGTH OF SPLICES
Whenever necessary to splice a pile, the strength of the pile at the splice must be no less than the strength of pile at any normal section of the pile. Submit full details of proposed splicing methods with the tender.

WELDING

PIL1.W1810.7 TESTING OF WELDERS
As Worksection STR1.

PIL1.W1820.7 ADVERSE WEATHER CONDITIONS
Do not carry out welding under adverse weather conditions as determined by the CM.

PIL1.W1830.7 WELDED JOINTS
Joint all piles by butt-welding in such a manner that the full strength of the original section is developed and:
1. Provide adequate facilities for supporting and aligning piles prior to welding;
2. Ensure that the joints are waterproof in the case of pipe piles.

PIL1.W1840.7 TACK WELDS
Keep tack welds to a minimum.

PIL1.W1850.7 STANDARDS
Weld by electric arc welding:
1. Comply with Worksection STR1 for welding Standards;
2. Where grade S450 steel H-piles are used, ensure that welding procedures is carried out on Site and Approved.

PIL1.W1860.7 PREPARATION
Ensure the surface to be welded is free from all scale, grease, paint and rust and other matter.

PIL1.W1870.7 PILE SHOES
Ensure welding is:
1. Adequate to transmit the ultimate pile load and to prevent the detachment of the points in the case of withdrawal to remove obstructions;
2. In accordance with the manufacturer's recommendations.

PIL1.W1880.7 FINISHING
After every run of weld, chip out slags, and thoroughly wire brush surfaces.
PILING AND FOOTING

SPECIFICATION LIBRARY

PIL1.W1890.7 DEFECTS
Make good any defects in a weld, such as distortion, spatter, cracks, undercut, slag holes, unequal width of bead, irregular ripple etc to the satisfaction of the CM.

PIL1.W1900.7 ETCHED SECTIONS
Submit etched sections to the CM for examination when required.

RECORDS AND CERTIFICATES

PIL1.W2010.7 REPORT ON COMPLETION OF PILING WORKS FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. In accordance with PRE.B4.060, after all piles of a block or part of a structure as agreed by the CM have been installed, submit four copies of a report on completion of the piling works for that block or that part of the structure. The report shall be signed by the Authorized Signatory and the TCP Grade T4 as specified in the SSP for foundation works and include the following:

   a. Scope of the Works and foundations adopted;
   b. General description of the geology of the Site, including an assessment report with rockhead contour plans as appropriate and at least one geological cross-section of the ground beneath that block or that part of the structure indicating the inferred soil layers’ SPT - N values, bedrock and pile tip levels;
   c. Piling records as PIL1.W1510 to PIL1.W1560;
   d. Schedule and summary of all pile test results excluding the proof tests specified in PIL1.T030;
   e. As-built piling design certified by the Design Certifying Consultant;
   f. If the soil parameters given in this Specification have been modified, details of laboratory tests, instrumented pile tests and other load tests;
   g. Settlement analysis as PIL1.D510 to PIL1.D570 certified by the Design Certifying Consultant;
   h. Final ground investigation reports prepared by the Ground Investigation Contractor;
   i. Authorized Signatory's certification confirming that the completed piling works are satisfactory for the purpose intended and the piles, as installed, are properly penetrated into insitu decomposed rock or onto bedrock as approved by the CM;
   j. Report of remedial work, if any;
   k. Any other relevant information;
   l. Conclusion.

2. After submitting the report specified in sub-clause (1) above, request the CM to select piles for proof tests. The Contractor may, however, seek CM’s agreement to select piles for proof tests after submitting part of the report; in such an event, submit the outstanding part of the report not later than the time of submitting Form ICU14 as specified in sub-clause (3) below. Allow the CM at least 21 days to select piles for proof tests in accordance with PIL1.T030. If resubmission of the report is required, allow the CM another 21 days to select piles for proof tests after resubmission;

3. Upon satisfactory completion of the proof tests, complete and submit Form ICU14 and report of further remedial work, if any, to the CM on block by block basis, unless otherwise agreed by the CM.
PILING AND FOOTING

REPORT ON COMPLETION OF PILING WORKS FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. In accordance with PRE.B4.060, after all piles of a block or part of a structure as agreed by the CM have been installed, submit four copies of a report on completion of piling works for that block or that part of the structure. The report shall be signed by the Authorized Signatory and the TCP Grade T4 as specified in the SSP for foundation works and include the following:
   a. Scope of the Works and foundations adopted;
   b. General description of the geology of the Site, including an assessment report with rockhead contour plans as appropriate and at least one geological cross-section of the ground beneath that block or that part of the structure indicating the inferred soil layers' SPT - N values, bedrock and pile tip levels;
   c. Piling records as PIL1.W1510 to PIL1.W1560;
   d. Schedule and summary of all pile test results excluding the proof tests specified in PIL1.T030;
   e. Final ground investigation reports prepared by the Ground Investigation Contractor;
   f. Authorized Signatory's certification confirming that the completed piling works are satisfactory for the purpose intended and the piles, as installed, are properly penetrated into insitu decomposed rock or onto bedrock as approved by the CM;
   g. Report of remedial work, if any;
   h. Any other relevant information;
   i. Conclusion.

2. After submitting the report specified in sub-clause (1) above, request the CM to select piles for proof tests. The Contractor may, however, seek CM's agreement to select piles for proof tests after submitting part of the report; in such an event, submit the outstanding part of the report not later than the time of submitting Form ICU14 as specified in sub-clause (3) below. Allow the CM at least 21 days to select piles for proof tests in accordance with PIL1.T030. If resubmission of the report is required, allow the CM another 21 days to select piles for proof tests after resubmission;

3. Upon satisfactory completion of the proof tests, complete and submit Form ICU14 and report of further remedial work, if any, to the CM on block by block basis, unless otherwise agreed by the CM.

CERTIFICATION FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. Submit the following prior to serving notice in writing to the CM on completion of the Works in accordance with GCC Clause 8.7:
   a. Authorized Signatory's certification confirming that the completed job is satisfactory for the purpose intended and the piles, as installed, properly penetrate into insitu decomposed rock or onto bedrock as approved by the CM;
   b. Four copies of the as-built pile cap design and drawings based on the as-built piling layout and/or four copies of the as-built footing design and drawings; the as-built pile cap and/or footing design and drawings should be certified by the Design Certifying Consultant and should not contain any amendments which have not been Approved;
   c. Four copies of report listing the date of casting of concrete, the quality and quantity of materials used and the excavation record of each pile cap and/or footings;
d. Four copies of final test reports on the pile caps and/or footings not carried out by the Direct Testing Contractors;

e. Completed Form ICU 14;

f. Any other relevant information.

2. Any submission not to the satisfaction of the CM shall have to be re-submitted. Allow 21 days for each submission and re-submission for the checking of the CM.

PIL1.W2040.7 CERTIFICATION FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. Submit the following prior to serving notice in writing to the CM on completion of the Works in accordance with GCC Clause 8.7:

a. Authorized Signatory's certification confirming that the completed job is satisfactory for the purpose intended and the piles, as installed, properly penetrate into insitu decomposed rock or onto bedrock as approved by the CM;

b. Four copies of the as-built pile cap drawings based on the as-built piling layout and/or four copies of the as-built footing drawings;

c. Four copies of report listing the date of casting of concrete, the quality and quantity of materials used and the excavation record of each pile cap and/or footings;

d. Four copies of final test reports on the pile caps and/or footings not carried out by the Direct Testing Contractors;

e. Completed Form ICU 14;

f. Any other relevant information.

2. Any submission not to the satisfaction of the CM shall have to be re-submitted. Allow 21 days for each submission and re-submission for the checking of the CM.

PILE CAPS AND FOOTINGS

PIL1.W2110.7 GENERAL

Execute the work described in this Sub-section in accordance with the provisions of the other relevant Worksections in this Specification.

PIL1.W2120.7 APPROVED DESIGN FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Construct the pile caps and/or footings in accordance with the Approved, submitted design.

PIL1.W2130.7 STARTER BARS FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Apart from the execution of the pile caps and/or footings, provide and execute starter bars shown on the Drawings.

PIL1.W2135.7 STARTER BARS FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Apart from the design and execution of the pile caps and/or footings, provide and execute starter bars shown on the Drawings.
PILING AND FOOTING  PIL1 > WORKMANSHIP

PIL1.W2140.7 BACKFILLING EXCAVATIONS
Backfill excavation with Suitable Material up to the top level of the pile caps and/or footings and:

1. Form and maintain the sides of the backfill adjacent to the pile caps and/or footings to an angle of inclination as given in the Project Specific Specification;
2. Deposit surplus excavated Suitable Material on Site in stockpiles in Approved locations;
3. Remove Unsuitable Material from Site.

PIL1.W2150.7 INCREASING CONCRETE STRENGTH
Where it is anticipated that the specified 28 day compressive strength tests for concrete of any pile caps cannot be completed within the Contract Period, the CM will consider any proposal to use a higher grade of concrete to that specified for the pile caps concerned and an application for additional compressive strength tests of such concrete to be made at less than 28 days, subject to the following:

1. Assess the results of these cube tests and core tests in accordance with:
   a. Clauses CON1.T620 to CON1.T650 inclusive for cubes;
   b. Clause CON1.T760 for cores; and
   Do not make any adjustment to the measured strength in respect of the age of the cubes and cores when tested;
2. If the test results, assessed in accordance with sub-clause (1) above for the grade of concrete specified for the pile caps, comply with the specification's requirements, the Contractor may notify CM the completion of the Works in accordance with GCC 8.7 together with an undertaking stating that:
   "If the results of tests for compressive strength at 28 days, received after the CM has issued the certificate of completion, fail to comply with the specification's requirements, the Contractor shall carry out further tests and/or remedial works, all at the Contractor's expenses, and shall bear all expenses and loss of the Employer due to failure of the tests."

PIL1.W2160.7 FOUNDING AND PROVING BEDROCK FOR FOOTINGS
Refer to EAR1.W930 and EAR1.W940.

MECHANICAL COUPLER FOR TYPE 5 PILES

PIL1.W2210.7 QUALIFIED SUPERVISION
Qualified supervision for mechanical coupler shall be in accordance with CON3.W310.

PIL1.W2220.7 INSPECTION LOG BOOK
1. Record the details in an inspection log book as per CON3.W320.
2. Keep the inspection log book on Site for CM’s inspection when required and submit the inspection log book to CM upon completion of the mechanical splice works.
TESTING

TESTING GENERALLY

PIL1.T010.7  NUMBER AND DISPOSITION OF TEST PILES
The number and disposition of the piles to be tested will be as Instructed. Make allowance for testing one preliminary pile early in the Contract to provide reasonable assurance that the Specification is being met.

PIL1.T020.7  REQUIRED MINIMUM NUMBER OF TESTS
1. Unless otherwise specified, the required minimum number of tests in this Worksection shall be calculated based on the testing frequency or sample size stated and the total number of piles installed in the whole Site. In case the calculated number of tests is not a whole number, any fraction of test shall be construed as one test;
2. Request the CM to select locations or piles for testing when all the piles have been installed and are ready for testing;
3. Upon agreement with the CM, the Contractor may request the CM to select locations or piles for testing when a portion of the piles have been installed and are ready for testing. In such an event, the required minimum number of tests for the portion shall be calculated based on the testing frequency or sample size stated and the total number of piles of that portion. In case the calculated number of tests is not a whole number, any fraction of test shall be construed as one test. As a consequence, the total number of tests carried out for all the portions may be more than the required minimum number of tests for the whole Site. Bear all additional costs and no extension of time is allowed.

PIL1.T030.7  PROOF TEST
1. After receiving the report on completion of piling works as specified in PIL1.W2010 or PIL1.W2020, the CM shall select piles for proof test accordingly;
2. In this Specification, proof test shall mean:
   a. Loading test of working piles as specified in PIL1.T610 and PIL1.T1010 to PIL1.T1130 for Type 1, 2, 4, 5, 6 and 7 piles;
   b. Core test as specified in PIL1.T1210 to PIL1.T1250 for Type 1c piles and Type 3 piles.
3. Notwithstanding the samples size specified in PIL1.T610 for loading test and PIL1.T1220 for core test, the CM shall select at least 1 pile per block for each type of proof test;
4. Allow the Direct Testing Contractor at least 7 working days to carry out each proof test.

PIL1.T040.7  BATCH OF MECHANICAL COUPLER FOR TYPE 5 PILES
A batch of mechanical coupler is as specified in CON3.T025.
PRELIMINARY DRIVEN PILES

PIL1.T110.7  PRELIMINARY PILES - TYPES 1, 2 AND 4 FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Before driving any pile, install at least one preliminary additional pile, for each of the proposed pile types to verify the proposed design methods and parameters and as follows:

1. Install the pile at a location outside the building structure and to a design depth, all as Approved;
2. Refer to PIL1.T130 for details of instrumentation;
3. Install a borehole adjacent to the preliminary pile and before it is driven to determine the geotechnical conditions;
4. Test the preliminary pile by Pile Driving Analyser with CAPWAP analysis after installation to the Approval founding depth;
5. Carry out a loading test on the preliminary pile as PIL1.T810 to PIL1.T880, immediately after driving to determine the ultimate side resistance and tip resistance of the pile;
6. Unless otherwise instructed by the CM, the Contractor may choose to pitch the first sections of working piles before the test result is known but in the case of a test failure, the Contractor must revise the design parameters and submit them for Approval. Any piles driven on the basis of the original proposal will be deemed to be unacceptable;
7. Carry out Approved remedial measures for such unacceptable piles including extracting and disposing, off Site, of any abandoned piles, where necessary, without any claim for extension of time;
8. Install a preliminary pile for the revised Approved design, repeating the procedure described above as necessary until a successful test result is achieved;
9. No claim for an extension of time will be allowed in connection with the provisions of this clause;
10. Trim down the preliminary pile to two metres below the finished ground level, or as directed, after completion of the loading test.

PIL1.T120.7  PRELIMINARY PILES - TYPES 1, 2 AND 4 FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Before driving any pile, install a preliminary additional pile, for each pile type to verify the driveability and the design assumptions as follows:

1. Install the pile at a location outside the building structure and to a design depth, all as Approved;
2. Refer to PIL1.T130 for details of instrumentation;
3. Install a borehole adjacent to the preliminary pile and before it is driven to determine the geotechnical conditions;
4. Test the preliminary pile by Pile Driving Analyser with CAPWAP analysis after installation to the Approval founding depth;
5. Carry out a loading test on the preliminary pile as PIL1.T810 to PIL1.T880, immediately after driving to determine the ultimate side resistance and tip resistance of the pile;
6. Unless otherwise instructed by the CM, the Contractor may choose to pitch the first sections of working piles before the test result is known. If any of the loading tests fail, the CM may order the installation of additional piles and the repetition of the procedures specified in this clause until a successful result is achieved.

PIL1.T130.7 INSTRUMENTATION

1. Instrument the preliminary pile with calibrated strain gauges to determine the distribution of side resistance in each major soil stratum down the pile and tip resistance in the bearing stratum during the loading test;

2. Propose, for the above purpose, the type, number and locations of strain gauges to be installed in each preliminary pile as well as the method of installation and protection of the strain gauges;

3. Acceptance of the Contractor's proposal by the CM shall not relieve the Contractor from the responsibility for ensuring the proper installation of the strain gauges and their satisfactory performance during load testing of the piles;

4. Check the performance of the strain gauges installed in the preliminary pile before and after installation of each segment of the pile into the ground, and before and during load testing of the pile;

5. The preliminary pile will be deemed unacceptable should there be more than 20% of the required total number of installed strain gauges not functioning properly during load testing of the pile;

6. Install an additional preliminary pile as PIL1.T110;

7. No claim for an extension of time will be allowed in connection with the provisions of this clause;

8. Take strain gauge reading at each incremental change of test load during the load test;

9. Present the strain gauge results by an Approved personal computer compatible spreadsheet software in both tabular and pictorial forms agreed by the CM;

10. Submit two copies of the data stored on floppy diskettes to the CM within one week after completion of the loading test.

PIL1.T140.7 FAILURE OF PRELIMINARY PILES

A preliminary pile is deemed to have failed the loading test when any of the following conditions occur in loading stage 2 as defined in PIL1.T830:

1. The settlement of the pile head reaches the magnitude of settlement at failure as defined in PIL1.T910;

2. The permanent settlement after removal of stage load 2 exceeds the permitted value specified in PIL1.T920.

SAMPLING AND TESTING FOUNDING LEVELS TO PILE TYPES 3, 4, 5, 6 AND 7

PIL1.T210.7 CORES FOR TYPE 3 PILES

1. Testing arrangements and testing samples:
   a. At every Type 3 pile location, take cores of minimum NX size to a minimum depth of 5000 mm into bedrock below the proposed pile base before commencement of excavation for the pile, when Instructed.

2. Testing methods:
a. Extract rock core samples from the core holes in the presence of the CM or his representative and provide records of bores for the CM's inspection;
b. When Instructed, carry out laboratory compression tests or field point load tests on recovered cores to determine rock strength;
c. Submit to the CM ground investigation reports within 3 days after completion of coring and not less than 10 days prior to the commencement of pile excavation;
d. Take further cores at any location as the Contractor deems necessary and at his own expense as stated in PIL1.G440;
e. Keep the rock samples and a copy of the ground investigation reports in the container store rooms;
f. Backfill the drillholes with cement grout or Approved material.

3. Test on bearing strata:
   a. Carry out the uniaxial compressive strength test or equivalent point load index test on the founding material for piles founded on Cat 1(c) or better rock in accordance with the testing methods stated in sub-clause (2)(b) above. Perform a minimum of 1 such test on rock specimen obtained at the location of each installed pile.

PIL1.T220.7 PROVING BEDROCK - TYPE 3 PILES

1. Testing arrangements and testing samples:
   a. When Instructed, upon excavation for Type 3 pile reaching bedrock as previously described in PIL1.G450, take an NX size core for a depth of 5000 mm into the bedrock.

2. Testing methods:
   a. Extract rock core samples from the core holes in the presence of the CM or his representative and provide records of bores for the CM's inspection;
b. When Instructed, carry out laboratory compression tests or field point load tests on recovered cores to determine rock strength;
c. Submit to the CM ground investigation reports within 3 days after completion of coring;
d. Take further cores at any location as the Contractor deems necessary and at his own expense as stated in PIL1.G440;
e. Keep the rock samples and a copy of the ground investigation reports in the container store rooms.

PIL1.T230.7 PROVING BEDROCK BEFORE INSTALLATION - FOR TYPES 5 AND 6 PILES AND FOR TYPE 4 PILE DRIVEN TO BEDROCK

1. Testing arrangements and testing methods:
   a. Before the commencement of piling, take cores of minimum NX size down to at least 5 m (or the designed rock socket length of the nearest pile, whichever is the greater) deep into the bedrock below the rock head of the specified grade of rock. Provide rock core samples and records of the bores for the CM's inspection. Backfill the drillholes with cement grout or Approved material. Submit to the CM ground investigation reports within 3 days after completion of the coring.

2. Testing samples:
   a. The number of drillholes required shall be such that the pile tip of every pile shall be within 5 metres from a drillhole and there shall be at least a drillhole at every pile cap location.
PILING AND FOOTING

PIL1 > TESTING

PIL1.T240.7 Founding Level for Types 5 and 6 Piles and for Type 4 Pile Driven to Bedrock

1. Testing arrangements:
   a. When Instructed, provide equipment for obtaining disturbed and undisturbed soil and rock samples in accordance with BS 5930:1981 from ground in the vicinity of the pile shaft during installation.

2. Testing methods:
   a. When Instructed, carry out the following tests on Site or in the laboratory as directed by the CM:
      i. The standard penetration test in accordance with BS1377 : 1975 (Test 19), modified by "Geoguide 2: Guide to Site Investigation", Hong Kong Government, 1987;
      iii. Uniaxial compression strength test in accordance with ASTM Designation: D2938 – 86.
   b. When the drillhole reaches the rockhead, recover continuous rock cores to at least the base level of the rock socket. Log all rock cores to ensure the quality of the rock socket;
   c. Provide suitable containers for samples of soil and ground water, ensuring that containers for cohesive material are airtight;
   d. Arrange for the testing of the samples in an Approved laboratory.

3. Test on bearing strata for Types 5 and 6 Piles:
   a. Carry out the uniaxial compressive strength test or equivalent point load index test on the founding material for piles socketed in Cat 1(c) or better rock in accordance with the testing methods stated in sub-clause (2)(a)(ii) and (iii) above. Perform at least 1 such test on rock specimen taken within 5m of each installed pile.

PIL1.T250.7 Proving Bedrock After Installation - Types 5 and 6 Piles and for Type 4 Pile Driven to Bedrock

1. Testing arrangements:
   a. After installation of the piles, the CM will order a Direct Testing Contractor to take cores of minimum NX size in accordance with the requirements stated in clause 7.4.3 of the Code of Practice for Foundations. The drillholes shall be in the vicinity of the piles;
   b. Provide attendance on the Direct Testing Contractor as described in Worksection PRE.B12 or PRE.C12, as appropriate.

2. Testing samples:
   a. The number of drillholes required shall be at least 2 or 1% of the total numbers of piles, whichever is the greater.

PIL1.T260.7 Founding Level for Type 7 Piles

1. Testing arrangements and testing methods:

Specification Library 2014 Edition
a. Before the commencement of piling, carry out pre-drilling down to at least 5 m below the tentative founding level of the specified category in accordance with the Code of Practice for Foundations. Carry out standard penetration tests at maximum interval of 2 m along the drillholes from cut-off levels down to 5 m below the tentative founding levels. Provide records of the bores for the CM’s inspection. Backfill the drillholes with cement grout or Approved material. Submit to the CM ground investigation reports within 3 days after completion of the coring.

2. Testing samples:
   a. The number of drillholes required shall be such that the pile tip of every pile shall be within 5 metres from a drillhole.

TESTING GROUT FOR TYPES 3, 5, 6 AND 7 PILES

PIL1.T310.7 DEFINITION OF 'BATCH'
1. For the tests specified in PIL1.T320 and PIL1.T330, a 'batch' of grout is any quantity of grout used for grouting in one continuous operation in one day;
2. For the test specified in PIL1.T340, a 'batch' of grout is the quantity of grout as stipulated in Clause 1.2 of CS1:2010.

PIL1.T320.7 TEST FOR BLEEDING AND FREE EXPANSION
1. Testing arrangements and testing samples:
   a. Provide one sample of grout from each batch not more than 30 minutes after mixing and protect from changes in moisture content before tests are carried out.
2. Testing methods:
   a. Divide each sample into three specimens and place a portion of each specimen in a covered cylinder with a diameter of 100 ±10 mm to a depth of 100 ±5 mm;
   b. Measure the amount of bleeding and free expansion by a scale fixed to the outside of the cylinder.
3. Non-compliance:
   a. If the result of any test for the amount of bleeding or free expansion of the grout does not comply with the specified requirements, submit particulars of proposed changes to the materials, grout mix or methods of production to the CM and carry out further grouting trials unless otherwise permitted by the CM;
   b. For Type 7 piles, the acceptance criteria for the result of any test for the amount of bleeding or free expansion of the cement sand grout shall be reviewed, established and subject to the CM’s agreement after conducting the trial mix of the grout.

PIL1.T330.7 FLOW CONE EFFLUX TEST
1. Testing samples:
   a. After mixing and sieving and prior to injection, take one sample from each batch.
2. Testing methods:
   a. Test the grout in accordance with ASTM C939-94 to determine the Flow Cone Efflux time;
   b. For Type 7 piles, a 19 mm diameter flowcone shall be used. Flow rates shall be within 15 to 25 seconds.
3. Non-compliance:
   a. Except with the CM's prior agreement for grout mixes containing additives and admixtures, grout having an efflux time of less than 15 seconds will be rejected.

PIL1.T340.7 TEST FOR CRUSHING STRENGTH

1. Testing samples:
   a. Provide one sample (Type 3 Pile) from every 25 m³ or every 25 batches, whichever is the smaller volume. At least one sample shall be provided from grout produced on any one day;
   b. Provide one sample (Types 5, 6 and 7 Piles) from every 10 m³ or every 10 batches, whichever is the smaller volume. At least one sample shall be provided from grout produced on any one day;
   c. Each sample provided in sub-clauses (a) and (b) above shall not be taken at a time more than one hour after the grout is mixed and shall be protected from weather before test cubes are made.

2. Testing methods:
   a. The DTC shall prepare two cubes of 100 mm size from each sample, cure and test the cubes for crushing strength at 28 days in accordance with CS1:2010;
   b. The average of the two crushing strengths shall be taken as the test result. The criteria C1 and C2 shall be adopted as appropriate for assessing compliance stipulated in CON1.T640 and CON1.T660 of Worksection CON1;
   c. The test result shall comply with the following requirements:
      i. Individual test results: comply with the strength determined from limits given in Column A of the Table specified in CON1.T650 of Worksection CON1;
      ii. Average strength determined from any group of four consecutive test results: comply with the strength determined from limits given in Column B of the Table specified in CON1.T650 of Worksection CON1. Where there are less than four available test results, treat the average of the first two or first three consecutive test results in the same manner as groups of four consecutive test results.

VISUAL INSPECTION

PIL1.T410.7 REQUIREMENT

When Instructed, open up for inspection any piles covered up as specified in the following clauses in this sub-section.

PIL1.T420.7 METHOD

Excavate to expose piles for a minimum of 750 mm from face of the pile all round and:

1. Plank and strut and shore all faces of the excavation and keep the excavation free from water by pumping or bailing;
2. Wash surfaces of piles to be inspected clean of all silt, mud or other adhering material;
3. Deposit excavated material in temporary spoil heaps on Site;
4. After inspection, fill in and well ram to the entire satisfaction of the CM, around the piles with Special Filling Material suitable for the piling system adopted. If necessary, remove excavated Unsuitable Filling Material from site and make up voids with Special Filling Material.

PIL1.T430.7 CRITERIA FOR FAILURE
Piles that upon inspection are found to be honeycombed, necked or cracked are deemed to be defective.

DESTRUCTIVE TESTS ON SAMPLES OF TYPES 4 AND 6 PILES

PIL1.T510.7 GENERAL
Testing arrangements:
1. Allow for providing additional piles for testing, making samples of steel plates and their delivery.

PIL1.T520.7 SAMPLES
Testing samples:
1. The CM will order approximately 1% of the number of the steel piles delivered to Site to be subjected to testing in accordance with this sub-section before driving;
2. Take two samples from the steel plates at both ends of each of the chosen piles for tensile testing;
3. Tensile tests on steel samples will be carried out by Direct Testing Contractor.

PIL1.T530.7 NON-COMPLIANCE
In the event that the tensile test results fail to comply with this Specification, all piles delivered on the same date will be deemed unacceptable and must be removed from the Site.

PIL1.T540.7 PREMATURE INSTALLATION
Where piles are installed before test results are known, submit, for Approval, proposals for remedying any unacceptable piles already installed.

LOADING TESTS GENERALLY

PIL1.T610.7 REQUIREMENT FOR TESTING
1. Test the preliminary pile(s) in accordance with this sub-section but do not test pile(s) before the concrete and/or grout has attained sufficient strength to withstand the test loads;
2. Loading tests for working piles of each type of Types 1, 2, 4, 5, 6 and 7 Piles:
   a. Unless otherwise specified by the CM, the sampling rate for loading tests shall be in accordance with the following table:

<table>
<thead>
<tr>
<th>Type of loading test</th>
<th>Category of pile</th>
<th>Sampling rate for loading tests</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compression Test</td>
<td>Pile designed to take compression only.</td>
<td>1% of or 1 number from the total</td>
</tr>
</tbody>
</table>
For loading tests in compression, the CM will order the Direct Testing Contractor to carry out the tests in accordance with this Worksection;

c. For loading tests in tension, submit details of tests for CM's approval and carry out the tests according to the Approved procedures.

3. Testing arrangements:

a. Piles will not be tested before the concrete and/or grout has attained sufficient strength to withstand the test loads and selection of piles for testing shall be in accordance with PIL1.T030;

b. Allow sufficient time in the programming of the Works for the CM to order the piles to be load tested and for performing the number of tests stated before completion of the Works or the respective Section thereof;

c. Provide attendance on the Direct Testing Contractor as Worksection PRE.B12 or PRE.C12 as appropriate;

d. Pave the area around the test pile with chunam or other materials approved by the CM immediately after the pile has been selected for load test. The extent of the paved area to be determined by the CM. Keep the paved area from being damaged prior to the load test;

e. Provide adequate site safety to cater for the possible failure of the piles during testing;

f. For Type 7 piles, the pile shall be loaded at cut-off level. When the loading test is carried out before trimming the pile to cut-off level, the additional shaft friction above the cut-off level shall be taken into consideration for the test loading. The loading test proposal shall be submitted to the CM for approval at least 14 days before commencement of the loading test.

LOADING TESTS OF PRELIMINARY PILES

PIL1.T710.7 TESTING EQUIPMENT

1. Supply suitable platforms, hydraulic and other equipment together with four deflectometers reading to 0.025 mm and all other appliances necessary to record the settlement of the pile to Approval;

2. Ensure that the support of the reference beam is at least 2000 mm or 3 times the pile diameter, whichever is the greater, from the test and anchor piles.

PIL1.T720.7 CALIBRATION OF HYDRAULIC EQUIPMENT

Before commencement of the testing, submit to the CM, calibration test certificates from an independent laboratory in respect of all hydraulic equipment. Carry out the calibration:

1. In the period between the notified date for commencement of the Works and commencement of testing; or
2. Whenever the equipment has been adjusted.

PIL1.T730.7 MEASUREMENT OF TEST LOADS
Measure test loads by the use of a calibrated load cell and a calibrated pressure gauge included in the hydraulic system and:
1. Ensure that the load cell is axially loaded throughout the test;
2. Use the values given by the load cell for the interpretation of the test result, the pressure gauge readings being required as a check for gross error.

PIL1.T740.7 TEMPERATURE VARIATIONS
Provide suitable protection to minimise the effect of temperature variations on the test.

PROCEDURE FOR LOAD TESTS OF PRELIMINARY PILES

PIL1.T810.7 ANCHORAGES
1. Apply the load by jacking against suitable reactions provided by kentledge, anchor piles, or other anchorages to Approval;
2. Provide the centre of such reactions at a minimum distance of 2000 mm or three times the pile diameter, whichever is the greater, from the centre of the pile to be tested and from the centre of any adjacent pile.

PIL1.T820.7 PILE CAP TO TEST PILE
Extend the pile to be test loaded from its original level to a suitable level for the carrying out of the test and design and construct a suitable pile cap to the test pile.

PIL1.T830.7 LOADING OF A PRELIMINARY PILE
Apply and remove the test loading of a preliminary pile at cut off level or at other level agreed by the CM in three stages as follows:

<table>
<thead>
<tr>
<th>Stage</th>
<th>Test Loading</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>100% P</td>
</tr>
<tr>
<td>2</td>
<td>200% P</td>
</tr>
<tr>
<td>3</td>
<td>360% P (for pile types 1 &amp; 2) or 330% P (for pile type 4)</td>
</tr>
</tbody>
</table>

P = safe load carrying capacity as defined in PIL1.D390 for Contractor's Design Piling Contract / Combined Piling and Building Contract; or
P = safe load carrying capacity as specified by the CM for Engineer's Design Piling Contract / Combined Piling and Building Contract.

PIL1.T840.7 SEQUENCE
Adopt the following sequence of testing of preliminary pile unless otherwise instructed:
1. Apply the load in increments of 50%P up to the stage 1 test loading;
2. Do not apply increments of loading until the rate of settlement of the pile is less than 0.05 mm in 10 minutes;
3. Remove the test load and determine the recovery of the pile before resuming loading;
4. Repeat procedures in sub-clauses (1) and (2) above for the stage 2 test loading;
5. Maintain the full stage 2 test loading for 72 hours before removal;
6. Remove the test load and record the recovery of the pile;
7. Apply the load in increments of 50%P up to the stage 2 test loading allowing 20 minutes between load increments;
8. Maintain the stage 2 test loading for 20 minutes;
9. Apply the load in increments of 10%P until the stage 3 test loading or the failure load as defined in PIL1.T910 is reached, allowing 20 minutes between load increments;
10. Maintain the stage 3 test loading for 2 hours if failure of the pile does not occur;
11. Remove the test load in four equal decrements allowing 20 minutes between decrements, and record the recovery of the pile.

**PIL1.T850.7 RECORDING AND CHECKING DATA**

1. Carefully record the settlement of the pile under each increment of loading and the exact time at which such increment is applied or removed, in the presence of the CM;
2. Throughout the period of the test, make check observations of the settlement of the pile being tested by a suitable surveyor's level.

**PIL1.T860.7 CONTRACTOR'S REPRESENTATIVE**

Have a representative in attendance continuously throughout the period of the test to take and record all specified data hourly or at such other intervals as may be stipulated by the CM.

**PIL1.T870.7 COMPLETION**

On completion of the test, remove all testing equipment etc, demolish the test pile cap, make good the test pile and the Site back to their original condition and remove all debris arising from the test from the Site.

**PIL1.T880.7 RECORDS AND SUBMISSION OF REPORT TO THE CM**

Keep records of load tests on piles on the Site and submit a report to the CM within 12 hours of the test being completed. Keep the records on standard forms as shown in Appendix V to this Worksection and available to the CM for inspection at all times. The records must include graphs showing load and settlement versus time, plotted in the format as agreed by the CM.

**LOAD TEST RESULTS OF PRELIMINARY PILES**

**PIL1.T910.7 FAILURE LOAD**

Keep records during loading and unloading. The ultimate or failure load of the pile is that load which produces a settlement of the pile head exceeding:

\[ f = D_e + D/120 + 4 \text{ mm} \]

where:

\[ f = \text{settlement at failure in mm.} \]
\[ D = \text{least lateral dimension of the pile in mm.} \]
\[ D_e = \text{elastic deformation of the pile shaft and is defined as:} \]
De = 3.7PLp/AE  for stage 3 test loading for preliminary pile of pile types 1 & 2; or
3.3PLp/AE  for stage 3 test loading for preliminary pile of pile type 4; or
2PLp/AE  for all other stages of test loading for preliminary pile.

where:
P = as defined in PIL1.T830; unit in kN
Lp = pile length in mm
A = cross sectional area of pile in mm²
E = Young’s Modulus for pile material in kN/mm²

RESIDUAL SETTLEMENT

When the rate of recovery after the removal of the maximum test load is less than 0.1 mm/hour observed in a period of not less than 15 minutes, the residual settlement at the head of the pile exceeding the greater of D/120 + 4 mm or 25% of the maximum pile head settlement during the test, will be deemed a failure of the pile.

LOADING TESTS OF WORKING PILES

GENERAL

The Direct Testing Contractor will carry out load tests of working piles in accordance with the requirements of the Specification.

LOADING OF A WORKING PILE

As ordered by the CM, the Direct Testing Contractor will apply and remove the test loading of a working pile at cut off level or at other level agreed by the CM, in two stages as follows:

<table>
<thead>
<tr>
<th>Stage</th>
<th>Test Loading for Pile Types 1, 2, 4, 5, 6 &amp; 7</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>100% P</td>
</tr>
<tr>
<td>2</td>
<td>200% P</td>
</tr>
</tbody>
</table>

P = safe load carrying capacity as defined in PIL1.D390 for Contractor’s Design Piling Contract / Combined Piling and Building Contract; or
P = safe load carrying capacity as specified by the CM for Engineer’s Design Piling Contract / Combined Piling and Building Contract.

LOADING TYPES 5, 6 AND 7 PILES

The Direct Testing Contractor will not carry out the test until the grout has reached the 28-days characteristic compressive strength.

SEQUENCE

The Direct Testing Contractor will adopt the following sequence of testing of working pile unless otherwise instructed:
1. Apply the load in increments of 50%P up to the stage 1 test loading;
2. Do not apply increments of loading until the rate of settlement of the pile is less than 0.05 mm in 10 minutes;
3. Remove the test load and determine the recovery of the pile before resuming loading;
4. Repeat procedures in sub-clauses (1) and (2) above for the stage 2 test loading;
5. Maintain the full stage 2 test loading for 72 hours before removal;
6. Remove the test load and record the recovery of the pile.

LOAD TEST RESULTS OF WORKING PILES

PIL1.T1110.7  FAILURE LOAD AND RESIDUAL SETTLEMENT
1. Keep records during loading and unloading. The ultimate or failure load of the pile is that load which produces a settlement of the pile head exceeding:
   \[ f = D_e + D/120 + 4 \text{ mm} \]
   where:
   \[ f = \text{settlement at failure in mm.} \]
   \[ D = \text{least lateral dimension of the pile in mm.} \]
   \[ D_e = \text{elastic deformation of the pile shaft and is defined as:} \]
   \[ D_e = 2PL_p/AE \text{ for all other stages of test loading for working pile.} \]
   where:
   \[ P = \text{as defined in PIL1.T1020 as appropriate; unit in kN} \]
   \[ L_p = \text{pile length in mm (For pile with rock sockets, Lp should be measured to the centre of the rock socket. For pile without rock sockets, Lp should be taken as the entire length of the pile)} \]
   \[ A = \text{cross sectional area of pile in mm}^2 \]
   \[ E = \text{Young's Modulus for pile material in kN/mm}^2 \]
2. Consider the following in calculating the \( D_e \):
   a. For Type 5 pile, the contribution from steel bars, cement grout and steel casing along the whole pile length, \( L_p \); and
   b. For Type 6 pile, the contribution from cement grout within the length of the rock socket.
3. When the rate of recovery after the removal of the maximum test load is less than 0.1 mm/hour observed in a period of not less than 15 minutes, the residual settlement at the head of the pile exceeding the greater of \( D/120 + 4 \text{ mm} \) or 25% of the maximum pile head settlement during the test, will be deemed a failure of the pile.

PIL1.T1120.7  FAILED PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
Where a pile fails, install additional piles as instructed by the CM and then retest. The Contractor may be required to carry out test probes in order to position the additional piles to the CM’s satisfaction. Carry out the extended pile caps consequent upon the installation of the additional piles to an Approved design and in an Approved manner. Bear all costs and no time extensions will be allowed.

PIL1.T1130.7  FAILED PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
In the event that a pile fails, the CM will investigate the cause of failure and carry out any tests he deems necessary. Provide attendance to CM’s investigation as required by the CM. If the failure is due to poor workmanship or faulty materials, carry out remedial works as follows:
1. Rectify such non-compliance in accordance with this Specification;
2. Where additional piles or extended pile caps are required, carry out such work to an Approved design and in an Approved manner;

3. Bear all costs and no extension of time is allowed for testing, remedial works and installation of additional pile(s).

CORE TESTING TYPE 1c AND TYPE 3 PILES

PIL1.T1210.7 GENERAL

Testing arrangements:

1. Core tests of piles as described in this sub-section will be carried out by Direct Testing Contractor(s) and selection of piles for testing shall be in accordance with PIL1.T030;

2. Provide attendance on the Direct Testing contractor(s) as Worksection PRE.B12 or PRE.C12, as appropriate;

3. Allow sufficient time in the programming of the Works for the CM to order the piles to be tested and for performing the number of tests stated before completion of the Works or the respective Section thereof.

PIL1.T1220.7 CORE DIMENSIONS AND SAMPLE SIZE

The following works will be carried out by Direct Testing Contractor:

1. Testing samples
   a. Take full-length concrete core specimens of minimum NX size for Type 1(c) piles or 100 mm diameter for Type 3 piles;
   b. Take cores of minimum NX size down to not less than 600 mm, or one half of the diameter of the pile base, whichever is the larger, into the rock below the pile base;
   c. Sample size: minimum 2 number or 5% of the total number of piles, whichever is the greater.

2. Testing methods:
   a. Laboratory compression tests on 3 core samples selected from the full length concrete core; acceptance criteria for concrete core compression tests are given in PIL1.T1240.

PIL1.T1230.7 REINSTATEMENT OF CORE HOLES

Fill core holes solid with non-shrinkage grout of at least the same crushing strength as the pile cored.

PIL1.T1240.7 CRITERIA FOR FAILURE

Non-compliance:

1. Concrete of the respective piles is considered failed if:

   a. The estimated in-situ cube strength of any core specimen is less than 75% of the specified grade strength or the average estimated in-situ cube strength of the three core specimens is less than 85% of the specified grade strength, for cases other than that stated in sub-clause (1)(a)(ii) below;
ii. The estimated in-situ cube strength of any specimen is less than 60% of the specified grade strength or the average estimated in-situ cube strength of the three core specimens is less than 70% of the specified grade strength for the case where a reduction factor of 0.8 is applied to the design stresses of concrete placed under water; or

b. The concrete cores show evidence of honeycombing or segregation of individual constituent materials; or
c. In the opinion of the CM, the concrete fails to meet the specified requirements in any other respect.

2. The interface of concrete and rock of the respective pile is considered failed if, in the opinion of the CM, the concrete and rock of the core specimen is not in good contact;

3. The rock below the pile base is considered failed if, by visual examination, the rock core obtained does not conform to the rock material specified in the design;

4. The respective pile will be considered not complying with the requirements of this Specification if any one of the failure criteria stated in sub-clause (1), (2) or (3) above is met; in such event,

   a. Comply with the requirements stated in PIL1.T1120 or PIL1.T1130, as appropriate;
   b. The CM may order the Direct Testing Contractor to carry out further tests on other piles and the number of piles to be tested shall be in accordance with PIL1.T1410;
   c. Bear all costs and no extension of time is allowed for testing, remedial works and installation of additional pile(s) as a consequence of the above non-compliance.

PIL1.T1250.7 REQUIREMENT FOR FURTHER TESTS

Non-compliance:

1. Cube test results

   a. When concrete cube compressive test result does not comply with CON1.T630 to CON1.T660, the CM will order the Direct Testing Contractor to extract full length concrete core from each pile cast on the same concreting day and further select 3 core samples from each pile according to instruction of CM for compression test (the cores taken in this case are not included in the core sample specified in PIL1.T1220). Acceptance criteria and further actions arising from such tests shall be in accordance with PIL1.T1240.

2. Core test results

   a. When the concrete of a pile fails according to sub-clause (1)(a) of PIL1.T1240, no further test on concrete core of this pile is allowed.

3. Bear all costs and no extension of time is allowed for testing, remedial works and installation of additional pile(s) as a consequence of the above non-compliance.

DESTRUCTIVE TESTING OF SAMPLES OF PRECAST CONCRETE PILES

PIL1.T1310.7 GENERAL

Testing arrangements:

1. Allow for providing additional materials of piles for testing;
2. Arrange for the taking and testing of concrete cores by a Direct Testing Contractor employed direct by the Authority;

3. Provide attendance on the Direct Testing Contractor as PRE.B12.530 or PRE.C12.240 as appropriate and remove the tested piles from Site on completion of the tests.

PIL1.T1320.7 SAMPLE SIZE
Testing samples:
1. Where precast concrete piles (Types 1(a) and 2) are proposed for the Contract, the CM will order approximately 1% of the number of piles delivered to Site to be subjected to the tests as specified in the following clauses in this sub-section, prior to driving;

2. Where precast prestressed spun concrete piles (Type 1(b)) are proposed for the Contract, the CM will order at least 2% of the number of piles with a minimum of one pile per batch per delivery to Site to be subjected to the tests as specified in the following clauses in this sub-section, prior to driving.

PIL1.T1330.7 CORING
Testing methods:
1. For Types 1(a) and 2:
   a. Direct Testing Contractor will take cores in accordance with CON1.T710 to CON1.T760 from each of the chosen precast concrete piles for core test.

2. For Type 1(b):
   a. Direct Testing Contractor will take 3 sets of 3 cores (total 9 nos.) of 76 mm diameter taken normal to the length and from 3 transverse sections of a chosen precast prestressed spun concrete pile in accordance with CON1.T710 and CON1.T720 for core test;

   b. Where the estimated insitu cube strength of any individual core is less than 85% of the specified grade strength, comply with any instruction of the CM for the taking of additional core samples to make up a total of 12 numbers of core samples in the same concreting day for further tests. Allow the time without any claim for extension of time and bear all the costs for such extra work;

   c. Assess the coring test results in accordance with CON1.T760.

3. Do not apply the provisions of CON1.T770 to precast concrete piles generally nor those of CON1.T740 to precast prestressed spun concrete piles.

PIL1.T1340.7 TEST FAILURE
Non-compliance:
1. In the event that the coring test results fail to comply with the Specification, all piles concreted on the same day will be deemed to be unacceptable and must be removed from the Site.

PIL1.T1350.7 PREMATURE DRIVING
Where driving is carried out before test results are known, submit remedial proposals for those unacceptable piles, as described above, which have already been driven, for Approval.
FURTHER INSPECTION AND TESTING

PIL1.T1410.7 REQUIREMENT
If inspection, loading tests, core tests (for Type 3 piles) or weld tests show that any pile is not in accordance with the Specification or the Drawings, the CM may order further inspection/tests, the number to be calculated by the application of the formula given below and no extension of time will be allowed. Bear the cost of such further inspection/tests.

\[
\text{number of further inspections/tests} = \left( n^2 - 2n + 3 \right)
\]

where \( n \) = total number of unsuccessful inspections/tests progressively until all inspections/tests are successful.

PIL1.T1420.7 SAMPLE EVALUATIONS
Typical examples of evaluations of number of further inspections/tests are given in Appendix II to this Worksection, for illustrative purposes only.

NON-DESTRUCTIVE TESTS ON WELDS

PIL1.T1510.7 GENERAL
Testing arrangements:
1. Non-destructive tests on welds will be carried out by Direct Testing Contractor(s), allow at least 3 working days for the execution of each weld test by the Direct Testing Contractor(s);
2. Provide attendance on the Direct Testing Contractors as Worksection PRE.B12 or PRE.C12 as appropriate;
3. Allow sufficient time in the programming of the Works for the CM to order the piles to be tested and for performing the number of tests stated before completion of the Works or the respective Section thereof.

PIL1.T1520.7 TYPES OF TEST AND SAMPLE SIZE
1. Testing methods and testing samples:
   a. During the progress of the works, the CM will require testing of the butt and fillet welded joints to all types of piles to be examined by non-destructive tests as follows:
      i. In accordance with the requirements stated in STR1.T120;
      ii. For full penetration butt weld, the testing frequency shall be 100%, in accordance with clause 14.3.6.1 of Code of Practice for the Structural Use of Steel 2005. The CM may, at his discretion, reduce such testing frequency to a minimum of 10%.
   b. In addition, the CM will order another Direct Testing Contractor to carry out the same test on 5% of the tested welds again.
2. Non-compliance:
   a. In the event that the result of test carried out by either one of the Direct Testing Contractors failed, the tested weld shall be deemed not complying with the requirement of the Contract.
NON-DESTRUCTIVE TESTS ON PILES

PIL1.T1610.7 GENERAL

1. Testing methods and test samples:
   a. In addition to the normal requirements for testing of the piles, a proportion of the installed piles will be tested by Direct Testing Contractor(s), using non-destructive tests which includes the following types of test:

<table>
<thead>
<tr>
<th>Type of Test</th>
<th>Number of Piles to be Tested</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pile driving analyser</td>
<td>i. Minimum 5% of the total number of all driven piles excluding Type 4 piles driven to bedrock and driven concrete piles</td>
</tr>
<tr>
<td></td>
<td>ii. Minimum 10% of the total number of all Type 4 piles driven to bedrock</td>
</tr>
<tr>
<td></td>
<td>iii. Refer to sub-clause (1)(b) for driven concrete piles</td>
</tr>
<tr>
<td>Pile Integrity Test</td>
<td>i. Minimum 15% of the total number of all Type 7 piles for compliance with ASTM D5882 or other Approved standard</td>
</tr>
<tr>
<td></td>
<td>ii. Refer to sub-clause (1)(b) for driven concrete piles</td>
</tr>
<tr>
<td>Sonic logging</td>
<td>i. 100% of the total number of all Type 3 piles</td>
</tr>
<tr>
<td></td>
<td>ii. 100% of the total number of all Type 7 piles</td>
</tr>
</tbody>
</table>

   b. The total number of driven concrete piles tested by pile driving analyser and Pile Integrity Test, taken together, will be minimum 5% of the total number of all driven concrete piles;

   c. In addition, the CM will order another Direct Testing Contractor or the Housing Department Materials Testing Laboratory to carry out the same tests on 5% to 10% of the tested piles again.

2. Testing arrangements:
   a. Inform the CM in writing at least 7 working days before all piles of each individual pile cap or every 20% of the total numbers of piles of the same block, whichever is less, are ready for the non-destructive test; allow at least 7 working days for the execution of non-destructive test on each pile by the Direct Testing Contractor(s);

   b. Provide attendance on the Direct Testing Contractors and/or Housing Department Material Testing Laboratory as Worksection PRE.B12 or PRE.C12 as appropriate;

   c. Allow sufficient time in the programming of the Works for the CM to order the piles to be tested and for performing the number of tests stated before completion of the Works or the respective Section thereof.

3. Preparation works for sonic logging (for Type 3 piles):
   a. Install sonic access tubes of mild steel with thickness not less than 2.5 mm for Type 3 pile of number as given in the following table:

<table>
<thead>
<tr>
<th>Pile Diameter</th>
<th>No. of Sonic Access Tube</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 2 m diameter</td>
<td>4</td>
</tr>
<tr>
<td>Equal to or exceeding 2 m diameter</td>
<td>6</td>
</tr>
</tbody>
</table>
b. Half of the number of the sonic access tubes installed in a Type 3 pile shall be used for both sonic logging test and confirmatory core testing. These tubes shall be of 150 mm internal diameter. The remaining half number of the sonic access tubes shall be used for sonic logging test only in accordance with the following table.

<table>
<thead>
<tr>
<th>Pile Diameter (Pile Length)</th>
<th>Remaining half number of the Sonic Access Tube</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 2 m diameter (Length less than 50 m)</td>
<td>2 nos. of internal diameter not less than 42 mm</td>
</tr>
<tr>
<td>Less than 2 m diameter (Length equal to or longer than 50 m)</td>
<td>2 nos. of 150 mm internal diameter</td>
</tr>
<tr>
<td>Equal to or exceeding 2 m diameter (Length less than 50 m)</td>
<td>3 nos. of internal diameter not less than 42 mm</td>
</tr>
<tr>
<td>Equal to or exceeding 2 m diameter (Length equal to or longer than 50 m)</td>
<td>3 nos. of 150 mm internal diameter</td>
</tr>
</tbody>
</table>

(Pile Length = length of bored pile measured from cut off level to founding level)

c. Install sonic access tubes for both sonic logging test and confirmatory core testing and those for sonic logging test only in alternate positions along the perimeter inside the pile shaft;

d. Fit all tubes with screw-on steel watertight shoes or other Approved means at both ends. Fix all tubes securely to the interior of the reinforcement cage of the pile by method to be approved by the CM;

e. All sonic access tubes to be watertight including any joints, evenly spaced, parallel to each other and to the axis of the pile, free from corrosion with clean internal and external faces so as to allow free and unobstructed passage of the testing probes;

f. Plug or cap all sonic access tubes before concreting. Extend the tubes along the depth of the pile from 300 mm approximately above the pile top level down to 1 m above the pile base for the 150 mm diameter tubes used for both sonic logging test and confirmatory core testing, and down to 500 mm above the pile base for the remaining half number of the sonic access tubes used for sonic logging test only;

g. Fill up the sonic access tubes with water prior to concreting of pile and during testing;

h. Cut off all tubes flush with the concrete surface of pile and fill up the tubes with non-shrinkage grout of at least the same crushing strength as the concrete of the pile upon completion of all testing.

4. Preparation works for sonic logging (for Type 7 piles):

a. Install a single sonic access tube of uPVC with closed bottom end and internal diameter of 40 mm;

b. Fix the single tube securely to the centre of the reinforcement cage of the pile by method to be approved by the CM;

c. The single tube to be watertight including any joints, parallel to the axis of the pile, clean internal and external faces so as to allow free and unobstructed passage of the testing probe;

d. Plug or cap the single tube before inserting the reinforcement cage into the grouted shaft. Extend the single tube along the depth of the pile from 300 mm approximately above the pile top level down to the bottom level of the reinforcement cage for sonic logging test;
e. Fill up the single tube with water prior to installation of reinforcement cage and during testing;
f. Cut off the single tube flush with the grout surface of pile and fill up the tube with non-shrinkage grout of at least the same crushing strength as the grout of the pile upon completion of all testing.

**PIL1.T1620.7 RELATIONSHIP TO LOAD TESTING OR CORE TESTING**

The results of this testing will, in conjunction with other considerations, be used in selecting piles for load testing or core testing as appropriate.

**PIL1.T1630.7 TEST REPORT**

A report of these tests will be prepared by the Direct Testing Contractor(s) and will include the following:

1. Date of testing;
2. Pile reference number;
3. Measured pile length;
4. Record test data;
5. Defects such as cracks, fractures or other dis-continuities;
6. Pile stiffness for pile driving analyser.

**PIL1.T1640.7 TESTING OF PILES DRIVEN BY HYDRAULIC HAMMERS FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**

1. a. For piles pitched by using hydraulic hammers, the pile driving analyser tests as stipulated in PIL1.T1610 shall be performed with CAPWAP analysis in accordance with the following table.

<table>
<thead>
<tr>
<th>Pile Type (Type of Hammer Used for Final Set)</th>
<th>Number of Piles to be Tested by the Pile Driving Analyser (Number of Tests with CAPWAP Analysis)</th>
</tr>
</thead>
<tbody>
<tr>
<td>All driven piles excluding Type 4 piles driven to bedrock and Type 1b piles (drop hammers or other types of hammers as allowed in PIL1.W520)</td>
<td>Minimum 5% of the total number of piles (at least half of the pile driving analyser tests)</td>
</tr>
<tr>
<td>Type 4 piles driven to bedrock (drop hammers or other types of hammers as allowed in PIL1.W520)</td>
<td>Minimum 10% of the total number of piles (all the pile driving analyser tests)</td>
</tr>
<tr>
<td>Type 1b piles (drop hammers or other types of hammers as allowed in PIL1.W520)</td>
<td>Minimum 5% of the total number of piles (all the pile driving analyser tests)</td>
</tr>
<tr>
<td>All driven piles (hydraulic hammers)</td>
<td>Minimum 10% of the total number of piles (all the pile driving analyser tests)</td>
</tr>
</tbody>
</table>
b. Unless otherwise agreed by the CM, use only hydraulic hammers to carry out the tests.

2. Prepare and submit a report of hydraulic hammer performance which should include particularly the following:
   a. Correlation of the results of final sets measurement, the results of pile driving analyser tests with or without CAPWAP and the results of static load tests;
   b. Back calculate the values of the Hydraulic Hammer Factor, "$K_h\$", of the modified Hiley formula specified in the Drawings by using appropriate test results.

**PIL1.T1645.7 TESTING OF PILES DRIVEN BY HYDRAULIC HAMMERS FOR CONTRACTOR’S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**

1.
   a. For piles pitched by using hydraulic hammers, the pile driving analyser tests as stipulated in **PIL1.T1610** shall be performed with CAPWAP analysis in accordance with the following table.

<table>
<thead>
<tr>
<th>Pile Type (Type of Hammer Used for Final Set)</th>
<th>Number of Piles to be Tested by the Pile Driving Analyser (Number of Tests with CAPWAP Analysis)</th>
</tr>
</thead>
<tbody>
<tr>
<td>All driven piles excluding Type 4 piles driven to bedrock and Type 1b piles (drop hammers or other types of hammers as allowed in <strong>PIL1.W520</strong>)</td>
<td>Minimum 5% of the total number of piles (at least half of the pile driving analyser tests)</td>
</tr>
<tr>
<td>Type 4 piles driven to bedrock (drop hammers or other types of hammers as allowed in <strong>PIL1.W520</strong>)</td>
<td>Minimum 10% of the total number of piles (all the pile driving analyser tests)</td>
</tr>
<tr>
<td>Type 1b piles (drop hammers or other types of hammers as allowed in <strong>PIL1.W520</strong>)</td>
<td>Minimum 5% of the total number of piles (all the pile driving analyser tests)</td>
</tr>
<tr>
<td>All driven piles (hydraulic hammers)</td>
<td>Minimum 10% of the total number of piles (all the pile driving analyser tests)</td>
</tr>
</tbody>
</table>

b. Unless otherwise agreed by the CM, use only hydraulic hammers to carry out the tests.

2. Prepare and submit a report of hydraulic hammer performance which should include particularly the following:
   a. Correlation of the results of final sets measurement, the results of pile driving analyser tests with or without CAPWAP and the results of static load tests;
   b. Back calculate the values of the Hydraulic Hammer Factor, "$K_h\$", of the proposed modified Hiley formula stated in **PIL1.D390** by using appropriate test results.
PILING AND FOOTING

CHECKING OF SIZE OF PILE SHAFT AND BELL-OUT OF TYPE 3 PILE

1. Testing sample and method:
   a. Prior to installation of permanent lining and steel reinforcement of each Type 3 pile, check the correctness of the size of the pile shaft and the bell-out by using Ultrasonic Echo Sounder Test or other approved tests and submit the test report to the CM.

2. Testing method:
   a. Unless otherwise agreed by the CM, the testing equipment shall fulfil the following minimum quality and capability:
      i. Comply with the requirements of clause 8.12 of the Code of Practice for Foundations;
      ii. Be able to generate ultrasonic wave of suitable frequency and energy for reflection of the pile shaft and casing surface within 0.5 m to 8 m in distance;
      iii. Have four sensors each mutually perpendicular to one another and be able to provide two cross sectional profiles of the pile simultaneously in one go;
      iv. Have measurement accuracy within ±0.5% in horizontal distance;
      v. Be able to measure up to a depth as stated in the Project Specific Specification;
   b. The test report shall include the following:
      i. The profile of the pile;
      ii. The verticality of the pile – besides the verticality of the whole pile, the verticality of the pile from cut off level down to intermediate depths of maximum 10 m intervals shall be reported;
      iii. The original electro-sensitive paper records which shall be endorsed by the QCM or SQCC of the Contractor and the field technician of the laboratory;
      iv. Interpretation of the test results with respect to the acceptance criteria.

3. Testing arrangement:
   a. Unless otherwise agreed by the CM, employ an Approved laboratory to carry out the tests;
   b. Prior to the tests, seek CM's agreement on the following:
      i. Testing procedures and equipment;
      ii. Acceptance criteria of the tests other than those stated in the Specification;
      iii. Test report format;
      iv. Submission arrangement of the test reports.
   c. In addition, the CM will order a Direct Testing Contractor to carry out the same tests on 5% of the total number of Type 3 piles; allow at least 7 working days for the execution of each test by the Direct Testing Contractor(s); provide attendance on the Direct Testing Contractor as specified in PRE.B12.520 or PRE.C12.260 as appropriate;
   d. Carry out investigation and rectify any defect or irregularities identified by the test and carry out further tests, all to CM's satisfaction, before proceeding to the next stage of work;
e. Allow sufficient time in the programming of the Works for the CM to order the piles to be tested and for performing the number of tests stated before completion of the Works or the respective Section thereof. No claim for additional cost and any extension of time as a result of complying this clause will be entertained by the CM.

CONFIRMATORY CORE TESTING OF FOUNDING STRATA OF TYPE 3 PILES

PIL1.T1710.7 REQUIREMENT FOR CONFIRMATORY CORE TESTING

1. Testing samples:
   a. Take core of minimum NX size down the concrete/rock interface through one of the sonic tubes with its end installed 1 m above the bottom of the pile; the core taken shall include the 1 m of concrete above the interface and at least 1 m of rock below the interface. Use triple-tube core-barrels to extract cores;
   b. Sample size: 100% of the total number of Type 3 piles.

2. Testing methods:
   a. Laboratory compression tests and/or field point load tests on core specimens to determine the concrete or rock strength when ordered.

3. Testing arrangement:
   a. Submit three copies of each of the reports of the confirmatory core tests within three working days after completion of each test;
   b. In addition, the CM will order a Direct Testing Contractor to carry out confirmatory core tests on 5% of the total number of Type 3 piles; allow at least 7 working days for the execution of each confirmatory core testing by the Direct Testing Contractor(s); provide attendance on the Direct Testing Contractor(s) as Worksection PRE.B12 or PRE.C12 as appropriate;
   c. Allow sufficient time in the programming of the Works for the CM to order the piles to be tested and for performing the number of tests stated before completion of the Works or the respective Section thereof.

PIL1.T1720.7 EQUIPMENT AND METHOD

Obtain Approval for the coring equipment and the method of executing the work.

PIL1.T1730.7 TREATMENT OF SPECIMENS

Deal with the concrete core specimens in accordance with CS1:2010 all as set out in Worksection CON1 of this Specification.

PIL1.T1740.7 REINSTATEMENT OF CORE HOLES

Fill core holes and sonic tubes solid with non-shrinkage grout of at least the same crushing strength as the pile cored.

PIL1.T1750.7 CRITERIA FOR FAILURE

Non-compliance:

1. Concrete of the respective piles is considered failed if:
   a. The concrete cores show evidence of honeycombing or segregation of individual constituent materials; or
   b. In the opinion of the CM, the concrete fails to meet the specified requirements in any other respect.
2. The interface of concrete and rock of the respective pile is considered failed if, in the opinion of the CM, the concrete and rock of the core specimen is not in good contact;

3. The respective pile will be considered not complying with the requirements of this Specification if any one of the failure criteria stated in sub-clause (1) or (2) above is met; in such event,
   a. Comply with the requirements stated in PIL1.T1120 or PIL1.T1130, as appropriate;
   b. The CM may order the Direct Testing Contractor to carry out further tests on other piles and the number of piles to be tested shall be in accordance with PIL1.T1410;
   c. Bear all costs and no extension of time is allowed for testing, remedial works and installation of additional pile(s) as a consequence of the above non-compliance.

MECHANICAL COUPLER FOR TYPE 5 PILES

PIL1.T1810.7 RATE OF SAMPLING
Provide test specimens as per CON3.T510.

PIL1.T1820.7 METHOD OF TESTING
Testing for splicing assemblies without ductility requirement shall be in accordance with CON3.T520.

PIL1.T1830.7 COMPLIANCE CRITERIA
1. Compliance criteria for mechanical coupler without ductility requirement shall be in accordance with CON3.T530;
2. Any non-complying batch is to be removed from Site.

PIL1.T1840.7 TIME REQUIRED FOR TESTING
1. Allow time for the availability of test results as per CON3.T540;
2. Do not use the mechanical couplers until the relevant test specimens have passed all tests.
APPENDICES

PIL1.APPEND2.7 CALCULATION OF NUMBER OF FURTHER INSPECTIONS/TESTS
APPENDIX PIL1/II - CALCULATION OF NUMBER OF FURTHER INSPECTIONS/TESTS

Typical Examples for Illustrative Purposes Only

1. Loading test shows 2 piles failed to meet the requirements of the Contract.

2. The Contractor when required, at his own expense, is to carry out further tests in accordance with the formula of:
\[
(n^2 - 2n + 3)
\]
\[
= 2^2 - 2 \times 2 + 3
\]
\[
= 3 \text{ further tests}
\]

3. If one of the above 3 further tests fails, the CM may order further tests to be carried out at the contractor's expense by re-applying the formula and taking into account the total number of failed piles. Altogether and based on the formula, the number of total retesting required:
\[
= 3^2 - 2 \times 3 + 3
\]
\[
= 6
\]
As 3 tests have been carried out the Contractor therefore when ordered by the CM is to carry out:
\[
6 - 3 = 3 \text{ further tests}
\]

4. If the next 3 further tests show further failed piles, the formula will be re-applied as before until all the tests are successful.
PIL.1 APPEND3.7 PILE DRIVING RECORD (PRECAST CONCRETE, PREFABRICATED STEEL AND DRIVEN CAST-IN-PLACE PILES)

SLW1 GENERAL PLANTING REQUIREMENTS

MATERIALS

PLANTS GENERALLY

SLW1.M010.7 SPECIES
All plants, seeds etc. must be true to species.

SLW1.M020.7 HEALTH
Plants and seeds must be free from pests, disease, parasites, discolouration, and mechanical damage.

SLW1.M030.7 SOURCE
Obtain all plants from a recognised cultivated source and not from the wild.

SLW1.M040.7 HABIT
Ensure all plants exhibit the habit, growth and a well developed shape for the species specified and that all plants have a vigorous fibrous root system.

SLW1.M050.7 NAME
In the event of any discrepancy between the Botanic Name, English Common Name, and the Chinese Common Name for any plant specified, accept the Botanic Name.

SLW1.M060.7 SUBSTITUTION
At no time, either make or allow any substitution, without prior Approval.

SLW1.M070.7 PARASITIC PLANTS
Do not allow any of the following species of parasitic plants to be present in any form on any plant or soil brought on to the Site:
1. Cuscuta chinensis (Chinese Dodder, Yellow Colour Thread);
2. Cassytha filiformis (Green Colour Thread).

FERTILIZERS AND ADDITIVES

SLW1.M110.7 SLOW RELEASE FERTILIZER
Slow release fertilizer to be granular NPK chemical fertilizer with a minimum 12-week release period conforming to the following formula:

14 - 18 Parts N (Nitrogen)
7 - 12 Parts P (Phosphorus)
12 - 16 Parts K (Potassium)
1 - 3 Parts MgO (Magnesium Oxide plus other trace elements)
Apply at the rates specified in the appropriate planting Section.

SLW1.M120.7  SLOW RELEASE FERTILIZER FOR SUMMER APPLICATION
Slow release fertilizer for summer application to be granular NPK chemical fertilizer with a minimum 12-week release period conforming to the following formula:

\[
\begin{align*}
&3 - 6 \text{ parts } N \quad \text{(Nitrogen)} \\
&18 - 24 \text{ parts } P \quad \text{(Phosphorus)} \\
&8 - 12 \text{ parts } K \quad \text{(Potassium)} \\
&1 - 3 \text{ parts } \text{MgO} \quad \text{(Magnesium Oxide plus other trace elements)}
\end{align*}
\]

Apply at the rates specified in the appropriate planting Section.

SLW1.M130.7  QUICK RELEASE FERTILIZER
Quick release fertilizer to be granular NPK chemical fertilizer with a minimum two-week release period conforming with the following formula:

\[
\begin{align*}
&14 - 16 \text{ parts } N \quad \text{(Nitrogen)} \\
&14 - 16 \text{ parts } P \quad \text{(Phosphorus)} \\
&14 - 16 \text{ parts } K \quad \text{(Potassium)}
\end{align*}
\]

Apply at the rates specified in the appropriate planting Section.

SLW1.M140.7  DISCOURAGEMENT OF VERMIN
Do not use peanut cake as a fertilizer, nor any other substance likely to encourage vermin.

SLW1.M150.7  LIMESTONE
1. Composition: ground limestone containing a minimum of 90% calcium and magnesium carbonates and capable of passing through a 10 mm mesh sieve;
2. Certification: prior to use and for every 50 tonnes delivered to Site, take samples of the limestone for analysis at an Approved laboratory and within 14 calendar days, produce the laboratory's Certificate stating:
   a. Calcium and magnesium carbonate content;
   b. The particle size.

CHEMICALS

SLW1.M210.7  TOXICITY
Do not use chemicals which are toxic to humans or animals.

SLW1.M220.7  PESTICIDE
Submit details of the pesticides for the approval of the CM. The pesticides must be registered under the Pesticide Ordinance (Cap. 133) with Agriculture, Fisheries and Conservation Department (AFCD) in Hong Kong, properly packed and clearly labelled bilingually both in English and Chinese and conform to regulations stipulated by the Government of the HKSAR.
MULCHES

SLW1.M310.7 MULCH
Mulch as shown on Drawings, to be:
1. Fibrous mulch to be organic material such as decomposed leaf litter, decomposed sawdust, prepared compost or spent mushroom compost; and/or
2. Wood chip mulch, to comprise:
   a. Particle size: in the range 10 mm to 30 mm;
   b. Thickness: in the range 2 mm to 5 mm.

ANCILLARY MATERIALS

SLW1.M410.7 PLANT LABELS
Plant labels to be 120 mm x 80 mm x 2 mm thick, white acrylic or aluminium with:
1. 2 holes of 5 mm diameter, centred 50 mm apart, 10 mm from the top edge;
2. The Botanic name, English and Chinese Common names of the plant, heat - indented in black characters;
3. The size of the capital letter for Botanic and English Common names to be not less than 10 mm and the lower case to be not less than 7 mm;
4. Chinese characters not less than 13 mm high.

SLW1.M420.7 PROTECTIVE FENCING
Protective fencing as shown on Drawings, to be:
1. Proprietary bamboo fencing, comprising:
   a. 10 to 20 mm diameter bamboo palings fastened together at each joint with galvanized metal staples and washers, which when erected forms a framework with palings at 150 mm centres;
   b. Vertical support stakes and inclined support struts, 600 mm longer than the finished height of the fence, of either:
      i. 50 mm diameter bamboo; or
      ii. 30 x 30 x 3 mm mild steel angle, painted black with one priming coat and one finishing coat.
   c. Open ends of bamboo palings and stakes to be sealed with sealant approved by CM. No stagnant water should be found inside or outside of the stakes.
2. Proprietary plastic lattices to be of UV stabilized HDPE plastic resin with 70 mm grid opening, and 4.4 mm thick, with appropriate supporting system, colour as specified;
3. Finished height: Height of fencing, either 600 mm or 900 mm height as shown on Drawings, ±25 mm.

SLW1.M430.7 PEA GRAVEL
Pea gravel to be clean rounded river washed gravel:
Size: in the range 5 mm to 12 mm.

SLW1.M440.7 GRAVEL
Gravel to be clean broken stone:
Size: in the range 10 mm to 30 mm.
WORKMANSHIP

PROGRAMME

SLW1.W010.7 PLANTING SEASON
Unless specified otherwise for individual species or types of planting, do not plant between the period 1st December to the end of February, without prior Approval.

SLW1.W020.7 PLANTING TREES
Where trees are planted in grass or shrub areas, plant trees before the seeding/grassing or shrub planting operations.

SLW1.W030.7 PLANTING SHRUBS
Where shrubs are planted in grass areas, plant the shrubs before the seeding/grassing operations.

LIFTING PLANTS

SLW1.W110.7 ROOT PRUNING
Carry out root pruning and undercutting of the root system of the rootballed stock twelve months prior to lifting from the nursery.

SLW1.W120.7 WATERING AND LIFTING
Water plants grown in open ground prior to lifting and carefully lift to ensure the specified root ball is obtained.

SLW1.W130.7 PROTECTIVE WRAPPING
Wrap rootballs in moist hessian sacking, or an Approved equivalent protective wrapping.

PROTECTION AND STORAGE PRIOR TO PLANTING

SLW1.W210.7 PROTECTION GENERALLY
1. Adequately wrap and protect all plants to prevent mechanical damage, excessive transpiration and wilting during lifting, transportation and storage;
2. Protect all plants against excessive sunlight, wind and drought;
3. Keep plants moist at all times.

SLW1.W220.7 STORAGE OF PLANTS ON SITE
Maintain plants in good condition and:
1. Store plants, other than trees, on level ground, standing upright;
2. Store trees on level ground at an angle greater than 45° to the horizontal;
3. Where trees and shrubs are delivered to the Site with shoots and branches bundled, remove all tying materials immediately to prevent heating up and subsequent defoliation.

**PREPARATORY WORK**

**CLEARING**

Clear all areas to be planted of rubbish, weeds, deleterious matter, and stones larger than 50 mm in any dimension, and remove all such material from Site.

**PREPARING PLANTS**

1. Cut loose and remove all wrapping materials around roots and containers;
2. Trim any broken roots with seateurs or a sharp knife.

**WATERING**

Thoroughly soak all plants before planting. If rootballs or containers are very dry, immerse the roots in water until air bubbles cease to rise.

**PLANTING**

**GENERAL**

1. Carry out all planting works in accordance with good horticultural practice;
2. Do not leave pits excavated for planting on or adjacent to slopes, open during wet weather.

**TIMING**

Plant all plants in their final position within two days of delivery to Site.

**FINISHED SOIL LEVELS**

1. Ensure that the finished soil level round the plant is the same as that in which the plant was growing in the nursery or container, with the root collar at ground level;
2. When planting in grassed areas finish soil level 50 mm below the surrounding soil level to allow for mulching.

**FINISHING**

Rake planted areas through on completion of planting to leave the soil surface clean and tidy.

**WATERING IN**

Immediately after planting and before mulching, thoroughly water all plants at a rate of 10 litres/m², unless required otherwise by the CM, to settle the soil around the roots.
POST PLANTING WORK

SLW1.W510.7 WEEDING AND MAINTENANCE
Keep all planted areas weed free and maintain all plants in grass areas as SLW9.W320 during the contract period.

SLW1.W520.7 WATERING PLANTS
Continue watering as necessary to maintain a moist soil at all times during the Planting Period, having regard to the following or as directed by the CM:

1. Normally, water all planted areas on every day that the rainfall is less than 5 mm per day except on the day following a day that rainfall exceeded 20 mm per day or when the soil is saturated during the Time for Completion of the Works of the Planting Period;

2. For planted areas under cover, water every day unless the soil remains moist from previous day's watering during the Time for Completion of the Works of the Planting Period.

SLW1.W530.7 ERECTING PROTECTIVE FENCING
Erect fencing in locations shown on the Drawings, securing palings to support stakes with galvanized wire. Drive support stakes into the ground at 2000 mm centres.

DEALING WITH PARASITIC PLANTS

SLW1.W610.7 GENERAL
Report to the CM any case of parasitic plants, as SLW1.M070, being inadvertently brought on to the Site. Take whatever action is specified in the following clauses, relating to the degree of infestation and as Instructed.

SLW1.W620.7 LIGHTLY AFFECTED PLANTS
Remove all parts of the parasitic plant and burn off site.

SLW1.W630.7 BADLY AFFECTED PLANTS
Remove the host plant and burn off site.

SLW1.W640.7 EXTENSIVE INFESTATION
Clear the whole area of all plants and burn off site.

SLW1.W650.7 CULTIVATION AFTER TREATMENT
Cultivate the area by turning the soil over to a depth of 100 mm to prevent germination of the parasitic plant seeds.

USE OF CHEMICALS

SLW1.W710.7 GENERAL
Do not use chemicals without prior Approval.
SLW1.W720.7  STORING, MIXING AND APPLYING CHEMICALS
Store, mix and apply in accordance with the manufacturer's instructions. Dispose of all product containers in a proper manner after use.

TREE REMOVAL

SLW1.W810.7  GENERAL
Fell diseased and dead trees as shown on the Drawings or as instructed.

1. These works shall include those trees and palms transplanted to the Site by the Employer's Direct Contractor, as refer to PRE.B2.010 for relevance.
SLW2 TRESSES

MATERIALS

GENERAL

SLW2.M010.7 GENERAL PLANTING REQUIREMENTS
Read this Worksection in conjunction with the appropriate clauses in Worksection SLW1.

SLW2.M020.7 HOME GROWN TREES
Complying in all respects with the requirements of this Specification at the time of planting.

SLW2.M030.7 IMPORTED TREES
Complying in all respects with the requirements of this Specification at the time of planting.

SLW2.M040.7 FEATHERED TREES
Trees described as feathered in the planting schedule or on the Drawings, must exhibit the characteristics required for the type, size and species of tree as specified, with the head/crown of the tree a defined, straight and upright leader, its stem well furnished with unpruned lateral shoots.

SLW2.M050.7 SPECIES
Tree species to be as shown or scheduled on the Drawings.

TREES CLASSIFIED BY SIZE

SLW2.M110.7 SEEDLING TREES
Seedling trees to exhibit all the following characteristics:
1. Age: between 1 and 2 years;
2. Conformation: a single slender stem;
3. With a well developed vigorous root system;
4. Height above soil level: between 150 mm and 600 mm;
5. Grown in a container not less than 75 mm in diameter and 100 mm deep or a tube not less than 60 mm in diameter and 150 mm long.

SLW2.M120.7 WHIPS
Whips to exhibit all the following characteristics:
1. Age: between 2 and 3 years;
2. Conformation: a single central stem and elementary branch system;
3. With a well developed vigorous root system;
4. Height above soil level: between 600 mm and 1500 mm;
5. Grown in a container not less than 125 mm in diameter and 150 mm deep.

**SLW2.M130.7 LIGHT STANDARD TREES**

Light standard trees to exhibit all the following characteristics:

1. Height from the root collar to the lowest branch: between 1600 mm and 2100 mm;
2. Total height above soil level: between 2400 mm and 3000 mm;
3. Stem diameter measured at a point one metre above the root collar: between 25 mm and 50 mm;
4. Conformation: a sturdy straight stem with a well balanced branching head, or a well defined straight and upright leader with branches growing out from the stem with good symmetry, and a minimum length of 500 mm;
5. Rootball size:
   a. Diameter: not less than 300 mm;
   b. Depth: not less than 300 mm.
6. When container grown trees are required, grow the tree in a container not less than 350 mm diameter and 400 mm deep.

**SLW2.M140.7 STANDARD TREES**

Standard trees to exhibit all the following characteristics:

1. Stem height from the root collar to the lowest branch: between 1700 mm and 2200 mm;
2. Total height above soil level: between 2750 mm and 3500 mm;
3. Stem diameter measured at a point one metre above the root collar: between 50 mm and 75 mm;
4. Conformation: a sturdy straight stem with a well balanced branching head, or a well defined straight and upright leader with branches growing out from the stem with good symmetry, and a minimum length of 600 mm;
5. Rootball dimensions:
   a. Diameter: not less than 450 mm;
   b. Depth: 300 mm.
6. When container grown trees are required, grow the tree in a container not less than 500 mm diameter and 500 mm deep.

**SLW2.M150.7 HEAVY STANDARD TREES**

Heavy standard trees to exhibit all the following characteristics:

1. Stem height from the root collar to the lowest branch: between 1800 mm and 2400 mm;
2. Total height above soil level: between 3500 mm and 5000 mm;
3. Stem diameter measured at a point one metre above the root collar: between 75 mm and 150 mm;
4. Conformation: a sturdy straight stem, with a well balanced branching head, or a well defined straight and upright leader with branches growing out from the stem with good symmetry, and a minimum length of 800 mm;
5. Rootball dimensions:
   a. Diameter: not less than 750 mm;
   b. Depth: 400 mm.
6. When container grown trees are required, grow the tree in a container not less than 750 mm in diameter and 600 mm deep.

**SLW2.M160.7 SEMI-MATURE TREES**

Semi-mature trees to exhibit all the following characteristics:

1. Stem height from soil level to the lowest branch: not less than 2000 mm;
2. Total height above soil level: greater than 6000 mm;
3. Stem diameter measured at a point one metre above the root collar: greater than 150 mm;
4. Conformation: a sturdy, straight stem with a well balanced branching head, or a well defined straight and upright leader with branches growing out from the stem with good symmetry, and a minimum length of 1500 mm;
5. Root ball dimensions:
   a. Diameter: not less than 1200 mm;
   b. Depth: 600 mm.
6. A root system previously undercut a minimum of one year prior to lifting, to encourage compact fibrous growth.

**CONIFERS AND PALMS**

**SLW2.M210.7 CONIFERS**

Conifers to exhibit all the following characteristics:

1. A well developed upright stem and vigorous shoots with good symmetry;
2. A well-developed vigorous root system;
3. Minimum dimensions not less than those shown on the Drawings or plant schedule +300 mm, -0 mm;
4. A rootball appropriate and in proportion to the size of the plant.

**SLW2.M220.7 PALMS**

Palms to exhibit all the following characteristics:

1. A well developed, upright habit and vigorous fronds with good symmetry;
2. A well developed, vigorous root system;
3. Minimum dimensions not less than those shown on the Drawings or plant schedule +300 mm, -0 mm. Palms with multi-stems to be measured with overall height. Palms with single trunk to be measured with "Stem Height". "Stem Height" shall be measured from the root collar to the base of the growing tip;
4. A root ball appropriate and in proportion to the size of the plant.

**TREE SUPPORTS ETC.**

**SLW2.M310.7 METAL STAKES**

1. Material: mild steel angle, size: 30 mm x 30 mm x 3.5 mm thick;
2. Length: as specified in the table to SLW2.W420 ±50 mm;
3. With 5 mm to 10 mm diameter hole drilled 30 mm from the top;
4. Finish: Approved paint, applied prior to installation, with one coat primer and one black top coat;
5. Protective caps: black plastic or neoprene cap, 40 mm deep to fit tightly on top of metal stake.

**SLW2.M320.7** **BAMBOO STAKES**

Open ends of bamboo stakes to be sealed with Approved sealant. No stagnant water should be found inside or outside of the stakes:

1. Bamboo stakes for whips to be 35 mm diameter poles, length as specified in the table to SLW2.W420;
2. Bamboo stakes for light standard, standard trees, palms and conifers (up to 2.5 m overall height) to be 50 mm diameter poles, length as specified in the table to SLW2.W420.

**SLW2.M330.7** **TIES**

Tie as shown on Drawings, to be:

1. Rot-proof rope: 5 mm diameter in dark colour; and/or
2. Plastic coated wire: 3 mm overall diameter in dark colour; and/or
3. Stainless steel braided wire: 3 mm diameter with 20 mm adjustable galvanized steel screw clamp.

**SLW2.M340.7** **GUYS**

Guys as shown on Drawings, to be:

1. Rot-proof rope: 8 mm diameter in dark colour; and/or
2. Plastic coated wire: 4 mm overall diameter in dark colour; and/or
3. Stainless steel braided wire: 4 mm diameter with 20 mm adjustable galvanized steel screw clamp.

**SLW2.M350.7** **GUING TURNBUCKLES**

Turnbuckles and associated fittings to be stainless steel. Turnbuckles to be not less than 100 mm long. The specified length excludes any attached fittings, or adjusting screws.

**SLW2.M360.7** **GUING STAKES**

1. Material: galvanized mild steel angle, size: 30 mm x 30 mm x 3.5 mm thick;
2. With 5 mm to 10 mm diameter hole drilled 30 mm from the top prior to galvanizing.

**SLW2.M370.7** **TRUNK PROTECTION**

Trunk protection as shown on Drawings, to be:

1. Hosing: clear unplasticised polyvinyl chloride (uPVC) plastic hosing, 10 mm diameter; and/or
2. Rubber: 2 mm thick 150 mm wide rubber pad, long enough to wrap twice round the trunk.

**SLW2.M380.7** **EYE BOLTS**

Eye bolts to be stainless steel with:

1. 70 mm overall length;
2. Threaded shank;
3. 15 mm diameter eye.
SLW2.M390.7  ROOT BARRIERS AROUND TREE PITS
Root barriers to be 5 mm thick copper lined root resistant bitumen membrane, or Approved proprietary type:
1. Depth: depth of tree pit below paving level less 100 mm;
2. Diameter: as for tree pit.

LABELS

SLW2.M410.7  LABELS FOR USE
Labels to be as SLW1.M410 for each type of tree.

SLW2.M420.7  LABELS FOR STOCK
Supply additional labels to the housing manager, totalling 30% of those provided above and name on a pro-rata basis.
WORKMANSHIP

GENERAL

SLW2.W010.7 GENERAL PLANTING REQUIREMENTS
Read this Worksection in conjunction with the appropriate clauses in Worksection SLW1.

NOTCH PLANTING

SLW2.W110.7 SEEDLING TREES
1. Form notch, using a hand held pick or spade, deep enough to accommodate the root of the plant;
2. Place the plant upright in the notch and take care to keep the soil and root intact;
3. Firm the plant in the ground with the shoot upright.

SLW2.W120.7 WHIPS
Unless specified otherwise on the Drawings or plant schedule:
1. Form notch, using a hand held pick or spade, deep enough to accommodate the root of the plant;
2. Place the plant upright in the notch and take care to keep the soil and root intact;
3. Firm the plant in the ground with the shoot upright.

PIT PLANTING

SLW2.W210.7 LIGHT STANDARD, STANDARD AND HEAVY STANDARD TREES, CONIFERS AND PALMS
Plant light standard, standard and heavy standard trees, conifers and palms in accordance with the following procedure and sequence:
1. Dig tree pit to size specified in SLW2.W250;
2. Soak rootball;
3. Fork over base of tree pit to a depth of 150 mm;
4. Prepare backfill material, adding and mixing in fertilizer as SLW2.W310, backfill base in layers and firm in to adjust planting depth;
5. Remove rootball covering, place tree, adjust orientation of the crown and check planting depth, adjusting as necessary;
6. Fix vertical stakes as SLW2.W420;
7. Tie tree to stakes;
8. Backfill in layers, firming in each layer with heel and water thoroughly;
9. Adjust tree ties;
10. Water again and continue to water as required.
SLW2.W220.7  SEMI-MATURE TREES
Plant semi-mature trees in accordance with the following procedure and sequence:
1. Dig tree pit to size specified in SLW2.W250;
2. Soak rootball;
3. Fork over base of tree pit to a depth of 150 mm;
4. Prepare backfill material, adding and mixing in fertilizer as SLW2.W310, backfill base in layers and firm in to adjust planting depth;
5. Remove rootball covering, place tree, adjust orientation of the crown and check planting depth, adjusting as necessary;
6. Fix guying stakes as SLW2.W420;
7. Secure trees with guys as SLW2.W420;
8. Backfill in layers, firming in each layer with heel and water thoroughly;
9. Water again and continue to water as required.

SLW2.W230.7  PLANTING IN PAVED AREAS
Where trees are planted in paved areas, carefully lift any tree grilles, lay them aside and:
1. Excavate tree pit, 900 mm deep, to the full area of the tree grille and expose the surface of aggregate layer over existing land drain at the base;
2. Carry out a water percolation test to check the functioning of the subsoil drain by filling the pit fully with water. If water does not drain away immediately or within 1 working day inform the CM;
3. Complete planting operations specified in this Worksection appropriate to the tree being planted and compact backfill to finish 75 mm below adjacent paving level;
4. Place a filter layer, as EXT13.M110, over the entire pit area tucking all edges into the soil;
5. Lay 50 mm of gravel, as SLW1.M440;
6. Transport from store on the estate, if necessary, and carefully replace tree grilles previously set aside, flush with the surrounding kerb or paving;
7. Fill the interstices and around the base of the trunk as shown on Drawings, with pea gravel, as SLW1.M430, or gravel as SLW1.M440.

SLW2.W240.7  BACKFILLING WITH DG
Where excavated soil is DG as Worksection EXT12, mix it with soil conditioner to form fabricated soil as EXT12.M310.

SLW2.W250.7  TREE PIT DIMENSIONS
Plant trees in pits 300 mm larger than the rootball or in accordance with the following table whichever is the greater except where planted in tree grilles (see SLW2.W230).

<table>
<thead>
<tr>
<th>Type of tree</th>
<th>Size of Pit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Light Standard, Standard, Conifers and Palms</td>
<td>750 mm diameter x 600 mm deep</td>
</tr>
<tr>
<td>Heavy Standard</td>
<td>900 mm diameter x 750 mm deep</td>
</tr>
<tr>
<td>Semi-mature</td>
<td>1500 mm diameter x 900 mm deep</td>
</tr>
</tbody>
</table>
SLW2.W260.7  FIXING ROOT BARRIERS
Where indicated on Drawings fix root barrier, as SLW2.M390, in tree pits so that top edge finishes at underside of paving or tree grille level and bottom edge finishes 100 mm above bottom drainage layer of tree pit. Before fixing fully bond 100 mm minimum side laps by torching in accordance with manufacturer's instructions.

SLW2.W310.7  APPLICATION OF FERTILIZER
Apply slow release fertilizer, as SLW1.M110, in accordance with the following table:

<table>
<thead>
<tr>
<th>Type of tree</th>
<th>Amount per tree</th>
<th>Application</th>
</tr>
</thead>
<tbody>
<tr>
<td>Seedling trees</td>
<td>25 gm</td>
<td>Spread around each notch.</td>
</tr>
<tr>
<td>Small Conifers and Palms</td>
<td>50 gm</td>
<td>Mix with the backfilling soil.</td>
</tr>
<tr>
<td>Whips</td>
<td>50 gm</td>
<td>Mix with the backfilling soil or around the notch.</td>
</tr>
<tr>
<td>Light Standard trees</td>
<td>Note 1</td>
<td>Mix with the backfilling soil.</td>
</tr>
<tr>
<td>Standard trees, Medium Conifers and Palms</td>
<td>Note 1</td>
<td>Mix with the backfilling soil.</td>
</tr>
<tr>
<td>Heavy Standard trees, Large Conifers and Palms</td>
<td>Note 1</td>
<td>Mix with the backfilling soil.</td>
</tr>
<tr>
<td>Semi-mature trees</td>
<td>Note 1</td>
<td>Mix with the backfilling soil.</td>
</tr>
</tbody>
</table>

Note 1: Mix 0.5 kg of fertilizer with every m³ of backfilling soil.

SLW2.W410.7  STAKES
Drive vertical stakes firmly into the base of the pit prior to planting the tree; after planting fit protective caps as SLW2.M310 (5) on top of metal stakes.

SLW2.W420.7  SECURING TREES - GENERAL
Secure trees in accordance with the following table, passing ties and guys through trunk protection as SLW2.M370 to prevent trunk and branches being chafed or cut:

<table>
<thead>
<tr>
<th>Type of tree</th>
<th>No. of stakes</th>
<th>Type of support</th>
<th>Method of fixing</th>
</tr>
</thead>
<tbody>
<tr>
<td>Whips</td>
<td>1</td>
<td>Bamboo stake as SLW2.M320</td>
<td>Two-thirds the height of the plant. When driven into the ground one-third of its height</td>
</tr>
<tr>
<td>Light Standard and Standard Trees; Palms and Conifers (up to 2.5 m high)</td>
<td>2</td>
<td>Metal stake as SLW2.M310</td>
<td>1800 mm long, 300 mm from either side of the trunk. Drive into the ground to a depth of 900 mm with the point of the 'V' toward the tree. Stakes angled out at the top by approx. 15°. Ties as SLW2.M330.</td>
</tr>
<tr>
<td></td>
<td>Quantity</td>
<td>Description</td>
<td>Specification</td>

<tr>
<td>---------------------------</td>
<td>----------</td>
<td>-----------------------------------------------------------------------------------------------</td>
<td>---------------</td>
</tr>
<tr>
<td>Bamboo stake as SLW2.M320</td>
<td>3</td>
<td>1500 mm long, securely tied with 'scaffold tie' to form a tripod not exceeding 60% of the overall height of the plant.</td>
<td></td>
</tr>
<tr>
<td>Metal stake as SLW2.M310</td>
<td>3</td>
<td>As for Standard etc. but 2000 m long, 600 mm from either side of the trunk. Drive into the ground to a depth of 1100 mm</td>
<td></td>
</tr>
<tr>
<td>Guys as SLW2.M340; Guying turn buckles as SLW2.M350; Guying stakes as SLW2.M360</td>
<td>3</td>
<td>Drive 900 mm long guying stakes 750 mm into the ground. Fix guys with turnbuckles to tree trunk immediately above the lowest branch and tie to each guying stake</td>
<td></td>
</tr>
</tbody>
</table>

**SLW2.W430.7 SECURING TREES IN PLANTERS WITH CONCRETE BASES**

1. Guy each tree with 4 No. guys, as SLW2.M340, fixed to tree trunk immediately above the lowest branch;
2. Tie each guy through an eye bolt, as SLW2.M380, drilled and plugged into the inner face of the planter walls 100 mm below coping and tighten each end with a galvanized fastener;
3. Tension guys with turnbuckles, as SLW2.M350, inserted 200 mm from the eye bolt;
4. Ensure all guys are of an equal angle to the horizontal, sufficient to hold the tree firm.

**SLW2.W440.7 SECURING HEAVY STANDARD AND SEMI-MATURE TREES IN PAVED AREAS**

Submit detailed proposals for underground guying for Approval.

**LABELLING**

**SLW2.W510.7 FIXING LABELS**

1. Attach one label to each tree of Light Standard size and above at a height of 1500 mm above ground level;
2. Attach one label to each separate species in each plant bed for seedlings and whips;
3. Attach labels with dark coloured plastic coated wire and stainless steel coil spring protected with plastic covering;
4. Do not injure the tree.
SLW3 GROUND COVER, SHRUBS, CLIMBERS AND BAMBOOS

MATERIALS

GENERAL

SLW3.M010.7 GENERAL PLANTING REQUIREMENTS
Read this Worksection in conjunction with the appropriate clauses in Worksection SLW1.

PLANTS

SLW3.M110.7 SPECIES
Plant species are as shown or scheduled on the Drawings.

SLW3.M120.7 GROUND COVER PLANTS
Ground cover plants to exhibit all the following characteristics:
1. Well developed vigorous shoots, no fewer in number than specified on the Drawings or plant schedules;
2. A well-developed vigorous root system;
3. Minimum dimensions not less than those specified on the Drawings or plant schedule +50 mm, -0 mm;
4. Grown in a container not less than 125 mm in diameter and 150 mm deep.

SLW3.M130.7 SMALL SHRUBS
Small shrubs to be seedlings or rooted cuttings exhibiting all the following characteristics:
1. A minimum of three, one year old vigorous shoots with a well balanced shape;
2. A well-developed, vigorous root system;
3. Minimum dimensions not less than those specified on the Drawings or plant schedule +100 mm, -0 mm;
4. Grown in a container not less than 125 mm in diameter and 150 mm deep.

SLW3.M140.7 LARGE SHRUBS
Large shrubs to be transplanted seedlings or rooted cuttings exhibiting all the following characteristics:
1. Pruned to encourage bushiness with a minimum of three vigorous, one year old shoots, well furnished to produce a diameter two thirds that of the height;
2. A well-developed, vigorous root system;
3. Minimum dimensions not less than those specified on the Drawings or plant schedule +200 mm, -0 mm;
4. Grown in a container not less than 200 mm in diameter and 250 mm deep.
SLW3.M150.7 CLIMBERS
Climbers to exhibit all the following characteristics:
1. A minimum of four vigorous shoots not less than 600 mm long, except when specified otherwise on the Drawings or plant schedule;
2. A well developed vigorous root system;
3. Grown in a container not less than 125 mm in diameter and 150 mm deep.

SLW3.M160.7 BAMBOOS
Bamboos to exhibit all the following characteristics:
1. A minimum of four 1200 mm +150 mm, -0 mm high main shoots sprouting from the base unless specified otherwise on the Drawings or plant schedule;
2. A well developed, vigorous root system;
3. Grown in a container not less than 450 mm in diameter and 450 mm deep.

SUPPORTS

SLW3.M210.7 STAKES
Stakes to be bamboo poles:
1. For general use:
   a. Diameter: 15 mm;
   b. Length: height of plant to be supported +50% in the ground.
2. As intermediate fixings where non self-clinging climbers are placed between columns of pergolas:
   a. Diameter: 25 mm;
   b. Length: height of pergola above ground +300 mm.

SLW3.M220.7 TIES
1. Ties to be either:
   a. 3 mm diameter, bitumen impregnated, rot-proof string; or
   b. 2 mm diameter, dark coloured plastic coated wire.
2. Do not use nylon string or plastic strapping.

SLW3.M230.7 CLIMBER WIRES
Climber wires to be 3 mm diameter, braided, stainless steel wire, with a clear plastic coating and galvanized clamps.

SLW3.M240.7 TURNBUCKLES
Turnbuckles and associated fittings to be stainless steel. Turnbuckles to be not less than 80 mm long. The specified length excludes any attached fittings, or adjusting screws.

SLW3.M250.7 TRUNK PROTECTION
Trunk protection to comprise 10 mm diameter clear unplasticized polyvinyl chloride (uPVC) hosing.
SLW3.M260.7  **GUIDING STAKES**
1. Material: galvanized mild steel angle;
2. Size: 25 mm x 25 mm x 5 mm thick and 900 mm long;
3. With 5 mm to 10 mm diameter hole drilled 30 mm from top prior to galvanizing.

SLW3.M270.7  **HORSESHOE NAILS**
Horseshoe nails to be 25 mm long, galvanized, mild steel nails, horseshoe shaped and pointed at both ends, suitable for hammering into timber.

SLW3.M280.7  **EYE BOLTS**
Eye bolts to be stainless steel with:
1. 70 mm overall length;
2. Threaded shank;
3. 15 mm diameter eye.

**LABELS**

SLW3.M310.7  **LABELS FOR USE**
Provide plant labels as SLW1.M410, one label per species per plant or one label per 50 m² of planting as Instructed.

SLW3.M320.7  **LABELS FOR STOCK**
Supply additional labels to the housing manager, totalling 30% of those provided above and name on a pro-rata basis.
WORKMANSHIP

PLANTING GENERALLY

SLW3.W010.7 SEQUENCE AND GENERAL PROCEDURE
1. Prepare plants in the nursery and plant beds just prior to planting in accordance with Worksection SLW1;
2. Soak rootball;
3. Set out the plant spacing;
4. Excavate the planting hole to the dimensions given at SLW3.W020;
5. With the exception of climbing plants and other plants tied to climber wires or columns, as SLW3.W110 to SLW3.W130, drive in a single support stake so as to leave two thirds of its height above finished ground level;
6. Remove the plant from its container and place it in the hole, spreading the roots as necessary and checking and adjusting the planting depth if required;
7. Tie the plant to its support stake, if one has been provided;
8. Backfill the hole and firm in the plant;
9. Thoroughly water in the plant and mulch to the depths specified at SLW3.W310;
10. Continue watering as SLW1.W520.

SLW3.W020.7 PLANTING HOLE SIZES
Excavate hole to the same depth as the rootball and:
1. For ground cover, small shrubs and climbers, to a diameter 100 mm greater than that of the rootball;
2. For large shrubs and bamboos, to a diameter 150 mm greater than that of the rootball.

SLW3.W030.7 CLIMBERS
Plant as SLW3.W010, at a distance of 150 mm from the structure which is to lend support.

SLW3.W040.7 BARE ROOTED PLANTS
Plant generally as SLW3.W010 but spread out the roots evenly and, as backfilling proceeds, lightly shake the plant to ensure that the soil penetrates between the roots.

SLW3.W050.7 PLANTING IN GRASS AREAS (EXISTING OR NEW)
Plant as SLW3.W010 to SLW3.W040 except:
1. Fork over base of hole in existing grass areas; and
2. Finish top of mulch level with soil level of surrounding grass.
SUPPORTING PLANTS OTHER THAN CLIMBERS

SLW3.W105.7 NON-CLIMBER SUPPORTS
Support plants whose natural habit is to be upright and cannot initially stand upright or which may be blown down by strong winds with a single bamboo stake as SLW3.M210 (1). Drive support into the ground so as to leave two thirds of its height above finished ground level and loosely attach the plant to the stake with ties as SLW3.M220.

SUPPORTING NON-SELF-CLINGING CLIMBERS

SLW3.W110.7 FIXING TO WALLS
For each support:
1. Fix the top of each of 3 no. of the climbing wires, 150 mm apart with a galvanized screw clamp to an eye bolt, plugged and screwed securely into the wall at a height of 3000 mm above the soil level, unless otherwise instructed;
2. Secure the bottom of each wire via a turnbuckle:
   a. To either an eyebolt plugged and screwed securely into the wall at a height of 200 mm above soil level;
   b. To the hole at the top of a guying stake driven firmly 450 mm into the ground at a distance of 300 mm from the wall;
3. Use 20 mm screw clamps for all fixings;
4. Tension wires by adjusting the turnbuckle;
5. After planting the climber, remove all nursery restraining ties and carefully turn the plant around the wire supports with the leading shoots trained upwards;
6. Loosely attach the climber to the supports with ties, as SLW3.M220.

SLW3.W120.7 FIXING TO PERGOLA COLUMNS
Where columns are in or immediately adjacent the plant bed, loosely attach the climber to the column with ties as SLW3.M220.

SLW3.W130.7 FIXING TO WIRE SUPPORTS ON PERGOLAS
For each support:
1. Securely fix the top of each of 3 no. of the climbing wires to the top of the timber slats, using horseshoe nails;
2. Secure the bottom of each wire via a turnbuckle:
   a. To either an eyebolt screwed into the support column of the pergola 200 mm above soil level; or
   b. To the hole at the top of a guying stake driven firmly 450 mm into the ground, in an adjoining planter, as close to the pergola as possible;
3. After planting the climber, remove all nursery restraining ties and carefully turn the plant around the wire supports with the leading shoots trained upwards;
4. Loosely attach the climber to the supports with ties, as SLW3.M220.

SLW3.W140.7 FIXING TO BAMBOO STAKES
1. Drive bamboo stakes, as SLW3.M210 (2), 300 mm into the ground and tie against the top of the pergola;
2. After planting the climber, remove any nursery retaining ties and carefully turn the plant around the bamboo stake with the leading shoots trained upwards;
3. Loosely attach the climber to the wire supports with ties as SLW3.M220.

FERTILIZING

SLW3.W210.7 RATES OF APPLICATION
Thoroughly mix fertilizer, as SLW1.M110, into the backfilling soil, at the following rates:
1. 50 g per plant for shrubs, climbers, bamboos and ground cover plants.

MULCHING

SLW3.W310.7 MULCHING DEPTHS
Apply mulch immediately after watering in, to the following depths:
1. 25 mm on all planting areas, except grassed area.

LABELLING

SLW3.W410.7 FIXING LABELS
1. Use one label, as SLW1.M410, per species per plant bed, or one label per 50 m² of species planting as Instructed;
2. Attach each label with 1 mm diameter, dark coloured, plastic coated wire 50 mm from the top of a 25 mm diameter bamboo pole, of the following lengths applicable to plant type:

<table>
<thead>
<tr>
<th>Plant Type</th>
<th>Length of Pole</th>
<th>Height above Soil Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ground cover</td>
<td>300 mm</td>
<td>150 mm</td>
</tr>
<tr>
<td>Small shrub</td>
<td>500 mm</td>
<td>300 mm</td>
</tr>
<tr>
<td>Large shrub</td>
<td>800 mm</td>
<td>500 mm</td>
</tr>
<tr>
<td>Bamboo</td>
<td>800 mm</td>
<td>500 mm</td>
</tr>
</tbody>
</table>
3. Attach labels direct to climbers.
**HERBACEOUS PLANTS**

**MATERIALS**

**PLANTS AND SEEDS**

**SLW4.M010.7 SPECIES**

Species are as shown or scheduled on the Drawings.

**SLW4.M020.7 DEFINITIONS**

1. Bulbs: modified shoot consisting of a small fleshy disk-like stem bearing a spherical mass of fleshy leaves above the developing adventitious root system;
2. Corms: solid swollen part of the stem at or near ground level that produces a bud at its apex;
3. Tuber: swollen underground branch, roundish in shape with buds or 'eyes' from which new plants are produced.

**SLW4.M030.7 BULBS**

Bulbs to be firm with good vigorous root system and free from rot.

**SLW4.M040.7 CORMS**

Corms to be firm with strong healthy bud, vigorous root system and free from rot.

**SLW4.M050.7 TUBERS**

Tubers to be firm with six 'eyes' minimum, strong root system and free from rot.

**SLW4.M060.7 HERBACEOUS PLANTS**

Herbaceous plants to exhibit all the following characteristics:
1. Number of shoots as specified on the Drawings or plant schedule;
2. Strong vigorous growth;
3. Strong vigorous root system;
4. Not pot bound;
5. Grown in pots, minimum size 150 mm diameter x 100 mm deep;
6. Size(s): as shown on Drawings or plant schedule +150 mm -0 mm.

**STAKE TIES**

**SLW4.M110.7 TIES**

Ties to be bitumen impregnated jute string:
1. Type: as Approved;
2. Colour: dark colour.
WORKMANSHIP

GENERAL

SLW4.W010.7 GENERAL PLANTING REQUIREMENTS
Read this Worksection in conjunction with the appropriate clauses in Worksection SLW1.

SLW4.W020.7 PLANTING PROGRAMME
Sow or plant herbaceous plants during the appropriate season for the species specified whether during the Planting or Establishment Periods as applicable.

SLW4.W030.7 PLANTING IN SHRUB BEDS
Plant herbaceous plants after shrubs ensuring shrubs are not disturbed or damaged during herbaceous planting operations.

SLW4.W040.7 PLANTING IN GRASSED AREAS
Plant herbaceous plants either:
1. Before grassed area is sown; or
2. After a suitable sward has been established.

SOWING SEEDS

SLW4.W110.7 BROADCAST SOWING
Broadcast seeds evenly at the rate of 30 gm/m² over the areas shown on the Drawings.

PLANTING

SLW4.W210.7 BULBS, CORMS AND TUBERS
1. Randomly scatter bulbs, corms or tubers by hand over previously prepared soil in locations shown on the Drawings;
2. Dig holes where bulbs, corms or tubers have landed between 50 mm and 100 mm deep, depending on species being planted, and 100 mm in diameter;
3. Place bulb, corm or tuber the right way up on the bottom of the hole and backfill with previously excavated soil.

SLW4.W220.7 HERBACEOUS PLANTS
1. Plant herbaceous plants in holes in previously prepared soil;
2. Dig holes to depth of rootball, or root system if bare-rooted and to a diameter 100 mm greater than rootball diameter or root spread;
3. Secure to stakes, as SLW3.M210, where necessary with tie;
4. Place plants on the bottom of the hole and spread roots where bare without damage and backfill with previously excavated soil.
SLW5 AQUATIC PLANTS

MATERIALS

AQUATIC PLANTS

SLW5.M010.7 PLANTS
Plant species as shown or scheduled on the Drawings and exhibiting all the following characteristics:
1. Grown in pots but not pot bound;
2. Strong vigorous growth;
3. Be capable of maintaining strong vigorous growth for twelve months before requiring repotting or potting on;
4. Tolerance on size(s) shown on Drawings: +150 mm, -0 mm.

PLANTING MATERIALS

SLW5.M100.7 PLANTING MEDIUM
Planting medium comprises DG, as EXT12.M120, with a high plastic clay content thoroughly mixed with:
1. 20% by volume of animal manure compost as, EXT12.M240; and
2. 50% bone-meal to 50% dried blood mix fertilizer added at a rate of 250 g/m³ of planting medium.

SLW5.M120.7 GRASS SODS
Grass sods to be 20 mm thick x 200 mm square with a well developed fibrous root system.

SLW5.M130.7 HESSIAN
Natural woven jute, brown in colour and of a type used in the manufacture of sacks.

CONTAINERS AND SUPPORTS

SLW5.M200.7 UNGLAZED FIRECLAY CONTAINERS
1. Sound and free from cracks, chips etc.;
2. Of matching colour, preferably natural;
3. With adequate drainage holes in base;
4. With a depth to diameter ratio appropriate for plant species to be contained and as follows, in all situations pot depth to be greater than diameter.

<table>
<thead>
<tr>
<th>Species</th>
<th>Pot dimensions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cyperus alternifolius</td>
<td>300 mm dia. x 350 mm minimum depth</td>
</tr>
<tr>

<td>450 mm dia. x 500 mm minimum depth</td>
</tr>
</tbody>
</table>
Nymphaea Spp. | 450 mm dia. x 500 mm minimum depth
---|---
Other species as shown on drawing | As shown on drawing

**SLW5.M220.7 PLASTICS MESH CONTAINERS**
1. Open mesh, bread and laundry basket pattern;
2. Colour: dark colour;
3. Shape: rectangular, circular or oval;
4. Minimum size: suitable for the species and plant size being contained but not less than:
   a. 450 mm diameter x 300 mm deep for circular containers;
   b. 500 mm x 400 mm x 300 mm deep for rectangular and oval containers.

**SLW5.M230.7 WIRE MESH CAGES**
Wire mesh cages to be made from galvanized mild steel expanded metal, not more than 2 mm thick with 10 mm x 10 mm or 5 mm x 20 mm slot pattern.

**SLW5.M240.7 CONTAINER SUPPORTS**
Container supports to be either:
1. Upturned fireclay pots of same diameter as containers being supported; or
2. Precast concrete blocks of same size as containers being supported.

**ANCILLARY MATERIALS**

**SLW5.M310.7 BALLAST**
Ballast to be clean rounded stone, evenly graded in the size range 30 - 75 mm diameter.

**SLW5.M320.7 TIES**
Ties to be bitumen impregnated jute string:
1. Type: as Approved;
2. Colour: dark colour.
WORKMANSHIP

GENERAL

SLW5.W010.7 GENERAL PLANTING REQUIREMENTS
Read this Worksection in conjunction with the appropriate clauses in Worksection SLW1.

SLW5.W020.7 PLANTING PROGRAMME
Plant no more than two days prior to pool being filled with water.

SLW5.W030.7 SOAKING PLANTS
Keep plants thoroughly soaked at all time prior to being submerged or placed in the pool.

PLANTING, SUPPORT AND PROTECTION

SLW5.W110.7 PLANT BOX FILLING
Fill in-situ plant boxes with planting medium as SLW5.M110, to a depth of 50 mm below lip of box.

SLW5.W120.7 PLANTING IN PLANT BOXES
Plant into in-situ plant boxes while the pool is empty. Remove plants from their pots and plant as follows:
1. In holes previously prepared in planting medium to a depth of the rootball. Diameter to be 100 mm greater than rootball diameter;
2. Place plants the right way up on the bottom of the hole and spread roots, where bare, without damaging and backfill with previously excavated soil;
3. Secure to stake, as SLW3.M210, where necessary with tie.

SLW5.W130.7 PLANTING IN FIRECLAY CONTAINERS
1. Place a broken rock or flat stone over drainage hole in base of container;
2. Place a layer of planting medium, as SLW5.M110, over base;
3. Position plant centrally in container and backfill with planting medium, as SLW5.M110 firmed down around plant;
4. Fill to a depth 50 mm below container lip;
5. Secure to a stake, as SLW3.M210, where necessary with a tie, as SLW5.M320.

SLW5.W140.7 PLANTING IN PLASTICS MESH CONTAINERS
1. Line container with a double layer of hessian, as SLW5.M130, folding the top level with basket lip and overlapping by 75 mm;
2. Place grass sods, as SLW5.M120, tightly around the base and sides of baskets with grass facing inwards;
3. Place a layer of planting medium over base of container;
4. Position plant centrally in container and backfill with planting medium firmed down around plant;
5. Fill to a depth 50 mm below basket lip after settlement;
6. Secure to a stake, as SLW3.M210, where necessary with a tie, as SLW5.M320.

**SLW5.W150.7 PLACING CONTAINERS**

Place containers on supports, as SLW5.M240, at a level to ensure tops of containers are at the depths below water level as follows:

<table>
<thead>
<tr>
<th>Species</th>
<th>Depth below water level (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cyperus alternifolius</td>
<td>at water level</td>
</tr>
<tr>
<td>Nelumbo nucifera</td>
<td>50 - 100 mm</td>
</tr>
<tr>
<td>Nymphaea Spp.</td>
<td>300 - 500 mm</td>
</tr>
<tr>
<td>Other species as shown on drawing</td>
<td>As shown on drawing</td>
</tr>
</tbody>
</table>

**SLW5.W160.7 BALLAST COVER**

After planting and before filling the pool with water, cover all planting medium with a 50 mm deep layer of ballast as SLW5.M310. Take care not to damage plants.

**SLW5.W170.7 WIRE MESH CAGES**

After placing containers in final positions and filling the pool with water surround each group of containers or large individual containers with a wire mesh cage, as SLW5.M230, that:

1. Is constructed to form a circle or oval shape as appropriate with ends lapped by 50 mm and securely fastened together with galvanized wire;
2. Protrudes a minimum of 50 mm above water level and is bent through 90° at the base to form a 100 mm plinth;
3. Is a distance from the plant to permit development and floating leaves to fully expand as follows:

<table>
<thead>
<tr>
<th>Species</th>
<th>Distance from Container Edge to Edge of Cage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cyperus alternifolius</td>
<td>300 mm</td>
</tr>
<tr>
<td>Nelumbo nucifera</td>
<td>300 mm</td>
</tr>
<tr>
<td>Nymphaea Spp.</td>
<td>1000 mm - 1500 mm</td>
</tr>
<tr>
<td>Other species as shown on drawing</td>
<td>As shown on drawing</td>
</tr>

</table>
SLW6 INDOOR PLANTS

MATERIALS

GENERAL

SLW6.M010.7 GENERAL PLANTING REQUIREMENTS
Read this Worksection in conjunction with the appropriate clauses in Worksection SLW1.

PLANTS

SLW6.M110.7 GENERAL
Plants must exhibit the following characteristics:
1. Not pot bound;
2. Capable of at least 12 months healthy, vigorous growth before requiring repotting or potting on.

SLW6.M120.7 ARTIFICIAL PLANTS
Obtain artificial plants from an Approved supplier subject to individual Approval and exhibiting the following characteristics:
1. Man-made, densely leafed with flowers and foliage of colour-fast silk or polyester appearing in colour, texture, form and habit like a real version of the species stated on the Drawings or plant schedule;
2. With real, preserved trunks and stems, free from insects and fungus;
3. Multi-stemmed when appropriate to the species stated on the Drawings or plant schedule;
4. With all leaves, flowers, stems, trunks and branches securely fixed;
5. Set in appropriately sized pots, entirely filled with dark brown coloured concrete, or an Approved equivalent without leaving a protruding lip.

POTS

SLW6.M210.7 PLAIN EARTHENWARE
Plain earthenware pots to be unglazed fireclay:
1. Sound and free from cracks, chips etc.;
2. Of matching colour;
3. With adequate drainage holes in the base;
4. With a depth to diameter ratio, appropriate to the plant it is intended to contain, but in any case greater than 1.

SLW6.M220.7 DRAGON POTS
Dragon pots used for individual feature plants to be:
1. True to type and of matching design;
2. Sound and free from cracks, chips etc.;
3. Colour: brown;
4. With adequate drainage holes in the base;
5. Size: 500 mm high x 510 mm diameter.

**PLANTING MATERIALS**

SLW6.M310.7 **POTTING COMPOST**
An Approved proprietary potting compost suitable for the species concerned and:
1. Holding sufficient reserves of nutrients to maintain the plant in satisfactory condition for a reasonable period of time after planting;
2. Comprising by weight:
   2 parts sterilized loam;
   1 part soil conditioner, as EXT12.M210;
   1 part sand, as EXT12.M230.

SLW6.M320.7 **POT DRAINAGE LAYER**
Any of the following:
1. Clean pea gravel, as SLW1.M430;
2. Broken fireclay;
3. An Approved equivalent.

SLW6.M330.7 **PLANT BOX DRAINAGE LAYER**
Aggregate, as EXT13.M010.

SLW6.M340.7 **FILTER LAYER**
As EXT13.M110.

**ANCILLARY MATERIALS**

SLW6.M410.7 **LEAF POLISH**
An Approved type.

SLW6.M420.7 **WIRE NETTING**
Galvanized steel with a mesh size of 25 mm.

SLW6.M430.7 **WOOD CHIP MULCH**
As SLW1.M310.

SLW6.M440.7 **SURFACE COVER**
To artificial plant beds:
1. Type: wood chip mulch as SLW1.M310;
2. Thickness: 100 mm ±5 mm.
WORKMANKSHIP

POTTING

SLW6.W010.7 GENERAL
Cultivate indoor plants in potting compost appropriate to the species concerned.

SLW6.W020.7 DRAINAGE LAYER
Lay a drainage layer, as SLW6.M320, in each pot to the following depths.

<table>
<thead>
<tr>
<th>Diameter of Pot (mm)</th>
<th>Depth of Drainage Layer (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>75 - 150</td>
<td>15</td>
</tr>
<tr>
<td>175 - 300</td>
<td>25</td>
</tr>
<tr>
<td>Over 300</td>
<td>35</td>
</tr>
</tbody>
</table>

SLW6.W030.7 PLANTING
Fill pot to level of the base of the rootball with compost, place the plant and fill the remainder of the pot with compost to within 15 mm of the rim, firming as necessary.

PLANTING IN PLANT BOXES

SLW6.W110.7 DRAINAGE LAYER
Lay aggregate, as SLW6.M330 to a depth of 100 mm in each plant box and cover with filter layer.

SLW6.W120.7 SOILING
Fill planting boxes with fabricated soil, as EXT12.M310, to a level 75 mm below the top of the box.

SLW6.W130.7 PLANTING
As shown on Drawing, place all plants in the planters in their pots, keeping the rim of each pot level with the soil surface in the plant box, and/or remove plants from pots and place in holes of appropriate size excavated in the plant box filling, ensuring that the soil level adjacent to the plant remains unchanged.

SLW6.W140.7 FERTILIZING
Apply fertilizer, as SLW1.M110, at the following rates (±5%):

<table>
<thead>
<tr>
<th>Type of Plant</th>
<th>Rate of Application</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ground Cover and Herbaceous Plants</td>
<td>15 g per plant</td>
</tr>
<tr>
<td>Shrubs, Climbers and Bamboos</td>
<td>20 g per plant</td>
</tr>
<tr>
<td>Conifers and Whips</td>
<td>20 g per tree</td>
</tr>
<tr>
<td>Light Standard Trees</td>
<td>80 g per tree</td>
</tr>
<tr>
<td>Standard Trees and Palms</td>
<td>100 g per tree</td>
</tr>
</tbody>
</table>
**SLW6.W150.7**  
**POLISHING FOLIAGE**  
Immediately prior to placing in position, thoroughly clean and polish all leaves.

**SLW6.W160.7**  
**MULCHING**  
Apply wood chip mulch, as SLW1.M310, to a depth of 50 mm ±5 mm.

**ARTIFICIAL PLANTS**

**SLW6.W210.7**  
**PLANT BEDS**  
1. Place plant pots securely in beds and fill to a level 125 mm below the top with aggregate, as EXT13.M010;  
2. Where the depth of the plant bed is greater than that of the plant pot, adjust the height by placing the pot on appropriately sized, upturned empty pots before placing the aggregate.

**SLW6.W220.7**  
**SECURING PLANTS**  
1. Cover the surface of the aggregate with wire mesh and tuck down the sides of the planter to secure the mesh in place;  
2. Place artificial plants through cross-cuts in the mesh and retie the mesh securely around the stem to prevent theft.

**SLW6.W230.7**  
**SURFACE COVER**  
Cover the surface of plant beds with cover, as SLW6.M440.
SLW7 GRASSING

MATERIALS

SPRIGS

SLW7.M010.7 SPRIGS
Stoloniferous grass with blades at least 150 mm long and a vigorous root system at least 100 mm long.

SLW7.M020.7 SPRIG SPECIES
One or a mixture of the following species unless otherwise specified:

<table>
<thead>
<tr>
<th>Botanic Name</th>
<th>English Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axonopus compressus</td>
<td>Carpet grass</td>
</tr>
<tr>
<td>Cynodon dactylon</td>
<td>Bermuda grass</td>
</tr>
<tr>
<td>Paspalum conjugatum</td>
<td>Hilo grass</td>
</tr>
<tr>
<td>Other species as shown on Drawing</td>
<td>-</td>
</tr>
</tbody>
</table>

TURVES AND FIXINGS

SLW7.M110.7 TURVES
1. Grass of even density, capable of healthy growth and free from weeds, impurities, pests, fungi and disease;
2. With a sufficiently fibrous root system to hold together when handled;
3. 300 x 300 x 25 mm thick.

SLW7.M120.7 SPECIES MIX
Any of the following grass species:

<table>
<thead>
<tr>
<th>Botanic Name</th>
<th>Chinese Name</th>
<th>English Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axonopus compressus</td>
<td>地毯草 (大葉草)</td>
<td>Carpet grass</td>
</tr>
<tr>
<td>Cynodon dactylon</td>
<td>百慕達草</td>
<td>Bermuda grass</td>
</tr>
<tr>
<td>Paspalum vaginatum</td>
<td>海雀稗</td>
<td>Bahia grasses</td>
</tr>
<tr>
<td>Eremochloa ophiuroides</td>
<td>假儉草</td>
<td>Centipede grass</td>
</tr>
<tr>
<td>Zoysia japonica</td>
<td>朝鮮草</td>
<td>Korean lawn grass</td>
</tr>
</tbody>
</table>

SLW7.M130.7 TURF PINS
8 Standard Wire Gauge (SWG) galvanized wire bent to hairpin shape not less than 200 mm long.
**SECURING PEGS**

5 mm diameter, stainless steel rod, 450 mm long, with top bent over to form a 50 mm diameter loop.

**GRASS SEED**

**GRASS SEED MIX**

Consisting of the following species and proportions:

<table>
<thead>
<tr>
<th>Botanic Name</th>
<th>English Name</th>
<th>% by weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axonopus compressus</td>
<td>Carpet grass</td>
<td>20</td>
</tr>
<tr>
<td>Cynodon dactylon</td>
<td>Bermuda grass</td>
<td>20</td>
</tr>
<tr>
<td>Paspalum notatum</td>
<td>Bahia grass</td>
<td>50</td>
</tr>
<tr>
<td>Zoysia japonica</td>
<td>Korean lawngrass</td>
<td>10</td>
</tr>
</tbody>
</table>

**GERMINATION**

Germination capacity of each constituent of the grass seed mix to be at least 80%.

**PURITY**

Purity of each constituent of the grass seed mix to be greater than 90%. Total pernicious weed seed content to be less than 0.5% and total content of other crop seeds to be less than 1.0%.

**CERTIFICATION**

Submit a certificate of testing for each species of grass seed, not less than 14 days before sowing, stating:

1. Grass species, both Botanic and Chinese names;
2. Date of tests (not more than 6 months prior to sowing);
3. Percentage germination;
4. Percentage purity.

**GRASS SEED MIX FOR USE IN GRASS PAVING SYSTEM**

In the locations as shown on Drawings, the grass seed mix for use in grass paving system shall comprise of the following species and proportions at a rate of 1 Kg/m³, incorporated with soil mix and other constituents as EXT12.M330:

<table>
<thead>
<tr>
<th>Mix 1</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Botanic Name</td>
<td>English Name</td>
<td>% by weight</td>
</tr>
<tr>
<td>Axonopus compressus</td>
<td>Carpet grass</td>
<td>33</td>
</tr>
<tr>
<td>Cynodon dactylon</td>
<td>Bermuda grass</td>
<td>33</td>
</tr>
<tr>
<td>Festuca arundinacea</td>
<td>Hybrid tall fescue</td>
<td>34</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Mix 2</th>

</table>
WORKMANSHIP

GENERAL

SLW7.W010.7 PROGRAMME
Where trees or shrubs are planted in grass areas, carry out all tree or shrub planting prior to any grassing operations.

PREPARATION

SLW7.W110.7 CULTIVATION
1. Prior to cultivation, remove all pernicious and perennial weeds, by hand, including the complete root system;
2. Cultivate areas less steep than 1:2 to a depth of 125 mm and bring to a 25 mm deep fine tilth by hand raking or Approved mechanical means;
3. If necessary, carry out regrading of the surface to conform to the prescribed finished levels and create free flowing contours free from humps and water collecting hollows;
4. Final level: 25 mm above any adjacent hard surfaces.

SLW7.W120.7 CULTIVATION ON EMBANKMENTS
On embankments with slopes of 1:2 or steeper, do not cultivate the existing soil, so that the slope remains stable and erosion is prevented.

SLW7.W130.7 STONE PICKING
Remove all stones larger than 30 mm in any dimension, except on embankments of a gradient of 1:2 or greater.

SLW7.W140.7 FINISHED LEVELS
Finish levels to those indicated on the Drawings, creating free flowing contours, free from water collecting hollows and level with (+25 mm, -0 mm) adjoining hard surfaces.

SPRIGGING

SLW7.W210.7 PROGRAMME
Plant sprigs in their final positions within 36 hours of lifting.

SLW7.W220.7 CULTIVATION
Cultivate all areas, as SLW7.W110 and SLW7.W120, as appropriate. Scarify embankments, with a gradient of 1:2 or greater, to a depth of 5 mm with a hand rake to break up the surface.

SLW7.W230.7 APPLYING PRE-SPRIGGING FERTILIZER
Four to seven days prior to sprigging apply quick release fertilizer, as SLW1.M130, evenly at a rate of 40 g/m² and lightly rake into the soil.
SLW7.W240.7  WATERING
Thoroughly moisten the previously prepared soil immediately prior to sprigging using a fine spray hose attachment to avoid soil erosion and run off.

SLW7.W250.7  SPRIGGING
Lay sprigs at 100 mm staggered centres, apply top-dressing, as SLW7.M330, and firm the ground by trampling or flat roller and water in immediately.

SLW7.W260.7  APPLYING POST-SPRIGGING FERTILIZER
30 days after sprigging, apply slow release fertilizer, as SLW1.M110, evenly at a rate of 20 g/m² (±5%).

SLW7.W270.7  SPRIGGING TAKE
Where grass areas do not show a 90% take 28 days after sprigging immediately recultivate the area and re-sprig, whether this date is in the Planting Period or Establishment Period.

TURFING

SLW7.W310.7  PROGRAMME
Lay turves in their final positions within 48 hours of lifting.

SLW7.W320.7  CULTIVATION
Cultivate all areas for turfing as SLW7.W110 and SLW7.W120 as appropriate. Scarify embankments, with a gradient of 1:2 or greater, to a depth of 5 mm with a hand rake to break up the surface.

SLW7.W330.7  APPLYING PRE-TURFING FERTILIZER
Four to seven days prior to turfing, apply quick-release fertilizer, as SLW1.M130 evenly at a rate of 40 g/m² (±5%) and lightly rake into the soil.

SLW7.W340.7  WATERING
Thoroughly moisten the previously prepared soil immediately prior to turfing using a fine spray hose attachment to avoid erosion and run off.

SLW7.W350.7  DELIVERY AND STACKING
Carefully unload turves and:
1. Store on cleared ground;
2. Stack not more than 1000 mm high unless palletted;
3. Do not allow turves to dry out.

SLW7.W360.7  PLANKED SUPPORTS
Transport turves from stacks to laying areas along planks laid closely side by side. Provide sufficient planks and always use to support workmen and barrows, and for access and laying.

SLW7.W370.7  LAYING
Lay turves:
1. Working off planks;
2. In consecutive rows in stretcher bond to correct levels starting at near side of the area so that work proceeds over turf already laid;

3. With closely butted joints and firm by lightly and evenly beating with approved wooden beaters, the bottom of the beaters being frequently scraped clean of accumulated soil or mud.

SLW7.W380.7 SLOPES EXCEEDING 1:2
1. Provide sufficient planks and ladders to ensure safe and efficient working;
2. Lay turves to the areas shown on the Drawings in consecutive rows either diagonally or horizontally, in stretcher bond with closely butted joints;
3. Firm as previously specified and secure each turf with one turf peg or turf pin, as appropriate, to provide a firm fixing, properly driven home, just below the surface.

SLW7.W390.7 UNEVENNESS OF FINISHED LEVEL
Adjust any unevenness in the finished level of turf as the work proceeds by lifting, raking out or infilling with fine soil and replacing and refirming the turf.

SLW7.W400.7 ROLLERS
Do not use rollers during or immediately after laying.

SLW7.W410.7 PERIMETERS
Use whole turves only and trim to clean, straight lines or regular curves as shown on Drawings.

SLW7.W420.7 TURF JOINTS
After laying, fill any gaps with top dressing, as SLW7.M330, well brush in to fill all joints and water in carefully with a fine rose.

SLW7.W430.7 SHRINKAGE
Should shrinkage occur, fill the open joints with fine fabricated soil, as EXT12.M310, or compost, as EXT12.M240, brush in and well water.

SLW7.W440.7 APPLYING POST-TURFING FERTILIZER
30 days after turfing apply slow release fertilizer, as SLW1.M110, evenly at a rate of 20 g/m² (±5%).

SLW7.W450.7 TURFING TAKE
Where bare patches still occur 21 days after laying, remove the whole turf, recultivate the soil and returf the patch.

SLW7.W460.7 LAYING TURF IN GRASS PAVING SYSTEM
In the locations as shown on Drawings, lay turf to grass paving system as follows:
1. Apply soil filling mix as EXT12.M330 to the openings of the grass paving system and water lightly prior to laying turf;
2. Prepare turf for use by cutting to an appropriate size and shape to fit the openings in the grass paving system in use;
3. Lay the cut turf in each of the openings of the grass paving system with closely butted joints and firm the turf by lightly and evenly beating with approved wooden beaters. The bottom of the beaters being frequently scraped clean of accumulated soil or mud;

4. After laying, fill any gaps with top dressing, as SLW7.M330, and brush in well to fill all joints and water carefully using a fine spray hose attachment;

5. Should shrinkage occur, fill the open joints with fine fabricated soil, as EXT12.M310, or compost, as EXT12.M240, brush in and water well using a fine spray hose attachment;

6. 60 days after turfing, apply slow release fertilizer, as SLW1.M110, evenly at a rate of 20 g/m² (±5%);

7. Where bare patches within the turfed portions of the grass paving system still occur 21 days after laying, remove the whole turf, re-cultivate the soil and re-turf the patch.

SEEDING

SLW7.W510.7 STORING SEED
Store seed on boards off the ground, in a clean dry place, free from vermin.

SLW7.W520.7 APPLYING PRE-SEEDING FERTILIZER
Four to seven days prior to broadcast sowing apply quick release fertilizer, as SLW1.M130, evenly at a rate of 40 g/m² (±5%) and lightly rake into the soil.

SLW7.W530.7 BROADCAST SOWING
1. Evenly broadcast grass seed mix, SLW7.M210, over areas shown on the Drawings by sowing at half the rate specified below in two equal sowings at right angles to each other, either by hand or by an Approved mechanical drill;
2. Rate of sowing: 30 g/m².

SLW7.W540.7 RAKING, HARROWING AND ROLLING
1. Lightly rake or harrow in the seed;
2. Roll and cross-roll with a lightweight roller.

SLW7.W550.7 APPLYING PRE-EMERGENT WEED-KILLER
Apply pre-emergent weed-killer evenly to newly seeded areas in accordance with the manufacturer's recommendations.

SLW7.W560.7 TURF EDGING TO SEEDED AREAS
Edge seeded areas with turf 300 mm wide where shown on the Drawings. Adjust soil level to receive turf and marry-in surface of seed bed to surface of turf.

SLW7.W570.7 EDGE TRIMMING TO SEEDED AREAS
Trim edges of seeded areas which have not been edged with turf when sufficiently established to clean, straight lines or regular curves as shown on Drawings.

SLW7.W580.7 APPLYING POST-SEEDING FERTILIZER
Ten days after broadcast sowing, apply slow release fertilizer, as SLW1.M110, evenly at a rate of 20 g/m² (±5%).
GERMINATION OF BROADCAST SOWN SEED
Where grass areas do not show 90% cover over any 10 m² area, 28 days after sowing immediately re-cultivate and re-sow the area, whether this date occurs in the Planting Period or the Establishment Period.

APPLICATION OF GRASS SEED AND SOIL FILLING MIXTURE IN GRASS PAVING SYSTEM
In the locations as shown on Drawings, apply grass seed and soil filling mixture to grass paving system as follows:
1. Thoroughly mix grass seed as SLW7.M270 and soil filling as EXT12.M330 to form grass seed and soil filling mixture;
2. Apply grass seed and soil filling mixture to the openings of the grass paving system;
3. Lightly compact, and finish flush with the adjoining surfaces;
4. Water immediately and continue to water as SLW1.W520 using a fine spray hose attachment to avoid erosion and run off;
5. Apply pre-emergent weed-killer evenly to newly seeded areas in accordance with the manufacturer's recommendation;
6. 60 days after applying the grass seed and soil filling mixture, apply slow release fertilizer, as SLW1.M110, evenly at a rate of 20 g/m² (±5%);
7. Germination rate: Where grass seeded areas within the grass paving system do not show 90% grass cover over any 10 m² area, 28 days after sowing, immediately re-cultivate and re-sow the area, regardless of whether this date occurs within the Planting Period or the Establishment Period;
8. Cutting: Make the first cut when the grass sward is 75 mm high and reduce the sward to 35 mm high. Make subsequent cuts as soon as the grass sward is 60 mm high and reduce the sward to 35 mm high;
9. After germination and throughout the Planting Period and Establishment Period, ensure that the soil surface within the seeded areas of the grass paving system remain flush with the surrounding surfaces by the addition of top dressing, as SLW7.M330, and seed mixture as SLW7.M270. Water in carefully using a fine spray hose attachment.

POST PLANTING OPERATIONS

WATERING
Water immediately after laying and continue to water as SLW1.W520 using a fine spray hose attachment to avoid erosion and run off.

ROLLING
When Instructed roll the area with a 250 kg flat roller immediately prior to the first grass cut.

CUTTING
1. Make the first cut when the grass sward is 75 mm high and reduce the sward to 25 mm high;
2. Make subsequent cuts as soon as the grass sward is 50 mm high and reduce the sward to 25 mm high;
3. Trim edges after cutting.
SLW8 TREE SURGERY WORKS

MATERIALS

GENERAL

SLW8.M010.7 SCOPE OF WORK

The scope of the Works comprises the removal of dead, dying and diseased branches and stumps, cleaning out cavities, raising and thinning the crown, for transplanting purposes as Worksection EXT11 and generally improving the shape of existing trees, as scheduled and shown on the Drawings or as Instructed.

1. These works shall include those trees and palms transplanted to the Site by the Employer's Direct Contractor, as refer to PRE.B2.010 for relevance.
WORKMANSHIP

TREE SURGERY

SLW8.W010.7 STANDARD
Carry out works in accordance with BS 3998:1989 "Recommendations for Tree Work".

SLW8.W020.7 PRUNING TECHNIQUES
1. Cut back dead branches to living tissue/growing point;
2. Where removal of a whole lateral branch is required, do not cut flush to the main trunk or leaving a stub. Apply under cut technique to prevent tearing the bark and cut limbs in two operations. Cut initially from the underside close to the trunk or parent limb, without cutting into the branch bark ridge or collar. Make the second cut from above at a point 25 mm further away from the trunk;
3. Cut all limbs sloping away from the main trunk at an angle of approximately 60° from the horizontal on a line above the branch bark ridge and the branch collar without leaving a stub, in accordance with BS 3998:1989; figure 1;
4. Long and heavy branches should be cut in sequence of section by section. Carefully lower all cut branches to the ground to prevent any damage to limbs being retained;
5. Keep the crown in a well-balanced form and natural shape after pruning. Do not remove more than one quarter of the original crown coverage in each pruning operation.

SLW8.W030.7 CUTTING BACK BARK
Cleanly cut back loose, dead or damaged bark to firm healthy bark, and trim to leave rounded edges.

SLW8.W040.7 TIMING OF PRUNING
Carry out pruning of evergreen trees just before spring. For deciduous trees, pruning after shedding leaves in winter when trees are dormant is preferred. Avoid pruning prior to flowering seasons of the trees.

SLW8.W050.7 CAVITY TREATMENT
Cut out rotten wood from cavities, without exposing clean healthy wood.

SLW8.W060.7 ADDITIONAL DAMAGE
Repair any additional damage to existing trees, caused by tree surgery operations or any other cause during the Contract Period, as Instructed.

SLW8.W070.7 TOOLS AND EQUIPMENT
Use the tools and equipment recommended by and in accordance with BS 3998:1989, Paragraph 9.1.
SLW9  ESTABLISHMENT WORKS

WORKMANSHIP

DEFINITIONS

SLW9.W010.7  ESTABLISHMENT WORKS
Establishment Works (EW) is the works as defined in the Preliminaries Worksection to be carried out during the Establishment Period (EP) to establish the soft landscaping.

1. These works shall include those trees and palms transplanted to the Site by the Employer's Direct Contractor, as refer to PRE.B2.010 for relevance.

SLW9.W020.7  ESTABLISHMENT PERIOD
Establishment Period (EP) is the 24 month period, commencing the day after the certified date for Completion of Section A - Planting Works, during which the EW are to be carried out.

GENERAL

SLW9.W110.7  VANDALISM DAMAGE TO PLANTING
The Authority will accept responsibility for replacing dead or damaged stock resulting from vandalism only when the Contractor

1. Proves that such death or damage was caused by circumstances outside his control; and
2. Submits written claims to the CM within three working days of the event happening.

SLW9.W120.7  TYPHOON DAMAGE
1. Within 48 hours of Typhoon Signal No. 8 or above being lowered:
   a. Make a photographic record and detailed report of all plant damage;
   b. Replant all plants blown over and firm up all other plants.
2. Within five days of Typhoon Signal No. 8 or above being lowered:
   a. Remove dead plants and clear the Site of all debris;
   b. Provide the above photographic record and report to the CM.
3. The Authority will accept responsibility for plants recorded as dead or dying after, and as a result of, the typhoon only when:
   a. The CM is notified within one month of the end of the typhoon; and
   b. Replanting works are carried out satisfactorily as specified and thorough watering is carried out each day.
REPLACEMENT PLANTING

Replace any plant during the EP which is, in the opinion of the CM, dead, dying, ailing or no longer conforming to this Specification within two weeks of identification. Carry out replacement planting in accordance with this Specification. Bear all costs of replacement unless due to extreme weather conditions, vandalism, or typhoons as SLW9.W110 and SLW9.W120.

1. Those trees and palms transplanted to the Site by the Employer's Direct contractor are excepted, as refer to PRE.B2.010 for relevance.

PLANT DIVISION

Where the CM considers ground cover and herbaceous planting to be overcrowded, divide and transplant as Instructed and in accordance with the following:

1. Dig up at an appropriate season;
2. Divide by teasing the roots apart by hand or using two forks back to back taking care to maintain an adequate root system with each divided part;
3. Replant one part in the original location and carry the other parts to another part of the estate as Instructed;
4. Replant in agreed positions, fertilize and water, all in accordance with this Specification.

THINNING

Where Instructed reduce the number of plants due to overcrowding as

1. Dig up plants, transport and replant in locations as directed; or
2. Dig up plants, transport and replant in locations within a 20 km round trip of the original location as directed; or
3. Remove from site;
4. Fertilize and water all in accordance with this Specification.

PARASITIC PLANTS

Parasitic plants, as defined as SLW1.M070, which become evident during the first four months of the EP are deemed to have been brought in on plants or soil delivered to the Site. Treat these parasitic plants as SLW1.W610 to SLW1.W650.

RECORDS

1. Ensure that the Approved Foreman reports to the Estate's Housing Manager's office before and after carrying out each day's establishment work and makes a signed record each day:
   a. Stating the work carried out;
   b. Indicating the percentage completed for each day's operation on the standard form (DLAP-F005) provided for the purpose.
2. Obtain countersignatures from the CM's site staff and keep the records available for inspection in the Estate Housing Manager's office.

WATER SUPPLY

See clauses PRE.B10.1210 and PRE.B10.1220.
## SCHEDULES OF ESTABLISHMENT WORKS OPERATIONS

### SLW9.W210.7 GENERAL

In the event of the scheduled operations requiring amendment due to the site and weather conditions prevailing during the EP, seek Approval, at least four weeks before the operation on site, with full justification to exceed the numbers specified.

### SLW9.W220.7 FIRST TWELVE MONTHS OF ESTABLISHMENT PERIOD

During the first twelve months of EP, carry out the operations as scheduled below as applicable to the Soft Landscaping Works in accordance with this Specification and shown or scheduled on the Drawings:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Anticipated No.</th>
<th>Timing</th>
</tr>
</thead>
<tbody>
<tr>
<td>Watering (in open air) (under cover)</td>
<td>300</td>
<td>As specified.</td>
</tr>
<tr>
<td></td>
<td>350</td>
<td>As specified.</td>
</tr>
<tr>
<td>Weeding</td>
<td>12</td>
<td>As specified.</td>
</tr>
<tr>
<td>Fertilizing</td>
<td>1</td>
<td>Early Summer, or otherwise Instructed.</td>
</tr>
<tr>
<td>Soil aeration</td>
<td>1</td>
<td>Immediately after fertilizer application.</td>
</tr>
<tr>
<td>Mulch application</td>
<td>1</td>
<td>Immediately after aeration operation.</td>
</tr>
<tr>
<td>Firming up</td>
<td>Min. 3</td>
<td>Immediately after strong wind and/or every four months.</td>
</tr>
<tr>
<td>Checking and adjusting tree ties</td>
<td>6</td>
<td>Check every two months; adjust/replace as necessary.</td>
</tr>
<tr>
<td>Tying climbers to supports and climber wires</td>
<td>As required</td>
<td>Check monthly, tie as necessary.</td>
</tr>
<tr>
<td>Climber wires</td>
<td>6</td>
<td>Check every two months; adjust/replace as necessary.</td>
</tr>
<tr>
<td>Pruning</td>
<td>Varies according to species</td>

<tr>
<td></td>
<td>Tradescantia fluminensis</td>
<td>Prune hard back to 100 mm.</td>
</tr>
<tr>
<td></td>
<td>Zebrina pendula</td>
<td>Prune hard back to 100 mm.</td>
</tr>
<tr>
<td></td>
<td>Aquatic:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>All</td>
<td>Remove dead leaves and stems.</td>
</tr>
<tr>
<td>End of February</td>
<td>Large Shrubs:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Acalypha spp. (except A.hispida)</td>
<td>Prune hard back to 300 mm to remove previous year’s growth.</td>
</tr>
<tr>
<td></td>
<td>Barleria cristata</td>
<td>Prune hard back to 300 mm.</td>
</tr>
<tr>
<td></td>
<td>Lagerstroemia spp.</td>
<td>Prune to 900 mm.</td>
</tr>
<tr>
<td></td>
<td>Manihot spp.</td>
<td>Prune back to 300 mm.</td>
</tr>
</tbody>
</table>
### Specification Library 2014 Edition

#### SLW9 > WORKMANSHIP

**Mussaenda spp.**  Prune to 600 mm.

**Tecoma stans**  
- As mass planting: prune 900 mm.
- As feature plant: no pruning.

**Thunbergia erecta**  Light pruning to remove dense overcrowded crossing branches. Shorten branches by one half. Prune as necessary to encourage even, natural free form habit.

**Small Shrubs:**

- **Allamanda nerifolia**  Prune hard back to 300 mm.
- **Jasminum sambac**  Prune hard back to 300 mm.
- **Jasminum mesnyi**  Thin out stems.
- **Nandina spp.**  Remove dead leaves.

**Ground Cover:**

- **Catharanthus roseus**  Prune hard back to 300 mm.

#### ESTABLISHMENT OPERATIONS

**SLW9.W300.7 MAKING GOOD ERODED SEEDED AREAS**

Make good any erosion of seeded, or hydroseeded, areas by broadcast sowing as SLW7.W530 or hydroseeding as EXT14.W310 as appropriate and carry out post application operations as specified.

**SLW9.W310.7 WATERING**

Water all planted areas so as to maintain a moist soil through the depth of the fabricated soil profile adequate to ensure satisfactory establishment and as a minimum:

1. For plants exposed to natural rainfall:
   a. Water during the first 12 months of EP, on every day that the rainfall is less than 5 mm per day except on the day following a day that rainfall exceeded 20 mm per day or when the fabricated soil profile is saturated;
   b. Water during the second 12 months of EP on every day that the rainfall is less than 2 mm per day except on the day following a day that rainfall exceeded 15 mm per day or when the fabricated soil profile is moist.

2. For plants NOT exposed to natural rainfall:
   Water every two to three days irrespective of the weather conditions during the whole EP.

Carry out watering either early mornings or late afternoon or both.

**SLW9.W320.7 WEEDING**

Keep all planted areas weed-free and:

1. During the first twelve months of EP, undertake a weeding operation at least once every three weeks during the wet season, and at least once every two months during the dry season;
2. During the second twelve months of EP, undertake a weeding operation at least once every month during the wet season, and at least once every two months during the dry season;
3. Replace any mulch or soil disturbed or removed during this process;
4. Maintain a circle of bare soil, 200 mm diameter greater than that of the tree trunk or plant stem, around all plant bases in grassed areas;
5. Collect all arisings resulting from these operations and remove from the Site to a properly designated tip.

**SLW9.W330.7 FERTILIZING**

1. During the first twelve months of the EP, carry out one applications of fertilizer during early summer, as SLW1.M110, at the following rates (±5%):
a. 200 gm per semi-mature tree;
b. 150 gm per heavy standard tree, large palm and large conifer;
c. 100 gm per standard tree, light standard tree, medium size palm and medium size conifer;
d. 50 gm per seedling tree, whip, small palm (up to 2000 mm high), small conifer;
e. 30 gm for shrub, climbing plant and bamboo;
f. 5 gm per ground cover and herbaceous plant;
g. 25 gm/m² for grass area.

2. During the second twelve months of the EP, carry out two applications of fertilizer, one during early spring as SLW1.M110, and one during later summer as SLW1.M120, at the following rates (±5%):
   a. 200 gm per semi-mature tree;
   b. 150 gm per heavy standard tree, large palm and large conifer;
   c. 100 gm per standard and light standard tree, medium size palm and medium size conifer;
   d. 50 gm per seedling tree, whip, small palm, small conifer;
   e. 10 gm for shrub, climbing plant and bamboo;
   f. 5 gm per ground cover and herbaceous plant;
   g. 25 gm/m² for grass areas.

3. For the purpose of this clause the following definitions apply:

<table>
<thead>
<tr>
<th>Conifer height (mm)</th>
<th>Palm height (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Large: Above 3000</td>
<td>Above 4000</td>
</tr>
<tr>
<td>Medium: Above 1200 but not above 3000</td>
<td>Above 2000 but not above 4000</td>
</tr>
<tr>
<td>Small: Not above 1200</td>
<td>Not above 2000</td>
</tr>
</tbody>
</table>

4. These works shall include those trees and palms transplanted to the Site by the Employer's Direct Contractor, as refer to PRE.B2.010 where relevant.

SLW9.W340.7 TOP DRESSING TO GRASSED AREAS

Immediately after fertilizing, top dress all grass areas with top dressing, as specified at SLW7.M330, to smooth out minor depressions.

SLW9.W350.7 AERATION

1. Shrub areas, including bamboos, climbers and herbaceous plants: immediately after fertilizing, cultivate the soil by hand using a fork to a depth of 100 mm;
2. Ground cover areas: immediately after fertilizing lightly break up the soil by hand using a fork to a depth of 75 mm;
3. Grass areas: immediately before fertilizing aerate the soil by inserting a tine or fork to a depth of 100 mm at 200 mm centres.

SLW9.W360.7 MULCHING

Immediately after aeration, top up all shrub and ground cover areas, by adding mulch to match existing to the following minimum depths:
1. Shrubs, bamboo, climber and herbaceous plants: 25 mm;
2. Ground cover plants: restore to the original depth;
3. Plants in grassed areas: 25 mm in mulched circle.

**SLW9.W370.7 AERATION AND MULCHING**

Do not undertake aeration or mulching to ground cover areas once ground cover plants have successfully established and there are not visible bare areas of soil.

**SLW9.W380.7 TOPPING UP GRAVEL MULCH TO TREE GRILLES**

At three monthly intervals top-up gravel to match existing to fill the interstices of the tree grilles.

**SLW9.W390.7 FIRMING UP**

Firm up plants and tree stakes from time to time during the EP and particularly after heavy rain or wind.

**SLW9.W400.7 TREE SUPPORTS**

1. Tighten, slacken or replace tree ties, as SLW2.M330, as necessary for the healthy growth of the tree, and adjust or replace the trunk protection, as SLW2.M370 as necessary to prevent chafing of the bark;

2. Adjust guying turnbuckles as necessary to ensure guys are taut.

**SLW9.W410.7 GRASS CUTTING**

Cut grass by hand or machine, as SLW7.W630 (2) and EXT14.W350, or otherwise instructed. These works shall include those existing grassed / hydroseeded area on Site:

1. During the main growing period (April to October): at least once per month;

2. During the dry season (November to March): at least twice at equal intervals;

3. Rake up and remove all cuttings from site to a properly designated tip within 24 hours after cut.

**SLW9.W420.7 PRUNING PROGRAMME**

Carry out pruning:

1. At the appropriate time of year for each species as scheduled in SLW9.W240;

2. Once each year of the EP, except when otherwise specified.

**SLW9.W430.7 PRUNING PROCEDURES**

Carry out pruning using sharp tools to give a clean cut, free from ragged edges and:

1. Ensure cuts are immediately above buds or branches and slope away from an outward facing bud;

2. Prune back branches, to the main stem to encourage bushy growth and improve flowering;

3. Remove dead, damaged or crossing branches and dead flower heads;

4. Retain the individual habit and shape of the plant, unless otherwise directed or the intention of the design is to form a clipped hedge;

5. Prune flowering shrubs by removing the shoots bearing the dead flower heads and/or the new growth dependant on species.
SLW9.W440.7  TREATMENT OF PESTS AND FUNGAL GROWTH
1. Regularly check all plant and grass areas for signs of insect attack or fungal infestation, whether or not the insects or fungi are injurious to the plants or only cause a nuisance. Pay particularly attention during known periods of activity;
2. Report immediately to the CM any signs of insect attack or fungal infestation, and carry on to identify, monitor, and assess the insect attack or fungal infestation and propose remedial measures according to prevailing guidelines on pest control laid down by AFCD and Guidelines on Occupational Safety and Health for Pest Control Operators laid down by Food and Environmental Hygiene Department (FEHD);
3. Post warning notices (e.g. poison, no-entry, name of pesticide, date and time of application, re-entry time etc.) at conspicuous locations to avoid the public from entering the area under treatment before and after spraying of pesticide. Inform Estate Management to notify residents on the application and on spray drift risks;
4. Effect remedial measures by applying pesticides approved by the CM in strict accordance with the manufacturer's recommendations and labelling instructions, and carry out associated arboriculture works to the infected and/or infested areas in the manner as stated in PRE.B8.1260 sub-clauses (5)(a) and (5)(c) to (g);
5. Take due care and have regard to the safety and convenience of the general public and carefully control the spraying of the chemical pesticide to avoid unnecessary dispersion;
6. Plant parts pruned from diseased plants shall not be stockpiled anywhere on the Site and shall be disposed of from the Site.

SLW9.W445.7  CLEARANCE OF EXISTING VEGETATED AREAS
Keep existing vegetated areas clear as EXT11.W110.

SLW9.W450.7  CARE OF INDOOR PLANTS
Clean the leaves of all indoor plants at least once a month, and fertilize as SLW9.W330.

SLW9.W460.7  CARE OF ARTIFICIAL PLANTS
Maintain artificial plants as follows:
1. Clean each leaf and keep tidy once per month;
2. Replace leaves when they are loose or missing.

SLW9.W470.7  MAINTENANCE OF PROTECTIVE FENCING
Regularly check protective fencing and immediately carry out all necessary repairs to ensure that fencing is maintained in good condition at all times.

SLW9.W480.7  REMOVAL OF PROTECTIVE FENCING
Remove temporary protective fencing during or at the end of the EP as Instructed.

SLW9.W490.7  REMOVAL OF STAKES
Remove stakes when the plant root system is sufficiently developed to support the plant at the end of the EP unless otherwise instructed.

SLW9.W500.7  REMOVAL OF HESSIAN BINDING TO TRANSPLANTED TREES
Remove hessian binding from trunk and large branches of transplanted trees as soon as satisfactory growth has occurred as Instructed.
SLW9.W510.7 FINAL INSPECTION

1. In the presence of the CM carry out an inspection and formal check of the Works at the end of the EP;

2. Carry out the last of the operations scheduled immediately prior to the final handover inspection;

3. On satisfactory completion of any outstanding defective and replacement work, a completion Certificate will be issued in accordance with Clause 53 of the "said Conditions".

ELE1.1 APPLICATION OF SPECIFICATION

ELE1.1.010.7 PRELIMINARIES
This Specification and this Worksection ELE1 in particular should be read in conjunction with Preliminaries for Building Services Sub-contracts.

ELE1.1.020.7 APPLICATION TO SYSTEMS
1. This Worksection ELE1 of this Specification is applicable to the whole of the Sub-contract Works while the other Worksections are applicable to the Systems described in the respective Worksection;

2. Worksection ELE2, which specifies general system requirements should be read in conjunction with subsequent Worksections of this Specification which are reference Worksections and define details of installations.
ELE1.2  THE WORKS

ELE1.2.010.7  SITE OF THE WORKS
The site of the Works is given in the Project Specific Specification.

ELE1.2.020.7  SCOPE OF THE WORKS
The scope of the works is given in the Project Specific Specification.
ELE1.3 CONTRACT DOCUMENTATION

ELE1.3.010.7 DRAWINGS AND DOCUMENTS
1. A Schedule of the Sub-contract Drawings is included in Appendix 'P';
2. The tenderer's attention is also drawn to the latest revision of the Standard Lighting Fitting Schedule issued by the Housing Department;
3. The Schedule is available for inspection at the Building Services Section, Housing Department during normal office hours upon application to the Contract Manager;
4. The Sub-contract Drawings and the Schedule shall hereinafter be referred to as the Drawings.

ELE1.3.020.7 TECHNICAL INFORMATION SUPPLIED WITH TENDER AND SUB-CONTRACTOR'S RESPONSIBILITY
1. All technical information supplied with the tender, including the tenderer's proposed design and the materials offered, is for tender assessment only;
2. Acceptance of the tender will not relieve the Sub-contractor of his responsibility for the proper working of the installation to meet the specified requirements in compliance with the Sub-contract documents to the entire satisfaction of the Contract Manager;
3. In the event of the installation being, in the opinion of the Contract Manager, not in compliance with the specified requirements, the Sub-contractor shall modify his design, replace any unsatisfactory materials and do everything necessary for compliance with the specified requirements at his own cost.

ELE1.3.030.7 DEFINITIONS AND ABBREVIATIONS
In this Specification the word "shall" is mandatory, the word "will" is informative, the word "should" is advisory and the word "provide" means supply and fix, or supply and install. In addition the following words shall have meanings herein assigned:
1. "Authority"
   means Hong Kong Housing Authority.
2. "Indicated"
   means indicated elsewhere in the Specification or on the Drawings.
3. "or Equal" or "or Similar"
   means having similar characteristics and Specification, as regards type of construction, performance, general appearance and standard of quality of manufacture.
4. "Drawing"
   means the drawings referred to in the Specification and any modification of such drawings Approved by the Contract Manager and such other drawings as may be, from time to time, furnished or Approved.
5. "Standard Drawings"
   means the drawings prepared by the Authority to show detailed arrangements of the common standard installations.
6. "EMSD"
   means the Electrical and Mechanical Services Department.
7. "WSD"
means the Water Supplies Department.

8. "FSD"
   means the Fire Services Department.

9. "IET"
   means the Institution of Engineering and Technology UK.

10. "CSA"
    means the conductor cross-sectional area.

11. "BSI"
    means the British Standards Institution.

12. "BS"
    means British Standards, including British Standard Specifications and British Standard Codes of Practice published by the British Standards Institution.

13. "EN"
    means European Standard.

14. "ISO"
    means International Organization for Standardization Publications.

15. "IEC"
    means International Electrotechnical Commission Publications.

16. "BS EN"
    means European Standard adopted by the British Standards Institution to replace any relevant British Standard.

17. "ASTM"

18. "ANSI"
    means American National Standards Institution.

19. "PASS"
    means Performance Assessment Scoring System.

20. "BSPASS"
    means Building Services Performance Assessment Scoring System.

---

**ELE1.3.040.7**

**SINGULAR AND PLURAL**

Words importing the singular only also include the plural vice versa where the context requires.
COMPLIANCE WITH REGULATIONS AND STANDARDS

STATUTORY REGULATIONS

The Sub-contractor shall comply with the latest edition of all relevant Ordinances and Regulations together with any amendments made thereto, Laws of Hong Kong and shall be responsible for giving notifications to the appropriate authorities and paying all fees in accordance with the Sub-contract.

The following are particularly relevant:

1. Electricity Ordinance Chapter 406, and other subsidiary legislation made under the Ordinance;
2. Regulations of the Telecommunication Authority, Government of Hong Kong;
3. Buildings Energy Efficiency Ordinance (Cap. 610);
4. Energy Efficiency (Labelling of Products) Ordinance Chapter 598;
5. Fire Safety (Commercial Premises) Ordinance and Fire Safety (Buildings) Ordinance;
6. Dangerous Goods Ordinance and Dangerous Goods (General) Regulations;
7. Occupational Safety and Health Ordinance, Chapter 509, and other subsidiary legislation made under the Ordinance;
8. Factories and Industrial Undertakings Ordinance, Chapter 59, and other subsidiary legislation made under the Ordinance;
9. Construction Site (Safety) Regulations;
10. Construction Site Safety Manual issued by the Development Bureau, the Government of the HKSAR;
11. All regulations on safety issued by the Labour Department from time to time;
12. Other relevant Ordinances and Regulations, Laws of Hong Kong;
13. Code of Practice for the Electricity (Wiring) Regulations (hereinafter referred to as the Electrical CoP);
14. Guidance Notes for the Electrical Products (Safety) Regulation (hereinafter referred to as the Electrical Product Guidance Notes), which applies to all electrical products designed for household use and supplied in Hong Kong;
15. Codes of Practice for minimum Fire Service Installations and Equipment and Inspection, Testing and Maintenance of Installations and Equipment, and Circular Letters issued by the Fire Services Department (hereafter referred to as Fire Services COP).

STANDARDS

All materials and workmanship shall comply, where applicable, with all relevant sections, together with any revisions or amendments made thereto, of the following:

1. The Supply Rules issued by the respective Supply Company currently in operation in Hong Kong (hereinafter referred to as the Supply Rules);
2. 17th Edition of the Regulations for Electrical Installations, issued by the IET (hereinafter referred to as the 17th Edition IEE Wiring Regulations). The 17th Edition IEE Regulations was jointly published by the BSI and the IET as BS 7671 (hereinafter referred to as BS 7671) and is the general standard now referred to in this Specification. Reference is also made to Guidance Notes published by the IET for use in conjunction with BS 7671;
3. Appropriate British Standards/International or National Standards/Code of Practice subject to clause ELE1.4.040. When a British Standard quoted in this Specification has been wholly or partially superseded by another equivalent or similar British Standard, the Sub-contractor is allowed to offer material in compliance with the latter in lieu for Contract Manager's Approval; 

4. Relevant parts of the HKHA Specification Library for Building Works (hereinafter referred to as the HKHA Building Works Specification) which may be viewed during normal office hours in the Authority's offices upon application to the Contract Manager; 

5. General Technical Specifications for Monochrome and Colour Closed Circuit Television Systems (Specification No. ESG 14 March 2009 Edition) issued by the Electronic & Data Communication Division, Electrical and Mechanical Services Department, Hong Kong; 

6. General Specification for Public Address System (Specification No. ESG11 issued 4 December 2008 and Amendment 3 December 2008) issued by the Projects Division, Electrical and Mechanical Service Department, Hong Kong (hereinafter referred to as the General PA Specification); 

7. Other International or National Standard Specifications as detailed in ELE1.4.050 (hereinafter referred to as Equivalent Standards). 

ELE1.4.030.7 PRECEDENCE 

In case of conflict between the requirements among the publications referred to in ELE1.4.010 and ELE1.4.020, interpretation shall be in accordance with the following order of preference unless otherwise specified or directed by the Contract Manager: 

1. Ordinances and subsidiary legislations, Regulations, Laws of Hong Kong; 

2. The Project Specific Specification and / or the contract documents for a particular project; 

3. The Specification and/or the Drawings; 

4. The Electrical CoP; 

5. Electrical Product Guidance Notes; 

6. Supply Rules; 

7. BS 7671 when specified; 

8. British Standard Specifications and Codes of Practice; 

9. Equivalent standard; 

ELE1.4.040.7 APPLICATION OF BRITISH STANDARDS/INTERNATIONAL OR NATIONAL STANDARDS / CODE OF PRACTICE 

1. The date/year of British Standards (BS)/International or National Standards / Codes of Practice (CP) shall be referred to Appendix 1 of the Specification. Where it is not specified in the Specification, it shall be deemed to refer to any valid or latest version, and any applicable amendments to that version; 

2. Where the date/year is specified, due to intended purposes, the specified version and any amendments to that version shall be compiled with unless otherwise approved by Contract Manager; 

3. "Head standards" (HS) are not dated because they do not contain any technical content. However reference to a head standard invokes all relevant extant “parts” of that standard which are themselves dated. Reference to head standards is a practicable method of using a general BS reference in situations where detailed reference to each part would be cumbersome.
ELE1.4.050.7 OTHER INTERNATIONAL OR NATIONAL STANDARD SPECIFICATIONS

Materials or equipment manufactured to other International or National Standard Specifications (Equivalent Standard) may be considered for acceptance provided that:

1. The Equivalent Standard shall be no less stringent than the corresponding BS; and

2. The materials or equipment shall be compatible, in all respects, with and comply with the corresponding BS; and

3. The following documents shall be produced when required:
   a. An English translation of the Equivalent Standard, certified true by the Equivalent Standard issuing or organization or an acceptable authority;
   b. A comparison table highlighting the differences between the Equivalent Standard and the corresponding BS.

ELE1.4.060.7 TESTING AND CERTIFICATION

1. Unless otherwise specified, equipment shall be type-tested in accordance with the testing requirements as stipulated in the appropriate recognised standard as stipulated in the Electrical CoP;

2. Test certificates for each type test complete with reports and drawings, where applicable, shall be produced when required, to prove to the satisfaction of the Contract Manager of the compliance with the recognised standard. If the original documents are not produced in English, an English translation of the documents, certified true by the issuing organisation or an acceptable authority, shall be produced when required;

3. For the purpose of product testing and certification, the following interpretation shall apply:
   a. "Independent" shall mean not owned, managed or operated, either in whole or in part, by the manufacturer or its agents;
   b. "Accredited Laboratory" shall mean a laboratory accredited to carry out the specified tests by:
      i. IECEE (IEC System for Conformity Testing to Standards for Safety of Electrical Equipment) CB Scheme; or
      ii. Hong Kong Accreditation Service (HKAS) or Hong Kong Laboratory Accreditation Scheme (HOKLAS); or
      iii. Other equivalent national laboratory accreditation schemes which have mutual recognition agreements with HKAS/HOKLAS as stipulated in the Electrical CoP.
   c. "Short Circuit Testing Organisation" shall mean:
      i. The Association of Short Circuit Testing Authorities (ASTA); or
      ii. NV tot Keuring van Elektrotechnische Materialen (KEMA); or
      iii. Association des Stations d'Essais Francaises d'Appareillage (ASEFA); or
      iv. An Accredited Laboratory; or
      v. Other short-circuit testing authorities internationally recognized as having equal standing as ASTA.
   d. "Equivalent Quality Surveillance Scheme" shall mean equivalent quality surveillance schemes internationally recognized as having equal standing as the specified scheme(s).
ELE1.4.085.7  CODE OF PRACTICE FOR ENERGY EFFICIENCY OF BUILDING SERVICES INSTALLATION

1. All materials and workmanship, where specified, shall comply with the latest edition of Code of Practice for Energy Efficiency of Building Services Installation (The Building Energy Code);

2. The Sub-contractor shall provide all necessary information and document to the Contract Manager for Registered Energy Assessor's preparation of all relevant submission as required under the Buildings Energy Efficiency Ordinance (Cap. 610);

3. Attend and provide necessary equipment for random check and site check upon requested by Contract Manager.
ELE1.5 CONDITIONS OF SUPPLY

ELE1.5.010.7 ELECTRICITY SUPPLY

Unless otherwise specified, the complete electrical installation shall be suitable for operation under the supply system with a nominal frequency of 50 Hz and nominal voltage of 380V, 3-phase and 220V, single phase within the variation limits as declared by the local Supply Companies.

ELE1.5.020.7 SERVICE CONDITIONS

The complete electrical installation shall be suitable for use under Hong Kong climatic conditions with relative humidity and ambient temperature as shown below:

1. Relative Humidity: up to 0.99 saturation;
2. Ambient Temperature: peak from minus 5°C to plus 40°C for 4 hours continuously with an average from 0°C to plus 35°C over only 24 hours period.
ELE1.6 MATERIALS AND EQUIPMENT

ELE1.6.010.7 METRIC UNITS
Materials shall be of metric unit.

ELE1.6.020.7 SUBMISSIONS FOR APPROVAL
1. The Sub-contractor shall submit catalogues, technical information, certificate of safety compliance and samples of the materials proposed for Approval as required by the Contract Manager. The Sub-contractor shall also read in conjunction with the associated requirements stipulated at Preliminaries for Building Services Sub-contracts;
2. The Sub-contractor shall ensure the availability of the certificate of safety compliance for all proposed household products, prior to the submission for approval;
3. Approval of equipment will not be considered until and unless proper rating/type of sample complete with detailed information/technical data such as equipment catalogue, manufacturer's specification and certificates, when required are submitted for examination.

ELE1.6.030.7 SELECTION OF EQUIPMENT
1. Selection of equipment shall be based on this Specification and technical data contained on the Drawings for a particular installation;
2. Where items of equipment are interconnected to form an integral part of the complete electrical installation, their characteristics of performance and capacities shall be so matched as to give efficient, economical, safe and reliable operation of the complete electrical installation.

ELE1.6.040.7 EQUIPMENT CATALOGUES AND MANUFACTURER'S SPECIFICATIONS
1. Equipment Catalogues and manufacturers' Specification related to the proposed equipment shall be in the English language, specific and shall include all information necessary for the Contract Manager to ascertain that the equipment complies with this Specification and Drawings. Data and sales catalogue of a general nature will not normally be accepted;
2. Equipment catalogues and manufacturers' specifications must be submitted for the examination by and Approval of the Contract Manager before any equipment is to be ordered.

ELE1.6.050.7 CONSISTENCY
All equipment of the same category shall be the product of the same manufacturer and shall preferably be of the same colour scheme throughout.

ELE1.6.060.7 RESTRICTED USE OF ASBESTOS PRODUCTS
Asbestos or products containing asbestos shall not be used without prior Approval.
ELE1.7 WORKMANSHIP

ELE1.7.010.7 TRADESMEN
All tradesmen must be experienced in the trade and the works carried out shall be consistent with good practice in Hong Kong and to the satisfaction of the Contract Manager.

ELE1.7.020.7 TOOLS AND INSTRUMENTS
1. Proper tools shall be used to carry out the electrical installations;
2. Adequate and accurate testing/measuring instruments shall also be used to demonstrate compliance of the electrical installations with the relevant specifications and regulations;
3. The Contract Manager has the right to stop any work on which the correct tools and/or instruments are not being used;
4. Instruments used for acceptance test shall be calibrated at appropriate intervals and/or as specified in Project Specific Specification.

ELE1.7.030.7 SAFETY ON SITE
All works shall be carried out in such a manner as to comply with all regulations together with any amendments made thereto on safety aspects. These include but are not limited to the following:
1. Construction Sites (Safety) Regulations;
2. Factories & Industries Undertakings Electricity Regulations;
3. Electricity Ordinance, Chapter 406;
4. IEC 60364-7-704: Construction and Demolition Site Installation.

ELE1.7.040.7 GUARD AND RAILING FOR MOVING OR ROTATING PARTS OF EQUIPMENT
1. All moving or rotating parts of equipment shall be provided with an Approved guard and railing complying with the Factories & Industrial Undertakings (Guarding and Operation of Machinery) Regulations, published by the Labour Department, together with any amendments made thereto;
2. Guards shall be rigid and of substantial construction and shall consist of heavy mild steel angle frames, hinged and latched with either heavy galvanized mild steel wire crimped mesh securely fastened to frames or galvanised sheet metal of 1.2 mm minimum thickness;
3. All apertures shall be such that finger access to dangerous parts is not possible.
4. All sections shall be bolted or riveted;
5. Railings shall be 32 mm galvanized mild steel pipe and rail fittings.

ELE1.7.050.7 IDENTIFICATION OF CABLES AND CONDUITS
1. Cables for control circuits, inter-communication circuits, signalling circuits, and bell wiring shall be identified as required for each particular circumstance. Cables for power and lighting circuits shall be identified in accordance with the Electrical CoP Code 13D;
2. Electrical conduits, where required to be distinguished from pipelines of other services, shall use orange as the basic identification colour in compliance with BS 1710.
ELE1.7.060.7 SAMPLE FLATS AND SAMPLE WING

During the construction for domestic building blocks, a specified sample flats and wing located on a typical floor and construction mock-up will be required to be completed by the Main Contractor including the flats, the corridor, the flights of common staircase leading to the floors immediately above and below the sample wing and the lift lobby etc. If necessary, flats at the adjacent wing may also be selected. The Sub-contractor shall complete the electrical installations in the specified sample flats, sample wing and construction mock-up in co-ordination with the Main Contractor to cope with the construction programme. The proposed samples and details of electrical installations in the sample flats and the sample wing shall be submitted to the Contract Manager for approval prior to commencement of works. The Sub-contractor shall be responsible to replace any electrical installations which are found damaged or deformed and to carry out the necessary adjustments to restore to as-new condition before building completion.
ELE1.8 SITE MANAGEMENT

ELE1.8.010.7 APPOINTMENT OF SUPERVISING ENGINEERS, SITE SUPERVISORS AND BLOCK FOREMEN

1. Immediately upon the award of the Sub-contract, the Sub-contractor shall appoint Supervising Engineer(s) and Site Supervisor(s) specified in ELE1.8.020 and ELE1.8.030 who shall be both English and Cantonese speaking and in the Sub-contractor's full-time employment for the supervision of the Sub-contract Works to the satisfaction of the Contract Manager;

2. The Sub-contractor shall also identify Block Foremen as in ELE1.8.035;

3. Immediately after the award of the Sub-contract, the name, qualifications and curriculum vitae of the Supervising Engineer(s) and Site Supervisor(s) shall be submitted for Approval to the satisfaction of the Contract Manager;

4. None of the Supervising Engineer(s) and Site Supervisor(s) shall be removed from their respective duties without prior Approval;

5. In the event of any of them being unsatisfactory, in the opinion of the Contract Manager, or misconducting themselves, they shall be removed forthwith and be replaced by suitable substitutes to the Contract Manager's satisfaction within seven days from the Contract Manager's instruction in writing.

ELE1.8.020.7 SUPERVISING ENGINEERS

1. Unless otherwise specified, the Sub-contractor is to employ for the supervision of all works on Site, at least one qualified Supervising Engineer. The Supervising Engineer shall generally represent the Sub-contractor in all respects of the Sub-contract and assume the following duties:

   a. Co-ordinate and supervise the work in the Sub-contractor's office and the Site;

   b. Develop, in conjunction with the Main Contractor, schedules of installation drawings, builder's work drawings, material submission and delivery, statutory submissions, the programme of works and testing and commissioning programme, for approval by the Contract Manager;

   c. Liaison with the Contract Manager and other parties;

   d. Attend at the office of the Contract Manager for the finalisation of drawings and equipment selection;

   e. Attend progress meetings and co-ordination meetings;

   f. Monitor and supervise installation drawings submission, builder's work drawings submission, material submission and delivery, statutory submissions in accordance with the respective submission schedules. Submit progress reports to the Contract Manager monthly or at shorter intervals when such requested by the Contract Manager;

   g. Check and confirm the installation drawings, builder's work drawings and material submissions are suitable for the installation works and in compliance with the requirements of the Sub-contract;

   h. Examine, verify and confirm in writing to the Contract Manager on a monthly basis that the material delivered to the Site under the Sub-Contract has been approved by the Contract Manager;

   i. Certify all material delivery vouchers in accordance with PRE.B12.280 of the Main Contract;

   j. Prepare, in conjunction with the Main contractor, the delivery method statements for delivery of plant and equipment;
k. Undertake all site test and commissioning of the Sub-contract Works and endorse the test and commissioning reports to confirm that he is satisfied with the completeness, workmanship and performance of the installations which comply fully with the Sub-contract requirements, prior to submission to the Contract Manager.

2. Qualification requirements:
   At least one year of proven post qualification at supervisory level on electrical installations in buildings with the following qualification:
   a. Registered Professional Engineer (Electrical or BS Discipline) under the Engineers Registration Ordinance; or
   b. Member of the Hong Kong Institution of Engineers (Electrical or BS Discipline) elected after 5 December 1975; or
   c. Member (Electrical or BS Discipline) of an overseas engineering institution which has signed agreements for the mutual recognition of qualifications with the Hong Kong Institution of Engineers.

3. The Supervising Engineer(s) shall be highly competent and experienced, and shall be given a high level of delegated authority such that they can take decisions, including those involving expenditure.

ELE1.8.030.7 SITE SUPERVISORS
1. Unless otherwise specified, the Sub-contractor is to employ at least one qualified Site Supervisor. The Site Supervisor(s) shall be stationed on site;

2. Qualifications requirements:
   Registered Electrical Worker Grade B(2) or above registered under the Electricity Ordinance.

ELE1.8.035.7 BLOCK FOREMEN
The Sub-contractor is to identify from time to time one Block Foreman per block who shall be answerable to the Contract Manager for the quality and progress of works for the block. The Block Foreman shall be stationed on Site. This Block Foreman and the Site Supervisor shall not be the same person.

ELE1.8.040.7 BUILDING SERVICES PERFORMANCE ASSESSMENT SCORING SYSTEM
1. The Housing Authority has adopted a Building Services Performance Assessment Scoring System (BSPASS) to assess the performance of building services Nominated Sub-contractors undertaking works for the Authority;

2. BSPASS will be operated in this Sub-contract and assessments by Building Services PASS Assessment Team (BSPAT) or other staff of the HA will be conducted at quarterly intervals or other intervals as required by the Contract Manager;

3. Upon the Contract Manager's notification, the Sub-contractor's authorised representative shall attend all such assessments;

4. The Sub-contractor shall provide all necessary attendance, and all necessary measuring instruments, in addition to those specified in PRE.BS1.630, etc. to facilitate the BSPASS assessment as stipulated in the relevant BSPASS manuals;

5. In addition, the Sub-contractor shall also provide labours for the opening up and re-fixing of the works, the operation of the equipment and the testing, etc. as required by the assessment.
ELE1.8.050.7 CO-ORDINATION WITH MAIN CONTRACTOR ON INTENDED CONSTRUCTION METHOD FOR INTERNAL PARTITION WALLS (PANEL WALLS) IN DOMESTIC FLATS, PRECAST CONCRETE WALL & PRECAST FACADE PANEL

The internal partition walls (panel walls) in the domestic flats, precast concrete walls and the precast facade panel are of prefabricated panel wall construction. The Sub-contractor shall co-ordinate with the Main Contractor on their intended panel wall construction method and makes necessary allowance for the conduit installation work. The provision and installation of GI/PVC conduits and conduit fittings on internal partition walls (panel walls), precast concrete walls and precast facade panel should be carried out by Main Contractor and the proposed installation details are shown on Drawings. The Sub-contractor should ensure that all the conduit systems are in compliance with the Specification & Drawings.

ELE1.8.060.7 MODIFICATION WORKS IN NON-DOMESTIC PREMISES DURING MAINTENANCE PERIOD

1. During the Maintenance Period, the Employer may employ other workmen or contractors to carry out modification works pertaining to the installation to suit the fitting out works of the tenants;
2. The Sub-contractor shall provide the necessary attendance, including operation of the installation, as instructed by the Contract Manager to facilitate such modification works;
3. The costs of the attendance will be determined by a fair valuation made by the Contract Manager in conjunction with the Sub-contractor and paid for separately;
4. The employment of other workmen or contractors by the Employer for the modification of the installation shall not in any way relieve the Sub-contractor of his responsibilities for the maintenance and defects of the Works, other than those parts which have been modified by others, in accordance with the Contract.

ELE1.8.070.7 NOTICES AND FEES

The Sub-contractor shall comply with the regulations and requirements of all relevant Authorities such as Fire Services Department, the Building Authority, the Telecommunications Authority, the Electrical and Mechanical Services Department, Utility Companies, etc and shall be responsible for giving notifications to the appropriate Authorities and for paying all fees levied; such fees shall be included in the Tender Price, and also for collecting all necessary certificates and licenses for the installation.
ELE1.9 SITE SECURITY

ELE1.9.010.7 SUB-CONTRACTOR'S STORE ROOMS
1. In addition to the storage shed to be constructed by the Main Contractor as required under PRE.BS1.380 of the Preliminaries for Building Services Sub-contracts, the Main Contractor will also hand over to the Sub-contractor the switchroom of each building six months after the concreting of the structural frame and ceiling slab of the respective main switchroom, or four months before the completion of each building, whichever is the earlier;

2. The Sub-contractor may make use of the rooms for storage of materials, subject to the progress of the Works not being affected. The Sub-contractor shall make available to the Contractor the builder's work drawings and programme in good time to enable the Contractor to complete his works necessary for the handover of the rooms;

3. Immediately after the handover of the rooms, the Sub-contractor shall lock the doors with a good quality padlock. The padlock shall have proven reliability and in-service records for the Housing Authority projects. The Sub-contractor shall also provide and maintain in good operating conditions a burglar alarm system as specified in ELE1.9.020;

4. The Sub-contractor shall remove the padlocks and burglar alarm system upon completion of the respective building and upon Approval by the Contract Manager.

ELE1.9.020.7 BURGLAR ALARM SYSTEM FOR SUB-CONTRACTOR'S STORE ROOMS
The Sub-contractor shall provide the following whole burglar alarm system for each Electrical Sub-contractor's store room during the period as specified in ELE1.9.010:

1. System description
   The system shall consist of:
   a. Volumetric motion detector;
   b. Magnetic door contacts;
   c. Burglar alarm panel;
   d. Self activated bell;
   e. Dedicated-line remote alarm transmission circuit.

2. Volumetric motion detector
   a. Volumetric detectors used shall make use of dual technology, including passive infra red and microwave/ultrasonic wave, such that the possibility of false alarm will be reduced to the minimum;
   b. There shall be at least one detector installed facing each cable trench or any other weak points or openings.

3. Magnetic door contact
   Surface-mounted magnetic door contacts shall be installed on the inner door frame. It will be used to detect door open.

4. Control panel
The control panel shall be installed inside the protected room. It shall be powered by AC mains and backed up by stand-by battery sufficient for 8 hours. The control panel shall have real time clock display and alarm latching display. The panel shall be able to be armed or disarmed by mechanical key or by keying in secret code via the panel keypad. The panel shall also be built-in with entry and exit delay timer, such that the timer will be triggered by the entry, exit route sensors.

5. Alarm annunciator
   a. Self-activated alarm bell shall be installed on outstanding location on the outer wall of the protected room. The bell shall be housed in strong steel housing with anti-corrosion finishing and are tamper protect against removal of the lid, the bolt or attempted removal of the housing from the wall. The bell shall be self-powered by rechargeable battery. If input circuit is cut off, it shall give out annunciation. Upon activation it shall give out alarm sound level not less than 100 db at 1 metre distance. There shall also be a strobe light on the bell to provide visual warning;
   b. A cut off timer adjustable from 1 minute to 15 minutes shall be provided. Should the bell ring for the pre-set period, it shall be cut off by the timer. However, the strobe light shall remain flashing. Should the built-in battery voltage goes below the threshold limit, the bell shall give intermittent audio and visual warning to signify the need for battery replacement.

6. Dedicated line remote alarm transmission
   a. Alarm signal shall be transmitted to a remote central station. The signal shall be transmitted through dedicated lease-line. The alarm transmission line shall also be supervised, such that communication failure can be detected from the central station;
   b. The transmitter used shall have identity signals sent back to the central station such that compromising by direct swapping of transmitter shall not be possible. Communication data shall also be encrypted to deter compromising;
   c. The alarm signal shall be terminated in the central station which shall be manned by at least 2 persons any time. The central station shall enforce stringent security measures and meeting BS 5979 is preferred. The central station shall be operated by a well established and reputable security service company, the name of which shall be submitted to the Contract Manager for Approval;
   d. In the central station, there shall be records of telephone numbers of site guard post and keyholders. Should there be any alarm received by the central station, its operator shall call site guard and the keyholder. Upon notification, the keyholder shall return to the protected premises to investigate and reset the control panel. Should there be any suspected theft or burglary, the operator shall call the police. All telephone conversations with central station must be recorded and kept for at least 30 days for later reference.

7. Operating cost
   All operating costs for the burglar alarm system, including the rental charges for the lease-line, the charges for the remote central station etc. shall be borne by the Sub-contractor.

**ELE1.9.030.7**

**MARKING OF RESIDUAL CURRENT CIRCUIT BREAKERS (RCCB)**

The name of the estate and the phase number (e.g. LOK FU 5), or the suitable description of the contract, shall be indelibly marked on an external surface of the enclosure of the RCCB in capital letters of not less than 3 mm high. The marking shall not affect the appearance and performance of the RCCB. A sample of the marked RCCB shall be submitted to the Contract Manager for Approval prior to installation.
ELE1.10  REQUIREMENTS FOR SUB-CONTRACTOR'S DRAWINGS

1. Size of drawings

Drawings submitted by the Sub-contractor shall be of a standard size from A0 to A4 in accordance with BS EN ISO 5457. "As-fitted" drawings shall be of A0 or A1 size only.

2. Installation drawings

The Installation Drawings shall detail and dimension the following, where relevant and also read in conjunction with Preliminaries for Building Services Sub-contracts:

a. Site distribution, cable and busduct routes;

b. General layout drawings giving accurate and dimensioned locations of all plant and equipment included in the Sub-contract;

c. Schematic diagrams for main and sub-main distribution;

d. Main switchboard details, including schematic diagram, component layout, busbar arrangement, compartmentation, conductor sizes, cabling arrangement, termination details, control diagram;

e. Details of distribution boards and consumer units, including types and rating of protective devices, sizes and types of incoming and outgoing cables, circuit description;

f. Busduct installation details showing connections, mounting details and setting out of all components including straight runs elbows, offsets, tap-off units, etc.;

g. Prefabricated Branch Cables installation details showing connections, mounting details and setting out of all components including straight runs elbows, offsets, tap-off units, etc.;

h. Lighting layouts for normal and emergency fittings, detailing positions, mounting methods, types of luminaires, switch positions and wiring connections;

i. Conduit routes with conduit sizes, showing adaptable boxes, details of cables and circuit references (see ELE1.10.020);

j. Trunking and cable tray routes with details of sizes, fixings, cables carried;

k. Generator installation details, showing plant layout and sections, exhaust pipe details, fuel system details, acoustic treatment, control equipment;

l. Earthing and equipotential bonding system with details of conductor sizes and routing, bonding arrangement;

m. Lightning protection system with details of air terminations, down conductors and bonding;

n. CABD, Security, CCTV, EAS, PA and carpark control systems, whichever included in the Sub-contract, with schematics, equipment details, cable routes, termination details, fixing details, etc.;

o. Label schedules, showing wording and formats for the labelling of equipment and distribution board circuits;

Operating and maintenance clearances for the equipment and their static and dynamic structural loading shall be shown on the installation drawings wherever necessary.

3. "As-fitted" drawings
The "as-fitted" drawings shall be based on the full set of Approved Installation Drawings updated to show the actual positions and arrangement of all items installed. Any additional drawings which are considered necessary by the Contract Manager for showing the complete installation shall be included. The Drawings shall be drawn in black-ink lines on transparent linen or other Approved materials, suitable for reproduction of prints.

ELE1.10.020.7 CONDUIT RUN DRAWINGS
The Sub-contractor shall submit detailed conduit layout drawings for Approval prior to commencement of the installation. The Sub-contractor shall supply to the Contract Manager eight (8) sets of conduit run drawings after Approval.

ELE1.10.030.7 WORKING DRAWINGS AND AS-FITTED DRAWINGS

1. The Sub-contractor's attention is drawn to Preliminaries for Building Services Sub-contracts for installation drawings and ELE1.10.020 above;

2. Schematic wiring diagrams for the electrical installation of each building shall be provided and fixed properly to the satisfaction of the Contract Manager, in the locations hereunder. The diagrams shall be of A1 size minimum and each diagram shall be treated with acrylic varnish to prevent deterioration and mounted in an anodised aluminium frame with transparent plastic front plate of 3 mm minimum thickness and wooden backing board of 5 mm minimum thickness;

<table>
<thead>
<tr>
<th>System</th>
<th>Location of diagram</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electrical power distribution and associated systems</td>
<td>Main switchroom and near other main switches as required in compliance with the Electrical CoP</td>
</tr>
<tr>
<td>Security system</td>
<td>Meter room accommodating the main control equipment</td>
</tr>
<tr>
<td>Public address system</td>
<td>Adjacent to the main system amplifier</td>
</tr>
</tbody>
</table>

3. The complete set of as-fitted drawings shall consist of each of the drawings, which shall include but not be limited to the following:
   a. Site plan and underground cable route of telecommunication lines, supply company cables, road lighting layout plan;
   b. Schematic wiring diagrams;
   c. Electrical floor layout plans;
   d. Typical domestic flat layout plans;
   e. Schematic wiring diagram of public lighting;
   f. Public lighting layout plans;
   g. External lighting layout plans;
   h. Transformer room, main switch room and meter room layout plans;
   i. Installation details - lateral main, trunking and mounting methods;
   j. Lightning protection system;
   k. Schematic diagram for doorphone system;
   l. Control block diagram for doorphone system;
   m. Security system – schematic diagram for all sub-systems (showing the type of integrated circuits transistors, diodes and other semiconductor devices, voltage rating and values of all passive components etc), one to one scale printed board layout and the arrangement of components on the circuit boards;
n. CCTV installation layout plan;
o. Security alarm installation;
p. Public address system;
q. CABD system - site layout plan (showing antenna position and direction) and signal field strength.

ELE1.10.040.7 DOCUMENTS AND TECHNICAL LITERATURE TO BE SUBMITTED AFTER COMPLETION

The Sub-contractor shall submit the following documents and technical literature to the Contract Manager for the whole installation and equipment provided under this Sub-contract which shall include, but not be limited to the following:

1. User manual consisting of:
   a. Information (catalogue, manual, instruction etc.) on special precautions/procedures/methods required on the use, operation, cleaning, servicing, maintenance, repair and replacement of all proprietary material and equipment installed such as air circuit breaker(s)/moulded case circuit breaker(s) including protection and instrumentation devices, lighting fittings, amplifiers and cameras. Requirements on proper use and operation for durability, safety and statutory consideration shall be clearly stated;
   b. A list of recommended spare parts;
   c. Testing and commissioning reports on the system and equipment installed (electronic copy in PDF format stored on recordable compact disc shall be provided in addition to hard copies).

2. Original certificate of warranty for any material, equipment and installation with warranty period last beyond Maintenance Period; and

3. Other items as required by the Contract Manager.

For public address system, apart from the documents stipulated above, three sets of operation and maintenance manuals with detailed circuit diagrams and descriptions shall be submitted to the Contract Manager one month before the commissioning of the installation.

ELE1.10.050.7 EVIDENCE OF COUNTRY/PLACE OF MANUFACTURE AND AUTHENTICITY

1. The Sub-contractor shall, when required, produce documentary evidence to verify the country/place of manufacture and authenticity of the materials delivered to Site or installed;

2. Such documentary evidence shall be in the form of purchase orders to, and shipment/delivery orders or produce certificates from the manufacturers or the manufacturers' authorized agents in Hong Kong;

3. The materials of the works containing such materials will not be certified for payment until the required evidence has been produced to the satisfaction of the Contract Manager;

4. The Tenderer shall indicate in the 'Schedule of Information Supplied by the Tenderer' the country/place of manufacture of the materials being offered at the time of tendering.

ELE2.040.7  FLOODLIGHTING FITTINGS ................................................................. 19
ELE2.1 DOMESTIC BLOCKS

ELE2.1.1 APPLICATION

ELE2.1.1.010.7 BLOCKS
ELE2.1 applies to the domestic blocks covered by this Sub-contract unless otherwise specified in Project Specific Specification or Drawings.

ELE2.1.1.020.7 REFERENCE DOCUMENTS
The Sub-contractor shall provide the whole of the electrical installation in each of the blocks/buildings as detailed on the Drawings and in this Specification including Project Specific Specification. This section of the Specification should be read in conjunction with other Worksections.

ELE2.1.2 MAINS SUPPLY

ELE2.1.2.010.7 PROVISION BY SUPPLY COMPANY
1. The Supply Company will provide an independent 380V, 3-phase, 4-wire, TT system supply to each block/building;
2. The Sub-contractor shall provide durable labels at the main incoming circuit breakers and along the risers at all floor levels to indicate the source transformers as per the power supply company’s requirements and as otherwise specified in Project Specific Specification.

ELE2.1.2.020.7 ATTENDANCE BY SUB-CONTRACTOR
The Sub-contractor shall provide all necessary attendance, complete with all necessary work, and enforce all safety measures required for the connection of supply.

ELE2.1.3 MAIN CUBICLE SWITCHBOARD

ELE2.1.3.010.7 PROVISION OF DETAILS
The main cubicle switchboard shall be provided as shown on the Drawings. The Sub-contractor shall submit a set of detailed installation drawings showing the proposed layout, positioning and construction of the cubicle switchboard for Approval prior to assembly. The proposal shall take into account the actual site conditions and Supply Company’s requirements with regard to incoming supply termination, clearance space for installation, operation and maintenance, incoming cable/bars and outgoing cable routing, supporting framework, etc.

ELE2.1.3.020.7 INSTALLATION OF SUPPLY COMPANY’S ELECTRICITY METERS
The Sub-contractor shall apply, collect and install the Supply Company’s electricity meters, and liaise with the Supply Company to ensure that the provisions for termination of the incoming supply cables/busbars and installation of the electricity meters are suitable and meet the Supply Company’s requirements.

ELE2.1.3.030.7 OFF-SITE INSPECTION
Inspection of the cubicle switchboard may be carried out by the Contract Manager or his representative at the manufacturer’s works during the construction stage.
ELE2.1.3.040.7 TESTS
Tests shall be carried out by the Sub-contractor upon completion in the presence of the Contract Manager or his representative prior to acceptance and delivery to Site.

ELE2.1.3.050.7 SUPPLY FEEDING FROM HEC
1. Unless otherwise specified on Drawings, the Sub-contractor shall supply and install the LV transit blocks and single cores XLPE/PVCI/PVCS power supply cables connecting to the incoming air circuit breakers;
2. For design using busbar trunking system, the Sub-contractor shall supply and install the LV transit blocks and busbar trunking system connecting to the incoming air circuit breakers;
3. The busbar trunking system shall comply with IEC 60439-1 and shall be assembled by the same manufacturer of the main cubicle switchboard;
4. The copper busbars shall be of 2500A TP and full neutral and housed in an enclosure of IP 31. The system and its installation details shall be submitted for Approval prior to installation.

ELE2.1.3.060.7 POWER FACTOR CORRECTION EQUIPMENT
1. When power factor correction equipment is required, a separate floor-standing cubicle housing the power factor correction capacitor bank and the associated equipment shall be provided within the main switch room as shown on the Drawings;
2. The power factor correction cubicle shall be manufactured/assembled by the same manufacturer of the main cubicle switchboard;
3. The Sub-contractor shall submit a set of detailed installation drawings showing the proposed layout, positioning and construction of the power factor correction cubicle for Approval prior to assembly.

ELE2.1.3.070.7 PAINTING SWITCHGEAR
All the switchgears fed from essential supply circuitry shall be painted in red.

ELE2.1.4 RISING MAINS AND SUB-MAINS DISTRIBUTION SYSTEMS

ELE2.1.4.010.7 SCOPE OF WORK
The Sub-contractor shall supply, install and connect rising mains and sub-mains distribution systems comprising cables, busbar/pre-fabricated branch cable risers, conduit and accessories, MCB distribution boards, busbar chambers, etc as shown on the Drawings and otherwise as specified in Project Specific Specification.

ELE2.1.4.020.7 BUSBAR/PRE-FABRICATED BRANCH CABLE RISING MAINS
The busbar/pre-fabricated branch cable rising mains shall be manufactured and designed for the particular job with all purpose-made fittings and accessories.

ELE2.1.4.030.7 BUSBAR/PRE-FABRICATED BRANCH CABLE RISERS
1. The Sub-contractor shall submit the manufacturer’s drawings showing the details of the busbar/pre-fabricated branch cable risers to the Contract Manager or his representative for Approval prior to manufacture;
2. The busbar risers shall be securely fixed on the surface of the wall and shall be straight from the bottom to the top;
3. When the gap between a riser and wall is considerable due to uneven plastering or concrete at fixing point, the Sub-contractor shall install suitable packing or Approved galvanized steel brackets to which the trunking shall be fixed;

4. The minimum distance between the trunking case and the wall shall be 25 mm.

ELE2.1.4.040.7  **FIXING ARMOURED CABLES**

All armoured cables run on walls shall be fixed by cable cleats of the following types:

<table>
<thead>
<tr>
<th>Cable Diameter (mm)</th>
<th>Type of Cable Cleat</th>
</tr>
</thead>
<tbody>
<tr>
<td>dia. ≤ 50</td>
<td>1-bolt Fixing Type</td>
</tr>
<tr>
<td>dia. &gt; 50</td>
<td>2-bolt Fixing Type</td>
</tr>
</tbody>
</table>

Also, the cables shall be fixed on wall by means of angle iron support or metal framework depending on actual site conditions.

ELE2.1.4.050.7  **PAINTING SWITCHGEAR**

All the switchgears fed from essential supply circuitry shall be painted in red.

ELE2.1.5  **BRANCH-OFF CIRCUITS FROM RISING MAINS**

ELE2.1.5.010.7  **SCOPE OF WORK**

The Sub-contractor shall supply, install and connect the TP & N branch-off circuits from the busbar/pre-fabricated branch cable rising mains comprising cables, TP & N fuse combination unit and MCB distribution board etc. in the meter rooms of each domestic floor and at other locations as shown on the Drawings and otherwise as specified in Project Specific Specification.

ELE2.1.6  **RADIAL MAINS TO DOMESTIC UNITS**

ELE2.1.6.010.7  **THE INSTALLATION**

1. The mains supply to each domestic unit on one floor shall be fed from the appropriate MCB distribution board in the meter room on the same floor or the other floor as shown on the Drawings;

2. Each circuit commencing from the respective double pole MCB shall be fed via the Supply Company's electricity meter to each individual domestic unit by PVC insulated cable in a cable containment system such as surface steel conduit/PVC conduit/trunking system as shown on the Drawings inside the meter room(s), and in concealed PVC conduit system from the meter room(s) to the consumer unit in each domestic unit;

3. The meter board for the installation of Supply Company's meter shall be provided and installed by the Sub-contractor;

4. The Supply Company's meters will be supplied and installed on the meter board in Meter Rooms at each floor by the Supply Company as shown on the Drawings. The Sub-contractor shall be responsible for providing connection and fixing facilities, at the position and ready for installing Supply Company's meter. The Sub-contractor shall check and ensure everything of the circuit is in an orderly manner before meter connection by the Supply Company.
ELE2.1.6.020.7 METER CONNECTION AND ENERGISATION FOR DOMESTIC FLATS

1. Before the installation and connection of the meters by Supply Company for the flats, the Sub-contractor shall switch off all the control switches i.e. the DP MCBs in the meter rooms and shall insulate properly any exposed conductors of the meter tails to the satisfaction of the Contract Manager;

2. The Sub-contractor shall also switch off all the main switches of consumer units in the flats and provide, next to each main switch, a temporary label/notice, in English and Chinese, as follows

"Danger : Do not switch on the main switch unless the meter is connected and the electricity supply to this flat is ready. (Please check with the Management Office for the readiness of supply)."

危險：在本單位電錶安裝和電源接駁妥當前
切勿閉合(開)電源總掣
(有關電錶 / 電源接駁時間，請與管理處聯絡)

The label/notice shall be legible and reasonably durable. Sample shall be submitted for Approval.

3. The Supply Company, before connecting the meters, will inspect and test the installation of the flats. The Sub-contractor shall provide all necessary attendance for such inspection and testing carried out within the Maintenance Period and shall pay all fees levied on retesting;

4. The Sub-contractor shall be responsible for switching on the supply circuits to individual flats subsequent to the installation of meters by the Supply Company. Immediately before switching on the supply to each flat, the Sub-contractor shall check to ensure that the switching will not cause any danger to other persons and the installation;

5. The Sub-contractor shall liaise with the Supply Co. and the Management Office for programming the meter connection and the switching operation before and within the Maintenance Period. The Sub-contractor shall complete the switching operation within 12 hours after collecting the daily return from the Management Office for those flats with the meter connected or upon notification by the Management Office. After the switching, the Sub-contractor shall return the record of flats energised to the Management Office immediately.

ELE2.1.7 INSTALLATION FOR DOMESTIC UNITS IN RENTAL BLOCKS

ELE2.1.7.010.7 SCOPE OF INSTALLATION

Each installation shall comprise a door bell and push, 13A 3-pin single and twin sockets, 20A DP switches, connection units, lampholders, lighting switches etc, to complete as shown on the Drawings and otherwise as specified in Project Specific Specification.

ELE2.1.7.020.7 WIRING SYSTEM

The Sub-contractor shall supply, install and connect a concealed PVC conduit wiring system for lighting and power points in each domestic unit, commencing from the surface mounted consumer unit as shown on the Drawings.

ELE2.1.7.050.7 ACCESSORIES

1. All electrical accessories shall be of flush type;
2. Inscription is not required on front plate of control switches feeding fixed electrical appliances in domestic blocks;

3. The door bell shall operate at extra-low voltage, comprising double wound transformer, bell and push etc. Sample of the door bell shall be submitted for Approval prior to ordering of material.

**ELE2.1.060.7 CONSUMER UNIT**

1. A plastic label to indicate the on and off of the main switch and the function of each MCB and spare way shall be provided in accordance with Worksection ELE2.8.1;

2. The range of instantaneous tripping current for MCB for the A/C unit shall be in accordance with IEC 60898-1 or BS EN 60898-1 - type C tripping characteristics;

3. The range of instantaneous tripping current for MCB for lighting and power shall be in accordance with IEC 60898-1 or BS EN 60898-1 – type B tripping characteristics;

4. The earthing terminal of the consumer unit shall be connected by protective conductor of adequate size PVC insulated cable as shown on the Drawings to the proper earthing terminal of the incoming supply system.

**ELE2.1.070.7 CONDUIT FOR COMMUNICATIONS INSTALLATIONS**

1. A concealed PVC conduit system complete with draw wire and accessories shall be provided by the Sub-contractor for the Fixed Telecommunication Network Services (FTNS), Communal Aerial Broadcasting Distribution (CABD) installation, Subscription Television Distribution Network (STDN) installation, Towngas Automatic Meter Reading (AMR) system and security system installation as shown on the Drawings;

2. The Sub-contractor shall take the roles of coordinating other neighbouring services and determine the exact concealed conduit routes for communications installations while those given on the Drawings are for indicative and tendering purposes.

**ELE2.1.080.7 EQUIPOTENTIAL BONDING - GENERAL**

1. The Sub-contractor shall provide a system of main equipotential bonding and local supplementary bonding for all exposed and extraneous conductive parts for each domestic unit in accordance with the Electrical CoP, BS 7671, Supply Rules and ELE17;

2. The Sub-contractor shall ensure the bonding for extraneous conductive parts is sound and the result complies with the Electrical CoP and BS 7671 by proper measurement with records at good time. For those parts of equipotential bonding system found not electrical conductive, the Main Contractor and the Sub-contractor shall be responsible for rectification of their own works as early as possible.

**ELE2.1.085.7 MAIN EQUIPOTENTIAL BONDING**

The water and gas main incoming pipes inside the domestic flat shall be bonded at their point of entry to the flat to the earth terminal of the consumer unit by cables in concealed PVC conduit system and surface wires as shown on the Drawings.
ELE2.1.090.7 LOCAL SUPPLEMENTARY BONDING

1. Local supplementary bonding shall also be provided for the exposed metal cold/hot water pipes and/or gas pipes in the flats, when they are not connected to the main pipes by reliable metal-to-metal joints of negligible impedance. Local supplementary bonding for these pipes inside pipe duct, under sink, cooking bench or below bath tub may be by surface wiring;

2. The Sub-contractor shall provide, local supplementary bonding for the following extraneous conductive parts, which are not exhaustive in the domestic flat as shown on the Drawings:
   a. Sink/combined unit/cooking bench;
   b. Windows;
   c. Louvers;
   d. Bathroom fittings.

3. Supplementary Bonding
   a. For sink/combined unit/cooking bench
      i. The Main Contractor will provide a 1.5 mm thick stainless steel earthing lug with a 5 mm diameter hole welded to each sink/combined unit/cooking bench;
      ii. The Sub-contractor shall provide the supplementary bonding for the sink/combined unit/cooking bench by surface wiring to the earthing terminal of the nearby extraneous/exposed conductive parts or BS 4662 or IEC 60670-1 box or the nearby fused connection unit via concealed PVC conduit to the BS 4662 or IEC 60670-1 box. For the former case, the bonding conductor shall be fixed by a 4 mm diameter stainless steel screw, washer and nut to the earthing lug.
   
   b. For windows and louvers
      i. The Main Contractor will provide at each of the extraneous conductive parts, a 20 mm wide, 1.5 mm thick hot-dip galvanized steel earthing lug one end of which will be fixed to the extraneous conductive part by 2 nos. M4 self-tapping stainless steel screws at 60 mm c/c and the other end with a 5 mm diameter hole provided, for the termination of the bonding conductor, will be extended to the nearby BS 4662 or IEC 60670-1 box as shown on the Drawings;
      ii. The Sub-contractor shall provide the bonding conductor which shall be fixed to the earthing lug by a 4 mm diameter stainless steel screw, washer and nut and to the earthing terminal of the nearby [BS 4662 or IEC 60670-1 box]/[lighting point or connection unit];
      iii. The recess slot will be provided and backfilled after the fixing of the earthing lug by the Main Contractor;
      iv. The Sub-contractor shall advise the Main Contractor of the location of the recess slot in conjunction with the layout of the BS 4662 or IEC 60670-1 box for equipotential bonding.
   
   c. For bathroom fittings
      i. The Main Contractor will provide a concealed 30 mm wide, 1.5 mm thick hot-dip galvanized steel metal strip for equipotential bonding of the extraneous conductive parts as shown on the Drawings;
      ii. The Main Contractor will fix one end of the hot-dip galvanized steel metal strip to the extraneous conductive part and the other end with a 5 mm diameter hole provided, for the termination of the bonding conductor in the nearby BS 4662 or IEC 60670-1 box as shown on the Drawings;
iii. The Sub-contractor shall provide the bonding conductor which shall be fixed to the metal strip by a 4 mm diameter stainless steel screw, washer and nut and to the earthing terminal of the nearby [BS 4662 or IEC 60670-1 box]/[lighting point or connection unit];

The Sub-contractor shall advise the Main Contractor of the location of the BS 4662 or IEC 60670-1 box for equipotential bonding.

ELE2.1.8 NOT USED

ELE2.1.9 NOT USED

ELE2.1.10 NOT USED

ELE2.1.11 NOT USED

ELE2.1.12 PUBLIC LIGHTING AND POWER

**ELE2.1.12.010.7** SCOPE OF INSTALLATION

The Sub-contractor shall supply, install and connect concealed PVC conduit wiring systems for the electrical installations at all public areas and plant rooms, comprising conduits and fittings, cables, lighting fittings, switches, MCB boards, sockets, etc to complete as shown on the Drawings.

**ELE2.1.12.020.7** ESSENTIAL LIGHTING

Part of the public lighting is essential lighting fed from the essential supply board as shown on the Drawings.

**ELE2.1.12.030.7** LIGHTING CONTROLS

1. The public lighting shall be controlled by 24 hours time switches/photocells complete with metal box as shown on the Drawings;

2. A by-pass switch shall be provided for each time switch to control the operation manually;

3. The time switch/photocell shall be submitted for Approval before installation;

4. The control of the lightings on roof is timer controlled and interconnected with the fire alarm installation and door contacts for operation as shown on the Drawings and as otherwise specified in Project Specific Specification;

5. The public lighting main switch and MCB distribution boards shall be installed in switch/meter rooms at various floors and blocks as shown on the Drawings.

**ELE2.1.12.050.7** EXIT SIGNS

The Sub-contractor shall supply and install the exit signs as shown on the Drawings.

**ELE2.1.12.060.7** MCB UNIT

Unless otherwise specified, the range of instantaneous tripping current for MCB unit for lighting and power circuitry shall be in accordance with IEC 60898 or BS EN 60898-1 type B tripping characteristics.
ELE2.1.13  LIFT SUPPLY

ELE2.1.13.010.7  SCOPE OF INSTALLATION
1. The Sub-contractor shall supply, install and connect lift power supply system consisting of multi-core fire resistant armoured cables, floor mounted L.V. cubicle switchboard, isolator, changeover contactor, fuse combination units, busbar chamber, MCB distribution boards, etc, as shown on the Drawings and otherwise as specified in Project Specific Specification.
2. The L.V. cubicle switchboard shall be provided as shown on the Drawings. The Sub-contractor shall submit a set of detailed installation drawings showing the proposed layout, position and construction of the cubicle switchboard for approval prior to assembly.

ELE2.1.13.020.7  INSTALLATION CABLES
The cables shall be installed with a minimum horizontal or vertical separation distance of 75 mm with other circuits.

ELE2.1.13.030.7  CONDUIT FOR LIFT ALARM BELLS
Except for surface mounted conduit which shall be of G. I. type, a system of concealed PVC conduit completed with draw wire and accessories reserved for lift alarm bells at ground floor and central lift alarm indication system shall be carried out by the Sub-contractor as shown on the Drawings.

ELE2.1.14  PUMP SUPPLY

ELE2.1.14.010.7  SCOPE OF INSTALLATION
The Sub-contractor shall supply, install and connect the pump power supply system consisting of multi-core armoured cable, switchgears, busbar chambers, MCB distribution board, etc inside the fire services pump rooms, and water pump room, as shown on the Drawings and otherwise as specified in Project Specific Specification.

ELE2.1.14.020.7  FACILITIES PROVIDED BY OTHERS
All water pumps including fire pumps, starters, control panel, control wiring and accessories up to the roof tank will be provided by others.

ELE2.1.14.030.7  INSTALLATION OF CABLES
The circuit for fire pump supply shall be at a horizontal or vertical separation distance of 75 mm with other circuits.

ELE2.1.14.040.7  CONDUIT FOR PUMP SUPPLY
Except for surface mounted conduit which shall be of G. I. type, a system of concealed PVC conduits completed with draw wires and accessories, etc from the roof tanks down to the pump rooms for the pump control circuit, shall be carried out by the Sub-contractor as shown on the Drawings.
ELE2.1 ELE2.1.15 PUMP, LIFT MACHINE, GENERATOR ROOMS, REFUSE STORAGE & MATERIAL RECOVERY CHAMBERS, REFUSE STORAGE & MATERIAL RECOVERY ROOMS AND REFUSE COLLECTION POINT/JUNK COLLECTION POINT

ELE2.1.15.010.7 SCOPE OF INSTALLATION

1. The Sub-contractor shall supply, install and connect in surface steel conduit wiring system for the electrical installation in all lift machine rooms, FS pump rooms, water pump rooms and generator rooms as shown on the Drawings and otherwise as specified in the Project Specific Specification, whereas for refuse storage & material recovery chambers, refuse storage & material recovery rooms and refuse collection point/junk collection point, concealed PVC conduit system shall be used;

2. The Sub-contractor shall supply and install mechanical ventilation systems for the refuse collection point/junk collection point, refuse storage & material recovery chambers, refuse storage & material recovery rooms, refuse chutes, pump rooms, lift machine rooms, generator rooms and other rooms all as shown on the Drawings and otherwise as specified in the Project Specific Specification and ELE31.

ELE2.1.15.025.7 SCOPE AND REQUIREMENTS OF MECHANICAL VENTILATION SYSTEM

1. The Sub-contractor shall supply, install, commission, test and maintain the mechanical ventilation systems all as shown on the Drawings and as specified in this Specification;

2. The sections in ELE31 stipulate the performance specification to be supplied and installed by the Sub-contractor and set out in general the design criteria, minimum requirements, types and standards of the relevant equipment and materials to be provided. The Sub-contractor shall be fully responsible for the comprehensive application design, manufacture, supply, installation, testing and commissioning to meet the project requirements, whether or not installation details are indicated in the Specification and/or on the Drawings;

ELE2.1.15.030.7 EXECUTION OF WORK FOR MECHANICAL VENTILATION SYSTEM

The Sub-contractor shall employ a registered ventilation contractor to supply, install, commission, test and maintain the complete systems and to issue ventilation certificates to the Contract Manager during the Maintenance Period where required by Building (Ventilating Systems) Regulations.

ELE2.1.15.040.7 EXTRACTION SYSTEM FOR VEHICLE EXHAUST

Extraction system for vehicle exhaust shall be provided for the refuse collection point when specified in the Project Specific Specification and shown on the Drawings.
ELE2.1.15.050.7 FILTERS FOR MECHANICAL VENTILATION SYSTEM
Outdoor air shall be filtered by washable panel filter when shown on the Drawings to improve indoor air quality and protect equipment before it enters the mechanical ventilation system.

ELE2.1.16 TRANSFORMER ROOMS/H.V. SWITCH ROOMS

ELE2.1.16.010.7 SCOPE OF INSTALLATION FOR POWER SUPPLY FROM CLP
The Sub-contractor shall supply, install and connect the electrical installation comprising surface steel conduits and accessories, cables, MCB distribution board, switches, socket-outlets, lighting fittings, cable tray, etc to complete as shown on the Drawings and otherwise as specified in the Project Specific Specification.

ELE2.1.16.015.7 SCOPE OF INSTALLATION FOR POWER SUPPLY FROM HEC
The Sub-contractor shall supply, install and connect the electrical installation comprising surface steel conduits and accessories, cable, MCB distribution board, switches, socket-outlets, lighting fittings, etc to complete as shown on the Drawings and otherwise as specified in the Project Specific Specification.

ELE2.1.16.020.7 SUPPLY
The supply to the MCB distribution board will be provided by the Supply Company.

ELE2.1.16.030.7 FANS FOR CLP TRANSFORMER ROOM
1. The exhaust fan and the temperature control panel will be provided by the Supply Company but shall be collected and installed by the Sub-contractor;
2. The mounting diaphragm and flexible connection for exhaust fan shall be supplied and installed by the Sub-contractor.

ELE2.1.16.035.7 FANS FOR HEC TRANSFORMER ROOM
1. The axial flow fan and silencer will be supplied by the Supply Company and will be installed by the Main Contractor;
2. The fan control cubicle will be supplied by the Supply Company and shall be installed by the Sub-contractor.

ELE2.1.16.040.7 AIR TRUNKING
The air trunking inside the transformer rooms/switch rooms will be provided and installed by the Main Contractor.

ELE2.1.16.050.7 EQUIPOTENTIAL BONDING
The Sub-contractor shall also provide the equipotential bonding for the air trunking, steel door, etc to the earthing terminal of the MCB distribution board as shown on the Drawings.
ELE2.17 PROVISION FOR FIXED TELECOMMUNICATION NETWORK SYSTEM (FTNS) INSTALLATION

ELE2.17.010.7 CONDUIT AND TRUNKING
Except for the surface mounted conduit which shall be of G. I. type, a system of concealed PVC conduit and steel trunking together with accessories only for fixed telecommunication network system (FTNS) installation shall be provided by the Sub-contractor as shown on the Drawings.

ELE2.17.020.7 EARTHING
An earthing terminal for the FTNS equipment shall be provided by the Sub-contractor at the location as shown on the Drawings.

ELE2.17.030.7 LIGHTING IN TBE ROOMS
The Sub-contractor shall supply and install lighting fittings and switches in TBE rooms in concealed PVC conduit system as shown on the Drawings.

ELE2.17.040.7 TBE ROOM SUPPLY
The Sub-contractor shall supply, install and connect power supply system for FTNS installation consisting of switchgear, MCB board, trunking and cables in TBE room as shown on the Drawings.

ELE2.18 PROVISION FOR SECURITY SYSTEM (SE) INSTALLATION

ELE2.18.010.7 PROVISION OF SYSTEM / INSTALLATION
The Sub-contractor shall supply, install and connect the SE installation as shown on the Drawings and otherwise as specified in the Project Specific Specification and ELE24.

The detail of the building to be provided with a separate security system is specified in the Project Specific Specification.

The provision of Security System, unless otherwise stated in the Project Specific Specification or the Drawings, shall consist of the following:

1. A complete doorphone system with doorphone panel in main entrance or other entrances as indicated on the Drawings for every domestic block;
2. A complete local CCTV monitoring system for lifts and entrances at every domestic block;
3. A complete local alarm and door monitoring system at every domestic block;
4. A complete central alarm and door monitoring system;
5. A complete central CCTV system for entrances and guard counter;
6. Telephone at guard counter and in Estate Office.

ELE2.18.020.7 PROVISION OF POWER SUPPLY AND CONDUIT
1. The Sub-contractor shall provide the power supply and surface steel conduit/trunking system inside the meter/service room for SE installation;
2. A system of concealed PVC conduit together with accessories from the meter/service rooms to the domestic units and roof shall be provided as shown on the Drawings and otherwise as specified in the Project Specific Specification.

ELE2.1.19 PROVISION FOR SUBSCRIPTION TELEVISION DISTRIBUTION NETWORK (STDN) INSTALLATION

ELE2.1.19.010.7 CONDUIT AND TRUNKING

1. Except for surface mounted conduit which shall be of G.I. type, a system consisting of concealed PVC conduit and steel trunking together with accessories only for CABD & STDN installations shall be provided by the Sub-contractor as shown on the Drawings;

2. The Sub-contractor shall take the roles of coordinating other neighbouring services and determine the exact concealed conduit routes for communications installations while those given on the Drawings are for indicative and tendering purposes;

3. The Sub-contractor shall check and locate the exact location of the antenna in preparing the conduit run drawing from the meter/service room on the top floor to the roof and submit to the Contract Manager for Approval as this portion of conduit routing has not been shown on the Drawings;

4. The coordinated conduit layout for the entire CABD, STDN and any other television broadcasting distribution systems shall be submitted to the Contract Manager for approval prior to the commencement of works.

ELE2.1.19.020.7 COORDINATION

1. The Sub-contractor shall coordinate with the STDN operators and obtain a set of their exact technical requirements for installation. The Sub-contractor shall also install the CABD equipment in consideration of any space allocated for STDN installation;

2. The CABD equipment the Sub-contractor is installing shall not cause any interference that will impair the quality of to other neighbouring telecommunication services, including the STDN one.

ELE2.1.20 EARTHING AND FAULT PROTECTION

ELE2.1.20.010.7 GENERAL

This section should be read in conjunction with other Worksections relating to earthing and fault protection.

ELE2.1.20.020.7 EARTHING TERMINALS

1. An earthing terminal bonded to the reinforcement or steel piles of the building in each main switchroom will be provided by the Main Contractor as shown on the Drawings;

2. The Sub-contractor shall supervise the work and label the terminal and connect it up with copper tapes to the main earthing terminal in accordance with the Drawings;

3. The Sub-contractor shall follow Power Company Code of Practice 101 / Guide to Connection of Supply to provide bonding terminal and connection to the main earthing terminal as shown on the Drawings for bonding to the earthed point of transformer.
**ELE2.1.20.030.7 EARTH ELECTRODE**
The earth electrode shall be of rod electrode.

**ELE2.1.20.040.7 EARTHING SYSTEM FOR TBE ROOM**
In addition to earthing provided for exposed conductive parts of electrical installations in TBE room, a separate earthing system consisting of earth electrode(s), earthing conductor and earthing terminal shall be provided for telecommunication equipment as shown on the Drawings.

**ELE2.1.20.050.7 CIRCUIT PROTECTIVE CONDUCTOR**
1. For distribution boards supplying circuits for both sockets and fixed equipment, the Sub-contractor shall also check, in accordance with the offered equipment, and ensure that the impedance of the protective conductor between the exposed conductive parts and the point at which the protective conductor is connected to the main equipotential bonding of an installation does not exceed 50Zs/Uo ohms, where Zs is the earth fault loop impedance corresponding to a disconnection time of 5 sec. and Uo is the nominal voltage equivalent to 220V, failing which the Sub-contractor shall provide CPC with larger cross-sectional area wherever necessary;

2. For circuits supplying only fixed equipment within the equipotential zone, the earth fault loop impedance at every point of utilisation is such that disconnection occurs within 0.4 second or 5 seconds in accordance with Code 11B(b) (ii) of the Electrical CoP;

3. For circuits supplying fixed equipment outside the equipotential zone, the earth fault loop impedance at every point of utilisation is such that disconnection occurs within 0.2 second or 0.4 second in accordance with Code 11B(b) (iii) of the Electrical CoP.

**ELE2.1.20.060.7 EQUIPOTENTIAL BONDING FOR EXTRANEOUS CONDUCTIVE PARTS IN COMMUNAL AREA OF BUILDING**
1. Notwithstanding the provisions of the following specification on workmanship and materials for installation of cast iron piping system by Main Contractor, the Sub-contractor has the responsibility to verify that the resistance of installed cast iron pipes to main earth is not less than 45,000 Ohm even under the worst conditions (e.g. high moisture) in accordance with the Electrical CoP and if otherwise and necessary to provide the equipotential bonding in accordance with the requirements of the Electrical CoP:
   a. Use cold caulking compound for jointing of cast iron pipes and fittings in accordance with manufacturer's instruction;
   b. The pipe brackets for mounting cast iron pipe shall be lined with resilient plastic at pipe clamp;
   c. Paint cast iron pipes/fittings with at least 2 finish coats of bitumen to BS 3416 after installation.

**ELE2.1.21 LIGHTNING PROTECTION SYSTEM**

**ELE2.1.21.010.7 STANDARD**
The Sub-contractor shall supply, install and connect a lightning protection system at the roof top of Domestic Blocks as shown on the Drawings.

**ELE2.1.21.020.7 CONSTRUCTION**
The lightning protection system comprising aluminium tapes shall be complete with fixing saddles bonded to the structure as shown on the Drawings.
ELE2.1.21.030.7 EQUIPOTENTIAL BONDING
The Sub-contractor shall also provide equipotential bonding of the lightning protection system to the electrical system in accordance with the Electrical CoP.

ELE2.1.21.040.7 RESISTANCE
After the completion of the lightning protection system installation, the Sub-contractor shall measure the resistance of the down conductors between the air termination on roof and the structural earth terminal in the main switch room and report the measured results to the Contract Manager for checking purpose.

ELE2.1.22 STANDBY DIESEL GENERATING SET(S)

ELE2.1.22.010.7 APPLICATION
A standby diesel generating set shall be provided as an emergency supply to comply with the Fire Services Department requirements as shown on the Drawings.

ELE2.1.23 PROVISION FOR TOWNGAS AUTOMATIC METER READING (AMR) SYSTEM INSTALLATION

ELE2.1.23.010.7 CONDUIT AND TRUNKING
Except for surface mounted conduit which shall be of G.I. type, a system of consisting of concealed PVC conduit and steel trunking together with accessories for AMR system installation shall be provided as shown on the Drawings.

ELE2.1.24 COMMUNAL AERIAL BROADCAST DISTRIBUTION SYSTEM

ELE2.1.24.010.7 PROVISION OF SYSTEM / INSTALLATION
A complete communal aerial broadcast distribution system shall be provided as shown on the Drawings and otherwise as specified in the Project Specific Specification and ELE23.

ELE2.1.24.020.7 SPECIAL REQUIREMENTS
The special requirements are specified in the Project Specific Specification.

ELE2.1.25 PUBLIC ADDRESS SYSTEM

ELE2.1.25.010.7 PROVISION OF SYSTEM / INSTALLATION
Complete public address systems shall be provided as shown on the Drawings and otherwise as specified in the Project Specific Specification and ELE25.
ELE2.2  EXTERNAL PUBLIC LIGHTING

ELE2.2.010.7  SCOPE
The Sub-contractor shall supply, install and connect the complete external public lighting system as shown on the Drawings and otherwise as specified in the Project Specific Specification.

ELE2.2.020.7  INSTALLATION
1. Where the lighting fittings are mounted on the periphery of the block, they shall be wired in concealed conduits;
2. Power supply to each circuit of lighting fitting(s) shall be fed from MCB unit via individual residual current devices;
3. The Sub-contractor shall provide all necessary fixing facilities and accessories as recommended by manufacturers for installation of external lighting fittings as shown on the Drawings;
4. Provision of ducts, excavation, concrete foundation necessary for installation of external lighting fittings and the cement/soil filling will be carried out by the Main Contractor;
5. The Sub-contractor shall coordinate with the Main Contractor and submit drawings showing details of all builder’s works requirements necessary to complete installation of external public lighting to the Main Contractor for subsequent transmission to and Approval by Contract Manager.

ELE2.2.030.7  SWITCH CONTROL
The public lighting shall be controlled by 24 hours time switches/photocell as shown on the Drawings.

ELE2.2.040.7  FLOODLIGHTING FITTINGS
The Sub-contractor shall also be responsible for adjusting the mounting heights and aiming angles of the flood lighting fittings (if any) for the ball courts, playgrounds, etc. This may be carried out at night when required.
ELE3  LOW VOLTAGE SWITCHGEAR & ASSOCIATED EQUIPMENT
## ELE3.1  GENERAL

- ELE3.1.010.7  SCOPE ................................................. 6

### ELE3.19  SITE BUILT ASSEMBLIES .......................................... 38
- ELE3.19.010.7 SITE BUILT ASSEMBLIES ................................... 38
ELE3.1 GENERAL

ELE3.1.010.7 SCOPE
1. This section specifies the general requirements of low voltage switchgear and associated equipments which are intended for assembly on site from individual items of components. Additional and specific requirements for factory built assemblies of switchgear and controlgear are given in ELE4, the Drawings, other documents issued by the Contract Manager or Project Specific Specification;
2. The component equipments covered in this Section shall include the following:
   a. Fuse combination units and switch disconnectors;
   b. Circuit-breakers comprising moulded case circuit-breakers (MCCBs), miniature circuit breakers (MCBs) and residual current-operated circuit-breakers (RCCBs);
   c. Double-pole switch disconnectors;
   d. Fuses;
   e. Distribution boards including consumer units;
   f. Starters and contactors;
   g. Time switches;
   h. Measuring instrument;
   i. Site built assemblies.
3. The general requirements specified in ELE3.1.020 to ELE3.1.080 both inclusive shall apply to all items of switchgear and associated equipment where applicable unless explicitly mentioned otherwise.

ELE3.1.020.7 SERVICE CONDITIONS
The following conditions shall apply:
1. Ambient temperature: peak from minus 5°C to plus 40°C for 4 hours continuously with an average from 0°C to plus 35°C over only 24 hour period;
2. Relative humidity: up to 0.99 saturation.

ELE3.1.030.7 SHORT-CIRCUIT RATING AND CONTINUOUS CURRENT RATING
1. Low voltage switchgear shall be suitably rated for the specified prospective short-circuit current which can occur at the point of its installation. It shall also be rated for uninterrupted duty when carrying continuously the specified full load current. For non-automatic switching devices the rated short-time withstanding current shall be at least 12 times the continuous current rating for 1 second;
2. Where equipment components are installed in enclosures, they shall be suitable for operation at the actual maximum temperatures which will be reached within the enclosures under normal loaded conditions when the ambient temperature is 40°C.

ELE3.1.040.7 VOLTAGE RATING
Low voltage switchgear and associated equipment shall be suitable for use on 220V (single phase) or 380V (3 phase) 50Hz supply.
**ELE3.1.050.7 DEGREE OF PROTECTION FOR ENCLOSURE**
Enclosures for low voltage switchgear and associated equipment shall have an index of protection, in accordance with IEC 60529 of at least IP 30 for indoor applications and of at least IP 54 for outdoor applications.

**ELE3.1.060.7 MATERIALS**
1. Unless otherwise specified, low voltage switchgear and associated equipment except MCCBs and MCBs shall be metalclad. All ferrous metal parts shall be galvanised or chrome plated unless the final finish has been painted or enamelled in the manufacturer's factory;
2. All extraneous conductive parts shall be electrically continuous.

**ELE3.1.070.7 ON AND OFF INDICATION**
1. The design of a switching device shall incorporate some positive means to indicate clearly and reliably the ON (or CLOSE) and the OFF (or OPEN) positions of the contacts. Indication of either position shall only occur when the ON or OFF position on every pole has been attained. Such indication shall be provided on the outside of the device and shall be prominently visible to an operator when the device is installed in the normal manner;
2. When the switching device is also used for isolation purpose, then an indication of the OFF position shall occur only when all contacts are also in the OFF position and the isolating distance between contacts in every pole has attained a clearance not less than those specified in the respective equipment standards.

**ELE3.1.080.7 IDENTIFICATION OF CIRCUIT**
1. Labels or other means of identification shall be provided for every item of switchgear and associated equipment to indicate the purpose of the item. The labels shall either be fixed at the front cover or at the inside surface of the hinged front cover;
2. For a split-busbar consumer unit, the labels shall identify all outgoing MCBs which are protected by an RCCB from those which are not.
ELE3.2 SURFACE MOUNTED FUSE COMBINATION UNITS AND SWITCH-DISCONNECTORS

ELE3.2.1 GENERAL

ELE3.2.1.010.7 TYPE AND STANDARD
Surface mounted switch-disconnector fuses, fuse-switch disconnectors and switch-disconnectors (hereinafter referred to as "switching device" or "switching devices") shall be air-break, metalclad type and shall comply with IEC 60947-3.

ELE3.2.1.020.7 ARRANGEMENT
The switch-disconnector fuses or fuse-switch disconnectors shall be a combination of a switch-disconnector and one or more fuses in a composite unit.

</tbody>
</table>

ELE3.2.1.040.7 IN-SERVICE RECORDS
Prior to the time of material submission for Approval, the equipment shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.
ELE3.2.2 TYPE-TEST

ELE3.2.2.010 TEST STANDARDS
Switch-disconnector fuses, fuse-switch disconnectors and switch-disconnectors shall be type-tested in accordance with Clause 8.2 and Clause 8.3 of IEC 60947-3. For switch-disconnectors to be used in circuits protected by fuses, test sequence III of Clause 8.3.5 is not required, but test sequence IV of Clause 8.3.6 shall be performed to such switch-disconnectors connected in series with bolt-type fuse links as specified in ELE3.13.010 of the corresponding rated maximum current.

ELE3.2.2.020 TYPE-TESTING
The following test sequences of IEC 60947-3 shall be carried out by a Short Circuit Testing Organisation.
1. For fuse combination units – test sequences I & IV;
2. For switch-disconnectors – test sequences I & III.
Switch disconnectors converted from type-tested switch-disconnector fuses/fuse-switch disconnectors by replacing the fuse links with copper short links for a rated operational current not greater than the maximum rated operational current for the original switch-disconnector fuses/fuse-switch disconnectors and are installed in circuits protected by bolt-type fuses as specified in ELE3.13.010 are also acceptable.

ELE3.2.3 CONSTRUCTION AND DESIGN

ELE3.2.3.010 TYPE
Switch-disconnector fuses, fuse-switch disconnectors and switch-disconnectors shall be triple or single pole as shown on the Drawings, with detachable fully rated front accessible neutral link, or 4-pole as shown on the Drawings.

ELE3.2.3.020 CURRENT RATINGS ABOVE 100A
For fuse combination units with current ratings above 100A, the switching devices shall make and break on both the incoming supply side and the outgoing load side.

ELE3.2.3.030 CURRENT RATINGS OF 100A AND BELOW
For fuse combination units with current ratings of 100A and below, fuse bases and carriers shall be provided for housing the fuse links if the switching device are not making and breaking on both the incoming supply side and the outgoing load side.

ELE3.2.3.040 CURRENT CARRYING MATERIAL
The current carrying parts shall be made of hard drawn, high conductivity copper to BS EN 13601.

ELE3.2.3.050 ENCLOSURE
The enclosure shall be made of sheet steel of thickness not less than 1.6 mm for current ratings above 32A and not less than 1.2 mm for 32A and below, complete with stoved epoxy powder paint, or equal and Approved finish of a gloss light colour.

ELE3.2.3.060 FRONT COVER
The front cover of switching devices shall be hinged or of an equal and Approved construction, to enable easy access to the interior for replacement of fuse links. Gland plates shall be provided for top and bottom cable entry for switching devices of current ratings above 32A.
ELE3.2.3.070.7 DEGREE OF PROTECTION
1. Under normal service conditions, the enclosure shall be of totally enclosed type with a degree of protection against ingress of foreign solid bodies and liquids of at least IP41 as per IEC 60529 for the top surface and IP31 for the other surfaces of the enclosures. With the front-hinged door open and in replacing fuse links, the degree of protection to the live parts shall be at least IP2X. If the degree of protection to the neutral conductor of the live part cannot comply with this requirement, a warning label shall be provided next to the neutral conductor;

2. The switching devices shall be suitable for installation under environmental condition of pollution degree 3 unless otherwise specified.

ELE3.2.3.080.7 SPACE IN TERMINAL ENCLOSURE
1. Terminal connections shall be by means of screws so to ensure that the necessary contact pressure is maintained;

2. The terminal enclosure shall have sufficient space for accommodating cable lugs for the largest cables which the switching device is designed to receive, and also for proper cable termination with cable bending radius in accordance with the Electrical CoP otherwise proper extension cable terminals and/or cable boxes shall be provided. The palm width of the cable lugs shall comply with BS 91.

ELE3.2.3.090.7 FUSE COMBINATION UNITS
For switch-disconnector fuses or fuse-switch disconnectors, the fuse holders shall be capable of accepting any fuse links of physical dimension complying with the minimum and maximum limits of the respective fuse reference tabulated in the Specification for fuses (i.e. ELE3.13).

ELE3.2.3.100.7 EARTHING TERMINAL
An external accessible earthing terminal shall be provided at the side panel of the enclosure.

ELE3.2.4 OPERATION

ELE3.2.4.010.7 DESCRIPTION
The switching devices shall be independent manual operated and shall have mechanical interlock to prevent access to the interior except when the switching devices are in the OFF position, and to prevent the contacts from being switched to close when the door is open.

ELE3.2.4.020.7 PERFORMANCE
The latter interlock shall be able to be defeated by trained personnel for maintenance when necessary.

ELE3.2.4.030.7 SECURITY
A facility shall be provided for padlocking the switching devices in the OFF position.
ELE3.3  CIRCUIT BREAKER - GENERAL

ELE3.3.010.7  SCOPE OF CIRCUIT BREAKER
This Sub-section covers the general requirements of ACBs, MCCBs, MCBs, and RCCBs. Additional requirements relevant to particular types of circuit-breakers shall be given in ELE3.4 to ELE3.6 both inclusive.

ELE3.3.020.7  NUMBER OF POLES
Circuit-breakers shall be of four-pole, three-pole, double-pole or single-pole, as specified and shall have air-break contacts.

ELE3.3.030.7  OPERATING MECHANISM
1. The operating mechanism of a circuit-breaker shall be trip-free;
2. When an MCCB or MCB or RCCB trips and opens its contacts, the operating toggle shall automatically resume the OFF or TRIPPED position.

ELE3.3.040.7  CASING
The casing of an MCCB, an MCB, an RCCB shall be formed from an insulating material. The construction shall be capable of withstanding the appropriate rated short circuit current and reasonably rough use without fracture or distortion.

ELE3.3.050.7  CURRENT RATING
The rated current of a circuit-breaker shall be taken as that rated continuous current when the circuit-breaker is installed in the enclosure together with other equipment, if any, under normal operating conditions as shown on the Drawings.
ELE3.4  MOULDED CASE CIRCUIT BREAKERS (MCCB)

ELE3.4.1  GENERAL

ELE3.4.1.010.7 STANDARD
Moulded Case Circuit Breakers (MCCB) shall comply with IEC 60947-2.

ELE3.4.1.030.7 IN-SERVICE RECORDS
Prior to the time of material submission for Approval, the equipment shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.

ELE3.4.2  CONSTRUCTION AND DESIGN

ELE3.4.2.010.7 MCCB
1. MCCB shall be triple, double or single pole complete with overcurrent and/or earth leakage tripping device as shown on the Drawings, and suitable for direct mounting inside a metal enclosure or a cubicle switchboard. Both triple and single pole MCCB shall be provided with detachable, fully rated, front accessible neutral copper link mounted inside the enclosure;

2. a. For surface mounted MCCB cable terminals shall be at the top and bottom with access from the front;
   b. For MCCB housed in switchboard cubicles, the cable terminals shall be suitable for busbar connection;
   c. Interphase barriers shall be provided when necessary to maintain safe electrical clearance.

3. MCCB shall be type-tested and comply with the additional requirements for circuit breakers suitable for isolation in accordance with Clause 7.1.2 of IEC 60947-2.

ELE3.4.2.020.7 ENCLOSURES FOR SURFACE-MOUNTED MCCB
1. 
a. The enclosure shall be of totally enclosed type with a degree of protection against ingress of foreign solid bodies and liquids of at least IP41 as per IEC 60529, for the top surface, and IP31 for the other surfaces of the enclosures;

b. The enclosure shall conform to the type-tested standard or as recommended by the manufacturer. The front cover of the enclosure shall be hinged or equal and approved. With the front-hinged cover opened, all live parts shall be protected to IP20. If the degree of protection to the neutral conductor of the live part cannot comply with this requirement, a warning label shall be provided next to the neutral conductor;

c. The enclosure shall have sufficient space for accommodating cable lugs for the largest cables which the MCCB is designed to receive;

d. The palm width of the cable lugs shall comply with BS 91;

e. There shall also be sufficient space for proper cable termination with cable bending radius in accordance with the Electrical CoP, otherwise proper extension cable terminals and/or cable box shall be provided.

2. An external accessible earthing terminal shall be provided at the side panel of the enclosure. The enclosure shall be formed from sheet steel 1.6 mm thick;

3. All inside and outside surfaces of the enclosures shall be treated with either anti-rust protective coating followed by two stoved coats of gloss paint of contrasting colours, or an alternative acceptable finish such as phosphate treatment followed by epoxy powder paint. The finishing colour shall be approved by the Contract Manager.

ELE3.4.3 OPERATION

ELE3.4.3.010.7 OPERATING CHARACTERISTICS

1. MCCB shall have inverse time delay and instantaneous tripping time-current characteristic which cannot be inadvertently adjusted. The operating characteristic shall be such that:

   a. The time delay on overload tripping shall be inversely proportional to the overcurrent up to a threshold value of approximately 7 times the rated current or as otherwise specified;

   b. There shall be no intentional time-delay on overcurrent tripping due to short-circuit or heavy overcurrent exceeding the threshold value.

2. The operating characteristic shall be calibrated at 40°C. For earth leakage protection, the tripping current shall be as shown on the Drawings. The earth leakage relay and the zero-sequence current transformer, if any, shall comply with the relevant British Standard.

ELE3.4.3.020.7 OPERATING MECHANISM AND INDICATIONS

1. The operating mechanism shall be independent manual and trip-free. Indication of OFF position shall occur only when the specified isolation distance on each pole has been attained. Reliable visual indication of ON and OFF position and trip indication shall be provided;

2. Facilities shall be provided for padlocking the MCCB in the OFF position.

ELE3.4.3.030.7 TYPE-TEST

MCCB shall be type-tested to IEC 60947-2. Verification of short-circuit making and breaking capacity shall be carried out by a Short-Circuit Testing Organization.
ELE3.5 MINIATURE CIRCUIT BREAKERS (MCB)

ELE3.5.010.7 GENERAL
Miniature Circuit Breakers (MCBs) shall comply with IEC 60898-1 or BS EN 60898-1, suitable for 220/380V supply operation with rated current and number of poles as shown on the Drawings.

ELE3.5.020.7 CATEGORY OF DUTY
MCBs shall have a standard value of rated short-circuit capacity of not less than 4500A.

ELE3.5.030.7 TYPE
Unless otherwise specified or shown on the Drawings, MCBs shall have an instantaneous tripping operation of type B or type C in accordance with IEC 60898-1 or BS EN 60898-1.

ELE3.5.040.7 CABLE TERMINALS
Terminals suitable for terminating appropriate size of solid or stranded conductors shall be provided for the outgoing cables. The terminals shall be accessible from the front for easy cable termination.

ELE3.5.050.7 CONTACTS
Contacts shall be non-weld type.

ELE3.5.060.7 TRIPPING MECHANISM
1. Tripping elements shall be thermal magnetic type with instantaneous tripping characteristic under short-circuit conditions and inverse time delay tripping characteristic under overload conditions;
2. For domestic buildings, the double pole MCBs providing supply to domestic units before the power company's meters shall be capable of both isolating and switching the full load current of the respective circuits.

ELE3.5.070.7 OPERATING MECHANISM
Operating mechanism shall be quick break, trip free type. Where the handle is used to indicate the position of the contacts, the handle, when released, shall automatically take up the position corresponding to that of the moving contacts; in this case, the handle shall have two distinct rest positions corresponding to the position of the contacts but, for automatic opening, a third distinct position of the handle may be provided.

ELE3.5.080.7 TYPE-TEST
Full type-test certificates to Section 9 of BS EN 60898-1 or Section 9 of IEC 60898-1 shall be produced to the satisfaction of the Contract Manager. In addition, type-test to test sequences C, D and E of IEC 60898-1 or BS EN 60898-1 shall be carried out by a Short Circuit Testing Organization.
ELE3.6  RESIDUAL CURRENT OPERATED CIRCUIT BREAKERS (RCCB)

ELE3.6.010.7  PERFORMANCE
Residual current operated circuit breakers (RCCBs) shall be General type complying with IEC 61008-1, and shall be suitable for 220/380V supply operation with rated current and number of poles as indicated on the Drawings. The rated residual operating current of RCCBs shall be 30 mA unless otherwise specified. RCCBs shall not require any auxiliary source for operation. However, 2-pole RCCB requiring an integral auxiliary source for operation will still be acceptable provided that in the event of failure of integral auxiliary source through the loss of neutral, it shall either still function as a RCCB or open automatically without delay.

ELE3.6.020.7  TYPE-TEST CERTIFICATES
Full type-test certificates to Section 9 of IEC 61008-1 shall be produced to the satisfaction of the Contract Manager.

ELE3.6.030.7  CIRCUIT FAULT CURRENT TEST
1. The short circuit tests as specified in Clause 9.11 of IEC 61008-1 shall be carried out by a Short-circuit Testing Organisation;
2. For RCCBs which form part of consumer units or miniature circuit breaker distribution boards which have been satisfactorily tested in accordance with ELE3.12.4 or ELE3.11.5 respectively, the short circuit tests as specified in Clause 9.11 of IEC 61008-1 will not be required.
ELE3.7  NOT USED
ELE3.8 DOUBLE POLE SWITCH-DISCONNECTORS

ELE3.8.010.7 PERFORMANCE
1. Double Pole Switch-disconnectors shall comply with IEC 60947-3, suitable for 220V supply operation with rated current as indicated on the Drawings;
2. They shall have Utilization Category AC22A and shall be provided with facility for padlocking the switch disconnectors in the isolated position;
3. Incoming terminal shall be protected against direct contact to IP2X.

ELE3.8.020.7 TYPE-TEST REPORTS
Full type-test report to Clause 8.1.2 of IEC 60947-3 shall be produced to the satisfaction of the Contract Manager.
ELE3.9 DISTRIBUTION BOARDS - GENERAL

ELE3.9.010.7 SCOPE OF DISTRIBUTION BOARDS
This sub-section covers the general requirements of MCCB distribution boards. Additional requirements relevant to a particular type of MCCB distribution board shall be given in ELE3.10.

ELE3.9.020.7 CONSTRUCTION OF ENCLOSURE
1. The enclosure of a distribution board shall be constructed from sheet steel, rust proofed and baked enamedelled or stove epoxy powder painted;
2. The construction shall be of robust design, capable of withstanding the mechanical, electrical and thermal stresses under all working conditions, including fault conditions.

ELE3.9.030.7 ARRANGEMENT OF COMPONENT PARTS
1. Distribution boards shall include all necessary components and accessories to form a complete assembly;
2. Components and accessories shall be firmly fixed in position in the distribution board, and shall be assembled in such a way that it shall be possible to remove or replace any component parts and to carry out cable connections from the front;
3. Ample space shall be allowed for cabling;
4. MCCBs shall be arranged neatly in a row or rows;
5. All components shall be totally concealed: only the toggles of the MCCBs shall protrude through the cover plate of the distribution board.

ELE3.9.040.7 BUSBARS
All busbars shall be of hard drawn copper having ratings as specified and shall be electro-tinned. Neutral busbars shall be of the same CSA as the phase busbars, and shall have adequate number of terminals for all outgoing circuits including spare ways.

ELE3.9.050.7 EARTHING TERMINALS
1. Every distribution board shall be provided with an external earthing terminal for connection to the main earthing terminal. In addition, a multi-terminal connector shall be provided within the distribution board for connection of protective conductors of all outgoing circuits including spare ways;
2. Both the external earthing terminal and the multi-terminal connector for protective conductor shall be of hard drawn electro-tinned copper and shall be labelled in accordance with the requirements of IEC 60439-1.

ELE3.9.060.7 PROVISION OF SPARE WAYS
Each distribution board shall be provided with spare ways for future expansion. For new installations, the number of spare ways shall not be less than 20% of the total number of outgoing ways in the distribution board. Each spare way shall be blanked off with a suitable blanking plate having a finish comparable to that of the distribution board.
ELE3.9.070.7 SHROUDING OF LIVE PARTS

1. All conductive parts shall be properly shrouded against accidental contact by means of rigid barriers, partitions of insulating materials such that accidental contact can be prevented during operation of component replacement or cable connection;

2. All conductive structural parts of the distribution boards shall comply with the protective circuit requirements of IEC 60439-1.
ELE3.10 MOULDED CASE CIRCUIT BREAKER (MCCB) DISTRIBUTION BOARDS

ELE3.10.010.7 GENERAL
1. The enclosure of an MCCB distribution board shall be constructed from sheet steel having a thickness of not less than 1.5 mm, and shall be designed for general commercial and light industrial applications;
2. The design, construction and testing specifications of the distribution boards shall comply with IEC 61439-1 and IEC 61439-2, or IEC 60439-1.

ELE3.10.020.7 TYPE OF MCCB DISTRIBUTION BOARD
1. MCCB distribution boards shall be of two types, viz. Type A and Type B. Type A MCCB distribution board shall be suitable for accommodating, in any combination, the double-pole and triple-pole MCCBs of 100A frame size. Type B MCCB distribution boards shall be suitable for accommodating triple-pole MCCBs of 225A frame size;
2. All MCCB distribution boards shall each be provided with a moulded-case isolating switch having a current rating not less than that of the supply side protective device. The moulded-case isolating switch shall meet the relevant requirements of ELE3.1 and ELE3.2.

ELE3.10.030.7 BUSBARS
1. MCCB distribution boards shall be provided with vertical triple-pole and neutral copper busbars of rating not less than that of the supply side protective device subject to a minimum of 250A;
2. The configuration of the busbars, busbar supports and busbar mounting arrangement shall be type-tested to a short-time withstanding current of not less than 14 kA in the case of type A boards or 22 kA in the case of type B boards for 0.2 seconds at a voltage of not less than 380V;
3. Outgoing MCCBs shall be mounted horizontally on both sides of the vertical busbars. The connection between the MCCBs and the phase busbars shall be by means of copper tapes and bolted joints. Plug-in type of current carrying contacts shall not be accepted.
ELE3.11 MINIATURE CIRCUIT BREAKER (MCB) DISTRIBUTION BOARDS

ELE3.11.1 GENERAL

ELE3.11.1.010.7 TYPE

Miniature Circuit Breaker Distribution Boards (MCB boards) shall be of surface mounted and enclosed type, and shall comply with IEC 60439-3 or BS EN 60439-3.

ELE3.11.1.020.7 GUARANTEE OF TYPE TEST EQUIVALENCE

In cases where miniature circuit breaker distribution boards are manufactured under licence from a Principal Company, letters of guarantee for products manufactured by the licensee from the Principal Company shall be produced to prove that such products are equivalent, in every respect, to the type-tested products.

ELE3.11.1.030.7 IN-SERVICE RECORDS

Prior to the time of material submission for Approval, the equipment including its major components shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.

ELE3.11.3 ENCLOSURE

ELE3.11.3.010.7 CONSTRUCTION

MCB boards shall be fabricated from sheet steel with a thickness of not less than 1.2 mm. They shall be robustly constructed and rustproof.
FINISH

All inside and outside surfaces of the enclosure shall be treated with either anti-rust protective coating followed by two stoved coats of gloss paint of contrasting colours or an alternative acceptable finish such as phosphate treatment followed by stove epoxy powder paint. The finishing coat shall be approved by the Contract Manager.

KNOCKOUTS

Knockouts of appropriate size shall be provided on the top and bottom of the enclosure.

FASTENING DEVICE

The fastening device (e.g. screws) for fixing the cover to the enclosure shall be captive and shall not cause damage to the enclosure during fastening and loosening.

DEGREE OF PROTECTION

1. The degree of protection for the enclosure with all functional units and blanking plates fitted shall be at least IP41 and IP 31 for the top surface and other surfaces respectively;

2. If any cover or blanking plate can be removed without a tool, the degree of protection against direct contact with live parts shall be at least IP 2X with the cover or blanking plate removed;

3. With the front cover removed or in replacing the MCB unit, any live parts which cannot be isolated by the MCB board's integral incoming switch-disconnector shall be provided with barrier or other means affording a degree of protection at least IP 2X. If the degree of protection to the neutral conductor of the live part cannot comply with this requirement, a warning label bearing "DANGER - 危险" in red legible letters and characters each not less than 10 mm high shall be provided next to the neutral conductor. And, if the MCB board is not provided with an integral incoming switch disconnector, a warning notice shall be placed in such a position that any person gaining access to live parts will be warned of the need to use the appropriate isolating device.

DANGER LABEL

A label bearing "DANGER - 危險" in red legible letters and characters each not less than 10 mm high shall also be provided on the cover.

COMPONENTS AND ARRANGEMENT

SPECIFICATION

The functional units such as MCBs, RCCBs, switch-disconnectors etc. shall comply with the relevant BS EN/BS/IEC and the relevant sections in this Specification.

MOUNTING ARRANGEMENT

All the MCBs, RCCB (if provided) and switch-disconnectors (if provided) shall be mounted in a straight line manner and fixed firmly in position. The toggles of all devices shall be projected through the front panel of the MCB board. The on and off identifications for all these devices shall be clearly visible such that the close or open state of the devices shall be easily distinguished when they are mounted in the normal service position.
ELE3.11.4.030.7 MAIN BUSBARS
The main busbars shall be copper to BS EN 13601 and be completely tinned. Fixing of busbars shall not rely on any functional unit.

ELE3.11.4.040.7 NEUTRAL TERMINAL BLOCK
The neutral terminal block, where specified, shall allow the connection of copper conductors having current carrying capacity of the phase conductor. The number of outgoing terminals in the neutral blocks shall not be less than the maximum number of outgoing circuits.

ELE3.11.4.050.7 EARTHING TERMINAL BLOCK
The earthing terminal block shall be provided with sufficient terminals for the incoming and maximum number of outgoing circuits.

ELE3.11.4.060.7 SPACING
Sufficient space shall be provided for wiring and termination after all the functional units are fixed in position.

ELE3.11.4.070.7 MOUNTING
The functional units, terminal blocks, busbars, incoming switch-disconnector, etc. shall be mounted as skeleton units or on a backplate. The skeleton units shall not be disintegrated for the removal or replacement of any functional unit.

ELE3.11.4.080.7 REMOVAL
Removal of any skeleton unit or the backplate, replacement of MCB, or termination of cable shall not disturb or loosen the other components or wiring.

ELE3.11.4.090.7 STEEL SCREWS
All steel screws shall be zinc plated or chromate coated. Self tapping screws are not acceptable.

ELE3.11.4.100.7 IDENTIFICATION
1. For MCB board designed to incorporate both multi-pole and single pole MCBs, phase and neutral colour identification shall be provided adjacent to each MCB outgoing way and neutral connection;
2. Ferrules shall be provided for wires, including earthing, phase and neutral conductor, throughout the distribution board internally for circuit identification.

ELE3.11.4.110.7 CIRCUITY
The circuitry of the MCB board shall be as shown on the Drawings.

ELE3.11.5 TYPE-TEST

ELE3.11.5.010.7 STANDARD
MCB boards shall be type-tested to Clause 8 of BS EN 60439-3 or IEC 60439-3. Partially type-tested assemblies (PTTA) will only be accepted provided that the non-type-tested arrangements are derived from and have been verified to comply with the standard of the type-tested ones and/or been tested to the satisfaction of the Contract Manager. PTTA shall be verified and substantiated by test certificates/reports and/or graphs, calculations, etc. together with the details of the type-tested arrangement from which the PTTA is derived.
ELE3.11.5.020.7 VERIFICATION

The short-circuit strength of the MCB board shall be type-tested and verified by a Short Circuit Testing Organization with the conditional short-circuit current specified in ELE3.11.2.

ELE3.11.5.030.7 SHORT-CIRCUIT

The short-circuit shall be made as follows:

1. For MCB boards designed to incorporate single pole MCBs only: across the phase and neutral;

2. For MCB boards designed to incorporate DP MCBs: across each phase and neutral. If the busbars in all phases are equally constructed and subject to the Approval of the Contract Manager, partially type tested assembly (PTTA) will be acceptable;

3. For MCB boards designed to incorporate TP and/or SP MCBs: across the three phases. Where a neutral bar exists, it shall be subjected to one test to prove its short-circuit withstand strength in relation to the nearest phase bar for the conditional short-circuit current specified in ELE3.11.2;

4. The bolted short-circuit connection shall be provided immediately at the terminals of the outgoing functional unit. The prospective short-circuit current shall pass through the integral incoming switch-disconnector (if provided), the main busbars, the neutral busbar (if provided), RCCB (if provided) and SP, DP or TP MCBs, as appropriate, located at the farthest position from the incoming supply point.
ELE3.12 CONSUMER UNITS

ELE3.12.1 GENERAL

ELE3.12.1.010.7 STANDARD
Consumer units shall comply with IEC 60439-3 or BS EN 60439-3 and shall be tropicalised for use in Hong Kong.

ELE3.12.1.020.7 GUARANTEE OF TYPE-TEST EQUIVALENCE
In case where consumer units are manufactured under licence from a Principal Company, a letter of guarantee for products manufactured by the licencee from the Principal Company shall be produced to prove that such products are equivalent, in every respect, to the type-tested standard products.

ELE3.12.1.030.7 IN-SERVICE RECORDS
Prior to the time of material submission for Approval, the equipment including its major components shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.

ELE3.12.2 ENCLOSURE

ELE3.12.2.010.7 CONSTRUCTION
Consumer units shall be fabricated from sheet steel with a thickness of not less than 1.2 mm for the enclosures, cover plates and hinged covers. They shall be robustly constructed and rustproof. The hinged covers shall be capable of covering up all functional units including labels fitted on the consumer units. The hinged covers together with hinges shall be so designed and fixed to the enclosures to enable their easy removal when and where required without causing any damage to the finish or impairing the integrity and the specified IP of the cover plates and enclosures.

ELE3.12.2.020.7 FINISH
1. All inside and outside surfaces of the enclosure, cover plate and hinged cover shall be treated with, either anti-rust protective coating followed by two stoved coats of gloss paint of contrasting colours, or an alternative acceptable finish such as phosphate treatment, followed by two stoved coats of gloss paint of contrasting colours, or an alternative acceptable finish such as phosphate treatment followed by stoved epoxy powder paint;
2. The finishing colour shall be the manufacturer’s standard colour or a standard alternative light gray colour RAL 9002 according to the Classic RAL System, subject to the approval of the Contract Manager.

ELE3.12.2.030.7 KNOCKOUTS
Knockouts of appropriate size on the top and rear of the enclosure shall be provided.

ELE3.12.2.040.7 FASTENING DEVICE
The fastening device (e.g. screws) for fixing the cover plate/cover to the enclosure shall not cause damage to the enclosure during fastening and loosening. Hinges and screwed connections shall be properly designed and fixed to ensure permanent good conductivity between the enclosure, cover plates and hinged covers.
**ELE3.12.2.050.7 DEGREE OF PROTECTION**

The degree of protection for the enclosure shall be at least IP 41 with all the functional units and blanking plates fitted.

**ELE3.12.3 COMPONENTS AND ARRANGEMENT**

**ELE3.12.3.010.7 COMPONENTS**

Each consumer unit shall comprise, but not be limited to, the following items:

1. Tinned main copper busbars to BS EN 13601;
2. A double pole switch-disconnector;
3. A residual current operated circuit breaker (RCCB);
4. An assembly of miniature circuit breakers (MCBs);
5. Multi-terminal bar(s) for neutral conductors with one hole and screw of suitable size for each way; the bar(s) shall be properly supported to and insulated from the backplate or enclosure;
6. A multi-terminal bar for circuit protective conductors with one hole and screw of suitable size for each way, earthing lead and two bonding conductors;
7. Rigidly fixed but removable metal backplate or mounting rail assembly;
8. Plastic labels for incoming and outgoing circuits and RCCB on the cover;
9. Rigid blanking plates; and
10. Interconnecting tinned copper bars of appropriate rating to BS EN 13601 or copper cables of appropriate rating to BS EN 50525-2-31.

**ELE3.12.3.020.7 CIRCUITRY**

The circuitry of the consumer unit shall be as shown on the Drawings.

**ELE3.12.3.030.7 SPECIFICATION**

The functional units such as MCBs, RCCB, switch-disconnector, etc. shall comply with the relevant BS/BS EN/IEC and the relevant sections in this Specification.

**ELE3.12.3.040.7 MOUNTING ARRANGEMENTS**

All the MCBs, RCCB and switch-disconnector shall be mounted in a straight line manner and fixed firmly in position so as not to allow any lateral movement. Except for rotary type, the toggles of all devices shall be operated in the same direction and projected through the front panel of the unit. The on and off identifications for all these devices shall be clearly visible such that the close or open state of the devices shall be easily distinguished when they are mounted in the normal service position.

**ELE3.12.3.050.7 SPACING**

Sufficient space shall be provided for wiring and termination after all the circuit breakers are mounted in position.

**ELE3.12.3.060.7 MOUNTING**

All the MCBs, RCCB, switch-disconnector, main busbars and the interconnecting copper bars or cables shall form an integral assembly on the metal backplate or mounting rail in such a way that it can be easily removed from the enclosure without disintegration.
**ELE3.12.3.070.7 MULTI-TERMINAL BARS**

The multi-terminal bars for neutral and circuit protective conductors shall be fixed securely and held captive so that they cannot be rotated. These bars shall be of copper to BS EN 13601.

**ELE3.12.3.080.7 STEEL SCREWS**

All steel screws within the unit shall be zinc plated or chromate coated.

**ELE3.12.4 TYPE-TEST**

**ELE3.12.4.010.7 STANDARD**

Consumer units shall be type-tested to Clause 8 of BS EN 60439-3 or IEC 60439-3. Partially type-tested assemblies (PTTA) will only be accepted provided that the non-type-tested arrangements are derived from and have been verified to comply with the standard of the type-tested ones and/or been tested to the satisfaction of the Contract Manager. PTTA shall be verified and substantiated by test certificates/reports and/or graphs, calculations, etc. together with the details of the type-tested arrangement from which the PTTA is derived.

**ELE3.12.4.020.7 VERIFICATION**

The short-circuit strength of the consumer unit shall be type-tested and verified by a Short Circuit Testing Organization in accordance with Annex ZA to BS EN 60439-3 or IEC 60439-3 at 16 kA minimum.
ELE3.13 FUSES

ELE3.13.010.7 GENERAL

1. Fuses shall comply with IEC 60269-1, IEC 60269-2 and BS 88:Section 2.2 or BS 88-2;

2. Fuses of compact dimensions to BS 88:Part 6 or BS 88-2 are only acceptable for metering circuits and/or control circuits provided that the rated breaking capacity of the fuse shall exceed the prospective short-circuit current at the point where the fuse is installed;

3. All fuses shall be of a.c. rating and their current ratings shall be as shown on the Drawings;

4. Fuse links shall be certified to use and shall bear the marking of "ASTA 20 CERT" or a similar and Approved Equivalent Quality Surveillance Scheme;

5. Unless otherwise specified, fuse links shall be of current limiting type with full-range breaking capacity for general application (i.e. Utilization Category "gG"). Fuse links shall have conventional fusing current not more than 1.45 times the rated current under the intended service conditions;

6. Fuse links other than those to be used in fuse combination units shall be provided with fuse holders. The maximum power dissipation of the fuse link shall not exceed the maximum rated power acceptance of the fuse holder under the intended service conditions;

7. When fuse holders are specified, the degree of protection against electric shock for the complete fuse shall be IP3X under normal service conditions. When replacing the fuse link or removing the fuse carrier, the degree of protection against electric shock shall be at least IP2X;

8. Type-test certificates and reports, time/current characteristics, cut-off characteristics, pre-arcing and operating \(I^2 t\) characteristics and Letter of Authorisation to use "ASTA 20 CERT" endorsement or similar documents shall be submitted for reference and examination if required.

ELE3.13.020.7 FUSES TO BS 88:SECTION 2.2

1. Fuses shall comply with IEC 60269-1, IEC 60269-2 and BS 88:Section 2.2 or BS 88-2;

2. When the fuse link is to be used in a fuse combination unit, its rated power dissipating shall not exceed that of the fuse link used in carrying out the temperature-rise type test of the unit;

3. The physical dimensions of the fuse links shall be as shown in the following table:

<table>
<thead>
<tr>
<th>Current rating of fuse link (I)</th>
<th>Dimension as fuse reference of BS 88:Section 2.2 or BS 88-2</th>
</tr>
</thead>
<tbody>
<tr>
<td>(32 &gt; or = I)</td>
<td>A2</td>
</tr>
<tr>
<td>(32 &lt; I &lt; or = 63)</td>
<td>A3</td>
</tr>
<tr>
<td>(63 &lt; I &lt; or = 100)</td>
<td>A4 or B1</td>
</tr>
<tr>
<td>(100 &lt; I &lt; or = 200)</td>
<td>B2</td>
</tr>
<tr>
<td>(200 &lt; I &lt; or = 315)</td>
<td>B3</td>
</tr>
<tr>
<td>(315 &lt; I &lt; or = 400)</td>
<td>B4 or C1</td>
</tr>
<tr>
<td>(400 &lt; I &lt; or = 630)</td>
<td>C2</td>
</tr>
</tbody>
</table>
For fuse links rated at or below 100A mounted in cubicle switchboard, the physical dimensions of the fuse links as shown in Fig. 1 of BS 88:Section 2.2 or Figure 501 of BS 88-2 are also acceptable;

4. Fuses shall be type-tested to IEC, 60269-1, IEC 60269-2 and BS 88:Section 2.2 or BS 88-2. Type-test of 'Verification of Breaking Capacity' shall be carried out by a Short-Circuit Testing Organisation.

ELE3.13.030.7 FUSES TO BS 88:PART 6

1. Fuses of compact dimensions shall comply with IEC 60269-1 and BS 88:Part 6 or BS 88-2;

2. Fuses shall be type-tested to IEC 60269-1 and BS 88:Part 6 or BS 88-2. Type test of 'Verification of Breaking Capacity' shall be carried out by a Short-Circuit Testing Organisation.
ELE3.14  NOT USED
ELE3.15 CONTACTORS

ELE3.15.1 GENERAL APPLICATION

ELE3.15.1.010.7 STANDARD
Contactors shall comply with IEC 60947-4-1.

ELE3.15.1.030.7 CONSTRUCTION AND DESIGN
1. Contactors shall be four-pole, triple-pole, double-pole or single-pole as shown on the Drawings;
2. The mechanical endurance of the contactors shall not be less than 3 million no-load operating cycles;
3. Unless otherwise specified, the number of on-load operating cycles for category AC-3 shall not be less than 1/20 of the number of no-load operating cycles corresponding to the mechanical endurance of the contactor;
4. Contactors shall be silver or silver-faced;
5. Insulation shall be of class B of IEC 60085.

ELE3.15.1.040.7 OPERATION
Contactors shall be electro-magnetically controlled, double air-break type. The rated control circuit voltage shall be the same as that of the main circuit; otherwise it shall be 24V, 30V or 110V d.c. as specified.

ELE3.15.1.050.7 UTILISATION CATEGORY
1. Unless otherwise specified, contactors shall be of utilisation category AC-2 for general application;
2. For special applications described in clause ELE3.15.2, the utilisation categories of the contactors used shall comply with the correspondent requirements accordingly. Contactors with utilisation category other than the stipulated categories are acceptable provided that the test currents, voltages, power factors or time constants, number of operating cycles, the on and off times given in the Tables 7 and 8 of IEC 60947-4-1 and the test circuit for the assigned utilisation categories are not more severe than those of the contactor has been tested and the temperature rise has been verified at a current not less than the highest assigned rated operational current in continuous duty.

ELE3.15.1.060.7 TYPE TESTS
Contactors shall be type-tested to IEC 60947-1 and IEC 60947-4-1. Full type-test certificates shall be produced to the satisfaction of the Contract Manager.
ELE3.15.2 SPECIAL APPLICATIONS

ELE3.15.2.010.7 CHANGEOVER CONTACTORS FOR CUBICLE TYPE SWITCHBOARD
1. Two identical contactors, mechanically and electrically interlocked such that only one of them can be closed at any one time, shall be used;
2. Each changeover contactor shall be enclosed in a separate and segregated compartment with a hinged front door as specified in ELE4.2.050. The contactor shall be provided with phase barriers and arcing chutes where applicable. At least one "a" contact and one "b" contact shall be provided for each contactor;
3. Contactors shall be rated for AC-3 utilisation category and intermittent duty of Class 30. When the main contacts of a contactor remain closed at either the main supply side or the essential supply side, the contactor shall be suitably rated for the specified current for uninterrupted duty;
4. Prior to the time of material submission for approval, the equipment shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.

ELE3.15.2.020.7 CONTROL CONTACTORS FOR POWER FACTOR CORRECTION EQUIPMENT
1. The contacts shall be of quick break and have a high arc resistance during switching operation;
2. Contactors shall be of utilisation category AC-6b and specifically designed for switching direct connected capacitor banks with intermittent duty of Class 30.

ELE3.15.2.030.7 CONTACTORS FOR MOTOR STARTER
1. Contactors for star/delta starting or reversing contactors shall be fitted with the necessary mechanical and electrical interlocks;
2. Contactors shall be of utilisation category AC-3 for general motor circuits and AC-4 for motor circuits with plugging or inching facilities. Contactors for motor starters of AC-3 utilisation category shall be of uninterrupted duty and intermittent duty Class 12, 60% on-load factor; and contactors for AC-4 category shall be of intermittent duty Class 30, 60% on-load factor.

ELE3.15.2.040.7 CONTROL CONTACTORS FOR DISCHARGE LAMPS
Contactors shall be of utilisation category AC-5a for electric discharge lamps. Also it shall be specifically designed for switching operations of the lamps with intermittent duty of Class 30.

ELE3.15.2.050.7 CONTROL CONTACTORS FOR HERMETIC REFRIGERANT COMpressor MOTORS
Contactors shall be of utilisation category AC-8a for hermetic refrigerant compressor motors with manual reset of overload releases and AC-8b for the one with automatic reset of overload releases. Also it shall be specifically designed for switching operations of these items with intermittent duty of Class 30.
ELE3.16 STARTERS

ELE3.16.010.7 GENERAL
Starters shall be air-break triple pole electromagnetic contractor type and shall comply with and be tested to IEC 60947-4-1 or EN 60947-4-1. Unless otherwise specified, each starter shall comprise an isolating device, a thermal overload protective device, main and auxiliary contacts, on/off controls and indications.

ELE3.16.020.7 UTILISATION CATEGORY
Starters shall be of utilisation categories AC-3 for general motor circuits and AC-4 for motor circuits with plugging or inching facilities. Motor starters for AC-3 utilisation category shall be of both uninterrupted duty and intermittent duty Class 0.1 60% on-load factor. Starters of category AC-4 shall be of intermittent duty Class 0.3 60% on-load factor.

ELE3.16.030.7 MECHANICAL AND ELECTRICAL ENDURANCE
1. The mechanical and electrical endurance of the starters shall be tested in accordance with IEC 60947-4-1 or EN 60947-4-1;
2. The mechanical endurance of the starters shall not be less than 0.1 million no-load operating cycles for category AC-3 starters and 0.3 million no-load operating cycles for AC-4 starters;
3. The number of on-load operating cycles for category AC-3 starters shall not be less than 1/20 of the number of no-load operating cycles corresponding to the mechanical endurance of the starters.

ELE3.16.040.7 THERMAL OVERLOAD RELAY
Thermal overload relay shall be Type B compensated for ambient temperature of 40°C and have a setting range of 50% - 150% rated operational current.

ELE3.16.050.7 AUXILIARIES
For assisted start starters, timers shall be solid state plug-in type with 0 - 15 seconds setting. For star/delta and reversing starters, mechanical and electrical interlocks shall be fitted with the contactors.
ELE3.17 TIME SWITCHES

ELE3.17.010.7 OPERATION
Time switches shall be self-starting and driven by synchronous motor or an electronic operated clock.

ELE3.17.020.7 MOUNTING/HOUSING
Time switches shall be suitable for either flush, surface or panel mounting as specified in ELE2 and shall be housed in metal or robust moulded plastic enclosure with a removable clear plastic front cover.

ELE3.17.030.7 RATING
The time switches shall be rated at 15A (Resistive load) unless otherwise specified. The time accuracy shall be within ±1 second per day.

ELE3.17.040.7 FEATURES
1. An automatic rewind spring reserve or lithium/NiMH battery backup, of not less than 72 hours, to drive the mechanism during power interruption;
2. A 24-hour dial with at least 2 "ON-OFF" operation cycles everyday;
3. An on/off or test switch to enable the circuit to be controlled at will without affecting the normal dial operation;
4. A minimum time setting period of 15 minutes shall be achievable.
MEASURING INSTRUMENTS

ELE3.18.010.7 KILOWATT-HOUR METERS
1. Kilowatt-hour meters shall be suitable for small rating circuits and have rated current not less than the rating of the circuit protection MCBs at the upstream of the corresponding circuits, single-phase or three-phase, as shown on the Drawings;
2. The meters shall comply with IEC 62053-21 or EN 62053-21, with IP51 in protective enclosure for indoor meters;
3. The meters shall be of direct connection type and without external CT required for measurement;
4. The meters shall be mounted on a DIN rail and housed inside a metal enclosure with the display exposed to view on the front cover;
5. The display of the meter shall show the accumulative reading in kilowatt-hour and have minimum 4 digits. The reading shall be maintained even under power interruption and be continued upon power resumption;
6. The accuracy of the meters shall not be less than Class 2 according to IEC 62053-21. Manufacturer's calibration certificate shall be issued for every batch of meters;
7. The meters shall comply with the Electromagnetic Compatibility (EMC) requirements in accordance with IEC 61000-4-2, IEC 61000-4-3, IEC 61000-4-4 and IEC 61000-4-5 standards.

ELE3.18.020.7 AMMETERS AND VOLTMETERS
1. a. Ammeters and voltmeters shall be of moving iron type or moving magnet type or moving coil with transducer type, complying with IEC 60051-1 and IEC 60051-2;
   b. The accuracy class shall be "2.5" or better in accordance with IEC 60051-1 and IEC 60051-2;
   c. The dial shall have a nominal diameter of approximate 75 mm and shall have a minimum scale deflection of 90°.
2. a. An ammeter for any circuit of rating up to 60A may be connected directly in series with the circuit, so that the full circuit current passes through the instrument;
   b. For a circuit of rating exceeding 60A, the ammeter shall be fed through the secondary winding of a current transformer, and shall give a scale deflection with a secondary current of 5A.

ELE3.18.030.7 CURRENT TRANSFORMERS
Current transformers for use with measuring instruments shall comply with IEC 60044-1 having rated secondary current of 5A and rated output suitably matched with the burden of the measuring instrument.

ELE3.18.040.7 SELECTOR SWITCH FOR AMMETER
1. Where a single ammeter is used to measure the current in each phase, or the neutral of a three phase circuit, the ammeter shall be connected to a selector switch which shall enable the ammeter to be inserted in series with each phase and the neutral in turn;
2. When the ammeter is connected to the secondary windings of the measuring current transformers, the selector switch shall have facilities to prevent the current transformers from being open circuited during change-over and at OFF position.

ELE3.18.050.7 SELECTOR SWITCH FOR VOLTMETERS

1. In three phase circuits, in which a single voltmeter is used to measure the voltage, the voltmeter shall be provided with a selector switch to enable the following voltages to be measured:
   a. Voltage between each phase to neutral;
   b. Voltage between any two phases.

2. The selector switch shall also have an OFF position.

ELE3.18.060.7 MOUNTING POSITION OF SELECTOR SWITCHES

Selector switches for ammeters or voltmeters shall be mounted immediately below the meters with which they are associated.

ELE3.18.070.7 METER CHAMBERS

1. Construction:
   a. Meter chambers for housing watt-hour meters shall be made of galvanised steel not less than 1.6 mm thick and shall be of ample size to accommodate the required number of watt-hour meters and meter cables;
   b. Provision shall be made to enable the watt-hour meters to be fixed inside the chamber without removing the chamber from the wall or other supports;
   c. Meter fixing screws shall not project through the back of the chamber.

2. Front covers:
   a. When a meter chamber is installed indoors, it shall be fitted with a hinged metal front cover;
   b. Meter chambers installed outdoors shall be waterproof, with screw-on type front covers;
   c. The degree of protection in the latter case shall be of at least IP54 in accordance with IEC 60529.

3. Windows:
   a. Glass windows shall be provided in the front covers of meter chambers to enable the registers of the watt-hour meters to be read easily;
   b. A window shall be provided for each meter, and the size of the window shall be large enough to enable the serial number of the meter and the register to be clearly visible.

ELE3.18.080.7 MOUNTING OF CURRENT TRANSFORMERS ASSOCIATED WITH A WATT-HOUR METER

1. Current transformers, if required in association with a watt-hour meter, may be mounted inside the meter chamber, or in a separate current transformer chamber, as dictated by the circumstances of each particular job;

2. When current transformers are mounted in the meter chamber, the front cover shall be arranged so that the opening or removal of the front cover to gain access to the meters will not expose the current transformers;

3. A separate cover giving access to the current transformers compartment shall be provided;
4. Suitable engraved labels shall be fixed on the covers to identify the installed equipment therein.

ELE3.18.090.7 IDENTIFICATION OF INSTRUMENTS

Each measuring instrument shall be identified by means of a label fitted under the associated instrument. This label shall denote the function of the circuit connected to the meter.
ELE3.19 SITE BUILT ASSEMBLIES

ELE3.19.010.7 SITE BUILT ASSEMBLIES

Site built assemblies of switchgear and controlgear shall be constructed, assembled and installed in accordance with ELE2 or the Drawings. They shall also comply with and be tested to the relevant BS EN/BS/IEC Specifications.

ELE4.1 GENERAL

ELE4.1.005.7 STANDARDS
1. Switchboards shall be constructed to fully comply with either IEC 60439-1 standard, or alternatively the new IEC 61439-1 and IEC 61439-2 standards.
2. All switchboards provided for the Contract shall comply with the same standard(s).

ELE4.1.010.7 SWITCHBOARDS (FOR IEC 60439 COMPLIANCE)
1. Switchboards shall be low-voltage switchgear and controlgear assemblies (hereinafter referred to as "ASSEMBLY" or "ASSEMBLIES") in full compliance with IEC 60439-1. They shall be of the enclosed, stationary, floor-standing, multi-cubicle type ASSEMBLIES for indoor use;
2. The manufacturer shall operate quality management system including design, manufacture, installation and maintenance of the ASSEMBLIES conforming to ISO 9001 and be certified by a certification body which is accredited by one of the following accredited bodies:
   a. Hong Kong Accreditation Services (HKAS);
   b. An accredited body considered as having equivalent standard by the Development Bureau.
3. In the case where the ASSEMBLIES are manufactured under licence from a Principal Company, a letter of guarantee from the Principal Company shall be produced to prove that the products manufactured by the licences are equivalent, in every respect, to those type-tested standard products;
4. Prior to delivery to Site, the ASSEMBLIES shall have satisfactory proven record of reliability in local application for a minimum period of 12 months which shall be established after the satisfactory completion of the type tests stipulated in ELE4.1.030;
5. All materials and components used in the ASSEMBLIES shall be of the same make and brand of the type tested ones. Alternative materials or components will not be accepted without prior Approval;
6. The switchboards shall adopt the full compliance of IEC 60439-1 as a whole.

ELE4.1.015.7 SWITCHBOARDS (ALTERNATIVE TO CLAUSE ELE4.1.010 FOR IEC 61439 COMPLIANCE)
1. Switchboards shall be low-voltage switchgear and controlgear assemblies (hereinafter referred to as "ASSEMBLY" or "ASSEMBLIES") in full compliance with IEC 61439-1 and IEC 61439-2. They shall be of the enclosed, stationary, floor-standing, multi-cubicle type ASSEMBLIES for indoor use;
2. The manufacturer shall operate quality management system including design, manufacture, installation and maintenance of the ASSEMBLIES conforming to ISO 9001 and be certified by a certification body which is accredited by one of the following accredited bodies:
   a. Hong Kong Accreditation Services (HKAS);
   b. An accredited body considered as having equivalent standard by the Development Bureau.
3. In the case where the ASSEMBLIES are manufactured under licence from a Principal Company, a letter of guarantee from the Principal Company shall be produced to prove that the products manufactured by the licences are equivalent, in every respect, to those verified standard products;
4. Prior to delivery to Site, the ASSEMBLIES shall have satisfactory proven record of reliability in local application for a minimum period of 12 months which shall be established after the satisfactory completion of the verification in compliance with IEC 61439-1 and IEC 61439-2 stipulated in ELE4.1.035;

5. All materials and components used in the ASSEMBLIES shall be of the same make and brand of the verified ones. Alternative materials or components will not be accepted without prior Approval;

6. The switchboards shall adopt the full compliance of IEC 61439-1 and IEC 61439-2 as a whole.

ELE4.1.020.7 TYPE-TEST (FOR IEC 60439 COMPLIANCE)

1. Switchboards shall be of type-tested assemblies (TTA). Partially type-tested assemblies (PTTA) will only be accepted provided that the non-type-tested arrangements are derived from and have been verified to comply with the standard of the type-tested ones and/or been tested to the satisfaction of the Contract Manager;

2. ASSEMBLIES, circuit breakers and fuse combination units shall be type tested to comply with IEC 60439-1, IEC 60947-2 and IEC 60947-3 respectively. They shall be suitable for installation under environment condition of pollution degree 3 unless otherwise specified;

3. Test certificates for each type-test complete with reports and drawings showing enclosures and partitions of the TTA to demonstrate the segregation of circuits, the type and thickness of insulation barriers, details of insulating supports and the clearances of equipment that passed the type-tests shall be submitted if required by the Contract Manager;

4. Verification of PTTA shall be substantiated by test certificates/reports and/or graphs, calculations, etc. together with the details of the type-tested arrangement from which the PTTA is derived.

ELE4.1.025.7 VERIFICATION (ALTERNATIVE TO CLAUSE ELE4.1.020 FOR IEC 61439 COMPLIANCE)

1. Three different but equivalent types of verification of requirements as stipulated in IEC 61439-1 shall be made for the ASSEMBLIES:
   a. Verification by testing;
   b. Verification by calculation / measurement;
   c. Verification by satisfying design rules.

2. ASSEMBLIES, circuit breakers and fuse combination units shall be verified to comply with IEC 61439-1 and IEC 61439-2, IEC 60947-2 and IEC 60947-3 respectively. They shall be suitable for installation under environment condition of pollution degree 3 unless otherwise specified;

3. Certificates for verification complete with reports and drawings showing enclosures and partitions of the ASSEMBLIES to demonstrate the segregation of circuits, the type and thickness of insulation barriers, details of insulating supports and the clearances of equipment that passed the verification shall be submitted if required by the Contract Manager;

4. Verification shall be substantiated by test certificates/reports and/or graphs, calculations, etc. together with the details of the verified arrangement from which is derived.

ELE4.1.030.7 SHORT-CIRCUIT TEST (FOR IEC 60439 COMPLIANCE)

1. ASSEMBLIES:
The following short-circuit type-tests on the main circuits of ASSEMBLIES shall be carried out by a Short Circuit Testing Organization in compliance with IEC 60439-1 at the value of short circuit currents specified in either Option 1 or Option 2 below:

<table>
<thead>
<tr>
<th>Circuit</th>
<th>Test Current</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Busbars connected to the outgoing terminals of the outgoing functional unit in accordance with paragraph (a) of Clause 8.2.3.2.3 of IEC 60439-1</td>
<td>Option 1: 40kA for 1 second when outgoing functional unit is an air circuit breaker; Prospective short-circuit current of 40kA to flow until it is broken when the outgoing functional unit is a fuse combination unit or MCCB unit. Option 2: 50kA for 1 second when outgoing functional unit is an air circuit breaker; Prospective short-circuit current of 50kA to flow until it is broken when the outgoing functional unit is a fuse combination unit or MCCB unit.</td>
</tr>
<tr>
<td>b. Main busbars including riser/droppers in accordance with paragraph (b) of Clause 8.2.3.2.3 of IEC 60439-1</td>
<td>Option 1: 40kA for 1 second when circuit is below 1600A; 40kA for 3 seconds when the circuit is 1600A or above. Option 2: 50kA for 1 second</td>
</tr>
<tr>
<td>c. Neutral busbars of the above circuits in accordance with paragraph (d) of Clause 8.2.3.2.3 of IEC 60439-1</td>
<td>Option 1: 24kA for 1 second when circuit is below 1600A; 24kA for 3 seconds when the circuit is 1600A or above. Option 2: 30kA for 1 second</td>
</tr>
<tr>
<td>d. Separate protective conductors and the terminals for the outgoing protective conductor in accordance with Clause 8.2.4.2 of IEC 60439-1</td>
<td>Option 1: 24kA for 1 second at main earth bar; Prospective short-circuit current of 24kA to flow until it is broken at outgoing protective conductor in each modular section. Option 2: 30kA for 1 second at main earth bar; Prospective short-circuit current of 30kA to flow until it is broken at outgoing protective conductor in each modular section.</td>
</tr>
</tbody>
</table>

2. Circuit breakers and fuse combination units:

The following short-circuit type-test on the circuit breakers and fuse combination units shall also be carried out by a Short Circuit Testing Organization in accordance with IEC 60947-2 and IEC 60947-3 respectively. The Option 1 or Option 2 of the test current shall correspond with that of ASSEMBLIES:
a. Air Circuit Breakers:
   i. Rated service short-circuit breaking capacities:
      - 40kA
      - 50kA
   ii. Rated short-circuit making capacity:
      - 84kA at 0.25p.f.
      - 105kA at 0.25p.f.
   iii. Rated short-time withstand current:
      - 40kA for 3 seconds for circuit of 1600A or above;
      - 40kA for 1 second for circuit below 1600A.

b. MCCBs:
   - Rated ultimate short-circuit breaking capacity:
     - 40kA
     - 50kA

c. Fuse Combination Units:
   - Rated fused short-circuit current:
     - 40kA
     - 50kA

**ELE4.035.7 SHORT-CIRCUIT WITHSTAND STRENGTH VERIFICATION**
(ALTERNATIVE TO CLAUSE ELE4.1.030 FOR IEC 61439 COMPLIANCE)

1. ASSEMBLIES:
   The following short-circuit withstand strength verification on the main circuits of ASSEMBLIES shall be carried out by a Short Circuit Testing Organization in compliance with IEC 61439-1 and IEC 61439-2 at the value of short circuit currents specified in either Option 1 or Option 2 below:

<table>
<thead>
<tr>
<th>Circuit</th>
<th>Test Current</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Busbars connected to the outgoing terminals of the outgoing functional unit in accordance with Clause 10.11.5.3.2 of IEC 61439-1</td>
<td>Option 1</td>
</tr>
<tr>
<td></td>
<td>40kA for 1 second when outgoing functional unit is an air circuit breaker; Prospective short-circuit current of 40kA to flow until it is broken when the outgoing functional unit is a fuse combination unit or MCCB unit.</td>
</tr>
<tr>
<td>b. Main busbars including riser/droppers in accordance with Clause 10.11.5.3.3 of IEC 61439-1</td>
<td>40kA for 1 second when circuit is below 1600A; 40kA for 3 seconds when the circuit is 1600A or above.</td>
</tr>
</tbody>
</table>
2. Circuit breakers and fuse combination units:

The following short-circuit type-test on the circuit breakers and fuse combination units shall also be carried out by a Short Circuit Testing Organization in accordance with IEC 60947-2 and IEC 60947-3 respectively. The Option 1 or Option 2 of the test current shall correspond with that of ASSEMBLIES:

<table>

ELE4.2  ASSEMBLIES - DESIGN AND CONSTRUCTION

ELE4.2.010.7  GENERAL ARRANGEMENT (FOR IEC 60439 COMPLIANCE)

1. ASSEMBLIES shall be formed from one or more modular sections (vertical-panel), each with a maximum width not exceeding 1000 mm and shall not accommodate more than two fuse combination units in the same row. They shall be fitted together to form a flush front continuous board of uniform height and depth front-to-back and be suitable for floor mounting without any mounting structure. ASSEMBLIES shall be pleasing in appearance and shall be extensible at both ends;

2. ASSEMBLIES shall be of the totally enclosed type with openings only for ventilating purposes. Ventilating grills or louvres located on top of the board shall be protected against ingress of condensate water (see also ELE4.2.030). In no case shall ventilating louvres be located at the front of ASSEMBLIES;

3. No forced ventilation to any components of ASSEMBLIES is allowed.

ELE4.2.015.7  GENERAL ARRANGEMENT (ALTERNATIVE TO CLAUSE ELE4.2.010 FOR IEC 61439 COMPLIANCE)

1. ASSEMBLIES shall be formed from one or more modular sections (vertical-panel), each with a maximum width not exceeding 1000 mm and shall not accommodate more than two fuse combination units in the same row. They shall be fitted together to form a flush front continuous board of uniform height and depth front-to-back and be suitable for floor mounting without any mounting structure. ASSEMBLIES shall be pleasing in appearance and shall be extensible at both ends;

2. ASSEMBLIES shall be of the totally enclosed type with openings only for ventilating purposes. Ventilating grills or louvres located on top of the board shall be protected against ingress of condensate water (see also ELE4.2.035). In no case shall ventilating louvres be located at the front of ASSEMBLIES;

3. No forced ventilation to any components of ASSEMBLIES is allowed.

ELE4.2.020.7  MECHANICAL DESIGN

1. ASSEMBLIES shall be of steel construction, self supporting, with the enclosures, covers, removable covers and cover plates made of sheet steel of not less than 2 mm thick. All removable covers and doors shall be notched and all joints shall be machined to give a rigid and smooth appearance to the satisfaction of the Contract Manager;

2. Marks of welding shall not be visible from the external surface of panels;

3. Detachable hinges shall be provided for the doors. Exposed hinges shall be bright cadmium or nickel chromium plated;

4. Gaskets shall be fitted on doors and removable covers and shall be continuous, without joints around corners, and suitably arranged to minimize the transmission of vibration, and to prevent the entry of dust.

ELE4.2.030.7  PROTECTION AGAINST ELECTRIC SHOCK AND EXTERNAL INFLUENCES (FOR IEC 60439 COMPLIANCE)

1. Protection against direct contact shall be by means of barriers of enclosures in accordance with IEC 60439-1;
2. All external surfaces of an ASSEMBLY shall have a degree of protection against ingress of solid foreign bodies and liquid of at least IP31 in the normal service condition in accordance with IEC 60439-1;

3. With the front-hinged door of the functional units open and in replacing the fuse links, the degree of protection to the live part shall be at least IP2X. If the degree of protection to the neutral conductor of the live part cannot comply with this requirement, a warning label shall be provided next to the neutral conductor;

4. The bottom of the ASSEMBLY shall be closed and made vermin-proof by means of barriers cut away, where required, to fit the cables passing through. The barriers in the cable compartment shall be made of phenolic resin bonded paper laminate sheet of a minimum thickness of 6 mm;

5. For PTTA, the construction of the enclosure shall be the same as the TTA, and be checked by visual inspection and standard test finger, if necessary, as IEC 60529;

6. Protection against indirect contact shall be by means of protective circuits in accordance with IEC 60439-1. The size and installation of the protective conductors in an ASSEMBLY shall be in accordance with ELE4.3.1.070.

ELE4.2.035.7 PROTECTION AGAINST ELECTRIC SHOCK AND EXTERNAL INFLUENCES (ALTERNATIVE TO CLAUSE ELE4.2.030 FOR IEC 61439 COMPLIANCE)

1. Protection against direct contact shall be by means of barriers of enclosures in accordance with IEC 61439-1 and IEC 61439-2;

2. All external surfaces of an ASSEMBLY shall have a degree of protection against ingress of solid foreign bodies and liquid of at least IP31 in the normal service condition in accordance with IEC 61439-1 and IEC 61439-2;

3. With the front-hinged door of the functional units open and in replacing the fuse links, the degree of protection to the live part shall be at least IP2X. If the degree of protection to the neutral conductor of the live part cannot comply with this requirement, a warning label shall be provided next to the neutral conductor;

4. The bottom of the ASSEMBLY shall be closed and made vermin-proof by means of barriers cut away, where required, to fit the cables passing through. The barriers in the cable compartment shall be made of phenolic resin bonded paper laminate sheet of a minimum thickness of 6 mm;

5. The construction of the enclosure shall be the same for ASSEMBLIES under all types of verification, and be checked by visual inspection and standard test finger, if necessary, as IEC 60529;

6. Fault protection shall be by means of protective circuits in accordance with IEC 61439-1 and IEC 61439-2. The size and installation of the protective conductors in an ASSEMBLY shall be in accordance with ELE4.3.1.075.

ELE4.2.040.7 FINISH

1. Before untreated steel work is painted, it shall be thoroughly cleaned by an Approved method, such as grit-blasting or chemical pickling and an Approved rust inhibitive priming coat applied. Treated steelwork e.g. zintec, shall be suitably cleaned and degreased;

2. Surfaces shall then have not less than two coats of stoved finish paint of contrasting colours; the finishing colour, both interior and exterior shall be equivalent to colour code 00A01 of BS 4800 (light grey) or lighter;

3. Care shall be taken to ensure that edges of metalwork have an adequate dry film thickness of paint and that paint build-up does not occur at edges;

4. Alternative finishing processes such as phosphate treatment followed by stoved epoxy powder paint conforming to BS EN 12476 will also be accepted.
COMPARTMENTATION (FOR IEC 60439 COMPLIANCE)

1. Internal separation of an ASSEMBLY shall be provided by means of barriers or partitions made of sheet steel or non-hygroscopic and flame retardant insulating materials rigidly fixed;

2. The size and construction of the compartments shall be the same as the type-tested ones;

3. Openings necessary for interconnection, control or ventilation shall be at least IP2X for protection against contact with live parts in the adjacent compartments, and be such that exhaust outlets of functional units shall not discharge directly to the live parts in adjacent compartments;

4. The ASSEMBLY shall be capable of withstanding any external fault. In the event of any internal arcing fault on a functional unit, the damage shall be confined to that unit so that the busbar and all other functional units remain fit for further service;

5. The internal separation shall be of Form 3a in accordance with IEC 60439-1. Further compartmentation shall also be provided for each of the following equipment:
   a. Incoming power supply cables, conductors and connections to the incoming supply side terminals of each incoming circuit breakers;
   b. Protective relays and terminal blocks;
   c. Batteries and Battery Charger;
   d. Supply Company's meter;
   e. Supply Company's CT;
   f. Capacitor bank;
   g. Fuse combination unit for capacitor bank;
   h. Control gears and relays for capacitor bank;
   i. Each section (vertical-panel) except the horizontal busbar compartments;
   j. Cable terminals for outgoing functional units.

6. Front doors shall be provided for items given in sub-clauses (5)(b), (5)(c), (5)(d), (5)(e), (5)(g) and (5)(h) above and each outgoing functional units;

7. Removal back covers shall be completed with pair of handles for easy fixing and removal and provided for items given in sub-clauses (5)(a), (5)(f) and (5)(i) above;

8. Voltmeters, ammeters together with associated switches and indication lamps are allowed to be mounted on the front cover/door of the respective functional unit monitored by the meters, provided that they do not obstruct the operation of the unit, are suitably protected against direct contact of live parts of at least IP2X, even when the door is open and, are properly earthed.

COMPARTMENTATION (ALTERNATIVE TO CLAUSE ELE4.2.050 FOR IEC 61439 COMPLIANCE)

1. Internal separation of an ASSEMBLY shall be provided by means of barriers or partitions made of sheet steel or non-hygroscopic and flame retardant insulating materials rigidly fixed;

2. The size and construction of the compartments shall be the same as the type-tested ones;

3. Openings necessary for interconnection, control or ventilation shall be at least IP2X for protection against contact with live parts in the adjacent compartments, and be such that exhaust outlets of functional units shall not discharge directly to the live parts in adjacent compartments;
4. The ASSEMBLY shall be capable of withstanding any external fault. In the event of any internal arcing fault on a functional unit, the damage shall be confined to that unit so that the busbar and all other functional units remain fit for further service;

5. The internal separation shall be of Form 3a in accordance with IEC 61439-1 and IEC 61439-2. Further compartmentation shall also be provided for each of the following equipment:
   a. Incoming power supply cables, conductors and connections to the incoming supply side terminals of each incoming circuit breakers;
   b. Protective relays and terminal blocks;
   c. Batteries and Battery Charger;
   d. Supply Company's meter;
   e. Supply Company's CT;
   f. Capacitor bank;
   g. Fuse combination unit for capacitor bank;
   h. Control gears and relays for capacitor bank;
   i. Each section (vertical-panel) except the horizontal busbar compartments;
   j. Cable terminals for outgoing functional units.

6. Front doors shall be provided for items given in sub-clauses (5)(b), (5)(c), (5)(d), (5)(e), (5)(g) and (5)(h) above and each outgoing functional units;

7. Removal back covers shall be completed with pair of handles for easy fixing and removal and provided for items given in sub-clauses (5)(a), (5)(f) and (5)(i) above;

8. Voltmeters, ammeters together with associated switches and indication lamps are allowed to be mounted on the front cover/door of the respective functional unit monitored by the meters, provided that they do not obstruct the operation of the unit, are suitably protected against direct contact of live parts of at least IP2X, even when the door is open and, are properly earthed.

ELE4.3.1.030.7 BUSBARS (FOR IEC 60439 COMPLIANCE)

1. Busbars shall be three phase and full rating neutral busbar made of hard drawn, high conductivity, bare solid copper bars to BS EN 13601 with electrotinned finish. The temperature-rise type test with rated current on each busbar section shall be witnessed by an acceptable third-party;

2. Main busbars shall run horizontally and conform to the type-tested arrangement;

3. A vertical busbar riser/dropper shall be required for each section of the ASSEMBLY where switchgears are arranged in multi-tier, with a cross-section capable of carrying either the total rated current of all outgoing units connected to it or the current rating of the protective device protecting it, whichever is the less, without undue temperature-rise in accordance with Clause 8.2.1 of IEC 60439-1;

4. Busbars connecting the riser/dropper to the supply side of outgoing functional unit shall be with adequate insulation or shrouding;
5. Busbars shall be provided to connect between functional units and to extend each outgoing terminal of the functional units to the cabling compartment.

**ELE4.3.1.035.7 BUSBARS (ALTERNATIVE TO CLAUSE ELE4.3.1.030 FOR IEC 61439 COMPLIANCE)**

1. Busbars shall be three phase and full rating neutral busbar made of hard drawn, high conductivity, bare solid copper bars to BS EN 13601 with electrotinned finish. The temperature-rise verification with rated current on each busbar section shall be witnessed by an acceptable third-party;

2. Main busbars shall run horizontally and conform to the verification arrangement;

3. A vertical busbar riser/dropper shall be required for each section of the ASSEMBLY where switchgears are arranged in multi-tier, with a cross-section capable of carrying either the total rated current of all outgoing units connected to it or the current rating of the protective device protecting it, whichever is the less, without undue temperature-rise in accordance with Clause 10.10 of IEC 61439-1 and IEC 61439-2;

4. Busbars connecting the riser/dropper to the supply side of outgoing functional unit shall be with adequate insulation or shrouding;

5. Busbars shall be provided to connect between functional units and to extend each outgoing terminal of the functional units to the cabling compartment.

**ELE4.3.1.040.7 ARRANGEMENT OF BUSBARS AND CONNECTIONS**

1. In the incoming terminal compartment, the busbars shall be arranged in a manner that the provision and arrangement for the cable/busbar terminations shall comply with the Supply Company's requirement;

2. Unless otherwise specified, busbars and main connections which are generally in one plane shall be arranged in the order of L1-L2-L3 phases as follows:
   a. If the run of the conductors is horizontal, the L1 phase shall be the top, or the left or farthest away as viewed from the front of the ASSEMBLY;
   b. If the run of the conductor is vertical, the L1 phase shall be the left or farthest away as viewed from the front of the ASSEMBLY.

3. The busbars from the incoming supply connections through the incomer circuit breaker to the nearest main horizontal busbars, which follow the phase notation of the Supply Company's incoming terminals, shall also be acceptable;

4. The neutral shall occupy the outer position and shall be clearly marked.

**ELE4.3.1.050.7 BUSBAR IDENTIFICATION (FOR IEC 60439 COMPLIANCE)**

Each busbar and protective conductor shall be identified by colours in accordance with the Electrical CoP. The terminals for external protective conductors shall be marked in accordance with IEC 60439-1.

**ELE4.3.1.055.7 BUSBAR IDENTIFICATION (ALTERNATIVE TO CLAUSE ELE4.3.1.050 FOR IEC 61439 COMPLIANCE)**

Each busbar and protective conductor shall be identified by colours in accordance with the Electrical CoP. The terminals for external protective conductors shall be marked in accordance with IEC 61439-1 and IEC 61439-2.

**ELE4.3.1.060.7 BUSBAR JOINTING AND SUPPORT (FOR IEC 60439 COMPLIANCE)**

1. Jointing of sections of busbars shall be made by bolts and nuts or clamps. Soldered, welded or riveted joints shall not be used;

2. Bolts for jointing busbars shall be of steel, either hot-dip galvanized or heavily electrotplated with zinc or cadmium, to guard against corrosion;
3. Conductors shall be supported on insulators of non-hygroscopic and non-
deteriorating materials as type-test;
4. The method and materials used in jointing and support shall conform to the type-
tested arrangement.

ELE4.3.1.065.7 BUSBAR JOINTING AND SUPPORT (ALTERNATIVE TO CLAUSE
ELE4.3.1.060 FOR IEC 61439 COMPLIANCE)
1. Jointing of sections of busbars shall be made by bolts and nuts or clamps. Soldered, welded or riveted joints shall not be used;
2. Bolts for jointing busbars shall be of steel, either hot-dip galvanized or heavily electroplated with zinc or cadmium, to guard against corrosion;
3. Conductors shall be supported on insulators of non-hygroscopic and non-
deteriorating materials as verification;
4. The method and materials used in jointing and support shall conform to the verification arrangement.

ELE4.3.1.070.7 PROTECTIVE CONDUCTORS (FOR IEC 60439 COMPLIANCE)
1. Protective conductors shall be of size in accordance with IEC 60439-1;
2. The cross sectional area and the installation of the protective conductor shall be so selected and designed to eliminate the possibility of the fault current in the protective conductor causing a temperature rise that may damage the conductor or impair its electrical continuity before the operation of the protective device, for a duration that may last up to 5 seconds;
3. A continuous tinned copper bar of size satisfying the above requirement and in any case not less than 150 mm² shall be fixed at the rear interior bottom portion throughout the length of the ASSEMBLY, bonding the frame-work of all modular sections, terminals for the outgoing protective conductor(s) of each circuit, the circuit breaker's earthing terminal and finally connected to the earthing terminals on the external surface at the extreme ends of the ASSEMBLY.

ELE4.3.1.075.7 PROTECTIVE CONDUCTORS (ALTERNATIVE TO CLAUSE
ELE4.3.1.070 FOR IEC 61439 COMPLIANCE)
1. Protective conductors shall be of size in accordance with IEC 61439-1 and IEC 61439-2;
2. The cross sectional area and the installation of the protective conductor shall be so selected and designed to eliminate the possibility of the fault current in the protective conductor causing a temperature rise that may damage the conductor or impair its electrical continuity before the operation of the protective device, for a duration that may last up to 5 seconds;
3. A continuous tinned copper bar of size satisfying the above requirement and in any case not less than 150 mm² shall be fixed at the rear interior bottom portion throughout the length of the ASSEMBLY, bonding the frame-work of all modular sections, terminals for the outgoing protective conductor(s) of each circuit, the circuit breaker's earthing terminal and finally connected to the earthing terminals on the external surface at the extreme ends of the ASSEMBLY.

ELE4.3.2 AUXILIARY CIRCUITS

ELE4.3.2.010.7 WIRING
1. All auxiliary circuits shall be wired in PVC insulated copper cables to type CK of BS 6231 of not less than 2.5 mm² conductor;
2. All wiring shall be clipped in a neat and tidy manner by nylon type cable ties or installed in plastic wiring channels;
3. Wiring from the fixed part of the ASSEMBLY to equipment mounted on the hinged door shall be enclosed by a flexible PVC tubing.

**ELE4.3.2.020.7 MARKING**

1. Sleeve type cable markers shall be fitted to both ends of each length of cable to denote its function; the function letter shall be followed by a number identifying the individual wire;
2. Each branch of any connection shall bear the same identification mark. Where it is necessary to identify branches which are common, different identification marks for the branches shall be employed only if they are common through links or are connected to separate terminals which are then common by removable connections;
3. Numbering shall read from the terminals outwards on all wires;
4. Circuit function letters and wire numbers shall be in accordance with the following table:

<table>
<thead>
<tr>
<th>Circuit</th>
<th>Test Current</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>10 - 29 : L1 phase</td>

**ELE4.3.2.030.7 TERMINATION**

1. Wiring from one section to another section of an ASSEMBLY shall feed through terminal blocks;
2. Except for the Supply Company's metering, test/disconnect terminal blocks shall be provided for each measurement and protection current transformer. The terminal blocks shall be housed in the same relay compartment with hinged front door;
3. All terminal blocks shall be feed-through terminal blocks with screw clamp connections and conforming to the following requirements:
   a. Electrical and mechanical characteristics to be type tested to IEC 60947-7-1;
   b. Voltage rating 750V;
   c. Moulding material to be melamine with low flammability as certified to UL94-V0(5V);
   d. Designed to be mounted directly on assembly rail to BS 5825;
e. All current carrying parts to be copper coated with tin lead alloy. Clamping yokes and screw to be zinc plated steel with additional protection by a chromate layer.

In addition, test/disconnect terminal blocks complete with plugs and test sockets for tapping off/disconnection shall be provided for test and measurement circuits.

4. The terminal blocks shall be provided with manufacturer's standard assembly rails, end section, partition, bracket, cross connection plug, jumper bar, warning sign, plastic screw, marking tags, disconnect plugs, test plug bolt, test plug, etc.;

5. Only one cable shall be terminated in each terminal, where necessary, jumper bars or cross connecting plugs shall be used;

6. Terminal blocks for the live conductor shall be indicated with a warning sign and separated from other terminal blocks by partitions.

**ELE4.3.3 AIR CIRCUIT BREAKERS**

**ELE4.3.3.010.7 STANDARDS (FOR IEC 60439 COMPLIANCE)**

ELE4.3.3.030.7  CIRCUIT BREAKER (FOR IEC 60439 COMPLIANCE)

1. The circuit breaker shall be triple pole or four pole as specified on the Drawings, air break and of metalclad, horizontal withdrawable type, fitted with a shunt trip coil and/or overcurrent release, depending on the type of protection scheme used, as specified in ELE4.4.1 and shown on the Drawings;

2. The circuit breaker shall be housed in a separate and segregated circuit breaker compartment as specified in ELE4.2.050. Each circuit breaker of triple pole type shall be complete with an accessible bolted type neutral link in accordance with the type-tested designs;

3. The circuit breaker shall have independent manual closing with stored energy or spring assisted mechanism, unless otherwise specified. Neutral link/pole shall be easily accessible for inspection and maintenance even after cabling;

4. Unless otherwise specified, opening and closing of incoming and bus-section ACB shall be capable of being remote controlled repeatedly by the integrally mounted shunt trip coil and shunt close coil respectively and shall be provided with on and off or "1" and "0" mechanical indicators on the front panel of the circuit breaker. The closing operation of the ACB shall be operable either by a solenoid coil or by a motorized mechanism;

5. For circuit breaker with mechanism controlled by a solenoid coil, the closing mechanism shall be controlled by the solenoid coil which replaces the standard closing spring. The a.c. supply to the rectifier for the solenoid coil shall be taken from the "Live" side of the circuit breaker. The closing contactor, rectifier and anti-hunting relay shall all be integrally mounted on the circuit breaker;

6. For circuit breaker with motorized mechanism, the closing spring shall be capable of being released electrically or manually and shall automatically be recharged upon each release operation with indication showing the mechanism is fully charged;

7. A push button shall be mounted on the front door of the circuit breaker to enable local closing for normal operation;

8. The remote closing and tripping function shall be designed to be operated through a pair of voltage free contacts on a remote operating device. A female 3-pin receptacle without the remote operating device shall be provided inside the IDMT Relay/Fuse chamber of the cubicle. The receptacle shall be of rating 250V 10A, a.c. to IEC 60320 or equivalent and approved standard. One number remote operating device shall be provided with each switchboard. The connection of the receptacle shall be as follows:
   a. Earth: common;
   b. Live: for remote closing;
   c. Neutral: for remote tripping.

9. The circuit breaker shall be of horizontal withdrawable type with 'connected', 'test' and 'isolated' positions, fitted with mechanical position indicators and pad-locking facilities in each of the positions;

10. The circuit breaker shall be type-tested and comply with the additional requirements for circuit breakers suitable for isolation in accordance with Clause 7.1.2 of IEC 60947-2.

ELE4.3.3.035.7  CIRCUIT BREAKER (ALTERNATIVE TO CLAUSE ELE4.3.3.030 FOR IEC 61439 COMPLIANCE)

1. The circuit breaker shall be triple pole or four pole as specified on the Drawings, air break and of metalclad, horizontal withdrawable type, fitted with a shunt trip coil and/or overcurrent release, depending on the type of protection scheme used, as specified in ELE4.4.1 and shown on the Drawings;
2. The circuit breaker shall be housed in a separate and segregated circuit breaker compartment as specified in ELE4.2.055. Each circuit breaker of triple pole type shall be complete with an accessible bolted type neutral link in accordance with the type-tested designs;

3. The circuit breaker shall have independent manual closing with stored energy or spring assisted mechanism, unless otherwise specified. Neutral link/pole shall be easily accessible for inspection and maintenance even after cabling;

4. Unless otherwise specified, opening and closing of incoming and bus-section ACB shall be capable of being remote controlled repeatedly by the integrally mounted shunt trip coil and shunt close coil respectively and shall be provided with on and off or "1" and "0" mechanical indicators on the front panel of the circuit breaker. The closing operation of the ACB shall be operable either by a solenoid coil or by a motorized mechanism;

5. For circuit breaker with mechanism controlled by a solenoid coil, the closing mechanism shall be controlled by the solenoid coil which replaces the standard closing spring. The a.c. supply to the rectifier for the solenoid coil shall be taken from the "Live" side of the circuit breaker. The closing contactor, rectifier and anti-hunting relay shall all be integrally mounted on the circuit breaker;

6. For circuit breaker with motorized mechanism, the closing spring shall be capable of being released electrically or manually and shall automatically be recharged upon each release operation with indication showing the mechanism is fully charged;

7. A push button shall be mounted on the front door of the circuit breaker to enable local closing for normal operation;

8. The remote closing and tripping function shall be designed to be operated through a pair of voltage free contacts on a remote operating device. A female 3-pin receptacle without the remote operating device shall be provided inside the IDMT Relay/Fuse chamber of the cubicle. The receptacle shall be of rating 250V 10A, a.c. to IEC 60320 or equivalent and approved standard. One number remote operating device shall be provided with each switchboard. The connection of the receptacle shall be as follows:
   a. Earth: common;
   b. Live: for remote closing;
   c. Neutral: for remote tripping.

9. The circuit breaker shall be of horizontal withdrawable type with 'connected', 'test' and 'isolated' positions, fitted with mechanical position indicators and pad-locking facilities in each of the positions;

10. The circuit breaker shall be type-tested and comply with the additional requirements for circuit breakers suitable for isolation in accordance with Clause 7.1.2 of IEC 60947-2.

**ELE4.3.3.040.7 MECHANICAL INTERLOCKS**

The circuit breaker shall be provided with the following mechanical interlocks:

1. Circuit breaker cannot be racked in or withdrawn when in closed position;

2. Circuit breaker cannot be closed unless it is either the main circuit connection is fully connected, at test position or completely isolated;

3. In case that there is provision for maintenance and adjustment of contacts, circuit breaker shall be possible to 'slow close' in the fully isolated position;

4. With hand charged spring mechanism, initiation of the closing of the circuit breaker is not possible until the closing mechanism is fully charged;

5. Other mechanical interlocks if specified on the Drawings to facilitate sequential operation of circuit breakers/section switches of the ASSEMBLY incorporating more than one circuit breaker.
ELE4.3.3.050.7  CIRCUIT BREAKERCOMPARTMENT/INTERLOCK

The circuit breaker compartment shall maintain a degree of protection against direct contact with live parts of at least IP 2X during normal operation without overriding the interlock. To ensure safety, the circuit breaker compartment shall be provided with the necessary mechanical interlock as follows, or other equal and Approved means of mechanical interlock, so that:

1. If a door is used to enclose the breaker, it can only be opened when the main circuit of the circuit breaker has opened and it shall not be possible to close the circuit breaker while the door is opened, except by overriding the interlock. The interlock shall be restored on reclosing the door; or
2. If a front panel is used to enclose the breaker, the panel shall be fitted to the withdrawable part of the breaker and carried in unity with it in the drawout/rack-in operation. It shall be possible to remove the panel with tools when the circuit breaker is in the 'isolated' position.

ELE4.3.3.060.7  SAFETY SHUTTERS

1. A set of safety shutters shall be provided to cover each three phase or three phase and neutral group of stationary isolating contacts for three pole or four pole circuit breaker respectively;
2. Shutters shall be opened automatically by a positive drive from the circuit breaker moving portion and, when closed, shall prevent access to stationary isolating contacts. When the circuit breaker is withdrawn, shutters shall be capable of being operated and padlocked in the closed position;
3. Each safety shutter shall bear a colour label with 15 mm minimum white lettering as follows:
   a. Incoming supply : red/incomer;
   b. Busbar : yellow/busbar;
   c. Bus section : red/bus section;
   d. Outgoing feeder : yellow/outgoing.

ELE4.3.3.070.7  AUXILIARY CONTACTS, CONTROL CONTACTS AND AUXILIARY SWITCHES

1. All the control and instrumentation wiring between the fixing part of the ASSEMBLY and the withdrawable part of the breaker shall through the auxiliary and control contacts. Automatic safety shutters or screens with warning signs shall be provided if they are still live when the circuit breaker is withdrawn;
2. The auxiliary contacts shall engage when the breaker is in the "connected" and "test" positions and disengage when in the "isolated" position;
3. At least one spare a - contact and one spare b - contact shall be provided.

ELE4.3.4  FUSE COMBINATION UNITS AND SWITCH-DISCONNECTORS

ELE4.3.4.010.7  COMPLIANCE WITH SPECIFICATION

Unless otherwise specified, cubicle mounted fuse combination units and switch-disconnectors shall comply with the relevant parts of Specification for surface mounted fuse combination units and switch-disconnector (i.e. ELE3.2).
ELE4.3.4.020.7 ASSEMBLY (FOR IEC 60439 COMPLIANCE)
The assembly of the switching devices in the ASSEMBLY shall also comply with IEC 60439-1.

ELE4.3.4.025.7 ASSEMBLY (ALTERNATIVE TO CLAUSE ELE4.3.4.020 FOR IEC 61439 COMPLIANCE)
The assembly of the switching devices in the ASSEMBLY shall also comply with IEC 61439-1 and IEC 61439-2.

ELE4.3.4.030.7 SWITCHING DEVICE (FOR IEC 60439 COMPLIANCE)
Each switching device shall be enclosed in a separate and segregated compartment with hinged front door as specified in ELE4.2.050 and flush mounted on the front of the ASSEMBLY.

ELE4.3.4.035.7 SWITCHING DEVICE (ALTERNATIVE TO CLAUSE ELE4.3.4.030 FOR IEC 61439 COMPLIANCE)
Each switching device shall be enclosed in a separate and segregated compartment with hinged front door as specified in ELE4.2.055 and flush mounted on the front of the ASSEMBLY.

ELE4.3.5 CHANGEOVER CONTACTORS

ELE4.3.5.010.7 COMPLIANCE WITH SPECIFICATION
Unless otherwise specified, changeover contactors shall comply with the relevant parts of Specification for contactors. (i.e. ELE3.15).

ELE4.3.5.020.7 INSTALLATION (FOR IEC 60439 COMPLIANCE)
The installation of the changeover contactors in the ASSEMBLY shall also comply with IEC 60439-1. The installation such as the ways of mounting, the connection of incoming and outgoing conductors, the clearance and creepage distance, the enclosure, etc. shall be identical to the type-tested one or as recommended by the contactor manufacturers.

ELE4.3.5.025.7 INSTALLATION (ALTERNATIVE TO CLAUSE ELE4.3.5.020 FOR IEC 61439 COMPLIANCE)
The installation of the changeover contactors in the ASSEMBLY shall also comply with IEC 61439-1 and IEC 61439-2. The installation such as the ways of mounting, the connection of incoming and outgoing conductors, the clearance and creepage distance, the enclosure, etc. shall be identical to the type-tested one or as recommended by the contactor manufacturers.

ELE4.3.5.030.7 SHORT-CIRCUIT WITHSTAND CAPACITY
For contactors protected by fuse, the short-circuit withstand capacity of the contactors shall be not less than the maximum let-through energy of the respective fuse and be verified by test.
ELE4.3.6  CABLE TERMINATION

ELE4.3.6.010.7  INCOMING/OUTGOING CABLES (FOR IEC 60439 COMPLIANCE)
All incoming/outgoing cables, unless otherwise specified, shall be of bottom-entry and incoming/outgoing busbar trunking of top entry and terminated in separate compartments as stated in ELE4.2.050. The cables shall be located at the rear of the ASSEMBLY complete with removable back covers.

ELE4.3.6.015.7  INCOMING/OUTGOING CABLES (ALTERNATIVE TO CLAUSE ELE4.3.6.010 FOR IEC 61439 COMPLIANCE)
All incoming/outgoing cables, unless otherwise specified, shall be of bottom-entry and incoming/outgoing busbar trunking of top entry and terminated in separate compartments as stated in ELE4.2.055. The cables shall be located at the rear of the ASSEMBLY complete with removable back covers.

ELE4.3.6.020.7  CABLE GLAND PLATES
Cable gland plates made of brass or steel of not less than 2 mm thick shall be provided below the lug termination at a distance not exceeding 600 mm. Adequate space shall be reserved for future cabling for the spare functional units.

ELE4.3.6.030.7  CABLE SUPPORTS
Cable and cable supports shall be suitably installed to prevent terminals or cables being subjected to stresses, which may reduce their normal life or performance.

ELE4.3.7  SUPPLY COMPANY'S METERING EQUIPMENT

ELE4.3.7.010.7  METERING COMPARTMENTS
1. Separate compartments shall be provided for accommodating the Supply Company's meter(s) on the front of the ASSEMBLY and for the corresponding current transformers;
2. The metering compartment shall be complete with a hinged glazed door for meter viewing and suitable support for mounting the meter.

ELE4.3.7.020.7  METERING EQUIPMENT
1. The metering equipment will be supplied and fixed by the Supply Company on site, but the ASSEMBLY shall be complete with fuses for the voltage coil, removable links for mounting the current transformers and the associated wiring to the meter;
2. The fuses shall be of rating according to the requirements of the Supply Company, with provision for sealing to prevent unauthorized removal and the incoming side of the fuseholders bolted to the incoming supply busbar.
ELE4.3.8 MOULDED CASE CIRCUIT BREAKERS (MCCB)

ELE4.3.8.010.7 COMPLIANCE WITH SPECIFICATION
Unless otherwise specified, MCCBs mounted in the ASSEMBLY shall comply with the relevant parts of Specification for MCCB (i.e. ELE3.4). MCCB shall be type-tested and comply with the additional requirements for circuit breakers suitable for isolation in accordance with Clause 7.1.2 of IEC 60947-2.

ELE4.3.8.020.7 INSTALLATION (FOR IEC 60439 COMPLIANCE)
The installation of MCCBs mounted in the ASSEMBLY shall also comply with IEC 60439-1. The installation details such as the ways of mounting, mounting plates, termination of incoming and outgoing conductors, clearance and creepage distances, dimensions of enclosure, etc. shall be submitted to verify them in full compliance with the type-tested arrangements and/or the MCCB manufacturers' recommendations.

ELE4.3.8.025.7 INSTALLATION (ALTERNATIVE TO CLAUSE ELE4.3.8.020 FOR IEC 61439 COMPLIANCE)
The installation of MCCBs mounted in the ASSEMBLY shall also comply with IEC 61439-1 and IEC 61439-2. The installation details such as the ways of mounting, mounting plates, termination of incoming and outgoing conductors, clearance and creepage distances, dimensions of enclosure, etc. shall be submitted to verify them in full compliance with the type-tested arrangements and/or the MCCB manufacturers' recommendations.

ELE4.3.9 POWER FACTOR CORRECTION EQUIPMENT

ELE4.3.9.010.7 COMPLIANCE WITH SPECIFICATION
Unless otherwise specified, power factor correction equipment mounted on/housed in the ASSEMBLY shall comply with the Specification for Power Factor Correction Equipment (i.e. ELE5).
ELE4.4 PROTECTION AND INSTRUMENTATION

ELE4.4.1 CIRCUIT BREAKER PROTECTION

ELE4.4.1.010.7 COMPLIANCE WITH SPECIFICATION (FOR IEC 60439 COMPLIANCE)

The protection scheme for circuit breakers shall be in accordance with ELE4.4.1.020 and ELE4.4.1.030 as indicated on the Drawings.

ELE4.4.1.015.7 COMPLIANCE WITH SPECIFICATION (ALTERNATIVE TO CLAUSE ELE4.4.1.010 FOR IEC 61439 COMPLIANCE)

The protection scheme for circuit breakers shall be in accordance with ELE4.4.1.020 and ELE4.4.1.035 as indicated on the Drawings.

ELE4.4.1.020.7 PROTECTION SCHEME WITH EXTERNAL D.C. SOURCE FOR TRIPPING

For overcurrent or earth fault protection the circuit breaker shall trip by means of shunt trip release operated from the battery set and charger and controlled by protection relays. Three overcurrent relays, one for each phase, and one earth fault relay shall be provided.

ELE4.4.1.030.7 BATTERY SET AND CHARGER (FOR IEC 60439 COMPLIANCE)

1. General:

A set of battery and charger system shall be provided for the tripping circuit. The battery set and charger shall be manufactured by a specialised battery and charger manufacturer and be suitable for use under the intended service conditions;

2. Battery/Charger equipment:

The battery/charger equipment shall be housed in a segregated front accessible compartment as defined in ELE4.2.050. The input voltage of the battery charger shall be 220V a.c., 50Hz and the output voltage of the battery shall be 30V d.c;

3. Batteries:

a. The batteries shall be sealed nickel cadmium to IEC 61951-1 or nickel-metal hydride to IEC 61951-2, maintenance free type, rated at 5 hours discharge rate. Type test report shall be submitted if required by the Contract Manager. Cells shall be of the sealed nickel cadmium sintered plate type or nickel-metal hydride type;

b. The rated capacity of the battery for switchgear tripping auxiliary supplies shall be sufficient for at least 20 operations without charging and for at least two air circuit breakers tripping simultaneously, and shall be of at least 4 Ampere-hour rating.

4. Battery charger:

The battery charger shall be automatic trickle-charge type with two rates charging to suit the battery characteristics. The first rate of charging shall be capable of restoring full capacity and second rate shall maintain the batteries in a fully charged condition. The standard charge rate and the float charge rate of the battery charger shall be adjustable to meet requirements of battery rating up to 10 Ampere-hour;

5. Battery re-charging time:
The time required for re-charging batteries from fully discharged to fully charged condition shall be not more than eight hours. Battery over-current protection shall be provided to safeguard the battery under short circuit conditions and facilities shall also be provided to prevent the batteries from being overcharged;

6. Battery charger indication/facilities:
   The battery charger shall be provided with the following indications/facilities which shall be extended and mounted on the front door of the compartment:
   a. Mains On;
   b. Charger Fail;
   c. Voltmeter;
   d. Ammeter;
   e. Test Facilities.

ELE4.4.1.035.7 BATTERY SET AND CHARGER (ALTERNATIVE TO CLAUSE ELE4.4.1.030 FOR IEC 61439 COMPLIANCE)

1. General:
   A set of battery and charger system shall be provided for the tripping circuit. The battery set and charger shall be manufactured by a specialised battery and charger manufacturer and be suitable for use under the intended service conditions;

2. Battery/Charger equipment:
   The battery/charger equipment shall be housed in a segregated front accessible compartment as defined in ELE4.2.055. The input voltage of the battery charger shall be 220V a.c., 50Hz and the output voltage of the battery shall be 30V d.c;

3. Batteries:
   a. The batteries shall be sealed nickel cadmium to IEC 61951-1 or nickel-metal hydride to IEC 61951-2, maintenance free type, rated at 5 hours discharge rate. Type test report shall be submitted if required by the Contract Manager. Cells shall be of the sealed nickel cadmium sintered plate type or nickel-metal hydride type;
   b. The rated capacity of the battery for switchgear tripping auxiliary supplies shall be sufficient for at least 20 operations without charging and for at least two air circuit breakers tripping simultaneously, and shall be of at least 4 Ampere-hour rating.

4. Battery charger:
   The battery charger shall be automatic trickle-charge type with two rates charging to suit the battery characteristics. The first rate of charging shall be capable of restoring full capacity and second rate shall maintain the batteries in a fully charged condition. The standard charge rate and the float charge rate of the battery charger shall be adjustable to meet requirements of battery rating up to 10 Ampere-hour;

5. Battery re-charging time:
   The time required for re-charging batteries from fully discharged to fully charged condition shall be not more than eight hours. Battery over-current protection shall be provided to safeguard the battery under short circuit conditions and facilities shall also be provided to prevent the batteries from being overcharged;

6. Battery charger indication/facilities:
   The battery charger shall be provided with the following indications/facilities which shall be extended and mounted on the front door of the compartment:
a. Mains On;
b. Charger Fail;
c. Voltmeter;
d. Ammeter;
e. Test Facilities.

**ELE4.4.1.040.7 ELECTROMECHANICAL TYPE PROTECTION RELAY**

1. Overcurrent and earth/fault protection relays shall be of induction type to BS EN 60255 or IEC 60255 with IDMT characteristics in accordance with the time setting specified below;

2. The relays shall be accommodated in draw-out cases and contacts shall be fitted which shall short-circuit the associated current transformers on withdrawal of the relay. For the overcurrent relays, the three single phase elements shall be arrayed in one horizontal plane and accommodated in a common draw-out case, which shall be flush mounted on the front hinged door of the ASSEMBLY;

3. Operation indicators shall be provided for each protective element and installed within the same relay. They shall have a common hand-reset device openable without opening the relay case. The overcurrent relay shall comprise the following features:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Current setting</td>
<td>50% to 200% of 5A (CT rating), adjustable in 7 equal steps;</td>
</tr>
<tr>
<td>b. Time setting</td>
<td>0.63 second at 10 times current setting (for HEC supply); 1.3 seconds at 10 times current setting (for CLP supply);</td>
</tr>
<tr>
<td>c. Burden</td>
<td>3.5VA maximum at current setting.</td>
</tr>
</tbody>
</table>

4. The earth fault relay shall comprise the following features:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Current setting</td>
<td>10% to 40% of 5A (CT Rating), adjustable in 7 equal steps;</td>
</tr>
<tr>
<td>b. Time setting</td>
<td>1.3 seconds at 10 times current setting;</td>
</tr>
<tr>
<td>c. Burden</td>
<td>3.5VA maximum at current setting.</td>
</tr>
</tbody>
</table>

**ELE4.4.1.050.7 ELECTRONIC TYPE PROTECTION RELAYS**

1. Electronic type protection relays shall comply with BS EN 60255 or IEC 60255 with choice of the following characteristic curves:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Normal inverse IDMT curve</td>
<td></td>
</tr>
<tr>
<td>b. Very inverse IDMT curve</td>
<td></td>
</tr>
<tr>
<td>c. Extremely inverse IDMT curve</td>
<td></td>
</tr>
</tbody>
</table>

2. The relay shall provide trip contact for overcurrent and earth fault protections, and separate signal contacts for time delayed phase fault, instantaneous high-set phase fault and time delayed earth fault operations;

3. Trip indicators shall be provided which will enable the type of fault condition to be identified. Each indicator shall be capable of being reset by hand without opening the relay case;

4. The relay shall comprise the following features:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Current setting</td>
<td>0.5 to 2 x In in step of 0.05 x In with instantaneous high-set of 5 to 10 x In for overcurrent protection; 0.1 to 0.4 x In in step of 0.05 x In for earth fault protection;</td>
</tr>
</tbody>
</table>
b. Time multiplier setting: 0.1 to 1.0 in 0.05 step;
c. AC burden: less than 0.5VA for 5A relay in any setting.

5. The relay shall be accommodated in a dust-proof case to IP51 and can be easily drawn out on front side in the event that the relay requires replacement. Facility shall be provided for short-circuiting the associated current transformers on withdrawal of the relay. The draw-out case shall be flush mounted on the front-hinged door of the ASSEMBLY. The relay shall be rated for an operating temperature up to 55°C;

6. The relay shall be type-tested for compliance with the following international standards by an Accredited Laboratory:

<table>
<thead>
<tr>
<th>Standards</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BS EN 61000-6-4 or IEC 61000-6-4</td>
<td>Electromagnetic Emission</td>
</tr>
<tr>
<td>BS EN 61000-6-2 or IEC 61000-6-2</td>
<td>Electromagnetic Immunity</td>
</tr>
<tr>
<td>BS EN 60255-3 or BS EN 60255-151 or IEC 60255-151</td>
<td>Accuracy</td>
</tr>
<tr>
<td>BS EN 60255-21-1 or IEC 60255-21-1</td>
<td>Vibration Tests - Class 1</td>
</tr>
<tr>
<td>BS EN 60255-21-2 or IEC 60255-21-2</td>
<td>Shock &amp; Bump Tests - Class 1</td>
</tr>
<tr>
<td>BS EN 60255-22-2 or IEC 60255-22-2</td>
<td>Electrostatic Discharge Tests - Class 2</td>
</tr>
</tbody>
</table>

7. The relay shall be suitable for operation at 30V d.c. auxiliary power supply and accepts current inputs from standard protection current transformers with rated secondary current of 5A. An exclusive battery set and charger shall be provided for relay operation.

ELE4.4.2 NOT USED

ELE4.4.3 FUSE PROTECTION

ELE4.4.3.010.7 METHOD OF PROTECTION
All potential auxiliary and control circuits shall be protected by fuses.

ELE4.4.3.020.7 COMPLIANCE WITH SPECIFICATION
All fuses used, including those used in fuse combination units, shall be in compliance with the Specification for Fuses (i.e. ELE3.13).

ELE4.4.4 CURRENT TRANSFORMERS

ELE4.4.4.010.7 STANDARD AND TYPE
Current transformers shall comply with IEC 60044-1 and shall be of ring and encapsulated type.
ELE4.4.020.7  MEASURING CURRENT TRANSFORMERS

Measuring current transformers shall have a minimum accuracy class of 1. The C.T. ratio for measuring current transformer shall match the corresponding indicating/measuring device.

ELE4.4.030.7  PROTECTION CURRENT TRANSFORMERS

Protection current transformers shall have a minimum accuracy class of 10P. The rating of the current transformer shall match the total burden of the trip circuit including the relays, connection leads and overcurrent release where applicable, to which the current transformer is connected, such that, under the most severe fault conditions, the current transformer does not saturate and is still capable of maintaining its accuracy. For 2500A incoming ACB obtaining power supply from CLP, the protection current transformer shall have a C.T. ratio of 2250/5 unless otherwise specified.

ELE4.4.040.7  FITTING

Unless otherwise specified, the protective current transformers shall be fitted on the outgoing side of the respective circuit breaker, whereas for the measuring current transformer, on the outgoing side of the functional unit, removable short links for mounting the current transformer shall be provided to facilitate subsequent easy replacement/maintenance.

ELE4.4.5  INDICATING METERS

ELE4.4.5.010.7  STANDARD

Indicating meters shall comply with class 2.5 of IEC 60051.

ELE4.4.5.020.7  MOUNTING

Meters with approximate 75 mm dial and with an external zero adjustment shall be flush mounted on the front cover of the ASSEMBLY.

ELE4.4.5.030.7  MONITORING

Multi-function electronic meters, ammeters, voltmeters etc. shall be provided as shown on the Drawings. The ammeters used for monitoring the total current carried by the incoming circuit breaker shall be of the combination type with the thermal demand and the instantaneous values shown. The thermal demand shall indicate the mean r.m.s. current over the past 15 minutes with a slave pointer showing the maximum value reached.

ELE4.4.5.040.7  MULTI-FUNCTION ELECTRONIC METERS

1. Multi-function electronic meter shall be of a digital display type to measure the following electrical parameters by means of microprocessor technology:

<table>
<thead>
<tr>
<th>Function of Measurement</th>
<th>Minimum Accuracy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current: per-phase &amp; neutral</td>
<td>±0.5%</td>

PROTECTION AND INSTRUMENTATION

### ELE4.4.6 VOLTAGE SENSING RELAYS

#### ELE4.4.6.010.7 GENERAL

1. Two numbers of voltage sensing relays of different brands for monitoring the mains supply conditions shall be provided to control the operation of the automatic changeover contactors and to activate the starting of the standby generating set and alarm indication as shown on the drawings.

#### ELE4.4.6.020.7 FEATURES (FOR IEC 60439 COMPLIANCE)

1. The relay shall be suitable for monitoring voltage of 380/220V 3-phase 4-wire system;
2. The relay shall be provided with indication to show its operation status;
3. The voltage sensing elements shall operate from measured phase-to-neutral voltages. When the voltage at either one phase drops below the voltage setting and sustains for a period exceeding the time setting, the relay shall activate the dry contacts to open position. The dry contacts shall be reset to close position automatically when all the measured voltages resume normal;
4. The relay shall operate at 24V d.c. auxiliary power supply. The battery set and charger for the auxiliary power supply shall comply with the requirement as stipulated in ELE4.4.1.030;
5. The relay shall comply with the following requirement:

<table>
<thead>
<tr>
<th>Description</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adjustable voltage monitoring element setting</td>
<td>Undervoltage: 75 – 100%</td>
</tr>
<tr>
<td>Adjustable time delay setting</td>
<td>0 – 1 sec.</td>
</tr>
<tr>
<td>Expected mechanical life</td>
<td>0.2 million operations</td>
</tr>
<tr>
<td>Standard</td>
<td>IEC 60255 or other reputable national/international standards.</td>
</tr>
<tr>
<td>Operating temperature</td>
<td>0°C to +55°C</td>
</tr>
</tbody>
</table>

**FEATURES (ALTERNATIVE TO CLAUSE ELE4.4.6.020 FOR IEC 61439 COMPLIANCE)**

1. The relay shall be suitable for monitoring voltage of 380/220V 3-phase 4-wire system;
2. The relay shall be provided with indication to show its operation status;
3. The voltage sensing elements shall operate from measured phase-to-neutral voltages. When the voltage at either one phase drops below the voltage setting and sustains for a period exceeding the time setting, the relay shall activate the dry contacts to open position. The dry contacts shall be reset to close position automatically when all the measured voltages resume normal;
4. The relay shall operate at 24V d.c. auxiliary power supply. The battery set and charger for the auxiliary power supply shall comply with the requirement as stipulated in ELE4.4.1.035;
5. The relay shall comply with the following requirement:

<table>
<thead>
<tr>
<th>Description</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adjustable voltage monitoring element setting</td>
<td>Undervoltage: 75 – 100%</td>
</tr>
<tr>
<td>Adjustable time delay setting</td>
<td>0 – 1 sec.</td>
</tr>
<tr>
<td>Expected mechanical life</td>
<td>0.2 million operations</td>
</tr>
<tr>
<td>Standard</td>
<td>IEC 60255 or other reputable national/international standards.</td>
</tr>
<tr>
<td>Operating temperature</td>
<td>0°C to +55°C</td>
</tr>
</tbody>
</table>

**FACTORY TESTING**

1. The relay shall be tested on load with a dummy circuit at the switchboard manufacturer workshop for operation for at least 50 times with each operating voltage and time properly recorded before installed in the switchboard cubicle. Result shall be incorporated into the test report. The setting shall be properly sealed after the factory test.

**BATTERY SET AND CHARGER FOR CONTROL CIRCUIT**

**BATTERY SET AND CHARGER (FOR IEC 60439 COMPLIANCE)**

1. General:
A separate battery and charger system shall be provided for the control circuit. The battery set and charger shall be manufactured by a specialised battery and charger manufacturer and be suitable for use under the intended service conditions;

2. Battery/Charger equipment:

   The battery/charger equipment shall be housed in a segregated front accessible compartment as defined in ELE4.2.050. The input voltage of the battery charger shall be 220V a.c., 50Hz and the output voltage of the battery shall be 24V d.c. for control circuit;

3. Batteries:

   a. The batteries shall be sealed nickel cadmium to IEC 61951-1 or nickel-metal hydride to IEC 61951-2, maintenance free type, rated at 5 hours discharge rate. Cells shall be of the sealed nickel cadmium sintered plate type or nickel-metal hydride type;

   b. The rated capacity of the battery for control circuits shall be sufficient for at least 24 hours operations without charging including at least 10 times change of state of the control relays.

4. Battery charger:

   The battery charger shall be automatic trickle-charge type with two rates charging to suit the batteries characteristics. The first rate of charging shall be capable of restoring full capacity and second rate shall maintain the batteries in a fully charged condition. The standard charge rate and the float charge rate of the battery charger shall be adjustable to meet requirements of battery rating up to 10 Ampere-hour;

5. Battery re-charging time:

   The time required for re-charging batteries from fully discharged to fully charged condition shall be not more than eight hours. Battery over-current protection shall be provided to safeguard the battery under short circuit conditions and facilities shall also be provided to prevent the batteries from being overcharged;

6. Battery charger indication/facilities:

   The battery charger shall be provided with the following indications/facilities which shall be extended and mounted on the front door of the compartment:

   a. Mains On;

   b. Charger Fail;

   c. Voltmeter;

   d. Ammeter;

   e. Test Facilities.

ELE4.4.7.015.7 BATTERY SET AND CHARGER (ALTERNATIVE TO CLAUSE ELE4.4.7.010 FOR IEC 61439 COMPLIANCE)

1. General:

   A separate battery and charger system shall be provided for the control circuit. The battery set and charger shall be manufactured by a specialised battery and charger manufacturer and be suitable for use under the intended service conditions.

2. Battery/Charger equipment:

   The battery/charger equipment shall be housed in a segregated front accessible compartment as defined in ELE4.2.055. The input voltage of the battery charger shall be 220V a.c., 50Hz and the output voltage of the battery shall be 24V d.c. for control circuit.
3. Batteries:
   a. The batteries shall be sealed nickel cadmium to IEC 61951-1 or nickel-metal hydride to IEC 61951-2, maintenance free type, rated at 5 hours discharge rate. Cells shall be of the sealed nickel cadmium sintered plate type or nickel-metal hydride type;
   b. The rated capacity of the battery for control circuits shall be sufficient for at least 24 hours operations without charging including at least 10 times change of state of the control relays.

4. Battery charger:
   The battery charger shall be automatic trickle-charge type with two rates charging to suit the batteries characteristics. The first rate of charging shall be capable of restoring full capacity and second rate shall maintain the batteries in a fully charged condition. The standard charge rate and the float charge rate of the battery charger shall be adjustable to meet requirements of battery rating up to 10 Ampere-hour.

5. Battery re-charging time:
   The time required for re-charging batteries from fully discharged to fully charged condition shall be not more than eight hours. Battery over-current protection shall be provided to safeguard the battery under short circuit conditions and facilities shall also be provided to prevent the batteries from being overcharged.

6. Battery charger indication/facilities:
   The battery charger shall be provided with the following indications/facilities which shall be extended and mounted on the front door of the compartment:
   a. Mains On;
   b. Charger Fail;
   c. Voltmeter;
   d. Ammeter;
   e. Test Facilities.
ELE4.5 MISCELLANEOUS

ELE4.5.1 INFORMATION, MARKING AND LABELLING

ELE4.5.1.010.7 INFORMATION TO BE GIVEN (FOR IEC 60439 COMPLIANCE)

1. The ASSEMBLIES shall be provided with one or more plates, marked in a durable manner and located in a place such that they are visible and legible when the ASSEMBLIES is installed;

2. The following shall be given on the nameplates:
   a. The manufacturer's name or trade mark;
   b. Type designation or identification number or other means of identification making it possible to obtain relevant information from the manufacturer;
   c. Standard of the ASSEMBLIES (e.g. IEC 60439-1);
   d. Type of current;
   e. Rated operation voltage and frequency;
   f. Rated insulation voltage;
   g. Short-circuit withstand strength;
   h. Degree of protection; and
   i. Rating of main busbars.

ELE4.5.1.015.7 INFORMATION TO BE GIVEN (ALTERNATIVE TO CLAUSE ELE4.5.1.010 FOR IEC 61439 COMPLIANCE)

1. The ASSEMBLIES shall be provided with one or more plates, marked in a durable manner and located in a place such that they are visible and legible when the ASSEMBLIES is installed;

2. The following shall be given on the nameplates:
   a. The manufacturer's name or trade mark;
   b. Type designation or identification number or other means of identification making it possible to obtain relevant information from the manufacturer;
   c. Standard of the ASSEMBLIES (e.g. IEC 61439-1 and IEC 61439-2);
   d. Type of current;
   e. Rated operation voltage and frequency;
   f. Rated insulation voltage;
   g. Short-circuit withstand strength;
   h. Degree of protection; and
   i. Rating of main busbars.

ELE4.5.1.020.7 LABELS AND MARKINGS

1. Each equipment, functional unit and settings of overcurrent and earth fault protection of air circuit breakers and moulded case circuit breakers of the ASSEMBLY shall be marked or labelled in a durable and indelible manner in both English and Chinese for identification;
2. Unless otherwise specified, all warning labels referred to in the previous clauses shall be coloured in red with white lettering in both English and Chinese denoting,
"DANGER 380/220V
危險 380/220 伏特"

3. The removable cover of the incoming conductor and connection compartment shall bear a warning label coloured in red with white lettering in both English and Chinese denoting,
"INCOMING CONNECTION - DANGER - 380/220 V - SWITCH OFF FROM SUPPLY COMPANY'S SIDE BEFORE REMOVING COVER
電源接點 - 危險 - 380/220V
開蓋前必須切斷電力公司來電"

4. For other circuits of the ASSEMBLY which may be still live when the incoming circuit breaker(s) are switched off, such as the essential busbars, the circuit for discharging the capacitive electrical energy, etc., the covers shall bear appropriate warning labels (e.g. LIVE BUSBAR 危險 - 帶電電巴) for personnel gaining access to those parts.

ELE4.5.2 VERIFICATION AND TESTING

ELE4.5.2.010.7 VERIFICATION (FOR IEC 60439 COMPLIANCE)
1. Two sets of shop drawings showing the details of the proposed ASSEMBLY including the front and end elevations, single line busbar diagrams, control wiring diagrams, list of equipment schedule and any other details as required by the Contract Manager, shall be submitted for approval prior to assembly;

2. The drawings shall indicate which portions of the ASSEMBLY are TTA and PTTA if required by the Contract Manager. For PTTA, documents such as test reports, calculations, etc., to verify the conformity with the TTA shall be submitted for examination.

ELE4.5.2.015.7 VERIFICATION (ALTERNATIVE TO CLAUSE ELE4.5.2.010 FOR IEC 61439 COMPLIANCE)
1. Two sets of shop drawings showing the details of the proposed ASSEMBLY including the front and end elevations, single line busbar diagrams, control wiring diagrams, list of equipment schedule and any other details as required by the Contract Manager, shall be submitted for approval prior to assembly;

2. The drawings shall indicate which portions of the ASSEMBLY are verified by testing, by calculation, measurement or by satisfying design rules if required by the Contract Manager. Documents such as test reports, calculations, etc., to verify the above conformity shall be submitted for examination.

ELE4.5.2.020.7 WORKSHOP TESTS (FOR IEC 60439 COMPLIANCE)
1. The following tests shall be performed at the manufacturer's workshop during the course of assembly and on completion immediately prior to transportation to site:
   a. Inspection of the ASSEMBLY including wiring, electrical and mechanical connections, external and internal finish, degree of protection, creepage distance and clearance, etc.;
   b. Mechanical test;
   c. Primary and secondary injection tests to check that all measuring, protection and control circuits and associated components are operative;
d. Continuity test;
e. Dielectric properties test;
f. Functional check, including the shunt trip operation of breakers at 70% and 110% of the rated control supply voltage, if applicable.

2. All the above inspections and tests shall be carried out in accordance with IEC 60439-1, IEC 60947-2 and IEC 60947-3 and the standard test report format prepared by the Contract Manager.

ELE4.5.2.025.7 WORKSHOP TESTS (ALTERNATIVE TO CLAUSE ELE4.5.2.020 FOR IEC 61439 COMPLIANCE)

1. The following tests shall be performed at the manufacturer's workshop during the course of assembly and on completion immediately prior to transportation to site:
   a. Inspection of the ASSEMBLY including wiring, electrical and mechanical connections, external and internal finish, degree of protection, creepage distance and clearance, etc.;
   b. Mechanical test;
   c. Primary and secondary injection tests to check that all measuring, protection and control circuits and associated components are operative;
   d. Continuity test;
   e. Dielectric properties test;
   f. Functional check, including the shunt trip operation of breakers at 70% and 110% of the rated control supply voltage, if applicable.

2. All the above inspections and tests shall be carried out in accordance with IEC 61439-1 and IEC 61439-2 and IEC 60947-2 and IEC 60947-3 and the standard test report format prepared by the Contract Manager.

ELE4.5.2.030.7 SITE TESTS

After the erection of the ASSEMBLY on site, the following test/inspections shall also be carried out:

1. General inspection of the ASSEMBLY;
2. Mechanical tests;
3. Continuity and insulation resistance tests;
4. Function checks;
5. Contact resistance test (testing of a series of joints at one time for horizontal main busbars and vertical busbar riser/droppers; the test shall be recorded in the format approved by CM);
6. Secondary injection test to re-calibrate all measuring, protection and control circuits and associated components.

ELE4.5.2.040.7 COMMISSIONING TESTS

The following inspections and tests shall be carried out immediately before the ASSEMBLY is put into normal service:

1. Voltage tests between any two combinations of each phase, neutral and earth;
2. Phase sequence tests on each outgoing unit;
3. Functional checks, especially on the controlling devices.
ELE4.5.2.050.7 VERIFICATION ON ACCURACY OF MULTI-FUNCTION ELECTRONIC METER
Verification test on the accuracy of energy measurement in kWh of multi-function electronic meter shall be carried out within the Maintenance Period. The exact date for the test shall be as directed by the Contract Manager:

1. The verification test shall include the provision of add-on metering equipment on each selected circuit for seven (7) days and operate in parallel with the installed multi-function meter;
2. Two (2) meters per each ASSEMBLY shall be selected and tested for accuracy verification. The positions of which shall be approved by the Contract Manager;
3. All labour, instruments, data logging devices, etc. required for the verification test shall be provided by the Sub-contractor.

ELE4.5.3 AUXILIARY EQUIPMENT

ELE4.5.3.010.7 COMPLETENESS
Each ASSEMBLY shall be supplied complete with all operating handles, jigs, etc. required for the normal operation and inspection of all circuit breakers and switchgears of the ASSEMBLY.

ELE5.1 GENERAL ARRANGEMENT

ELE5.1.010.7 HOUSING
The capacitor units shall be housed in a separated compartment to prevent the control equipment from being damaged by the capacitors in case of a fault.

ELE5.1.020.7 CONTROLS
For capacitor installation of ratings equal to 30 kVAr or less, no step-switching mechanism and control relay or regulator will be required. For ratings greater than 30 kVAr, the capacitor installation shall be switchable type complete with switching devices and automatic control relays.
ELE5.2 CUBICLE CABINET DESIGN

ELE5.2.010.7 CONSTRUCTION
The construction of the cabinet and the fixture of the capacitor installation shall be sufficiently rigid to stand the thermal, electrical and mechanical stresses due to short circuit, step-switching and discharging of the capacitor.

ELE5.2.020.7 MOUNTING OF SWITCHES
For switchable type capacitor cabinet, flush mounted indicating devices and selector control switches shall be fitted on the front panel which shall be in the form of a hinged door.

ELE5.2.030.7 DEGREE OF PROTECTION
The cubicle cabinet shall have a degree of protection not less than IP 31 and IP 2X when the cubicle door is in the "close" and "open" position respectively.

ELE5.2.040.7 POSITION OF MAIN FUSESWITCH
The main fuseswitch for the power factor correction equipment shall not be housed within the control cabinet.

ELE5.2.050.7 SPACING
1. Sufficient space shall be allowed between cables connecting distribution fuses to contactors and contactors to capacitor banks for insertion of clamp-on meters for current measurement.

2. The capacitor units shall be spaced to enable access to individual capacitor terminals for on-load electrical tests.
ELE5.3  CAPACITORS

ELE5.3.010.7 STANDARD
1. IEC 60831-1;
2. IEC 60831-2.

ELE5.3.020.7 RATED OUTPUT OF CAPACITOR BANK
The output kVar rating of capacitor bank shall be provided according to the standard ratings listed below:
20, 25, 30, 40, 50, 60, 90, 120, 150, 180, 200, 240, 280 (subsequent increases in 40 kVar steps).

ELE5.3.030.7 RATED OUTPUT OF CAPACITOR UNIT
The output kVar rating of each capacitor unit shall be provided according to the standard ratings listed below (all in kVar):
20, 25, 30, 40.

ELE5.3.040.7 SAFETY FEATURES
1. All capacitor elements shall be of self-healing type, capable of self-restoration after breakdown of insulation due to momentary over voltage. The self-healing process shall be complete within half-a-cycle and with no significant changes in capacitance and the loss angle;
2. The capacitor elements shall be completely encapsulated in metal or epoxy case and fitted with tear-off fuse or other effective means to minimize overpressure due to internal fault;
3. Capacitors shall be dry type only;
4. PCBs (polychlorinated biphenyls) shall not be used and dielectric shall be environment compatible, i.e. no pollution to environment in case of leakage;
5. All materials used in capacitors except the dielectric shall be non-flammable and self-extinguishing;
6. Fuses having a current rating 1.5 times the capacitor current shall be provided to protect each capacitor unit and shall comply with ELE3.13;
7. A label shall be fixed on the front surface of the cubicle to indicate, in English and Chinese, the operating procedures before accessing the live parts inside the cubicle compartment. The label shall be submitted to Contract Manager for Approval;
8. The metallic container of the capacitor units and also the cubicle cabinet shall be properly earthed by permanent connection.

ELE5.3.050.7 DISCHARGE DEVICE
1. A resistor discharge device of appropriate resistance value shall be provided to reduce the residual voltage to less than 50V within one minute after actuation of the device. The discharge device shall function automatically on loss of supply and the discharge circuit shall be rated to discharge the capacitor bank from the peak of 30% overvoltage;
2. The residual voltage shall be measured across the terminals of the whole capacitor bank, i.e. not across individual capacitor element or unit;
3. The discharge path shall have no disconnecting link, switch, fuse or series capacitor interposed.
ELE5.3.060.7  **LOSSES**

1. The losses measured under nominal voltage and frequency shall be less than 0.5 W per kVar. Type test report to the satisfaction of the Contract Manager shall be submitted to verify that this requirement has been met;
2. Puncture of insulation due to momentary overvoltage across electrodes shall not lead to significant increase in losses.

ELE5.3.070.7  **CAPACITANCE TOLERANCES**

1. The capacitance shall not differ from the rated capacitance by more than:
   a. -5% to 15% for units and banks up to 100 kVar;
   b. 0% to 10% for units and banks above 100 kVar.
2. In three-phase units, the ratio of maximum and minimum value of the capacitance measured between any two-line terminals shall not exceed 1.08;
3. Rating plate bearing the information markings as stipulated in Sections 26 & 27 of IEC 60831-1, shall be provided for each capacitor unit and the capacitor bank.
ELE5.4 AUTOMATIC CONTROL EQUIPMENT

ELE5.4.010.7 APPLICATION
For capacitors of 40 kVAR and above, automatic control relay shall be provided to maintain the power factor at the specified value.

ELE5.4.020.7 OPERATION OF CONTROL SYSTEM
The control system shall continuously detect and measure the power factor and switch-in or switch-out bank(s) of capacitors in steps to maintain the designed power factor. The value of each step is determined as follows:

<table>
<thead>
<tr>
<th>Total capacitor rating in kVAR</th>

</table>

ELE5.4.030.7 STEPS
The number of steps shall be programmable within the range of 2 steps to 12 steps using a code switch.

ELE5.4.040.7 POWER FACTOR SELECTOR SWITCH
The power factor selector switch shall be continuously adjustable between 0.85 inductive to 0.95 capacitive.

ELE5.4.050.7 CONTROL RELAY
The control relay shall be designed in such a way that there shall be no relay hunting when the load power fluctuates. A starting reactive current (c/k ratio) setting device shall be provided to allow stepless adjustment between 0.075 to 1.0.

ELE5.4.060.7 SWITCHING TIME
The switching time between each switching stage shall be adjustable from 30 seconds to 60 seconds or above to give a time delay longer than the charging and discharging times of the previous stage so that there shall be no simultaneous charging or discharging of two stages.
ELE5.4.070.7 PROVISIONS FOR POWER FAILURE
In the event of power failure, all the capacitors shall be automatically disconnected and discharged. On restoration of supply, the relay shall, after a waiting time to ensure sufficient discharge of stored energy, commence operation in accordance with the selected switching programme and power factor setting.

ELE5.4.080.7 ACCESS TO CONTROL SWITCHES
Unless otherwise stated, all the control switches shall be front accessible without opening the cabinet door stated in ELE5.2.020.
ELE5.5 MANUAL CONTROL

ELE5.5.010.7 SELECTOR SWITCH
A selector switch for manual or automatic control of the equipment shall be provided inside the cubicle cabinet.

ELE5.5.020.7 PUSH-BUTTONS
Push-buttons shall be provided for steps "switching-in" and "switching-out" in the manual mode with the switching time delay as provided at ELE5.4.060.

ELE5.5.030.7 CAPACITOR CONTROL
The number of capacitors "switching-in" or "switching-out" shall be entirely manually controlled irrespective of the mode of controller output.
**ELE5.6 ** ADDITIONAL MANUAL CONTROL

**ELE5.6.010.7**  OVERRIDE SWITCH
An additional selector switch to override the automatic control relay in case of its failure shall be provided inside the control cabinet.

**ELE5.6.020.7**  CAPACITOR CONTROL LOCATION
Under this manual control, the number of capacitors "switching-in" or "switching-out" shall be entirely manually controlled by additional push-buttons inside the control cabinet.
ELE5.7  CONTACTORS

ELE5.7.010.7  NUMBER
The number of contactors shall be determined by the number of switching stages stipulated in ELE5.4.020.

ELE5.7.020.7  SPECIFICATION
Contactors shall be in compliance with ELE3.15.
ELE5.8 INDICATING INSTRUMENTS

ELE5.8.010.7 LOCATION OF INDICATORS
Indicators shall be fitted on the front panel of the cubicle cabinet.

ELE5.8.020.7 INDICATORS FOR RATINGS GREATER THAN 30 KVAR
1. Supply ON/OFF indicator;
2. Power factor meter for inductive/capacitive indication;
3. Indicator showing the number of stages of capacitors being connected;
4. Indicator showing mode of operation, automatic or manual control;
5. Warning plate which reads “WARNING : WAIT 5 MINUTES AFTER ISOLATING SUPPLY BEFORE HANDLING” in both English and Chinese.

ELE5.8.030.7 INDICATORS FOR RATINGS EQUAL TO 30 KVAR OR LESS
1. Warning plate which reads “WARNING : WAIT 5 MINUTES AFTER ISOLATING SUPPLY BEFORE HANDLING” in both English and Chinese;
2. The warning plate specified in sub-clause (1) above shall constitute the minimum requirements and extra indicators relevant to the operation of the control equipment shall be provided to suit the design features of the equipment offered. In particular, the warning plate shall be provided on all access panels or doors;
3. Labels in the cubicle cabinet for indicators and control switches shall be in English or internationally accepted abbreviation.
ELE5.9  TYPE-TESTS AND ROUTINE TESTS

ELE5.9.010.7  TYPE-TESTS
Type-test reports to verify compliance with the specified requirements and details in IEC 60831-1 and IEC 60831-2 shall be submitted to the Contract Manager.

ELE5.9.020.7  ROUTINE TESTS
Routine tests for every capacitor supplied shall be carried out at manufacturer's works and test certificates shall be submitted to the Contract Manager.
ELE5.10 COMMISSIONING AND ACCEPTANCE TESTS

ELE5.10.010.7 FACTORY TESTS
Before putting the equipment into operation, acceptance tests shall be carried out in the manufacturing factory.

ELE5.10.020.7 MINIMUM ACCEPTANCE TESTS
The acceptance tests shall comprise at least the following:
1. Capacitance measurement and output calculation;
2. Measurement of the tangent of the loss angle (\(\tan \delta\)) of the capacitor;
3. Voltage test between terminal and container;
4. Test of the internal discharge device;
5. Control simulation test.

ELE5.10.030.7 VOLTAGE TEST
During voltage test between terminals, self-healing breakdowns will be allowed. However, the capacitance and tangent of the loss angle shall be measured subsequently and no significant changes in value shall be allowed.

ELE5.10.040.7 CONTROL SIMULATION TEST
During control simulation test, adequate temporary facilities, including field testers to simulate the actual load variations for checking the operation of the control relay and the correct functions of the power factor correction equipment, shall be provided.

ELE5.10.050.7 REPORT FORMATS
The report formats for the tests listed in ELE5.10.020 will be provided by the Contract Manager.

ELE5.10.060.7 ACCEPTANCE TEST REPORT
The acceptance test report for each capacitor installation should be submitted to the Contract Manager prior to delivery to Site.

ELE5.10.070.7 ACCEPTANCE TESTS DURING MAINTENANCE PERIOD
At the end of the Maintenance Period, or at any time instructed by the Contract Manager during the Maintenance Period, the Sub-contractor shall carry out the followings and shall replace, at his own cost, any capacitor that fails the inspection and test:
1. Visual inspection;
2. Control simulation test;
3. 24-hour continuous measurements on power factor variations.

ELE6.1 BUSBAR CHAMBERS

ELE6.1.010.7 STANDARD
Busbar chambers shall comply with and be type-tested to IEC 60439-1 and IEC 60439-2.

ELE6.1.020.7 ENCLOSURE
1. The busbar chamber enclosure shall be made of sheet steel not less than 1.5 mm thick for ratings not exceeding 500A, and not less than 2 mm thick for rating above 500A;
2. The enclosure shall be formed in such a way as to give a rigid structure of sufficient strength;
3. The cover shall be provided with rubber gasket and fixed on to the main enclosure at the front by means of heavily electroplated hexagonal headed screws and nuts;
4. Either the screw or the nut shall be permanently fixed on to the main enclosure;
5. The enclosure shall be suitable for surface mounting with a degree of protection against ingress of foreign solid particles and liquids of at least IP31 of IEC 60529 with the cover closed.

ELE6.1.030.7 FINISH
All steel work shall be treated to prohibit corrosion by hot-dip galvanising or electrolytically coated with zinc. The inside and outside surfaces of the enclosure shall then be coated with not less than two layers of stove enamel finish paint of contrasting colours, or one layer of stoved enamel epoxy powder paint, of an Approved colour.

ELE6.1.040.7 BUSBARS
1. Busbars shall be hard drawn, high conductivity, air insulated, electro-tinned, solid copper bars to BS EN 13601;
2. The neutral busbar shall be of the same rating as the phase busbars;
3. Each busbar shall be marked with the appropriate phase colour at intervals of not more than 600 mm;
4. Busbars shall be mounted on insulators that shall follow the type-tested designs.

ELE6.1.050.7 TAP-OFF DEVICES
Unless otherwise Approved, proper tap-off devices in the form of tap-off clamps and cable lugs, where necessary, shall be provided for the tap-off cables and such devices shall not reduce the effective size or rating of the busbars. Slots through enclosures for tap-off cables shall be sealed with phenolic resin bonded paper laminated sheet not less than 6 mm thick.

ELE6.1.060.7 TYPE-TESTING
Busbar chambers shall be type-tested in accordance with Clause 8.1.1 of IEC 60439-1 and IEC 60439-2. The verification of short-circuit strength shall be carried out by a Short-Circuit Testing Organisation at the value of short circuit current specified below:

<table>
<thead>
<tr>
<th>Busbar rating</th>
<th>Test circuit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not exceeding 500A</td>
<td>*Fused short circuit of 40kA</td>
</tr>
</tbody>
</table>
| 2. | Over 500A | a. Short time withstand current of 40kA for one second;  
|    |          | b. Peak withstand current of 84kA.  

* IEC 60269-1: and IEC 60269-2: and BS 88: Section 2.2 or BS 88-2.
ELE6.2  NOT USED
ELE6.3 ALL INSULATED BUSBAR TRUNKING SYSTEM (BUSDUCT)

ELE6.3.010.7 GENERAL

1. This specification covers the all-insulated busbar trunking system including fittings & accessories (hereinafter referred to as "busduct" or "busducts") up to and including 2500A;

2. Busducts shall comply with IEC 60439-2, and meeting all clauses as described in this Specification. Other standards, e.g. National Electrical Manufacturers Association (NEMA) or Underwriters Laboratories Inc. (UL) may be considered as acceptable provided that the standard is not inferior to the relevant IEC standards;

3. All the materials and components use for the busducts shall be of the same make and same country/place of manufacture of the typed-tested ones;

4. The busduct shall be manufactured at the base country/place of the original manufacturer. Licensed to make at other country/place will not be accepted;

5. Busduct current rating indicated on the Schedule of Rates, drawings or the particular specifications is the anticipated full load current (concentrated load) that the busduct must be capable of carrying continuously;

6. If the busduct is installed in flatwise mounting, appropriate de-rating factor as recommended by the manufacturer shall be applied to the busduct;

7. Busducts shall be totally enclosed type with ingress of protection not less than IP55 for indoor installation, including tap-off units, and IP66 for outdoor installation without tap-off units;

8. Unique model numbers shall be used to differentiate busducts with or without tap-off units;

9. Permanent nameplates shall be fixed on each busduct section and fitting. The use of stickers is not considered permanent in these circumstances.

ELE6.3.020.7 DESIGN AND CONSTRUCTION

1. The busducts shall be factory fabricated, fully insulated, totally enclosed, non-ventilated (sandwich) type. The busduct shall be designed to operate under the service conditions as specified in ELE1.5;

2. The busduct shall be of three phases and full size neutral busbar type;

3. Same length of busduct sections shall be interchangeable and polarized for phase relation. Each length of fitting shall bear the manufacturer's name, catalogue no. and rating. Each length or fitting shall bear the manufacturer's name, catalogue no. and rating;

4. All busducts can be mounted either flatwise or edgewise without loss in their mechanical strength and the current carrying capacity;

5. All plug-in sections provided shall be standardised to 1200 mm (4 feet) nominal length.

ELE6.3.030.7 BUSDUCT ENCLOSURE

1. The enclosure of the busducts shall be rigidly constructed from galvanized sheet steel of not less than 1.5 mm thickness or aluminium of minimum 2.5 mm thickness. Where a combination of sheets of these two materials is used as the assembly, no apparent visible stress shall be observed during operation when the busducts are properly supported. However, the thickness of the metal sheets employed shall, in no case, be less than 1.5 mm each;
2. The enclosure shall have one of the following finishes and the colour shall be grey or the manufacturer's colour of standard production:
   a. Stoved enamel paint;
   b. Stoved epoxy powder paint;
   c. Anodic oxidation coatings to Class 25 of EN 12373-1 for aluminum alloy;
   d. Other equivalent finishes approved by the Contract Manager.

3. For plug-in type busduct, the plug-in access opening shall be equipped with a hinged cover which covers the opening when not in use. All openings shall be usable simultaneously, if required.

**ELE6.3.040.7 BUSBARS**

1. Busbars shall be of hard drawn, high conductivity, solid copper bar to BS EN 13601 or alternatively hard drawn, high conductivity solid copper bars of 97% International Annealed Copper Standard Conductivity;

2. The busbar including all electrical contact surfaces shall be electroplated with silver or tin. The busbars shall be of adequate size to carry the rated current of the busducts continuously without exceeding the temperature rise limits specified in IEC 60439-2 when tested in accordance with Sub-clause 8.2.1 of IEC 60439-2 at ambient temperature of 40°C;

3. Each busbar shall be insulated over its entire length except at joints and contact surfaces. The insulation material shall be of at least class B (130°C);

4. The insulation material shall be of heat-resistant, self-extinguishing, non-hygroscopic and high insulation resistance and mechanical strength to withstand the stresses under all services and fault conditions and it shall be tested in accordance with Clauses 8.2.14 of IEC 60439-2 or to the satisfaction of the Contract Manager;

5. The maximum voltage drop value of a three phases and neutral busduct shall be 10 volts per 100 metres run when the busduct is operating at a full rated sinusoidal a.c. current of 50 Hz (concentrated load), at a power factor of 0.85 and at an ambient temperature of 35°C. Use of higher current rating busducts to achieve the above maximum voltage drop value is acceptable subject to the maximum allowable structural opening size shown on the drawings not being exceeded;

6. Drilling of busbars for power take off shall not be permitted, unless otherwise approved by the Contract Manager.

**ELE6.3.050.7 BUSBAR JOINTING**

1. Two sections of busducts shall be joined by connecting the joint-ends of the busbars in an interleaved manner;

2. The joints shall be of bolt-on type. The contact pressure shall be maintained by insulated bolts through the joint with the bolt at earth potential. Soldered, welded or riveted joints shall not be permitted;

3. The bolt shall be torque indicating and be tightened up by means of a torque wrench as recommended by the manufacturer;

4. The joint shall be protected by metal cover plates of same type of material and finish as the busduct casing so that the degree of protection shall not be less than that of an unjoined busduct;

5. The design of jointing shall permit safe, practical checking of joints for tightness without de-energising the busbars, or exposing maintenance personnel to any electrical hazard;
6. It shall be possible to tighten up a joint from one side only of the busducts. The joint shall be so designed and located that removal of any length should not result in the removal of the adjacent lengths.

**ELE6.3.060.7 BUSBAR SUPPORT**

1. Busducts shall be securely fixed on the building structure by means of hangers and brackets specifically designed and supplied by the same manufacturers;

2. Unless otherwise specified, horizontal run busducts shall be supported by hangers spaced at intervals of not more than 2 meters. Extra number of hanger shall be required for joints. At least one hanger shall be provided for every section of the busducts. Additional supports as recommended by the busduct manufacturer shall be provided;

3. Vertical busducts shall be supported by spring hangers on every floor. The spring hangers shall be properly adjusted such that the loading of vertical busducts is evenly distributed among the supports. Additional guide brackets in intermediate position between two supports shall be provided, if necessary, to balance the offset loading of the tap-off units.

**ELE6.3.070.7 EXPANSION UNIT**

1. Expansion unit shall be provided where busduct is installed across any structural expansion joint. The expansion unit shall be so constructed that any lateral or axial displacement on both the conductors and the casing caused by any movement of the building joint (in all directions) can be absorbed easily and cause no distortion to the busduct in whatever form;

2. Thermal expansion units, if required, shall be so constructed that any change in length on both the conductors and the casing so caused by thermal expansion and contraction in all direction can be absorbed easily and cause no distortion of the busduct in whatever form;

3. All expansion units shall be protected from water dripping by means of properly fabricated enclosure, details of which shall be submitted for Approval.

**ELE6.3.080.7 TAP-OFF UNIT**

1. Power tapping-off from the busduct shall be taken by means of specially designed tap-off units. These devices shall be plug-in type units, which shall be held in position by means of wing nuts or other quick fastening and quick release device. Quick fastening device shall mean that no tools are required for the removal of tap-off units. The design and construction of tap-off units shall be such that the electricity supply to other floors will not be interrupted no matter the tap-off units were plugged in or removed;

2. All plug-in access openings shall be equipped with a hinged door which covers the openings when not in use. The plug-in access opening doors can only be opened by tools otherwise the plug-in access opening door should be padlockable. The Sub-contractor shall provide pad-locks to all spare padlockable doors. A master key shall open all pad-locks of the same busduct. Details of the plug-in access opening doors shall be submitted for Approval;
3. The plug-in or the bolt-on type tap-off unit boxes together with the jaws and internal connection terminals shall be of the same manufacturer and country/place of manufacture of the busducts. The Sub-contractor shall propose, with the support of the busduct manufacturer, a type of FCU complying with ELE3.2 for Approval. If any modification to the manufacturer's standard tap-off unit boxes is required to suit the particular type of FCU, such modification shall be designed and carried out by the busduct manufacturer. The manufacturer shall undertake that such modifications are safe and suitable for the intended purpose. No modification by the Sub-contractor on site is allowed. The plug-in box complete with built-in FCU and fuses shall be type tested to IEC 60439-1 & IEC 60439-2. Full fault level, protection co-ordination and earth fault calculations should be submitted by the Sub-contractor for Contract Manager's Approval;

4. The tap-off units shall be equipped with internal barriers so that when the covers of the boxes are removed/opened, a degree of protection of the least IP2X is still maintained. Internal phase barriers shall be provided where necessary;

5. The tap-off unit shall be mechanically inter-locked with the busduct to prevent installation or removal of the unit while the unit is in the ON position. In addition, the cover of the tap-off unit shall have interlocks to prevent the covers from being opened while the tap-off unit is in the ON position. Means shall also be provided to padlock the FCU in its OFF position;

6. Tap-off unit boxes shall make positive earth connection with the earthing conductors before the jaws make contact with the phase busbars. The earthing method shall be such that it cannot be defeated by future painting of the busduct housing;

7. Tap-off unit shall be equipped with means for direct positioning or hanging so that the weight of the unit is borne by the busduct before the plug-in jaws make contact.

ELE6.3.090.7 BUSDUCT FITTINGS AND ACCESSORIES

1. All the busduct fittings, as listed below but not limited to, shall be specifically designed to suit the requirements of the busduct concerned and made by the same manufacturer:
   a. Flanged end;
   b. Flatwise and edgewise elbow;
   c. Combination elbow;
   d. Flatwise and edgewise offset;
   e. End closer;
   f. Tee-joints.

ELE6.3.100.7 LABELS AND WARNING NOTICES

1. All labels and warning notices shall be in both English and Chinese characters. Details shall be submitted to the Contract Manager for Approval;

2. Warning notices shall be provided along the entire busduct with the following wording in both English and Chinese characters:
   "DANGER - LIVE PART"
   "危險 - 帶電部份"

3. The warning notice shall be in the form of durable self-adhesive type label with red lettering on yellow background. The label shall have a minimum size of 150 mm x 75 mm with the lettering not less than 20 mm high;

4. The warning notices shall be located on all visible sides of the busduct, including all fittings, with a maximum spacing of 2 m along each side.
**ELE6.3.110.7 TESTING AND CERTIFICATION**

1. Short circuit test shall be carried out and certified by a Short Circuit Testing Organisation;

2. Short-circuit test for the busduct shall be carried out in accordance with Clause 8.2.3 of IEC 60439-1 or to the satisfaction of the Contract Manager at the value of short-circuit current specified below:

<table>
<thead>
<tr>
<th>Busbar Rating</th>
<th>Test Current</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Not exceeding 500A:</td>
<td>* Fused short-time withstand current of 40 kA</td>
</tr>
<tr>
<td>b. Over 500A &amp; below 1600A:</td>
<td>Short-time withstand current of 40 kA minimum for one (1) second.</td>
</tr>
<tr>
<td>c. 1600A &amp; above:</td>
<td>Short-time withstanding current of 50kA for one (1) second.</td>
</tr>
</tbody>
</table>

*IEC 60269-1 and IEC 60269-2 and BS 88 : Section 2.2 or BS 88-2.

3. Before energization, the Sub-contractor shall carry out insulation resistance test for whole length of the busway, including feeders, expansion joints, and tap off/plug-in to verify the insulation resistance of the busway between phases and phases to earth to be not less than 10MΩ. For length of the busway exceeding 50 m, it is acceptable to carry out the insulation resistance test in two sections.

**ELE6.3.120.7 IN-SERVICE RECORDS**

Prior to the time of material submission for Approval, the equipment including its major components shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.

Specification Library 2014 Edition

ELE7 /2
ELE7.1 GENERAL REQUIREMENTS

ELE7.1.010.7 QUALITY SURVEILLANCE SCHEME

1. Where a national/international product standard exists, cables of the particular type shall be manufactured under BASEC licence or an Equivalent Quality Surveillance Scheme (EQSS) (e.g. HAR scheme recognized by the European Committee for Electrotechnical Standardization, CENELEC, etc.) and bear BASEC marking or the appropriate marking of the EQSS (e.g. 'X' <HAR>, where 'X' is one of the Approval Organizations' designation under CENELEC).

2. The EQSS shall be a System 5 product certification system in accordance with ISO/IEC 17067 for determining the conformity of a product with specified requirements through initial testing of samples of the product, assessment and surveillance of the involved quality system, and surveillance by testing of product samples taken from the manufacturer, the open market or the supply from the Purchasers.

3. The certification body providing the EQSS shall be accredited by Hong Kong Accreditation Services (HKAS) or its Mutual Recognition Agreement (MRA) partners in accordance with this Scheme, ISO/IEC 17065 and its corresponding International Accreditation Forum (IAF) Guidance.

4. The cable manufacturer shall have its own machineries and facilities to make the cables and laboratories to perform routine tests on cables. Cross licence and sub-contracting of cable manufacture can be acceptable subject to the advance approval is obtained from the approved certification body. Cables manufactured under Original Equipment Manufacture (OEM) or private labelling shall not be accepted.

5. The certification body providing the EQSS shall submit complete set of the EQSS document and substantiate with separate information to the satisfaction of the Contract Manager that their product certification work and quality surveillance scheme are equivalent to that of BASEC’s by making reference and comparison to each of the following:
   a. Each factory location where cable production occurs, and its product, is separately audited / tested and certified;
   b. Audited quality management system requirements include all requirements of ISO 9001.
   c. Audit includes production equipment and processes, and factory in-process and off-line testing equipment, calibration, etc. Factories must maintain specified minimum suite of laboratory testing equipment;
   d. Three year certification cycle in line with ISO requirements;
   e. Audit / sample pickup frequency at each factory shall be four times per annum with at least one being unannounced. Sample numbers selected shall be up to 150 per annum for building wires / flexes, 50 per annum for armoured and fire performance cables, and 50 per annum for IEC or special types, which the number shall be geared by volume of production. Reduced level of surveillance can be acceptable only if a risk assessment system is established in the scheme and the licensee maintains persistent satisfactory quality results that meet the criteria for reduced surveillance as defined in the risk assessment. In any case, the risk assessment system and acceptable criteria shall not be less stringent than that adopted by BASEC.
   f. Alternative to item e above, EQSS having yearly routine surveillance test at each factory plus inspection acceptance tests to be carried out on each batch cables to be supplied for individual project will also be acceptable. The inspection acceptance tests shall be conducted on each size and type of cable and at least include the following:
i. verify all the results of routine tests conducted by the factory as defined in the corresponding cable standard and carry out supplementary auditing tests if necessary;

ii. conduct all the Sample Tests (S) as stipulated in the corresponding cable standards on minimum 10% of each size and type of cables reels;

iii. conduct the following verification tests on all cables:
   - resistance of conductors
   - absence of faults in insulation (the spark test)
   - voltage test

   All the tests shall be carried out in an accredited laboratory. Identification of the tested batch of cables such as purchase order number(s) and date(s) shall be submitted for the Contract Manager’s checking prior to delivery. The purchase order number(s) shall be printed on the cables as one of the markings on the cable.

g. Initial type testing covering all requirements of cable standards and any subsidiary materials, performance and test standards referenced;

h. Surveillance testing covers all type, sample and routine tests on each cable type over the certification cycle;

i. Full traceability maintained from incoming material, through production to factory final test, and for samples onwards from auditor selection of samples through to final test;

j. Minor irregularities of deviations on test results are handled as non-conformities and require root cause analysis, correction and corrective action;

k. In case of serious test failures product recall notices are issued to the manufacturer;

l. Complaints and appeals system in cases of concern, test failure or failure in use, with range of sanctions applied;

m. Specific assessment criteria of test results for each type of cable.

n. The certified products, together with their links to news of suspensions, recalls, etc, shall be shown on the certification bodies’ websites.

o. The surveillance test report shall be submitted to the Contract Manager for checking upon requested.

**ELE7.1.020.7 CABLE COLORS**

1. The compliance of electric cables with a national/international product standard shall require their design, construction and manufacture to adhere to that particular standard in all aspects except the cable colours that unless otherwise stated, should be in line with the Electrical CoP;

2. For any electrical installation based on the new cable core colour code, the registered electrical workers employed shall have satisfied the Electrical & Mechanical Services Department training requirements for new cable core colour code.
ELE7.2 WIRING SYSTEM IN CONDUIT

ELE7.2.010.7 TYPE OF CABLE
The cable installed in conduits shall be one of the following types with copper conductors unless otherwise stated:
1. Single-core, PVC-insulated cables to BS EN 50525-2-31 or IEC 60227-3;
2. PVC-insulated cables to BS 6231;
3. Single-core, non-sheathed, non-armoured, low smoke zero halogen cables to BS EN 50525-3-41;
4. Single-core, non-sheathed, non-armoured, fire-resistant cables;
5. Single-core, sheathed, non-armoured, fire-resistant cables;
6. Multi-core, sheathed, non-armoured, fire-resistant cables.

ELE7.2.020.7 GRADE OF CABLE
The cable installed in conduits shall have the minimum voltage rating given in the table below:

<table>
<thead>
<tr>
<th>Type of Cables</th>
<th>Minimum Voltage Rating (V)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Single-core, PVC-insulated cables to BS EN 50525-2-31 or IEC 60227-3</td>
<td>450/750</td>
</tr>
<tr>
<td>2. PVC-insulated cables to BS 6231</td>
<td>600/1000</td>
</tr>
<tr>
<td>3. Single-core, non-sheathed, non-armoured, low smoke zero halogen cables to BS EN 50525-3-41</td>
<td>450/750</td>
</tr>
<tr>
<td>4. Single-core, non-sheathed, non-armoured, fire-resistant cables</td>
<td>450/750</td>
</tr>
<tr>
<td>5. Single-core, sheathed, non-armoured, fire-resistant cables</td>
<td>600/1000</td>
</tr>
<tr>
<td>6. Multi-core, sheathed, non-armoured, fire-resistant cables</td>
<td>300/500</td>
</tr>
</tbody>
</table>
ELE7.3  WIRING SYSTEM IN TRUNKING

ELE7.3.010.7  TYPE OF CABLE

The cable installed in trunkings shall be one of the following types with copper conductors unless otherwise stated:

1. Single-core, PVC-insulated cables to BS EN 50525-2-31 or IEC 60227-3;
2. PVC-insulated cables to BS 6231;
3. Single-core, non-sheathed, non-armoured, low smoke zero halogen cables to BS EN 50525-3-41;
4. Single-core, non-sheathed, non-armoured, fire-resistant cables;
5. Single-core, sheathed, non-armoured, fire-resistant cables;
6. Multi-core, sheathed, non-armoured, fire-resistant cables.

ELE7.3.020.7  GRADE OF CABLE

The cable installed in trunkings shall have the minimum voltage rating tabulated below:

<table>
<thead>
<tr>
<th>Type of Cables</th>
<th>Minimum Voltage Rating (V)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Single-core, PVC-insulated cables to BS EN 50525-2-31 or IEC 60227-3</td>

</tbody>
</table>

ELE7.4.020.7 PVC-INSULATED, NON-SHEATHED, GENERAL PURPOSE, SINGLE-CORE CABLES

Cables shall comply with BS EN 50525-2-31 or IEC 60227-3.

ELE7.4.030.7 XLPE/PVC-INSULATED, PVC-SHEATHED, SINGLE-CORE CABLES

1. Cables with copper conductor sizes up to and including 35 mm² shall comply with BS 6004 Table 3;
2. Single-core cables with copper conductor sizes from 50 mm² to 1000 mm² inclusive shall comply with BS 7889 or IEC 60502-1.

ELE7.4.040.7 PVC-INSULATED, PVC-SHEATHED, FLAT TWIN CABLES
1. Cables with or without integral circuit protective conductor shall comply with BS 6004 Tables 3 & 4;
2. The colour of the PVC sheath shall be white.

ELE7.4.060.7 XLPE-INSULATED, PVC-SHEATHED, ARMOURED CABLES
1. XLPE-insulated, PVC-sheathed, armoured cables shall comply with BS 5467 or IEC 60502-1;
2. The XLPE insulated cable cores shall be sheathed with PVC which serves as bedding for the galvanized steel single-wire armouring;
3. The XLPE insulation shall be able to operate continuously at a conductor temperature of 90°C.

ELE7.4.070.7 PVC-INSULATED CABLES FOR SWITCHGEAR AND CONTROLGEAR WIRING
Flexible cables shall comply with type CK of BS 6231.

ELE7.4.090.7 MINIMUM SIZE OF LIVE CONDUCTOR
1. Cables for circuits of rating not exceeding 10A shall have CSA of not less than 1.5 mm²;
2. Cables for circuits rated at 15A and above shall have CSA of not less than 2.5 mm²;
3. Flexible cables and flexible cords shall have CSA of not less than 0.75 mm².

ELE7.4.100.7 CIRCUIT PROTECTIVE CONDUCTOR (CPC)
1. In installations where cables are clipped direct having CSA up to 16 mm² and below used for single phase circuit shall be twin-core with integral CPC except where:
   a. They are used in earth free situations; or
   b. They are used for extra low voltage circuits; or
   c. The CSA of the integral CPC cannot meet the requirement of the adiabatic equation laid down in BS 7671 or IEC 60364.
2. Separate CPC shall be single core cables, to BS EN 50525-2-31 or IEC 60227-3;
3. Tee connection in the CPC shall not be allowed;
4. The minimum CSA of a CPC shall be 1.0 mm² if the CPC is incorporated in the same cables as the associated live conductors, otherwise the minimum CSA shall be 4 mm²;
5. CPC shall be properly sized in accordance with ELE17.

ELE7.4.120.7 IDENTIFICATION OF CABLE CORE
The identification of cable cores shall follow the requirements of the Electrical CoP.
WIRING SYSTEM USING MINERAL INSULATED CABLE

ELE7.5.010.7 TYPES OF CABLE
All mineral-insulated cables shall be copper sheathed with copper conductors complying with IEC 60702-1 or BS EN 60702-1.

ELE7.5.020.7 GRADE OF CABLE
Unless otherwise specified, all mineral-insulated cables shall be 750V (heavy duty) of IEC 60702-1 or BS EN 60702-1.

ELE7.5.030.7 LOW SMOKE ZERO HALOGEN (LSOH) OUTER COVERING
1. Mineral-insulated cables shall have LSOH thermoplastic outer covering when:
   a. They are exposed to weather;
   b. They are installed in situations where the atmosphere is likely to cause corrosion;
   c. They are laid upon or fixed direct to a concrete or stone surface subject to dampness;
   d. They are laid upon or fixed directly to a zinc coated surface, e.g. a galvanised cable tray or corrugated sheeting, subject to dampness;
   e. They are buried direct in the ground;
   f. They are as specified in ELE2 or the Drawings.
2. LSOH thermoplastic outer covering shall not be used in refrigerated spaces or other situations where the temperature is consistently below 0°C;
3. The LSOH thermoplastic outer covering shall have an orange colour.
ELE7.6 POWER DISTRIBUTION CABLES

ELE7.6.020.7 XLPE- INSULATED POWER CABLES WITH COPPER CONDUCTORS
XLPE insulated PVC-sheathed, armoured cable shall comply with the requirement specified in ELE7.4.060.

ELE7.6.040.7 GRADING OF POWER CABLES
All power cables for electricity supply shall have a grading of 600/1000V.
ELE7.7 **CABLE GLANDS**

**ELE7.7.010.7 CONSTRUCTION**

Cable glands shall be mechanical cable glands in compliance with BS 6121:Part 1 or BS EN 50262 and use brass as basic material.

**ELE7.7.020.7 TERMINATION**

For the termination of steel wire armoured cables of any of the following types, type D1W glands shall be employed for indoor applications while type E1W shall be employed for outdoor applications:

1. Cables to BS 5467 or IEC 60502-1;
2. Cables to BS 6724 or IEC 60502-1;
3. Fire-resistant cables.

**ELE7.7.030.7 ATTACHMENTS**

1. Each gland shall be provided with locknut and earth bond attachment of appropriate size and same material as the gland body for making electrical connection to the armour of the cable to be terminated;
2. Each gland shall be complete with a shroud made of the following materials according to the types of cables served:

<table>
<thead>
<tr>
<th>Type of Cable</th>
<th>Material of Shroud</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Cables to BS 5467 or IEC 60502-1</td>
<td>PVC</td>
</tr>
<tr>
<td>b. Cables to BS 6724, or IEC 60502-1 and IEC 60332-1-1 and IEC 61034-2 and IEC 60754-1</td>
<td>Low smoke zero halogen thermosetting or thermoplastic compound</td>
</tr>
<tr>
<td>c. Fire-resistant cables to BS 6387</td>
<td>Low smoke zero halogen thermosetting or thermoplastic compound</td>
</tr>
</tbody>
</table>

**ELE7.7.040.7 CERTIFICATION**

Test certificates giving the results of type-tests shall be produced to verify compliance with the test requirements stipulated in BS 6121: Part 1 or BS EN 50262.
ELE7.8  FIRE-RESISTANT CABLES

ELE7.8.010.7  GENERAL REQUIREMENTS

1. Cables shall have cross-sectional area of not less than 1.5 mm²;

2. Unless otherwise stated, the following fire services installations defined in the Fire Services COP shall require the cable to fall into the categories below under BS 6387:

<table>
<thead>
<tr>
<th>Type of Fire Services Installations</th>
<th>Category, $C_F$, under BS 6387</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Automatic fixed installations using water (other than sprinkler systems)</td>
<td>For power supply cables, $C_F \geq AWX$ or SWX</td>
</tr>
<tr>
<td>b. Sprinkler systems</td>
<td></td>
</tr>
<tr>
<td>c. Deluge systems</td>
<td></td>
</tr>
<tr>
<td>d. Fire hydrant/hose reel systems</td>
<td></td>
</tr>
<tr>
<td>e. Street fire hydrant system</td>
<td></td>
</tr>
<tr>
<td>f. Water spray system</td>
<td></td>
</tr>
<tr>
<td>g. Drencher systems</td>
<td></td>
</tr>
<tr>
<td>h. Fixed foam systems</td>
<td></td>
</tr>
<tr>
<td>i. Ring main systems with fixed pumps</td>
<td></td>
</tr>
<tr>
<td>j. Fire alarm systems</td>
<td></td>
</tr>
<tr>
<td>k. Audio/visual advisory system</td>
<td></td>
</tr>
</tbody>
</table>
| l. Smoke extraction systems | i. For power supply cables, $C_F = CWZ$
   ii. For control cables, $C_F \geq AWX$ or SWX |
| m. Pressurization of staircases | For power supply cables only, $C_F = CWZ$ |
| n. Emergency generators | For power supply cables from the emergency generator to the main switchboard, $C_F = CWZ$ |
| o. Fireman's lifts | For power supply cables from the main switchboard to the main switch for lift power circuit and car lighting etc. in the lift machine room, $C_F = CWZ$ |
| p. Emergency lighting except that inside cinemas, theaters and other specified premises for entertainment | For power supply cables, $C_F \geq B$ |

The legends used in the above table are as follows:

a. A - Resistance to fire alone at 650°C for 3 hours;
b. B - Resistance to fire alone at 750°C for 3 hours;
c. C - Resistance to fire alone at 950°C for 3 hours;
d. S - Resistance to fire alone at 950°C for 20 minutes;
e. W - Resistance to fire with water;

f. X - Resistance to fire at 650°C with mechanical shock;

g. Y - Resistance to fire at 750°C with mechanical shock;

h. Z - Resistance to fire at 950°C with mechanical shock.

3. Cables for the following types of circuits shall comply with BS EN 60702-1 and BS EN 60702-2, or BS 7629 or BS 7846 or other FSD accepted fire-resistant cables complying with relevant international standards:

   a. Fire detection circuits;

   b. Extra-low voltage circuits supplied from an external power supply unit;

   c. Low-voltage final circuits providing mains supply to the external power supply unit;

   d. Power supply to fire alarm sounders.

4. Cables for automatic fixed installations other than water shall comply with BS 5467, BS EN 50525-2-31, BS 6231, BS 6724 or BS EN 50525-3-41.

5. Fire-resistant cables shall be verified for compliance with ELE7.8.010 by well established Product Certification Bodies (PCBs) as stipulated in FSD Circular Letter No. 1/2007.

ELE7.8.020.7 SPECIAL REQUIREMENTS

1. Single-core, non-sheathed, non-armoured, fire-resistant cables:

   a. Cables shall be installed in hot-dipped galvanised steel conduits with material, tool and workmanship in accordance with the Electrical CoP.

2. Multi-core, sheathed, non-armoured, fire-resistant cables:

   a. Cable sizes falling within the ranges in the table below shall comply with BS 7629:Part 1:

<table>
<thead>
<tr>
<th>Number of Cores</th>
<th>Cross-Sectional Area of Conductors, $A_c$ (mm²)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2, 3 or 4</td>
<td>1.5 ≤ $A_c$ ≤ 4</td>
</tr>
<tr>
<td>7, 12 or 19</td>
<td>$A_c$ = 1.5 or 2.5</td>
</tr>
</tbody>
</table>

3. Multi-core, sheathed, armoured, fire-resistant cables:

   a. Cables with different number of cores shall comply with the relevant tables of BS 7846:

<table>
<thead>
<tr>
<th>Number of Cores</th>
<th>Table of BS 7846</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>4</td>
</tr>
<tr>
<td>3</td>
<td>5</td>
</tr>
<tr>
<td>4</td>
<td>6</td>
</tr>
<tr>
<td>5</td>
<td>7</td>
</tr>
<tr>
<td>7, 12, 19, 27, 37 or 48</td>
<td>8</td>
</tr>
</tbody>
</table>

b. Cables shall fall into Category F2 in BS 7846.
ELE7.9  PREFABRICATED BRANCH CABLES

ELE7.9.010.7  GENERAL
1. Being XLPE-insulated, PVC-sheathed type, main and branch cables shall comply with one of the standards below:
   a. BS 7889;
   b. IEC 60502-1.
2. The sizes of main and branch cables shall be in line with those shown on the Drawings.

ELE7.9.020.7  TYPE OF CONDUCTORS
Main and branch cables shall be of copper conductors.

ELE7.9.030.7  TYPE OF BRANCH JOINTS
1. Each branch joint shall take the form of main and branch cables bound together to a compression connector that complies with one of the product standards below:
   a. BS EN 61238-1;
   b. JIS C 2810;
   c. HD 623 S1 or BS EN 50393;
   d. IEC 61238-1.
2. Each branch joint shall be assembled and encapsulated in a thermoplastic moulding, which is compatible with the cable sheath. The entire production process shall be under a quality management system to ISO 9001.

ELE7.9.040.7  VOLTAGE RATING
Prefabricated branch cables shall have a voltage rating of 600/1000V.

ELE7.9.050.7  INSTALLATION OF BRANCH CABLES
Prior to ordering, drawings to show the actual installation details of prefabricated branch cables shall be submitted to the Contract Manager for approval.

ELE7.9.060.7  PROTECTION
Cable ends for main and branch cables shall be sealed at factory before delivery to site.

ELE7.9.070.7  TYPE & ROUTINE TESTS
Prefabricated branch cables shall be assembled under a product specification that establishes at least the following test requirements:
1. Type tests:
   a. Heat cycle test according to the method given in one of the followings:
      i. JIS C 2810 Class A;
      ii. HD 623 S1 or BS EN 50393;
      iii. BS EN 61238-1;
iv. Total 125 test cycles undergone - after the 25th cycle, the surface temperature of the thermoplastic moulding shall not exceed 75°C. This temperature shall also not reach more than 8°C plus that at the 25th cycle when measurements are taken at the end of the 50th, 75th, 100th and 125th cycles.

b. Resistance to flame propagation according to one of the standards below:
   i. JIS C 3005;
   ii. BS 4066-1, or IEC 60332-1-1, or BS EN 60332-1-1 and BS EN 60332-1-2 and BS EN 60332-2-1;
   iii. IEC 60332-1-2;
   iv. IEC 60332-3 Category C.

c. Insulation resistance test: the cables in water shall have a minimum insulation resistance of 50MΩ;

d. Tensile strength test: the cables shall withstand without breakage twice the specified weight of main and branch cables for the duration of not less than 24 hours.

2. Routine tests:
   a. Voltage withstand test: The cables in water shall withstand a minimum voltage of 3.5kV for 1 minute without breakdown;
   b. Connector resistance or conductivity test according to the method given in one of the followings:
      i. JIS C 3005;
      ii. The resistance measured between the connector before and after the tensile test mentioned above shall agree to each other within 12%;
      iii. \( \frac{R_1}{R_2} \leq 1.2 \) where
          - \( R_1 \) is the cable resistance measured across the connector between the main and one of the branch cables; and
          - \( R_2 \) is the summation of the resistance of individual cables having the same length of cable up to the connector and conductor sizes as the main and branch cables respectively.

ELE7.9.080.7 FACTORY TEST REPORT
Prefabricated branch cables shall prove to have satisfactorily passed all tests stipulated in the product specification in ELE7.9.070. Prior to delivery to site, a factory test report on routine tests shall be submitted to the Contract Manager for approval.

ELE7.9.090.7 SITE TESTS/INSPECTION
Each prefabricated branch cable shall satisfactorily pass the site inspections/tests below along its entire route once its installation is completed:
1. Visual inspection;
2. Insulation resistance test: the cables in air shall have a minimum insulation resistance of 2MΩ.

ELE7.9.100.7 MANUFACTURERS' RECOMMENDATIONS & SPECIAL TOOLS
Manufacturers' recommendations shall be followed and special tools/accessories shall be used in the installation of prefabricated branch cables on site.

ELE8.6.010.7 CORE IDENTIFICATION OF POWER CABLES ................................ 16
ELE8.6.020.7 INTERNAL BENDING RADII OF POWER CABLES ..................... 16
ELE8.1 GENERAL INSTALLATION REQUIREMENTS

ELE8.1.010.7 IDENTIFICATION OF CORE
Each core of a power cable shall be identified continuously throughout its entire length. The identification shall take the form of appropriate colour or number codes in accordance with ELE8.6.010 or the relevant British Standard specifications.

ELE8.1.020.7 IDENTIFICATION AT JOINT OR TERMINATION
At each joint or termination, a non-ferrous metallic label shall be fixed to the cable giving the size and identification of the cable, e.g. 50 mm² 4-core PVC/SWA/PVCS copper cable to "Services Block".

ELE8.1.030.7 USE OF SINGLE-CORE POWER CABLES WITH STEEL WIRE ARMOURS
Single-core power cables with steel wire armours shall not be used for a.c. circuits.

ELE8.1.040.7 SIZE OF NEUTRAL CONDUCTOR
The CSA of the neutral conductor shall have the same size as that of the phase conductors, unless otherwise specified.

ELE8.1.050.7 BENDING RADIUS OF CABLE
The internal bending radius of every power cable shall not be less than the appropriate values given in ELE8.6.020.

ELE8.1.060.7 MINIMUM SIZE OF CABLE CONDUCTOR
1. Cables for lighting, bell and control circuits shall have CSA of not less than 1.5 mm², and cables for power circuits shall have CSA of not less than 2.5 mm²;
2. The CSA of any cable shall not be reduced at its point of termination, junction, joints etc.

ELE8.1.070.7 USE OF PVC-INSULATED CABLES AT LOW TEMPERATURE
PVC-insulated cables shall not be installed in refrigerated spaces or other situations where the temperature is consistently below 0°C.

ELE8.1.080.7 TERMINATION OF WIRING CONNECTIONS
All wiring connections are to be properly terminated.
ELE8.2  PARTICULAR INSTALLATION REQUIREMENTS

ELE8.2.010.7  CABLES MOUNTED ON SURFACE

1. Power cables mounted on the surface of walls or ceilings or other building structures shall either be cleated in position by Approved type cable cleats or cable saddles;

2. Cables cleats or cable saddles shall be provided along the entire cable route at regular intervals and at spacing in accordance with the requirements stipulated in the Electrical CoP unless otherwise specified on the Drawings;

3. Alternatively, the cables shall be supported on cable trays in accordance with the requirements of ELE9;

4. For vertical cable runs exceeding 100 m, tension releasing sections shall be provided in accordance with the recommendation of the cable manufacturer, failing which, a tension releasing section shall be provided for every 100 m vertical run.

ELE8.2.020.7  CABLES LAID IN ENCLOSED TRENCH

When more than one power cable is laid in an enclosed trench, the cables shall be spaced in accordance with BS 7671 or IEC 60364. Correction factors shall be applied to the current ratings as indicated in Table 4B and 4C of the above Standard. For cable sizes not shown in the above-mentioned tables, reference shall be made to the appropriate tables in the ERA Report 69-30 Part III.

ELE8.2.030.7  CABLES ENCLOSED IN DUCTS

1. General:
   a. Power cables installed in ducts shall conform to the provisions of ELE9;
   b. Prior to the drawing-in of the cables, the cylindrical ducts shall be cleaned with a cylindrical brush of appropriate size.

2. Pulling cables through ducts - general:
   a. Attachment to facilitate the pulling of cables through a duct shall be made to the cores, insulation, inner and outer sheath and not to the armour in order to avoid twisting;
   b. Attachment to the armour will only be permitted for small cables with the Approval of the Contract Manager;
   c. When pulling power cables into small ducts, an emulsion of graphite powder and soft soap in water may be used for brushing onto the cable surfaces where they enter the duct to reduce friction during pulling;
   d. The use of "French Chalk" or other methods will not be precluded provided that such materials or methods shall not damage the cables and that the prior Approval of the Contract Manager has been given.

3. Pulling cables through ducts - lead-sheathed insulated:
   a. When pulling-in lead-sheathed insulated power cables, the following stresses shall not be exceeded:
      i. Maximum stress in sheath - 10,000kPa (with stocking pulling grip);
      ii. Maximum stress in conductors - 70,000kPa (with pulling eye attached to conductors).
b. When the cables are being drawn into ducts, the maximum pull shall be limited to 220,000 Newtons.

**ELE8.2.040.7 CABLES BURIED DIRECT IN GROUND**

1. Power cables buried direct in ground shall be armoured;
2. They shall be buried at a depth of not less than 450 mm and shall be protected by means of Approved cable cover tiles;
3. The bottom of the trench shall be covered, to a depth of 100 mm with a bedding layer of sand or fine soil;
4. On top of the cables, a layer of sand or fine soil, also to a depth of 100 mm, shall again be provided;
5. The sand or fine soil shall not be larger than 13 mm sieve;
6. Particular care shall be taken to ensure that there shall be no pebbles or small stones in the bedding layer or after the layer of fine sand or soil;
7. The cables shall then be covered, throughout the entire route, by cable cover tiles which shall be laid on top of the after layer.

**ELE8.2.050.7 CABLE MARKERS**

1. The route of all power cables buried direct in ground shall be clearly indicated by cable markers laid in the ground;
2. Cable markers shall be placed at regular intervals not exceeding 60 m apart and also at positions where the cable route changes direction;
3. At the position of each underground junction box, a cable marker shall also be installed. Such markers shall be engraved with, in addition to the wordings mentioned above, the appropriate information, such as "3 way Joint Box".

**ELE8.2.060.7 CABLES CONNECTED TO OR IN CONTACT WITH BARE CONDUCTORS OR BUSBARS**

1. PVC cables for interconnection between busbar risers and their outgoing switchgears, or between busbar chambers and their incoming/outgoing switchgears shall be to type CK of BS 6231 or equal and Approved;
2. Where cables to BS EN 50525-2-31 or BS 5467 or IEC 60502-1 are terminated to bare conductors or busbars of ACBs, MCCBs, fuse combination units or switch-disconnectors in the applications other than those given in sub-clause (1) above, the insulation and sheath of the cables shall be suitable for the maximum temperature of the terminals of the switchgear or equipment.
3. If the Sub-contractor fails to verify the above requirement as given in sub-clause (2) above to the satisfaction of the Contract Manager, the insulation and/or sheath of the cables shall be removed for a distance of 150 mm from the termination and replaced by at least 0.21 mm thick heat-resisting insulating tapes complying with IEC 60454-3-1 and suitable for operating temperatures up to 105°C.
ELE8.3 WIRED SYSTEM USING PVC INSULATED AND PVC SHEATHED CABLES

ELE8.3.1 WIRED SYSTEM

ELE8.3.1.010.7 GENERAL
1. XLPE/PVC insulated and PVC sheathed non-flexible cables shall be used for surface wiring in fixed installations. The cables shall not be buried in concrete or plaster;
2. PVC insulated and PVC sheathed flexible cables or flexible cords shall be used for connection to apparatus, appliances or equipment via an appropriate wiring accessory;
3. Flexible cables or flexible cords shall not be used in a fixed installation, except for final connection to a fixed equipment.

ELE8.3.1.020.7 JOINTS IN CABLES OR CORDS
Joints in cables or cords shall not be allowed unless Approved. In such cases, the joints shall be electrically and mechanically sound and shall be accessible for inspection.

ELE8.3.2 MATERIALS FOR ACCESSORIES

ELE8.3.2.010.7 WIRING ACCESSORIES
Wiring accessories, e.g. switches and socket outlets, shall be of the all-insulated pattern suitable for flush mounting on to a moulded box or pattice. In all other respects, they shall comply with ELE20.

ELE8.3.2.020.7 BOXES OR PATTRESSES
Moulded boxes or pattresses or the enclosure of surface mounted wiring accessories shall be of insulating material and shall comply with BS 4662. Each box or pattress shall have a copper earth terminal for the connection of the circuit protective conductors.

ELE8.3.2.030.7 CABLE FIXING CLIPS AND PINS
Buckle clips shall be of heavy gauge, heavily tinned brass with countersunk fixing holes. Fixing pins shall be of copper or brass with a minimum length of 15 mm.

ELE8.3.2.040.7 CABLE FIXING SADDLES AND SCREWS
Saddles shall be of heavy gauge galvanised steel. The fixing screws shall be of non-ferrous metal.
ELE8.3.3 INSTALLATION OF NON-FLEXIBLE CABLES

ELE8.3.3.010.7 CABLE ROUTES

1. All cables shall be run in a vertical or horizontal direction, and shall be secured flat on the surface of walls, columns, partitions or ceilings, etc. throughout the entire route, including at bends. Fixing on to the ceiling shall be avoided unless the cable is required to feed a point on the ceiling;

2. Where required, the cables may be run under floors, between partitions or inside ceiling voids provided that they are enclosed in ducts, conduits or trunking which comply fully with the relevant clauses in ELE9, ELE11, ELE12 and ELE13;

3. When cables are routed along or across steel joints, beams, stanchions, etc. they shall be enclosed in steel trunking/conduit or rigid PVC conduit;

4. Cables shall not be run as a span between beams, trusses, etc. without rigid support throughout their length.

ELE8.3.3.020.7 PROTECTION TO CABLES SUSCEPTIBLE TO DAMAGE

Cables susceptible to damage shall be protected by means of metal channels. Where protection is required for cables running up a wall from the floor, the metal channel shall be fixed to a minimum height of 2 m above finished floor level.

ELE8.3.3.030.7 CABLES PASSING THROUGH A BUILDING STRUCTURE

Where cables pass through a building structure such as a wall or column, the cables shall be drawn through PVC sleeves inserted into the building structure. The size of the PVC sleeves shall be such that the space factor shall not exceed 45%.

ELE8.3.3.040.7 CABLES CROSSING EXPANSION JOINT

Cables passing an expansion joint shall be formed into a loop such that any movement in the joint shall not stress the cables.

ELE8.3.3.050.7 CABLES PASSING THROUGH METAL WORK

Rubber grommets or insulated bushes shall be used to protect the cables passing through metal parts of a distribution board, a luminaires, a metal box or any other metal work.

ELE8.3.3.060.7 SEGREGATION FROM OTHER SERVICES

Cables shall be run at least 150 mm clear of all other non-electrical services.

ELE8.3.3.070.7 "LOOPING-IN" WIRING SYSTEM

The cables shall be wired on the "looping-in" system. Cable joints of any type in cable runs shall not be allowed.

ELE8.3.3.080.7 NEUTRAL CONDUCTOR AT SWITCH POSITION

The neutral conductor of a cable for a lighting final circuit shall be looped through an insulated connector enclosed in the moulded box or pattress housing the switch.

ELE8.3.3.090.7 TERMINATION OF CABLES

1. Cables terminated at a moulded box or pattress, a luminaire or other fittings shall have the overall protective sheaths carried into the moulded box or pattress, luminaire or other fittings for a minimum of 13 mm;
2. The circuit protective conductor shall be terminated at the earth terminal provided in the moulded box or pattress housing the wiring accessories;

3. Where it is not required to terminate the circuit protective conductor in an accessory, the circuit protective conductor shall not be cut back or removed. Instead it shall be coiled away from the live terminals or any bare conductors and shall be insulated and sleeved with a green-and-yellow PVC sleeve.

**ELE8.3.100.7 BENDING RADIUS OF CABLES**

The internal radii of cables shall not be less than the values given below:

<table>
<thead>
<tr>
<th>Cable type</th>
<th>D (mm)</th>
<th>Minimum internal radius of cable</th>
</tr>
</thead>
<tbody>
<tr>
<td>BS EN 50525-2-31 Clause 4.1 and BS 7889 or IEC 60502-1</td>
<td>D ≤ 10</td>
<td>3 D</td>
</tr>
<tr>
<td>10 &lt; D ≤ 25</td>
<td>4 D</td>
<td></td>
</tr>
<tr>
<td>D &gt; 25</td>
<td>6 D</td>
<td></td>
</tr>
</tbody>
</table>

**ELE8.3.110.7 FIXING OF CABLES**

1. Cables having an overall diameter not exceeding 10 mm shall be fixed by means of buckle clips. Cables of other diameters shall be fixed by means of cable saddles.

2. a. Where a number of cables running together on the surface of walls, columns, partitions or ceiling such that their aggregated width exceeds 50 mm, a 13 mm thick hardwood batten of adequate width shall be fixed along the cable route for mounting the cables;

b. The hardwood batten shall be finished with one coat of Approved priming on front and edges, and treated at the back with waterproof compound;

c. Lengths of the batten shall be properly fitted together and fixed in position by counter-sunk brass screws in rawplugs.

**ELE8.3.120.7 FIXING OF CLIPS**

1. a. Buckle clips shall be fixed to the surface of wall, column, partition or ceiling by pins secured to one plug inserted to a minimum depth of 20 mm;

b. Where the buckle clips are fixed to plaster, concrete, etc. the plugs shall be made from teak dowelling of parallel length;

c. The head of every pin shall be level with the surface of the clip so that no damage to the sheath of the fixed cables can occur.

2. Every hole in the buckle clip shall require a fixing pin;

3. A separate buckle clip shall be required for every cable of size above 2.5 mm² twin with CPC, or of equivalent size. Not more than two cables shall be allowed in one clip under all circumstances;

4. Buckle clips shall be provided along the entire cable route at regular intervals not exceeding 250 mm on horizontal runs and 400 mm on vertical runs;

5. A clip shall also be provided at a distance not exceeding 75 mm from a termination and from both sides of a bend.
ELE8.3.130.7  FIXING OF CABLE SADDLES
Cable saddles shall be securely fixed by fixing screws. Saddles shall be provided along the entire cable route at regular intervals. The spacing between adjacent saddles shall be in accordance with the requirements stipulated in the Electrical CoP unless otherwise specified on the Drawings.

ELE8.3.140.7  CORRECTION FACTORS TO CURRENT RATING OF CABLES
There more than two twin cables are fixed together, or when the cables are installed at or in thermally insulated materials, etc., suitable correction factors, as recommended by BS 7671 or IEC 60364 shall be applied in determining the size of the cables to be installed.

ELE8.3.4  INSTALLATION OF FLEXIBLE CABLES AND FLEXIBLE CORDS

ELE8.3.4.010.7  CONNECTIONS TO PORTABLE EQUIPMENT
Flexible cables or flexible cords for connections to portable appliances or equipment shall be of suitable length (preferably 1.5 m to 2 m) to avoid undue risk of mechanical damage.

ELE8.3.4.020.7  CONNECTIONS TO FIXED EQUIPMENT
Exposed lengths of flexible cable or flexible cord used for final connections to fixed equipment or appliance shall be as short as possible.

ELE8.3.4.030.7  CONNECTIONS TO LUMINAIRES
Where a flexible cord supports or partly supports a pendant luminaires, the maximum mass acting on the cord shall not exceed 3 kg for flexible cord of 0.75 mm², and shall not exceed 5 kg for flexible cord of larger conductor cross sectional area.
ELE8.4 WIRING SYSTEM USING MINERAL-INSULATED CABLES

ELE8.4.1 MATERIALS FOR ACCESSORIES

ELE8.4.1.010.7 CABLE SADDLES AND CLIPS
Saddles and clips for fixing mineral-insulated cables shall be of the type specially made by the cable manufacturer for this purpose. Where the cables are fitted with low smoke zero halogen (LSOH) thermoplastic outer covering, the saddles or clips used shall also have LSOH thermoplastic or thermosetting covering.

ELE8.4.1.020.7 CONDUIT/ADAPTABLE BOXES
Conduit/adaptable boxes shall meet the requirements of ELE11.3.

ELE8.4.2 INSTALLATION OF CABLES

ELE8.4.2.010.7 CABLE ROUTES
Mineral-insulated cables shall be run neatly on the surface of the walls, columns, beams or ceilings in a vertical or horizontal direction, and at least 150 mm clear of all plumbing and mechanical services. The use of conduit and/or cable trunking to enclose such cables shall be kept to the minimum.

ELE8.4.2.020.7 CABLE SUPPORTS
1. Mineral-insulated cables shall be adequately supported by saddles which shall be obtained from the same manufacturer as the cables;
2. Saddles shall be provided through the entire cable route at regular intervals;
3. The spacing between adjacent saddles shall not exceed the values given in ELE8.4.3.010;
4. Saddles shall also be provided at a distance not exceeding 150 mm away from termination and from both sides of a bend.

ELE8.4.2.030.7 BENDING RADIUS
The minimum internal bending radius for mineral-insulated cables shall be 6 times the overall diameter of the cable.

ELE8.4.2.040.7 CABLE LOOP FOR PREVENTION OF VIBRATION
A loop shall be introduced in a cable immediately before its entry into the connected equipment which is subject to vibration or occasional movement. A clear space of at least 10 mm shall be maintained at the point in the loop where the cable passes over itself.

ELE8.4.2.050.7 CABLE TERMINATIONS
1. Cable termination shall generally comply with IEC 60702-2 or BS EN 60702-2;
2. The cable to be terminated shall be cut, screwed, sealed with cold compound and fitted with brass terminating glands, nuts, compression ring, gland body, sealing pot, disc and sleeves. The conductors shall be carried unbroken through the sealing pot to the terminal sockets or clamping screws;
3. The sealing shall be properly carried out to protect the cable ends from moisture and the insulation shall be thoroughly dry before the sealing is applied. The sealing material and any material used to insulate the conductors when they emerge from the insulation shall have adequate insulating and moisture proofing properties and shall retain these properties throughout the range of temperature they may be subjected to in service;

4. Where a mineral insulated cable is terminated at an insulating casing or enamelled/painted metal casing, the sealing pot shall be provided with a copper circuit protective conductor, complying with the requirements of BS EN 60228 and of an appropriate size in accordance with IEC 60702-2 or BS EN 60702-2;

5. Where more than one cable terminates at a galvanised or zinc coated enclosure the gland plate shall be of brass or insulating materials;

6. LSOH thermoplastic or thermosetting shrouded terminating glands shall be used when the cables are fitted with LSOH thermoplastic outer covering;

7. Only tools recommended by the manufacturer of the cables shall be used and the manufacturer's recommended methods of cable termination shall be adopted in all cases.

**ELE8.4.2.060.7 INSULATION RESISTANCE**

1. The insulation resistance between the cores and between each core and the sheath shall be measured before the cable end is sealed;

2. The measured insulation resistance, \( R_I \) dependent on its length, \( l \), on a 500V insulation resistance tester shall be given as follows:

<table>
<thead>
<tr>
<th>Length, ( l ) (km)</th>
<th>Requirements on insulation resistance, ( R_I )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( l &lt; 0.1 )</td>
<td>( R_I \geq 10,000\text{M\Omega} )</td>
</tr>
<tr>
<td>( l = 0.1 )</td>
<td>( R_I \geq 10,000\text{M\Omega} )</td>
</tr>
<tr>
<td>( l &gt; 0.1 )</td>
<td>( l R_I \geq 1,000\text{M\Omega km} )</td>
</tr>
</tbody>
</table>

3. If the reading is less than the values given above, the cable shall be heated by means of a blow lamp or similar device so that moisture is driven out to the open end of the cable and evaporated there;

4. Heating shall be continued until the measured insulation resistance reaches the values given above and the sealing shall be applied without delay;

5. The insulation resistance shall be measured when the cable end has been sealed, and shall meet the values given above;

6. For mineral-insulated cable with LSOH thermoplastic outer covering, adequate length of the LSOH thermoplastic outer covering shall be cut out in the event of low insulation resistance to achieve the required insulation resistance.

**ELE8.4.2.070.7 IDENTIFICATION OF CORE**

1. The cores of the mineral-insulated cables shall be identifiable at their termination by the application of sleeves or discs of appropriate colours as prescribed below:

<table>
<thead>
<tr>
<th>Type</th>
<th>Colour</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phase of single-phase circuit</td>
<td>Brown</td>
</tr>
<tr>
<td>Phase R of 3-phase circuit</td>
<td>Brown</td>
</tr>
<tr>
<td>Phase Y of 3-phase circuit</td>
<td>Black</td>
</tr>
<tr>
<td>Phase B of 3-phase circuit</td>
<td>Grey</td>
</tr>
<tr>
<td>Neutral of a circuit</td>
<td>Blue</td>
</tr>
<tr>
<td>Protective conductor</td>
<td>Green &amp; Yellow</td>
</tr>
</tbody>
</table>
2. Identification sleeves shall comply with BS 3858 Type 3 where appropriate and shall have temperature rating similar to that of the seals.

**ELE8.4.2.080.7  BONDING OF CABLE SHEATH TO METALWORK**

Where a mineral-insulated cable passes through or makes contact with any metal, the metal and cable sheath shall be effectively bonded together.

**ELE8.4.2.090.7  USE OF SINGLE-CORE CABLES**

Single-core mineral-insulated cables running together shall be laid with the cable sheaths in contact. Mineral-insulated cables for 3-phase circuits shall be laid in trefoil formation. Where the cables used are rated at 100A or above, gland plates of apparatus shall be of brass.

**ELE8.4.2.100.7  PROTECTION FROM MECHANICAL DAMAGE**

The mineral-insulated cables shall be protected by steel conduits or steel sheathings where the cables are exposed in vulnerable positions. Where cables pass through floors, ceilings and walls, the holes shall be made good with cement or other non-combustible material and where cables pass through steelwork, the holes must be bushed.

**ELE8.4.2.110.7  RESTRICTION OF USE**

Mineral-insulated cables shall not be used:

1. In discharged lighting circuits unless suitable Approved precautions have been taken to avoid excessive voltage; or
2. For earthed concentric wiring system.

**ELE8.4.3  REFERENCE TABLE**

**ELE8.4.3.010.7  MAXIMUM SPACING OF SADDLES FOR MINERAL-INSULATED CABLES**

1. The spacing between adjacent saddles shall not exceed the values given in the table below:

<table>
<thead>
<tr>
<th>Overall Diameter of Cable, D (mm)</th>
<th>Maximum Spacing (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Horizontal Run †</td>
</tr>
<tr>
<td>D ≤ 9</td>
<td>600</td>
</tr>
<tr>
<td>9 &lt; D ≤ 15</td>
<td>900</td>
</tr>
<tr>
<td>15 &lt; D</td>
<td>1500</td>
</tr>
</tbody>
</table>

† The spacing stated for horizontal runs may be applied also to runs at an angle of more than 30° from the vertical. For runs at an angle of 30° or less from the vertical, the vertical spacing is applicable.

2. Saddles shall be provided at a distance not exceeding 150 mm away from a termination and away from both sides of a bend.
ELE8.5  CABLE JOINTS AND TERMINATIONS

ELE8.5.010.7  GENERAL

1. Joints and terminations of all power cables shall be made by skilled cable jointers who shall be approved by the Contract Manager before work commences;

2. No reduction in the number of strands of a cable core shall be allowed at a cable joint or termination;

3. Ferrules, compression connectors and bare portions of cable core resulting from a jointing or terminating process shall be insulated with an Approved type insulating tape or heat shrinkable tubing after completion of the process. Such insulating tape or heat shrinkable tubing shall have equal or better electrical and mechanical properties than those of the original insulation removed, and shall be adhered to the cores etc. securely and permanently. The final thickness shall be in a smooth contour throughout the whole length;

4. Every compression joint shall be of a type which has been the subject of a test certificate as described in BS 4579 or IEC 61238-1. When a compression joint is made, the appropriate tools specified by the manufacturer of the joint connectors shall be used.

ELE8.5.020.7  JOINT BOXES AND TERMINATING BOXES

1. Boxes for joints in all power cables shall be of cast-iron, compound filled and of adequate size;

2. The boxes shall be fitted with suitable armouring clamps and glands;

3. The armouring of the cables shall be terminated at the armouring clamps and the inner sheath shall pass through the gland;

4. The box shall be warmed thoroughly before the compound is poured to allow total adhesion between the compound and the box. The compound shall then be allowed to cool and tapped up before the box is closed. No air locks shall be formed within the box.

ELE8.5.030.7  USE OF COLD COMPOUND AND PLASTIC SHELLS

With the consent of the Contract Manager, plastic shells fitted with suitably sized armour bond and filled with Approved type cold pouring encapsulating compound may be used as an alternative to the compound filled cast iron joint boxes for jointing XLPE/PVC-insulated power cables. In such cases, the complete jointing kit, including plastic shell, compound, insulating tape etc., shall be from the same proprietary manufacturer who is specialised in manufacturing products for this purpose. The jointing method and procedure shall be in strict accordance with the manufacturer’s recommendations.

ELE8.5.040.7  EARTH CONTINUITY ACROSS JOINTS

A circuit protective conductor having adequate CSA and of same material as the phase conductors shall be installed and connected to maintain the effectiveness of the earth continuity across every cable joint.
CABLE JOINTS AND TERMINATIONS

ELE8.5

ELE8.5.050.7 STRAIGHT-THROUGH JOINTS FOR COPPER CONDUCTORS
1. In a straight-through joint for copper conductors, the two conductors shall be butted together after the strands have been soldered solid and shall be jointed by means of a weak back ferrule, soldered to the cores. Soldering shall be carried out by pouring tinman's solder over the cores and weak back ferrule. In no circumstances shall direct flame from a blowlamp be used for soldering;
2. As an alternative, conductors may be jointed by Approved type compression connectors using appropriate tools and connectors.

ELE8.5.060.7 TEE-JOINTS FOR COPPER CONDUCTORS
When two cables with copper conductors are tee-jointed, the branch conductor shall be connected to the main conductor by means of claw type or weak back ferrules. The strands in both branch and main conductors are to be sweated solid before sweating to the ferrule. Soldering shall be carried out as detailed in ELE8.5.050.

ELE8.5.100.7 TERMINATION OF XLPE/PVC-INSULATED POWER CABLES WITH COPPER CONDUCTORS
1. XLPE/PVC-insulated power cables shall be terminated in a gland fitted with an armour clamp;
2. Provision shall be arranged to enable a watertight seal to be made between the gland and the inner PVC or low smoke zero halogen sheath;
3. The gland body shall be provided with an internal conical seating to receive the armour clamping cone and a clamping nut which shall secure the armour clamping cone firmly to the armour wires ensuring that the armour wires are tightly clamped between the armour cone and conical armour seating;
4. The spigot on the gland body shall be threaded to suit standard conduit accessories;
5. A shroud shall be fitted to cover the body of the gland and the exposed armour wires.

ELE8.5.120.7 USE OF HEAT SHRINKABLE TUBING
1. With the consent of the Contract Manager, heat shrinkable tubing and accessories may be used for cable joints or terminations. All tubing and accessories shall be specially designed for this purpose and shall be suitable for use with the type and construction of cable to be jointed or terminated;
2. The heat shrinkable materials shall have electrical and mechanical properties equal to or better than those of the cable insulation and sheath, where applicable. After the application of the heat, the heat shrinkable materials shall seal the interfaces between the heat shrinkable materials or between the heat shrinkable materials and the cable surfaces;
3. Whenever heat shrinkable tubing and accessories are used, the complete kit shall be from the same proprietary manufacturer who is specialised in manufacturing products for this purpose. The method and procedures adopted shall be strictly as those laid down by the manufacturer.

ELE8.5.130.7 OTHER METHODS OF JOINTING AND TERMINATION
Methods for jointing or terminating a power cable, other than those specified in the Section, will not be precluded provided that:
1. The method used shall be proven to be capable of affording the degree of safety and efficiency not less than that achieved by those specified in this Section;
2. The method used shall satisfy the requirements of the BS 7671 or IEC 60364;
3. The prior Approval of the Contract Manager has been obtained.

ELE9.1  CABLE DUCTS

ELE9.1.010.7  MATERIALS FOR DUCTS
Cable ducts shall be formed from concrete, PVC, metal or such other materials as may be specified by the Contract Manager in ELE2 or on the Drawings.

ELE9.1.020.7  METALLIC DUCTING
Metallic ducting shall comply with the same requirements as metal trunking.

ELE9.1.030.7  CONCRETE DUCTS CAST IN-SITU
Ducts cast in in-situ concrete shall be formed so that the radial thickness of the concrete or screed surrounding the cross-section of the complete ducting shall not be less than 15 mm at every point.

ELE9.1.040.7  CABLES IN CONCRETE DUCTS
Cables in ducts formed from concrete shall be PVC insulated and PVC sheathed with wire armour, or paper insulated with lead sheath and armoured or mineral insulated with PVC outer covering.

ELE9.1.050.7  CABLES IN WOOD DUCTS
Cables in ducts formed from wood shall be PVC insulated, or PVC insulated and PVC sheathed, and shall be held in position by clips, saddles, or equal and Approved fixings.

ELE9.1.060.7  CABLES IN UNDERGROUND DUCTS
Cables in underground ducts shall be of armoured type as specified in ELE7.

ELE9.1.070.7  INTERNAL BARRIERS
1. In every vertical duct, which is designed as totally enclosed without ventilation, internal barriers shall be provided to prevent the air at the top of the duct from attaining an excessively high temperature;
2. The distance between adjacent barriers shall be the distance between floors;
3. Where the floor to floor distance exceeds 5 m, additional barriers shall be provided at intervals not exceeding 5 m.

ELE9.1.080.7  FIRE BARRIERS
Where a cable duct passes through fire resistant structural elements, such as floors or walls designated as fire barriers, the opening thus formed shall be sealed with fire resistant materials having the same degree of fire resistance as the structural element. In addition, suitable internal fire barriers shall also be provided. An internal barrier may also serve as an internal barrier described previously in ELE9.1.070 above.

ELE9.1.090.7  ACCESSORIES FASTENED TO DUCT COVER
Where a duct cover is used as a support for fixing socket outlet or other accessories, provision shall be made to enable the cover to be removed, so that the enclosed cables can be accessed without taking down the socket outlet or other accessories from the cover.
ELE9.1.100.7 STEEL CONDUITS TERMINATED AT A DUCT
Steel conduits terminating at a duct shall each be securely fixed by means of conduit coupler and brass male brush.

ELE9.1.110.7 RADIUS OF CURVATURE
Where a change in direction in a duct occurs, provision shall be made to enable the cables in the duct to have adequate radii of curvature in accordance with ELE7 and ELE8.

ELE9.1.120.7 DRAW-IN PITS
1. Where cables in a duct are inaccessible for the greater part of their lengths, adequate number of draw-in pits shall be provided at regular intervals of not greater than 45 m;
2. Sufficient room shall be available in the draw-in pits to enable cables to be manoeuvred without damage;
3. In the case of armoured cables, the draw-in pits shall be concrete or brick lined and shall be fitted with a waterproof heavy cast iron lid;
4. Draw-in pits shall not be filled with sand or other materials.

ELE9.1.130.7 SPACE FACTOR
The space factor in a cable duct shall not exceed 35%.

ELE9.1.140.7 SEGREGATION OF CABLES OF DIFFERENT CIRCUIT CATEGORIES
Separate ducts shall be provided for cables of different circuit categories. However, cables of different categories may be allowed to pass through the same draw-in pit provided that they are properly and appropriately segregated.

ELE9.1.150.7 SEALING OF DUCT ENTRIES TO BUILDING
1. After the cables have been installed, both the cables and the exposed duct end shall be sealed to form a gas, water and fire barrier;
2. Open ends of spare ducts shall be closed with duct plugs as shown on drawings to prevent gas and water ingress. If the open ends of spare ducts are located in two separate fire compartments, either one end shall be further sealed with fire resistant material of fire rating not less than the fire resistant requirement of the compartments.

ELE9.1.160.7 SEALING OF DUCT ENTRIES TO MANHOLES/DRAWPITS
After the cables have been installed, all cables duct ends at the manholes/drawpits, including the spare ducts shall be sealed up to form a gas and water barrier according to the installation details as shown on the Drawings.
ELE9.2 METAL CABLE TRAYS

ELE9.2.010.7 MATERIALS FOR TRAYS
Metal cable trays shall be perforated, formed from plain steel sheet complying with BS 1449:Part 1 and shall be hot-dipped galvanised to ISO 1460, ISO 1461 after perforation. Cable trays shall have corrosion protection not lower than medium protection to BS EN 50085-1 and BS EN 50085-2-1 or Class 5 to IEC 61537.

ELE9.2.020.7 DIMENSION OF TRAYS
Cable trays have the following dimensions:

<table>
<thead>
<tr>
<th>Nominal width</th>
<th>Minimum height of upstand</th>
<th>Nominal thickness of steel sheet</th>
</tr>
</thead>
<tbody>
<tr>
<td>100 mm</td>
<td>12 mm</td>
<td>1.2 mm</td>
</tr>
<tr>
<td>150 mm</td>
<td>12 mm</td>
<td>1.2 mm</td>
</tr>
<tr>
<td>225 mm</td>
<td>12 mm</td>
<td>1.5 mm</td>
</tr>
<tr>
<td>300 mm</td>
<td>20 mm</td>
<td>1.5 mm</td>
</tr>
<tr>
<td>450 mm</td>
<td>20 mm</td>
<td>2.0 mm</td>
</tr>
<tr>
<td>600 mm</td>
<td>20 mm</td>
<td>2.0 mm</td>
</tr>
</tbody>
</table>

ELE9.2.030.7 BEND PIECES
Bend pieces shall be of the same material, thickness and finish as the main body of the cable tray and shall have an inner radius of 50 mm and a straight length of 100 mm at each end.

ELE9.2.040.7 PERFORATIONS IN BEND PIECES
1. No perforation shall be made in the circular portion of all bend pieces having a nominal width of 150 mm or 100 mm;
2. Perforation may be allowed in bend pieces having a nominal width of 225 mm or above provided that the perforation is made along a line passing through the centre of curvature of the bend pieces and set at an angle \(\theta\) to the normal of the axis of the cable tray;
3. The values of \(\theta\) are tabulated below:

<table>
<thead>
<tr>
<th>Nominal width of cable tray</th>
<th>Value of (\theta)</th>
</tr>
</thead>
<tbody>
<tr>
<td>225 mm and 300 mm</td>
<td>45°</td>
</tr>
<tr>
<td>450 mm and 600 mm</td>
<td>30° and 60°</td>
</tr>
</tbody>
</table>

ELE9.2.050.7 TEE PIECES
Tee pieces shall be of the same material, thickness and finish as the main body of the cable tray. The distance measured between the point of the intersection and the end of the tee piece shall not be less than 100 mm.

ELE9.2.060.7 CONNECTIONS BETWEEN ADJACENT LENGTHS OF TRAY
1. Connections between adjacent lengths of tray, tee or bend pieces, shall be made by butt joints and fixed by mushroom-head steel roofing bolts and nuts complying with BS 1494:Part1;
2. The connection shall be mechanically strong so that no relative movement between the two lengths can occur.

ELE9.2.070.7  CUTTING OF TRAYS
Cable trays shall be cut along a line of plain metal only, i.e. they shall not be cut through the perforation. All cut edges of the galvanised cable tray shall be prepared and treated with a cold galvanised paint.

ELE9.2.080.7  CABLE TRAY ACCESSORIES
1. Manufacturer’s standard items of accessories shall be used;
2. Site fabrication of accessories shall only be allowed after Approval and shall be kept to a minimum;
3. Where special sections are required, the material, thickness and finish shall be as specified for the standard items.

ELE9.2.090.7  HOLES IN TRAYS
Holes cut in a cable tray for the passage of cables shall be provided with grommets. Alternatively they shall be bushed or lined.

ELE9.2.100.7  SPACE BEHIND TRAYS
A minimum clear space of 20 mm shall be left behind all cable trays.

ELE9.2.110.7  FIXING OF TRAYS
1. Cable trays shall be fixed securely to the walls, ceiling or other structure by means of mild steel hangers or brackets of adequate mechanical strength;
2. The hangers or brackets shall be painted in accordance with ELE28.7;
3. Fixings for cable trays shall be disposed at regular intervals not exceeding 1200 mm and on both sides of, and at a distance not exceeding 225 mm from, a bend or intersection.

ELE9.2.120.7  FIXING OF CABLES ON TRAYS
1. For horizontal run of multi-core cables to BS 5467, cable ties for securing these cables to cable trays shall be made from nylon or polypropylene material. In the cases of low smoke zero halogen or fire-resistant multi-core cables, stainless steel cable ties shall be used;
2. For vertical run of multi-core armoured cables, cable cleats of cast iron with hot dipped galvanised finish or die cast aluminium shall be used for the fixture of multi-core armoured cables. In the case of multi-core non-armoured cables mounted vertically, metallic cable clamps or clips shall be used;
3. Single-core cables shall be secured to the cable tray by non-magnetic metallic cable cleats, clamps or clips specially designed to suit the dimensions of the cables. In the case of low smoke zero halogen or fire-resistant single-core cables, the cable cleats, clamps or clips shall be resistant to a flame at 950°C;
4. The cleats, clamps or clips of these single-core cables shall be secured to the cable tray by means of bolts, washers and nuts.

</table>
ELE11.1 CONDUIT SYSTEM

ELE11.1.010.7 CONCEALED CONDUIT SYSTEM
Unless otherwise specified in ELE2 or shown on the Drawings, conduits shall be concealed within walls, floor slabs, false ceilings, or other suitable space.

ELE11.1.020.7 SURFACE CONDUIT SYSTEM
Where surface conduits are specified, they shall be fixed by distance saddles, and shall run only in a vertical or horizontal direction.

ELE11.1.030.7 MINIMUM SIZE OF CONDUIT
The minimum outside diameter of any conduit to be used shall be 20 mm. Where special situations demands, 16 mm conduit may be used subject to prior Approval being obtained from the Contract Manager.

ELE11.1.040.7 STANDARD
Steel conduits, except flexible conduits, shall be of heavy gauge, screwed, longitudinally welded. All conduits shall comply with BS 4568: Part 1 or IEC 61386-21 or BS EN 61386-21.
ELE11.2 CONDUITS AND FITTINGS

ELE11.2.010.7 TYPE-TESTING
Steel conduits and conduit fittings shall be type-tested for complete compliance with the following Standards by an Accredited Laboratory:

1. Steel conduits: BS 4568:Part 1 or IEC 61386-21 or BS EN 61386-21;
2. Conduit fittings: BS EN 61386-1 or IEC 61386-1;
3. Steel boxes for Electrical Accessories: IEC 60670-1 with dimensions to BS 4662.

ELE11.2.020.7 FLEXIBLE STEEL CONDUITS
1. Flexible steel conduits and solid type brass adaptors shall comply with BS EN 61386-1, or IEC 61386-1 and IEC 61386-23. In addition, the conduits shall be of the metallic watertight pattern, PVC oversheathed and with a separate circuit protective conductor drawn into the conduit for each continuity. PVC oversheath will not be required for installations within ventilated ceiling voids;
2. Length of each flexible conduit shall not be more than 1 m for general applications or 2 m inside false ceiling and raised floor.

ELE11.2.030.7 CONDUIT FITTINGS
1. All conduit fittings shall comply with BS EN 61386-1 or IEC 61386-1;
2. Adaptable boxes complete with covers shall be of cast iron, galvanised, or sheet steel having a protection against corrosion in accordance with IEC 60670-1. Unless otherwise specified, boxes of the preferred sizes only, as given in IEC 60670-1, shall be used. Screws for securing the cover shall be of stainless steel;
3. Circular boxes, dome covers and hook covers shall be of galvanised malleable cast iron. Ceiling mounted boxes shall be of deep pattern type having an internal depth of not less than 60 mm;
4. Bushes and plugs shall be of brass;
5. Distance saddles shall be of galvanised cast iron. The screws for fixing the saddles shall be of brass;
6. Solid or inspection tee-pieces, couplers or elbows shall not be used on any conduit installation.

ELE11.2.040.7 METAL BOXES FOR ACCESSORIES
1. Metal boxes for the enclosure of electrical accessories in conduit installation shall comply with IEC 60670-1 with dimensions to BS 4662;
2. 35 mm and 47 mm deep boxes shall be used to house accessories such as domestic switches, socket outlets, etc.;
3. 16 mm and 25 mm deep boxes may be used to house specially designed electrical accessories of shallow pattern subject to prior Approval.

ELE11.2.050.7 CLASS OF PROTECTION AGAINST CORROSION
1. Steel conduits shall have Class 4 protection against corrosion in accordance with BS 4568: Part 1 or IEC 61386-1 or BS EN 61386-1 i.e. heavy protection both inside and outside (e.g. hot-dip zinc coating or sherardizing);
2. Steel conduit fittings shall have Class 4 protection in accordance with BS EN 61386-1 or IEC 61386-1 i.e. heavy protection both inside and outside (e.g. hot-dip zinc coating or sherardizing);
3. Metal boxes for the enclosure of electrical accessories shall have protection both inside and outside in accordance with IEC 60670-1.

ELE11.2.060.7 CORROSION RESISTANCE TEST

Upon request from the Contract Manager, documentary evidence that the batch/consignment of steel conduits and conduit fittings delivered to site having satisfied the corrosion protection requirement as stipulated in the relevant Standards mentioned in ELE11.2.010 shall be provided.
ELE11.3 CONDUIT AND WIRING INSTALLATION

ELE11.3.010.7 CONDUIT CONTINUITY
1. The steel conduit installation shall be mechanically and electrically continuous throughout, and efficiently earthed;
2. Earth continuity of the conduit installation shall be tested before concreting of floors and walls and also on completion of the entire installation;
3. Where the circuit protective conductor is formed by the conduits, the terminal of the socket outlet shall be connected by a separate protective conductor, having the same cross sectional area and type as the live conductors, to an earth terminal incorporated in the associated metal box or enclosure;
4. Flexible conduit shall not be used as a protective conductor.

ELE11.3.020.7 JOINTS IN STEEL CONDUITS
1. Joints in steel conduits shall be made by means of a solid coupler into which the adjacent ends of the two conduits shall be inserted and screwed up tightly in order to make the conduit run mechanically and electrically continuous;
2. Running couplings shall be avoided. Where such a coupling cannot be avoided, the coupler shall be screwed up tightly onto the short threaded portion of one conduit, the threaded portion of which shall project approximately half way into the length of the coupler. The threaded portion of the mating conduit should also project approximately half way into the coupler;
3. Electrical continuity should be ensured by tightening up a hexagon locknut against the coupler;
4. Any exposed threads on either conduit shall be painted with at least two coats of anti-rust paint.

ELE11.3.030.7 PROVISION OF ADAPTABLE BOXES
1. An adequate number of suitably sized adaptable boxes shall be provided in all conduit runs to enable cables to be drawn in easily and without damage;
2. Adaptable boxes shall be provided immediately after every two bends, after a bend plus a total maximum straight run of 10 m or after a maximum straight run of 15 m;
3. Where an adaptable box is required for conduits installed in the floor screed, it shall be fitted in such a manner that the lid is covered by the same material as the remainder of the floor, and shall remain accessible at all times.

ELE11.3.040.7 SPACING BETWEEN CONDUITS
Adjacent or parallel conduits cast in concrete (except the first 200 mm straight runs from the same box) shall be separated by a spacing of not less than 25 mm so as to allow concrete aggregate to pass and set between them.

ELE11.3.050.7 TERMINATION OF STEEL CONDUITS AT METAL CASING
1. a. Where a steel conduit terminates at a metal casing, a coupler or a brass adaptor for flexible conduit together with a brass male bush shall be used;
b. The brass male bush shall be screwed into the coupler or adaptor from the inside of the metal casing through a clearance hole drilled in the metal casing to suit the bush;

c. Both the conduit and the bush shall be screwed tightly into the coupler or adaptor so as to grip the metal casing securely for mechanical and electrical continuity;

d. Threads on the steel conduit shall be at least half the coupler length, and no threads on the metal casing shall be allowed;

e. The connection between the flexible conduit and the adaptor shall be securely fixed and effectively watertight.

2. Where the metal casing is painted or enamelled, the electrical continuity between the conduit and the casing shall be achieved by means of a separate protective conductor of adequate size connecting the conduit and an earth terminal inside the metal casing through a copper earthing placed between the bush and the metal casing. Neither the paint nor the enamel shall be damaged or removed to achieve electrical continuity.

ELE11.3.060.7 CONDUIT BENDS
Conduits shall not be bent with an acute angle. The internal radius of the bend shall not be less than 2.5 times the outside diameter of the conduit.

ELE11.3.070.7 CHASES FOR CONDUITS
Chases for conduits to be concealed in walls, columns or beams shall be vertical or horizontal.

ELE11.3.080.7 CONDUITS CROSSING EXPANSION JOINTS
1. Where a conduit crosses an expansion joint, special arrangements shall be made to allow relative movement to occur on either side of the expansion joint;

2. A separate circuit protective conductor shall be installed to maintain an effective electrical continuity across the expansion joint;

3. The circuit protective conductor shall have a cross-sectional area rated to suit the largest live conductors drawn into the conduits in accordance with for the Electrical CoP.

ELE11.3.090.7 USE OF EXTENSION PIECE
1. An extension piece shall be fitted to a conduit box where the plaster wall finish (including plaster) is more than 25 mm from the conduit box;

2. Only extension pieces of the correct depth shall be used;

3. Under no circumstances shall multiple extension pieces be permitted.

ELE11.3.100.7 PREVENTION OF INGRESS OF FOREIGN MATTER
1. During the building construction, all open ends of the conduit termination, which are liable to be filled with water, moisture or other foreign matter, shall be plugged with Approved conduit stopping plugs; paper or rag materials will NOT be allowed for this purpose;

2. Conduit boxes in similar circumstances shall also be similarly plugged to prevent concrete or plaster from entering the boxes during the building construction.
ELE11.3.110.7 PREVENTION OF ACCUMULATION OF WATER OR MOISTURE
1. The conduits shall be so laid to prevent accumulation of condensed moisture in any part of the installation. Due care shall also be taken to prevent the ingress of water into the conduits from leakage in walls and ceilings of the building structure;
2. Approved type of sealant for the prevention of condensed moisture shall be applied to ceiling conduit outlets installed in a cool space subject to the influx of warm air.

ELE11.3.120.7 CONDUITS LAID DIRECT IN THE GROUND
Steel conduits laid direct in ground or buried in soil shall be painted with two coats of bituminous paint before installation.

ELE11.3.130.7 FIXING OF SURFACE MOUNTED BOXES
In surface conduit installations, conduit boxes, adaptable boxes and metal boxes for accessories shall be securely fixed to walls, ceilings or other substantial parts of a structure by means of suitable brass screws correctly spaced. The fixing of these boxes shall be independent of the fixing of the associated conduits.

ELE11.3.140.7 FIXING OF SADDLES
1. Galvanised distance saddles, for the support of surface conduits, shall be provided throughout the entire route at regular intervals;
2. The spacing between the adjacent saddles shall not be more than those given in the Electrical CoP;
3. Each bend of a surface conduit shall be supported by a saddle on either side of the bend, and the saddles shall be fixed as near to the bend as practicable;
4. Distance saddles shall be fixed with brass screws in Rawplugs or other Approved method.

ELE11.3.150.7 CONDUITS INSTALLED OUTDOORS OR IN DAMP SITUATIONS
Where conduits are installed outdoors or in damp situations all conduit fittings and conduit accessories, shall not be placed in contact with other metals with which they are liable to set up electrolytic action. In addition, where the conduit installation is subjected to weather, the conduit fittings and conduit accessories shall be provided with weatherproof sealant or other materials to ensure that the installation is completely weatherproof.

ELE11.3.160.7 SWABBING OUT OF CONDUITS
Conduits shall be swabbed out and free from moisture before wiring work is commenced. The swabbing operation shall be carried out under the supervision of the authorised representative of the Contract Manager. Only Approved draw-in tape or wire of appropriate size and absorbent cloth shall be used.

ELE11.3.170.7 CONDUITS PASSING THROUGH FIRE RESISTANT BARRIERS
Where conduits pass through fire resistant structural elements, such as walls and floors designated as fire barriers, the opening made shall be sealed according to the appropriate degree of fire resistance of the wall and floor. In addition, where conduits are installed in channels, ducts, ducting, trunking or shafts which pass through such elements, suitable internal fire resistant barriers shall also be provided to prevent the spread of fire.
ELE11.3.180.7 IDENTIFICATION
Conduits, where required to be distinguished from pipelines of other services, shall use orange as the basic identification colour in compliance with BS 1710.

ELE11.3.190.7 CABLE CAPACITY OF CONDUITS
1. The number of cables drawn into a conduit shall be such that no damage will be caused to the cables or to the conduits during their installation;
2. In determining the size of the conduit, the "unit system" method as recommended by the Electrical CoP shall be adopted;
3. For cables and conduits NOT included in the Electrical CoP, the number of cables drawn into a conduit shall be such that the resulting space factor shall not exceed 40%.

ELE11.3.200.7 METHOD OF DRAWING CABLES INTO CONDUITS
Cables shall be drawn into conduits by using Approved draw-in tape or wire of the appropriate size. Only lubricating materials which are confirmed in writing from a cable manufacturer or recognised certification body that there will be no adverse effect on the cable insulation for the lifetime of the cable may be allowed to be used for drawing cables into conduits.

ELE11.3.210.7 SEGREGATION OF CABLES OF DIFFERENT CIRCUIT CATEGORIES
Separate conduits shall be provided for cables of different circuit categories.

ELE11.3.220.7 "LOOPING-IN" WIRING SYSTEM
Each conductor in a run shall be of one continuous length and wired on the "loop-in" system. No joint in cable run will be allowed.

ELE11.3.230.7 NUMBER OF FINAL CIRCUITS IN CONDUIT
A conduit serving final circuits direct from a distribution board or from an adaptable box used as a final distribution point shall contain one final circuit except in the case of lighting final circuit where two circuits with 1.5 mm² cables will be permitted in a 20 mm conduit. For 3 phase final circuits, a separate conduit shall be used for each circuit.

ELE11.3.240.7 GROUPING OF CABLES IN CONDUIT
1. Where an adaptable box is used as the final distributing point, a number of final circuits may be grouped together between the distribution board and the adaptable box by means of conduits of appropriate diameter. All live conductors of the same a.c. circuits shall be drawn into the same conduit;
2. Correction factors for grouping, as recommended by the Electrical CoP, shall be applied in determining the size of cables to be installed.

ELE11.3.250.7 NEUTRAL CABLE OF LIGHTING POINT
The neutral cable of a lighting final circuit shall be routed in the conduit direct to the lighting point and shall not pass through the switch box.
ELE11.4  TOOLS AND WORKMANSHIP

ELE11.4.010.7  TOOLS
Conduit bends shall be formed on a bending machine, and the conduits shall not be flattened at bends.

ELE11.4.020.7  CUTTING OF HOLES
Holes in metal work for the termination of conduits shall be drilled with a twist drill of the correct size or by means of other hole cutting device.

ELE11.4.030.7  REMOVAL OF BURRS AND SHARP EDGES
Burrs and sharp edges are to be removed from the ends of conduits before they are installed.

ELE11.4.040.7  MAKING GOOD OF DAMAGED COATING
Where the protective coating on a steel conduit has been damaged after installation, such surface shall be painted with at least two coats of an Approved anti-rust paint to prevent corrosion.

- ELE12.4.030.7 MAKING GOOD OF DAMAGED COATING ..................................... 8
ELE12.1 TRUNKING SYSTEM

ELE12.1.010.7 ARRANGEMENT OF CABLES
Cables in each final circuit and/or in each sub-main shall be bunched and tied or clipped together.

ELE12.1.020.7 PROVISION OF CABLE RETAINING BARS AND CABLE SUPPORTS
1. Trunking, which is installed in such a position that the cables would fall out when the cover is removed, shall be fitted with cable retaining bars or other suitable devices to prevent cables falling out;
2. Trunking installed in a vertical plane shall contain sufficient supporting devices within the trunking to prevent strain on the cables due to the weight of the cables, and to prevent vertical movement of the cables.

ELE12.1.030.7 CABLE CAPACITY OF TRUNKING
1. The number of cables put into a trunking shall be such that no damage is caused to the cable or the trunking;
2. In determining the size of the trunking required for a particular installation, the "unit system" method as recommended by the Electrical CoP shall be adopted;
3. For cables and trunking not included in the Electrical CoP, the number of cables to be enclosed in the trunking shall be such that the resulting space factor shall not exceed 45%.

ELE12.1.040.7 CORRECTION FACTORS FOR GROUPING
Where more than three loaded conductors or more than one multi-core cable are enclosed in a common trunking, suitable correction factors for grouping, as recommended by BS 7671 or IEC 60364, shall be applied in determining the size of the cables to be installed.

ELE12.1.050.7 SEGREGATION OF CABLES OF DIFFERENT CIRCUIT CATEGORIES
1. Where a common trunking is used to accommodate cables for different circuit categories, they shall be effectually segregated by means of partitions or dividers;
2. The partitions or dividers shall be adequately secured to the body of the trunking.
ELE12.2 MATERIALS FOR TRUNKING SYSTEM

ELE12.2.010.7 GENERAL
1. Trunkings and fittings shall comply with BS EN 50085-2-1, IEC 61084-2-1 or equivalent unless otherwise specified;
2. Manufacturer’s standard fittings such as tee or angle pieces, connectors etc. shall be used throughout unless prior Approval has been obtained from the Contract Manager.

ELE12.2.020.7 CLASS OF PROTECTION AGAINST CORROSION
Trunking and fittings shall have continuous hot-dip zinc coating on both sides with a minimum coating mass of 275 g/m².

ELE12.2.030.7 CONSTRUCTION
1. Trunking shall be of square or rectangular cross-section of which one side of the trunking shall be removable or hinged;
2. If screws are used to secure the cover or the connector, they shall not project internally over 2mm to avoid causing damage to the cables inside;
3. Where partitions or dividers are provided for the segregation of circuits, they shall be rigidly fixed to the main body of the trunking.

ELE12.2.040.7 MARKING ON TRUNKING
Every standard length of trunking shall bear an easily legible and durable marking or a printed adhesive label showing the name or the trademark of the manufacturer, British Standard, International Electrotechnical Standard, and class of protection against corrosion, as appropriate. The marking shall be provided inside the trunking cover when it is in the form of painting or printed adhesive label.

ELE12.2.050.7 DIMENSIONS
1. The sizes, body and cover thicknesses and preferred lengths of surface trunking shall comply with Code 14C of the Electrical CoP;
2. Trunking to special order, having dimensions differing from those given in Code 14C of the Electrical CoP, may be used provided they meet all the other requirements as stated in this specification and with tolerance in external dimensions not exceeding +5%.

ELE12.2.060.7 CONNECTIONS BETWEEN LENGTHS OF TRUNKING
1. Connections between adjacent lengths of trunking, tee or angle pieces, accessories, etc. shall be made by means of U-shaped butt joints. The two adjacent ends of the trunking shall be fixed so that there shall be no relative movement between them. At least two screws shall be used to attach each connector to each section of the trunking;
2. Electrical continuity shall be achieved by means of a copper tape of minimum size 2mm x 12mm connecting the two adjacent ends of the trunking;
3. Prefabricated trunking assemblies shall have sections connected by welding or screws. Welding points shall be touched up with anti-rust paint.
**ELE12.2.070.7 TRUNKING COVERS**

1. Trunkings and fittings shall have removable or hinged covers extending over the entire length. The covers shall be of the same material and finish as those of the trunking body;

2. Removable covers shall be held in position on the trunking either by the natural elasticity of the material of the cover (e.g. spring capped trunking) or by a means which shall form an integral part of the cover (e.g. captive screws);

3. Bends, tee junctions, etc. shall also be fitted with removable or hinged covers.

**ELE12.2.080.7 SCREWS**

1. Screws used for securing the cover or connector and for the fixing of the trunking shall have isometric threads;

2. They shall be of brass or steel and if of steel they shall be protected against corrosion by a finish at least equal to the zinc coating specified in BS 7371-12;

3. Electro-brass plated screws or self-tapping screws will not be acceptable.
ELE12.3 INSTALLATION OF TRUNKING SYSTEM

ELE12.3.010.7 LAYOUT
Trunking shall be installed neatly on the surface of the walls, columns or beams and shall be truly vertical and horizontal.

ELE12.3.020.7 TRUNKING CONTINUITY
The trunking installation shall be mechanically and electrically continuous throughout, and efficiently earthed.

ELE12.3.030.7 CONNECTION TO APPARATUS
Connection between trunking and apparatus shall be by a screwed coupler and brass male bush, or a standard flange coupling or an adaptor neck, fabricated or casted. Direct attachment of trunking to apparatus will only be permitted if cable entries are provided with smooth bore bushes or grommets and the return edge of the lid of the trunking is left intact.

ELE12.3.040.7 CONNECTION TO DISTRIBUTION BOARD
Where connection is made between trunking and a distribution board, the cable entry or entries shall be sized to accept all cables from all used and "spare" ways.

ELE12.3.050.7 FIXING OF TRUNKING
1. Individual pieces of trunking shall be independently supported by means of at least two fixed points per piece;
2. On straight runs supports for trunking shall be fixed at regular intervals with maximum spacings as given in Code 25B of the Electrical CoP;
3. For runs with bends, supports shall be fixed as near to the bend as practicable;
4. Overhead trunking shall be suitably supported by means of mild steel hangers, brackets or other Approved devices, so that no visible sag is observed when loaded with cables. These supports shall be painted with at least two coats of an Approved anti-rust paint to prevent corrosion.

ELE12.3.060.7 CABLES THROUGH TRUNKING
Cables penetrating through trunking shall be protected by conduits except for PVC insulated and sheathed cables if such cables form part of a surface wiring system. In such cases, the holes in the trunking, through which such cables penetrate shall be fitted with suitable rubber grommets or insulated bushes.

ELE12.3.070.7 TRUNKING PASSING THROUGH FIRE RESISTANT BARRIERS
1. Whenever trunking passes through a fire resistant structural element, such as a floor or wall, designated as fire barrier, the opening thus formed shall be sealed with Approved type of fire resisting material according to the appropriate degree of fire protection required. In addition, suitable internal fire barriers shall also be provided to prevent the spread of fire or smoke through the trunking;
2. In vertical trunking installations, internal fire barriers shall be provided between floors or at intervals of 5 m apart whichever is less.
ELE12.3.080.7  PREVENTION OF ELECTROLYTIC ACTION
Whenever the trunking is installed in damp situations, or where the trunking is likely to be exposed to weather, the trunking shall be kept away from other metalwork with which electrolytic action is liable to be established.

ELE12.3.090.7  PREVENTION OF INGRESS WATER
Every entry to the trunking shall be so placed as to prevent and/or to be protected against the ingress of water.
ELE12.4 TOOLS AND WORKMANSHIP

ELE12.4.020.7 CUTTING IN TRUNKING
Holes in trunking shall be drilled, punched or cut by ring saw. After cutting, burrs and sharp edges on the trunking shall be removed to prevent abrasion of cables.

ELE12.4.030.7 MAKING GOOD OF DAMAGED COATING
Where the protective coating on the trunking has been damaged after installation, such surface shall be painted with at least two coats of an Approved anti-rust paint to prevent corrosion.

ELE13.1 CONDUIT SYSTEM

ELE13.1.020.7 STANDARDS
1. Rigid plain polyvinyl chloride (PVC) conduits, conduit fittings and PVC boxes shall comply with the respective Standards listed below:

<table>
<thead>
<tr>
<th></th>
<th>standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>PVC conduits</td>
<td>IEC 61386-21 or BS EN 61386-21</td>
</tr>
<tr>
<td>PVC conduits fittings</td>
<td>IEC 61386-1 or BS EN 61386-1 or BS 4607:Part 1 for male bush and female adaptor or BS 4607:Part 5 for plain moulded slip type couple and expansion type coupler</td>
</tr>
<tr>
<td>PVC circular conduit boxes and adaptable boxes</td>
<td>IEC 60670-1 or BS EN 61386-1 or BS 4607-5</td>
</tr>
<tr>
<td>PVC boxes for electrical accessories</td>
<td>IEC 60670-1 and dimensions to BS 4662</td>
</tr>
</tbody>
</table>

2. All PVC conduits, fittings and boxes shall be of the same make.

ELE13.1.030.7 COLOUR
All PVC conduits, fittings and boxes shall be white in colour.

ELE13.1.040.7 FLAME RESISTANCE
All PVC conduits, fittings and boxes shall be non-flame-propagating and self-extinguishing.

ELE13.1.050.7 TEMPERATURE CLASSIFICATION
All PVC conduits, fittings and boxes shall comply with the temperature classification for transport, installation and permanent application not less than -5°C. For PVC conduits, where the ambient temperature at the place of manufacture is likely to be below -5°C, the temperature classification of conduits shall be capable for transport, installation and permanent application not less than -25°C.
ELE13.2  RIGID PLAIN PVC CONDUITS

ELE13.2.010.7 CONSTRUCTION AND SIZE
1. PVC conduits shall be rigid, plain and of a non-threadable type;
2. The nominal diameter of rigid plain PVC conduits shall be within the range of 20 mm to 32 mm unless otherwise specified.

ELE13.2.020.7 MECHANICAL PROPERTIES
Rigid plain PVC conduits shall have heavy mechanical strength, capable of withstanding the heavy compression and impact tests specified in IEC 61386-21 or BS EN 61386-21.

ELE13.2.030.7 TYPE-TEST CERTIFICATES
1. Rigid plain PVC conduits shall be type-tested for complete compliance with IEC 61386-21 or BS EN 61386-21 by an Accredited Laboratory;
2. Test certificates or test reports are acceptable for the purpose of product testing and certification.

ELE13.2.040.7 MARKING
1. Rigid plain PVC conduits shall be marked on the surface with the first four digit classification code for declared properties in accordance with IEC 61386-21 or BS EN 61386-21;
2. The PVC conduits shall have a minimum classification code of 4421. If the ambient temperature at the place of manufacturer of the PVC conduits is likely to be below -5°C, the classification code of the PVC conduits shall be upgraded to 4441.
ELE13.3 NOT USED
ELE13.4  PVC CONDUIT FITTINGS

ELE13.4.010.7  CONSTRUCTION
1. Plain, moulded slip-type couplers and expansion type couplers to IEC 61386-1 or BS EN 61386-1 shall be used in the jointing of conduits;
2. Saddles and spacers in compliance with IEC 61386-1 or BS EN 61386-1 shall be used for fixing of conduits unless otherwise specified.

ELE13.4.020.7  TYPE-TEST CERTIFICATES
1. PVC conduit fittings shall be type-tested for complete compliance with the following standards by an Accredited Laboratory:
   a. Plain moulded slip type coupler: IEC 61386-1 or BS EN 61386-1 or BS 4607-5;
   b. Male bush and female adaptor: IEC 61386-1 or BS EN 61386-1 or BS 4607-1.
2. Test certificates or test reports are acceptable for the purpose of product testing and certification.
ELE13.5 PVC CIRCULAR CONDUIT BOXES, PVC BOXES FOR ELECTRICAL ACCESSORIES AND PVC ADAPTABLE BOXES

ELE13.5.010.7 CONSTRUCTION AND DIMENSIONS
1. All PVC boxes and their covers shall comply with the relevant International Standard and British Standard Specifications listed above in ELE13.1.020;
2. All screw holes shall be fitted with metal inserts. Other than PVC adaptable boxes, each box shall be provided with a brass earthing terminal complete with screw for the connection of circuit protective conductor (CPC);
3. Ceiling-mounted circular conduit boxes shall be of deep pattern type having an internal depth of not less than 60 mm. Extension rings shall comply with IEC 60670-1;
4. Each PVC box shall be moulded in one piece;
5. The minimum wall thickness of IEC 60670-1 boxes and adaptable boxes shall be 2 mm;
6. For flush installation, the overall sizes of the covers of the PVC adaptable boxes shall be larger than the adaptable boxes on each edge by at least 5 mm. Screws for securing the cover shall be of stainless steel;
7. BS 4662/IEC 60670 boxes equipped with spouts for mounting wiring accessories can be used as an alternative for easy connection to conduits.

ELE13.5.020.7 MECHANICAL PROPERTIES
1. All PVC boxes shall comply with the requirements for mechanical properties stated in the relevant International Standard and British Standard Specifications listed in ELE13.1.020 above;
2. PVC adaptable boxes shall be moulded of sufficient mechanical strength to withstand forces encountered in concealed conduit wiring system application and complete with provision for prevention of deformation of the boxes where necessary;
3. Boxes for the suspension of luminaires or other equipment, where considerable heat will be produced, shall be fitted with steel insert clips;
4. Plastic boxes shall not be used in situations where the temperature of the box is likely to exceed 60°C or where the mass suspended from the box exceeds 3 kg.

ELE13.5.030.7 TYPE-TEST CERTIFICATES
1. PVC circular conduit boxes, PVC boxes for electrical accessories and PVC adaptable boxes shall be type-tested for complete compliance with IEC 60670-1 by an Accredited Laboratory;
2. Test certificates or test reports are acceptable for the purpose of product testing and certification.
ELE13.5.040.7  TOLERANCE IN SETTING-OUT OF CONCEALED JUNCTION/ADAPTABLE BOXES ON WALLS AND SLABS INSIDE DOMESTIC FLATS AND AT PUBLIC AREAS IN STANDARD BLOCKS

The deviation of the installed position of concealed junction/adaptable boxes from the specified position as shown in the Drawings shall be within a tolerance of ±150 mm with the following considerations:

1. Inside domestic flats:

   In general, the sockets outlets and lighting switches etc. shall be at the same level in the same room. Vertical levels of boxes designed at the same level on the same structural wall shall be within ±8 mm, and that on the same panel wall shall be within ±3 mm.

2. At public areas:

   In general, junction boxes shall be aligned and properly confined in a small area. The regular pattern of the boxes and their alignment along the corridors’ ceiling slabs shall be maintained within ±10 mm.

3. The installed position of boxes after taking the above tolerance into consideration shall not contravene the requirements of the position of switches/sockets as stipulated in the Design Manual - Barrier Free Access 2008; nor have conflict with other installations such as skirting, door frame, etc.;

4. Deviations exceeding the tolerance under special site condition shall be subject to the approval of the Contract Manager.

ELE13.5.050.7  CONCEALED CONDUITS INSTALLATION ON PANEL WALLS WITH PRE-INSTALLED CONDUITS

1. Co-ordinate with Main Contractor for the alignment of the concealed conduit in the slab and the pre-installed in panel walls;

2. Interconnect conduits from ceiling slab to pre-installed conduits in panel wall partitions including the provision of conduits, couplers, sockets and all electrical accessories;

3. Wherever necessary, adjust alignment of conduits in ceiling slab and conduit ends at the open slots of panel walls for smooth interconnection;

4. Interconnect the draw wires in the conduits in ceiling slab and the draw wires in the pre-installed conduits for subsequent wiring work;

5. Attend and co-ordinate with the Main Contractor for the making good of the open slots on panel wall;

6. Installation of concealed conduits in panel walls shall follow the Electrical CoP. Unless otherwise specified, mechanical protection cover for pre-installed conduits shall comply with the Electrical CoP.
ELE13.6 CONDUIT AND WIRING INSTALLATION

ELE13.6.010.7 CONDUIT BENDS
Conduit bends shall have an internal radius of at least 4 times the outside diameter of the conduit.

ELE13.6.020.7 BENDING, JOINTING AND TERMINATING OF CONDUITS
The method of carrying out the conduit bends, conduit joints, fixing conduits to boxes without spouts, and the tools and materials to be used shall be as recommended by the manufacturer of the conduits.

ELE13.6.030.7 EARTHING
Unless otherwise specified, a PVC insulated cable shall be drawn into the conduit system to serve as the circuit protective conductor (CPC), the cross-sectional area of which shall comply with Electrical CoP for the size of the largest live conductors enclosed.

ELE13.6.040.7 EARTHING FOR PRE-INSTALLED STEEL CONDUIT
In case pre-installed steel conduit is adopted in panel wall, provide earthing of the metal boxes to the corresponding wiring accessories with cost agreed with and borne by the Main Contractor.
ELE13.7 TRUNKING AND FIXING

ELE13.7.010.7 GENERAL
Trunking of sizes up to 100 mm x 100 mm shall have covers of the clip-on type. Larger sizes shall have covers secured by special plastic rivets.

ELE13.7.020.7 FIXING OF TRUNKING
1. The trunking shall be fixed and supported in the normal way by screws, but the holes in the trunking shall be made oversize to allow for the movement of expansion;
2. Washers shall be used under the head of the screw which should not be tightened to its full extent;
3. The spacing between adjacent supports for trunking shall not be larger than those given in the Electrical CoP.

ELE13.7.030.7 EARTHING
Unless otherwise specified, a PVC insulated cable shall be drawn into the trunking system to serve as the circuit protective conductor (CPC), the cross-sectional area of which shall comply with the Electrical CoP for the size of the largest live conductors enclosed.

ELE13.7.040.7 ALLOWANCE FOR THERMAL EXPANSION
Due allowance shall be made for the expansion of the PVC tubing at high temperatures. Expansion coupling or other fittings shall be included in a straight run of 8 m or more. Saddles or clips shall be of sliding fit.
ELE14 LIGHTNING PROTECTION SYSTEM

- ELE14.1.140.7  TESTING ......................................................................................................... 4
ELE14.1 PROTECTION OF STRUCTURES AGAINST LIGHTNING

ELE14.1.010.7 INSTALLATION OF LIGHTNING PROTECTION SYSTEMS
1. The lightning protection system shall comprise an air termination network connected by down conductors to earthing electrodes;
2. The lightning protection systems shall be installed in accordance with Project Specific Specification and Drawings, and as directed by the Contract Manager.

ELE14.1.020.7 SCOPE
1. This section covers lightning protection systems applicable to buildings and similar structures;
2. It does not cover the protection of overhead lines and other specialised applications;
3. The installation shall conform to the requirement and recommendations set out in IEC 62305-1 and IEC 62305-2 and IEC 62305-3 and IEC 62305-4, or BS EN 62305-1 and BS EN 62305-2 and BS EN 62305-3 and BS EN 62305-4, or AS/NZS 1768.

ELE14.1.050.7 AIR TERMINATION ON ROOF AND UPPER ROOF
1. An air termination consisting of a network of aluminium roof conductors shall be provided on roof and upper roof as shown on the Drawings;
2. All salient points of the roof structure shall be incorporated in the air termination network;
3. All metallic projections, chimneys, ducts, vent pipes, railings, gutters, etc., on or above the main surface of the roof of the roof structure, shall be fixed to, and form part of, the air termination network by appropriate clamps;
4. Aluminium roof conductors shall be of 25 mm x 3 mm and fixed to the roof structure at regular intervals of not more than 0.5 m by means of spacer saddles;
5. The spacer saddles shall be of pressing or casting aluminium alloys.

ELE14.1.055.7 AIR TERMINATION ON SIDE WALLS
1. Air termination on external wall of the building, if required, shall be in form of tinned copper plate of thickness not less than 4 mm mounted on the cast in bonding point as shown on the Drawings;
2. The cast in bonding point shall be of copper and pre-welded to a 70 mm² PVC insulated cable. The cable shall be bonded to two reinforcement bars by means of rod-to-cable clamps;
3. The tinned copper plate shall have good contact with the cast in bonding point and shall be properly protected to avoid covering up by the external wall paint. The fixing screws shall be welded to the tinned copper plate after testing to have negligible resistance to the down conductor. The Sub-contractor shall coordinate with the Main Contractor on the sequence of installation during construction.

ELE14.1.060.7 DOWN CONDUCTORS
1. Down conductors shall be of 25 mm x 3 mm aluminium strips, or steel reinforcement bars as shown on the Drawings;
2. The reinforcement bars extended from the foundation shall be tested to be having low earthing resistance before selected as down conductors. At each down conductor position, two reinforcement bars shall be used;

3. Continuity shall be maintained between different sections of the selected reinforcement bars by using clamps as shown on the Drawings. Each connection shall be tested to be at negligible resistance before concreting. The Sub-contractor shall ensure the reinforcement bars at the same position, from foundation up to the roof, to be used as the down conductors;

4. The reinforcement bars selected as down conductors shall be connected to the aluminium roof conductors and the cast in bonding point on external wall according to the details and locations as shown on the Drawings;

5. The total resistance measured from the earth inspection pit to each down conductor on roof and to each cast in bonding point on external wall shall be recorded.

ELE14.1.080.7 EARTH TERMINATION

The building foundation shall be used as the earth electrode of the lightning protection system. The steel reinforcement bars of the foundation shall be connected to earth inspection pits via cast in bonding point and copper tape as shown on the Drawings. The complete lightning protection system shall have a combined resistance to earth not exceeding 10 ohms. Where it is difficult, due to local conditions, to obtain a value of less than 10 ohms by the sole use of the foundation, additional rod electrodes complying with ELE17.3 shall be provided and connected to the copper link inside the earth inspection pits until the combined resistance to earth not exceeding 10 ohms. The proposed installation details shall be submitted for the Contract Manager's approval prior to commencement of works.

ELE14.1.110.7 BONDING TO OTHER SERVICES

1. Lightning protection systems shall normally be kept segregated from the metalwork of other services;

2. The earthing of electrical system shall be bonded to the lightning protection system through the main earthing terminal provided inside the main switch room and services rooms as shown on the Drawings;

3. Cables, earthing systems and pipes belonging to the Supply Company, the Telephone Companies, the Hong Kong & China Gas Co. Ltd. and other utility companies shall not be bonded except with the written permission of such companies.

ELE14.1.120.7 BONDING TO METALWORK

Unless otherwise stated, metalwork on roof shall be bonded to the roof conductor by means of 25 mm x 3 mm aluminium strip. The bonding of movable items to the lightning protection system shall use flexible copper braid with termination nut suitable for connection to aluminium conductor. The connections shall be of negligible resistance, metal to metal and mechanically sound with non-ferrous nuts, bolts and washers using clamps where necessary.

ELE14.1.130.7 JOINTS IN CONDUCTORS

Joints in aluminium roof conductors shall be made by suitable tape clamps. The tape clamps shall each be provided with at least 4 screws or bolts. All such joints shall have negligible resistance and good mechanical strength.

ELE14.1.140.7 TESTING

1. On completion of the installation, the lightning protection system shall be tested and recorded in accordance with the checklists given in Appendix 13 of the Electrical CoP;
2. The earthing resistance of the foundation metalwork shall also be tested in accordance with Code 21 of the Electrical CoP with test instruments approved by the Contract Manager;

3. The results of all tests shall be submitted to the Contract Manager for record.

ELE16.1 TELECOMMUNICATION SYSTEMS

ELE16.1.010.7 SCOPE
1. This sub-section covers the conduit installations for the following systems:
   a. Telephone;
   b. Inter-communication and Public Address (PA) Systems;
   c. Communal Aerial Broadcast Distribution (CABD) System;
   d. Subscription Television Distribution Network (STDN).
2. Separate conduits shall be provided for each of these systems;
3. Nylon draw-wires of adequate strength shall be provided in all empty conduits.

ELE16.1.020.7 CONDUITS FOR TELEPHONE AND PA SYSTEMS
Conduits shall be of PVC not smaller than 20 mm in diameter, and shall be installed in accordance with ELE11.

ELE16.1.030.7 OUTLET BOXES FOR TELEPHONE POINTS
1. At each telephone outlet position, the conduit shall be terminated at a 47 mm deep BS 4662 box for electrical accessories with blank cover plate. If the outlet is installed with a telephone outlet plate by the FTNS operator, the provision of blank cover plate is not required;
2. Outlet boxes shall be located at skirting level or otherwise as stated on the Drawing;
3. The cover plate shall be of moulded material unless otherwise specified.

ELE16.1.040.7 OUTLET BOXES FOR PA SYSTEMS
1. At each PA outlet position, the conduit shall be terminated at a 47 mm deep BS 4662 box for electrical accessories with blank cover plate. If the outlet is installed with equipment on top, the provision of blank cover plate is not required;
2. Outlet boxes shall be fixed at skirting level or otherwise as shown on the Drawing.

ELE16.1.060.7 CONDUITS FOR CABD/STDN SYSTEMS
1. Conduits for CABD/STDN systems shall be of PVC, not smaller than 25 mm in diameter, and shall be installed generally in accordance with ELE11;
2. They shall be kept clear of power and telephone conduits and shall be arranged to cross them at right angles whenever possible;
3. Draw-in boxes shall be provided at intervals of not exceeding 10 metres and at all 90° changes of direction, unless otherwise shown on the Drawings.

ELE16.1.070.7 OUTLET BOXES FOR CABD/STDN SYSTEMS
1. At each CABD/STDN outlet position, the conduit shall be terminated in a 47 mm deep BS 4662 box for electrical accessories with blank cover plate. If the outlet is installed with CABD/STDN socket, the provision of blank cover plate is not required;
2. Outlet boxes shall be fixed at skirting outlet plate level or otherwise as shown on the Drawing.
**ELE16.2** BELL AND AUDIBLE WARNING SYSTEM

ELE16.2.040.7 CALL BELL AND DOOR BELL SYSTEMS

1. Bells shall operate at a voltage not exceeding 24V a.c. obtained from a double wound transformer which shall be connected to the mains supply through a 2A fused connection unit, unless otherwise specified;

2. Unless otherwise specified cables shall be 1.5 mm² PVC insulated cables enclosed in conduit for concealed conduit installation.

ELE16.2.050.7 BELLS FOR EXTRA LOW VOLTAGE

1. Call bells shall be of the underdome type having a gong of approximately 75 mm diameter and shall be fixed to a substantial frame;

2. Door bell shall be 2 tones sound and of a wall mounted design with white or ivory colour cover and is to be free of any projection on the rear surface;

3. Door bell shall be classified, as a minimum requirement, to Class II as described in IEC 60335-1;

4. The insulating enclosure of the door bell shall be opened only with the use of a tool and this insulating enclosure shall provide a degree of protection of at least IP20 as described in IEC 60529. Where the enclosure can be opened without the use of a tool, every conductive part which is accessible if the enclosure is open shall be behind an insulating barrier which prevents a person from coming into contact with those parts; this insulating barrier shall provide a degree of protection of at least IP20 as described in IEC 60529 and be removable only by use of a tool.

ELE16.2.060.7 BELL TRANSFORMERS

1. Bell transformers shall be a single phase, double wound, safety isolating transformer specifically intended to supply domestic sound signalling equipment and comply with IEC 61558-2-8. Factory test certificates shall be submitted as evidence of compliance with the required standard;

2. The transformer shall be inherently short circuit proof. The reactance of the transformer winding shall be of such value that a continuous short circuit across the terminals of the secondary winding shall not damage the transformer, or cause dangerous overheating;

3. The windings, core and terminals of the transformer shall be contained within an insulating plastic case.

ELE16.2.070.7 CONNECTION OF BELL TRANSFORMERS

Bell transformers shall be connected to the lighting final circuit as shown on the Drawing, unless otherwise specified.

ELE16.2.080.7 CALL BELL PUSHES

1. Call bell pushes for indoor use shall be of flush pattern with white or ivory colour front plate;

2. Call bell pushes for outdoor use, or for areas where they may be subjected to rain or water, shall be weatherproof.
ELE16.2.090.7 MOUNTING OF CALL BELL PUSHES
1. In conduit installations, bell pushes shall be fixed in 35 mm deep, BS 4662 boxes for electrical accessories;
2. In surface cable installations, bell pushes shall be fixed in a plastic pattress;
3. Bell pushes shall not be mounted on doors without Approval.

ELE16.2.140.7 SEGREGATION OF CIRCUITS
Cables for operation at extra low voltage shall not be routed in the same conduit with cables for operation at higher voltages.

ELE17.1 GENERAL

ELE17.1.010.7 SCOPE

Unless otherwise specified the protective measures for fault protection is by earthed equipotential bonding and automatic disconnection of supply.

ELE17.1.020.7 COMPLIANCE WITH RULES AND REGULATIONS

The Sub-contractor shall provide the earthing system for the electrical installation, and also bond the electrical installation and extraneous conductive parts to fully comply with the Electrical CoP, BS 7671, Supply Rules and BS 7430 Code of practice for earthing.

ELE17.1.030.7 BONDING FOR EXTRANEOUS CONDUCTIVE PARTS

1. Building exposed metallic parts such as metallic doors, windows, louvres, burglar bars, railings, water supply pipeworks, drainage pipe, catladder etc. are extraneous conductive parts requiring equipotential bonding;

2. Main equipotential bonding
   Main equipotential bonding conductors should be provided in accordance with ELE17.5,

3. Supplementary Bonding
   Supplementary bonding conductors should be provided in accordance with ELE17.6,

4. The Sub-contractor shall ensure the bonding for extraneous conductive parts is sound and the result complies with the Electrical CoP and BS 7671 by proper measurement with records at good time. For those parts of equipotential bonding system found not electrical conductive, the Main Contractor and the Sub-contractor shall be responsible for rectification of their own works as early as possible.
ELE17.2 MAIN EARTHING TERMINALS

ELE17.2.010.7 LOCATION
A solid copper main earthing terminal of ample size shall be provided for every electrical installation at a position near the main incoming switch or switchboard for the connection of the circuit protective conductors, the main equipotential bonding conductors, the structural earthing terminal and the earthing conductors to create the equipotential zone.

ELE17.2.020.7 SEPARATE BUILDINGS OR UNITS
Where an installation distributes to a number of buildings or units, a separate main earthing terminal shall be provided for each individual building or unit at the point of intake thereby creating a separate equipotential zone in each building or unit.

ELE17.2.030.7 CONNECTION TO EARTH
The mains earthing terminal shall be connected to Earth via an earthing conductor to an earth electrode or a group of electrodes.
ELE17.3 EARTH ELECTRODES

ELE17.3.010.7 TYPES OF EARTH ELECTRODES

Unless otherwise specified in Project Specific Specification or on the Drawings, rod electrodes shall be installed.

ELE17.3.020.7 ROD ELECTRODES

1.
   a. Rod electrodes shall be of mild steel inner core with a bonded hard drawn copper sleeve of an Approved type.
   b. The overall diameter of the rod shall not be less than 14 mm and the thickness of the copper sleeve shall not be less than 0.25 mm;
   c. The minimum length shall be 2.4 m. The length shall comprise a single piece of rod or two 1.2 m pieces coupled together;
   d. Additional lengths, whenever required, shall each be of 1.2 m, connected together by a coupling;
   e. The penetrating end of the rod electrode shall be a hardened steel point.

2. Rod electrodes shall be driven into the ground within an earth pit. Only Approved tools e.g. electric hammer or pneumatic hammer shall be used for their installation;

3. The number of rod electrodes and the location of the earth pits shall be determined on site such that the resultant earth loop impedance will effect the disconnection of supply within 5 sec. by the protective device in case of any earth faults occurred at any part of the installation other than the final circuits;

4.
   a. In cases where the earthing resistance achieved by one rod is not sufficiently low for the purpose required, additional lengths or additional rods shall be installed;
   b. For the latter application, the additional rods shall be driven into the ground outside the resistance area of the previously installed rods;
   c. Under normal circumstances, a mutual separation of 3.5 m is considered adequate;
   d. All rods thus installed shall be connected together by means of 25 mm x 3 mm copper tapes enclosed in PVC ducts and laid at a minimum depth of 600 mm below ground surface;
   e. The connecting copper tapes shall be run in direct lines between the rods.
ELE17.4  EARTHING CONDUCTORS

ELE17.4.010.7  CONDUCTOR MATERIALS
Earthing conductors shall be copper tapes 25 mm x 3 mm in cross section and for outdoor application, the copper tapes shall be tinned.

ELE17.4.020.7  CONNECTION TO ELECTRODES
1. The earthing conductor shall be connected to the earth electrode(s) by means of Approved copper connector-clamps such that the connection can only be disconnected by means of a tool;
2. The connection shall be contained within a concrete lined earth pit with a substantial removable cover to ensure accessibility and maintainability.
ELE17.5 MAIN EQUIPOTENTIAL BONDING CONDUCTORS

ELE17.5.010.7 CONDUCTOR MATERIALS
Unless otherwise specified, main equipotential bonding conductors shall be of copper.

ELE17.5.020.7 BONDING POSITIONS
1. Main equipotential bonding conductors shall connect the extraneous conductive parts of other services within the premises to the main earthing terminal of the installation;
2. Such extraneous conductive parts shall include main water and gas pipes, other service pipes and risers and exposed metallic parts of the building structure liable to transmit a potential;
3. Connections shall be made as near as practicable to the point of entry of the non-electrical services into the premises concerned, and shall be on the installation side of the possible breaks in the system, such as gas meter or water meter.

ELE17.5.030.7 BONDING METHOD
Unless otherwise specified or shown on Drawings, the main equipotential bonding conductors shall be securely and reliably connected to extraneous conductive parts of the non-electrical services by means of a connector-clamp of an Approved type suitable for the particular applications or other effective bonding methods approved by the Contract Manager. All contact surfaces shall be clean and free from non-conducting materials, such as grease or paint, before making the connection.
ELE17.6 SUPPLEMENTARY BONDING CONDUCTORS

ELE17.6.010.7 CONDUCTOR MATERIALS
Unless otherwise specified, supplementary bonding conductors shall be of copper.

ELE17.6.030.7 APPLICATION
Supplementary bonding of extraneous conductive parts will be required whenever such conductive parts are likely to be accessible simultaneously with other extraneous conductive parts, or exposed conductive parts, and are not electrically connected to the main equipotential bonding by means of permanent and reliable metal-to-metal joints of negligible impedance.

ELE17.6.040.7 BONDING METHODS
1. Unless otherwise specified or shown on Drawings, the supplementary bonding conductors shall be solidly and effectively connected to the extraneous or exposed conductive parts by means of a connector-clamp of an Approved type suitable for the application or other effective bonding methods approved by the Contract Manager. All contact surfaces shall be clean and free from non-conducting materials, such as grease or paint, before making the connection;

2. For surface conduit installations, the supplementary bonding conductors shall be terminated at the nearest conduit or conduit box forming an integral part of the conduit installation;

3. Unless otherwise specified or shown on Drawings, for concealed conduit installations, the subject extraneous or exposed conductive part shall be terminated via a cord outlet plate with 1 no. supplementary bonding conductor. The BS 4662 conduit box of the cord outlet plate, forming an integral part of the conduit installation shall be located as near as possible to the bonding position and the exposed part of the supplementary bonding conductor shall be made as short as possible;

4. When necessary and required, insulated connector enclosed in base box of cord outlet plate (for bonding conductor) or base box of electrical equipment in vicinity of extraneous or exposed conductive part can be used for interconnection of all associated supplementary bonding conductors from related extraneous or exposed conductive part or from earthing terminal of the nearby electrical equipment in order to achieve the requirements of the Electrical CoP on electrical bonding.
ELE17.7  CIRCUIT PROTECTIVE CONDUCTORS (CPC)

ELE17.7.010.7  GENERAL
Circuit protective conductors (CPC) may be formed by a separate conductor/cable, the metallic sheath or armour of a cable, part of the same cable as the associated live conductor, rigid steel conduits, trunking or ducting, or the metal enclosure of the wiring system. Flexible conduits and the exposed conductive parts of equipment shall not form part of the circuit protective conductors.

ELE17.7.030.7  CPC FOR FLEXIBLE CONDUIT
For every length of flexible conduit, a separate circuit protective conductor shall be provided inside the conduit to ensure the earth continuity of the installation between the two ends of the flexible conduit.

ELE17.7.040.7  CPC FOR BUSBAR TRUNKING AND BUSWAY
1. A copper tape, 25 mm x 3 mm in cross section shall be provided for the entire length of a busbar trunking or busway. The copper tape shall be bonded to the busbar trunking or busway at intervals not exceeding 3 m and at the position of each tape-off point;
2. Subject to prior Approval the provision of copper tapes for a busbar trunking or busway may be exempted provided that the enclosure of the busbar trunking or busway can be proved to satisfy the full requirements of the circuit protective conductor.

ELE17.7.050.7  CPC FOR FINAL RING CIRCUIT
For wiring systems using PVC insulated, PVC sheathed cables, the circuit protective conductor of every ring final circuit shall also be run in the form of a ring having both ends connected to the earth terminal at the origin of the circuit.
ELE17.8  JOINTS IN PROTECTIVE CONDUCTORS

ELE17.8.010.7  PROVISION FOR DISCONNECTION
Provision shall be made in an accessible position for disconnecting a protective conductor from the main earthing terminal or the earth electrode to permit testing and measurements of earthing resistance.

ELE17.8.020.7  MEANS OF DISCONNECTION
Such joints shall only be disconnected by means of a tool, be mechanically strong and shall be tinned to maintain the electrical continuity reliably.

ELE17.8.030.7  USE OF SWITCHING DEVICES
No switching devices shall be inserted in a protective conductor.
ELE17.9 IDENTIFICATION AND LABELLING

ELE17.9.010.7 COLOUR IDENTIFICATION

1. All cables used as protective conductors, including earthing conductors, main equipotential bonding conductors, supplementary bonding conductors and circuit protective conductors shall be identified by the colour combination "green and yellow";

2. Bare copper tapes used as protective conductors shall also be made similarly identifiable, by the application of tapes with the above colour combination at maximum 2 m intervals and at each tee-off points.

ELE17.9.020.7 LABELS FOR EARTHING AND BONDING CONNECTIONS

Every point of connection for earthing conductor to an earth electrode and the main equipotential bonding shall be provided with a warning notice in accordance with ELE28.1.
ELE17.10 SIZING OF PROTECTIVE CONDUCTORS

ELE17.10.010.7 PROTECTIVE CONDUCTORS

1. The cross sectional area of a protective conductor, excluding equipotential bonding conductors, shall comply with Code 11 C of the Electrical CoP. Alternatively, it can be calculated using the formula given in Regulation 543.1.3 of BS 7671;

2. When a separate PVC insulated copper cable is used as the protective conductor and not contained in conduit, trunking, ducting or other enclosure of a wiring system, it shall have a minimum cross sectional area of 4 mm² and shall be insulated to BS EN 50525-2-31 or better unless its CSA is greater than 6 mm²;

3. When metal enclosures for cables are used as protective conductors, they shall have CSA equivalent to that of copper, not less than that resulting from the above-mentioned adiabatic equation.

ELE17.10.020.7 PROTECTIVE CONDUCTORS BURIED IN SOIL

Where protective conductors are buried in the soil, they shall comply with Code 11H(a) of the Electrical CoP.

ELE17.10.030.7 EQUIPOTENTIAL BONDING CONDUCTORS

1. The cross sectional area of a main equipotential bonding conductor shall comply with Code 11E(d) of the Electrical CoP;

2. The cross-sectional area of a supplementary bonding conductor shall comply with Code 11F(d) of the Electrical CoP.
ELE17.11 EARTH FAULT LOOPS

ELE17.11.010.7  AUTOMATIC DISCONNECTION TIME
The characteristics of the protective devices for automatic disconnection shall be coordinated with the earthing impedances of the circuits and comply with Code 11B(b) of the Electrical CoP.

ELE17.11.030.7  MAXIMUM EARTH FAULT LOOP IMPEDANCE
1. The maximum permissible earth fault loop impedance shall comply with Code 11 I of the Electrical CoP;
2. Where the armouring of an armoured cable forms part of the circuit protective conductor, and if the maximum earth fault impedance exceeds the specified limits, a separate protective conductor of appropriate size shall be provided.
ELE17.12 USE OF RESIDUAL CURRENT-OPERATED CIRCUIT BREAKER (RCCB)

ELE17.12.010.7 GENERAL
1. RCCBs shall be installed for final circuits where the earth fault loop impedance is too high to allow sufficient earth fault current to operate the overcurrent protective device within the specified automatic disconnection time of 0.4 seconds or 5 seconds. In such cases, the product of the rated residual operating current in amperes of the residual current-operated circuit breaker and the earth fault loop impedance, in ohms, of the circuit shall not exceed 50;
2. Residual current-operated circuit breaker shall meet the requirements specified in ELE3.6.

ELE17.12.020.7 APPLICATION IN HOUSEHOLD INSTALLATIONS
RCCBs used to protect socket outlet circuits in a household or similar installation shall have a rated operating residual current not exceeding 30 mA.

ELE17.12.030.7 EQUIPMENT OUTSIDE SAME EQUIPOTENTIAL ZONE
For circuits supplying fixed equipment outside the equipotential zone shall refer to Code 11B(b)(iii) of the Electrical CoP.

ELE18.1 GENERAL

ELE18.1.010.7 COMPLIANCE WITH REGULATION

Domestic appliances together with their electric components and cabling shall comply with the currently-in-force edition of Electrical Products (Safety) Regulation, CAP 406G, Laws of Hong Kong.
ELE18.2 400MM SWEEP ROTARY CEILING FAN

ELE18.2.010.7 CAPACITY
The unit shall be capable of an air delivery of not less than 1.1 m³/s.

ELE18.2.020.7 DIMENSION
The sweep diameter of the unit shall be 400 mm.

ELE18.2.030.7 DUTY
1. The unit shall be suitable in all respects for operation in ambient air condition of 40°C and 95% R.H;
2. The unit shall be suitable for operation on 220V, 50Hz, single phase a.c. supply;
3. The fan shall not require periodic lubrication;
4. The fan shall operate quietly at all speeds.

ELE18.2.040.7 CONSTRUCTION
1. General:
   a. The unit shall be of deluxe pattern with smooth, safe edges and "easy-to-disassemble" design for cleaning;
   b. The fan shall have high quality aluminium or plastic blades;
   c. The fan shall be fully balanced after assembly;
   d. The blades shall be enclosed by chromed, closely meshed metal guard. The gap of the guard slots shall preferably be not greater than 13 mm at the widest;
   e. The fan shall be provided with rotary mechanism for a swing of 360° when mounted on the ceiling;
   f. The whole unit shall be finished to manufacturer's standard light colour Approved by the Contract Manager.
2. Electrics:
   a. All electrical components, cables etc. shall conform to the appropriate British Standards Specification, or shall be of fully equivalent quality and capacity;
   b. All exposed metal parts of the unit shall be suitably earthed via the 3 core flexible cable;
   c. The fan shall be provided with two (2) metres of 0.75 mm², 3 core, PVC insulated and sheathed flexible cable.
ELE18.3  400MM SWEEP ELECTRIC WALL FAN

ELE18.3.010.7  CAPACITY
The unit shall be capable of an air delivery of not less than 1.1 m³/s.

ELE18.3.020.7  DIMENSION
The sweep diameter of the unit shall be 400 mm.

ELE18.3.030.7  DUTY
1. The unit shall be suitable in all respects for operation in ambient air condition of 40°C and 95% R.H;
2. The unit shall be suitable for operation on 220V, 50Hz, single phase a.c. supply;
3. The fan shall not require periodic lubrication;
4. The fan shall operate quietly at all speeds.

ELE18.3.040.7  CONSTRUCTION
1. General:
   a. The unit shall be of deluxe pattern with smooth, safe edges and "easy-to-disassemble" design for cleaning;
   b. The fan shall have high quality aluminium or plastic blades;
   c. The fan shall be fully balanced after assembly;
   d. The blades shall be enclosed by chromed, closely meshed metal guard. The gap of the guard slots shall preferably be not greater than 13 mm at the widest;
   e. The unit shall be suitable for direct fixing on to a wall. Conversion from Desk Fan will NOT be accepted;
   f. The unit shall be fitted with "3-speed and off" push bottom or pull switch.
   g. The fan shall be provided with oscillating and tilting mechanism for horizontal swing and vertical adjustment respectively;
   h. The oscillator shall have a clutch that slips or disengages if the fan meets an obstruction as it swings. The mechanism shall also be easily disengaged when not required;
   i. The whole unit shall be finished to manufacturer's standard light colour Approved by the Contract Manager.
2. Electrics:
   a. All electrical components, cables etc. shall conform to the appropriate British Standards Specification, or shall be of fully equivalent quality and capacity;
   b. All exposed metal parts of the unit shall be suitably earthed via the 3 core flexible cable;
   c. The fan shall be provided with two (2) metres of 0.75 mm², 3 core, PVC insulated and sheathed flexible cable.
ELE18.4 DOMESTIC EXHAUST FAN

ELE18.4.010.7 CAPACITY
The unit shall be capable of the following air extraction rate:
1. 0.06 m³/s for 150 mm diameter fan;
2. 0.23 m³/s for 230 mm diameter fan;
3. 0.47 m³/s for 300 mm diameter fan.

ELE18.4.020.7 DUTY
1. The unit shall be suitable in all respects for operation in ambient air condition of 40°C and 95% R.H;
2. The unit shall be suitable for operation on 220V, 50Hz, single phase a.c. supply;
3. The fan shall operate quietly at all speeds;
4. The unit casing, outlet grille, fan blade and shutters shall be moulded in rigid flame-retardant plastic. This shall also apply to the motor casing if not manufactured in metal.

ELE18.4.030.7 CONSTRUCTION
1. General:
   a. The unit shall be suitable for mounting on window glass and partitions;
   b. The unit shall have in-built draught excluding shutters suitable for remote control through an "on/off" switch;
   c. The unit shall have "easy-to-disassemble" design for cleaning and maintenance;
   d. The fan shall be fitted with silent running, self-aligning, self-oil bearings;
   e. The fan shall be fully balanced after assembly;
   f. The whole unit shall be finished in white or ivory colour or alternatively to manufacturer's standard light colour Approved by the Contract Manager.
2. Electrics:
   a. The fan shall be driven by a totally enclosed, single phase, induction motor;
   b. All exposed metal parts of the fan shall be suitably earthed via the 3-pin plug;
   c. The fan shall be of single speed and be capable of being switched on and off by a remote 5A switch;
   d. The fan shall be provided with two (2) metres of 0.75 mm², 3 core, PVC insulated and sheathed flexible cable.
ELE18.5 ELECTRIC HAND AND FACE DRYER

ELE18.5.010.7 GENERAL
1. The electrically operated hand and face dryer shall be of good design and pleasant appearance, suitable for heavy duty operation. It shall be of robust construction, intrinsically safe, tamperproof and the drying cycle shall not exceed 35 seconds;
2. The dryer shall be suitable for operation on 220V, 50Hz, single phase, a.c. supply with full bonding to earth through an amply sized 3 core supply cable;
3. The dryer shall be suitable for mounting on the surface of walls, including ceramic tiles.

ELE18.5.020.7 STANDARD CONSTRUCTION
1. The front shall be manufactured from a fully enveloping one piece metal, or Approved high strength plastic cover, fitted with a capacitive touch switch, or insulated metal push button marked "Touch or Push" (as applicable) to start, bi-directional air flow nozzle spring loaded to automatically return to the hand drying position and permanently engraved operating instructions recessed if applicable;
2. Metallic covers shall be finished with acid resistant porcelain enamel;
3. The cover shall be secured to the dryer base by recessed Allen head, or similar type bolts. The base shall be secured to the wall by at least three mounting bolts;
4. The air inlet shall be at the bottom and shall be protected by a suitably sized protective vaned grill. The air outlet shall similarly be protected by metal vanes inside the bi-directional nozzle;
5. All metal parts shall be of stainless, cadmium, or chromium plated steel;
6. The dryer shall be suitable for back and side cable entry with an insulated bushing;
7. The dryer shall be complete with internal electrical overload protection for the fan motor and preferably also for the heater unit.

ELE18.5.030.7 ALTERNATIVE CONSTRUCTION
As an alternative, tenderers may offer units having an infra-red proximity detector, in lieu of the touch switch, or push button control. In this case the operation instructions shall, by internationally recognisable symbols, clearly indicate the method of operation. It would also be preferable for these instructions to state in both English and Chinese:
"Place hands below the air outlet to start."

ELE18.5.040.7 MAINTAINABILITY
The equipment offered shall be designed for easy maintenance.
ELE18.6 QUARTZ MOVEMENT WALL CLOCK

ELE18.6.010.7 GENERAL

1. The clock shall be of deluxe wall hanging pattern having a nominal clock-face diameter of not less than 300 mm;
2. It shall be of Quartz-crystal oscillator controlled movement type and battery operated.

ELE18.6.020.7 CONSTRUCTION

1. The clock shall be of a design which can be flush mounted on the wall and is to be free of any projections on the rear surface;
2. The clock dial shall be white with large Arabic Numerals in black and graduated in minutes;
3. The hour, minutes and second full sweep hands shall preferably be of distinct colour complete with a glass or clear plastic covered front;
4. The rim of the clock shall either be metal or plastic finished in white or ivory colour and the clock movement shall be enclosed to protect it from dust;
5. The type and voltage of the battery powering the clock shall be specified in the supplier's quotation. It shall have a minimum normal use life of at least one year and shall be easily replaceable by non-skilled labour.

ELE18.6.030.7 ACCURACY

The accuracy of timekeeping shall not exceed ±0.5 sec./day at room temperature (25°C) and the clock unit shall be tropicalised and dust-proof.
ELE18.7  CEILING FANS

ELE18.7.010.7  SCOPE
Each ceiling fan shall be complete with speed regulator. The sweep diameter of the unit shall be 900 mm, 1200 mm or 1400 mm as shown on the Drawings or specified in Project Specific Specification.

ELE18.7.020.7  CAPACITY
The unit shall be capable of an air delivery as below:

<table>
<thead>
<tr>
<th>Sweep diameter of the unit (mm)</th>
<th>Air delivery (m³/s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>900</td>
<td>2.2</td>
</tr>
<tr>
<td>1200</td>
<td>3.9</td>
</tr>
<tr>
<td>1400</td>
<td>4.5</td>
</tr>
</tbody>
</table>

ELE18.7.030.7  DUTY
1. The unit shall be suitable in all respects for operation in ambient air condition of 40°C and 95% R.H.;
2. The unit shall be suitable for operation on 220V, 50Hz, single phase A.C. supply;
3. The unit shall be designed for heavy duty commercial and domestic usage;
4. The fan shall operate quietly at all speeds.

ELE18.7.040.7  CONSTRUCTION
1. Motor:
   a. The motor shall be a totally enclosed, capacitor run induction motor, with internal stator and external squirrel-cage rotor;
   b. The rotor shall be mounted in grease lubricated ball bearings;
   c. The power factor shall not be less than 0.8 at any speed. The motor shall be rated for continuous operation under ambient air conditions of 40°C and 95% R.H. and the temperature of the windings shall not exceed 50°C after two (2) hours of continuous operation;
   d. All electrical components, cables etc. shall conform to the appropriate British Standards Specification or shall be of fully equivalent quality and capacity.
2. Blades:
   a. 900 mm Sweep diameter units:
      i. The fan shall be fitted with three (3) blades. "Twisted" blades are preferred;
      ii. The blade assemblies shall consist of one piece all aluminium blades of not less than 1.5 mm thickness;
      iii. Where the one piece blades are twisted to give the required angle of incidence to the blades there shall be large radius bends to prevent stress concentrations in the blade roots;
      iv. Anti-vibration bushes shall be installed between the one piece blades and the motor frame;
v. The blades, shall be securely fastened to the frame of the motor by machine screws and spring washers, the whole designed to ensure that there is no possibility of a blade becoming detached during operation.

b. 1200 mm & 1400 mm Sweep diameter units:
   i. The fan shall be fitted with three (3) blades. "Twisted" blades are preferred;
   ii. The blade assemblies shall consist of blades manufactured from heavy gauge aluminium riveted to steel blade carriers. The rivets shall conform to appropriate British Standards Specification;
   iii. The blade carriers will be manufactured from mild steel plate of not less than 3 mm in thickness and of not less than 40 mm width at the narrowest point, pressed to shape. The blades shall be of not less than 1.5 mm thickness;
   iv. Where the blade carriers are twisted to give the required angle of incidence to the blades there shall be large radius bends to prevent stress concentrations in the blade roots;
   v. Anti-vibration bushes shall be installed between the blades and blade carriers;
   vi. The blade carriers shall be securely fastened to the frame of the motor by machine screws and spring washers, the whole designed to ensure that there is no possibility of a blade becoming detached during operation.

3. Terminals and capacitor:
   a. 
      i. The plastic terminal block and capacitor shall be mounted in a ferrous metal connecting piece, located between the fan and the down-rod;
      ii. The leads from the stator windings shall be connected to the terminal block;
      iii. An earthing terminal, consisting of a round head brass screw and washer shall be provided on the connecting piece;
      iv. All exposed metal parts of the fan unit shall be connected to this earthing terminal.
   b. 
      i. The bottom portion of the connecting piece shall be screwed on to the shaft of the motor;
      ii. The connecting piece shall be tightened on to a shoulder formed on the motor shaft;
      iii. A 4 mm minimum thickness steel hexagonal lock-nut shall then be fitted and tightened in position. The connecting piece shall additionally be secured in the fully tightened position by two hardened steel grub screws;
      iv. These screws shall engage in shallow depressions drilled in the shaft after the connecting piece has been tightened in place to ensure positive locking.

4. Down-rod assembly:
   a. The down-rod assembly shall consist of a down-rod and a steel shackle with a hard rubber roller for suspension of the fan;
   b. 
      i. The down-rod shall be supplied, as required, in lengths of 200 mm, 300 mm, 450 mm, 600 mm, 750 mm, 900 mm and 1200 mm measured from the top of the connecting piece to the centre of the pin in the shackle at the top;
ii. Cables of a length to suit the down-rod shall be provided;

iii. The down-rod shall be manufactured from 12 mm bore standard mild steel/iron pipe of not less than 3 mm, wall thickness, having an external diameter of approximately 20 mm;

iv. It shall be accurately threaded at one end and shall be screwed into the top portion of the fan connecting piece (capacitor housing) from which it shall protrude by a minimum of 2 mm;

v. It shall be locked in position by two (2) hexagonal steel lock nuts, having a minimum thickness of 6 mm, tightened on to the upper machined surface of the fan connecting piece;

vi. The down-rod shall also be locked to the fan connecting piece by means of a steel split-pin, of not less than 5 mm diameter, passing through both the fan connecting piece and the down-rod.

c.

i. The split-pin holes in the fan connecting piece shall be of such a diameter that the split-pin is a light push fit therein;

ii. The matching split-pin holes in the down-rod shall be just sufficiently large so that the split-pin shall be a light push fit, when the hole is in its worst position relative to the threading;

iii. All burrs and sharp edges shall be removed from the split-pin holes in both the fan connecting piece and the down-rod.

d.

i. The steel suspension shackle shall be welded to the down-rod;

ii. Welding shall be of good quality and to the satisfaction of the Contract Manager;

iii. The rubber roller shall be mounted on an 8 mm diameter steel clevis pin secured by a split-pin.

e.

i. The ends of the down-rod shall be rounded off and free from burrs;

ii. There shall be no sharp edges which could cause damage to the insulation of the wiring.

5. Suspension joints and threaded parts:

a. Joints along the suspension rod must be of double-locking design. i.e. at least two independent positive locking devices must be employed to prevent a joint from loosening itself;

b. All factory-assembled threaded components which form part of a suspension joint must be bonded with glue as approved by the Contract Manager;

c. The maximum clearance between threaded mating parts must not exceed 1% of their mean diameter;

d. The down-rod threaded end shall be interchangeable with the existing government ceiling fans;

e. The direction of rotation of the fan shall be such that all screwed joints tend to be tightened when the fan is in operation.

6. Canopies:

Two (2) canopies shall be provided manufactured from plastic or pressed steel sheet and fitted over the upper and lower ends of the down-rod. They shall be fixed to the down-rod by grub screws.

7. Balance:
a. All fans shall be fully balanced after assembly, with any necessary adjustment being made to ensure that they shall not oscillate due to out-of-balance forces;

b. All blades shall be given a single identification number, or letter, permanently stamped thereon, with a corresponding mark stamped on the motor body so that the fan blades may be reassembled in the correct position.

8. Finish:
The whole fan shall be finished in high quality stove enamel, white or ivory colour.

9. Speed Regulator:
a. The speed regulator shall be of robust construction with at least three (3) speed controls and an "OFF" position, built on a flame retardant moulded plastic, or insulated steel base and enclosed by a flame-retardant moulded plastic cover or metal cover. Plastic cover shall be in white or ivory colour to match the fan. Metal cover shall be of stainless steel or metalclad finish;

b. For choke type regulator, an earth terminal shall be provided on the base with an earth wire permanently connected to the steel core of the choke unit;

c. The rotary switch of the speed regulator shall be designed for smooth and easy movement by hand between different speed positions.

### ELE19.11 REFRIGERATORS

- ELE19.11.010.7 METHOD OF SUPPLY .......................................................... 13
ELE19.1 GENERAL

ELE19.1.010.7 CONNECTIONS TO APPLIANCES
1. Domestic appliances shall each be connected to the electrical supply through a suitable wiring accessory and a suitable length (preferably 1.5 m to 2 m) of flexible cable or PVC insulated cables enclosed in a flexible conduit;
2. For portable appliances, plugs and sockets shall be used. For fixed appliances, the wiring accessories shall be opened or removed only by means of a tool;
3. Wiring accessories shall meet the requirements of ELE20. They shall be installed as near as practicably possible to the appliances they are supplying. Fuse-links shall comply with BS 1362 and shall have current ratings suitable for the appliances to be controlled;
4. Flexible cables for final connection to domestic appliances shall be white in colour unless otherwise specified, and shall be circular sheathed, twin with CPC to BS EN 50525-2-11 (PVC-insulated) or to BS EN 50525-2-21 (rubber-insulated), all with copper conductors. The cores of the flexible cables shall have identification colours in accordance with Code 13 D of the Electrical CoP.

ELE19.1.020.7 USE IN BATHROOMS
No portable appliance shall be installed in a room containing a fixed bath or shower. Fixed appliances installed in such a room shall be located out of reach by a person using the bath or shower, and the controlling switches shall be located outside the room.

ELE19.1.030.7 ENGRAVING FOR IDENTIFICATION
The front plate of every switched socket outlet, connector box, spur box or control switch feeding a fixed domestic appliance shall be engraved in accordance with ELE28 to indicate its correct function.

ELE19.1.040.7 EARTHING OF APPLIANCES
All domestic appliances except Class II equipment to BS 2754 shall be effectively earthed to the main earth via a circuit protective conductor. Where the cables for final connection to a fixed appliance are enclosed in a flexible conduit, effective earthing shall be achieved by means of a separate circuit protective conductor drawn into the flexible conduit.

ELE19.1.050.7 APPLIANCES REQUIRING AN EXCLUSIVE CIRCUIT
The following types of domestic appliances shall be supplied from an exclusive final circuit:
1. Household electric cookers;
2. Water heaters other than oversink water heaters;
3. Water boilers;
4. Room coolers;
5. Appliances having a nominal power rating of 3 kW or above.
ELE19.2  CEILING FANS & CEILING-MOUNTED ROTARY FANS

ELE19.2.010.7  METHOD OF SUPPLY
1. Supply to a ceiling fan or a ceiling mounted rotary fan shall be by means of a 2A fused connector box with earthing facilities;
2. The fused connector box shall be square, suitable for mounting on a moulded box or plastic pattress to BS 4662 or IEC 60670-1.

ELE19.2.020.7  FIXING
1. Every ceiling fan shall be suspended from a substantial hook fixed securely to the ceiling structure;
2. Rotary fans shall be fixed direct to the ceiling structure.

ELE19.2.030.7  FAN REGULATORS
1. Fan regulators shall be fixed on the surface of walls;
2. In a concealed conduit installation, the fan regulator shall be mounted on a back-plate over a recessed 35 mm deep BS 4662 or IEC 60670-1 box where the conduit shall be terminated. The back-plate shall be made of 3 mm thick galvanised steel with suitable grommeted hole for cable entry;
3. In a surface conduit installation, the fan regulator shall be mounted on a special fabricated box made of 1.5 mm thick galvanised sheet steel and having the same size as the regulator. The conduit shall be terminated at this specially made surface mounted box through which the cables shall enter the fan regulator;
4. In a surface wiring installation, the fan regulator shall be mounted on a wooden block. Grooves shall be formed at the back surface of the wooden block to suit the cables, and holes shall be drilled to enable the cables to enter the fan regulator from the rear.
ELE19.3 WALL-MOUNTED FANS

ELE19.3.010.7 METHOD OF SUPPLY
Supply to a wall mounted fan shall be by means of a 2A fused connector box in a similar manner as for a ceiling fan, except that the fused connector box shall be fixed on the wall adjacent the fan.

ELE19.3.020.7 FIXING
Wall mounted fans shall be fixed by means of a wall mounting bracket supplied with the fans or sit on a mounting bracket or batten made of teak wood or other material approved by the Contract Manager.
ELE19.4 EXHAUST FANS

ELE19.4.010.7 METHOD OF SUPPLY

1. Unless otherwise specified, supply to a domestic type exhaust fan shall be by means of a connection unit, and shall be controlled by a fused connection unit with double-pole switch as shown on the Drawing;

2. Supply to an industrial type exhaust fan shall be by means of a fused spur box and shall be controlled by a 20A switch D.P. with pilot light.

ELE19.4.020.7 FIXING

1. Exhaust fans shall be installed on the structural opening by means of a steel mounting plate;

2. Where an exhaust fan is intended to draw exhausted air through a fume cupboard, the fan shall be ducted to the fume cupboard by means of PVC pipes of suitable size and length.

ELE19.4.030.7 BUILDERS WORK IN CONNECTION WITH FIXING VENTILATION FANS

The openings in slabs or walls or window glass for mounting roof extractors and/or other ventilation fans shall be provided by the Main Contractor. However, the Sub-contractor shall submit detailed drawings to the Contract Manager to indicate the dimensions of the openings and the details of the diaphragm plates and the proposed method of mounting for Approval prior to installation.
ELE19.5 NOT USED
ELE19.6 ELECTRIC FIRES AND HEATERS

ELE19.6.010.7 WALL-MOUNTED RADIATORS
Supply to wall-mounted radiators shall be fed through a fused spur box and shall be controlled by a 15/20A, D.P. switch with pilot light.

ELE19.6.020.7 PANEL FIRES
1. Method of supply:
   Panel fires rated at 3 kW or less shall be supplied and controlled by a connection unit and a double-pole switch with pilot light.
2. Fixing:
   The connection unit shall be installed on the same side of the panel fires as where the flexible cable enters the panel fires unless otherwise specified.

ELE19.6.030.7 TUBULAR HEATERS
Tubular heaters shall be supplied and controlled by a 13A 3-pin switched socket outlet.
ELE19.7 WATER HEATERS & WATER BOILERS

ELE19.7.010.7 OVERSINK WATER HEATERS
1. Method of supply:
   a. Supply to an oversink water heater shall be by means of a fused spur box and shall be controlled by a 15/20A, D.P. switch with pilot light at a distance of not less than 2 m from any water taps;
   b. The front plate of the fused spur box shall have an outlet hole and the necessary cordgrip for the flexible cable.

2. Fixing:
   In a surface wiring installation, the fused spur box and the 15/20A, D.P. switch shall each be mounted on a moulded box or plastic pattress to BS 4662 or IEC 60670-1.

ELE19.7.020.7 OTHER TYPES OF WATER HEATER
1. Method of supply:
   Supply to domestic water heaters, other than oversink type, shall be controlled by a 20A D.P. switch with pilot light.

2. In a concealed or surface conduit installation:
   a. The PVC insulated cables shall be enclosed in a conduit from the control switch to a standard circular conduit box fitted with a dome cover and then through a flexible conduit from the dome cover to the water heater;
   b. The dome cover and the conduit box shall be fixed as near to the water heater as practicable.

3. In a surface wiring installation:
   a. The control switch shall be mounted on a moulded box or plastic pattress;
   b. Final connection to the water heater shall be taken direct from the control switch via a flexible cable, twin with CPC;
   c. The control switch shall be fixed as near to the water heater as practicable.

ELE19.7.030.7 WATER BOILERS
The installation of a water boiler shall be similar to that for a water heater except that the control switch shall have a rating of 30A.

ELE19.7.040.7 WASH BOILERS & TEA URNS
1. Method of supply:
   Wash boilers and tea urns having a rating of 3 kW or less, shall be supplied and controlled by a connection unit and a double-pole switch with pilot light.

2. Fixing:
   The connection unit shall be installed on the same side of the wash boiler and tea urn as where the flexible cable enters the wash boiler and tea urn unless otherwise specified.
ELE19.8 ELECTRIC COOKERS

ELE19.8.010.7 BABY BELLING COOKERS
The installation of a Baby Belling type cooker shall be similar to that for a wash boiler.

ELE19.8.020.7 HOUSEHOLD COOKERS
1. Method of supply:
   Supply to a household cooker shall be controlled by a cooker control unit of rating not less than 45A unless otherwise specified. The control unit shall be installed at a height of 1350 mm above finished floor level;
2. In a concealed or surface conduit installation:
   a. The PVC insulated cables from the control unit shall be enclosed in a conduit and terminated at an insulated terminal block inside a 47 mm deep BS 4662 or IEC 60670-1 conduit box;
   b. The PVC insulated cables shall then be changed into PVC insulated and sheathed cable twin with CPC before connecting to the cooker;
   c. The insulated terminal block shall be mounted on the wall at 300 mm above finished floor level;
   d. The PVC insulated and sheathed cable twin with CPC shall be 1.5 m to 2 m long to allow the cooker to be moved for cleaning purposes.
3. In a surface wiring installation:
   PVC insulated and sheathed cable twin with CPC shall be used throughout.
ELE19.9 ELECTRIC HAND DRYERS

ELE19.9.010.7 ELECTRIC HAND DRYERS

The supply to an electric hand dryer shall be by means of a fused spur box complete with an integral D.P. switch and pilot light. The front plate of the fused spur box shall have an outlet hole and the necessary cordgrip for the flexible cable.
**ELE19.10 ROOM COOLERS**

**ELE19.10.010.7 METHOD OF SUPPLY**
Supply to a room cooler shall be by means of a connection unit or an insulated terminal block and a control switch, both of which shall have a current capacity of not less than the rated value of the room cooler. The control switch shall be D.P. with pilot light.

**ELE19.10.020.7 POSITION OF CONNECTION UNIT AND TERMINAL BLOCK**
The connection unit or insulated terminal block shall be installed adjacent to the room cooler and shall be on the same side of the room cooler as where the flexible cable enters the room cooler. Where it is not possible to ascertain where the flexible cable enters the room cooler, the connection unit or insulated terminal block shall be installed on the left side of the room cooler, as viewed from the front.
ELE19.11 REFRIGERATORS

ELE19.11.010.7 METHOD OF SUPPLY

Supply to a refrigerator shall be by means of a fused spur box fitted with a 20A D.P. switch or a 13A socket outlet as shown on the Drawing.

ELE20.1 WIRING ACCESSORIES - GENERAL

ELE20.1.010.7 STANDARD
Wiring accessories shall meet the general requirements of BS EN 60670-22 and BS 5733, unless otherwise specified.

ELE20.1.020.7 COLOUR AND CONSISTENCY
Unless otherwise specified, wiring accessories of the same cover plate material shall be of the same colour scheme and for those used for domestic purpose, they shall be in white. All wiring accessories in domestic units, with the exception of batten lampholders, shall be from the same range of product of a single manufacturer.

ELE20.1.030.7 MOUNTING
1. In surface cable installations, they shall be fixed onto moulded boxes or pattresses;
2. In conduit installations, they shall be mounted on either plastic moulded boxes or cast iron galvanised boxes;
3. Where a waterproof or flameproof pattern is required, they shall be mounted as the particular circumstances demand.

ELE20.1.040.7 ENCLOSURES
Moulded boxes or pattresses and steel or cast iron boxes for the enclosure of wiring accessories shall comply with IEC 60670-1 and dimensions to BS 4662 and shall meet the requirements specified in ELE11, ELE12 and ELE13 where appropriate.

ELE20.1.050.7 ENGRAVING
The front plate of each socket or control switch feeding an essential circuit or a fixed electrical appliance, such as wash boiler, water heater, cooker, wall-mounted fan, wall mounted radiator, incinerator, exhaust fan, room cooler, etc., shall be engraved according to the appliance being controlled. Details of the inscription shall be submitted to the Contract Manager for approval. See Project Specific Specification for particular project requirements, if any.
**ELE20.2 DOMESTIC SWITCHES**

**ELE20.2.010.7 GENERAL**

1. **Standard:**
   Switches for domestic and similar purposes shall comply with BS EN 60669-1.

2. **Mounting:**
   a. They shall be mounted at a height of 1350 mm above finished floor level unless otherwise specified;
   b. Unless otherwise specified, lighting switches shall be designed for flush mounting on to pattresses or boxes to IEC 60670-1 and dimensions to BS4662.

3. **Type-testing:**
   Lighting switches shall be type-tested for complete compliance with BS EN 60669-1 by an Accredited Laboratory.

**ELE20.2.020.7 LIGHTING SWITCHES**

1. **Type:**
   Lighting switches shall be suitable for use on a.c. circuits, and shall be of the quick make-and-break type when used in d.c. circuits. Suspension pear type switches will not be permitted.

2. **Front plate:**
   a. The front plate shall be made of an insulating material such as urea-formaldehyde or polycarbonate and white in colour;
   b. The B.S. number shall be indelibly marked on the lighting switch assembly;
   c. The whole assembly shall have a pleasant appearance and shall be fixed onto the enclosure by means of bright electroplated oval head screws;
   d. The screws shall be flush with the surface of the front plate.

3. **Cable terminals:**
   a. Cable terminals shall be made of brass, suitably positioned for easy cable termination and suitably shrouded to prevent accidental contact with other metal or current-carrying parts;
   b. The ends of the terminal screws shall be so shaped as to prevent damage to the conductor.

4. **Plastic pattresses:**
   a. Lighting switches for surface cable installations shall be fixed onto proprietary-made plastic pattresses;
   b. The pattress shall be complete with copper earthing terminal and shall be at least 25 mm internal depth to accommodate the cables to be installed and to prevent acute bends of the cables;
   c. The colour, shape and material of the pattress shall match that of the front plate of the switch.

5. **Rating:**
   Lighting switches shall be single pole rated at 5AX or 10AX as specified in Project Specific Specification or on the Drawings.

6. **Multi-gang mounting:**
When lighting switches are mounted adjacent to one another, they shall be grouped in a single enclosure (multigang box) and shall share a common switch plate, subject to a maximum of three lighting switches per single-gang plate.

7. Location:
Lighting switches, installed adjacent to a door shall be located on the handle side of the door and shall be as near to the door as practicable.

**ELE20.2.030.7** D.P. SWITCHES FOR APPLIANCES
1. Switches controlling appliances with heating elements or appliances permanently connected to the supply shall be of double pole type, and shall have a rating not smaller than the current capacity of the appliances being controlled;
2. The front plate of each such switch shall be properly engraved in accordance with ELE20.1.050;
3. The pilot light, where specified, shall be formed by a neon lamp with resistor and a red coloured lens.

**ELE20.2.040.7** SPARKLESS SWITCHES
1. Sparkless switches shall be of the tilting mercury type;
2. The contacts of a sparkless switch shall be contained in a sealed glass capsule;
3. The rating shall be as specified in Project Specific Specification or on the Drawings.

**ELE20.2.050.7** TIME SWITCHES
As ELE3.17.

**ELE20.2.060.7** SWITCHES EXPOSED TO WEATHER
Switches mounted outdoors, or in positions where they may be exposed to rain or water, shall be weatherproof with ingress protection of at least IP55 to BS EN 60529 or IEC 60529. Switches with covers on top to achieve the IP requirement are not acceptable.

**ELE20.2.070.7** APPLICATION IN BATHROOMS ETC.
No switch shall be installed inside a room containing a fixed bath or shower or inside a toilet.

**ELE20.2.080.7** DOOR BELL PUSH BUTTON
Door bell pushes button shall be of large press button type and flush pattern with white or ivory colour front plate to BS EN 60669-1.
ELE20.3  SOCKET OUTLETS

ELE20.3.010.7  GENERAL
1. Socket outlets and plugs rated at 5A and 15A for general application shall comply with BS 546 and the Electrical CoP;
2. Socket outlets and plugs rated at 13A shall comply with BS 1363: Parts 1 & 2;
3. All socket outlets shall be of 3 pin, and shall be of the shuttered type;
4. 5A socket outlets may be unshuttered provided they are installed on the ceiling or at high level and are not normally accessible;
5. Socket outlets intended for supplying fixed or stationary appliances shall be located as near as possible to the appliances.

ELE20.3.020.7  13A SOCKET OUTLETS
1. Design:
   Unless otherwise specified, socket outlets shall be designed for flush mounting onto pattresses or boxes to IEC 60670-1 and dimensions to BS 4662.
2. Type-testing:
   Socket outlets shall be of 3-pin shuttered type and shall be type-tested for complete compliance with BS 1363: Part 2 by an Accredited Laboratory.
3. Front plate:
   a. The front plate shall be made of an insulating material such as urea-formaldehyde or polycarbonate and white in colour;
   b. The B.S. number shall be indelibly marked on the socket outlet assembly;
   c. The whole assembly shall have a pleasant appearance and shall be fixed onto the enclosure by means of bright electroplated oval head screws;
   d. The screws shall be flush with the surface of the front plate.
4. Cable terminals:
   a. Cable terminals shall be made of brass, suitably positioned for easy cable termination and suitably shrouded to prevent accidental contact with other metal or current-carrying parts;
   b. The ends of the terminal screws shall be so shaped as to prevent damage to the conductor.
5. Plastic pattresses:
   a. Socket outlets for surface cable installations shall be fixed onto proprietary-made plastic pattresses;
   b. The pattress shall be at least 25 mm internal depth to accommodate the cables to be installed and to prevent acute bends of the cables;
   c. The colour, shape and material of the pattress shall match that of the front plate of the socket outlet.

ELE20.3.030.7  INTEGRAL SWITCH FOR SOCKET OUTLETS
For socket outlet with integral switch, the integral switch shall be of single pole, forming part of the same front plate as the socket outlet.
WEATHERPROOF SOCKET OUTLETS
Weatherproof socket outlets of appropriate types and ratings shall be provided as shown on drawings. The socket outlets shall comply correspondingly with the following requirements:

1. Industrial type surface mounting socket outlet to BS EN 60309-2 or IEC 60309-2 with a push-on cap and cap retaining ring having ingress protection of at least IP44 to BS EN 60529 or IEC 60529. The socket outlet shall be suitable for wall mounting and the outlet shall face downward, to facilitate plug insertion and to minimize ingress of water;

2. General purpose type socket outlet to BS 1363 with the plug fully enclosed by protective cover and with the cord entry properly sealed when in use condition and having ingress protection of at least IP44 to BS EN 60529 or IEC 60529. The hinge mechanism for the protective cover shall be of sturdy construction with opening angle greater than 120 degrees.

SHAVER SUPPLY UNITS
1. Electric shaver supply units shall comply with BS EN 61558-1 and BS EN 61558-2-23, or IEC 61558-1 and IEC 61558-2-23 and shall be insulated, suitable for flush mounting;

2. Each unit shall comprise two outlets one for 110V and the other for 220V obtained from a double wound transformer;

3. The complete unit shall be enclosed in a galvanised metal box for flush mounting, or a cast iron or plastic surface box for surface mounting.

SOCKET OUTLETS TO SURFACE CONDUIT INSTALLATIONS
In pump rooms, plant rooms, boiler houses, switch rooms and other places where surface conduit and accessories are installed, socket outlets shall be metalclad, with bronze front plate, unless otherwise specified.

PLUGS
1. Plugs for 13A socket outlets shall be fitted with a fuse, complying with BS 1362 or IEC 60269-1, suitably rated to suit the appliance connected to it;

2. Where the current rating of the appliance cannot be ascertained, a 13A fuse shall be fitted;

3. Every plug shall be fitted with a cord grip which is so designed that no stress will be taken by the terminals or the conductors of the flexible cable connected to it;

4. The extent of provision of plugs, if required, is given in Project Specific Specification or Drawings.

SOCKET OUTLETS IN HAZARDOUS AREAS
1. The installation of socket outlets in hazardous areas should be avoided as far as possible;

2. Where it is absolutely essential to install a socket outlet in such an area, the socket outlet shall comply with BS EN 60309-2 or IEC 60309-2 and shall be controlled by a sparkless switch;

3. The socket outlet shall be interlocked with the plug so that removal or insertion shall not be possible unless the controlling switch is in the OFF position;

4. The plug shall have shrouded pins and the design of the pin contacts shall be such as to guard against development of hot spots or sparking.
ELE20.3.100.7  SOCKET MOUNTING HEIGHT
Unless otherwise specified socket outlets shall be mounted at a height of 1350 mm above finished floor level in kitchens, sculleries, ironing rooms and the like, and at a height of 300 mm above finished floor level in other locations.

ELE20.3.110.7  SOCKET OUTLETS FOR DIFFERENT VOLTAGE SYSTEMS
Socket outlets and plugs for one voltage system shall not be interchangeable with those for use at other voltage and/or frequency systems in the same installation.

ELE20.3.120.7  APPLICATION IN BATHROOMS ETC.
No socket outlets, other than shaver supply units complying with BS, shall be installed inside a room containing a fixed bath or shower or inside a toilet.
ELE20.4 CONNECTION UNITS

ELE20.4.010.7 CONNECTION UNITS - GENERAL

1. Design:
   Unless otherwise specified, connection units shall be suitable for flush mounting onto pattresses or boxes to IEC 60670-1 and dimensions to BS 4662.

2. Type-testing:
   Connection units shall be type-tested to BS 5733 by an Accredited Laboratory.

3. Current rating:
   The current rating of connection units shall be at least 20A unless otherwise specified on the Drawings.

4. Front plate:
   a. The front plate shall be made of an insulating material such as urea-formaldehyde or polycarbonate and white in colour;
   b. Where pilot light and integral switch are specified, the light shall comprise a neon lamp and a red coloured lens, and the switch shall be of double pole, unless otherwise specified, and forming part of the same front plate;
   c. The front plate shall also incorporate a flex outlet with a clamp for anchoring the flexible cord;
   d. The whole assembly shall have a pleasant appearance and shall be fixed onto the enclosure by means of bright electroplated oval head screws;
   e. The screws shall be flush with the surface of the front plate.

5. Cable terminals:
   a. Cable terminals shall be made of brass, suitably positioned for easy cable termination and suitably shrouded to prevent accidental contact with other metal or current-carrying parts;
   b. The ends of the terminal screws shall be so shaped as to prevent damage to the conductor.

6. Plastic pattresses:
   a. Connection units for surface cable installations shall be fixed onto proprietary-made plastic pattresses;
   b. The pattress shall be complete with copper earth terminal and shall be at least 25 mm internal depth to accommodate the cables to be installed and to prevent acute bends of the cables;
   c. The colour, shape and material of the pattress shall match that of the front plate of the unit.

ELE20.4.020.7 FUSED CONNECTION UNITS

1. Fused connection units shall comply with BS 1363: Part 4 and contain plugs incorporating cartridge fuse-links to BS 1362 or IEC 60269-1 of a.c. rating either 2A or 13A as shown on the drawings;

2. The plug shall only be removable by the use of a tool;

3. The unit shall be clearly marked with the word “FUSE” or "FUSED" in a conspicuous position on the front plate;

4. Fused connection unit shall be type-tested by an Accredited Laboratory.
ELE20.5  INSULATED TERMINAL BLOCKS

ELE20.5.010.7  VOLTAGE RATING
The rated voltage of terminal blocks shall not be less than 435V between terminals and 250V to earth.

ELE20.5.020.7  CONSTRUCTION
Terminal blocks shall comprise brass connectors with screw connections, all contained within a moulded block suitable for working temperature up to 100°C.

ELE20.5.030.7  DESIGN
Terminals shall be designed to clamp the conductor between metal surface with sufficient contact pressure but without causing damage to the conductors. With the largest recommended conductor in position, and tightly clamped, there shall be at least two full threads of the screw engaging in the connector.

ELE21.1 LAMPS

ELE21.1.020.7 TUBULAR FLUORESCENT LAMPS

1. Tubular fluorescent lamps with preheated cathode, for general lighting service, shall be manufactured and tested to BS EN 60081 or IEC 60081 or BS1853: Part 2. Lamps shall start satisfactorily with switch-start control gears operated on 220V 50Hz single-phase supply;

2. Lamps shall have the colour appearance of 'white' the colour temperature of 4000 K and the colour rendering index of 85. Initial luminous output and the minimum luminous output at 2000 burning hours shall not be less than that shown in the table below:

<table>
<thead>
<tr>
<th>26 mm diameter fluorescent tubular lamp</th>
<th>Initial luminous output at 100 hours (lm)</th>
<th>Minimum luminous output at 2000 hours (lm)</th>
</tr>
</thead>
<tbody>

<td>3300</td>
<td>3100</td>
</tr>
<tr>
<td>1500 mm</td>
<td>5150</td>
<td>4900</td>
</tr>
</tbody>
</table>

3. Lamp life expectancy shall not be less than 8000 hours. By the end of lamp life, the luminous output shall not be less than 80% of initial luminous output specified above;

4. Lamps shall be fitted with bi-pin G13 lamp caps, 26 mm diameter, they shall be completely interchangeable with, and shall operate on, the corresponding circuits for 38 mm diameter fluorescent lamp.

ELE21.1.025.7 COMPACT FLUORESCENT LAMPS

Compact fluorescent lamps with preheated cathode, either with built in control gear or separate control gear, shall be manufactured and tested to BS EN 60901 or IEC 60901 and BS EN 61199 or IEC 61199.

ELE21.1.030.7 COMPACT FLUORESCENT LAMPS

1. Construction:
   a. The lamp shall be as follows;
      i. 10W or 13W (consist of four narrow fluorescent tubes, bonded together with a 2-pin, single end type G24d-1 lamp base or 4-pin, single end type G24q-1 lamp base);
      ii. 11W (consist of two narrow fluorescent tubes, bonded together with a 2-pin, single end type G23 lamp base or 4-pin, single end type 2G7 lamp base);
      iii. 18W (consist of four narrow fluorescent tubes, bonded together with a 2-pin, single end type G24d-2 lamp base or 4-pin, single end type G24q-2 lamp base);
      iv. 24W (consist of two narrow fluorescent tubes, bonded together with a 4-pin, single end type 2G11 lamp base or four narrow fluorescent tubes, bonded together with a 4-pin, single end type 2G10 lamp base);
      v. 26W (consist of four narrow fluorescent tubes, bonded together with a 2-pin, single end type G24d-3 lamp base or 4-pin, single end type G24q-3 lamp base).
   b. The lamp base shall form an integral housing for the integrated starter and radio interference suppressor;
c. Ignition of the lamp should be almost instantaneous with minimum
   flickering;

d. The lamp wattage shall be rated with a.c. supply voltage of 220V 50Hz
   single-phase for the operating gear.

2. Luminous characteristic:
   a. The initial luminous output shall be not less than 600 lumen for 10W, 900
      lumen for 11W, 900 lumen for 13W, 1200 lumen for 18W, 1800 lumen for
      24W, 1800 lumen for 26W. They shall have a colour temperature of 4000K
      unless otherwise specified;
   b. The life expectancy of the lamp shall not be less than 8000 hours for switch
      start circuit and 12000 hours for high frequency start circuit;
   c. The initial luminous output shall be measured at the end of 100-hour ageing
      period;
   d. The lumen maintenance shall not be less than 80% of the initial value. This
      value shall be measured after 2000 hours operation including the ageing
      period.

3. Marking:
   Each lamp shall be indelibly marked with the following information:
   a. The manufacturer's identification;
   b. The country/place of manufacture;
   c. The rated wattage.

4. Performance and endurance tests:
   The lamp shall be type-tested by an Independent Testing Laboratory/Institution
   in accordance with BS EN 60901 or IEC 60901 for lamp ageing test; BS EN
   13032-1 for lamp luminous output test, BS EN 61199 or IEC 61199 for safety
   requirement.

ELE21.040.7 DISCHARGE LAMPS

1. All discharge lamps shall comply with BS EN 62035 or IEC 62035. High
   pressure sodium lamp shall also comply with BS EN 60662 or IEC 60662; Low
   pressure sodium lamp shall comply with BS EN 60192 or IEC 60192; High
   pressure mercury lamp shall comply with BS EN 60188 or IEC 60188; Metal
   halide lamp shall comply with BS EN 61167 or IEC 61167;

2. Mercury vapour and metal halide lamps shall have fused silica discharge tubes
   whereas low pressure sodium lamps shall employ glass having an internal layer
   of a different glass resistant to sodium vapour;

3. The discharge tube of high pressure sodium lamps shall be made translucent
   alumina;

4. Discharge lamps shall be started without heating the electrodes.

ELE21.050.7 ANCILLARY EQUIPMENT AND CIRCUITRY OF DISCHARGE LAMPS

The ancillaries complying with BS EN 61347-1 and BS EN 61347-2-8 and
BS EN 60921 and BS EN 61347-2-9 and BS EN 60923 and BS EN 61048 and
BS EN 61049, or IEC 61347-1 and IEC 61347-2-8 and IEC 61347-2-11 and IEC
60921 and IEC 61347-2-9 and IEC 60923 and IEC 61048 and IEC 61049 shall be
adopted to suit the respective lamp parameters to achieve maximum light output
consistent with lamp life. The function of the ancillary gear and circuitry shall be:

1. To operate the lamp, and its rated output in lumens, and to attain the rated life of
   lamp under normal running conditions;

2. To ensure reliable starting under all conditions for which the installation has
   been designed;
3. To suppress the generation of radio television interference;
4. To restrict, within specified limits, the level of noise generated by the inductor windings and to minimise the generation of additive harmonics;
5. To limit the temperature rise of cables, lampholders, and all ancillary gear with particular reference to inductors and capacitors.

ELE21.1.060.7 PROVISION OF FLUORESCENT TUBES AND LAMP BULBS
The Sub-contractor shall supply and fix fluorescent tubes and lamp bulbs as appropriate in all luminaires except those in the lampholders in domestic units.
ELE21.2 LAMPHOLDERS

ELE21.2.010 BATTEN LAMPHOLDERS
1. Unless otherwise specified, batten lampholders shall be suitable for flush mounting on plastic pattresses or BESA boxes;
2. Batten lampholders shall be type-tested for complete compliance with BS EN 61184 or IEC 61184 by an Accredited Laboratory;
3. The lampholder shall be of the all-insulated bayonet socket pattern manufactured from moulded hard white or ivory colour plastic material which shall be unaffected by the heat from the lamp, and shall be fitted with a shaded carrier ring and a ventilated shield unless otherwise specified;
4. The whole assembly shall have a pleasant appearance and shall be fixed onto the enclosure by means of bright electroplated oval head screws;
5. An earthing terminal shall be provided to each lampholder for connection to the circuit protective conductor of the final circuit;
6. Cables terminals shall be made of brass, suitably positioned for easy cable termination and suitably shrouded to prevent accidental contact with other metal or current-carrying parts. The ends of the terminal screws shall be so shaped as to prevent damage to the conductor;
7. Batten lampholders for surface cable installation shall be fixed onto proprietary-made plastic pattresses. The pattress shall have sufficient space for accommodating the cables to be installed and to prevent acute bends of the cables. The colour, shape and material of the pattress shall match that of the lampholder;
8. Batten lampholders shall be of type "22d" with temperature rating of "T2" unless otherwise specified.

ELE21.2.020 CORD GRIP LAMPHOLDERS
1. Cord grip lampholders to BS EN 61184 or IEC 61184 shall be white or ivory in colour and fitted with cord grips so designed that no stress can be taken by the conductors of terminals;
2. Lampholders shall be of the all-insulated bayonet socket pattern fitted with shade carrier ring, a ventilated shield, or a moulded white plastic cone as required;
3. They shall be suitable for PVC insulated and sheathed, circular flexible cable of not less than 0.75 mm² size;
4. White moulded plastic break joint rings shall be used;
5. Where a flexible cord supports, or partly supports, a luminaire, the maximum mass supported by the cord shall not exceed the values as given in ELE8.3.4.030;
6. Lampholders shall be of type "22d" with temperature rating of "T2" unless otherwise specified.

ELE21.2.030 LAMPHOLDERS FOR WEATHERPROOF LUMINAIRES
Weatherproof luminaires shall be fitted with porcelain lampholders, complying with BS EN 61184 or IEC 61184.
ELE21.2.040.7  LAMPHOLDER FOR TUBULAR FLUORESCENT LAMPS

Lampholders for use with tubular fluorescent lamps shall be bi-pin type, complying with BS EN 60400 or IEC 60400 and BS EN 60061-1 or IEC 60061-1 and BS EN 60061-2 or IEC 60061-2. They shall be made in moulded white plastic material and designed to hold the tube in position without the need for an additional clip.
ELE21.3 LUMINAIRES

ELE21.3.010.7 GENERAL

1. Luminaires shall be well constructed and shall comply with the requirements of BS 4533 or BS EN 60598 or IEC 60598 and be chosen to suit the conditions under which they will operate;

2. Luminaires to be supplied shall contain components of the same brands and models as those shown on type test certificates. However, luminaires equipped with alternative controlgear will be acceptable if the Sub-contractor can meet the following conditions to the satisfaction of the Contract Manager:
   a. The Sub-contractor shall seek the luminaire manufacturer's confirmation that the use of these alternatives will neither jeopardize safety nor have any adverse effect on performance;
   b. The Sub-contractor shall submit the luminaire manufacturer's test certificates that can prove the concerned luminaire, together with alternative controlgear, to have satisfactorily undergone endurance tests and thermal tests specified in BS EN 60598-1 or IEC 60598-1 or BS 4533 Section 102.1 or IEC 60598-2-1 respectively. Tests conducted on the luminaire manufacturer's premises are acceptable;
   c. Luminaires with alternative controlgear shall be of the same construction as the original one that comes with a full set of type test certificates;
   d. Alternative controlgear shall meet their respective product standards stipulated in the Specification.

3. For other special luminaires, particularly specified in the project the Sub-contractor shall confirm to provide adequate substantiations to justify these special luminaires on safety and performance aspects to the satisfaction of the Contract Manager. For special luminaires other than those specified in this specification and without comprehensive test reports, the Sub-contractor shall submit adequate substantiations to justify these special luminaires be suitable for the installation without jeopardising their safety and performance to the satisfaction of the Contract Manager, particularly on operation voltage / frequency / power factor (220V, 50Hz at 0.85 lagging or above), heat resistant of wiring (at least 90°C), IP rating (minimum IP54 for outdoor luminaires), insulation resistance (not less than 1MΩ between phases and phase to earth), excessive temperature rise (not to cause the luminaires be operated in overheat condition) and safety device provision to prevent dropping (required for luminaires mounted on high position). In addition, under no circumstances shall the wiring be visible in the lamp compartment.

ELE21.3.020.7 INDOOR LUMINAIRES

1. The luminaires shall comply with BS EN 60598-1 or IEC 60598-1, BS 4533: Section 102.1 or EN 60598-2-1 or IEC 60598-2-1;

2. Unless otherwise specified, the following components of the luminaire shall be manufactured in accordance with the relevant British Standard Specifications and shall carry the BSI Kitemark or the mark of an equivalent Quality Surveillance Scheme:
   a. Electromagnetic ballast: BS EN 61347-1 and BS EN 61347-2-8 and BS EN 60921, or IEC 61347-1 and IEC 61347-2-8 and IEC 61347-2-11 and IEC 60921 or;
   ii. Electronic ballast: BS EN 61347-1 or IEC 61347-1 and IEC 61347-2-3 and BS EN 60929 or IEC 60929.
b. Starter: BS EN 60155 or IEC 60155;

c. Capacitor: BS EN 61048 and BS EN 61049 or IEC 61048 and IEC 61049.

3. The controlgear loss of the tubular fluorescent lamp and compact fluorescent lamp shall be equal to or smaller than the corresponding maximum allowable value as specified in the table below:

<table>
<thead>
<tr>
<th>Lamp type</th>
<th>Nominal lamp wattage ($L_w$)</th>
<th>Maximum allowable lamp controlgear loss (W)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lamp controlled by electromagnetic ballast</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Tubular fluorescent</td>
<td>$L_w \leq 18W$</td>
<td>7</td>
</tr>
<tr>

</tr>
<tr>
<td>Lamp controlled by electronic ballast</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

4. The overall power factor of the luminaire shall not be less than 0.85 lagging;

5. Fluorescent luminaires shall be radio interference suppressed to limits specified in BS EN 55015 or EN 55015. Test certificates and reports shall be submitted as evidence of compliance as and when required by the Contract Manager;

6. Internal wiring shall be appropriately colour coded, neatly wired and properly terminated;

7. A sample of the luminaires shall be submitted for inspection and Approval as and when required.

ELE21.3.030.7 OUTDOOR LUMINAIRÉS

1. Outdoor luminaires shall comply with BS EN 60598-1 and BS EN 60598-2-3 and BS EN 60598-2-5, or IEC 60598-1 and IEC 60598-2-3 and IEC 60598-2-5;

2. Unless otherwise specified, the following components of the luminaires shall be manufactured in accordance with the relevant British Standard / IEC/ BS EN Specifications and shall carry the BSI Kitemark or the mark of an Equivalent Quality Surveillance Scheme:

a. Ballast - BS EN 61347-1 and BS EN 61347-2-9 and BS EN 60923 or IEC 60923 and IEC 61347-1 and IEC 61347-2-9

b. Capacitor - BS EN 61048 and BS EN 61049 or IEC 61048 and IEC 61049

3. The controlgear loss of the tubular fluorescent lamp and compact fluorescent lamp shall be equal to or smaller than the corresponding maximum allowable value as specified in the table below:

Lamp controlled by electronic ballast

| Tubular and compact fluorescent | Comply with the requirements of the latest version of Hong Kong Voluntary Energy Efficiency Labelling Scheme for Electronic Ballasts, EMSD |

4. The overall power factor of the luminaire shall not be less than 0.85 lagging;

5. The type of protection against electric shock provided shall be Class I or II; and the degree of protection against ingress of dust and moisture shall be at least IP54 unless otherwise specified;

6. a. Outdoor luminaires shall be able to withstand the weather;
   b. Metalwork should be protected against corrosion, and luminaire parts which have to be removed for access to the interior should be properly gasketed to restrict the entrance of moisture and dirt;
   c. Stirrup mounting and similar parts shall be heavily galvanised, and bolts shall either be made of stainless steel or be galvanised.

7. a. The adjustment nuts and bolts of the luminaires that will be mounted high on buildings or columns shall be captive to prevent loss or accident during servicing;
   b. Safety devices shall be provided to prevent luminaires mounted on high positions dropping;
   c. The luminaires installed in such locations that are within hand reach shall be strongly constructed, fitted with an impact-resistant transparent or diffusing cover, and shall have secret key fixings for the cover to the body of the luminaires;
   d. Where necessary, wire guards shall be fitted over the cover to give extra protection.

### ELE21.3.040.7 Indoor Batten Type Fluorescent Luminaires (SF11 to SF24, SF33, SF39)

1. Luminaires shall be licensed with the BSI Kitemark Scheme or with an equivalent Quality Surveillance Scheme. The licence and associated type-test report(s) issued by BSI or the licensing organisation, shall be submitted as evidence of compliance with the required standard;

2. The luminaires shall be classified, as a minimum requirement, to Class I and IP20 as described in BS EN 60598-1 or IEC 60598-1;

3. Each luminaire shall be supplied as a complete set comprising the main part, end plates, cover plate/ reflector/ diffuser, ballast, starter and starter-holder, power factor correction capacitor, bi-pin lampholder, fused terminal block, integral earthing terminal and internal wiring;

4. The starter shall be positioned in such a way as to be accessible for detachment from the exterior of the luminaire without having to remove any part of the luminaire and the lamp(s);
5. A fused terminal block, fitted with a suitably-rated fuse to BS 1362 or IEC 60269-1, shall be properly fixed to the body in such a way as to be easily accessible for fuse replacement;

6. The main part of the luminaire shall be made of substantive sheet steel of minimum thickness 0.5 mm, pretreated to prohibit corrosion on both sides and finish coated in gloss white stoved enamel or epoxy powder on the outside surface. It shall be formed and suitably shaped into one continuous U-channel piece to give a fairly rigid structure on its own, but can be further strengthened by ribs where necessary;

7. The luminaire shall be provided with cover plate (for SF11 to SF14, SF33), reflector (for SF15 to SF19, SF39), or diffuser (for SF20 to SF24) as appropriate. The cover plate and reflector shall be of the same material and finish as the main part, but the reflector shall be finish coated on both inside and the outside surfaces. The cover plate and reflector shall be of one continuous piece formed and suitably shaped to give adequate mechanical strength. The fixing screw for the cover plate and reflector shall be captive with the main part. The diffuser shall be made of clear prismatic plastic material unless otherwise specified;

8. The end plate for the main part shall be of white finish and can be made of plastic or sheet steel. If made of sheet steel, the end plate shall be of the same material and finish as the main part. A knockout shall be formed on the end plate for conduit entry. The bi-pin lampholder can either be integral with the end plate or alternatively be mounted on the main part or end plate;

9. The main part shall be formed with knockouts on the mounting face for fixing to conduit and BESA box. The ballast, power factor correction capacitor, starter-holder and fused terminal block shall be conveniently positioned and securely fixed to the main part. The mounting face of the main part shall be purposely formed with small protrusions to adequately cover the heads of any fixing screws projecting beyond its outside surface.

ELE21.3.050.7 CORROSION RESISTANT TYPE FLUORESCENT LUMINAIRE (SF25, SF26, SF34 - SF36)

1. A type-test certificate together with the associated test report(s) issued by BSI or an Accredited Laboratory shall be submitted as evidence of compliance with the required standard;

2. The luminaire shall be classified, as a minimum requirement to Class I and IP54 as described in BS EN 60598-1 or IEC 60598-1;

3. The luminaire shall be supplied as a complete set comprising the main part, reflector/gear tray, diffuser, ballast, starter and starter-holder, power factor correction capacitor, bi-pin lampholder, fused terminal block, integral earthing terminal and internal wiring;

4. A fused terminal block fitted with a suitably-rated fuse to BS 1362 or IEC 60269-1 shall be properly fixed to the body in such a way as to be easily accessible for fuse replacement;

5. The main part of the luminaire shall be a one piece moulded polycarbonate or glass fibre reinforced plastic finished in light grey colour. The mounting face of the main part shall be formed with a knockout for back entry and holes for mounting screws. The two ends of the main part shall each be provided with a hole for conduit entry which shall be sealed with a suitable plastic plug;

6. The reflector/gear tray shall be made of substantive sheet steel pretreated and finish coated in gloss white stoved enamel or epoxy powder. It shall be of one continuous piece formed and suitably shaped to give adequate mechanical strength. The ballast, power factor correction capacitor, starter-holders and bi-pin lampholder shall be conveniently positioned and securely fixed onto the tray;
7. The reflector/gear tray shall be securely mounted to the main part by screws, or other suitable means, which shall remain captive with the main part, or the tray, when the tray is detached from the main part. In the detached position, the tray shall be securely strapped or hinged to the main part;

8. The diffuser shall be a one piece moulded clear prismatic polycarbonate with smooth outer surface. It shall be fixed to the main part by means of an adequate number of plastic clips. The plastic clips shall remain captive with the main part when the diffuser is removed;

9. A neoprene or silicone gasket shall be provided between the main part and the diffuser and shall be retained firmly in the purposely formed groove in the main part.

ELE21.3.060.7 BULKHEAD TYPE FLUORESCENT LUMINAIRES (SF 8 & SF 50)

1. Luminaires shall be licensed with the BSI Kitemark Scheme or with an equivalent Quality Surveillance Scheme. The licence and associated type-test report(s) issued by BSI or the licensing organisation shall be submitted as evidence of compliance with the required standard;

2. The luminaire shall be classified, as a minimum requirement, to Class I and IP 54 as described in BS EN 60598-1 or IEC 60598-1;

3. The luminaire shall be supplied as a complete set comprising the main part, reflector/gear tray, diffuser, ballast, 4-pin single ended type 2G7 lamp base compact fluorescent tube lampholder, metal lamp supporter, fused terminal block, integral earthing terminal and internal wiring. Earthing terminal shall be fitted to the main part and not the reflector/gear tray;

4. The electronic ballast used in the luminaire shall comply with ELE21.20;

5. A fused terminal block, fitted with a suitably-rated fuse to BS 1362 or IEC 60269-1, shall be properly fixed to the body in such a way as to be easily accessible for fuse replacement;

6. The main part of the luminaire shall be a one piece aluminium alloy diecasting, pretreated and finished stoved enamel in cream colour on the outside surface. The main part shall be formed with knockouts on the mounting face for fixing to conduit and BESA Box. The two ends of the main part shall each be provided with a threaded hole for 20 mm conduit entry and shall be fitted with a suitable threaded plastic plug;

7. The reflector/gear tray shall be made of substantive sheet steel or diecast aluminium alloy, pretreated and finish coated in gloss white stoved enamel. The ballast, lampholder and metal lamp supporter shall be conveniently positioned and securely fixed onto the tray;

8. The reflector/gear tray shall be securely hinged to the main part and maintained in normal position by captive screw(s);

9. An isolating device with tinned contacts shall be provided between the main part and the reflector/gear tray such that the mains supply will be isolated automatically on opening the reflector/gear tray;

10. The luminaire shall be neatly wired up with heat resistant PVC cable to BS 6231 or IEC 60227-3 with a maximum conductor temperature of 90º C. Under no circumstances shall the wiring be visible in the lamp compartment;

11. The diffuser shall be a one piece moulded clear prismatic polycarbonate. It shall be fixed to the main part with secret head captive screws openable by a special tool, and shall be securely strapped or hinged to the main part when opened. The quality of diffuser shall be certified by an independent accredited laboratory on the following tests:

   a. Impact test complying with BS EN 60598-1 or IEC 60598-1 with impact energy of 6.5Nm at 25º C without visible damage; and
b. Exposure test complying with BS EN ISO 4892-2 for a period of not less than 48 hours exposure without visible change.

12. A neoprene or silicone gasket shall be provided between the main part and the diffuser and shall be retained firmly in the purposely formed groove in the main part;

13. Prior to the time of material submission for approval, the luminaire including its major components shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.

**ELE21.3.080.7 GAS DISCHARGE LUMINAIORES**

Luminaires for gas-discharge lamps, such as fluorescent, mercury vapour, sodium vapour etc., which utilise chokes as part of the circuit, shall be complete with capacitors of sufficient capacitance to ensure that the overall power factor of the lighting circuit does not fall below 0.85 lagging. The control gear shall be placed as near as possible to the discharge lamp it serves.

**ELE21.3.090.7 FLAMEPROOF LUMINAIORES**

Not used.

**ELE21.3.100.7 SPOT LIGHTS (SF42)**

1. The luminaire shall be licensed with the BSI Kitemark Scheme or with an equivalent Quality Surveillance Scheme. The licence and associated type-test report(s) issued by BSI or the licensing organisation shall be submitted as evidence of compliance with the required standard;

2. The luminaire shall be classified, as Class I or Class II, IP20 (minimum) and suitable for direct mounting on normally flammable surfaces as described in BS EN 60598-1 or IEC 60598-1;

3. The luminaire shall be fitted with a PAR 38 Reflector Lamp of wattage and type of diffusion (flood or spot) as specified on the Drawings;

4. The main part of the luminaire shall be rotatable in all directions within 90 degree perpendicular to the exposed side of the mounting surface;

5. The luminaire shall be of surface mounting type unless otherwise specified;

6. The colour of the exposed part of the luminaire shall be as specified on the Drawings.

**ELE21.3.110.7 TILTED SPHERICAL SEMI-RECESSED LIGHTS (EYE-BALL LIGHT) (SF43)**

1. The luminaire shall be designed and constructed in accordance with BS EN 60598-2-2 or IEC 60598-2-2. The luminaire shall be licensed with the BSI Kitemark Scheme or with an equivalent Quality Surveillance Scheme. The licence and associated type-test report(s) issued by BSI or the licensing organisation shall be submitted as evidence of compliance with the required standard;

2. The luminaire shall be classified, as Class I or Class II, IP20 (minimum) and suitable for direct mounting on normally flammable surfaces as described in BS EN 60598-1 or IEC 60598-1;

3. The luminaire shall be fitted with a PAR 38 Reflector Lamp of wattage and type of diffusion (flood or spot) as specified on the Drawings;

4. The main part of the luminaire shall be rotatable in all directions within 30 degree perpendicular to the exposed side of the mounting surface;
5. The main part of the luminaire shall be able to be dismantled from the exposed side of the mounting surface without having to dismantle any part of the mounting surface;

6. The colour of the exposed part of the luminaire shall be as specified on the Drawings.

**ELE21.3.120.7 CYLINDRICAL FULLY RECESSED LIGHTS (DOWN LIGHTS) (SF44)**

1. The luminaire shall be designed and constructed in accordance with BS EN 60598-2-2 or IEC 60598-2-2. The luminaire shall be licensed with the BSI Kitemark Scheme or with an equivalent Quality Surveillance Scheme. The licence and associated type-test report(s) issued by BSI or the licensing organisation shall be submitted as evidence of compliance with the required standard;

2. The luminaire shall be classified, as Class I or Class II, IP20 (minimum) and suitable for direct mounting on normally flammable surfaces as described in BS EN 60598-1 or IEC 60598-1;

3. The luminaire shall be fitted with a PAR 38 Reflector Lamp of wattage and type of diffusion (flood or spot) as specified on the Drawings;

4. The main part of the luminaire shall be able to be dismantled from the exposed side of the mounting surface without having to dismantle any part of the mounting surface;

5. The colour of the exposed part of the luminaire shall be as specified on the Drawings.

**ELE21.3.130.7 CIRCULAR FULLY RECESSED LIGHTS (DOWN LIGHTS) WITH PLC LAMP (SF45)**

1. The luminaire shall be designed and constructed in accordance with BS EN 60598-2-2 or IEC 60598-2-2;

2. The luminaire shall be classified, as Class I or Class II, IP20 (minimum) and suitable for direct mounting on normally flammable surfaces as described in BS EN 60598-1 or IEC 60598-1;

3. The luminaire shall be fitted with bi-pin PLC Lamp(s) of 10, 13, 18 or 26 watts as specified on the Drawings;

4. The main part of the luminaire shall be able to be dismantled from the exposed side of the mounting surface without having to dismantle any part of the mounting surface;

5. The luminaire shall be supplied as a complete set comprising the gear box, ballast, power factor correction capacitor, lampholder, terminal block, integral earthing terminal, internal wiring, trim, gear box supporting structure, false ceiling clamping fixture, reflector and lamp;

6. The reflector shall be made of aluminium;

7. The gear box shall be made of sheet steel of minimum thickness 0.5 mm and be integral with the main part of the luminaire by a rigid metallic structure both of which shall be pretreated to prohibit corrosion;

8. The gear box shall house the ballast, capacitor, lampholder and terminal and be provided with a knockout for flexible conduit entry;

9. The colour of the exposed part of the luminaire shall be as specified on the Drawings.

**ELE21.3.140.7 OVAL BULKHEAD FLUORESCENT FITTING (SF83)**

1. The luminaire shall be classified, as a minimum requirement to Class I and IP55 as described in BS EN 60598-1 or IEC 60598-1 and suitable for wall mounted;
2. The luminaire shall be supplied as a complete set comprising the main part, reflector/gear tray, diffuser, ballast, starter and starter-holder, power factor correction capacitor, lampholder, fused terminal block, integral earthing terminal and internal wiring;

3. The luminaire shall be fitted with 26W compact fluorescent lamp unless otherwise specified on the Drawings;

4. The luminaire shall have die-cast aluminium housing, UV-stabilized vandalproof polycarbonate diffuser. The diffuser shall be held in place by the retaining ring which is fixed onto the housing by stainless screws;

5. A neoprene or silicone rubber gasket shall be provided between the main part and the diffuser and shall be retained firmly in the main part.
ELE21.4 POLE TOP LANTERNS (SF 29)

ELE21.4.010.7 GENERAL
Lanterns shall comply with BS EN 60598-2-3 or IEC 60598-2-3 and shall be suitable for vertical pole top mounting for 76 mm x 76 mm spigot.

ELE21.4.020.7 LAMP TYPE
1. Lanterns shall be compatible with the following types of lamps:
   a. SON : one 50W or 70W;
   b. MBF/U : one 80W or 125W.
2. The exact type of lamp used shall be as specified in ELE2 or on the Drawings.

ELE21.4.030.7 CONSTRUCTION
1. The lantern body shall consist of a truncated mould-cone held between a cast aluminium base incorporating a spigot cap and a die-cast light alloy upper rim. The vertical rods which join the base to the upper rim shall also support the lamp holder assembly;
2. The lantern shall be covered with an aluminium or UV stabilised glass reinforced polyester top canopy secured by a nylon or aluminium alloy screw cap. Alternatively, the canopy can be hinged to the upper rim and secured with a stainless steel toggle switch catch;
3. A clear anti-vandal UV stabilised polycarbonate prismatic cone designed to give a symmetrical all round light distribution in the lower hemisphere, shall be securely fixed to the lantern;
4. The fitting shall be supplied with an integral set of the required control gear comprising ballast, capacitor, ignitor as appropriate to the type of lamp fitted.
ELE21.5 GLOBE LANTERNS (SF 27, SF 28)

ELE21.5.010.7 GENERAL
1. Lanterns shall comply with BS EN 60598-2-3 or IEC 60598-2-3 and shall be suitable for vertical pole-top mounting or on wall-mounted bracket;
2. Type-test report(s) issued by BSI or an Accredited Laboratory shall be submitted as evidence of compliance with the above BS.

ELE21.5.020.7 LAMP TYPE
1. Lanterns shall be compatible with the following types of lamps:
   a. MBF/U: one 80W or 125W;
   b. SON: one 50W or 70W.
2. The exact type of lamp used shall be as specified in ELE2 or on the Drawings.

ELE21.5.030.7 CONSTRUCTION
1. The diffuser support of the lantern shall be made of corrosion-resistant die-cast aluminium alloy with black enamelled finish. Diffuser support made of matt black or grey high strength plastic may be accepted;
2. The globe shall be made of clear polycarbonate with a smooth surface and UV stabilised. The globe shall be secured to the support by means of captive socket headed screws shrouded on the bottom of the diffuser support. The globe shall be easily removed and reassembled for maintenance;
3. A heat shield shall be provided and fixed positively on to its correct position without adjustment;
4. Suitable prismatic glass refractor or aluminium lamp shield enclosing the lamp shall be provided to control the glare;
5. The bracket to which the lantern is fixed shall be of the same manufacturer as the lantern and fixed as recommended by the manufacturer;
6. All control gear such as ballast, capacitor and ignitor shall be provided and housed inside the globe.
ELE21.6 SIDE-ENTRY STREET LANTERNS (SF 30, SF 31)

ELE21.6.010.7 GENERAL
Lanterns shall comply with BS EN 60598-2-4 or BS EN 60598-2-3 or IEC 60598-2-3 and shall be suitable for side entry to suit 25 mm BSP mounting bracket.

ELE21.6.020.7 LAMP TYPE
1. Lanterns shall be compatible with the following types of lamps:
   a. MBF/U: one 80W or 125W;
   b. SON: one 70W;
   c. SOX: one 35W.
2. The exact type of lamp used shall be as specified in ELE2 or on the Drawings.

ELE21.6.030.7 CONSTRUCTION
1. The main body of the lantern shall be cast from pressure die-cast aluminium alloy or high impact, corrosive resistant material with a separate compartment for housing the control gear, such as ballast, capacitor, ignitor, etc.;
2. Lanterns shall be so constructed that their live parts are not accessible when the lanterns have been installed and wired as in normal use, and when opened as necessary for replacing lamps even if the replacement cannot be achieved by hand;
3. The lantern shall incorporate an injection moulded UV stabilised polycarbonate diffuser which shall be securely fixed to the main body of the lanterns. Another device shall be provided to prevent the diffuser from falling should the fixing device fail under normal conditions;
4. Optical control shall be achieved by means of the diffuser and silver anodized aluminium reflector to give the required light distribution;
5. The bracket to which the lantern is fixed shall be obtained from the same manufacturer as the lantern and fixed as recommended by the manufacturer.
ELE21.7  OUTDOOR AREA FLOODLIGHTS (SF 46)

ELE21.7.010.7  GENERAL
1. Floodlights shall comply with BS EN 60598-2-5 or IEC 60598-2-5 and shall be suitable for outdoor use;
2. The degree of protection against ingress of dust and moisture shall be at least IP65.

ELE21.7.020.7  LAMP TYPE
The exact type of lamp used shall be as specified in ELE2 or on the Drawings.

ELE21.7.030.7  LIGHT DISTRIBUTION
The light distribution shall be as specified in ELE2 or on the Drawings.

ELE21.7.040.7  MAIN BODY CONSTRUCTION
The main body shall be manufactured in aluminium alloy. Luminaire of one-piece glass reinforced plastic moulded body may be acceptable.

ELE21.7.050.7  FRONT FRAME AND GLASS
The front glass shall be toughened type and framed by a non-ferrous metal or glass reinforced plastic frame with silicon rubber gasket. The frame shall be hinged and secured to the main body by screw catches or swivel bolts which shall not possibly fall off even in loose position.

ELE21.7.060.7  REFLECTOR
The reflector shall be made of durable and highly reflective material.

ELE21.7.070.7  WIND SPEED PERFORMANCE
The floodlight, including its fixing/mounting accessories, will be able to withstand wind speeds of 150 km/h on the projected surface of the floodlight assembly without undue deformation, deflection or vibration.

ELE21.7.080.7  STABILITY
1. Fixings which carry the weight of the floodlight and internal accessories shall be provided with appropriate means to prevent dislodgement of any part of the floodlight either in service or during maintenance. Parts of the floodlight which are fixed other than with at least two devices, for example, screws or equivalent means of sufficient strength, shall have such extra protection necessary to prevent those parts from falling if a fixing device fails under normal conditions;
2. A safety chain shall also be provided between the floodlight and the lamp pole to ensure that the floodlight will not drop down should the floodlight support fail. The chain shall be of galvanised steel and of adequate strength to support at least three times the weight of the floodlight.

ELE21.7.090.7  ANGULAR ADJUSTMENT
Floodlights shall be provided with means for angular adjustment in the azimuth and zenith planes and there shall be provision for positive locking after any such adjustment has been effected.
ELE21.7.100.7  FIXING ACCESSORIES
All exposed external hinges, screws, bolts, washers of the luminaires shall be of stainless steel. All the associated means for attaching the floodlight to its support, such as mounting/fixing bracket, universal pole clamp etc., shall be made of galvanised steel or appropriate corrosion resistant materials.

ELE21.7.110.7  WINDAGE AREA AND WEIGHT
The maximum projected area in any horizontal direction of the pole-mounted floodlight, including the fixtures and gear box etc., shall be 0.2 m². The total weight of each floodlight assembly shall be not more than 18 kg in aggregate.

ELE21.7.120.7  INTEGRATED CONTROL-GEAR
Unless otherwise specified, all control gear such as ballast, capacitor, ignitor shall be provided and integrated inside the lantern.

ELE21.7.130.7  CABLE ENTRY
Compression type cable gland suitable for 9-11 mm O/D cable for cable entry shall be provided.
ELE21.8  BOLLARDS (SF 37)

ELE21.8.010.7  GENERAL
1. Bollards shall comply with BS EN 60598-2-4 or BS EN 60598-2-3 or IEC 60598-2-3 and shall be of outdoor type with a cylindrical external shape;
2. The dimensions of the bollard shall be as indicated on the Drawings or otherwise specified.

ELE21.8.020.7  LAMP TYPES
1. Bollards shall be compatible with the following types of lamps:
   a. MBF/U: up to 50W;
   b. SON: up to 50W;
   c. CFL: up to 26W.
2. The exact type of lamp used shall be as specified in ELE2 or on the Drawings.

ELE21.8.030.7  CONSTRUCTION
1. The external body of the bollard shall be of extruded aluminium with a durable and scratch-proof outer coating to a colour specified by the Contract Manager. The bollard shall be of base-plate mounted type;
2. The optical assembly of the bollard shall be made of a clear UV stabilised polycarbonate lens with or without an external corrosion resistant metal louvre as specified;
3. A wiring compartment shall be provided within the bollard. It shall be of adequate size to accommodate all the control and switch gear, wiring, etc., and space for one MCB with room for working with hands and tools easily. A gland plate, for armoured cable or conduit termination, shall be provided inside the wiring compartment;
4. Removal of any part of the luminaire should only be possible by using tools other than a slotted head or Philips head screw driver.
ELE21.9  STEEL LAMP COLUMNS (3, 4, 5, 10, 12 M NOMINAL HEIGHT)

ELE21.9.010.7  GENERAL
The columns shall comply with BS 5649 Part 5 and BS EN 40-1 and BS EN 40-2
and BS EN 40-3-1 and BS EN 40-3-2 and BS EN 40-3-3, or BS 5649 Part 5 and EN
40-1 and EN 40-2 and EN 40-3-1 and EN 40-3-2 and BS EN 40-3-3. In general 3, 4
and 5 m columns shall be suitable for post top lanterns and 10 and 12 m columns
shall be suitable for mounting four floodlights and complete with mounting arm(s),
step bars, and a working platform.

ELE21.9.020.7  CONSTRUCTION
1. Construction shall be similar or equivalent to that shown in the Master Details
of the Housing Department;
2. Unless otherwise approved, columns shall be provided with ground root but, if
mounted on podium slab, shall be provided with flange plate;
3. The base compartment shall have adequate room to accommodate a corrosion
resistant service box to house MCBs and cable connection unit;
4. The compartment door shall be fixed flush with the column by corrosion
resistant bolts or tamper proof door lock;
5. The whole column, after installation, shall have ingress protection not less than
IP33 and shall be effectively earthed.

ELE21.9.030.7  DIMENSIONS
The following dimensions shall be complied with:

<table>
<thead>
<tr>
<th>Nominal Height</th>
<th>Minimum Root Length</th>
<th>Minimum Door Size</th>
<th>Min Clear Compartment Space (depth x width)</th>
</tr>
</thead>
<tbody>
<tr>
<td>3, 4, 5 m</td>
<td>800 mm</td>
<td>400 x 80 mm</td>
<td>80 x 60 mm</td>
</tr>
<tr>
<td>10 m</td>
<td>1500 mm</td>
<td>500 x 140 mm</td>
<td>140 x 140 mm</td>
</tr>
<tr>
<td>12 m</td>
<td>1700 mm</td>
<td>500 x 140 mm</td>
<td>140 x 140 mm</td>
</tr>
</tbody>
</table>

ELE21.9.040.7  CORROSION PROTECTION
The whole column including all ferrous accessories shall be hot-dip galvanised to BS
EN ISO 1461 after fabrication. The external surface above ground shall be painted
with etched primer suitable for galvanised surfaces before any finish coating
according to ELE21.14. The external surface of the ground section shall be
protected with bitumen coating to a height 50 mm above the cement skirt.

ELE21.9.050.7  STRENGTH
The column shall be of adequate strength to withstand the imposed static and wind
load. It shall be fabricated in accordance with the Master Details of the Housing
Department, or otherwise, the structural design shall be verified by calculation in
accordance with BS EN 40-3-1 or EN 40-3-1 and BS EN 40-3-3 or EN 40-3-3 with
partial load factors Class B and maximum horizontal deflection Class 1. The
calculation shall be counter-checked by an independent Registered Professional
Engineer (RPE) recognised by Hong Kong Engineers Registration Board.
ELE21.10 LOW BAY FLOODLIGHTS (WIDE LIGHT DISTRIBUTION)

ELE21.10.010.7 GENERAL

1. Unless otherwise specified below, the luminaire shall be in compliance with sub-clauses ELE21.4.030 (1) to (4);

2. The luminaire shall comply with BS 4533 : Section 102.1 or EN 60598-2-1 or IEC 60598-2-1 and shall be suitable for ceiling mounting. The ballast and capacitor shall be manufactured in accordance with the following standard and shall carry the B.S.I. Kitemark or the mark of an Equivalent Quality Surveillance Scheme:
   a. Ballast - BS EN 61347-1 and BS EN 61347-2-9 and BS EN 60923, or IEC 61347-1 and IEC 61347-2-9 and IEC 60923
   b. Capacitor - BS EN 61048 and BS EN 61049, or IEC 61048 and IEC 61049

3. The degree of protection against ingress of dust and moisture shall be at least IP54 as described in BS EN 60598-1 or IEC 60598-1.

ELE21.10.020.7 LAMP TYPE

Unless otherwise specified on the Drawings, the type of lamp used shall be 150W SON.

ELE21.10.030.7 CONSTRUCTION

1. The luminaire shall be of robust construction with excellent resistance against vandalism. The main body shall be made of die-cast aluminium or steel coated in corrosion resistant textured finish;

2. The diffuser shall be a one piece moulded prismatic polycarbonate which shall be securely fixed to the main body by means of an adequate number of stainless steel screws. Gasket of appropriate type shall be provided between the main body and the diffuser and shall be retained firmly in the purposely formed groove in the main body;

3. The reflector shall be made of durable and highly reflective material, painted white or as approved;

4. All control gears such as ballast, capacitor, ignitor shall be provided and integrated inside the luminaire.

ELE21.10.040.7 LIGHT DISTRIBUTION

The luminaire shall be capable of giving a uniform light distribution for a mounting height as low as three metres with limited glare. As requested by the Contract Manager, photometric data shall be submitted for assessment to ascertain that the luminaire is suitable for the intended application. Unless otherwise specified, the luminaire, in each of transverse plane and axial plane, shall have the light distribution characteristic as follows:

<table>
<thead>
<tr>
<th>Angle from Vertical Plane (Degrees) (5 degrees step)</th>
<th>Luminous Intensity (Cd / 1000 lumen)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - 25</td>
<td>Not less than 90 in both planes</td>
</tr>
<tr>
<td>Range</td>
<td>Requirement</td>
</tr>
<tr>
<td>---------</td>
<td>------------------------------------------</td>
</tr>
<tr>
<td>30 - 55</td>
<td>Not less than 80 in either transverse or axial plane</td>
</tr>
<tr>
<td>60 - 70</td>
<td>Not less than 50 in either transverse or axial plane</td>
</tr>
</tbody>
</table>
ELE21.11 SELF-CONTAINED EXIT SIGNS AND DIRECTIONAL SIGNS

ELE21.11.010.7 TYPE OF FITTING
The EXIT or directional signs shall be internally illuminated by either fluorescent lighting fitting or LED, acceptable to the Fire Services Department and suitable to use on 220V 50Hz, single phase a.c. supply.

ELE21.11.030.7 STANDARDS
The complete EXIT or directional signs shall, where applicable, meet the requirements of Fire Services COP, BS 5499: Part 3 and BS EN 60598-2-22 or IEC 60598-2-22.

ELE21.11.040.7 CONSTRUCTION AND COMPONENTS
1. The dimensions, lettering, construction and the general layout of EXIT or directional signs using fluorescent lighting fitting shall conform to the appropriate type of standard EXIT or directional signs as shown on the Master Details of the Housing Department unless otherwise specified. The components of the fluorescent lighting fitting shall comply with ELE21.3.020 (2) and ELE21.20. The fluorescent lighting fitting shall be arranged that the gear compartment is separated from the lamp compartment such that the live parts are not accessible when the sign box is opened for lamp replacement;

2. For EXIT or directional signs using LED, the dimensions and construction basing on the manufacturer's proposal shall be submitted to Contract Manager for approval. The LED and associated control gear shall be securely fixed and contained inside the sign box. The live parts shall be properly shielded when the sign box is opened for maintenance. The assembly shall comply with the following:
   a. The LED shall be of white colour and with colour temperature within 5000 – 9000K;
   b. Adequate LED shall be provided to produce luminance of at least 100 cd/m² in white area of the sign in both normal and emergency operation mode;
   c. The total power consumption including the charger and control gear for a 450 mm long sign shall not be greater than 5W during full charge of the battery unless otherwise approved;
   d. The light output shall not be dropped to less than 95% of its original designed value in the first 10,000 hours operation and less than 70% after 50,000 hours of continuous operation;
   e. The following document shall be submitted for checking:
      i. Test report showing the offered sign complies with the standards specified in ELE21.11.030;
      ii. LED manufacturer's declaration on the performance of the LED including service life and output lumen maintenance factor;
      iii. Job reference.

3. All components such as fused terminal block, ballast, starter, capacitor, etc. shall be securely fixed and contained inside the sign box. Internal wiring shall be heat resistant PVC cable suitable for operation at or above 90°C and comply with BS 6231 or IEC 60227-3 and be appropriately colour coded, neatly wired and properly terminated;
4. If emergency lighting modification unit is used inside the EXIT or directional sign box, the emergency lighting modification unit (conversion kit) shall comply with ELE21.12; the fittings shall comply with BS 5266 Part 1 and BS EN 60598-2-22 and operation of the sign box shall comply with ELE21.11.050 and ELE21.11.060 respectively.

ELE21.11.050.7 FITTINGS TO EXIT SIGN AND DIRECTIONAL SIGN BOX

The Sub-contractor shall supply and install the following fittings and features on the external surface of the EXIT or directional sign box if emergency lighting modification unit (conversion kit) is used.

1. LED indication lamp to show that the main is "on";
2. LED indication lamp to show that the battery is being charged;
3. A self-returning switch to be switched on to simulate failure of normal supply to test the emergency operation of the emergency lighting fitting.

ELE21.11.060.7 OPERATION

The lighting fitting or LED shall be of maintained type if emergency lighting modification unit (conversion kit) is used:

1. Under normal conditions, the 220V a.c. mains shall power the fluorescent lamp or LED and charge a sealed nickel cadmium battery or nickel-metal hydride battery through a battery charger. On failure of mains supply, the emergency lighting modification unit shall instantaneously switch to battery power operation. Upon restoration of mains supply, the unit shall switch back to normal power and the batteries shall be re-charged again. The changeover operations shall be automatic;
2. The duration of emergency operation shall be at least 3 hours after the mains supply fails with a light output up to the end of the duration of not less than the requirements specified in ELE21.12.070;
3. The charging system shall be capable of recharging the battery to full capacity in 24 hours after a total discharge of the battery.

ELE21.11.070.7 SAMPLE

A sample of the EXIT or directional signs box shall be submitted for Approval prior to installation.
ELE21.12 EMERGENCY LIGHTING MODIFICATION UNITS (CONVERSION KITS)

ELE21.12.010.7 QUALITY SURVEILLANCE SCHEME
The emergency lighting modification units (conversion kits) shall be licensed with BSI Kitemark Scheme or with an Equivalent Quality Surveillance Scheme. The license issued by BSI or other licensing organisation shall be submitted as evidence of compliance with the required standard.

ELE21.12.020.7 CONSTRUCTION
1. The modification unit comprising an emergency lighting module, a battery pack and related connecting devices (e.g. cables, screw, etc.) can be fully or partially contained inside the connected luminaire;
2. The emergency lighting module shall comply with BS EN 61347-1 and BS EN 61347-2-7 and BS EN 60925, or IEC 61347-1 and IEC 61347-2-7 and IEC 60925 for light fitting with fluorescent lamp and shall comply with IEC 61347-2-13 for light fitting with LED. The type-test report(s) issued by BSI or the licensing organisation shall be submitted as evidence of compliance with the required standard;
3. The cables used for the modification unit shall be heat resistant PVC cable to BS 6231 or IEC 60227-3 with maximum conductor temperature of 90º C;
4. The batteries used for the modification unit shall be high temperature (70º C) sealed rechargeable nickel cadmium batteries and comply with BS EN 60598-2-22 or IEC 61951-1, or nickel-metal hydride batteries comply with IEC 61951-2;
5. The complete modification unit or remaining components of the modification unit, if mounted separately from the connected luminaire, shall be housed inside a metallic box with inner or outer finishes protected against corrosion.

ELE21.12.030.7 OPERATION MODE
The unit shall be capable of being connected in maintained or non-maintained operation modes as specified on the Drawing.

ELE21.12.040.7 CHARGING SYSTEM
The charging system shall be capable of recharging the battery to full capacity in 24 hours after a total discharge of the battery.

ELE21.12.050.7 BATTERIES
Batteries with excess initial capacity shall be chosen to compensate for the loss of effective capacity during operation such that the four years minimum interval between batteries replacement will be achieved.

ELE21.12.060.7 BATTERY PROTECTION
The battery shall be protected against over-discharge by a low voltage "cut-out" device which shall disconnect the battery from the load once the discharging voltage of the battery drops below 1V per cell.
ELE21.12.070.7 LIGHT OUTPUT DURING EMERGENCY OPERATION MODE

The capacity of the batteries shall be such that, from 5 seconds to 3 hours after failure of normal supply, the light output of the emergency lighting fitting shall not be less than the following ballast lumen factor of the lamp at normal supply voltage:

<table>
<thead>
<tr>
<th>Fluorescent Lamp Type and Wattage</th>

ELE21.12.080.7 INDICATION AND TESTING FACILITIES

The emergency modification unit shall have the following fixtures:

1. LED indication lamp to show that the main supply is “on”;
2. LED indication lamp to show that the battery is being charged;
3. A self-returning switch to simulate failure of normal supply for testing the emergency operation of the complete emergency lighting assembly.
ELE21.13 INSTALLATION OF LAMPS AND LUMINAIRES

ELE21.13.010.7 "GRID" SYSTEMS
1. Unless otherwise stipulated, fluorescent luminaires installed on the "grid" system, shall be suspended from the ceiling by means of two chromium plated steel chains, with 20 mm oval links. The chains shall be fixed to chromium-plated carrier rings which shall be screwed into 2A 3-pin socket front plates by removing one of the fixing screws. Where no socket exists at a point at which it is necessary to suspend a chain, a carrier ring stud shall be embedded into the ceiling slab as circumstances dictate;

2. Electricity supply to the luminaires shall be obtained from the nearest 2A 3-pin socket enclosed in a circular conduit box in the ceiling via a 3-core circular flexible cable having CSA of not less than 0.75 mm²;

3. Sockets shall be positioned as shown on the Drawings, but if no drawing exists, they shall be positioned on a square grid at approximately 1.5 m centres, depending upon the size and geometry of the area concerned.

ELE21.13.020.7 TUBE PENDANTS
Tube pendants shall comprise a dome cover and a piece of screwed steel conduit of suitable length to give the required mounting height of the luminaire. A lock nut shall be provided to bear against the conduit entry of the luminaires.

ELE21.13.030.7 PLAIN PENDANTS
Plain pendants shall comprise a ceiling rose and a cord-grip lampholder connected by a flexible cord having a suitable length to give the required mounting height of the lamp shade.

ELE21.13.040.7 LUMINAIRES MOUNTED ON WOODEN BATTENS
When a luminaire is not provided with facility for a surface cable entry the luminaire shall be mounted on a suitably shaped wooden batten or pattress. The cable shall then enter the luminaire from the rear through a slot and a hole formed in the batten.

ELE21.13.050.7 CABLES IN ENCLOSED LUMINAIRES
1. Cables entering or within the gear compartment of an enclosed type luminaire shall be properly protected against damage due to the excessive heat generated by the lamp within the luminaire;

2. Protection shall be by means of sleeving the insulation of the cables with fibre glass or other equivalent heat resistant insulating materials. The sleeves shall be provided for all cables within the luminaire;

3. Alternatively protection shall be by means of using heat resisting cables selected in accordance with Requirement 522.2.2 of BS 7671.

ELE21.13.060.7 STROBOSCOPIC EFFECT
Luminaires, other than those using tungsten filament lamps, installed over rotating machinery, shall be arranged so that at least two luminaires connected to different phases are used to illuminate the machinery's moving parts. Alternatively where different phases are not available, or the use of which is impractical, separate tungsten filament lamps shall be used in addition to the gas discharge lamps to eliminate the stroboscopic effect.
ELE21.13.070.7 PAINTING OF PLASTIC ITEMS
Painting of the factory fabricated lighting equipment and luminaire to meet the colour requirements stipulated in this Specification or to meet the directions of the Contract Manager is not acceptable.

ELE21.13.080.7 PAINTING OF EXPOSED METAL PARTS
Metal parts such as cover plates for adaptable boxes, blanking plate for any boxes and conduit pendants, etc. shall be painted white or a suitable colour to match the interior finish of a particular location as specified in ELE28.7.

ELE21.13.090.7 LUMINAIRE TRACK SYSTEMS
1. The electrical supply track system for luminaires (hereinafter referred as the track system) shall be designed and constructed in accordance with the requirements as described in BS EN 60570 or IEC 60570;
2. A type-test certificate together with the associated test report(s) issued by BSI or an Accredited Laboratory shall be submitted as evidence of compliance with the required standard;
3. The track system shall be classified as Class I, IP20 (minimum) and suitable for ordinary interior use for mounting on, or flush with, or suspended from walls and ceilings;
4. The track system shall have a rated current of not exceeding 16A per conductor for distribution of supply to luminaires. It shall consist of three conductors for a single circuit system or five conductors for a system of three separately switchable circuits;
5. Components of the track system shall be so designed that there is no risk of accidental contact between the earthing contacts of the components and the current-carrying parts of the track during insertion and removal by the user;
6. Suitable adaptors shall be used to provide sound electrical and mechanical connections of luminaires to the track so that the weight of the adaptors and/or luminaires are not supported by the electrical connections of the adaptors and the track. The live parts of the adaptor shall not be touchable when the adaptor is in partial or complete engagement and is wired as in normal use. Each adaptor when used in a 3-circuit track system shall be provided with a pre-switched circuit selection function so that the luminaire can be switched to the designed circuit before installation;
7. The track shall be protected from corrosion by using anodized aluminium or stove enameled paint or equivalent material.

ELE21.13.100.7 PHOTOCELL DEVICES
Photocell devices shall be IP65 and comply with BS EN 61000-6-3 and BS EN 61000-6-1 and shall have good tolerances, small physical dimensions and no moving parts. An additional circuitry shall be provided to achieve a delay of at least 30 seconds so as to eliminate switching due to lightning or other short period changes in illumination.
ELE21.14 EXTERNAL LIGHTING SYSTEM

ELE21.14.010.7 SCOPE
This section covers pole mounted tungsten or discharge lighting installations for street lighting, security lighting, floodlighting and general area lighting.

ELE21.14.020.7 SPECIFICATION AND DRAWINGS
External lighting installations shall be installed in accordance with ELE2.

ELE21.14.030.7 LUMINAIRES
1. The type of lamps and luminaires including reflectors to be used shall be as specified in this Specification or as directed by the Contract Manager;
2. The luminaires shall be securely mounted on the poles;
3. A safety chain shall also be provided between the luminaires and the lamp pole to ensure that the luminaires will not be dropped down in case the luminaires support fails;
4. The chain shall be of galvanised steel and of adequate strength to support at least three times the weight of the luminaire.

ELE21.14.040.7 CONSTRUCTION OF LAMP POLES
1. Lamp poles shall be constructed of mild steel pipe of one, two or three sections of diameter and modulus all as specified on Drawings;
2. Pole caps, cat ladders and platforms shall be fitted where shown;
3. Material samples and working drawings shall be submitted when requested by the Contract Manager;
4. The poles shall be finished overall with at least two coats of primer and two coats of finishing paint after erection;
5. The colour of the finishing paint shall be as directed by the Contract Manager.

ELE21.14.050.7 FOUNDATIONS FOR LAMP POLES
Lamp poles shall be securely bolted down in an upright position to the foundations constructed in accordance with the Drawings.

ELE21.14.060.7 SERVICE BOXES
1. A mild steel service box shall be provided on each pole at an appropriate height above ground level to accommodate the MCB control box. The construction of the service box and the MCB control box shall be as shown on the Drawings;
2. Each lamp circuit shall be protected by an MCB. Where the CSA of the incoming/outgoing cable cores are larger than that which can be accommodated by the terminal of the MCB, a fixed insulator connector block of adequate rating shall be installed with a tail to the MCB. Alternatively, a copper busbar may be used;
3. Where the service box serves more than one circuit, the supply to the MCBs shall be by means of a copper busbar of adequate rating. The phase conductors of the incoming/outgoing cables shall then be terminated to the busbar by means of cable sockets;
4. Each control box shall be fitted with a neutral block of adequate rating and having sufficient number of ways for the incoming/outgoing cable cores. It shall be securely fixed to the base of the control box by means of a 6 mm thick paxolin block;

5. The service box shall be fitted with a 3 mm thick galvanised mild steel cover made waterproof with a 3 mm thick soft rubber or neoprene gasket. The cover shall be fixed by means of four M6 brass fixing bolts and washers and shall be hinged if specified;

6. Provision shall be made in the batten plate of the box for supporting and terminating up to three numbers of incoming/outgoing PVC/SWA & PVCS cables by means of suitable cable glands. The cable sizes shall be as specified in ELE2 or on the Drawings.

ELE21.14.070.7 UNDERGROUND CABLES TO POLES
1. Underground cables for external lighting systems shall be copper cored, PVC insulated, steel wire armoured and PVC sheathed cables (PVC/SWA & PVCS) unless otherwise specified;
2. Cables shall enter and leave the pole below ground level and each cable shall terminate in a gland fixed to the MCB control box;
3. The cable cores between the glands and the terminals shall not be in tension.

ELE21.14.080.7 CABLES BETWEEN SERVICE BOX AND LUMINAIRES
1. a. Cables from the neutral terminal block and the MCBs to the luminaires shall be PVC insulated and PVC sheathed having CSA as specified;
   b. Arrangements shall be made to prevent the cores from being under tension where they are attached to terminals;
   c. All cables shall be contained within the poles;
   d. Rubber grommets shall be installed where cable pass through any metal works.
2. Where the sustained arc voltage of a discharged lamp exceeds 250V, the cables used for connecting the lamp and the control-gear shall be of heat resistant type to BS 6231 or equivalent as recommended by the lamp manufacturer according to lamp requirements;
3. Where the design of the cable termination of the luminaires is only suitable for flexible cables, PVC insulated and PVC sheathed flexible cables shall be used. Such cables shall enter the luminaires by means of suitable waterproof compression glands;
4. Where four or more floodlights are mounted on a pole, the flexible cables shall be connected to the luminaires by means of a mild steel connector box with waterproof hinged cover. The connector box shall be fitted near to the top of the pole, all as shown on the Drawings.

ELE21.14.090.7 SWITCHES FITTED TO POLES
1. Where specified switches may be mounted on the pole for local control;
2. Switches mounted on the pole shall be fixed on to it by tapped holes and brass fixing screws;
3. The switches shall be waterproof or be contained within a waterproof type galvanised metal case, with an external galvanised metal operating knob or handle;
4. Switches shall be fitted at least 2 m above finished ground level.
ELE21.1407 CONTROL GEAR FOR DISCHARGE LIGHTING

1. Control gear for discharge lamps shall be contained within a galvanised steel box mounted on or inside the pole as directed by the Contract Manager;

2. When mounted on the pole, the steel box shall be watertight and positioned at a height higher than normal working level in such a way that a ladder is needed for access;

3. The box shall be of adequate size to accommodate all control gear, cable and connections;

4. The method of construction shall be similar to the service box.

ELE21.14107 TESTING OF ILLUMINATION LEVEL

1. Illumination and luminance measurements shall be carried out after dark using Lux meter and luminance meter with valid calibration certificates issued by accredited calibration laboratory;

2. The proposed measurement procedures, measurement locations and aiming adjustment of luminaires shall be submitted for Contract Manager’s agreement before carrying out the test; particularly to avoid obtrusive light affecting occupants of nearby properties and to direct the light into the area required to avoid waste light. When situations necessitate the technical support from the local lighting specialist / supplier(s), the Sub-contractor shall arrange and bear the necessary cost for the local lighting specialist / supplier(s)’s presence and advice during commissioning of the external lighting installation at project completion stage;

3. The Sub-contractor shall carry out re-adjustment of the aiming angle of the luminaires or if necessary, to incorporate additional lourvres, baffles or shields to the respective luminaires to control the affect of spill light;

4. The date, time and climatic conditions when the measurement was conducted, measurement locations, type and geometric details of the lighting installation, location and aiming of luminaires, installation drawings, record photos, technical details of measuring instruments etc., shall all be prepared and detailed in a submission report with format to be agreed by the Contract Manager.
ELE21.15 NOT USED
ELE21.16 NEW TUBULAR BULKHEAD FLUORESCENT LUMINAIRE WITH ELECTROMAGNETIC BALLAST (SF 71 & SF 73)

ELE21.16.010.7 GENERAL
1. The luminaire shall comply with BS 4533: Section 102.1 or EN 60598-2-1 or IEC 60598-2-1;
2. The luminaire shall be licensed with the BSI Kitemark/ENEC Mark Scheme or with an equivalent Quality Surveillance Scheme. The license and associated type-test report(s) issued by BSI or the licensing organisation shall be submitted as evidence of compliance with the required standard;
3. Unless otherwise specified, the following components of the luminaire shall be manufactured in accordance with the relevant British Standard Specifications and shall carry the BSI Kitemark/ENEC Mark or the mark of an equivalent Quality Surveillance Scheme:
   a. Ballast: BS EN 61347-1 and BS EN 61347-2-8 and BS EN 60921, or IEC 61347-1 and IEC 61347-2-8 and IEC 61347-2-11 and IEC 60921;
   b. Starter: BS EN 60155 or IEC 60155;
   c. Capacitor: BS EN 61048 and BS EN 61049 or IEC 61048 and IEC 61049.
4. The luminaire shall be classified, as a minimum requirement, to Class I and IP54 as described in BS EN 60598-1 or IEC 60598-1;
5. The overall power factor of the luminaire shall not be less than 0.85 lagging;
6. The luminaire shall be radio interference suppressed to limits specified in BS EN 55015 or EN 55015. Test reports shall be submitted as evidence of compliance as and when required by the Contract Manager;
7. The maximum controlgear loss of the lamp shall be equal or smaller than the maximum allowable value as specified in the table below:

<table>
<thead>
<tr>
<th>Lamp type</th>
<th>Nominal lamp wattage (Lw)</th>
<th>Maximum allowable lamp controlgear loss (W)</th>

</tbody>
</table>

ELE21.16.020.7 LAMP TYPE
1. The luminaire shall be compatible with either single or twin 24W 4-pin 2G11 compact fluorescent lamp;
2. The exact type of lamp used shall be as specified in ELE2 or on the Drawings.

ELE21.16.030.7 LIGHT DISTRIBUTION
1. The luminaire, in each of transverse plane and axial plane, shall have the light distribution characteristic certified by independent accredited laboratory as follows:
2. Photometric data shall be submitted for assessment to ascertain that the luminaire is suitable for the intended application as requested by the Contract Manager.

ELE21.16.040.7 CONSTRUCTION

1. The luminaire shall be supplied as a complete set comprising the main part, gear tray/reflector, diffuser, 4-pin 2G11 compact fluorescent tube, lampholder, lamp supporter, ballast, power factor correction capacitor, starter, fused terminal block, integral earthing terminal and internal wiring. Earthing terminal shall be fitted to the main part and not the reflector/gear tray;

2. The main part of the luminaire shall be a one piece aluminium alloy diecasting, pretreated and finished stoved enamel in cream or white colour on the outside surface. The main part shall be formed with knockouts on the mounting face for fixing to conduit and BESA Box. The two ends of the main part shall each be provided with a threaded hole for 20 mm conduit entry and shall be fitted with a suitable threaded plastic plug;

3. The gear tray shall be made of substantive sheet steel or diecast aluminium alloy, pretreated and finish coated in gloss white stoved enamel. The gear tray shall be securely hinged to the main part and maintained in normal position by captive screw(s);

4. An isolating device with tinned contacts shall be provided between the main part and the gear tray such that the mains supply will be isolated automatically on opening the gear tray;

5. The ballast, capacitor, starter, 4-pin lampholder and lamp supporter shall be conveniently positioned and securely fixed onto the tray. The starter shall be positioned in such a way as to be accessible for detachment from the exterior of the gear tray without opening the gear tray;

6. A fused terminal block, fitted with a suitably-rated fuse to BS 1362 or IEC 60269-1, shall be properly fixed to the body in such a way as to be easily accessible for fuse replacement;

7. The luminaire shall be neatly wired up with heat resistant PVC cable to BS 6231 with a maximum conductor temperature of 90ºC. Internal wiring shall be neatly wired and properly terminated. Under no circumstances shall the wiring be visible in the lamp compartment;

8. The diffuser shall be a one piece moulded clear prismatic polycarbonate. It shall be fixed to the main part with secret head captive screws openable by a special tool, and shall be securely strapped or hinged to the main part when opened. The quality of diffuser shall be certified by an independent accredited laboratory on the following tests:

   a. Impact test complying with BS EN 60598-1 or IEC 60598-1 with impact energy of 6.5Nm at 25°C without visible damage; and

   b. Exposure test complying with BS EN ISO 4892-2 for a period of not less than 48 hours exposure without visible change.

9. A neoprene or silicone gasket shall be provided between the main part and the diffuser and shall be retained firmly in the purposely formed groove in the main part.
ELE21.17 NEW CIRCULAR BULKHEAD FLUORESCENT LUMINAIRE WITH ELECTROMAGNETIC BALLAST (SF 75 & SF 77)

ELE21.17.010.7 GENERAL

1. The luminaire shall comply with BS 4533: Section 102.1 or EN 60598-2-1 or IEC 60598-2-1;
2. The luminaire shall be licensed with the BSI Kitemark/ENEC Mark Scheme or with an equivalent Quality Surveillance Scheme. The license and associated type-test report(s) issued by BSI or the licensing organisation shall be submitted as evidence of compliance with the required standard;
3. Unless otherwise specified, the following components of the luminaire shall be manufactured in accordance with the relevant British Standard Specifications and shall carry the BSI Kitemark/ENEC Mark or the mark of an equivalent Quality Surveillance Scheme:
   a. Ballast: BS EN 61347-1 and BS EN 61347-2-8 and BS EN 60921 or IEC 61347-1 and IEC 61347-2-8 and IEC 61347-2-11 and IEC 60921;
   b. Starter: BS EN 60155 or IEC 60155;
   c. Capacitor: BS EN 61048 and BS EN 61049 or IEC 61048 and IEC 61049.
4. The luminaire shall be classified, as a minimum requirement, to Class I and IP54 as described in BS EN 60598-1 or IEC 60598-1;
5. The overall power factor of the luminaire shall not be less than 0.85 lagging;
6. The luminaire shall be radio interference suppressed to limits specified in BS EN 55015 or EN 55015. Test reports shall be submitted as evidence of compliance as and when required by the Contract Manager;

8. The input power of the ballast/lamp circuit shall meet Class B1 of proposed CELMA standard.

ELE21.17.020.7 LAMP TYPE

1. The luminaire shall be compatible with either single or twin 24W 4-pin 2G10 compact fluorescent lamp;
2. The exact type of lamp used shall be as specified in ELE2 or on the Drawings.

ELE21.17.030.7 LIGHT DISTRIBUTION

1. The luminaire, in each of transverse plane and axial plane, shall have the light distribution characteristic certified by independent accredited laboratory as follows:
Angle from Vertical Plane | Luminous Intensity (Cd / 1000 lumen)
---|---|---
(Degrees) | Transverse plane | Axial plane
0 - 5 | > 125 | > 125
10 - 15 | > 120 | > 120
20 - 25 | > 115 | > 115
30 - 35 | > 110 | > 110
40 - 45 | > 85 | > 85
50 - 55 | > 75 | > 75
60 - 65 | > 60 | > 60
70 - 75 | > 40 | > 40
80 - 90 | > 20 | > 20

2. Photometric data shall be submitted for assessment to ascertain that the luminaire is suitable for the intended application as requested by the Contract Manager.

**ELE21.17.040.7 CONSTRUCTION**

1. The luminaire shall be supplied as a complete set comprising the main body, gear tray/reflector, diffuser, 4-pin 2G10 compact fluorescent tube, lampholder, ballast, power factor correction capacitor, starter, fused terminal block, integral earthing terminal and internal wiring;

2. The main body of the luminaire shall be a one piece moulded polycarbonate or aluminium alloy diecasting, pretreated and finished stoved enamel in cream or white colour on the outside surface. The main body shall be formed with knockouts on the mounting face for fixing to conduit and BESA box;

3. The gear tray shall be made of substantive sheet steel or diecast aluminium alloy, pretreated and finish coated in gloss white stoved enamel. The reflector/gear tray shall be securely mounted to the main body by screws, or other suitable means, which shall remain captive with the main body, or the tray, when the tray is detached from the main body. In the detached position, the tray shall be securely strapped or hinged to the main body;

4. The ballast, capacitor, starter and 4-pin lampholder shall be conveniently positioned and securely fixed onto the tray. The starter shall be positioned in such a way as to be accessible for detachment from the exterior of the gear tray without opening the gear tray;

5. A fused terminal block, fitted with a suitably-rated fuse to BS 1362 or IEC 60269-1, shall be properly fixed in such a way as to be easily accessible for fuse replacement;

6. The luminaire shall be neatly wired up with heat resistant PVC cable to BS 6231 with a maximum conductor temperature of 90º C. Internal wiring shall be neatly wired and properly terminated. Under no circumstances shall the wiring be visible in the lamp compartment;

7. The diffuser shall be a one piece moulded clear prismatic or reeded polycarbonate. A circular trim can be mounted if required. The diffuser or the trim shall be fixed to the main body with secret head captive screws or equivalent, openable by a special tool, and shall be securely strapped or hinged to the main body when opened. The quality of diffuser, trim and main body if polycarbonate is used, shall be certified by an independent accredited laboratory on the following tests:
a. Impact test complying with BS EN 60598-1 or IEC 60598-1 with impact energy of 6.5Nm at 25°C without visible damage; and

b. Exposure test complying with BS EN ISO 4892-2 for a period of not less than 48 hours exposure without visible change.

8. A neoprene or silicone gasket shall be provided between the main body and the diffuser and shall be retained firmly in the purposely formed groove in the main body.
ELE21.18 NEW TUBULAR BULKHEAD FLUORESCENT LUMINAIRE WITH ELECTRONIC BALLAST (SF 72 & SF 74)

ELE21.18.010.7 GENERAL
1. The luminaire shall comply with BS 4533: Section 102.1 or EN 60598-2-1 or IEC 60598-2-1;
2. The luminaire shall be licensed with the BSI Kitemark/ENEC Mark Scheme or with an equivalent Quality Surveillance Scheme. The license and associated type-test report(s) issued by BSI or the licensing organisation shall be submitted as evidence of compliance with the required standard;
3. The luminaire shall be classified, as a minimum requirement, to Class I and IP54 as described in BS EN 60598-1 or IEC 60598-1;
4. The electronic ballast used in the luminaire shall comply with ELE21.20;
5. The luminaire shall meet the electromagnetic compatibility requirements specified in BS EN 55015 and BS EN 61000-3-2 and BS EN 61547, or EN 55015 and IEC 61000-3-2 and IEC 61547. Test certificates or reports shall be submitted as evidence of compliance with the required standard;
6. The overall power factor of the luminaire shall not be less than 0.95 unless otherwise specified;
7. The maximum controlgear loss of the lamp shall comply with the requirements of the latest version of Hong Kong Voluntary Energy Efficiency Labelling Scheme for Electronic Ballasts, EMSD;
8. Photometric data shall be submitted for assessment to ascertain that the luminaire is suitable for the intended application as requested by the Contract Manager.

ELE21.18.020.7 LAMP TYPE
1. The luminaire shall be compatible with either single or twin 24W 4-pin 2G11 compact fluorescent lamp;
2. The exact type of lamp used shall be as specified in ELE2 or on the Drawings.

ELE21.18.030.7 LIGHT DISTRIBUTION
1. The luminaire, in each of transverse plane and axial plane, shall have the light distribution characteristic certified by independent accredited laboratory as follows:

</tr>
</tbody>
</table>
2. Photometric data shall be submitted for assessment to ascertain that the luminaire is suitable for the intended application as requested by the Contract Manager.

ELE21.18.040.7 CONSTRUCTION

1. The luminaire shall be supplied as a complete set comprising the main part, gear tray/reflect, diffuser, 4-pin 2G11 compact fluorescent tube, lampholder, lamp supporter, ballast, fused terminal block, integral earthing terminal and internal wiring. Earthing terminal shall be fitted to the main part and not the reflector/gear tray;

2. The main part of the luminaire shall be a one piece aluminium alloy diecasting, pretreated and finished stoved enamel in cream or white colour on the outside surface. The main part shall be formed with knockouts on the mounting face for fixing to conduit and BESA Box. The two ends of the main part shall each be provided with a threaded hole for 20 mm conduit entry and shall be fitted with a suitable threaded plastic plug;

3. The gear tray shall be made of substantive sheet steel or diecast aluminium alloy, pretreated and finish coated in gloss white stoved enamel. The gear tray shall be securely hinged to the main part and maintained in normal position by captive screw(s);

4. An isolating device with tinned contacts shall be provided between the main part and the gear tray such that the mains supply will be isolated automatically on opening the gear tray;

5. The ballast, 4-pin lampholder and lamp supporter shall be conveniently positioned and securely fixed onto the tray;

6. A fused terminal block, fitted with a suitably-rated fuse to BS 1362 or IEC 60269-1, shall be properly fixed to the body in such a way as to be easily accessible for fuse replacement;

7. The electronic ballast shall be of preheat starting. One electronic ballast can be used for twin lamp circuit;

8. The luminaire shall be neatly wired up with heat resistant PVC cable to BS 6231 with a maximum conductor temperature of 90 °C. Internal wiring shall be neatly wired and properly terminated. Under no circumstances shall the wiring be visible in the lamp compartment;

9. The diffuser shall be a one piece moulded clear prismatic polycarbonate. It shall be fixed to the main part with secret head captive screws openable by a special tool, and shall be securely strapped or hinged to the main part when opened. The quality of diffuser shall be certified by an independent accredited laboratory on the following tests:
   a. Impact test complying with of BS EN 60598-1 or IEC 60598-1 with impact energy of 6.5Nm at 25°C without visible damage; and
   b. Exposure test complying with BS EN ISO 4892-2 for a period of not less than 48 hours exposure without visible change.

10. A neoprene or silicone gasket shall be provided between the main part and the diffuser and shall be retained firmly in the purposely formed groove in the main part.
ELE21.19 CIRCULAR BULKHEAD FLUORESCENT LUMINAIRE WITH ELECTRONIC BALLAST (SF 76 & SF 78)

ELE21.19.010.7 GENERAL
1. The luminaire shall comply with BS 4533: Section 102.1 or EN 60598-2-1 or IEC 60598-2-1;
2. The luminaire shall be licensed with the BSI Kitemark/ENEC Mark Scheme or with an equivalent Quality Surveillance Scheme. The license and associated type-test report(s) issued by BSI or the licensing organisation shall be submitted as evidence of compliance with the required standard;
3. The luminaire shall be classified, as a minimum requirement, to Class I and IP54 as described in BS EN 60598-1 or IEC 60598-1;
4. The electronic ballast used in the luminaire shall comply with ELE21.20;
5. The luminaire shall meet the electromagnetic compatibility requirements specified in BS EN 55015 and BS EN 61000-3-2 and BS EN 61547; Test certificates or reports shall be submitted as evidence of compliance with the required standard;
6. The overall power factor of the luminaire shall not be less than 0.95 unless otherwise specified;
7. The maximum controlgear loss of the lamp shall comply with the requirements of the latest version of Hong Kong Voluntary Energy Efficiency Labelling Scheme for Electronic Ballasts, EMSD.

ELE21.19.020.7 LAMP TYPE
1. The luminaire shall be compatible with either single or twin 24W 4-pin 2G10 compact fluorescent lamp;
2. The exact type of lamp used shall be as specified in ELE2 or on the Drawings.

ELE21.19.030.7 LIGHT DISTRIBUTION
1. The luminaire, in each of transverse plane and axial plane, shall have the light distribution characteristic certified by independent accredited laboratory as follows:

<table>
<thead>
<tr>
<th>Angle from Vertical Plane (Degrees)</th>
<th>Luminous Intensity (Cd / 1000 lumen)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Transverse plane</td>
</tr>
<tr>
<td>0 - 5</td>
<td>&gt; 125</td>
</tr>
<tr>
<td>10 - 15</td>
<td>&gt; 120</td>
</tr>
<tr>
<td>20 - 25</td>
<td>&gt; 115</td>
</tr>
<tr>
<td>30 - 35</td>
<td>&gt; 110</td>
</tr>
<tr>
<td>40 - 45</td>
<td>&gt; 85</td>
</tr>
<tr>
<td>50 - 55</td>
<td>&gt; 75</td>
</tr>
</tbody>
</table>
2. Photometric data shall be submitted for assessment to ascertain that the luminaire is suitable for the intended application as requested by the Contract Manager.

**ELE21.19.040.7 CONSTRUCTION**

1. The luminaire shall be supplied as a complete set comprising the main body, gear tray/reflector, diffuser, 4-pin 2G10 compact fluorescent tube, lampholder, ballast, fused terminal block, integral earthing terminal and internal wiring;

2. The main body of the luminaire shall be a one piece moulded polycarbonate or aluminium alloy diecasting, pretreated and finished stoved enamel in cream or white colour on the outside surface. The main body shall be formed with knockouts on the mounting face for fixing to conduit and BESA box;

3. The gear tray shall be made of substantive sheet steel or diecast aluminium alloy, pretreated and finish coated in gloss white stoved enamel. The reflector/gear tray shall be securely mounted to the main body by screws, or other suitable means, which shall remain captive with the main body, or the tray, when the tray is detached from the main body. In the detached position, the tray shall be securely strapped or hinged to the main body;

4. The ballast and 4-pin lampholder shall be conveniently positioned and securely fixed onto the tray;

5. A fused terminal block, fitted with a suitably-rated fuse to BS 1362 or IEC 60269-1, shall be properly fixed to the body in such a way as to be easily accessible for fuse replacement;

6. The electronic ballast shall be of preheat starting. One electronic ballast can be used for twin lamp circuit;

7. The luminaire shall be neatly wired up with heat resistant PVC cable to BS 6231 with a maximum conductor temperature of 90°C. Internal wiring shall be neatly wired and properly terminated. Under no circumstances shall the wiring be visible in the lamp compartment;

8. The diffuser shall be a one piece moulded clear prismatic or reeded polycarbonate. A circular trim can be mounted if required. The diffuser or the trim shall be fixed to the main body with secret head captive screws or equivalent, openable by a special tool, and shall be securely strapped or hinged to the main body when opened. The quality of diffuser, trim and main body if polycarbonate is used, shall be certified by an independent accredited laboratory on the following tests:
   a. Impact test complying with BS EN 60598-1 or IEC 60598-1 with impact energy of 6.5Nm at 25°C without visible damage; and
   b. Exposure test complying with BS EN ISO 4892-2 for a period of not less than 48 hours exposure without visible change.

9. A neoprene or silicone gasket shall be provided between the main body and the diffuser and shall be retained firmly in the purposely formed groove in the main body.
ELE21.20 ELECTRONIC BALLAST

ELE21.20.010.7 GENERAL
1. The electronic ballast shall comply with BS EN 61347-1 or IEC 61347-1, BS EN 61347-2-3 or IEC 61347-2-3 and BS EN 60929 or IEC 60929;
2. The electronic ballast shall be suitable for 220V ±6% 50Hz supplies;
3. The electronic ballast shall be automatically re-start after a sudden voltage fluctuation outside its normal operating range and the luminaire shall resume to normal operation.

ELE21.20.020.7 QUALITY ASSURANCE
1. The electronic ballast shall be licensed with the BSI Kitemark/ENEC Mark Scheme or with an equivalent Quality Surveillance Scheme. The license and associated type-test report(s) issued by BSI or the licensing organisation shall be submitted as evidence of compliance with the required standard;
2. The electronic ballast shall be radio interference suppressed to limits specified in BS EN 55015 or EN 55015. Harmonics generated by electronic ballast shall be within the limit set by BS EN 61000-3-2 or IEC 61000-3-2. The total harmonic distortion (THD) of supply current shall be less than 15%. The electronic ballast shall comply with the EMC immunity requirements in BS EN 61547 or IEC 61547. Test certificates or reports shall be submitted as evidence of compliance with the required standard.

ELE21.20.030.7 ENERGY EFFICIENCY
The maximum controlgear loss of the lamp shall comply with the requirements of the latest version of Hong Kong Voluntary Energy Efficiency Labelling Scheme for Electronic Ballasts, EMSD.

ELE21.20.040.7 PERFORMANCE
1. The overall power factor of the luminaire shall not be less than 0.95;
2. The ambient temperature (ta) of the electronic ballast shall be ranged from -5°C to +50°C;
3. The electronic ballast shall withstand a casing temperature (tc) of 70°C minimum;
4. The mean service life at maximum case temperature shall be 50,000 hours minimum;
5. The lamp operating frequency shall be larger than 30kHz unless otherwise specified;
6. The leakage current of each ballast shall be less than 0.5mA;
7. The electronic ballast shall withstand overvoltage at 320V for one hour;
8. The electronic ballast shall allow high voltage insulation testing (Megger testing) of building wiring to be undertaken without disconnecting the power supply.

ELE21.20.050.7 PROVEN RECORD OF RELIABILITY
The electronic ballast shall have satisfactory proven record of reliability in local service for a minimum period of one (1) year after all the above mentioned type test certification.
SUITABILITY FOR APPLICATION

The maximum number of electronic ballast suitable for use with Type B or C miniature circuit breaker in accordance with BS EN 60898-1 or IEC 60898-1 at different lamp wattage shall be submitted for assessment to ascertain that the ballast is suitable for intended application when required by the Contract Manager.
ELE21.21 FLUORESCENT LUMINAIRE AND LAMP (T5)

ELE21.21.010.7 APPLICATION

The scope of application for T5 fluorescent luminaires and lamps is defined in Project Specific Specification.

ELE21.21.020.7 FLUORESCENT LUMINAIRE LAMP (T5)

1. The luminaires, including the control gear, shall be suitable for operation at 220V ±6%, 50 Hz ±2%, single phase, a.c. supply;

2. The luminaires shall comply both in manufacturing and testing with the following international standards:
   - Luminaires: BS EN 60598-1 or IEC 60598-2-1.
   - Electronic ballast: BS EN 61347-1 or IEC 61347-1 and IEC 61347-2-3 and BS EN 60929 or IEC 60929.
   - Test certificate shall be provided and the luminaires shall be marked in accordance with the requirements of EN 60598-2-1 or IEC 60598-2-1.

3. The maximum controlgear loss of the lamp shall comply with the requirements of the latest version of Hong Kong Voluntary Energy Efficiency Labelling Scheme for Electronic Ballasts, EMSD.

ELE21.21.040.7 AVERAGE RATED LIFE FOR FLUORESCENT LAMP (T5)

The average rated life of fluorescent lamp (T5) shall be not less than 20,000 hours.
ELE21.22 MOTION DETECTOR UNIT

ELE21.22.010.7 GENERAL
Motion detector unit shall consist of a motion sensor mounted on a steel housing with terminal block inside for connection of cable. It shall be used to control the on/off of the light fitting by detection of motion and ambient light level. The unit shall be surface mounted and attached to the light fitting via the conduit entry on the body of the light fitting.

ELE21.22.020.7 CONSTRUCTION
1. The housing of the motion detector unit shall be made of galvanized sheet steel of not less than 1.6 mm thick. The inside and outside surfaces shall be painted with one coat of primer, followed by a coat of stoved enamel finish of colour same as that of the light fitting to be controlled;
2. Cable termination blocks, properly fixed to the housing, shall be provided for connection of cables in/out the unit. A fused terminal block, fitted with a suitably rated fuse to BS 1362 or IEC 60269-1, shall be provided for the phase conductor;
3. The connection between the motion detector unit and the light fitting shall be neatly wired up with heat resistant PVC cable to BS 6231 or IEC 60227-3 with a maximum conductor temperature of 90ºC.

ELE21.22.030.7 MOTION SENSOR
1. The motion sensor shall be flush-mounted on the housing and comply with the following specification:
   a. Type of sensor: passive infrared, ceiling mounted;
   b. Operation voltage: 220V, 50Hz, single phase a.c. supply;
   c. Detection range: 360 degree;
   d. Detection distance: 3 m at floor level for 2.5 m mounting height;
   e. Connected load: capable to supply upto 100W circuit of fluorescent light fittings;
   f. Time delay: automatically turns off 10 minutes (adjustable) after no motion object is detected;
   g. Built-in light level sensor (to be provided when specified on Drawings): turns the connected light fitting off when natural light level raised above a pre-set level which shall be adjustable to suit the site conditions;
   h. Quality standard: U.L. listed or equivalent certification.
2. The setting of the motion detector unit shall not be affected by switching on/off of the power supply to the circuit.

ELE21.22.040.7 MOCK-UP INSTALLATION
The motion detector units and the associated light fittings shall be installed at the sample floor for testing. Approval on the motion detector units shall be given only when the function has been tested to be satisfactory.
ELE21.22.050.7  WARRANTY FOR MOTION SENSOR

1. The motion sensors to be installed in each project shall be supplied with a certificate of warranty issued by its manufacturer stating their warranty to provide free replacement of defective parts, components or the motion sensors as a whole against inferior materials, faulty design and/or workmanship for a period of five years from the date of completion of the Section of the Works. The Sub-contractor shall submit the content and format of the letter of warranty for approval together with the material submission;

2. The Sub-contractor shall submit an undertaking issued by the local supplier/manufacturer stating their promise to provide free labour and materials for replacing any parts, components or the motion sensors as a whole found to be defective and provide free on site technical support during the testing and commissioning and the five years warranty period.

ELE23.1 NOT USED
ELE23.2 NOT USED
ELE23.3 GENERAL & SPECIAL REQUIREMENTS

ELE23.3.1 - SCOPE

ELE23.3.1.010.7 INSTALLATION TO COMPLY WITH THIS SPECIFICATION
The communal aerial broadcasting distribution (CABD) installation shall comply in every respect with this Specification which details the intrinsic properties (including materials and workmanship) of the installation unless otherwise specified in the currently in force Hong Kong Laws, Project Specific Specification, Drawings and/or written instructions by the Contract Manager.

ELE23.3.1.020.7 SCOPE OF THE WORKS
This Specification, Project Specific Specification, Tender Equipment Schedule and Drawings detail the performance requirements of the Works. The Works to be carried out in accordance with this Specification shall include the whole of the design for a CABD installation only, installation and supply of all materials necessary to form a complete installation including any necessary tests, adjustments, commissioning and maintenance as prescribed and all other incidental sundry components together with the necessary labour for installing such components, for the proper operation of the installation.

ELE23.3.1.030.7 TERMS AND DEFINITIONS
In this Specification, the following words or expressions shall have the meanings assigned to them except when the context otherwise requires:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Guided Drawings</td>
<td>The drawings for reference purpose to show detailed arrangements of the common standard installations.</td>
</tr>
<tr>
<td>Headend</td>
<td>Equipment connected between the receiving aerials and the remainder of the broadcast reception system to process the signals to be distributed. The headend may, for example, comprise channel amplifiers, channel converters, combining and separating networks.</td>
</tr>
<tr>
<td>Splitter</td>
<td>A device in which the signal energy at the input port is divided equally or unequally between two or more output ports.</td>
</tr>
<tr>
<td>Tee-unit</td>
<td>A device that a 'through' output to connect a series of other Tee-units in cascade and one, or more user's tap for connecting to user's outlets.</td>
</tr>
</tbody>
</table>

ELE23.3.1.040.7 EXECUTION OF THE WORKS
1. The Sub-contractor shall employ a contractor on the List of Approved Suppliers of Materials and Specialist Contractors for Public Works for CABDS Installation to carry out the works for the CABD system. The name of the contractor shall be included on the Schedule of Information to be supplied by Tenderer at the time of tender submission. Subsequent to the acceptance of tender, the aforementioned contractor shall not be changed unless otherwise approved by the Contract Manager;

2. The List of Approved Suppliers of Materials and Specialist Contractors for Public Works for CABDS Installations may be inspected by applying to the appropriate Housing Department Officer named in Special Condition of Tender SCT6 prior to submission of tender.
ELE23.3.2 - STATUTORY OBLIGATIONS AND OTHER REGULATIONS

ELE23.3.2.010.7 STATUTORY OBLIGATIONS AND OTHER REQUIREMENTS
The CABD installation shall comply with the statutory obligations stipulated in the following Laws of the HKSAR and other documents currently in force:

1. Statutory Obligations:
   a. The Specification No. HKTA-1103 "Performance Requirements of Television Signals Input to the Head End of Subscription Television System";
   b. The Specification No. HKTA-1104 "Performance Requirements for In-building Coaxial Cable Distribution System (IBCCDS)" issued by the Office of Telecommunications Authority (OFTA) (hereinafter referred to as the Performance Specification);
   c. The Specification No. HKTA-1105 "Technical Information for Frequency Planning of In-Building Coaxial Cable Distribution System (IBCCDS)" issued by OFTA;
   d. Fire Service (Installations and Equipment) Regulations, Fire Services Ordinance, Chapter 95, and other subsidiary legislation made under the Ordinance;
   e. Other Statutory Regulations as detailed in ELE1.4.010.

2. Other Requirements:
   a. Testing & Commissioning Procedure No. 7 for Broadcast Reception Installation in Government Buildings, Hong Kong issued by Building Services Branch, Architectural Services Department, the Government of the HKSAR;
   b. Other Standards as detailed in ELE1.4.020.

3. Safety Requirements:
   a. The Specification No. HKTA-1101 "Performance and Safety Requirements for Subscription Television System";
   b. The Specification No. HKTA-1102 "Radiation Limits and Measurement Methods for In-Building Coaxial Cable Distribution System (IBCCDS)";
   c. The Specification No. HKTA-1104 "Performance Requirements for In-building Coaxial Cable Distribution System (IBCCDS)" issued by OFTA (hereinafter referred to as the Performance Specification.);
   d. The Specification No. HKTA-1105 "Technical Information for Frequency Planning of In-building Coaxial Cable Distribution System (IBCCDS)" issued by OFTA;
   e. Other safety requirements as detailed in ELE1.4.010.

ELE23.3.2.030.7 ADDITIONAL SUBMISSION REQUIRED WITH TENDER
In addition to the information required under the General Conditions of Tender and the Special Conditions of Tender, the following additional submission is required with tender in a separate folder bearing the name of the Sub-contractor and Company's chop:

1. An extra copy of the Information to be supplied by Tenderer;
2. Schedule of Rates for CABD System.
ELE23.4 INSTALLATION METHODOLOGY

ELE23.4.1 - CABD SYSTEM DESIGN

ELE23.4.1.010.7 GENERAL

1. A CABD system is designed with an aim to convey the best receivable signal at a particular site to individual users sharing the same system. The CABD system performance shall comply with BS EN 60728-1 and BS EN 60728-10, or EN 60728-1 and EN 60728-10;

2. At any particular site, the CABD system shall be designed to convey the best receivable digital and analogue terrestrial TV and FM signals to individual users sharing the same system;

3. The CABD system shall allow for digital terrestrial TV broadcasting (DTTB) distribution whose details OFTA has announced. Furthermore, the CABD system shall meet the requirements laid down in HKTA 1104, HKTA 1105 & BS EN 60728-1 and BS EN 60728-10, or EN 60728-1 and EN 60728-10.

ELE23.4.1.020.7 VOLTAGE COVERED BY THIS SPECIFICATION

All apparatus, equipment, materials and wiring shall be suitable for use on 220V ±6%, 50 Hz ±2%, a single phase a.c. system.

ELE23.4.1.030.7 ONE CABD SYSTEM PER BUILDING BLOCK

One CABD system shall be installed for each building block in a particular project.

ELE23.4.1.040.7 CHOICE OF EQUIPMENT AND SITING OF AERIALS

1. For the avoidance of doubt, no signal field strength will be provided. The Sub-Contractor shall be responsible for their own signal field strength measurements and deemed to have inspected, measured and investigated the actual conditions on site as necessary, and finding out any source of interference that may affect the installation for choice of equipment and sitting of aerials. The Sub-contractor shall be responsible for the performance of the CABD system in accordance with the specification.

2. The location of aerials shall be the best position for reception with minimum interference from reflection and tidal effect. Should the system be subject to such interference after the commissioning of the system, the Sub-contractor shall be responsible for all necessary rectification work including the relocation of aerials and modification/adjustment to the system to the satisfaction of the Contract Manager at no extra cost to the Employer during the maintenance period.

ELE23.4.1.050.7 SELECTING THE GAIN OF TV AND FM AERIALS

To maximize signal to noise ratio and to achieve good directivity, the gain of TV and FM aerials shall be chosen to be as high as possible and in compliance with other requirements when specified in the Project Specific Specification for the installation.

ELE23.4.1.060.7 SEPARATE DOWN LEADS FOR THE TV AND FM SIGNALS

1. The TV and FM signals shall be conveyed through separate down leads to the respective amplifiers in the headend circuit for amplification;

2. The Sub-contractor shall allow one spare down leads for future digital terrestrial television.
ELE23.4.1.070.7 SELECTION OF AMPLIFIERS
For systems design, which involves the use of amplifiers in the headend to drive the TV channel amplifiers and/or FM channel amplifier, the first amplifiers to be used for the TV and/or FM signal path shall be a TV bandpass preamplifier and/or a FM band preamplifier respectively. Alternatively, a TV bandpass filter shall be used for the TV signal path and shall be connected to the input of the first wideband amplifier, notwithstanding that it is a preamplifier or a distribution amplifier. Such design practice shall ensure that the amplifiers of the system shall not be overloaded by strong out-of-band signals.

ELE23.4.1.080.7 LOSS ALLOWANCE
A 3 dB attenuation factor shall be included in the calculation of system level to account for practical installation losses such as cable joints.

ELE23.4.1.090.7 ENCLOSURE OF HEADEND CIRCUIT COMPONENTS
The headend circuit components shall be enclosed in a well-ventilated enclosure fitted with lock. The equipment shall be adequately screened from radio interference caused by lift equipment, starters, etc.. The case shall be properly secured against the wall and have sufficient space for cable routing and bending.

ELE23.4.2 - PERFORMANCE REQUIREMENTS

ELE23.4.2.010.7 SIGNAL LEVELS AT FM/TV OUTLETS
The r.m.s. voltage of each vision carrier at the peak of the modulation envelope when measured at the user’s outlet across a non-inductive 75 ohm resistor (or referred to 75 ohm) shall be:

1. Minimum level:
   a. 60 dBμV for analogue terrestrial TV signals;
   b. 50 dBμV for digital terrestrial TV signals;
   c. 50 dBμV for FM signals.

2. Maximum level:
   a. 77 dBμV for analogue terrestrial TV signals;
   b. 74 dBμV for digital terrestrial TV signals;
   c. 70 dBμV for FM signals.

ELE23.4.2.020.7 PERMISSIBLE DIFFERENT SIGNAL LEVELS IN AN OUTLET

1. The difference in level between the weakest and the strongest TV signals at the same outlet ("tilt") shall not exceed the following:
   a. 12 dB for frequency range between 47 and 862 MHz;
   b. 6 dB in the range of 60 MHz;
   c. 3 dB between adjacent channels.

2. The difference in level between the weakest and the strongest FM signals at the same outlet shall not exceed 15 dB for frequency range 88 and 108 MHz.

ELE23.4.2.030.7 INTERMODULATION
1. At each outlet, the level of any unwanted signal generated in the system in any channel shall make the minimum carrier-to-noise be the followings:
   a. 44 dB for analogue terrestrial TV signals;
b. 34 dB for digital terrestrial TV signals;
c. 48 dB for FM signals.

2. Bit error rate (BER) of digital signals after error correction shall be better than $3 \times 10^{-6}$;
3. Modulation error ratio (MER) shall be not less than 30 dB.

**ELE23.4.2.040.7 MUTUAL ISOLATION BETWEEN OUTLETS**

To minimize the local oscillator energy from one receiver causing interference to other receivers on the same cable system, the mutual isolation between outlets connected separately to a spur feeder shall not be less than 36 dB for Terrestrial TV, and 42 dB for FM signal.

**ELE23.4.3 - TERRESTRIAL TELEVISION SYSTEM**

**ELE23.4.3.010.7 TERRESTRIAL AERIALS**

1. The mast or poles and the aerials shall be of heavy duty construction and be designed to be able to operate normally under a loading pressure associated with a sustained wind speed of up to 74 km/hr. and gusts up to 190 km/hr. In addition, the complete equipment together with the supporting structures shall be designed to withstand the loading pressure associated with sustained wind speed up to 140 km/hr. and gusts up to 220 km/hr. without any physical damages;
2. If the FM aerial is required to be mounted on the same mast for the TV aerial, the two aerials shall be separated by at least 1.8 m apart so as to achieve the minimum interaction;
3. The aerial system shall be adequately earthed and protected against lightning in accordance with IEC 62305-1 and IEC 62305-2 and IEC 62305-3 and IEC 62305-4, or BS EN 62305-1 and BS EN 62305-2 and BS EN 62305-3 and BS EN 62305-4, or AS/NZS 1768 by mean of bonding the aerial masts or supporting frames of antenna to the air termination for the lightning protection system under the sub-contract with at least 25x3 mm² aluminium tape or an acceptable equivalent.

**ELE23.4.3.020.7 PREAMPLIFIERS AND FILTERS**

1. TV bandpass preamplifiers shall be used in weak TV field strength areas. Similarly, FM band preamplifiers shall be used in weak FM field areas;
2. Alternatively, TV/FM bandpass filters shall be incorporated if wideband preamplifier is used.

**ELE23.4.3.030.7 AMPLIFIERS**

1. Signal amplification within the system shall be provided with channel amplifiers at the headend for signal processing and wideband distribution amplifiers;
2. At sites where the aerial is not in direct line-of-sight with the transmitter, the channel amplifier shall be equipped with automatic gain control circuitry;
3. When channel amplifiers are required, this shall include one channel amplifier for FM reception, at least two (2) channel amplifiers for closed circuit TV reception, two (2) interconnection points to combiners/amplifiers transmitting four (4) UHF and twenty (20) VHF signals from Domestic Pay Television Programme Services (DPTPS), two (2) additional spare interconnection points for future uses and eight (8) channel amplifiers for reception of any one TV channel group as required by the location of reception in accordance with the frequency plans allocated for TV and FM. DPTPS will provide the above combiners and amplifiers for their UHF and VHF signals. Only one TV channel group transmitted by any one transmitter shall be relayed;
4. The design levels used for the output of all amplifiers shall be 4 dB lower than their respective maximum allowable output with the exception of channel amplifiers equipped with AGC and all amplifiers following these AGC channel amplifiers. The maximum allowable output is the output level at which the specification limit for unwanted signal detailed in the wideband amplifiers, FM channel amplifiers and TV channel amplifiers & AGC channel amplifiers etc. can no longer be met with further increase in outputs;

5. The headend equipment of each system shall be installed in the "Broadcast Signal Reception Room or Location of Headend Equipment" telecommunication duct as shown on the Drawings;

6. Cable routing shall be as short as possible and where possible screened from the sight of the TV Transmitter.

ELE23.4.3.040.7 FREQUENCY CONVERTERS

Television signals shall be conveyed at the received signal frequencies. If frequency conversion is required, the outlet frequencies shall be in the frequencies 470 to 862 MHz for television reception.

ELE23.4.3.050.7 UHF MODULATORS

The video signals from the closed circuit television system cameras shall be modulated to UHF range channels and combined at the headend of the system.

ELE23.4.3.060.7 SPLITTERS/TEE-UNITS

All splitters and tee units shall have a wide bandwidth to allow for cascaded mode of operation. The maximum number of tee units in cascade shall be limited to 6. Mock-up tests may be required to assess the design prior to installation, if in the opinion of the Contract Manager, the cascaded chain is too long as to create unacceptable signal tilting.

ELE23.4.3.070.7 COAXIAL CABLES

1. The wiring installation from the aerial to the head-end equipment, amplifiers and tee units/splitters on other floors shall be carried out in surface/concealed conduit system and surface trunking system as shown on the Drawings;
2. Coaxial cables terminating at aerial arrays shall be neatly and securely fixed to the supporting structures by means of PVC strapping with nylon stubs or flexible moulded nylon self-locking cable ties at intervals not greater than 250 mm;
3. Co-axial cable shall not be bent to a radius smaller than 15 times the outer diameter of the cable. Joints in the cable runs and looping of cables at outlet terminals shall NOT be allowed;
4. All wiring shall be properly installed and segregated in accordance with the Electrical CoP;
5. The wiring installation in each domestic unit shall be in concealed conduits. The TV/FM socket outlets shall be mounted on concealed BS 4662 boxes located as shown on the Drawings. The number of the Sub-contractor's coaxial cables to be installed in a conduit of any size shall be limited to two (2);
6. A set of spare conduits running from the Meter/Telecom Room on respective floors to individual flats, along with the conduits for CABD system, is designated for future telecommunication and broadcasting services. Under no circumstances, will the Sub-contractor be allowed to use these spare conduit facilities. In addition, the Sub-contractor shall propose the conduits to be used for the CABD system and the number of cables running in each of them whereas no works can commence without the Contract Manager's prior approval for such proposal;
7. All coaxial cables shall have distinctive labels along its length. All coaxial cables except the underground cables shall be white or ivory in colour;

8. Domestic Pay Television Programme Services (DPTPS) Operators’ coaxial cables will be run in common trunkings, conduits and boxes with the CABD coaxial cables. The Sub-contractor shall closely liaise and coordinate with the DPTPS Operators on the shared use of trunkings, conduits and boxes.

**ELE23.4.3.080.7 FM/TV OUTLETS**

1. Looping of outlets to achieve the sufficient isolation shall not be acceptable. Only isolation using splitters and tee units with isolation shall be considered;

2. The FM/TV socket outlets shall be mounted at 100 mm above the skirting level unless otherwise specified and located as shown on the Drawings;

3. The outlets shall be fixed on electrical accessory boxes with made of insulating material in compliance with 47 mm deep BS 4662 boxes whose colour and shape shall match those of the FM/TV outlets. Outlets shall be white or ivory in colour.

**ELE23.4.3.090.7 FIBRE OPTICAL CABLE SYSTEM**

1. Fibre optical cable system should be provided where the length of main trunk cable without splice exceeds 200 meters. The fibre optical cable in riser shall be enclosed in a galvanized iron cable trunking with space factor not exceeding 40%. In any case, the cable trunking should not be smaller than 50 mm X 50 mm. Where the main trunk is installed underground, the fibre optical cables shall be protected by minimum 100 diameter galvanized iron pipes and cable draws;

2. Fibre optical cable amplifier shall be provided where the total attenuation loss of the optical circuit exceeds the maximum output power of the transmitter;

3. Loose tube buffer fibre optical cables shall be specified for outdoor or locations subject to moisture or temperature variations;

4. The length of fibre optical cables without splice between the optical transmitter and the fibre optical splitter shall not exceed 5000 meters and between the fibre optical splitter and the fibre optical transceiver exceeds 2000 meters.
ELE23.5 MATERIAL & EQUIPMENT

ELE23.5.1 - TERRESTRIAL TELEVISION SYSTEM

ELE23.5.1.010.7 TERRESTRIAL AERIALS

The terrestrial aerials shall be suitable for both analogue and digital terrestrial television and shall comply with EN 60728-11 and EN 50083-2 and EN 60728-5 and the followings:
1. TV aerial should have a gain of at least 13 dB and a front to back ratio not less than 20 dB. The aerial shall be of the type to minimize ghost image;
2. FM aerial should have a gain of 4 to 7 dB;
3. The impedance of the aerial should be 75 Ω unbalanced;
4. The aerial system should be provided with a durable protective coating;
5. The aerial mast should be made of stainless steel;
6. The aerial should be capable of receiving digital signal.

ELE23.5.1.020.7 PREAMPLIFIERS AND FILTERS

The performance of the preamplifiers, TV bandpass preamplifiers, FM bandpass preamplifiers, TV bandpass filters and FM bandpass filters shall be suitable for both analogue and digital terrestrial television and shall comply with EN 60728-11 and EN 50083-2 and EN 60728-5 and the followings:

### ELE23.5.1.070.7 COAXIAL CABLES

1. All coaxial cables used shall be of 75 Ω type copper cables designed for transmitting UHF (470 to 862 MHz) and VHF (88 to 108 MHz) signals. All coaxial cables used shall comply with the relevant sections of EN 50083-1, EN 50083-8 and EN 50117;

2. The feeder shall conform to IEC 60096-3 (cable designation 370 or above of BS 5425-1 and the trunk feeder shall be to cable designation 550 or above of BS 5425-1);

3. Underground cables shall be of low loss coaxial copper cable with polyethylene outer sheath, copper foil outer conductor. These shall conform to IEC 60096-3 (cable designation 550 MB or above of BS 5425-1).

### ELE23.5.1.080.7 FM/TV OUTLETS

1. Outlets shall be dual socket type for FM/TV (88 to 862 MHz) signals complete with frequency dividing network and the respective socket shall be identified with labels embossed on the front plate;
2. The outlets shall comply with EN 60728-11 and EN 50083-2 and EN 60728-4 and shall be suitable for flush mounting on 47 mm deep BS 4662 boxes;

3. The FM/TV outlet shall comply the followings:

<table>

**ELE23.5.1.090.7 ALLOWANCES FOR DIGITAL TERRESTRIAL TV BROADCASTING (DTTB) SYSTEM**

1. The CABD system shall allow for the future additional channel installation of DTTB equipment whose details OFTA has already announced, such as digital headend amplifiers/converters to enable a satisfactory reception and distribution of DTTB broadcasting signals;

2. The DTTB equipment shall be compatible with the CABD system installed and in no circumstances cause interference to the original analogue terrestrial channels.
ELE23.6 INSPECTION, TESTING & COMMISSIONING DURING CONSTRUCTION PERIODS

ELE23.6.1 - GENERAL REQUIREMENTS

ELE23.6.1.010.7 GENERAL

1. The purpose of Inspection, Testing and Commissioning during construction is to ensure the quality of delivered material and equipment and the workmanship of the installation comply with the relevant Regulations, Standards, Code of Practice and requirements of the Sub-contract and the function and performance of the systems meet the requirements specified in the Sub-contract;

2. Inspection and testing shall be carried out on all new installations and alterations to an existing installation in accordance with the requirements of this Section;

3. At the start of the Sub-contract, the Sub-contractor shall propose and obtain agreements from the Contract Manager on the time frames for the process of verification of materials and equipment delivered on site, inspection and testing of installed works;

4. The Sub-contractor shall be responsible for the submission of relevant and sufficient documents to the Contract Manager to describe the materials, equipment and installations to be inspected, tested and commissioned before carrying out of the inspection, tests and commissioning;

5. The Sub-contractor shall provide all necessary specialists, labour, materials, tools, instruments and equipment for carrying out of inspections, testing including analyzing the data, and commissioning. The Sub-contractor's specialist approved by the Contract Manager shall undertake all testing and commissioning procedures;

6. The Sub-contractor shall dispatch competent and experienced commissioning engineers to carry out the test and commissioning of the installation. Such personnel shall collaborate closely with the Contract Manager on site, who will witness the tests carried out under the Sub-contract. The Sub-contractor shall provide the Contract Manager with access to inspect all equipment during any phase of the installation and shall provide all reasonable facilities for such access. The Sub-contractor shall notify the Contract Manager of impending tests in sufficient time to allow the Contract Manager to be present. Parts to be subjected to witnessed tests will not be accepted unless the relevant test result are provided and has been signed by the Contract Manager and Sub-contractor;

7. All tests at site shall be performed in the sequence required by the construction and commissioning programme. The Sub-contractor shall prepare itemised and detailed testing and commissioning schedule. These schedules shall be prepared and submitted to the Contract Manager at least three months before the commencement of the test and approved by the Contract Manager. The schedule shall be completed by the Sub-contractor and presented to the Contract Manager for approval;

8. All instrument used for testing should be calibrated as specified in the Specification for the inspection, measuring and testing of the installation. The Sub-contractor shall submit to the Contract Manager valid calibration certificates issued and signed by approved calibration organizations before the use of the instruments;
9. The entire installation shall be commissioned and tested in accordance with the latest edition of "Testing and Commissioning Procedure for Broadcast Reception Installation in Government Buildings, Hong Kong Special Administrative Region";

10. The Sub-contractor shall record all data and information gathered during all inspections, testing and commissioning and produce reports to the Contract Manager within 3 weeks after the inspection;

11. The Sub-contractor at their own expense shall rectify all defects in performance, material and workmanship before the installation is accepted.

ELE23.6.1.020.7 COMPONENT ACCEPTANCE

1. The following components offered for the CABD installation shall be of approved equipment on the 'List of Approved Broadcast Reception Installation Equipment' issued by EMSD:
   a. TV and FM bandpass filters or preamplifier;
   b. Channel amplifiers;
   c. Broadband amplifiers (with or without AGC)/Frequency converters;
   d. Splitters/tap-off units;
   e. FM/TV outlets;
   f. Coaxial cables.

2. The Sub-contractor shall submit, at least one month before actual installation, all the channel amplifiers/AGC converters to EMSD for acceptance tests. In the event of the components failing the acceptance tests, the Sub-contractor shall resubmit fresh components for further tests until the components are accepted;

3. The Sub-contractor shall bear the cost of full type testing required by EMSD on any CABD equipment;

4. In addition, the Contract Manager shall have the right to order any components to be tested by EMSD, if, in their opinion, the components are suspected of not complying with this General Specification. All components failing such tests shall be replaced by the Sub-contractor at their own cost to the satisfaction of the Contract Manager.

ELE23.6.1.030.7 VERIFICATION OF MATERIALS AND EQUIPMENT DELIVERED

1. All materials and equipment delivered to site shall be verified by the Contract Manager that they comply with the requirements and conform to the materials and equipment approved by the Contract Manager;

2. The Sub-contractor shall request in writing the Contract Manager to inspect materials and equipment delivered on site in accordance with the agreed time frame;

3. The request for inspection shall be made together with detail descriptions of the materials/equipment including, but not limited to, brand name, model number, country of origin, their tested standards and record of Contract Manager's approval for the using the materials and equipment.

ELE23.6.1.040.7 INSPECTION AND TESTING OF INSTALLED WORKS

1. The Sub-contractor shall request in writing in accordance with the agreed time frame to the Contract Manager for the inspection and witness testing of installed works in order to ensure that the installed works conform to the approved drawings and also meet the requirements of the Sub-contract;
2. Inspection and testing of installed works may be carried out for the whole or portion by portion of an installation, as appropriate. The Sub-contractor shall make proposal to the Contract Manager and obtain the Contract Manager's agreement on the arrangement before commencement of the works;

3. The request shall be made together with descriptions or drawings showing details of the works including, but not limited to, area/location of the works and types of installations;

4. Request for inspection for works to be covered up subsequently shall be made according to the work progress and well before the installations are covered up by subsequent activity. The Sub-contractor is responsible for any delay and its associated financial or time loss arising from late or unsatisfactory planning and arrangement of inspection and testing of works incurred to himself and others, consequential or otherwise.

**ELE23.6.1.050.7 COMMISSIONING AND FUNCTIONAL AND PERFORMANCE TESTS**

1. All installations and equipment shall be properly commissioned and tested to ensure that they are operating to deliver the design capacities and at the most optimum favourable operation conditions of the installations and the equipment and they are functioning properly in accordance with the design requirements;

2. The Sub-contractor shall submit proposed testing and commissioning programmes, testing and commissioning methods, procedures and formats of test records to the Contract Manager for approval at least three (3) months before commencement of commissioning and testing or within four (4) months after commencement of the Sub-contract whichever is earlier. The submission shall be submitted together with a list of major equipment with their crucial information such as brand names, model numbers, types, capacities and locations;

3. The Sub-contractor shall check and ensure that all related building items such as false ceiling, partitions, windows, louvers, etc. that will affect proper operation of the system have been provided and ready for carrying out of the commissioning before starting commissioning works;

4. The Sub-contractor shall check and ensure that all related building services items including those provided by others are available and ready for carrying out of the commissioning before starting commissioning works;

5. The Sub-contractor shall carry out commissioning work portion by portion rather than waiting until completion of the whole system if the commissioning work is more effective and appropriate to be proceeded in such arrangement. Nevertheless, after completion of the whole installation, the Sub-contractor shall commission the whole system in one go in order to ensure that the whole system is operating smoothly to deliver the design capacities and at its optimum favourable operation condition;

6. The Sub-contractor shall test the system on their own and is satisfied that the performance of the system comply with the design requirements before making requests to the Contract Manager for witness of commissioning and tests;

7. Commissioning and testing shall be conducted strictly under the specified design condition as far as possible. For commissioning works or tests that would be affected by environment condition or other factors outside the Sub-contractor's control and it is unlikely that the commissioning works or tests can be arranged to be proceeded under the design condition, the Sub-contractor shall submit alternative proposal for the Contract Manager's approval for carrying out the commissioning works or tests under condition with slight deviation from the specified design condition. Nevertheless, the Sub-contractor shall demonstrate from the result of commissioning and testing, either by means of calculation or other methods that the system can operate to deliver the design capacities;
8. The Sub-contractor shall, at its own cost, provide temporary TV channels at the headend in addition to the receivable off air and CCTV channels at the time of testing and commissioning. This is to demonstrate that the system shall be able to operate and deliver the design output for a total of not less than 30 TV channels;

9. In addition to the commissioning and test reports submitted by the Sub-contractor within 3 weeks after the commissioning and tests, the Sub-contractor shall compile all inspection, test and commissioning records in one report and submit it to the Contract Manager within 4 weeks after contract completion.

ELE23.6.2 - EQUIPMENT CALIBRATION

ELE23.6.2.010.7 GENERAL

The Sub-contractor shall make available the calibrated equipment and the associated calibration records etc. whenever the relevant test is performed. The equipment together with the relevant documentation shall conform to the requirements as set out in the following:

1. Accreditation:
   The equipment shall be calibrated in accredited laboratories. The calibration shall be made against certified equipment having a known valid relationship to internationally or nationally recognized standards. Where no such standards exist, the basis used for calibration shall be documented. In such cases, the laboratories shall provide satisfactory evidence of correlation of results, for example by participation in a suitable programme of inter-laboratory comparisons or proficiency testing.

2. Acceptance of the calibration of the equipment:
   The calibration and acceptance of the calibration of the equipment shall comply with the requirements as set out in the schedule.

3. Document the calibration process:
   The Sub-contractor shall define and document the process employed for the calibration of the equipment including details of equipment type, unique identification, location, frequency of checks, check method, acceptance criteria and the action to be taken when results are unsatisfactory.

4. Calibration records of the equipment:
   The Sub-contractor shall maintain and submit calibration records of the equipment to the Contract Manager and the records shall include:
   a. The description and unique identification of equipment;
   b. The date of equipment calibration;
   c. The calibration results obtained after and, where relevant, before any adjustment and repair;
   d. The assigned calibration interval;
   e. The calibration procedure;
   f. The designated limits of permissible error or accuracy of equipment;
   g. The source of the calibration used to obtain traceability;
   h. The relevant environmental conditions and a statement about any corrections thus necessary;
   i. A statement of the uncertainties involved in calibrating the equipment and of their cumulative effect;
   j. Details of any maintenance such as servicing, adjustment, repairs or modifications carried out;
k. Any limitations in use;

l. Identification of the person(s) performing the calibration;

m. Identification of person(s) responsible for ensuring the correctness of the recorded information;

n. Unique identification (such as serial numbers) of any calibration certificates and other relevant documents concerned.

5. Calibration under suitable environmental conditions:

Calibration shall be carried out under suitable environmental conditions considering the conditions under which the equipment is used for inspections, measurements and tests.

6. Label marked "calibrated":

The Sub-contractor shall identify the equipment with a label marked "calibrated" and approved identification record to show the calibration status and the next due date.

7. Doubt on the accuracy of the equipment:

The Sub-contractor shall re-calibrate the equipment at intervals as shown in the schedule, or at shorter periods when the Contract Manager has doubt on the accuracy of the equipment.

8. Return of equipment:

The equipment shall be returned to the Sub-contractor at the completion of the Sub-contract when there is no outstanding or remedial works to be completed.

ELE23.6.3 - TESTING & COMMISSIONING

ELE23.6.3.010.7 VISUAL INSPECTION

A visual inspection shall be carried out before testing of the installation in order to verify the followings:

1. Compliance with Regulations and/or CoP:

   The installation has been carried out in compliance with regulations and/or CoP.

2. Correctness:

   The correctness of the designation of the installation; and

3. Visual Damage:

   There is no visual damage to the installation.

ELE23.6.3.020.7 TESTING & COMMISSIONING

The Sub-contractor shall carry out complete performance tests for all equipment and systems installed by him, make all necessary adjustments, commission the installations and submit the test reports, all to the satisfaction of the Contract Manager who may require the Sub-contractor to repeat all or some of the tests in the presence of his or her representatives before the installation will be accepted. Where relevant, the following tests shall be carried out in the sequence indicated. In the event of any test indicating failure to comply, that test and those preceding tests, the results of which may have been influenced by the fault indicated, shall be repeated after the fault has been rectified.

1. Signal Level Measurement of TV Headend and Trunk Distribution Equipment:
a. Measure the input and output signal levels of each headend and trunk distribution equipment item with the signal level meter, starting from the antenna side. All the TV channels to be distributed shall be measured. For FM signals, three of the principal programmes to be distributed, namely those with the lowest, middle and highest frequencies, shall be measured;

b. The input and output signal levels shall agree with the calculation done by the Sub-contractor on the approved System Schematic Diagram(s).

2. The Automatic Gain Control (AGC) Performance of TV Channel Amplifiers:
   a. If the TV channel amplifiers are fitted with AGC facilities, the AGC functions shall be tested. The input signal of each AGC channel amplifier shall be varied by +10 dB and –10 dB from its nominal value. External amplifier and attenuator shall be temporarily inserted at the channel amplifier input for this test;
   b. For proper AGC function, the channel amplifier output shall not vary by more than ±1 dB.

3. Measurement of Signal Levels at FM/TV Outlets:
   a. The signal level at FM/TV outlets shall be measured by the signal level meter for each TV channel and three of the principal FM programmes to be distributed, namely those with the lowest, middle and highest frequencies;
   b. The signal levels shall fall within the following items:

<table>
<thead>
<tr>
<th>Channel</th>
<th>Minimum Signal Level (dBµV)</th>
<th>Maximum Signal Level (dBµV)</th>
<th>&quot;Tilt&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Analogue Terrestrial TV</td>
<td>60</td>
<td>77</td>
<td>i. 12 dB for 47 to 862 MHz</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>ii. 6 dB in the range of 60 MHz</td>
</tr>
<tr>
<td>Digital Terrestrial TV</td>
<td>50</td>
<td>74</td>
<td>iii. 3 dB between adjacent channels</td>
</tr>
<tr>
<td>FM</td>
<td>50</td>
<td>70</td>
<td>15 dB</td>
</tr>
</tbody>
</table>

Note: "Tilt" is the difference in signal level between the strongest and the weakest TV signals.

4. Mutual Isolation between FM/TV Outlets:
   a. The mutual isolation between FM/TV outlets from the same tee unit shall be measured. About 3 pairs of outlets shall be tested for each type of tee unit;
   b. The mutual isolation shall not be less than 36 dB for terrestrial TV and 42 dB for FM signal.

5. Functional Testing:
   The picture quality at TV outlets shall be measured by a Portable TV monitor c/w sound monitoring loudspeaker for each TV channel. The test results shall be recorded in the report.
ELE23.7 MAINTENANCE REQUIREMENTS

ELE23.7.010.7 GENERAL MAINTENANCE REQUIREMENTS

1. The Sub-contractor shall furnish maintenance, free of further charge, for the complete installation for a period of twenty-four (24) months from the date of acceptance. This maintenance shall include the following services:
   a. Routine inspection, testing and maintenance services;
   b. Emergency inspection, testing and repairs.

2. All inspection, testing, maintenance services and repairs shall be carried out generally in accordance with the manufacturers' recommendations/instructions and to the satisfaction of the Contract Manager;

3. The Sub-contractor shall despatch competent and experienced engineers and technicians equipped with the testing instruments, tools, equipment etc. to inspect, service, test, adjust and maintain the installation in a satisfactory operating condition. The Sub-contractor shall allow for carrying out such inspection, service, testing, adjustment and maintenance at a time outside normal office hours including general holidays;

4. All labour and materials including cleaning materials, lubricants, battery electrolyte, tools, instruments etc., and transportation required for carrying out routine and emergency inspection, testing, repair, replacement and maintenance services shall be included in this Sub-contract. Any renewals or repairs necessitated by reason of negligence of the end user or misuse of the equipment by the end user or by reason of any other causes not due to the fault of the Sub-contractor shall be carried out by the Sub-contractor and paid for in accordance with the Sub-contract with prior notice to the Contract Manager;

5. The Sub-contractor shall be responsible for all repairs necessary to maintain the installation in a safe, reliable and operative condition at all times. The Sub-contractor must ensure that their servicing staff carrying out necessary repairs immediately utilising manufacturer's original replacement parts. Any component taken down for services shall be reinstated within 2 hours or otherwise replaced by a spare unit at the Sub-contractor's expenses;

6. After each routine inspection, testing and maintenance service, the Sub-contractor shall furnish to the Contract Manager within 14 days a report complete with the following details:
   a. Date and time of inspection, testing and maintenance service;
   b. Persons carrying out the task;
   c. Details of inspection and maintenance service;
   d. Results of all tests performed;
   e. Any external factors significantly affecting the service and test results;
   f. Any follow-up actions as required.

ELE23.7.020.7 ON-CALL MAINTENANCE AND REPAIR SERVICE

1. The Sub-contractor shall dispatch technically competent and specially trained personnel for on-call maintenance and repair service and restore the malfunctioning CABD System to proper working order within the time period as specified below:
a. The Sub-contractor shall respond immediately to system fault or breakdown affecting the service to a whole building or effecting 'no picture' for large-scale residents and inspect the failure within one hour during office hours or two hours if outside office hours after receiving a call for service from the Contract Manager or his or her representatives or from the estate office. The system shall be restored to normal within 4 hours. In the event that it being impossible to perform the requirement within the time stipulated, the Sub-contractor shall explain immediately to the Contract Manager or his or her representatives the reason for such non-conformance;  

b. For any other system minor fault, or complaints not involving loss of picture, the Sub-contractor shall restore the system to proper working order within 24 hours from receiving a fault report from the Contract Manager or his or her representatives.

2. The on-call maintenance and repair services shall include all works, whether they are of mechanical, electrical or electronic nature which are found necessary to maintain the CABD System in good and safe working order at all times and in conformity with:

a. The Specification No. HKTA-1103 "Performance Requirements of Television Signals Input to the Head End of Subscription Television System" issued by OFTA;

b. The Specification No. HKTA-1104 "Performance Requirements for In-building Coaxial Cable Distribution System (IBCCDS)" issued by OFTA (hereinafter referred to as the Performance Specification);

c. The Specification No. HKTA-1105 "Technical Information for Frequency Planning of In-Building Coaxial Cable Distribution System" issued by OFTA.

Should the Sub-contractor find it necessary to remove any system equipment to his Workshop for repair, he shall install, at the time of removal, a suitable replacement equipment for temporary use at no cost to the Housing Authority in order to maintain the system in proper working condition during the entire period of repair;

3. In case a system breakdown call occurs in Outlying Islands (e.g. Cheung Chau), the Sub-contractor shall, as far as practicable, restore the system to normal operating condition in 24 hours from receiving the call;

4. The Sub-contractor shall provide all transport, labours and materials including cleaning materials, tools and testing instruments required for the on-call maintenance and repair service. The Sub-contractor shall employ sufficient number of competent technicians and have adequate number of testing instruments for the service;

5. The Sub-contractor should note that the cost for the provision of the on-call repair service for the CABD system as well as the overtime work during on-call services is deemed to have been included in this Sub-contract;

6. The on-call repair service for CABD System shall be provided once the system is included in the Sub-contract and shall last until the end of the Sub-contract. Therefore, the Sub-contractor should make sufficient allowance in her tender;

7. The Sub-contractor shall within one week after the commencement of the Sub-contract, submit a name list with at least two names and telephone numbers of his English and Cantonese speaking representatives to whom repair calls should be directed;

8. For indicative purposes, the average number of on-call maintenance and repair service is around 23 per month. However, this figure is likely to vary due to:

a. Addition or deduction of CABD system in this Sub-contract;

b. Connection of the CABD drop-in cables to other Subscription TV networks or re-connection of CABD drop-in cables back to CABD system;
c. Addition of video signals from CCTV cameras on the CABD system;
d. Reception and distribution of DTTB signals in addition to analogue ones from 2007 onwards.

**ELE23.7.030.7 ROUTINE HALF-YEARLY INSPECTION, TESTING AND MAINTENANCE**

The Sub-contractor shall visit the installation at least once every six months to carry out tests, repairs and adjustment. All environmentally sensitive devices shall be inspected, cleaned, adjusted and calibrated. A test sequence shall be carried out in accordance with the manufacturer's instructions.

**ELE23.7.040.7 FINAL INSPECTION, TESTING AND MAINTENANCE**

1. At the final inspection, the Sub-contractor shall, in addition to the routine half-yearly inspection and testing, adjust all the electronic equipment to the optimum state of operational efficiency. All mechanical equipment and control panels shall be inspected for rusting or corrosion such that touching-up or re-painting shall be carried out as necessary;
2. A complete performance test of the whole installation shall be carried out and any defects in operation, materials and workmanship so developed shall be rectified.

**ELE23.7.050.7 TAKING RECORDS IN LOG-BOOK**

The Sub-contractor shall have their maintenance staff completing the site/installation record 'Log-Book' after each visit. The log books shall be provided by the Contract Manager and can be completed in either English or Chinese.

**ELE23.7.060.7 CONTRACT MANAGER TO BE INFORMED**

No replacements of installation or parts of installation shall be carried out at any time unless the Contract Manager has previously been notified and has signified their approval.

ELE24.1 GENERAL REQUIREMENTS

ELE24.1.010.7 INFORMATION FURNISHED WITH TENDER
1. The Tenderer shall furnish the following information, as applicable, with his Tender, which will be considered incomplete without such information:
   a. Name of manufacturer, country of manufacture, type and catalogue number, and full technical performance details, of all major items of equipment offered;
   b. Voltage of operation, and current consumption;
   c. Type and size of wiring;
   d. Illustrated brochures showing all major items of equipment and their installation requirements;
   e. A list of spares and tools included in the offer;
   f. Details of any special works required to be carried out by others.
2. In addition to the information required under the General Conditions of Tender and the Special Conditions of Tender, the following additional submission is required with tender:
   a. An extra copy of the Information to be Supplied by Tender and Schedule of Rates for Security System in a separate folder bearing the name of the Subcontractor and Company’s Chop.

ELE24.1.020.7 AS-FITTED DRAWINGS
The provisions shall follow the details in ELE1.10.030.

ELE24.1.030.7 ROBUST DESIGN
All equipment shall be of robust design, having a durable nature and of pleasant appearance all to the satisfaction of the Contract Manager.

ELE24.1.040.7 SCREENING
All equipment shall be properly screened and/or shielded against any possible external frequency interference where necessary.

ELE24.1.050.7 DOORPHONE SYSTEM VOLTAGE
1. The Doorphone System shall be operated at not more than 50 V d.c. Where battery is used, an automatic charger shall be provided to maintain the charge, and tapping off from the battery to obtain different voltage levels shall not be allowed;
2. All system components, other than electronic circuits, shall preferably be operated at a single voltage level.

ELE24.1.060.7 SUPPRESSION OF ELECTROMAGNETIC EMISSION
The whole system should be suitably suppressed to fall within the limits allowed by BS EN 55014-1:1997 for electromagnetic emission.

ELE24.1.070.7 WORKS BY OTHERS
The following works interfacing with the security system will be provided by other contractors:
1. Lift Installation
a. CCTV cameras in lift cars and the associated video cables in lift shaft will be installed by the Lift Sub-contractor. The video cables connected to lift car cameras will be terminated at a connection unit at high level of the entrance lift lobby or otherwise as shown on the Drawings;

b. Volt free contacts will be provided by the Lift Sub-contractor in an interface box in ground floor meter room or otherwise as shown on the Drawings for each lift. The contacts shall consist of the following:
   i. Two N.O. contacts for lift alarm, to be closed when the lift emergency alarm push button is pressed;
   ii. One N.O. contact to be assigned to each lift landing floor, to be closed only when the lift is at the floor which the contact is assigned to. At any one time, only one of these contacts will be closed;
   iii. Two N.O. contacts for lift travel directions, one to be closed when the lift is going up and the other to be closed when the lift is going down. Simultaneous closing of the two contacts will not occur.

   All terminals for the dry contacts shall be properly labelled to indicate their functions. Subject to the Contract Manager's approval, it is acceptable that digital signals are used in lieu of the above dry contact signals, should an agreement be reached between the Sub-contractor and the Lift Sub-contractor. In this case, the details of communication protocol, data format and the hardware interface shall be clearly defined by the two parties and submitted to the Contract Manager for approval.

2. Building Works

   The door and guard counter will be provided by the Main Contractor. The Sub-contractor shall co-ordinate with the Main Contractor on their construction details and make necessary allowance for the installation work.

ELE24.1.080.7 DOCUMENTATION

1. For each equipment offered, tenderers shall supply with the tender full and complete technical information in English sufficiently detailed to enable a technical appraisal of the equipment to be made. Submissions without sufficient information may be discounted;

2. Apart from the documents stipulated in Section ELE1.10, the Sub-contractor shall, within one month prior to equipment delivery, supply the number of equipment handbook in English language as stated in sub-clause (4) giving full details on:
   a. Principle of operations;
   b. Details of installation and setting-up procedures;
   c. Maintenance and operation instructions;
   d. Schematic and block diagrams;
   e. Circuit diagrams with details down to component levels with their respective descriptions;
   f. Printed circuit board layout;
   g. Calibration procedures;
   h. Full parts list; and
   i. If microprocessors are used, all program storage devices (ROM's, EPROM's etc.) shall be supplied with comprehensive part and version numbers for ordering of replacement; additionally, the method of generation/ duplication of the data in the storage device shall be given.

3. Should any Original Equipment Manufacturer (OEM) products be included, the documents as specified in sub-clause (2) above shall also be provided;
4. Three sets of the manufacturer's operations and maintenance manuals in English shall be provided with each equipment ordered, up to a maximum of six sets per model of equipment. The following table indicates the number of documents required:

<table>
<thead>
<tr>
<th>No. of equipment per model</th>
<th>Sets of manufacturer's operation and maintenance manuals required</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 - 2</td>
<td>3 (at least 1 original)</td>
</tr>
<tr>
<td>3 - 5</td>
<td>4 (at least 2 originals)</td>
</tr>
<tr>
<td>6 or more</td>
<td>6 (at least 3 originals)</td>
</tr>
</tbody>
</table>

5. The Sub-contractor shall supply "As-fitted" drawings showing the positions of all items of equipment installed and the routing of interconnecting cables;

6. The Sub-contractor shall not use confidentiality as a reason for withholding the supply of relevant documentation required by Contract Manager. The Contract Manager's representative will if required certify that all sensitive material in handbooks will not be released to any organisation outside Contract Manager. Any charges for such material supplied shall be included within the Contract. The Sub-contractor should make sure that all his overseas/local principals understand such obligation when submitting tender;

7. The Contract Manager shall be granted the right of duplicating the documents stated above for internal use;

8. The Contract Manager shall be kept informed of any recommended modifications during the operational life of the equipment.

**ELE24.1.090.7 EXECUTION OF THE WORK**

The Sub-contractor shall verify to the satisfaction of the Contract Manager that they are licensed for carrying out type III security work under the Security and Guarding Services Ordinance Cap. 460 and are competent to complete the works, otherwise they shall employ a competent contractor, who has the required licence, to carry out the works. For the latter case, the Sub-contractor shall submit the proposed contractor's relevant information related to the licence, technical capability, working experience on security system to the Contract Manager for approval. Whenever necessary, the Sub-contractor shall also submit document and drawings for the completed projects to the Contract Manager for consideration. Inspection of the completed projects and visit of the proposed contractor's office and workshop may be conducted, if deemed necessary.
ELE24.2  EQUIPMENT OF SECURITY SYSTEM

ELE24.2.1  CCTV VIDEO CAMERA

ELE24.2.1.010.7  GENERAL
1. The CCTV camera shall be of CCD video camera equipped with integral lens, CCD imager, electronic processing circuitry and synchronization pulse generation circuits;
2. All power, control and video cables connecting the camera with the housing shall be in plug-socket arrangement to facilitate easy removal of camera for maintenance;
3. The camera shall be operated by a CCD imager of not smaller than 1/3”. The active picture element shall at least be 752(H) x 582(V). The camera shall satisfy the following minimum performance characteristics:
   a. Sensitivity shall be such that under a scene illuminance of 0.5 lux (at 2856 K) with the F1.8 lens at the highest gain (i.e. AGC ON) and with a 75% highlight reflectance chart, full video output can be obtained;
   b. The horizontal resolution shall not be less than 450 TV lines and the depth of modulation of the test signal at 350 lines shall be greater than 30%.
4. The camera shall be provided with white clip control. If this is not field adjustable, the white "clipper" shall be factory adjusted to clip at 110% of video level;
5. The camera, in conjunction with the lens, shall be able to handle a scene contrast range of 30,000 :1;
6. The camera shall be designed to operate continuously without switching off at 7V-15V d.c. supply or 24V a.c. supply or other extra low voltage supply fed from coaxial cable. Having been set up and installed, the camera shall operate within Specification without adjustment for at least three months;
7. The camera shall be provided with electronic shutter for operating in wide range of lighting level;
8. The camera shall be provided with auto white balance function;
9. The outdoor camera shall be provided with auto iris lens (such as camera in doophone panel);
10. In situation where line synchronization is employed, the power supply to all cameras shall be from the same phase of the a.c. supply to that of the supply to the related equipment in the system.

ELE24.2.1.020.7  SHADING REQUIREMENTS
With the lens capped, the automatic black level control and automatic gain control circuitries defeated and fixed at the respective nominal levels, the black level variation shall not exceed 4% of peak video level in both the horizontal direction (line rate) and the vertical direction (field rate).

ELE24.2.1.030.7  NOISE
The video signal to noise ratio shall be better than 40 dB unweighted.
ELE24.2.1.040.7 SYNCHRONIZATION
The video camera shall be provided with a built-in synchronization generator which is selectable for roll-free vertical interval switching. Cameras connected to sequential switcher shall provide line lock function.

ELE24.2.1.050.7 COLOUR SYSTEM AND SCANNING
The video camera shall be provided with the following colour and scanning systems:
1. CCIR 625-line, 50 fields/sec, PAL colour system;
2. Horizontal frequency: 15.625 kHz;
3. Vertical frequency: 50 Hz;

ELE24.2.1.060.7 TEST SIGNAL
The video camera shall be provided with internal correction circuitry against the peaking of test signal. The test signal below 250 lines shall not be peaked.

ELE24.2.1.070.7 CAMERA PROTECTIVE HOUSING
All outdoor cameras shall be fitted with die-cast metallic protective housing. The housing shall accommodate the camera provided, complete with lens and other accessories. The housing shall be sturdy and tamper-proof. Notwithstanding, with the aid of easy-to-use tools, operation and maintenance staff shall make easy and safe access to the camera and other accessory of the camera or housing for maintenance and cleaning purpose.

The field of view of the camera shall not be obstructed by the housing. All power, control and video cables entering or leaving the housing externally shall be protected by a conduit.

The housing shall not cause degradation of any of the performance parameters of the video camera. Outdoor camera housings shall be water and dust-proof to at least IP54.

The weight of the housing, excluding the camera and its accessories, shall be less than 12 Kg.

ELE24.2.1.080.7 CAMERA MOUNTING
Each camera shall be provided with a camera mounting which mechanically couples the camera housing to a wall or ceiling or some other form of mechanical support (e.g. a pole, metal mounting rack) so that the camera assembly can be suitably and stably located.

The mounting offered must be of a design such that it allows free adjustment of the angle of the camera. The design of the mounting shall also take into account of the structural or architectural support where the camera mounting is fixed.

The mounting shall provide a field-adjustable mechanism and a suitable mechanical joint so that the camera assembly can be swung or tilted to the appropriate surveillance direction and locked into this particular position.

The tensile strength of the mounting and the method used to connect the mounting to the architectural or structural support must withstand the total weight of the camera, plus housing.

The colour of the camera mounting shall preferably be the same as that of the camera housing.
ELE24.2.2  LCD VIDEO MONITOR

ELE24.2.2.010.7  GENERAL
1. Size of the LCD monitor shall be of 19” or otherwise specified on the Drawings. The screen shall be provided with anti-glare surface/coating and some means of protection allowing greater firmness;
2. The LCD monitor shall be designed as a professional/industrial type with Mean Time Between Failure (MTBF) rate not less than 50,000 hours;
3. The LCD monitor shall be suitable for 24 hours continuous operation;
4. The monitor shall accept and display colour video signal from the digital video recorders as described in Worksection ELE24.2.4, via a VGA input terminal;
5. The resolution shall be at least 1,280 x 1,024 pixels;
6. Brightness shall not be less than 300cd/m2. The contrast ratio shall be at least 700 : 1;
7. The response time shall be not more than 8 ms. The pixel pitch shall be 0.3 mm or less. The display colours level shall not less than 16 million;
8. The horizontal and vertical viewing angle shall be at least 140/135 degrees;
9. The LCD monitor shall be equipped with controls to adjust the basic settings, including brightness, contrast, vertical and horizontal position, vertical and horizontal size;
10. The LCD monitor shall be completed with adjustable tilting angle wall mounted bracket and desk mounted support depending on the application on site.
11. The LCD monitor shall be compatible to VGA, SVGA, XGA and SXGA formats.

ELE24.2.3  VIDEO DISTRIBUTION AMPLIFIER

ELE24.2.3.010.7  GENERAL
The video distribution amplifier is used to buffer and distribute video signals in the system highway. In general, video distribution amplifier should be used whenever the required video path transverses more than one bridging input.

ELE24.2.3.020.7  INPUT AND OUTPUT
1. Each distribution amplifier shall contain at least one (1) high impedance bridging input. It shall provide at least four (4) isolated outputs;
2. The distribution amplifier performance shall be better than
   a. Frequency response 50 Hz to 5 MHz ± 0.5 dB with respect to 100 kHz;
   b. 2T pulse K factor 1%;
   c. Output isolation: 35 dB up to 5 MHz;
   d. Return loss ratio: 35 dB up to 5 MHz.

ELE24.2.3.030.7  ADJUSTMENT
The distribution amplifier shall contain gain adjustment to vary the video level to ±3 dB. Preferably it shall also be provided with some form of high frequency compensation adjustments.
ELE24.2.4 DIGITAL VIDEO RECORDER

ELE24.2.4.010.7 TECHNICAL REQUIREMENTS

1. The digital video recorder (DVR) shall be designed for professional video, audio surveillance and alarm monitoring applications including recording, playback and signal transmission simultaneously;

2. The DVR shall support recording of not less than 16 non-synchronized PAL video inputs;

3. The DVR shall digitize, compress and store the images received in its internal removable hard disks with a total data storage capacity not less than 28 days and minimum 4TB for 16 camera inputs simultaneously and which can be expandable for longer time continuous recording. The minimum resolution of the recorded images shall be not less than 720 x 576 pixels with high picture quality at total frame rate of 100fps for PAL video images as accepted by Contract Manager;

4. The DVR shall support displaying of live video images up to 400fps for PAL videos from connected cameras either in full screen, 2x2, 3x3 or 4x4 multiplexed screen modes and displaying recorded images up to 100fps;

5. The DVR shall operate in multiplex manners including simultaneous local live viewing, recording, playback and network transmission without causing any adverse effect to the performance of each other in any circumstances;

6. The network transmission of video signal from DVR to the networked PC at remote site shall comply with Transmission Control Protocol/Internet Protocol (TCP/IP);

7. The DVR shall be equipped with alarm inputs to perform pre-selected function (i.e. image captured from the camera with the alarm being triggered, shall be popped up and displayed in full at the main monitor and the recording frame rate for the corresponding camera shall be increased to the pre-set value up to 25fps simultaneously). The system operation shall automatically resume to normal after the pre-set time period;

8. The number of alarm inputs shall match with the number of video inputs;

9. The DVR shall allow the user to define the duration for event recording with a pre-event recording period not less than 3 seconds and for post-event within a range from minimum 1 to 99 seconds adjustable;

10. The DVR shall allow continuous recording and shall overwrite the oldest recorded images under a first in first out approach when all the hard disks are full. The DVR shall also allow an adjustable pre-set recording days of storage from 7 to 30 days;

11. The DVR shall be automatically resumed operation on resumption of power after interruption;

12. The status and control of the DVR shall be monitored and operable through the front panel controls for the following:
   a. Indicate time and system operation condition;
   b. Start and stop recording;
   c. Control pause, stop, playback, fast forward / reverse and playback speed;
   d. Access on-screen search functions by event, date and time;
   e. Access / select the menu function on-screen.
13. The DVR shall be equipped with at least 2 nos. of spot monitor outlet(s) independent of the main monitor (tower guard). The main monitor shall be able to display up to 16 cameras on a single screen simultaneously either under playback or real time display condition. The spot monitor(s) shall only be able to display one selected camera or to display up to 16 cameras sequentially with one at each time;

14. The DVR shall provide alarm signal for the events including triggering from external alarm, detectors, video motion detection, video signal loss from camera, power interruption, hardware failure and hard disk overheat warning signal;

15. The DVR shall provide indication on screen whether the input video signal from each camera is under recording or not;

16. The digital video recording system shall be able to search alarm for playback according to events. The alarms shall be logged and reported;

17. The DVR shall provide not less than 20 x 16 masking grids on each camera input for selection of area for video motion detection. The sensitivity level of the video motion detection shall also be configurable;

18. All images exported from the DVR can also be viewed on a networked PC at the remote sites through LAN or Internet via a proprietary software player provided by the DVR Manufacturer at no extra cost;

19. The proprietary software player shall be compatible for operation on a PC with the latest version of Window platform or other Window platform to the satisfaction of the Contract Manager and also have a multi-site video reception software allowing for connection up to 16 nos. of networked DVRs at different sites under any pre-selected grouping of cameras for viewing on one screen of a designated networked PC simultaneously;

20. The DVR shall have multi-level login hierarchy for access by administrator, supervisor and operator at local or remote site to the system for setting of the operation configuration and normal operation of the DVR;

21. A standard USB style connector of latest version shall be provided at the face panel of the DVR for interfacing with the USB flash drive, DVD writer or external hard disk for video backup functionality;

22. The backup video data file copied from the DVR can be viewed on any other PC via the proprietary player as mentioned in item 18 and 19 above which shall be free licence to the Authority;

23. The DVR shall incorporate digital watermark recording function. Letter issued by the DVR Manufacturer certifying the reliability / authentication of watermarking feature shall be provided under the Contract;

24. The DVR shall be integrated with a built-in real-time clock capable of configuring the system's time and date for display. On-screen display shall include the date, time, camera location, hard disk currently under recording mode and site description name up to 12 alpha-numeric characters;

25. Date shall be displayed by 8 digits composite with year (4 digits), followed by month (2 digits) and day (2 digits) under the format of YYYYMMDD;

26. Time shall be displayed in international time by 6 digits composite with hour, minute and second under 2 digits each under the format of hhmmss;

27. All alpha-numeric characters displayed on screen shall be white in colour and edging with thick black colour lines;

28. DVR shall provide with 75 ohms BNC type video connectors for cable connections to other video equipment;

29. 3-core 2 m long PVC insulated and PVC sheathed power cable shall be provided with the DVR. One end of the power cable shall be properly connected to the supply terminals inside the DVR while the other end of the cable shall be connected with a 13A 3-pin plug;
30. Operation manual both in English and Chinese shall be provided for each DVR. Each DVR shall be under individual packing with all accessories, hard copy of the operation manual and CD-ROM corresponding to the proprietary video software player as mentioned in items 18 and 19 for the system operation and backup.

31. The DVR shall have the mask function for every channel. When the area of a channel is masked, the image of the area then cannot be viewed by the monitor but can be recorded by the DVR.

32. Once the video images exported from DVR are being edited, these video images shall not be read at the proprietary remote client software to ensure the video integrity. The message “This is NOT the original images” or equal and equivalent with the agreement from Contract Manager or his representatives shall also be shown on the screen.

33. Time-clock shall be avoided to display on individual channel screen but they must be stamped on the recorded films. 34. Fixed font size characters display on the screen shall be provided whenever in full screen, 2x2, 3x3 or 4x4 multiplexed screen modes.

**ELE24.2.5  NOT USED**

**ELE24.2.6  QUAD MULTIPLEXER**

**ELE24.2.6.010.7  GENERAL**

1. The quad multiplexer shall be capable to display up to 4 colour CCTV cameras simultaneously on one screen. The acceptable video signal format shall be PAL 625 line, 50 field per second;

2. The display resolution shall not be less than 720 x 564 pixels, 8-bit grey levels, 16 million colours;

3. The quad multiplexer shall have 4 asynchronised video input capability. Gain adjustment shall be provided individually for each input channel. The video refresh rate shall be 50 fields per second for each quadrant;

4. All video input and output shall be 1.0V p-p 75 ohms;

5. The quad multiplexer shall provide on-screen, preset alphanumeric camera identification of at least eight characters per camera. The preset display shall be stored in non-volatile memory and shall not be lost upon power interruption. It shall be able to switch off the display of identification for individual screen;

6. Facility shall be provided to alert the operator when any input signal being monitored is lost.

**ELE24.2.7  TELEPHONE SET**

**ELE24.2.7.010.7  GENERAL**

1. The telephone set shall be a model certified by Telecommunications Authority as in conformance with the relevant Telecommunications Authority’s standard. The telephone set shall have the following feature:
   a. Hands-free speaker phone;
   b. 28 Telephone memory;
   c. One touch redial;
   d. Wall mounting;
ELE24.2.8 CABLES

ELE24.2.8.010.7 GENERAL

1. Singlecore cables shall conform to BS EN 50525-2-31 and the conductor size shall be not less than 1.0 mm². Multicore cables to be installed inside buildings shall be of copper conductor/PVC insulated/PVC sheathed non-armoured type with tinned copper drain wire and colour identification for cores. The conductor size shall be not less than 0.5 mm diameter Contract Manager's approval is required prior to the installation of cables;

2. Multicore cables to be installed underground shall be of copper conductors/PVC insulated/PVC inner sheathed/steel wire armoured/PVC sheathed type with colour identification for cores. The conductor size shall be not less than 0.5 mm diameter Contract Manager's approval is required prior to the installation of cables;

3. Non-armoured cables shall be installed in trunking/conduit systems and armoured cables shall be installed in underground galvanised steel/PVC ducts outside the building boundaries. A system of trunking/conduits and underground galvanised steel/PVC ducts shall be provided by the Sub-contractor for the Doorphone System installation as shown on the drawings, the Sub-contractor shall also be responsible for any additional provision to complete the installation;

4. Multicore cables shall be terminated at fixed terminals. Where cable termination blocks are used, they shall be of suitable size for the conductors;

5. Movable parts shall be connected to the system by means of flexible cables;

6. Labels shall be provided at visitor's panels, indicating panels, control panels, cable termination/junction boxes etc. to identify the function (e.g. door lock release) of the respective core of the outgoing cables;

7. The colour code of the wiring for the doorphone system shall comply with BT CW 1293 or IEC 60708-1.

ELE24.2.8.020.7 VIDEO CABLES

1. Video cables shall be of the coaxial type with a single central core of annealed copper. The dielectric shall be polythene with a shield of copper braid or tape. The cable shall be insulated with an overall sheath of PVC;

2. The attenuation characteristic of the cable shall be better than:
   a. 1.1 dB/100 m at 1 MHz;
   b. 3.8 dB/100 m at 10 MHz;
   c. 13.5 dB/100 m at 100 MHz.

3. Unless total conformance to a relevant recognised international standard, which is subject to Contract Manager's approval, is achieved, the cable shall have the following characteristics:
   a. Strand diameter not to be less than 0.58 mm;
   b. Dielectric diameter not to be less than 3.71 mm;
   c. Outer conductor diameter not to be less than 4.39 mm;
   d. Nominal overall diameter not to be greater than 6.2 mm;
   e. Capacitance not to be more than 67 pF/m;
   f. Bending radius not to be less than 60 mm;
g. Weight not to be less than 55 kg/km;
h. Characteristic impedance to be 75 ohm ± 3 ohm;
i. Return loss ratio to be better than 20 dB at 10 MHz;
j. Insulation resistance to be not less than 30 M ohm per km.

**ELE24.2.8.030.7 CONTROL CABLES**

1. Control cables shall be of the multicore type. Each core shall be made up of stranded annealed copper conductors with PVC insulation. The whole cable shall be screened with copper tape or copper braid and shall have an overall sheath of PVC;

2. The cable shall satisfy the following minimum characteristics:
   a. At least 7 strands per conductor.
   b. Strand diameter not to be less than 0.2 mm;
   c. Conductor resistance to be less than 90 ohm/km;
   d. Insulation resistance to be better than 20 Mohm/km measured between cores or between core and screen.

**ELE24.2.8.040.7 RADIO FREQUENCY CABLES**

The radio frequency cable shall comply with BS EN 50117-1 and BS EN 50117-2-1 and BS EN 50117-2-2 and BS EN 50117-2-3 and BS EN 50117-3 and BS EN 50117-4.

**ELE24.2.8.050.7 OPTICAL FIBRE CABLES**

The optical fibre cable shall be of multimode type with minimum 4 cores of 62.5μm diameter.

**ELE24.2.9 SEMICONDUCTOR DEVICES**

**ELE24.2.9.010.7 GENERAL**

Unless otherwise specified or a particular application requires the use of other types, semiconductor devices shall be of silicon type, and shall have instantaneous electrical characteristics capable of handling the transient power, voltage and current which the devices may encounter in the circuit. The continuous power, voltage and current ratings of the semiconductor devices shall be not less than 1.5 times the respective maximum value at which the devices are intended to operate. Power devices shall be mounted on adequately sized heat sinks.

**ELE24.2.10 CAPACITORS**

**ELE24.2.10.010.7 GENERAL**

Capacitors shall have a nominal working voltage of not less than 1.5 times the maximum voltage at which they are intended to operate. The values of the nominal working voltage and capacitance shall be marked on the body of the capacitor.
**ELE24.2.11 RESISTORS**

**ELE24.2.11.010.7 GENERAL**

Resistors shall have resistance values better than ± 5% tolerance and, continuous power rating of not less than 1.5 times the maximum power which the resistors shall dissipate. The values of resistance and tolerance shall be marked on the body of the resistors.

**ELE24.2.12 PRINTED CIRCUIT BOARDS**

**ELE24.2.12.010.7 GENERAL**

All electronic circuits shall be fabricated on printed circuit boards. Printed circuit boards shall be of fibre glass material and all conducting parts shall be tin plated. Connections between circuit boards and from circuit boards to outgoing circuits shall be of plug-in type to facilitate easy replacement. Direct soldering of outgoing cable onto printed circuit boards shall not be allowed.

**ELE24.2.13 MAGNETIC DOOR CONTACT**

**ELE24.2.13.010.7 GENERAL**

1. Magnetic door contact shall be equipped with completed concealed magnetic switch and shall be recessed mounted into the door;
2. The design shall offer years of positive fail-safe separating power when door is opened even after years of being held closed. When the door is closed, high contact force shall be developed to ensure proper contact;
3. The magnetic door contact shall be U.L. listed for the application.

**ELE24.2.14 EQUIPMENT RACK**

**ELE24.2.14.010.7 GENERAL**

1. Equipment rack made of 1.2 mm sheet steel shall be provided in meter room or equipment room or other areas as shown on the Drawings to house the security equipment. There shall be lockable panels at the front and back of the rack. The front panel shall be glass. The rack shall be modular in design such that the trays and sliding shelves can be added or deleted if required;
2. The rack shall consist at least the following types of basic modules:
   a. Ventilation fan module;
   b. Power distribution panel;
   c. Cable trays;
   d. Illuminating lamp.
3. The size of rack shall be suitable for standard 483 mm rack mounted equipment with standard rack aperture;
4. The rack shall be painted with stove enamel paint of Approved colour;
5. Security equipment such as digital video recorder (DVR), patch panel, router, ethernet switch, amplifiers, cable accessories etc., situated in a common location shall be housed in a single equipment rack. A spare space for the installation of one additional DVR in the future shall be provided in the equipment rack housing DVR.
ELE24.3 INSTALLATION REQUIREMENTS

ELE24.3.1 NOT USED

ELE24.3.2 DOORPHONE SYSTEM

ELE24.3.2.010.7 GENERAL

1. The doorphone system shall be of digital selection and display type complete with secret code door lock release feature. The system shall provide high fidelity communication between the visitors at the main entrance and the occupants in a particular flat of whom the visitors intend to visit. The system shall enable the occupant to remotely release the entrance door lock to allow the visitors to enter the building by operating a switch on the handset located within the flat;

2. The doorphone system shall only permit communication and control between the selected flat and the doorphone panel/door lock at the main entrance of the building. All flats which are not selected shall be cut off from the system, voice transmission to and from these flats and operation of the door lock release through the handsets in these flats shall be inhibited intrinsically by the system;

3. For linked blocks, the visitor panel shall be provided in the main entrance of the joint entrance lobby as shown on the drawings. In addition to the requirements as detailed in ELE24.3.2.030, a set of block selection feature shall be provided in the visitor panel. Once the block is selected in the panel, the operation sequence of the system shall follow the details in ELE24.3.2.060;

4. The operation of the doorphone system shall not be affected by any fault or incorrect wiring in any handset or prolonged removal of the handpiece of a handset from its base unit. If a handpiece is removed from its base unit without being called by a visitor from the doorphone panel, this handset shall be disconnected from the system and the services to other handsets shall be maintained. Once the disconnected handset is put back to the base unit properly, the service to this handset shall resume. If there is any faulty or incorrect wiring connection for a handset due to installation mistake or unauthorised alteration, the system shall be able to detect this condition and disconnect this handset automatically and maintain services to other handsets.

ELE24.3.2.020.7 ELECTRO-MAGNETIC LOCK

1. This clause shall be read in conjunction with the Drawings for electro-magnetic lock installation details;

2. The main entrance and side entrance shall be provided with electro-magnetic locks which shall have no mechanical moving parts. The lock shall be UL listed as a releasing device for exit door;

3. The lock shall provide instantaneous unlocking with no residual magnetism upon interruption of power supply;

4. The magnet core shall be permanently sealed by epoxy resin in a metal casing to form an integral magnet assembly. For recess-mounted application, the magnet assembly shall be secured to the door frame in such a way that loosening or undoing of any or all fixing screws on the magnet assembly shall not result in the assembly itself being pulled out from the recess aperture when the door is being opened by force;

5. The lock shall be fail-safe type. When power is cut off, the lock shall be automatically released to allow door opening;
6. The lock shall be equipped with a built-in lock status sensing device with dry contact output to positively indicate that the door is secured;

7. Installation of the electro-magnetic lock shall be in accordance with the standard details shown on the Drawings and all required mounting hardware/accessories shall be either supplied or approved by the manufacturer of electro-magnetic lock. The installation method shall be endorsed by the manufacturer of electro-magnetic lock as appropriate for their product in case the actual details differ from manufacturer's own standard methods;

8. The lock shall operate at low voltage of d.c. 12V and consume low current of not more than 400 mA. When locked, the traction force shall not be less than 226.8 kg. Even if the lock is forced open by excessive force, it shall not be damaged and shall be re-locked immediately afterwards;

9. Other provisions for the electro-magnetic lock shall include:
   a. Bypass key
      i. There shall be a keyswitch at the bottom of the doorphone panel and combination lock panel outside the entrances. Upon turning the keyswitch, power for the electro-magnetic lock shall be cut off and free access shall be allowed;
      ii. 5 sets of keys for the entrance door lock shall be provided by the Sub-contractor at the completion of the works to the Contract Manager.
   b. Door release
      i. A door release button shall be provided at the inside of the building and adjacent to each main and side entrance such that by pressing this button, the corresponding electro-magnetic lock shall be released for an adjustable period of 1 to 30 seconds. The lock shall be relocked after the expiry of the timer period. The button shall be fitted on a stainless steel plate together with two LED lights, one in green and the other in red, for the indication of status of the electro-magnetic lock. The red LED shall be turned on when the door is locked and the green LED shall be turned on when the door is unlocked. The signals to operate the LED lights shall be derived from the output of the built-in lock status sensing device in the electro-magnetic lock;
      ii. Another door release button shall be provided at the guard counter for releasing the door lock of the main entrance by the tower guard. The lock shall be relocked after an adjustable period of 1 to 30 seconds;
      iii. The door release button shall be vandal resistant and suitable for operation under extreme humid condition. The button shall be submitted to Contract Manager for approval.
   c. Emergency breakglass
      An emergency breakglass release switch shall be provided adjacent to each main and side entrance on the inside of the building. Upon breaking of a breakglass, power to the corresponding electro-magnetic lock shall be cut. The entrance shall then serve as an emergency exit. At the same time an alarm signal shall be indicated at the tower guard counter and sent to the security control room through the central alarm and door monitoring system, if available, for reporting of emergency. The breakglass shall be engraved with the following labels in Chinese and English, "Emergency Breakglass for Door Release" and "緊急開門掣". A permanent operation instruction plate shall be provided next to the switch.
   d. Safety measure
      The circuit for controlling the supply to the electro-magnetic lock shall be designed such that the failure of any electronic components shall cause all the electro-magnetic door locks to be released.
   e. Spare parts
A spare and complete set of mounting accessories such as washers, roll pins, centre bolts and lock nuts in labelled packing shall be handed over to Contract Manager for each electro-magnetic lock at the completion of the works.

ELE24.3.2.030.7 DOORPHONE PANEL

1. At each main entrance of the domestic block positioned as shown on the Drawings, the Sub-contractor shall supply and install a vandal proof panel with stainless steel faceplate comprising, but not limited to:
   a. A set of numerical floor number selection push buttons (from 0 - 9), and an alphabetical "G" button for ground floor where necessary;
   b. A set of numerical, or alphabetical as specified, flat number selection push buttons;
   c. A "Combination Lock" push button for the selection of secret code combination door lock;
   d. A 5 x 7 dot matrix yellow L.E.D. display unit of sufficient digits to display the particular floor and flat number being selected. All L.E.D. in the display unit shall have equal and steady brightness. The display shall be right hand justified;
   e. Self-illuminated operating instruction displayed in English and Chinese for the following:
      PLEASE SELECT 請選擇
      PLEASE WAIT 請等候
      PLEASE TALK 請通話
      PLEASE ENTER 請進入
      NO ANSWER 無答覆
      INCORRECT INPUT, PRESS "CLEAR", INPUT AGAIN 輸入錯誤，按「取消」，重新輸入
   f. Voice message generator for giving audible instructions in either Cantonese or both Cantonese and English as directed by Contract Manager for the following status:
      PLEASE WAIT 請等候
      PLEASE ENTER 請進入
      NO ANSWER 無答覆
      WRONG NUMBER, PLEASE PRESS THE CLEAR BUTTON AND TRY AGAIN 輸入錯誤，請按取消掣重新輸入

The voice message generator shall provide high quality audible instruction using digital data compression technique. The voice message generator shall provide 5 individual pre-recorded messages for a total time period (for 5 messages) of not less than 90 seconds. The generator shall accept 5 digital control inputs to output the 5 individual pre-recorded messages. The length of individual message shall be variable from 0 to 90 seconds. All messages shall be approved by Contract Manager prior to being programmed into the memory of the generator. The voice output level shall be adjustable and the maximum level shall not be less than 60 dB at a distance of 1 metre from the panel.
g. A set of high fidelity and sensitivity two way communication unit. The output shall be clearly audible of at least 60 dB at a distance of 0.5 metre from the panel;

h. A "Clear" push button switch for resetting of incorrect entry of floor/flat number;

i. A push button for communication with the guard counter if specified on the Drawings;

j. A CCTV camera;

k. All push buttons shall be vandal resistant and weatherproof. Keypads shall be vandal resistant and weatherproof. All push buttons with numerical or alphabetical figures shall be back-lit by LED through plastic insert forming the figures. The colour of the insert shall be red unless otherwise specified on the Drawings. The LED, with a life span of 35,000 hours minimum, shall be on throughout the operation of the panel. Keypad and push buttons shall be submitted to Contract Manager for approval;

l. A Block selection feature shall be provided for linked block design;

m. Braille instructions as specified on the Drawings.

2. The Sub-contractor shall submit drawings for the arrangement of the "Doorphone Panel" to the Contract Manager for approval prior to manufacture.

ELE24.3.2.040.7 DOORPHONE CONTROL UNIT

The doorphone control unit shall be totally enclosed containing all necessary components and accessories for satisfactory doorphone operation. The control unit shall be located in ground floor meter room where an a.c. supply in the form of a 13A connection unit.

ELE24.3.2.050.7 HANDSET

1. Each flat shall be provided with one handset positioned as shown on the Drawings. The handset shall be submitted to Contract Manager for approval prior to ordering;

2. Two separate and independent push buttons shall be provided integral with the handset, one for remotely releasing the main entrance door lock and the other for interfacing to the lighting control system for corridor lighting. The buttons shall be marked permanently with respective graphic symbols for easy identification of their functions. The graphic symbol for door lock release shall be in green colour and for corridor lighting in red colour. The buttons shall separate from each other by a minimum distance of 100 mm. The button for lighting control shall be at the lower portion of the handset and be operable without the need to lift the hand-piece for lighting control only;

3. All contacts and other equipment inside the handset shall be of durable type;

4. The handset shall be equipped with independent buzzer / speaker for the call tone and the buzzer / speaker shall be distinct from the loudspeaker at the handset. The call tone shall be of pleasant type and shall be clearly audible anywhere in the flat.

ELE24.3.2.055.7 LIGHTING CONTROL INTERFACE PANEL

1. The push button for lighting control on each handset shall be connected to a lighting control interface panel in the telecom/meter room on the respective floor;
2. Relays with single pole normally open (NO) contact and operated by DC control voltage derived from the doorphone system shall be provided in the lighting control interface panel. Pressing and releasing of a push button shall result in closing and opening of a corresponding NO contact in the interface panel. The output terminals of the NO contacts (one for each flat) shall be located in a segregated compartment in the interface panel for interfacing to the lighting control system. LED indicating lights shall be provided on the hinged cover of the interface panel to show the status of each push button. All relays, terminals and LED lights shall be properly labelled for easy identification;

3. The relays provided in the interface panel shall satisfy the following technical requirements:
   a. Contact: min. rated load 1A, max. switching voltage 250VAC;
   b. Coil operating voltage: 12 or 24 DC (to be drawn from the doorphone system);
   c. Insulation resistance: 100 MΩ (at 500V DC);
   d. Dielectric strength: 1000Vrms 1 minute between open contacts;
   e. 2000Vrms 1 minute between contact and coil;
   f. Mounting: by plug and socket;
   g. Conformance: UL or equivalent standard.

4. The interface panel shall be a metal enclosure properly earthed and finished in epoxy powder coating. A sample shall be submitted to Contract Manager for Approval and the approved sample can be utilized in the actual installation.

**ELE24.3.2.060.7  OPERATION SEQUENCE**

The operation sequence of the doorphone system shall be as follows:

1. The "Please Select" indicator shall be illuminated when the system is at "normal" condition. For linked blocks, a block selection feature shall be provided for selecting appropriate block at the first place. When a visitor presses the appropriate floor number key on the floor selection key board followed by the flat number key on the other flat selection key board, the selected floor and flat number shall display on the screen immediately after the depression of each key, when any floor from ground floor to ninth floor is to be selected, the sequence shall not necessitate the entry of a "O" preceding the floor number. Depression of any button on the doorphone panel shall be accompanied by a beep tone;

2. An intermittent call tone shall be initiated at the handset of the selected flat. Simultaneously, a "Please Wait" voice message shall be generated at the doorphone panel and the illuminated signal on the instruction display shall change to "Please Wait" until the handset in that selected flat is picked up by the occupant. At the moment, the illuminated signal shall change to "Please Talk", then intercommunication between the occupant and the visitor can take place;

3. If the hand-piece is not picked up within a predetermined period, which is adjustable from 1 to 30 seconds, the call tone shall stop. A "No Answer" voice message shall be generated at the doorphone panel and the illuminated signal shall change from "Please Wait" to "No Answer" and after 3 seconds the system and illuminated signal shall automatically revert back to "Please Select" as normal;

4. The two way intercommunication between the occupant and the visitor shall be limited to a predetermined period ranging from 20 to 120 seconds. When the pre-determined period expires, the intercommunication between the two parties shall be automatically cut off and the system shall revert back to its normal conditions;
5. Before the hand-piece is being put back to its normal position, pushing the door release push button on the hand-piece shall remotely release the electrical door lock at the main entrance door. A "Please Enter" voice message shall be generated at the doorphone panel and the illuminated signal shall change from "Please Talk" to "Please Enter". The communication shall be terminated after an adjustable period of 1 to 30 seconds after the release of the door lock. The lock shall then be reverted to locked state after the door is closed again. If the door is not opened by the visitor after a predetermined period adjustable from 1 to 30 seconds, the lock shall then revert to the locked state;

6. After the termination of the communication link and the reverting of the door lock to its locked stated, the illuminated indication on the instruction display shall revert to "Please Select" as normal;

7. When the selection of floor or flat number is not completed within a preset time period which is adjustable from 1 to 15 seconds, the system shall revert to normal condition;

8. The display shall be blanked when the number of a non-existent floor/flat is entered, a "Wrong Number" voice message shall be generated at the doorphone panel and the illuminated signal on the instruction panel shall change to "Incorrect Entry". The system shall reset to its normal condition by pressing the "Clear" button or after a predetermined period adjustable from 1 to 30 seconds;

9. When the handset is not connected to the entrance panel, i.e. when the flat number is not pressed at the entrance panel by any visitor, operation of the door release button at any hand-piece shall not release the lock of the main entrance door;

10. The door lock shall be such that in case the electric push button inside the entrance door or the secret digital code door lock release is not operative the door can still be opened by operating a keyswitch at the bottom of the doorphone panel and combination lock panel outside the entrances. The door lock shall revert to its normal closing state when the door is closed;

11. When the "Clear" button is pressed at any stage during the operation of the doorphone panel, the system shall switch off the display, terminate any established communication link and revert to the "normal" condition.

ELE24.3.2.070.7 COMBINATION LOCK SYSTEM

1.
   a. Combination lock system for the main entrance and side entrance doors shall be built in the control unit of the doorphone system;
   b. Correct entry of the code at any combination lock control panel shall only cause the electro-magnetic lock of the corresponding entrance to be released;
   c. The combination lock system shall allow connection of up to 5 combination lock control panels for 5 side entrances in additional to the combination lock control panel at the main entrance. All the combination lock control panels can be operated at the same time without affecting each other;

2. For the main entrance, the combination lock system shall be accessed and controlled through the doorphone panel. If the "Combination Lock" button is pressed, the floor selection buttons shall serve as a combination lock control panel;

3. For each side entrance, a combination lock control panel shall be provided;

4.
   a. The four-digit secret code for releasing lock shall be kept in the non-volatile memory. The secret code shall be easily changeable by adjusting a set of selector switches or push buttons housed in the control unit in the meter room. Code changing by re-connecting jumpers is not acceptable;
b. The code shall be adjustable to any combination of the four digits from 0 to 9. An instruction procedure for code changing shall be fixed inside the door of the enclosure. Security measures shall be provided against illegal changes of the secret code.

5. The combination lock control panel for the side entrance shall be constructed with 1.5 mm thick stainless steel faceplate and 1.2 mm thick stainless steel housing enclosure comprising:
   a. A keypad fitted with a set of numerical push buttons (from 0-9). The keypad and push buttons shall be vandal resistant and weatherproof. All push buttons shall be back-lit by LED through plastic insert forming the numerical figures. The colour of the insert shall be red unless otherwise specified on the Drawings. The LED, with a life span of 35,000 hours minimum, shall be on throughout the operation of the panel. Keypad and push buttons shall be submitted to Contract Manager for approval;
   b. A "clear" push button for resetting of incorrect entry;
   c. Operating status/instruction L.E.D. indicators with instructions in English and Chinese for the following:
      i. **SYSTEM ON** 系统正常
      ii. **PLEASE ENTER** 請進入
      iii. **INCORRECT ENTRY** 錯輸入
   d. Voice message generator to give audible instructions in either Cantonese or both Cantonese and English as directed by Contractor Manager for the following status:
      i. Please enter 請進入
      ii. Wrong number, please press the clear button and try again 輸入錯誤，請按取消掣重新輸入

The voice message generator shall be of the same specification as that used in the doorphone panel;

e. Braille instructions as specified on the Drawings.

6. Each pressing of the button shall have a 'beep' sound.

6. The enclosure for the secret code setting devices shall be fabricated from sheet steel with a thickness not less than 1.2 mm. All inside and outside surfaces of the enclosure shall be treated with anti-rust protective coating followed by an Approved painting;

7. The door lock shall be released only when the entry of a pre-assigned 4-digit code in proper sequence within a 10 seconds period otherwise a timer will activate causing the code already entered to reset. When the door is unlocked, the corresponding visual and audio instructions shall be activated. The unlocked period shall be adjustable from 1 to 30 seconds. The L.E.D. matrix display at the main entrance doorphone panel shall only display "*" during the code entry and before the door is released. When incorrect codes are entered, the visual and audio instructions for "Incorrect Entry" shall be activated and the system shall reset to its normal condition by pressing the "Clear" button or after a predetermined period adjustable from 1 to 30 seconds.

**ELE24.3.2.080.7 WIRING INSTALLATION**

The wiring from the equipment enclosure on each floor to the doorphone handset in each domestic flat shall be carried out by the Sub-contractor in concealed conduit wiring system as shown on the Drawings. The wiring from the meter room to each domestic flat through the concealed conduits shall be multicore cables with number of cores not less than four.
STANDBY POWER SUPPLY
The Doorphone System shall be provided with standby power supply to enable the system to operate for a period of not less than four hours at average power consumption of 20 calls per hour subsequent to a mains failure. The stand-by power shall be of nickel cadmium type battery complete with trickle charger and with minimum nominal capacity of not less than 10AH. The battery shall be automatically recharged when the permanent supply restores.

LOCAL CLOSED CIRCUIT TELEVISION MONITORING SYSTEM

GENERAL
1. Closed circuit television systems shall be installed at the various locations of each block as indicated on the Drawings; public signage related to CCTV surveillance shall be provided and installed in accordance with the details shown on the Drawings;
2. Unless otherwise specified in Project Specific Specification or Drawings, all DVR's and LCD monitors will be supplied by others. The Sub-contractor shall be responsible for picking up and delivery to site the above equipment from the respective suppliers as directed by the Contract Manager. Upon receipt of the DVR from the supplier, the Sub-contractor shall ensure the firmware of the DVR and the client remote software supplied with the DVR are the latest version by checking with the Contract Manager. The Sub-contractor shall be responsible for safe keeping, installing, wiring up and integrating the above equipment with their own supplied equipment to form a fully functional system as stipulated in the Specification. The Sub-contractor shall programme, set up, test, commission, maintain and service the entire system, including the above equipment provided by the others, as a single integrated system;
3. If the distance between the DVR and the LCD monitor is too large for a direct connection by VGA cable, a pair of VGA extenders shall be used as shown on the Drawing or as indicated in Project Specific Specification. The VGA extenders will be supplied by others but the Sub-contractor shall be responsible for the installation and all cabling between the extenders;
4. The technical specification of the DVR provided by others is given in section ELE24.2.4;
5. The technical specification of the LCD monitor provided by others is given in section ELE24.2.2.

DOORPHONE PANEL
1. CCTV camera shall be installed within the doorphone panel to capture the view of the visitors. The view shall be displayed at:
   a. Monitors at the guard counter;
   b. Tenants' television sets through the CABD installation.
2. The camera shall be built in the doorphone panel. Lighting other than those originally included in this sub-contract shall not be required for the camera to transmit clear and satisfactory pictures at night time.

LIFT
1. CCTV camera installed by others within each lift of the building shall be connected to the local CCTV monitoring system. The view shall be displayed at:
   a. Monitors at the guard counter;
   b. Tenants' television sets through the CABD installation.
2. Lift floor number generator:
   a. Lift floor number generator shall be provided for each lift. The lift floor number generator shall superimpose the following characters on the CCTV picture captured from the lift car:
      i. Lift floor numbers;
      ii. An up or down arrow showing lift travelling direction;
      iii. Lift alarm button activated.
   b. The image with superimposed characters shall be restricted for display at the monitor connected to the DVR at Security Counter only. The characters shall be positioned at one corner of the screen not interfering with other alphanumeric display, and clearly legible under all background conditions;
   c. The characters to be generated shall be based on the status of the lift provided by Lift Sub-contractor in the form of either normally open volt free contacts or digital signals. Interface shall be through an interface box located at the ground floor meter room or otherwise at locations as shown on the Drawings. The following types and quantities of data will be provided:
      i. Lift landing floor number, one for each landing floor;
      ii. Lift travelling directions, one for up and one for down;
      iii. Lift alarm activated status, one.
   d. Closing of a particular contact or change of state of a digital signal shall cause the generation of the corresponding set of characters it represents on the CCTV picture and the characters shall be removed as soon as the signal resets. When multiple closures of the same type of contacts are detected simultaneously, a fault signal (such as a blinking asterisk) shall be generated in lieu of the floor number or the directional arrow to indicate the fault condition. In case of digital signals, detection of contradictory signals shall also activate the same fault condition;
   e. The lift floor number generator shall conform to the following technical requirements:

<table>

ELE24.3.3.040.7 MAIN ENTRANCE/GUARD COUNTER

1. A CCTV camera shall be installed at the main entrance of each domestic block to capture the view of the guard counter/visitor;
2. The view shall be displayed at central CCTV system;
3. The camera lens shall be super wide angle type as follows:
   a. Focal length: F3.65 mm;
   b. Aperture: F1.8 to 3.5;
   c. Angular field of view: Not less than 72° horizontal, 97° diagonal.
SIDE ENTRANCE
A CCTV camera shall be installed at each side entrance of the block. The view shall be displayed at:
1. Monitors at the guard counter;
2. Central CCTV system at Estate Management Office.

ROOF EXIT
CCTV camera shall be installed at the roof exit staircase to monitor the staircase area leading from the top domestic floor to the roof exit gate. The view shall be displayed at
1. monitors at the tower guard counter.
2. Centralized CCTV system
The camera shall be similar to that used for lift CCTV system except that the camera shall be surface mounted under the ceiling. Super wide angle lens integral with the camera shall be used. The camera and the integral lens shall have the following characteristics:
- Focal length: f2.3mm to f2.5mm
- Aperture: F2.0
- Angular field of view: Not less than 95° horizontal 130° diagonal

RECORDING
1. The scenes captured by the above closed circuit television system except the camera inside the doorphone panel shall be recorded by a DVR installed at each building;
2. Video signal from cameras viewing guard counter and side entrances, should be presented for interface with the future central CCTV monitoring system in case the project does not include an Estate Management Office;
3. These video signals shall be in a form of standard composite video having the following specification;
4. Scanning: CCIR 625 lines 50 field Interlace 2:1;
5. Signal: Composite video normally 1.0V p-p characteristic impedance of 75ohms.

LOCAL ALARM AND DOOR MONITORING SYSTEM

LOCAL SYSTEM
1. A mimic panel made of 1.5 mm thick stainless steel plate with alarm buzzer and indicating light emitting diode (L.E.D.) showing the locations of the entrance doors and staircase exit doors at ground floor shall be installed at the guard counter. The layout of the building ground floor shall be engraved on the panel. An additional mimic panel shall be provided with indicating L.E.D. showing the locations of the staircase exit doors at roof level. The operation of the alarm and door monitoring system shall be as follows:
   a. Opening of any door shall cause the corresponding L.E.D. on the mimic panel to light up. Opening of the staircase exit door shall also cause the buzzer to sound intermittently. The L.E.D. and the buzzer if sounded shall go out if the door is closed afterward;
b. In case any main/side entrance door and staircase exit door has been opened for an adjustable period of 1 to 10 minutes without being re-closed and reset or any roof exit gate has been opened for an independently adjustable period of 0 (immediate alarm) to 10 minutes without being re-closed and reset, the corresponding L.E.D. shall flash and the buzzer shall sound continuously. A local indicating light shall be illuminated and a local buzzer shall also be sounded. An alarm signal shall be sent to the centralized alarm and door monitoring system for alarm reporting to the security control room;

c. The buzzer in the mimic panel shall be able to be muted by pressing the "Acknowledged" push button on the panel;

d. Pressing the "Reset" push button on the mimic panel after re-closing the door shall reset the local alarm;

e. In the event that any alarm has not been reset for an adjustable period of 1 to 10 minutes, an alarm signal shall be sent to the central alarm and door monitoring system for reporting the alarm to the security control room in the Estate Office;

f. Activation of the emergency breakglass for door opening shall cause a signal to be sent to the central alarm and door monitoring system;

g. Upon the activation of the guard counter panic alarm push button, L.E.D. on the mimic panel shall light up and an alarm signal shall be sent to the central alarm and door monitoring system;

h. Pressing of the "Test" push button on the mimic panel shall cause all the L.E.D. to light up and the buzzer shall sound.

2. In case interconnection is required to an existing central security system, the Sub-contractor shall ensure that the equipment provided for this system is compatible with the existing Central Security System for the interface requirements as stipulated in this Specification. The Sub-contractor shall be responsible for the verification of compatibility.

ELE24.3.4.020.7 INTERFACING WITH THE CENTRAL SECURITY SYSTEM

The details of interfacing requirement with central security system are specified in the Project Specific Specification.

ELE24.3.4.030.7 TELEPHONE SET

The requirements of provision of telephone sets are specified in the Project Specific Specification.

ELE24.3.5 CENTRAL SECURITY SYSTEM

ELE24.3.5.010.7 GENERAL

1. Central Security System or Second Tier Security System shall be installed in the security control room located in the Estate Management Office (EMO). These systems shall oversee the security system in individual building within the whole estate;

2. The Central Security System shall consist of the following:
   a. Central alarm and door monitoring system in security control room;
   b. Central CCTV system in security control room;
   c. A Local Area Network (LAN) providing connectivity between:
      i. The local CCTV and alarm systems of all domestic blocks;
      ii. Central alarm and door monitoring system;
      iii. Central CCTV system;
iv. Similar systems in other blocks as specified in Project Specific Specification and Drawings.

d. As shown in Project Specific Specification and on the Drawings, for those blocks that cannot be connected to the above LAN due to the obstruction by a barrier, such as a public road inaccessible for cabling work, or other site constraint that disallow cabling work, the connection to those blocks shall be provided by broadband lines subscribed from a Broadband Internet Service Provider (BISP). Each Broadband line shall conform to the following, unless otherwise specified:

i. Minimum 8 Mbps bandwidth for both uploading and downloading;

ii. With or without Internet access;

iii. Single fixed IP;

iv. IP access right within estate between PC and DVR;

v. All Transmission Control Protocol (TCP) and User Datagram Protocol (UDP) ports of broadband line shall be opened.

e. Telephone set at EMO and guard counters of domestic block and other location as specified in Project Specific Specification and Drawings.

3. The LAN mentioned in sub-clause 2 above shall conform to the following network standards on a backbone of optical fiber or cat. 5 UTP:

100 Mbps: Ethernet IEEE 802.3u, 100BASE-TX, 100BASE-FX.

4. The schematic of LAN, if shown on the Drawings, is for indicative purpose only. The Sub-contractor shall be responsible for the final design of the LAN and submit a detailed proposal, with a fully developed schematic, performance analysis and the technical specifications of all the hardware/software required, for the Contract manager's Approval. The system shall comprise all necessary components, such as switches, hubs, repeaters, bridges and routers, to form a fully functional network;

5. If broadband connection services are required, the Sub-contractor shall be responsible for the subscription and maintaining of the services at the EMO and the blocks, where the services are needed, for the entire period starting from testing and commissioning phase of the Works till the expiry of Maintenance Period. The details of the broadband connection services and the BISP shall be approved by the Contract Manager;

6. For all communication via Broadband Line, adequate data security shall be provided. All routers accessible from the Internet shall be configurable to run in Virtual Private Network (VPN) mode. The VPN routers shall be so selected that the data throughput shall be adequate for satisfactory transmission of CCTV images with no loss frame from the local systems to the central system with both firewall and VPN activated. The Sub-contractor shall verify the selection of the VPN routers in the performance analysis as stipulated in sub-clause 3 above;

7. The IP addresses and sub-netting arrangement of all the network devices on the LAN shall be submitted to the Contract Manager for approval. The Sub-contractor shall adopt the LAN IP format 192.168.xxx.xxx and sub-netting Class C with subnet mast set at 240 unless otherwise specified. The third octet number shall be assigned by the Contract Manager;

8. At the end of testing and commissioning of the central security system, the Sub-contractor shall prepare the following network data records for future maintenance and management of the system:

a. Network address list for all networked devices (with TCP/IP address of each network device, subnet setting, WAN IP address if any, etc.);

b. Network map (includes hardware location, device IP addresses and cable number/reference, etc.);
c. Network Equipment List (Equipment name, manufacturer name, Model no., Serial no., includes DVR, Ethernet Switch, Router, Personal Computer, LCD monitor, VGA extender, Cat5e cable, fibre optic cable, patch panel etc.);

d. Network hardware configuration (configuration information includes configuration files and protocol information, user name, password, etc. for each network device);

e. User manual for all networking and networked devices.

9. The Sub-contractor shall provide hard copy and soft copy of the data record as specified in sub-clause (8) above. Hard copy for data described in sub-clauses (8)(a), (8)(b), (8)(c) & (8)(d) shall be attached to the T & C report and these hard copies together with data described in sub-clause (8)(e) shall be included in the O & M manual. Soft copy of all the data records shall be burned onto CD-ROM or DVD-ROM and also stored in a protected sector of the hard drive in the PC of the central security system. A network map shall also be provided in each equipment rack housing the network devices, this map shall be fixed on the front glass panel in a secure manner and facing inward;

10. The Sub-contractor shall provide customized hands-on training on the operation and management of the central security system. The training shall include the system overview, the operation of hardware and the use of application software. The Sub-contractor shall allow two training courses each for up to 20 personnel nominated by the Contract Manager. One training course shall be arranged after the completion of the installation and the second upon the expiry of the Maintenance Period. The Sub-contractor shall provide all necessary training tools, materials and handouts. The Sub-contractor shall submit details of the training, such as the programme, the duration and the contents, for Contract Manager's approval.

ELE24.3.5.020.7 CENTRAL ALARM AND DOOR MONITORING SYSTEM

1. General

a. The central alarm and door monitoring system shall be provided for monitoring alarm signals from individual buildings for the whole estate. The central alarm and door monitoring system shall consist of the following:

i. Alarm transmitter and necessary network device at each domestic block;

ii. A central station consisting personal computer, printer, network devices and accessories at the security control room in estate office;

iii. Software for processing the alarms/events.

b. The communication between the transmitters at each local blocks and personal computer in EMO shall be through the LAN or Broadband Line connection;

c. The total numbers of alarm signals required for the whole estate are specified in Project Specific Specification.

2. Alarm Transmitter

a. The alarm transmitter shall have a minimum of 30 alarm inputs;

b. Upon receipt of an alarm, the transmitter shall send the alarm status to the central station at the security control room to report the emergency event;

c. The alarm transmitter shall test the alarm reporting function by reporting to the central station regularly at an adjustable time interval of ½ to 24 hours;

d. The alarm transmitter shall accept the following signals through the dry contacts:

i. Unattended prolonged opening or emergency opening of main/side entrance door;

ii. Unattended prolonged opening of staircase exit door;
iii. Emergency opening of roof staircase exit door;
iv. Panic alarm at guard counter;
v. Power failure to the control units;
vi. Signals from spare dry contacts;
vii. Lift alarm signals.
3. Central station
   The personal computer shall be of Approved registered trade name. The personal computer shall operate on Window XP or Vista platform (Traditional Chinese) or any latest versions of Window operating system approved by the Contract Manager and with minimum 2GB RAM memory, 100GB hard drive, DVD writer and the following peripheral hardware and software:
   a. Peripheral Hardware
      i. LCD monitor, 19 inch screen size;
      ii. Keyboard and optical mouse;
      iii. Laser jet colour printer;
      iv. All necessary network devices.
   b. Software
      i. Alarm processing and display system for all alarm signals from the whole estate plus 100% other future alarm signals;
      ii. All the texts/words shown on the screen for the information of and use by the guard supervisor shall be in Chinese. All the inputs required to be made by the guard supervisor shall be simple and user friendly to the approval of the Contract Manager;
      iii. Only licensed original software shall be used in each system.
4. Software function
   The software for processing and displaying the alarm in the central station shall have the following functions:
   a. Alarm and event monitoring overview
      The system shall be able to show a summary of all alarms and events and list the alarms and events in chronological sequence. The listed details shall include at least the following:
      i. Time of alarm/event;
      ii. Date of alarm/event;
      iii. Name of building;
   b. Password control
      The system shall be able to protect from use by unauthorized person by means of password control. The system shall provide different password for individual user. There shall be one master password for a user who has the authority to assign authority to individual user.
   c. Mimic map display
      In order for the security guard to easily identify the exact location of an alarm, the system shall store sets of mimic map including:
      i. The floor plans of each building with security doors and staircase exit doors within an estate with details of location of individual alarm detection points. All alarm detection points shall be properly labelled;
ii. Site layout plan in which a street map showing the location of all the buildings of an estate. The plan shall be properly labelled and easily updated in future.

These mimic map/plans shall be shown in at least 5 different colours.

d. History and reports

The system shall store the history of alarms and events received by the system for at least 31 days. The history shall be able to be retrieved by defining one or more of the parameters below:

i. Building name;
ii. Operator;
iii. Nature of event;
iv. Duration;
v. Type of action taken by the guard supervisor.

e. Remote terminal

The system shall have the ability to download information to another personal computer through LAN or Broadband Internet.

f. Database back-up

The system shall have facilities to back-up the data stored in the system on rewritable CD or DVD.

g. Capacity for future expansion

i. The system shall have capacity and facilities for expanding the alarm/event monitoring systems such that the no. of alarm/event signals can be doubled in future;

ii. Under normal condition, the alarm/event monitoring overview screen shall be presented. This screen shall show all the current and past alarm and event data. The outstanding alarms shall be in red colour. The reset of the alarm circuit shall cause the colour of the corresponding alarm text changed to white and at the same time, a text indicating the reset of the alarm circuit shall be shown. Events other than alarm shall be shown in white colour;

iii. Upon receipt of an alarm signal from the transmitter, the alarm shall be shown up on the monitor in the form of mimics. Initially, the site layout plan shall be shown with the block having alarm changed to red colour and flashed intermittently. The buzzer shall sound continuously. After the signal is accepted by the guard supervisor, the floor plan of the block shall be displayed with the location of alarm point changed to red colour and flashed intermittently. Simple instructions with nature of alarm and action required to be shown at the bottom of the screen;

iv. After the instructions are acknowledged by the guard supervisor, an action screen listing all the possible actions to be carried out by the guard supervisor shall be shown. The confirmation of the actions carried out by the guard supervisor shall be time tagged and stored in the system;

v. Should there be another alarm occur while the previous alarm is being processed, there shall be a window on the screen indicating the nature of the latest incoming alarm/event and the number of outstanding alarms on queue. This allows the guard supervisor to judge the urgency of the situation;

vi. By returning to the alarm/event monitoring overview screen the guard supervisor may select the most important alarm or event and process it accordingly;
vii. The history of the alarms and events can be produced by the printer at the command of the guard supervisor.

**ELE24.3.5.030.7 CENTRAL CCTV SYSTEM**

1. General
   a. The CCTV images captured by each local CCTV system shall be transmitted to the EMO via LAN or Broadband Internet as specified in *Project Specific Specification* and Drawings;
   b. The Sub-contractor shall programme and set up the DVR in each domestic block to transmit the video images to the personal computer in EMO;
   c. The Central CCTV system shall consist of the following components, to be provided by the Sub-contractor unless otherwise specified:
      i. Cameras at the local CCTV systems;
      ii. DVR's at the local CCTV systems;
      iii. LAN and Broadband Internet connection;
      iv. Central station (a personal computer with accessories) at security control room in EMO.

2. Central Station
   The personal computer shall be of Approved registered trade name. The personal computer (PC) shall operate on Window XP or Vista platform (Traditional Chinese), any latest Window operating system other than the above can be accepted subject to Contact Manager's approval. The PC shall be equipped with minimum 2GB RAM memory, 250GB hard drive, DVD writer and the following peripheral hardware and software:
   a. Peripheral Hardware
      i. LCD monitor, 19 inch screen size;
      ii. Keyboard and optical mouse;
      iii. Laser jet colour printer (shared with the central alarm and door monitoring system);
      iv. All necessary network devices.
   b. Software
      i. Remote end CCTV monitoring software to be provided by the DVR suppliers and installed and set up by the Sub-contractor.

**ELE24.3.6 CENTRAL SECURITY SYSTEM SIGNALS TERMINATION BOX**

**ELE24.3.6.010.7 TERMINATION**

All the video and panic alarm signals which all required to be interfaced with the central CCTV system shall be terminated properly to sockets in a separate metal housing at G/F of the meter room. The Sub-contractor shall collect the video transmitters and modems from the Estate Office and complete the Central Security System.
ELE24.3.7 CABLELING AND CONNECTIONS

ELE24.3.7.010.7 CABLE
1. Video and radio frequency cables shall be run in concealed conduit separated from power and control cables unless otherwise shown on the Drawings. If surface wiring of video and radio frequency cables has to be performed, they shall maintain a distance of at least 100 mm from power conductors;
2. Internal wiring within console or equipment racks shall be neatly run and held fixed in cable ducts by non-rusting cleats or cable ties;
3. The installation and handling of the cables shall be undertaken at all times by adequate staff suitably trained and supplied with all the necessary equipment and tools. The arrangement of the cables and all method of laying shall be Approved by the Contract Manager and shall be an orderly manner, free from unnecessary bends and crossing and will permit the removal of any one cable without undue disturbance to adjacent cables.

ELE24.3.7.020.7 CONNECTION
1. Connection of cables between an equipment and a wall-mounted adaptor box; or between the equipment rack or console and the cable conduit or trunking shall be protected by flexi-conduit to BS EN 61386-1 or IEC 61386-1;
2. Cable connections to an equipment or control panel shall, as far as possible, be provided with plug-socket configuration. Where direct entry of a cable through a metallic cover or panel of an equipment rack is unavoidable, the hole through the metallic cover or panel shall be protected by rubber grommets to avoid cuts;
3. Jointing of cables shall be avoided. Where a joint is considered acceptable by the Contract Manager all cables shall be jointed by properly designed connectors or inside joint boxes;
4. The Sub-contractor shall provide 75 ohms BNC type video connectors for all cable connections to video equipment or connection panel of control consoles;
5. Handsets of the doorphone system in individual flats shall be connected to the main trunk cable through a termination box located in the meter room on each floor. A printed circuit board shall be provided in the termination box for the purpose of cable connection and termination. All terminal blocks and other system components such as diodes and resistors shall be mounted on this printed circuit board. Interconnections between incoming terminals, outgoing terminals and other system components shall be achieved by copper tracks etched on the printed circuit board and jumper wires shall not be used. Labels shall be printed on the printed circuit board to show the identity of each component, the function and associated flat number of each terminal. A sample of a fully completed printed circuit board together with a labelled circuit diagram shall be submitted for approval prior to manufacturing.

ELE24.3.8 EARTHING

ELE24.3.8.010.7 GENERAL
1. All consoles, operator panels, equipment chassis, camera housing, monitor housing that are constructed from metal shall be suitably earthed against electric shock;
2. If the system design or equipment configuration requires the signal circuit common (applicable to video, radio frequency or control circuitries) to be earthed to minimise interference and/or electromagnetic pick-up, these shall be earthed at a single point to avoid hum loops;
3. Earthing arrangements shall be in accordance with the Electrical CoP.
ELE24.4 TESTING, COMMISSIONING, ACCEPTANCE AND MAINTENANCE

ELE24.4.1 PERFORMANCE TESTS, ADJUSTMENTS, COMMISSIONING AND ACCEPTANCE

ELE24.4.1.010.7 GENERAL
The Sub-contractor shall carry out complete performance tests for all equipment and system installed by him, make all necessary adjustments, commission the installations, and submit the test reports, all to the satisfaction of the Contract Manager who may request the Sub-contractor to repeat all or some of the tests in the presence of his representatives before the installation will be accepted.

ELE24.4.2 TEST

ELE24.4.2.010.7 TEST FOR DOORPHONE PANEL
Before delivery of the doorphone panel to site, the Sub-contractor shall perform the functional tests of the doorphone system at the manufacturer's workshop or bench test in EMSD's office to the satisfaction of Contract Manager's representative:

1. Functional test of all push buttons in the visitor panel shall be conducted;
2. Functional test of the selection of flats and the two-way communication between the panel and the selected flats shall be conducted;
3. To facilitate the test, a test panel with sufficient indication lights and sockets for connection of handset unit to simulate the flats of the block shall be provided to demonstrate the floor/flat selection and two-way communication. After pressing the selected floor and flat, the correct pilot light shall be illuminated in the test panel and the communication between the visitor panel and addressed flat's handset shall be functioned;
4. During the system communication, the sound quality, sound output level, sensitivity of microphone, and door releasing button of the handset shall be checked;
5. The picture displayed in the video monitor receiving from the CCD video camera in the visitor panel shall have good quality.

ELE24.4.2.020.7 ELECTRICAL TESTS
1. The electrical installation associated with the installation shall be tested to comply with the Electrical CoP and I.E.E. Wiring Regulations, latest edition;
2. Essential performance parameters of all active components of the system as detailed in this Particular Specification including CCTV, amplifier, quad unit etc. will be bench tested and verified by Electrical and Mechanical Services Department. The Sub-contractor shall, at his own cost, deliver the equipment together with test report as required by the Contract Manager or his representative for bench testing and subsequently to the site;
3. The testing procedures recommended by the manufacturer for CCD cameras shall be submitted for Approval;
4. After completion of the installation and before acceptance, the system shall be tested by the Sub-contractor in the presence of the Contract Manager or his representative. All operational functions and performance parameters as specified shall be clearly demonstrated and verified.

**ELE24.4.3 SCOPE OF WORK DURING MAINTENANCE PERIOD**

**ELE24.4.3.010.7 GENERAL**

The scope of work shall include:

1. To carry out all repairs necessary to maintain the Security System installation in good working order at all times;
2. To provide all transport, labour and materials, including cleaning materials, tools and all testing instruments required for the maintenance service;
3. To despatch competent and specially trained workmen to attend any requirement for an emergency inspection within 1 hour during office hours or 2 hours if outside office hours after receiving the report of a fault. The system shall be repaired and restored to normal within 24 hours. In the event that it being impossible to perform the requirement within the time stipulated, the Sub-contractor shall explain immediately to the Contract Manager or his or her representatives the reason for such non-conformance;
4. To despatch competent and specially trained workmen once monthly during normal working hours i.e. 0800 hours to 1700 hours, or as otherwise stated in the Schedule of Installations to inspect, clean and when necessary, align, adjust and maintain the whole installation, and to sign a "Maintenance Record Book" in the way described as follows:
   a. On arrival at the estate, the workmen shall report to the Estate Office and sign a "Maintenance Record Book" which will be kept by the Officer-in-Charge of the estate. At the time of signing, they shall note any message written in the book concerning the performance of any parts of the Security System on the estate, and shall take such action as may be required. They shall inspect the installation on the estate at the time of this regular inspection and make any repairs, replacements or adjustments which may be required, irrespective of whether or not such repair or adjustment is noted in the book;
   b. When leaving the estate, the workmen shall report to the Office-in-Charge and enter in the "Maintenance Record Book" a brief report on any repairs, replacements or adjustments, which have been carried out or on the fact that they have found the system operating satisfactorily.
5. The items provided by others have the following warranty periods offered by the respective suppliers. During the warranty period, the Sub-contractor shall be responsible for calling and liaison with the suppliers for on-site repair/maintenance of faulty equipment. Upon the expiry of the warranty and in case of equipment fault, the Sub-contractor shall obtain details of the necessary repair including cost information from the suppliers and report to Contract Manager. Under all circumstances, the Sub-contractor shall ensure the proper functioning of the entire installation after the faulty equipment is repaired or replaced by the suppliers:
   a. LCD Monitor/VGA extender - 24 months commencing after 23 days from the date of delivery to the Sub-contractor;
   b. DVR - 12 months commencing from the date of delivery to the Sub-contractor.
6. Throughout the Maintenance Period, the Sub-contractor shall be responsible for the updating of the firmware of the DVR and the software of the DVR remote client in the following manner, as and when requested by the Contract Manager. For firmware update, the installation will be carried out by the DVR supplier on site with the attendance of the Sub-contractor. For updating of the DVR remote client, the Sub-contractor shall obtain the upgrade software from the DVR supplier and install it on the Central Station. After each firmware and software update, the Sub-contractor shall test the system and do all adjustment of system settings as necessary to make sure the system is back to full operational conditions and functionalities and record all the details in "Maintenance Record Book";

7. To provide quarterly reports on the condition of the system:
   a. To provide repairs and replacement parts at no additional cost to the Authority such as mechanical, electrical and electronic parts of the installation which the Contract Manager or the Sub-contractor in his judgement may consider necessary for the correct operation of the installation. Provided always that any renewals or repairs necessitated by reason of negligence or misuse of the equipment or by reason of any other cause beyond the Sub-contractor's control, with the exception of ordinary wear and tear, shall be carried out by the Sub-contractor if so required by the Contract Manager at an additional cost to be negotiated by both parties. Replacements shall be obtained from the manufacturer's spare parts list. Alternative components shall not be used without prior Approval by the Contract Manager;
   b. Should the Sub-contractor find it necessary to remove any system parts to his workshop for repair, the Sub-contractor shall install at the time of removal replacement parts of the equipment during the period of repair, free of cost to the Authority.

**ELE24.3.020.7 QUARTERLY SERVICING**

The Sub-contractor shall carry out, at three months intervals, routine servicing and preventive maintenance to maintain the security systems in proper working condition within the Maintenance period. The Sub-contractor shall conduct the inspection, servicing and maintenance works and submit a report to the Contract Manager after each inspection, as stated below:

1. Security door lock:
   a. Check and clean the door contact;
   b. Clean and check the proper operation of the electro-magnetic door lock and the conditions of all physical mounting and alignment;
   c. Check that the entrance door with electro-magnetic door lock can be released when the emergency breakglass for door release is activated;
   d. Check that the entrance door with electro-magnetic door lock is unlocked in case of mains power failure.

2. Doorphone system:
   a. Check for and repair/replace the push buttons;
   b. Check the condition of electronic components and printed circuit board;
   c. Check the operation of L.E.D. matrix display and other indicators for proper operation;
   d. Check that the functional operation of the systems meets with the specification requirements.

3. Local closed circuit television system:
   a. Clean the lens and housing of camera;
   b. Check the focus of camera;
c. Adjust the angle of view of the camera;
d. Check views of the camera on the monitor and in particular take note of the resolution of the picture;
e. Check and adjust the contrast and brightness of the monitor;
f. Clean the screen of the monitor;
g. Check the operation of DVR.

4. Local alarm and door monitoring system:
   a. Check that the functional operation of the system in particular the time delay setting meets with the specification requirements;
   b. Test the indicators and buzzer;
   c. Check the condition of the battery and charger.

5. Central alarm and door monitoring system:
   a. Check that the functional operation of the system meets with the specification requirements by means of simulating alarms at the building;
   b. Clean the floppy disk drive, if provided;
   c. Check the data storage and back up if necessary;
   d. Clean and check the proper operation of the printer.

6. Central CCTV system:
   a. Check that the functional operation of the system and the alarm reporting operation meets with the specification requirements;
   b. Check the views of the cameras on the monitor and in particular take note of the resolution of the picture;
   c. Check and adjust the contrast and brightness of the monitor;
   d. Clean the screen of the monitor;
   e. Check the operation of all network devices (routers, network hubs/switches etc.) at the local systems and the central system (i.e. at domestic blocks and EMO);
   f. Check the operation of the Broadband Line connections.

</table>
ELE25.1 GENERAL REQUIREMENTS

ELE25.1.010.7 GENERAL

This Particular Specification is in addition to, and is to be read in conjunction with, the relevant sections of the latest issue/amendment of the General PA Specification. The installation shall comply with the above specifications where relevant.

ELE25.1.020.7 SCHEMATIC DIAGRAM

The proposed schematic diagrams for the systems given in the Drawings are intended to serve as guidelines only and may not be taken as the final design. If any deviations are proposed or expected, tenderer shall enclose details of the proposed alternatives with their tenders for consideration.

ELE25.1.030.7 INFORMATION TO BE SUPPLIED WITH TENDER

1. Tender shall be accompanied by specifications, catalogues, literatures etc. in English language for each item of equipment offered;

2. In addition to the information required under the General Conditions of Tender and the Special Conditions of Tender, the following additional submission is required with tender:
   a. An extra copy of the Information to be Supplied by Tenderer and Schedule of Rates for PA System in a separate folder bearing the name of the Sub-contractor and Company's chop.

ELE25.1.040.7 SAMPLES OF EQUIPMENT

Tenderer may be required to submit sample of any equipment proposed to the Director of Electrical and Mechanical Service for bench acceptance testing before installation.

ELE25.1.060.7 EXECUTION OF WORKS

1. The Sub-contractor shall employ a contractor on the List of Approved Suppliers of Materials and Specialist Contractors for Public Works for Supply and Installation of Audio Electronic Equipment to carry out the works for the public address system. The name of the contractor shall be included on the Schedule of Information to be supplied by Tenderer at the time of tender submission. Subsequent to the acceptance of tender, the afore-mentioned contractor shall not be changed unless otherwise Approved by the Contract Manager;

2. The List of Approved Suppliers of Materials and Specialist Contractors for Public Works for Supply and Installation of Audio Electronic Equipment may be inspected by applying to the appropriate Housing Department Officer named in Special Condition of Tender SCT6 prior to submission of tender.
ELE25.2 THE PUBLIC ADDRESS SYSTEM

ELE25.2.020.7 FUNCTIONALITY OF THE PUBLIC ADDRESS SYSTEM

The System will be used for making announcement and playing background music to the selected areas of the commercial centre. The system shall allow:

1. Announcement to be made from the console by means of a hand-held microphone with on-off switch;
2. Background music to be played by means of a CD player with MP3 playback function and/or a radio tuner at the console; and
3. Speeches and music programmes fed from remote signal input points (RSIPs), as specified in Project Specific Specification and/or Drawings, to be broadcasted.

ELE25.2.030.7 COMPONENTS OF THE PUBLIC ADDRESS SYSTEM

The system shall comprise the following items, each to be complete with necessary accessories:

1. A hand-held type microphone with built-in "ON/OFF" talk switch completes with mike hanger and coiled cable of 1 m to 1.5 m long;
2. An AM/FM radio tuner;
3. A CD player with MP3 playback function;
4. An input selection panel - the input selection panel shall perform the input switching function as detailed in ELE25.3.050 below;
5. One mixer preamplifier - the mixer preamplifier shall accept all system inputs. Individual volume control shall be provided for each system input;
6. The quantities and power ratings of power amplifiers to be used for the system shall be clearly stated by the tenderer in his tender. The total load connected to each individual power amplifier shall not be more than 90% of its rated power;
7. A speaker selector shall allow speaker zones to be selected individually or collectively in any combinational manner, plus the all-call function. Details of speaker zones are given in Project Specific Specification and/or Drawings;
8. A volume control panel shall allow individual step volume control of each speaker zone. Details of speaker zones are given in Project Specific Specification and/or Drawings;
9. A monitor panel with two monitoring circuits;
10. A steel equipment cabinet rack for holding items (1) to (9) above;
11. 3W ceiling mount speakers, number to be given in Project Specific Specification and/or Drawings;
12. Wide range horn speakers, number and wattage to be given in Project Specific Specification and/or Drawings;
13. Column speakers, number and wattage to be given in Project Specific Specification and/or Drawings; and
14. Remote signal input circuits where each circuit consists of a number of remote signal input points connected in parallel. Details to be given in Project Specific Specification and/or Drawings.

ELE25.2.040.7 REMOTE SIGNAL INPUT POINT (RSIP)

All remote signal input point (RSIP)'s shall be connected to the equipment rack by microphone cables. A cannon socket shall be provided for each RSIP and installed in the manner as described in ELE25.4.030.
ELE25.050.7 PORTABLE PUBLIC ADDRESS SYSTEM

The portable system shall comprise the following equipment items, each to be complete with necessary accessories:

1. 2 hand-held type microphones each complete with a tiltable mount adaptor and a suitable floor stand of adjustable height. The length of cable required for each microphone shall be 10 m;

2. A portable mixer power amplifier (or a portable mixer-preamplifier plus a portable power amplifier) with at least 2 microphone inputs, 1 magnetic phono input, and 1 auxiliary input. A line level output is also required. Minimum output power of the amplifier is given in the Project Specific Specification and/or Drawings;

3. 2 Nos. speaker columns each complete with a suitable height floor stand support. Output power of the speakers is given in the Project Specific Specification and/or Drawings;

4. A 10 m long extension microphone cable shall be provided for connecting the line output of the amplifier to any one of the RSIPs of the Public Address System. The cable end for connecting to the RSIP shall be terminated with a cannon plug;

5. A 10 m long extension speaker cable shall be provided for each speaker column for connecting the speaker to the power amplifier;

6. The Sub-contractor shall supply a trolley with heavy duty casters. All the above equipment except the speakers and their accessories shall be mounted on it. The sub-contractor shall submit a shop drawing to the Contract Manager for Approval prior to fabrication.
ELE25.3  EQUIPMENT FUNCTIONAL REQUIREMENTS AND PERFORMANCE CHARACTERISTICS

ELE25.3.010.7  GENERAL
1. Unless otherwise specified herein, all equipment items to be supplied shall comply with the functional requirements and performance characteristics specified in Section 4 of the General PA Specification;
2. In case of any discrepancy between this specification and the General PA Specification the former shall take precedence;
3. The Monitor Panel, the Input Selection Panel and the Volume Control Panel for the Public Address System shall be made of 1.5 mm thick stainless steel plate or 3.2 mm thick anodized aluminium plate. All labels shall be engraved. Drawings of the panel layout shall be submitted for Approval prior to fabrication;
4. The requirements of sub-clause (3) shall apply also to the front panel of the Speaker Selector for the Public Address System if this item is custom made.

ELE25.3.020.7  AM-FM RADIO TUNER
1. A quartz synthesizer AM/FM tuner with auto-scan tuning shall be provided. It shall be equipped with at least 12 preset tunings with 6 for FM channels and 6 for AM channels. The tuning circuit of the tuner shall be stable enough to maintain unattended operation over long period;
2. The tuner shall be capable of receiving radio programmes in AM band of 530 to 1,605 kHz and FM band of 88 to 108 MHz;
3. The tuner shall be complete with band selector and volume control, and shall also satisfy the following minimum performance characteristics:
   a. Sensitivity shall be better than 100uV for AM (1,000 kHz) and 10uV for FM (2 dB quieting, 40 kHz deviation);
   b. Signal-to-noise ratio shall be greater than 40dB for AM and 65 dB for FM;
   c. Selectivity shall be not lower than 6 kHz for AM and 250 kHz for FM at –3 dB point;
   d. Total harmonic distortion shall not exceed 2% for AM (5 mV, 400 Hz) and 1% for FM (1 kHz);
   e. FM intermodulation distortion shall not exceed 0.3%;
   f. FM frequency response shall not vary by more than 3dB over the frequency range 30 - 15,000 Hz;
   g. Output level shall be not less than 450 mV.

ELE25.3.030.7  CD PLAYER
1. This shall be a multi-CD player with MP3 playback function. It shall be of rugged design suitable for long hours playback of background music;
2. It shall comprise of a front access USB socket for audio file play back;
3. The multi-CD player shall have the series playback function so that after one disc finishes, the other shall start playing automatically;
4. It shall satisfy the following minimum performance characteristics:
a. Frequency response : 20 to 20,000Hz ± 2 dB;
b. Harmonic distortion : Less than 0.02% at 1 kHz;
c. Signal to noise ratio : Better than 98 dB.

ELE25.3.040.7 MICROPHONES
All microphones shall be of unidirectional (cardioid) dynamic type.

ELE25.3.050.7 INPUT SELECTION PANEL
1. The panel shall comprise of push-button switches, illuminated indicators and the associated control circuitry to facilitate the selection of the following inputs.
   a. Tuner;
   b. CD player with MP3 playback function;
   c. Console microphone (selected by the microphone "ON/OFF" switch);
   d. Remote signal input point;
   e. Spare.
2. The microphone input shall have priority over all other inputs and is selected by its "ON/OFF" switch. The control circuitry shall be able to select the microphone input automatically when the microphone is switched to "ON" position and back to the previous selected input source when it is switched off;
3. Only one input shall be selected at any one time;
4. The input selection panel and the volume control panel mentioned in ELE25.3.070 should preferably be installed in a single panel mounted on the console.

ELE25.3.060.7 MONITOR PANEL
1. The panel, required for the Public Address System, shall consist of two monitoring circuits - Circuit A for monitoring the outputs of all power amplifiers and Circuit B for monitoring the zone outputs of the volume control panel. The number of zones is given in Project Specific Specification and/or Drawings;
2. All the facilities specified in Clause 4.2.9(b) of the General PA Specification, except item (ii), shall be provided for the Monitor Circuits A & B;
3. A master power ON/OFF switch with lamp indication shall be provided on the panel for the whole Public Address System.

ELE25.3.070.7 VOLUME CONTROL PANEL
1. The panel, required for the Public Address System, shall have a number of sets of rotary switches and auto-transformer circuits for varying the output voltage of the speaker lines individually. The number of sets is given in Project Specific Specification and/or Drawings;
2. For each control circuit, a minimum of six control steps giving attenuation right from full speaker line output (0 dB) to a value of not less than 15 dB shall be provided.

ELE25.3.080.7 EQUIPMENT CABINET
1. Equipment cabinet for the Public Address System shall be a steel cabinet rack of standard 19 inch (483 mm) EIA type;
2. The cabinet rack shall be made of mild sheet steel of at least 1.2 mm thick, complete with two layers of stoved enamel or one layer of epoxy powder paint, and coloured grey;
3. Provision of a front locking door for the rack is optional. However, it shall have a detachable back panel (or cover) to facilitate easy servicing. The back panel (or cover) shall be either fixed by screws or fitted with hinge and lock. Blank panels shall be provided to fill up gaps and spaces on the rack front;

4. It shall be complete with a blower fan unit to assure good ventilation;

5. Drawing of the cabinet rack and proposed equipment mounting layout shall be submitted for Approval prior to fabrication.

ELE25.3.090.7 CEILING SPEAKER

1. Ceiling mount speakers for the Public Address System shall be suitable for flush-mounting on false ceiling;

2. Input power rating of the ceiling mount speaker shall be at least 3W and equipped with matching transformer. The transformer shall be complete with at least 1 W, 2 W and 3 W tappings with insertion loss of not exceeding 1 dB;

3. The ceiling mount speaker shall have aluminium or metallic alumited punching grille and complete with a metal enclosure. The area of punching shall be not less than 10% of the total area of the metal grille;

4. If there is no false ceiling, surface type ceiling speaker shall be provided.

ELE25.3.100.7 HORN SPEAKER

Wide range horn speakers of outdoor type shall be provided for the Public Address System. Input power rating of the horn speaker is given in the Project Specific Specification and/or Drawings.

ELE25.3.110.7 COLUMN SPEAKER

1. Column speaker shall be of weatherproof type suitable for outdoor application for the both fix mounting and portable PA Systems. Enclosure shall be made of non-rusting metallic material;

2. Input power rating of the column speaker is given in the Project Specific Specification and/or Drawings...
ELE25.4 INSTALLATION REQUIREMENTS

ELE25.4.010.7 GENERAL

Unless otherwise specified in this specification or on the Drawings, all signal cables shall be provided in concealed conduit wiring system. Speaker and microphone cables shall be installed in separate conduits. Voltage of control cables sharing the same conduit with microphone cables shall be d.c. 24V or lower. Microphone cables shall mean all microphone cables carrying line or lower level audio signals.

ELE25.4.020.7 MOUNTING OF CEILING SPEAKER

1. The ceiling speakers shall be linked to the BESA boxes at conduit outlets by flexible conduits (with PVC oversheath and dome covers);
2. The Sub-contractor shall provide mounting brackets and necessary mounting materials for the ceiling speakers;
3. Mounting of the ceiling speakers, including mounting brackets, shall be carried out by the Sub-contractor;
4. Cutting of openings on the false ceiling for the speakers will be carried out by the Main Contractor, however information of which shall be provided by the Sub-contractor;
5. The tenderer shall enclose details of the installation method, together with complete information on exact dimensions of the ceiling speaker and mounting bracket, size of ceiling opening required, total mechanical loading of speaker including mounting bracket, etc. in his tender for consideration;
6. Proper connector, such as terminal block, shall be provided inside the speaker enclosure for the speaker cable to facilitate easy removal of the loudspeaker unit.

ELE25.4.030.7 MOUNTING OF REMOTE SIGNAL INPUT POINT (RSIP) CONNECTORS

If RSIP is required, the Cannon Socket for the RSIP of the Public Address System shall be flush mounted or a stainless steel plate. The plate shall be fixed inside a drip-proof stainless steel box complete with hinged cover and lock. The size of the box shall not be more than 180 x 180 x 100 (D) mm and it shall be fixed onto a BS 4662 box provided by others.

ELE25.4.040.7 AM-FM RADIO TUNER

The FM signal for the AM-FM Radio Tuner shall be obtained from the Communal Aerial Broadcast Distribution System socket outlet at the position as shown on the Drawings.
ELE25.5 TESTING, COMMISSIONING, ACCEPTANCE AND MAINTENANCE

ELE25.5.010.7 PERFORMANCE TEST, ADJUSTMENTS, COMMISSIONING AND ACCEPTANCE

The Sub-contractor shall carry out complete performance tests for all equipment and systems installed by him, make all necessary adjustments, commission the installations, and submit test reports, all to the satisfaction of the Contract Manager who may request the Sub-contractor to repeat all or some of the tests in the presence of his representatives before the installation is accepted. At the end of the maintenance period, the Sub-contractor shall repeat the tests to the satisfaction of the Contract Manager.

ELE25.5.020.7 ELECTRICAL TEST

The electrical installation associated with the installation shall be tested to comply with latest edition of the Electrical CoP and I.E.E. Wiring Regulations.

ELE25.5.030.7 SCOPE OF WORK DURING MAINTENANCE PERIOD

The scope of work shall include:

1. To carry out all repairs necessary to maintain the Public Address System installation in good working order at all times;

2. To provide all transport, labour and materials, including cleaning materials, tools and all testing instruments required for the maintenance service;

3. To despatch competent and specially trained workmen to attend any requirement for an emergency inspection and repair within 24 hours of receiving the report of a fault;

4. To despatch competent and specially trained workmen once monthly during normal working hours i.e. 0800 hours to 1700 hours, to inspect, clean and when necessary, align, adjust and maintain the whole installation, and to sign a "Maintenance Record Book" in the way described as follows:

   a. On arrival at the estate, the workmen shall report to the Estate Office and sign a "Maintenance Record Book" which will be kept by the Officer-in-Charge of the estate. At the time of signing, they shall note any message written in the book concerning the performance of any parts of the Public Address System on the estate, and shall take such action as may be required. They shall inspect the installation on the estate at the time of this regular inspection and make any repairs, replacements or adjustments which may be required, irrespective of whether or not such repair or adjustment is noted in the book;

   b. When leaving the estate, the workmen shall report to the Officer-in-Charge and enter in the "Maintenance Record Book" a brief report on any repairs, replacements or adjustments which have been carried out or on the fact that they have found the system operating satisfactorily.

5. To provide half-yearly reports on the condition of the system. The report should include, but not be limited to, the number of calls attended, the number and types of system parts replaced;

6.
a. To provide repairs and replacement parts at no additional cost to the Authority such as mechanical, electrical and electronic parts of the installation which the Contract Manager or the Sub-contractor in his judgement may consider necessary for the correct operation of the installation. Provided always that any renewals or repairs necessitated by reason of negligence or misuse of the equipment or by reason of any other cause beyond the Sub-contractor's control, with the exception of ordinary wear and tear, shall be carried out by the Sub-contractor if so required by the Contract Manager at an additional cost to be negotiated by both parties;

b. Replacements shall be obtained from the manufacturer's spare parts list. Alternative components shall not be used without prior Approval by the Contract Manager;

c. Should the Sub-contractor find it necessary to remove any system parts to his workshop for repair, the Sub-contractor shall install at the time of removal replacement parts of the equipment during the period of repair, free of cost to the Contract Manager.

ELE26.1 SCOPE OF WORK

ELE26.1.010.7 PROVISION OF CARPARK CONTROL AND MANAGEMENT FACILITIES
The Sub-contractor shall provide the following carpark control and management facilities as shown on the Drawings:

1. Automatic Carpark Control System (ACCS) and revenue collection provision;
2. _______ nos. of proximity cards and _______ nos. of blank magnetic stripe paper tickets;
3. Vehicle Image and Licence Plate Recognition System (VLRS);
4. Intercom System;
5. Car counting system and "FULL" sign;
6. Carpark CCTV System at Entrance and Exit Control Points and at strategic locations in the car parking control area as shown on the Drawings;
7. Interfaces with the Octopus clearing system;
8. System Interfaces to exchange electronic data with a HA data hub server via dial-up modem.

ELE26.1.020.7 ENTRANCE CONTROL POINTS
Unless otherwise specified, the Sub-contractor shall provide the following components at the entrance control point(s) at the car parking control areas as located on the Drawings:

1. Entrance Control Unit;
2. Floor-mounted drop gate barrier completed with automatic raising arm;
3. Underground presence and passage loop detectors;
4. Cameras and Floodlight for CCTV System and VLRS and accessories completed with weatherproof housings including mounting poles and brackets;
5. Vehicle's height detector with mounting pole and bracket;

ELE26.1.030.7 EXIT CONTROL POINTS
Unless otherwise specified, the Sub-contractor shall provide the following components at the exit control point(s) at the car parking control area(s) as located on the Drawings:

1. Exit Control Unit;
2. Floor-mounted drop gate barrier completed with automatic raising arm;
3. Underground presence and passage loop detectors;
4. Cameras and Floodlight for CCTV and VLRS and accessories completed with weatherproof housing including mounting pole and bracket.

ELE26.1.040.7 CARPARK CONTROL CENTRE
Unless otherwise specified, the Sub-contractor shall provide the following components at the carpark control centre as located on the Drawings:

1. ACCS Workstation;
2. Revenue collection provision;
3. VLRS Computer Unit;
4. Manual button for barrier control;
5. Master station of intercommunication system;
6. Equipment rack to keep CCTV system equipment and digital video recorders.

**ELE26.050.7 WIRING CONNECTION**

The Sub-contractor shall provide all necessary cable wiring for data, communication and power connection between the entrance control point, the exit control point and the carpark control centre, at both above-ground and under-ground.

**ELE26.060.7 EXECUTION OF THE WORK**

1. The Sub-contractor shall verify to the satisfaction of the Contract Manager that they are licensed for carrying out type III security work under the Security and Guarding Services Ordinance Cap. 460 and are competent to complete the works, otherwise they shall employ competent sub-sub-contractor(s), who have the required licence, to carry out the works relating to security. For the latter case, the Sub-contractor shall submit the proposed sub-sub-contractors’ relevant information related to the licence, technical capability, working experience on security system to the Contract Manager for approval. Whenever necessary, the Sub-contractor shall also submit documents and drawings for the completed projects to the Contract Manager for consideration. Inspection of the completed projects and visit of the proposed contractor’s office and workshop may be conducted, if deemed necessary;

2. The Sub-contractor shall be an Octopus authorized contractor, or otherwise employ an Octopus authorized contractor as its sub-sub-contractor to provide the ACCS. All system hardware and software related to the Octopus clearing system shall be approved by the Octopus Cards Limited. The Sub-contractor shall provide copies of approval certificates to the Contract Manager for vetting;

3. The Sub-contractor or its sub-sub-contractor for the ACCS shall have at least five carpark systems satisfactorily completed for more than 6 months, in the past three years;

4. For Sub-contract of the latter phase of a housing estate, the Sub-contractor shall ensure the ACCS and VLRS to match with the ACCS and VLRS of the earlier completion phases in the same estate.
ELE26.2  SYSTEM DESCRIPTION

ELE26.2.010.7  AUTOMATIC CARPARK CONTROL SYSTEM

1. The Automatic Carpark Control System (ACCS) shall include the following components:
   a. Entrance Control Unit(s);
   b. Exit Control Unit(s);
   c. ACCS Workstation;
   d. Revenue collection facilities;
   e. Automatic drop gate barriers;
   f. Loop detectors;
   g. Height detectors;
   h. All necessary wiring and accessories.

2. The ACCS shall be able to handle the following types of parking modes:
   a. Hourly or Concessionary Parking - operated by Octopus cards, or during the suspension of Octopus Card System, by magnetic stripe paper tickets;
   b. Season/Monthly Parking - operated by proximity cards;
   c. Complimentary Parking - operated by either magnetic strip paper tickets or manual control.

3. The ACCS shall be of fully automatic type. Under normal operation, no operator is required. Only in the suspension of the Octopus Card System, an operator at the ACCS Workstation is required to handle the cashier work. The magnetic stripe paper ticket dispenser at the Entrance Control Unit shall be disabled if Octopus Card System works properly;

4. The ACCS shall possess an anti-passback function for all season/monthly proximity cards. When any proximity card has been accepted by an Entrance Control Unit, the card cannot be re-used again at any Entrance Control Unit of the ACCS until the card has been accepted by an Exit Control Unit of the ACCS. Same principle shall be applied to the Exit Control Unit.

ELE26.2.020.7  VEHICLE IMAGE AND LICENCE PLATE RECOGNITION SYSTEM

1. The Vehicle Image and Licence Plate Recognition System (VLRS) shall capture and store the image of incoming and outgoing vehicles and automatically detect, recognize and verify alphabetical and numerical characters on images of vehicle licence plates taken by infrared cameras at low level at entrance/exit control points. The system shall be able to recognise all kinds of vehicle licence plate formats issued by local authority;

2. The VLRS shall comprise all necessary equipment including infrared cameras with weatherproof housings, VLRS computer, LCD colour monitor (19" or above) and well developed software for the system to perform to the Contract Manager's satisfaction. The overall accuracy of the licence plate recognition shall be up to 95% at any time. Cameras shall be provided at all entrance and exit control points;
3. When vehicles of Octopus Card/Magnetic Stripe paper ticket users enter the carpark, the infrared cameras at entrance control point shall take images of the incoming vehicles and their licence plates. The VLRS computer shall store and link up the data with the respective Octopus Cards/Magnetic Stripe paper tickets. The infrared cameras at the exit control point shall also take images of the leaving vehicles and their license plates. The VLRS shall compare and verify whether a licence plate taken at exit has been recorded at entrance with respect to the respective Octopus Card prior to automatically raising up the exit barrier arm. If the verification process fails, an alarm shall be initiated at the carpark control centre to alert the operator;

4. When vehicles of proximity card users enter the carpark, the infrared cameras at entrance control point shall take images of the incoming vehicles and their license plates. The VLRS shall compare them with the stored data of a pre-defined list of authorized vehicles and verify their validity prior to automatically raising up the entrance barrier arm. When vehicles of proximity card users exit the carpark, the infrared camera at exit control point and the VLRS computer shall do the same. Once the verification process fails, an alarm shall be initiated at the carpark control centre to alert the operator;

5. The VLRS can be by-passed, disabled or isolated completely from the ACCS inside carpark control centre by simple means whenever required at any time.

**ELE26.030.7**

**OPERATION AT ENTRANCE CONTROL POINT**

1. Three types of incoming vehicles – vehicles with height below 2 m, vehicles with height 2 m or above and motorcycle shall be identified by presence detection loop and height sensors and then the ACCS Workstation automatically decide on which rate to be charged according to the pre-set fee structure;

2. For season and monthly parking, when a proximity card is detected, the card information shall be transferred to the ACCS Workstation for checking and the VLRS shall activate illumination and take image of the front car licence plate from the infrared camera and image read shall be compared with the pre-defined vehicle number. Another built-in CCTV camera inside Entrance Control Unit shall take image of the driver and image read shall be stored in the VLRS computer. If the car licence plate number is verified, the barrier arm will be raised. The barrier arm shall be lowered automatically after the vehicle has passed the passage detection loop;

3. For hourly parking, when an Octopus Card is detected or a magnetic stripe paper ticket is drawn, the type of vehicle and the Card information shall be transferred to the ACCS Workstation and the VLRS shall activate illumination and takes image of the front car licence plate from the infrared camera and image read shall be stored in the VLRS Workstation. Another built-in CCTV camera inside Entrance Control Unit shall take image of the driver and image read shall be stored in the VLRS computer. The LCD display panel in the Entrance Control Unit shall display the information such as time and date of entry and remaining money value of Octopus Card. An automatic cutting-off thermal printer shall issue ticket indicating the date and time of entry to the hourly parker if a request button is being pressed. The barrier arm shall be raised and then lowered automatically after the vehicle has passed the passage detection loop;

4. The function of the magnetic stripe paper ticket dispenser shall be disabled when the Octopus card system is in operation;

5. When any data or information found invalid, the reason of invalidity shall be shown on the LCD monitor at the ACCS Workstation. An alarm signal shall pass to the ACCS Workstation to arouse the operator's attention. The barrier shall not be activated. The reader shall be set to receive another card.

**ELE26.040.7**

**OPERATION AT EXIT CONTROL POINT**

1. The presence of a leaving vehicle is detected by the presence detection loop;
2. For season and monthly parking, when a season/monthly proximity card is detected, the card information shall be transferred to the ACCS Workstation for checking and the VLRS shall activate illumination and take image of the front car licence plate from the infrared camera and image read shall be compared with the pre-defined vehicle number. Another built-in CCTV camera inside Exit Control Unit shall also take image of the driver and image read can be compared with the pre-stored image in the VLRS computer. If the car licence plate number is verified, the barrier arm will be raised. The barrier arm shall be lowered automatically after the vehicle has passed the passage detection loop.

3. For hourly parking, when an Octopus Card/magnetic stripe paper ticket is detected, the card information shall be transferred to the ACCS Workstation and the corresponding vehicle licence plate number taken by the VLRS shall be retrieved and compared. Another built-in CCTV camera inside Exit Control Unit shall also take image of the driver and image read can be compared with the pre-stored image in the VLRS computer. If the car licence plate number is verified, appropriate amount shall be deducted from the Card as hourly parking fees. The LCD display panel in the Exit Control Unit shall display the information such as time and date of exit and the remaining money value of Octopus Card and parking fee paid and an automatic cutting-off thermal printer shall issue ticket indicating the date and time of exit and the parking fee paid to the hourly parker if a request button is pressed. The barrier shall be raised and then lowered automatically after the vehicle has passed the passage detection loop.

4. When any date or information found invalid, the reason of invalidity shall be shown on the LCD monitor at the ACCS Workstation. An alarm signal shall pass to the ACCS Workstation to arouse the operator's attention. The barrier shall not be activated. The reader shall be set to receive another card.

ELE26.050.7 ACCS WORKSTATION AND REVENUE COLLECTION PROVISION

1. The ACCS Workstation and revenue collection provision shall include the following:

a. Central data station/cashier computer completed with a fully developed carpark management software and central database;

b. LCD colour monitor (19" or above);

c. Uninterrupted power supply unit (UPS) - for a back-up period of not less than 15 minutes for the computers for ACCS, VLRS and Octopus;

d. Magnetic stripe paper ticket coding and printing device;

e. Octopus Card reader/validator;

f. Clearing institution (Octopus) communication interface;

g. Telephone point;

h. Cash drawer;

i. Fee indicator;

j. Receipt printer;

k. Report printer.

2. The ACCS Workstation shall be capable of handling the following activities:

a. Processing of hourly parking and concessionary parking for transient parkers using Octopus Card/Magnetic Stripe paper ticket;

b. Processing of Season/Monthly parking for long term parkers using Proximity Card;

c. Processing of complimentary parking for special parkers using Magnetic Stripe paper ticket;

d. Automatic fee calculation;
e. Record of malfunctions of equipment and every transaction;
f. Daily accounting record and statistics;
g. Information on parking spaces;
h. Instant cash audit function;
i. Instant proximity card/magnetic stripe ticket checking;
j. Anti-pass-back control;
k. Independent control of the barriers;
l. Activation of the "FULL" sign;
m. Automatic printout and alarm message in case of faulty operation.

3. The ACCS Workstation shall link up with the VLRS and all other components to monitor and proceed with the operations of the ACCS through an Ethernet network. It shall provide overall control of car parking activities, identification of possible reconciliation discrepancies from clearing institution and data collected, and comprehensive and efficient financial and statistical report generation;

4. The ACCS Workstation shall be able to allow reading, checking, debiting and archiving against usage of Octopus Cards, and process the access/exit requests at the Carpark and store the transaction information in the central database;

5. The ACCS Workstation shall be so designed as to permit season/monthly proximity cards to be issued with simple operation of command code on the terminal keyboard. The proximity card shall be coded from the machine terminal that the parkers are free to enter and exit the carpark for a defined period of time, and the system shall be able to examine the validity of the ticket at the entrance and exit reader;

6. The ACCS Workstation and the management software shall be able to handle several transactions in parallel and simultaneously;

7. The ACCS Workstation shall be able to monitor not less than six kinds of alterable fee rates with respect to different kinds of vehicles and settings of grace periods. Different fee structures shall be preset and altered at the control keyboard and be viewable at the LCD monitor;

8. Monthly carpark user can make payment in the carpark shroff office by cash (or future pay collection system e.g. paywave);

9. Hourly carpark user can make payment simply by Octopus (or future pay collection system e.g. paywave) at the egress or in the carpark shroff office by cash in case of magnetic stripe paper tickets;

10. To enable payment for hourly carpark user to leave the carpark when shroff office is closed after office hour (for carpark at grade with 150 parking spaces or less), revenue collection provision is provided at the estate control room;

11. During ACCS breakdown, device shall be provided for keying in the Octopus cards number to the ACCS system or allow the use of the card reader device to retrieve hourly carpark user the entering time to carpark in collection of revenue prior to the system resume normal.
ELE26.2.060.7 CAR COUNTING SYSTEM

Vehicles entering and leaving the carpark shall be counted in order to determine when it is full. The number of season/monthly proximity cards should be automatically deducted from the total number of available spaces in the carpark. Season/monthly proximity card holders entering or leaving the carpark will be counted under a separate category which will not affect the total car parking bays assigned to hourly parkers. When the spaces available for hourly parking are full, the carpark “FULL” Sign Box in English and Chinese characters at the carpark entrance lane and a "FULL" message at the LCD of Entrance Control Unit shall illuminate. The Entrance Control Unit shall not allow any entry of hourly parking vehicle. Management software shall be able to set tolerance to the total number of available spaces for hourly parking in the carpark in order to allow the entry of Taxi/Drop-off vehicles without charges within an adjustable period of time.

ELE26.2.070.7 INTERCOM SYSTEM

1. The intercom system shall comprise master station(s) located at the carpark control centre and a slave station at each of the Entrance Control Unit(s) and the Exit Control Unit(s) respectively;
2. The master station shall be designed for desk-top mounting and shall be capable of communicating with any one of the connected slave stations. Direct communication between the slave stations is not required;
3. To initiate a call at the master station, the operator shall press the slave selection button on the master station once. The respective slave station indicator shall light up automatically. When the “CALL” button at the master station is pressed a high note call alarm shall be heard at the selected slave station and communication between the operator at the master station and the visitor/parker at the slave station can be made via the corresponding microphone and loudspeaker unit. On completion of the call, the system shall be reset by pressing the selected slave station selection button again;
4. When the master station is being called by a slave station, the buzzer alarm at the master station shall sound and the corresponding slave station indication light shall flash and the operator can answer the call by pressing the slave selection button;
5. The master station shall be so designed that it can communicate with only one slave station at a time. When the master station is engaged with one slave station, call from other slave station shall cause the corresponding slave station indication light to flash only without activating the buzzer alarm. The operator shall follow the same procedure as described above in answering the waiting calls.

ELE26.2.080.7 CARPARK CCTV SYSTEM

1. The carpark CCTV system shall be provided at the entrance and exit control points for monitoring and recording the traffic condition and over the car-parking area for carpark surveillance. It comprises the following equipment:
   a. 1 no. camera (colour) each at every entrance control point and every exit control point at middle level;
   b. cameras (colour) at strategic locations over the car-parking area as shown on Drawings;
   c. 19” LCD colour monitors as mentioned in ELE24.2.2; and
   d. 16-channel colour Digital Video Recorders (DVR) as mentioned in ELE24.2.4.
2. The Sub-contractor shall install LCD monitors on the working bench and DVRs inside a lockable equipment rack at the carpark control centre for the completion of the System;
3. For open carpark, the Sub-contractor shall supply and install CCTV cameras of fixed type encased in weatherproof housings suitable for outdoor use, cables and wirings and all necessary auxiliary devices and equipment in order to complete the system. The Sub-contractor shall supply and install all necessary mounting poles and devices for mounting of CCTV cameras and accessories. Depending on the site condition, the CCTV cameras over the open carpark can be mounted on the lamp poles of the landscape lightings;

4. The traffic condition at the entrance and exit control points and the parking condition over the car parking area can be monitored through the LCD monitors and recorded by the DVRs;

   Easy reading from recorded CCTV system as a proof to indicate the entering time of the hourly carpark user in case the ACCS is in total failure for the purpose of revenue collection prior to the system resume normal.

5. A proper signage shall be affixed on a prominent location to notify the public about the installation of CCTV system at the entrance control point(s);

6. The CCTV system including CCTV cameras, LCD monitors and DVRs for ACCS shall be an independent set of system separated from the CCTV system for car-parking area for carpark surveillance.

**ELE26.2.090.7**

**INTERFACING REQUIREMENTS WITH OCTOPUS CLEARING SYSTEM**

1. In case due connection to the HA data hub server as mentioned in ELE26.2.100 is not available at the time of handover, the Sub-contractor shall design and provide a system software for interfacing and exchanging electronic data with the Octopus Clearing System until the interfacing works mentioned in ELE26.2.100 is satisfactorily completed within the Maintenance Period. These electronic data include:

   a. Octopus Full/Interim Blacklist File (in Octopus proprietary format) from Octopus Clearing System for the ACCS to validate the Octopus card used;

   b. Octopus Data Exchange File(s) (in Octopus proprietary format) of the hourly income collected through Octopus devices.

2. The Sub-contractor shall be responsible for liaising with Octopus for the proper implementation of the interfaces, including the interface channel, frequency etc..

**ELE26.2.100.7**

**INTERFACING REQUIREMENTS WITH HA DATA HUB SERVER**

1. The ACCS shall be automated with system interfaces to exchange electronic data with a HA’s data hub server via dial-up modem. The Sub-contractor is responsible for implementing the processes to perform the following system interfaces between ACCS and the data hub server:

   a. Getting licensee information (in ASCII format) from the data hub server to control the entry and exit of season/monthly parking licensees at the carpark. The process is to get an interface file from the data hub server daily and import it into the ACCS for updating the monthly parking licensees authorized to facilitate proximity card validation. The licensee information from the data hub server includes:

      i. Carpark stock identifier;

      ii. Vehicle number;

      iii. Licence identifier;

      iv. Valid period from;

      v. Valid period to.
b. Getting carpark information (in ASCII format) from the data hub server to update the number of carpark spaces allowed for parking on each parking space type.

The process is to get an interface file from the data hub server daily and import it into the ACCS for updating parking space information. The output file will be provided by change trigger mechanism. The parking space information from the data hub server includes:
   i. Carpark stock identifier;
   ii. Type of parking space;
   iii. Number of parking spaces for monthly letting;
   iv. Number of parking spaces for hourly parking;
   v. Number of parking spaces for HD's self use;
   vi. Number of parking spaces for other use;
   vii. Effective date.

c. Providing information (in ASCII format) of the total income collected through Octopus for reporting to HA, and sending it to the data hub server.

The process is to produce and send an interface file to the data hub server daily for reporting the total hourly income collected through Octopus. The total hourly income information to be sent to the data hub server includes:
   i. Carpark stock identifier;
   ii. Octopus card device identifier;
   iii. Transaction date and time;
   iv. Total hourly income amount collected through Octopus.

d. Providing information (in ASCII format) of the detailed transactions for reporting to HA, and sending it to the data hub server.

The process is to produce and send an interface file to the data hub server daily for reporting the detailed transactions. The information to be sent to the data hub server includes:
   i. Carpark stock name;
   ii. Transaction reference (ACCS reference);
   iii. Transaction type;
   iv. Vehicle number;
   v. Type of vehicle;
   vi. Carpark entry method;
   vii. Transaction start date and time;
   viii. Entry gate (device) ID;
   ix. Transaction end date and time;
   x. Exit gate (device) ID;
   xi. Parking charge amount;
   xii. Free parking start date and time;
   xiii. Free parking end date and time;
   xiv. Free parking amount;
   xv. Amount collected;
   xvi. Payment method;
   xvii. Octopus card identification number;
xviii. Smartcard identification number (if applicable).

e. Providing statistical information (in ASCII format) for management reporting to HA, and sending it to the data hub server.

The process is to produce and send an interface file to the data hub server monthly for management reporting. The information to be sent to the data hub server includes:

i. Carpark stock name;

ii. Records of hourly parking:
   - Number of day passes sold;
   - Amount of revenue collected for the sale of day passes;
   - Number of other hourly parking tickets sold;
   - Amount of revenue collected for the sale of other hourly parking tickets;
   - Number of tickets issued for free parking;
   - Amount of revenue waived for the free parking tickets issued.

iii. Records of redemption of discount parking coupons:
   - Number of hourly parking coupons sold;
   - Number of hourly parking coupons redeemed;
   - Amount of discount for reimbursement.

iv. Records of monthly tickets sold:
   - Number of reserved monthly tickets sold;
   - Amount of revenue collected for the sale of reserved monthly tickets;
   - Number of floating monthly tickets sold;
   - Amount of revenue collected for the sale of floating monthly tickets.

v. Records of concessionary parking for disabled persons:
   - Number of concessionary hourly tickets sold;
   - Amount of revenue collected for the sale of concessionary hourly tickets;
   - Number of concessionary monthly tickets sold;
   - Amount of revenue received for the sale of concessionary monthly tickets.

vi. Records of letting of part-time parking:
   - Number of part-time parking monthly tickets sold;
   - Amount of revenue collected for the sale of part-time parking monthly tickets.

vii. Records of granting free parking for special vehicles (e.g. rehabilitation bus):
   - Number of tickets issued to special vehicles for free parking;
   - Number of hours waived due to free parking by special vehicles;
   - Amount of revenue waived due to free parking by special vehicles.

viii. Records of granting privileged parking:
   - Number of privileged parking tickets issued;
   - Number of hours waived for privileged parking tickets issued;
   - Amount of revenue waived for privileged parking tickets issued.
ix. Records of impounding, towing, storage charges, auction and others:
   - Number of charging cases for impounding, towing, storage charges, auction and others;
   - Amount of revenue collected for these charging cases.

x. Number of parking spaces reserved for disabled persons (as at month-end position);

xi. Obtaining waivers for letting to non-residents (for carparks in HOS courts only) [An indicator shows "Yes" or "No"]

xii. Records of monthly parking charging rates (if any):
   - Monthly rate for full-time reserved covered parking space for private car;
   - Monthly rate for full-time floating covered parking space for private car;
   - Monthly rate for full-time reserved open parking space for private car;
   - Monthly rate for full-time floating open parking space for private car.

xiii. Records of hourly parking charging rates (if any):
   - Hourly normal rate for private car;
   - Abolition of hourly reduced rate for private car [An indicator shows "Yes" or "No"];
   - Hourly reduced rate for private car;
   - Abolition of day-pass reduced rate for private car [An indicator shows "Yes" or "No"];
   - Day-pass rate for private car;
   - Adoption of hourly ascending scale for private car [An indicator shows "Yes" or "No"];
   - Hourly rate under ascending scale for private car;
   - Hourly rate for motor-cycle;
   - Hourly rate for light goods vehicle;
   - Abolition of hourly double charge rate for light goods vehicle [An indicator shows "Yes" or "No"];
   - Hourly double charge rate for light goods vehicle;
   - Abolition of hourly reduced rate for light goods vehicle [An indicator shows "Yes" or "No"];
   - Hourly reduced rate for light goods vehicle.

f. Providing the Octopus Data Exchange File(s) (in Octopus proprietary format) of the hourly income collected through Octopus devices to the data hub server, for central submission to the Octopus Clearing System by the HA.

The process is to send all transaction file(s) collected daily on the Octopus Card device(s) to the data hub server;

g. Getting the Octopus Full Blacklist File/Interim Blacklist File (in Octopus proprietary format) from the data hub server for updating the Octopus Card devices.

The HA will get the Octopus Full Blacklist File/Interim Blacklist File from the Octopus Clearing System. The process is to get interface file(s) from the data hub server and update the Octopus Card devices.
2. The Sub-contractor shall develop all programs and/or scripts in ACCS to perform the system interface processes and automate these processes such that the interfaces can be performed with minimum human operation. The automation shall include:
   a. To generate the file to the data hub server;
   b. To connect to the data hub server by dial-up on telephone line, with re-dial(s) if telephone line is busy or dropped;
   c. To provide FTP username and password for authentication;
   d. To make FTP file transfer request to the data hub server to send/get the files as binary data;
   e. To disconnect the dial-up connection;
   f. To import the file from the data hub server to update ACCS;
   g. To log the progress of the automated processes during execution, and save the log in ACCS;
   h. To display message in ACCS to show the result of the processes after execution.

3. The system interfaces shall be performed using web services through dial-up connection on a telephone line without PBX and with caller ID display;

4. The system interface processes shall be automated to run daily at regular timeslot. When required, ad-hoc execution of the automated processes shall be allowed;

5. The system interface files and the logs from the executed processes shall be kept in the ACCS for an adjustable period up to three months;

6. The Sub-contractor shall provide the user guide for operating and administering the system interfaces. The user guide shall include but not limited to:
   a. How to set the daily schedule of the automated processes for regular execution;
   b. How to launch the automated processes manually for ad-hoc execution;
   c. How to inspect the result of the automated processes after execution;
   d. The exception handling procedures when the execution of any automated process failed which include the reporting channel(s) for the failure, the steps to manually dispatch and receive the electronic data with alternative means (e.g. flash static memory, DVD-R, e-mail attachment, etc.) in case dial-up connection to the data hub server cannot be established, the steps to manually perform the failed system interface process, etc.;
   e. How to change the system interface parameters, such as the login username and password, the carpark stock identifier, the destination phone number for dial-up to the data hub server, etc.

7. The Sub-contractor is responsible for liaising with and providing assistance to HA staff for implementation of the system interfaces. The implementation will consist of the following tasks:
   a. To set up dial-up connection;
   b. To develop FTP requests from ACCS;
   c. To develop programs and/or scripts in ACCS to automate the system interface processes;
   d. To prepare user guide for operating and administering the system interfaces;
   e. To participate in the acceptance testing of the system interfaces to prove that all automated system interface processes work properly, information to/from the data hub server is correct, and information from the data hub server is properly updated in ACCS;
f. To provide proper training for the operation and administration of the system interfaces to the operators.

**ELE26.2.110.7 DATA REQUIREMENTS FOR ACCS**

The Sub-contractor shall maintain a set of database for the ACCS comprising the following:

1. Carpark geographical zone - It shall maintain the geographical zone and the charging rate that the Carpark locate;

2. Carpark time table - It shall maintain the operating hours of the Carpark which specifies the opening time and closing time of the Carpark. It shall support the complicated charging scheme such as "Day parking" and "Night parking";

3. Carpark quota table - It shall maintain the quota of parking spaces available in the Carpark for controlling the entry of hourly parking;

4. Carpark charging rate table - It shall maintain the various charging rates of the Carpark. It is applicable to monthly parking spaces, hourly parking spaces and other miscellaneous income, such as Towing fee, impounding charge, etc.;

5. Carpark payment method - It shall maintain the payment methods that supported by the Carpark, e.g. Octopus, cash, free parking coupon, etc. Methods currently in use shall be allowed to change easily and new methods can be added;

6. Carpark entry method - It shall maintain the entry methods supported by the Carpark. The proposed methods include proximity card (for season/monthly parking) and Octopus Card/ Magnetic Stripe Paper Ticket (for hourly parking). Methods currently in use should be allowed to change easily and new methods can be added;

7. Carpark facility - It shall maintain the facilities provided by the Carpark. The information shall include:
   a. Type of parking space;
   b. Number of parking spaces for monthly letting;
   c. Number of parking spaces for hourly parking;
   d. Number of parking spaces for HD's self use;
   e. Number of parking spaces for other use.

8. Detailed parking transaction - It stores all the detailed information regarding the entry, exit and revenue collected from the vehicle. Relevant data should include:
   a. Carpark stock identifier;
   b. Vehicle number;
   c. Type of vehicle;
   d. Carpark entry method;
   e. Transaction reference (ACCS reference);
   f. Parking charge amount;
   g. Transaction start date and time;
   h. Entry gate (device) ID;
   i. Transaction end date and time;
   j. Exit gate (device) ID;
   k. Free parking amount;
   l. Free parking start time and end time;
   m. Payment method;
n. Other relevant information (e.g. the octopus card identification, Smartcard/Licensee identification, etc. if any);
o. Payment period start time and end time (for monthly parking).

9. Customer (licensee) - It shall store all personal information of a licensee who registers in ACCS for monthly parking; Personal information shall include but not limited to Carpark stock identifier, Vehicle number, Smartcard/Licence identifier, Valid period from, Valid period to, Driver name, contact number, Vehicle types, Parking charges, Image of vehicle, Image of driver and etc.;

10. Customer car information - It shall maintain the information of customer car.
ELE26.3 MATERIALS AND EQUIPMENT

ELE26.3.010.7 GENERAL

1. The system installations shall be suitable for use under Hong Kong climatic condition with relative humidity and ambient temperature as shown below:
   a. Relative Humidity : up to 0.99 saturation;
   b. Ambient Temperature : peak from minus 5°C to plus 40°C for 4 hours continuously with an average from 0°C to plus 35°C over 24 hours period.

2. All equipment provided shall be compatible with the system installation;

3. All equipment shall be entirely suitable for use in the intended locations. The material finishes and construction of the equipment shall be such that it can withstand the possibility of vandalism, tampering and impact from vehicles;

4. Unless otherwise Approved, all cabinets exposed to weather shall be corrosion-resistant, constructed of not less than 1.5 mm thick grade 304 stainless steel or better, or heavy gauge aluminium alloy with epoxy coating, or equivalent;

5. Alternative design proposal for various items of equipment hereinafter specified will be considered but subject to the submission of detailed technical information enclosed in the tender;

6. All carpark control equipment shall have not less than one year proven reliability and in-service record established in local application, and evidence shall be produced to the satisfaction of the Contract Manager upon request;

7. Unless otherwise Approved, the specification for CCTV video camera, LCD video monitor, video distribution amplifier, digital video recorder, cables, equipment rack, etc shall be referred to ELE24.2.

ELE26.3.020.7 CENTRAL DATA STATION/CASHIER COMPUTER

1. The central data/cashier computer shall comprise a main computing unit of sufficient processing speed to suit the intended purpose, a DVD-RW, a colour LCD monitor (19” or above) with built-in speakers, a mouse and a keyboard;

2. The central data/cashier computer shall contain duplex hard-disks of equal capacity of no less than 2 TB arranged in RAID 1 (mirroring) for data storage so that failure of any one hard-disk can be replaced by a new one without any permanent loss of data. History of financial transactions for two years shall be kept and easily be retrieved. Provision shall be incorporated in the system for short and long term data storage such that the archived data can be analyzed to produce results and reports on carpark occupancy, parking frequency, malfunctions etc.;

3. The central data/cashier computer shall be completed with a fully developed carpark management software and central database;

4. The central data/cashier computer shall operate under a platform of Traditional Chinese MS Windows of updated version to be confirmed by project team;

5. The central data/cashier computer shall be ready for dial-up network connection;

6. The central data/cashier computer shall be backed up by UPS for a duration of not less than 15 minutes to prevent data loss in the event of power failure;

7. All softwares included shall be in free or full user licenses with no expiry date. Full set of system recovery diskettes, back up diskettes for the softwares shall be provided.
ELE26.3.030.7  **VLRS COMPUTER**

1. The VLRS computer shall comprise a main computing unit of sufficient processing speed to suit the intended purpose, a hard-disk of no less than 2 TB, a DVD-RW, a colour LCD monitor (19" or above) with built-in speakers, a mouse and a keyboard;

2. The VLRS computer shall contain high speed photo image processing and capture card with frame grabber function and be completed with a fully developed vehicle licence plate recognition software;

3. The image recognition speed shall be within 0.5 second and the optical character recognition (OCR) accuracy shall be at least 95% at anytime;

4. The VLRS computer shall operate under a platform of Traditional Chinese MS Windows of updated version to be confirmed by project team;

5. The VLRS computer shall be able to recognise licence plates from black and white images taken by the infrared cameras and to record high resolution colour images taken by the CCTV cameras for manual functions;

6. The VLRS computer shall be backed up by UPS for a duration of not less than 15 minutes to prevent data loss in the event of power failure;

7. All softwares included shall be in free or full user licenses with no expiry date. Full set of system recovery diskettes, back up diskettes for the softwares shall be provided.

ELE26.3.040.7  **ENTRANCE CONTROL UNIT**

Entrance Control Unit shall be completed with a factory manufactured floor-mounted weatherproof stainless steel enclosure and as indicated on Drawings, comprise the following components:

1. A proximity card reader completed with mounting pole and bracket installed at 2 meters (subject to site condition) above ground level for season/monthly parking;

2. An Octopus card reader installed at not less than 900 mm or greater than 1,150 mm for hourly parking;

3. A magnetic stripe paper ticket dispenser with button labelled "Press Button for Hourly Ticket" in both English and Chinese characters installed at not less than 900 mm or greater than 1,150 mm for hourly parking covered with a proper blank-off plate in case the ticket dispenser is not in use;

4. A slave station of the intercom system;

5. A backlit LCD colour visual instruction display panel;

6. An automatic cutting-off thermal printer for issuing receipts showing date and time of entry at the Octopus card reader and a button labelled "Press Button for Receipt" in both English and Chinese characters near the printer;

7. A built-in CCTV camera installed at not less than 900 mm or greater than 1,150 mm above ground level for capturing image of driver;

8. Allow for future addition of fee collection system e.g. paywave.

ELE26.3.050.7  **EXIT CONTROL UNIT**

Exit Control Unit shall be completed with a factory manufactured floor-mounted weatherproof stainless steel enclosure and as indicated on Drawings, comprise the following components:

1. A proximity Card Reader completed with mounting pole and bracket installed at 2 meters (subject to site condition) above ground level for season/monthly parking;

2. An Octopus Card Reader installed at not less than 900 mm or greater than 1,150 mm for hourly parking;
3. A magnetic stripe paper ticket validator installed at not less than 900 mm or greater than 1,150 mm for hourly parking;
4. A slave station of the intercom system;
5. A backlit LCD colour visual instruction display panel;
6. An automatic cutting-off thermal printer for issuing Octopus payment receipts showing parking fee paid and date and time of exit at the Octopus card reader and a button labelled "Press Button for Receipt" in both English and Chinese characters near the printer;
7. A built-in CCTV camera installed at not less than 900 mm or greater than 1,150 mm above ground level for capturing image of driver;
8. Allow for future addition of fee collection system e.g. paywave.

**ELE26.3.060.7 AUTOMATIC DROP GATE BARRIER**

1. Automatic drop gate barrier shall be of straight rising arm type. Articulated arm shall be accepted if the headroom of the covered entrance/exit is not enough to allow the arm from 90 degree movement;
2. The arm shall be made from an Approved weather resistant material suitably treated to prevent corrosion. It shall be sufficiently strong to withstand vandalism. It shall be so fabricated that it will shear off under impact by a vehicle in order to minimize damage to the arm and prevent damage caused to the mechanism and the cabinet;
3. The arm when at low position shall be of a length not less than 3.5 m or the corresponding width of the drive way whichever is the shorter. The clearance from the drive way finished level to the top of arm when the barrier is raised shall be adjusted to suit the site condition;
4. When the barrier is at low position, the clearance between the bottom of the barrier and the drive way finished level shall be not less than 800 mm or greater than 1200 mm;
5. On receipt of an open signal from a card reader or ticket dispenser the barrier arm shall be raised and shall then be lowered on receipt of a closing signal from the passage loop detector. The barrier shall be raised again upon receiving another signal from a reader or dispenser;
6. Provision shall be made to enable the barrier to be manually operated (i) by holding down a Manual Control Barrier Button at carpark control centre, and (ii) by turning off the key switches at the corresponding Entrance/Exit control units in case of emergency;
7. The barrier shall have a "store vend" function which allows its barrier arm to reverse its downward motion immediately when a following vehicle has been accepted by an entrance control unit or an exit control unit.

**ELE26.3.070.7 LOOP DETECTOR**

1. Loop detector shall be inductive detection type suitable for placing in a slot cut on the drive way. The cables shall be waterproof and the slots shall be sealed with epoxy or an Approved sealant;
2. Loop detectors shall be installed as either presence detection loop or passing detection loop;
3. A presence detection loop shall pass an electric signal to the system when a vehicle is detected passing over it or stopped on it. The detector(s) at the entrance shall be capable of detecting any back-out vehicle;
4. A passing detection loop shall pass an electric signal to the system when a vehicle has passed over it. No electric signal shall be induced when a vehicle stops on it;
5. The loop detector provided shall be capable of detecting the presence and passing of three type of vehicles – vehicles with height below 2 m, vehicles with height 2 m or above and motorcycle;

6. Preventive measures of Electromagnetic Interference for detection loop shall be provided where applicable;

7. When no vehicle is detected passing over the loop detector within 30 seconds subsequent to the raising of a barrier arm, a signal shall pass to the ACCS Workstation to arouse operator's attention.

**ELE26.3.080.7**  
**HEIGHT DETECTOR**  
Height detector shall be weatherproof and of infrared type and used to detect the height of a vehicle stopping on the loop detector so as to differentiate different types of vehicles in order to determine automatically various fee rates for hourly parking and to facilitate car counting.

**ELE26.3.090.7**  
**PROXIMITY CARD**  
1. Long range proximity card for season/monthly parking shall be made of durable plastic with size of credit card. The card shall be a type commonly used in the automatic carpark control system. It shall be built-in with battery with lifetime of at least 4 years. The reading range shall be not less than 3 meters. The card reader shall enable frequency offset/hopping for operation on different frequencies such that multiple readers can be operated in close vicinity of each other without interference;

2. The Housing Authority logo and the name of the corresponding estate shall be clearly shown on the tickets.

**ELE26.3.100.7**  
**MAGNETIC STRIPE PAPER TICKET**  
Magnetic stripe paper ticket for hourly parking shall be made of durable paper and of magnetic operated type with the size same as the proximity card. They shall be capable of being printed with the date and time and encoded to enable the system to read.

**ELE26.3.110.7**  
"FULL" SIGN  
1. The "Full" sign box shall be housed in a cabinet made of not less than 1.5mm thick stainless steel;

2. The characters on the sign shall be in both English ("FULL") and Chinese ("滿") and arranged in bright LED matrix unless otherwise Approved. The shorter length on the effective illuminated area shall be not less than 250mm;

3. The Sub-contractor shall submit detailed drawings and samples of materials regarding the construction of illuminated signs for Contract Manager's Approval prior to the fabrication and installation;

4. The sign shall illuminate on receiving a signal from the central data station/cashier computer.

**ELE26.3.120.7**  
**INTERCOM SYSTEM MASTER AND SLAVE STATIONS**  
1. The master station(s) shall be designed for desk-top mounting;

2. Each master station shall comprise:
   a. A slave station selection panel;
   b. A microphone unit; and
   c. A built-in loudspeaker.

3. The number of master station(s) to be provided shall be sufficient for connection with each entrance and exit control points plus at least two spare ways;
4. A slave selection panel shall be provided to incorporate the following controls/indicators:
   a. 4 heavy duty Press-ON/Press-OFF slave station selection buttons;
   b. 4 slave station selection indicators;
   c. A heavy duty spring-loaded slave station "CALL" button;
   d. A loudspeaker volume control;
   e. A power supply status indicator;
   f. A lamp test button; and
   g. A buzzer alarm.

5. The slave stations shall be incorporated in the Entrance Control Unit and the Exit Control Unit. The slave station shall be integrated into the Control Units as a factory fitted product. Each slave station shall be completed with the following:
   a. A loudspeaker for hands free operation in a noisy environment;
   b. A heavy duty spring-loaded "CALL" button; and
   c. A buzzer alarm.
ELE26.4 TESTING AND COMMISSIONING

ELE26.4.010.7 TESTS
The Sub-contractor shall carry out the following tests for the installation in the presence of the Contract Manager:

1. Test of earth loop impedance of all relevant metallic parts of the equipment in compliance with the Electrical COP;
2. Continuous operation of the barrier and operating time as specified;
3. Testing and demonstration of all functions of the ACCS, VLRS, Car counting System, Octopus Card clearing, data exchange with HA’s data hub server, intercom system and carpark CCTV system as mentioned in the Specification.

ELE26.4.020.7 TEST RECORD
The Sub-contractor shall record all the tests and submit to the Contract Manager for Approval.

ELE26.4.030.7 TRAINING
1. The Sub-contractor shall provide not less than 40 hours training of the operation and maintenance for the carpark control and management facilities with a proposed training programme approved by the Contract Manager. The training shall be conducted during normal working hours for the estate management staff. The Sub-contractor shall record in 720p video or better throughout one training session and hand over 2 copies of DVD-videos of the record to the Contract Manager;
2. The Sub-contractor shall provide sufficient copies of detailed training manuals for operation and maintenance for the estate management staff;
3. The Sub-contractor shall provide 2 sets of the recovery disks for system restoration and e-copies of operation and maintenance manuals to the Contract Manager before handover.
ELE26.5 MAINTENANCE

ELE26.5.010.7 GENERAL

1. The Sub-contractor shall provide free maintenance including labour and materials to the system installation for the entire Maintenance Period after completion of the installation;

2. During the Maintenance Period, the Sub-contractor shall attend to all faults and complaints, remedy all defects, replace all malfunction items and maintain the complete installation in a clean, tidy and functional condition to the satisfaction of the Contract Manager.

ELE26.5.020.7 24-HOUR ON-CALL SERVICE DURING MAINTENANCE PERIOD

1. The Sub-contractor shall provide 24-hour on-call service at any time during the Maintenance period. The Contract Manager may instruct the Sub-contractor, in the Maintenance Period via telephone, mobile phone, paging service or any other means as advised by the Sub-contractor and Approved by the Contract Manager, to attend the reported breakdowns, and the Sub-contractor shall dispatch competent technicians or such other suitable personnel, who shall arrive at site and shall carry out any necessary inspection testing and repair work as soon as practicable and under all weather conditions;

2. The Sub-contractor shall submit to the Contract Manager for this purpose at least two names of English speaking representatives, who can be reached at any time of the day, with contact telephone numbers of direct lines, mobile phones or paging service for Approval. Prior Approval shall also be obtained for any subsequent changes of representatives, contact telephone numbers etc. during the Maintenance Period at least two weeks before the change is effected;

3. The Sub-contractor shall attend to emergency calls within three (3) hours of receiving such calls out of normal working hours and a maximum time limit of two (2) hours during normal working hours. For other repair calls, they shall carry out repair work within twenty four (24) hours;

4. The maintenance and servicing works, as described above, form part of the Main Works described in Clause 8.3(2)(c) of the General Conditions of Main Contract.

ELE26.5.030.7 PREVENTIVE MAINTENANCE

1. The Sub-contractor shall provide quarterly maintenance inspection and service to the ACCS, VLRS, Car Counting System and intercom system such as checking overall functioning of the system, cleaning of roller and magnetic heads, lubricating the mechanical part, adjusting inductive detection loops etc. The Sub-contractor shall submit a proposed maintenance programme, including the scope of maintenance activities, to the Contract Manager for Approval within 14 days after the commencement of the maintenance period. An inspection report should be submitted to the Contract Manager after each quarterly inspection;

2. The specification for maintenance inspection and service to the carpark CCTV System shall be referred to ELE24.4.3;

3. Upon request by the Contract Manager within the Maintenance Period, the Sub-contractor shall also provide free service to modify the computer programme to facilitate alteration of the system, such as change of tariff structure;

4. Four weeks before expiry of the maintenance period, the Sub-contractor shall carry out a hand/take-over inspection with the party taking up the on-going maintenance of the system in the presence of the representatives of the Contract Manager. Defects found should be rectified by the Sub-contractor to the satisfaction of the Contract Manager;
5. At the end of the Maintenance Period, the Sub-contractor shall execute all work of inspection, examination, and overhaul as required, to the complete installation to the satisfaction of the Contract Manager.

ELE28.1 LABELS AND NOTICES

ELE28.1.010.7 INSCRIPTION OF LABELS AND ENGRAVING
1. The labels shall be in both English and Chinese characters;
2. The labels shall be legible and durable such as by method of inscription or silk printing with transparent covering. Other methods giving legible and durable label are also acceptable;
3. Samples shall be submitted to the Contract Manager for approval prior to ordering.

ELE28.1.020.7 MATERIAL FOR LABELS
1. Labels shall be made of white plastic material with required letterings in red colour, unless otherwise specified;
2. Where equipment is fitted with labels provided by the manufacturer of the equipment, these labels may be used in lieu of the plastic material, provided that they are of equivalent quality and Approved.

ELE28.1.030.7 FIXING OF LABELS
Labels shall be fixed to switchgear and distribution board by screws. Where drilling and tapping of the equipment is impracticable, Approved adhesive means may be used subject to prior Approval.

ELE28.1.060.7 ENGRAVING FOR ELECTRICAL ACCESSORIES
1. Inscription is not required on front plate of control switches feeding fixed electrical appliances in domestic blocks;
2. For other building and/or occupied non-domestic premises, the front plate of each control switch, feeding a fixed electrical appliance, such as a wash boiler, water heater, cooker, wall-mounted fan, wall-mounted radiator, incinerator, exhaust fan, room cooler, etc., shall be engraved according to the appliance being controlled;
3. Details of the inscription shall be submitted for Approval;
4. Additional engraving to other electrical accessories will be as specified on the Drawings.

ELE28.1.070.7 LABELS AND WARNING NOTICES
1. Labels and warning notices as required by the Electricity Ordinance and the Electrical CoP shall be provided where appropriate;
2. Labels may be fixed in other positions specified or directed by the Contract Manager;
3. The following warning notices in English and Chinese shall be provided at the positions where appropriate:
   a. A label having a minimum size of 65 mm x 50 mm marked with the words "DANGER - HIGH VOLTAGE 危险 - 高壓" in lettering not less than 5 mm high to be fixed on every container on enclosure of ancillary equipment for discharge lighting installations operating at voltages exceeding "Low Voltage";
b. Where terminals or other fixed live parts between which a voltage exceeding 250 volts exists are housed in separate enclosures or items of equipment which, although separated, can be reached simultaneously by a person, a notice shall be secured in a position such that anyone, before gaining access to such live parts, is warned of the maximum voltage which exists between those parts.

ELE28.1.080.7 TREATMENT OF ELECTRIC SHOCK POSTER

The sub-contractor shall supply and fix an anodised aluminium frame with transparent plastic front plate of 3 mm minimum thickness and wooden backing board of 5 mm minimum thickness inside each main switch room and mount it with a "Treatment of Electric Shock" poster which may be obtained from the Labour Department free of charge. If the poster is not obtained from Labour Department, the sub-contractor shall ensure the poster supplied will have the same quality and size.
ELE28.2  SPARE FUSES IN SWITCH ROOMS

ELE28.2.010.7  FUSE REQUIREMENTS
The Sub-contractor shall provide in each switchroom of this project one complete set of spare fuses for each rating of fuse-switches or switchfuses installed.

ELE28.2.020.7  MOUNTING
Each set of spare fuses shall be hung on a wooden board with brass hooks. The wooden board shall be smoothed on both front and edges, painted and labelled.

ELE28.2.030.7  HAND-OVER
All the boards with fuses provided under this project shall be handed over to the Housing Manager.
ELE28.3 FIXINGS

ELE28.3.010.7 SCREWS AND BOLTS

1. Machine screws and nuts shall be to ISO/885;
2. Hexagon bolts, screws and nuts shall be to BS EN ISO 4016, BS EN ISO 4018 and BS EN ISO 4034;
3. Wood screws shall be to BS 1210 with countersunk head unless otherwise specified;
4. Bolts, nuts and washers shall be manufactured from non-ferrous materials;
5. Holes for bolts, screws and other fixings shall be drilled or stamped, and no larger than required for clearance of the bolt, screw, etc..

ELE28.3.020.7 PLUGS

1. Proper methods of fixing, such as expanding plugs of adequate size or other purpose-designed fixing devices approved by Contract Manager shall be used;
2. Screws shall not be fixed to wooden plugs unless otherwise specified.
ELE28.4 INSULATING MATERIALS

ELE28.4.010.7 INSULATING TAPES
Insulating tapes for low voltage applications shall comply with IEC 60454-3-1 pressure sensitive adhesive tape type F-PVCp (plasticized PVC) and have a minimum thickness of 0.21 mm.

ELE28.4.020.7 RESTRICTED MATERIALS
Non-impregnated paper, fabric, wood or press-hemp shall not be used for insulating purposes. Where synthetic resin bonded insulating boards are used, all cut edges shall be sealed with an Approved varnish.
ELE28.5  OPENINGS IN BUILDING STRUCTURE

ELE28.5.010.7  SLEEVES
1. Provide PVC sleeves for openings in walls within a fire compartment;
2. Provide galvanised mild steel sleeves for openings in walls and slabs connecting the fire compartment with other fire compartments/public areas.

ELE28.5.020.7  MAIN CONTRACTORS WORK
The holes, sleeves and slots reserved through walls/slabs/beams will be cleared and cleaned by the Main Contractor before hand-over to the Sub-contractor for use.

ELE28.5.030.7  SUB-CONTRACTOR'S WORK
The nails appertaining to concealed electrical boxes shall be cleared by the Sub-contractor subsequent to work completion and prior to execution of final painting work by the Main Contractor.

ELE28.5.040.7  WATERPROOFING
Where any work pierces the waterproofing including waterproof structure, the method of installation shall be as Approved.
ELE28.6 SHEET METALWORK

ELE28.6.010.7 CONSTRUCTION
Sheet metal boxes, meter chambers etc. shall be manufactured from plain steel sheets. The thickness of steel sheet shall be as specified in the relevant Worksection subject to a minimum of 1.0 mm. Where necessary, suitable stiffeners shall be provided to give adequate rigidity.

ELE28.6.020.7 PROTECTION AGAINST CORROSION
Protection against corrosion shall be achieved by means of hot-dip galvanising, anti-rust painting or enamel, or the use of stainless steel.

ELE28.6.030.7 STAINLESS STEEL SHEET
If stainless steel sheet is specified, it shall be to BS EN 10088-2, Symbol F9 for matt finish and F8 for polished finish.
ELE28.7 PAINTING METALWORK

ELE28.7.010.7 SCOPE

1. Exposed metal parts of the installation as specified in the Contract or as directed by the Contract Manager shall be painted by the Sub-contractor;

2. Wherever necessary, parts of the installation may be painted by the Main Contractor under the instruction of the Contract Manager. Under such circumstances, the Sub-contractor shall ensure that painting provided by the Main Contractor shall not cause any detrimental effects to the electrical installation.

ELE28.7.020.7 PREPARATION

Before painting, the surface of the metalwork shall be completely clean and free from rust, scale and grease and rust inhibitor shall be applied at least twelve hours prior to painting.

ELE28.7.030.7 PAINT COATINGS

Non-galvanised surfaces, both internal and external, other than nuts, bolts and washers that may have to be removed for maintenance purpose, shall receive one coat of metallic zinc-rich primer to BS 4652, two undercoats and one finish coat. Undercoats and finish coat shall be of properly matching type and the finish coat shall give a hard gloss finish or as required.

ELE28.7.040.7 PAINT APPROVALS

All primers and paints shall be made from lead free formulation. Paints shall be of colour to BS 4800. Approval shall be obtained from the Contract Manager before starting work.

**ELE29.1 GENERAL**

**ELE29.1.010.7 SCOPE**
This specification covers the supply, installation, testing and commissioning, maintenance of standby diesel generating sets and associated accessories. The scope shall also include all necessary design and provisions of acoustic treatment associated with the installation for compliance with the Noise Control Ordinance and all necessary submissions to the Authorities (such as EPD) in connection with the installation and operation of generating sets.

**ELE29.1.020.7 PURPOSE**
A standby diesel generating set shall be provided as an emergency supply to comply with the Fire Services Department requirements and meet essential loads as specified or shown on the Drawings.

**ELE29.1.030.7 FACTORY ASSEMBLY**
Each generating set shall be a factory-assembled packaged unit and shall comprise a diesel engine directly coupled to an alternator, mounted on a common steel baseframe. Each generating set shall be provided with a control cubicle housing all control equipment. The generating set shall comply with all parts of ISO 8528 and the requirement of this specification.

**ELE29.1.040.7 FS CODE OF PRACTICE**
Standby diesel generating sets shall comply in all respects with Part V, Section 5.8 of The 'Code of Practice for Minimum Fire Service Installations and Equipment' issued by Fire Services Department (hereinafter referred to as F.S. Code of Practice). The generating sets shall be of proven reliability established in local application and evidence shall be produced to the satisfaction of the Contract Manager upon request.

**ELE29.1.050.7 COMPATIBILITY OF COMPONENTS**
The manufacturer of the various components to be used with the generating set shall be as recommended by the manufacturer to ensure compatibility of the components.

**ELE29.1.060.7 COMPONENTS**
The Sub-contractor shall ensure and verify to the satisfaction of the Contract Manager that all components employed in this installation conform to the relevant International and local Standards.

**ELE29.1.070.7 OPERATING CONDITIONS**
The generating set shall be capable of continuously operating under the appropriate site conditions which shall normally be a temperature range of 5°C to 40°C, relatively humidity 100% and the altitude of the actual site.

**ELE29.1.080.7 IN-SERVICE RECORDS**
Prior to the time of material submission for Approval, the generating set including its major components shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.
ELE29.2 OUTPUT AND RATING

ELE29.2.010.7 OUTPUT
The generating set shall be of 380V, 50Hz, 3 phase, 4 wire output.

ELE29.2.020.7 ACCURACY OF OUTPUT
Unless otherwise specified, the generating set shall comply with the operating limits of performance class G3 in accordance with ISO 8528-5.

ELE29.2.030.7 RATING
1. The generating set shall have a prime power rating sufficient to satisfy both the steady and transient states of the electrical loads detailed in this Specification and Drawings. The power output shall be rated as prime power in accordance with ISO8528-1 and the permissible average power output during a 24 hour period shall not exceed 70% of the prime power unless otherwise agreed by the engine manufacturer;

2. The generating set shall be capable of meeting the basic electrical load requirements and also the starting kVA and starting kW as shown on the drawings. The Sub-contractor shall verify the actual amount of electrical loads connected to the generating set and prove that the generating set selected can satisfy this specification under both starting and steady conditions for such connected loads;

3. Power rating shall be net, excluding all accessories and shall be taken as at ambient temperature 40ºC and at sea-level;

4. The Sub-contractor shall supply, install and commission a generating set of rating, 0.8 power factor lagging, not less than the minimum rating as specified in the drawings taking into account all de-rating factors as recommended by the generator manufacturer;

5. A sign made of at least 1.5 mm thick stainless steel plate shall be provided for each generator set and affixed in a prominent position inside the emergency generator room and main switch room to indicate the essential loading of fire service installations and fireman’s lift(s) connected to the generator. The English and Chinese characters of the sign shall be at least 8 mm and 15 mm high respectively and the details are as follows:

**EMERGENCY GENERATOR**

應急發電機

LOADING OF FIRE SERVICE INSTALLATIONS AND FIREMAN’S LIFT(S)

消防裝置及消防升降機負荷

XXXX kVA/XXXX kW

WARNING: DO NOT OVERLOAD THE GENERATOR

警告：切勿引致發電機過量負荷
ELE29.2  

ELE29.2.040.7 TIMING OF LOADS APPLICATION

1. The generating set shall be designed for cold starting and be capable of supplying power for the full rated essential load in not more than 15 seconds from initiation of the starting procedure;

2. Unless otherwise specified, all essential loads other than non-fireman's lifts, will be started simultaneously. After an adjustable period up to 45 seconds, the non-fireman's lifts will be started sequentially to travel to the ground floor one at a time before the next non-fireman's lift is started and remains stationary.

ELE29.2.050.7 EXCESSIVE REGENERATIVE POWER AND NON-LINEAR LOADS

1. There will be high current harmonics from the variable voltage variable frequency controlled lift motors, light fittings with electronic ballasts, pump motors with soft starters, etc. and precautions shall be taken in the design of the generating set to guard against any adverse effects so caused;

2. The Sub-contractor shall provide appropriate dummy loads to absorb excessive regenerative power from the lifts as detailed on drawings, if necessary.
**ELE29.3 DESIGN**

**ELE29.3.010.7 MANUFACTURER'S RECOMMENDATIONS**
The complete installation shall be in accordance with the manufacturer's recommendation and to the satisfaction of the Contract Manager. Any design deviating from the manufacturer's recommendation shall be verified by the manufacture before being submitted to the Contract Manager for approval.

**ELE29.3.020.7 SAFETY**
All moving parts and bare exhaust manifolds and pipes shall be properly and completely guarded and/or insulated in accordance with the relevant International Standards and local regulations. The guards shall be of such design that will guard against the serviceman from coming into contact with any part which is likely to cause injury to personnel. All guards shall be detachable.

**ELE29.3.030.7 SPACE FOR MAINTENANCE**
Adequate space (not less than 600 mm) all round the set shall be provided for maintenance and cleaning.

**ELE29.3.040.7 VENTILATION**
Ventilation to the Approval of the Director of Fire Services shall be provided for both combustion and cooling air. If fans are necessary to provide this air they shall be provided by the Sub-contractor and shall operate at all times while the generator set is running.

**ELE29.3.050.7 AIR SUPPLY AND DISCHARGE**
The air supply and discharge shall be direct to outside air without any possible obstructions, i.e. no fire, smoke or regulating dampers shall be fitted, and shall not cause a public nuisance. However, silencers shall be provided at the air inlet and outlet apertures of the generator room as shown on the Drawings. Added pressure loss constituted by the silencers shall be kept to a minimum, and shall not affect the proper operation of the generator set.

**ELE29.3.060.7 EXHAUST SYSTEM**
Exhaust of combustion products shall be discharged through the exhaust system to the location as shown on the Drawings. The Sub-contractor shall ensure that the exhaust system meets the relevant requirements of the Air Pollution Control Ordinance. The Sub-contractor shall also ensure and verify, to the satisfaction of the Contract Manager, that the bends and the length of the exhaust pipe will not build up back pressure causing low efficiency and loss of engine power; otherwise, pipe bore will have to be increased.

**ELE29.3.070.7 EXHAUST AIR PIPES**
Exhaust air pipes outside the generator room shall be mounted with stainless steel brackets. Shop drawings showing the details of mounting and fixing of cladding shall be submitted for Approval prior to material ordering and fabrication. Adequate fall and drain point shall be provided for the exhaust pipe so that no water can enter into the engine through the exhaust outlet. The exhaust pipe outlet shall also be fitted with a stainless steel wire mesh to prevent ingress of birds or debris.
**ELE29.4 ENGINE**

**ELE29.4.010.7 TYPE AND DESIGN**
The engine shall be a four stroke, multi-cylinder, direct injection, naturally aspirated or turbo-charged, water-cooled diesel engine and shall be of industrial type complying with ISO 8528-2. The shaft speed shall not exceed 25rev/s. The fuel used shall be diesel fuel complying with EPD's requirement. The engine shall be designed to comply with the Air Pollution Control Regulations such that the emissions there from will not create an air pollutant nuisance.

**ELE29.4.020.7 COOLING SYSTEM**
The engine cooling system shall comprise a set-mounted radiator with engine or electric driven cooling fan, water circulating pump, water temperature regulating device, etc., and in addition to the operating conditions specified in ELE29.1.070, shall be suitable for operating at ambient temperatures up to 50°C.

**ELE29.4.030.7 SPEED GOVERNOR**
The engine speed governor shall provide governing in accordance with the relevant requirements for Performance Class G2 of ISO 8528-5.

**ELE29.4.040.7 FILTERS**
Filters shall be provided for the fuel oil and lubricating oil systems as well as the air intake and shall be of replacement element.

**ELE29.4.050.7 EXHAUST CONNECTORS**
The engine exhaust shall be provided with flexible connectors and tubular absorption type silencer.

**ELE29.4.060.7 AUTOMATIC SAFETY CUT-OUT DEVICES**
Automatic safety cut-out devices shall be provided for engine overspeed, high cooling water temperature and low lubricating oil pressure. An electric fuel stop solenoid valve as well as a manual fuel shut-off valve shall be provided.

**ELE29.4.070.7 INSTRUMENT PANEL**
An instrument panel shall be provided and shall incorporate lubricating oil pressure and temperature gauges, cooling water temperature gauge, tachometer and individual fault indicating lamps for low lubricating oil pressure, high-cooling water temperature & engine overspeed. Fuel level gauge shall be provided on the panel when the fuel tank is not located in the same room with the generating set. The panel shall be mounted on the generating set and properly isolated from vibration.

**ELE29.4.080.7 STARTER UNIT**
The engine shall be equipped with a D.C. electric starter motor, fly-wheel, flexible couplings, etc. to form a complete working unit.
ELE29.5 ALTERNATOR

ELE29.5.010.7 TYPE
The alternator shall be of salient pole, self-exciting, self-regulating, brushless type and shall comply with ISO 8528-3. The alternator shall be of basic continuous rating (BR) based on duty type S1 according to IEC 60034-1.

ELE29.5.020.7 PROTECTION
The alternator shall be screen protected and drip proof in accordance with IEC 60034-5 to degree IP21. Anti-condensation heaters of 220V shall be provided, connected to the mains, and shall be arranged to be switched off when the alternator is in operation. All exposed moving parts shall be provided with protection screens.

ELE29.5.030.7 INSULATION SYSTEM
The insulation system shall be IEC 60085 Class F or Class H.

ELE29.5.040.7 TERMINAL BOX
A terminal box of sufficient size shall be provided for cabling.

ELE29.5.050.7 RADIO INTERFERENCE SUPPRESSION
The alternator shall be fully equipped for radio interference suppression to BS EN 55014-1.
ELE29.6  BASEFRAME AND FUEL TANK

ELE29.6.010.7  BASEFRAME
The baseframe of the generating set shall be of prefabricated, structural steel type of all welded construction. The baseframe shall be provided with lifting points for transportation.

ELE29.6.020.7  INTEGRAL FUEL TANK
1. Unless otherwise specified, a fuel tank shall be integral within the base frame and shall be complete with filler, vent, drain, feed and return connections, fuel content gauge, flexible fuel lines between tank and engine connections;
2. The capacity of the tank shall be sufficient for sustaining operation of the connected loads for a period of not less than 6 hours but shall have a minimum capacity of 490 litres. If the minimum tank capacity required exceeds 500 litres, the tank shall be installed in a separate fuel tank room in accordance with FSD's requirement.

ELE29.6.025.7  SEPARATE FUEL TANK
1. Whenever specified, a separate fuel tank shall be installed inside the standby generator room and shall complete with cover, drip tray, fuel hand pump, fuel content gauge, vent pipe, control valves, fuel supply and return pipes between the tank and engine connections, etc.;
2. The capacity of the tank shall be sufficient for sustaining operation of the connected loads for a period of not less than 6 hours but shall have a minimum capacity of 490 litres. If the minimum tank capacity required exceeds 500 litres, the tank shall be installed in a separate fuel tank room in accordance with FSD's requirement;
3. A Surveyor's Report shall be submitted to certify that the fuel tank has been properly constructed, installed and tested and the fuel tank is in sound condition and is suitable for the storage of fuel oil without any leakage;
4. The tank shall be fabricated from mild steel plates welded on to a mild steel frame. Mild steel flat bars shall be welded on the inside of the tank to stiffen the tank when required;
5. All parts of the exterior surfaces of the tank shall be thoroughly cleaned to remove all rust, mill scale, grease and other foreign matters to achieve a bright, rust free and dry surface and then painted with one cost of zinc rich primer, one coat of epoxy based under coat and two finishing coats of approved paint. The interior surface of the tank shall be thoroughly dried out and applied with a thick coat of linseed oil to prevent rusting;
6. A semi-rotary double acting hand pump shall be provided for the fuel tank and consist of 25 mm diameter inlet, outlet and flexible oil resistant inlet pipe of adequate length to suit Site condition;
7. The Sub-contractor shall submit shop drawings showing all installation details of the fuel tank, pipe routing and associated builder’s works for approval before commencement of works.

ELE29.6.030.7  FUEL LEVEL SWITCH
The fuel tank shall be fitted with two stages fuel level switches to alert the caretaker and to shut down the non - fire services equipment supply when the remaining fuel capacity falls to a level adequate for 7.5 hours and 6.5 hours continuous running of the fire services equipment. The fuel level switch shall comply with the following requirements:
For Immersed Type Level Sensor:
1. The fuel level switch shall be suitable for measurement of fuel level in the integral tank;
2. The fuel level switch shall consist of two major components - a fuel level sensor and a switch unit. The fuel level sensing element shall be installed in a tube of stainless steel and places inside the fuel tank. The switch unit shall be mounted on the tank and with the fuel level sensor to form an integral set. The unit shall be housed inside a casing made of cast iron or aluminium alloy and shall be capable of detecting the signal from the sensor and transmitting it to control the on/off operation of the non-fire services equipment supply;
3. The level switch shall be manufactured to IEC 60079 Explosive Atmospheres or BS EN 60079 Explosive Atmospheres;
4. The level switch shall be at least of Group IIA and Temperature Class T1 in accordance with IEC 60079-0 or BS EN 60079-0;
5. The electrical components of the level switch installed in the vapour space above fuel and inside the fuel tank shall be of the type of protection of Ex ia which is suitable for installation in Zone 0 Hazardous Area as classified in IEC 60079-10-1 or BS EN 60079-10-1;
6. The electrical components of the level switch installed outside of the fuel tank shall be of the type of protection of Ex ib or Ex d which are all suitable for installation in Zone 1 Hazardous Area;
7. A copy of certificate to prove the apparatus rating shall be submitted for checking.

For Ultrasonic Type Level Sensor:
8. The fuel level switch shall consist of two major components - a fuel level sensor and a control unit;
9. The level sensor shall have non-contacting liquid level transmitter utilising ultrasonic pulses technology for measurement and suitable for the application of fuel tank;
10. The control unit shall connect with the fuel level sensor and contain a digital display showing fuel level information and system alarms. The control unit shall be equipped with output relays for external interface to control the on/off operation of the non-fire services equipment supply. The control unit shall be housed inside the control cubicle as stipulated in ELE29.10;
11. The fuel level switch shall be manufactured to IEC 60079 Explosive Atmospheres or BS EN 60079 Explosive Atmospheres;
12. The fuel level sensor shall be at least of Group IIA and Temperature Class T1 in accordance with IEC 60079-0 or BS EN 60079-0;
13. The electrical components of the fuel level switch installed in the vapour space above fuel and inside the fuel tank shall be of the type of protection of Ex ia which is suitable for installation in Zone 0 Hazardous Area as classified in IEC 60079-10-1 or BS EN 60079-10-1;
14. A copy of certificate to prove the apparatus rating shall be submitted for checking.
ELE29.6.040.7  CONTROL REQUIREMENT

The fuel level switches and the associated control shall be capable to control on/off operation of the non–fire services equipment supply as shown on Drawings. When the remaining fuel capacity falls, at or below a level adequate for 7.5 hours continuous running of the fire services equipment, the alarm connecting to the FS alarm panel shall be activated. When the remaining fuel capacity further falls, at or below a level adequate for 6.5 hours continuous running of the fire services equipment, a signal shall be provided to trip the non-fire services equipment automatically and the corresponding alarm connecting to the FS alarm panel shall also be activated.

ELE29.6.050.7  VERIFICATION OF FUEL LEVEL SETTINGS

1. A Surveyor's Report shall be submitted to certify that the fuel capacity inside the fuel tank according to each level settings as mentioned in ELE29.6.040 are accurately shown on the fuel level sensor;

2. The accuracy of the fuel level settings shall be demonstrated to FSD's officer during FSD's inspection;

3. For demonstration in sub-clause 2, the integral fuel tank shall be emptied for refilling in the presence of the FSD's officers to demonstrate the readings of the fuel level sensors be consistent with various settings and the capacity of fuel inside.
ELE29.7 STARTING SYSTEM

ELE29.7.010.7 SPECIFICATION
Engine starting shall be electric. The starting system shall be of 12V or 24V and shall comprise batteries, charger, contactors, wiring, etc.

ELE29.7.015.7 TYPE OF BATTERIES
The batteries shall be of nickel-cadmium type with plastic cases complied with IEC 60623. The batteries shall be suitable for engine starting application.

ELE29.7.020.7 MOUNTING OF BATTERIES
The batteries shall be mounted on a hardwood floor stand adjacent to the starter motor. A double pole D.C. battery switch shall be provided between the batteries and the starter. When the switch is turned to 'open' position, the "auto-starting of generator disabled" alarm, as stated in Clause ELE29.12.020, shall be activated.

ELE29.7.030.7 CAPACITY OF BATTERIES
The batteries shall have sufficient capacity for 4 operations of engine cranking each 15 seconds duration with 5 seconds intervals between each operation without permanent damage nor reduction in the rated life.

ELE29.7.040.7 BATTERY CHARGER
The battery charger shall be of trickle/boost type and shall be connected to the essential power supply socket/connection unit located at the generator room. The battery charger shall have sufficient capacity to maintain the batteries in fully charged condition at all times. The charger shall be capable of automatically recharging the discharged batteries to 75% of its rated capacity within 6 hours. Current limiting device shall be provided to limit the charging current as recommended by the battery manufacturer.
**ELE29.8  ENGINE EXHAUST SYSTEM**

**ELE29.8.010.7  SCOPE OF SYSTEM**
The engine exhaust system comprising silencers, flexible connectors, rain hoods, expansion joints, hangers, pipes & accessories etc., shall be provided as shown on the Drawings.

**ELE29.8.020.7  EXHAUST AIR PIPES**
Exhaust air pipes shall be black steel pipes to BS EN 10255 medium grade for pipe diameters up to and including 150 mm or BS EN 10216 for larger pipe diameters and jointed by welding. Pipes shall be adequately supported and provided with flexible/expansion joints to allow for expansion/contraction and for vibration isolation.

**ELE29.8.030.7  SIZING OF EXHAUST AIR PIPE**
The exhaust pipe shall be sized so that the back pressure created will not exceed the amount recommended by the manufacturer and the output power of the engine will not be derated.

**ELE29.8.040.7  LAGGING EXHAUST AIR PIPES**
1. The exhaust pipes outside the generator room, where exposed, shall be lagged with non-combustible and non-water-absorption type insulating materials complying with BS 476. The lagging shall be protected by a stainless steel cladding of 2 mm thick constructed in sections;
2. The thermal insulation material provided shall have a thickness of not less than 50 mm and maintain the external cladding temperature not exceeding 50°C. Calculation to substantiate the adequacy of insulation thickness shall be submitted to Contract Manager for checking;
3. The exhaust pipe in the generator room shall also be properly lagged in order to protect against any harmful thermal effects to personnel in carrying out operation and maintenance. The lagging shall be protected by a stainless steel cladding of 0.8 mm thick constructed in sections;
4. Each section of the cladding shall be removable for replacement of the insulating materials;
5. No flanged joint shall be used and the end product of the cladding shall be of a plain surface stainless steel pole;
6. Asbestos shall not be used for lagging.
ELE29.9 AIR DUCTWORK

ELE29.9.010.7 SCOPE
Air ducts, if required, shall be provided to connect the radiator to the metal louvre provided by others at the generator room as shown on the Drawings.

ELE29.9.020.7 CONSTRUCTION
Air ducts shall be constructed of 1 mm thick galvanised mild steel sheets and shall be adequately sized to deliver the required cooling air through the radiator.

ELE29.9.030.7 SUPPORTS
Air ducts shall be adequately supported and provided with connection flanges and flexible connections for vibration isolation.

ELE29.9.040.7 SILencers
Silencers shall be provided to attenuate the noise from the generating set through the intake and exhaust air louvers. The silencer shall consist of an outer casing fabricated from galvanised steel sheet not less than 1.6 mm thick and a number of splitters made from 0.8 mm perforated galvanised steel sheets which divide the silencer into separate longitudinal airways. All acoustic infill materials shall be inert, non-combustible, vermin proof, non-hygroscopic, wrapped in an acoustically transparent polyester membrane and sealed with polyester sealant to the approval of FSD.
ELE29.10 CONTROL CUBICLE

ELE29.10.010.7 CONSTRUCTION
1. The control cubicle shall be constructed of sheet steel not less than 2 mm thick;
2. The cubicle shall preferably be floor mounted;
3. If set mounted, the cubicle shall be effectively isolated from vibration to prevent damage;
4. Gaskets shall be fitted on doors and removable covers and shall be continuous without joints around corners;
5. The cubicle shall be treated with an Approved rust inhibitive priming coat and then two stoved finish coats of gloss paint of an Approved colour.

ELE29.10.020.7 PROTECTION DEVICES
The cubicle shall contain the automatic voltage regulator unit, delay timers, etc. necessary fulfil the operation requirements as stipulated in ELE29.11. The dry contacts for detection of main supply voltage should be obtained from the main switchboard cubicle and the lift supply switchboard respectively.

ELE29.10.030.7 FRONT PANEL
The following shall be provided on the front panel of the control cubicle unless prior Approval has been obtained for some instruments/indicators to be located on the instrument panel in ELE29.4.070:
1. Hour run meter;
2. Auto/off/manual selector switch;
3. "Start" & "Stop" push buttons for manual operation;
4. Battery charger ammeter and voltmeter;
5. "Mains On" indicating lamps - 3 phase;
6. "Generator On" indicating lamps - 3 phase;
7. "Engine Fault" indicating lamp & audible alarm;
8. "Fail to Start" indicating lamp & audible alarm;
9. "Auto Starting of Generator Disabled" indicating lamp & audible alarm;
10. "Fuel level at or below 7.5 hours operation of fire services equipment" indicating lamp & audible alarm;
11. "Fuel level at or below 6.5 hours operation of fire services equipment and non–fire services equipment supply tripped" indicating lamp & audible alarm;
12. Reset push button;
13. "Simulate mains failure" key switch;
14. Lamp Test Button;
15. Fuel level display of fuel level control unit (for ultrasonic type fuel level switch only).

ELE29.10.040.7 ALARMS
Remote visible & audible alarms shall also be provided as shown on the Drawings.
ELE29.10.050.7 ANTI-CONDENSATION HEATERS

The control cubicle shall be provided with thermostat controlled anti-condensation heaters, connected to the mains.

ELE29.10.060.7 CONTROLLER

Programmable controller if provided in the control cubicle to control the automatic start and stop of the engine shall comply with the following requirements:

1. The controller shall have local job reference and shall operate satisfactorily for at least 12 months;

2. Details of the controller including operation instruction, software for programming and the data set in the controller, etc. shall be included in the O&M manual and soft copy of programme together with data loaded in the controller shall be submitted upon project completion;

3. One set of all necessary computer interfacing connection cable & associated accessories shall be provided;

4. Training on data entry and configuration of a new controller suitable for replacement shall be provided to the maintenance staff before expiry of the defects liability period. A video in DVD disc showing the details shall be submitted upon completion of the training.
ELE29.11 OPERATION

ELE29.11.010.7 GENERAL
The operation of the generating set shall be fully automatic and shall comply with the requirements stipulated in the F.S. Code of Practice. Manual start/ testing facilities shall be provided.

ELE29.11.020.7 WORK BY OTHERS
One pair of normally open dry contacts will be provided by others at the location as shown on the Drawings for the purpose of giving a signal to override all automatic shut down features on fault.

ELE29.11.030.7 APPROVAL OF CONTROL CIRCUIT
The control circuit shall be submitted for Approval.

ELE29.11.040.7 PURPOSE
The generator set shall be provided as the standby supply for the essential loads of the building as shown on the Drawings.

ELE29.11.050.7 PROVISIONS OF OPERATION
The essential loads shall normally be fed from the mains supply and be switched automatically to the generating set through a changeover contactor in accordance with the following provisions:

1. A mains sensing device shall be provided to detect condition of the mains supply at the mains supply incoming terminals of the changeover switch, located in the main cubicle switchboard and at other location as shown drawings;

2. When failure of one or more phases of the mains supply or a reduction of voltage to less than 70% of normal is detected, a timing device having an adjustable setting from 0.5 to 2.0 seconds shall be initiated;

3. If the mains failure persists for the pre-set period, the generator set starting sequence shall be initiated automatically;

4. Within 15 seconds from the commencement of the starting sequence, the set shall be stabilised at its rated speed and full load transfer shall take place automatically;

5. Should the generating set fail to start after a period of 15 seconds, the sequence shall be interrupted for a period of 5 seconds and a further attempt to start, of 15 seconds duration, shall then be made. If it again fails to start, the starting sequence shall be locked out, an audio visual alarm given as described in ELE29.12 and it shall remain in this locked out condition until manually reset;

6. If the mains supply is restored during the starting period, the starting sequence shall not be interrupted but the operation of load transfer shall be prevented. After starting, the set shall continue to run on no-load for an adjustable period of 0 - 15 minutes and then stop if no further mains failure;

7. Subsequent failure of the mains supply while the set is running on no-load under provision (6) above shall, after expiration of the 0.5 - 1.0 second delay, cause load transfer to take place;

8. On restoration of the mains supply the set will continue to run and supply essential loads for an adjustable period of 0 - 10 minutes. Thereafter automatic transfer of essential load to mains supply shall take place as soon as the adjusted period has expired;
9. At the end of the adjustable period in provision (8) above the set shall continue to run on no-load for an adjustable period of 0 - 30 minutes;

10. If the mains supply fails again during the adjustable period specified in provision (8) above the control timer setting of the adjustable period (0 - 10 minutes) shall be cancelled in order to prevent the sequence of load transfer. When the mains power is restored again, the operating sequence will start again from sub-clause (8) above;

11. If the mains fails again during the adjustable period specified in provision (9) above the essential loads shall be connected automatically back to the set and the operating sequence will continue as if the connection had been made in the manner as described in provision (7) above;

12. In order to give a signal for lift control, the Sub-contractor shall provide one pair of normally open voltage free contacts terminated inside an adaptable box in each lift machine room. The contacts shall be closed upon load transfer to the generating set.

ELE29.11.060.7 REMOTE SHUT-OFF VALVE

1. A remote shut-off valve shall be installed in the supply pipe linking the fuel tank to the engine. The actuation of such a valve shall also actuate the audio and visual alarm outside the generator room and the 'auto starting of generator disabled' alarm as stated in ELE29.12.020;

2. The pull handle of the remote shut-off valve shall be housed inside a breakglass unit installed at the entrance of the generator room;

3. An operation instruction notice, made of white plastic material engraved with the following wordings in English and Chinese characters of at least 5 mm high in red colour, shall be provided and affixed adjacent to the breakglass unit.

GENERATING SET EMERGENCY STOP SWITCH
IN CASE OF EMERGENCY
BREAK GLASS AND PULL HANDLE TO FULL EXTENT

發電機停機掣
如須要緊急停機
打碎玻璃並盡拉此手掣
ELE29.12 AUDIO AND VISUAL ALARMS

ELE29.12.010.7 ENGINE OVERSPEED PROTECTION
1. In the event of a fault arising from engine overspeed, high water temperature or low oil pressure, the set shall initiate a 2-stage engine protective device;
2. The first stage shall be arranged to initiate both audio and visual alarm at the control cubicle and also at the remote indicator above the door outside the generator room as shown on the Drawings;
3. The audio alarm shall be cancelled by an acknowledge push button. The second stage shall be arranged to shut down the engine;
4. The setting of the two stages, for each system being monitored, shall be as specified by the manufacturer.

ELE29.12.020.7 STARTING FAILURE PROTECTION
1. However, for failure of starting under the condition as stated in ELE29.11.050 (5), the local and remote audio and visual alarms shall initiate immediately at the control cubicle and the remote indicator above the door outside the generator room. The indicator shall be of colour RED;
2. In addition, remote audio and visual alarms above the door outside the generator room to indicate "generating set supply disabled" by the following shall be provided:
   a. Pressing of the emergency stop switch of the generating set;
   b. Tripping of the main MCCB/ACB or any outgoing MCCBs of the switchboard cubicle inside the generator room;
   c. Switching off of the main MCCB/ACB or any outgoing MCCBs of the switchboard cubicle inside the generator room;
   d. Turning the "manual/auto" switch to "manual" or "off" position;
   e. Switching off of the battery supply switch;
   f. Actuation of remote shut-off valve.
3. The indicator shall be of colour RED.

ELE29.12.030.7 VOLTAGE FREE CONTACTS FOR FIRE CONTROL MAIN PANEL
The following pairs of voltage-free contacts, terminated inside a surface mounted box next to the Fire Control Main Panel, shall be provided from the Generator Room via concealed conduit system:
1. A pair of normally close dry contacts which shall be opened only when the generating set is running;
2. A pair of normally close dry contacts which shall be opened only when the generating set fails to start;
3. A pair of normally close dry contacts which shall be opened when the generating set supply is disabled under conditions as stated in ELE29.12.020 (2);
4. A pair of normally close dry contacts which shall be opened when the generating set is on fault;
5. A pair of normally close dry contacts which shall be opened when the generating set having fuel level at or below 7.5 hours operation of fire services equipment;
6. A pair of normally close dry contacts which shall be opened when the generating set having fuel level at or below 6.5 hours operation of fire services equipment and non – fire services equipment tripped.
ELE29.12.040.7  **OPERATION**

Whenever the generating set is started, an audio and visual alarm, at the control cubicle and at the remote indicator above the door outside the generator room, shall be actuated and shall remain in operation until reset manually. The indicator light shall be of colour AMBER. The voltage-free contacts next to the Fire Control Main Panel, as mentioned in **ELE29.12.030**, shall be actuated to indicate that the generating set is running.

ELE29.12.050.7  **TYPE OF INDICATOR LIGHTS AND METAL ENCLOSURE**

The above remote indicator shall be mounted on a Grade 304 stainless steel enclosure with a thickness of not less than 1.2 mm and installed outside the generator room. The indicator lights shall be of flashing type.
ELE29.13 INSTALLATION

ELE29.13.010.7 COMPLIANCE WITH INSTRUCTIONS
The generating set shall be installed in accordance with the instructions of the manufacturer.

ELE29.13.020.7 SUBMISSION FOR APPROVAL
Details of the installation shall be submitted for Approval.

ELE29.13.030.7 VIBRATION ISOLATION
1. Suitable vibration isolators shall be provided to prevent the transmission of vibration to the building structure;
2. The completed installation, when in operation, shall not cause any noticeable or objectionable vibration to any part of the building structure or unacceptable level of structure-borne noise in accordance with the Noise Control Ordinance;
3. In the event that undue vibration or excessive structure-borne noise occurs, the Sub-contractor shall rectify the installation or replace the equipment as necessary at his own expense to the satisfaction of the Contract Manager.

ELE29.13.040.7 PAINTING
1. All exposed ferrous metal surfaces of the generating set, pipes and accessories, air ducts, etc. shall, where applicable, be treated with a primer coat of rust resistant paint, followed by two coats of high gloss enamel;
2. Painting of the generating set shall be done at the place of manufacture, before despatch;
3. Touching up, when required on site, shall be carried out to the satisfaction of the Contract Manager.
ELE29.14 ELECTRICAL WORK

ELE29.14.010.7 GENERAL
1. All electrical work shall comply with the relevant sections of this specification;
2. All cables used at the engine shall be heat and oil resisting cables suitable for this purpose;
3. The earthing system & neutral connection for the generating set shall be as shown on the Drawings;
4. All exposed metal work inside the generator room shall be effectively bonded and earthed in accordance with the Electrical CoP;
5. The Sub-contractor shall ensure that the part of the installation which comprises of the essential loads shall be protected in accordance with the Electrical CoP when the installation is fed by the generating set. Protection shall include overcurrent and earth fault as detailed in this Section;
6. The Sub-contractor shall also provide a reverse power sensing device which shall initiate a visual indicator on the control panel and actuate the connection of the dummy load if the reverse power exceeds the regenerative power absorption limit of the generating set.

ELE29.14.020.7 OVERCURRENT PROTECTION
1. The rating and the tripping characteristics of the air circuit-breaker/MCCB in the switchboard cubicle shall be coordinated with the characteristics of the generating set to provide proper protection of the generating set and its associated power cables;
2. The Sub-contractor shall ensure, and verify to the satisfaction of the Contract Manager, that the essential loads, when fed by the generator, are also protected against short circuit in accordance with the Electrical CoP under that particular fault level of the generating set.

ELE29.14.030.7 EARTH FAULT PROTECTION
1. The Sub-contractor shall supply and install an earthing system independent of any other earthing system for the neutral connection and earthing of the generator;
2. The Sub-contractor shall ensure that the generating set installation is solidly and effectively earthed in accordance with the Electrical CoP, and BS 7430;
3. When the plant is subject to vibration, or where circumstances necessitate, the earthing connections shall be made of flexible copper conductor having a green-and-yellow PVC sheath;
4. Earth fault protection shall be provided at the switchboard cubicle inside the generator room to disconnect the supply from the generator to the connected installation within 5 seconds when earth fault occurs at any part of the connected installation other than the final circuits.

ELE29.14.040.7 INTERFACING WITH SWITCHBOARD CUBICLE
1. The Sub-contractor shall coordinate the interfacing signal required between the generating set control panel and the switchboard cubicles for the control and protection of the generating set;
2. For current signals to be connected from the switchboard cubicles, the Sub-contractor shall ensure the current transformers be properly selected with adequate burden and accuracy to suit the requirement of control equipment of the generating set;
3. The signal cables shall be coded with ferrules and clearly shown on the control wiring diagram;

4. The signal cables shall be of 1-core PVC surface mounted. The size of cable shall be provided according to the requirement of the generator control equipment but in any case shall not be less than 1.5 mm².
ELE29.15 PROVISION OF TECHNICAL INFORMATION

ELE29.15.010.7 LANGUAGE
All technical information provided shall be in English.

ELE29.15.020.7 SUBMISSIONS FOR APPROVAL
Within six weeks from the date of acceptance of tender the Sub-contractor shall forward the following drawings etc. for all items of work to the Contract Manager for approval:

1. Confirmation by the manufacturer that the size of the generating set offered satisfies the specified loads, with relevant supporting document for verification;
2. A general arrangement drawing of the generating set and controls with leading dimensions, weights, foundation details, oil and water drains, air intake and exhaust arrangement, etc.;
3. Complete schematic and wiring diagrams of the electrical systems;
4. One set of instruction manuals which shall cover the following aspects:
   a. Data Sheet which shall include the basic technical data appertaining to the engine, alternator, battery, etc.;
   b. Description which shall give a brief description of the equipment supplied including instrumentation, lifting arrangement, operation of control circuitry, etc.;
   c. Installation which shall state the basic principles to be observed when installing the plant;
   d. Commissioning;
   e. Operating Instructions which shall cover starting, stopping, protective circuits, automatic controls, battery charging, etc. method of adjustment, safety precaution requirements and performance parameters including the relevant nominal values and acceptable limits, etc. shall be detailed;
   f. Maintenance Instructions, which shall include the schedules for maintenance and the maintenance procedures for servicing, major overhaul and corrective maintenance. This section shall also give the guidance with respect to selection of fuel oil, lubricating oil, use of water treatment additives and anti-freeze as necessary;
   g. Fault finding guidance;
   h. Spares ordering information which shall give details of each item of plant and ancillaries including the name and address of the manufacturer and type and model serial number, etc..

ELE29.15.030.7 ADDITIONAL COPIES
Subject to the Approval of the above information submitted, the Sub-contractor shall supply the Contract Manager with a further three sets of all the information required above except item in ELE29.13, bound in durable hard covers.

ELE29.15.040.7 PRE SHIPMENT TEST EVIDENCE
The Sub-contractor shall submit, in triplicate, before shipment, test certificates for all plant, equipment and major components of the generating set.
DISPLAY OF INSTRUCTIONS AND SCHEMATIC WIRING DIAGRAM

1. Detailed instructions for operation, manual testing and shut down of the generating set and the schematic wiring diagram shall be clearly displayed in a separate anodised aluminium frame with transparent plastic front plate of 3 mm minimum thickness and wooden backing board of 5 mm minimum thickness adjacent to the control panel in each generator room;

2. A warning sign shall be provided with a prominent red notice on white ground, of durable material, with a size of not less than 300 x 300 mm inscribed in English and Chinese characters as follows:

```
DANGER 危险
THIS GENERATING SET IS AUTOMATICALLY CONTROLLED AND MAY START WITHOUT WARNING

此發電機組乃自動操作並會隨時起動
```

Lettering shall be at least 25 mm high. The notice shall be displayed adjacent to each generating set.
ELE29.16 ACCEPTANCE TESTING AND COMMISSIONING

ELE29.16.010.7 TESTING STANDARDS

1. The generating set shall be tested and maintained in accordance with this Section, the F.S. Code of Practice, the relevant F.S.D. circular letters and the standard forms for commissioning tests and routine monthly tests prepared by the Housing Department;

2. The engine shall be tested in accordance with ISO 3046-1, ISO 3046-3 and ISO 15550 and the alternator shall be tested in accordance with IEC 60034-1 and IEC 60034-2-1. The test report for measurements in ISO 15550 Table 6 - List A, items A1 – barometric pressure, humidity and ambient temperature, A2 – engine speed or cycle frequency, A3 – engine brake torque and/or fuel pump or governor & A5 – fuel consumption only and in Table 7 - List B – brake power and specific fuel consumption and IEC 60034-1 – basic tests or routine check tests supported by the results of earlier basic tests on a similar machine shall be provided.

ELE29.16.020.7 FACTORY TESTING

The assembled generating set shall be tested at the place of manufacture according to the acceptance test requirement of ISO 8528-6, before despatch. The tests shall also comprise insulation resistance tests, starting load acceptance capability test, regenerative power absorption test, voltage dip test, starting system test, fuel consumption test and full connected load test. Certified records of the above full operation tests shall be submitted to the Contract Manager before installation of the set.

ELE29.16.030.7 SCOPE OF TESTING

When the installation is completed, commissioning of the installation and performance tests shall be carried out for all equipment's and systems at site and witnessed by an authorised representative of the Contract Manager. The on-site tests shall include insulation resistance test, electrical circuit protection test, control function test, load acceptance capability test, dummy load test, on-load test, noise & vibration test and phase sequence test.

ELE29.16.040.7 TESTING OPERATIONS

The acceptance testing shall include the satisfactory operation of the following:

1. The normal supply shall be switched off in order to start the generating set;

2. When the generating set is ready to accept the Fire Services Installation load, each fire service installation shall be switched on until all installations are in operating conditions. A "simultaneous running" test shall then take place and shall last for a continuous period of one hour;

3. After one hour of testing the generating set shall be examined and all instruments, safety devices, etc. shall indicate "normal" running of the generator;

4. Noise measurement shall be made during the test to ascertain that the noise level emitted during the period of generator operation shall not exceed the limits imposed by Environmental Protection Department and in accordance with the Noise Control Ordinance.
ELE29.16.050.7 LABOUR AND MATERIALS
The Sub-contractor shall provide all labour, apparatus, instruments, tools, fuel, water, lubricants, cable connections etc. required for the testing and commissioning and shall fill up the fuel tank after testing to ensure that the set is in proper order prior to the handover of the installation to the Contract Manager.

ELE29.16.060.7 ACCURACY OF INSTRUMENTS
1. All instruments required for testing of the installation shall be supplied by the Sub-contractor;
2. The instruments used shall be of accurate type and calibrated;
3. The Sub-contractor may be required to produce calibration records and to verify the declared accuracy;
4. The Contract Manager may reject any instrument which, in his opinion, is not suitable for the test and the Sub-contractor shall replace the instruments when required.
ELE29.17 MAINTENANCE AND FINAL TESTING

ELE29.17.010.7 ROUTINE MAINTENANCE

Routine maintenance work shall include:

1. Regular monthly visits to inspect, clean, lubricate and necessary adjustments to maintain optimum operating conditions;

2. All repairs and replacements necessary to maintain optimum operating conditions;

3. Immediate answering of all emergency calls both during and out of working hours, and attendance at site within one (1) hours after receiving emergency calls from any place other than the outlying islands (Note: With the opening of the North Lantau Expressway, Lantau Island is not considered as an Outlying Island if it can be accessed by vehicle.) and within two (2) hours from receipt of such calls from outlying islands;

4. Recording all site attendances, on arrival and departure, whether regular service visit or emergency breakdown call, together with details of the work carried out, in the Emergency Generator record book held at the estate office. Note comments inserted in the record book and take suitable action accordingly;

5. On-load testing all sets once monthly for a period of not less than 30 minutes as below:

   a. Coordinate with the Building Management in advance and take every necessary step to ensure the testing can be carried out effectively with minimum disturbance to the tenants;

   b. Obtain necessary keys such as those of the generator rooms, switch rooms, and lift machine room, etc. from the estate office and have them returned after use;

   c. Before changing over the essential load to the generating set supply, discharge all passengers from all lifts including the fireman's lifts. During the changing over operation, ensure that no passenger is using any of the lifts. However, such lifts shall be in normal operation during the on-load testing of generating set;

   d. Simulate the normal supply failure by switching off the normal supply switches at the upstream of the changeover contactors of the essential supply at the main switch cubicle and of the fireman's lift supply inside the lift machine room. The generating set shall be automatically started up to supply the essential load of fireman's lifts and essential lighting and power. After testing, the electrical system shall be switched back to normal condition.

6. During this on-load testing period, all operating conditions shall be checked and recorded. Following the on-load testing, functional tests shall be carried out on all automatic and manual starting devices and safety controls. The monthly running and functioning tests shall be in accordance with the F.S. Code of Practice;
7. Annual on-load testing shall be performed on all generating set once every 12-months. During the testing, all connected load, including fireman's lifts, essential lighting and power and other fire services installations shall be operated on the generator set supply for a period of not less than 30 minutes. The procedures as stated in (1) to (6) above shall be followed. The Sub-contractor shall coordinate with the Main contractor in advance to arrange annual on-load testing together with F.S. & Water Pump Sub-contractor for on-load running of the fire services installation. The testing shall be in accordance with the requirement as stipulated in the Fire Services COP.

ELE29.17.020.7 MANUFACTURERS RECOMMENDATIONS
1. The Sub-contractor shall also provide the following maintenance as recommended by the manufacturer and to the satisfaction of the Contract Manager:
   a. Necessary maintenance for period longer than one month;
   b. Necessary maintenance on an hour run basis.
2. Fully detailed maintenance and testing instructions shall be provided in a permanent form adjacent to the sets.

ELE29.17.030.7 MAINTENANCE OF BATTERIES
Care and maintenance, if necessary, of any batteries shall be based on the relevant Standard but shall incorporate the manufacturer's specific recommendations for operation under Hong Kong conditions.

ELE29.17.040.7 PROVISION AND COMPLETION OF LOG BOOK
A log book shall be provided, be retained in the generator room and be kept up to date, recording, at the time of occurrence, all operations, faults occurrences and corrective actions taken, routine servicing, maintenance and periodic operation, etc. including dates, times, hour meter readings, worker/supervisors names and signatures, etc. for the set, batteries, compressors, etc.

ELE29.17.050.7 FINAL TESTING
At the end of the Maintenance Period the Sub-contractor shall repeat the tests including the insulation resistance test, electrical circuit protection test, control function test and the annual on-load test to the satisfaction of the Contract Manager.

ELE29.17.060.7 LABOUR AND MATERIALS
The Sub-contractor shall provide all labour, apparatus, instruments, tools, fuel, water, lubricants, fuses, lamps etc., during maintenance and final testing to ensure that the set is in proper order after each operation during the Maintenance Period including filling fuel tanks after each testing.

ELE30.1 TESTING

ELE30.1.010.7 GENERAL

1. Inspection and testing shall be carried out on all new installations and alterations to an existing installation in accordance with the requirements of this Section;

2. During the construction stage, the Sub-contractor shall submit test report for conduit continuity test executed prior to concreting of the concealed steel conduit work as specified in the ELE11.3.010;

3. The Sub-contractor shall be responsible for the electrical conductivity testing on samples of aluminium window frames submitted by Main Contractor on Site;

4. The Sub-contractor shall ensure the bonding for extraneous conductive parts is sound and the result complies with the Electrical CoP and BS 7671 by proper measurement with records at good time. For those parts for equipotential bonding system found not electrical conductive, the Main Contractor and the Sub-contractor shall be responsible for rectification of their own works at early as possible;

5. Upon the completion of the sample flats and the sample wing, the Sub-contractor shall carry out the equipotential bonding test to extraneous conductive parts as directed by Contract Manager and to his satisfaction. Test results shall be submitted to the Contract Manager for record purposes;

6. The whole installation shall be tested on completion by the Sub-contractor in compliance with the relevant clauses in this Section. In particular, the earth fault loop impedance shall be tested when the permanent electricity supply is available. The test reports, which shall be verified and endorsed by the Supervising Engineer and registered electrical worker of appropriate grade in accordance with ELE1.8.020, together with the Inspection and Completion Certificates as prescribed in the Electrical CoP for the whole installation shall be submitted to the Contract Manager for Approval before acceptance of the installation;

7. The Sub-contractor shall take account of the accuracy of the instruments when verifying the compliance of the installation. Appropriate safety margin shall be achieved on Site to ensure that the safe and proper functioning of the installation is within the specified safety and performance limits.

ELE30.1.020.7 INSTRUMENTS

1. In addition to PRE.BS1.630 which specifies the provision of a set of measuring instruments for BSPASS and Contract Manager's Representatives' use, which will be under the custody of the CMR, the Sub-contractor shall provide all necessary instruments used for measurement and testing of the installation. The instruments shall be capable of carrying out the measurement and testing with the necessary accuracy. Except for dummy resistive load bank given in sub-clause (1)(r) below, the instruments shall be calibrated with traceability to internationally or nationally recognized standards. Each instrument shall carry an indelible identification and, except where calibration is specified not necessary, be attached with a label showing the due date for calibration. The instruments shall include, but are not limited to, the followings:

   a. Low resistance ohmmeter;
   b. Insulation resistance tester;
   c. Earth-fault loop impedance tester;
   d. Earth electrode resistance tester;
   e. RCCB tester;
   f. Voltmeter;
g. Clamp-on ammeter;
h. Measuring tape;
i. Vernier calliper;
j. Frequency meter;
k. Sound Level Meter;
l. Lux meter;
m. Luminance meter;
n. Equipment for measurement of total harmonic distortion;
o. Multi-function electronic meter for measurement of current, voltage, power factor, kW, kVA, kVAR and KWh;
p. Primary current injection tester;
q. Secondary current injection tester;
r. Phase sequence tester / meter;
s. Dummy resistive load bank;
t. Digital stop watch;
u. Thermometer;
v. Pressure gauge.

2. Upon requested by the Contract Manager, the Sub-contractor shall submit calibration certificates or other evidence of calibration and records of calibration results for inspection. The Contract Manager may reject any instrument(s) which in his opinion are not suitable for the measurement or testing, and the Sub-contractor shall replace them with Approved types immediately when required.

ELE30.1.030.7 VISUAL INSPECTION

A visual inspection should be made to verify the electrical equipment as installed is correctly selected, erected and there is no apparent damage. The visual inspection should include a check on items as stipulated in the Electrical CoP Code 21A.

ELE30.1.040.7 TESTING SEQUENCE

Where relevant, the following items are to be tested preferably in the sequence indicated below:

1. Continuity of protective conductors, including main and supplementary equipotential bonding;
2. Continuity of ring final circuit conductors;
3. Insulation resistance;
4. Polarity;
5. Earth electrode resistance;
6. Earth fault loop impedance;
7. Functions of all protective devices;
8. Functions of all items of equipment.

ELE30.1.045.7 TESTING ARRANGEMENTS

1. The details and arrangements for each of the aforesaid tests shall refer to relevant clauses stipulated in Code 21B of the Electrical CoP;
2. In the event of any test indicating failure to comply, that test and those preceding, the results of which may have been influenced by the fault indicated, shall be repeated after the fault has been rectified.

ELE30.1.160.7 RECORDING OF TEST RESULTS

The test results of electrical work shall be recorded in the format be approved by CM. The test reports, together with Work Completion Certificates shall be certified by registered electrical worker of appropriate grade and registered electrical contractor, as prescribed in the Electrical CoP for the whole installation shall be submitted before acceptance of the installation.

ELE30.1.170.7 LIGHTNING PROTECTION SYSTEM

Every lightning protection system shall be tested in accordance with ELE14.

ELE30.1.180.7 FIRE SERVICE (F.S.) INSTALLATION

1. All plants, equipment and systems included in the scope of the Sub-contract and classified as fire services installations under F.S. Regulations/Code of Practices shall be installed, tested, certified and maintained in accordance with the relevant F.S. Regulations/Fire Services COP. The fire services installations included in the scope of the Sub-contract shall consist of, but are not limited to, the following:
   a. Emergency Lighting;
   b. Exit Signs and Directional Signs;
   c. Emergency Generator.

2. The emergency lighting shall include all essential lighting points along the escape route within the building such as lift lobbies, staircase, corridor, etc. and self-contained emergency lighting inside the switch/service/plant rooms, non-domestic premises etc. as shown on the Drawings;

3. For the F.S. installations mentioned above, the Sub-contractor shall produce Completion Certificates (i.e. Form 501) upon completion of installation and Maintenance Certificates (FS 251) at the end of the Maintenance Period in accordance with F.S. Regulations/Fire Services COP. These certificates shall be duly signed by an appropriate Registered F.S. Contractor. The Maintenance Certificate shall be submitted to FSD and copied to the Contract Manager within 14 days after a final acceptance test has been carried out. The Maintenance Certificate together with a list of fire services installation and equipment shall also be copied, framed and displayed in a prominent area of each building concerned under the direction of the Contract Manager.

ELE30.1.190.7 EMERGENCY GENERATOR INSTALLATION

Testing, commissioning and maintenance of the standby diesel generating sets shall be carried out as specified in ELE29.
ELE30.2 MAINTENANCE

ELE30.2.010.7 24-HOUR ON-CALL SERVICE DURING MAINTENANCE PERIOD

1. The Sub-contractor shall provide 24-hour on-call service at any time during the Maintenance Period;

2. The Contract Manager may instruct the Sub-contractor, in the Maintenance period via telephone, mobile phone, paging service or any other means as advised by the Sub-contractor and Approved by the Contract Manager, to attend to reported breakdowns, and the Sub-contractor shall dispatch competent technicians or such other suitable personnel, who shall arrive at site, carry out any necessary inspection, testing and repair work for service resumption within the time stipulated under the Performance Pledge of the Employer as listed below and under all weather conditions. In the event that it being impossible to perform the requirement as stipulated in the Performance Pledge, the Sub-contractor shall explain immediately to the Contract Manager or his or her representatives the reason for such non-conformance;

<table>
<thead>

<tr>
<td>Description</td>
</tr>
<tr>
<td>Arrival for maintenance during office hours</td>
</tr>
<tr>
<td>Arrival for maintenance after office hours</td>
</tr>
<tr>
<td>Resumption of power supply</td>
</tr>
</tbody>
</table>

3. The Sub-contractor shall submit to the Contract Manager, for this purpose, at least two names of English speaking representatives, who can be reached at any time of the day, with contact telephone numbers of direct lines, mobile phones or paging service for Approval;

4. Prior Approval shall also be obtained for any subsequent changes of representatives, contact telephone numbers, etc., during the Maintenance Period at least two weeks before the change is effected;

5. The maintenance and servicing works, as described above, form part of the Main Works described in Clause 8.3(2)(c) of the General Conditions of Main Contract.

ELE30.2.020.7 SUB-CONTRACTORS OBLIGATIONS

During the Maintenance Period, the Sub-contractor shall attend to all faults and complaints, remedy all defects, replace all malfunctional items and maintain the complete installation in a clean, tidy and functional condition to the satisfaction of the Contract Manager unless otherwise specified.

ELE30.2.030.7 REPLACEMENT OF DEFECTIVE BULBS/TUBES/FUSES

1. For all domestic buildings during the Maintenance Period, the defective lamp bulbs/fluorescent tubes and fuses shall be replaced by others;

2. For all other non-domestic buildings during the Maintenance Period, the defective lamp bulbs/fluorescent tubes and fuses shall be replaced by the Sub-Contractor;

3. In all cases, the Sub-Contractor shall replace defective lamps within their life expectancy as specified in the Contract.
EMERGENCIES
If any work is, in the opinion of the Contract Manager, required to avoid danger or to restore supply and the Sub-contractor is not available immediately and/or fails to arrive on site within the time required, the Contract Manager may instruct any other contractor, workman or person to carry out the work immediately and the responsibility of the Sub-contractor to fulfil the contractual obligations shall not be relieved under such circumstances, in which case the Sub-contractor shall be liable for all the cost incurred as if such work has to be carried out by the Sub-contractor.

ELECTRICITY SHUT-DOWN
Should shut-down of electricity to buildings be required for the execution of the work, the duration should be kept to a minimum and prior agreement of the Contract Manager shall be sought except for emergency operation.

PREVENTIVE MAINTENANCE
At the end of the Maintenance Period, the Sub-contractor shall execute all work of inspection, examination, and overhaul as required, to the complete installation, other than the installation inside domestic flats, to the complete satisfaction of the Contract Manager.

REPAIR, CORRECTIVE AND POST-FAULT MAINTENANCE
1. The Sub-contractor shall carry out all repair, corrective and post-fault maintenance as soon as practicable after receiving instruction from the Contract Manager;
2. Such work shall be carried out by the Sub-contractor at his own cost if the necessity for the work shall, in the opinion of the Contract Manager, be due to the use of materials or workmanship not in accordance with the contract, or due to failure on the part of the Sub-contractor to comply with any obligation expressed or implied in the Contract;
3. If, in the opinion of the Contract Manager, the necessity of such work is due to other causes for which the Sub-contractor is not responsible, the value of the work will be ascertained by the Contract Manager and paid for;
4. Post-fault maintenance of switching devices, distribution boards and switchboards shall be carried out in accordance with BS 6423.

FINAL INSPECTION
1. At the end of the Maintenance Period, the Sub-contractor shall carry out the visual inspection of the whole electrical system except the installations inside the domestic flats, and shall submit the inspection reports to the Contract Manager for record;
2. Should the inspection results indicate that the equipment or system not in full compliance with this specification, the Sub-contractor shall carry out, at his own expense, any alterations, replacements, or adjustment, as may be required to correct the faulty work;
3. The Contract Manager's decision as to what constitutes a satisfactory inspection shall be final.

ELE31.1 NOT USED
ELE31.2 EQUIPMENT & MATERIALS

ELE31.2.010 VENTILATION FANS

1. This section should be read in conjunction with Section B3 and C3 of the General AC Specification;

2. Fan capacities, heads, working pressures, minimum efficiencies and motor powers indicated are for reference and tendering purposes only. Any modifications to the system or any of its components such as fans, ductwork, motors, cables, switchgear etc. which may be required to meet the scheduled duties and space limitations shall be carried out at the Sub-contractor's expenses, except where modification is brought about by the written instruction of the Contract Manager. Notwithstanding this, no modification to any system shall be carried out where such modification may result in a reduction in system performance and efficiency, without the prior approval of the Contract Manager;

3. Sound power rating curves shall be certified by the manufacturer for the complete fan and drive assemblies and tested in accordance with BS EN ISO 5136 or Parts 1 to 4 of BS ISO 13347 or other equivalent standard;

4. The Sub-contractor shall be responsible for checking the actual data before ordering of equipment. It shall be supported with full fan duty calculations.

ELE31.2.020 DUCTWORK

1. General:
   a. Ductwork shall generally comply with Section B2 and C2 of the General AC Specification;
   b. Duct sizes given on the Drawings are clear internal dimensions and allowance shall be made for both internal and external insulation where applicable;
   c. All ductwork shall be fabricated as far as practicable according to site dimensions taken by the Sub-contractor. The Sub-contractor shall make suitable provision to accommodate any discrepancies that may occur between the Drawings and site dimensions. The Sub-contractor shall also note the obligations pertaining to co-ordination of services on site;
   d. The air leakage limit on ductwork shall conform and be tested to the requirements as stipulated in the AC Energy Code;
   e. This Specification and the Drawings only indicate the extent and general arrangement of the ducting system. If any departure from the Drawings is deemed necessary, details of such departure and reasons shall be submitted by the Sub-contractor to the Contract Manager for approval. Approved departures shall be made at no extra cost. Preferential changes arising from the Sub-contractor's processing and/or fabrication methods where approved shall be made at no extra cost.

2. Material:
   Unless otherwise specified on the Drawings or elsewhere in this Specification, air ducts shall be fabricated from hot dipped galvanised steel sheet to BS EN 10327 and any damage to the galvanised finish shall be made good with three coats of aluminium zinc rich paint or other approved corrosion resistant paint to the satisfaction of the Contract Manager in addition to painting as specified. Uninsulated ductwork running exposed to view shall be painted as specified in relevant sections of the General AC Specification and in white or another colour as directed by the Contract Manager.

3. Construction and standard:
a. All sheet metal ductwork described in this part of Specification and shown on the Drawings shall be constructed to the recommendation of the United Kingdom Heating and Ventilating Contractors Association in the latest editions of their Publication DW/144 and the additional requirements of this part of Specification;
b. Circular and flat-oval ductwork shall be spirally-wound and shall be suitable for medium pressure applications;
c. Pressure rating of rectangular ductwork shall be classified as per DW/144 according to the associated fan duty or as specified in other parts of this Specification;
d. Where ductwork passes through or connects to concrete and/or masonry walls and air shafts, ducts shall be collar flushed with metal angle flushing pieces, effectively sealed air tight and neatly finished. The annular space around the duct shall be caulked tight with approved gasket or sealant;
e. Flanged joints shall be provided for duct connections to plants and where removable sections are required to provide access for cleaning and maintenance;
f. Where duct bends or joints occur in ceiling spaces and flanges may foul ceiling suspension members, slip joints may be used and the duct stiffened locally, if necessary, to avoid duct vibration;
g. Test holes shall be provided where necessary for effective balancing and testing. Test holes shall be 25 mm diameter and fitted with removable sealed cap. Test points shall be provided for all dampers and equipment to enable fan duties and other items to be assessed and for commissioning of the system. Location of test holes shall be at a point of minimum turbulence;
h. Regulating dampers or split dampers shall be provided in every branch-off;
i. All intake and discharge openings to the building shall be fitted with 10 mm grid stainless steel wire mesh. This requirement is additional to any grilles or louvres indicated on the Drawings;
j. Open ends of ducts shall be covered with plastic sheets during erection to prevent ingress of dirt and rubbish. All ductwork shall be cleaned internally before the system is tested, commissioned and put into operation;
k. Side inspection and access panels for the purpose of cleaning duct interior shall be provided. The cleaning point shall in general be installed at a maximum distance of 4 metres between centres in fully accessible locations and subject to Contract Manager's approval. Stainless steel drain points complete with plugs and caps shall be provided at all low points of the air ducts.

**ELE31.2.030.7 DUCTWORK ACCESSORIES**

1. General:
Ductwork accessories shall generally comply with Section B2 and C2 of the General AC Specification.

2. Volume control dampers:
The Sub-contractors shall provide all necessary volume control dampers whether shown on the Drawings or not so that airflow rates specified can fully be achieved. Ductwork regulating dampers shall be of the opposed blade type with low pressure drop and noise regeneration characteristics.

3. Access doors and panels:
a. Access doors shall be hinged type and of double skin sandwich construction each having a cam-lock action retaining lock and complete with gaskets. Multiple screw fixings shall not be acceptable. Access openings shall be adequately reinforced. Insulation thickness in the door shall be equal to that of the duct or cabinet into which it is installed;

b. Access doors shall not be removable unless no larger than 300 mm x 300 mm or essential for access or maintenance purpose, in which case approval shall be sought from the Contract Manager;

c. Access doors shall be provided at all fire/smoke dampers, silencers, fans, duct probe type smoke detectors and where necessary for maintenance and other purposes whether or not they are specifically shown on the Drawings.

4. Turning vanes:
Wherever DW/144 requires the use of bend splitters, proprietary tuning vanes and square bends shall be provided whether detailed on the Drawings or not. Turning vanes shall be of aerofoil using proprietary vane rails.

**ELE31.2.040.7 GRILLES AND DIFFUSERS**

1. This section shall be read in conjunction with Section B3 and C3 of the General AC Specification;

2. All air supply, return, exhaust and dummy fittings shall be provided according to the types and duties shown on the Drawings;

3. All aluminium or steel louvres, grilles, diffusers, unless otherwise stated, shall have phosphate treatment with baked enamel finish to colours approved by the Contract Manager;

4. Before any diffusers, grilles, etc. are ordered or manufacture of fittings commences, confirmation must be obtained from the Contract Manager in respect of the exact finishes of fittings required. Samples of every type of grilles, diffusers, etc. shall be submitted to the Contract Manager for approval before orders are placed;

5. Supply grilles and diffusers shall be of aluminium construction with concealed fixings and shall incorporate rear opposed blade volume control damper with front accessible adjustment screw. Grilles shall have horizontal and vertical adjustable blades to suit the particular application;

6. Exhaust/return grilles shall be of aluminium construction with concealed fixings and square neck connection as indicated on the Drawings. The vanes shall be of extruded aluminium sections fixed at an inclined angle of 45 degrees. An opposed blade damper with front accessible adjustment screw shall be fitted to the neck for volume control.

**ELE31.2.050.7 FILTERS**

1. Filters shall in general comply with Section B1 and C1 of the General AC Specification;

2. Filter media shall be of FSD approved type;

3. Washable panel fitter shall have the minimum efficiency reporting value (MERV) by ANSI/ASHRAE Standard 52.2 and initial resistance at 2.5 m/s face velocity as shown below. The filter shall operate to a final resistance of 150, 100 or 75 Pa for 50, 25 or 12.5 mm thick panels respectively.

<table>

ACTIVATED CARBON/CHEMICAL FILTERS (FOR REFUSE COLLECTION POINT/JUNK COLLECTION POINT, REFUSE STORAGE & MATERIAL RECOVERY CHAMBERS AND REFUSE CHUTES)

1. General:
   a. The activated carbon/chemical filters shall be Underwriters Laboratories (UL) Class 1 listed and FSD approved;
   b. The filter unit shall consist of housing, modules and filtering media. The complete unit shall be manufactured by the same manufacturer with well-proven experience in construction of similar filter units;
   c. All filtering media shall be recognised by FSD as complying with the non-combustible requirement;
   d. Four sets of spare module with filtering media and pre-filter shall also be provided at completion stage.

2. Housing:
   a. Housing shall be constructed of AISI type 304 stainless steel sheet. Extruded luminous filter slide tracks shall be bolted to vertical formed channel supports at 610 mm intervals across the width of the housing;
   b. Filter tracks shall include nylon pile seal to match with the sealing face of all filters. Doors, on both sides, shall be hinged with stainless steel hinges and pins, and shall include permanently attached positive locking door latches. Gaskets shall be provided to prevent air leakage around doors and between the doors and the filters;
   c. Housing shall consist of two sections, first section for housing 50 mm pre-filters, second section for housing modules;
   d. The Sub-contractor is responsible for calculating the actual size of filter sections required for sizing of housing. The Sub-contractor shall also size the filter sections with face air velocity across the filter section not more than 2.5 m/s.

3. Modules:
   Modules shall be constructed of disposable paperboard or ABS (acrylo-nitrile butadiene styrene terpolymer) grade DFA-R thermoplastic. Modules shall have V-shape cross sections containing media. The modules shall be nominally 152 mm x 610 mm x 457 mm overall. Perforated plastic portion shall have 53% open area. Modules shall carry an Underwriters Laboratories (UL) Class 2 listing when filled with media. The modules shall be disposable, no separate handling of media to reduce the time of maintenance.

4. Filtering media:
   a. Media in the modules shall be mixture of 50% Medium A and 50% Medium B. Media should be able to absorb organic and inorganic gases;
   b. Medium A:
      i. Medium A shall consist of manufactured, generally spherical, porous pellets (nominal pellet diameter is 3 mm). Pellets shall be formed from a combination of powered activated alumina and other binders, suitably impregnated with potassium permanganate (minimum 4%) to provide optimum absorption and oxidation of a wide variety of gaseous contaminants. The potassium permanganate shall be applied during pellet formation, such that the pellet volume is totally available for reaction. The media shall be inorganic, non-toxic, non-flammable and shall not support bacterial or fungal growth;
      ii. Medium shall meet the following removal capacities:
- Hydrogen sulphide: 8.0% minimum by weight
- Sulphur dioxide: 3.5% minimum by weight
- Nitric oxide: 2.5% minimum by weight
- Nitrogen dioxide: 1.0% minimum by weight

iii. Medium shall operate normally at temperature -20°C to 51°C with 10 to 95% R.H. Medium shall have a scrubbing efficiency of not less than 99.95% at air velocities of 0.3 to 2.5 m/s.

c. Medium B:
Medium B shall be manufactured from a combination of coconut shells, bituminous coal and contain elemental sulphur less than 0.005%. The hardness of medium shall be 97 determined by ASTM D3802-79. The absorptive capacity for carbon tetrachloride shall be minimum 50% according to ASTM D3467-04.

d. Amount of media provided in the modules shall be capable of removing offensive smell in the exhaust air such that replacement of media is required not more than once every six months.

5. Pre-filter:
   a. Pre-filter shall be 50 mm thick washable panel type with average efficiency of 20% tested in accordance with ASHRAE 52.1 or ASHRAE 52.2. Pre-filter shall be of FSD approved type;
   b. Air resistance when clean shall not exceed 80 Pa. Design final resistance shall be 150 Pa.

6. Replacement of Filters:
   Dirty filters will be cleaned or replaced by others during the Maintenance Period.

ELE31.070.7 ACTIVATED CARBON/CHEMICAL FILTERS (FOR REFUSE STORAGE & MATERIAL RECOVERY ROOMS)

1. The activated carbon/chemical filters for refuse storage & material recovery rooms shall be 50 mm thick panel type with proven local job installation records and approved by the Contract Manager;

2. Filter shall be housed in the same galvanised steel cabinet that houses the exhaust fan or as otherwise specified. Filter track shall be provided to facilitate secure filter fixing and easy filter removal.
ELE31.3 SYSTEM REQUIREMENTS

ELE31.3.010.7 VENTILATION FAN CONTROL

1. Where a supply fan is specified in addition to an exhaust fan for a room, the operations of the two fans shall be interlocked;

2. Exhaust fans for refuse storage & material recovery rooms shall be group controlled by 24 hour time switches installed in a weatherproof enclosure in the refuse storage & material recovery chamber at ground floor as shown on the Drawings. The enclosure shall be constructed from minimum 1.5 mm thick sheet steel, rust proofed and epoxy powder painted or baked enamel finished for the inside and outside surfaces. The enclosure opening shall be rolled up with curled edges in order to stop water ingress slip into inner side of the panel. The front panel door shall be hinged permitting not less than 110 degree opening, inserted with a durable clear transparent panel sealed by rubber gaskets, and fitted with watertight handle. The edges of the door shall be fitted with neoprene rubber gaskets which at closing position, shall be tightly rested on the curled edges of the panel opening. The enclosure shall have an index of protection not less than IP42 to BS EN 60529 or IEC 60529;

3. For ventilation fans for refuse chute, refuse storage & material recovery chambers, pump rooms and lift machine rooms, the ventilation fan(s) in each room shall be operated by manual control and a 24 hour time switch;

4. In addition, thermal control device shall be used to control the ventilation fans in lift machine rooms and roof fresh water booster pump rooms;

5. A by-pass switch shall be provided for the manual control of each time switch;

6. The time switch shall be submitted for approval prior to installation;

7. Local control panels:

   a. Local control panels shall be provided for individual or each group of fans for refuse storage & material recovery chambers, refuse collection point and where specified;

   b. The whole enclosure of the local control panels shall be constructed from minimum 1.5 mm thick sheet steel, rust proofed and epoxy powder painted or baked enamel finished for all inside and outside surfaces. The panel opening shall be rolled up with curled edges in order to stop water ingress slip into inner side of the panel. The front panel shall be of double-door construction. The outer doors of the front panel shall be hinged permitting not less than 110 degree opening, inserted with a durable clear transparent panel sealed by rubber gaskets, and fitted with watertight handle. The edges of the outer doors shall be fitted with neoprene rubber gaskets which at closing position, shall be tightly rested on the curled edges of the panel opening. The inner doors of the front panel shall be hinged permitting not less than 90 degree opening and recessed in the panel with indication lights, selector switches, isolating switches etc. fitted on. The back sides of the inner panels shall be fitted with insulation boards to prevent direct exposure of live parts when opened. At closing position, the inner doors shall be fastened onto the panel by stainless steel screws. The panels shall be of a robust design, capable of withstanding the mechanical, electrical and thermal stresses under all working conditions including fault conditions. The enclosure shall have an index of protection not less than IP42 to BS EN 60529 or IEC 60529;

   c. Panels shall include all necessary components and accessories to form a complete assembly. Components and accessories shall be firmly fixed in position in the panel and shall be assembled in such a way that it shall be possible to remove or replace any component parts and to carry out cable connections from the front;
d. Permanently engraved labels in both English and Chinese shall be provided on the panel for identifying each piece of instrument and equipment such as push buttons, signal lights etc. The labels shall be engraved with white lettering on a black background. In addition to the aforesaid, each control panel shall have an identity label showing its designation as indicated on the Drawings;

e. Panels having equipment requiring three phase feed shall be complete with HRC fuses and individual on-load door interlocked isolators. Panels having equipment requiring only a single phase feed may be isolated by means of a switch mounted within the panel but in such circumstances every item inside shall be fully shrouded and the panel door shall be provided with barrel lock and keys. Alternatively, the Sub-contractor can propose alternative means of isolation, switching and/or emergency switching which satisfies safety requirements of users, occupants and maintenance personnel for approval by the Contract Manager;

f. Control panel for each refuse storage & material recovery chamber shall at least include the following operational features:
   i. Local start/stop push buttons and manual/off/auto switch;
   ii. Status and alarm indicating lamps (supply healthy, on, trip, overload, etc.);
   iii. Panel-mount time switch with a removable clear plastic front cover and its by-pass switch;
   iv. Isolating switch interlocked with the panel door, or isolating switch with door lock.

g. Control panel for each refuse collection point shall at least include the following operational features:
   i. Local start/stop push buttons;
   ii. Status and alarm indicating lamps (supply healthy, on, trip, overload, etc.);
   iii. Isolating switch interlocked with the panel door, or isolating switch with door lock.

h. The Sub-contractor shall submit full details of each type of control panel for approval before fabrication.

8. Motors under automatic control shall be provided with a warning notice, which shall be a prominent red notice on white background of durable material, displayed adjacent to each fan or each pair of fans, and inscribed in English letters and Chinese characters of at least 15 mm high as follows:

<table>
<thead>
<tr>
<th>DANGER</th>
</tr>
</thead>
<tbody>
<tr>
<td>THIS MOTOR IS AUTOMATICALLY CONTROLLED AND MAY START WITHOUT WARNING – ISOLATE BEFORE INSPECTION</td>
</tr>
<tr>
<td>危險</td>
</tr>
<tr>
<td>此機乃自動操作 - 維修前請先關掣</td>
</tr>
</tbody>
</table>

9. In each refuse storage & material recovery chamber, motorised shut-off dampers shall be provided to the intake air external louvres and interlocked with the exhaust fan operation as shown on Drawings;

10. In refuse collection point, a prominent notice of durable material shall be provided and inscribed in English and Chinese characters of at least 25 mm high as follows:

<table>
<thead>
<tr>
<th>PLEASE KEEP DOOR OPEN WHEN EXHAUST FAN IS IN OPERATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>抽氣扇運行時請保持房門開啟.</td>
</tr>
</tbody>
</table>
ELE31.3.020.7 EXTRACTION SYSTEM FOR VEHICLE EXHAUST

1. Extraction fan shall be of centrifugal type and shall meet the demands and duties for conveying vehicle exhaust gases. Construction shall be compatible with both petrol and diesel engine emissions and capable of withstanding high temperature (at least 125°C continuously) and corrosive nature of the exhaust gases. The induction motor to IP 44 shall be directly coupled to the fan and shall be designed to give long and continuous service;

2. The whole system shall be designed for use by heavy refuse collection vehicles of up to 24 tonnes gross vehicle weight with engine capacity of 15,000 c.c.;

3. The extraction unit shall be fitted with chained cap adaptors to suit the vehicles using the refuse collection point. The following accessories are to be provided:
   a. 12 m length of minimum 100 mm diameter crush proof metallic flexible hose;
   b. High and low point inlets to suit the overhead and under-chasis exhaust discharges of the vehicles;
   c. Exhaust funnels to fit tail pipe from 63.5 mm to 127 mm in diameter;
   d. Hose brackets, plugs and fitted kit as required.

4. Hose reel shall be of electric motor driven type with waterproof control panel at low level to the approval of the Contract Manager.

ELE31.3.030.7 NOISE AND VIBRATION CONTROL

1. General:
   a. The Sub-contractor shall supply and install noise and vibration control equipment to ventilation fans, ductwork silencers, flexible duct connections and acoustical enclosures to noise generated equipment where specified and where necessary;
   b. The Sub-contractor shall be responsible for checking and calculating the noise level generated by the ventilation equipment and providing suitable acoustic treatment to comply with the Noise Control Ordinance, requirements of Environmental Protection Department, the Drawings and General AC Specification. Such calculations shall be submitted to the Contract Manager for approval;
   c. All noise absorbing materials shall be inert, non-hygroscopic, verium proof and fire retardant. All materials installed outside building or uncovered shall be suitable for outdoor use;
   d. For evaluation of vibration standard and measuring techniques, BS ISO 3334 shall be applied;
   e. When ductwork or conduit crosses structural movement joints, flexible connection must be installed;
   f. The Sub-contractor shall be responsible for ensuring that all penetrations in walls, floors and ceilings provided for ducts, conduits, etc. are isolated and sealed around the penetrations. In all cases, masonry and other structure surrounding the plant shall not be in direct contact with the equipment;
   g. The Sub-contractor shall be responsible for selecting vibration isolators, ductwork supports, ductwork acoustic insulation, silencers etc. where appropriate and taking into account the manufacturers’ recommendations to ensure that the noise and vibration generated from the system could be effectively isolated in accordance with the requirements in Section B8 and C8 of the General AC Specification;
   h. Suspended equipment shall be supported on Type "F" spring and double deflection neoprene hangers;
i. Flexible connectors shall also be provided at ductwork connections to the ventilation equipment and at all building movement joints.

2. Duct silencers/sound attenuators:
   a. Duct silencers/sound attenuators where shown on the drawings shall be provided for all ducted ventilation fans. Additional attenuators shall be provided where necessary to meet relevant statutory requirements;
   b. Duct silencers/sound attenuators shall be factory constructed and tested;
   c. The duct silencers/sound attenuators shall be selected in accordance with the requirements of the General AC specification. The maximum pressure drop across the selected silencer shall not exceed 50 Pa;
   d. All acoustic infill materials shall be inert, non-combustible, vermin proof, non-hygrosopic, wrapped in an acoustically transparent polyester membrane and sealed with polyester sealant to the approval of FSD;
   e. All attenuators shall be fitted with end plates and packed in sealed bags at factory prior to shipment.

3. Acoustic enclosures:
   a. The Sub-contractor shall supply and install ventilation fan acoustic enclosures where shown on the Drawings and where necessary to satisfy the noise criteria specified. The arrangement shall be submitted to the Contract Manager for approval prior to installation;
   b. Construction of the enclosures shall generally be in accordance with the General AC Specification. Enclosure panel thickness shall be as recommended by the acoustic specialist but not less than 25 mm. Access panel shall be provided so that all removable and serviceable parts can be accessed for maintenance;
   c. All acoustic infill materials shall be inert, non-combustible, vermin proof and non-hygrosopic. The infill shall be wrapped in an acoustically transparent polyester membrane and sealed with polyester sealant to the approval of FSD except where detachment of fibres into the air stream is prevented by solid double wall construction.

ELE31.3.040.7 TESTING AND COMMISSIONING

1. All tests shall be carried out in accordance with this Specification and the following documents where applicable:
   a. Section A9 of the General AC Specification;
   c. Relevant CIBSE Commissioning Code;
   d. Relevant British Standard or British Standard Code of Practice.

2. All costs associated with the testing and commissioning procedures including materials, labour, instruments and provisions of all necessary test points shall be borne by the Sub-contractor. Such costs shall also include the cost of making good any defects arising out of such tests and having the work re-tested. In the case of off-site, all other incidental costs shall also be included;

3. Testing and commissioning shall also be required for all temporary works;

4. All tests shall be carried out to the satisfaction of the Contract Manager and shall be witnessed by the Contract Manager and/or his representative;

5. At least two months prior to the testing or commissioning of any system or process, the Sub-contractor shall furnish the following information to the Contract Manager for approval:
a. Type of instrument to be used;
b. Manufacture of instrument;
c. Calibration methods for instrument;
d. Operating instructions for instrument;
e. Accuracy and tolerances of instrument;
f. Proposed formats of testing and commissioning reports;
g. Schedule and programme of testing and commissioning activities.

6. The Sub-contractor shall submit in triplicate the testing and commissioning reports/certificates for each system to the Contract Manager on work completion.

ELE33.1 SCOPE OF WORKS AND GENERAL REQUIREMENTS

ELE33.1.010.7 GENERAL

1. The works under this part of the Sub-contract shall include the whole of the materials and the labour as prescribed or as necessary for the design, supply and installation of the entire grid-connected photovoltaic system (hereinafter refer to as PV System) and training of personnel nominated by the Contract Manager. The photovoltaic (PV) modules shall be installed at the location(s) as shown on the Drawings or described hereafter;

2. The PV System shall include not only the plant and equipment shown on the Drawings or specified, but also include all the incidental sundry components, software and licences necessary for the complete execution of the works and for the proper operation and maintenance of the PV System;

3. The Sub-contractor shall employ a specialist contractor with proven experience in the design, installation and maintenance of PV system of a scale similar to that required by this Specification to carry out the works. Local qualified technical service team shall be available for maintenance and backup service after completion of works;

4. Manufacturers of major components of the PV System including PV modules and inverters shall be implementing quality and environmental management systems in accordance with ISO 9001 and ISO 14001 or other internationally recognized standards in the design, procurement and manufacturing processes.

ELE33.1.020.7 SCOPE OF WORK

The scope of works shall include:

1. Design, supply and installation of the PV System complete with PV modules as described in Sub-clause (2) below, solar conversion systems, monitoring & management systems, interconnection & power distribution wirings and all other necessary equipment and accessories;

2. Provision of a total of _____kWp (rated at Standard Testing Conditions according to IEC 60904) mono-crystalline silicon PV modules at the following location(s) with respective capacities as shown inside brackets:
   a. Upper roof of Block __ (_____kWp);
   b. ..............................................;
   c. ..............................................;
   d. ..............................................;
   e. ..............................................;

3. Submission of schematic wiring diagrams of the PV System and all necessary equipment for the Contract Manager’s approval. Shop drawings indicating the LED/LCD display panel construction details, sizes of PV modules, their mounting details, orientation, spacing and a calculation to demonstrate the monthly and annual power output profiles of the system shall be provided for the Contract Manager’s approval before fabrication and installation;

4. Providing all necessary design drawings and technical data of the offered equipment including the synchronisation and de-coupling procedure of the PV System prior to installation;
5. Liaison with the power supply company for assessment and approval of the PV System design and equipment, and grid connection of the PV System. The Sub-contractor shall allow sufficient time in his programme for all necessary submissions and testing, and make modifications to the PV System as required by the power supply company before connection to the grid;

6. Payment of charges levied by the power supply company for the assessment of the PV System and connection to the grid;

7. Testing, commissioning and putting into operation, the PV System to the satisfaction of the Contract Manager;

8. Except general cleansing of photovoltaic modules, the Sub-contractor shall provide servicing and maintenance of all equipment of the PV System including regular calibration of sensors and measurement equipment as recommended by the manufacturers during the Maintenance Period. Temporary replacement shall be provided for sensors / equipment removed for off-site calibration;

9. Submission of monthly reports on PV System energy production to the power supply company and Contract Manager during the Maintenance Period, and half-yearly reports on system operation and performance to the Contract Manager as required in ELE33.6.020;

10. Provision of training to the Contract Manager's representatives, estate management staff or other personnel as instructed by the Contract Manager for a total duration of six working days, on the testing & commissioning, operation and maintenance of the PV System. The training shall be conducted in three sessions, one before and one after commissioning of the PV System, and the remaining session shall be at the end of the Maintenance Period. Each training session shall be approved by the Contract Manager to cover any or all of the following topics:
   a. Testing & commissioning procedures;
   b. Operation and maintenance of the complete system including PV modules, solar conversion system (SCS), etc.;
   c. Use of all software programmes of the monitoring & management system(s) and SCS for daily operation and monitoring of the PV System and the analysis of data collected.

ELE33.1.030.7 STANDARDS

The International System of Units (SI) shall be used. The PV System shall be designed and installed in compliance with the Specification and the latest editions of the following standards and codes, including all latest amendments:

1. General Requirement for Electronic Contracts Specification No. ESG01 issued by the Electronics Division, Electrical and Mechanical Services Department;

2. Technical Guidelines on Grid Connection of Small-scale Renewable Energy Power Systems issued by the Electrical and Mechanical Services Department;

4. IEC 60891: Procedures for temperature and irradiance corrections to measured I-V characteristics of crystalline silicon photovoltaic devices;

5. IEC 60904-1: Photovoltaic devices Part 1: Measurement of photovoltaic current-voltage characteristics;

9. IEC 60904-5: Photovoltaic devices – Part 5: Determination of the equivalent cell temperature (ECT) of photovoltaic (PV) devices by the open-circuit voltage method;

10. IEC 60904-6: Photovoltaic devices – Part 6: Requirements for reference solar modules;

11. IEC 60904-7: Photovoltaic devices – Part 7: Computation of spectral mismatch error introduced in the testing of a photovoltaic device;

12. IEC 60904-8: Photovoltaic devices – Part 8: Measurement of spectral response of a photovoltaic (PV) device;

14. IEC 60904-10: Photovoltaic devices – Part 10: Methods of linearity measurement;

15. IEC 61173: Over-voltage protection for photovoltaic (PV) power generation systems – Guide;

16. IEC 61215: Crystalline silicon terrestrial photovoltaic (PV) modules – Design qualification and type approval;

17. IEC 61277: Terrestrial photovoltaic (PV) power generating systems – General and guide;

18. IEC 61345: UV test for photovoltaic (PV) modules;

20. IEC 61701: Salt mist corrosion testing of photovoltaic (PV) modules;

21. IEC 61721: Susceptibility of a photovoltaic (PV) module to accidental impact damage (resistance to impact test);

22. IEC 61724: Photovoltaic system performance monitoring – Guidelines for measurement, data exchange and analysis;

23. IEC 61725: Analytical expression for daily solar profiles;

24. IEC 61727: Photovoltaic (PV) systems – Characteristics of the utility interface;

25. IEC 61730-1: Photovoltaic (PV) module safety qualification Part 1: Requirements for construction;

26. IEC 61730-2: Photovoltaic (PV) module safety qualification Part 2: Requirements for testing;

27. IEC 61829: Crystalline silicon photovoltaic (PV) array – On-site measurement of I-V characteristics;

28. IEC/TR2 61836: Solar photovoltaic energy systems – Terms and symbols;

29. IEC 62116: Testing procedure – Islanding prevention measures for power conditioners used in grid connected photovoltaic (PV) power generation systems;

30. IEEE 519: Recommended practices and requirements for harmonic control in electrical power systems;

31. IEEE 928: Recommended criteria for terrestrial PV power systems;

32. IEEE 929: Recommended practice for utility interface of residential and intermediate PV systems;

33. IEEE 1374: Guide for terrestrial photovoltaic power system safety;

34. IEEE P1547: Distributed resources interconnected with electric power systems;

35. UL1703: Flat-plate photovoltaic modules and panels;

36. UL 1741: Static inverters and charge controllers for use in PV power systems;
37. VDEW Guideline for operating in-plant generating units in parallel with the power company's low voltage main.

**ELE33.1.040.7** **SUBMISSION FOR TENDER ASSESSMENT**

The following information shall be submitted in the "Information to be Supplied by Tenderer" for tender assessment purpose:

1. Technical information of the proposed equipment for the PV System;
2. Schematic diagrams of the PV system;
3. A schedule of spare parts and tools required for servicing the installation after the expiry of the 2-year Maintenance Period;
4. The proposed specialist contractor for the design, supply, installation and maintenance of the PV System including his job references with details of system rating, installation completion dates, etc.

**ELE33.1.050.7** **INFORMATION TO BE SUBMITTED BEFORE INSTALLATION AND UPON COMPLETION**

1. The Sub-contractor shall submit the following information for the Contract Manager's approval prior to the commencement of installation work on site:
   a. 3 copies of complete set of detailed shop drawings and calculation including the sizes and types of the proposed PV modules, mounting details, connection diagram, heat dissipation of equipment and simulated monthly and annual power output profiles of the PV System taking into account any shadowing effect due to nearby modules/structures/buildings;
   b. 3 copies of shop drawings and specifications of the equipment/materials.
   c. 3 sets of method statement of installation;
   d. 3 copies of Manufacturer's Certificates of Origin, sensor / measurement equipment calibration certificates, test reports, reports for wind load withstanding capabilities of the PV modules and other relevant documents showing compliance with the Specification;
   e. 3 sets of draft certificates of product warranty specified in ELE33.2.030 & ELE33.3.030;
   f. 1 set of approved materials and accessories samples to be kept in the site office.

2. The Sub-contractor shall submit the PV System design and equipment for approval by the power supply company and shall program the submissions in such way as to allow sufficient time for both the power supply company and the Contract Manager to check and approve the design and equipment before installation;

3. The Sub-contractor shall submit upon completion of installation work on site:
   a. 2 sets of all equipment/system software in CD-ROMs or DVDs and relevant software licences;
   b. 3 sets of approved operation and maintenance manual including servicing and maintenance requirements recommended by equipment manufacturers, test reports with all equipment settings, name(s) of staff responsible for 24 hour on call service, schedule of spare parts and tools with indicative unit prices, etc. in both hard copy and electronic "pdf" format;
   c. 3 sets of training manual in both hard copy and electronic "pdf" format.

**ELE33.1.060.7** **ARCHITECTURAL REQUIREMENTS**

The design of the PV System shall take into consideration the various architectural characteristics including but not limited to the following:
SCOPE OF WORKS AND GENERAL

1. The PV System shall be designed to fit into the designated areas with due regard for the visual appeal and green image;

2. The shapes, sizes, surface finishes and colours of the PV System elements, which constitute the main aesthetic characteristics of the PV System, shall be proposed by the Sub-contractor for approval by the Contract Manager.

ELE33.1.070.7 STRUCTURAL REQUIREMENTS

1. The supports and holding frames for the PV modules shall be of hot-dip galvanized steel and fixed by stainless steel bolts and nuts supplied and installed by the Sub-contractor who shall also be responsible for the corresponding calculations to demonstrate the structural adequacy. The structural calculations shall be endorsed by a Registered Structural Engineer employed by the Sub-contractor and be submitted for approval by the Contract Manager prior to installation of the PV System supports / holding frames;

2. The supports / holding frames shall be designed and installed in such a way that any of the PV modules can be replaced without the need of dismantling any structural member or adjacent module;

3. Flat concrete plinths shall be provided by the Main Contractor above structural beams/columns for fixing of the PV module supports / holding frames by the Sub-contractor. The Sub-contractor shall be responsible for providing relevant information to the Contract Manager for the design of the concrete plinths.
ELE33.2 PHOTOVOLTAIC MODULES AND DC SOURCE CIRCUITS

ELE33.2.010.7 GENERAL REQUIREMENTS

1. The design and choice of photovoltaic (PV) modules and their mounting angle and/or direction shall be made in such way as to maximize the possible solar energy gain at their respective fixing locations;

2. The Sub-contractor shall design, supply and install PV modules, array combiners, circuit breakers, fuses, connectors, power cables, conduits, and other necessary equipment and accessories for integration with the solar conversion system(s) and monitoring & management system(s) to complete the PV System;

3. The Sub-contractor shall review the Drawings and conduct site visit to evaluate any possible shadowing effect due to nearby modules/structures/buildings, and to design the PV arrays and circuits in such way as to avoid/minimize interruption of power output from the PV strings due to shading between 9:00 a.m. and 3:00 p.m.;

4. The PV arrays shall also be designed to avoid/minimize possible glare to occupants of nearby buildings;

5. The Sub-contractor shall submit for Approval his proposed lightning protection system to protect personnel and the PV System from lightning stroke and transient over-voltage;

6. PV modules shall be fixed to the supports / holding frames using stainless steel screws, bolts and nuts and/or proprietary clamps to facilitate subsequent removal and reinstallation whenever necessary;

7. Manufacturer(s) of the offered PV modules shall have proven experience in the production of the respective products and have an annual production capacity of 25MW or above. Manufacturer(s) shall also be member(s) of the PV Cycle Association.

ELE33.2.020.7 TECHNICAL REQUIREMENTS

1. Mono-crystalline silicon PV modules complying with the following requirements shall be provided:
   a. PV module shall consist of tempered / heat-strengthened glass panel with solar factor greater than 0.91, solar cells and back supporting sheet with proper binding agent;

   b. The front glass panel of PV module shall be appropriately treated to ensure solar light reflection of not more than 4% as determined by ISO 9050. For locations where specified in the Drawings and/or where the PV modules will produce glare to nearby building occupants upon completion of works, the front glass panels shall be of textured surface;

   c. PV cells shall be of dark colour with optimised surface treatment;

   d. PV module shall be sealed to protect against ingress of moisture and to ensure UV stability and electrical isolation;

   e. The solar conversion efficiency of PV module shall be not less than 14% at Standard Testing Conditions in accordance with IEC 61215 and with a power tolerance not exceeding ±3%;

   f. The temperature coefficient for the power output of PV module shall not exceed –0.45% per ºC.;

   g. The guaranteed performance of PV module shall be not less than:
1. 90% of the rated power output for the first 10 years;

ii. 80% of the rated power output for the 11th to 25th year.

h. PV modules and their supports / holding frames shall be capable of withstanding the wind load at the location of installation, estimated according to the Code of Practice on Wind Effects in Hong Kong 2004 or the latest edition published by the Building Department;

i. Testing for wind load withstanding capability of PV modules such as wind tunnel test etc., if required by the Building Department / ICU, shall be in accordance with relevant national/international standards;

j. Wiring connection for PV modules shall be located at the back of each module and with factory assembled cable connector.

2. Exposed wiring cables shall be of low smoke zero halogen and UV resistant type complying with IEC 61034, IEC 60754 and EN-ISO 4892 or other relevant national/international standards, suitable for an operation temperature of up to 90°C and complete with weatherproof type prefabricated plug and socket cable connectors. Wiring cables in conduit or the like shall also be suitable for operation up to 90°C;

3. All array combiners / junction boxes to be installed in external areas shall be of weatherproof type to IP55 minimum and shall complete with surge arresters. Detailed arrangement and sample of the junction boxes shall be submitted to the Contract Manager for approval;

4. Sizing of DC source circuit conductors and over-current protection devices shall take into account appropriate de-rating factors (e.g. peak module operating temperatures, grouping of conductors in conduit, etc.). Over-current device shall have trip rating not greater than the de-rated ampacity of the conductor that it protects;

5. The overall loss in the PV array DC source circuits due to losses across conductors, all fuses / circuit breakers, blocking diodes, termination points and other factors such as normal dust accumulation on PV modules shall be limited to not more than 10%.

**ELE33.2030.7 WARRANTY**

1. The Sub-contractor shall provide the following within 4 weeks from the date of completion of the Works:-

   a. A certificate of product warranty from each of the manufacturers of the Approved PV modules in favour of the Employer to warrant that their said respective products shall be free from any defect, failure, imperfection or fault and be capable of carrying out its functions for the respective periods of warranty as specified below:-

<table>
<thead>
<tr>
<th>Warranty aspects</th>
<th>Period of warranty</th>
</tr>
</thead>
<tbody>
<tr>
<td>i. Free from any defect, failure, imperfection or fault</td>
<td>Five years</td>
</tr>
<tr>
<td>ii. Capable of carrying out the power output and performance in accordance with ELE33.2.020 Sub-clause 1(g)</td>
<td>Twenty-five years</td>
</tr>
</tbody>
</table>

2. Each of the periods of warranty stated above shall commence from the date of completion of the Works as certified by the Contract Manager in the certificate of completion but in the event of there being more than one certificate of completion, then from the date of completion of the Section of the Works in which the respective PV modules are situated as certified by the Contract Manager in the certificates of completion issued pursuant to Clause 53 of the General Conditions of the Main Contract. The Sub-contractor shall submit the content and format of the manufacturers’ certificate(s) of product warranty for Approval as required in ELE33.1.050.
ELE33.3 SOLAR CONVERSION SYSTEMS

ELE33.3.010.7 GENERAL REQUIREMENTS
1. Solar Conversion Systems (SCS) comprising grid connection type photovoltaic (PV) inverters, AC and DC circuit breakers, wiring and other required equipment shall be provided for the PV System as shown on the Drawings. Separate SCS shall be installed to serve the PV sub-systems on the roofs of individual blocks and to provide a balanced 3-phase AC supply;

2. The SCS inverters, AC and DC circuit breakers and other required equipment shall be located in the PV control rooms of individual blocks as shown on the Drawings. The Sub-contractor shall co-ordinate with other parties concerned and provide all necessary equipment, materials, protection/monitoring devices, control and wiring, etc. for integration of the PV System with the building power distribution system;

3. Where equipment are exposed to weather and subject to vandalism, proper enclosure complete with venting and weather sealing shall be provided to protect the equipment;

4. The Sub-contractor shall also supply and install equipment, such as energy meters and harmonic meters, etc. as required by the power supply company, to measure / monitor the generated solar power.

ELE33.3.020.7 TECHNICAL REQUIREMENTS
1. Grid connection type SCS inverter shall comply with UL1741, IEC61727 and IEC62116 or other equivalent international standards on grid connection requirements, and be capable of continuous operation over the range of voltage, current, and power output of the PV array connected;

2. SCS inverter shall have a "Mean Time Between Failure Index" of minimum 10 years and have separate provisions for power on/off, system reset and for communication with other equipment and monitoring system. The SCS inverter shall have a power management system to automatically control the power supply to the connected load;

3. SCS inverter shall possess the following:
   a. True sinusoidal output voltage of low harmonic distortion;
   b. Maximum Power Point Tracking (MPPT) function which shall be accurate and stable, and the adaptation efficiency shall be higher than 99%;
   c. Anti-islanding function;
   d. Output isolation transformer;
   e. Capability of automatic adaptation to the solar power generation of PV modules so that no range selection by the installer shall be required.

4. The following protection shall be incorporated in SCS inverter:
   a. Continuous self-diagnosis by internal microprocessor;
   b. Monitoring of the grid and the PV string voltages;
   c. Monitoring of temperature of power switches and the output isolation transformer;
   d. Prevention of injection of direct current into the grid;
   e. Supervision of all power stage transistors which shall be automatically switched off within a few milliseconds under fault condition. Fast response over-current detection for all transistors shall be used to guarantee maximum reliability in operation.
5. SCS inverter shall be self-commutated utilizing power electronics in a circuit topology suitable for meeting the specification with 3-phase or single-phase AC output. If three identical single-phase SCS inverters are offered for each PV subsystem, the design shall be such that supply currents are balanced over the three phases. The rating of each offered SCS inverter shall be capable of handling the available DC power input and other design requirements;

6. Characteristics of SCS inverter:
   a. Controller Type: Step-down converter;
   b. Bi-directional Sine-wave Inverter: IGBT-based pure-sinewave BI-modal inverter;
   c. Nominal output voltage: 380V 3-phase or 220V 1-phase; ± 6%;
   d. Utility service: Grounded wye;
   e. Output frequency: 50Hz (48.5 – 51Hz);
   f. Inverter efficiency: Minimum 95% EURO efficiency;
   g. Power factor shall be unity (1) at rated output;
   h. The total harmonic distortion (THD) of the normalized output current shall not exceed 5%;
   i. Losses in the READY or STANDBY modes shall not be more than 10% of the total useful power output.

7. SCS inverter shall include the following modes of operation:
   a. On;
   b. Off;
   c. Start;
   d. Ready;
   e. Standby;
   f. Reset.

8. SCS inverter shall automatically go to the standby mode if a fault occurs. If the fault is cleared, the SCS inverter shall automatically restart after a programmed time delay. The hardware protection shall include the following:
   a. AC surge protection;
   b. DC surge protection;
   c. Over-current protection and PV string isolation;
   d. Over-voltage protection.

9. The instrumentation and control of SCS inverter shall include the following:
   a. Maximum power point (MPP) tracking;
   b. Automatic start-up when there is sufficient solar power;
   c. Automatic turn-off when there is insufficient solar power.

10. SCS inverter shall provide the following signals for monitoring:
    a. Inverter On/Off/Standby;
    b. Power supply Normal/Fault/Low;
    c. Inverter Healthy/Trip/Fault;
    d. DC input current, voltage and instantaneous/cumulative power;
    e. Instantaneous AC output current and voltage per phase, supply frequency, instantaneous/cumulative output power and harmonics;
    f. High and low current and voltage alarms;
g. MPP status;

h. Inverter On-line/Off-line.

11. If any of the signals stipulated in Sub-clauses (10d) & (10e) above is/are not available, separate meter(s) shall be provided to fulfil such requirements;

12. Anti-islanding protection shall be provided to ensure there is no supply of solar power to the building electrical distribution system in case of abnormality. The SCS shall be automatically disconnected from the electrical distribution system of the building concerned in the event that the utility supply voltage and/or frequency deviate outside the allowable limits persistently for a pre-determined period as agreed by both the Contract Manager and the power supply company, or when there is a fault or malfunction of the SCS. The SCS shall be completely isolated within 0.2 second or such period as required by the power supply company upon occurrence of the said abnormality/fault;

13. Overall circuit loss of the SCS other than those through the SCS inverters shall be not more than 2%.

ELE33.3.030.7 WARRANTY

1. The Sub-contractor shall provide the following within 4 weeks from the date of completion of the Works:-

   a. A certificate of product warranty from each of the manufacturers of the Approved SCS inverters in favour of the Employer to warrant that their said respective products shall be free from any defect, failure, imperfection or fault for the periods of warranty as specified below:-

<table>
<thead>
<tr>
<th>Warranty aspects</th>
<th>Period of warranty</th>
</tr>
</thead>
<tbody>
<tr>
<td>i. Free from any defect, failure, imperfection or fault</td>
<td>Ten years</td>
</tr>
</tbody>
</table>

2. Each of the periods of warranty stated above shall commence from the date of completion of the Works as certified by the Contract Manager in the certificate of completion but in the event of there being more than one certificate of completion, then from the date of completion of the Section of the Works in which the respective SCS inverters are situated as certified by the Contract Manager in the certificates of completion issued pursuant to Clause 53 of the General Conditions of the Main Contract. The Sub-contractor shall submit the content and format of the manufacturers’ certificate(s) of product warranty for Approval as required in ELE33.1.050.
ELE33.4 MONITORING & MANAGEMENT SYSTEMS

ELE33.4.010.7 GENERAL
1. A monitoring system consists of measurement equipment, energy meter, data logger, LED display panel, wirings and accessories shall be provided for the PV sub-system of each individual block;
2. A central monitoring & management system shall be provided at the Estate Management Office to collect operation data of individual PV sub-systems for analysis and to display designated information on a LCD display panel at the location as shown on the Drawings;
3. The Sub-contractor shall provide all necessary equipment, wiring and accessories to complete and interconnect the individual and central monitoring/management system(s);
4. Provisions shall be made to prevent interruption of signal/data transmission of the monitoring & management systems through underground cables under adverse weather conditions.

ELE33.4.020.7 INDIVIDUAL MONITORING SYSTEM
1. Measurement equipment with good accuracy and reliability shall be provided and appropriately sited to collect the following weather data for posting to the data logger provided:
   a. Ambient temperature;
   b. Global irradiation at inclined angle of PV modules;
   c. PV module operating temperature.
2. The Sub-contractor shall provide additional measurement equipment for one of the PV sub-systems to collect wind speed/direction and UVB level data for the central monitoring & management system;
3. Normal/Fault status of the measurement equipment and circuit shall also be captured in the data logger;
4. An energy meter with visual display shall be provided for each PV sub-system to record its cumulative power output at the point of grid connection and for posting to the data logger;
5. Data logger shall also capture operation data including alarm/fault statuses of all the SCS inverters of each PV sub-system;
6. A data logger shall serve one or more PV sub-systems. It shall be capable of capturing all the data required at a sampling frequency of 1 minute and retaining them for a minimum period of 12 months. Data collected shall be stored in removable flash memory card and be capable of being downloaded directly by a handheld PC through connection to the data logger;
7. Data collected shall be time stamped and stored in the data logger in "csv" format. Data logger shall be capable of communicating with the central monitoring & management system and other monitoring/management system through Intranet and Internet;
8. A LED display panel shall be provided for each PV sub-system at the location as shown on the Drawings and interface with the data logger for collecting and displaying the following information of the sub-system in both Chinese and English:
   a. Instantaneous output power;
b. Cumulative power output;
c. Solar irradiation;
d. Reduction of carbon dioxide emission;
e. Sub-system servicing required (for fault/alarm conditions).

9. Letter height of the LED display panel shall be 50 mm minimum;
10. All equipment exposed to weather shall be of weatherproof type to IP55 minimum.

ELE33.4.030.7 CENTRAL MONITORING & MANAGEMENT SYSTEM

1. The Sub-contractor shall provide a user friendly graphic based central monitoring & management system in the Estate Management Office to capture the weather and operation data of all PV sub-systems through a dedicated Intranet. It shall include a workstation for local operator interface and hardware/software provisions for monitoring & management of the PV System. The system shall include the following features:
   a. Dynamic graphic monitoring and control of operation parameters including the On, Off, Standby, On-line and Off-line, etc. of each PV sub-system;
   b. Dynamic trend history report function;
   c. Utility cost management;
   d. Real time alarm management;
   e. Full password and user name protection;
   f. Setpoint archiving, retrieval and printing.

2. The central monitoring & management system shall include PC hardware, firewall protection software, alarm printer, report printer, LCD display panel and application software. The application software shall be able to control, monitor and indicate operation statuses, and capable of logging all operation data and issuing alarms of the PV System. Hardware configuration of the system shall be similar to those of the security system as specified in ELE24.3.5.020. The system shall also be capable of broadcasting DVD video and input text signals to the LCD display panel specified hereunder;

3. An uninterruptible power supply capable of backing up the central monitoring & management system, except the LCD display panel, for one-hour operation upon failure of normal power supply shall be included;

4. A weatherproof type display panel with casing constructed of Grade 316 stainless steel sheet of 1.5 mm minimum thickness shall be installed at the location as shown on the Drawings. The display panel shall:
   a. Consist of a 47” 1920x1080 full High Definition IPS LCD display and stereo speakers;
   b. Be suitable for outdoor application with a low reflective surface and high display intensity;
   c. Interface with the central monitoring & management system workstation to obtain the required information and signals.

5. Information and signals to be displayed shall include, but not be limited to:
   a. Video and input test signals from the central monitoring & management system workstation;
   b. Instantaneous output power of individual PV sub-systems and total output power;
   c. Individual PV sub-system output power and total output power of the day;
   d. Maximum system output power day and the total output power;
e. Minimum system output power day and the total output power; 

f. Cumulative output power of individual PV sub-system, cumulative system total output power, corresponding electricity cost saving and equivalent carbon dioxide emission reduction; 

g. Cumulative system running time; and 

h. Instantaneous weather conditions including ambient temperature, wind speed/direction, solar intensity and UVB level.

6. The LCD display shall be capable of displaying the PV System information in the form of animated pictographs. Design of the display of PV System information shall be submitted to the Contract Manager for prior approval;

7. Operation data and signals shall be collected from each PV sub-system for storage and analysis by the central monitoring & management system. The system shall also be capable of producing reports for:

a. Operation conditions and alarms of each PV sub-system and respective trend histories including:

i. On/Off/Standy/Online/Offline status; 

ii. Power supply Normal/Fault/Low condition; 

iii. Healthy/Trip/Fault status; 

iv. DC input current, voltage and instantaneous/cumulative power; 

v. Instantaneous AC output current and voltage per phase, supply frequency, instantaneous/cumulative output power and harmonics; 

vi. Total input and output power each day; 

vii. Maximum input and output power each day; 

viii. Minimum input and output power each day; 

ix. High and low current and voltage alarm; 

x. Total running time; 

xi. Sun Hour of each day; 

xii. Cumulative Sun Hour; 

xiii. Test/Auto status; 

xiv. MPP status; 

xv. Weather condition measurement equipment and circuit Normal/Fault status.

b. Performance indicators of each PV sub-system and respective trend histories including:

i. Daily, weekly, monthly and yearly yield; 

ii. Daily, weekly, monthly and yearly performance ratio; 

iii. Cumulative output power, corresponding electricity cost saving and equivalent reduction of carbon dioxide emission.

c. Weather data collected by each PV sub-system and respective trend histories including:

i. Ambient temperature; 

ii. Wind speed/direction; 

iii. UVB level; 

iv. Global irradiation at horizontal level; 

v. PV module operating temperature.
ELE33.5 TESTING AND COMMISSIONING

ELE33.5.010.7 TESTING AND COMMISSIONING

1. The Sub-contractor shall carry out all necessary testing and commissioning work upon completion of the installation of the PV System;

2. Verification tests shall be performed in the presence of the Contract Manager's representatives and if necessary, with the power supply company's representatives on all metering, protection, communication and control equipment/system. The harmonic voltage, current distortion and voltage fluctuation as a result of the connection and isolation of the PV System shall be measured. Testing of protection and synchronising systems shall include individual device settings and function. A copy of the test results and all protection settings shall be submitted to the Contract Manager for further transmission to the power supply company for approval;

3. The Sub-contractor shall prepare itemized and detailed testing and commissioning schedules for Contract Manager's approval prior to commencing the tests;

4. The Sub-contractor shall carry out preliminary tests to his own satisfaction before arranging for any formal witness test;

5. Unless otherwise indicated, the Sub-contractor shall be responsible for the cost of necessary instrument, plant and labour for all tests, including those witness tests in the presence of the representatives from the power supply company;

6. The Sub-contractor shall carry out all such tests as required by the Contract Manager to demonstrate that each item of equipment meets the requirements of the Specification;

7. Valid calibration certificates of testing instruments shall be produced upon request by the Contract Manager. The accuracy of testing instruments shall also be demonstrated if directed by the Contract Manager irrespective of whether valid calibration certificate is available.
ELE33.6 ANALYSIS SOFTWARE AND REPORT FOR SYSTEM OPERATION AND PERFORMANCE

ELE33.6.010.7 ANALYSIS SOFTWARE FOR SYSTEM OPERATION AND PERFORMANCE

1. The Sub-contractor shall provide to the Contract Manager, upon completion of the PV System installation, a "Windows" based analysis software for generating reports on the PV System operation and performance basing on the data downloaded from a data logger. The reports shall cover information required in ELE33.4.030 Sub-clauses (7a) to (7c) for a rolling period of 12 months;

2. The analysis software shall be capable of automatically capturing the data downloaded from a data logger for generating the required reports;

3. Format of report shall be submitted to the Contract Manager for approval before completion of the PV System installation.

ELE33.6.020.7 HALF-YEARLY REPORT ON SYSTEM OPERATION AND PERFORMANCE

1. The Sub-contractor shall submit reports generated by the same software as specified in ELE33.6.010 to the Contract Manager on half-yearly basis for the 24 months after completion of installation and grid connection of the PV System;

2. Each report shall cover a rolling period of the past 12 months and shall be submitted within one month from the last day of the 6-month period concerned.

ELE34.1 SCOPE OF INSTALLATION

ELE34.1.010.7 SCOPE OF WORK

1. Grid-backup solar powered pole top lighting(s) shall be provided at the location(s) as shown on the Drawings for general lighting purpose;

2. Training shall be provided to the Contract Manager's representatives, estate management staff or other personnel as instructed by the Contract Manager for the proper operation and maintenance of the grid-backup solar powered lighting.
ELE34.2 REQUIREMENTS

ELE34.2.010.7 GENERAL REQUIREMENTS

1. Each pole top lighting shall consist of a hot-dip galvanized lighting pole, lamp source, photovoltaic (PV) module(s), battery set and charger, inverter, changeover contactor and other necessary equipment and accessories to ensure proper functioning of the lighting at the time required under all weather conditions;

2. Electrical power generated by the PV module(s) shall be used for charging the battery set and powering the lamps. If power of the battery set has dropped to a low level, normal supply shall automatically cut in to power the lamps;

3. Lighting pole shall be painted to colour matching with the surrounding and as approved by the Contract Manager;

4. PV module shall be mounted on lighting pole top as far as practicable to receive the most amount of sunlight;

5. Pole top lighting shall be switched on and off through the timer or photocell control of other outdoor lightings in its vicinity;

6. Battery set and charger, inverter, changeover contactor and other necessary equipment shall be housed in a well ventilated stainless steel box of grade 316, integrated with or separated from the lighting pole, with adequate access for maintenance and suitable for outdoor use;

7. The Sub-contractor shall submit all relevant details including proposed lighting pole mounting arrangement for Approval before fabrication and installation of the pole top lighting(s);

8. The Sub-contractor shall submit, upon completion of the installation work, 3 sets of approved operation and maintenance manual including servicing and maintenance requirements recommended by manufacturers and schedule of spare parts and tools with indicative unit prices, etc. in both hard copy and "pdf" format.

ELE34.2.020.7 TECHNICAL REQUIREMENTS

1. Lamp source of each pole top lighting shall be of __________ type rated at ___W and shall comply with relevant requirements in other parts of the Specification;

2. PV module(s) of each pole top lighting shall be of mono-crystalline silicon type with a total capacity of ___Wp minimum. Specifications of the PV module(s) shall comply with the requirements in ELE33.2;

3. Battery set shall be of sealed (valve regulated), maintenance-free, lead acid type to IEC 61427 or other relevant national/international standards and with a capacity, when fully charged, to power continuously the lamp source for 18 hours;

4. Lighting pole shall be of ___m high and shall comply with relevant requirements in other parts of the Specification;

5. Anti-glare provision shall be included to prevent possible nuisance to occupants of nearby domestic flats in accordance with relevant requirements of BEAM-Plus.
