<td>- After pulsating test to $P_2$ and $P_2'$ and the Repeated Air Permeability Test, but before the Safety Test at pressure $P_3$ and $P_3'$ of the Resistance to Wind Test.</td>
<td></td>
</tr>
</tbody>
</table>

This Test to be carried out after the Repeated Pressure Test (i.e. pulsating test to $P_2$ and $P_2'$) and the Repeated Air Permeability Test, but before the Safety Test at pressure $P_3$ and $P_3'$ of the Resistance to Wind Test. |
b. Carry out and submit report on the following verifications for aluminium windows and grilles upon delivery on Site. Prior to carrying out the verifications, inform CM's Representative who may present to witness the verifications:

ALUMINIUM MEMBERS AND FINISHES

COM2.M010.7 SECTIONS
Extruded aluminium alloy to BS 1474:1987, and:
1. Alloy designation: 6063 - T5 or T6;
2. Structural members: minimum wall thickness 2 mm;
3. Non-structural members: minimum wall thickness 2 mm;
4. Glazing bead: minimum wall thickness 1.0 mm;
5. Dovetailed groove for weather stripping.

COM2.M020.7 CLEAR ANODIZING
To BS EN 12373-1:2001, thickness grade Class 25 for aluminium window frames.

COM2.M030.7 COLOUR ANODIZING
1. To BS 3987:1991 and not less than 25 microns thick;
2. Colour: as shown on the Drawings.

FIXINGS, FASTENINGS ETC

COM2.M110.7 WEATHERSTRIP
Santoprene grade 251-70W232 or an Approved equivalent designed for glazing and sealing applications, sized and shaped to fit the proposed window system.

COM2.M120.7 ALUMINIUM BEADS
Use beads which securely clip to the frame or are an integral part of the frame.
ALUMINIUM WINDOWS AND LOUVRES
COM2 > MATERIALS

COM2.M130.7  EXPOSED FIXINGS
Screws, nuts, bolts, washers and rivets: use aluminium alloy, stainless steel (grade 304/A2-70 for bolts and grade 302/A2-50 for screws), copper with chromium plated finish or nylon washers and caps for window grilles to match finish, where possible.

COM2.M140.7  CONCEALED FASTENING DEVICES
Galvanized mild steel or aluminium fasteners as shown on Drawings.

COM2.M145.7  FIXING LUGS
Galvanized steel to BS EN10346:2009, Coating Designation Z200 and 14 µm, size as shown on the Drawings unless otherwise Approved, with the cut edges to be painted with zinc phosphate primer.

COM2.M160.7  PERIMETER SEALANT
1. In compliance with WAT5.M110;
2. Low modulous silicone rubber sealant to BS 5889:1989, Type A.

COM2.M170.7  SEALANT FOR ASSEMBLING COMPOSITE UNITS
1. In compliance with WAT5.M110;
2. Silicone sealant to BS 5889:1989, Type B.

COM2.M171.7  SEALANT FOR FIXING GLAZING
1. In compliance with WAT5.M110;
2. Silicone sealant to BS 5889:1989 (neutral type), Type B.

COM2.M172.7  SMALL GAP SEALANT
1. In compliance with WAT5.M110;
2. Synthetic rubber base sealant for aluminium section joints.

COM2.M190.7  WATERPROOF BEDDING MORTAR
1. Cement and sand (1:3) with non-shrinkage waterproofing additives as recommended by the manufacturer or;
2. Proprietary mortar with non-shrinkage waterproofing additives as recommended by the manufacturers suitable for bedding and grouting window frames.

COM2.M195.7  WATER BARS
Aluminium with keyed surface bent to shape as shown on the Drawings.

WINDOWS FITTINGS

COM2.M210.7  FRICTION PIVOTS, SLIDING STAYS, BASE RAILS AND SCREWS OF FRICIONAL HINGES
1. All sliding stays are to be 2.5 mm minimum thick. All sliding stays and base rails are stainless steel of UNS Designation S30400 to ASTM A240/A240M-09c or equivalent grade of other recognised standards Approved by CM:
   a. For side hung window, provide a minimum clearance of 100 mm between frame and window when it opens at 90°;
   b. For top hung window, provide a minimum clearance of 70 mm between frame and window when it opens at 90°.
2. Friction pivots and screws are to be stainless steel of either UNS Designation S30200, S30400 or S30430 to ASTM A493-09, or equivalent grade of other recognised standards Approved by CM;
3. All friction pivots and sliding stays are to be fixed with at least 3 nos. of 5 mm diameter stainless steel screws onto galvanized mild steel bar 12 mm minimum (width) x 3 mm (thick) in nominal size, as follows:
   a. Frame members:
      i. At location with aluminium box section, the galvanized mild steel bar is to be inserted and pre-fixed inside the box;
      ii. At location with single web aluminium frame section, the galvanized mild steel bar is to be pre-fixed directly underneath the web.
   b. Sash members:
      i. The galvanized mild steel bar is to be inserted and pre-fixed inside the box, terminated at the aluminium alloy angle bracket at the corner for mechanical fixing of the mitre joint;
      ii. One screw is to be fixed onto the pre-tapped aluminium alloy angle bracket close to the mitre joint and the remaining screws are to be fixed onto the pre-fixed galvanized mild steel bar.
4. Length of the friction pivots and sliding stays for side hung window shall be of at least 60% of the width of the side hung window.

COM2.M220.7 CASEMENT FASTENERS, LOCKING HANDLES ETC
1. Moulded stainless steel with satin finish; or
2. Die-cast zinc alloy to BS EN 1774:1998 and BS EN 12844:1999 suitably coloured to match the anodised window.

COM2.M230.7 WINDOWS LOCKS
1. Dual lock, triple point lock and cam lock:
   a. Dual lock for side hung window up to 1200 mm high and triple point lock for side hung window exceeding 1200 mm high. The guiding system for both dual lock and triple point lock shall prevent loosening and sideway movement of the lock handles;
   b. Cam lock: one at 800 mm width for top hung window;
   c. The locks shall be of matching style and finishes;
   d. When the locks are supplied for domestic blocks, the profile and the visual quality of the locks shall be comparable with the latest benchmark samples of the locks maintained by the Housing Department.
2. Allen's lock: as shown on the Drawings.

COM2.M240.7 PULL HANDLES
Anodized aluminium.

COM2.M250.7 ROLLERS, GUIDES ETC
Electroplated zinc galvanized steel with nylon or brass rollers to suit weight of window and adjustable after installation.

REMOTE CONTROL EQUIPMENT

COM2.M310.7 HAND OPERATED SYSTEM
With shaft and lever.

COM2.M320.7 REMOTE CONTROL SYSTEM
Conduit and cable system with bronze or die-cast zinc alloy bevel gear boxes, adjustable arms and keyed shafts.
PROTECTIVE PAINTS

COM2.M410.7 BITUMINOUS PAINT
Black bitumen coating solution to BS 6949:1991, Type 1.
WORKMANSHIP

APPROVAL PRIOR TO FABRICATION AND SITE INSTALLATION

COM2.W020.7 SAMPLES AND SHOP DRAWING APPROVAL
Do not commence fabrication or site installation works until all samples and shop drawings have been Approved.

FABRICATION AND ASSEMBLY

COM2.W110.7 FIXING WEATHERSTRIPS
Securely fix weatherstrip into the dovetailed groove of the window section. Ensure there is continuous contact between each opening part and its fixed frame.

COM2.W120.7 WELDING WEATHERSTRIPS
Weld all corner joints of weatherstrips and provide a neat weathertight joint.

COM2.W130.7 FRAMES
Mechanically joint using mortice and tenon construction to provide a rigid and secure connection.

COM2.W140.7 SASH MEMBERS
Mechanically joint or mitre sash members to develop the full strength of members and provide a neat weathertight joint. Fix aluminium angle plate at the back of mitre joint of sash members with silicone sealant (neutral type).

COM2.W150.7 SIDE AND TOP HUNG WINDOWS
Hang to open as indicated on the Drawings and fit as specified with:
1. Friction pivots and sliding stays;
2. Pull handle with dual or triple-point lock for side hung windows;
3. Cam lock for top hung windows.

COM2.W170.7 OPENING LIGHT FRAMES
Ensure tightness and clearance between sash and frame of all opening lights before deliver to Site or precast facade yard.

INSTALLATION OF ALUMINIUM WINDOWS TO CAST IN-SITU CONCRETE WALLS

COM2.W210.7 COMPOSITE UNITS
Assemble all composite units on Site and provide all bolts, screws etc and sealants.

COM2.W220.7 CUTTING, TRIMMING AND WELDING
Do not cut, trim or weld during erection on Site.

COM2.W230.7 TOLERANCES
1. Check the position, size and alignment etc. of all openings for windows and adjustable louvres in accordance with the tolerances specified in Appendix H to this Specification and report any discrepancy to the CM;
2. Rectify any fault or discrepancy to the satisfaction of the CM, and bear the cost of such remedial work.

**COM2.W231.7 FIXING LUGS**
1. Space galvanized steel fixing lugs, formed to the dimensions shown on the Drawings, at 150 mm from corner edge and 300 mm maximum centre to the outer frame of each unit and where shown fix lugs with cartridge driving pin or proprietary anchoring system;
2. Form or cut pockets in heads etc. to receive fixing lugs, fixing/anchor bolts, build in lugs or insert bolts and screw to frames using packing pieces where necessary. Do not distort frames when tightening fixings.

**COM2.W232.7 POSITIONING**
Position windows and louvres plumb, level and square.

**COM2.W233.7 OPENING LIGHTS**
Check tightness and clearance between sash and frames of all opening lights.

**COM2.W234.7 BEDDING AND GROUTING FRAMES**
Mix and apply waterproof bedding mortar strictly in accordance with the mortar manufacturer's recommendations. Fully bed and grout frames leaving no gaps.

**COM2.W236.7 FIXING WATER BARS**
Fixed full height water bars at locations as shown on the Drawings.

**COM2.W265.7 POINTING TO PERIMETER OF WINDOWS AND LOUVRES**
1. Remove filler board from the pre-formed joint, if any, around external perimeter of window frames;
2. Mask any adjoining surfaces which would be impossible to clean if smeared with sealant;
3. Point external perimeter of window frames with sealant to form a smooth flat joint; and
4. Remove excess sealant from the adjoining surfaces and wipe clean.

**FIXING LOUVRE FRAMES**

**COM2.W310.7 HANDLING AND STORAGE**
Avoid distortion during handling and storage.

**COM2.W320.7 POSITIONING**
Position frames plumb, level and square.

**COM2.W330.7 FIXING**
When fixing:
1. Form or cut pockets to receive fixing lugs, where required. Build in lugs and screw to sub-frames; or
2. Where necessary, plug and screw sub-frames using packing pieces; and
3. Plug and screw louvre frames and weatherstrips, where required.

**COM2.W340.7 BEDDING AND GROUTING IN MORTAR**
Mix and apply waterproof bedding mortar in accordance with manufacturer's recommendation. Fully bed and grout sub-frames leaving no gaps.
LOUVRE FRAMES
Screw louvre frames to sub-frames at maximum 225 mm centres to centre. Do not distort frames when tightening fixings.

INSTALLATION OF ALUMINIUM WINDOWS TO PRECAST CONCRETE FACADES

FIXING LUGS
Space fish-tail galvanized steel fixing lugs by slotting into the window frame at 150 mm from corner edge and 300 mm maximum centre to centre.

POSITIONING
Position windows plumb, level and square.

FIXING
Fix windows and window frames in position with adequate supports to avoid distortion and damage to windows before placing concrete in moulds for the facade units.

POINTING TO PERIMETER OF WINDOWS AND LOUVRES
1. Mask any adjoining surfaces which would be impossible to clean if smeared with sealant;
2. Point external perimeter of window frames with sealant to form a smooth flat joint; and
3. Remove excess sealant from adjoining surfaces and wipe clean.

EARTH / EQUIPOTENTIAL BONDING

EQUIPOTENTIAL BONDING TO WINDOWS AND LOUVRES
Unless otherwise specified on Drawings, provide equipotential bonding connection for windows and louvres as follows:
1. Provide a 20 mm x 1.5 mm thick steel plates earthing lug electroplated zinc galvanized to BS 1706:1990, Class B and 13 μm to the outer frame of window and louvers. The cut edges of earthing lug shall be painted with zinc phosphate primer;
2. Fix one end of the earthing lug to the window and louvers with 2 nos. M4 self-tapping stainless steel screws at 60 mm centres;
3. Provide a 5 mm diameter hole at the other end for connection of the bonding conductor by the Nominated Sub-contractor for Electrical Installation;
4. For window:
   a. The fixing position of the earthing lug should be as far away from the hinge of the window as possible;
   b. Ensure that full electrical continuity is maintained between all the component elements of composite windows as COM2.W470.
5. Louvres for services rooms: ensure that full electrical continuity is maintained between all the component elements of the louvres;
6. The Nominated Sub-contractor for Electrical Installation shall ensure the bonding for extraneous conductive parts is sound and the result complies with the CoP for the Electricity (Wiring) Regulation and BS 7671:2001 by proper measurement with records at good time. For those parts of equipotential bonding system found not electrical conductive, the Main Contractor and the Nominated Sub-contractor for Electrical Installation shall be responsible for rectification of their own works as early as possible.
COM2.W470.7 EQUIPOTENTIAL BONDING REQUIREMENTS FOR COMPOSITE WINDOWS

1. Maintain electrical conductivity with negligible impedance between each member and component of window sets constructed either by means of screw joints, mortice and tenon joints, or riveting;
2. Maintain electrical continuity for composite window construction:
   a. Use appropriate number of stainless self-tapping stainless steel screws;
   b. Determine number of stainless steel screws and positions to be fixed on windows so as to maintain electric conductivity with negligible impedance between each member and component of the window set.
3. Submit samples of the windows completed with shop drawings showing detailed construction of window sets, including stainless steel screws for earth continuity, all for Approval prior to actual delivery and installation on site.

TRANSPORTATION, HANDLING AND STORAGE

COM2.W490.7 TRANSPORTATION, HANDLING AND STORAGE

1. Avoid distortion during handling and storage, transporting to and within Site and the precast facade yard;
2. Do not allow working platform rest on windows and/or window frames to prevent damage or distortion;
3. Keep upright during handling to prohibit sagging and stack off ground on levelled hard standing under cover, clear of mud and site traffic.

PROTECTION

COM2.W510.7 PRIMING STEEL REINFORCEMENT ETC
Prime the cut edges of galvanized steel reinforcement, cores, anchors and brackets, (except fixing lugs), with zinc phosphate primer and paint the whole piece of material with two coats of bituminous paint.

COM2.W515.7 ALUMINIUM FRAME AND SASH
Provide adequate backing supports to all fixed accessories on frame and sash such as dual lock, cam lock, glazing bead and etc.

COM2.W520.7 ALUMINIUM IN CONTACT WITH OTHER MATERIALS
Protect concealed aluminium surfaces which may come in contact with wet mortar, cement, plaster or similar materials with one coat of bituminous paint.

COM2.W525.7 PROTECTION OF ALUMINIUM IN CONTACT WITH OTHER MATERIALS
Avoid contact with concrete, mortar, plaster or other similar materials. Where there is not possible refer to COM2.W530 and COM2.W540.

COM2.W530.7 TEMPORARY PROTECTIVE COATINGS TO EXPOSED ALUMINIUM
Protect all exposed aluminium surfaces with a strippable coating or low-tack masking tape.

COM2.W540.7 WINDOWS AND OTHER ASSOCIATED MATERIALS
Wrap in stout waterproof paper or polythene to protect against damp and scratching. Avoid premature delivery to Site.
COM2.W550.7  REMOVAL OF TEMPORARY PROTECTIVE COATINGS
Maintain and renew protective coating as necessary and carefully remove to leave clean on completion of the works.

COMPLETION

COM2.W610.7  ON COMPLETION
Lubricate and adjust moving components and leave in perfect working order on completion.
TESTING ON-SITE VERIFICATION TEST

COM2.T210.7 TESTING INSTALLED WINDOWS FOR WATERTIGHTNESS

1. Testing Arrangements:
   a. Carry out watertightness test to properly fixed and glazed windows as early as possible before scaffolding is removed or gondola is dismantled/removed unless the CM is satisfied that testing and any subsequent remedial work can adequately be executed after the dismantling/removal of scaffolding or gondola.

2. Testing Samples:
   a. 100% of properly fixed and glazed windows, except those windows with louvers and doors, in accordance with the procedures as specified in sub-clauses (3)(a) to (3)(i).

3. Testing Methods:
   a. Test joints between window frames and:
      i. The concrete surround;
      ii. Frames of casements;
      iii. Fixed panels;
      iv. Transoms and mullions; and
      v. Sashes.
   b. Use brass nozzle comprising:
      i. 13 mm diameter outlet fitted with diffuser connected to a 20 mm garden hose; and
      ii. A control valve and a pressure gauge as illustrated at Appendix COM2/I to this Worksection.
   c. Carry out the test with the water jet from the outside, with the window in the closed position;
   d. Spray a continuous jet of water, at a nozzle pressure of between 210 kPa and 240 kPa, at approximately 300 mm from the window joints;
   e. Move the spraying nozzle to and fro along the joints, starting at the lowest horizontal joint at the cill then the middle horizontal joints, then the vertical joints and lastly the topmost horizontal joint at the window head;
   f. Test the joints between the window frames and the surrounding structure for a period of 1 minute for every 2 metres of joint length, and other joints for a period of 1 minute for every 3 metres of joint length or on pro-rata basis;
   g. Observe the whole watertightness test from indoor. Tap the lowest glazing bead slightly to check for water leakages or seepage;
   h. All watertightness tests must be witnessed by the Contractor or his representative and the CM's representative;
   i. Submit three copies, or other number of copies as directed by the CM, of the test reports for the watertightness tests for record.

4. Non-compliance:
   a. The window joints will be deemed to have failed where there are signs of water seeping through the joints during the watertightness test specified in this Worksection or within half an hour to two hours after the test;
   b. In the event that any test failed to meet the requirements:
      i. Remedy all such failed joints by Approved methods. Retest all remedial joints until all the joints meet the specified criteria;
      ii. Bear the cost of all remedial work and the retest. No extension of time will be allowed.
SURVEILLANCE TESTS

COM2.T405.7 SURVEILLANCE TESTS FOR ALUMINIUM WINDOWS AND GRILLES

1. Testing Arrangements:
   a. When Instructed, surveillance tests shall be carried out by CM's Representative, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the following pertaining to surveillance tests:
      i. Provide attendance on the Site and the manufacturers' factories along the supply chain, including the aluminium window and precast concrete component manufacturing factories;
      ii. Provide, deliver and collect samples etc. as directed by CM or as specified;
      iii. Arrange transportation for the parties referred to in sub-clause 1(a) above for passages to and from the manufacturers' factories in the supply chain for sampling of materials; and
      iv. Provide attendance on the selection, examination of aluminium windows and detachment of hinges from aluminium windows.

2. Testing Samples:
   a. Provide one set of test sample from the batch of material delivered to or manufactured in:
      i. Site under the delivery note as specified in COM2.M005 (3)(a); or
      ii. The manufacturer's factory of aluminium window; or
      iii. The manufacturer's factory of precast concrete components; or
      iv. Locations as instructed by CM.
   b. One set of test sample shall consist of two representative frictional hinge specimens and three representative aluminium window specimens of any type without louvre. Sample shall be the completed component as to be installed, including glazing, all fixed parts, casements, top-hung and fixings necessary to ensure normal operation. Bear all cost for any replacement of samples.

3. Testing methods:
   a. Aluminium window quality and performance requirements: As per COM2.M005 (2)(a);
   b. Mechanical property and chemical composition tests for sliding stays and base rails of the frictional hinges: As referred to in ASTM A240/A240M-09c; and
   c. Mechanical property and chemical composition tests for friction pivots and screws of the frictional hinges: As referred to in ASTM A493-09.

4. Non-compliance:
   a. In the event that any of the testing samples fail to meet the testing requirements, follow either one of the following actions:
      i. Remove the representative batch off Site or from further production or fabrication in the material supply chain for HA's construction contracts where appropriate; or
      ii. Carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) above in a laboratory that complies with the requirements stated in PRE.B9.570 on three separate sets of samples selected by the CM from the representative batch. In case any one sample fails the re-test, remove the representative batch off Site;
b. When the representative batch of aluminium windows is removed off Site or from further production or fabrication in the material supply chain for HA's construction contracts, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3) above in a laboratory that complies with the requirements stated in PRE.B9.570 for one sample selected by the CM from the replacing batch. In case such test fails, follow action stated in sub-clause (4)(a);

c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.

COM2.T410.7 ON-SITE OPERATION TESTS - MOVEMENT OF SASH

1. Testing Arrangements:
   a. When Instructed, surveillance tests shall be carried out by CM's Representative, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the following pertaining to the tests:
      i. Provide attendance on the Site;
      ii. Provide, deliver and collect samples etc. as directed by CM or as specified.

2. Testing Samples:
   a. The test locations and samples are selected by CM's Representative;
   b. Each sample consists of 2 window sash.

3. Testing methods:
   As per COM2.M005 (2)(a)(ii) "Movement of Sash".

4. Non-compliance:
   a. In the event that any of the testing samples fail to meet the testing requirements, follow either one of the following actions:
      i. Remove the representative batch of associated window hinges off Site;
      or
      ii. Carry out re-test in accordance with the testing methods as specified in sub-clause (3) above by a laboratory that complies with the requirements stated in PRE.B9.570 on three separate samples selected by the CM's Representative from the representative batch. In case any one sample fails the re-test, remove the representative batch off Site.
   b. When the representative batch of frictional hinges is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3) above by a laboratory that complies with the requirements stated in PRE.B9.570 for one sample selected by the CM's Representative from the replacing batch. In case such test fails, follow actions stated in sub-clause (4)(a);
   c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.
APPENDIX COM2/I

COM2.APPEND1.7 SITE WATERTIGHTNESS TEST
COM3 UPVC WINDOWS

DESIGN

GENERAL

COM3.D010.7 SPECIFICATION REQUIREMENTS
Design and construct uPVC windows, complete with glazing, in accordance with this Worksection and the relevant clauses of COM4.

COM3.D020.7 WINDOWS
1. Must be suitable for inside glazing, unless otherwise shown on the Drawings;
2. Must be an Approved glazing system with uPVC beads;
3. Heat welded corner joints. Welded joints are to be mitred and neat;
4. The size of the window profile must provide sufficient glazed area to satisfy with the requirement stipulated in all applicable Ordinances, Regulations and Codes in Hong Kong;
5. Colour to be consistent for all windows profiles.

DESIGN PARAMETERS

COM3.D110.7 TOLERANCES
Design window so that the tolerances are co-ordinated with the appropriate building tolerances for the structural works as described in Appendix H to this Specification.

COM3.D120.7 GLASS THICKNESS
Design glass thickness to withstand the wind load as COM3.D130 and in no case allow it to be less than 5 mm. Calculate and check the correct thickness.

COM3.D130.7 WIND LOADING FOR GLAZED WINDOWS
1. When fixed in position and glazed, windows must withstand:
   a. A wind load calculated in accordance with the current Code of Practice on Wind Effects, Hong Kong; and
   b. The resultant resistance to wind loading of a minimum of:
      i. 3.0 kPa for non-domestic buildings such as schools, commercial centres etc.;
      ii. 3.8 kPa for domestic buildings excluding ground floor or podium.
2. A maximum permissible deflection of 1/180 the length of a particular member or 20 mm;
3. Use galvanized mild steel cores, anchors, brackets, etc as stiffeners, where necessary.

COM3.D140.7 DRAINAGE
1. Design the bottom frame members of the openable windows to drain away water and condensation from other frame members. Provide adequate drainage to bottom frame members whenever necessary;
2. Drainage paths should prevent water running through the reinforcement chamber of the profile which are to be fully sealed when the main profiles are welded together.
SUBMISSION

COM3.D210.7  SHOP DRAWINGS AND STRUCTURAL CALCULATION

Structural calculation by RSE, shop drawings and test reports in COM3.M010 (1)(a)(v) showing compliance with the design parameters specified in the Worksection must:

1. Be submitted for Approval in accordance with the following:
   a. Six months prior to fabrication for uPVC windows fixed to cast in-situ concrete walls;
   b. Within two months of the notified date for the commencement of the Works for uPVC windows fixed to precast concrete facade;

2. Be re-submitted for Approval where amendments are necessary;

3. Shop drawings must include
   a. Design and technical details of members, reinforcement, ironmongery and accessories;
   b. Type and position of fixings;
   c. Method statement for fixing friction pivots and sliding stays onto galvanized mild steel bars to window frames and sashes;
   d. Waterproofing design details between window frame and opening;
   e. Design of drainage;
   f. Type and thickness of glass;
   g. Calculation on the net glazing and openable areas of windows in compliance with the minimum area required under Building Regulations.

COM3.D230.7  COMPLIANCE WITH STANDARDS

Design uPVC windows in compliance with the appropriate Standards listed below:

1. All applicable Ordinances, Regulations and Codes in Hong Kong (i.e. the 'Hong Kong Building Code');
2. BS 6262:1982 - Code of Practice for glazing for buildings;
MATERIALS

GENERAL

1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed uPVC windows and grilles for CM's approval together with all the following substantiation for CM's information:
      i. Job reference;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agent/distributor in Hong Kong or the document from the supplier showing the appointment of the manufacturer and manufacturer’s agreement for the production of the proposed product;
      v. When the uPVC windows and grilles are supplied for domestic blocks, except for the ancillary facilities at lower floors, comply with the following in the submission:
         - Two identical sample boards similar to the sample boards for all other windows maintained by the Housing Department showing the extrusions, ironmongeries and accessories for the proposed uPVC windows and grilles;
         - Original or a certified true copy of the ISO 9001 certificate for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by a certification body or by the QCM. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.
   b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(a) for CM's information:
      i. The date of the test shall be generally within five years prior to the notified date for commencement of the Works or at an earlier date for domestic blocks subject to CM's consideration on the track records as maintained by the Housing Department;
      ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);
      iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:
   a. The quality and performance requirements are as follows:

<table>
<thead>
<tr>
<th>Items</th>
<th>Method</th>
<th>Acceptance Standards</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>i. Dimensional Tests</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### - Overall Size
Measure the peripheral and diagonal dimensions of the sample to nearest 0.5 mm. Indicate the measurements in the report with aid of schematic diagrams.

- Peripheral dimensions:
  - ±1.0 mm for length < 2 m
  - ±1.5 mm for 2 m ≤ length < 3.5 m
  - ±2.0 mm for length ≥ 3.5 m

- Diagonal dimensions:
  - ±1.5 mm for length < 2 m
  - ±2.5 mm for 2 m ≤ length < 3.5 m
  - ±3.5 mm for length ≥ 3.5 m

### - Individual Member
(Select three members)
Outer wall thickness of frame profile and glazing bead.

- Two specimens are required, one for tests (i) to (vi) and the other for test (vii) to (x). Separate sections are also required for test on outer wall thickness of individual member under test (i).
- For tests (i), please refer to the shop drawings submitted by the suppliers for dimensions of each type of windows.
- For test on individual member under test (i), suppliers should provide additional sections of the members 1000 mm long, in case suitable testing positions are difficult to access in complete windows set.
- For tests (ii) to (vi):
  Sequence of tests from (ii) to (vi) shall be followed. Failure of any test will have the whole sequence re-tested.
- Test (vi) does not apply to top hung windows.
- For tests (vii) to (x):
  Full size sample of window with glazing shall be used.
  Sequences and stipulated requirements indicated in the BS 6375:Part 1: 1989:Cl. 4.2 shall be followed.
- For tests (xi):
| v. | Strength of Restricted Opening Devices, Location Devices and Maximum Opening Stops | BS 6375:Part 2: 1987:Cl. 6.4 and A7 but testing force of 1000 N shall be used. | BS 6375:Part 2: 1987:Cl. 6.4 |
| vii. | Air Permeability Test | BS 6375:Part 1: 1989:Cl. 5 and BS 5368: Part 1: 1976 Pa max = 600 Pa | BS 6375:Part 1: 1989:Cl. 5 and Figure 1: Graph C No damages and functional defects shall be noted. |
| ix. | Structural Adequacy (Static) Test | BS 6375:Part 1: 1989:Cl. 7 and BS 5368:Part 3: 1978 Positive wind pressure : \( P_1 = 0.5 P_2 \), \( P_3 = 1.25 P_2 \); Negative wind pressure : \( P'_1 = 0.5 P'_2 \), \( P'_3 = 1.25 P'_2 \); \( P_2 \) and \( P'_2 \) are the maximum designed positive and negative wind loadings respectively in accordance with COM3.D130 n = 5 (Diagram 2 to be used as sequence of operation) | - BS 6375:Part 1: 1989:Cl. 7.2 to 7.5 (Permissible deformation to any member quoted in Cl. 7.3 is amended to less than 1/180 the length of the particular member and shall not be greater than 20 mm) - Extent of recovery of deformation 15 minutes after the removal of the test load should be at least 95%. |
| x. | Water Penetration Test by Cyclic Static Air Pressure Differential | ASTM:E547 - 00 Test pressure difference = 770Pa Ten test cycles | No water leakage, damages and functional detects shall be noted. |
| xi. | Test on Steel Reinforcement Coating | | |
| - Uniformity of coating | BS 729:1971 Appendix B | BS 729:1971 Appendix B |

### 3. On Site Delivery Verification:
a. At delivery stage, submit the following documents:
   i. Written confirmation that the material delivered to Site conforms with the approved sample submitted under sub-clause (1)(a);
   ii. Original or certified true copy of the Certificate of Origin for every batch of delivery. One batch being the material quantity covered under each delivery note;
   iii. Delivery notes for all material delivered to Site.

b. Carry out and submit report on the following verifications for uPVC windows and grilles upon delivery on Site. Prior to carrying out the verifications, inform CM's representatives who may present to witness the verifications:
   i. Method:

<table>
<thead>
<tr>
<th>Verification Items</th>
<th>Method</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dimension Check</td>
<td>By measurement</td>
<td>COM3.M010 (2)(a)(i) on overall size</td>
</tr>
<tr>
<td>Surface Quality</td>
<td>Visual</td>
<td>No discolouration, no damage, no staining, no blemish, acceptable colour consistency, no visible coating defects.</td>
</tr>
<tr>
<td>Ironmongery Check</td>
<td>Visual</td>

</tr>
<tr>
<td>Surface Quality</td>
<td>1 sample for every 200 pieces or part thereof</td>
<td>Same batch of material delivered to Site under one Delivery Note</td>
</tr>
<tr>
<td>Ironmongery Check</td>
<td>1 sample for every 200 pieces or part thereof</td>
<td>Same batch of material delivered to Site under one Delivery Note</td>
</tr>
<tr>
<td>Hinge and Structural (if required)</td>
<td>1 sample for every 200 pieces or part thereof</td>
<td>Same batch of material delivered to Site under one Delivery Note</td>
</tr>
<tr>
<td>Reinforcement Bars Check</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Dimension of the Structural Reinforcement Bars (if required) | 1 sample for every 200 pieces or part thereof | Same batch of material delivered to Site under one Delivery Note

c. Where any of the verifications fail to meet the acceptance standards, either:
   i. Remove the representative batch off Site; or
   ii. When agreed by the CM, repeat the verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

MEMBERS AND FIXINGS

COM3.M110.7 FRAME PROFILES AND SECTIONS
1. unplasticised polyvinyl chloride (uPVC) must not be carcinogenic;
2. Profiles for windows: extruded sections of a multi-chambered design and of a four-corner hot welded construction;
3. Transoms/mullions: weld onto frames or mechanically fix onto frames with joints filled with windows supplier's recommended sealant in compliance with WAT5.M110 or Approved equivalent to provide a neat weather-tight joint;
4. Outer wall thickness (maximum tolerance allowed 0.3 mm) for frames and transom: 2.5 mm minimum;
5. Colour of profile: white or Approved, uniform in colour when viewed by normal vision. The external and internal face surfaces of the profile are to be free from foreign bodies, cracks, sink marks or die lines when similarly viewed.

COM3.M120.7 REINFORCEMENT
2. Securely fixed as recommended by the window supplier.

COM3.M130.7 GLAZING GASKETS AND WEATHERSTRIP
Glazing gaskets and weatherstrip shall have no adverse effect on the uPVC profile as recommended by window supplier.

COM3.M140.7 UPVC GLAZING BEADS
1. Use beads which securely clip to the frame or are an integral part of the frame;
2. Wall thickness of glazing bead: 2 mm minimum with maximum tolerance of 0.3 mm.

COM3.M150.7 EXPOSED FIXINGS
Screws, nuts, bolts washers and rivets: stainless steel (grade 304 for bolts and grade 302 for screws), or nylon washer and caps for window grilles to match finish.

COM3.M160.7 CONCEALED FASTENING DEVICES
Galvanized mild steel.

COM3.M170.7 BEDDING AND GROUTING MATERIAL
Bedding and grouting material shall be compatible with the use of uPVC windows as recommended by the window supplier.
COM3.M180.7 PERIMETER SEALANT
External perimeters: seal with a low modulus silicone rubber sealant in compliance with WAT5.M110 or an Approved equivalent, which is of a compatible formula to adhere to uPVC and the building materials, i.e. concrete, sand/cement, plaster, tiles etc., at the abutment between the window frame and the fabric of the structure.

WINDOW FITTINGS/HARDWARE

COM3.M210.7 FRICTION PIVOTS AND SLIDING STAYS
1. All friction pivots and sliding stays to be 3 mm thick stainless steel of grade 304/A2-70 or Approved equivalent:
   a. For side hung window, providing a minimum clearance of 100 mm between frame and window when opening at 90°;
   b. For top hung window, providing, a minimum clearance of 70 mm between frame and window when opening at 90°.
2. All friction pivots and sliding stays to be fixed with stainless steel screws onto galvanized mild steel bars 12 mm minimum (width) x 3 mm (thick) in nominal size to all frame members and sash members.

COM3.M220.7 LOCKING HANDLES & PULL HANDLES ETC.
Polyester powder coated aluminium alloy or an Approved equivalent.

COM3.M230.7 IRONMONGERY
1. All ironmongery and metal components of hardware are to be corrosion resistant materials;
2. Metals that are in contact with each other are to be compatible so as to prevent galvanitic corrosion of dissimilar metals by electrolytic action.
WORKMANSHIP

APPROVAL PRIOR TO FABRICATION AND SITE INSTALLATION

COM3.W010.7 TESTING REPORT
Do not commence fabrication until test reports in COM3.M010 (1)(a)(v) have been approved.

COM3.W020.7 SHOP DRAWING AND SAMPLE APPROVAL
Do not commence fabrication until all shop drawings and samples have been Approved.

OFF SITE FABRICATION AND ASSEMBLY

COM3.W110.7 FIXING WEATHERSTRIPS
Securely fix weatherstrip. Ensure there is continuous contact between each opening part and its fixed frame.

COM3.W130.7 SIDE AND TOP HUNG WINDOWS
Hang to open as indicated on the Drawings and fit as specified with:
1. Friction pivots and sliding stays;
2. Pull handle with dual lock for side hung window; and
3. Cam lock for top hung window.

FIXING OF UPVC WINDOWS TO CAST IN-SITU CONCRETE FACADE

COM3.W210.7 COMPOSITE UNITS
Assemble all composite units on Site and provide all bolts, screws etc. and sealants.

COM3.W220.7 CUTTING TRIMMING AND WELDING
Do not cut, trim or weld during erection on Site.

COM3.W230.7 TOLERANCES
1. Check the position, size and alignment etc. of all openings for windows in accordance with the tolerances specified in Appendix H to this Specification and report any discrepancy to the CM;
2. Rectify any fault or discrepancy to the satisfaction of the CM, and bear the cost of such remedial work.

COM3.W260.7 POSITIONING
Position windows plumb, level and square.

COM3.W270.7 INSTALLATION
1. Install uPVC windows in accordance with window supplier's recommendation;
2. Apply bedding and grouting materials in accordance with window supplier's recommendation.
COM3.W280.7 PERIMETER POINTING OF EXTERNAL WINDOWS
1. Remove filler board from the preformed joint, if any, around external edges of window and door frames;
2. Mask adjoining surfaces which would be impossible to clean if smeared with sealant;
3. Point around external edges of window frames with Approved sealant in COM3.M180 to form a neat, smooth and flat joint;
4. Remove excess sealant from the adjoining surfaces and leave clean.

FIXING UPVC WINDOWS TO PRECAST CONCRETE FACADES

COM3.W410.7 POSITIONING
Position windows plumb, level and square.

COM3.W420.7 OPENING LIGHT FRAMES
Check tightness and clearance between sash and frames of opening lights which are to be fixed before and during concreting of the facade units.

COM3.W425.7 POSITIONING OF WINDOWS AND WINDOW FRAMES
Fix windows and window frames in position before placing concrete in moulds for the facade units.

COM3.W430.7 CURING OF CONCRETE
In case of steam curing, ensure that temperatures are not to exceed the softening temperature of uPVC profile.

COM3.W440.7 POINTING TO PERIMETER OF WINDOW
Point perimeter of window frames with Approved sealant in COM3.M180 to form a neat, smooth, flat joint and:
1. Mask any adjoining surfaces which would be impossible to clean if smeared with sealant; and/or
2. Remove excess sealant from adjoining surfaces and wipe clean.

HANDLING, STORAGE AND PROTECTION

COM3.W610.7 TRANSPORTATION, HANDLING AND STORAGE
As COM2.W490.

COM3.W620.7 PROTECTION
1. Wrap all windows and other associated materials in stout waterproof paper or polythene to protect against damp and scratching;
2. Protect all exposed surfaces with a strippable coating or low-track masking tape;
3. Maintain and renew protective coating as necessary;
4. Carefully remove protective coating and leave clean on completion of building works.
TESTING

SURVEILLANCE TESTS FOR UPVC WINDOWS AND GRILLES

COM3.T050.7 SURVEILLANCE TESTS

1. Testing Arrangements:
   a. When Instructed, surveillance tests shall be carried out by CM's Representative, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the followings pertaining to surveillance tests:
      i. Provide attendance on the Site;
      ii. Provide, deliver and collect samples etc. as directed by CM or as specified.

2. Testing Samples:
   a. Provide one set of test sample from the batch of material delivered to Site under the delivery note as specified in COM3.M010 (3)(a) or as instructed by CM;
   b. One set of test sample shall consist of two representative uPVC window specimens of any type without louvre. Sample shall be the completed component as to be installed, including glazing, all fixed parts, casements, top-hung and fixings necessary to ensure normal operation. Bear all cost for any replacement of samples.

3. Testing methods:
   As per COM3.M010 (2)(a) except (vii), (viii), (ix) & (x).

4. Non-compliance:
   a. In the event that the testing samples fail to meet the testing requirements, follow either one of the following actions:
      i. Remove the representative batch off Site; or
      ii. Carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 on three separate sets of samples selected by the CM from the representative batch. In case of any one sample fails the re-test, remove the representative batch off Site.
   b. When the representative batch of uPVC window is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 for one sample selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clauses (4)(a);
   c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.

ON-SITE VERIFICATION TEST

COM3.T310.7 TESTING INSTALLED WINDOWS FOR WATERTIGHTNESS

As COM2.T210.
COM4  GLAZING

MATERIALS

GLASS

COM4.M010.7  FLOAT GLASS
Clear float glass to BS 952:Part 1:1995, thickness as shown on Drawings.

COM4.M020.7  CLEAR SHEET GLASS
To BS 952:Part 1:1995 and of a general quality for glazing, thickness as shown on Drawings.

COM4.M030.7  TRANSLUCENT GLASS
To BS 952: Part 1:1995
1. Type: clear patterned glass;
2. Quality: to BS EN 572-5:2004;
3. Degree of obscuration/diffusion: medium or approved;
4. Thickness as shown on the Drawings.

COM4.M040.7  WIRED GLASS
To BS 952:Part 1:1995,
1. Type: as shown on Drawings;
2. Square mesh wire, 13 mm squares, electrically welded at each intersection;
3. Thickness: as shown on Drawings.

COM4.M050.7  MIRROR GLASS
Selected float glass to BS 952:Part 1:1995 suitable for silvering:
1. Edges: square or bevelled as shown on the Drawings;
2. Exposed arrises: ground smooth.

COM4.M060.7  THERMALLY TOUGHENED GLASS/TEMPERED GLASS
1. To BS 952:Part 1:1995 and manufactured:
   a. To precise glazing sizes and thickness as shown on the Drawings;
   b. With permanent identification mark in position which is visible but not prominent after fixing.
2. The glass shall be heat treated to approximately three times the strength and impact resistance of untreated glass and upon fracture would break into small fragments;
3. The glass shall be heat soak treated to reduce the risk of spontaneous breakage by accelerating the expulsion of the nickel sulphide in the glass through the heat soak process conforming to BS EN 14179-1: 2005 or other equivalent international standards;
4. Submit compliance report for heat soak process issued by the glass manufacturer containing the following information:
   a. Name of the tempered glass manufacturer;
   b. Name of the project using the manufacturer's tempered glass;
   c. Total number and surface area of tempered glass panes used in the project;
   d. Location and identity number of the ovens, in which the heat soak process of the glass panes in (c) was conducted;
e. Calibration report of the ovens in accordance with BS EN 14179-1: 2005 or equivalent;
f. Quantity and configuration of thermocouples used to measure the glass surface temperatures in the oven. A minimum of 8 thermocouples shall be used. The location of these thermocouples shall be determined from the calibration report of the oven;
g. Recorded temperature versus time graphs for each of the 8 thermocouples during the heating phase, holding phase and cooling phase of the heat soak process;
h. Quantity, dimensions and thickness of the tempered glass panes conforming to BS EN 14179-1: 2005 or other equivalent international standards, and the record of breakages of panes in each heat soak process with corresponding oven number;
i. Date of carrying out the heat soak process.

COM4.M070.7 ANTI-BANDIT GLASS
To BS 5544:1995, thickness as shown on Drawings.

COM4.M080.7 BULLET RESISTANT GLASS
To BS 5051:Part 1:1995, category as shown on Drawings.

COM4.M090.7 TINTED GLASS
1. To BS 952:Part 1:1995:
2. Type of tint, colour and intensity: as specified in Project Specific Specification;
3. Thickness: as shown on Drawings.

COM4.M100.7 REFLECTIVE GLASS
1. Surface to be coated reflective, colour and performance: as specified in Project Specific Specification;
2. Thickness: as shown on Drawings.

COM4.M110.7 LAMINATED GLASS
To BS 952:Part 1:1995, thickness as shown on Drawings.

COM4.M120.7 GLASS LOUVRE BLADES
With bevelled edges and ground to remove sharp arrises, thickness as shown on Drawings.

PLASTIC GLAZING MATERIALS

COM4.M210.7 POLYCARBONATE SHEET
Thickness: as shown on Drawings.

COM4.M220.7 SURFACE HARDENED POLYCARBONATE SHEET
Thickness: as shown on Drawings.

COM4.M230.7 PLASTICS GLAZING MATERIALS
Plastics type and thickness: as shown on Drawings.

SAMPLES

COM4.M310.7 GLAZING SAMPLES
Submit samples, 300 mm minimum square, for each type of glass and plastic sheet for Approval in accordance with PRE.B9.410.
ANCILLARY MATERIALS

COM4.M410.7 DISTANCE PIECES
PVC to BS 2571:1990, and:
1. Length: 10 mm minimum;
2. Width: equal to space between glass and rebate or bead;
3. Depth: giving 5 mm minimum cover of sealant.

COM4.M420.7 SETTING BLOCKS
1. Manufactured from either:
   a. PVC to BS 2571:1990, with a softness number between 35 and 45;
   b. Neoprene with Shore A hardness number between 80 and 90.
2. Length: 30 mm/m² of glazing but:
   a. In no circumstance less than 25 mm;
   b. Not less than 60 mm in vertically pivoted windows.

COM4.M430.7 LOCATION BLOCKS
Do not use location blocks if sealant is used in lieu of glazing compound.

COM4.M440.7 NON-SETTING COMPOUND
Of proprietary type as recommended by the window manufacturer: colour to Approval.

COM4.M450.7 PLASTIC SHEET GLAZING COMPOUND
Of proprietary type and compatible with proprietary sheets: colour to Approval.

COM4.M460.7 LINSEED OIL PUTTY
To BS 544:1969.

COM4.M470.7 PUTTY FOR HARDWOOD APPLICATION
A proprietary type recommended by the window manufacturer.

COM4.M480.7 SILICONE SEALANT
1. In compliance with WAT5.M110;
2. For mirror: one-part sealant to BS 5889:1989, Type A, neutral type sealant;
3. For glazing: one-part sealant to BS 5889:1989, Type B, neutral type sealant.

COM4.M490.7 GLAZING SPRIGS
Small, headless, non-corrodible nails or pins.
WORKMANSHIP

GENERAL

COM4.W010.7 STANDARD
Comply with BS 6262:1982 unless specified otherwise.

COM4.W020.7 DELIVERY
Ensure glass and plastic sheet is kept dry and clean during delivery.

COM4.W030.7 STORAGE
Store glass and plastic sheet vertically in a well ventilated location, protected from condensation and other moisture.

PREPARATION OF SURROUNDS

COM4.W110.7 PREPARATION OF REBATES
Ensure rebates are clean, dry and unobstructed at time of priming and glazing.

COM4.W120.7 PRIMING OF WOODEN SURROUNDS
Ensure priming paint, in accordance with Worksection FIN7, has been applied to rebates before glazing with linseed oil putty.

FIXING GLASS GENERALLY

COM4.W210.7 GENERALLY
Ensure external glazing is wind and water tight on completion.

COM4.W220.7 CAST OR PATTERNED GLASS FOR EXTERNAL GLAZING
Fix cast or patterned glass for external glazing with patterned side inside.

COM4.W230.7 WIRED GLASS
Fix wired glass with the wires parallel to surround and align wire in adjacent panes.

COM4.W240.7 CUT EDGES OF WIRED GLASS
Grind the edge of cut glass smooth and paint cut edges of wired glass with black bituminous base paint to inhibit rusting.

COM4.W250.7 DIRECTIONALLY PATTERNED GLASS
Fix directionally patterned glass with the pattern parallel to surround.

COM4.W260.7 EDGE CLEARANCES OF SEALANT FOR ALUMINIUM WINDOWS
Ensure edge clearances are equal all round each pane and are at least 3 mm.

COM4.W270.7 EDGE COVER
1. Provide edge cover with sealant in accordance with the following table:

<table>
<thead>
<tr>
<th>Glass area</th>
<th>Edge cover</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 0.5 m²</td>
<td>5 mm</td>
</tr>
<tr>
<td>0.5 to 1.5 m²</td>
<td>9 mm</td>
</tr>
<tr>
<td>Area</td>
<td>Thickness</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------</td>
</tr>
<tr>
<td>1.5 to 4.0 m²</td>
<td>12 mm</td>
</tr>
<tr>
<td>Over 4.0 m²</td>
<td>As recommended by the sealant manufacturer</td>
</tr>
</tbody>
</table>

**COM4.W275.7 EDGE COVER FOR SINGLE GLASS GLAZED IN PUTTY OR NON-SETTING COMPOUND**

Ensure the cover is in accordance with Tables 13 & 14 of BS 6262:1982.

**COM4.W280.7 SETTING, LOCATION BLOCKS AND DISTANCE PIECES**

1. Use setting blocks for all panes exceeding 0.2 m²;
2. Use distance pieces for all panes exceeding 0.2 m² and use minimum 2 Nos. of distance pieces on each side of the glass pane at 600 mm centres or less;
3. Use location blocks for all panes without sealant.

**COM4.W290.7 POSITIONING AND SETTING LOCATION BLOCKS**

Locate setting and location blocks in accordance with BS 6262:1982, Figure 22 and not less than 30 mm from corner of surround to end of block nearest corner.

**COM4.W300.7 BEDDING FOR NON-SETTING COMPOUND**

Ensure that no voids or spaces are left in backing or bedding non-setting compounds and there is no glass to frame contact.

**COM4.W310.7 STRIPPING SURPLUS NON-SETTING COMPOUND**

Strip surplus backing or bedding non-setting compound as follows:
1. To top and side edges: flush with top of rebate or bead;
2. To bottom edges: at 45° angle.

**COM4.W320.7 SILICONE SEALANT**

Where specified, seal the joint between the glass and bead with an Approved silicone sealant.

**COM4.W330.7 PREFORMED TAPES, SHIMS AND COMPRESSION GASKETS FOR GLAZING**

Obtain Approval before use and comply with manufacturer's recommendations.

**GLAZING TIMBER WINDOWS**

**COM4.W410.7 SECURING GLASS**

Secure glass to wooden surrounds with glaziers sprigs at 450 mm maximum centres.

**COM4.W420.7 BACK PUTTY**

Of regular thickness and 2 mm minimum.

**COM4.W430.7 FRONT PUTTY**

Form front putty to a neat triangular fillet stopping 2 mm short of sight lines.

**COM4.W440.7 OPENING LIGHTS**

Ensure opening lights remain in closed position until putty has set sufficiently to prevent displacement of glass.

**COM4.W450.7 SEALING PUTTY**

Seal linseed oil putty once sufficiently hard and within manufacturer’s recommended times with primer and paint as specified in Worksection FIN7.
COM4.W460.7  BEDDING GLAZING BEADS
Bed glazing beads in glazing compound for external glazing.

COM4.W470.7  SECURING WOODEN GLAZING BEADS
Secure wood glazing beads with rustproof panel pins or with countersunk brass screws and cups at 200 mm maximum centres and 75 mm maximum from each corner.

GLAZING ALUMINIUM WINDOWS

COM4.W540.7  GLAZING ALUMINIUM WINDOWS
To be carried out by the specialist contractor supplying and fixing the windows in accordance with Worksection COM2 as specified.

LOUVRES

COM4.W610.7  FIXING LOUVRE BLADES
Fix louvre blades into adjustable frames using clips as recommended by the frame manufacturer.

GLAZING WITH PLASTIC SHEETS

COM4.W710.7  CUTTING PLASTIC SHEETS
Cut plastic sheets with a fine tooth saw and smooth or chamfer edges.

COM4.W720.7  EDGE CLEARANCE
Allow edge clearance and cover as recommended by the sheet manufacturer.

COM4.W730.7  PROTECTIVE COVERING
Remove only sufficient of the protective covering around edges to allow glazing.

FINISHING

COM4.W810.7  CLEANING
1. Remove paint drips whilst wet;
2. Remove mortar, plaster or concrete spillage whilst wet;
3. Prior to practical completion of works:
   a. Remove all smears and excess glazing compound;
   b. Remove protective covering from plastic sheets;
   c. Leave clean, inside and out and free from scratches.

COM4.W820.7  BROKEN OR DAMAGED GLAZING
Replace glass or fixing materials broken or damaged before completion of the Works and redecorate as Instructed.
COM5 TIMBER DOORSETS

MATERIALS

DOORSETS GENERALLY

COM5.M001.7 MATERIALS OF TIMBER DOORSETS

1. Non-fire rated doorsets and doorsets with fire resistance rating of 30 minutes:

<table>
<thead>
<tr>
<th>Parts of doorsets</th>
<th>Materials</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Door leaves</td>
<td></td>
</tr>
<tr>
<td>- Core battens</td>
<td>Softwood</td>
</tr>
<tr>
<td>- Stiles and rails</td>
<td>Softwood or hardwood</td>
</tr>
<tr>
<td>- Facing</td>
<td>Plywood</td>
</tr>
<tr>
<td>- Lipping</td>
<td>Hardwood</td>
</tr>
<tr>
<td>b. Door frame</td>
<td>Hardwood</td>
</tr>
<tr>
<td>c. Architrave</td>
<td>Softwood or hardwood</td>
</tr>
</tbody>
</table>

2. Doorsets with fire resistance rating of 60 minutes:

<table>
<thead>
<tr>
<th>Parts of doorsets</th>
<th>Materials</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Door leaves</td>
<td></td>
</tr>
<tr>
<td>- Core battens</td>
<td>Softwood or hardwood</td>

   Proprietary design recommended by door manufacturers to CM’s approval.

COM5.M005.7 USE OF SUSTAINABLE TIMBER

1. All softwood used in timber doorsets shall be from sustainable sources;
2. At least 50% of all timber by volume for doorsets shall be from sustainable sources;
3. The hardwood or softwood to be regarded as sustainable shall be originated from a well-managed source which is governed under an internationally recognised, globally applicable, independent certification scheme for sustainable forest management;
4. The softwood or hardwood to be regarded as sustainable shall be originated from a well-managed source under the following independent certification scheme:
   a. Forest Stewardship Council (FSC); or
   b. Programme for the Endorsement of Forest Certification Schemes (PEFC); or
c. Other equivalent internationally recognized, globally applicable, independent certification scheme for sustainable forest management in terms of environmental, ecological, biodiversity, social and economic needs.

5. Submit the following documents as specified in COM5.M040 to demonstrate that softwood or hardwood from a well-managed source in sub-clause (4) has been purchased, processed and delivered to Site:

a. Confirmation in writing the composition and sources (e.g. sustainable source / non-sustainable source) of all the solid timber and plywood used for manufacturing of timber doorsets;

b. i. Copies of Chain-of-Custody (COC) certificate of the supplier/manufacturer of timber doorsets; or
   ii. For supplier/manufacturer of timber doorsets without COC certificate, submit the following documents:
       - Copies of COC certificates of the vendor;
       - Letter from the vendors stating the timber is originated from the well-managed sources;
       - Photographs taken at the manufacturing factory of timber doorsets showing arrival of the timber carrying the label of the independent certification scheme.

c. Purchase order of the timber doorsets issued by the Contractor to the supplier/manufacturer of timber doorsets;

d. Invoice issued by the supplier/manufacturer of timber doorsets to the Contractor stated with the name and COC number of the vendors and quantity delivered to the Site;

e. Delivery order from the supplier/manufacturer of timber doorsets stated with the name and COC number of the vendors and quantity delivered to the Site;

f. Additional documents for other independent certification scheme in sub-clause (4)(c):
   i. The species and country of origin of softwood or hardwood;
   ii. The name of the concessions or plantations from which the hardwood or softwood originate;
   iii. Copies of the forestry policies implemented by these concessions or plantations which confirm that the management of the timber resource is sustainable.

COM5.M010.7 TIMBER QUALITY

To comply with the following:

1. Class and exposure to BS 1186:Part 1:1991, as follows:

**COM5.M015.7 COMPOSITE JOINTED (LAMINATED) TIMBER AND FINGER JOINTED TIMBER**

1. Laminated timber and finger jointed timber may be used at door frames, stiles and rails of door leaves subject to CM’s approval;

2. Laminated timber and finger jointed timber shall be to BS 1186:Part 2:1988 and comply with the following dimensional requirements:

   a. Composite jointed (Laminated) timber:

      i. Min. dimension of each piece: 25 mm

      ii. Max. no. of laminated pieces in stiles/ rails: 2 nos.

      iii. Max. no. of laminated pieces in door frames: 4 nos.

   b. Finger jointed timber:

      i. Min. length of each segment: 150 mm

      ii. Min. length of end pieces: 100 mm

      iii. Min. overlapping of adjacent segments: 50 mm

      iv. Max. no. of finger jointed segments in vertical stiles: 7 nos.

      v. Max. no. of finger jointed segments in horizontal rails: 4 nos.

3. Detailed composition and dimension of laminated timber and finger jointed timber components / segments shall be clearly indicated in shop drawings submission for CM’s approval.

**COM5.M020.7 AVERAGE PERMISSIBLE MOISTURE CONTENT**

For timber incorporated into the work:

1. The average permissible moisture content is 13% to 17%;

2. Measure the moisture content of timber using an electrical resistance moisture meter in accordance with clause 7 of BS 1186:Part 1:1991;

3. Draw to the CM’s attention any situations where these percentages cannot be attained due to local circumstances of supply and availability.

**COM5.M025.7 SOFTWOOD FOR CORE BATTENS, STILES AND RAILS AND ARCHITRAVE OF DOOR LEAVES**

1. Softwood shall be originated from sustainable source as specified in COM5.M005;

2. The softwood used in the core battens, stiles and rails and architrave of door leaves etc. shall be Douglas Fir, Larch, Hemlock, Radiata Pine, Red Cedar, Spruce, Yellow Cypress or other softwood as approved;
3. The minimum average density of softwood at 15% moisture shall be 450 kg/m³.

**COM5.M030.7 HARDWOOD FOR CORE BATTENS, STILES, RAILS, ARCHITRAVE AND LINING OF DOOR LEAVES**
"Meranti" or equivalent wood species of minimum average density of 450 kg/m³ at 15% moisture content for the construction of the door leaves.

**COM5.M035.7 HARDWOOD FOR LIPPING AND FRAME**
1. The hardwood used for the lipping and frameshall be "San Cheung" (Kapore), Ash Wood or other hardwood as approved;
2. The minimum average density of hardwood at 15% moisture content shall be 620 kg/m³.

**COM5.M040.7 TIMBER DOORSETS**
1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed wooden doorsets for CM's approval together with all the following substantiation for CM's information:
      i. Job reference;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agent/distributor in Hong Kong or document from the supplier showing the appointment of the manufacturer and manufacturer's agreement for the production of the proposed product;
      v. Original or a certified true copy of product conformity certificate for the doorsets of fire rated construction. This shall be submitted at sample submission and approval stage, or at a time not later than the delivery of the material. The certification shall be to the "Product Conformity Certification Scheme For Passive Fire Protection Products" published by the Hong Kong Institute of Steel Construction. The product conformity certificate shall be issued by a certification body accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS. If a photocopy of the product conformity certificate is submitted, it shall be certified true by the certification body or by the QCM. The product conformity certificate shall cover tests in accordance with either set of standards below:
   It shall be certified as being capable of resisting the action of fire for the specified periods by a laboratory which must be accredited for the specific test by HKAS under the Hong Kong Laboratory Accreditation Scheme (HOKLAS), or an equivalent organization which has signed a mutual recognition agreement with HOKLAS with appropriate qualifications and experience in fire resisting construction.
   vi. The detail specification of the doorsets selected for the product conformity certification audit testing by the certification body, together with drawings and photographs sufficient to completely describe the doorset's construction, materials, fittings used and installation details;
   vii. A copy of the fire test reports, assessment reports or fire test certificate which are certified true by the accredited laboratory or QCM and generally within 5 years prior to the notified date for commencement of the Works;
viii. Shop drawings for Approval showing the materials and exact dimensions of all doorset components, fixing, joint details, the internal arrangements of the rail and battens, and particularly routing of the cavity reserved for the wiring of the electrical locksets. Where laminated timber and finger jointed timber are used, detailed composition and dimension of the components / segments shall be incorporated in the shop drawings;

ix. Samples of wooden veneer faced plywood and door frame if timber veneer finished doorsets are shown on Drawings;

x. When the doorsets are supplied for domestic blocks also include the followings in the submission:
   - Two identical sample boards similar to the one maintained by the Housing Department showing the quality, species and country of origin of timber for the doorsets;
   - Test report showing the average density of not less than 3 nos. of timber samples of proposed species;
   - Documents as specified in sub-clause (5)(a), (b) and (f) of COM5.M005;
   - Calculation to demonstrate at least 50% of all timber by volume for the doorsets is from sustainable source;
   - One sample each for kitchen, bathroom, flat entrance and exit staircase doorsets in Standard Domestic on Site for the purposes of inspection and Approval. The Approved samples shall be kept on Site until completion of the doorset installation work;
   - Original or a certified true copy each of the certification to ISO 9001 and ISO 14001 for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by the certification bodies or by the QCM. The certification bodies shall be as follows:

<table>
<thead>
<tr>
<th>ISO</th>
<th>Certification Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISO 9001</td>
<td>The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
<tr>
<td>ISO 14001</td>
<td>The certification body shall be accredited by the Hong Kong Accreditation Service (HKAS), or the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
</tbody>
</table>

   - A test report showing compliance with sub-clause (3)(b)(iii) for doorsets produced by the proposed doorset manufacturer to demonstrate the effectiveness of the insecticidal control on the production of doorsets.

xi. When the doorsets are supplied with smoke seal:
   - Catalogue, brand name/model name, origin and job reference of the smoke seal;
   - Name of the manufacturer of the smoke seal;
   - Sample board of the proposed smoke seal with all accessories;
   - Original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements as specified in sub-clause (1) & (2) of COM5.M090 for CM's information. The date of the test shall be generally within five years prior to the notified date for commencement of the Works.
xii. The proposed Radio Frequency Identification tag and fixing method as specified in Worksection COM11.

b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clauses (2)(d) to (2)(e) for CM’s information:
   i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works or at an earlier date for domestic blocks subject to CM's consideration on the track records as maintained by the Housing Department;
   ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);
   iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:
   a. Doorsets must be capable of withstanding incidental static and dynamic loads imposed during use, including forced opening and closing and impacts from human bodies and hard objects. The loads must not result in significant damage or deformation to the doorsets, nor dislodge or shatter any composite parts in a dangerous manner;
   b. Doorsets with fire resistance rating of 30 minutes:
      i. A fire resistance rating of 30 minutes, 30/30 (30 minutes integrity, 30 minutes insulation) or 30/- (30 minutes integrity with no specified requirement for insulation) shall be provided when tested to BS 476:Part 22:1987 or BS EN 1634:Part 1:2008;
      ii. Timber doorsets including frame, hinges, door closers and any other hardware shall be as specified in Appendix A.2.3 of BS 476:Part 22:1987 or clause 6.7 of BS EN 1634:Part 1:2008;
      iii. Should be closely fitted around the edges to impede the passage of smoke and flame. Bottom gap shall not be more than the designed values of the door specified in the relevant fire test reports and should not exceed 10mm (between the bottom of the door and the floor when the smoke seal is lifted up).
   c. Doorsets with fire resistance rating of 60 minutes:
      i. A fire resistance rating of 60 minutes, 60/60 (60 minutes integrity, 60 minutes insulation) or 60/- (60 minutes integrity with no specified requirement for insulation) when tested to BS 476:Part 22:1987 or BS EN 1634:Part 1:2008;
      ii. Timber doorsets including frame, hinges, door closers and any other hardware shall be as specified in BS 476:Part 22:1987:Appendix A.2.3 or BS EN 1634:Part 1:2008.6.7;
      iii. Should be closely fitted around the edges to impede the passage of smoke and flame. Bottom gap shall not be more than the designed values of the door specified in the relevant fire test reports and should not exceed 10 mm (between the bottom of the door and the floor when the smoke seal is lifted up).
   d. Satisfy the requirements of the following tests. After each test, the doorset must function properly and any damage or deformations are to be within the limits prescribed in sub-clauses (2)(f) to (2)(p). Two brand new samples are required for the tests below. Test number 1 to 3 to be carried out on Sample A in any order, and evaluation of result need not be terminated because of failure of one test. Test number 4 to 11 to be carried out on Sample B in sequence:

- At 20 Nm for kitchen and bathroom doorsets, and at 40 Nm for flat entrance and exit staircase doorsets
- At 20 Nm for kitchen and bathroom doorsets, and at 80 Nm for flat entrance and exit staircase doorsets
e. Record the following information in the test reports:
   i. Description of product: a detailed specification and any necessary
drawings or photographs, sufficient to completely identify the product
and its fittings;
   ii. Test results:
       - Numerical test results expressed in the units prescribed for the
       appropriate test;
       - Any other specified criteria, e.g. "no damage occurred" etc.;
       - A graph of performance against increasing stress wherever
       applicable;
       - Diagrams or photographs to show points of failure where
       appropriate.
   iii. Test conditions: details of atmosphere i.e. conditions prior to and during
   testing where appropriate.
   f. Test No. 1 - dimensional accuracy, squareness:
      i. Specified linear dimensions and squareness will be measured in
      accordance with BS 5278:1976, except that the height and width of
      doors will be measured with a maximum uncertainty of ±1.0 mm.
   g. Test No. 2 - general flatness, evenness:
      i. Evenness of surfaces will be measured by metal straight edges, one each
      of 50 ± 2 mm and 200 ± 2 mm and a set of feeler gauges which enables
      measurement of 0.2 to 1.0 mm in increments of 0.1 mm;
      iii. Each door will be examined along four horizontal lines and two vertical
      lines, equally spaced, on each face of the doors, for any deviation in
      position exceeding the specified limits;
      iv. Each continuous gap will be measured once at the point of maximum
      deviation;
      v. The position of the point measured together with the magnitude of
      deviation will be recorded and reported.
   h. Test No. 3 - behaviours under humidity variations:
      i. Tests will be conducted in accordance with BS 5369:1987;
      ii. Measurements of bending and twist will be taken within 6 hours of
      removal from the chamber;
      iii. Doors that cannot be measured within the above specified period will be
      stored in the relevant climate or sealed in plastic wrapping;
      iv. Have a maximum deviation due to bending of 7.5 mm, measured
      vertically;
      v. The range between maximum deviation, due to twisting of any corner of
      the door in relation to the other three corners under the three climatic
      conditions, must not exceed 10 mm.
   i. Test No. 4 - resistance to impact, hard body:
      i. Test apparatus:
- The impactor will be a solid steel ball of diameter $50 \pm 2.5$ mm, which can be dropped down the inside of a release tower of 100 mm internal diameter, with a flat base and weighing about 5 kg, excluding the steel ball. The tower will incorporate a means of releasing the ball quickly and freely.

ii. Test method:
- The test doorset will be laid horizontally on a solid base, supported along three edges (top and both sides). Impacts of 3 Nm will be applied to fifteen points on the surface as specified below.

iii. Object of impact pattern:
- The object of the impact pattern is to control the spread of test points so that an undue concentration on places of high or low resistance is avoided;
- Figure 4(a) in Appendix COM5/I to this Worksection illustrates the principles by which a pattern is constructed, and shows one-half of the specimen;
- Aiming points are chosen from the centres of those sub-areas marked X;
- One point is selected from each of the fifteen rows, so that aiming points are spread in consecutive columns as shown in figure 4(a).

iv. Standard impact patterns:
- Figure 4(b) in Appendix COM5/I to this Worksection indicates four different sets of aiming patterns developed in this way;
- Some door constructions may require different aiming points from the remaining sub-areas marked Y but alternatives will not give such a balanced pattern;
- Any of the four patterns shown may be used for a test but the location which is expected to be most vulnerable will be included;
- The development of alternative patterns is not essential.

v. Repeat testing template:
- Where repeated testing is expected, such as for door leaves of standard size, a template may be used to avoid the need to mark out the face of a door leaf.

vi. Measurement of indents:
- The depth of indent caused by an impact will be measured by a dial gauge mounted on a reference bar;
- The contact between the reference bar and the door leaf surface is by a flattened knife edge at one end and a single rounded point contact at the other;
- The knife edge will be positioned at right angles to the length of the bar and set at a separation of 200 mm from the point of contact;
- The dial gauge will be positioned centrally between the knife edge and the point of contact;
- The extent of damage caused by an impact will be assessed by a transparent sheet on which a circle of 15 mm diameter has been inscribed.

vii. Test method sequence:
The sequence of the test method will be carried out as follows:
- An aiming point will be selected;
- A dial gauge reading will be taken at this point with the bar in a known orientation relative to the door edges;
- The tower will be positioned with its central axis over the aiming point;
- The ball will be dropped from a height where the distance from its underside to the door leaf surface corresponds to the specified impact energy;
- The tower will be removed and the depth of indent measured (by the difference of readings) with the bar and dial gauge in the previous position and orientation;
- Any consequent cracking of the material of the door together with any other damage caused by the impact will be assessed;
- This procedure will be repeated for the remainder of the specified aiming points.

j. Test No. 5 - resistance to torsion:
   i. Test apparatus:
      - The doorset will be mounted vertically and fixed in accordance with the manufacturer's recommendations;
      - Arrangements will be made whereby the door leaf can be held open at 90 degrees by means of a clamp to top lockside corner;
      - A means of applying force normal to the plane of the door leaf will be provided acting at its mid height;
      - The force will act at the lockside edge of the door leaf;
      - Deflection normal to the plane of the door leaf will be measured at the lower lockside corner.
   
   ii. Initial loading:
      - Slack in the hinges will be taken up initially by preloading;
      - Preloading will be carried out by carefully applying a force of 200 N to the attachment point in increments not exceeding 100 N, the force acting at right angles to the door leaf;
      - The force will be removed in the same incremental stages as in the loading procedure;
      - The position of the lockside lower corner will be noted as a datum for deflection measurements.
   
   iii. Test loading:
      - A force of 400 N will be applied in increments not exceeding 100 N, the force acting at right angles to the door leaf;
      - The deflection will be measured after the door leaf has stabilised at each increment, the movement of the dial gauge being less than 0.02 mm per minute;
      - After the recording of the deflection under maximum force the reverse procedure will be adopted to remove the load. The final residual deflection at least 1 hour after all force has been removed will be recorded;
      - Refer to Figure 5 - Torsion in Appendix COM5/I to this Worksection.

k. Test No. 6 - strength in the plane of the door leaf:
   i. Test specimen:
      - Doorset with factory-finish or finished as specified.
   
   ii. Test method:
      As Test No. 5 - resistance to torsion test:
      - The doorset will remain in the rig position described;
      - In the resistance to torsion test, the force will be applied, acting downwards in the plane of the door leaf, to a point at about mid-height of the door leaf near the lockset in a vertical direction;
      - The point of measurement will be on the centre line of the bottom edge of the door leaf and 10 mm in from the locking edge.
   
   iii. Test reading:
iv. Loading door:
- A downward vertical force of 500 N will be applied in increments of 50 N;
- The final force will be maintained for 5 minutes when the maximum deformation is recorded;
- The reverse procedure will be adopted and the residual deformation measured one hour after all downward forces have been released.

v. Test criteria:
- The maximum and residual deformation must not exceed 1.00 mm.

l. Test No. 7 - slamming open:
  i. Mount for test:
- The doorset, including any architraves, trims, door stop, check or similar as specified, will be mounted, positioned and supported as in intended operational use, with the door leaf fully opened.
  
  ii. Test method:
- The door leaf will be moved towards the closed position through an angle of 30 degrees and allowed to open freely under the influence of a 4 kg weight applied to the middle of the edge opposite the hinges at right angles to the plane of the fully open door;
- The procedure will be repeated 10 times at a rate not exceeding 15 times per minute;
- Double swing doors will be slammed open 10 times in each direction;
- If no closer or stop is specified, a floor mounted door stop will be provided at the 90 degrees open position;
- Refer to Figure 2 - slamming open, in Appendix COM5/I to this Worksection.

m. Test No. 8 - slamming closed:
  i. Test apparatus:
- The doorset will be placed vertically in a rigid rig, fixed by a method recommended by the manufacturer;
- A light strong line will be arranged, that allows the door leaf to be closed from 60 degrees open by the descent of a weight of mass of 15 kg;
- The line will be attached to the leaf at the lockset or if this is more than 150 mm from the lockside edge at some point within 150 mm of that edge at the level of the lockset;
- The line will be passed horizontally from the door leaf and then over a 25 mm diameter, horizontal bar of smooth steel arranged with its axis parallel to the plane of the door frame;
- The bar will be positioned 400 mm from the door leaf face when the door leaf is closed and spanning the width of the doorset;
- The line will descend vertically from the bar and carry the weight at its lower extremity so arranged that, at the point of closure, the weight strikes a platform removing further tension from the line.
  
  ii. Test method:
- The door leaf will be opened to 60 degrees and released, the door will be slammed shut by the action of the falling weight;
- Carry out test 20 times;
- Refer to Figure 1. - slamming closed, in Appendix COM5/I to this Worksection.

n. Test No. 9 - resistance to jarring and vibration:
i. **Mount for test:**
- The doorset will be mounted vertically in a rigid rig and fixed in accordance with the manufacturer's recommendations.

ii. **Test apparatus:**
- A spherocinical bag to BS EN 596:1995 Clause 6.2 will be hung from an independent support at about the same height as the top of the door leaf as a pendulum capable of striking the door’s closing face;
- The bag will be hung so that, at rest, with the door open at 45 degrees, it just contacts the surface of the door leaf with its centre of gravity at the level of the lockset, and at mid-width of the door frame;
- The lockset will be removed where this would be struck.

iii. **Test method:**
- The door leaf will be opened from the closed position through an angle of 45°;
- If any closing device is fitted, the door leaf will be restrained slightly against closing, but not against opening; otherwise the door leaf will be unrestrained;
- If no closer or stop is specified, a floor mounted door stop at the 90° open position will be provided;
- The test body will be drawn away from the door leaf in a vertical plane normal to the door frame through an arc of 250 mm vertical height then released to strike the door leaf;
- Carry out test 100 times;
- Refer to Figure 7 - jarring, in Appendix COM5/I to this Worksection.

o. **Test No. 10 - resistance to impact; heavy body:**

i. **Test apparatus:**
- A spherocinical bag to BS EN 596:1995 Clause 6.2 will be hung as a pendulum capable of striking the door leaf;
- The bag will be placed so that, at rest, it just contacts the surface of the door leaf with its centre of gravity at the level of the lockset, such that when swung in a vertical plane normal to the door leaf it will impact the door leaf at mid-width of the door leaf.

ii. **Mount for test:**
- The doorset will be mounted vertically and fixed in accordance with the manufacturer’s recommendations. The door leaf, will be closed and locked.

iii. **Test method:**
- With the door leaf closed and locked, the test body will be swung against the door leaf three times to the closing face, with an impact energy of:
  - 20 Nm each time for kitchen and bathroom doorsets and;
  - 40 Nm each time for flat entrance and exit staircase doorsets.
  - The doorset will then be examined for any damage or deformation; then
- With the door leaf closed and locked and clamped at the position of the lockset the test will be repeated against both sides of the door leaf, three times, commencing with the opening face and with an impact energy of:
  - 40 Nm each time for kitchen and bathroom doorsets and;
  - 80 Nm each time for flat entrance and exit staircase doorsets.
  - The doorset will then be examined for any breakage.
- Refer to Figure 3 - heavy body, in Appendix COM5/I to this Worksection.
p. Test No. 11 - resistance to closing against an obstruction:
   i. Mount for test:
      - The doorset will be mounted vertically in a rigid rig, and fixed in accordance with the manufacturer's recommendations. A dry hardwood slip, 50 mm x 50 mm x 10 mm and of mass between 15 g and 20 g will be provided for the test.
   ii. Test method:
      - The door will be opened and the hardwood slip placed in the gap between the door leaf and the bottom of the hinge side jamb of the frame in order to hold the door ajar. The slip will be inserted from the closing face with its grain horizontal and its plane vertical and parallel to the plane of the door frame as shown in Figure 6 - "Arrangement of Hardwood slip for obstruction test", in Appendix COM5/I to this Worksection;
      - A force will be applied, acting at right angles to the plane of the frame, increasing in 50 N increments to the lockside edge, at the handle height until it reaches 200 N.

q. Test No. 12 – endurance test of mechanical smoke seal
   i. The drop seal sample will be installed securely to the timber door/ panel set up in laboratory. The assembly of the timber door/ panel set up will be similar to the recommended installation details indicated in the shop drawing;
   ii. The door/ panel will be closed such that the seal will be in fully dropped position and seal up the gap at bottom of the door/ panel. Photos of the test sample will be taken at both closed and opened positions of the door/ panel for record;
   iii. Hydraulic jack / motor / pressure cylinder will be used to open and close the door with an opening angle of around 10 degrees to activate the mechanism of drop seal such that the seal will be lifted up when the door is opened and in fully dropped position when the door is closed. Each test cycle will be completed in 2 to 3 seconds;
   iv. After completion of the first 50,000 test cycles in step (iii), the test sample will be examined for any distortion or breakage, and any abnormality of the dropping / lifting of the seal and any wear and tear of the seal observed will be recorded;
   v. Step (iii) and (iv) will be repeated to a total of 500,000 test cycles;
   vi. In case the mechanical operation of the drop seal fails during the test (i.e. the seal either cannot drop when the button / block is pushed or cannot be lifted up when the button / block is released), the test will be suspended and the failure condition will be recorded.

r. When the wooden doorsets are supplied for domestic blocks, standard of visual quality of doorsets shall be comparable with the benchmark samples maintained by the Housing Department.

3. On Site Delivery Verification:
   a. At delivery stage, submit to the CM the followings:
      i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a);
      ii. Original or certified true copy of the Certificate of Origin for every batch of delivery. A batch being the accumulative total of 1500 doorsets or part thereof delivered to Site;
      iii. Delivery notes for all material delivered to Site;
      iv. Documents specified in sub-clause (5)(c), (d) and (e) of COM5.M005.
   b. Carry out X-ray scanning test as follows:
      i. In an Approved laboratory within two weeks from the delivery day of every batch of doorsets on Site to prove that the doorsets delivered is free from live insects and larvae infestation;
ii. Select two specimens in one sample of doorsets from each batch of delivery for the test;

iii. Testing method in sequence shown below:
- Apply X-ray scanning to the whole door leaf;
- Select 10 spots from the X-ray scanning films;
- Remove the facing on one side of the door leaf for general inspection;
- Study in detail on the 10 selected spots including microscopic inspection (multiplication X20);
- Record the findings of the 10 selected spots including photographs of the whole leaf and individual selected spots.

iv. Remove the whole batch of doorsets off Site if the test results fail to meet the requirement stated in (b)(i).

c. Verify the average density of solid core timber doorsets as follows:
   i. Measure the density of 6 nos. of timber samples from one door leave and take average;
   ii. Measure the density of 3 nos. of timber samples from one set of door frame and take average;
   iii. Where the results fail to meet the requirement stated in COM5.M025, COM5.M030 and COM5.M035, either:
      - Remove the representative batch of timber doorsets off Site; or
      - When agreed by the CM, repeat verification in (c)(i) and (c)(ii) for three separate door leaves and door frames selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

d. Carry out and submit report on the following verifications for wooden doorsets upon delivery on Site. Prior to carrying out the verifications, inform CM's representatives who may present to witness the verifications:
   i. Method:

<table>

- When any of the verifications fail to meet the acceptance standards, either:
  - i. Remove the representative batch off Site; or
  - ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

**COM5.M050.7 DOORSET TYPE (PAINT FINISH)**
Doorset to comprise of the followings:
1. Solid core or skeleton flush door leaves with paint finish complete with ironmongeries and hinged to door frame;
2. Hardwood door frame with paint finish;
3. Hardwood or softwood architraves with paint finish;
4. Glazing beads with paint finish, fixing screws for glazing beads; and
5. Plastic pellets.

**COM5.M060.7 DOORSET TYPE (TIMBER VENEER FINISH)**
Doors to comprise of the followings:
1. Solid core or skeleton flush door in timber veneer faced plywood finish sprayed with semi-gloss clear water based polyurethane paint or clear water based lacquer paint complete with ironmongeries and hinged to door frame;
2. Hardwood door frame to comprise a frame sprayed with semi-gloss clear water based polyurethane paint or clear water based lacquer paint;
3. Glazing beads sprayed with semi-gloss clear water based polyurethane paint or clear water based lacquer paint, fixing screws for glazing beads and matching wooden fillet.

**COM5.M070.7 IDENTIFICATION**
Supply with a unique serial number marked in an inconspicuous position on each doorset and its detached parts. Identify and record the date of manufacture.

**COM5.M080.7 INTUMESCENT STRIP**
1. Proprietary intumescent strip and fire mastic used in fire rated doorsets shall comply with the requirement of BS 476:Part 22:1987 or BS EN 1634:Part 2:2008;
2. For intumescent strip made of hygroscopic materials, the ends and the cut edges of the intumescent strip shall be properly protected and sealed with fire mastic to prevent deterioration through the absorption of atmospheric moisture;
3. Where the intumescent strip has to be used with a bedding liner made of hygroscopic materials underneath the glazing bead around the glazing panel, suitable means such as a continuous bead of sealant to prevent the bedding liner from deterioration through the absorption of atmospheric moisture shall be provided;
4. The use of intumescent strip and any details such as application of fire mastic or sealants shall be covered under a valid fire test report or the assessment report.

**COM5.M090.7 SMOKE SEAL**
1. Doors with smoke seal should be tested at ambient temperature and medium temperature and demonstrated to comply with the smoke leakage rate criteria in accordance with BS EN 1634:Part 3:2004;
2. The use of smoke seal in a door and any related application details shall be covered under a valid smoke test report or the assessment report of the door;
3. Mechanical "drop-type" smoke seal shall effectively seal up the gap at bottom of the door;

4. Certified as tested 500,000 cycles for mechanical drop seal used at bottom of doors with test procedures as per sub-clause 2(q) of COM5.M040.

DIMENSIONAL ACCURACY

COM5.M210.7 DOORSETS, DOOR LEAVES AND FRAMES GENERALLY
Comply with BS 4787:Part 1:1980 unless otherwise specified in Appendix H "Schedule of Tolerances" to this Specification.

PREFORMING AND DRILLING

COM5.M310.7 DOORSETS
Preformed with:
1. Holes or recesses to receive ironmongery as scheduled with the exception of overhead door closers and door stops and pre-drill screw fixing holes:
   a. For the purpose of fixing the door frames on to the sub-frames/linings or drywall partitions;
   b. On the door frames at 150 mm above finished floor level and at maximum 450 mm centres;
   c. Ensuring position of the ironmongery does not obstruct the predrilled fixing holes.
2. A cavity, where necessary, for the installation of wiring for the electrical locksets.

COM5.M320.7 EXPANDING ANCHOR FOR FIXING DOOR TO CONCRETE
1. Not less than 10 mm diameter proprietary expanding anchor, consisting of zinc electro-plated steel screw and zinc electro-plated steel sleeve. The anchor and sleeve shall be from the same manufacturer and packaged and supplied as a complete unit;
2. Minimum 30mm effective anchorage depth in concrete. Application and fixing shall be in strict compliance with the manufacturer’s recommendations.

COM5.M330.7 EXPANDING ANCHOR FOR FIXING DOOR TO PANEL WALL
1. Not less than 10 mm diameter proprietary expanding anchor, consisting of zinc electro-plated steel screw and polyamide sleeve. The anchor and sleeve shall be from the same manufacturer and packaged and supplied as a complete unit;
2. Minimum 50mm effective anchorage depth in panel wall. Application and fixing shall be in strict compliance with the manufacturer’s recommendations.

DOORSET FINISHES

COM5.M410.7 SURFACE FINISH
Ensure all timber doorsets, including top panels where applicable, frames and their parts are supplied in the following condition:
1. Door leaf surfaces: flat, true, smooth and jointless with no visible defects;
2. Inside of bathroom door leaf surfaces: finished with 1.0 mm plastic laminate;
3. Paint and decorative materials shall be as specified in FIN7 and generally in compliance with FIN7.M010:
   a. For doorsets with paint finish:
      i. Primed, undercoated and sprayed with wood paint of good adhesion and good resistance to fading (except sub-clause (2) above) as per FIN7.M585;
ii. With backs of hardwood door frames treated with two coats of wood preservative as per FIN7.M140.

b. For doorsets with timber veneer finish:
   i. Sprayed with semi-gloss clear water based polyurethane paint or clear water based lacquer paint (except sub-clause (2) above) as per FIN7.M585;
   ii. With backs of hardwood door frames and veneer faced plywood treated with two coats of wood preservative as per FIN7.M140.

COM5.M420.7 PLYWOOD FOR DOOR FACINGS
1. To BS 6566, Grade 2 veneer, 5 mm thick;
2. Plywood facings to be close grained and filled.

COM5.M430.7 LAMINATED PLASTIC SHEET FOR BATHROOM DOOR FACINGS
To BS EN 438:Part 1 & 2:1991:
1. Class: VG (Vertical - General Purpose);
2. Colour/sheen: matt texture with colour to Approval;
3. Thickness: 1.0 mm;
4. Submit samples for Approval.

IRONMONGERY AND ANCILLARY MATERIALS

COM5.M510.7 IRONMONGERY
Doorsets to be supplied with the following items of ironmongery:
1. Ironmongery supplied fitted:
   a. ‘Magic Eye’ where scheduled:
   b. Hinges;
   c. Kicker plates where scheduled;
   d. Others as shown on the Drawings or scheduled.
2. Ironmongery supplied loose:
   a. Door closer where scheduled;
   b. Locks and latches where scheduled;
   c. Push plates and pull handles where scheduled.

COM5.M520.7 WOOD SCREWS
Use for fixing solid core top panels where applicable, glazing beads and architraves.
WORKMANSHIP

GENERALLY

COM5.W010.7 FRAME ASSEMBLY
1. For doorsets with paint finish:
   a. Construct door frames and door leaf framing with tight fitting joints ensuring framework is square after assembly.
2. For doorsets with timber veneer finish:
   a. Construct door frames, door leaf framing and patterns on veneer faced plywood with tight fitting joints ensuring framework is square after assembly.

COM5.W020.7 HEAD FIXING
Mid-span fix at the head.

COM5.W030.7 PELLETING
Plug pre-drilled fixing holes with nylon pellets.

COM5.W040.7 SPLAY EDGES
Provide splay edges to the lipping to enhance the operation of door leaves.

COM5.W050.7 JOINTS
1. For doorsets with paint finish:
   a. Provide 'V' joints at mitre joints of frames and of glazing beads, and at 'T' joint for transoms and frames to control the possible cracks of the paint finishes.
2. For doorsets with timber veneer finish:
   a. Provide 'V' joints at mitre joints of frames and of glazing beads, and at 'T' joint for transoms and frames. Provide the joints of the veneered faced plywood as shown in the standard drawings.

COM5.W060.7 SPREAD OF ADHESIVE
1. For doorsets with paint finish
   Provide sufficient and even spread of adhesive for gluing the plywood faces. This is indicated by a consistent bead of adhesive squeeze from the timber to plywood joint all around the perimeter of door leaves.
2. For doorsets with timber veneer finish
   Provide sufficient and even spread of adhesive for gluing the veneer and plywood faces. This is indicated by a consistent bead of adhesive squeeze from the plywood to veneer and from timber to plywood joint all around the perimeter of door leaves.

FIXING SEQUENCE

COM5.W110.7 INSTALLATION
Fix doorsets in formed openings in accordance with the manufacturer's recommendations and in the following sequence:
1. Install sub-frames/linings for fixing of door frames. Provide 5 mm thick plywood packs at every fixing position of door frame/sides panels. Provide means of attaching the door frames to sub-frames/linings or to panel partitions;
2. Fix door frames after the completion of all wet trade in the adjacent areas. Apply low modulus silicone sealant at joints between panel partitions/sub-frames and back of door frames;
3. Install ironmongery to the predrilled holes or recesses on the doorsets;
4. Ease and oil knobsets and other ironmongery;
5. Install vision panels, overpanels and side panels as specified in Worksection COM4.
TESTING

SURVEILLANCE TESTS FOR WOODEN DOORSETS

COM5.T1605.7 SURVEILLANCE TESTS

1. Test Arrangements:
   a. When Instructed, surveillance tests shall be carried out by CM's Representative, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the followings pertaining to surveillance tests:
      i. Provide attendance on the Site;
      ii. Provide, deliver and collect samples etc. as directed by CM or as specified.

2. Testing Samples:
   a. Provide one set of test samples from the batch of material delivered to Site (inclusive of door leaves, frames, ironmongery and other accessories sufficient for assembling the doorsets) under the delivery note as specified in COM5.M040 (3)(a) or as instructed by CM;
   b. One set of test samples shall consist of two doorset specimens. Samples shall be the complete component as to be installed, including glazing, all fixed parts, leaf, fastenings and fixings necessary to ensure normal operation. Bear all cost for any replacement of samples.

3. Testing methods:
   a. For Fire Resistance Test, as per COM5.M040 (2)(b)(i) or (2)(c)(i) as appropriate;
   b. For Smoke Control Test, as per COM5.M090 (1);
   c. For Functional Dimensions / Strength Test, as per COM5.M040 (2)(d).

4. Non-compliance:
   a. In the event that any of the test samples fail to meet the testing requirements, follow either one of the following actions:
      i. Remove the representative batch off Site; or
      ii. For Fire Resistance Test or Smoke Control Test, carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 on one separate set of samples selected by the CM from the representative batch. For Functional Dimensions / Strength Test, carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 on three separate sets of samples selected by the CM from the representative batch. In case of any one sample fails the re-test, remove the representative batch off Site.
   b. When the representative batch of doorsets is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 for one set of samples selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clauses (4)(a);
   c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.

COM5.T1610.7 SURVEILLANCE TESTS FOR MECHANICAL SMOKE SEAL

1. Testing Arrangements:
a. When instructed, surveillance tests shall be carried out by CM’s Representative, a Direct Testing Contractor or the Housing Department Material Testing Laboratory;

b. Comply with the following pertaining to surveillance tests:
   i. Provide attendance on the Site;
   ii. Provide, deliver and collect samples etc. as directed by CM or as specified;
   iii. Set up the timber door/panel and install the test sample as directed by CM or as specified.

2. Testing Samples:
   a. Provide one set of test sample from the material delivered to Site as instructed by CM;
   b. One set of test sample shall consist of one smoke seal and the associated accessories, fastenings and fixings necessary to ensure normal operation or as instructed by CM.

3. Testing methods:
   As per sub-clause 2(q) of COM5.M040.

4. Non-compliance:
   a. In the event that the testing samples fail to meet the testing requirements, follow either one of the following actions:
      i. Remove the representative batch of mechanical smoke seal off Site; or
      ii. Carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 on three separate samples selected by the CM from the representative batch. In case of any one sample fails the re-test, remove the representative batch of mechanical smoke seal off Site.
   b. When the representative batch of mechanical smoke seal is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 for one sample selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clauses (4)(a);
   c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.

**DESIGN PARAMETERS**

**COM6.D110.7 WIND LOADING FOR EXTERNAL STEEL DOORS**
When fixed in position and glazed, steel doors must withstand:

1. A wind load calculated in accordance with the current Code of Practice on Wind Effects, Hong Kong; and
2. The resultant resistance to wind loading of a minimum of
   a. 3.0 kPa for non-domestic buildings such as schools, commercial centres etc.;
   b. 3.8 kPa for domestic buildings excluding ground floor or podium.
MATERIALS

STEEL MEMBERS AND FINISHES

COM6.M010.7 SECTIONS
Universal steel sections, hot rolled, cold straightened and:
1. Size: as shown on the Drawings;
2. Free from rolling defects;
3. With all manufacturer's fabrication holes sealed by welding prior to delivery to site.

COM6.M020.7 FRAMES
Must be:
1. Square and flat with mitred, welded corners;
2. With glazing bars machine tenoned and/or welded to frames;
3. With weatherbars for the complete width of the steel doors as shown on the Drawings.

COM6.M030.7 FINISH
1. All steel doors after fabrication must be hot dip galvanized as MET1.W330.
2. Any cutting, drilling or welding after galvanizing must be treated with an anti-rust paint on completion.

FIXINGS, FASTENING ETC

COM6.M110.7 SEALANT
As WAT5.M310.

COM6.M130.7 IRONMONGERY
Pull handle, striking plates, hinges, surface bolt, hasp and staple, padlock etc. as shown on the Drawings.
WORKMANSHIP

FABRICATION AND ASSEMBLY

COM6.W010.7 STEEL DOORS
Hang to open and fit with ironmongery as indicated on the Drawings.

COM6.W020.7 POSITIONING
Position steel doors plumb, level and square.

COM6.W030.7 EQUIPOTENTIAL BONDING TO STEEL DOORS AND LOUVRES
Unless otherwise specified on Drawings, provide equipotential bonding connection for steel doors and louvers as follows:
1. Louvres in public access areas:
   a. Provide a 20 mm x 1.5 mm thick steel plates earthing lug electroplated zinc galvanized to BS 1706:1990, class B and 13 μm to the outer frame of windows and louvres. The cut edges of earthing lug shall be painted with zinc phosphate primer;
   b. Fix one end of the earthing lug to the louvres with 2 No. M4 self-tapping stainless steel screws at 60 mm centres;
   c. Provide a 5 mm diameter hole at the other end for connection of the bonding conductor by the Nominated Sub-contractor for Electrical Installation;
   d. Ensure that full electrical continuity is maintained between all the component elements of louvres.
2. Doors and louvres for services rooms:
   a. Weld one end of 1.5 mm thick galvanised mild steel earthing lug(s) to the doors and louvres; and
   b. Form a 5 mm diameter hole at the other end of the earthing lug(s) for connection of the bonding conductor by the Nominated Sub-contractor for Electrical Installation;
   c. Ensure that full electrical continuity is maintained between all the component elements of the steel doors and louvres.
3. As COM2.W465 (6).

COM6.W040.7 BEDDING MORTAR
Bed steel frames in waterproof mortar as MAS3.W180 leaving no gaps.

COM6.W050.7 POINTING TO PERIMETER OF STEEL DOORS
Where specified, point around external perimeter of steel door frames. Point in accordance with the Workmanship requirements of Worksection WAT5.

COM6.W060.7 PAINTING
Deliver steel doors to site unprimed and paint surfaces in accordance with Worksection FIN7.

TRANSPORTATION, HANDLING AND STORAGE

COM6.W110.7 STEEL DOORS
Keep upright during handling to prohibit sagging, stack off ground on levelled hard standing under cover, clear of mud and site traffic and avoid:
1. Distortion during handling and storage;
2. Distortion during vertical transportation to floors at high level.

**TOLERANCES**

**COM6.W210.7**  
**GENERAL**  
Refer to Appendix H "Schedule of Tolerances" to this Specification.
COM7 GATESETS

GENERAL

APPLICATION OF SPECIFICATION

COM7.G010.7 GATESETS
The gatesets specified in this Worksection are for use in domestic flats design and comprise the following:
1. Galvanized mild steel sliding type;
2. Galvanized mild steel swing type.
DESIGN

GENERAL

COM7.D010.7 DESIGN RESPONSIBILITY
Design and manufacture the gatesets in accordance with the requirements of this Worksection.

PERFORMANCE CRITERIA

COM7.D110.7 CONSTRUCTION
Manufacture gatesets from the following materials:
1. Mild steel sections:
   a. Chemical composition and mechanical properties: to BS 4360:1986 Grade 43A;
   b. Section size and thickness: as shown on Drawings;
   c. Zinc electroplated component parts, except rolled sections, to BS 1706:1990 Class A 0.025 mm thick.
2. Rolled sections formed from metal sheets:
   a. 1 mm, 1.2 mm and 1.4 mm thick slit coils to grade Z27 of JIS G3302-1994 or coating designation Z275 of BS EN 10346:2009;
   b. Electrically galvanized except parts made of plastic, nylon or brass.

COM7.D120.7 CONSTRUCTION (STAINLESS STEEL PARTS)
1. Stainless steel parts: to BS EN 10095:1995:
   a. Section size and thickness: as shown on Drawings;
   b. Grade: Grade 304 in accordance with MET1.M060;
   c. Finish: as shown on Drawings.

COM7.D130.7 GATESET ASSEMBLY
1. Construct component parts for assembly without welding unless otherwise approved by CM or as indicated on Drawings;
2. All welding points are to be polished, free of rusting and pre-treated as appropriate before application of the electrostatic powder coating;
3. Assembled gatesets must be capable of receiving Approved steel rollers and ironmongery as specified in Worksection IRO1;
4. Carry out quality tests in accordance with the requirements of this Worksection when gateset are re-designed on project basis, as required by the CM.

COM7.D140.7 GATESET OPERATION
Ensure the operation of gateset is in a smooth and quiet manner.

COM7.D150.7 GATESET FINISH
Electrostatic powder coating of epoxy and polyester resin mix with hammer or plain finish applied by electrostatic spray by either manual or automatic methods. Apply finish in accordance with the finish manufacturer's recommended method of operation. Finish and application must meet the following requirements:
1. Performance properties:
   a. Nominal thickness: 70 microns - 150 microns;
b. Cross-cut test (BS EN ISO 2409: 2007): Classification = 1;
c. Salt spray (ASTM B117): - no discernible change after 1000 hours of test.

2. Colour and finish of the electrostatic powder coating to be submitted to CM for approval;

3. Pretreatment: pretreat metal surfaces with phosphate treatment or other alternative pretreatment process to CM’s approval prior to application of powder coating;

4. Extent: treat and finish all exposed steel and galvanized steel surfaces, including portions of the component parts forming moveable joints, pre-drilled screw holes, hinges, handles and welds as specified in Worksection MET1.

SUBMISSION

COM7.D210.7  SHOP DRAWINGS
Submit shop drawings for CM's approval, prior to the commencement of ordering of material. Drawings for each type of gateset must include:

1. Fixing details of metal gate to walls and floors;
2. The positions of anchor bolts;
3. Details of roller (with brand name if applicable), completed with lubricated bearings, threaded hangers and connection bars all in Approved steel together with materials specification;
4. Welding details of components and parts;
5. Details and sections to show sizes, profiles and fixings of assembling and concealed parts;
6. Fixing details of equipotential bonding connection for the gateset;
7. The proposed Radio Frequency Identification tag and the fixing method as specified in the Worksection COM11.

MOCK UP

COM7.D310.7  MOCK UP
Provide full scale mock up for different types of gatesets at flat entrance of sample flats as instructed by CM and obtain Approval prior to proceeding with the installation work.
MATERIALS

GALVANISED MILD STEEL GATESETS

COM7.M010.7 GALVANIZED MILD STEEL GATESETS

1. Submission Requirements:
   a. At sample submission and approval stage, submit one sample of the gateset and one sample board showing complete fittings and accessories including typical section of members, track and guide rail, Approved steel roller, steel anchor bolts and lock for CM’s approval together with all the following substantiation for CM’s information:
      i. Job reference;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. Original or a certified true copy each of the certification to ISO 9001 and ISO 14001 for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by the certification bodies or by the QCM. The certification bodies shall be as follows:

<table>
<thead>
<tr>
<th>ISO</th>
<th>Certification Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISO 9001</td>
<td>The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
<tr>
<td>ISO 14001</td>
<td>The certification body shall be accredited by the Hong Kong Accreditation Service (HKAS), or the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
</tbody>
</table>

   b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clauses (2)(d) to (2)(g) for CM’s information:
      i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works or at an earlier date for domestic blocks subject to CM’s consideration on the track records as maintained by the Housing Department;
      ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);
      iii. In the event that no test report has been submitted for CM’s information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:
   a. Satisfy the requirements of the following tests. Record the test results as specified in sub-clause (2)(b) and follow the sequence for carrying out the test as sub-clause (2)(c).
<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>Operation Test</td>
<td>Refer sub-clause (2)(d)</td>
<td>Movement of gateset must be smooth and quiet; opening force ( \leq 35 ) N.</td>
</tr>
<tr>
<td>Slamming Closed Test</td>
<td>Refer sub-clause (2)(e)</td>
<td>No damage, deformation or loosening of fixings or joints which would render it unfit for its purpose. No dislodgement or dangerous shattering of any component parts. After the test, the gateset must still meet the requirement of the Operation Test.</td>
</tr>
<tr>
<td>Slamming Open Test</td>
<td>Refer sub-clause (2)(f) (swing type only)</td>
<td>No visually unacceptable damage, deformation and functional defects at impact energy = 80 Nm, and gateset must remain fit for use. After the test, gateset must still meet the requirement of the Operation Test. No breakage or functional defects must be found at impact energy = 240 Nm.</td>
</tr>
<tr>
<td>Heavy Body Impact Test</td>
<td>Refer sub-clauses (2)(g) &amp; (2)(h)</td>
<td>No visually unacceptable damage, deformation and functional defects at impact energy = 80 Nm, and gateset must remain fit for use. After the test, gateset must still meet the requirement of the Operation Test. No breakage or functional defects must be found at impact energy = 240 Nm.</td>
</tr>
<tr>
<td>Resistance to torsion</td>
<td>Refer sub-clause (2)(i) (swing type only)</td>
<td>Not applicable No damage, deformation or loosening of fixings or joints which would render it unfit for its purpose. No dislodgement or dangerous shattering of any component parts. No functional defects. The residual deformation must not exceed 1 mm. After the test, the gateset must still meet the requirement of the Operation Test.</td>
</tr>
<tr>
<td>Strength in the plane of the gate leaf</td>
<td>Refer sub-clause (2)(j) (swing type only)</td>
<td>Not applicable Movement of gateset must be smooth and quiet; opening force ( \leq 35 ) N but the residual deformation must not exceed 1 mm.</td>
</tr>
</tbody>
</table>
| Resistance to closing against obstruction | Refer sub-clause (2)(k) (swing type only) | Not applicable No damage, deformation or loosening of fixings or joints which would
Resistance to jarring and vibration | Refer sub-clause (2)(l) (swing type only) | Not applicable | render it unfit for its purpose. No dislodgement or dangerous shattering of any component parts. After the test, the gateset must still meet the requirement of the Operation Test.

Endurance Performance Test | Refer sub-clause (2)(m) | No damage, deformation, functional defects or serious wear and tear to gateset must be found.

Test on security by personnel loading | Refer sub-clause (2)(n) (swing type only) | Not applicable | Deflection ≤ 1.5 mm, maximum deformation ≤ 1 mm. No damage, breakage or function defects must be found. After the test, the gateset must still meet requirement of the Operation Test.

b. Record the following information in test reports:
   i. A detailed description and specification of the product with any necessary drawings and photographs, sufficient completely to identify the product and its fittings;
   ii. Description of each test undertaken and the performance of the gateset relative to the acceptance standards;
   iii. Numerical test results expressed in the units prescribed for the appropriate test and supported by any other specified criteria, e.g. "no damage occurred" etc. A graph of performance against increasing stress will be included where appropriate, as will diagrams or photographs of points of failure;
   iv. Details of atmospheric conditions, prior to and during testing, where appropriate.

c. Carry out tests on two brand new samples for sliding type gateset and two brand new samples for swing type gateset:
   i. First sample (Sample A) for the tests in the following order:
      - Operation Test as in sub-clause (2)(d);
      - Slamming Closed Test as in sub-clause (2)(e);
      - Slamming Open Test as in sub-clause (2)(f);
      - Heavy Body Impact Test as in sub-clauses (2)(g) & (2)(h);
      - Resistance to torsion as in sub-clause (2)(i);
      - Strength in the plane of the gateset leaf as in sub-clause (2)(j);
      - Resistance to closing against obstruction as in sub-clause (2)(k); and
      - Resistance to jarring and vibration as in sub-clause (2)(l).
   ii. Second sample (Sample B) for the tests in the following order:
      - Endurance Performance Test as in sub-clause (2)(m); and
      - Security by personnel loading as in sub-clause (2)(n).

d. Operation Test:
   i. Install the gateset with frame secured in a vertical position, according to actual construction details, in the laboratory;
   ii. The gateset will be operated manually several times to ensure that it moves freely;
iii. The gateset will be tested in the state of lubrication in which it is supplied;

iv. For sliding type gateset, the force, acting at the position of the handle horizontally and in the direction of the travel of the gateset, required to open the gateset by 600 mm ± 30 mm from just open position (i.e. the side frame positioned 3 mm from the fixed frame) will be recorded to the nearest 0.5 N;

v. For swing type gateset, the force action at the position of the handle horizontally and in the direction of the travel of the gateset, required to open the gateset 60° ± 1° from just open position (i.e. the gate leaf positioned 10 mm from the fixed frame) will be recorded to the nearest 0.5 N.

e. Slamming Closed Test:
   i. Secure the gateset and prepare the test as sub-clause (2)(d);
   ii. For sliding type gateset, the gateset will be slammed closed from fully open position 20 times by a force of 15 kg ± 50 g action at the mid-height of the gate handle horizontally and in the direction of the travel of the gateset;
   iii. For swing type gateset, conduct the test as follows:
      - A light strong line will be arranged such that by it the gate leaf may be closed from 60 ± 1 degrees open by the descent of a weight of mass 15 kg ± 50 g. The line will be attached at some point within 150 mm of the lockside edge at the level of mid-height of the gate handle;
      - The line is to pass horizontally from the gate leaf and then over a horizontal bar of smooth steel arranged with its axis parallel to the plane of the gate frame. The bar is to be of 25 ± 1 mm diameter, be 400 ± 5 mm from the gate leaf face when the gate leaf is closed and span the width of the swing gateset. The line is to descend vertically from the bar and carry the weight strikes a platform removing further tension from the line;
      - The swing gate leaf will be opened to 60 ± 1 degrees and released. The gate leaf will be slammed shut by the action of the falling weight for 20 times.

f. Slamming Open Test:
   i. Secure the gateset and prepare the test as sub-clause (2)(d);
   ii. With the gate leaf fully opened, the gate leaf will be moved towards the closed position through an angle of 30 ± 1 degrees and allowed to open freely under the influence of a weight of mass 4 kg ± 5 g applied to a point 50 ± 1 mm form the lockside edge at level of mid-height of the gate handle and at right angles to the plane of the fully open door;
   iii. The gate leaf will be slammed open 10 times at a rate not exceeding 15 times per minutes against a floor mounted gate stop fixed at the 90 ± 1 degrees open position.

g. Heavy Body Impact Test for sliding type gateset:
   i. Secure the gateset and prepare the test as sub-clause (2)(d). The gate will be closed and locked;
   ii. The gateset will be struck by a spheroconical bag to BS EN 596:1995 Clause 6. The sand bag will strike the gateset normally with an impact energy of 80 Nm for three times at the following locations:
      - At the level of the handle and at the mid-width of the gateset;
      - At the centre of the upper infill grille panel;
      - At the centre of the lower infill grille panel.
   iii. The gateset will be examined for:
- Any visually unacceptable damage, checking that the gateset can still operate in the normal manner. Repeat the test in sub-clause (2)(d);
- Any breakage.

iv. Repeat sub-clause (2)(g)(ii) but with an impact energy of 240 Nm once for the location at the level of the handle and at the mid-width of the gateset;
v. The gateset will be examined for any breakage.

h. Heavy Body Impact Test for swing type gateset:
i. A spheroconeical bag to BS EN 596 Clause 6.2 will be hung as a pendulum capable of striking the gate leaf. The bag will be placed so that at rest it just contacts the surface of the gate leaf with its center of gravity at the level of the gate handle, such that when swung in a vertical plane normal to the gate leaf it will impact the gate leaf. The impact will be at mid-width of the gate leaf;

ii. Mount the gateset vertically and install in accordance with the manufacturer's recommendations. The gate leaf will be closed and locked;

iii. The test body will be swung against the gate leaf three times. This will be done to the closing face. The impact energy will be 80 Nm each time;

iv. The gateset will be examined for any breakage and/or any visually unacceptable damage; checking that the swing gateset can still operate in the normal manner. Test No. 2.6 will be repeated. Maximum deformation will be measured;
v. The test will be repeated with impact energy of 240 Nm once. Any breakage will be examined.

i. Resistance to torsion:

ii. A force of 400 ± 3 N will then be applied in increments not exceeding 100 N, the force acting at right angles to the gate leaf. The deflection will be measured after the gate leaf has stabilized at each increment, the movement of the dial gauge being less than 0.02 mm per minute. After recording the deflection under maximum force the reverse procedure will be adopted to remove the load, the final residual deflection being recorded at least 1 hour after all force has been removed.

j. Test on strength in the plane of the gateset leaf:
i. Same test specimen for sub-clause (2)(i), resistance to torsion will be used;

ii. This test will follow the resistance to torsion test. The swing type gateset will remain in the rig in the position as previously described in sub-clause (2)(i) (clamp at the top lockside corner must not restrict the gate leaf to move along its plane). The force, acting vertically downwards in plane of the gate leaf, is to be applied at mid-height of the gate leaf near the handle. The point of measurement will be on the center line of the underside of the gate leaf and 10 ± 1 mm from the bottom lockside corner;
iii. The initial and final readings of the dial gauge will be taken when the downward force of 50 ± 3 N is applied to the gate leaf (including the weight of the rope). The downward vertical force will then be increased to 1000 ± 5 N at increments of 50 N;

iv. The final force will be maintained for 5 minutes when the maximum deformation is recorded. The reverse procedure will be adopted and the residual deformation will be measured one hour after the downward force has been decreased to 50 ± 3 N.

k. Test on resistance to closing against an obstruction:
   i. Mount the swing type gateset vertically in a rigid rig, installed by the method recommended by the gateset manufacturer. A dry hardwood slip, 50 mm x 10 mm and of mass between 15 g and 20 g is required for the test;
   ii. The gateset will be opened and the hardwood slip placed in the gap between the gate leaf and the bottom of the hinge side jamb of the frame so as to hold the gate leaf ajar;
   iii. The slip will be inserted from the closing face with its grain horizontal and its plane vertical and parallel to the plane of the gateset frame. A force will be applied increasing in 50 N increments to the lockside edge at mid-height of the gate handle until it reaches 200 ± 3 N. The force will act at right angles to the plane of the frame.

l. Test on resistance to jarring and vibration:
   i. Mount the swing type gateset vertically in a rigid rig and install in accordance with the manufacturer's recommendations. A spheroconical bag to BS EN 596 Clause 6.2 will be hung from an independent support at about the same height as the top of the gate leaf as a pendulum capable of striking the closing face of the gate leaf. The bag will be hung so that at rest with the gateset open at 45 ± 1 degrees it just contacts the surface of the gate leaf with its center of gravity at mid-leaf width and at level of the mid-height of the gate handle;
   ii. The gate leaf will be opened from the closed position through an angle of 45 ± 1 degrees. Provide a floor mounted gate stop at the 90 ± 1 degrees open position;
   iii. The sand bag will be drawn away from the gate leaf in a vertical plane normal to the gate frame through an arc of 250 ± 5 mm vertical height then released to strike the gate leaf. This will be repeated 99 times.

m. Endurance Performance Test:
   i. Ensure that the gateset is installed and secured as sub-clause (2)(d);
   ii. The gateset will be operated manually to ensure that it moves freely. The sample will be tested in the state of lubrication in which it is supplied;
   iii. The test is performed as sub-clause (2)(d);
   iv. Either the inside or outside gate handle will be connected to a mechanical system capable of producing a uniform back and forth movement of the gateset;
   v. The gateset will then be moved backwards and forwards over a distance equal to at least 90% of the full travel distance of the gate leaf, from the closed position, for 60,000 operations at such a speed as will ensure free impact with the frame at each operation;
   vi. The specimen will be checked for damage and examined for, and a record made of, the wear and tear condition after 5,000, 10,000 and 20,000 operations and thereafter every 20,000 operations;
   vii. The test as sub-clause (2)(d) will then be repeated.

n. Test on security by personnel loading:
i. After performing sub-clause (2)(k), the swing gateset will be subject to an outward load of 50 ± 3 N normal to the opening face of gate leaf at mid-point of the highest 30 x 10 mm box section of the bottom panel of grills. Width of load will be 100 ± 5 mm. The gateset will be closed and locked when performing the test;

ii. The initial measurement will be taken at positions normal to the plane of the gate leaf at bottom lockside corner of the gateset (10 mm from both edges) and under the load;

iii. The load will be taken to 700 ± 5 N, and the maximum deflection measured at these positions 15 minutes after the load is applied;

iv. The load will be decreased to 50 ± 3 N, and the deformation recorded at these positions one hour later;

v. The load will be removed and the gateset examined for any visually unacceptable damage, breakage and functional defects;

vi. The test as sub-clause (2)(d) will then be repeated.

o. Standard of quality of gatesets shall be comparable with the benchmark samples maintained by the Housing Department.

3. On Site Delivery Verification:

a. At delivery stage, submit to the CM the following documents:

i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under the sub-clause (1)(a);

ii. Original or certified true copy of Certificate of Origin for every batch of delivery. A batch being the accumulative total of 500 metal gatesets or part thereof delivered to Site;

iii. Delivery notes for all material delivered to Site.

b. Carry out and submit report on the following verifications for gatesets upon delivery on Site. Prior to carrying out the verifications, inform CM's representatives who may present to witness the verifications:

i. Method:

<table>

</tr>
</tbody>
</table>

c. Where any of the verifications fail to meet the acceptance standards, either:

i. Remove the representative batch off Site; or
ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

COM7.M020.7  SAMPLES
Keep the Approved sample and sample board available for inspection on Site until completion of the installation work of all the gate sets.

COM7.M030.7  DIMENSIONAL ACCURACY
1. See Appendix H of this Specification for permissible tolerances;
2. Maximum gap size to be generally 0.5 mm between connecting parts;
3. Critical dimensions to be maintained as shown on the Drawings,
WORKMANSHIP

INSTALLATION OF GATESETS

COM7.W005.7 SAMPLES AND SHOP DRAWING APPROVAL
Do not commence fabrication until all samples and shop drawings have been Approved and all shop drawings have been checked on Site to suit all flat entrance sizes and conditions (with or without wall recess) for each flat.

COM7.W010.7 CLEANING AND PROTECTION
1. After installation, clean gatesets to remove any surface dirt, grime, oily substances etc;
2. Protect the installed components to prevent damage from subsequent works until completion of the works;
3. Enclose in corrugated carton paper and polythene wrapped with moulded polystyrene as transportation protection against damp and scratching. Avoid premature delivery to site;
4. Return to site on completion of the building works and carefully remove wrapping.

COM7.W015.7 EQUIPOTENTIAL BONDING TO GATESETS
1. When the gatesets are installed before the Occupation Permit for the domestic block is issued, comply with the following:
   a. Provide equipotential connection for gateset by the following:
      i. Weld one end of the stainless steel earthing lug to GMS track or jamb for gateset and;
      ii. Form a 5 mm diameter hole at the other end of the earthing lug for connection of bonding conductor by Nominated Sub-contractor for Electrical Installation.
   b. As COM2.W465 (6).
2. When the gatesets are installed after the Occupation Permit for the domestic block is issued, comply with the following:
   a. Provide equipotential connection for gateset by the following:
      i. Weld one end of the stainless steel earthing lug to GMS track or jamb for gateset; and
      ii. Form a 5 mm diameter hole at the other end of the earthing lug for connection of bonding conductor; and
      iii. Connect earthing lug of gateset to earthing terminal of door bell with provided bonding conductor.
   b. Ensure that the bonding for metal gateset is electrical sound and the result complies with the CoP for the Electricity (Wiring) Regulation and BS 7671 by proper measurement with records at good time. Rectify as early as possible those parts of equipotential bonding system that are found to be not electrical conductive.

COM7.W020.7 GATESET ASSEMBLY
1. The horizontal alignment at the top level of Approved steel rollers of the bottom hangers should be levelled (p.d.±1 mm). The size of the rolled top rail including the opening width should be consistent particularly at he position of the open end;
2. The size of the rolled grille bars should be consistent particularly at the gap position and the acceptable gap dimensions at the junction between vertical and horizontal grille bars is 0.5 mm each on both top and bottom faces of the vertical / horizontal grilles;
3. All moulding residues of plastic or nylon part should be neatly trimmed or cut before fixing;
4. Only stainless steel rivets are allowed for fixing and should be closely fixed onto the grille bars to ensure no protrusion;
5. No concavity at the position of punching slots of any surfaces should be ensured;
6. Bulking at stainless steel striking plate is not acceptable;
7. All holes for screw fixing shall be sealed with sealant before installation of screws;
8. All parts and accessories, such as stainless steel thumbturn cover, should be ground to smooth edge.

TOLERANCES

COM7.W110.7 GENERAL
Refer to Appendix H "Schedule of Tolerances" to this Specification taking into account that any tolerance application permissible under this Specification should not in any case jeopardize the installation requirements and design intent of the gateset in accordance with the standard Drawings.
TESTING

SURVEILLANCE TESTS FOR GALVANIZED MILD STEEL GATESETS

COM7.T010.7 SURVEILLANCE TESTS

1. Testing Arrangements:
   a. When Instructed, surveillance tests shall be carried out by CM's Representative, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the followings pertaining to surveillance tests:
      i. Provide attendance on the Site;
      ii. Provide, deliver and collect samples etc. as directed by CM or as specified.

2. Testing Samples:
   a. Provide one set of test sample from the batch of material delivered to Site under the delivery note as specified in COM7.M010 (3)(a) or as instructed by CM;
   b. One set of test sample shall consist of two representative gate set specimens. Sample shall be completed with fittings and accessories as to be installed, including typical section of members, track and guide rail, stainless steel roller, steel anchor bolts and lock to ensure normal operation. Bear all cost for any replacement of samples.

3. Testing methods:
   a. As per COM7.M010 (2)(a);

4. Non-compliance:
   a. In the event that the testing samples fail to meet the testing requirements, follow either one of the following actions:
      i. Remove the representative batch off Site; or
      ii. Carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 on three separate sets of samples selected by the CM from the representative batch. In case of any one sample fails the re-test, remove the representative batch off Site.
   b. When the representative batch of gatesets is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 for one sample selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clause (4)(a);
   c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.
**COM8 ROLLER SHUTTERS AND DOORS**

**DESIGN**

**GENERAL**

**COM8.D010.7 CONTRACTOR'S RESPONSIBILITY**
Take responsibility for the detail design of roller shutters specified in this Worksection and their installation, employing either:
1. The roller shutters manufacturer; or
2. An installation sub-contractor approved by the roller shutter manufacturer.

**COM8.D020.7 GENERAL DESCRIPTION**
Roller shutter comprising horizontal slats interlocking throughout their entire length, forming a continuous hinge and:
1. In accordance with Drawings;
2. Shutter type: open grille or solid slate or insulated as specified on the Drawings;
3. Basic material: hot dip zinc coated steel, aluminium, stainless steel, plastic or other materials as specified on the Drawings;
5. Finishes: hot dip zinc coated or anodised or powder coated as specified on the Drawings;
6. Features and fittings: as specified on the Drawings;
7. Equipotential bonding: provide earthing lug(s) for equipotential bonding connection of the roller shutter and doors.

**COM8.D030.7 MATERIALS AND WORKMANSHIP**
1. Comply with the relevant provisions of Worksection MET1 in respect of all materials and workmanship;
2. As COM2.W465 (6).

**OPERATING MECHANISM**

**COM8.D040.7 SELF CLOSING SHUTTERS**
Manually operated through an internal self-closing mechanism, opened and shut using lifting handles or a pole and hook and with an adjustable mechanism to control the effort required to raise or lower the door.

**COM8.D050.7 MANUALLY OPERATED SHUTTERS**
Operated by means of an endless chain fitted with a spur or worm reduction gear to prevent the shutter falling or rising without manual operation of the chain.

**COM8.D060.7 ELECTRICALLY OPERATED SHUTTERS**
1. Remote controlled, opened by an electric motor;
2. Comply with the "Code of Practice for Installation of Electrically Operated Sliding Gates, Sliding Glass Doors and Roller Shutters" published by the Electrical and Mechanical Services Department;
3. Design installation complete with:
a. Electric motors;
b. Associated overload protections;
c. Gearing drive mechanism;
d. Gear box;
e. Open and close limit switches;
f. Emergency stop;
g. Any other control devices or mechanisms recommended by the shutter manufacturer.

4. Provide full details of:
   a. Motors;
   b. Gearing;
   c. Drive mechanism;
   d. Control mechanism.

5. Totally enclosed three phase motors are preferred, with accessible motors, driving gears, limit switches and control mechanism for inspection and servicing;

6. An isolating switch provided by others with an adequate power supply, to allow for the isolation of electricity supply during inspection and servicing;

7. Provide auxiliary manually operating gear. Ensure change over is easily effected without climbing up to the gearing drive mechanism to engage or disengage manual operation;

8. Provide an interlock switch to prevent locked roller shutters from operating electrically. Mount the interlock switch on a stationary part of the door (such as guide rails) not on any moving part of the shutters.

CONSTRUCTION

COM8.D110.7 WIND LOAD
Design and construct external shutters, gear and fastenings to withstand a wind load as required in the current Code of Practice on Wind Effects, Hong Kong.

COM8.D120.7 STEEL SLATS
Fit ends of alternate hot dip zinc coated steel slats with a malleable iron end stop riveted on to prevent lateral movement and protect the shutter against wear.

COM8.D130.7 HORIZONTAL BARREL FOR CARRYING SHUTTER CURTAIN
Ensure:
1. Barrel is of sufficient diameter and strength to resist deflection;
2. There are enough counter balance springs to enable the shutter to be balanced correctly in all positions;
3. Barrel is rust proofed steel.

COM8.D140.7 BARREL SUPPORT
Shutter and barrel support to provide sufficient bearing. Provide brackets with appropriate fixings for attaching to the soffit, face or side of opening.

COM8.D150.7 VERTICAL GUIDES
Vertical channel guides to be:
1. Of adequate size and depth as COM8.D110;
2. Provided with appropriate fixings for attaching to the soffit, face, jamb or side openings or base and apex in the case of movable mullions;
3. Manufactured from hot dip zinc coated steel, anodised aluminium, stainless steel or other materials as shown on the Drawings.
COM8.D160.7 **HOODS AND CASINGS**
1. Fully braced and supported to prevent sagging or distortion;
2. With access doors or plates as appropriate to allow routine inspection and servicing;
3. Manufactured from hot dip zinc coated steel, anodised aluminium, stainless steel or other materials as shown on the Drawings.

COM8.D170.7 **LOCKING DEVICE**
Design shutters with a locking device and two malleable iron shoot bolts of an Approved type. Fit shoot bolts to the bottom bar at either end of all shutters to assist holding the shutter under high wind conditions.

COM8.D180.7 **FITTINGS AND FIXINGS**
Ensure screws, bolts and fixing lugs are supplied as necessary for the assembling and fixing of the roller shutters.

COM8.D190.7 **RUST PROOFING**
Ensure all ungalvanized steel is painted with one coat of zinc phosphate primer before despatch to Site.

**FIRE RESISTING DOORS AND SHUTTERS**

COM8.D210.7 **STANDARD**
Comply with the requirements of BS 476:Part 22:1987 for roller shutters for the period of fire resistance specified.

COM8.D220.7 **PERFORMANCE**
Fire resisting roller shutters and doors must be self-closing, activated by fusible links, electronic heat or smoke detectors. Provide certificates of tests.

**SUBMISSION**

COM8.D310.7 **SHOP DRAWINGS**
Provide and obtain Approval of shop drawings before manufacturing.

COM8.D320.7 **INSTRUCTION MANUALS**
Provide two instruction manuals giving detailed operating and maintenance instructions that include:
1. Wiring and schematic drawings where applicable;
2. Schedule of component parts;
3. Price list of recommended spares.
COM9 COOKING BENCH/SINK UNITS

DESIGN

SUBMISSION

COM9.D110.7 SHOP DRAWINGS
Submit shop drawings to CM for approval prior to the commencement of fabrication and ordering of materials.
MATERIALS

GENERAL

COM9.M010.7 COOKING BENCH/SINK UNIT

1. Submission Requirements:
   a. At sample submission and approval stage, submit one sample of the cooking bench/sink unit for CM's approval together with all the following substantiation for CM's information:
      i. Job reference;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. Original or a certified true copy each of the certification to ISO 9001 and ISO 14001 for the manufacturing plant. If the cooking bench and sink unit are not manufactured in the same plant, the certification is required for all manufacturing plants. If a copy of the ISO certificate is submitted, it shall be certified true by the certification bodies or by the QCM. The certification bodies shall be as follows:

<table>
<thead>
<tr>
<th>ISO</th>
<th>Certification Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISO 9001</td>
<td>The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
<tr>
<td>ISO 14001</td>
<td>The certification body shall be accredited by the Hong Kong Accreditation Service (HKAS), or the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
</tbody>
</table>

   v. Original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports for polymer resin worktop showing full compliance with the requirements in COM9.M150 for CM's information:
      - The date of the test shall be generally within five years prior to the notified date for commencement of the Works;
      - The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a) above, or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a) below;
      - In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be granted.

   vi. Installation procedure of the cooking bench/sink unit.

2. Quality Requirements:
   a. Cooking bench/sink unit comprising:
      i. A polymer resin cooking bench with bullnosed front edge and coved back upturn;
      ii. A reinforced concrete sink top with a single bowl stainless steel sink;
      iii. Reinforced concrete supporting legs finished with epoxy paint to all exposed surfaces;
      iv. Stainless steel earthing lugs for stainless steel supporting frames and sink unit;
v. All necessary fixing accessories including concrete inserts, galvanized mild steel angle brackets, fixing bolts, stainless steel supporting frames, stainless steel screw caps etc.

b. Standard of quality of the cooking bench/sink units shall be comparable with the benchmark samples maintained by the Housing Department.

3. On Site Delivery Verification
   a. At delivery stage, submit to the CM the following documents:
      i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under the sub-clause (1)(a);
      ii. Original or certified true copy of Certificate of Origin for every batch of delivery. One batch being the material quantity covered under each delivery note;
      iii. Delivery notes for all material delivered to Site.
   b. Carry out and submit report on the following verifications for cooking bench/sink unit upon delivery on Site. Prior to carrying out the verifications, inform CM's representatives who may present to witness the verifications:
      i. Method:

<table>
<thead>
<tr>
<th>Verification Items</th>
<th>Method</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delivery Note</td>
<td>Document Check</td>
<td>Complete with information of serial number as COM9.M030</td>
</tr>
<tr>
<td>Material and packaging</td>
<td>Visual</td>
<td>To Approved sample</td>
</tr>
<tr>
<td>Dimension Check</td>
<td>By measurement</td>
<td>As shown on Drawings and to Approved sample</td>
</tr>
<tr>
<td>Surface Quality</td>
<td>Visual</td>
<td>No damage, no staining, no blemish</td>
</tr>
</tbody>
</table>

   ii. Frequency:

<table>
<thead>
<tr>
<th>Items</th>
<th>Sampling Frequency</th>
<th>Representative Batch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dimension Check</td>
<td>1 sample for every 100 pieces or part thereof</td>
<td>Same batch of material delivered to Site under one Delivery Note</td>
</tr>
<tr>
<td>Surface Quality</td>
<td>1 sample for every 100 pieces or part thereof</td>
<td>Same batch of material delivered to Site under one Delivery Note</td>
</tr>
</tbody>
</table>

c. Where any of the verifications fail to meet the acceptance standards, either:
   i. Remove the representative batch off Site; or
   ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

**COM9.M020.7 SERIAL NUMBER**

Print on the bottom of each unit and on each of its detached parts a unique serial number. Repeat the serial number on all packaging. Keep a separate sheet record identifying the date of manufacture.

**COM9.M030.7 SAMPLES**

Keep the Approved sample available for inspection on Site until completion of the cooking bench/sink unit installation work.
COM9.M040.7  **DIMENSIONAL ACCURACY**
See Appendix H of this Specification for permissible tolerances in major dimensions of the cooking bench/sink units.

**STAINLESS STEEL SHEET**

COM9.M110.7  **STAINLESS STEEL SHEET FOR SINK UNIT**
To BS EN 10095:1999:
1. Grade 304 in accordance with MET1.M060;
2. Finish No 2R;
3. Minimum thickness of 0.8 mm.

**STAINLESS STEEL SUPPORTING FRAME**

COM9.M115.7 **STAINLESS STEEL SUPPORTING FRAME FOR COOKING BENCH**
To BS EN 10095:1999:
1. Grade 304 in accordance with MET1.M060;
2. Section size and thickness: as shown on Drawings.

**POLYMER RESIN WORKTOP**

COM9.M120.7 **POLYMER RESIN WORKTOP FOR COOKING BENCH**
1. Colour: white solid colour;
2. Thickness: 12 mm to maximum 13 mm;
3. The quality requirements for the polymer resin worktop are as follows:

<table>
<thead>
<tr>
<th>Items</th>
<th>Test Method</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Cross-cut test: Rating 5 – cuts are smooth, no finish removed, except for small chips at the intersections of the cuts and an occasional small chip along the cut</td>
</tr>
<tr>
<td>ii. Light Resistance</td>
<td>NEMA LD3-2005 Cl. 3.3</td>
<td>Slight effect – a change in colour or surface finish visible only at certain angles and directions</td>
</tr>
<tr>
<td>iii. Boiling Water Resistance</td>
<td>NEMA LD3-2005 Cl. 3.5</td>
<td>No effect - no change in colour or surface finish</td>
</tr>
<tr>
<td>iv. High Temperature Resistance</td>
<td>NEMA LD3-2005 Cl. 3.6</td>
<td>No effect - no change in colour or surface finish</td>
</tr>
<tr>
<td>v. Ball Impact Resistance</td>
<td>NEMA LD3-2005 Cl. 3.8</td>
<td>No fracture by the polished stainless steel ball dropped from vertical height of 900 mm</td>
</tr>
<tr>
<td>vi. Coefficient of Linear Thermal Expansion</td>
<td>ASTM D696-03</td>
<td>Not more than 3.02 x 10^{-5} / °C</td>
</tr>
<tr>
<td>vii. Resistance to fungi</td>
<td>ASTM G21-96 (Reapproved 2002)</td>
<td>Observed fungal growth on specimens: None (Rating 0)</td>
</tr>
<tr>
<td>viii. Flame Spread Index</td>
<td>ASTM E84-12b</td>
<td>Class A of NFPA 101: Flame Spread Index 0 - 25</td>
</tr>
<tr>
<td>ix. Smoke Developed Index</td>
<td>ASTM E84-12b</td>
<td>Class A of NFPA 101: Smoke Developed Index 0 - 450</td>
</tr>
<tr>
<td>x. Water Absorption</td>
<td>ASTM D570-98 (Reapproved 2010)</td>
<td>24 hour immersion: not more than 0.08%</td>
</tr>
</tbody>
</table>
### Wear and Cleanability

<table>
<thead>
<tr>
<th>Specification</th>
<th>Test Details</th>
</tr>
</thead>
</table>
| ANSI Z124.6-2007 Cl. 5.3 | Wear Test  
- Surface finish shall not be worn through in the middle third of the specimen.  
Cleanability Test  
- Each specimen, after 10,000 cycles, shall pass the cleanability test with an absolute percentage loss of white-light reflectance of not more than 5% after the cleaning with standard liquid detergent  
- If the average absolute percentage loss of white-light reflectance is greater than 2% but less than 5%, absolute percentage loss of white-light reflectance of not more than 2% after additional cleaning with abrasive slurry |

### Stain Resistance

<table>
<thead>
<tr>
<th>Specification</th>
<th>Test Details</th>
</tr>
</thead>
</table>
| ANSI Z124.6-2007 Cl. 5.2 | Maximum stain resistance rating shall be 64  
Maximum allowable thickness of material removed to eliminate stain shall be 0.127 mm |

### FIXING AND POINTING MATERIALS

**COM9.M210.7 ANCHORS AND FIXING BOLTS**
For supporting legs and frames of cooking bench/sink units:  
1. For concrete block/concrete walls: proprietary type of stainless steel fixing bolts to Approval;  
2. For proprietary types of partition walls, use fixings as recommended by partition manufacturer.

**COM9.M220.7 BONDING AGENT**
For bonding stainless steel to concrete components: proprietary type of bonding agent to Approval.

**COM9.M230.7 SILICONE SEALANT**
1. In compliance with WAT5.M110;  
2. Silicone sealant to BS 5889:1989, Type B (non-acidic type).

**COM9.M240.7 CEMENT MORTAR**
For bedding concrete support legs to floors: cement : sand mix with water : cement : sand ratio of 0.5:1:3 and produced in accordance with the requirements of Worksection MAS3.

**COM9.M250.7 EARTHING LUG**
25 mm x 1.5 mm thick stainless steel earthing lug for equipotential bonding connection, or otherwise as indicated on Drawings.
WORKMANSHIP

SUPPORTING LEGS

COM9.W010.7 CRACK REPAIR IDENTIFICATION AND RESPONSIBILITY

1. In accordance with clause 58(2) of the Conditions of Contract, all visual cracks discovered within the hardened concrete at any time prior to the issue of the final certificate will be regarded as defective. In this respect the provision of BS 8110:1985 relating to the permitted calculated maximum crack width will not apply;

2. Take responsibility and liability for any such crack defect as sub-clause (1), other imperfection or fault under clause 58(2) of the Conditions of Contract, unless such cracks are proved to be due to the Authority's design fault. Where cracks are proven to be due to the design fault of the Authority any expense incurred by the Contractor for investigation and remedial work will be paid in accordance with clause 58(3) of the Conditions of Contract;

3. Where directed by the CM, investigate and repair visual cracks in accordance with the procedures and methods as specified in this sub-section. Notwithstanding the above provision, where Instructed replace sink units found to be defective.

COM9.W020.7 CLASSIFICATION AND REMEDIAL REPAIR OF CRACKS

1. Crack width classification:
   a. Fine: maximum width at any point 0.3 mm or less;
   b. Coarse: maximum width at any point greater than 0.3 mm;

2. Determine crack width at the surface of the concrete with either the aid of a transparent sheet marked with lines of different widths or, by examining the crack with a low powered microscope incorporating a measuring graticule;

3. Determine crack depth by one of the following procedures:
   a. Where the line of the crack on one surface can be traced on another surface parallel to the first surface, or where the crack can be seen to transverse two adjacent surfaces in different planes, it is deemed to be a through crack;
   b. Where a crack follows an irregular pattern on one surface of an element only and is branched at a minimum of two points, it is deemed to be a non-through crack;

4. a. Prior to commencement of repairs submit a method statement of the materials and the method to be used for Approval;
   b. Use the following methods for rectifying cracks:
      i. Fine non-through crack: brush into crack cement grout or a mixture of cement and water until the crack appears to be filled;
      ii. Coarse non-through crack: cut a V-groove and fill with proprietary repair mortar;
      iii. Through cracks: seal by arranging for a low viscosity polymer resin to flow under the influence of gravity or injection into the crack to fill it and harden therein.

POLYMER RESIN WORKTOP

COM9.W050.7 MINOR REPAIR TO POLYMER RESIN WORKTOP

Seek CM's approval for repair minor visual scratch and other imperfection to the quality of the Approved sample. Notwithstanding the above provision, replace defective polymer resin worktop where Instructed.
INSTALLATION

COM9.W110.7  FIXING COOKING BENCH/SINK UNITS
1. Check units have no missing or dislodged concrete inserts, and components are free from scratches, cracks, dents, voids and other damage;
2. Assemble and set units correctly in relation to position on plan and height above finished floor level;
3. Fix units using stainless steel supporting frames, brackets and bolts specified and as indicated on the Drawings;
4. Apply cement mortar bedding between support leg and floor;
5. Seal joints between top and wall and between sink leg and unit with silicone sealant applied in accordance with Worksection WAT5;
6. Protect units from damage and maintain protective film intact.

COM9.W120.7  EQUIPOTENTIAL BONDING TO COOKING BENCH/SINK UNITS
1. Provide equipotential bonding connection for stainless steel supporting frames of cooking bench and sink units by:
   a. Weld one end of the earthing lug to sink and stainless steel supporting frames; and
   b. Form a 5 mm diameter hole at the other end of the earthing lug for connection of bonding conductor by the Nominated Sub-contractor for Electrical Installation.
2. As COM2.W465 (6).

ACCURACY AND TOLERANCES

COM9.W210.7  ERECTION ACCURACY
Refer to Appendix H, "Schedule of Tolerances" to this Specification.

PROTECTION

COM9.W310.7  PROTECTION OF FINISHES
1. Protect sink stainless steel surface and polymer resin worktop with removable adhesive film;
2. Remove protective film on 5% of installed sinks for inspection;
3. Remove all protection before completion of the Works unless approved by the CM.
COM10  GLASS PANEL BALUSTRADES

DESIGN

GENERAL

COM10.D010.7 SPECIFICATION REQUIREMENTS
Design, construct, fix and glaze the glass panel balustrades in accordance with this Worksection and the relevant clauses of:
1. MET1 General Metalwork;
2. COM4 Glazing;
3. WAT5 Sealants.

COM10.D020.7 SHOP DRAWINGS
When proprietary design of glass panel balustrades is used by Contractor:
1. Provide shop drawings with technical substantiation for construction showing details of the members and fixings of glass panel and obtain Approval prior to commencement of fabrication of glass panel balustrade elements;
2. Appoint a Registered Structural Engineer registered with the Building Authority of the Government of the Hong Kong Special Administrative Region for the design of the glass protective barrier. The Registered Structural Engineer shall certify and sign all shop drawings and technical substantiation including calculations.

COM10.D030.7 METHOD STATEMENT
Submit method statement detailing the installation procedure (including procedure for reglazing and torque of fixing bolts) and obtain Approval prior to starting fabrication.

COM10.D040.7 SAMPLES
Submit samples of each type of glass, sealants, distance pieces and setting blocks and obtain Approval prior to starting fabrication.

COM10.D050.7 MOCK UP
Provide full scale mock up for glass panel balustrade and obtain Approval prior to proceeding with the installation work.

DESIGN PARAMETERS

COM10.D110.7 GENERAL
The design parameters specified in COM10.D120 to COM10.D150 apply when the Contractor is required to submit shop drawings for the proprietary design of glass panel balustrades.

COM10.D120.7 MINIMUM HORIZONTAL IMPOSED LOADS
Calculate to demonstrate the glass panel balustrade must resist the following, whichever shall produce the more adverse effects:
1. The minimum horizontal imposed loads as specified in accordance with the Building (Construction) Regulations for the following when separately applied:
   a. Areas where crowd load is not expected;
   b. Places of assembly and all panic barriers;
2. Wind load where applicable.

COM10.D130.7 DEFLECTION LIMITS
1. Design glass panel balustrade to resist the most unfavourable combination of imposed and wind loads with an adequate margin of safety against collapse and without unacceptable deflections or distortions;
2. Draw particular attention to the following deflection limits which are in addition to any recommendations for limiting deflection under full load given in the appropriate structural codes for the material to be used and in which event, apply the most onerous limit:
   a. Horizontal displacement of any part of the glass panel balustrade: not exceed 25 mm;
   b. For bolt fixing of glass barriers under the design loads, design the barrier such that the relative in-plane movement of the bolted connections in the same glass panel do not exceed 2 mm;
   c. When the glass components are subjected to half the most unfavourable combination of imposed and wind loads, the horizontal displacement of any point of the glass component, relative to its fixings, shall not exceed the following:
      i. The smaller of 12.5 mm or L/125 for infill panels, where L is the longest dimension of the glass for fully framed infill panels; or the span between the supporting frames for two-edge framed infill panels; or the maximum space between support points for clipped infill panel; or the span between the bolt connectors for point supports infill panels;
      ii. 10 mm for free-standing glass panel balustrade.

COM10.D140.7 FIXING
1. Design fixings, the frame section of the glass panel balustrade, the clips, the bolted connectors and their fixings or connections to the main frame to withstand the design loads transferred through the glass infill panels;
2. Design all joints to provide the full strength of the members being joined. Take into account particularly the material into which the fixing is placed, the spacing between fixings, the edge distance, and the position of reinforcement in the concrete;
3. Refer to manufacturer's recommendation when using proprietary fixing products.

COM10.D150.7 HANDRAIL ATTACHMENT FOR FREE-STANDING GLASS PANEL BALUSTRADE
Calculate to demonstrate handrail attached to free-standing glass panel balustrade must behave in the following manner should a glass panel fracture:
1. Remain in position;
2. Do not fail if the design load is applied across the resulting gap.
MATERIALS

COM10.M010.7 METALWORKS
As specified in Worksection MET1.

COM10.M020.7 GLASS
1. As specified in COM4.M010 to COM4.M110;
2. Comply with the impact test requirements for safety glazing materials given in recognised testing standards. The type of glass shall achieve impact resistance not inferior to the impact class A of BS 6206:1981 when the free path is greater than 1500 mm. Submit test certificates from the manufacturer of the glass material to prove its impact resistance.

COM10.M030.7 SETTING BLOCKS
Rot-proof, non-absorbent and load bearing, capable of maintaining the requisite edge clearance without presenting local areas of stress to the glass though being non-compressible or non-resilient and as COM4.M420.

COM10.M040.7 DISTANCE PIECES
Resilient, non-absorbent, generally of plasticized PVC complying with BS 2571:1990 softness number 35 to 45:
1. Length: 25 mm minimum;
2. Thickness: equal to the front and back clearance, thus retaining the glass firmly in the frame so that it cannot be displaced;
3. Depth: giving 3 mm minimum cover of sealant.

COM10.M050.7 SEALANTS
As specified in WAT5.M110 to WAT5.M170.
WORKMANSHIP

GENERAL

COM10.W010.7 STANDARD

COM10.W020.7 DELIVERY
Ensure glass is kept dry and clean during delivery.

COM10.W030.7 STORAGE
Store glass vertically in a well-ventilated location, protected from condensation and other moisture.

FIXING GLASS GENERALLY

COM10.W110.7 EDGE COVER
Provide a minimum 15 mm edge cover with sealant for glass infill panels.

COM10.W120.7 CLIP FIXING OF GLASS INFILL PANEL
For clipped infill panel, position the clips around the periphery of the infill panel at a maximum spacing of 600 mm. Each clip shall be not less than 50 mm in length and give a minimum depth of cover of 25 mm to the glass panel.

COM10.W130.7 BOLT FIXING OF GLASS INFILL PANELS
1. Use toughened glass where glass is supported by bolt connections through holes in the glass;
2. Surround bolts through holes in the glass with incompressible bushes 2 mm to 3 mm thick, and use 1 mm thick incompressible fibre gaskets under clamping plates;
3. a. Clamping plates and gaskets on both sides of the glass provide a minimum of 50 mm diameter cover to the glass;
   b. Clamping plates: not less than 6 mm thick in steel or 10 mm thick in other suitable metals.

COM10.W140.7 FREE-STANDING GLASS PANEL BALUSTRADE
Depth of clamping at base fixing of free-standing glass panel balustrade that does not rely on bolts through glass: not less than 75 mm.

COM10.W150.7 BOLT FIXING OF FREE-STANDING GLASS PANEL BALUSTRADE
1. Point fixing clamps:
   a. Fixing clamps on each side: not less than 100 mm x 150 mm and minimum 12 mm thick;
   b. Fixing clamps for every 1 m length of balustrade: not less than two;
2. Continuous fixing clamps:
   a. Fixing clamps on each side of the glass: not less than 100 mm wide and minimum 12 mm thick;
   b. Clamps: continuous for the entire length of the glass pane and have a maximum bolt spacing of 500 mm.
COM10.W160.7  **POSITIONING SETTING BLOCKS**

Position the setting blocks as near to the quarter points as possible. Where it is necessary to avoid undue deflection of the frame section, position the setting blocks as follows:

1. Not less than 30 mm from the corner of the glass;
2. In positions to coincide with the frame section fixing points, if these are between 30 mm from the corner and the quarter points.

COM10.W170.7  **POSITIONING DISTANCES PIECES**

1. Position distance pieces as follows:
   a. First distance piece: at approx. 50 mm from the corner;
   b. Remainder: at approx. 300 mm centres or less.
2. Never coincide a distance piece with a setting block position.

COM10.W180.7  **SILICONE SEALANT**

Where specified, seal the joint between the glass and bead with an Approved silicone sealant.

**FINISHING**

COM10.W210.7  **BROKEN OR DAMAGED GLAZING**

Replace glass or fixing materials broken or damaged before completion of the works and make good the adjoining areas.
COM11 RADIO FREQUENCY IDENTIFICATION AND WEB-BASED DATABASE SYSTEM FOR BUILDING COMPONENTS

DESIGN

GENERAL

COM11.D010.7 RADIO FREQUENCY IDENTIFICATION (RFID) SYSTEM
1. Provide, operate, and maintain a RFID System for the following building components in accordance with this Worksection and COM11.APPEND1 to COM11.APPEND4 and other relevant Worksections of this Specification:
   a. Precast Concrete Facades (CON5 and CON7);
   b. Aluminium Windows and Louvres (COM2);
   c. Timber Doorsets (COM5); and
   d. Gatesets (COM7).
2. Install approved RFID tags to the respective building components at the place of manufacture to record the manufacturing process, the logistics in delivery and the installation detail of the building components as indicated in COM11.APPEND1 to COM11.APPEND4. The workflow and data fields specified in COM11.APPEND1 to COM11.APPEND4 may be subject to amendments to suit the manufacturing processes proposed by the Contractor and agreed by CM.

COM11.D020.7 MAIN COMPONENTS OF THE RADIO FREQUENCY IDENTIFICATION (RFID) SYSTEM
Provide all required facilities and services for the RFID System to support the operation of the RFID System, including but not limited to:
1. RFID tags;
2. RFID readers, at least two numbers for each manufacturing factory of building components specified in COM11.D010 and on site;
3. RFID Web-based Database System as specified in COM11.D050;
4. Middleware for the readers;
5. Networking infrastructure, equipment and services connecting the RFID devices and workstations (wired or wireless);
6. Internet connection for all locations involved in the workflow;
7. Servers and workstations for all RFID devices, including web and application servers, database servers;
8. Security facility for all RFID devices; and
9. All other resources to ensure the operation of the RFID System meet the service level requirements.

COM11.D030.7 OUTLINE OF THE OPERATION OF THE RADIO FREQUENCY IDENTIFICATION (RFID) SYSTEM
The RFID System provided shall follow the workflow outlined in COM11.APPEND1 to COM11.APPEND4 which shall include but not limit to following sequences:
1. Provide and install RFID tags in building components as specified in COM11.D010;
2. During the manufacturing, record the date and time for each tagged building components via RFID readers at locations/steps specified and then upload these data to the RFID Web-based Database System as specified in COM11.D050;
3. During the delivery and on site installation, record the date and time for each tagged building components via the RFID reader at locations/steps specified and then upload these data to the RFID Web-based Database System as specified in COM11.D050; and
4. Through the RFID Web-based Database System via internet, authorized users can be able to view, search, sort and identify logistics workflow in the manufacturing, delivery and installation of every building components with RFID tags installed and follow the workflow as specified in COM11.APPEND1 to COM11.APPEND4.

COM11.D040.7 SUPPLY OF RFID TAGS AND RFID READERS
Make available all approved RFID tags and approved RFID readers and other equipment at a date not more than 60 days after the notified date for commencement of the Works.

COM11.D050.7 RFID WEB-BASED DATABASE SYSTEM
1. Provide, operate and maintain a RFID System from a date not more than 60 days after the notified date for commencement of the Works until the expiry of Maintenance Period, in the manufacturing, delivery and installation processes for building components as specified in COM11.D010. The RFID Web-based Database System shall comply with COM11.APPEND1 to COM11.APPEND4; and

SUBMISSIONS

COM11.D110.7 PROVISIONAL APPROVAL
Submit the following items to CM for provisional approval as specified in COM11.D010 at a date not more than 60 days after the notified date for commencement of the Works:
1. One sample of each type of RFID tag to be used in the RFID System;
2. Fixing method of RFID tags;
3. RFID tags shall be embedded in building components as specified in COM11.D010. Where embedment of RFID tag in the building component is not feasible, alternative fixing method shall be submitted to CM for approval;
4. Shop drawings of building components showing location of RFID tags in each type of building component;
5. The proposed RFID Web-based Database System as specified in COM11.M210;
6. The proposed RFID Reader to be used in the RFID System; and

COM11.D120.7 PROGRAMME
Indicate the installation programme of RFID tags, including the duration for the verification of proper functioning of all tags by RFID readers, in the manufacturing programme of building components as required in other Worksections of this Specification.
RESOURCES

COM11.D210.7 RFID PROJECT COORDINATOR

1. The Contractor shall appoint one full time RFID Project Coordinator to deliver the services including but not limited to, the provision of operation, support and maintenance service of all RFID related works including the RFID Web-based Database System. The RFID Project Coordinator is responsible for monitoring/controlling data input, and various related processes in the on-going support and delivery of the services;

2. The RFID Project Coordinator shall liaise with the vendors for the provision of the RFID Web-based Database System and the Contractor shall provide necessary IT support for the RFID Project Coordinator to ensure the proper and effective operation/maintenance of the whole System;

3. A RFID Project Coordinator shall have:
   a. Level 2/Grade E or above in five subjects including Mathematics in the Hong Kong Certificate of Education Examination (HKCEE), or equivalent (the five subjects include Chinese Language and English Language);
   b. met the language proficiency requirements of Level 2 or above in Chinese Language and English Language in HKCEE, or equivalent (“Grade E” in Chinese Language and English Language (Syllabus B) in previous HKCEE is accepted as comparable to “Level 2” in Chinese Language and English Language in the 2007 HKCEE and henceforth);
   c. good knowledge in Chinese and English word processing and in the application of common business software (including Microsoft Word and Excel); and
   d. a minimum two years’ working experience in the application of common business software.
MATERIALS

RADIO FREQUENCY IDENTIFICATION TAGS

COM11.M010.7 STANDARD
1. RFID tag shall:
   a. Comply with ISO 18000:2004, Part 6B or Part 6C, or relevant standards when other frequency range is proposed by the Contractor and approved by CM;
   b. Be of ‘passive’ type with all inlays protected by outlays;
   c. Be pre-bagged with a print out record or a soft copy showing the unalterable serialized Tag Identifier (TID) of each tag inside.
2. RFID tags embedded in the building components shall be capable of withstanding all induced stresses arising from the manufacturing process and transportation and site operations and shall remain functional after the installation of the building components on Site. In addition, it shall exhibit:
   a. Good durability for environment and conditions during the manufacturing process after it was embedded in the building components;
   b. Good abrasion resistance; and
   c. Good chemical resistance.
3. Tag number including TID and user-defined serial number of all RFID tags to be used in the Contract shall be registered in the RFID Web-based System prior to the commencement of manufacturing process of building components. The registered tag number list shall be delivered to CMR for information and record.

COM11.M020.7 TECHNICAL PERFORMANCE
RFID tags shall be capable of achieving the following performance:
1. Good functional conditions for serving the temperature, conditions and environment anticipated during the manufacturing process of the building components;
2. Sufficient storage capacity for all the data indicated in COM11.APPEND1 to COM11.APPEND5; being able to protect memory;
3. When embedded in the proposed locations in the building components:
   a. Free from interferences by metal;
   b. Detectable to facilitate data transfer by the RFID reader at a reasonable distance during the quality control inspections, delivery and when installed.
4. Unalterable serialized Tag Identifier (TID) exists; and
5. Protected by write-proof and kill-proof password.

RADIO FREQUENCY IDENTIFICATION READERS

COM11.M110.7 STANDARD
RFID readers shall:
1. Comply with the exemption requirements under the Telecommunication (Telecommunications Apparatus) (Exemption from Licensing) (Amendment) Order 2005, under the Telecommunication Ordinance (Cap. 106); and
2. Be of portable handheld type.
Submit to demonstrate to CM the performance of all RFID supporting software complying with workflows as specified in COM11.APPEND1 to COM11.APPEND4 for data preparation, capture and submission amongst RFID tags, RFID readers and the RFID Web-based Database System specified in COM11.D010 at a date not more than 60 days after the notified date for commencement of the Works.

RFID readers shall be compatible with RFID tags using in the project and capable of achieving and performing functions specified and/or required in the supporting RFID Web-based Database System.

RADIO FREQUENCY IDENTIFICATION (RFID) WEB-BASED DATABASE SYSTEM

1. Provide, operate and maintain a RFID Web-based Database System for uploading all RFID data as specified in COM11.D030 and to prepare relevant tabulated data. The Contractor shall submit the details of RFID Web-based Database System to CM as specified in COM11.D110 for approval at a date not more than 60 days after the notified date for commencement of the Works. The RFID Web-based Database System shall be:
   a. Website readily accessible on internet by CMRs and authorized users with proper security measures, including but not limited to user accounts and password. Users account shall be locked after a pre-defined number (configurable) of unsuccessful logon attempts. The system must provide facilities to monitor unsuccessful logon attempts. Reports shall be available for analysis of such attempts;
   b. All RFID data and specified information shall be uploaded within the time schedule for submission specified in this specification;
   c. All data shall be uploaded to Housing Authority’s system when instructed by CM;
   d. A user logon session shall be logged off automatically by the System if it is unattended for a certain period of time; and
   e. Logical access to the applications and system utilities shall be restricted to authorized users and the type of access rights granted to them shall be governed by user account and password.

2. Requirements on website
   a. All data and information shall be made available for viewing and downloadable by Project Officers or authorized users;
   b. Data and related information shall be shown in chronological order of the manufacturing time of the building components or as instructed by the CM;
   c. Change control: The date of any data uploaded on to the website shall be included in each report for change control. Any amendment to the data shall be notified and carried out by authorized personnel of the Contractor with proper version control;
   d. Performance:
      Indices to the data and information to be retrieved from the RFID Database System via internet shall be shown within 30 seconds and be shown in chronological order of the RFID tag number, manufacturing date or other similar criteria as requested via the web site by CM or authorized users.
      i. Retrieval of the selected report shall be completed within about 30 seconds;
ii. The RFID Database website shall be able to support at least 20 concurrent users.

e. Availability: The RFID Web-based Database System shall be available at all time around the clock, and availability of the System shall not be less than 98% within the hours from 7:00 am to 10:00 pm, and shall not be less than 95% during other hours. The Contractor shall report its RFID Web-based Database System availability to CM upon request;

f. Search: Search facilities shall be provided to search data and reports by RFID tag number, building component serial number, manufacturing date, component type, delivery date, installation date, installed location in blocks, floors, and flat number or other similar criteria as instructed by CM;

g. Browser support: The System shall support Internet Explorer version 7.0 or above;

h. Security:
   i. Website shall only be accessible to authorized users with User ID and password;
   ii. The System shall require users to change passwords within a specific range of time agreed by CM and support users to change their password as required. All passwords shall be encrypted and invisible on the screen when type in;
   iii. The Contractor shall maintain, update a list of the User IDs and Passwords, and report to CM whenever there is a change;
   iv. Data shall be encrypted and secured when transmitted over the internet;
   v. The Contractor shall maintain a logging of the browsers of the website, and have it readily available for inspection;
   vi. The System shall be protected by reliable antivirus software with the latest virus definition updated.

3. The Contractor shall submit typical user-interface layouts to CM for approval. The user-interface shall be easy-to-use and selections by mouse click are used as far as possible. The user-interface layout sequence is as follows:
   a. Prompt and authenticate user ID and password to enter RFID data and information;
   b. Prompt and authenticate user ID to enter into Project reports;
   c. Select type of building component;
   d. Browse/download data, information, or reports;
   e. Exit website by a logout process.

4. When instructed by CM, for each building component as specified in COM11.D010, the Contractor shall produce electronic data file on RFID data, information, reports and/or test reports, and transmit to a Housing Authority web based system. The input formats of each type of RFID tagged building component are given in COM11.APPEND1 to COM11.APPEND4 to the Specification;

5. The user-interface of the RFID-Web-based Database System shall follow the layout as specified at COM11.APPEND5. The Contractor may submit alternative design to CM for approval;

6. When instructed by CM, submit summary report to demonstrate the performance of the RFID-Web-based Database System to fulfil the requirements stipulated in the above sub-clause 2;

7. The Contractor shall review the performance of the RFID Web-based Database System at intervals agreed by CM. The review shall include:
   a. Achievement of the performances as stated at above clauses;
   b. Feedback received and remedial and follow-up actions as raised;
   c. Results of planned/random inspections on the performance of the System;
   d. Other relevant information.
COM11.M220.7 BACKUP AND RECOVERY OF PROGRAMME AND DATA
1. Back up regularly the System, including configuration files and all data, in a full-scale and centralized approach. Appropriate system/application/system data files backups are required every time when there is change of system, change of application or change of system data files;
2. Periodically archive all data and information in the RFID Web-based Database System into removable media (e.g. DVD-RW) and deliver to CM. The period is defined by CM.

COM11.M230.7 INTEGRITY OF DATA
1. Take reasonable precautions to preserve the integrity of data in the RFID Web-based Database System and to prevent any corruption or loss;
2. Take such steps as are necessary to ensure that, in the event of any corruption or loss of Data howsoever caused, it is in a position to restore or procure the restoration of Data; and
3. At the request by CM in the event of any corruption or loss of Data and without prejudice to any other remedies that may be available to it either under the Contract or otherwise, restore or procure the restoration of Data to its state immediately prior to the said corruption or loss.

COM11.M240.7 HANDLING OF DATA
1. All data, information and related document in the RFID Web-based Database System for the Contract are properties of HA. The Contractor shall not disclose, transmit, copy any of them to other parties in any form without the approval from CM;
2. Upon the expiry of the RFID System or as instructed by CM, the Contractor shall copy all data, and information in the database of the RFID Web-based Database System into removable media (e.g., DVD-RW) and submit to CM.

COM11.M250.7 REMOVAL OF EQUIPMENT AND DATA UPON COMPLETION
1. Upon the expiry of the RFID System or as instructed by CM, unless otherwise approved by CM, remove the RFID devices and associated equipment installed in the site. The removal shall be carried out with method and procedures as approved by CM;
2. Upon the expiry of the RFID System or as instructed by CM, unless otherwise approved by CM, delete all data and information of the contract from the RFID Web-based Database System. The removal shall be carried out with method and procedures as approved by CM.
WORKMANSHIP

INSTALLATION OF RFID TAGS

COM11.W010.7 INSTALLATION OF RFID TAGS
Install RFID tags at the locations detailed in COM11.APPEND6, by using the approved fixing method during the manufacturing process of building components. Alternative RFID tags installation locations may be proposed to CM for approval.

COM11.W020.7 REPLACEMENT OF INSTALLED TAGS
In the event that a RFID tag fails to be detected by the RFID reader or becomes damaged after installation to the building component, replace the non-functional/damaged tag immediately. When replacement of RFID tag in the building component is not feasible, alternative remedial measures shall be submitted to CM for approval.

DATA TRANSFER

COM11.W110.7 DAILY UPLOADING OF DATA AND RECORDS
1. Upload daily all data, records and information of building components installed with RFID tags to the RFID Web-based Database System as indicated in COM11.APPEND1 to COM11.APPEND4 via internet;
2. Unless otherwise instructed by CM, complete daily uploading:
   a. At the casting yard or place of manufacturing of the respective building components for daily productions and testing; and
   b. At the Site after installation of the respective building components.

COM11.W120.7 CORRECTNESS OF DATA
1. Check the correctness of data each time after uploading of data to the RFID Web-based Database System as indicated in COM11.APPEND1 to COM11.APPEND4; and
2. Inform CM immediately of any non-matching data.

COM11.W130.7 VIEWING OF RECORDS
1. Make available the data, record and information uploaded to the RFID Web-based Database System for viewing and downloading by CM and his representatives if required;
2. All reports and colour photographs including those taken by digital cameras if provided in the RFID Web-based Database System shall be legible.

DATA FORMAT

COM11.W210.7 DOCUMENT FORMAT
The data, record and information uploaded to the RFID Web-based Database System shall be in unalterable format such as Adobe "Portable Document Format" (PDF) or other similar format approved or specified by CM.

COM11.W220.7 SECURITY
1. Access to the RFID Web-based Database System shall be via internet and shall be restricted and secured by user ID and password;
2. The Contractor shall only allow authorized users to access the RFID Web-based Database System.
COM1.W230.7 CHANGE CONTROL
1. The date of the data, record and information uploaded to the RFID Web-based Database System shall be included for change control purposes;
2. Any amendment to the database shall be notified and carried out by the Contractor's authorized person with proper change control in line with the hard copy records.

COM1.W240.7 HARDWARE AND SOFTWARE
The Contractor shall provide his own computer hardware and software for the development and access to the RFID Web-based Database System.

COM1.W250.7 TAG STRUCTURE
The encoding structure for the data to be stored in the RFID tags shall be in accordance with COM1.APPEND7.
TESTING

FIELD TRIAL AND SYSTEM ACCEPTANCE TEST OF RFID SYSTEM

COM11.T010.7 SYSTEM ACCEPTANCE TEST
1. Carry out System Acceptance Tests with CM or his representatives. The Contractor shall set up the environments for the System Acceptance Tests and prepare test plan and testing data for such acceptance test;
2. Provide guidelines for the operation of the System; and

COM11.T020.7 FIELD TRIAL AND DEMONSTRATION
1. Prepare field trial of the RFID System on receipt of the provisional approval specified in COM11.D110;
2. Carry out field trial to demonstrate the proper data transfer in the RFID Web-based Database System at the casting yard or place of manufacturing and on Site and complete in good time before the commencement of tag installation to the building components;
3. Further field trials shall be made until CM is satisfied with the performance of the RFID system before Approval.

COM11.T030.7 PROCEDURE
1. A test sample for field trial shall comprise RFID tag, RFID reader, RFID supporting software, the RFID Web-based Database System, computer hardware and software necessary for the data transfer in the RFID system;
2. Unless otherwise agreed by CM, provide one test sample for each type of building components;
3. Perform data preparation, capture and submission to the RFID Web-based Database System at the casting yard or place of manufacturing and on Site and verify the correctness of data in the RFID System.
APPENDIX COM11/I

COM11.APPEND1.7 CONCEPTUAL WORKFLOW FOR THE RFID SYSTEM - PRECAST CONCRETE FAÇADE

SYSTEM SET UP

Start

Contractor set up a RFID System

Contractor submit RFID hardware; the proposed RFID Middleware* and RFID Web-based Database System to CM for approval

CM

Carry out Field Trials and System Acceptance Tests

System

Establish User Accounts and the System is ready for production use

*Middleware = Software for the communication/data transfers amongst RFID tags, RFID Readers/ and the RFID Web-based Database System.  **The provisional approval from CM as per COM11.D110.
If aluminium window(s) to be installed in the precast elements (e.g. precast façade, volumetric precast bathroom, etc.), read also the RFID tag(s) of respective aluminium window(s) to record the installation date and time.
Users can access the RFID Web-based Database System via internet.

Data in the RFID Reader and all other necessary data uploaded to the RFID Web-based Database System via internet.

The RFID Reader automatically record the date and time of façade arrival.

Install the façade in location.

Read the RFID tag by the RFID Reader.

The RFID Reader automatically record the date and time of façade installation.

Read the RFID tag by the RFID Reader.

Facade delivered on site.

Plant.

Finish.

Export related data to HA's system.
### Data Fields for data to be stored and maintained in the RFID Web-based Database System and RFID tags installed in Precast Concrete Façade

</table>

The Contractor may make use of the System to record other data such as Finishes, Tile adhesive, Tile Grout, Aluminum Window, Conduit and etc. (All optional)

**Note**

1. This field of data to be stored in the user memory of RFID tags installed;
2. Real time record with reference to the built-in clock inside the reader or other date definition agreed by CM;
3. Data to be input after the building component is installed in its final location;
4. Resident Supervisor (RS) inspection to be carried out before the concreting of the precast façade;
5. The "Remarks" field is to record any other information related to the component, e.g. any relevant tests carried out to the component.
6. Unalterable unique TID is assigned by the manufacturer of RFID tags.
7. RFID tag no. to be stored in the format of Electronic Product Code (EPC).
APPENDIX COM11/II

COM11.APPEND2.7 CONCEPTUAL WORKFLOW FOR THE RFID SYSTEM - ALUMINIUM WINDOW

SYSTEM SET UP

Start

Contractor set up a RFID System

Contractor submit RFID hardware; the proposed RFID Middleware* and RFID Web-based Database System to CM for approval

CM

Carry out Field Trial and System Acceptance Tests

No

System

Establish User Accounts and the System is ready for production use

*Middleware = Software for the communication/data transfers amongst RFID tags, RFID Readers/and the RFID Web-based Database System. **The provisional approval from CM as per COM11.D110.
PLANT

Start

Manufacturing of the window

Install RFID tag in the window

Read the RFID tag by the RFID Reader

Window leaving the factory to site/precast façade plant

Read the RFID tag by the RFID Reader

Site/Plant

Export related data to HA's system

The RFID Reader automatically record the production date and time

Data in the RFID Reader and all other necessary data uploaded to the RFID Web-based Database System via internet

Related the RFID Tag number with window serial number

Users can access the RFID Web-based Database System via internet
For aluminium windows to be installed in precast elements (e.g. precast façade, volumetric precast bathroom, etc.), read the RFID tag to record the date and time of aluminium window arrival to precast factory and store the data in the datafield of "Site Arrival Date".

For aluminium windows to be installed in precast elements, read the RFID tag before concreting the related precast element to record the casting date of the precast element as the date and time of installation of aluminium window.
### Data Fields for data to be stored and maintained in the RFID Web-based Database System and RFID tags installed in Aluminum Window

</table>

The Contractor may make use of the system to record other data such as test reports, mill certificates, shop drawings and etc. (All optional)

**Note**

1. This field of data to be stored in the user memory of RFID tags installed;
2. Real time record with reference to the built-in clock inside the reader or other date definition agreed by CM;
3. Data to be input after the building component is installed in its final location;
4. The "Remarks" field is to record any other information related to the component, e.g. any glazing pre-installed.
5. Unalterable unique TID is assigned by the manufacturer of RFID tags.
6. RFID tag no. to be stored in the format of Electronic Product Code (EPC).
7. For aluminium window to be installed in precast elements, date of arrival to precast factory to be stored in the data field for "Site Arrival Date".
8. For aluminium window to be installed in precast elements, date of casting for the respective precast element to be stored in the data field for "Installation Date".
9. For aluminium window to be installed in common areas, the following abbreviation to be stored in the data field of "Flat Number":
   - ST – Staircase
   - PD – Pipe Duct Room
   - FS – FS Pump Room
   - EM – Electrical Meter Room
   - SW – Switch Room
   - SR – Store Room
   - TB – T.B.E Room
   - CD – Cable Duct Room
   - WC - Toilet

The Contractor may make use of the System to record other data such as test reports, materials certificates, shop drawings and etc. (All optional)

Note
(1) This field of data to be stored in the user memory of RFID tags installed;
(2) Real time record with reference to the built-in clock inside the reader;
(3) Data to be input after the building component is installed in its final location;
(4) The "Remarks" field is to record any other information related to the component, e.g. any door furniture installed.
(5) Unalterable unique TID is assigned by the manufacturer of RFID tags.
(6) RFID tag no. to be stored in the format of Electronic Product Code (EPC).
(7) For timber door to be installed in common areas, the following abbreviation to be stored in the data field of "Flat Number":
   ST – Staircase          EM – Electrical Meter Room   TB – T.B.E Room
   PD – Pipe Duct Room     SW – Switch Room           CD – Cable Duct Room
   FS – FS Pump Room       SR – Store Room            WC – Toilet
   LM – Lift Machine Room  CO – Corridor              LL – Lift Lobby
   RS – Refuse Storage & Material Recovery Room
For other areas, abbreviation to be proposed by the Main Contractor for CMR’s agreement.
APPENDIX COM11/IV

COM11.APPEND4.7 CONCEPTUAL WORKFLOW FOR THE RFID SYSTEM - METAL GATESET

SYSTEM SET UP

Start

Contractor set up a RFID System

Contractor submit RFID hardware; the proposed RFID Middleware* and RFID Web-based Database System to CM for approval

CM

No

Carry out Field Trial and System Acceptance Tests

No

System

Establish User Accounts and the System is ready for production use

*Middleware = Software for the communication/data transfers amongst RFID tags, RFID Readers/ and the RFID Web-based Database System. **The provisional approval from CM as per COM11.D110.
PLANT

Users can access the RFID Web-based Database System via internet

Data in the RFID Reader and all other necessary data uploaded to the RFID Web-based Database System via internet

Related the RFID Tag number with metal gateset serial number

The RFID Reader automatically record the production date and time

Read the RFID tag by the RFID Reader

Metal gateset leaving the factory to site

Read the RFID tag by the RFID Reader

Export related data to HA's system

Start

Manufacturing of the metal gateset

Install RFID tag in the metal gateset

Site
Metal gateset delivered on site

The RFID Reader automatically record the date and time of metal gateset arrival

Install the metal gateset in location

Data in the RFID Reader and all other necessary data uploaded to the RFID Web-based Database System via internet

The RFID Reader automatically record the date and time of metal gateset installation

Read the RFID tag by the RFID Reader

Finish

Users can access the RFID Web-based Database System via internet

Export related data to HA's system

Read the RFID tag by the RFID Reader
Data Fields for data to be stored and maintained in the RFID Web-based Database System and RFID tags installed in Metal Gateset

APPENDIX COM11/VI

COM11.APPEND6.7  LOCATIONS OF RFID TAGS

Location of RFID Tags:
(A1) Precast Facade

NOTES:
1. DIMENSIONS FOR THE LOCATION OF THE RFID TAG ARE APPROXIMATE FIGURES.
2. ALTERNATIVE DIMENSIONS CAN BE PROPOSED TO CONTRACT MANAGER FOR APPROVAL.
3. DRAWINGS ARE NOT TO SCALE.
4. THE APPROXIMATE POSITION OF RFID TAG SHOULD BE AS SHOWN ON THE DRAWINGS.
5. SEE (A2) FOR DETAIL ‘A’.
Location of RFID Tags:
(A2) Precast façade

NOTES:
1. DIMENSIONS FOR THE LOCATION OF THE RFID TAG ARE APPROXIMATE FIGURES.
2. ALTERNATIVE DIMENSIONS CAN BE PROPOSED TO CONTRACT MANAGER FOR APPROVAL.
3. DRAWINGS ARE NOT TO SCALE.
4. THE APPROXIMATE POSITION OF RFID TAG SHOULD BE AS SHOWN ON THE DRAWINGS.
Location of RFID Tags:
(B) Aluminum Window
Location of RFID Tags:
(C) Timber Door

ELEVATION
* The dimension can be vary to prevent the clashing with the door hinge.

SOLID WOOD LIPPING
(Caution in the nailing process of the solid wood lipping to prevent damage of the RFID tag)
Location of RFID Tags:

(D) Metal Gateset
APPENDIX COM11/VII

COM11.APPEND7.7 RFID TAG STRUCTURE
The encoding structure for data to be stored in RFID tags should be as follows:

<table>
<thead>
<tr>
<th>Unique Tag Identifier (TID) assigned by Tag Manufacturer (Unalterable)</th>
<th>User-defined Serial Number – RFID Tag Number stored in the form of Electronic Product Code (EPC) (Write-protected)</th>
<th>Individual Asset Reference</th>
<th>User Information (Write-protected)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Company Prefix</td>
<td>Product ID</td>
<td>Version</td>
<td>Serial number</td>
</tr>
</tbody>
</table>

Unique Tag Identifier (TID): Each RFID Tag shall have a unique TID assigned by Tag manufacturer. The TID must be unique for the same manufacturer. This TID is unalterable. At least 20-bit shall be provided.

User-defined Serial Number: The user-defined serial number is a GIAI number in accordance with GS1 EPC GIAI-96 standard and shall be used as the RFID tag number. The GIAI number shall be stored in EPC number area in the form of Electronic Product Code. The GIAI number shall comprise of company prefix and individual asset reference. At least 62-bit shall be provided.

Company Prefix: The company prefix shall denote the Contractor. The coding number of the Contractor shall be in accordance with the information provided by CM.

Individual Asset Reference: Individual asset reference shall comprise the data of product ID, version of the EPC scheme and serial number of the building component.

Product ID: The product ID shall denote the type of building components. The coding number of the type of building components shall be in accordance with the information provided by CM. At least 10-bit shall be provided.

Version: The version of EPC scheme shall be defined by the Contractor. At least 7-bit shall be provided.

Serial Number: Serial number shall comprise the data of the contract number, reserved memory for future extension, RFID Device ID and serial numbers of building components. At least 45-bit shall be provided.

Contract Number: Coding number shall be defined by the Contractor for mapping to HA’s building contract number in the RFID web-based system. At least 13-bit shall be provided.

Reserved: At least 4-bit reserved memory shall be provided for future extension.
Device ID: Coding number shall be defined by the Contractor for mapping to the RFID device used to write the RFID tag. At least 7-bit shall be provided.

B.C. Serial Number: A serial number shall be defined and assigned by the Contractor or the building components manufacturer for each building component to be used in the Contract. The serial number shall not be repeated. At least 21-bit shall be provided.

User Information: The information specified in APPENDIX COM11/I to /IV including Contract Number, Contractor, Type of Building Component and Serial Number shall be stored in the user memory in the following sequence:

e.g. 20131234#### – ABC COMPANY# – PCF – MFT5BLK1RM2001#####

(1) HA’s Contract Number (maximum 12 characters)
(2) Name of the Contractor (maximum 15 characters) * Abbreviation to be agreed by CM
(3) Type of Building Components (maximum 3 characters) * e.g. PCF for Precast Façade, ALW for Aluminium Window, TID for Timber Door and MEG for Metal Gateset, etc.
(4) Building Component Serial Numbers (maximum 20 characters) * Format shall be defined by the Contractor or Manufacturer

Remarks:
(i) # represents space
(ii) Each data field shall be separated by dash " – " or a space.
PLASTIC FOLDING DOORS

MATERIALS

PLASTIC FOLDING DOORS

1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed plastic folding door for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name/model name and job reference of the product;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. Shop drawings and installation methods.
   b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(b) for CM's information:
      i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works or at an earlier date for domestic blocks subject to CM's consideration on the track records as maintained by the Housing Department;
      ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material to Site;
      iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:
   a. Extruded plastic folding doors of robust design and smooth sliding and folding operation shall comprise of the following:
      i. Double ply door leaves with rigid joint;
      ii. Caps at top and bottom of door leaves and stiles;
      iii. Vertical twin rollers securely connected to the door leaves. For leading door leaf, two nos. vertical twin rollers shall be provided;
      iv. Plastic top rail;
      v. Closure channel for lead side and closure channel with hooks for end side;
      vi. Magnetic catch;
      vii. Plastic lock with plastic or corrosion resisting metal latch and with door handles on both sides. The lock shall be operated from inside bathroom without key. In case of emergency, the lock can be released by coin operated emergency bolt action or similar operation from outside.
   b. The quality and performance requirements are as follows:
<table>
<thead>
<tr>
<th>Items</th>
<th>Test Method</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endurance Test</td>
<td>To move the plastic folding door repeatedly backwards and forwards over a</td>
<td>No damage, deformation and serious wear and tear</td>
</tr>
<tr>
<td></td>
<td>distance equal to at least 90% of the full travel distance of the plastic</td>
<td></td>
</tr>
<tr>
<td></td>
<td>folding door from the closed position for 60,000 cycles with 7 second per</td>
<td></td>
</tr>
<tr>
<td></td>
<td>cycle. The operation rest for one hour at 5,000 cycle interval.</td>
<td></td>
</tr>
</tbody>
</table>
WORKMANSHIP

PLASTIC FOLDING DOORS

COM12.W010.7 PLASTIC FOLDING DOORS
1. Install the plastic folding doors in accordance with manufacturers’ instructions;
2. The clear door width shall not be less than 750 mm after the installation of the plastic folding door.
TESTING

SURVEILLANCE TESTS

COM12.T010.7 SURVEILLANCE TESTS FOR PLASTIC FOLDING DOORS

1. Testing Arrangements:
   a. When Instructed, surveillance tests shall be carried out by CM’s Representative, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the following pertaining to surveillance tests:
      i. Provide attendance on the Site;
      ii. Provide, deliver and collect samples etc. as directed by CM.

2. Testing Samples:
   a. Provide one set of test sample from the batch of material delivered to Site;
   b. One set of test sample shall consist of one plastic folding door. Sample shall consist of the complete set of components as to be installed to ensure normal operation. Bear all cost for any replacement of samples.

3. Testing methods:
   a. As per COM12.M010 (2)(b).

4. Non-compliance:
   a. In the event that the testing samples fail to meet the testing requirements, follow either one of the following actions:
      i. Remove the representative batch off Site; or
      ii. Carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) above in a laboratory that complies with the requirements stated in PRE.B9.570 on three separate sets of samples selected by the CM from the representative batch. In case any one sample fails the re-test, remove the representative batch off Site.
   b. When the representative batch of plastic folding doors is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3) above in a laboratory that complies with the requirements stated in PRE.B9.570 for one sample selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clause (4)(a);
   c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.

FIN1 PLASTERED AND RENDERED FINISHES

MATERIALS

CEMENT AND LIME

FIN1.M010.7 CEMENT

1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed material for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name, and job reference of the material;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. When the material is supplied, plain or prebagged, for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:
         - Original or a certified true copy of the ISO 9001 certificate for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by a certification body or by the QCM. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.
         - Original or a certified true copy of the product conformity certificate to the "Product Conformity Certification Scheme For Cement Products" published by the Hong Kong Concrete Institute. The product conformity certificate shall be issued by a certification body accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS. If a photocopy of the product conformity certificate is submitted, it shall be certified true by the certification body or by the QCM;
   b. A summary of the test results under the audit testing of the "Product Conformity Certification Scheme For Cement Products". The summary shall be prepared by the accredited laboratory carried out the testing or the certified manufacturer. If so directed by CM, submit a full set of the audit test reports to CM for record;
   c. Original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2) for CM's information unless the test requirements are covered by the scope of the "Product Conformity Certification Scheme For Cement Products":
      i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works;
      ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);
iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:

3. On Site Delivery Verification:
   a. At delivery stage, submit the following documents:
      i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a); one batch being the material quantity covered under each delivery note;
      ii. Delivery notes for all material delivered to Site.
   b. Carry out and submit report on the following verifications for cement upon delivery on Site. Prior to carrying out the verifications, inform CM's representatives who may present to witness the verifications:
      i. Method:
         | Verification Items | Method    | Acceptance Standards                                           |
         |--------------------|-----------|---------------------------------------------------------------|
         | Delivery Note      | Document Check | Serial number recorded in the Delivery Notes to be same as the material delivered. |
         | Material and packaging | Visual   | To Approved sample                                             |
         | Expiry Date        | Check information printed on the packaging | Not expired
      ii. Frequency:
         One set of verification should be carried out for every delivery of the material made to Site under each Delivery Note submitted in sub-clause (3)(a).
   c. Where any of the verifications fail to meet the acceptance standards, either:
      i. Remove the representative batch off Site and one batch being the material quantity covered under each delivery note; or
      ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

**FIN1.M020.7 LIME**

1. Submission Requirements:
   a. As per **FIN1.M010** (1).

2. Quality Requirements:
   a. Hydrated lime to BS 890:1995;
   b. In sealed bags bearing the manufacturer's name or brand.

3. On Site Delivery Verification:
   a. As per **FIN1.M010** (3).
FIN1.M030.7  LIME PUTTY
Prepared in accordance with BS 5492:1990 by adding hydrated lime to water and mixing to a thick, creamy consistency, after leaving for a minimum of 16 hours before use.

GYPSUM PLASTERS

FIN1.M110.7  UNDERCOAT FOR SOLID BACKGROUNDs
Retarded hemihydrate gypsum browning plaster to BS 1191:Part 1:1973, Class B, Type a1, mixed with sand, 1 : 2.

FIN1.M120.7  UNDERCOAT FOR METAL LATHING
Retarded hemihydrate gypsum lathing plaster to BS 1191:Part 1:1973, Class B, Type a2, mixed with sand, 1 : 1.5.

FIN1.M130.7  FINISH COAT
Retarded hemihydrate gypsum finish plaster to BS 1191:Part 1:1973, Class B, Type b1, with or without lime putty to a maximum of 25%.

ACOUSTIC PLASTER

FIN1.M210.7  ACOUSTIC PLASTER
1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed material for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name, and job reference of the material;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. A letter from the manufacturer certifying that the plaster is asbestos free.

   b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2) for CM's information:
      i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works;
      ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material to Site;
      iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:
   a. A proprietary plaster;
   b. Asbestos free.
**WATER**

FIN1.M310.7 WATER

In accordance with PRE.B10.1210 to PRE.B10.1260.

**AGGREGATES**

FIN1.M410.7 SAND GENERALLY

1. Clean, hard, durable crushed rock, or clean sand; free from salt and its quality shall comply with the "quality of sand" as stated in BS 1199:1976;
2. The quantity of clay, fine silt and fine dust present, when determined in accordance with BS 812:Section 103.1:1985, must not exceed 10% by weight.

FIN1.M420.7 GRADING OF SAND FOR MIXES WITHOUT LIME

1. The grading of sand shall conform with Type A under Table 1 of BS 1199:1976 Amendment No.3;
2. Sand other than the 6.30 mm size, whose grading falls outside the limits as set out in the table stated in sub-clause (1) above by a total amount of not exceeding 5% will be accepted.

FIN1.M430.7 GRADING OF SAND FOR MIXES WITH LIME

1. The grading of sand shall conform with Type B as stated under Table 1 of BS 1199:1976 Amendment No.3;
2. Sand other than 6.30 mm size, whose grading falls outside the limits as set out in the table as stated in sub-clause (1) above by a total amount of not exceeding 5% will be accepted.

FIN1.M440.7 EXPOSED AGGREGATE RENDER/SHANGHAI PLASTER

Granite, white stone or marble chippings:
1. Graded from 3 mm to 5 mm;
2. Free from dust;
3. In the proportions given in the following table for the colour of finish required:

<table>
<thead>
<tr>
<th>Proportions of Chippings</th>
<th>Stone Chippings</th>
<th>Marble Chippings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Colour</td>

</tr>
<tr>
<td>White</td>
<td>White</td>
<td></td>
</tr>
</tbody>
</table>

FIN1.M450.7 PAPER PULP

Do not use.

FIN1.M460.7 READY-MIXED MORTARS AND READY-TO-USE MORTARS

1. Submission Requirements:
a. At sample submission and approval stage, submit a sample of the proposed material for CM's approval together with all the following substantiation for CM's information:
   i. Catalogue, brand name, and job reference of the material;
   ii. Name, address and contact person of the local supplier;
   iii. Name, address and contact person of the manufacturer;
   iv. When the material is supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:
      - Original or a certified true copy of the ISO 9001 certificate for the manufacturing plant for CM's inspection. If a copy of the ISO certificate is submitted, it shall be certified true by a certification body or by the QCM. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.

b. Original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2) for CM's information:
   i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works or at an earlier date for domestic blocks subject to CM's consideration on the track records as maintained by the Housing Department;
   ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);
   iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:
   a. To BS EN 998-1:2003, including requirements of "Evaluation of conformity’ on Initial type tests and Factory Production Control;
   b. The properties and performance requirements shall be type GP (General purpose rendering/ plastering mortar):

```
<table>
<thead>
<tr>
<th>Item</th>
<th>Method of Test</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compressive strength</td>
<td>EN 1015-11</td>
<td>&gt; 6 N/mm²</td>
</tr>
<tr>
<td>Dry bulk density</td>
<td>EN 1015-10</td>
<td>Self-declared (kg/m³)</td>
</tr>
<tr>
<td>Tensile Adhesion Strength</td>
<td>EN 1015-12</td>
<td>Self-declared, min. 0.5 N/mm²</td>
</tr>
<tr>
<td>Reaction to Fire</td>
<td>EN 13501-1</td>
<td>Self-declared on the mass or volume fraction of homogeneously distributed organic materials and reaction to fire class</td>
</tr>
<tr>
<td>Durability</td>
<td>-</td>
<td>Self-declared to the provisions valid in the intended place of use of the mortar</td>
</tr>
</tbody>
</table>
```

3. On Site Delivery Verification:
   a. At delivery stage, submit the following documents:
i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a);

ii. Delivery notes for all material delivered to Site.

b. Carry out and submit report on the following verifications for ready-mixed mortars upon delivery on Site. Prior to carrying out the verifications, inform CM’s representatives who may present to witness the verifications:

i. Method:

<table>
<thead>
<tr>
<th>Verification Items</th>
<th>Method</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delivery Note</td>
<td>Document Check</td>
<td>Serial number recorded in the Delivery Notes to be same as the material delivered</td>
</tr>
<tr>
<td>The date &amp; time of final mixing &amp; specified Working Life</td>
<td>Check information printed on the Delivery Notes</td>
<td>Not expired</td>
</tr>
</tbody>
</table>

ii. Frequency:

One set of verification should be carried out for every delivery of ready-mixed mortar made to Site under each Delivery Note submitted in sub-clause (3)(a).

c. Where any of the verifications fail to meet the acceptance standards, remove the delivery off Site.

**RENDERS**

**FIN1.M510.7**  
UNDERCOATS GENERALLY  
Cement and sand or granite fines, 1 : 3.

**FIN1.M520.7**  
RENDERS FOR TILE AND MOSAIC FINISHES  
To BS 5385:Part 2:1991, cement and sand or granite fines, 1 : 3.

**FIN1.M530.7**  
FINISH COAT FOR INTERIOR PAINT FINISHES  
Cement, lime and sand or granite fines, 1 : 3 : 6.

**FIN1.M540.7**  
FINISH COAT FOR EXTERIOR PAINT FINISHES  
Cement and sand or granite fines, 1 : 3.

**FIN1.M550.7**  
FINISH COAT FOR EXPOSED AGGREGATE RENDER/SHANGHAI PLASTER  
Cement and stone chippings, 1 : 1:  
1. Colour: as shown on Drawings;  
2. Cement: colour as appropriate for required finish colour (see table to clause FIN1.M440).

**FIN1.M560.7**  
PFA IN CEMENTITIOUS RENDERS  
Cementitious render mixes containing a blend of Ordinary Portland Cement and Pulverized Fuel Ash may be offered as a substitute for those specified in this Worksection provided that:
2. Not more than 25% by weight of the cementitious content of the proposed mix comprises PFA;
3. The physical properties and workability of the proposed mix can be demonstrated to be equivalent to or better than those of the specified mixes to the CM's satisfaction;
4. Setting and hardening times will not be so affected as to compromise the construction programme;
5. The PFA cement mortar is a manufactured product pre-mixed off-site and delivered in bulk by mixer trucks to Site;
6. No site mixing is allowed and storage of PFA on Site is not permitted.

**LIME PLASTERS**

**FIN1.M610.7** UNDERCOATS FOR SOLID BACKGROUNDS  
Cement, lime, sand, 1 : 1: 4.

**FIN1.M620.7** UNDERCOATS FOR METAL LATHING  
Cement, lime, sand, 1 : 2: 6.

**FIN1.M630.7** FINISHING COAT  
Cement, lime and sand, 1 : 1 : 4.

**FIN1.M640.7** PAPER PULP PLASTER  
Do not use.

**SPECIALIST RENDERS**

**FIN1.M710.7** DECORATIVE FINISHES  
Resin, epoxy, urethane and acrylic based finishes obtained from Approved manufacturers.

**ADMIXTURES FOR CEMENTITIOUS RENDERS**

**FIN1.M810.7** GENERAL  
Ensure that the chloride ion content of admixtures for renders containing embedded metal does not exceed 2% by mass of the admixture or 0.03% by mass of the cement, whichever is the less.

**FIN1.M820.7** PIGMENTS FOR PORTLAND CEMENT AND PORTLAND CEMENT PRODUCTS  
To BS 1014:1975.

**FIN1.M830.7** ACCELERATING ADMIXTURES  
FIN1.M840.7  RETARDING ADMIXTURES

FIN1.M850.7  WATER REDUCING ADMIXTURES

FIN1.M860.7  SUPERPLASTICISERS

FIN1.M870.7  WATERPROOFING ADMIXTURE
1. Approved proprietary waterproofing product;
2. The waterproofing admixture shall comply with the following:
   a. Do not cause any hazard or injury to the operatives;
   b. Compatible with all other contacting materials.
3. Store the material in a cool, well ventilated and covered storage accommodation.

FIN1.M880.7  WATERPROOFING ADMIXTURE FOR TANKS FOR POTABLE WATER
Non-toxic type of additive approved by the Water Supplies Department for this purpose.

ANCILLARY MATERIALS

FIN1.M910.7  SPATTERDASH
1. Cement and coarse sand or granite fines, 1:2, and an Approved proprietary bonding agent of Styrene Butiene Rubber (SBR) latex, Ethyl Vinyl Acctate (EVA) emulsion, or an acrylic emulsion in accordance with the manufacturer's recommendations;
2. When a proprietary surface applied bond coat is proposed by the Contractor as an alternative to replace the spatterdash bonding compound in sub-clause (1) and approved by CM, its application procedures as recommended by the manufacturer must be strictly followed. Take extreme care during application and inspection of the work.

FIN1.M920.7  BONDING AGENT
An Approved proprietary product:
1. Compatible with both the background and the subsequent application;
2. Designated as suitable for internal or external use;
3. Either for surface application or integral mixing.

FIN1.M930.7  PLAIN EXPANDED METAL LATHING
To BS 1369:Part 1:1987:
1. Reference number: L3, expanded metal lath G275;
2. Size: minimum 5 mm across short way of mesh;
3. Weight: not less than 1.6 kg/m² ± 15%;
FIN1.M940.7  RIBBED EXPANDED METAL LATHING
To BS 1369:Part 1:1987:
1. Reference number: RL5, ribbed lath G275;
2. Size: minimum 5 mm across short way of mesh;
3. Weight: not less than 2.25 kg/m² ± 15%;

FIN1.M950.7  BEADS AND STOPS
1. Stainless steel corner beads, plaster stops and movement joint stops with expanded metal wings and obtained from an Approved manufacturer;
2. As an alternative to sub-clause (1) above, proprietary plastic beads or stops for use in internal areas may be proposed subject to CM's approval.

FIN1.M970.7  WIRE NETTING
To BS 1485:1983 and:
1. Mesh size: 25 mm;
2. Wire designation: 19;

FIN1.M980.7  STAPLES

FIN1.M990.7  TYING WIRE
1.22 mm diameter annealed steel wire, galvanized to BS 443:1982.
WORKMANSHIP

GENERAL

FIN1.W010.7  STANDARD
Generally comply with the following:
1. BS 5262:1991 in respect of external rendering;
2. BS 5492:1990 in respect of internal plastering.

FIN1.W020.7  CONSTRUCTION MOCK-UP
Construct a Construction Mock-up of around 5 m² as PRE.B9.440 for each different type of plastered and rendered surfaces showing the workmanship of each construction layer including background preparation through to the installation of finishes, including E&M works and accessories etc., as directed by CM.

FIN1.W030.7  READY-MIXED AND READY-TO-USE PLASTER AND RENDER APPLICATION
1. Submit method statement detailing the application procedure of ready-mixed and ready-to-use plaster or render finishes including preparation of the substrate for receiving plaster or render finishes for Approval;
2. Demonstrate the application method at the Construction Mock Up in accordance with FIN1.W020 before use.

FIN1.W040.7  MOVEMENT JOINTS
1. Construct movement joints as shown on the Drawings and as specified in Worksection CON6;
2. Ensure the joint cavity all the way back to the concrete substrate is free from mortar and incompressible material;
3. Ensure the movement joints extend through the combined depth of the tiles, tile bedding and render substrate.

FIN1.W050.7  HANDLING AND STORAGE OF GYPSUM PLASTERS
Ensure that gypsum plaster is delivered to Site in sealed containers and:
1. Store in weathertight structures with a raised floor;
2. Store different types of consignments separately;
3. Use plaster in the order of delivery.

FIN1.W060.7  ADMIXTURES
Mix and apply admixtures in accordance with manufacturer's instructions.

BACKGROUND PREPARATION FOR PLASTER AND RENDERING

FIN1.W110.7  GENERAL
To BS 5385:1995 and BS 8000:Part 10:1995 and comply with the followings:
1. Use high pressure water jet to remove efflorescence, laitance, oil, formwork release agent, grease, dirt and loose materials from the concrete surfaces prior to application of subsequent finishes;

2. Allow minimum 4 weeks continuous drying out for new concrete wall after curing before cement sand plastering/rendering commence;

3. Allow additional 2 weeks drying out after application of cement sand plastering/rendering to concrete wall before tiling. Extend drying time in damp weather conditions and adjust programme to ensure satisfactory installation;

4. Protect the prepared concrete surfaces from the weather and contamination from concreting run-offs.

FIN1.W120.7 CONCRETE BACKGROUNDS GENERALLY
Hack off extraneous concrete projections.

FIN1.W130.7 PREPARING HARDENED CONCRETE TO RECEIVE CEMENTITIOUS RENDERS
Either:
1. Prepare surface by:
   a. Shortly before applying the finish, thoroughly hacking the concrete surface to remove any laitance or, where Approved, with an electric spade;
   b. Thoroughly cleaning and wetting the surface as required, to adjust its suction, before applying finish and remove surplus water;
   c. Brushing neat cement slurry into the damp surface immediately before applying the finish; or
2. Apply bonding agent in accordance with the manufacturer's recommendations.

FIN1.W140.7 PREPARING HARDENED CONCRETE TO RECEIVE GYPSUM PLASTERS
Apply bonding agent in accordance with the manufacturer's recommendations.

FIN1.W150.7 JUNCTIONS BETWEEN DISSIMILAR SOLID BACKGROUNDS
At junctions between different backgrounds, like concrete and blockwork, or where the same finish is to be applied to surfaces in differing planes, fix a strip of steel lathing as FIN1.W310.

FIN1.W160.7 JUNCTIONS BETWEEN PANEL WALL PARTITIONS AND OTHER BACKGROUNDS
As MAS1.W1140.

FIN1.W170.7 DUBBING OUT
When necessary to correct inaccuracies in the background, dub out:
1. In layers of a maximum thickness of 10 mm;
2. In the same mix as the first coat;
3. Allowing each coat to dry out before applying the next;
4. Cross scratching each coat to provide a key for the next;
5. To a total thickness not exceeding 25 mm.
APPLYING SPATTERDASH TO NEW CONCRETE

FIN1.W210.7 APPLYING SPATTERDASH
1. Apply spatterdash to concrete vertical surfaces and soffits immediately after striking formwork;
   a. Throw on spatterdash to give an overall coverage of thin coating of rough texture such that;
      i. Uncovered areas do not exceed 0.01 m²;
      ii. Spacing between strokes is less than 50 mm;
      iii. Uncovered area at wall edges is less than 50 mm.
   b. After hardening and curing, use high pressure water jet to clean off dust and loose particles before applying subsequent finishing coat.
2. Use spatterdash as late-applied mechanical key to concrete with bonding agent if late application of spatterdash is proposed by the Contractor and subject to satisfaction of the CM.

FIN1.W240.7 JOINT INSPECTION TO SPATTERDASH
1. Carry out joint inspection with CM's representative to minimum 10% of spatterdash;
2. After hardening and curing, check the adhesion of the spatterdash coat by brushing with a stiff wire brush;
3. Where spatterdash is easily removed, completely remove loosened spatterdash. Re-apply and re-inspect after 7 days;
4. Do not start subsequent works on any affected area until re-inspection is to CM's satisfaction.

FIXING STEEL LATHING

FIN1.W310.7 FIXING METHODS
Fix taut, with the long dimension of mesh running at right angles to the supports where provided, and:
1. To concrete, brickwork, blockwork or cement-sand backfilling, with 40 mm long nails or staples or with explosive cartridges when agreed by CM's representative at 300 mm centres staggered and fitted with appropriate sized washers;
2. To timber, with staples at not more than 100 mm centres;
3. To steelwork, with tying wire at not more than 100 mm centres;
4. Extend at least 150 mm to either side of the junction with the fixing methods as above at junctions between dissimilar solid backgrounds or discontinuous constructions.

FIN1.W320.7 LAPS
Secure laps with tying wire at 75 mm centres and lap:
1. 25 mm minimum, generally;
2. 50 mm where end laps occur between supports.

FIN1.W330.7 CUT ENDS
Apply one coat of bituminous paint or zinc rich primer to cut ends.
MIXING PLASTERS AND RENDERS

FIN1.W410.7 GAUGE BOXES
Measure constituents by volume, using clean gauge boxes of sizes to suit the volumes required.

FIN1.W420.7 MIXING RENDERS
To BS 8000:Part 10:1995:
1. By mechanical mixer or, where Approved, by hand on a clean, close-boarded platform;
2. Avoid too strong or too wet render mix which will increase the render drying shrinkage;
3. Without over-mixing renders containing plasticizers;
4. Dry constituents before mixing with lime putty or water;
5. Using the minimum amount of water to achieve the required consistency making due allowance for the moisture content of sand.

FIN1.W430.7 MIXING GYPSUM PLASTERS
To BS 8000:Part 10:1995:
1. Mix plasters for hand application by hand unless otherwise Approved;
2. Allow for the moisture content of sand in sanded mixes;
3. Do not use admixtures.

FIN1.W440.7 LIMITS ON USE OF MIXED MATERIAL
1. Use within one hour of mixing, with the exception of those added with retarding admixture, and:
   a. Do not use after the initial set has taken place; and
   b. Do not reconstitute material.
2. Submit compatibility report and method statement if use of pulverised fuel ash is proposed.

FIN1.W450.7 USE OF SUPERPLASTICIZERS
Use strictly in accordance with the manufacturer's recommendations and adjust the mix proportions of the render accordingly.

APPLYING RENDER

FIN1.W510.7 KEYING UNDERCOATS
Cross scratch undercoats to provide key for each subsequent coat.

FIN1.W520.7 RENDER FOR TILE OR MOSAIC FINISH
To BS 5385:Part 1:1995 and BS 5385:Part 2:1991 with particular attention to the following:
1. For render applied in a single coat:
   a. For manual application, to a maximum thickness of 10 mm; for mechanical applications, comply with manufacturer's recommendations;
b. Where localized undulation is greater than 10 mm, apply in two coats as specified in sub-clause (2) below for manual applications.

2. For render applied in more than one coat adopting manual application:
   a. Undercoat not exceeding 10 mm thick;
   b. Second coat not exceeding 10 mm thick and should not be thicker than the undercoat;
   c. Combs undercoat to provide the key for the second coat, and allow undercoat to harden and dry out as stated in FIN1.W1210;
   d. When the total thickness exceeds 20 mm, add metal lathing in the undercoat to CM's approval.

3. For subsequent tile finishes with cement sand bedding, comb the top coat of the render lightly to form the key; and for tile finishes with cementitious adhesive bedding, provide the top coat with wood float finish;

4. For subsequent mosaic finishes with cement sand bedding or cementitious adhesive bedding, provide the top coat of the render with float finish by polystyrene or wood to form the key.

FIN1.W530.7 RENDER FOR PAINT FINISH

Apply in two coats as follows:

1. Undercoat not exceeding 10 mm thick scratched to form key;
2. Finish coat to be one of the following as specified in Drawings:
   a. Finish coat for interior paint finishes as FIN1.M530, 5 mm thick trowelled smooth;
   b. Finish coat for exterior paint finishes as FIN1.M540, not exceeding 10 mm thick trowelled smooth in accordance with clause FIN1.W910.

FIN1.W540.7 WATERPROOF RENDERING FOR STANDARD DOMESTIC

Incorporate waterproofing admixture into render strictly in accordance with the manufacturer's recommendations and apply in two coats as follows:

1. Undercoat not exceeding 10 mm thick;
2. Finish coat:
   a. Not exceeding 10 mm thick with the surface lightly scratched to form a key where tiles are to be fixed; or
   b. As FIN1.M540, 5 mm thick trowelled smooth where paint is to be applied.

FIN1.W550.7 EXPOSED AGGREGATE RENDER/SHANGHAI PLASTER

Apply in two coats, as follows:

1. Undercoat 10 mm thick;
2. Finish coat 10 mm thick;
3. Before the finish coat has set, scrub off the surface to expose the aggregate.

APPLYING LIME PLASTERS

FIN1.W610.7 KEYING UNDERCOATS

Cross scratch undercoats to provide a key for subsequent coats.
FIN1.W620.7 **SOLID BACKGROUNDS**
1. Apply in two coats on walls as follows:
   a. Undercoat not exceeding 10 mm thick;
   b. Cement, lime, sand finishing coat, 5 mm thick.
2. Apply in one coat to soffits as FIN1.M630 not exceeding 10 mm.

FIN1.W630.7 **METAL LATHING INTERNALLY**
Apply in three coats to a total thickness not exceeding 13 mm measured from the face of the lathing as follows:
1. First and second undercoats to a thickness not exceeding 8 mm;
2. Finish coat of cement, lime, sand, 5 mm thick, or of gypsum plaster gauged with lime, 5 mm thick, and brought to a smooth finish.

FIN1.W640.7 **EXTERNAL ANGLES**
Finish external angles, except those to beam soffits, with returns 50 mm wide in Keene's cement, on a cement sand render backing as FIN1.M510, with a slightly rounded arris.

**APPLYING GYPSUM PLASTER**

FIN1.W710.7 **KEYING UNDERCOATS**
Cross scratch undercoats to provide a key for subsequent coats.

FIN1.W720.7 **SOLID BACKGROUNDS**
Apply in two coats to a total thickness not exceeding 10 mm, as follows:
1. Undercoat;
2. Finish coat trowelled to a smooth finish.

FIN1.W730.7 **METAL LATHING**
Apply in three coats to a total thickness not exceeding 13 mm, measured from the outer face of the lathing, as follows:
1. First and second undercoats;
2. Finish coat trowelled to a smooth finish.

**ARRISES, BEADS, STOPS AND CORNICES**

FIN1.W810.7 **ARRISES**
Form arrises to be square or pencil round as shown on Drawings.

FIN1.W820.7 **FIXING BEADS AND STOPS**
Fix corner beads, plaster stops and movement joint stops with nails, staples or plaster dabs and trowel the finish coat flush with the outer edge of the beads or stops to manufacturer's recommendations.

FIN1.W830.7 **CORNICES**
Form coved or moulded cornices either:
1. With a backing of cement, sand render, 1 : 3 and a finish coat identical to that used on the adjacent wall, finished with a steel template, to a smooth finish; or
2. With pre-formed sections, fixed in accordance with the manufacturer's recommendations.

SURFACE FINISHES

FIN1.W905.7 GENERAL
Finish plaster and render the surfaces as shown on the Drawings and in accordance with the following clauses in this sub-section to the same standard of workmanship as Approved in the Construction Mock-up specified in PRE.B9.440.

FIN1.W910.7 SMOOTH FINISH
Finish with a steel trowel to a smooth surface, free of blemishes.

FIN1.W920.7 WOOD FLOAT FINISH
Finish with a dry wood float to give an overall even surface.

FIN1.W930.7 TEXTURED FINISH
Finish by stippling, scraping, brushing with a stiff brush or other means to produce an Approved textured surface.

FIN1.W940.7 ROUGH CAST FINISH
Throw a wet mix of aggregate and cementitious material onto the undercoat.

FIN1.W950.7 MACHINE APPLIED, TEXTURED FINISH
Apply in accordance with the manufacturer's recommendations.

ACOUSTIC PLASTER

FIN1.W1010.7 MIXING AND APPLYING
Mix and apply by special spray equipment:
1. In accordance with the manufacturer's recommendations;
2. Number of coats and total thickness: as shown on Drawings.

SPECIALIST RENDERS

FIN1.W1110.7 APPLICATION
Employ an Approved firm for the application of all resin, epoxy, urethane and acrylic based decorative finishes.

DRYING OUT AND CURING

FIN1.W1210.7 UNDERCOATS
Allow undercoats to dry out for 7 days before the application of a subsequent coat.
FIN1.W1220.7 PREMATURE DRYING
Prevent excessively rapid or localised drying out of wall or ceiling finishes by an Approved means.

ACCURACY AND TOLERANCES

FIN1.W1310.7 GENERAL
Comply with the requirements of Appendix H "Schedule of Tolerances" to this Specification and:
1. Finish wall and ceiling finishes to a true plane and to the correct line and level;
2. Ensure angles are true right angles unless otherwise required, with walls and reveals plumb and square.

PROTECTION AND CLEANLINESS

FIN1.W1410.7 PROTECTION OF EXISTING WORK
Protect existing work with boards, dust sheets and the like. Clean any droppings on existing work off immediately.

FIN1.W1420.7 PROTECTION OF NEW FINISHES
Prevent all finishes from discolouration or damage until completion.

FIN1.W1430.7 CLEANLINESS
Keep plant and tools clean and free from all traces of previous mixes.
TESTING

SURVEILLANCE TESTS

FIN1.T010.7  SURVEILLANCE TESTS FOR READY-MIXED MORTARS AND READY-TO-USE MORTARS

1. Test Arrangements:
   a. When Instructed, surveillance tests shall be carried out by CM's Representative, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the followings pertaining to surveillance tests:
      i. Provide attendance on the Site;
      ii. Provide, deliver and collect samples etc. as specified or as directed by CM.

2. Testing Samples:
   a. Provide one set of test sample from the batch of material delivered to Site under the delivery note as specified in FIN1.M460 (3)(a) or as instructed by CM. One batch being the material quantity covered under each delivery note;
   b. One set of test sample shall consist of one bag of ready-mixed or ready-to-use mortars.

3. Testing methods:
   As per FIN1.M460 (2)(b).

4. Non-compliance:
   a. In the event that the testing samples fail to meet the testing requirements, follow either one of the following actions:
      i. Remove the representative batch off Site; or
      ii. Carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 on three separate sets of samples selected by the CM from the representative batch. In case of any one sample fails the re-test, remove the representative batch off Site.
   b. When the representative batch of ready-mixed or ready-to-use mortars is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 for one sample selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clauses (4)(a);
   c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.
FIN2  PLASTERBOARD

MATERIALS

PLASTERBOARD

FIN2.M010.7 GYPSUM PLASTERBOARD
1. To BS 1230: Part 1:1985 with square edges;
2. Thickness: as shown on Drawings.

STUDDING

FIN2.M110.7 TIMBER STUDDING
As Worksection TIM1.

FIN2.M120.7 STEEL STUDDING
Galvanized steel support system to BS 7364:1990:
1. Design partition width: as shown on Drawings;
2. Minimum thickness of steel in studs: 0.55 mm;

FIXING AND JOINTING MATERIALS

FIN2.M210.7 NAILS FOR FIXING PLASTERBOARD
2.65 mm galvanized steel nails with jagged shanks, to BS 1202: Part 1:1974 and
1. 30 mm long for plasterboard not exceeding 12.7 mm thick;
2. 40 mm long for plasterboard not exceeding 19 mm thick.

FIN2.M220.7 JOINT REINFORCEMENT
Jute scrim cloth, not less than 90 mm wide.

FIN2.M230.7 BEADS AND STOPS
As FIN1.M950.

FIN2.M240.7 SCREWS FOR FIXING TO STEEL STUDDING
Self-drilling, self-tapping, plated, cross-head, countersunk screws, as recommended by the studding system manufacturer.

FINISHING PLASTER

FIN2.M310.7 BOARD FINISH PLASTER
Retarded hemihydrate gypsum plaster to BS 1191: Part 1:1973, Class B, Type 'b2'.
WORKMANSHIP

HANDLING AND STORAGE

FIN2.W010.7 PLASTERBOARD
1. Carry plasterboard on edge;
2. Stack plasterboard inside a building, flat, on a level surface and clear of the floor;
3. Keep the plasterboard dry and free of mould growth, programming deliveries to ensure that storage on site is kept to a minimum during periods of high humidity.

FIN2.W020.7 GYPSUM PLASTER
Ensure that gypsum plaster is delivered to Site in sealed containers and:
1. Store in weather-tight structures with a raised floor;
2. Store different types of consignments separately;
3. Use plaster in the order of delivery.

FIXING PLASTERBOARD

FIN2.W110.7 GENERAL

FIN2.W120.7 FIXING TO TIMBER BEARERS
Nail boards:
1. At each support;
2. At 150 mm centres;
3. At a minimum of 15 mm from the edge of each board;
4. Leaving a gap of 3 mm to 5 mm between the edges of the boards.

FIN2.W130.7 FIXING TO STEEL STUDDING
Erect studding and fix plasterboard, all to the studding manufacturer's sitework instructions and:
1. Screw fix plasterboard sheets generally at 300 mm centres;
2. Screw fix plasterboard to 200 mm centres to all external angles.

FIN2.W140.7 JOINTING
1. Fill joints with board finish plaster;
2. Press strips of reinforcement into the plaster, trowel flat and allow to set but not to dry before general plastering commences.

FIN2.W150.7 ACCURACY AND TOLERANCES
Comply with the requirements of Appendix H "Schedule of Tolerances", to this Specification and:
1. Finish wall and ceiling finishes to a true plane and to the correct line and level;
2. Ensure angles are true right angles unless otherwise required, with walls and reveals plumb and square.

FINISHING

FIN2.W210.7 PREPARATION
Fill all nail and screw heads and other imperfections with board finish plaster and allow to set but not to dry before general plastering commences.

FIN2.W220.7 APPLYING BOARD FINISHING PLASTER
Apply gypsum plaster as one finishing coat:
1. To a thickness not exceeding 3 mm;
2. Trowelled to a smooth surface using as little water as possible.

FIN2.W230.7 FIXING BEADS AND STOPS
As FIN1.W820.

FIN2.W240.7 ARRISSES
Finish arrises to be square or pencil round as specified in Drawings.

FIN2.W250.7 PROTECTION
Protect all finishes from discolouration or damage until completion of the Works.
FIN3 SCREEDS

MATERIALS

GENERAL

FIN3.M010.7 STANDARDS
Unless otherwise specified in this Worksection, supply materials for and lay screeds in accordance with the relevant provisions of:

1. BS 8204:Part 1:1999;

CEMENT AND AGGREGATES

FIN3.M110.7 CEMENT
As FIN1.M010.

FIN3.M120.7 PFA IN SCREED MIXES
Screed mixes containing a blend of Ordinary Portland Cement and Pulverized Fuel Ash may be offered as a substitute for those specified in this Worksection provided that:

2. Not more than 25% by weight of the cementitious content of the proposed mix comprises PFA;
3. The physical properties and workability of the proposed mix can be demonstrated to be equivalent to or better than those of the specified mixes to the CM's satisfaction;
4. Setting and hardening times will not be so affected as to compromise the construction programme.

FIN3.M130.7 SAND GENERALLY
As FIN1.M410.

FIN3.M140.7 GRADING OF SAND FOR SCREEDS
As FIN1.M420.

FIN3.M150.7 LIGHTWEIGHT AGGREGATES
Either:
1. 5 mm exfoliated vermiculite to BS 3797:1990; or
2. Lightweight beads or granules of Approved proprietary manufacture.

FIN3.M160.7 COARSE AGGREGATE FOR SCREEDS 48 MM THICK AND OVER
Aggregate graded from 10 mm down with at least 75% being retained on a 5 mm BS Test Sieve.
FIN3.M170.7 READY-MIXED MORTARS AND READY-TO-USE MORTARS
As FIN1.M460.

WATER

FIN3.M210.7 WATER
In accordance with PRE.B10.1210 to PRE.B10.1260.

SCREEDS

FIN3.M310.7 SCREEDS BETWEEN 25 MM AND 48 MM THICK
Consisting of cement and sand or granite fines, 1 : 3, mixed with the minimum of water consistent with workability.

FIN3.M320.7 SCREEDS 48 MM THICK AND OVER
Comprising a fine concrete mix of cement, sand or granite fines and course aggregate, 1 : 1.5 : 3.

FIN3.M330.7 LIGHTWEIGHT AGGREGATE SCREEDS FOR ROOFS
Consisting of cement and lightweight aggregate, 1 : 8 unless otherwise indicated by the manufacturer's recommendations.

FIN3.M340.7 LIGHTWEIGHT AGGREGATE SCREEDS FOR FLOORS
Consisting of cement and lightweight aggregate, 1 : 6 unless otherwise indicated by the manufacturer's recommendations.

FIN3.M350.7 AIR ENTRAINED SCREEDS
Having a maximum dry density of 1200kg/m³.

FIN3.M360.7 TOPPING FOR LIGHTWEIGHT SCREEDS
Consisting of cement and sand 1 : 4.

ANCILLARY MATERIALS

FIN3.M410.7 ADMIXTURES

FIN3.M420.7 BONDING AGENT
As FIN1.M920.

FIN3.M430.7 AIR ENTRAINING ADMIXTURE FOR LIGHTWEIGHT SCREEDS
An Approved proprietary product capable of producing a screed of the required density.
FIN3.M440.7  VAPOUR BARRIER
80 microns thick polyethylene sheet.

FIN3.M450.7  MECHANICAL MOVEMENT JOINTS
Obtain from an Approved manufacturer.

FIN3.M460.7  WATERPROOFING ADMIXTURE
As FIN1.M870.

FIN3.M470.7  WATERPROOFING ADMIXTURE FOR TANKS FOR POTABLE WATER
Non-toxic type of additive approved by the Water Supplies Department for this purpose.
WORKMANSHIP

BASE PREPARATION

FIN3.W010.7 GENERAL
1. Remove efflorescence, laitance, oil, grease, all traces of release agents, dirt and loose material by dry brushing and scraping;
2. Protect surfaces from the weather and ensure they are completely compatible with the finish to be applied before starting work.

FIN3.W020.7 PREPARATION OF HARDENED OR EXISTING CONCRETE
Either:
1. Prepare surface by:
   a. Shortly before applying the finish, thoroughly hacking the concrete surface to remove any laitance and to expose the aggregate;
   b. Thoroughly cleaning and wetting the surface as required, to adjust its suction before applying screed and remove surplus water;
   c. Brushing neat cement slurry into the damp surface immediately before applying the finish; or
2. Apply bonding agent in accordance with the manufacturer's recommendations.

MIXING SCREED MORTARS

FIN3.W110.7 GENERAL
1. Measure constituents by volume, using clean gauge boxes of sizes to suit the volumes required;
2. Make an appropriate allowance for bulking. The proportions given in this Worksection allow for the use of dry sand.

FIN3.W120.7 MIXING
Mix:
1. By mechanical mixer or, where Approved, by hand on a clean, closeboarded platform;
2. Without overmixing mortars containing plasticizers;
3. Dry constituents before mixing with water;
4. Using the minimum amount of water to achieve the required consistency.

FIN3.W130.7 LIMITS ON USE OF MIXED MATERIAL
Use within one hour of mixing and do not:
1. Use screed mortar after the initial set has taken place;
2. Reconstitute screed mortar.

FIN3.W140.7 READY-MIXED MORTARS AND READY-TO-USE MORTARS
Mix to BS 4721:1981 and use strictly in accordance with manufacturer's recommendations for screeds.
THICKNESSES OF SCREEDS

**FIN3.W210.7 BONDED TO HARDENED CONCRETE**
Lay screed to the level shown on the Drawings in a layer normally up to 40 mm thick and with a minimum thickness of 25 mm at any point. Thickness of the screed may be increased to above 40 mm as and when indicated on the Drawings.

**FIN3.W220.7 UNBONDED**
Lay screeds not fully bonded to the base to the levels shown on the drawings in a layer up to and exceeding 70 mm thick and with a minimum thickness of 50 mm at any point, excluding the applied tile finish unless otherwise specified in the drawings.

**FIN3.W230.7 FLOATING SCREEDS**
Lay screed to the level shown on the Drawings in a layer up to and exceeding 90 mm thick and with a minimum thickness of 65 mm at any point, excluding the applied tile finish.

**FIN3.W240.7 LIGHTWEIGHT SCREEDS**
Lay screed to the level shown on the Drawings in a layer up to and exceeding 90 mm thick and with a minimum thickness of 65 mm at any point, excluding the toping.

**FIN3.W250.7 TOPPING FOR LIGHTWEIGHT SCREEDS**
Finish lightweight screeds with a topping of 15 mm minimum thickness.

LAYING SCREEDS

**FIN3.W310.7 GENERAL**
To BS 8000:Part 9:1989, lay and compact screeds level or to falls as shown on the Drawings or as otherwise required.

**FIN3.W320.7 MECHANICAL APPLICATION**
Submit method statement for mechanical method of applying screeding for Approval before use.

**FIN3.W330.7 LAYING SCREEDS**
Lay screeds to BS 8204:Part 1:1999 with particular attention to the following:

1. In areas of 24 m²and larger:
   a. Not greater than 3 to 4 m width and 5 to 6 m length for screed of all thickness; and the joints of the bays shall follow any movement joints of the base slab;
   b. With the length of each bay not greater than 1.5 times its width;
   c. In a chequerboard pattern.

2. In areas or rooms smaller than 24 m²:
   a. To whole area or room, or as sub-clauses (1)(a) and (1)(b); and
   b. Form a construction joint at door openings, or along the shortest distance across the area or room.

3. In corridors:
   a. To the full corridor width;
b. In alternating bays not exceeding 6 m in length, and the joints of the bays shall follow any movement joint of the base slab.

4. Allowing a minimum of 12 hours to elapse between the laying of screeds in adjoining bays, connecting areas or rooms, or alternate bays;

5. As an alternative to sub-clause (4) above, the Contractor may propose to lay screeds in adjoining bays, connecting areas or rooms, and alternate bays with appropriate removable joint filler boards. Submit proposal with method statement to CM for approval.

FIN3.W336.7 VERIFICATION OF BONDED SCREED
To BS 8204:Part 1:1999 with particular attention to the following:

1. Arrange CM to select verification locations when the maximum effect of drying shrinkage of screed has taken place and before applying tile;

2. Perform one set of verification for every 10 floors or part thereof;

3. Verify the screed bonding by tapping or dragging a rod or a mallet on the surface. Hollow sound and when accompanied by lifting of bay edges or at cracks, or when not to the satisfaction of CM, propose remedial method(s) and make good the unsatisfactory areas to the satisfaction of CM.

4. Make reference to the Construction Mock-up as per PRE.B9.440 for surface roughness;

5. Record the verifications, together with the date, location reference and any other relevant information and submit two copies of the completed record to the CM.

FIN3.W340.7 LAYING LIGHTWEIGHT SCREEDS
Lay topping monolithically with the screed.

FIN3.W350.7 VAPOUR BARRIER
Loose lay a vapour barrier under lightweight roof screeds, lapping 150 mm at joints.

FIN3.W360.7 ADMIXTURES
Mix and apply admixtures in accordance with manufacturer's instructions.

FINISHES

FIN3.W410.7 GENERAL
Apply screeds on the surfaces as shown on the Drawings and in accordance with the following clauses in this sub-section to the same standard of workmanship as approved in the Construction Mock-up specified in PRE.B9.440.

FIN3.W420.7 SMOOTH FINISH
Finish with a steel trowel to a smooth surface, free of blemishes.

FIN3.W430.7 WOOD FLOAT FINISH
Finish with a dry wood float to give an even overall surface.

FIN3.W440.7 TEXTURED FINISH
Finish by stippling, scraping, brushing with a stiff brush or other means to produce an Approved textured surface.
SURFACES FOR FLEXIBLE SHEET AND TILE FINISHES
Finish with a smooth surface as specified in FIN3.W420.

SCREEDS FOR RIGID TILE AND SLAB TILE FINISHES
Finish screeds to receive rigid tile or slab finishes with a wood float finish in accordance with FIN3.W430.

MOVEMENT JOINTS

GENERAL
Construct movement joints as shown on the Drawings and as specified in Worksection CON6.

MECHANICAL MOVEMENT JOINTS
Install in accordance with the Drawings and with the manufacturer's recommendations.

ROOF SCREEDS PENETRATED BY PIPES

SCREEDS PENETRATED BY PIPES LESS THAN 50 MM IN DIAMETER
Form a surround of cement and sand or granite fines, 1 : 3, 150 mm × 150 mm around the pipe sleeve, projecting 150 mm above the finished roof level and:
1. Finish the top to a slope;
2. Form combined surrounds for groups of pipes.

DRYING OUT AND CURING

CURING SCREEDS
Where exposed to direct wind and sunlight, immediately after laying, protect surface of screed as follows:
1. Cover the surface as soon as it is sufficiently hardened, with canvas, waterproof sheeting, mats or a layer of damp sand;
2. Keep these covering layers constantly wet for a minimum period of 7 days.

PROTECTION AND CLEANLINESS

PROTECTING EXISTING WORK
Protect existing work with boards, dust sheets and the like. Clean off any droppings on existing work immediately.

CLEANLINESS
Keep plant and tools clean and free from all traces of previous mixes.

PROTECTING NEW SCREEDS
Protect screeds from wear and other damage until the final floor finish is laid.
TOLERANCES

FIN3.W910.7  GENERAL

Refer to Appendix H "Schedule of Tolerances" to this Specification.
FIN4  INSITU WALL AND FLOOR FINISHES

MATERIALS

CEMENT

FIN4.M010.7  CEMENT
As FIN1.M010.

AGGREGATES

FIN4.M110.7  SAND GENERALLY
As FIN1.M410.

FIN4.M120.7  GRADING OF SAND
As FIN1.M420.

FIN4.M130.7  STONE
Crushed grey granite or white stone to BS 882:1992, graded from 10 mm to 3 mm and free from dust.

FIN4.M140.7  READY-MIXED MORTARS AND READY-TO-USE MORTARS
As FIN1.M460.

WATER

FIN4.M210.7  WATER
In accordance with PRE.B10.1210 to PRE.B10.1260.

MIX PROPORTIONS

FIN4.M310.7  CEMENT AND SAND OR GRANITE FINES
Cement and sand or granite fines in the proportion 1 : 3.

FIN4.M320.7  GRANOLITHIC
1. Mix granolithic in the proportions shown in the following table, relating to the types of finish shown or scheduled on the Drawings:
Granolithic Finishes

<table>
<thead>
<tr>
<th>Type</th>
<th>Cement</th>
<th>Granite Fines or Sand</th>
<th>Granite Aggregate</th>

ANCILLARY MATERIALS

FIN4.M410.7 PIGMENTS FOR CEMENT
To BS EN 12878:1999.

FIN4.M420.7 BONDING AGENT
As FIN1.M920.

FIN4.M430.7 SURFACE HARDENER
A proprietary liquid hardener and dust proofer to Approval.

FIN4.M440.7 HARDENING ADMIXTURE
A proprietary product to Approval.

FIN4.M450.7 METAL DIVIDING STRIP
1. Material: brass, stainless steel or aluminium as shown on Drawings;
2. Thickness: as shown on Drawings;
3. Size: to the full depth of the finish.
FIN4.M460.7  PLASTIC DIVIDING STRIP
1. Colour: as shown on Drawings;
2. Thickness: as shown on Drawings;
3. Size: to the full depth of the finish.

FIN4.M470.7  NON-SLIP COMPOUND INSERT
A compound of cement and carborundum dust in the proportion, 1 : 1, for filling into a pre-formed groove.

FIN4.M480.7  NON-SLIP INSERT STRIPS
An Approved proprietary insert strip:
1. Size: as shown on Drawings;
2. Colour: as shown on Drawings;
3. Slightly rounded on the top.
WORKMANSHIP

GENERAL

FIN4.W010.7 STANDARD

FIN4.W020.7 CONSTRUCTION MOCK-UP
Construct a Construction Mock-up of around 5 m² as PRE.B9.440 for each different type of in-situ wall and floor finishes showing the workmanship of each construction layer including background preparation through to the installation of finishes, including E&M works and accessories etc. as directed by the CM.

FIN4.W030.7 MECHANICAL APPLICATION
1. Do not use mechanical method of application without Approval for finishes other than cement sand or granite fine finish;
2. Submit method statement for mechanical method of applying finishes for Approval before use.

FIN4.W040.7 MOVEMENT JOINTS GENERALLY
Construct movement joints as shown on the Drawings and as specified in Worksection CON6.

FIN4.W050.7 MECHANICAL MOVEMENT JOINTS
Install in accordance with the Drawings and with the manufacturer's recommendations.

BASE PREPARATION

FIN4.W110.7 GENERAL
1. Remove efflorescence, laitance, oil, grease, all traces of release agents, dirt and loose material by dry brushing and scraping;
2. Protect surfaces from the weather and ensure they are completely compatible with the finish to be applied before starting work.

FIN4.W120.7 JUNCTIONS BETWEEN DISSIMILAR BACKGROUNDS
At backgrounds in the same plane or where the same finish is to be applied to surfaces in differing planes, fix a strip of steel lathing as FIN1.W310.

FIN4.W130.7 HARDENED OR EXISTING CONCRETE
1. Prepare surface by:
   a. Thoroughly hacking the concrete surface to remove any laitance and to expose the aggregate shortly before applying the finish;
   b. Thoroughly cleaning and wetting the surface as required, to adjust its suction, shortly before applying the finish;
c. Brushing neat cement slurry into the damp surface immediately before applying the finish; or

2. Apply bonding agent in accordance with the manufacturer's recommendations.

**MIXING MORTARS AS A FINISH**

**FIN4.W170.7 SITE MIX MORTAR**
As FIN3.W110 to FIN3.W130.

**FIN4.W180.7 READY-MIXED MORTARS & READY-TO-USE MORTARS**
As FIN3.W140.

**APPLYING FINISHES GENERALLY**

**FIN4.W210.7 ACCURACY AND TOLERANCES**
Refer to and comply with the requirements of Appendix H "Schedule of Tolerances" to this Specification and:

1. Finish wall and ceiling finishes to a true plane and to the correct line and level;
2. Ensure angles are true right angles unless otherwise required, with walls and reveals plumb and square.

**FIN4.W220.7 LEVELS AND FALLS**
Lay and compact finishes level or to falls and currents as shown on the Drawings or as otherwise required.

**FIN4.W225.7 LAYING CEMENT AND SAND OR GRANITE FINES FINISH**

**FIN4.W230.7 FINISHING FLOORING**
Finish surfaces as specified for individual materials as soon as compaction is completed, and:

1. Do not bring excessive laitance to the surface, removing any which appears;
2. Do not wet the surface;
3. Repeat the trowelling process or power floating at least three times at intervals within ten hours of laying.

**FIN4.W240.7 DIVIDING STRIPS**
Bed the dividing strip through the whole thickness of the finishing coat and do not haunch them prior to laying the base.

**FIN4.W250.7 NON-SLIP COMPOUND INSERT**
Fill the compound into the pre-formed grooves, slightly round the top and project from the finished surface by 3 mm.

**FIN4.W260.7 NON-SLIP INSERT STRIPS**
Bed the strip into the pre-formed grooves and project from the finished surface by 3 mm.
APPLYING GRANOLITHIC AND TERRAZZO

FIN4.W310.7

THICKNESSES

Apply granolithic and terrazzo to the minimum thicknesses given in the following table:

<table>
<thead>
<tr>
<th>Location</th>
<th>Granolithic Thicknesses</th>
<th>Terrazzo Thicknesses</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>First Coat (mm)</td>
<td>Finishing Coat (mm)</td>

FIN4.W315.7

LAYING GRANOLITHIC FLOOR

1. To BS 8204:Part 2:2002 with particular attention to the following:
   a. Prepare concrete base in accordance with FIN4.W130;
   b. Brush a thin layer of neat cement grout into the surface of concrete base. A proprietary bonding agent may be added to the cement grout;
   c. Divide granolithic floor into panels with each bay not exceeding 15 m², and the length of each bay not greater than 1.5 times its width for bonded construction;
   d. Daywork joints between bays should be straight untreated vertical butt joint;
   e. Form contraction joints by sawing through the finish within 7 days of laying at 6 to 8 m in both directions;
   f. Expansion joints may be necessary subject to the location, and especially where it is exposed to weather.

2. Comply also with the following:
   a. Lay two coats if the total thickness is greater than 40 mm;
   b. Minimum thickness of first and finishing coat as FIN4.W310 for bonded construction;
   c. The finishing coat shall not be thicker than the first coat; neither coat shall be less than 20 mm thick;
   d. Both coats shall have the same mix proportions, place the finishing coat immediately on the first coat when compacted thoroughly;
   e. No pipe or conduit shall be laid in the granolithic floor finish.

FIN4.W320.7

COLOURED GRANOLITHIC AND TERRAZZO

Mix using pigmented cement and apply the second coat after the first has set.

FIN4.W330.7

TROWELLED FINISH GRANOLITHIC

Where a trowelled finish is shown or scheduled on the Drawings, either:
1. Finish with a steel trowel to a smooth surface, free of blemishes; or
2. Finish with a dry wood float to give an even overall surface.

**FIN4.W340.7 RUBBED FINISH GRANOLITHIC**

Where a rubbed finish is shown or scheduled on the Drawings, bring to a trowelled finish and after the granolithic has set, rub down with fine carborundum stone to form a smooth surface and to expose the aggregate.

**FIN4.W350.7 WASHED FINISH GRANOLITHIC**

Where a washed finish is shown or scheduled on the Drawings, bring to a trowelled finish and before the granolithic has set, brush off the surface to expose the aggregate.

**FIN4.W360.7 APPLYING TERRAZZO**

To BS 8204:Part 4:1993 with particular attention to the following:

1. Minimum thickness of first and finishing coat as FIN4.W310;
2. Unless specified in Drawings, divide terrazzo work into panels not exceeding 1 m², with the length of each panel not greater than 3 times its width and separated by dividing strips while the screed is still in a workable condition;
3. Prepare concrete base in accordance with FIN4.W130;
4. Lay first coat of cement sand screed in accordance with FIN3.W330;
5. Lay finishing coat of terrazzo on the screed within 2 days after curing;
6. Grind surface to expose aggregate and produce a smooth finish after completion of laying for a minimum of 4 days;
7. Fill any voids with matching cement;
8. Apply one coat of wax polish to all wall finishes;
9. Do not highly polish or wax polish floor finishes.

**APPLYING COLOURED CEMENT AND SAND OR GRANITE FINES**

**FIN4.W410.7 APPLYING TWO COAT COLOURED FINISH**

Where coloured cement and sand or granite fines is shown or scheduled on the Drawings, lay in two coats as follows:

1. First coat using ordinary cement to a minimum thickness of 10 mm and lightly scratch to form a key;
2. Finishing coat using pigmented cement, to a minimum thickness of 5 mm, applied after the first coat has set.

**DRYING OUT AND CURING**

**FIN4.W510.7 WALL FINISHES**

Prevent excessively rapid or localised drying out of wall finishes by an Approved method.

**FIN4.W520.7 CURING FLOOR FINISHES**

Where exposed to direct wind and sunlight immediately after laying, protect surface of finish as follows:
1. Cover the surface as soon as it is sufficiently hardened, with canvas, waterproof sheeting, mats or a layer of damp sand;
2. Keep these covering layers constantly wet for a minimum period of 7 days.

**PROTECTION AND CLEANLINESS**

**FIN4.W610.7** PROTECTION
Protect all finishes from discolouration or damage until completion.

**FIN4.W620.7** PROTECTION OF EXISTING WORK
Protect existing work with boards, dust sheets and the like. Clean any droppings, on existing work, off immediately.

**FIN4.W630.7** CLEANLINESS
Keep plant and tools clean and free from all traces of previous mixes.

**FIN4.W640.7** PROTECTING NEW FINISHES
Protect finishes from wear and other damage until completion.
FIN5  FLOOR AND WALL TILES AND SLABS

GENERAL

WALL TILING WORKS IN BUILDINGS OR STRUCTURES

FIN5.G010.7 PERFORMANCE REQUIREMENTS

1. Design, install and test individual components and materials of the tile fixing system of the wall tiling works to fulfil the followings:
   a. No disintegration of the wall tiling works such as visible de-bonding, delamination or bulging out of the wall tiles and the like;
   b. No damages of the tiling surfaces;
   c. Plane of adjacent tiles and alignment of joints shall be within the tolerance as specified in TOL.FIN5; and
   d. No growth of mould and no peeling off of the grouting. No discolouration of the proprietary or coloured grouting.

2. Comply with the acceptance standards for the Pull-off tests specified in FIN5.T150 (3)(c).

FIN5.G020.7 CONTRACTOR'S DESIGN AND BUILD TILE FIXING SYSTEM OF THE WALL TILING WORKS

1. Design and build a tile fixing system complying with the following requirements:
   a. In full compliance with the performance requirements as specified in FIN5.G010;
   b. Do not alter the types, profiles, dimensions, pattern, colour, texture and appearance of the wall tiles and grout as specified in the Specification and as shown in the Drawings;
   c. Do not alter construction of the reinforced concrete walls, panel wall partitions, brick and block walls;
   d. Do not alter the clear width of the passageway and the doorway;
   e. Do not induce mismatched junction assembling details of the adjoining components and finishes;
   f. Compatible with the installation of waterproofing system where required;
   g. Do not lower the quality standard of the original design as shown on Drawings;
   h. Meet all prevailing regulations and standards;
   i. Allow for any additional components, materials, fixing systems, changes to interfacing details etc. which are required for achieving the performance requirements as specified in FIN5.G010;
j. Demonstrate to the satisfaction of the CM prior to the ordering of any proposed materials that the submitted proposal for the tile fixing system of wall tiling works complies with the minimum pull-off strengths by carrying out a Pull-off test in accordance with FIN5.T150 on a test mock-up sample on site;

k. Allow for the sequence and timing for Approvals and carrying out the works without affecting the overall progress;

l. Have no additional time or cost adjustment implications to the Contract.

2. Submit the tile fixing system for CM's Approval except when the tile fixing system or method of the wall tiling works as may be shown on the Drawings and/or described in the Specification, which is provided on a without liabilities basis, are adopted.
MATERIALS

CERAMIC TILES GENERALLY

FIN5.M010.7 STANDARD
Where applicable, tiles and accessories must comply generally with BS EN 14411:2006.

FIN5.M020.7 CONSISTENT SUPPLY
Obtain all the tiles and accessories in a specified range from the same Approved manufacturer and ensure that they match in colour, texture and batch number.

CERAMIC FLOOR TILES

FIN5.M110.7 SPECIAL TILES
Where ceramic floor tiles and floor quarries are specified as "including specials", ensure that the full range of BS accessories are available.

FIN5.M120.7 FLOOR TILES AND NOSING TILES
Extruded to Group Al_a or Group Al_b or Group AII_a of BS EN 14411:2006 or dry-pressed to Group BI_a or Group BI_b or Group BII_a of BS EN 14411:2006:
1. With water absorption not exceeding 6%;
2. Size: as shown or scheduled on Drawings;
3. Colour: as shown on Drawings or to Approval;
4. Including specials tiles as in FIN5.M110.

FIN5.M130.7 CLAY QUARRY TILES
Extruded to Group AII_a or Group AII_b of BS EN 14411:2006. Either pressed or not pressed:
1. The water absorption shall not exceed 10%;
2. Size: as scheduled on the Drawings;
3. Colour: as shown on Drawings or to Approval;
4. Specials tiles where shown or scheduled on Drawings;
5. Non-slip surface: as shown on Drawings or to Approval.

FIN5.M140.7 NON-SLIP TILES
Where tiles are described on the Drawings or in this Specification as "non-slip" or "anti-slip", ensure that they are suitably embossed or treated with carborundum, or a similar grit, to provide an anti-slip surface.

FIN5.M150.7 CANTON TILES
1. Hard, sound, square, well burnt and free from twists, cracks or other defects throughout;
2. Size: uniformly, between 300 mm and 400 mm square and between 30 mm to 35 mm thick.
FIN5.M160.7 NON-SLIP TACTILE HOMOGENEOUS FLOOR TILES
1. Tiles with raised profiles to provide a distinctively textured walking surface easily detectable by foot and cane for guidance of the visually impaired;
2. Quality requirements:
   a. To Group BI₄ or Group BI₅ of BS EN 14411:2006, matt finish with anti-stain coating;
   b. Types: three types of tactile tiles to be used at location as shown on the Drawings:
      i. Hazard warning tiles with raised dots arranged in square grid for indication of hazard;
      ii. Directional tiles with raised strips for indication of direction; and
      iii. Positional tiles with raised dots arranged in staggered position for indication of change of direction.
   c. Nominal size: as shown on the Drawings;
   d. Colour: as shown on the Drawings or to Approval;
   e. Slip-resistant tested to ASTM C1028-07
      i. minimum static coefficient of friction of 0.8 under dry condition; and
      ii. minimum static coefficient of friction 0.67 under wet condition.

FIN5.M170.7 NON-SLIP HOMOGENEOUS FLOOR TILES
1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed material for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name/model name and job reference of the product;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
   iv. When the material is supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:
      - Original or certified true copies of certification to ISO 9001 and ISO 14001 for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by the certification bodies or by the QCM. The certification bodies shall be as follows:

<table>
<thead>
<tr>
<th>ISO</th>
<th>Certification Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISO 9001</td>
<td>The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
<tr>
<td>ISO 14001</td>
<td>The certification body shall be accredited by the Hong Kong Accreditation Service (HKAS), or the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
</tbody>
</table>
- Original or a certified true copy of the product conformity certificate to the "Product Conformity Certification Scheme For Ceramic Tiles" published by the Hong Kong Concrete Institute. The product conformity certificate shall be issued by a certification body accredited by Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS. If a photocopy of the product conformity certificate is submitted, it shall be certified true by the certification body or by the QCM.

b. A summary of the test results under the audit testing of the "Product Conformity Certification Scheme For Ceramic Tiles". The summary shall be prepared by the accredited laboratory carried out the testing or the certified manufacturer. If so directed by CM, submit a full set of the audit test reports to CM for record;

c. Original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clauses (2)(a)(i)&(ii) and (2)(b) for CM's information unless the test requirements are covered by the scope of the "Product Conformity Certification Scheme For Ceramic Tiles":

i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works;

ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);

iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:

a. To Group BIa or Group BIb of BS EN 14411:2006:

i. With dimensions and surface quality, physical and chemical properties complying with the acceptance standards stated in BS EN 14411:2006 in particular Table G.1 for Group BIa or Table H.1 for Group BIb for non-slip homogeneous floor tiles;

ii. With a water absorption property not exceeding 3%;

iii. Nominal size: as scheduled on the Drawings;

iv. With logo-key integrated at back of tiles.

b. Slip resistance: minimum static coefficient of friction tested to ASTM C1028-07 under dry condition shall be of 0.5 or above;

c. Colour: as shown on the Drawings or to Approval.

3. On Site Delivery Verification:

a. As FIN5.M210 (3).

**CERAMIC WALL TILES**

**FIN5.M210.7**  GLAZED CERAMIC WALL TILES

1. Submission Requirements:

a. At sample submission and approval stage, submit a sample of the proposed material for CM's approval together with all the following substantiation for CM's information:

i. Catalogue, brand name/model name and job reference of the product;
ii. Name, address and contact person of the local supplier;

iii. Name, address and contact person of the manufacturer;

iv. When the material is supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:

- Original or certified true copies of certification to ISO 9001 and ISO 14001 for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by the certification bodies or by the QCM. The certification bodies shall be as follows:

<table>
<thead>
<tr>
<th>ISO</th>
<th>Certification Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISO 9001</td>
<td>The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
<tr>
<td>ISO 14001</td>
<td>The certification body shall be accredited by the Hong Kong Accreditation Service (HKAS), or the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
</tbody>
</table>

- Original or a certified true copy of the product conformity certificate to the "Product Conformity Certification Scheme For Ceramic Tiles" published by the Hong Kong Concrete Institute. The product conformity certificate shall be issued by a certification body accredited by Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS. If a photocopy of the product conformity certificate is submitted, it shall be certified true by the certification body or by the QCM.

b. A summary of the test results under the audit testing of the "Product Conformity Certification Scheme For Ceramic Tiles". The summary shall be prepared by the accredited laboratory carried out the testing or the certified manufacturer. If so directed by CM, submit a full set of the audit test reports to CM for record;

c. Original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(a)(ii) for CM's information unless the test requirements are covered by the scope of the "Product Conformity Certification Scheme For Ceramic Tiles":

i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works;

ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);

iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:

a. Extruded to Group AIII or dry-pressed to Group BIII of BS EN 14411:2006:

i. With dimensions, surface quality, physical and chemical properties complying with the acceptance standards stated in BS EN 14411:2006 in particular Table F.1 for Group AIII tiles or Table L.1 for Group BIII tiles;
ii. With a water absorption property exceeding 10% but not exceeding 18%;

iii. Nominal size: as shown on the Drawings;

iv. With cushion edges and round edges as shown on Drawings;

v. With logo-key integrated at back of tiles.

b. Colour: as shown on the Drawings or to Approval.

3. On Site Delivery Verification:

a. At delivery stage, submit the following documents:

i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a);

ii. Original or certified true copy of the Certificate of Origin for every batch of delivery. One batch being the material quantity covered under each delivery note;

iii. Delivery notes for all material delivered to Site.

b. Carry out and submit report on the following verifications for glazed ceramic wall tiles upon delivery on Site. Prior to carrying out the verifications, inform CM's representatives who may present to witness the verifications:

i. Method:

<table>
<thead>
<tr>
<th>Verification Items</th>
<th>Method</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dimension Check</td>
<td>By measurement</td>
<td>Within the specified BS tolerance</td>
</tr>
<tr>
<td>Surface Quality Check</td>
<td>Visual</td>
<td>No discolouration, no damage, no staining, no blemish, acceptable colour consistency</td>
</tr>
<tr>
<td>Check Identification Mark</td>
<td>Visual</td>
<td>To CM's Approved sample</td>
</tr>
<tr>
<td>Dampness Test</td>
<td>Visual</td>
<td>No apparent patches at the glazed surface of the tile after water is poured onto the back of tiles</td>
</tr>
</tbody>
</table>

ii. Frequency:

<table>
<thead>
<tr>
<th>Verification Items</th>
<th>Sampling Frequency</th>
<th>Representative Batch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dimension Check</td>
<td>one sample for all 4 verification items comprising 3 pieces of tiles for each delivery per each type</td>
<td>Material delivered to Site under the same Delivery Note</td>
</tr>
<tr>
<td>Surface Quality Check</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Check Identification Mark</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Dampness Test</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

c. Where any of the verifications fail to meet the acceptance standards, either:

i. Remove the representative batch off Site; or
ii. When agreed by the CM, repeat all verification items on three separate samples each with 3 pieces of tiles selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

FIN5.M220.7 HOMOGENEOUS WALL TILES

1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed material for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name/model name and job reference of the product;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. When the material is supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:
         - Original or a certified true copy of the ISO 9001 certificate for the manufacturing plant. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS. If a copy of the ISO certificate is submitted, it shall be certified true by the certification body or by the QCM.
   b. Original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(a)(i)&(ii) for CM's information:
      i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works;
      ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);
      iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:
   a. To Group BIₐ or Group BIₐ of BS EN 14411:2006:
      i. With dimensions, surface quality, physical and chemical properties complying with the acceptance standards stated in BS EN 14411:2006 in particular Table G.1 for Group BIₐ or Table H.1 for Group BIₐ for the homogeneous wall tiles;
      ii. With a water absorption property not exceeding 3%;
      iii. Nominal size: as scheduled on the Drawings;
      iv. With square edges;
      v. With logo-key integrated at back of tiles.
   b. Colour: as shown on the Drawings or to Approval.

3. On Site Delivery Verification:
   a. As FIN5.M210 (3).
FIN5.M230.7 EXTERNAL FACING TILES

1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed material for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name/model name and job reference of the product;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. When the material is supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:
         - Original or a certified true copy of the ISO 9001 certificate for the manufacturing plant. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS. If a copy of the ISO certificate is submitted, it shall be certified true by the certification body or by the QCM.
   b. Original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(a)(i)&(ii) for CM's information:
      i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works;
      ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);
      iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.
   c. Submit confirmation that the proposed colour ranges are in accordance with sub-clause (2)(b) below.

2. Quality Requirements:
   a. To Group B1a or Group B1b of BS EN 14411:2006:
      i. With dimensions, surface quality, physical and chemical properties complying with the acceptance standards stated in BS EN 14411:2006 in particular Table G.1 for Group B1a or Table H.1 for Group B1b for external facing tiles;
      ii. With water absorption property not exceeding 3%;
      iii. Type: with cushion edges as shown on Drawings;
      iv. Nominal size: as shown on the Drawings;
      v. With logo-key integrated at the back of tiles.
   b. Colour: as shown on Drawings or to Approval.

3. On Site Delivery Verification:
   a. As FIN5.M210 (3) with the exception of the sampling frequency which is as follows:
FLOOR AND WALL TILES AND SLABS

<table>
<thead>
<tr>
<th>Verification Items</th>
<th>Sampling Frequency</th>
<th>Representative Batch</th>
</tr>

FIN5.M240.7 HOMOGENEOUS COVED SKIRTING TILES

1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed material for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name/model name and job reference of the product;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. When the material is supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:
         - Original or a certified true copy of the ISO 9001 certificate for the manufacturing plant. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS. If a copy of the ISO certificate is submitted, it shall be certified true by the certification body or by the QCM.
   b. Original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(a)(i)&(ii) for CM's information:
      i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works;
      ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);
      iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:
   a. Group B1a or Group B1b of BS EN 14411:2006:
      i. With dimensions, surface quality, physical and chemical properties complying with the acceptance standards stated in BS EN 14411:2006 in particular Table G.1 for Group B1a or Table H.1 for Group B1b for the homogeneous coved skirting tiles;
      ii. With water absorption property not exceeding 3%;
      iii. Nominal size: as scheduled on the Drawings;
      iv. With logo-key integrated at back of tiles.
   b. Colour: to match floor tile or as shown on the Drawings or to Approval.
3. On Site Delivery Verification:
   a. As FIN5.M210 (3).

**CERAMIC AND VITREOUS MOSAIC TILES**

**FIN5.M310.7 GLAZED CERAMIC MOSAIC TILES**

   a. With water absorption exceeding 6% but not exceeding 10%;
   b. Size: as scheduled on the Drawings;
   c. Colour: as shown on Drawings or to Approval;
   d. With square edges.

2. Submit sample of the proposed tiles together with the following information for CM’s approval:
   a. Catalogue, brand name/model name and job reference of the product;
   b. Name, address and contact person of the supplier;
   c. Name, address and contact person of the manufacturer;
   d. Confirmation that the proposed colour ranges are in accordance with sub-clause (1)(c) above.

**FIN5.M320.7 UNGLAZED VITREOUS MOSAIC WALL TILES**

1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed material for CM's approval together with all the following substantiation for CM’s information:
      i. Catalogue, brand name/model name and job reference of the product;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
   iv. When the material is supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the following in the submission:
      - Original or a certified true copy of the ISO 9001 certificate for the manufacturing plant. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS. If a copy of the ISO certificate is submitted, it shall be certified true by the certification body or by the QCM.
   b. Original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(a)(i)&(ii) for CM’s information:
      i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works;
      ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);
      iii. In the event that no test report has been submitted for CM’s information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.
c. Submit confirmation that the colour ranges of the proposed brand are in accordance with sub-clause (2)(b) below.

2. Quality Requirements:
   a. To Group BI or Group BIb of BS EN 14411:2006:
      i. With dimensions, surface quality, physical and chemical properties complying with the acceptance standards stated in BS EN 14411:2006 in particular Table G.1 for Group BI, or Table H.1 for Group BIb for unglazed vitreous mosaic wall tiles;
      ii. With water absorption property not exceeding 3%;
      iii. Nominal sizes: as shown on Drawings.
   b. Colour: generally in the ranges of light, medium and dark, and as shown on Drawings or to Approval.

3. On Site Delivery Verification:
   a. As FIN5.M210 (3) with the exception of the sampling frequency which is as follows:

<table>
<thead>
<tr>
<th>Verification Items</th>
<th>Sampling Frequency</th>
<th>Representative Batch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dimension Check</td>
<td>One sample for all 3 verification items comprising 3 sheets of tiles for each delivery per each type</td>
<td>Material delivered to Site under the same Delivery Note</td>
</tr>
<tr>
<td>Surface Quality Check</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Check Identification Mark</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

GLASS MOSAIC TILES

FIN5.M330.7 GLASS MOSAIC TILES

1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed material for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name/model name and job reference of the product;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. When the material is supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:
         - Original or a certified true copy of the ISO 9001 certificate for the manufacturing plant. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS. If a copy of the ISO certificate is submitted, it shall be certified true by the certification body or by the QCM.
   b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clauses (2)(a)(i) to (2)(a)(iii) below for CM's information:
i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works;

ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);

iii. In the event that no test report has been submitted for CM’s information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

c. Submit confirmation that the colour ranges of the proposed brand are in accordance with sub-clause (2)(b) below.

2. Quality Requirements:

a. Fully vitrified glass mosaic tiles, regular in shape, free from cracks and sharp edges and:

i. Dimensions and surface quality:

<table>
<thead>
<tr>
<th>Test Items</th>
<th>Test Method BS EN ISO 10545</th>

FIN5.M340.7 SAMPLES OF GLASS MOSAIC TILES FOR PRECAST CONCRETE FACADE UNITS

Submit samples of the tiles specified in clause FIN5.M330 for fixing to precast concrete facade units, as PRE.B9.410, within two months of the notified date of the commencement of the works.

TERRAZZO

FIN5.M510.7 TERRAZZO FLOOR TILES

To BS 4131:1973 and:

1. Size: as shown on Drawings;
2. Colour: as shown on Drawings;
3. Surface finish: as shown on Drawings.

NATURAL AND RECONDITIONED STONE

FIN5.M610.7 MARBLE SLABS

Of the quality and colours selected by the CM and:

1. Free from flaws and defects throughout;
2. Size on face as shown on the Drawings;
3. Thickness: 20 mm or as otherwise shown on the Drawings.
4. Surface finish as follows or as shown or scheduled on drawings:
   a. Highly polished;
   b. Matt finish.
5. Subject to the Approval of a sample submitted before any order being placed.
FIN5.M620.7  GRANITE SLABS
Of the quality and colours selected by the CM and:
1. Free from flaws and defects throughout;
2. Size on face as shown on the Drawings;
3. Thickness: 20 mm or as otherwise shown on the Drawings;
4. Surface finish as follows or as shown or scheduled on drawings:
   a. Highly polished;
   b. Matt finish;
   c. Flamed finish.
5. Subject to the Approval of a sample submitted before any order being placed.

FIN5.M625.7  MARBLE AND GRANITE WALL TILES
1. Maximum thickness of 7 mm;
2. Other requirements except the dimension of thickness:
   a. As FIN5.M610 for marble;
   b. As FIN5.M620 for granite.

FIN5.M630.7  NON-SLIP ARTIFICIAL GRANITE AND AGGLOMERATED MARBLE TILES
1. Size: as shown or scheduled on the Drawings;
2. Colour: all colour range;
3. With skirting tiles, tactile tiles and corner nosing tiles for steps.

CONCRETE TILES

FIN5.M710.7  CONCRETE FLOOR TILES
Plain concrete or granolithic to BS 1197:Part 2:1973, and:
1. Size: As shown or scheduled on drawings;
2. Colour: to Approval;
3. Surface finish: to Approval.

BEDDING AND JOINTING MATERIALS

FIN5.M810.7  CEMENT
As FIN1.M010.

FIN5.M820.7  WATER
In accordance with PRE.B10.1210 to PRE.B10.1260.

FIN5.M830.7  SAND GENERALLY
As FIN1.M410.

FIN5.M840.7  GRADING OF SAND
As FIN1.M420.
FIN5.M860.7  CEMENT SLURRY
1. Plain or coloured cement and water mixed to a creamy consistency;
2. Do not use white cement except otherwise stated.

FIN5.M865.7  SEMI-DRY MIX
To BS 5385:Part 5:1994 with particular attention to the following:
1. Cement and sand, 1 : 3 to 4 mix;
2. Water cement ratio ranging from 0.55 to 0.6.

FIN5.M870.7  MORTAR FOR CEMENT SAND MORTAR BEDDING FIXING
Cement and sand, 1 : 3 mix.

FIN5.M880.7  BEDDING FOR MARBLE AND GRANITE FLOOR SLABS
Cement and sand, 1 : 3 mix.

FIN5.M890.7  PLASTERS FOR MARBLE AND GRANITE WALL TILES
To BS 5492:1990 Table 1 and 2.

FIN5.M900.7  FIXINGS FOR MARBLE AND GRANITE WALL SLAB
1. Dowel, adjustable plates, angle brackets, connecting bolts, washers, shins, anchor bolts shall be of stainless steel grade 304 for internal use or grade 316 for external use as in MET1.M060;
2. Stainless steel dowels shall be:
   a. No less than 3 mm diameter for wall slabs with nominal thickness of 30 mm or less;
   b. No less than 4.7 mm diameter for wall slabs with nominal thickness of 40 mm.
3. Fixing methods in accordance with the Drawings or Approved shop drawings.

FIN5.M920.7  POINTING FOR MARBLE AND GRANITE FLOOR SLABS
1. Coloured cement and sand, 1 : 3 mix for 3 mm and above tile joint;
2. Neat coloured cement grout for narrow joints;
3. Colour: as shown on Drawings or to Approval.

FIN5.M930.7  POINTING FOR MARBLE AND GRANITE WALL TILES
1. Cementitious pointing:
   a. 4 : 1 cement sand mortar for narrow joints with width at 1 mm to 2 mm;
   b. 1 : 3 cement sand mortar for joints with width at 3 mm or more.
2. Sealant pointing:
   a. To BS 8298:1989 Table 8 and WAT5, 1 part polyurethane sealant or 1 part polysulphide;
   b. Other types of sealant may be submitted subject to CM's approval;
   c. Obtain information from the sealant manufacturer that the sealant will not stain the stone.
3. Colour of the mortar and sealant: as shown on Drawings or to Approval.
FIN5.M940.7 GROUT FOR FLOOR TILING
Cement and sand, 1 : 1 mix, mixed to a paste with a minimum of water.

FIN5.M950.7 GROUT FOR MOSAIC TILING
White or ordinary cement mixed to a paste with a minimum of water, for tile joint not greater than 3 mm wide or cement and sand, 1 : 3 mix, for joint greater than 3 mm wide.

FIN5.M960.7 GROUT FOR GLAZED WALL TILING
White cement mixed to a paste with a minimum of water, for tile joint not greater than 3 mm wide or cement and sand 1 : 3 mix for joint greater than 3 mm wide.

FIN5.M970.7 GROUT FOR EXTERNAL FACING TILES
Cement mixed to a paste with a minimum of water, for tile joint not greater than 3 mm wide or cement and sand 1 : 3 mix for joint greater than 3 mm wide.

FIN5.M980.7 PROPRIETARY GROUT
Approved proprietary manufacturer and product.

FIN5.M990.7 BONDING AGENT
As FIN1.M920.

FIN5.M995.7 MOVEMENT JOINTS FOR MARBLE AND GRANITE WALL TILES AND FLOOR SLABS
Unless otherwise indicated on the Drawings or instructed by the CM:
1. Sealant: 1 part polyurethane to WAT5.M150;
2. Back-up material to WAT5 with particular attention to the following:
   a. Compatible with the Approved sealant.
   b. Circular section strip of cellular rubber or cellular polyethylene.

TILE ADHESIVES AND GROUTING

FIN5.M1010.7 TILE ADHESIVES AND TILE GROUT
1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed tile adhesives and tile grout for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name/model name and job reference;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agent/distributor in Hong Kong or document from the supplier showing the appointment of the manufacturer and manufacturer's agreement for the production of the proposed product;
      v. Detailed Method Statement for the installation of the tiling systems, showing all work procedures from the preparation of background through to the cleaning of the completed assembly;
vi. Proposed arrangement for the quarantine material verification test specified in sub-clause (5), including delivery programme, quantity of each batch of delivery and storage location of tile adhesive delivered to Site and to manufacturer's factory of precast concrete components;

vii. When the tile adhesives and grout are supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:

- Two identical sample boards similar to the one maintained by the Housing Department showing the quality, detailed method statement and work procedures of the adhesives and grout;

- Original or a certified true copy each of the certification to ISO 9001 and ISO 14001 for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by the certification bodies or by the QCM. The certification bodies shall be as follows:

<table>
<thead>
<tr>
<th>ISO</th>
<th>Certification Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISO 9001</td>
<td>The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
<tr>
<td>ISO 14001</td>
<td>The certification body shall be accredited by the Hong Kong Accreditation Service (HKAS), or the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
</tbody>
</table>

- Original or a certified true copy of the product conformity certificate to the "Product Conformity Certification Scheme For Tile Adhesives" published by the Hong Kong Concrete Institute. The product conformity certificate shall be issued by a certification body accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS. If a photocopy of the product conformity certificate is submitted, it shall be certified true by the certification body or by the QCM.

viii. When the tile adhesive is used for fixing external wall tiles, confirmation from the tile adhesive manufacturer that the tile adhesive is suitable for external applications.

b. A summary of the test results under the audit testing of the "Product Conformity Certification Scheme For Tile Adhesives". The summary shall be prepared by the accredited laboratory carried out the testing or the certified manufacturer. If so directed by CM, submit a full set of the audit test reports to CM for record;

c. Original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(b), (2)(c), (2)(d) & (2)(i) for CM's information unless the test requirements are covered by the scope of the "Product Conformity Certification Scheme For Tile Adhesives":

i. The date of the test shall be generally within two years prior to the notified date for commencement of the Works or at an earlier date for domestic blocks subject to CM's consideration on the track records as maintained by the Housing Department;

ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);
iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:
   a. Cement based compatible with the substrate and tiles to be installed;
   b. For glass mosaic tiles and other tile types (except homogeneous tiles) of size below 300x300 mm, use tile adhesive to BS EN 12004:2007 normal setting cementitious type class C1 with minimum tensile adhesive strength as follow:

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Requirement</th>
<th>Test Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initial tensile adhesion strength</td>
<td>≥ 0.5 N/mm²</td>
<td>8.2 of BS EN 1348: 2007</td>
</tr>
<tr>
<td>Tensile adhesion strength after water immersion</td>
<td>≥ 0.5 N/mm²</td>
<td>8.3 of BS EN 1348: 2007</td>
</tr>
<tr>
<td>Tensile adhesion strength after heat ageing</td>
<td>≥ 0.5 N/mm²</td>
<td>8.4 of BS EN 1348: 2007</td>
</tr>
<tr>
<td>Tensile adhesion strength after freeze-thaw cycles</td>
<td>≥ 0.5 N/mm²</td>
<td>8.5 of BS EN 1348: 2007</td>
</tr>
<tr>
<td>Open time: tensile adhesion strength</td>
<td>≥ 0.5 N/mm² after not less than 20 min</td>
<td>BS EN 1346:2007</td>
</tr>
</tbody>
</table>

c. For homogeneous tiles and other tile types of size 300x300 mm or above, use tile adhesive to BS EN 12004:2007 improved cementitious type class C2E with additional characteristics and minimum tensile adhesive strength as follow:

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Requirement</th>
<th>Test Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>High initial tensile adhesion strength</td>
<td>≥ 1 N/mm²</td>
<td>8.2 of BS EN 1348: 2007</td>
</tr>
<tr>
<td>High tensile adhesion strength after water immersion</td>
<td>≥ 1 N/mm²</td>
<td>8.3 of BS EN 1348: 2007</td>
</tr>
<tr>
<td>High tensile adhesion strength after heat ageing</td>
<td>≥ 1 N/mm²</td>
<td>8.4 of BS EN 1348: 2007</td>
</tr>
<tr>
<td>High tensile adhesion strength after freeze-thaw cycles</td>
<td>≥ 1 N/mm²</td>
<td>8.5 of BS EN 1348: 2007</td>
</tr>
<tr>
<td>Extended open time: tensile adhesion strength</td>
<td>≥ 0.5 N/mm² after not less than 30 min</td>
<td>BS EN 1346:2007</td>
</tr>
</tbody>
</table>

d. Tile grout to ANSI A118.6:1992, in particular the followings:

<table>
<thead>
<tr>
<th>Items</th>
<th>Test Method</th>
<th>Acceptance Standards</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linear Shrinkage</td>
<td>ANSI A118.6: 1992 Clause H4.3</td>
<td>1 day shrinkage &lt; 0.1% 7 days shrinkage &lt; 0.2%</td>
<td>Cast and store grout specimens at 21° - 25°C, 45 - 55% R.H.</td>
</tr>
<tr>
<td>Water Absorption</td>
<td>ANSI A118.6: 1992 Clause H3.4</td>
<td>From 50% R.H. to immersion &lt; 5% From immersion to dry &lt; 7%</td>
<td>Determine water absorption from 50% R.H. to immersion and from immersion to dry.</td>
</tr>
</tbody>
</table>
Compatibility with Tile Adhesive

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BS 5980:1980 Appendix D with modification.</td>
<td>A layer of tile grout is applied on tile adhesive for tensile adhesion test</td>
</tr>
</tbody>
</table>

(Tensile Adhesion)

Requirements of BS 5980:1980 are taken

- For 14 days in laboratory condition: $\geq 950 \text{ N}$
- For 7 days curing in laboratory condition followed by 7 days immersion in water: $\geq 560 \text{ N}$

Laboratory Condition: $20^\circ \pm 2^\circ C$, 45 to 75% R.H.

A layer of tile grout (1.5 mm thick) is applied over tile adhesive 1.5 mm thick (brand to be the one selected by CM) which shall have been embedded in standard test piece tiles to harden for 24 hours. Ten such assemblies are prepared and cured for 14 days at laboratory condition and then subject to tensile force. Further ten assemblies are required for similar tensile tests under 7 days curing at laboratory condition followed by 7 days immersion in water.

Resistance to Mould Growth

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BS 5980:1980 Appendix B</td>
<td>No sign or evidence of mould growth on tile grout.</td>
</tr>
</tbody>
</table>

3 mm thick tile grout is applied over biscuit side of test piece tile and the assembly be placed in Petri dishes for incubation at $29^\circ \pm 1^\circ C$ for 24 hrs after addition of potato dextrose agar. Aspergillus niger is inoculated into the grout. The whole assemble is incubated for 14 days at $29^\circ \pm 1^\circ C$.

e. Colour: white or grey for tile adhesive and to Approval for tile grout;

f. Packed in three ply together with preparation procedures and application methods. Minimum one set of the preparation procedures and application methods shall be printed in Chinese and diagrammatic forms for each lot that is delivered to site;

g. Brand name, batch number, type and class, shelf life, pot life and open time to be clearly printed on outside of package;

h. No prior soaking of tiles is required;

i. Tile adhesive compatibility with panel wall to be demonstrated via the following test method:

i. Test against the panel wall partition selected for the Contract complete with moisture sealer. Acceptance standard to be minimum 0.3 N/mm²;

ii. Select four specimens of 200x200 mm ceramic glazed wall tile and fix the four tiles vertically without additional support according to the manufacturer’s specification;

iii. The interval between applying tile adhesive and placing tiles is not more than 5 minutes. Record the extent to which slip occurs per the first minute after placing tile specimen. The tile specimens are fixed by adhesive tape to prevent further slip;

iv. The sample shall be subjected to tests of Tensile Adhesion Strength with an adhesive not exceeding 3 mm in final bed thickness;

v. Pull off tiles on a minimum of 28 days after fixing;

vi. Attach an aluminium/steel dolly onto the surface of the specimen by a suitable adhesive resin;

vii. Use strong adhesive tape to fix the position of dolly until strength of the resin is developed as advised by the resin manufacturer;
viii. Connect the dolly to the Pull-off Test device. The pull-off equipment shall be capable of increasing the load steadily without jerking at a rate of \((250 + 50)\) N/s, and must be provided with a measurement device which shall retain the maximum force exerted, the so called failure load to the nearest 0.01KN. The measurement inaccuracy of the equipment must be less than 2%, in accordance with accuracy Grade 2 of BS 1610: Part 1: 1985;

ix. Apply a tensile force gradually by the device;

x. Record the failure force, location of failure and any other observations or abnormalities;

xi. Record the force from the readout unit;

xii. Repeat steps as described in sub-clauses (vi) to (xi) until Pull-off Tests to all four tiles are completed;

xiii. Take photographs.

3. On Site Delivery Verification:

a. At delivery stage, submit the following documents:

i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a);

ii. Original or certified true copy of the Certificate of Origin, batch number and manufacturing date for every batch of delivery. One batch being the material quantity covered under each delivery note;

iii. Delivery notes for all material delivered to Site.

b. Carry out and submit report on the following verifications for tile adhesive and grout upon delivery on Site. Prior to carrying out the verifications, inform CM's representatives who may present to witness the verifications:

i. Method:

<table>
<thead>
<tr>
<th>Verification Items</th>
<th>Method</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Material and Packaging</td>
<td>Visual</td>
<td>To Approved Sample</td>
</tr>
<tr>
<td>Product Identification Number</td>
<td>Document Check</td>
<td>As Approved</td>
</tr>
<tr>
<td>Expiry Date</td>
<td>Check information printed on the packing</td>
<td>Not expired</td>
</tr>
</tbody>
</table>

ii. Frequency:

One set of verification should be carried out for every delivery of tile adhesive or grout made to Site under each Delivery Note submitted in sub-clause (3)(a).

c. Where any of the verifications fail to meet the acceptance standards, either:

i. Remove the representative batch off Site; or

ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

4. Delivery Verification at Manufacturer's Factory of Precast Concrete Components:

a. At delivery stage, submit the following documents to CM's Representative resident at manufacturer's factory:
i. Written confirmation that the material delivered to the manufacturer's factory conforms with the Approved sample submitted under sub-clause (1)(a);

ii. Original or certified true copy of the Certificate of Origin, batch number and manufacturing date for every batch of delivery. One batch being the material quantity covered under each delivery note;

iii. Delivery notes for all material delivered to the manufacturer's factory.

b. Carry out the following verifications for tile adhesive and grout upon delivery to the manufacturer's factory and in the presence of CM's Representative resident at manufacturer's factory:

i. Method:

<table>
<thead>
<tr>
<th>Verification Items</th>
<th>Method</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Material and Packaging</td>
<td>Visual</td>
<td>To Approved Sample</td>
</tr>
<tr>
<td>Product Identification Number</td>
<td>Document Check</td>
<td>As Approved</td>
</tr>
<tr>
<td>Expiry Date</td>
<td>Check information printed on the packing</td>
<td>Not expired</td>
</tr>
</tbody>
</table>

ii. Frequency:

One set of verification should be carried out for every delivery of tile adhesive or grout made to the manufacturer's factory under each Delivery Note submitted in sub-clause (4)(a).

c. Where any of the verifications fail to meet the acceptance standards, either:

i. Remove the representative batch off the manufacturer's factory; or

ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off the manufacturer's factory, bear all associated costs, and no extension of time will be allowed.

5. Quarantine for Material Verification Test

a. Each batch of tile adhesive delivered to Site and to manufacturer’s factory of precast concrete components shall be subject to material verification test specified in the respective specification in FIN5.T105 and FIN5.T108. No tile adhesive shall be used in permanent works or precast concrete components during the material verification test unless approved by the CM under sub-clause (5)(d).

b. In the event that the tile adhesive delivered to Site is stored on Site during the material verification test to be conducted as specified in FIN5.T105, comply with the following requirements for storing the delivered materials:

i. Store the tile adhesive in a cool, well-ventilated and covered storage accommodation on Site and in accordance with manufacturer's recommended ambient storage conditions;

ii. Provide a record of the batch number, manufacturing date, quantity and storage location of each batch for CM's record.

C. In the event that the tile adhesive delivered to the manufacturer's factory is stored in the manufacturer's factory during the material verification test to be conducted as specified in FIN5.T108, comply with the following requirements for storing the delivered materials:
i. Store the tile adhesive in a cool, well-ventilated and covered storage accommodation in the manufacturer's factory and in accordance with manufacturer's recommended ambient storage conditions;

ii. Provide a record of the batch number, manufacturing date, quantity and storage location of each batch to CM's Representative resident at manufacturer's factory for record.

d. In the event of circumstances where the contractor considers necessary to use the tile adhesive in permanent works or precast concrete components during the material verification test as stipulated in sub-clause (5)(a), seek Approval in advance of the material delivery with full substantiation and proposed measures to safeguard against the risk of material non-compliance.

ANCILLARY MATERIALS

FIN5.M1110.7 NON-SLIP SURFACE
Anti-slip system for surface treatment of granite floor tiles to CM's Approval.

FIN5.M1120.7 MOVEMENT JOINTS FOR CERAMIC AND MOSAIC TILES
Sealant and back-up material to WAT5 and BS 5385:Part 1:1995 with particular attention to paragraph 2.10.
WORKMANSHIP

GENERAL

FIN5.W010.7 STANDARD
Except where otherwise specified carry out:
1. Internal ceramic wall tiling and mosaics generally in accordance with BS 5385-1:1995;
2. External ceramic wall tiling and mosaics generally in accordance with BS 5385-2:1991;
3. Internal ceramic floor tiling and mosaics generally in accordance with BS 5385-3:1989;

FIN5.W020.7 PREPARATION OF CONCRETE SURFACES FOR DIRECT APPLICATION OF TILING
Either:
1. Prepare the surface by:
   a. Thoroughly hack the concrete surface to remove any laitance and to expose the aggregates;
   b. Thoroughly clean and wet the surface shortly before applying the finish;
   c. Brush neat cement slurry into the damp surface immediately before applying the finish; or
2. Apply proprietary bonding agent in accordance with the manufacturer's recommendations.

FIN5.W025.7 CUTTING TILES
To BS 8000:Section 11.1:1989:
1. Cut tiles neatly and accurately;
2. Maintain general joint width along cut edges;
3. Cut and fit tiling neatly around pipes, electrical boxes, etc.

FIN5.W030.7 CLEANLINESS
Clean all tiling as the work progresses, removing bedding mortar, adhesive, and grout from the tile surfaces at each stage, as soon as the initial set has taken place and before the material has fully hardened. Cleaning tiles at a later stage using corrosive cleaning agent will not be permitted.

FIN5.W040.7 CUT MITRES ETC
Cut mitres and the like only when tiles are specified without special tiles and, when a full range of tile fittings is unavailable.

FIN5.W050.7 CONSTRUCTION MOCK-UP
Construct a Construction Mock-up of around 5 m² each for the wall and floor installations in accordance with PRE.B9.440 for:
1. Wall tiling at lift lobby, bathroom and kitchen:
   a. Where applicable, show the workmanship of each construction works including spatterdash, rendering, substrate preparation, junctions, jointing, sealant, moisture sealer, E&M works and accessories, waterproofing, skirting, floor drain, bond coat, bedding, tiles laying and pointing, cleanliness etc., as directed by CM.

2. Floor tiling at lift lobby, bathroom and kitchen:
   a. Where applicable, show the workmanship of each construction layer including substrate preparation, angles fillet, layers of waterproofing, floor drains, floor screed, bond coat, bedding, tiles laying and pointing, cleanliness and etc., as directed by CM.

**FIN5.W060.7 TILE JOINT TREATMENT**

1. Remove any dust or debris that is collected in the tile joints prior to grouting;
2. Proprietary grouts: do not wet joint cavities prior to grouting if proprietary grout is used particularly when fixing with adhesive or according to the manufacturer's recommendation;
3. Cement grouts: wet the joint cavities prior to grouting;
4. Use plastic string or strip to form the required width of joints in lieu of cross-shaped spacers for both ceramic and homogeneous wall tiles. Do not leave behind any plastic tile spacers or string in the tiling work.

**FIN5.W070.7 TILING WORKS ADJOINING FRAMES OF TIMBER DOOR AND HOSE REEL CABINETS**

1. Fix tiling works around the door frames in accordance with Drawings;
2. Do not fix tiles over frames of timber doors and cabinets.

**LAYING FLOOR TILES**

**FIN5.W120.7 CEMENT : SAND MORTAR BEDDING METHOD**

To BS 5385:Part 3:1989 with particular attention to clause 24.1:

1. Soak tiles in clean water as required in accordance with the manufacturers' instruction and allow to drain;
2. Dampen the screed with clean water to reduce suction if required;
3. Lay 1 : 3 cement and sand bedding mortar over the screed, spread and trowel to the thickness as shown on Drawings;
4. Spread the back of the tiles with slurry and immediately lay and tamp them firmly into the bedding, forming straight and even joints, 3 mm wide unless shown otherwise on Drawings;
5. Allow the bedding to set and grout up joints, cleaning any surplus grout from the face of the tiles as the work proceeds.

**FIN5.W130.7 CEMENT-BASED ADHESIVE BEDDING METHOD**

To BS 5385-3:1989 with particular attention to clause 24.4:

1. Fix tiles with adhesive and ensure the tile adhesive is prepared and mixed in accordance with the manufacturer's recommendations;
2. Grout up joints using proprietary grout in accordance with the grout manufacturer's recommendations.
FIN5.W140.7  SEMI-DRY METHOD
Do not use.

FIN5.W150.7  LAYING TACTILE HOMOGENEOUS FLOOR TILES
1. Avoid as much as practicable the cutting of tiles;
2. Normal tile to tile joints to be the same as that for adjacent general flooring;
3. In order not to cause any disruption to the tactile guide path, keep away accessories such as metal grating and manhole covers which will cause a disruption to the floor pattern.

FIN5.W160.7  TRAFFIC ON NEWLY LAID FLOORS
Do not allow traffic on newly laid floors until 4 days have elapsed since completion of laying. Permit only light traffic for a further period of ten days.

FIN5.W210.7  CEMENT : SAND MORTAR BEDDING METHOD
To BS 5385-1:1995 with particular attention to clause 4.2.3.5.
1. Bonding coat referred to in sub-clause 4.2.3.5.1 to be in accordance with FIN5.M860;
2. Soak tiles in clean water for a minimum of 30 minutes, stack to drain and fix as soon as the surface water has drained from them. Do not soak homogeneous wall tiles;
3. Tiles to be cleaned free of dust and loose powder before application;
4. Dampen the wall render with clean water, sufficiently to prevent it absorbing water from the bedding mortar;
5. Butter the back of each tile with cement and water slurry and tamp it firmly into position so that the bed is uniformly spread throughout to a minimum thickness of 3 mm and not more than 6 mm at localised areas for rectification of slight variations in the trueness of the render background;
6. Form joints 1.5 mm wide for tiles up to 150 x 150 mm and 3.0 mm wide for tiles of 200 x 200 mm and over, unless shown otherwise on Drawings. Ensure the required joint width is provided through the entire depth of the tile joint;
7. Clean tiles and joints before the bedding hardens;
8. Grout the joints at least 24 hours after fixing the tiles and clean off surplus grout as the work proceeds.

FIN5.W220.7  CEMENT-BASED ADHESIVE BEDDING METHOD
To BS 5385-1:1995:
1. Site demonstration is to be carried out by the adhesive supplier on the whole application procedures before commencing the tiling works;
2. Tiles to be cleaned free of dust and loose powder and left thoroughly dry before immediate application;
3. Do not wet tiles when fixing with tile adhesives unless stated in the manufacturer's recommendation;
4. Prepare and mix tile adhesive in strict accordance with the manufacturer's recommendation;
5. Apply the adhesive by notched trowelling and buttering method;
6. Apply and press the adhesive into the surface to give a bed thickness of about 3 mm before combing the adhesive with a notched trowel of size recommended by manufacturer. Do not apply more adhesive on the wall than can be covered with tiles within the "open time" of the adhesive;

7. Butter a thin coating of adhesive over the back of tile to fill the ribs or keys before pressing and tamping the tiles in position on the combed adhesive bed to spread the adhesive evenly over the back of tile;

8. There should be no significant increase in the final bed thickness;

9. Form joints to width specified against respective tile sizes;

10. Grout up joints using proprietary grout in accordance with the grout manufacturer's recommendations;

11. Cleaning of tiles to be in accordance with FIN5.W030.

FIN5.W230.7 FIXING TO PANEL WALL PARTITIONS

1. Fix wall tiles using a proprietary adhesive in accordance with FIN5.M1010. Apply adhesive in accordance with FIN5.W220;

2. Grout up joints using a proprietary grout in accordance with FIN5.M1010. Apply tile grout in accordance with the grout manufacturer's recommendation.

FIN5.W240.7 FIXING TO BLOCKWORK OR CONCRETE

1. Fix wall tiles using proprietary adhesive in accordance with FIN5.M1010 on single coat render in accordance with FIN1.W520 (1); or

2. Fix wall tiles using a proprietary adhesive in accordance with FIN5.M1010 on two coats render in accordance with FIN1.W520 (2); and

3. Grout up joints using proprietary grout in accordance with FIN5.M1010. Apply tile grout in accordance with the grout manufacturer's recommendation.

FIXING MOSAIC TILES

FIN5.W310.7 FIXING TO FLOOR BY CEMENT SAND MORTAR BEDDING METHOD

To BS 5385-3:1989 with particular attention to clause 33.2 and the following:

1. Dampen the floor screed with clean water sufficiently to prevent it absorbing water from the bedding mortar;

2. Lay 1 : 3 cement and sand bedding mortar over the screed, spread and wood float finish to a minimum thickness as shown on Drawings;

3. Pre-grout the bed side of the mosaic tiles using the same colour neat cement as the final grout. Where joints are wider than 2 mm, or thickness of the mosaic tiles are greater than 4 mm, use 1 : 1 cement sand grout;

4. When using taped-backed or mesh-backed mosaic, spread and trowel over the bed with 2 mm thick slurry of neat cement or 1 : 1 cement sand;

5. Place sheets of mosaic tiles in position and tamp them firmly into the bedding, and maintain straight and regular joints between sheets;

6. Remove the backing paper, complete the final straightening and rub the surface with grout, coloured as required, to fill the joints and clean any surplus from the face of the mosaic as the work proceeds.

FIN5.W315.7 FIXING TO FLOOR BY CEMENT-BASED ADHESIVE BEDDING METHOD

To BS 5385-3:1989 with particular attention to clause 33.1 and the following:
1. Fixing mosaic with adhesive in accordance with the manufacturer’s recommendations;
2. Grouting the joints with a proprietary grout applied in accordance with the grout manufacturer’s recommendations.

**FIN5.W320.7**  
**FIXING TO WALLS BY CEMENT SAND MORTAR BEDDING METHOD**
1. To BS 5385-1:1995 with particular attention to clause 5.4.2 for internal wall;
2. To BS 5385-2:1991 with particular attention to clause 27.2 for external wall;
3. Dampen the wall render with clean water, sufficiently to prevent it absorbing water from the bedding mortar;
4. Preglout the back of sheets of mosaic tiles with preglout materials to FIN5.M860;
5. Place sheets of mosaic tiles in position and tamp them firmly into the bedding, maintaining straight and regular joints;
6. Remove the backing paper, complete the final straightening and rub the surface with grout, coloured as required, to fill the joints and clean any surplus from the face of the tiles as the work proceeds;

**FIN5.W330.7**  
**FIXING TO WALLS BY CEMENT-BASED ADHESIVE BEDDING METHOD**
1. To BS 5385:Part 1:1995 with particular attention to 5.4.1 for internal wall;
2. To BS 5385:Part 2:1991 with particular attention to 27.1 for external wall;
3. Fixing mosaic with adhesive in accordance with FIN5.W220;
4. Grouting the joints with a proprietary grout applied in accordance with the grout manufacturer’s recommendations.

**FIN5.W340.7**  
**FIXING TO WALLS BY CEMENT SLURRY BEDDING METHOD**
1. Dampen the wall surface sufficiently to prevent it absorbing water from the cement slurry;
2. Coat the surface of the wall with cement slurry in accordance with FIN5.M860 of the same colour of the final grout in one operation and coat the backs of the sheets of mosaic tiles with cement slurry, immediately before fixing;
3. Place sheets of mosaic tiles in position and tamp them firmly in maintaining straight and regular joints;
4. Remove the backing paper, complete the final straightening and rub the surface with grout, coloured as required, to fill the joints and clean any surplus from the face of the tiles as the work proceeds.

**FIN5.W350.7**  
**FIXING TO PANEL WALL PARTITIONS**
Fix mosaic tiles as FIN5.W330.

**FIN5.W360.7**  
**FIXING GLASS AND GLAZED MOSAIC TO PRECAST FACADE**
1. Use cement-based adhesive bedding method as FIN5.W330;
2. Fix mosaic tiles before erection, or after erection with Approval.

**MARBLE AND GRANITE SLAB OR TILE FINISHES**

**FIN5.W405.7**  
**APPLY PLASTERS FOR MARBLE AND GRANITE WALL TILES**
As Worksection FIN1.
FIN5.W410.7  LAYING MARBLE AND GRANITE FLOOR SLABS
To BS 5385:Part 5:1994 with particular attention to the following alternative methods:

1. Lay floor slabs solid on screed base as follows:
   a. Lay bedding mortar to a minimum thickness of 20 mm, maximum 30 mm and finish with a perfectly level, even surface;
   b. Butter slabs completely with neat cement slurry, use white cement for light colour granite; a water resistant bonding agent may be incorporated in the slurry;
   c. Tap each slab firmly into position using rubber mallet;
   d. Lay slabs with joints at 1 mm to 2 mm wide for smooth finish, 6 mm wide for textured and riven finishes, and 2 mm wide for other finishes in general;
   e. Point joints and clean off any surplus grout as the work proceeds.

2. Lay floor slabs solid on concrete base with semi-dry mix method as follows:
   a. Wet the base for several hours, brush clean the base before the bedding is laid;
   b. Within 30 minutes before bedding, brush a thin layer of neat cement slurry into the base concrete;
   c. Spread the semi-dry mix to the minimum thickness of 25 mm, and to the maximum of 70 mm without fall or 100 mm with fall, and compact thoroughly;
   d. Spread and trowel an even layer of 2 mm thick cement slurry over the bedding;
   e. Follow sub-clauses (1)(b) to (1)(e) above.

FIN5.W420.7  FIXING MARBLE AND GRANITE WALL SLABS
1. Unless otherwise shown on Drawings, fix to BS 8298:1989 with particular attention to the following:
   a. Fix at a distance of 25 mm or more from structural surfaces;
   b. Partially fill the holes with cement and sand (1:3 mix) packing or approved resin before the dowels are inserted and grout the gaps between the dowels and the preformed pocket with slurry or resin before the slabs are fixed in position;
   c. Unless indicated otherwise on Drawings, provide 5 mm wide, open butt joints between the slabs, or 3 mm wide for those on the ground floor. Install back-up material and point with sealant to FIN5.M930;
   d. At vertical movement joints, stones should be supported by separated fixings as shown on the Drawings or Approved shop drawings.

2. Comply also with the following:
   a. Drill edges of slabs to receive stainless steel fixing dowels at approximately 450 mm centres;
   b. Drill slabs to receive stainless steel cramps and fixing methods at approximately 350 mm centres and solidly bed cramps to the structure and hooks to the backs of the slabs.

FIN5.W430.7  FIXING MARBLE AND GRANITE WALL TILES
1. Application of plaster, prior to fixing of tiles, as FIN5.W405;

2. Unless otherwise shown on Drawings, fix tiles to BS 5385:Part1:1995 with particular attention to the following:
a. Fix marble or granite tile after plasterwork is dry throughout or at least 4 weeks after plasterwork is completed;  

FIN5.W440.7  SHOP DRAWINGS  
For wall facing slabs, submit shop drawings of anchor details, with calculations by a Registered Structural Engineer, prior to installation.

FIN5.W450.7  FINISHING  
1. Cover all marble and granite flooring and wall facing slabs with a sealer;  
2. For floors, use proprietary anti-slip system in accordance with the manufacturer's recommendations.

FIN5.W460.7  PROTECTION  
Protect all marble and granite flooring and wall facing slabs with a suitable covering until completion.

TOLERANCES

FIN5.W610.7  GENERAL  
Refer to Appendix H "Schedule of Tolerances" to this Specification.
TESTING

MATERIAL VERIFICATION TEST FOR TILE ADHESIVE

FIN5.T105.7 MATERIAL VERIFICATION TEST FOR TILE ADHESIVE DELIVERED TO SITE

1. Test Arrangements:
   a. For each batch of tile adhesive delivered to Site under each delivery note as specified in FIN5.M1010 (3)(a), material verification test shall be carried out by CM's Representative, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the followings pertaining to material verification test:
      i. Provide attendance on the Site;
      ii. Provide, deliver and collect samples etc. as specified or as directed by CM.
   c. The material verification test shall require a minimum of 7 weeks commencing from the date of delivering the test sample to the laboratories;
   d. During the material verification test, handle tile adhesive delivered to Site as follows:
      i. Store the tile adhesive on Site in accordance with FIN5.M1010 (5)(b);
      ii. If the use of tile adhesive in the tiling works during the material verification test is approved by the CM as specified in FIN5.M1010 (5)(d), submit full record of the locations where each batch of the tile adhesive has been installed.

2. Testing Samples:
   a. Provide one set of test sample for every 1500 bags of tile adhesive or part thereof from the batch of material delivered to Site under the delivery note as specified in FIN5.M1010 (3)(a) or as instructed by CM;
   b. One set of test sample shall consist of one bag of tile adhesive.

3. Testing methods:
   As per FIN5.M1010 (2)(b) and FIN5.M1010 (2)(c);

4. Non-compliance:
   a. In the event that the testing sample fails to meet the testing requirements, follow either one of the following actions:
      i. Remove the representative batch including material already incorporated into the permanent work off Site. Reinstate that part of the work damaged, disturbed or affected by the removal of tile adhesive to the satisfaction of the CM; or
ii. Submit a written request to CM applying for re-testing three separate sets of sample selected by CM from the representative batch. When CM agrees to carry out the re-test, comply with sub-clauses (1)(b) and (2)(b) and provide sufficient sets of sample pertaining to material verification test. Bear all associated costs for the re-test which shall be conducted as specified in sub-clauses (1)(a) and (3) and no extension of time will be allowed. In case of any one selected sample fails the re-test, remove the representative batch of tile adhesive including material already incorporated into the permanent work off Site and reinstate that part of the work damaged, disturbed or affected by the removal of tile adhesive to the satisfaction of the CM. No extension of time will be allowed.

5. Material Verification Test for the Replaced Tile Adhesive:
   a. When the representative batch of tile adhesive is removed off Site and replaced with another new batch, the new batch of tile adhesive shall be subject to material verification test as specified in sub-clauses (1), (2), (3) and (4);
   b. Bear all associated costs for the test and re-test and no extension of time will be allowed.

FIN5.T108.7 MATERIAL VERIFICATION TEST FOR TILE ADHESIVE DELIVERED TO MANUFACTURER'S FACTORY OF PRECAST CONCRETE COMPONENTS

1. Test Arrangements:
   a. For each batch of tile adhesive delivered to the manufacturer's factory under each delivery note as specified in FIN5.M1010 (4)(a), material verification test shall be carried out by CM's Representative, CM's Representative resident at manufacturer's factory, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the followings pertaining to material verification test:
      i. Provide attendance at the manufacturer's factory;
      ii. Provide, deliver and collect samples etc. as specified or as directed by CM.
   c. The material verification test shall require a minimum of 7 weeks commencing from the date of delivering the test sample to the laboratories;
   d. During the material verification test, handle tile adhesive delivered to the manufacturer's factory as follows:
      i. Store the tile adhesive at the manufacturer's factory in accordance with FIN5.M1010 (5)(c);
      ii. If the use of tile adhesive in the tiling works during the material verification test is approved by the CM as specified in FIN5.M1010 (5)(d), submit to CM's Representative resident at manufacturer's factory the full record of the precast concrete elements in which each batch of the tile adhesive has been installed.

2. Testing Samples:
   a. Provide one set of test sample for every 1500 bags of tile adhesive or part thereof from the batch of material delivered to the manufacturer's factory under the delivery note as specified in FIN5.M1010 (4)(a) or as instructed by CM;
   b. One set of test sample shall consist of one bag of tile adhesive.

3. Testing methods:
   As per FIN5.M1010 (2)(b) and FIN5.M1010 (2)(c).

4. Non-compliance:
a. In the event that the testing sample fails to meet the testing requirements, follow either one of the following actions:

i. Remove the representative batch including material already incorporated into the precast concrete elements off the manufacturer's factory. Reinstate that part of the precast concrete elements damaged, disturbed or affected by the removal of tile adhesive to the satisfaction of the CM; or

ii. Submit a written request to CM applying for re-testing three separate sets of sample selected by CM from the representative batch. When CM agrees to carry out the re-test, comply with sub-clauses (1)(b) and (2)(b) and provide sufficient sets of sample pertaining to material verification test. Bear all associated costs for the re-test which shall be conducted as specified in sub-clauses (1)(a) and (3) and no extension of time will be allowed. In case of any one selected sample fails the re-test, remove the representative batch of tile adhesive including material already incorporated into the precast concrete elements off the manufacturer's factory and reinstate that part of the precast concrete elements damaged, disturbed or affected by the removal of tile adhesive. No extension of time will be allowed.

5. Material Verification Test for the Replaced Tile Adhesive:

a. When the representative batch of tile adhesive is removed off the manufacturer's factory and replaced with another new batch, the new batch of tile adhesive shall be subject to material verification test as specified in sub-clauses (1), (2), (3) and (4);

b. Bear all associated costs for the test and re-test and no extension of time will be allowed.

SURVEILLANCE TESTS

FIN5.T110.7 SURVEILLANCE TEST FOR TILE GROUT

1. Test Arrangements:

a. When Instructed, surveillance tests shall be carried out by CM's Representative, a Direct Contractor or the Housing Department Material Testing Laboratory;

b. Comply with the followings pertaining to surveillance tests:

i. Provide attendance on the Site;

ii. Provide, deliver and collect samples etc. as specified or as directed by CM.

2. Testing Samples:

a. Provide one set of test sample from the batch of material delivered to Site under the delivery note as specified in FIN5.M1010 (3)(a) or as instructed by CM;

b. One set of test sample shall consist of one bag of tile grout.

3. Testing methods:

As per FIN5.M1010 (2)(d).

4. Non-compliance:

a. In the event that the testing samples fail to meet the testing requirements, follow either one of the following actions:

i. Remove the representative batch off Site; or
ii. Carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 on three separate sets of samples selected by the CM from the representative batch. In case of any one sample fails the re-test, remove the representative batch off Site.

b. When the representative batch of tile grout is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 for one sample selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clause (4)(a);

c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.

FIN5.T130.7 SURVEILLANCE TEST FOR TACTILE HOMOGENEOUS FLOOR TILE

1. Test Arrangements:
   a. When Instructed, surveillance tests shall be carried out by CM's Representative, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the followings pertaining to surveillance tests:
      i. Provide attendance on the Site;
      ii. Provide, deliver and collect samples etc. as specified or as directed by CM.

2. Testing Samples:
   a. Provide one set of test sample for each type of tactile homogeneous floor tiles from the batch of material delivered to Site under one delivery note or as instructed by CM;
   b. One set of test sample shall consist of three tactile homogeneous floor tiles.

3. Testing methods:
   As per FIN5.M160 (2)(e).

4. Non-compliance:
   a. In the event that the testing samples fail to meet the testing requirements, follow either one of the following actions:
      i. Remove the representative batch off Site; or
      ii. Carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 on three separate sets of samples selected by the CM from the representative batch. In case of any one sample fails the re-test, remove the representative batch off Site.
   b. When the representative batch of tactile homogeneous floor tile is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 for one sample selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clause (4)(a);
   c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.
ON-SITE VERIFICATION TESTS

FIN5.T150.7 IN-SITU PULL-OFF TESTS ON COMPLETED TILES

1. Test Arrangements:
   a. Carry out tests by employing a laboratory that complies with the requirements stated in PRE.B9.570.

2. Testing Samples:
   a. Two samples for each of the following locations for every 10 typical floors or part thereof for one domestic block when tiles are fixed with cement-based adhesive bedding on panel wall, on rendering over concrete substrate or direct on concrete substrate or fixed with slurry on rendering over concrete substrate:
      i. Typical floor lift lobby;
      ii. Kitchen;
      iii. Bathroom;
      iv. Precast Facade.
   b. Each sample comprises one wall tile specimen selected by CM;
   c. Samples are not to be taken on tiles installed over waterproofing layers.

3. Testing Methods:
   a. To comply with the following:
      i. Carry out Pull-off tests after a minimum of 28 days. Except for the tiles installed at facades, the Pull-off test shall be carried out within 60 days after fixing;
      ii. The pull-off equipment shall be capable of increasing the load steadily without jerking at a rate of (250 + 50) N/s, and must be provided with a measurement device which shall retain the maximum force exerted, the so called failure load to the nearest 0.01kN. The measurement inaccuracy of the equipment must be less than 2%, in accordance with accuracy Grade 2 of BS 1610:Part 1:1985;
      iii. Saw cut the tested portion through to the substrate;
      iv. Attach an aluminium/steel dolly onto the surface of the tile by a suitable adhesive resin;
      v. Use strong adhesive tape to fix the position of dolly until strength of the resin is developed as advised by the resin manufacturer;
      vi. Apply a tensile force gradually by the device;
      vii. Record the failure force, location of failure and any other observations or abnormalities;
      viii. Record the force from the readout unit;
      ix. Repeat steps as specified in sub-clauses (3)(a)(i) to (3)(a)(viii) until Pull-off tests to all selected tiles are completed;
      x. Take photographs;
      xi. Make good the testing areas to satisfaction of the CM.
   b. The report for Pull-off test shall contain the following data and information:
      i. The calculated tensile adhesion strength of individual tile and tile adhesive to the nearest 0.001 N/mm²;
      ii. The pull-off load to the nearest 0.01 kN;
      iii. The type of failure;
iv. The area of test piece to the nearest 1 x 1 mm;
v. A description of the test piece tile;
vi. A description of the tested substrate;
vii. The thickness of the tile adhesive bedding;
viii. The age of the bedding at the time of testing;
ix. A description of the pulling equipment by stating the make, type, test capacity and measurement range;
x. The size, the thickness and material of the dolly;
xi. The type of epoxy resin;
xii. The date of the test;
xiii. Photographs.
c. Acceptance standard for the Pull-off test shall be:
i. Minimum 0.5 N/mm² for concrete substrate, except that for glass mosaic tiles which would be 0.3 N/mm²;
ii. Minimum 0.3 N/mm² for panel wall.

4. Non-compliance in initial test:
a. In the event that any one sample fails to meet the requirements, take three separate samples for re-test on the same type of locations or works executed by the respective gang(s) of labourers all as selected by the CM within the same 10 floors or part thereof referred to in sub-clause (2)(a);
b. Where any of the re-tests fails to meet the testing requirements as specified in sub-clause (3)(c), comply with the following:
i. Remove all the tiling works executed on the date(s) same as the date(s) of execution of the re-test samples and the initial test samples in the said 10 floors or part thereof executed by the respective gang(s) of labourers irrespective of the type of locations. Should there be no daily labour record for tracking down the respective gang(s) of labourers, remove all the tiling works executed on the date(s) same as the date(s) of execution of the re-test samples and the initial test samples in the said 10 floors or part thereof regardless of whether they are executed by the respective gang(s) of labourers. Re-install the tiling works. Re-test the rectified areas in accordance with sub-clauses (2), (3), (4) and (5) but with the application of such sub-clauses limited to the rectified areas only; and
ii. Observe further re-testing requirements stipulated in sub-clause (5) below;
c. Bear all associated costs including further re-tests and no extension of time will be allowed.

5. In the event that any one of the re-test samples in sub-clause (4)(a) fails to meet the testing requirements:
a. Take three additional separate samples for further re-test on the same type of locations or works executed by the respective gang(s) of labourers all as selected by the CM within the said 10 floors or part thereof referred to in sub-clause (2)(a);
b. Where any of the further re-tests fails to meet the testing requirements as specified in sub-clause (3)(c), the Contractor may elect to comply with either (i) or (ii) of the following:
i. Remove all the tiling works executed by the respective gang(s) of labourers within the said 10 floors or part thereof irrespective of the date(s) of execution of the further re-test samples. Re-install the tiling works. Re-test the rectified areas in accordance with sub-clause (2), (3), (4) and (5) but with the application of such sub-clauses limited to the rectified areas only; or

ii. Remove all the tiling works executed on the date(s) same as the date(s) of execution of the further re-test samples in the said 10 floors or part thereof executed by the respective gang(s) of labourers irrespective of the type of locations. Should there be no daily labour record for tracking down the respective gang(s) of labourers, remove all the tiling works executed on the date(s) same as the date(s) of execution of the further re-test samples in the said 10 floors or part thereof regardless of whether they are executed by the respective gang(s) of labourers. Re-install the tiling works. Re-test the rectified areas in accordance with sub-clauses (2), (3), (4) and (5) but with the application of such sub-clauses limited to the rectified areas only; and

- Conduct further re-tests in accordance with sub-clause (5)(a) and repeat conducting such further re-tests when any one of the re-test samples fails until the test result(s) verify that the tiling works in the said 10 floors or part thereof comply with the specified requirements. Remove all defective tiling works identified in such further re-tests in the manner as stipulated in the first bullet point above. Re-install the tiling works. Re-test the rectified areas in accordance with sub-clauses (2), (3), (4) and (5) but with the application of such sub-clauses limited to the rectified areas only.

c. Bear all associated costs including further re-tests and no extension of time will be allowed.
FIN6  FLEXIBLE SHEET AND TILE FINISHES

MATERIALS

GENERAL

FIN6.M010.7 QUALITY GENERALLY
Obtain and fix materials of an Approved type and colour and in accordance with the remaining clauses in this Worksection.

FIN6.M020.7 SAMPLES
Submit samples of all tile and sheet products for Approval.

PVC TILES AND SHEET

FIN6.M110.7 SEMI-FLEXIBLE TILES
To BS 3260:1969, size and thickness as shown on Drawings.

FIN6.M120.7 UNBACKED FLEXIBLE TILES
To BS 3261:1973: Type B, size and thickness as shown on Drawings.

FIN6.M130.7 UNBACKED FLEXIBLE SHEET
To BS 3261:1973: Type A, thickness as shown on Drawings.

FIN6.M140.7 FOAM BACKED SHEET
To BS 5085: Part 2 and:
1. With a wearing sheet of PVC sheet to BS 3261:1973: Type A;
2. Thickness as shown on Drawings.

FIN6.M150.7 COVED SKIRTINGS
Obtained from the same Approved manufacturer as the adjacent PVC material and matching in colour and texture.

LINOLEUM

FIN6.M210.7 SHEET AND TILES
To BS 6826:1987, thickness as shown on Drawings.
RUBBER

FIN6.M310.7 SHEET AND TILES
Solid rubber to BS 1711:1975, thickness as shown on Drawings.

FIN6.M320.7 NON-SLIP TACTILE SYNTHETIC RUBBER FLOOR TILES
Tiles with raised profiles to provide a distinctively textured walking surface easy detectable by foot and cane for guidance of the visually impaired.
1. Type: Two types of tactile tiles to be used as shown or scheduled on drawings:
   a. Tiles with raised dots for indication of hazard or orientation; and
   b. Tiles with raised strips for indication of direction.
2. Size, thickness, profile & location: as shown or scheduled on drawings;
3. Colour: to Approval;
4. To be slip-resistant;

ANCILLARY MATERIALS

FIN6.M410.7 ADHESIVE
1. As recommended by the manufacturer of the material being fixed;
2. In compliance with the prescribed limits of VOC content as set out in the Air Pollution Control (Volatile Organic compounds) Regulation.

FIN6.M415.7 ADHESIVE FOR FIXING TACTILE SYNTHETIC RUBBER FLOOR TILE
1. Epoxy-resin-base bonding system, which must be confirmed by the manufacturer for the rubber tactile tiles that it is compatible with the tile material;

FIN6.M420.7 PVC WELDING RODS
Of Approved manufacture, coloured to match the material being joined.

FIN6.M430.7 POLISH
An Approved type of non-slip emulsion polish recommended by the manufacturer of the material being finished.
WORKMANSHIP

GENERAL

FIN6.W010.7 GENERAL

FIN6.W020.7 DAMAGED MATERIALS
Do not use tiles or sheet which have deteriorated in stock or which have a tendency to curl at the edges or corners.

FIN6.W030.7 PREPARATION OF LAYING SURFACE
Thoroughly clean the screed or wall rendering or concrete surfaces and:
1. Ensure that it is free from all loose particles, laitance, traces of grease, oil, paint, wax, dirt or dust;
2. Fill all cracks, minor holes or crevices with a suitable filler recommended by the manufacturer of the material to be laid.

LAYING SHEET AND TILES

FIN6.W110.7 GENERAL
Lay all tiles and floor and wall sheeting strictly in accordance with the manufacturer's instructions, with any pattern in accordance with the Drawings.

FIN6.W120.7 PRE-HEATED TILES
When required by the manufacturer's instructions:
1. Pre-heat tiles to a temperature just sufficient to give the required pliability;
2. Do not pre-heat single tiles.

FIN6.W130.7 APPLYING ADHESIVE
Apply in a thin film and spread evenly with a plain or notched trowel in accordance with the manufacturer's recommendations and ensure that:
1. Where a notched trowel is used:
   a. The notches are the size recommended by the manufacturer;
   b. It is renewed periodically to ensure the correct spread of adhesive.
2. Only sufficient adhesive is applied to prevent subsequent bleeding;
3. Clean off all excess adhesive as the work proceeds.

FIN6.W140.7 JOINTING AND CUTTING
Closely butt joints and cut accurately perpendicular to the finish surface, to an agreed design or as indicated on the Drawings, using only the minimum of jointing.

FIN6.W150.7 JOINTING PVC SHEET
Weld joints to form a continuous surface, with PVC welding rods.
FIN6.W160.7  FIXING TACTILE SYNTHETIC RUBBER FLOOR TILES
Fix the rubber tiles with adhesive as specified in FIN6.M415 in accordance with the following:
1. Prepare the laying surface in accordance with FIN6.W030;
2. Mix and apply the adhesive all in accordance with manufacturer's recommendations.

FIN6.W170.7  DEFECTIVE AREAS
Relay any areas insufficiently bonded or showing an uneven surface.

FINISHING

FIN6.W210.7  CLEANING
After laying, thoroughly clean the surface with water and a detergent as recommended by the finish manufacturer.

FIN6.W220.7  POLISHING
Apply two coats of polish in accordance with the manufacturer's recommendations.

FIN6.W230.7  PROTECTION
Protect floors with a suitable covering.

TOLERANCES

FIN6.W310.7  GENERAL
Refer to Appendix H "Schedule of Tolerances" to this Specification.
FIN7 PAINTING

MATERIALS

GENERAL

FIN7.M010.7 PAINTS AND DECORATIVE MATERIALS
All paints and decorative materials must be:
1. Of an Approved type, brand and colour;
2. Supplied in sealed containers each containing the name and information of the supplier, the manufacturer label and printed instructions;
3. In compliance with the prescribed limits of VOC content as set out in the Air Pollution Control (Volatile Organic Compounds) Regulation.

FIN7.M015.7 WATER BASED PAINTS
All water based paints must comply with the following environmental requirements:

<table>
<thead>
<tr>
<th>Material Contents</th>
<th>Requirements</th>
<th>Testing Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Formaldehyde</td>
<td>&lt;=100 mg/kg</td>
<td>Guo Biao 18582 - 2008</td>
</tr>
<tr>
<td>2. Heavy Metal</td>
<td></td>
<td></td>
</tr>
<tr>
<td>a. Lead</td>
<td>&lt;= 90 mg/kg</td>
<td>Guo Biao 18582 - 2008</td>

<td>&lt;= 75 mg/kg</td>
<td>Guo Biao 18582 - 2008</td>
</tr>
<tr>
<td>d. Mercury</td>
<td>&lt;= 60 mg/kg</td>
<td>Guo Biao 18582 - 2008</td>
</tr>
</tbody>
</table>

FIN7.M016.7 SOLVENT BASED PAINTS
All solvent based paints must comply with the following environmental requirements:

<table>
<thead>
<tr>
<th>Material Contents</th>
<th>Requirements</th>
<th>Testing Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Benzene</td>
<td>&lt;=0.3%</td>
<td>Guo Biao 18581 - 2009</td>

<td>Guo Biao 18581 - 2009</td>
</tr>
<tr>
<td>d. Mercury</td>
<td>&lt;= 60 mg/kg</td>
<td>Guo Biao 18581 - 2009</td>
</tr>
</tbody>
</table>

FIN7.M020.7 UNIFORM SUPPLY
1. Where possible, obtain all the materials in a coating system from the same manufacturer;
2. Furnish the CM with two copies of the manufacturer's data sheets for the proposed paints.
PESTICIDES AND PRESERVATIVES

FIN7.M110.7 RUST INHIBITOR
An Approved proprietary chemical agent which converts rust to iron phosphate.

FIN7.M120.7 ANTI-MOULD LIQUID
An Approved fungicidal solution.

FIN7.M130.7 PESTICIDAL COATING
Containing an Approved pesticide:
1. Registered under Pesticides Ordinance;
2. Safe to use for its purpose without causing hazards;
3. Effective in killing all stages of insect infestation and protecting timber from subsequent insect attack;
4. Colourless or coloured;
5. It shall be suitable for overpainting where treated surfaces are likely to be exposed or in contact with a painted finish.

FIN7.M140.7 WOOD PRESERVATIVE
1. An Approved proprietary brand to BS 1282:1999;
2. Safe to use for its purpose without causing hazards;
3. Colourless or unless otherwise specified;
4. It shall be suitable for overpainting where treated surfaces are likely to be exposed or in contact with a painted finish.

FIN7.M150.7 WATER REPELLENT LIQUID
Silicone based or other Approved water repellent.

PRIMING PAINTS AND SEALERS

FIN7.M210.7 WOOD PRIMERS
Aluminium primer to BS 4756:1998: Type 1.

FIN7.M220.7 METAL PRIMERS
One of the following as recommended by the manufacturer of the finishing paint system:
1. Zinc phosphate primer;

FIN7.M230.7 PRIMERS FOR GALVANIZED SURFACES
1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed water based anti-corrosion primer for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name/model name and job reference of the material;
      ii. Name, address and contact person of the local supplier;
iii. Name, address and contact person of the manufacturer;

iv. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agent/distributor in Hong Kong or document from the supplier showing the appointment of the manufacturer and manufacturer's agreement for the production of the proposed product;

v. When the primer is supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:

- Original or a certified true copy of the ISO 9001 certificate for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by a certification body or by the QCM. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.

b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(b) for CM's information:

i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works;

ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material to Site;

iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:

a. Water based anti-corrosion primer:

i. Resins shall be based upon acrylic resin;

b. The quality and performance requirements are as follows:

<table>
<thead>
<tr>
<th>Items</th>
<th>Method</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content of zinc phosphate</td>
<td>Atomic Absorption Analysis</td>
<td>Min. 10%</td>

<td>BS 3900-E6:1992 Class 1</td>
<td>The dried primer film should show no failure on a cross cut test when applied to a untreated galvanized iron panel and dried for 7 days.</td>
</tr>
</tbody>
</table>
FIN7.M240.7  METAL PRIMERS FOR POLYURETHANE FINISHES  
Polyurethane primer, as recommended by the paint finish manufacturer.

FIN7.M250.7  SEALERS FOR PLASTER, MASONRY ETC  
An Approved alkali resistant primer sealer.

FIN7.M260.7  FLOOR SEALER  
An Approved resin based sealer.

PAINTS

FIN7.M340.7  ANTI-MOULD INTERNAL EMULSION PAINT  
1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed internal emulsion paint for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name/model name and job reference of the material;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agent/distributor in Hong Kong or document from the supplier showing the appointment of the manufacturer and manufacturer's agreement for the production of the proposed product;
      v. When the internal emulsion paints are supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:
         - Two identical sample boards similar to the one maintained by the Housing Department showing the quality, detail technical information and application procedures for the proposed internal emulsion paint;
         - Original or a certified true copy each of the certification to ISO 9001 and ISO 14001 for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by the certification bodies or by the QCM. The certification bodies shall be as follows:

<table>
<thead>
<tr>
<th>ISO</th>
<th>Certification Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISO 9001</td>
<td>The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
<tr>
<td>ISO 14001</td>
<td>The certification body shall be accredited by the Hong Kong Accreditation Service (HKAS), or the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
</tbody>
</table>

   vi. Written confirmation from suppliers or manufacturers that the proposed internal emulsion paint is with anti-mould properties.

   b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(b) for CM's information:
i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works or at an earlier date for domestic blocks subject to CM's consideration on the track records as maintained by the Housing Department;

ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);

iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:
   a. Water based emulsion paint in accordance with sub-clause (2)(b) comprising:
      i. One sealer coat;
      ii. Minimum two finishing coats;
      iii. Colour: to Approval.
   b. The quality and performance requirements are as follows:

<table>
<thead>
<tr>
<th>Items</th>
<th>Method</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preliminary examination of paint</td>
<td>Surface skin</td>
<td>-No surface skin</td>
</tr>

</tr>
</tbody>
</table>

3. On Site Delivery Verification:
   a. At delivery stage, submit the following documents:
i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a);

ii. Original or certified true copy of the Certificate of Origin for every batch of delivery. One batch being the material quantity covered under each delivery note;

iii. Delivery notes for all material delivered to Site.

b. Carry out and submit report on the following verifications for internal emulsion paint upon delivery on Site. Prior to carrying out the verifications, inform CM’s representatives who may present to witness the verifications:

i. Method:

<table>
<thead>
<tr>
<th>Verification Items</th>
<th>Method</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manufacturer's Certificate of Origin &amp; Delivery Note</td>

</tr>
<tr>
<td>Product</td>
<td>Remove container cover and check the quality of the sample</td>
<td>No contamination, drying out and obvious colour inconsistency shall be accepted</td>
</tr>
<tr>
<td>Product validity</td>
<td>Check expiry date on packaging</td>
<td>No product is found in store on site with invalid expiry date</td>
</tr>
</tbody>
</table>

ii. Frequency:

Sampling frequency of verification are as follows:

<table>
<thead>
<tr>
<th>Items</th>
<th>Sampling Frequency</th>
<th>Representative Batch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manufacturer's Certificate of origin &amp; Delivery Note</td>
<td>1 sample from each batch</td>
<td>Individual</td>
</tr>
</tbody>
</table>
Packaging and labelling | 1 sample from each batch | Same batch of material delivered to Site under one Delivery Note
Product and product validity | 1 sample from each batch | Same batch of material delivered to Site under one Delivery Note

c. Where any of the verifications fail to meet the acceptance standards, either:
i. Remove the representative batch off Site; or

ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

**FIN7.M350.7**

**TEXTURED EMULSION PAINT**

Water based acrylic emulsion paint textured with a finely dispersed aggregate by spray method or stone texture effect by trowel.

**FIN7.M370.7**

**ANTI-MOULD EXTERNAL EMULSION PAINT**

1. Submission Requirements:

a. At sample submission and approval stage, submit a sample of the proposed external emulsion paint for CM's approval together with all the following substantiation for CM's information:

i. Catalogue, brand name/model name and job reference of the material;

ii. Name, address and contact person of the local supplier;

iii. Name, address and contact person of the manufacturer;

iv. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agent/distributor in Hong Kong or document from the supplier showing the appointment of the manufacturer and manufacturer's agreement for the production of the proposed product;

v. When the external emulsion paints are supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:

- Two identical sample boards similar to the one maintained by the Housing Department showing the quality, detail technical information and application procedures for the proposed external emulsion paint;

- Original or a certified true copy each of the certification to ISO 9001 and ISO 14001 for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by the certification bodies or by the QCM. The certification bodies shall be as follows:

<table>
<thead>
<tr>
<th>ISO</th>
<th>Certification Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISO 9001</td>
<td>The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
<tr>
<td>ISO 14001</td>
<td>The certification body shall be accredited by the Hong Kong Accreditation Service (HKAS), or the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
</tbody>
</table>
vi. Written confirmation from suppliers or manufacturers that the proposed internal emulsion paint is with anti-mould properties.

b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(b) for CM's information:

   i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works or at an earlier date for domestic blocks subject to CM's consideration on the track records as maintained by the Housing Department;

   ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);

   iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:

   a. Water based external emulsion paint in accordance with sub-clause (2)(b) comprising:

      i. One sealer coat;

      ii. Minimum two finishing coats;

      iii. Colour: to Approval.

   b. The quality and performance requirements are as follows:

<td>After the specified hours of testing there shall be no signs of checking, blistering, or cracking, and the loss of gloss shall not be more than 30% of the original gloss. In addition, there shall be little change or no change in colour, and any change in colour shall be equivalent to a degree of contrast of not less than grade four of the grey scale conforming to BS 1006: 1992</td>
<td>ASTM G154-12a Min. 500 hours (“Cycle 2” in “Table X2.1 - Common Exposure Conditions” to be adopted except that UVA-340 lamp should be used in place of UVB-313)</td>
</tr>
<tr>
<td>Algal resistance</td>
<td>No sign of algal growth on the paint film</td>
<td>Refer sub-clause (c)</td>
</tr>
</tbody>
</table>

c. Determination of algal resistance:
i. General:
   - The test screens only the Trentepohlia Odorata species for algal resistance in emulsion paints for decorative purposes to be used on buildings in Hong Kong. It has been found that this species predominates on surfaces of most of the local buildings, besides being the first to colonise such surfaces;
   - A suitable level of an effective non-mercurial algicide shall be used. The level used should not render the finish or its film hazardous to health. The algicide used shall be one that is resistant to solar irradiation, consistent with the climatic conditions in Hong Kong.

ii. Testing apparatus:
   - Sterilized petri dish, ca. 90 mm diameter;
   - Shelf with fluorescent lighting, such that the light intensity incident to the test surface is 1,000 to 1,400 lux. This can be done by installing 2 tubes of 40-watt cool fluorescent lamp, ca. 25 cm apart on horizontal level and ca. 60 cm above the test surface;
   - Autoclave, 1.2 to 1.5 kgf/cm²;
- All chemicals, water and non-disposable containers and tools used for the test must be sterilized by an autoclave under the pressure of 1.2 to 1.5 kgf/cm² for 20 minutes.

iii. Reagents:

- Sterilized Bold Basal medium;
- Algae culture, predominantly Trentepohlia Odorata, maintained in Bold Basal medium.

iv. Testing procedure:

- Preparation of paint film: two coats of paint under test are applied to the interior bottom and vertical surface of the petri dish. The first coat of paint is allowed to dry overnight before the second coat is painted;
- Pre-ageing of paint film: the paint film prepared is allowed to stand at room temperature for 3 days followed by 168 hours UV ageing in accordance with ASTM G53-96. The following operating cycles shall be used:
  - 8 hours - lights on at 55°C;
  - 4 hours - condensation on and lights off at 45°C;
  - Light source - UV fluorescent lamps B313.
- After the ageing, allow the dish to stand at room temperature for 24 hours;
- Inoculation with algae culture: homogenise the algae culture with a tissue grinder shortly before inoculation. Adjust the concentration of the culture to 0.3 ± 0.1 mg/L chlorophyll with Bold Basal medium;
- Add 2 ml of the algae culture into the petri dish. Spread the culture to the painted surface as evenly as possible. Add the same quantity of algae culture into a blank petri dish to serve as control for the test. The same lot of algae culture is used for inoculating both the test sample and the blank dish. Replace the dish with cover after the inoculation. Subsequent operations are done on both the sample under test and on the blank;
- Exposure under lights: the petri dish is subject to exposure under fluorescent lighting at room temperature. Lighting cycle is 12 hours on followed by 12 hours off. Keep the paint film moistened by adding drops of diluted Bold Basal medium (1 part Bold Basal medium to 3 parts distilled water by volume) periodically. Normally this will require no more than 1 ml per 2 days. The petri dish is kept covered during the exposure period;
- The exposure period is 8 weeks from the day of inoculation of algae culture;
- The test is conducted in duplicate for both the paint sample and the blank.

v. Interpretation of results:

- At the end of the test, compare the growth intensity of algae on the paint sample with that of the blank control. The paint sample is deemed to pass the test if the algae culture is killed, as evidenced by the bleaching of the green colour, against the increase in algal growth in the blank petri dish;
- If no increase in growth is observed in the blank dish, the results are invalid and the test shall be repeated.

3. On Site Delivery Verification:
a. At delivery stage, submit the following documents:
   i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a);
   ii. Original or certified true copy of the Certificate of Origin for every batch of delivery. One batch being the material quantity covered under each delivery note;
   iii. Delivery notes for all material delivered to Site.

b. Carry out and submit report on the following verifications for external emulsion paint upon delivery on Site. Prior to carrying out the verifications, inform CM's representatives who may present to witness the verifications:

   i. Method:

**c.** Where any of the verifications fail to meet the acceptance standards, either:

  **i.** Remove the representative batch off Site; or
  
  **ii.** When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

**FIN7.M380.7**  **MULTI-COLOUR PAINT**  
An Approved brand comprising a base coat and hardwearing top coat incorporating a pigmented spatter coat.

**FIN7.M400.7**  **EXTERNAL TEXTURED PAINT**  
An Approved, heavy duty masonry paint, incorporating a fine aggregate filler.

**FIN7.M410.7**  **FIRE RETARDANT PAINT**  
Intumescent paints which, when used alone, or in conjunction with other paints and applied to combustible substrates in accordance with manufacturer's tested system, achieves a Class 1 surface spread of flame rating when tested to BS 476:Part 7:1997.

**FIN7.M420.7**  **COLD CURE EPOXY PAINT**  
An Approved two pack type.

**FIN7.M430.7**  **POLYURETHANE PAINT**  
A two pack type and part of an Approved system.

**FIN7.M440.7**  **CHLORINATED RUBBER PAINT**  
Part of an Approved system, comprising primers, undercoats and finishes.

**FIN7.M450.7**  **MICACEOUS IRON OXIDE PAINT**  
Part of an Approved system. Chlorinated rubber may be incorporated as a binder.

**FIN7.M460.7**  **BLACK BITUMASTIC PAINT**  
Tar based, complying with BS 1070:1993:Type B (quick drying).

**FIN7.M470.7**  **BLACK BITUMEN COATING SOLUTION**  
To BS 3416:1991:Type 1, for general purposes.
FIN7.M480.7 **FLUORESCENT PAINT**
1. Water or oil base as shown on Drawings;
2. Undercoat: white synthetic paint.

FIN7.M490.7 **REFLECTING PAINT**
Consisting of:
1. Undercoat: white synthetic paint;
2. Finish coat: white synthetic paint with a high gloss finish and a surface coating of fine grain reflective aggregate.

FIN7.M500.7 **METALLIC PAINT**
Composed of acrylic resin solution base mixed with:
1. Finely divided aluminium to give a bright finish; or
2. Finely divided copper or copper alloy to give a bronze finish.

FIN7.M510.7 **HEAT RESISTING PAINT**
Heat resisting primer, undercoat and Approved enamel finish.

FIN7.M520.7 **ACID RESISTING PAINT AND THINNER**
An Approved brand resistant to attack by all commonly used commercial acids and alkalis.

FIN7.M530.7 **BLACK ENAMEL**
High grade, quick drying black japan capable of drying to a perfectly smooth, hard and elastic surface within 12 hours at 16°C.

FIN7.M560.7 **CHALKBOARD PAINT**
An Approved, hard drying, flat black or dark green paint, containing a fine abrasive.

FIN7.M570.7 **SYNTHETIC PAINT**
1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed synthetic paint for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name/model name and job reference of the synthetic paint;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agent/distributor in Hong Kong or document from the supplier showing the appointment of the manufacturer and manufacturer's agreement for the production of the proposed product;
     v. When the synthetic paints are supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:
- Two identical sample boards similar to the one maintained by the Housing Department showing the quality, detail technical information and application procedures for the proposed synthetic paint;
- Original or a certified true copy each of the certification to ISO 9001 and ISO 14001 for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by the certification bodies or by the QCM. The certification bodies shall be as follows:

<table>
<thead>
<tr>
<th>ISO</th>
<th>Certification Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISO 9001</td>
<td>The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
<tr>
<td>ISO 14001</td>
<td>The certification body shall be accredited by the Hong Kong Accreditation Service (HKAS), the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
</tbody>
</table>

b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(b) for CM’s information:

i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works or at an earlier date for domestic blocks subject to CM’s consideration on the track records as maintained by the Housing Department;

ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);

iii. In the event that no test report has been submitted for CM’s information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:

a. Solvent based or water based synthetic paint in accordance with sub-clause (2)(b) comprising:

i. One sealer or primer coat;

ii. Minimum two finishing coats;

iii. Colour: to Approval.

b. The quality and performance requirements are as follows:

c. Where any of the verifications fail to meet the acceptance standards, either:
   i. Remove the representative batch off Site; or
   ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

FIN7.M580.7 MULTI-LAYER ACRYLIC PAINT

1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed multi-layer acrylic paint for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name/model name and job reference of the material;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agent/distributor in Hong Kong or document from the supplier showing the appointment of the manufacturer and manufacturer's agreement for the production of the proposed product;
      v. Documents from the supplier or manufacturer showing the appointment of the applicators for the proposed multi-layer acrylic paint;
      vi. When the multi-layer acrylic paints are supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:
         - For multi-layer acrylic paints with texture, two identical sample boards similar to the ones maintained by the Housing Department with a 'Visual Sample Board' and the data of minimum coverage rate of:
            - 1.3 kg/m² to 3.8 kg/m² for external walls;
            - 0.9 kg/m² to 3.8 kg/m² for corridor walls.
         - as required in JIS A6910: 1988 Section 2.1 of the proposed system to show the appearance of the paint is not below the standard of the benchmark sample boards and showing the quality, detail technical information and application procedures for the proposed multi-layer acrylic paint; within six months of the commencement of the superstructure work and within two months where acrylic paint is specified for application to the precast facade units;
         - Original or a certified true copy each of the certification to ISO 9001 and ISO 14001 for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by the certification bodies or by the QCM. The certification bodies shall be as follows:
b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(b) for CM's information:
   
i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works or at an earlier date for domestic blocks subject to CM's consideration on the track records as maintained by the Housing Department;
   
ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);
   
iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:
   
a. Water based multi-layer acrylic paint in accordance with sub-clause (2)(b) comprising:
   
i. One sealer coat;
   
ii. One main texture coat for multi-layer acrylic paint with texture;
   
iii. Minimum two finishing coats;
   
iv. Colour: to Approval.

FIN7.M585.7 **DOORSET PAINT**

An Approved proprietary water based paint product comprising:

1. Undercoat: one coat, type as recommended by the paint manufacturer;
2. Finishing coat: minimum three coats of cellulose lacquer.

FIN7.M590.7 **TEXTURED SPRAYED PAINT COATING**

1. Textured spray paint coating of solvent based polyurethane of all colour range and comprising:
   a. Sealer;
   b. Texture base;
   c. Undercoat;
   d. Top coat.
2. The paint system shall comply with the following requirements:

<table>

<td>No discoloration, cracking, peeling after immersion of: 720 hours in 5% NaCl solution. 720 hours in 100% mineral spirit. 144 in 1% HCl, H2SO4, HNO3, H3PO4 solution.</td>
</tr>
<tr>
<td>j. Fire Resistance</td>
<td>Conforms to the fire-resistance material no. 0001 authorized by The Ministry of Construction in Japan.</td>
<td></td>
</tr>
</tbody>
</table>

3. Submit the following to CM for approval:
a. Manufacturers product data sheet or catalogue in sufficient detail to reveal the characteristics of the ingredients and their properties;
b. Supporting laboratory test data, performance test reports; including requirements listed in sub-clause (2) above;
c. Full specification for surface preparation and method of application;
d. Comprehensive colour chart;
e. Delivery schedule to job site;
f. Colour sample board of size not smaller than 600 x 600 mm for each and every colour specified by the CM (the colour of the painted sampled panel must be identical to the ones specified for application on the job site.);
g. Previous jobs references.

CLEAR WOOD TREATMENTS

FIN7.M610.7 LINSEED OIL
To BS 6900:1987.

FIN7.M620.7 STAINS FOR VARNISHING OR POLISHING
An Approved water or spirit based stain suitable for use under varnish or wax polish.

FIN7.M630.7 SELF FINISHED STAINS
An Approved proprietary brand.

FIN7.M640.7 COPAL VARNISH
No. 1, extra pale quality for internal use only.

FIN7.M650.7 SYNTHETIC VARNISH
Long linseed oil alkyd type for internal or external use.

FIN7.M660.7 POLYURETHANE VARNISH
For internal or external use:
1. Moisture cure oil, modified one pack type for internal use only;
2. Isocyanate cure, two pack type for internal or external use.

FIN7.M670.7 WAX POLISH
An Approved proprietary brand suitable for floors, furniture and joinery as required.

FIN7.M680.7 CELLULOSE LACQUER
An Approved proprietary brand.

ANCILLARY MATERIALS

FIN7.M710.7 KNOTTING FOR METAL
An Approved proprietary brand of knotting suitable for application to coated metal pipes.
FIN7.M720.7  KNOTTING FOR WOOD
To BS 1336:1971.

FIN7.M730.7  STOPPING FOR INTERNAL WOODWORK
Linseed oil putty to BS 544:1969, tinted to match painted surface if required.

FIN7.M740.7  STOPPING FOR EXTERNAL WOODWORK
White lead paste and gold size, well mixed.

FIN7.M750.7  FILLER FOR PLASTER SURFACES
Either:
1. Plaster of Paris to BS 1191:Part 1:1973:grade A; or
2. An Approved proprietary brand.

FIN7.M760.7  SURFACE FILLER FOR WOOD
An Approved proprietary brand.

FIN7.M770.7  WHITE SPIRIT
To BS 245:1976.

FIN7.M780.7  STONE CLEANER AND SEALER
Appropriate chemical solutions from an Approved manufacturer.

FIN7.M790.7  SKIM COAT FOR PAINT FINISHES
1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed
      skim coat for CM's approval together with all the following substantiation
      for CM's information:
         i. Catalogue, brand name/model name and job reference;
         ii. Name, address and contact person of the local supplier;
         iii. Name, address and contact person of the manufacturer;
         iv. Written confirmation from paint suppliers and skim coat suppliers that
             the paint finishes and the skim coat are compatible and the paint finishes
             will not adversely affect the performance of the skim coat and vice versa;
         v. Method statement for the application of skim coat on various substrates
             and for various paint finishes;
         vi. When the skim coat is supplied for domestic blocks, except those for the
             ancillary facilities at lower floors, include the followings in the
             submission:
             - Original or a certified true copy of the ISO 9001 certificate for the
               manufacturing plant. If a copy of the ISO certificate is submitted, it
               shall be certified true by a certification body or by the QCM. The
               certification body shall either be accredited by the Hong Kong
               Accreditation Service (HKAS) or an accreditation body which has
               entered into a mutual recognition agreement with HKAS.
   b. Submit original or certified true copy (issued or certified by the laboratory
      that complies with PRE.B9.570) of the test reports showing full compliance
      with the requirements of sub-clause (2)(c) for CM's information:
i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works;

ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);

iii. In the event that no test report has been submitted for CM’s information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:

a. Pre-packed skim coat mix shall be mechanically mixed with the amount of water as specified by the manufacturer;

b. The pH value of the hardened skim coat before painting shall not be more than 10;

c. The quality and performance requirements are as follows:

<table>

d. Curing conditions:

i. Initial tensile adhesion strength:

- Condition the test specimens under a temperature of 27±2°C at a relative humidity of 55±5% for 27 days;
- Bond the pull-head plates to the test specimens;
- After a further 24 hours storage under a temperature of 27±2°C at a relative humidity of 55±5%, determine tensile adhesion strength according to BS EN 1015:Part 12:2000.

ii. Tensile adhesion strength after water immersion:
- Condition the test specimens under a temperature of 27±2°C at a relative humidity of 55±5% for 7 days;
- Immerse in water at temperature of 27±2°C for 20 days;
- Remove the test specimens from the water, wipe with a cloth and bond the pull-head plates to the test specimens;
- After a further 7 hour immerse the test specimens in water at temperature of a 27±2°C;
- Remove the test specimens from water the following day and immediately determine tensile adhesion strength according to BS EN 1015:Part 12:2000.

iii. Tensile adhesion strength after heat ageing:
- Condition test specimens under a temperature of 27±2°C at a relative humidity of 55±5% for 14 days;
- Place the test specimens in an air-circulating oven at 70±2°C for a further 14 days;
- Remove the test specimens from the oven and bond the pull-head plates to the test specimens;
- Condition the test specimens for a further 24 hours at temperature of 27±2°C at a relative humidity of 55±5%;
- Determine tensile adhesion strength according to BS EN 1015:Part 12:2000.

iv. Tensile adhesion strength after freeze-thaw cycles:
- Condition test specimens under a temperature of 27±2°C at a relative humidity of 55±5% for 7 days;
- Immerse the test specimens in water for 21 days;
- Carry out 25 freeze-thaw cycles with each freeze-thaw cycle as follows:
  - Remove the test specimens from the water and lower the temperature to -15±3°C within 2 hr ± 20 min.;
  - Maintain the test specimens at -15±3°C for 2 hr ± 20 min.;
  - Immerse in water at 20±3°C and raise the temperature to 15±3°C and maintain this temperature for 2 hr ± 20 min.;
- Allow the test specimens to reach standard conditions in air after the last cycle and determine the tensile adhesion strength according to BS EN 1015:Part 12:2000.

e. Packed in three ply paper and 1 ply ethylene together with preparation procedures and application methods. Minimum one set of the preparation procedures and application methods shall be printed in Chinese and diagrammatic forms for each lot that is delivered to site;

f. Brand name, batch number, shelf life, pot life and open time to be clearly printed on outside of package.

3. On Site Delivery Verification:
a. At delivery stage, submit the following documents:
   i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a);
   ii. Original or certified true copy of the Certificate of Origin for every batch of delivery. One batch being the material quantity covered under each delivery note;
   iii. Delivery notes for all material delivered to Site.

b. Carry out and submit report on the following verifications for skim coat upon delivery on Site. Prior to carrying out the verifications, inform CM's representatives who may present to witness the verifications:
   i. Method:

<table>
<thead>
<tr>
<th>Verification Items</th>

</tr>
<tr>
<td>Expiry Date</td>
<td>Check information</td>
<td>Not expired</td>
</tr>
<tr>
<td></td>
<td>printed on the packing</td>
<td></td>
</tr>
</tbody>
</table>

   ii. Frequency:
   One set of verification should be carried out for every delivery of skim coat made to Site under each Delivery Note submitted in sub-clause (3)(a).

c. Where any of the verifications fail to meet the acceptance standards, either:
   i. Remove the representative batch off Site; or
   ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.
WORKMANSHIP

GENERAL

FIN7.W010.7 STANDARD
Carry out painting generally in accordance with BS 6150:1991 and this Specification.

FIN7.W020.7 HEALTH AND SAFETY
Do not use materials or working practices which would result in any hazard or injury to operatives or to others in the vicinity of the Site.

FIN7.W030.7 HANDLING AND STORAGE
1. Store the materials on the Site or in the Contractor's workshops etc in cool, well ventilated, covered storage accommodation;
2. Fit the entrance door to the store with a "NO SMOKING" sign and provide a suitable fire extinguisher, immediately outside the entrance door for use in the event of a fire in the store.

FIN7.W040.7 PROTECTION OF EXISTING SURFACES
Protect surfaces, fittings, furniture and the like by suitable and Approved means.

FIN7.W050.7 CLEANLINESS
Remove and clean off all splashes whilst work is in progress and:
1. Make good any damage;
2. Leave the work and all areas in which the work was executed clean and perfect on completion.

FIN7.W060.7 COLOURS
Carry out decoration in colours Natural Colour System or to BS 4800: 1989 or to master colour chart by paint manufacturer as selected by the CM.

FIN7.W070.7 SAMPLE OF FINISHED WORK FOR CONSTRUCTION MOCK-UP
Provide the following and obtain Approval before commencing the work:
1. Paint sample of finished works;
2. A Construction Mock-up:
   Construct a Construction Mock-up of around 5 m² as PRE.B9.440 for painted surfaces showing the workmanship of each construction layer including preparation, applying primers, undercoats, and finishing coats etc. as applicable and as directed by CM.

FIN7.W080.7 DISPOSAL OF TINS
All paint tins shall be disposed as recycle materials after use of the contents.
PREPARATION - DEFINITION OF TERMS

FIN7.W110.7 PAINTING
Unless specifically stated to the contrary, the term "Painting work" includes also all preparatory and paint application works as defined in the remaining clauses of this sub-section necessary to:
1. Produce a first class finish, free of all blemishes, blisters and weeps;
2. Avoid brush marks.

FIN7.W120.7 WASH DOWN
Depending on the context, means:
1. The removal, with clean water, of all dirt not absorbed into the surface of a material not previously decorated; or
2. The removal, with clean water, of existing limewash, non-washable distemper or similar material not absorbed into the decorated surfaces; or
3. The removal of dirt from and the cleaning down of existing washable distempered, cement painted, synthetic painted and similarly decorated surfaces with sugar soap powder, mixed with water, followed by further applications of clean water.

FIN7.W130.7 BROOM DOWN
Means the thorough dry brushing of any surface with a stiff broom or brush so as to remove all cobwebs, dust or loose particles of previous finishes.

FIN7.W140.7 SCRAPE
Means the removal of all existing coats of paint, limewash, colourwash, distemper etc by the use of scraping tools, without the use of chemical solvents or heat and without damage to the underlying material. Make good any such damage at own expense. Wash down the surface after scraping.

FIN7.W150.7 WIRE BRUSH
Means the thorough brushing down of the surface with a wire brush.

FIN7.W160.7 STRIP
Means the complete removal, without damage to the underlying surface, of all existing coats of limewash, distemper, paints or other decorative material by means of washing and scraping, together with the application of chemical solvents or heat, if necessary. After the use of any chemical solvents, wash down the surface and neutralise in accordance with the manufacturer's recommendations.

FIN7.W170.7 STOP (PLASTER)
Means the careful trimming of the edges of all holes, cracks or crevices of any description and filling to produce an even, flat surface and touching up all patches with a coat of sealer prior to repainting.

FIN7.W180.7 STOP (WOODWORK)
Means the cleaning out and filling of all holes, cracks and crevices etc.
KNOT (METAL PIPES)
Means the application of one coat of patent knotting to the surface of any bitumen coated pipe.

KNOT (WOODWORK)
Means the application of a sufficient number of coats of knotting over all knots in the wood to prevent the bleeding of resin through the subsequent decoration.

RUB DOWN
Means the rubbing of newly prepared surfaces, or surfaces of existing paint remaining after preparation for redecoration, with Approved waterproof glass paper, sand paper, pumice stone or similar, to give a true and keyed surface for new paint.

FILL
Means the filling of the grain with surface filler.

PREPARATION - UNDECORATED SURFACES

GENERAL
Remove all dust, dirt, stains, efflorescence, grease, loose material and stepped joints. Provide a level surface and, unless otherwise specified, prepare new surfaces for decoration in accordance with the remaining clauses in this sub-section.

PLASTERED AND RENDERED SURFACES
Wash down, stop and rub down.

INTERNAL FAIR-FACED CONCRETE, PLASTERED SURFACES AND PANEL WALL PARTITIONS TO DOMESTIC BLOCKS
Apply cementitious skim coat of Approved type in 2 coats and sand down after the second coat.

CONCRETE, MASONRY AND ROOF TILES
Broom down

STRUCTURAL STEELWORK
As Worksection STR1.

UNCOATED IRON AND STEEL
Clip off and remove all scale and rust, wire brush to leave a bare, clean surface and apply a rust inhibitor at least twelve hours prior to painting with the primer specified.

ZINC COATED IRON AND STEEL
Clean down and apply Approved primer.

COATED IRON AND STEEL PIPES
Clean down and knot.
Where exposed copper is scheduled to be painted, wash with soap and warm water, rub down with coarse emery cloth and apply a coat of one part acetone to two parts of benzole prior to priming.

FIN7.W390.7 WOODWORK TO RECEIVE PAINT
Knot, prime, stop and rub down surfaces.

FIN7.W400.7 WOODWORK TO RECEIVE PRESERVATIVES AND PESTICIDES
Broom down surfaces.

FIN7.W410.7 WOODWORK TO RECEIVE LINSEED OIL
Rub smooth and brush clean.

FIN7.W420.7 WOODWORK TO RECEIVE CLEAR FINISHES
Rub down and fill surfaces to receive stain, varnish, wax polish or lacquer.

FIN7.W430.7 WOODWORK TO RECEIVE CHALKBOARD PAINT
Wash down surfaces.

FIN7.W440.7 ABSORBENT FIBRE BASED BOARDS
Broom down, punch down nail heads, stop all nail and screw holes, rub down and leave with a texture to match the surrounding surfaces.

FIN7.W450.7 FIBRE CEMENT
Broom down, using appropriate safety equipment to prevent the inhalation of dust and ensuring that:
1. Dust is kept down by spraying with water;
2. Operatives are provided with half mask (orinasal) respiratory protection.

FIN7.W460.7 SURFACES TO RECEIVE POLYURETHANE OR COLD-CURE EPOXY PAINTS
Fill surfaces with an Approved epoxy filler.

PREPARATION - DECORATED SURFACES

FIN7.W510.7 GENERAL
Remove all dust, dirt, stains, efflorescence, grease and loose material and, unless otherwise specified, prepare existing decorated surfaces for decoration in accordance with the remaining clauses in this sub-section.

FIN7.W520.7 SURFACES SUBJECT TO MOULD GROWTH
Wash down with one coat of anti-mould liquid before preparation of the surface for decoration and ensure that surfaces are entirely clean of old mould growth and spores.

FIN7.W530.7 LIMEWASHED OR WHITENED SURFACES
Scrape, broom down, stop, apply and bring forward bare spots with new material.
FIN7.W540.7  WASHABLE AND NON-WASHABLE DISTEMPERS
Strip off distempered washable sealer or non-washable distempered surfaces completely, wash down, stop, seal and prepare to receive new paint system as scheduled.

FIN7.W550.7  EMULSION PAINTED SURFACES
Scrape, wash down, stop, apply and bring forward bare spots with new material.

FIN7.W560.7  SYNTHETIC PAINTED SURFACES OTHER THAN METAL AND WOOD
Scrape, wash down, stop, rub down and apply primer to and bring forward bare spots with undercoat.

FIN7.W570.7  BLACK BITUMINOUS COATED SURFACES
Spot prime bare areas with black bituminous coating.

FIN7.W580.7  UNGALVANIZED IRON AND STEEL
Wash down, scrape, chip off and wire brush to remove all scale and rust, rub down, apply rust inhibitor and primer to bare areas or to such additional areas as directed and bring forward with undercoat.

FIN7.W590.7  PAINTED, ZINC COATED IRON AND STEEL
Wash down, scrape and remove all scale and rust, rub down and apply specified primer to and bring forward bare spots with undercoat.

FIN7.W600.7  SYNTHETIC PAINTED WOODWORK
Wash down, scrape, rub down, knot, prime and stop, and bring forward bare spots with undercoat.

FIN7.W610.7  POLYURETHANE OR EPOXY PAINTED WOODWORK
Wash down, scrape, rub down, stop and apply epoxy filler to, and bring forward bare spots with undercoat.

FIN7.W620.7  VARNISHED WOODWORK
Wash down, scrape, rub down and bring forward bare spots with varnish.

FIN7.W630.7  WAXED AND LACQUERED WOODWORK
Rub down, fill and again rub down to produce a smooth surface for refinishing.

FIN7.W640.7  WAXED FLOORS
Clean with wire wool or sand down as shown on Drawings.

FIN7.W650.7  STRIPPING EXISTING DECORATIONS
1. Where Instructed, strip existing decoration which is in a poor condition or which is to be replaced by a different type of finish;
2. After stripping, prepare surfaces as required for the type of finish to be applied.
APPLYING PAINTS GENERALLY

FIN7.W710.7 AMBIENT CONDITIONS
No painting works shall be carried out in adverse weather conditions such as extremely cold, raining, foggy, high humidity and where there is excessive dust in the air. Application of paints shall be in strict accordance with manufacturer's specification.

FIN7.W720.7 SURFACE CONDITION
1. Prior to application of skim coat, ensure that:
   a. Surfaces shall be level and free from stepped joints, structural cracks, broken edges, honey-combing, excessive blowholes or other irregularities;
   b. All holes, cracks and other defects in the surfaces have been made good.
2. After application of skim coat and one sealer coat of paint and before application of subsequent coat, ensure that:
   a. Blemishes shall be avoided;
   b. Surfaces shall be free from pin-holes, blowholes and blisters or other irregularities to ensure that they are smooth, clean and level to receive paint.
3. Before a subsequent coat is applied, surfaces shall be clean and dry after any previous coatings have hardened and rub down smooth with fine glass paper.

FIN7.W730.7 IRONMONGERY AND HARDWARE
1. If painting operations is obstructed, remove all articles of ironmongery, hardware etc before painting and replace, with matching screws, and plugs if required, of suitable sizes, after completion;
2. If painting operations is not obstructed, protect fittings and other surfaces with covers as appropriate;
3. Leave everything clean and completely free from all paint stains, splashes and the like.

FIN7.W740.7 MIXING AND APPLYING
Mix and apply paints in accordance with the manufacturer's recommendations.

FIN7.W750.7 THINNING
Only thin paints with Approval and in accordance with the manufacturer's recommendations.

FIN7.W760.7 BRUSH APPLICATION
Apply coatings with brushes of a suitable size, with flat wall brushes not less than 150 mm wide and:
1. Well brush each coat into the surface so that every part, including junctions and angles etc, is adequately covered;
2. Take care to avoid brush marks and an excessive or uneven thickness of paint film, particularly at edges, angles and junctions;
3. Apply the coating carefully so that the finished surface is free of unsightly marking due to excessive sanding; or inconsistent brush/roller marks;
4. Cut in neatly and cleanly without splashing or marking adjacent surfaces.
FIN7.W770.7 THICKNESSES OF COATS
Ensure the thicknesses of individual coats and the total thicknesses of paint systems fall within the standard thicknesses recommended by the manufacturers unless specified otherwise in this Worksection.

FIN7.W780.7 SUCCESSIVE COATS
Apply successive coats of paint in slightly differing tints.

FIN7.W790.7 APPLICATION BY ROLLERS, CLOTHS AND GLOVES
Do not use rollers, cloths or gloves for the application of decorative coatings unless otherwise Instructed or Approved.

FIN7.W800.7 MECHANICAL APPLICATION
Mechanical spraying machines may be used instead of brush application for emulsion paint except in proximity to pipework along corridor ceilings unless the pipework are protected with covers.

FIN7.W810.7 SURFACES LIKELY TO BECOME INACCESSIBLE
Prime and paint surfaces prior to fixing.

FIN7.W820.7 WEATHERSTRIPPING
Do not paint weatherstripping on metal windows and doors.

FIN7.W830.7 TOUCHING UP
Where Instructed, touch up coated surfaces on completion.

FIN7.W840.7 CLEANLINESS
Keep surfaces clean and free of dust during coating and drying.

FIN7.W850.7 PROTECTION OF NEWLY COATED SURFACES
1. Protect freshly applied surface coatings from damage;
2. Exhibit "WET PAINT" signs in English and Chinese and provide protective barriers where necessary.

APPLYING PRIMERS

FIN7.W910.7 GENERAL
Work primer into surface, angles, joints and end grain and:
1. Ensure that priming coats are of adequate thickness to suit the surface porosity;
2. Ensure that any primed surfaces that have deteriorated on site or in transit are touched up or re-primed;
3. Apply priming coats on new work before the articles are fixed in position.

FIN7.W920.7 METAL SURFACES
Apply primer to metal surfaces on the same day as they have been cleaned.

FIN7.W930.7 WASH AND ETCH PRIMERS
Allow wash and etch primers to harden before applying subsequent priming coats.
FIN7.W940.7 REBATES, GLAZING BEADS AND PUTTY
1. Apply a suitable primer for the glazing compounds specified in Worksection COM4 to glazing beads and rebates, before glazing;
2. Seal putty fronting with a suitable primer and paint system.

APPLYING UNDERCOATS AND FINISHING COATS

FIN7.W1010.7 UNDERCOATING
1. Apply in an even film over all surfaces, avoiding uneven thicknesses at edges and angles;
2. If the undercoating of any specified paint system is available only in white, apply an additional finishing coat in place of the second undercoat.

FIN7.W1020.7 FINISHING COATS GENERALLY
Apply in an even film over all surfaces and avoid brush marks, sags, runs and other defects.

FIN7.W1030.7 TWO FINISHING COATS
Where two hard gloss finishing coats are specified:
1. Apply the second coat when the first is dry and within 48 hours of the first or as per manufacturer's recommendations;
2. Rub down with medium/fine glass paper between coats to provide a key.

WATER REPELLENT LIQUID

FIN7.W1110.7 APPLICATION
Brush, clean down and apply one coat of water repellent liquid in accordance with the manufacturer's recommendations.

EXTERNAL TEXTURED PAINT

FIN7.W1310.7 APPLICATION
Allow a minimum drying time of 12 hours between coats unless required otherwise by the manufacturer's recommendations.

PESTICIDES AND PRESERVATIVES

FIN7.W1410.7 APPLYING PESTICIDAL COATINGS
Where specified elsewhere in this Specification, or shown on Drawings, apply over the entire surface in bands 75 mm wide in accordance with manufacturer's instructions.

FIN7.W1420.7 TIMBER PRESERVATIVE TREATMENT
Where timber is specified to be preservative treated elsewhere in this Specification or shown on Drawings:
1. Ensure that the timber has the correct moisture content before commencing the application of preservative;
2. Carry out treatment after all cutting and drilling;
3. Apply preservative to all the surfaces of the timber in accordance with the manufacturer's recommendations;
4. Stack the treated timber to dry out before priming and fixing.

**BLACK BITUMEN COATING SOLUTION**

**FIN7.W1510.7** APPLYING COATINGS TO RECEIVE PLASTERS AND RENDERS
1. Blend the coating with clean, sharp sand while it is still tacky;
2. Ensure that the final covering is applied as soon as possible after the black bitumen coating.

**BLACK ENAMEL**

**FIN7.W1610.7** APPLICATION
Work the paint well in with the brush and ensure that the finished surface is hard and elastic when dry.

**REFLECTING PAINT**

**FIN7.W1710.7** APPLYING REFLECTIVE AGGREGATE
Apply reflective aggregate at the rate of 0.6 kg/m² while the finishing coat is still wet.

**CLEAR WOOD TREATMENTS**

**FIN7.W1810.7** LINSEED OIL
Allow a minimum drying time of two hours between coats.

**FIN7.W1820.7** WAX POLISH ON JOINERY
Apply with a soft cloth and:
1. Allow a minimum drying time of four hours between coats;
2. Brush the surface with a soft brush to obtain an eggshell finish.

**FIN7.W1830.7** WAX POLISH FLOOR FINISHES
Apply with a weighted felt pad or an electric polisher.

**FIN7.W1840.7** CELLULOSE LACQUER
Apply:
1. Undercoats and rub down with "flour grade" glass paper after each coat;
2. Final coat and polish to produce a finish free from marks and imperfections.
SIGNWRITING

FIN7.W1910.7  PAINTING LETTERS, CHARACTERS AND FIGURES

Paint to the sizes required on the Drawings in a thick coat of synthetic paint so that they stand out boldly and solidly, free from brush marks.

MULTI-LAYER ACRYLIC PAINT

FIN7.W2010.7  GENERAL

Prepare the surface and apply acrylic paint strictly in accordance with the manufacturer's recommendations for the following:

1. One sealer coat;
2. One main texture coat;
3. Minimum two finishing coats.

PAINTING TO KITCHEN, BATHROOM, FLAT ENTRANCE AND EXIT STAIRCASE DOORSETS IN DOMESTIC

FIN7.W2110.7  GENERAL

Carry out spray painting in the supplier's workshop prior to delivery to Site and in accordance with the paint manufacturer's recommendations and the requirements as specified below.

FIN7.W2120.7  SAMPLES OF FINISHED WORK

1. Prior to the order of the paints, submit a sample, for Approval, consisting of two sets of the upper half of the finished doorsets indicating materials used for the filler, undercoat and finishing coats proposed and the standard of workmanship on the paint application;
2. The Approved sample will be used as an acceptance standard for the workmanship of the spray paint finish application.

FIN7.W2130.7  COLOURS

The colour of the finishing coats of the whole doorset will be selected from the 'NCS' colour range or to master colour chart by paint manufacturer as selected by the CM.

FIN7.W2140.7  SURFACE PREPARATION

1. Fill all surface irregularities with filler or stopper as recommended by the paint manufacturer;
2. Leave to dry and sand down until smooth;
3. Ensure all surfaces to be painted are smooth, clean, dry and free from oil or grease and other contaminants.

FIN7.W2150.7  AMBIENT CONDITIONS

Do not commence painting in weather conditions with relative humidity above the limit specified by the paint manufacturer.
FIN7.W2160.7 APPLICATION OF PAINT
1. Apply one coat of undercoat by spray or by brush. Sand down and dust off;
2. Carry out thinning in accordance with the manufacturer's recommendation;
3. Allow sufficient time for the undercoat to dry before sanding and overcoating as recommended by the manufacturer;
4. Apply a minimum of three finishing coats by spray until the finished surfaces are smooth and free from wood grain. Ensure the working pressure of the pump, the nozzle size, the thinning process and the minimum recoating time satisfies the manufacturer's recommendations.

FIN7.W2170.7 DRYING AND PACKAGING
After application, leave to dry for a period of time before packing as recommended by the paint manufacturer. Wrap doorsets with uncoated white paper or equivalent material as recommended by the paint manufacturer. Do not use plastic coated materials or coloured paper for wrapping.

PAINTING TO GALVANIZED SURFACES

FIN7.W2180.7 PAINTING TO GALVANIZED SURFACES
Paint galvanized surfaces as follows:
1. Lightly sand the galvanized surfaces;
2. Remove grease, dirt, contaminants and white storage stain from the galvanized surfaces using cleanser recommended by paint suppliers for at least two times;
3. Apply water based anti-corrosion primer to the galvanized surfaces in accordance with manufacturer's recommendation;
4. Apply undercoat not less than 7 days from the date of applying the water based anti-corrosion primers or the number of days as recommended by manufacturer. Prior to applying the undercoat, remove dirt and grease from the surfaces;
5. Prior to applying the topcoat, remove dirt and grease from the surfaces.

SCHEDULES OF PAINT TYPES AND NUMBERS OF COATS

FIN7.W2210.7 GENERAL
Prepare and apply paints and coatings in the number of coats specified in the tables in the remaining clauses of this sub-section. Unless stated otherwise, treat internal and external surfaces the same.

## PIPEWORK AND MACHINERY

### FIN7.W2405.7 GENERAL

All pipework installations shall not be painted unless otherwise specified.

### FIN7.W2410.7 INSULATED PIPES

1. Colour code all insulated pipes and trunking concealed in ducts or behind suspended ceilings and not normally accessible;
2. Plaster all insulated pipes and trunking running in accessible vertical ducts or in normally visible positions and paint in the appropriate colour code or with appropriate colour code bands.

### FIN7.W2420.7 UNINSULATED PIPES

Whether concealed or visible, paint either in the appropriate colour code or as required by the CM and with the appropriate colour code bands.
FIN7.W2430.7 PAINTING MACHINERY
Unless otherwise specified, paint all machinery in green, 14 E 51, to BS 4800: 1989.

FIN7.W2460.7 CAST IRON PIPES
Paint cast iron pipes and fittings with at least 2 coats of bitumen to BS 3416: 1991 after installation.

FIN7.W2465.7 GALVANIZED PIPES
Paint galvanized pipes and fittings to this Worksection.

FIN7.W2470.7 REFRIGERANT PIPES
Bright polish and lacquer visible, uninsulated copper pipes and fittings.

FIN7.W2475.7 UPVC PIPES ON FLAT ROOFS AND CANOPIES
Paint uPVC pipes on roof and canopy with an Approved white acrylic paint.

FIN7.W2480.7 METALWORK IN REFRIGERATOR SPACES
Finish all metalwork inside cold stores and similar refrigerator spaces in a mould resistant paint, suited to low temperature application, to the satisfaction of the CM.

FIN7.W2490.7 PIPELINE IDENTIFICATION
Paint pipes and pipelines either in the colours shown in the schedule in FIN7.W2500 or as directed, and comply with the followings:

1. Apply the basic identification colour over the whole length of the pipe with colour code indication banding at all junctions, at both sides of valves, service appliances, bulkheads, wall penetrations and at any other locations where identification is necessary or directed; or

2. If the whole length of pipe is applied with colour other than basic identification colour, apply basic identification colour banding together with colour code indication banding at all junctions, at both sides of valves, service appliances, bulkheads, wall penetrations and at any other locations where identification is necessary or as directed;

3. Paint valves with the appropriate identification colour except for those on pipelines coded for fire fighting purposes which must be painted red;

4. Indicate the direction of flow in the pipeline by means of an arrow over the basic identification colour, painted in black or white in order to contrast clearly with the basic identification colour.

**FIN7.W2520.7**

**PAINTING TO PIPEWORK AND EXPOSED METALWORK TO BUILDING SERVICES INSTALLATIONS**

Prime and paint two undercoats and one finishing coat of gloss synthetic paint to surface mounted town gas pipework, LPG pipework, and exposed metal conduit, trunking and cable trays of the electrical installation.
TESTING

SURVEILLANCE TESTS FOR PAINTS

FIN7.T050.7

SURVEILLANCE TESTS

1. Testing Arrangements:
   a. When instructed, surveillance tests shall be carried out by CM's Representative, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the followings pertaining to surveillance tests:
      i. Provide attendance on the Site;
      ii. Provide, deliver and collect samples etc. as directed by CM or as specified.

2. Testing Samples:
   a. Provide one set of test sample from the batch of material delivered to Site under the delivery note as specified in the following for each type of paint or as instructed by CM:
      i. FIN7.M340 (3)(a) for anti-mould internal emulsion paint;
      ii. FIN7.M370 (3)(a) for anti-mould external emulsion paint;
      iii. FIN7.M570 (3)(a) for synthetic paint;
      iv. FIN7.M580 (3)(a) for multi-layer acrylic paint with texture coat; or
      iii. FIN7.M580 (3)(a) for multi-layer acrylic paint without texture coat.
   b. For emulsion and synthetic paint, one set of test sample shall consist of one container per different major colour of finishing paint or as instructed by CM;
   c. For multi-layer acrylic paint, one set of test sample shall consist of one container each of sealer, texture coat and one container per different major colour of finishing paint or as instructed by CM.

3. Testing methods:
   a. As per FIN7.M340 (2)(b) for anti-mould internal emulsion paint;
   b. As per FIN7.M370 (2)(b) for anti-mould external emulsion paint;
   c. As per FIN7.M570 (2)(b) for synthetic paint;
   d. As per FIN7.M580 (2)(b) for multi-layer acrylic paint with texture coat;
   e. As per FIN7.M580 (2)(b) for multi-layer acrylic paint without texture coat;
   f. As per Part 5 of Schedule 1 in Air Pollution Control (Volatile Organic Compounds) Regulations for volatile organic compound content of paints;
   g. As per FIN7.M015 for water based paints;
   h. As per FIN7.M016 for solvent based paints.

4. Non-compliance:
   a. In the event that the testing samples for any type of paint fail to meet the testing requirements, follow either one of the following actions:
      i. Remove the representative batch of that type of paint off Site; or
ii. Carry out re-test for the representative batch of that type of paint in accordance with the testing methods as specified in sub-clauses (3)(a), (3)(b), (3)(c), (3)(d) or (3)(e) in a laboratory that complies with the requirements stated in PRE.B9.570 on three separate sets of samples selected by the CM from the representative batch for that type of paint. In case of any one sample fails the re-test, remove the representative batch of that type of paint off Site.

b. When the representative batch of that type of paint is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clauses (3)(a), (3)(b), (3)(c), (3)(d) or (3)(e) in a laboratory that complies with the requirements stated in PRE.B9.570 for one sample selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clauses (4)(a);

c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.
APPENDIX FIN7/I

FIN7.APPEND1.7 ACCELERATED TESTS FOR RESISTANCE TO FUNGAL AND ALGAL GROWTH OF PAINT

1. Scope:
   An accelerated test method for assessing the resistance to fungal and algal growth of paint applied in the laboratory to specified fungi and algae found on the surfaces of buildings in Hong Kong.

2. Biological safety precautions:
   a. The accelerated test shall be carried out in certified or equivalent microbiology laboratory;
   b. The operator has formal microbiological training and practices with good microbiological precaution especially reference to biosafety;
   c. The treatment and handle of the biohazards shall follow the instruction and guidelines of the Department of Health, the Government of Hong Kong Special Administration Region;
   d. Containment of the micro-organisms shall be practised as far as possible;
   e. Prevention of spillage and practice of spraying using diluted bleaching solution to contaminated areas shall be practised;
   f. All the used materials shall be autoclaved before disposal.

3. Principle:
   a. Sterilized inert petri dish / multi-well plate / 6-well plate are painted. Each test fungus or alga is inoculated into individual coated petri dish / multi-well plate / 6-well plate with suitable strength nutrient broth. The inoculated petri dish / multi-well plate / 6-well plate are then incubated in an incubator under specified conditions and inspected at specified intervals for fungal and algal growth;
   b. The nutrient broth provides the start-up resources for test fungus and alga to initiate growth. As incubation period lasts, test fungus and alga if viable needs to consume the nutrient in the paint coating. Viable fungus will spread from the inocula to the nutrient broth and painted surface of petri dish / multi-well plate / 6-well plate. Viable alga will form visible green patches in the nutrient broth and painted surface;
   c. Coating resistance to microbial attack is determined by the residual viability of the artificially inoculated micro-organism. Viability refers to gain in population size, biomass and spread of micro-organism;
   d. Colony spread in terms of area coverage is an identified property for rating the filamentous growth format of a micro-organism. However, for unicellular or slow-growth micro-organisms which do not spread their colonies in fast manner, their density of the colonies might need to be assessed. Dead algae may autodegrade their organelles and biomolecules, leading to decolorization (loss of the green colour) in contrast to the live green algal patches / dots / spots. Area coverage, colony density and colour are needed for interpretation of the growth of micro-organism.

4. Testing apparatus and materials:
   a. Sterilized petri dish / multi-well plate / 6-well plate;
   b. Sterilized pipette tips (0.2, 1 and 5 mL);
   c. Sterilized potato dextrose broth (PD);
   d. Sterilized modified Allen's medium;
e. Sterilized distilled water;
f. Sterilized Eppendorf tubes (1.8 mL);
g. Sterilized Falcon tubes (15 mL, 50 mL);
h. Sterilized plastic bags;
i. A set of Pipette man (0.2, 1 and 5 mL);
j. Paint samples and brushes;
k. An illuminated incubator;
l. Digital camera for recording;
m. Fungal and algal cultures;
n. Biosafety cabinet class II or equivalent;
o. 70% alcohol for cleaning, diluted bleaching solution for disinfection;
p. Bunsen burner, town gas;
q. Vortex mixer for mixing;
r. Haemocytometer for determining the concentration of spore / cell in a suspension;
s. Autoclave, 1.2 to 1.5 kgf/cm²;
t. Water, non-disposable containers and tools used in the test must be sterilized by an autoclave under the pressure of 1.2 to 1.5 kgf/cm² for 20 minutes.

5. Preparation of paint samples:
   Each paint sample consists of two test paints and a control.
   a. Test paint:
      i. The paint shall be used before their expire dates;
      ii. Thoroughly mix and dilute the paint for coating according to the manufacturer's instruction;
      iii. Apply by brushing two coats of paint to the surface of petri dish / multi-well plate / 6-well plate. Allow the first coat of paint to dry for at least 4 hours before the second coat is applied;
      iv. Allow the coating to dry for one day before use.
   b. Control:
      i. Uncoated petri dish / multi-well plate / 6-well plate contain suitable strength nutrient broth for fungus and alga to grow;
      ii. If fungus or algal growth of growth rank at or above 1 in the petri dish / multi-well plate / 6-well plate is not obtained at day 7, carry out reinoculation. This may be owing to insufficient inoculum size, poor incubation conditions in terms of environmental or nutrient conditions. Check the incubation conditions. Replenishment of the suitable strength nutrient broth may be needed;
      iii. Fungus or algal growth of growth rank above 2 at day 28 in the petri dish / multi-well plate / 6-well plate indicates viability of the fungal and algal cultures for the validity of the test results. If such result is not obtained, repeat the test with viable test micro-organisms under confirmed standardized conditions with proper nutrient composition.

6. Microbiological tests
   a. Local species of fungi and algae for test which are available in School of Life Sciences, the Chinese University of Hong Kong:
      i. Fungal species
- *Cladosporium cladosporides* strain HK-1
- *Trichoderma viride* strain HK-1
- *Auroebasidum pullulans* strain HK-1
- *Alternaria alternate* strain HK-1
- *Curvularia lunata* strain HK-1

ii. Algal species
- *Chlorella pyrenoidosa* strain HK-1
- *Scenedesmus sp.* strain HK-1

b. Preparation of cultures:

i. Fungal culture

Maintain a fungal culture on potato dextrose agar (PDA) of composition (g/L): potato starch, 4; dextrose, 20; agar, 15 for 7 days at 28-30°C in darkness to prepare an active growing log-phase culture.

ii. Algal culture

Maintain an algal culture in a modified Allen's broth of pH 6.3 with composition shown in table below for 14 days under illumination at 25°C:

<table>
<thead>

</tbody>
</table>

c. Preparation of inoculum:

i. Prepare a liquid suspension of fungal culture as follows:

- Use sterilized loop to scrape the spores / hyphal fragments from a fully grown fungal plate culture onto 1 mL nutrient broth (prepared in 1/10 strength of PD) using aseptic technique:

- To facilitate an even fungal suspension, a non-ionic surfactant, e.g. 0.05% Tween 80, may be added;

- Prepare an inoculum for a fungus at 10⁸ spore / hyphal fragments per mL for test;
- Use a haemocytometer for measurement to ensure that each inoculum contains not less than $10^8$ spore/hyphal fragments per mL. If this level is not present, repeat the preparation for that species using a fresh plate culture.

ii. Prepare a liquid suspension of algal culture as follows:
- Use pipetting to transfer and inoculate an algal inoculum to nutrient broth using aseptic technique;
- Prepare an inoculum for an alga at $10^8$ cells per mL for test;
- Use haemocytometer for measurement to ensure that each inoculum contains not less than $10^8$ cell per mL. If this level is not present, use centrifugation to concentrate the algal suspension.

d. Inoculation:
   i. Thoroughly mix the inoculum using vortex mixer for 1 minute before inoculation;
   ii. Using aseptic technique, 1 volume of the inoculum is inoculated into 10 volumes of the nutrient broth (1/10 strength PD for the fungus and modified Allen medium for the alga) in the coated petri dish / multi-well plate / 6-well plate as follows:
      - 1 mL inoculum into 9 mL medium in a 9 cm petri dish; or
      - 0.05 mL inoculum into 0.45 mL medium in a 96 multi-well plate; or
      - 0.5 mL inoculum into 4.5 mL medium in a 6-well plate;
      - Use sterilized 5 mL cut-off pipette tip for the transfer of the fungal inoculum which contains spores and hyphal fragments and sterilized 1 mL pipette tip for the algal inoculum which contains unicellular cells.
   iii. Add the same quantity of inoculum into the same quantity of nutrient broth for the control;
   iv. Take digital photo records of the paint samples and control just after inoculation;
   v. Cover the inoculated petri dish / multi-well plate / 6-well plate. Seal the container with paraffin for safe transport and process.

e. Incubation:
   i. The inoculated petri dish / multi-well plate / 6-well plate with cover of the plate in place are incubated in a conventional incubator with an illumination cycle. The incubation conditions are: $28 \pm 2^\circ$C and 12 hour light – 12 hour dark cycle.

7. Observation and data record:
   a. Observe the paint samples as follows and assess the fungal and algal growth using the growth rank in sub-clause (8)(d):
      i. Observe the paint and control samples at day 7. Carry out reinoculation to paint samples and control if the growth rank is 1 or less. Replenishment of nutrient broth to prevent dry up of the test culture may be performed;
      ii. Observe the paint and control samples at day 14. Replenishment of nutrient broth to prevent dry up of the test culture may be performed;
      iii. Observe the paint and control samples at day 28.
   b. Take digital photo records of the paint and control samples at day 7, day 14 and day 28 for comparison;
   c. Use the record sheet in sub-clause (9) to record the growth rank.
8. Assessment criteria for resistance to growth:
   a. The assessment is a semi-quantitative assessment with visual examination of micro-organism growth according to the principle described in sub-clause (3) above;
   b. Following the assessment made in (a) above, growth of a micro-organism shall be rated by comparing its area spread, colony density and colour on the day of assessment to the situation at day 1 (to be expressed as percentage) and then ranked as follows:
      i. Rank 0, No growth observed in the broth and container wall;
      ii. Rank 1, trace growth ($\leq 15\%$);
      iii. Rank 2, light growth ($>15\%$ but $\leq 40\%$);
      iv. Rank 3, medium / moderate growth ($>40\%$ but $\leq 70\%$);
      v. Rank 4, heavy growth ($>70\%$).
   c. Only when the growth rank of the test micro-organism in the control is above 2 at day 28 as described in sub-clause (5)(b)(iii), the test result of the paint sample is accepted for conclusion;
   d. For the two replicates of the test paint, take the average of the growth rank and round up the figure for report in the record sheet;
   e. Resistance Index:
      A resistance index is calculated from the growth ranks of the test micro-organisms of the same fungal or algal group in the paint sample.
      i. When one of tested micro-organisms could establish on a paint coating, its colony will shield the paint biocide favouring the landing and establishment of more micro-organisms. Thus the highest growth rank among the tested micro-organisms of the same fungal or algal group is then reported as the resistance index of the paint sample as follows:
         - Fungal resistance:
            the highest growth rank of the 5 tested fungal species
         - Algal resistance:
            the highest growth rank of the 2 tested algal species.

9 Test report:
   The test report shall include the following information:
   a. The type and identification of the product tested;
   b. A reference to this test method;
   c. Any deviation, by agreement or otherwise, from the procedure described;
   d. The assessment using the record sheet below;
   e. Digital photo records of paint samples just after incubation, at day 7, day 14 and day 28;
   f. The date of the assessments.

**Note 1:** Growth performance
- Rank 0, No growth observed in the broth and container wall
- Rank 1, trace growth (≤ 15%)
- Rank 2, light growth ( > 15% but ≤ 40%)
- Rank 3, medium / moderate growth ( > 40% but ≤ 70%)
- Rank 4, heavy growth ( > 70%)

**Note 2:** Resistance Index
- Fungal resistance: the highest growth rank of the 5 tested fungal species
- Algal resistance: the highest growth rank of the 2 tested algal species
FIN8 PROPRIETARY SUSPENDED CEILINGS

DESIGN

GENERAL

FIN8.D010.7 DRAWINGS AND SCHEDULES
Read this Specification in conjunction with layout Drawings and finishing schedules.

FIN8.D020.7 STANDARD

FIN8.D030.7 CEILINGS SUBJECT TO EXTERNAL CONDITIONS
Design ceilings in locations subject to external conditions:
1. In accordance with the Code of Practice for Wind Effects for Hong Kong;
2. To withstand without distortion, damage, corrosion or other damage:
   a. Maximum external temperature: 36°C;
   b. Minimum external temperature: 0°C;
   c. Maximum external relative humidity: 90%.

FIN8.D040.7 ACCESS
Provide, as an integral part of the ceiling system and in the positions indicated on Drawings, suitable means of access to:
1. Permit the inspection and maintenance of any services contained within the ceiling cavity or integrated with the ceiling system;
2. Enable the ceiling components to be cleaned and maintained in accordance with the manufacturer's recommendations.

FIN8.D050.7 SERVICES
Allow for the incorporation of the following services at the locations as shown on Drawings:
1. Luminaires;
2. Heating, ventilating or air conditioning registers, ducts and fittings;
3. Fire detection and extinguishing equipment.

FIN8.D060.7 SHOP DRAWINGS
Provide the CM in adequate time to permit Approval process and subsequent production of detail drawings sufficient to illustrate:
1. The suspension system, methods and location of attachment to the building structure;
2. The relationship of the system to the building services and the location of all access panels;
3. All cavity fire barriers and the location and methods of fire stopping around service pipes and ducts penetrating such barriers and ceilings scheduled to be fire resisting;

4. Reveals to any openings and rooflights.

**FIN8.D070.7 CERTIFICATION**

Obtain from the supplier and submit to the CM in adequate time before the commencement of erection of suspended ceilings on Site, certificates proving compliance with the fire performance requirements of this Specification. Such certificates must be the result of independent testing carried out by a laboratory accredited by HOKLAS or an equivalent authority.
MATERIALS

GENERAL

FIN8.M010.7 COMPONENT MATERIALS
Construct the suspended ceiling from materials which:
1. Do not contain any asbestos. Obtain from the system manufacturer, a certificate of compliance with this requirement and submit it to the CM;
2. Are non-toxic on physical contact or by inhalation of any gases produced;
3. Do not emit unpleasant odours;
4. Are resistant to infestation by vermin and the growth of moulds and mildews;
5. Can be cleaned on their exposed surfaces, using routine methods.

PANEL SYSTEM

FIN8.M110.7 SUSPENDED CEILING
1. To BS 8290:Part 2:1991;
2. Grid dimensions, suspension system and soffit panels are as shown on Drawings;
3. Fire performance:
   a. Fire resistance: tested in accordance with BS 476:Part 22:1987 to fulfil the fire resisting hours as shown on Drawings;
   b. Surface spread of flame classification: Class 1 when tested in accordance with BS 476:Part 7:1987;
   c. Index of Performance (I) not exceeding 12 and sub index (i) not exceeding 6 when tested in accordance with BS 476:Part 6:1989.

FIN8.M120.7 SAMPLES
Submit samples of the grid, the suspension system and the soffit or infill panels for Approval.

ALUMINIUM CELL SYSTEM

FIN8.M210.7 SUSPENDED CEILING
To BS 8290:Part 2:1991 and:
1. Suspension system: comprising a combination of galvanized mild steel and aluminium as follows:
   a. Suspension brackets: extruded aluminium;
   b. Accessories: galvanized steel runner splices, sliding clips etc.;
2. Grid sections: main and cross runners of ‘U’ profile strip:
   a. Thickness: 0.5 mm;
   b. Overall dimensions: as shown on Drawings;
   c. Including cut-outs in main runners to locate cross runners;
d. With cross runners provided with hooked ends for connection and location in both horizontal and vertical directions.

3. Hangers: designed to facilitate the adjustment of the ceiling height and to support the weight of the ceiling with all fittings and attachments and not less than 4 mm in diameter;

4. Cells: 0.5 mm thick 'U' profile strip sections with inward returns at edges of 2.5 mm; dimensions as shown on Drawings;

5. Panels: strip cellular panels with dimension as shown on Drawings;
   a. Alloy designation: AA5050;
   b. Finish: stoved enamel.

6. Edging strip: 0.7 mm thick aluminium sheet forming the shape of the edge strip where shown on Drawings:
   a. Alloy designation: AA5050;
   b. Finish: stoved enamel.

FIN8.M220.7 SAMPLES
Submit samples of the grid, suspension system, the cells and colour samples for Approval.

FIN8.M230.7 SPARE PARTS
Provide extra 5% of the total amount of the suspended ceiling panels on the typical floor of Concord Block as the spare parts for maintenance.

ANCILLARY MATERIALS

FIN8.M310.7 CAVITY BARRIERS AND FIRE STOPPING
Provide, as specified in the Project Specific Specification and at the locations as shown on Drawings:

1. Cavity barriers, purpose designed to prevent the spread of fire through the ceiling void for the periods shown on Drawings;

2. Fire stopping around any service pipes penetrating such cavity barriers or ceiling soffits specified to be fire resisting.

FIN8.M320.7 INSULATION
Where shown on Drawings, provide a continuous insulation as specified in the Project Specific Specification.

FIN8.M330.7 SOFFIT FIXINGS
Either:

1. Approved sockets, anchors or other fixings cast into the slab; or

2. Approved proprietary plugs or self-drilling anchors.
WORKMANSHIP

GENERAL

FIN8.W010.7 APPROVED FIXING SUB-CONTRACTOR
Employ a specialist Sub-contractor, for the fixing of suspended ceilings, who is:
1. Licensed by the manufacturer to fix his system and whose operatives are appropriately trained in all aspects of the work;
2. Operating a Quality Assurance system certified under ISO 9001 or an Approved equivalent scheme.

INSTALLING CEILINGS

FIN8.W110.7 GENERAL
Comply with:
1. All relevant provisions of BS 8290:Part 3:1991;
2. The manufacturer's recommendations.

FIN8.W120.7 HANDLING AND STORAGE
Take delivery, handle and store suspended ceiling components:
1. Store tiles/boards on a smooth, flat base and in conditions of temperature and humidity similar to those in which they are to be fixed;
2. Protect tiles/boards and accessories from damage and distortion. Retain any protective coverings in place for as long as possible.

FIN8.W130.7 INSTALLATION CONDITIONS
Ensure that the building is fully enclosed and in proper condition with regard to cleanliness, humidity and temperature and all wet work is complete and dry at the date programmed for installation.

FIN8.W140.7 SETTING OUT
1. Ensure that all lighting, ventilation and fire protection services, having elements which are to be incorporated in the ceiling, have been installed and are accurately located relative to the ceiling grid, and that common datums have been used throughout;
2. Set out accurately, according to the Approved shop drawings, without visible undulations and with all visible lines straight and parallel with right angles accurate at 90º, or in accordance with any special setting out requirements;
3. Carry out all cutting at perimeters.

FIN8.W150.7 FIXING TRIMS
Fix all cover strips and edge trims etc in accordance with the manufacturer's recommendations.
FIN8.W160.7  CAVITY BARRIERS
Install cavity barriers at locations as shown on Drawings. Work in conjunction with ceiling fixers where necessary. Ensure barriers fully seal cavity/void, paying particular attention to seals around building services etc.

FIN8.W170.7  ELECTRICAL CONTINUITY AND EARTH BONDING
Provide electrical continuity and earth bonding to metallic parts of the system in accordance with the current edition of the IEE Regulations for electrical installations.

FIN8.W180.7  PROTECTION
Protect completed ceilings from damage and factory finished ceilings free from contamination until completion of contract. Make good any damage and remove any contamination.

ACCURACY AND TOLERANCES

FIN8.W210.7  GENERAL
Refer to Appendix H "Schedule of Tolerances" to this Specification.
# IRO1 Ironmongery

IRONMONGERY

MATERIALS

GENERAL

IRO1.M010.7 SAMPLES
Obtain and submit samples of all ironmongery for Approval in accordance with PRE.B9.410.

IRO1.M020.7 MANUFACTURER'S INSTRUCTIONS
At the same time as submission of the samples, obtain for the Works one complete set of the manufacturer's ironmongery fixing and maintenance instructions.

IRO1.M030.7 CERTIFICATION
Obtain and submit to the CM full documentary evidence, including manufacturer's catalogues, test certificates etc. that indicate supplied ironmongery fully meets the requirements of this Specification.

IRO1.M040.7 PRODUCT RANGE
1. Where specified, obtain ironmongery and associated fittings from the same product range of co-ordinated components of matching style, finish and from a single source of manufacture unless otherwise Approved;
2. Where specified, obtain locks for gatesets of matching finish and from at least 2 different sources of manufacturers in equal share distributed among the gatesets except in either one of the following situations:
   a. The cylinder of lockcase has a minimum of 4000 number of effective differs;
   b. The total number of domestic flats is less than 1000;
   c. When otherwise approved by CM.

IRO1.M050.7 IRONMONGERY SCHEDULE
Supply ironmongery as scheduled on drawings and in compliance with IRO1 generally.
1. After Approval of ironmongery samples, supply the CM with a consolidated ironmongery schedule, for Approval, giving the following information on a door by door format:
   a. Manufacturer and component references including products range;
   b. Fire resistance requirements including door fire rating and provision of smoke stops as applicable;
   c. Door thicknesses and handing;
   d. Suiting and master keying arrangements;
   e. Incorporating appropriate information provided on the Drawings and schedules;
   f. Any other requirements shown on the drawings.
2. The Approved schedule will form the basis for provision of ironmongery for the Contract. No alteration to the Approved schedule will be permitted without Approval.

IRO1.M060.7 SUPPLY AND PACKAGING
Ensure ironmongery and associated fixings are delivered to site suitably boxed and:
1. Marked to indicate content and site installation requirements;
2. Delivered in sets where appropriate and when so delivered each set must be bagged and labelled indicating door number to which it will be affixed;
3. For letter box locks, labelled indicating key combinations and different numbers of locks.

IRO1.M070.7 KEYS
1. Material: brass or nickel plated brass;
2. Ensure each lock is supplied with a minimum of two keys and fitted with stainless steel split ring and 25 mm diameter x 1.5 mm thick plastics disk engraved, in 5 mm minimum high letters, with lock or room numbers;
3. Master keying system to the locks shall be supplied as shown in the ironmongery schedule. Forward master keys direct to the CM;
4. For security locks, comply with the following:
   a. Prior to ordering, agree with the CM the method of ordering, supply, fixing and maintenance of security arrangements;
   b. Register in the name of the Government;
   c. Only obtain duplicate keys from original manufacturer;
   d. Master keying is not permitted.

FINISHES TO COMPONENTS

IRO1.M110.7 STAINLESS STEEL
To BS EN 10095:1999.

IRO1.M120.7 NICKEL AND CHROMIUM ELECTROPLATING
To BS 1224:1970.

IRO1.M130.7 ZINC ELECTROPLATING ON IRON AND STEEL
To BS 1706:1990.

IRO1.M140.7 ANODIC OXIDATION COATING ON ALUMINIUM
To BS 1615:1987:Grade AA10.

IRO1.M150.7 PHOSPHATE TREATMENT OF IRON AND STEEL
To BS 3189:1991.

IRO1.M160.7 CONCEALED COMPONENTS
Manufacturer’s standard finishes to concealed components, including lock bodies is acceptable provided where applicable, they are in accordance with this Specification.
Hinges

IRO1.M210.7 Classification
1. To BS 7352:1990;
2. The following classifications for hinges are referred to in this Specification and on the Drawings:
   a. Class A1: Extra heavy duty;
   b. Class A: Heavy duty;
   c. Class B: Standard duty;
   d. Class C: Light duty.

IRO1.M220.7 Thickness
Hinge thickness specified to be measured adjacent the knuckle.

IRO1.M230.7 Class A1 Brass Butt Hinges
1. Material: nickel plated brass;
2. Thicknesses: 4.5 mm;
3. Construction: set screw fixed, non-removable stainless steel pin complete with four permanent attached ball bearings.

IRO1.M240.7 Class A1 Stainless Steel Hinges
1. Material: satin finished stainless steel, grade 304 in accordance with MET1.M060;
2. Thickness: 3.3 mm;
3. Construction: non-removable stainless steel pin, with four sets of anti-friction bearings.

IRO1.M250.7 Class A and Class B Brass Butt Hinges
1. Material: brass;
2. Thickness: 3.9 mm;
3. Construction: non-removable stainless steel pin with four sets of stainless steel washers;
4. Finish: as shown on Drawings.

IRO1.M260.7 Class A Stainless Steel Hinges
1. Material: satin finished stainless steel, grade 304 in accordance with MET1.M060;
2. Thickness: 3.0 mm;
3. Construction: non-removable stainless steel pin, with at least two sets of anti-friction stainless steel bearings.

IRO1.M270.7 Class A Steel Butt Hinges
1. Material: zinc plated steel with steel washers;
2. Thickness: 2.5 mm.
IRO1.M280.7  CLASS B BRASS LIFT OFF OR REMOVABLE PIN HINGES
1. Material: brass;
2. Thickness: 3.9 mm;
3. Finish: as shown on Drawings.

IRO1.M290.7  CLASS B STAINLESS STEEL HINGES
1. Material: satin finished stainless steel, grade 304 in accordance with MET1.M060;
2. Thickness: 2 mm;
3. Construction: four nylon bushed bearings.

IRO1.M300.7  CLASS B STEEL BUTT HINGES
1. Material: zinc plated steel with nylon washers;
2. Thickness: 2 mm.

IRO1.M310.7  CLASS B SPECIAL HINGES
From the product range as IRO1.M040,
1. Type: falling or rising butts, parliament or other hinges as shown on Drawings;
2. Material: solid brass, stainless steel or anodized aluminium as shown on the Drawings, with hardened bearing surfaces;
3. Finish: as scheduled on Drawings.

IRO1.M320.7  CLASS C BRASS BUTT HINGES
To BS 7352:1990:
1. Material: brass;
2. Thickness: 2.35 mm;
3. Construction: stainless steel pin with 4 sets of stainless steel washers;
4. Finish: as shown on Drawings.

IRO1.M330.7  CLASS C STAINLESS STEEL HINGES
1. Material: satin finished stainless steel, grade 304 in accordance with MET1.M060;
2. Thickness: 1.6 mm.

IRO1.M340.7  CLASS C SPECIAL HINGES
From the product range as IRO1.M040:
1. Type: backflap, continuous or other hinges as shown on Drawings;
2. Material: solid brass or stainless steel as shown on Drawings;
3. Finish: as scheduled on Drawings.

IRO1.M350.7  SPRING HINGES
1. Type: single action;
2. Material: stainless steel;
3. Fire performance: spring hinges, fitted to appropriately rated fire door, to be tested and certified to BS 476:Part 22:1987 to confirm compliance with the fire resistance requirements shown on the Drawings.

IRO1.M360.7  FIXINGS FOR CLASS A1, A AND B HINGES
Fixing screws to match hinge material:
1. Supply hinges complete with screws:
   a. No. of screws per hinge: 8;
   b. Gauge: 12 SG, smaller gauge permitted for 2 mm thick hinges;
   c. Length: 32 mm for fixing to timber, 12.5 mm for fixing to metal.
2. Holes arrangement for hinges:
   a. Staggered arrangement for fixing to timber;
   b. Template arrangement for fixing to metal.
3. All hinges to have 8 number of counter sunk holes;
4. Depth of pre-drilled holes in door leaves prior to hinge fixing is half the length of screw.

IRO1.M370.7  FIXINGS FOR CLASS C HINGES
Fixing screws to match hinge material:
1. Supply hinges complete with screws:
   a. No. of screws per hinge: 6;
   b. Gauge: 6 SG;
   c. Length: To suit fixing application.
2. All hinges to have 6 number of counter sunk holes in staggered or template arrangement as applicable;
3. Depth of pre-drilled holes in door leaves prior to hinge fixing is half the length of screw.

FLOOR SPRINGS

IRO1.M410.7  CLASSIFICATION
1. To BS EN 1154:1997 or ANSI A156.4-2000;
2. Certified as tested 2,000,000 cycles to ANSI A156.4-2000 for floor spring use in building entrances.

IRO1.M420.7  FIRE PERFORMANCE
Floor springs, fitted to appropriately rated fire door, to be tested and certified to BS 476:Part 22:1987 to confirm compliance with the fire resistance requirements shown on the Drawings.

IRO1.M430.7  CONSTRUCTION
1. Action: single or double as shown on the Drawings;
2. Construction:
   a. Hydraulic check spring mechanisms sealed into an oil or hydraulic fluid filled box;
   b. Complete with a loose protective steel box for fixing into concrete floors;
c. With detachable cover plate;
d. With mechanical back check effective for the opening angle of the floor spring;
e. With hold-open feature as shown on the Drawings;
f. Floor spring shall be capable of handling the weight of door;
g. Centre hung pivots for double acting doors and offset pivots with cover caps for single acting doors. Pivots shall be constructed of steel;
h. The non-adjustable bottom strap designed to suit type, size and weight of door, but not less than 160 mm long and holed for four screw fixings;
i. For fitting to metal doors the floor springs to be constructed as above except that a non-ferrous strap is incorporated to suit profile of the doors bottom rail and the top centre of the doors top rail.

3. Adjustment:
   a. Within the box to provide full horizontal movement for door alignment, final positioning and height and adjustment;
   b. After installation the position of the floor spring within the loose protection box must be adjustable;
   c. The top pivot for double action floor springs must be adjustable.

4. Finish:
   a. Exposed parts of floor spring to match same standard as other door ironmongery;
   b. Top plate: satin finished stainless steel, grade 316 in accordance with MET1.M060.

5. Barrier free access requirements for floor springs to be used for doors/ gates at common areas:
   a. Closing period:
      For interior doors/gates, a period of at least 3 seconds measured from an open position of 70° to a point 75 mm from the closed position measured from the leading edge of the door.
   b. Opening force:
      Shall allow doors/gates to be opened with horizontal forces of not more than 30N.

OVERHEAD DOOR CLOSERS

IRO1.M530.7 OVERHEAD DOOR CLOSERS

1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed overhead door closers complete with all accessories for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name/model name and job reference of the material;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agent/distributor in Hong Kong; or the document from the supplier showing the appointment of the manufacturer and manufacturer's agreement for the production of the proposed product;
v. When the overhead door closer is supplied for domestic blocks, except for the ancillary facilities at lower floors, comply with the following particular requirements:

- Two identical sample boards, with accessories mounted on boards, similar to the one maintained by the Housing Department showing the quality, components and internal construction for the overhead door closers, for comparison of the standard of visual quality with the benchmark samples maintained by the Housing Department;

- Original or a certified true copy each of the certification to ISO 9001 and ISO 14001 for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by the certification bodies or by the QCM. The certification bodies shall be as follows:

<table>
<thead>
<tr>
<th>ISO</th>
<th>Certification Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISO 9001</td>
<td>The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
<tr>
<td>ISO 14001</td>
<td>The certification body shall be accredited by the Hong Kong Accreditation Service (HKAS), or the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
</tbody>
</table>

b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(c) for CM's information:

i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works or at an earlier date for domestic blocks subject to CM's consideration on the track records as maintained by the Housing Department;

ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);

iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:

a. Overhead door closer to BS EN 1154:1997 except clause 7.2 and to comply with the following:

i. To the product range as IRO1.M040;

ii. Horizontal pattern with regular arm unless otherwise required or scheduled;

iii. Capable of being fitted to door handing and of closing door positively;

iv. With one or more control valves to regulate closing speed;

v. Latch control to BS EN 1154:1997 sub-clause 5.2.12;

vi. Select the appropriate sizes of overhead door closers as scheduled on Drawings and to select Size 4 closers for those door closers of parallel arm installation type;

vii. Finish:

- Where closers supplied with separate covers, the covers are to be rust proof steel plated or finished to the approval of CM.
viii. Barrier free access requirements for door closers to be used for doors to exit staircases, protected lobbies and common areas:

- Closing period: for interior doors, a period of at least 3 seconds measured from an open position of 70 degrees to a point 75 mm from the closed position measured from the leading edge of the edge of the door;
- Opening force: shall allow exterior and interior doors to be opened with forces of not more than 30 N and 22 N respectively;
- Fire rated doors installed along accessible route shall be opened with horizontal force of not more than 30N.

b. Classification according to BS EN 1154:1997:

i. Category of use: Grade 3 for closing doors from at least 105° open and Grade 4 for closing doors from 180° open;

ii. Durability: Grade 8, tested to 500,000 test cycles;

iii. Door closer power size:

- According to Table 1 of BS EN 1154:1997 as tabulated below;
- Power size of 3 for door required to have fire resistance period installed along accessible route;

<table>
<thead>
<tr>
<th>Door closer power size</th>
<th>Recommended door leaf width mm max.</th>
<th>Test door mass kg</th>

iv. Fire resistance: Grade 1, identified as suitable for use on fire/smoke door assemblies, or to comply BS 476:Part22:1987;

v. Safety: Grade 1, met the Essential Requirements of safety in use;

vi. Corrosion resistance: Grade 2 with moderate resistance for the closers installed at domestic flats and public areas.
c. Performance requirements as follows:

i. For the test Sample B as stated in BS EN 1154:1997, comply with the mechanical performance and durability as follows (two samples at maximum and minimum strength for adjustable strength closers):

<table>
<thead>
<tr>
<th>Items</th>
<th>Reference in BS EN 1154:1997</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set test door to required mass for strength of closer on test.</td>
<td>7.3.1 para. 1</td>
<td>-</td>
</tr>
<tr>
<td>Open door to determine maximum opening angle.</td>
<td>7.3.1 para. 2; 5.2.7</td>
<td>The test door shall be opened: - Grade 3 - from at least 105° open - Grade 4 - from 180° open. The door closer shall control the door from a minimum angle of 70°, down to the closed position.</td>
</tr>
<tr>
<td>Cycle opening to 90° and allowing to close to 0°, in a time of 3 to 7 seconds, 5000 times.</td>
<td>7.3.2; 7.3.3.1</td>
<td>-</td>
</tr>
<tr>
<td>Measure torques and calculate efficiency over region 0° to 4°.</td>
<td>7.3.4.1; 7.3.4.2; 5.2.3 - 5.2.5</td>
<td>Measure the closing moments and opening moments to meet requirements in the Table of sub-clause (2)(b). Calculate the door closer efficiency and verify that the value is in accordance with the Table in sub-clause (2)(b). For door closer with a range of power sizes, the power size used for the testing shall be stated in the test report.</td>
</tr>
<tr>
<td>Measure closing time.</td>
<td>7.3.4.3; 5.2.6</td>
<td>Verify that the closing time from 90° is capable of adjustment to between 3 seconds and 20 seconds.</td>
</tr>
<tr>
<td>Closing overload test set abuse weight to value in table, set weight to be arrested at door position 15°. Set closer to close from 90° in 10 seconds. Allow weight to close door from 90° for 10 times.</td>
<td>7.3.4.4; 5.2.8</td>
<td>Able to withstand the closing overload test.</td>
</tr>
<tr>
<td>All closers cycle for a total of 500000 cycles. Measure closing time.</td>
<td>7.3.5.1; 7.3.6.1</td>
<td>The door closer shall be rejected if closing time from 90° to the fully closed position is more than 2 times, or less than 0.7 times the value after 5000 test cycles.</td>
</tr>
<tr>
<td>Calculate efficiency over region 0° to 4°.</td>
<td>7.3.6.2; 7.3.4.1; 7.3.4.2; 5.2.3 - 5.2.5</td>
<td>Measure the closing moments and opening moments to meet requirements in the Table of sub-clause (2)(b). Calculate the door closer efficiency and verify that the value is in accordance with the Table in sub-clause (2)(b). For door closer with a range of power sizes, the power size used for the testing shall be stated in the test report.</td>
</tr>
<tr>
<td>Measure closing time.</td>
<td>7.3.6.3</td>
<td>Verify that the closing time from 90° open to fully close is not less than 20 seconds.</td>
</tr>
</tbody>
</table>
Closing overload test set abuse weight to value in table, set weight to be arrested at door position 15°. Set closer to close from 90° in 10 seconds. Allow weight to close door from 90° for 10 times.

Note: There shall be no fluid leakage or damage (that would adversely affect the performance) to the door closer throughout the tests.

For the test Sample C as stated in BS EN 1154:1997, comply with the corrosion resistance as follows (one sample set to minimum strength for adjustable closers):

<table>
<thead>
<tr>
<th>Items (BS EN 1154:1997 Clause 7.4)</th>
<th>Reference in BS EN 1154:1997</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set test door to required mass.</td>
<td>7.4.1</td>
<td>-</td>
</tr>
<tr>
<td>Measure opening and closing torques.</td>
<td>7.4.2</td>
<td>Measure the closing moments to meet the requirements in the Table of sub-clause (2)(b).</td>
</tr>
<tr>
<td>Expose to neutral salt spray in accordance with BS EN 1670:1998 Grade 0 no exposure Grade 1 24 hours exposure Grade 2 48 hours exposure Grade 3 96 hours exposure Grade 4 240 hours exposure</td>
<td>7.4.3</td>
<td>Refer clause 5.7 of BS EN 1670:1998.</td>
</tr>
<tr>
<td>Measure closing moments</td>
<td>7.4.4; 7.4.2; 5.2.17</td>
<td>The closing moments of the door closer shall be not less than 80% of the closing moments measured prior to the test.</td>
</tr>
</tbody>
</table>

3. On Site Delivery Verification:
   a. At delivery stage, submit the following documents:
      i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a);
      ii. Original or certified true copy of Certificate of Origin for every batch of delivery. One batch being the material quantity covered under each delivery note;
      iii. Delivery notes for all material delivered to site.
   b. Carry out and submit report on the following verifications for overhead door closers upon delivery on Site. Prior to carrying out the verifications, inform CM’s representatives who may present to witness the verifications:
      i. Method:

<table>
<thead>
<tr>
<th>Verification Items</th>
<th>Method</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Surface Quality</td>
<td>Visual</td>
<td>No discolouration, no damage, no staining, no blemish</td>
</tr>
<tr>
<td>Logo and label check</td>
<td>Visual</td>
<td>Same as CM’s Approval sample</td>
</tr>
</tbody>
</table>

ii. Frequency:
<table>
<thead>
<tr>
<th>Test Items</th>
<th>Sampling Frequency</th>
<th>Representative Batch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Surface Quality</td>
<td>1 sample for each delivery</td>
<td>Same batch of material delivered to Site under one Delivery Note</td>
</tr>
<tr>
<td>Logo and label check</td>
<td>1 sample for each delivery</td>
<td>Same batch of material delivered to Site under one Delivery Note</td>
</tr>
</tbody>
</table>

c. Where any of the verifications fail to meet the acceptance standards, either:
   
i. Remove the representative batch off Site; or
   
ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

SECURITY LOCKS

IRO1.M610.7 CLASSIFICATION

The following classification relating to security locks are referred to in this Specification and on the Drawings:

1. Class A: security locks to BS 3621:1980;
2. Class B: locks manufactured to BS 3621:1980, with additional features, like security bolt, to comply with the performance requirements of BS 5872:1980:Category B. Locks and latches.

IRO1.M620.7 SECURITY LOCKS

1. Construction:
   
a. 5 levers minimum or if pin or disc mechanism a minimum of 6 pin or disc tumblers or more than one row of pins and rollers with rows set in same plane;
   
b. Forends: double thickness;
   
c. Rebating sets: where applicable, capable of fitting to rebated doors with 12.5 mm or 25 mm deep rebates. Rebate depths as indicated on the Drawings;

2. Finish:
   
a. Exposed parts: satin finished stainless steel, grade 316 for external and grade 304 for internal installations, both in accordance with MET1.M060;
   
b. Rebating sets: matching nickel plated brass.

LOCKS AND LATCHES

IRO1.M710.7 CLASSIFICATION

The following classification relating to locks and latches are referred to in this Specification and on the Drawings:

1. Class A: to BS 5872:1980:Category B, certified as tested to 500,000 operations for locks and 1,000,000 operations when in conjunction with lever handles;

2. Class B: to BS 5872:1980:Category A, certified as tested to 300,000 operations for locks, latches, bored locks or latch sets and 150,000 operations for cylinder rim night latches. With dimensions to BS 5872:1980.
**IRO1.M720.7 CONSTRUCTION**

1. To BS 5872:1980:
   a. 3 Levers and 2,000 differs minimum;
   b. Cylinder locks: not less than standard 5 pin cylinders;
   c. Rebating sets: where applicable, capable of fitting to rebated doors with 12.5 mm or 25 mm deep rebates. Rebate depth as indicated on the Drawings;
   d. Where to receive lever or knob furniture: to BS 4951:1973:Category 1. Where springing system cannot meet requirements of BS 4951:1973, handles must be spring loaded. If in order to meet requirements of BS 4951:1973, handles require bolting through the lock, the lock must be drilled at 38 mm centres horizontally or vertically to accommodate bolts.

2. Master keying: as IRO1.M070;

3. Identification: stamp locks with lock number as agreed with the CM;

4. Finish:
   a. Forend and strike plate: satin finished stainless steel, grade 316 for external and grade 304 for internal installations, both in accordance with MET1.M060;
   b. Rebating sets: satin finished stainless steel or nickel plated brass;
   c. Finish and plating to match standard of other door ironmongery.

**IRO1.M730.7 CYLINDER RIM DRAWBACK LOCKS**

1. Submission Requirement:
   a. At sample submission and approval stage, submit a sample of the proposed material complete with all accessories for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name/model name and job reference of the material;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
   iv. When the cylinder rim drawback lock is supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:
      - Two identical sample boards similar to the one maintained by the Housing Department showing the cylinder rim drawback lock and accessories;
      - Original or a certified true copy of the ISO 9001 certificate for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by a certification body or by the QCM. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.
   b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clauses (2)(a) and (2)(b) for CM's information:
      i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works;
      ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);
iii. In the event that no test report has been submitted for CM’s information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:
   a. Lock to BS 3621:1980 and BS 5872:1980:
      i. Cylinder rim drawback lock with pull handle;
      ii. Deadbolt double thrown, locked or unlocked by key outside, thumb turn operated inside;
      iii. Latch bolt withdrawn by key outside and handle inside;
      iv. Backset: 60 mm minimum;
      v. Minimum 5 pin or disc tumblers;
      vi. Suitable for 1/2 hour fire resisting period door.
   b. Properties: performance to BS 3621:1980;
   c. Finish: chrome plated finish for exposed cylinder and pull handle.

3. On Site Delivery Verification:
   a. At delivery stage, submit the following documents:
      i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a);
      ii. Original or certified true copy of Certificate of Origin for every batch of delivery. One batch being the material quantity covered under each delivery note;
      iii. Delivery notes for all material delivered to Site.
   b. Carry out and submit report on the following verifications for cylinder rim drawback locks upon delivery on Site. Prior to carrying out the verifications, inform CM’s representatives who may present to witness the verifications:
      i. Method:

      | Verification Items | Method   | Acceptance Standards                      |
      |-------------------|----------|-------------------------------------------|
      | Surface Quality Check | Visual   | No discolouration, no damage, no staining, no blemish, |
      | Logo and label check   | Visual   | Same as CM’s Approval sample              |

      ii. Frequency:

      | Verification Items | Sampling Frequency | Representative Consignment |
      |-------------------|--------------------|----------------------------|
      | Surface Quality Check | 1 sample for every 500 sets or part thereof | 500 sets |
      | Logo and label check   | 1 sample for every 500 sets or part thereof | 500 sets |

   c. Where any of the verifications fail to meet the acceptance standards, either:
      i. Remove the representative batch off Site; or
ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time.

IRO1.M740.7 MORTICE DEAD LOCKS

1. Submission Requirement:
   a. At sample submission and approval stage, submit a sample of the proposed material complete with all accessories for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name/model name and job reference of the material;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. When the mortice dead lock is supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in submission:
         - Two identical sample boards similar to the one maintained by the Housing Department showing the mortice dead lock and accessories;
         - Original or a certified true copy of the ISO 9001 certificate for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by a certification body or by the QCM. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.
   b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clauses (2)(a) and 2(b) for CM's information:
      i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works;
      ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);
      iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:
   a. Locks to BS 5872:1980:
      i. Key operated outside and no operation for door opening from inside unless specified in Drawings;
      ii. Backset: Length to suit the design dimension of door and frame for ease of operation, and in no case less than 50 mm;
      iii. Minimum 5 pin or disc tumblers;
      iv. Master-keyed;
      v. Suitable for 1/2 hour fire resisting period or a fire resisting period as specified in the Drawings.
   b. Properties: performance to BS 3621:1980;
   c. Finish: chrome plated or satin stainless steel for exposed cylinder and pull handle.

3. On Site Delivery Verification:
a. At delivery stage, submit the following documents:
   i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a);
   ii. Original or certified true copy of Certificate of Origin for every batch of delivery. One batch being the material quantity covered under each delivery note;
   iii. Delivery notes for all material delivered to Site.

b. Carry out and submit report on the following verifications for mortice dead locks upon delivery on Site. Prior to carrying out the verifications, inform CM’s representatives who may present to witness the verifications:
   i. Method:

<table>

   c. Where any of the verifications fail to meet the acceptance standards, either:
   i. Remove the representative batch off Site; or
   ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

IRO1.M750.7 LOCKS FOR GATESETS
Complying with the following requirements:
1. Operation:
   a. To be locked by operating the thumbturn device without key from inside and by key from outside;
   b. Openable by operating the thumbturn device from inside when locked;
   c. From outside operable by key when locked.
2. Keys: ensure each lock is supplied with a minimum of two keys and fitted with stainless steel split ring and 25 mm diameter x 1.5 mm thick plastic disks engraved, in 5 mm minimum high letters, with the serial number of the gateset;
3. Lockcase:
   a. Compliance with BS 5872:1980, item A13, 14, 15, 19 & 21;
   b. Cylinder to be minimum 5 pin/discs, complete with 4 mushroom drivers/notching. Number of effective differs to be 2000 minimum;
c. Suitable for installing into the gateset;
d. All exposed parts to be non-rusting material.

4. Thumbturn device: Recessed type designed to prevent operation of the thumbturn device from outside by any means of tools intruding through the grille of the gateset;

5. Strike plate to be completed with strike box, all in stainless steel;

6. Certification: Prior to ordering, submit to the CM:
   a. An original or certified true copy of test certificates indicating that the gateset locks proposed complies with relevant clauses of BS 5872:1980;
   b. Specification, drawings, sample of the whole lockset etc, completely describes the gateset lock's construction including materials used.

**IRO1.M760.7 LEVER HANDLE FURNITURE AND LOCKS**

1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed lever handle furniture and locks for CM's approval together with all the following substantiation for CM’s information:
      i. Catalogue, brand name/model name and job reference of the material;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agent/distributor in Hong Kong; or the document from the supplier showing the appointment of the manufacturer and manufacturer's agreement for the production of the proposed product;
   v. When the lever handle furniture and locks are supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:
      - Two identical sample boards, with accessories mounted on boards, similar to the one maintained by the Housing Department showing the quality, components and internal construction for the lever handle furniture and locks, for comparison of the standard of visual quality with the benchmark samples maintained by the Housing Department;
      - Original or a certified true copy each of the certification to ISO 9001 and ISO 14001 for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by the certification bodies or by the QCM. The certification bodies shall be as follows:

<table>
<thead>
<tr>
<th>ISO</th>
<th>Certification Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISO 9001</td>
<td>The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
<tr>
<td>ISO 14001</td>
<td>The certification body shall be accredited by the Hong Kong Accreditation Service (HKAS), or the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
</tbody>
</table>

vi. Method statement for installation which shall cover all types of locks and cases of different door thickness.
b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(d) for CM's information:

i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works or at an earlier date for domestic blocks subject to CM's consideration on the track records as maintained by the Housing Department;

ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);

iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:

a. Locks to BS 5872:1980:

i. To suit door thickness as shown on the Drawings. Blocking is not permitted;

ii. Lever handles on both sides with latches and locks as shown on the Drawings;

iii. Spacing between the follower-to-keyway centres shall not be less than 70 mm;

iv. Locks for flat entrance door shall comply with the following requirements:
   - Backset: 64 mm minimum unless otherwise shown on the Drawings;
   - Latchbolt shall be withdrawn by lever handles on both sides;
   - Double throw deadbolt shall be locked or unlocked by cylinder key outside and cylinder turn inside;
   - Minimum 5 pin or disc tumblers;
   - Minimum 2000 key changes.

b. Finish to exposed parts:

i. As shown on the drawings; or

ii. Satin finished stainless steel grade 316 for external installations and grade 304 for internal installations in accordance with MET1.M060.

c. Locks for entrance and kitchen door to be suitable for 1 hour and 1/2 hour fire resisting period respectively;

d. The quality performance requirements are as follows:

<table>
<thead>
<tr>
<th>Test Items</th>
<th>Test Method</th>
<th>Acceptance Standards</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>i. Freedom of operation of follower and spring bolt action</td>
<td>BS 5872:1980 A2</td>
<td>Clause 8.1 After testing, the bolt shall return to its normally extended position under its own spring pressure.</td>
<td>Apply to all types of locks.</td>
</tr>
<tr>
<td>ii. Strength of bolt spring</td>
<td>BS 5872:1980 A6</td>
<td>Clause 8.2 When depressed to its full extent, the bolt shall just support a force within the limits given in Table 2 of the BS.</td>
<td>Apply to all types of locks.</td>
</tr>
<tr>
<td>III.</td>
<td>Strength of follower or cam, spring bolt and stopping medium</td>
<td>BS 5872:1980 A7</td>
<td>Clause 8.3 After testing, no part of the lock or latch shall be damaged or distorted.</td>
</tr>
<tr>
<td>IV.</td>
<td>Dead bolt against end pressure</td>
<td>BS 5872:1980 A13</td>
<td>Clause 8.7 When tested by the method described in A.13.1, turning the key to throw the bolt shall fully extend the bolt and lock it. A reverse turn of the key shall unlock and withdraw the bolt. After testing by the method described in A.13.2, there shall be no damage to the mechanism, and the key shall continue to operate the mechanism correctly.</td>
</tr>
<tr>
<td>V.</td>
<td>Operation of security mechanism</td>
<td>BS 5872:1980 A14</td>
<td>Clause 8.8 After testing, the lock or latch shall still be operable by the key. In the case of deadbolt mechanisms, it shall not be possible to remove the key from lock before the bolt is fully thrown and properly retained. Any failure of the key on the lock or latch shall be deemed to be a failure of the test.</td>
</tr>
<tr>

</tbody>
</table>
xiv. Repeat of Test No. (xii)  | BS 4951:1973 B5  | After completion of Test No. (xiii), the specimen shall be resubmitted, without adjustment, to Test No. (xiii) and shall comply with the requirements of that test as a condition of acceptance of Test No. (xiii).  | Apply to all types of locks. |

xv. Repeat of Test No. (xi)  | BS 4951:1973 B6  | After completion of Test No. (xiv), the specimen shall be resubmitted to Test No. (xi).  | Apply to all types of locks. |

Notes:
Type 1 - Lock/Latch for Flat Entrance
Type 2 - Lock/Latch for Kitchen
Type 3 - Lock/Latch for Bathroom
Samples tested by BS 5872 can be separated from those under BS 4951

3. On Site Delivery Verification:
   a. At delivery stage, submit the following documents:
      i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a);
      ii. Original or certified true copy of Certificate of Origin for every batch of delivery. One batch being the material quantity covered under each delivery note;
      iii. Delivery notes for all material delivered to Site.
   b. Carry out and submit report on the following verifications for lever handle door furniture and locks upon delivery on Site. Prior to carrying out the verifications, inform CM’s representatives who may present to witness the verifications:
      i. Method:
         |
         | Verification Items | Method | Acceptance Standards |
         | Surface Quality    | Visual | No discolouration, no damage, no staining, no blemish |
         | Logo and label check | Visual | Same as CM’s Approval sample |
         | Length of spindle  | By Measurement | IRO1.M830 |
      ii. Frequency:
         |
         | Test Items | Sampling Frequency | Representative Batch |
         | Surface Quality | 1 sample for each delivery | Same batch of material delivered to Site under one Delivery Note |
         | Logo and label check | 1 sample for each delivery | Same batch of material delivered to Site under one Delivery Note |
         | Length of spindle | 1 sample for each delivery | Same batch of material delivered to Site under one Delivery Note |
      c. Where any of the verifications fail to meet the acceptance standard, either:
         i. Remove the representative batch off Site; or
         ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.
IRO1.M765.7 LEVER HANDLE FURNITURE AND LOCKS WITH PLATE FOR FLAT ENTRANCE DOOR OF HOS

1. Submission Requirements: as per IRO1.M760;
2. Quality Requirements:
   a. Locks to BS 5872:1980:
      i. To suit door thickness as shown on the Drawings. Blocking is not permitted;
      ii. Lever handles integrated with cast stainless steel plate (overall minimum dimension 240x50x10 mm), spring loaded capable of returning the fitting to its original position after use and with latches and locks as shown on the Drawings;
      iii. Spacing between the follower-to-keyway centres shall not be less than 70 mm;
      iv. Locks for flat entrance door shall comply with the following requirements:
         - Backset: 64 mm minimum unless otherwise shown on the Drawings;
         - Latchbolt shall be withdrawn by lever handles on both sides;
         - Double throw deadbolt shall be locked or unlocked by cylinder key outside and cylinder turn inside;
         - Minimum 5 pin or disc tumblers;
         - Minimum 2000 key changes.
   b. Finish to exposed parts: as per IRO1.M760;
   c. Fire resisting period of locks: as per IRO1.M760;
   d. Quality performance requirements: as per IRO1.M760.
3. On Site Delivery Verification: as per IRO1.M760.

IRO1.M770.7 KNOBSETS

1. To BS 5872:1980 and from the product range as IRO1.M040:
   a. To suit door thickness. Blocking is not permitted;
   b. Backset: 70 mm minimum unless otherwise shown on the Drawings or scheduled is permitted to increase to 127 mm by use of adaptor;
   c. Knobsets with latches: fitted with anti-thrust action (automatic dead locking) in the latch;
2. Finish: finish to exposed parts as shown on the Drawings:
   a. Satin finished stainless steel, grade 316 for external and grade 304 for internal installations, both in accordance with MET1.M060;
   b. Satin anodised aluminium.

LOCK AND LATCH FURNITURE

IRO1.M810.7 CLASSIFICATION

The following classifications relating to lock and latch furniture are referred to in this Specification and on the Drawings:

1. Class A: to BS 4951:1973:Category 1, suitable for heavy duty use, certified as tested to 1,000,000 operations minimum;
2. Class B: to BS 4951:1973:Category 2, suitable for general residential use, certified as tested to 300,000 operations minimum.

IRO1.M820.7 FIRE PERFORMANCE
For knob or lever handles scheduled or shown on Drawings as fitted to fire rated doors, fit with aluminium or similar low melting alloy inserts for fixing or spindle housings to prevent spread of fire by melting inserts affecting operation of lever or knob operation and prevent accidental door opening.

IRO1.M830.7 CONSTRUCTION
Knobs or lever handles with rose or back plates to BS 4951:1973 from the product range as IRO1.M040:
1. Type as shown on the Drawings;
2. Spring loaded knobs and lever handles capable of returning the fitting to its original position after use without the assistance of locker latch spring unless specifically designed for this operation;
3. Centre between keyhole and spindle: 57 mm;
4. Spindle: 7.6 mm or 8 mm square section, projecting 12 mm minimum into lever or knob fitting. In the event of fully floating spindle or spindle fixing with screws to lever or knob in both sides, the spindle shall be of such length that when the spindle is engaged to full depth of the hole of lever or knob in one side, it shall allow a minimum of 12mm engagement in the other side of lever or knob after passing through the cored hole of the door. Spindle system capable of transmitting loads defined in BS 4951:1973. Otherwise bolt fittings through door and lock at 38 mm centres.
5. Finish: knob and lever handles: finish as shown on the Drawings as:
   a. Satin finish stainless steel, grade 316 for external and grade 304 for internal installations, both in accordance with MET1.M060.
   b. Satin anodised aluminium.

PANIC FITTINGS

IRO1.M1010.7 CLASSIFICATION
The following classifications relating to panic fittings are referred to in this Specification and on the Drawings:
1. Class A: type certified for use on fire rated doors;
2. Class B: for use on other types of door.

IRO1.M1020.7 CONSTRUCTION
1. To BS 5725:Part 1:1981 and ensuit with matching product range as IRO1.M040. Type of fitting as shown on the Drawings:
   a. Operation:
      i. Horizontally activated bar across inside face of the door operated when pushed anywhere along its effective length in direction of exit and or moved in a downward arc;
      ii. Panic fittings with two point locking vertical shoots: to have automatic catches holding bolts in withdrawn position when doors opened and automatically releasing bolts on closing of the door;
iii. Where panic fittings capable of opening from other side of door and being locked, the lock operation must not interfere with exit from the inside.

b. With anti-thrust devices to prevent operation by other means than specified above.

c. Body, push bar and covers to be of rolled steel section, zinc plated steel or pressure die cast aluminium;

d. Stainless steel bolt heads and die cast aluminium catch cover.

2. Finish: to suit other door ironmongery and:

a. Satin finished stainless steel, grade 316 for external and grade 304 for internal installations, both in accordance with MET1.M060; or

b. Satin anodised; or

c. Sprayed and stoved enamelled finish.

DOOR FURNITURE

IRO1.M1110.7 TYPE AND RANGE
From matching co-ordinated range as IRO1.M040. Type of furniture as shown on the Drawings.

IRO1.M1120.7 FLUSH BOLTS
Comprising:
1. Lever action bolt, 9.5 mm minimum diameter shoot;
2. Holed shoots, plate or keeper for head fixing excluding floor socket for bottom fixing;
3. Fit easy clean floor sockets in wet areas.

IRO1.M1130.7 SURFACE BOLTS
Comprising:
1. Straight barrel bolt, 9.5 mm minimum diameter shoot;
2. Holed shoot, plate or keeper for head fixing or dust excluding floor socket for bottom fixing;
3. Fit easy clean floor sockets in wet areas.

IRO1.M1140.7 INDICATOR BOLTS
Comprising:
1. Coin operated emergency bolt action;
2. Red and green indicator.

IRO1.M1150.7 PUSH AND KICK PLATES
1. Material: as applicable:
   a. Satin finished stainless steel plate minimum 1.0 mm thick;
   b. Satin anodised aluminium plate minimum 2.0 mm thick.
2. Features: countersunk drilled at not more than 225 mm centres to receive 8 gauge screws for kick plates and 6 gauge screws for push plates; with corners radiused and no sharp arrises;
3. Size: to provide 4 mm gap between edge of door or door frame which ever is closer.

IRO1.M1160.7 DOOR STOPS
Type as applicable:
1. Floor mounted: with more than one floor fixing point to prevent rotation or bending at fixing;
2. Wall mounted: concealed fixing with sufficient projection to prevent impact damage to door and ironmongery.

IRO1.M1170.7 DOOR HOLDERS
Floor mounted type that allows for replacement of spring mechanism and opening for cleaning.

IRO1.M1180.7 CABIN HOOKS
Appropriate type with staples securely fixed by welding or brazing to back plate.

IRO1.M1190.7 LIMIT AND FRICTION STAYS
Appropriate type capable of limiting door opening and retaining in the open position.

IRO1.M1200.7 DOOR SELECTORS
1. Size: to suit depth of rebate and width of door leaves;
2. Type: on external doors opening outward, use screwed under frame pattern type.

IRO1.M1210.7 DOOR CHAINS
1. Short metal chain assembly complete with matching finished No. 10 x 30 mm long woodscrews, 2 No. to secure chain plate, 4 No. to secure anchor plate;
2. Chain assembly secured by bridge plate passing through end link of chain;
3. When in fixed position capable of withstanding test loading of gradually applied tensile load of 2 kN that subjects staple and chain to direct tension and the anchor plate to shear when staple and plate screwed to Grade 'A' timber in pre-bored partly drilled holes.

IRO1.M1215.7 SECURITY DOOR GUARD
1. Security door guard comprised of:
   a. chrome plated zinc alloy ball catch and with the movable arms stay at 0°, 90° and 180°;
   b. grade 304 stainless steel pivots;
   c. grade 304 stainless steel fixing screws.
2. Capable to withstand substantial impact load when engaged;
3. The ball catch must not touch the movable arm when the door is being closed.

IRO1.M1220.7 DOOR VIEWERS
A type with viewing angle not less than 180°.

IRO1.M1230.7 HAT AND COAT HOOKS
A type with a minimum two screw fixings.
**ALUMINIUM INDICATOR SIGN PLATES**

1. Material: satin anodised aluminium plates not less than 1.6 mm thick;
2. Countersunk drilled at not less than 225 mm centres to receive 6 gauge screw fixings;
3. With corners radiused and no sharp arrises;
4. Size: to provide 4 mm gap between edge of door or door frame whichever is closer.

**EXIT SIGNS**

**FIRE SAFETY SIGNS**
To BS 5499:Part 1:1990.

**IRONMONGERY FOR JOINERY FITTINGS**

**TYPE AND QUALITY**
Ironmongery to drawers, cupboards and other joinery fittings to match quality and finish of door ironmongery and from co-ordinated range as IRO1.M040. Type of ironmongery as shown on the Drawings.

**FINISH**
As applicable and to match other ironmongery and door furniture:
1. Stainless steel;
2. Satin anodised aluminium;
3. Chromium plated brass.

**IRONMONGERY**
1. Hinges: Class C;
2. Standard drawer lock comprising:
   a. Cast zinc with brass or chromium plated brass cap;
   b. Size of cap: Approximately 22 mm diameter;
   c. Four tumbler cylinder and 4 mm thick brass bolt;
3. Cash drawer locks with brass spring loaded bolt;
4. Flush or surface bolts with 6 mm minimum diameter shoot;
5. Bales catches: Comprising 9.5 mm diameter ball mounted in a face plate with matching striking plate;
6. Door catches: Magnetic type within plastic casing. Overall length 45 mm minimum;
7. Flush pulls:
   a. Size: 100 mm x 500 mm x 18 mm deep;
   b. Fixings: 4 No. countersunk screws;
8. Drawer pulls:
   a. 7.5 mm diameter rod twice bent to form handle 100 mm x 25 mm overall. Each leg drilled and tapped 15 mm minimum to receive 3 mm threaded rod;
b. Threaded rods fitted with 2 No. flat washers and fixing nuts.

**LETTER BOX LOCKS**

**IRO1.M1610.7 LOCKS**

Camlocks:

1. Type: having 200 minimum or the total number of flats per block whichever is higher different key combinations for each lock model when used in residential blocks;
2. Finish: chromium plated;
3. Construction:
   a. 19 mm minimum diameter barrel and bright chrome finish;
   b. 200 minimum or the total number of flats per block whichever is higher different key combinations;
   c. Locking mechanism:
      i. Require key to turn through 90° to unlock letter box;
      ii. Traps key in lock in unlocked position;
      iii. Frees key in locked position.

**IRO1.M1620.7 SCHEDULE**

Provide CM with schedule showing different numbers of all letter box locks prior to installation.

**SUNDRY FITTINGS AND FIXINGS**

**IRO1.M1715.7 CURTAIN TRACKS**

An Approved proprietary type complete with matching fitting from the same manufacturer.

**IRO1.M1720.7 SHOWER CURTAIN RAILS**

Stainless steel hollow tube of grade 316, size as shown on Drawings with matching, purpose made, end flange fixings.

**IRO1.M1730.7 TOWEL RAILS OR GRAB BAR**

Stainless steel heavy duty hollow tube as MET1.M050 with matching, purpose made end flange fixings.

**IRO1.M1740.7 FIXING SCREWS**

Stainless steel, brass or aluminium as applicable to BS 1210:1963, with countersunk heads and, unless otherwise specified, to match ironmongery being fixed.

**POWERED PEDESTRIAN DOOR SYSTEM**

**IRO1.M1810.7 POWERED SLIDING DOOR SYSTEM**

Powered sliding door system to BS 7036:Part 1 & 2:1996 and EMSD Code of Practice for Installation of Electrically Operated Sliding Gates, Sliding Glass Doors and Rolling Shutters comprising:
1. Sliding door leaves and side screens with dimensions and details shown in the Drawings;

2. Operator which shall comply with the following requirements:
   a. Suit the door construction, configuration, location and frequency of use and operate at 230/240vAC 50Hz;
   b. Allow adjustment of opening and closing speed, hold open time, backcheck and power and allow manual override, in case of power failure;
   c. A suitable type that will not compromise the fire rating of fire rated doors and shall be linked to fire alarm systems to close automatically in case of fire.

3. Activation devices: motion or presence activators;

4. Safety devices: force limitation device for door leaves, hold-open beam at 200 mm and 1000 mm above the finished floor level and presence sensing safety devices;

5. Breakout facility: full breakout whereby sliding door leaves and side-screens can be pushed outward manually to allow emergency escape.

**IRO1.M1820.7 SUBMISSIONS**

Submit the following for CM's approval before the commencement of the fabrication:

1. Product data including description of materials, components, fabrication, finishes and installation;

2. Shop drawings including elevations, sections and details indicating dimensions, materials, and fabrication of door leaves, side screens, frames, operator, activation devices, safety devices, anchors, hardware, accessories, builder's works requirement etc.;

3. Operation and Maintenance Manual including spare parts list.

**IRO1.M1830.7 TESTING AND COMMISSIONING**

Upon completion of the installation, carry out a testing and commissioning of the powered sliding door system including verification of the detection zone.

**IRO1.M1840.7 INSTRUCTION MANUALS**

Provide two copies of as-built drawings and two copies of Operation and Maintenance Manual.
WORKMANSHIP

FIXING IRONMONGERY

IRO1.W010.7 MANUFACTURER'S INSTRUCTIONS
Where applicable fix ironmongery and fittings in accordance with manufacturer's instructions.

IRO1.W020.7 MORTICING DOORS AND FRAMES
1. Ensure mortices provide tight and secure fitting for ironmongery especially into fire rated doors and frames;
2. Protect items morticed into one hour fire rated doors and frames with an Approved type of intumescent material as follows:
   a. Locks and latches: one layer of intumescent sheet to both sides of lock or latch case;
   b. Other items: coat with intumescent paint before fitting.

IRO1.W030.7 SCREW FIXINGS
1. Screw into drilled pilot hole using correctly sized screw driver;
2. Do not hammer screws to any depths into holes;
3. Replace all burred screw heads at own expense.

IRO1.W040.7 PLUGGING
Where appropriate, screw or bolt into appropriate plugs inserted into construction.

IRO1.W045.7 FIXING DOORSET IRONMONGERY
1. Fix ironmongery in positions shown on the Drawings;

IRO1.W050.7 FIXING PULL HANDLES AND PUSH PLATES
1. Face fix with 4 No. screws minimum per handle;
2. Bolted through with 6 mm diameter minimum bolts and stabilised by a face fixing or semi-recessed washer on one side of door;
3. Fix in pairs by through bolting.

IRO1.W060.7 FIXING FLOOR SPRING
1. Coordinate with hardware manufacturers, door suppliers to establish location, reinforcement requires etc. for the fixing details;
2. Use bolts and nuts for fixings when necessary. No welding is allowed;
3. Provide access panel for the bottom strap and for the top centre of centre hung pivots to facilitate future maintenance and inspection;
4. Provide stainless steel safety chain as shown on the Drawings.
IRO1.W070.7  FIXING LETTER BOX LOCKS
Fix lock, to face of letter box doors with fixing nuts threaded into lock barrel to rear face of locks.

IRO1.W080.7  FIXING CURTAIN TRACKS
As IRO1.W010 and;
1. Fix 13 No. runners per metre of track and all other accessories including brackets, stopped ends and overlap set;
2. Where specified install cord sets and leave in correct working order.

IRO1.W090.7  FIXING SHOWER CURTAIN RAILS
1. Plug and screw end flanges to concrete and masonry walls with stainless steel screws;
2. Co-ordinate to conceal the earthing wire.

IRO1.W100.7  FIXING TOWEL RAILS
1. Plug and screw end flanges to concrete and masonry walls with stainless steel screws;
2. Co-ordinate to conceal the earthing wire.

IRO1.W120.7  ADJUSTMENT
On completion, oil and adjust all ironmongery as appropriate to leave in perfect working order.

IRO1.W130.7  PROVISION AND STORAGE OF KEYS
Arrange with CM safe storage and handling of keys until handing them over to CM on completion.

FIXING DOORSET IRONMONGERY SUPPLIED FOR DOMESTIC FLATS

IRO1.W210.7  IRONMONGERY POSITIONING
Fix in positions as shown on Drawings.

IRO1.W220.7  HINGE FIXING POSITIONS

INSPECTION OF FLOOR SPRING SYSTEM DURING MAINTENANCE PERIOD

IRO1.W310.7  INSPECTION OF FLOOR SPRING SYSTEM DURING MAINTENANCE PERIOD
1. Conduct half-yearly inspection of the installed floor spring system with the CM's representative at the 6th, the 12th, the 18th and the 24th month from the date of completion of the Works certified by the CM or where the Works are completed in Sections, from the date of completion of the respective Section;
2. The inspection shall include checking the safety and proper operation of the floor spring system including the conditions of all component parts the physical mounting and alignment;

3. Complete, sign and submit inspection form in prescribed format to the CM's representative for witnessing after each inspection;

4. Bear all costs of repair and replacement of any component due to defective design, materials or workmanship, which appear within the Maintenance Period.
TESTING

SURVEILLANCE TESTS

IRO1.T030.7 SURVEILLANCE TESTS FOR OVERHEAD DOOR CLOSER

1. Testing Arrangements:
   a. When Instructed, surveillance tests shall be carried out by CM's Representative, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the followings pertaining to surveillance tests:
      i. Provide attendance on the Site;
      ii. Provide, deliver and collect samples etc. as directed by CM or as specified.

2. Testing Samples:
   a. Provide one set of test sample from the batch of material delivered to Site under the delivery note as specified in IRO1.M530 (3)(a) or as instructed by CM;
   b. One set of test sample shall consist of one overhead door closer and the associated accessories, fastenings and fixings necessary to ensure normal operation or as instructed by CM.

3. Testing methods:
   As per IRO1.M530 (2)(c).

4. Non-compliance:
   a. In the event that the testing samples fail to meet the testing requirements, follow either one of the following actions:
      i. Remove the representative batch off Site; or
      ii. Carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 on three separate samples selected by the CM from the representative batch. In case of any one sample fails the re-test, remove the representative batch off Site.
   b. When the representative batch of material is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 for one sample selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clauses (4)(a).
   c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.

IRO1.T040.7 SURVEILLANCE TESTS FOR LEVER HANDLE DOOR FURNITURE AND LOCKS

1. Testing Arrangements:
   a. When Instructed, surveillance tests shall be carried out by CM's Representative, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the followings pertaining to surveillance tests:
i. Provide attendance on the Site;
ii. Provide, deliver and collect samples etc. as directed by CM or as specified.

2. Testing Samples:
   a. Provide one set of test sample from the batch of material delivered to Site under the delivery note as specified in IRO1.M760 (3)(a) or as instructed by CM;
   b. One set of test sample shall consist of six lever handle furniture and lock and the associated accessories, fastenings and fixings necessary to ensure normal operation or as instructed by CM.

3. Testing methods:
   As per IRO1.M760 (2)(d).

4. Non-compliance:
   a. In the event that the testing samples fail to meet the testing requirements, follow either one of the following actions:
      i. Remove the representative batch off Site; or
      ii. Carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 on three separate samples selected by the CM from the representative batch. In case of any one sample fails the re-test, remove the representative batch off Site.
   b. When the representative batch of material is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 for one sample selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clauses (4)(a).
   c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.

MAS1 BRICKWORK, BLOCKWORK AND PANEL PARTITIONS

MATERIALS

BRICKS

MAS1.M010.7 BRICK DIMENSIONS
As shown on Drawings.

MAS1.M020.7 CLAY BRICKS GENERALLY
Approved, well burnt, hard, sound, square and clean.

MAS1.M030.7 CONCRETE BRICKS
1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed material for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue and job reference of the product;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer.
   b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2) for CM's information:
      i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works;
      ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (1)(c);
      iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.
   c. At delivery stage, submit the following documents:
      i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a);
      ii. Delivery notes for all material delivered to site.
2. Quality Requirements:
   b. Size: 225 x 105 x 70 mm nominal;
   c. Minimum compressive strength: 7.0 MPa.

MAS1.M040.7 BRICKS FOR FAIR FACED WORK
Selected for evenness of texture, sharpness of arris and uniformity of colour.
MAS1.M050.7  FACING BRICKS
1. Submission Requirements:
   a. As MAS1.M030 (1).

2. Quality Requirements:
   a. To BS 3921:1985;
   b. Type: as shown on Drawings;
   c. Colour/texture: as shown on Drawings.

MAS1.M060.7  FIRE BRICKS
Imported, refractory, fireclay bricks, of the best quality, light in colour, uniform in texture and:
2. Class: to BS 3056;
3. Tested: to BS 1902.

BLOCKS

MAS1.M110.7  CONCRETE BLOCKS
1. Submission Requirements:
   a. As MAS1.M030 (1).

2. Quality Requirements:
   b. Minimum compressive strength: 2.8 MPa;
   c. Size: as shown on Drawings.

MAS1.M120.7  CONCRETE BLOCKS FOR FAIR FACED WORK
Selected for evenness of texture and sharpness of arris.

MAS1.M130.7  CONCRETE HOLLOW BLOCKS
1. Average crushing strength of a randomly selected sample of 10 blocks: not less than 5.0 MPa of the gross area unless otherwise specified;
2. Size: as shown on Drawings.

MAS1.M140.7  GLASS BLOCKS
1. To BSEN 1051:Part 1:2003 or Approved equivalent;
2. For panel construction, complete with expansion strips, panel reinforcing, panel anchors, asphaltic emulsion and sealants. See Drawings for pattern and size.

PANEL WALL PARTITIONS

MAS1.M210.7  PANEL WALL PARTITIONS FOR DOMESTIC FLATS
1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed panel wall partitions for CM’s approval together with all the following substantiation for CM’s information:
i. Catalogue, brand name/model name and job reference;

ii. Name, address and contact person of the local supplier;

iii. Name, address and contact person of the manufacturer;

iv. Confirmation that the manufacturing plant have:
   - Automatic weighing, recording and printing equipment for the preparation of the aggregates, mechanical mixing of batching;
   - Curing facilities in accordance with CS1:2010, or other to be Approved;
   - Weather protected production area.

v. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agent/distributor in Hong Kong or document from the supplier showing the appointment of the manufacturer and manufacturer's agreement for the production of the proposed product;

vi. Original or a certified true copy of product conformity certificate for the panel walls of fire rated construction. The certification shall be to the "Product Conformity Certification Scheme For Passive Fire Protection Products" published by the Hong Kong Institute of Steel Construction. The product conformity certificate shall be issued by a certification body accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS. If a photocopy of the product conformity certificate is submitted, it shall be certified true by the certification body or by the QCM. The product conformity certificate shall cover:
   - The tests in accordance with BS 476:Part 20:1987 and BS 476:Part 22:1987 and certified as being capable of resisting the action of fire for the specified periods by a laboratory which must be accredited for the specified test by HKAS under the Hong Kong Laboratory Accreditation Scheme (HOKLAS), or an equivalent organization which has signed a mutual recognition agreement with HOKLAS with appropriate qualifications and experience in fire resisting construction.

vii. The detail specification of the panel walls selected for the product conformity certification audit testing by the certification body, together with drawings and photographs sufficient to completely describe the panel wall partition construction and materials used;

viii. A copy of the fire test reports, assessment reports or fire test certificate which are certified true by the accredited laboratory or QCM and generally within 5 years prior to the notified date for commencement of the Works;

ix. Manuals showing:
   - General product information, packaging, handling and site storage (include product labelling sample);
   - General proprietary specifications (dimensional properties, density, FRP, characteristic strength, standard deviation, tolerance and shrinkage properties of panels and non-shrink mortar);
- Full dimensional drawings of all types of panels (showing profiles, reinforcement arrangements together with the corresponding manufacturing tolerance, areas of local strengthening with non-shrinkage cement sand mortar or other Approved materials filled up the core holes (if any) for inserting the anchors, typical ceiling conduits connection openings, jointing details and mechanical fixing, fixing details of panel wall to the underside of ceiling slab, fixing details of the support for overhead door panel to adjoining panel walls, etc.);

- General layout, elevations and details to panel wall partition for typical flats;

- Installation procedure and method statement including - erection of panel walls and overhead door lintel panels, treatment to joints and surface of panels. Suggestion for fixing of doors, cabinet, cooking bench and sink unit, wash hand basin and minor fixtures, repair methods to minor surface hairline cracks and extent of cracks allowed;

- All installation accessories and materials (completed with proprietary products catalogue attached and highlighted to relevant information) included - joint fibre tape, moisture sealer, joint sealant, bonding agent, non-shrink cement sand mortar/grout, crack repairing materials and fixing anchors, fixing accessories, etc.

x. Characteristic strength data as per sub-clause (2)(b);

xi. When the panel wall partitions are supplied for domestic blocks, also include the following in the submission:

- Two identical panels with accessories mounted on boards similar to the one maintained by the Housing Department showing the quality, detailed method statement and work procedures;

- Original or a certified true copy each of the certification to ISO 9001 and ISO 14001 for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by the certification bodies by the QCM. The certification bodies shall be as follows:

<table>
<thead>
<tr>
<th>ISO</th>
<th>Certification Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISO 9001</td>
<td>The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
<tr>
<td>ISO 14001</td>
<td>The certification body shall be accredited by the Hong Kong Accreditation Service (HKAS), or the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
</tbody>
</table>

b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(d) for CM's information:

i. The date of the test shall be generally within five years prior to the notified date for commencement of the Works or at an earlier date for domestic blocks subject to CM's consideration on the track records as maintained by the Housing Department;

ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);
iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

c. Before mass production, submit the following information for Approval:

i. Shop drawings of electrical conduit system complete with its accessories.

2. Quality Requirements:

a. The panel wall partitions are to be a proprietary system, homogeneous across the entire section, compatible with the building structure and building works:

i. Light-weight to be handled manually on site;

ii. Nominal width to be 600 mm, height and thickness to refer to drawings;

iii. Complete with pre-installed electrical conduits system made either of steel or PVC. If PVC conduits are used, there shall be minimum 30mm cover from the finished surface;

iv. For 25mm diameter conduit installed in 85mm thick panel wall, the conduit shall be made of steel and terminated at PVC boxes for mounting of wiring accessories;

v. All panel wall partitions delivered to Site to be individually marked with the production number and date of production, which shall be visible after erection;

vi. Each panel wall partition has to be provided with means on top of the partition for connecting to the underside of the ceiling slab by mechanical fixings;

vii. In addition to mechanical fixings to the underside of the ceiling slab, each overhead door panel has to be supported by galvanised steel brackets fixed at the sides to the adjoining panels;

viii. The panel wall hollow holes next to the corners and door openings to be either solid or filled up with non-shrink cement mortar. Where wash basins, cooking bench and sink units are attached to the panel wall partitions, the hollow holes at such locations to be either solid or filled up with non-shrink cement mortar up to 1100 mm from the bottom of the partitions;

ix. All joints and pockets to be fully grouted with non-shrink grouting/mortar. All vertical and horizontal joints to be covered with a minimum 50 mm wide tape;

x. Tensile pull-off strength of minimum 0.3 N/mm² when tested to method specified in FIN5.M1010 sub-clauses (2)(h)(vi) to (2)(h)(xi);

b. Characteristic strength of the panel wall partitions shall be in accordance with MAS1.M250;

c. Standard of visual quality shall be comparable with the benchmark samples maintained by the Housing Department;

d. The quality and performance requirements are as follows:

<table>
<thead>
<tr>
<th>Items</th>
<th>Method</th>
<th>Acceptance Standards</th>

- Heavyweight anchorage - wash hand basin  
  (Load = 1500 N). But for the test rig in Figure K.1, the overall length of the vertical legs is reduced from 185 mm to 135 mm and the vertical distance between the fixing anchors is changed from 135 mm to 85 mm.  
- Shim retained;  
- Maximum deflection according to Fig K.3 in BS 5234:Part 2: 1992:Annex K;  
- 1 mm residual deformation; and  
- No loosening, detachment or damage to panel.

- Heavyweight anchorage - wall cupboard  
  (Load = 4 KN)  
- Shim retained and 5 mm maximum deflection and 1 mm residual deformation;  
- No loosening, detachment or damage to panel.

vii. Compatibility Test with Adhesive  
FIN5.M1010 (2)(h)  
Tensile Force ≥ 0.3 N/mm²

viii. Watertightness  
As given in (d)(xi) and (d)(xii) below. Use telephone type shower head.  
No seepage through the walls.

ix. Tile removal  
As given in (d)(xi) and (d)(xii) below. By hydraulic tools, Annexes C & E of BS 5234. The configuration of the partition specimen to suit site conditions.  
- Maximum deformation ≤ 2 mm;  
- No visible cracking and breakage;  
- No collapse or dislocation.

x. Chasing  
As given in (d)(xi) and (d)(xii) below. Form 50 x 37.5 mm depth chase. Annexes C & E of BS 5234. The configuration of the partition specimen to suit site conditions.  
- Maximum deformation ≤ 2 mm;  
- No visible cracking and breakage;  
- No collapse or dislocation.

xi. Set up for Watertightness, Tile Removal and Chasing tests:  
- Set up Test Areas A, B, C as per testing details given below;  
- Apply the recommended moisture sealer to the surface of the panel wall system facing the wet side of all 3 Test Areas;  
- For Test Area A, apply to the wet side the recommended sealant and tape to all vertical joints including those between the panel wall and the concrete wall. Install 200 x 200 mm tiles from the ceiling down to 605 mm from the structural floor;  
- For Test Area B, apply sealant as per Area A and form non-shrink cement/sand angle fillet and apply cold applied waterproofing material in accordance with Contract Drawings;  
- For Test Area C, along the entire length of the wall, chase 50 mm high x 37.5 mm deep conduit openings at 300 mm height at both sides of the wall. Install along its length 20 mm diameter uPVC electrical conduits. Refill the openings with the recommended refilling compound;  
- After the above works are adequately cured, the following tests shall be carried out with an accredited laboratory.

xii. Detail testing method for Watertightness, Tile Removal and Chasing tests:
- Tile removal demonstration (Test Area A) - 'L' shape wall in bathroom:
  • Carry out the tile removal demonstration by hydraulic tools simulating the future user's decorator's normal tile removal practice to all tiled surfaces. The tile removal to both sides of the party wall are to be carried out simultaneously;
  • Carry out the large soft body impact tests of Annexes C & E of BS 5234:Part 2 to the party wall after the tiles have been removed. The impact point shall be at the mid-point of the central panel of the party wall.

- Watertightness test (Test Area B) - 'L' shape wall in bathroom (to be different from Test Area A):
  • Carry out the watertightness test to the non-tiled L-shaped section;
  • The water shall be applied using a common domestic telephone type shower head fitted to 13 mm diameter pipe at a water pressure of 210 to 240 kPa (30 to 35 psi). The pressure gauge shall be located at a distance not exceeding 1500 mm from the shower head;
  • The shower head is moved to and fro along the tested surface, at a perpendicular distance of 300 – 600 mm from the wall or floor surface;
  • Spray water evenly to the walls up to a height of 1500 mm above finished floor level for 2 minutes duration.

- Chasing demonstration (Test Area C) - party wall between kitchens of two flat units:
  • Carry out the large soft body impact tests of Annexes C & E of BS 5234:Part 2 to the party wall after the wall has been chased. The impact point shall be at the mid-point of the central panel of the party wall.

3. On Site Delivery Verification:
   
a. At delivery stage, submit the following documents:
   
i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a);
   
ii. Original or certified true copy of Certificate of Origin for every batch of delivery. One batch being the material quantity covered under each delivery note;
   
iii. Delivery notes for all material delivered to Site;
   
iv. Type Testing Certificates for electrical conduits and fittings as per MAS1.M560 and MAS1.M690;
   
v. Work Completion Certificates:
   
- Form WR1(A) specified by Electrical and Mechanical Services Department duly signed in both Part 1 and 2 by a Registered Electrical Contractor and a Registered Electrical Worker, certifying that the pre-installed conduit system installation is in full compliance with the Specification and the Code of Practice for the Electricity (Wiring) Regulations;

- A single certificate can be issued for the production lot covered under one delivery note as per sub-clause (3)(a)(iv). Each certificate shall show the production number as per sub-clause (2)(a)(iv).
b. Carry out and submit report on the following verifications for panel wall partitions upon delivery on Site. Prior to carrying out the verifications, inform CM’s representatives including building services site staff who may present to witness the verifications:

i. Method:

<table>
<thead>
<tr>
<th>Verification Items</th>
<th>Method</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manufacturer's Certificate of Origin &amp; Delivery Note</td>
<td>Document Check</td>
<td>From an Approved origin with information of product identification number</td>
</tr>
<tr>
<td>Dimension Check</td>
<td>By measurement</td>
<td>MAS1.W1310</td>
</tr>
<tr>
<td>Surface Quality</td>
<td>Visual</td>
<td>No crack, no damage, no honeycomb, same as CM's Approved sample</td>
</tr>
</tbody>
</table>
| Pre-installed Conduit System Installation (Note 1) | By open up the panel(s) along the pre-installed conduit system. | No damage, no blockage, correct alignment, and marking.  
With minimum bending radius of 2.5 times and 4 times of the outside diameter for steel conduit and PVC conduit respectively.  
Brand name of the concealed conduits and accessories etc. to be same as CM's Approved sample. The setting-out of sockets/switches boxes is as Approved Drawings.  
Additional requirements for PVC conduit:  
- minimum 30mm cover from finished surface;  
- conduit bends with an internal radius of at least 4 times the outside diameter of the conduit; and  
- glue to be applied between conduit/accessories connections. |
Note 1: The pre-installed conduit system installation and on site inspection are combined with verifications conducted on the same panel(s).

ii. Frequency:

<table>
<thead>
<tr>
<th>Items</th>
<th>Sampling Frequency</th>
<th>Representative Batch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manufacturer's Certificate of Origin &amp; Delivery Note</td>
<td>1 sample from each batch of bulk delivery</td>
<td>Individual</td>
</tr>
<tr>
<td>Dimension Check</td>
<td>1 sample for every 300 panels or part thereof</td>
<td>Same batch of material delivered to Site under one Delivery Note</td>
</tr>
<tr>
<td>Surface Quality</td>
<td>1 sample for every 300 panels or part thereof</td>
<td>Same batch of material delivered to Site under one Delivery Note</td>
</tr>
<tr>
<td>Pre-installed Conduit System Installation and On Site Inspection</td>
<td>1 sample for every 1000 panels or part thereof</td>
<td>Same batch of material delivered to Site under one Delivery Note</td>
</tr>
</tbody>
</table>

c. Where any of the verifications, except for pre-installed conduit system installation, fail to meet the acceptance standards either:
   i. Remove the representative batch off Site; or
   ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

d. Where any of the verifications among the 0.1% selected panel wall samples with pre-installed conduit system installation fails to meet the acceptance standards:
   i. Further inspect on 0.3%, or at least 3 nos. samples random selected from the same batch;
   ii. In case of any anomalies found again, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

e. The selected panel wall partitions can be re-used again after the verification subject to approval by CM's representative.

**MAS1.M250.7 CHARACTERISTIC STRENGTH ESTABLISHMENT FOR PANEL WALL PARTITIONS**

Characteristic strength establishment is to be based on the following or similar:

1. 100 Nos. of standard 150 mm concrete cube samples are to be made at spot in the casting yard in 3 different casting days;
2. Samples of panel wall products manufactured in one casting day using the same batch of concrete from which the cubes are taken should be selected for testing in accordance with MAS1.M210 (2)(d)(vi);

3. The cubes should be sampled and made in accordance with CS1:2010, or other methods to be Approved. 90 Nos. of cubes are to be tested for compression strength at 28 days by HOKLAS accredited laboratories and 10 nos. of cubes are to be tested by the Housing Authority;

4. Establish an estimate of the characteristic strength (fcu) in accordance with Clause 6.5.2 of BS6089 and Table 7 of BS2846:Part 3:1975. fcu can be determined from the distribution of standard cube results using the expression fcu = mean concrete cube strength minus 1.93 x standard deviation;

5. When the test stipulated in sub-clause (2) is satisfactory, the characteristic strength of the panel wall resulting from the above estimation is to be the established characteristic strength and used as fcu for monitoring purpose as required in MAS1.W1220.

ANCILLARY MATERIALS

MAS1.M310.7 BED-JOINT REINFORCEMENT
1. Material: stainless steel for external and galvanized steel for internal use;
2. Width: 40 - 50 mm less in width than wall or leaf;

MAS1.M320.7 PLAIN EXPANDED METAL LATH
To BS 1369:Part 1:1987:
1. Reference number: L3, expanded metal lath G275;
2. Size: minimum 5 mm across short way of mesh;
3. Weight: not less than 1.6 kg/m² ± 15%;

MAS1.M330.7 TIES BETWEEN WALL ENDS AND CONCRETE
To be one of the following:
1. 6 mm diameter steel rods, 350 mm long, painted with 2 coats of bituminous paint; or
2. 20 x 3 mm steel flats, 350 mm long, fanged at each end; or
3. Strips of brickwork reinforcement, as MAS1.M310 (2), 350 mm long in the following widths:
   a. For 100-105 mm walls: 60 mm;
   b. For 200-225 mm walls: 110 mm.
   Strips to be fixed by shot firing may be reduced in length, subject to Approval;
4. Other methods approved by CM.

MAS1.M340.7 TIES FOR WALLS BUILT AGAINST CONCRETE
Formed from 20 x 3 mm thick steel strip, 150 mm long, fanged at both ends and galvanized after manufacture.

MAS1.M350.7 MOVEMENT JOINT MATERIALS
Comprising:
1. Joint filler: mineral wool quilt or equivalent compressible, fire resistant non-combustible material to BS 476:Part 4:1970;
2. Restraint brackets: as shown on Drawings.

MAS1.M360.7 **MORTAR**
As specified in Worksection MAS3.

MAS1.M370.7 **JOINT SEALANT**
1. Location:
   a. See MAS1.W1040 for glass blocks;
   b. See MAS1.W1200 for partitions in bathrooms and kitchen areas.
2. AS WAT5.M310.

**SAMPLES**

MAS1.M410.7 **SAMPLES**
Submit samples of each type of brick and block for Approval in accordance with the requirements PRE.B9.410.

**PRE-INSTALLED STEEL CONDUIT SYSTEM IN PANEL WALL PARTITIONS**

MAS1.M510.7 **STANDARD**

MAS1.M520.7 **MINIMUM SIZE OF CONDUIT**
1. Minimum outside diameter: 20 mm;
2. Where special situations demand, use 16 mm conduit subject to prior approval being obtained from CM.

MAS1.M530.7 **CONDUIT FITTINGS**
1. All conduit fittings: comply with BS EN 61386-1:2008 or IEC 61386-1:2008;
2. Bushes and plugs: brass;
3. Do not use solid or inspection tee-pieces, couplers or elbows.

MAS1.M540.7 **METAL BOXES FOR ACCESSORIES**
1. Metal boxes for the enclosure of electrical accessories in conduit installation: comply with IEC 60670-1:2002 with dimensions to BS 4662:2006(2009) and complete with one earthing terminal;
2. Use 35 mm and 47 mm deep boxes to house accessories such as domestic switches, socket outlets, etc.;
3. Use 16 mm and 25 mm deep boxes to house specially designed electrical accessories of shallow pattern subject to prior Approval.
CLASS OF PROTECTION AGAINST CORROSION

1. Steel conduits: have Class 4 protection against corrosion in accordance with BS 4568:Part 1:1970 (1993) or BS EN 61386-1:2008 or IEC 61386-1:2008 i.e. heavy protection both inside and outside (e.g. hot-dip zinc coating or sherardizing);

2. Steel conduit fittings: have Class 4 protection in accordance with BS EN 61386-1:2008 or IEC 61386-1:2008 i.e. heavy protection both inside and outside (e.g. hot-dip zinc coating or sherardizing);

3. Metal boxes for the enclosure of electrical accessories: have resistance to corrosion in accordance with IEC 60670-1:2002.

TYPE-TESTING FOR ELECTRICAL STEEL CONDUITS AND FITTINGS

1. The conduits and conduit fittings shall be type-tested for complete compliance with the following standards by an Independent Accredited Laboratory or an Independent Short-Circuit Testing Organisation:

<table>
<thead>
<tr>
<th>Conduits &amp; fittings</th>
<th>Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conduit fittings</td>
<td>BS EN 61386-1:2008 or IEC 61386-1:2008</td>
</tr>
</tbody>
</table>

PRE-INSTALLED PVC CONDUIT SYSTEM IN PANEL WALL PARTITIONS

STANDARD OF CONDUITS

All PVC conduits: comply with IEC 61386-21:2002 or BS EN 61386-21:2004; heavy mechanical strength, rigid, plain and non-thread type.

MINIMUM SIZE OF CONDUIT

1. Nominal diameter: 20 mm to 32 mm;
2. Where special situations demands, use 16 mm conduit subject to prior approval being obtained from CM.

PVC CONDUIT FITTINGS

2. Same make as PVC conduits.

PVC BOXES FOR ACCESSORIES

1. PVC boxes: fitted with metal inserts for all screw holes;
2. Minimum wall thickness: 2 mm and moulded in one piece;
3. Interchangeable with steel boxes;
4. Same make as PVC conduits.
MAS1.M650.7 COLOUR
All PVC conduits, fittings and boxes: white in colour.

MAS1.M660.7 MECHANICAL PROPERTIES
1. Withstand forces encountered in conduit wiring system application;
2. Complete with provision for prevention of deformation.

MAS1.M670.7 FLAME RESISTANCE
All PVC conduits, fittings and boxes shall be non-flame-propagating and self-extinguishing.

MAS1.M680.7 TEMPERATURE CLASSIFICATION
1. For all PVC conduits, fittings and boxes, comply with the temperature classification of -5°C in accordance with IEC 61386-1:2008 or BS EN 61386-1:2008;
2. For PVC conduits, where the ambient temperature at the country of manufacture is likely to be below -5°C, the temperature classification is -25°C.

MAS1.M690.7 TYPE-TESTING FOR ELECTRICAL PVC CONDUITS AND FITTINGS
1. Rigid plain PVC conduits and conduit fittings shall be type-tested for complete compliance with the following standards British Standards by an Independent Accredited Laboratory or an Independent Short-Circuit Testing Organisation:

<table>
<thead>
<tr>
<th>Conduits &amp; fittings</th>
<th>Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>PVC circular conduit boxes</td>
<td>IEC 60670-1:2002 or BS EN 60670-1:2008 BS 4607: Part 5:1982(1988) with the following conditions: a. The marking of the PVC circular conduit boxes shall be 60/10 kg. b. The PVC circular conduit boxes shall be type-tested to 10 kg suspended load.</td>

WORKMANSHIP

LAYING BRICKS AND BLOCKS GENERALLY

MAS1.W010.7 BRITISH STANDARD
Comply with BS 8000:Part 3:1989 in respect of:
1. Materials, handling and preparation (section 2);
2. Brick/block walling generally (subsection 3.1);
3. Jointing and pointing (subsection 3.2);
4. Fair faced masonry (subsection 3.5);
5. Constructional details (subsection 3.7).

MAS1.W020.7 HANDLING AND STORAGE
1. Unload and handle bricks and blocks without soiling, chipping or subjecting to other damage;
2. Stack bricks and blocks on level hardstandings and protect from damage and contamination.

MAS1.W030.7 JOINTS
Lay bricks or blocks on a full bed of mortar with the joints filled solid to a nominal thickness of 10 mm.

MAS1.W040.7 LOAD-BEARING BRICK WALLS
Lay single frog bricks with the frog uppermost and fill with mortar.

MAS1.W050.7 BED-JOINT REINFORCEMENT
Lay reinforcement to blockwork as follows:
1. At the vertical spacing intervals given in the following Table, unless otherwise specified:

<table>
<thead>
<tr>
<th>Vertical spacing of bed-joint reinforcement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Length to height ratio of blockwork panel (l:h)</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
</tr>
<tr>
<td>2:1</td>
</tr>
<tr>
<td>2.5:1</td>
</tr>
<tr>
<td>3:1</td>
</tr>
<tr>
<td>4:1</td>
</tr>
</tbody>
</table>

2. Flush up blockwork with mortar to provide a full even bed. Lay reinforcement in the mortar and complete joint to normal thickness;
3. Keep reinforcement 20 mm minimum back from external and 12 mm minimum back from internal building faces;
4. Lap reinforcement 225 mm at joints in length and fully at angles;
5. Openings: extended bed-joint reinforcement 600 mm minimum distance beyond either side of openings.
PROTECTIVE SKIN WALLS TO ASPHALT TANKING
Lay half brick thick skin, forming a 40 mm space between skin and tanking flushed up with mortar course by course as courses are laid.

SAMPLES OF FINISHED WORK

1. Prepare sample panels of faced brickwork and fair faced brickwork and blockwork, including pointing, in accordance with PRE.B9.430;
2. Panel size: not less than 1 m².

CONSTRUCTION MOCK-UP
Construct a Construction Mock-up of about 5 m² as PRE.B9.440 for panel wall partitions. Where applicable, show the workmanship of each construction works including fixing brackets, bedding, jointing, joint reinforcement, lintel fixing, door frame fixing, installation of E&M works and accessories, grouting, sealing, waterproofing, moisture sealer and etc., all as per the installation manual and as directed by CM.

PRECAUTIONS AGAINST ADVERSE WEATHER

DRY WEATHER
Wet bricks and blocks, in accordance with manufacturer's recommendations, for the minimum period necessary to prevent premature drying out of the mortar.

WET WEATHER
Protect freshly laid brickwork and blockwork during periods of heavy rain and at the completion of each day's work.

DIMENSIONS AND ACCURACY

COURSING BRICKWORK
Gauge brick courses with four courses and four joints to 320 mm.

ACCURACY
1. Keep courses level and perpends vertically in line;
2. Plumb quoins and other angles as the work proceeds.

FACEWORK

COLOUR MIXING
Distribute facing bricks and selected bricks for fair faced work, of varying colour, evenly throughout the work.

UNIFORMITY
Carry up work without allowing any portion to rise more than 900 mm above any other at any time.
MAS1.W430.7 PROTECTION
Protect all facework until practical completion.

BONDING

MAS1.W510.7 BRICK WALLS LESS THAN ONE BRICK THICK
Lay brick walls of 70 mm and 105 mm thickness in stretcher bond.

MAS1.W520.7 BRICK WALLS ONE BRICK THICK AND OVER
Lay brick walls 225 mm thick and over in English bond unless otherwise specified.

MAS1.W530.7 PERPENDS IN BRICKWORK
Lay bricks:
1. Throughout the work with the perpends in any course not less than a quarter of a brick from those in the course below;
2. In faced brickwork and fair faced brickwork and blockwork with joints to an even and regular pattern.

MAS1.W540.7 BLOCKWORK
Lay blocks:
1. In stretcher bond;
2. In fair faced work with joints to an even and regular pattern.

TYING TO CONCRETE

MAS1.W610.7 TYING ENDS OF MASONRY WALLS TO CONCRETE
Cast in, cut and pin or shot fire ties to concrete at 320 mm centres vertically, projecting 250 mm into brick or block walls.

MAS1.W620.7 MASONRY BUILT AGAINST FACE OF CONCRETE
Cast in or cut and pin ties to concrete at 900 mm centres horizontally, 320 mm centres vertically and staggered, projecting 75 mm into brick/block walls.

MAS1.W630.7 MOVEMENT JOINTS
Construct joints as shown on Drawings and:
1. Fix brackets at the required centres;
2. Pack filler into joint ensuring no voids remain.

FINISHING JOINTS

MAS1.W710.7 CONCEALED FACES
Strike joints off flush.

MAS1.W720.7 FAIR FACED WORK
Fill joints as the work proceeds to provide a smooth surface, flush with the brick or block face.
MAS1.W730.7  **FACEWORK**

Finish joints either with:

1. A trowelled, weathered joint as the work proceeds; or
2. The joints raked out to a depth of 10 mm as the work proceeds. Point up with a weathered joint on completion.

MAS1.W740.7  **BRICKWORK FACES TO BE PLASTERED OR RENDERED**

Rake out joints to a depth of 10 mm as the work proceeds.

MAS1.W750.7  **CLEANLINESS**

Clean off all mortar droppings as the work proceeds.

**OPENINGS**

MAS1.W810.7  **BUILDING TO STRUCTURAL SOFFITS**

Form movement joint adjacent structural soffits using joint filler and restraint brackets as MAS1.M350 and/or as shown on Drawings.

MAS1.W820.7  **LINTELS**

Build in lintels with mortar similar to that used in the adjacent walling.

MAS1.W830.7  **SOLID FRAMES**

Bed solid door and window frames and the like with mortar similar to that used in the adjacent walling.

MAS1.W840.7  **HOLES AND CHASES FOR SERVICES INSTALLATION**

Leave, form or cut chases, holes, recesses and reveals in walls to receive frames, rainwater or other pipes, conduits, electric cables and the like as required. Make good with mortar similar to that used in the adjacent walling on completion of the services installation.

MAS1.W850.7  **DISCONTINUOUS CONSTRUCTION**

Where brickwork or blockwork bonding is discontinued by the installation of a conduit:

1. Lay two 6 mm diameter tie rods, projecting 250 mm on both sides of the point of discontinuity at every third course;
2. Cover up conduit by packing joints solid with mortar similar to that used in the adjacent walling after conduits and junction boxes have been installed;
3. Fix a strip of steel lathing prior to the application of plaster or render.

**FLASHINGS AND SKIRTINGS**

MAS1.W910.7  **TURNING IN FLASHINGS AND SKIRTINGS**

1. Rake out joints to a depth of 25 mm;
2. Point flashings and skirtings in mortar similar to that used in adjacent walling.
MAS1.W920.7 ASPHALT SKIRTINGS
Rake out and cut bricks to form a 25 x 25 mm groove for turn in of asphalt skirtings.

MAS1.W930.7 POINTING METAL FLASHINGS
Point in mortar similar to that used in the adjacent walling.

**GLASS BLOCKS**

MAS1.W1010.7 ERECTION GENERALLY
Install in accordance with the manufacturer's site work instructions.

MAS1.W1020.7 PREPARATION
Paint all sides of structural opening to receive glass block panels with two coats of bituminous paint.

MAS1.W1030.7 LAYING BLOCKS
Lay blocks in cement/lime mortar and point both sides.

MAS1.W1040.7 MOVEMENT JOINTS
Allow the clearance at the head and jambs of block panels and fill gap with joint filler and sealant all in accordance with Worksection WAT5 and the glass block manufacturer's recommendations.

MAS1.W1050.7 REINFORCEMENT
Build in strips of reinforcement and carry ends of strips across the clearance gap and build into or secure to jambs of the opening in an Approved manner and in accordance with the manufacturer's recommendations.

**PANEL WALL PARTITIONS**

MAS1.W1110.7 ERECTION GENERALLY
Erect and install the panel wall partitions in accordance with the manufacturer's recommendations unless specified otherwise in this Worksection.

MAS1.W1120.7 PANEL THICKNESS
Construct 150 mm thick panels in one or two skins in accordance with the manufacturer's recommendations.

MAS1.W1130.7 TREATMENT OF VOIDS, RECESSES, REBATES, GROOVES AND JOINTS
Except for circumstances covered at MAS1.W1150, grout and fill up all voids, recesses and rebates in the following joints in accordance with the panel manufacturer's recommendations:
1. Joints between individual panels;
2. Joints between ceilings and top of panels;
3. Joints between floors and bottom of panels;
4. Joints between walls and end of panels;
5. Joints between windows and door frames and end of panels.
MAS1.W1140.7  TREATMENT AT CORNERS, INTERSECTIONS AND JUNCTIONS WITH BUILDING STRUCTURES
Erect, fix and finish all in accordance with the panel manufacturer's recommendations appropriate to surrounding construction.

MAS1.W1150.7  JOINT REINFORCEMENT
Apply reinforcement tape to vertical joints and junctions to surfaces to be tiled or rendered, internally and externally, particularly in the following locations:
1. All joints between individual panels;
2. All junctions between panels and concrete, blockwork, and other partition panels;
3. All joints between skins of panels at free ends of partitions where the panel wall partitions are constructed in two skins.

MAS1.W1160.7  SURFACES TO BE PAINTED
In accordance with panel manufacturer's recommendation:
1. Flush joint all vertical joints between surfaces of individual panels;
2. Apply material as recommended by the manufacturer to smooth and to flush all voids, irregularities and uneven surfaces and across vertical joints of panel wall partitions, with 50 mm wide reinforcement tape across vertical joints.

MAS1.W1170.7  ARRISSES
Ensure ends of panels at all corners and door and window jambs are square edged.

MAS1.W1180.7  ADJUSTMENT FOR CONCRETE TOLERANCES
Carry out all necessary adjustment by cutting, jointing and filling to panels to accommodate permissible tolerances on concrete.

MAS1.W1190.7  CONDUITS AND SWITCH/SOCKET BOXES
Treat in accordance with the panel manufacturer's recommendations and:
1. Cut chases, recesses, notches and the like for the installation of concealed conduits and switch/socket boxes, where required;
2. Make good all such chases, recesses, notches and the like on completion of the electrical installation.

MAS1.W1200.7  PANELS IN BATHROOM AREAS
Apply sealant, in accordance with Worksection WAT5, to fill vertical joints and intersections of the panels and also at their junctions with the concrete structure around the bath/shower area, in accordance with the panel manufacturer's recommendations, to render the joints waterproof where such gaps occur on bathroom side of the panel.

MAS1.W1210.7  PANELS IN BATHROOM AND KITCHEN AREAS
Apply moisture sealer, to the surface of the panel facing the interior of the kitchen and bathroom in accordance with the manufacturer's recommendations to render the panel waterproof after making good of all chases, recesses, notches and the like, cut or formed for conduits and switch/socket boxes.

MAS1.W1220.7  CONTINUOUS MONITORING OF CHARACTERISTIC STRENGTH FOR PANEL WALL PARTITIONS
Continuous monitoring is to be as follows or similar:
1. In accordance with CS1:2010, take one sample to make 2 test cubes (150 mm x 150 mm x 150 mm) for each casting day or every 100 m³ of material used whichever is the greater; send the test cubes to an Approved HOKLAS accredited (or equivalent) laboratory for compression test on 28 days cube strength and submit the test result to CM for record;

2. Submit an analysis and a summary of the test result showing compliance with this clause in an agreed format to CM in monthly intervals for the production of panel wall partitions delivered to Site;

3. If the difference between the compressive strengths of 2 test cubes made from one sample of material exceeds 15% of the averaged test result;
   a. Use the higher of the compressive strengths of the 2 test cubes to assess compliance as stated in sub-clause (4)(a);
   b. Do not use the test results for that sample to assess compliance as set out in sub-clause (4)(b) nor to calculate the standard deviation.

4. The results of tests for compressive strength at 28 days of material must comply with the following acceptance criteria:
   a. No individual test result is less than the characteristic strength established in MAS1.M250 minus 2 MPa; and
   b. The average of any 4 consecutive test results must exceed the characteristic strength. Where there are less than four available test results, treat the average of the first two or first three consecutive test results in the same manner as groups of four consecutive test results.

5. Follow up action to be carried out upon failure to comply with either of the acceptance criteria in sub-clause (4) above:
   a. CM to randomly select panel walls from the batch produced in the casting day affected for a door slam test. If erection of panel wall has commenced, door slam test is to be carried out at a location directed by the CM; except for the sizes and dimensions of the panel walls and doors, other specified test requirements are not to be varied. If the sample fails to comply with the requirements of door slam test, remove all the affected batches of panel walls from the site and make necessary replacement and rectification works;
   b. Submit investigation report to give explanation for the non-compliance and rectification works required.

6. When the calculated standard deviation of a set of 40 consecutive test results exceeds the standard deviation established in the 100 cubes exercise (SD100) by 30%, double the sampling frequency as mentioned in sub-clause (1). If the calculated standard deviation of a set of 40 consecutive test results exceeds the SD100 by 60%, stop the production until the problems in quality control be identified and rectified.

**TOLERANCES**

**MAS1.W1310.7 GENERAL**
Refer to Appendix H "Schedule of Tolerances" to this Specification.

**MAS1.W1320.7 MANUFACTURING TOLERANCE**
Refer to TOL.MAS1.310 in Appendix H to this Specification.
PRE-INSTALLED STEEL CONDUIT SYSTEM IN PANEL WALL PARTITIONS

MAS1.W1410.7 STEEL CONDUIT INSTALLATION
1. Pre-install galvanised steel conduit system complete with metal boxes, or with PVC boxes if otherwise specified, to IEC 60670-1:2002 with dimensions to BS 4662:2006(2009) and steel draw wires for panel wall partitions as indicated on the Drawings;
2. During manufacturing process of the panel walls, pre-installed conduits and accessories therein shall not be subjected to any attempts that cause adverse effect to their shape properties and mechanical strength;
3. All pre-installed conduits shall run vertically in panel wall partitions;
4. Provide slots at upper ends of panel walls;
5. Whenever necessary, make allowance for alignment of conduits between panel walls and ceiling slabs for subsequent interconnection of conduits by Nominated Sub-contractor for electrical installation;
6. All PVC conduits for interconnection shall have concrete, cement, plaster or similar cover to prevent penetration of cables inside conduits by nails, screws and the like; otherwise, means of mechanical protection to the PVC conduits to comply with the Code of Practice for Electricity (Wiring) Regulation shall be provided by the Main Contractor;
7. Comply with the panel wall manufacturer's recommendations to make good all such slots, recesses, notches and the like on completion of the electrical installation;
8. Provide steel draw wires for the complete conduit installation for panel wall partitions.

MAS1.W1420.7 SHOP DRAWINGS OF CONDUITS
Prepare shop drawings, co-ordinate and agree with the Nominated Sub-contractor for electrical installation and the supplier for panel wall partitions before submitting shop drawings for approval.

MAS1.W1430.7 SUBMISSION AND APPROVAL OF CONDUITS
Submit for approval technical details, samples and type-tested certificates for the conduit system as specified in clause MAS1.M560.

MAS1.W1435.7 WORK COMPLETION CERTIFICATION FOR ELECTRICAL CONDUIT SYSTEM INSTALLATION IN PANEL WALL PARTITIONS
1. All conduits and accessories installed have to be certified by at least Grade A2 of Registered Electrical Workers (REW);
2. Provide CM and the Nominated Sub-contractor for electrical installation each a copy of the Work Completion Certificate for record.

MAS1.W1440.7 CONDUIT BENDS
Internal radius: at least 2.5 times the outside diameter of the conduit.

MAS1.W1450.7 BENDING, JOINTING AND TERMINATING OF CONDUITS
Follow conduit manufacturers' recommendation for:
1. Method of carrying out the conduit bends and conduit joints;
2. Method of fixing conduits to boxes without spouts;
3. Use of tools and materials recommended by the manufacturer of the conduits.

MAS1.W1460.7 **SPACING BETWEEN CONDUITS**

In general, separate adjacent or parallel conduits by a spacing of not less than 25 mm. The strength of the panel wall partitions should not be reduced if the spacing between conduits is less than 25 mm.

MAS1.W1470.7 **TERMINATION OF STEEL CONDUITS AT METAL CASING**

1. Where a steel conduit terminates at a metal casing, use a coupler or a brass adaptor for flexible conduit together with a brass male bush;
2. Screw the brass male bush into the coupler or adaptor from the inside of the metal casing through a clearance hole drilled in the metal casing to suit the bush;
3. Screw both the conduit and the bush tightly into the coupler or adaptor so as to grip the metal casing securely for mechanical and electrical continuity;
4. Threads on the steel conduit shall be at least half the coupler length, and no threads on the metal casing shall be allowed;
5. Fix securely the connection between the flexible conduit and the adaptor and the connection shall be effectively watertight.

MAS1.W1480.7 **PREVENTION OF INGRESS OF FOREIGN MATTER**

1. Plug all open ends of the conduit termination, which are liable to be filled with water, moisture or other foreign matter, with Approved conduit stopping plugs; do not use paper or rag materials for this purpose;
2. Plug conduit boxes in similar circumstances similarly to prevent concrete or plaster from entering the boxes during the building construction.

MAS1.W1490.7 **PREVENTION OF ACCUMULATION OF WATER OR MOISTURE**

Lay the conduits in such manners to prevent accumulation of condensed moisture in any part of the installation. Also take due care to prevent the ingress of water into the conduits from leakage in walls and ceilings of the building structure.

MAS1.W1500.7 **SWABBING OUT OF CONDUITS**

Where required, swab conduits out and free them from moisture before wiring work is commenced. Carry out the swabbing operation under the supervision of the authorised representative of the CM. Use only Approved draw-in tape or steel wire of appropriate size and absorbent cloth.

MAS1.W1510.7 **TOOLS**

1. Tighten conduit bushes, couplers and similar items with Approved tools;
2. Form conduit bends on an Approved bending machine, and do not flatten the conduits at bends.

MAS1.W1520.7 **CUTTING OF HOLES**

Drill holes in metal work for the termination of conduits on Site with a twist drill of the correct size or by means of an Approved hole cutting device.

MAS1.W1530.7 **REMOVAL OF BURRS AND SHARP EDGES**

Remove burrs and sharp edges from the ends of conduits before they are installed.
MAS1.W1540.7  **MAKING GOOD OF DAMAGED COATING**
Where the protective coating on a steel conduit has been damaged after installation, paint such surface with at least two coats of an Approved anti-rust paint to prevent corrosion.

MAS1.W1550.7  **EARTHING FOR PRE-INSTALLED STEEL CONDUIT**
The pre-installed steel conduit and metal box in the panel walls shall not form part of the earthing system of the electrical installation. Separate circuit protective conductor (CPC) in compliance with the Code of Practice for Electricity (Wiring) Regulation will be provided by Nominated Sub-contractor for electrical installation. However, the metal box shall itself be earthed to the corresponding accessories, which shall be undertaken by the same Nominated Sub-contractor with cost borne by the Main Contractor.

**PRE-INSTALLED PVC CONDUIT SYSTEM IN PANEL WALL PARTITIONS**

**MAS1.W1610.7  CONDUITS INSTALLATION IN PANEL WALL**
1. All PVC conduits pre-installed inside panel wall partitions for cable wiring shall be set at minimum 30 mm from the final finished surface of the panel wall inclusive of finishing materials as shown on the Drawings to prevent penetration of cables inside conduits by nails, screws and the like;
2. During the manufacturing process of the panel walls, the PVC conduits and accessories therein shall not be subjected to a temperature exceeding 60ºC or other attempts that cause adverse effect to their shape, properties and mechanical strength;
3. All pre-installed conduits shall run vertically in panel wall partitions;
4. Provide slots at upper ends of panel walls;
5. Whenever necessary, make allowance for alignment of conduits between panel walls and ceiling slabs for subsequent interconnection of conduits by Nominated Sub-contractor for electrical installation;
6. Comply with the panel wall manufacturer's recommendations to make good all such slots, recesses, notches and the like on completion of the electrical installation;
7. Provide steel draw wires for the complete conduit installation in panel wall partitions.

**MAS1.W1620.7  SHOP DRAWINGS OF CONDUITS**
Prepare shop drawings, co-ordinate and agree with the Nominated Sub-contractor for electrical installation and the supplier for panel wall partitions before submitting shop drawings for approval.

**MAS1.W1630.7  SUBMISSION AND APPROVAL OF CONDUITS**
Submit for Approval technical details, samples and type-tested certificates for the conduit system as specified in clause MAS1.M690.

**MAS1.W1640.7  CONDUIT BENDS**
Internal radius: at least 4 times the outside diameter of the conduit.

**MAS1.W1650.7  BENDING, JOINTING AND TERMINATING OF CONDUITS**
Follow conduit manufacturers' recommendation for:
1. Method of carrying out the conduit bends and conduit joints;
2. Method of fixing conduits to boxes without spouts;
3. Use of tools and materials recommended by the manufacturer of the conduits.

**MAS1.W1660.7**  
**SPACING BETWEEN CONDUITS**

In general, separate adjacent or parallel conduits by a spacing of not less than 25 mm, the strength of the panel wall partitions should not be reduced if the spacing between conduits is less than 25 mm.

**MAS1.W1670.7**  
**PREVENTION OF INGRESS OF FOREIGN MATTER**

1. Plug all open ends of the conduit termination, which are liable to be filled with water, moisture or other foreign matter, with Approved conduit stopping plugs; do not use paper or rag materials for this purpose;
2. Plug conduit boxes in similar circumstances similarly to prevent concrete or plaster from entering the boxes during the building construction.

**MAS1.W1680.7**  
**PREVENTION OF ACCUMULATION OF WATER OR MOISTURE**

Lay the conduits in such manners to prevent accumulation of condensed moisture in any part of the installation. Also take due care to prevent the ingress of water into the conduits from leakage in walls and ceilings of the building structure.
TESTING

SURVEILLANCE TESTS FOR PANEL WALL PARTITIONS

MAS1.T105.7 SURVEILLANCE TESTS

1. Test Arrangements:
   a. When Instructed, surveillance tests shall be carried out by CM’s Representative, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the followings pertaining to surveillance tests:
      i. Provide attendance on the Site or on the manufacturing factory;
      ii. Provide, deliver and collect samples etc. as directed by CM or as specified.

2. Testing Samples:
   a. Provide one set of test sample from the batch of material delivered to Site under the delivery note as specified in MAS1.M210 (3)(a) or provide one set of test sample directly selected in the manufacturing factory or as instructed by CM;
   b. For Fire Resistance Test, one set of test sample shall consist of 10 pieces of panel wall partitions, including the associated fastenings and fixings necessary to ensure normal installation or as instructed by CM;
   c. For Strength and Robustness Tests, one set of test sample shall consist of 10 pieces of panel wall partitions, including the associated fastenings and fixings necessary to ensure normal installation or as instructed by CM;
   d. For inspection of wall materials, consistency, size, spacing and location of reinforcement, one set of test sample shall consist of 1 piece of panel wall partition.

3. Testing methods:
   a. For Fire Resistance Test, as per MAS1.M210 (2)(d) test item (i);
   b. For Strength and Robustness Tests, as per MAS1.M210 (2)(d) test item (vi);
   c. For inspection of wall materials, consistency, size, spacing and location of reinforcement, open up the panel wall partition for measurement as per the Approved submissions.

4. Non-compliance:
   a. In the event that the testing samples fail to meet the testing requirements, follow either one of the following actions:
      i. Remove the representative batch off Site; or
      ii. Carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 on one separate set of sample selected by the CM from the representative batch. In case of the sample fails the re-test, remove the representative batch off Site.
b. When the representative batch of panel wall is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 for one sample selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clauses (4)(a);

c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.
STONWORK

MATERIALS

STONE

MAS2.M010.7  GRANITE
1. Obtain locally; and
2. Free from defects which may adversely affect the strength or appearance of the stone.

MAS2.M020.7  CLADDING STONE
As shown on Drawings.

ANCILLARY MATERIALS

MAS2.M110.7  MORTAR
As specified in Worksection MAS3.

MAS2.M120.7  DAMP PROOF COURSE
To BS 6398:1983, but not hessian based types.

MAS2.M130.7  WALL TIES FOR FACING CONCRETE AND BRICKWORK
Stainless steel flat strip and:
1. Not less than 40 mm wide by 3 mm thick and 175 mm long;
2. Fanged at both ends.

MAS2.M140.7  TIES FOR JUNCTIONS WITH CONCRETE OR BRICKWORK
Stainless steel flat strip and:
1. 20 mm wide by 3 mm thick and 350 mm long;
2. Fanged at both ends.

MAS2.M150.7  JOINT FILLER BACK-UP MATERIAL AND BOND BREAKER
As Worksection WAT5.

MAS2.M160.7  JOINT SEALANT
As WAT5.M310.

SAMPLES

MAS2.M210.7  SAMPLES
Submit samples of stone for ashlar walling for Approval in accordance with PRE.B9.410 before ordering.
WORKMANSHIP

GENERAL

MAS2.W010.7 STANDARD
Comply generally with the requirements of BS 5390:1976.

SAMPLE PANELS

MAS2.W110.7 SAMPLES OF FINISHED WORK
Prepare sample panels, approximately 1 m² of stone walling, including pointing, in accordance with PRE.B9.430.

PREPARATION OF STONE

MAS2.W210.7 RANDOM RUBBLE
Prepare stones to an irregular shape and roughly cut:
1. Height: 75 - 300 mm;
2. Minimum depth: 75 mm;
3. Length on bed: 75 - 600 mm;
4. With the length or depth on bed of each stone greater than the height.

MAS2.W220.7 SQUARED RUBBLE
Prepare stones roughly square as follows:
1. Height: 75 - 300 mm, varying in 75 mm stages;
2. Depth: 100 - 150 mm;
3. Length on bed: 100 - 600 mm;
4. With the length or depth on bed of each stone greater than the height.

MAS2.W230.7 SQUARED, COURSED RUBBLE
Prepare stones roughly square as follows:
1. Height: 75 - 300 mm, to suit courses of regular height varying from 150 - 250 mm;
2. Depth: 100 - 150 mm;
3. Length on bed: 100 - 600 mm;
4. With the length or depth on bed of each stone greater than the height.

MAS2.W240.7 ASHLAR BLOCKS
Work the exposed and joint faces of each stone to a square and true, plane surface, free from hollow or rough areas and:
1. With exposed faces finely squared and dressed;
2. Stones not less than 300 mm high;
3. Each stone clearly marked to indicate its position in the finished work.

TRANSPORTING, STORING AND HANDLING ASHLAR BLOCKS

MAS2.W310.7 TRANSPORTING
Transport stone:
1. With the minimum of handling;
2. With the stones stacked carefully on the vehicle, using packing pieces to prevent damage.

MAS2.W320.7 STORAGE
Store stones in stacks, on battens and protect from the rain.

MAS2.W330.7 HANDLING
Provide adequate lifting plant to unload and handle the stones into position.

LAYING RUBBLE WALLING

MAS2.W410.7 GENERAL
Lay stones on a full and even bed of mortar in accordance with Worksection MAS3 with joints filled and between 5 and 15 mm wide.

MAS2.W420.7 RANDOM RUBBLE
Lay stones of random shapes and sizes, bonded together over each face of the wall and:
1. Select and rough dress the stones to keep joint widths to a minimum;
2. Provide at least one bonding stone per m² of 450 x 150 mm minimum dimensions carried through the full thickness of the wall as illustrated in figure a. of Appendix MAS2/I to this Worksection;
3. Do not permit any more than three stones to be adjacent to a vertical joint.

MAS2.W430.7 SQUARED RUBBLE
Lay stones of random sizes so that they are properly bonded together with continuous, straight horizontal joints as illustrated in figures b and e of Appendix MAS2/I to this Worksection, with vertical joints kept to a minimum.

MAS2.W440.7 SQUARED RUBBLE BROUGHT UP TO COURSES
Lay stones of random sizes so that they are properly bonded together and brought to level, horizontal joints at maximum centres of 750 mm, to line up with quoin and jamb stones as shown in figures c and e of Appendix MAS2/I to this Worksection.

MAS2.W450.7 SQUARED, COURSED RUBBLE
Lay stones in regular courses as shown in figures d and e of Appendix MAS2/I to this Worksection.

MAS2.W460.7 SQUARED RUBBLE OVER 300 MM THICK
Construct as shown in figure e of Appendix MAS2/I to this Worksection and:
1. Walls faced one side:
   a. Construct one face in roughly squared stones to a minimum thickness of 300 mm with a backing of random rubble;
   b. Provide at least two regularly spaced bonding stones per square metre carried through the whole thickness of the walling or 450 mm into the backing whichever is the less;
2. Walls faced both sides:
   a. Construct both faces in roughly squared stone to a minimum thickness of 150 mm with a core of random rubble;
   b. Provide bonding stones as specified in sub-clause (1)(b) above, but carried either through the whole thickness of the walling or 450 mm into the core.

MAS2.W470.7  POINTING
1. Rake out joints to a depth of 15 mm as the work proceeds;
2. Point in cement mortar with a flush, weathered or recessed joint on completion.

MAS2.W480.7  MOVEMENT JOINTS
Install movement joints, to coincide with those in the structural background in accordance with the relevant provisions of the Workmanship Section of Worksection WAT5.

LAYING ASHLAR

MAS2.W510.7  LAYING AND JOINTING GENERALLY
1. Lay stones on a full, even bed of mortar with all joints filled;
2. Joint width: 5 mm.

MAS2.W520.7  BONDING
Lay stones to bond together throughout the wall and to the backing using projecting bonding stones.

MAS2.W530.7  POINTING
1. Rake out joints to a depth of 15 mm as the work proceeds;
2. Point, using bedding mortar, with a flush joint on completion.

BUILDING AGAINST OTHER STRUCTURAL ELEMENTS

MAS2.W610.7  FACING OTHER STRUCTURAL ELEMENTS
For stone walling built as a facing to concrete or brickwork:
1. Cast in or build in for a depth of 100 mm at least 5 No wall ties per m² to project 75 mm into the stone walling;
2. Fill the joint between the stone walling and the backing with mortar.

MAS2.W620.7  JUNCTIONS WITH OTHER STRUCTURAL ELEMENTS
At junctions of stone walling with concrete or brickwork, cast or build in ties at minimum centres of 450 mm vertically, projecting 250 mm into walling.
ACCURACY AND TOLERANCES

MAS2.W710.7 GENERAL
Refer to Appendix H "Schedule of Tolerances" to this Specification.

NATURAL STONE CLADDING

MAS2.W810.7 FIXING
Fix stone claddings in accordance with BS 8298:1989 and as shown on Drawings.

PROTECTION AND CLEANING

MAS2.W910.7 PROTECTION
1. Protect newly erected stonework against inclement weather and firmly fix adequate protection to prevent damage to all arrises and projections;
2. Keep facework clean during construction and until completion.

MAS2.W920.7 CLEANING
Clean off and leave stonework perfect immediately before handing over.

MAS2.W930.7 CLEANING ASHLAR
Clean off, rub down and leave stonework perfect immediately before handing over.
APPENDIX MAS2/I

MAS2.APPEND1.7  TYPES OF RUBBLE WALLING

a) Random rubble

b) Squared rubble

c) Squared rubble brought up to courses

d) Squared coursed rubble

e) Squared rubble walls - Sections:

- not exceeding 300 mm
- exceeding 300 mm and faced both sides
- exceeding 300 mm and faced one side
MAS3 MORTAR

MATERIALS

CEMENT AND LIME

MAS3.M010.7 CEMENT
1. Ordinary or rapid hardening Portland cement: as FIN 1.M010;
2. Sulphate resisting cement: to BS 4027:1996;

MAS3.M020.7 HIGH ALUMINA CEMENT

MAS3.M030.7 LIME
As FIN1.M020.

MAS3.M040.7 LIME PUTTY
Prepared in accordance with BS 5492:1990, clause 39.1 by adding hydrated lime to water and mixing to a thick, creamy consistency, after which the putty must be left for a minimum of 16 hours before use.

AGGREGATES AND WATER

MAS3.M110.7 SAND
1. Clean, hard, durable crushed rock or clean sand conforming to the following grading limits:

<table>
<thead>
<tr>
<th>BS Test Sieve</th>
<th>Percentage by weight passing BS Test Sieve</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.00 mm</td>
<td>100</td>
</tr>
<tr>
<td>2.36 mm</td>
<td>90-100</td>
</tr>
<tr>
<td>1.18 mm</td>
<td>70-100</td>
</tr>
<tr>
<td>600 microns</td>
<td>40-100</td>
</tr>
<tr>
<td>300 microns</td>
<td>5-70</td>
</tr>
<tr>
<td>150 microns</td>
<td>0-15</td>
</tr>
</tbody>
</table>

2. Sand, other than the 5.00 mm size, falling outside the grading limits shown in the above table by no more than 5%, may be accepted subject to Approval;
3. The proportion of clay, fine silt or dust present, when determined according to BS 812:Part 1:1975 must not exceed 10% by weight.

MAS3.M120.7 SAND FOR FAIR FACED WORK
As specified in MAS3.M110, but free from all salts likely to cause efflorescence.
MORTAR

MAS3.M130.7 AGGREGATE FOR FIREBRICK MORTAR
Fine, crushed firebrick.

MAS3.M140.7 WATER
As PRE.B10.1210 to PRE.B10.1260.

ADDITIVES

MAS3.M210.7 PLASTICIZER

MAS3.M220.7 WATERPROOFING ADDITIVE
An Approved proprietary brand.

MAS3.M230.7 NON-SHRINK ADDITIVE
An Approved proprietary product, free from chlorides, nitrates and sulphates.

SPECIALIST MORTARS

MAS3.M310.7 MORTAR FOR FIREBRICK
An Approved proprietary fire cement.

MAS3.M320.7 MORTAR FOR ASHLAR WALLING
Cement and finally crushed stone, mixed 1 : 3 in proportion.

MAS3.M330.7 READY-MIXED MORTARS AND READY-TO-USE MORTARS

1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed material for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name, and job reference of the material;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer.
   b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2) for CM's information:
      i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works;
      ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);
      iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:
   a. To BS 4721:1981 and ensure mix used is suited to its intended use;
b. Comprising:
   i. Cement, lime and sand as specified in this Worksection;

d. With composition and properties in accordance with BS 4721:1981 tables 3 and 4, composition and specified properties of ready-to-use mortars;

3. On Site Delivery Verification:

   a. At delivery stage:
      i. Written confirmation that the materials delivered to Site is in accordance with the Approved sample submitted under sub-clause (1)(a);
      ii. Delivery notes for all material delivered to Site.

   b. Carry out and submit report on the following verifications for ready-mixed mortars upon delivery on Site. Prior to carrying out the verifications, inform CM's representatives who may present to witness the verifications:

      i. Method:

         | Verification Items                      | Method                  | Acceptance Standards                      |
         |-----------------------------------------|-------------------------|-------------------------------------------|
         | Delivery Note                           | Document Check          | Serial number recorded in the Delivery Notes to be same as the material delivered. |
         | The date & time of final mixing & specified Working Life | Check information printed on the Delivery Notes | Not expired. |

      ii. Frequency:

         One set of verification should be carried out for every delivery of ready-mixed mortar to Site under each Delivery Note submitted in sub-clause (3)(a).

   c. Where any of the verifications fail to meet the acceptance standards, remove the delivery off Site.

MAS3.M340.7  NON-SHRINK CEMENT MORTAR

1. Non-structural use only;
2. 1:3 cement and sand;
3. With minimum amount of water to achieve a consistency that is suitable for completely filling up voids or making up fillets;
4. The mix shall contain a non-shrink additive to MAS3.M230;
5. Not applicable to non-shrink cement mortar as used in the panel wall partitions.
6. Where it may be in contact with the Approved panel wall partition system, it shall be compatible with the panel wall partition system;
7. As an alternative and subject to CM's approval, pre-bagged non-shrink cement mortar with its volume control mechanism in compliance with Types A, B or C under Table 1 of ASTM C1107 - 99 may be proposed to be used, with particular attention to the following:
   a. Early age height change shall be within 0% to +4%; and
   b. Hardened grout or mortar height change shall be within 0% to +0.3%. 
WORKMANSHP

MIXING MORTAR

MAS3.W010.7 GAUGE BOXES
Measure constituents by volume, using clean gauge boxes of sizes to suit the volumes required.

MAS3.W020.7 MIXING
Mix:
1. By mechanical mixer or where Approved, by hand on a clean, closeboarded platform;
2. Without overmixing mortars containing plasticizers;
3. Dry constituents before mixing with lime putty or water;
4. Using the minimum amount of water to achieve the required consistency.

MIX PROPORTIONS AND USES

MAS3.W110.7 USE OF PLASTICIZERS
Use strictly in accordance with the manufacturer's recommendations and adjust the mix proportions of the mortar accordingly.

MAS3.W120.7 LIMITS ON USE OF MIXED MORTAR
Use mortar within one hour of mixing and do not:
1. Use mortar after the initial set has taken place;
2. Reconstitute mortar.

MAS3.W130.7 SAND
The proportions given in this Worksection allow for the use of dry sand and an appropriate allowance must be made for bulking.

MAS3.W140.7 CEMENT MORTAR
Cement and sand, ratio 1 : 3.

MAS3.W150.7 CEMENT/LIME MORTAR FOR EXTERNAL WALLS

MAS3.W160.7 CEMENT/LIME MORTAR FOR INTERNAL WALLS
Cement, lime putty and sand, ratio 1 : 2 : 9.

MAS3.W170.7 CEMENT/LIME MORTAR FOR CHINESE TILING
MAS3.W180.7 WATERPROOF CEMENT MORTAR
50kg of cement to 150kg of sand to 5kg of waterproofing additive, or in such ratio as may be recommended by the additive manufacturer.

MAS3.W190.7 FIREBRICK MORTAR
Either:
1. High alumina cement and aggregate mixed 1 : 2; or
2. Proprietary product used neat.

MAS3.W200.7 TYPES OF MORTAR
Use mortars as follows:
1. Cement mortar for:
   a. Work below damp proof course;
   b. Chimney stacks above roof level;
   c. Brickwork of 70 and 105 mm thickness;
   d. Concrete blockwork not exceeding 150 mm thick;
   e. Load bearing walls;
   f. Brickwork in engineering bricks;
   g. Pointing where directed by the CM and where the bedding mortar is cement mortar;
2. Firebrick mortar for firebrick work;
3. Cement/lime mortar in all other cases;
4. Ready-to-use mortar: use in situations (1) and (3) above.

MET1 GENERAL METALWORK

DESIGN

FALL ARREST SYSTEM

MET1.D010.7 CONTRACTOR'S RESPONSIBILITY

1. Design and install the fall arrest system specified in this Worksection, employing either:
   a. The fall arrest system manufacturer; or
   b. An installation sub-contractor approved by the fall arrest system manufacturer.

2. Bear full responsibility for the design of the fall arrest system notwithstanding that the design or details of the fall arrest system are accepted by the CM.

MET1.D020.7 GENERAL DESCRIPTION

1. The fall arrest system shall be designed to safely arrest personnel who accidentally fall at their work place in accordance with the following:
   a. The system shall be suitable for 2-person (with a design load of 100 kg per person) operation;
   b. The system shall allow the users to attach or detach themselves at any point along the system. The system shall take into consideration the features, installations and changes in level in the work zone so that during system attachment, the users shall be able to walk along and reach every part of the work zone without detaching themselves from the system and the shuttle shall glide along the cable and any intermediate bracket or corner unit automatically unless protective railing or similar protective measures together with adequate warning is provided at the point of detachment;
   c. The fall arrest system shall be a proprietary system consisting of a stainless steel horizontally mounted life-line cable which serves as an attachment point for the travel restraint safety harnesses of the system and complete with all necessary components and accessories such as end clevis, tensioners, intermediate brackets, energy absorbers, corner units, end anchor, bolts and nuts;
   d. Each cable shall be mounted in accordance with the Drawings and Specification at a reachable height not lower than waist level on the external walls to cover the designated areas unless it is proven to be impractical for safety, security and/or technical reasons. The cable fixings shall be able to withstand force generated by any fall of the worker and shall ensure minimal dynamic friction to the cables. End unit tensioners shall be provided for the fall arrest system to ensure that the cables are maintained in the required positions and at working tension. A minimum of two (2) lanyard connectors with travel restraint safety harnesses shall be provided for each fall arrest system;
   e. The fall arrest system shall comply with the following standards or other EN standards whenever applicable:
      i. EN 795 Class C (system);
      ii. EN 354 (lanyard);
      iii. EN 355 (energy absorber);
iv. EN 361 (harness);
v. EN 364 (testing);
vii. BS 7883:2005 (Code of Practice for anchor device conforming to BS EN 795).

f. Each fall arrest system shall be installed so that the users are able to put on the travel restraint safety harnesses and attach to or detached from the system at the safety zone of the building or suitable protected area or the protected access / egress of the work zone. The system shall ensure that users are prevented from falling from any unprotected edges of the canopy, roof or the like by adopting suitably designed lanyard length;
g. Co-ordinate the fall arrest system with other building services to avoid clashes with the pipes, cables etc..

2. The design, materials, method of fabrication, assembly, erection, fastening, method of support and the like for the fall arrest system shall be in strict compliance with the manufacturer’s recommendations. No additional equipment shall be used without written permission of the manufacturer;

3. Location and spacing of all anchor points shall be proposed by the system manufacturer. Fixing and supporting details shall be designed to be compatible with the waterproofing system at the location of fixing where appropriate;

4. Provide and mount an aluminium identification plate for each fall arrest system at a visible area at the access point of the fall arrest system. The identification plate shall record the following information:
   a. System reference number;
   b. Maximum number of person allowed;
   c. Maximum weight of person allowed;
   d. Maximum length of lanyard to be used;
   e. Commission date;
   f. Service due date.

5. Provide training courses as follows:
   a. One session of training course for 25 users upon completion of the installation;
   b. Another session of training course for 25 users within the Maintenance Period;
   c. Additional sessions of training course as instructed by the CM.

**MET1.D030.7 MATERIALS AND WORKMANSHIP**

1. Comply with the relevant provisions of Worksection MET1 in respect of all materials and workmanship;

2. All main body of the system components and accessories such as end clevis, tensioners, intermediate brackets, energy absorbers and corner units, bolts & nuts, anchors, screws, and other fixing shall be manufactured from stainless steel. Rivet shall not be allowed unless otherwise approved by the CM;

3. Install in accordance with Approved shop drawings. Lifeline systems shall be installed under the supervision and direction of the manufacturer’s authorized and trained competent person employed by Contractor's specialist sub-contractor;

4. Install anchorage and fasteners to obtain the allowable working loads listed on the engineering data sheet and in accordance with this Specification;

5. For anchorage drilled into concrete, comply with the following:
   a. Follow instructions of the anchorage system manufacturer;
b. Do not cut or damage reinforcement;
c. Clean drill hole to remove debris and contaminants;
d. Install anchorage at indicated locations and embedment depth;
e. When clearance and spacing of anchorage is not indicated on drawings, install at locations recommended by the manufacturer so as to obtain maximum working loads in accordance with the distances provided on the engineering data sheet.

**MET1.D040.7 SUBMISSIONS**

1. Submit original or certified true copy of certification to ISO 9001 for the fall arrest system manufacturer to CM;
2. Submit shop drawings with schedule of works, installation method, details and specifications of the relevant components for CM's approval prior to manufacturing the component parts of the fall arrest system in factory;
3. Submit for CM's record the design calculation and the layout plan of the fall arrest system, which shall be duly endorsed by the manufacturer's authorized and trained competent person employed by the Contractor's specialist sub-contractor. Attach with the submission an output of fall-simulation analysis (from manufacturer's approved programme) of each complete fall arrest system including system span, bracket spacing, quantity of intermediate bracket and corner unit etc.. The fall-simulation analysis shall take into consideration of any obstacles beneath the work zone;
4. Submit training certificate of the manufacturer's authorized and trained competent person employed by the Contractor's specialist sub-contractor to the CM for approval prior to the installation.

**MET1.D050.7 INSPECTION AND COMPLETION CERTIFICATES**

1. The manufacturer's authorized and trained competent person shall inspect and make all final adjustments for proper operation when the lifeline system is installed and properly tensioned;
2. Arrange on site trial and make modification as may be necessary to demonstrate that the design and operation of the full system comply with the statutory requirements and the specification for acceptance by the CM prior to project completion;
3. Submit for CM's record the completion certificate signed by the manufacturer's authorized and trained competent person. The certificate shall record all information as shown on the identification plate of the fall arrest system.

**MET1.D052.7 COMMISSIONING AND REPORT**

1. Engage an independent qualified engineer (Registered Professional Engineer – RPE) to carry out load test to each individual end bracket. The RPE shall be of the relevant discipline and registered under the Engineers Registration Ordinance (Cap. 409);
2. Submit a commissioning and system checking report prepared and certified by the RPE that the installed system is safely installed and ready for operation.

**MET1.D060.7 MAINTENANCE MANUALS**

1. Provide CM with two hard copies and one electronic copy of the maintenance manual for the completed works. The manual shall include, but not be limited to, the following information:
   a. Name, address and telephone number of each firm and/or sub-contractor involved in the supply of materials, components, assembles and finishes;
b. A clear and concise description of the construction method used to form the various areas of proposed design on the particular project;

c. Copies of materials and components certification and test reports as required by this Specification;

d. A method statement showing the means of access to all parts of the features and their safe loading;

e. Recommendations for routine maintenance, cleaning, suitable cleaning agents and any lubrication/adjustments to the working parts;

f. A full set of construction drawings, updated to include any changes that have been made up to the time of completion;

g. The terms and conditions of any guarantees relating to the installed system.

2. The manuals shall be signed by the manufacturer's authorized and trained competent person employed by the Contractor's specialist sub-contractor to certify that all information contained therein is correct.

**MET1.D070.7 INSPECTION DURING MAINTENANCE PERIOD**

1. Provide inspection during Maintenance Period as follows:

   a. Conduct regular annual inspection of the fall arrest system and submit inspection reports to representative of Housing Authority confirming that all components of the system, lanyard and harness are in order and indicating clearly any parts or components that require repairs or replacement. The content of the report shall be approved by the CM and signed by the manufacturer's authorized and trained competent person employed by the Contractor's specialist sub-contractor;

   b. Provide safety check of the system as considered necessary by the CM and such inspection / checking shall be free of charge if the system is under normal use.

2. Bear all costs for making good the following defective design, material and workmanship which appear within the Maintenance Period for the fall arrest system including components of the personal safety kit:

   a. Any abnormal deterioration, discolouring, deformation, de-figuring, weathering of the work;

   b. Failure of operating parts to function normally;

   c. Structural failure due to pressures and forces up to specified limits;

   d. Deterioration of discolouration of stainless steel finishes;

   e. Corrosion of any component materials.

**MULTI-SENSORY MAP**

**MET1.D110.7 CONTRACTOR'S RESPONSIBILITY**

1. Design and install multi-sensory map which shall fulfill the following objectives:

   a. Be used as a map by the general public;

   b. Be used as a tactile map by the visually impaired;

   c. Be displayed in high contrasting colour and equipped with audible system for use by the visually impaired.
2. Before the commencement of the fabrication of the multi-sensory map, provide a letter from an organization of the visually impaired, the Hong Kong Society for the Blind confirming that the Braille shown in the shop drawings has been proof read and the design of the multi-sensory map is suitable for use by the visually impaired;

3. Upon completion of the installation of the multi-sensory map and the testing and commissioning, provide a letter from the organization of the visually impaired confirming that the multi-sensory map has been properly installed on Site and is ready for operation.

MET1.D120.7 GENERAL DESCRIPTION

1. Multi-sensory map shall show the following:
   a. Estate: the general layout of the estate and tactile guide paths leading from the main estate entrances to the domestic blocks, major estate facilities including welfare premises, community facilities, estate management office, major transport link etc. as shown on the Drawings;
   b. Commercial centre: the general layout of the commercial centre and tactile guide paths leading from the main entrances to lift zone, multi-sensory map and functional areas including information counter, public toilets at the main entrance floor etc. as shown on the Drawings.

2. Multi-sensory map shall comprise of the following:
   a. Tactile map of 2 mm thick stainless steel plate with aluminium top plate coated with automotive paint as tactile features and backed by a 5 mm thick stainless steel base plate. The tactile map shall be in high contrasting colour to assist persons with low vision to read the map;
   b. Stainless steel tactile symbols for staircases, ramps, lifts, escalators, main entrances, "You are here", tactile guide path etc. as shown on the Drawings;
   c. Text and legend in Chinese, English and Braille. Braille shall be of stainless steel and in Cantonese and English. The Chinese, English and other markings shall be silkscreen on colour coated aluminium and electric etched on stainless steel;
   d. An audio system that comprises a sound generator, a timer and loudspeakers. The audio system shall operate on 220V AC. The sound generator shall produce a musical homing signal and a pre-recorded vocal description of the routing and destination of the tactile guide path, using audio files in a memory card. An adjustable timer shall control the daily operating period of the system. The loudspeakers shall be of the suitable type, wattage and arrangement that provide the optimal audio performance. A fuse shall be provided to protect the electrical circuits;
   e. Vocal description of the routing and destination of the tactile guide paths in Cantonese and English activated by pressing the buttons, located at the underside of either the lower left or lower right corner of the multi-sensory map with one button for Cantonese and one button for English;
   f. Stainless steel stand with stainless steel sign casing of galvanized mild steel frame and stainless steel tapping rail.

3. Tactile features, tactile symbols and Braille shall be firmly fixed to the stainless steel plate. No adhesive fixing and welding shall be allowed;

4. Sharp edges and corners shall be avoided;

5. The multi-sensory map shall be inclined at 30° to 45° from the vertical and the lower edge of the multi-sensory map shall be at 900 mm to 1200 mm above the finished floor level;

6. The orientation of the multi-sensory map shall match with the orientation of the estate when the map is viewed;
7. The entire multi-sensory map shall be electrically earthed in accordance with the safety requirements stipulated in Electricity Ordinance.

**COURT ENTRANCE METAL GATE FOR HOS**

**MET1.D210.7 DESIGN RESPONSIBILITY**
Appoint a Design Certifying Consultant for the design of the court entrance metal gate. Design the court entrance metal gate in accordance with the requirements of Contract Drawings, this Worksection and the relevant clauses of MET1.

**MET1.D220.7 GATE OPERATION**
Ensure the operation of gate is in a smooth and quiet manner.

**MET1.D230.7 GATE COLOUR AND FINISH**
Submit proposed colour and finish of gate to CM for approval. Treat and finish all exposed steel and galvanized steel surfaces, including portions of the component parts forming moveable joints, pre-drilled screw holes, hinges and handles as specified in Worksection MET1.

**MET1.D240.7 SHOP DRAWINGS**
Submit shop drawings for CM's approval, prior to the commencement of ordering of material. Drawings must include:
1. Fixing details of entrance gate to walls/ posts and floors;
2. Positions of anchor bolts;
3. Details of hinge, roller (with brand name if applicable), completed with lubricated bearings, threaded hangers, connection bars etc. including materials specification and dimension;
4. Welding details of components and parts;
5. Details and sections to show sizes, profiles and fixings of assembling and concealed parts;
6. Fixing details of equipotential bonding connection for the gateset;
7. The Design Certifying Consultant referred to in MET.D210 shall certify and sign all shop drawings and technical substantiation including structural calculations.
MATERIALS

IRON AND STEEL

MET1.M010.7  STRUCTURAL STEEL
As specified in Worksection STR1.

MET1.M020.7  GREY CAST IRON
To BS 1452:1990, Grade 150.

MET1.M030.7  GALVANIZED PLAIN STEEL SHEET AND COIL
Hot dip zinc coated to BS EN 10142:2000.

MET1.M040.7  GALVANIZED STEEL TUBING
Light grade or medium grade to BS 1387:1985.

MET1.M050.7  STRUCTURAL STAINLESS STEEL TUBES
To BS 6323:Parts 1 and 8:1982, of the 18/9 chromium nickel group with surface finish as specified from the following:
1. Mill finish: No. 2B;
2. Polished finish: No. 4.

MET1.M060.7  STAINLESS STEEL PLATE, SHEET AND STRIP
1. Grade:
   a. as shown below or scheduled on Drawings;
   b. Grade 304: To BS EN 10088-1:2005 Number 1.4301 or ASTM A959-09 S30400 or JIS G4304:2005 SUS304;
   c. Grade 316: To BS EN 10088-1:2005 Number 1.4436 or ASTM A959-09 S31600 or JIS G4304:2005 SUS316.  
2. Stainless steel Grade 304 is recommended for general usage including external areas. Stainless steel Grade 316 is recommended to be used in public latrines, seacoast, industrial and heavily polluted areas unless stated otherwise.
3. Thickness: as shown or scheduled on drawings;
4. Finish:
   a. To BS EN 10095 or approved equivalent;
   b. As shown or scheduled on Drawings unless specified from the following:
      i. Cold rolled: No. 2B (mill finish);
      ii. Cold rolled special finishes: No. 2J (hairline/satin finish), No. 2P (mirror finish).
5. Manufacturer's certificate:
   Provide the original or a certified true copy of the manufacturer's certificate of compliance with chemical analysis for each consignment delivered to Site. The certificate shall:
   a. State the standard that the material complies with;
b. Show that the material has been tested and found to comply with the chemical composition specifically required under the standard quoted in 5(a) above.

MET1.M070.7  SLOTTED STEEL ANGLE  
Self-finished to BS 4345:1968. Fittings to be cadmium plated.

MET1.M080.7  GALVANIZED STEEL INSERT CHANNELS FOR CONCRETE  
An Approved type with expanded polystyrene temporary filler and matching sliding fixing device.

MET1.M090.7  STEEL WIRE MESH  
Hot-dip galvanized and welded to form a square or oblong mesh as specified.

NON-FERROUS METALS

MET1.M110.7  ALUMINIUM ALLOY PLATE, SHEET AND STRIP  
Of the specified designation to BS 1470:1987.

MET1.M120.7  ALUMINIUM ALLOY SECTIONS  
1. Bars, extruded tube sections and hollow sections: to BS 1474:1987, alloy designation 6063;  

MET1.M130.7  STRUCTURAL ALUMINIUM SECTIONS  
To BS 1161:1977.

MET1.M140.7  BRASS RODS AND SECTIONS  
To BS 2874:1986, designation CZ106, condition M.

FIXINGS FOR METALWORK

MET1.M210.7  GENERAL  
Ensure fixings are of the same material to which they are to be fixed.

MET1.M220.7  STUD ANCHORS AND FIXING BOLTS  
Approved proprietary expansion bolts and used in accordance with the manufacturer's recommendations.

MET1.M230.7  ADHESIVE FOR BONDING METAL TO WOOD AND METAL TO METAL COMBINATIONS  
1. In compliance with the prescribed limits of VOC content as set out in the Air Pollution Control (Volatile Organic compounds) Regulation;  
ARTICLES TO BE COATED

MET1.M310.7 METAL ARTICLES TO BE COATED
Ensure metal articles are designed in accordance with the recommendations and relevant part of BS 4479 prior to coating.

EQUIPOTENTIAL BONDING CONNECTION

MET1.M410.7 EARTHING LUG
1. Unless otherwise specified on Drawings, provide earthing lug(s) to extraneous conducive parts including the followings which are not exhaustive:
   a. Burglar bars;
   b. Grilles;
   c. Railing;
   d. Handrail;
   e. Cat ladder.
2. Earthing lug shall be of 1.5 mm thick steel plates electroplated zinc galvanized to BS 1706:1990, class B and 13 μm. The cut edges of earthing lug shall be painted with zinc phosphate primer.

MULTI-SENSORY MAP

MET1.M510.7 STAINLESS STEEL
To BS EN 10095:1999:
1. Grade 316 for in accordance with MET1.M060.

MET1.M520.7 ALUMINIUM ALLOY
Alloy designation 6061.
WORKMANSHIP

SAMPLES AND PROTOTYPES

MET1.W010.7 SAMPLES
Submit samples as Worksection PRE.B9.

MET1.W020.7 PROTOTYPE
Obtain Approval of prototype before starting fabrication of repetitive components.

FABRICATION

MET1.W110.7 GENERALLY
During fabrication:
1. Protect all surfaces that will be visible in the finished work;
2. Mitre junctions of identical sections;
3. Assemble moving parts to move freely and without binding;
4. Remove all burrs and sharp arrises which will be visible after fixing or be a hazard to the user.

MET1.W120.7 SLOTTED STEEL ANGLE
Cut square and securely bolt together using nuts, bolts and washers and angle braces as necessary.

MET1.W130.7 FIXING STEEL MESH
Fix at 75 mm centres to:
1. Steel framing by:
   a. Tack welding; or
   b. Tying with 2 mm galvanized tying wire.
2. Wood framing with 1.8 x 25 mm galvanized staples.

MET1.W140.7 CASTINGS
Sound, free from bubbles, cracks or other defects and to include the construction of patterns and moulds as required.

WELDING AND BRAZING

MET1.W210.7 WELDING GENERALLY
1. Remove grease, dirt, moisture, oxide and scale from the edges to be welded;
2. Use clamps or jigs, where practical, to ensure accuracy;
3. Fully fuse joints throughout with no holes, pores or cracks;
4. Protect self-finished surfaces from weld splutter;
5. Grind butt welds, visible in completed work, smooth and flush. Grind smooth fillet welds, if required;

MET1.W220.7 ALUMINIUM WELDING
1. Tungsten Inert Gas (TIG) welding of aluminium to BS 3019:Part 1:1984;

MET1.W230.7 STAINLESS STEEL WELDING

MET1.W240.7 WELDING OF GALVANIZED OR ZINC SPRAYED COATED METALWORK
1. Submit proposals for Approval to carry out welding in continuous runs;
2. Allow for making good damage to zinc sprayed coating or galvanizing and for treatment of welds with two coats of zinc-rich priming paint to BS 4652:1995.

MET1.W250.7 BRAZING

MET1.W260.7 JOINTING GALVANIZED STEEL TUBING
Carefully notch, fit and weld galvanized steel tubing to produce accurate joints. Grind smooth and treat with two coats of zinc rich priming paint to BS 4652:1995, Type 2.

FINISHES TO IRON AND STEEL

MET1.W310.7 ELECTROPLATED ZINC COATING
To BS 1706:1990, Class A and 0.025 mm thick.

MET1.W320.7 ZINC SPRAYED COATING
To BS 2569:Part 1:1964, nominal thickness 0.2 mm, unless otherwise specified.

MET1.W330.7 HOT DIP GALVANIZING
1. To BS EN ISO 1461:2009;
2. The minimum coating thickness:

<table>
<thead>
<tr>
<th>Article Thickness</th>
<th>Minimum Mean Coating Thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt;6 mm</td>
<td>85 µm</td>
</tr>
<tr>
<td>&gt;3 mm to ≤6 mm</td>
<td>70 µm</td>
</tr>
<tr>
<td>≥1.5 mm to ≤3 mm</td>
<td>55 µm</td>
</tr>
<tr>
<td>&lt;1.5 mm</td>
<td>45 µm</td>
</tr>
</tbody>
</table>

3. Unless Approved, all components are to be galvanized after fabrication and welding;
4. The hot dip galvanizing is to be carried out by galvanizers with ISO 9001 certification. Submit the name of galvanizer for Approval;
5. Submit original invoice/delivery note and galvanizing certification for each delivery. These documents shall include the following information:
   a. Project title/number;
   b. Name of galvanizer;
   c. Types and dimensions of articles;
   d. Quantities.
6. Attach a durable identification tape or tag to each batch of galvanized articles indicating the project title, galvanizing certification number and name of galvanizer;
7. For galvanized steel items that are to be painted, no passivation shall be carried out.

MET1.W350.7 DAMAGE TO ZINC COATINGS AND GALVANIZING
Make good damage and treat cut ends of galvanized sections with two coats of zinc-rich priming paint to BS 4652:1995.

MET1.W360.7 CHROMIUM PLATING
To BS 1224:1970:
1. Service condition number: 3 (Severe);
2. Surface finish: as specified from the following:
   a. Bright finish;
   b. Dull finish;
   c. Satin finish.

FINISHES TO ALUMINIUM

MET1.W410.7 NATURAL FINISH
As specified from the following:
1. Mill finish;
2. Polished finish;
3. Polished finish and treated with a protective lacquer.

MET1.W420.7 NATURAL ANODISED FINISH
To BS EN 12373-1:2001:
1. Thickness grade: Class15 for interior work;
2. Thickness grade: Class20 for exterior work;
3. Surface texture: as specified from the following:
   a. Matt finish;
   b. Satin finish;
   c. Bright finish;
   d. Polished finish.

MET1.W430.7 COLOUR ANODISED FINISH
To BS 3987:1991,
1. Average thickness of coating not less than 25 microns;
2. Surface finish: as specified from the following:
   a. Matt finish;
   b. Satin finish;
   c. Bright finish;
   d. Polished finish.

MET1.W440.7 PROPRIETARY ANODISED FINISH
Approved proprietary anodic film finish of thickness and colour as specified.

PROTECTION OF METALWORK

MET1.W510.7 PROTECTION OF METALWORK FINISHES
1. Protect all decorative finishes to metalwork against damp, scratching and other
damage;
2. Apply a strippable coating or masking tape to all stainless steel, anodised
aluminium or similar surfaces and only remove as and when necessary for
construction or prior to inspection for handover;
3. Remove surplus adhesive from metalwork with non-damaging solvent and wash
down.

MET1.W520.7 AVOIDANCE OF ALUMINIUM IN CONTACT WITH OTHER
MATERIALS
Avoid contact in the completed work between aluminium and concrete, mortar
plaster or similar materials.

MET1.W530.7 PROTECTION OF ALUMINIUM IN CONTACT WITH OTHER
MATERIALS
1. Ensure surfaces are clean, dry and thoroughly degreased with an Approved
organic solvent, roughened if necessary by mechanical means prior to
application to ensure paint adhesion;
2. Protect aluminium surfaces in contact with concrete, mortar plaster or similar
materials with one coat of bituminous paint or Approved tape;
3. Do not apply bituminous paint over painted or etch primed surfaces.

MET1.W540.7 AVOIDING BI-METALLIC CONTACT
Avoid contact in the completed work between the following metals:
1. Aluminium alloys and copper alloys, nickel, lead or stainless steel;
2. Iron and steel and copper alloys;
3. Zinc (including galvanizing) and copper alloys or nickel.

MET1.W550.7 PROTECTION OF BI-METALLIC CORROSION
1. Ensure surfaces are clean, dry and thoroughly degreased with an Approved
organic solvent, roughened if necessary by mechanical means prior to
application to ensure paint adhesion;
2. Protect metal to metal contact as specified in MET1.W540 by coating the contact
surface with bituminous paint, protective tape or other Approved means;
3. Do not apply bituminous paint over painted or etch primed surfaces.
MET1.W560.7 SITE STORAGE
Store metalwork off a levelled, well-drained and maintained hard-standing ground and in a manner which will not result in damage, deformation or contamination.

EQUIPOTENTIAL BONDING

MET1.W610.7 EQUIPOTENTIAL BONDING
1. Unless otherwise specified on Drawings, provide equipotential bonding connection for each extraneous conductive parts by:
   a. Weld one end of 1.5 mm thick galvanised mild steel earthing lug(s) to the extraneous conductive parts; and
   b. Provide a 5 mm diameter hole at the other end for connection of the bonding conductor by the Nominated Sub-contractor for Electrical Installation;
   c. Ensure that full electrical continuity is maintained between all the component elements of the metallic fixture.
2. As COM2.W465 (6).

MULTI-SENSORY MAP

MET1.W650.7 SUBMISSIONS
Submit the following for CM's approval before the commencement of the fabrication of the multi-sensory map:
1. Shop drawings of the multi-sensory map including tactile map for the general layout shown on the Drawings in sub-clause 1 of MET1.D120, text, legend, colours of the map, audible system, stand etc.;
2. Schematic diagrams for the audible system;
3. Script of the audible messages in both Chinese and English;
4. Operation manuals for audible system, etc;
5. Installation method and builder's works requirement;
6. Letter as specified in sub-clause (2) of MET1.D110.

MET1.W655.7 TESTING AND COMMISSIONING
1. Upon completion of the installation of the multi-sensory map, carry out a testing and commissioning of the multi-sensory map in the presence of the organization of the visually impaired to ensure the multi-sensory map is properly installed and ready for operation;
2. Rectify defects identified by the organization of the visually impaired;
3. Provide a letter as specified in sub-clause (3) of MET1.D110.

MET1.W660.7 INSTRUCTION MANUALS
Provide two copies of as-built drawings and instruction manuals giving detailed operation and maintenance instructions.
COMPLETION

MET1.W710.7  ON COMPLETION
Lubricate and adjust moving components and leave in perfect working order on completion.

PLU1 WATER SUPPLY

GENERAL

PLU1.G010.7 SCOPE OF THE WORK

1. The works to be carried out under this Worksection shall include the complete plumbing installation for fresh, flush, rainwater harvesting and fire services pipework all as shown on the Drawings and detailed in this Worksection including:

a. Fresh and flush water pipework installations commencing from the government mains at the entry of site boundary to individual sanitary fixtures, gas water heaters and taps. Part of the plumbing installation inside pump room, including the pumpsets, ball float valves etc., connection point inside the pump room will be carried out by the Nominated Sub-contractor for fire services and water pump installation where shown on the Drawings. The installation of gas water heater, if applicable, will be carried out by a separate gas water heater contractor;

b. Rainwater harvesting pipework installation commencing from outlets of the rainwater storage tank to individual irrigation water points. Part of the rainwater harvesting installation inside pump room, including the pumpsets, ball float valves, filter, chlorination system, pipework etc., will be carried out by the Nominated Sub-contractor for fire services and water pump installation where shown on the Drawings;

c. Fire services water pipework installation commencing from the government mains at the entry of the site boundary including the up-feed pipes to the fire services roof/transfer tank and, if applicable, down-feed pipes to the street fire hydrants. Part of the plumbing installation inside pump room, including the pumpsets, ball float valves etc., connection point inside the pump room will be carried out by the Nominated Sub-contractor for fire services and water pump installation where shown on the Drawings; and

d. Extend and connect the fresh, flush and fire services water pipes to the government mains outside the Site boundary, if applicable. Where shown in the Drawings, connection shall be made to existing in-service supply mains of adjacent Housing Authority estate instead of government mains.

2. The complete installation shall mean, not only the major items of equipment and apparatus conveyed in this Worksection, but all the incidental sundry components necessary for the complete execution of the works and for the proper operation of the installation with their labour charges, whether or not these supply components are mentioned in detail in the tender document;

3. Refer to Worksection PLU2 for the requirements on sanitary fixtures/appliances installation.

PLU1.G020.7 REGULATIONS AND STANDARDS

1. Comply with all statutory regulations together with any revisions or amendments made thereto. The following regulations and standards are particularly relevant:

a. The Waterworks Ordinance and its Regulations;

b. The Fire Services Ordinance and its Regulations;

c. The Noise Control Ordinance;

d. Hong Kong Waterworks Standard Requirements for Plumbing Installations in Buildings and Circular Letters issued by the Water Authority;

e. Codes of Practice for Minimum Fire Services Installations and Equipment and Inspection, Testing and Maintenance of Installations and Equipment and Circular Letters issued by the Fire Services Department;

f. Factories and Industrial Undertakings (Confined Spaces) Regulation;

g. Where applicable, relevant sections of appropriate international standards on materials and workmanship as listed in PLU1.APPEND1.

**PLU1.G030.7 PRECEDENCE**

In case of conflict between the requirements among the publications referred to PLU1.G020, interpretation shall be in accordance with the following order of precedence unless otherwise directed by the Contract Manager:

1. Ordinances and Regulations, Laws of Hong Kong;
2. This Specification and/or the Drawings;
3. International standards.
MATERIALS

PIPES, FITTINGS AND JOINTS

PLU1.M110.7 GENERAL
All pipes and fittings shall:
1. Conform to this Specification. Alternative materials may be used if approved by the Contract Manager;
2. Be constructed of materials suitable for the required working and test pressures and temperatures of the fluid carried;
3. Be capable of withstanding system working pressure and maximum static pressure that may arise upon failure of the associated pressure reducing devices;
4. Be of standard products. Do not use on-site fabricated and locally manufactured pipes and fittings except specified elsewhere or where shown on the Drawings or approved by the Contract Manager;
5. Be approved by the Water Authority for the intended application. Submit type test reports/certificates for pipes, elbows and equal tees issued by laboratories that comply with PRE.B9.570 for verification of compliance with this Specification. Submit type test reports/ certificates of fittings other than elbows and equal tees upon Contract Manager's request;
6. Be taken with all necessary precautions to avoid surface damage or contamination during shipping, handling, storage and fabrication;
7. Be provided with protective wrapping, including the pipe ends.

PLU1.M120.7 COPPER PIPES
1. Be of seamless drawn copper tubes manufactured to BS EN 1057 with nominal wall thickness as below:

<table>
<thead>
<tr>
<th>Nominal Pipe Outside Diameter (mm)</th>
<th>Nominal Minimum Pipe Wall Thickness (mm) Aboveground</th>
<th>Nominal Minimum Pipe Wall Thickness (mm) Underground</th>
<th>Hardness / Temper</th>
</tr>
</thead>
<tbody>

<td>1.5</td>
<td>2.0</td>
<td>HD</td>
</tr>
</tbody>
</table>

Note: HH - Half Hard R250
      HD - Hard Drawn R290

2. Take into account temper conditions after solder/brazed jointing or heat bending in determining their pressure withstanding capability;
3. Provide pipe markings in accordance with tube manufacturing standard BS EN 1057;
4. Copper pipes for cold water supply inside domestic flats shall be completed with factory applied plain polyethylene sheath to BS 3412. Copper pipes for cold water supply at external areas and common areas, including corridors, lobbies and plant rooms, shall be bare and without paint finishes;

5. Copper pipes for hot water supply inside and outside domestic flats shall be completed with factory applied castellated polyethylene sheath comply with BS 3412 and suitable for use up to 80°C.

**PLU1.M130.7 COPPER PIPE FITTINGS**

1. Copper and copper alloy fittings such as end feed capillary, integral solder capillary and compression type bushes, reducers, bends and tees: comply with BS EN 1254-1, 2, 4 & 5 or equivalent standard;

2. For compression type fittings used for hot water pipework, submit type test reports issued by laboratories that comply with PRE.B9.570 for proving their suitability for use at a pressure (working and/or maximum static pressure that may arise upon failure of the associated pressure reducing devices) above that allowed at 80°C in BS EN 1254-2 or equivalent standard by the following tests:
   a. Temperature cycling test of a pipe/fitting assembly of the compression type fittings to be carried out by alternately circulating water of 80°C and 15°C through it and pressurizing the assembly to the working or maximum static pressure, whichever is higher, for 2 minutes after it reaches 80°C and 15°C respectively in each cycle. A total of 400 cycles of test shall be performed;
   b. Pressure test of the pipe/fitting assembly to be carried out after the temperature cycling test at 1.5 times the working or maximum static pressure, whichever is higher, for 24 hours with its temperature maintained at 80°C throughout the 24-hour period;
   c. The compression type fittings are to be regarded as capable of withstanding the working and maximum static pressure that may arise upon failure of the associated pressure reducing devices at 80°C if no sign of deformation of the fittings and water leakage from the pipe/fitting assembly are observed/detected throughout the tests as mentioned in sub-clauses (2)(a) and (2)(b) above.

3. Provide written confirmation from the manufacturer on suitability of the compression type fittings for use with hot water pipework for application at 80°C under the working and maximum pressure;

4. Use compression type fittings for pipe sizes less than or equal to 54 mm or use solder (end feed or integral) or brazed capillary fittings for pipe sizes less than or equal to 76.1 mm;

5. Bolted flange joints: brazed type and comply with BS EN 1092-3 or equivalent standard;

6. Unless otherwise specified or shown on the Drawings, use the following types of joints and fittings:

<table>
<thead>
<tr>
<th>Application</th>
<th>Copper Pipe Size</th>
<th>Joint / Fitting</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Up-feed to storage tank, storage tank downfeed and mains pressure direct up-feed</td>
<td>Up to and including 76.1 mm</td>
<td>Brazed, end feed or integral solder capillary joints; Flanged joints where future disconnection is required.</td>
</tr>
<tr>
<td>b. Meter assembly branch and pipework</td>
<td>Up to and including 76.1 mm</td>
<td>Brazed, end feed or integral solder capillary joints;</td>
</tr>
</tbody>
</table>
c. Meter outlet and consumer pipework
   Up to and including 32 mm
   Brazed, end feed or integral solder capillary joints;
   Compression or screw joint fittings for connection to valves etc or if capillary jointing is not practical.

d. Consumer hot water pipework
   15 mm / 22 mm
   Brazed, end feed or integral solder capillary joints;
   Compression fittings for connection to valves, etc. or if capillary jointing is not practical.

7. Use dielectric fittings or epoxy coated flange with gasket for connecting copper pipe to pipes and fittings made of other metals in order to prevent direct contact with different metals.

PLU1.M140.7 PREFORMED POLYETHYLENE SHEATHS FOR CAPILLARY TYPE JOINTS AND FITTINGS OF SHEATHED COPPER PIPES

Be of "clip-on" type preformed polyethylene sheaths to BS 3412 or of equivalent quality in accordance with manufacturer’s recommendation. Thickness of sheaths shall not be less than that in straight pipes and suitable for use up to 80°C.

PLU1.M150.7 BRAZING ALLOYS FOR COPPER AND COPPER ALLOY CAPILLARY FITTINGS

1. Comply with Table 6 Section VI of BS EN 1254-1 with 2% nominal silver content;
2. Use cadmium-free category brazing alloy;
3. Do not use flux when brazing copper-to-copper joints;
4. Brazing filler material to BS EN ISO 17672 shall be used;
5. For joints other than copper to copper, use only a flux that is recommended by the brazing alloy manufacturer; or use a suitable type adaptor subject to the Contract Manager’s approval.

PLU1.M160.7 SOLDERING ALLOYS FOR COPPER AND COPPER ALLOY CAPILLARY FITTINGS

1. Comply with BS EN 1254-1, Table 6 Sections II & III;
2. Use of integral solder fittings is permitted provided they comply with BS EN 1254-1;
3. Use only lead-free category solders;
4. Use only a non-corrosive type of flux that is recommended by the solder alloy manufacturer.

PLU1.M170.7 DUCTILE IRON PIPES AND FITTINGS

1. Ductile iron pipes: comply with BS EN 545;
2. Ductile iron pipe fittings: comply with BS EN 545;
3. Be coated with metallic zinc and bitumen finishing externally to BS EN 545 and lined with cement mortar internally, or be coated with metallic zinc and epoxy externally and lined with cement mortar and epoxy internally. Epoxy coating shall be complied with BS EN 14901. Adoption of epoxy coating shall be subject to the Contract Manager approval;
4. The minimum wall thickness of pipes and fittings shall comply with the following table:

<table>
<thead>
<tr>
<th>Nominal size DN</th>
<th>Flexible push-on type connection (mm)</th>
<th>Screwed flange and integral flange connection (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>6.0</td>

</tr>
<tr>
<td>250</td>
<td>6.8</td>
<td>9.0</td>
</tr>
<tr>
<td>300</td>
<td>7.2</td>
<td>9.6</td>
</tr>
</tbody>
</table>

5. Slip on flange adaptors:
   a. Be provided at check meters positions;
   b. Be designed and manufactured to suit the pipework installation. The flanges shall comply with BS EN 1092-2 PN 16 or PN 25 as appropriate;
   c. Be made of ductile iron to BS EN 545 and shall be coated with epoxy externally and internally comply with BS EN 14901;
   d. Stud bolts and nuts of the flange adaptors shall be made of stainless steel to BS EN 10088-3 Grade 1.4401;
   e. Gaskets shall be made of Ethylene Propylene Diene Monomer (EPDM) If used for fresh water and fire services water, it shall comply with BS 6920;
   f. Be equipped with guide rod assembly to prevent damage from excessive movement. The assembly shall consist of guide rod plates, at least three guide rods each of minimum 16mm diameter and washers all made of stainless steel at least to BS EN 10088-3 Grade 1.4401 on both sides, and shall be fitted with resilient neoprene sleeves, resilient neoprene washers on at least one side of the assembly for isolating vibration transmission;

**PLU1.M180.7**

**GALVANIZED STEEL PIPES AND FITTINGS**

1. Galvanised steel pipes: comply with BS EN 10255 with screwing to BS EN 10226-1 and of medium grade for above ground installation and of heavy grade for below ground installation unless otherwise specified or shown on the drawings;

2. Pipe fittings: galvanised malleable cast iron to BS 143 and 1256 or BS EN 10242; Or galvanised wrought steel pipe fittings (screwed BS 21 R series thread) to BS EN 10241;

3. Mechanical couplings and fitting shall be as follows:
   a. As an alternative to flanged and screwed joints, grooved end mechanical couplings may be employed subject to the approvals of the Contract Manager,
b. Mechanical couplings shall be hot dip galvanized, self-centering, engaged and locked in place onto the grooved or shouldered pipe and pipe fitting ends. The result shall be in a positive watertight couple providing some allowance for angular pipe deflection, contraction and expansion. Coupling housing clamps shall consist of two or more malleable iron castings or rolled steel or ductile iron segment holdings with a composition water sealing gasket so designed that the internal water pressure increases in the water tightness of the seal. Sealing gasket shall be selected for the service and working temperature according to the manufacturer's recommendations. The coupling assembly shall be securely held together by two or more zinc plated track head square or oval-neck heat-treated carbon steel bolts and nuts. All pipe fittings connected to mechanical pipe couplings shall have groove and shouldered ends. Flanged or threaded end valves may be used with grooved adapters;

c. Coupling housing material of mechanical couplings shall be as follows:
   i. Ductile iron shall be to ASTM A536 or to BS EN 545 or BS EN 1563;
   ii. Rolled steel shall be to BS EN 10162.

d. Rubber gaskets shall be complied to the following standards:
   i. Hardness: ASTM D2240;
   ii. Tensile testing: ASTM D412;
   iii. Compression: ASTM D395;

**STAINLESS STEEL PIPES**

1. All stainless steel pipes and fittings shall be approved by Water Regulations Advisory Scheme (WRAS) UK and the Water Authority as suitable for use locally in conformity with the Waterworks Ordinance and Regulations for the intended application and shall be of standard products supplied by ISO 9001 accredited manufacturers;

2. All pipes, including fasteners, shall be of stainless steel to BS EN 10088-1 Grade 1.4301;

3. Stainless steel pipes with nominal outside diameter up to and including 54mm shall be suitable for use with stainless steel non-welding type fittings, pickled and supplied in solution annealed condition to BS EN 10312, Series 2;

4. Stainless steel pipes with nominal outside diameter above 54mm to BS EN 10217-7 or BS EN 10312 Series 2, suitable for use with stainless steel non-welding type fittings supplied in the solution-annealed condition or pickled. For stainless steel pipes to BS EN 10217-7, the dimensions, wall thickness, tolerances and conventional masses per unit length of pipes shall be to BS EN ISO 1127 with minimum wall thickness as below:

<table>
<thead>
<tr>
<th>Nominal size (mm)</th>
<th>Outside diameter (mm)</th>
<th>Minimum wall thickness (mm)</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>150</td>
<td>168.3</td>
<td>3.0</td>
</tr>
</tbody>
</table>

5. Submit sample of the pipes for the Contract Manager’s approval prior to placing orders. Samples submitted for approval shall be accompanied by test reports of those test methods required in the relevant standards.
6. Provide test specimens from the materials delivered to site and carry out testing on dimension and chemical composition in accordance with the relevant BS by an Approved Accredited Laboratory as required by PRE.B9.570. Rate of sampling to be one pipe per batch (regardless of size) delivered to site unless otherwise specified; one batch being the material quantity covered under each delivery note.

   a. In the event that the sample fails to meet the testing requirements, follow either one of the following actions:
      i. Remove the batch off Site; or
      ii. Carry out re-test for the batch in accordance with the testing methods as specified on three separate samples (regardless of size) selected by the Contract Manager from the batch. In case of any one sample fails the re-test, remove the batch off Site

   b. When the batch is removed off Site, replace with another new batch and carry out test for one sample (regardless of size) selected by the Contract Manager from the replacing batch. In case of such test fails, follow action stated in sub-clause (6)(a);

   c. Bear all associated costs for the test and re-test required.

7. Submit the supplier's original delivery note/invoice and mill certificates for all pipes before installation on site and shall include the following information on the items delivered:

   a. Manufacturer's name, the date and place of manufacture;
   b. Type, description and dimensions;
   c. Heat number of pipes;
   d. Quantities of items delivered;
   e. The grade and compositions of stainless steel pipes and international standard complied with;
   f. Results of tests;
   g. Pickling and surface treatment processed.

**PLU1.M191.7 STAINLESS STEEL PIPE FITTINGS**

1. All stainless steel pipe fittings, including fasteners, shall be of stainless steel to BS EN 10088-1 Grade 1.4301;

2. Stainless steel pipe fittings shall be tested in compliance with the pull out test requirement specified in BS EN 1254-2, (Clause 5.5 Resistance to pull out) or equivalent standard. Test report issued by laboratories that comply with PRE.B9.570 shall be submitted;

3. For all stainless steel non-welding type fittings, it shall be manufactured by loss wax investment casting or by stamping mould and welding, pickled and 100% inspected by hydrostatic testing. The minimum system working pressure and temperature of the fittings and pipe system shall be 20 bar and 80ºC respectively;

4. All sealing gaskets shall be silicone rubber to BS 6920 and O-rings shall be of nitrile rubber (NBR) or Ethylene Propylene Diene Monomer (EPDM);

5. All stainless steel fasteners, including bolts, screws, studs and nuts, shall be to BS EN ISO 3506-1 & 2 unless otherwise specified and shall be assembled to manufacturer's recommendations;

6. Use dielectric fittings or epoxy coated flange with gasket for connecting stainless steel pipe to pipes and fittings made of other metals in order to prevent direct contact with different metals;
7. Submit sample of the pipe fittings for the Contract Manager's approval prior to placing orders. Samples submitted for approval shall be accompanied by test reports of those test methods required in the relevant standards;

8. Provide test specimens from the materials delivered to site and carry out testing on dimension and chemical composition in accordance with the relevant BS by an Approved Accredited Laboratory as required by PRE.B9.570. Rate of sampling to be one pipe fitting per batch (regardless of size and type) delivered to site unless otherwise specified; one batch being the material quantity covered under each delivery note.

   a. In the event that the sample fails to meet the testing requirements, follow either one of the following actions:
      i. Remove the batch off Site; or
      ii. Carry out re-test for the batch in accordance with the testing methods as specified on three separate samples (regardless of size and type) selected by the Contract Manager from the batch. In case of any one sample fails the re-test, remove the batch off Site

   b. When the batch is removed off Site, replace with another new batch and carry out test for one sample (regardless of size and type) selected by the Contract Manager from the replacing batch. In case of such test fails, follow action stated in sub-clause (9)(a);

   c. Bear all associated costs for the test and re-test required.

9. Submit the supplier's original delivery note/invoice and mill certificates for all pipe fittings before installation on site and shall include the following information on the items delivered:

   a. Manufacturer's name, the date and place of manufacture;
   b. Type, description and dimensions;
   c. Heat number of pipe fittings;
   d. Quantities of items delivered;
   e. The grade and compositions of stainless steel pipe fittings and international standard complied with;
   f. Results of tests;
   g. Pickling and surface treatment processed.

PLU1.M200.7  

**UNPLASTICIZED PVC (UPVC) PIPES AND FITTINGS**

1. Pipes: comply with BS 3505, Class D or Class E or BS EN ISO1452-2 series S8 or higher to suit system working pressure and as shown on the Drawings;

2. Fittings: comply with BS 4346-1 in conjunction with BS EN ISO 1452-3 or BS 4346-2 in conjunction with BS EN ISO 1452-3;

3. Colour: white unless approved by the Contract Manager;

4. Jointing compound: be of a type recommended by the manufacturer of the pipes and fittings.

PLU1.M210.7  

**STAINLESS STEEL TYPE EXPANSION JOINTS**

Use for fresh and fire services water pipeworks passing through building expansion joints where shown on the Drawings and comply with the following requirements:

1. Be of axial pattern bellows type and able to withstand designed / allowable horizontal and vertical movement;

2. Be screwed ends to BS 21 in conjunction with BS EN 10226-1 or flanged ends to BS EN 1092-1 as appropriate to facilitate replacement;
3. Be manufactured from stainless steel of BS EN 10088-1 Grade 1.4301 or equivalent standard, or other Approved material appropriate to the system;

4. Be designed to withstand the test pressure of the system and maximum static pressure that may arise upon failure of the associated pressure reducing devices. Testing pressure of the expansion joints shall be not less than 1.5 times of the system working pressure involved.

5. Be equipped with guide rod assembly to prevent damage from excessive movement. The assembly shall consist of guide rod plates, guide rods and steel washers on both sides, and shall be fitted with resilient neoprene sleeves, resilient neoprene washers on at least one side of the assembly for isolating vibration transmission;

6. Be the type accepted by the Water Authority and FSD. For sprinkler system, the expansion joints shall be installed and provided to comply the design requirement of LPC Sprinkler Rules.

7. Submissions:
   a. Submit type hydraulic test certificates/reports issued by laboratories that comply with PRE.B9.570;
   b. Submit for Approval the installation length, material, rated movement (axial extension, axial compression, lateral deflection, angular rotation, or any combination thereof) and pressure ratings upon the Contract Manager's request.
   c. Submit details of anchors and guides installation in accordance with the recommendations of the expansion joint manufacturer for approval before manufacturing commences.

PLU1.M220.7 STAINLESS STEEL FLEXIBLE CONNECTORS

1. Use for fresh water pipeworks at pump room and other locations for pipeline vibration elimination where shown on the Drawings:
   a. Be of omega-shape, close pitch annular corrugation, and fabricated from stainless steel plates/sheets/strips;
   b. Be able to sustain a system working pressure compatible with the pipework with which the connectors are connected. Unless otherwise specified, the system working pressure shall not be less than 16 bar, a minimum test pressure of 1.5 times of the system working pressure and a minimum burst pressure of 40 bar;
   c. Include a bellow which shall be non-toxic, corrosion and abrasion resistant and complete with braiding. Should the convolution of the bellow not be gradually formed by continuous rolling in shape, appropriate heat treatment should be conducted to release the internal stress imposed on the bellow during the forming process;
   d. Be of sufficient length for absorption of offset motion and effective isolation of vibration. The total stress on bellow due to internal pressure, offset motion and vibration shall not exceed the design endurance limit. Unless otherwise specified, the minimum rated lateral movement shall be as tabulated below:

<table>
<thead>
<tr>
<th>Nominal bore of braided bellow</th>
<th>Minimum rated lateral movement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 100 mm diameter</td>
<td>4 mm offset motion plus ±1 mm vibration</td>
</tr>
<tr>
<td>Above 100 mm diameter</td>
<td>6 mm offset motion plus ±1 mm vibration</td>
</tr>
</tbody>
</table>

e. Be comprised of the following component materials unless otherwise specified, and inert gas arc welding shall be used for the termination of bellow and braiding at the tube ends:
i. Bellow: austenitic chromium nickel or austenitic chromium nickel molybdenum stainless steel sheet to BS 1449-2 or BS EN 10029 or BS EN ISO 9445-2 or BS EN 10048 or BS EN 10051 or BS EN 10095;

ii. Braiding: stainless steel wires or plates;

iii. Flange: corrosion resistant carbon steel.

f. Have any part which is in contact with the water of the same material as the bellow;

g. Unless otherwise specified, be of flanged end connection. Flanges shall comply with BS EN 1092-1;

h. Have identification markings for the brand name, model number, bellow material, braiding material, system working pressure and bellow nominal diameter;

i. Be equipped with guide rod assembly to prevent damage from excessive movement. The assembly shall consist of guide rod plates, guide rods and steel washers, and shall be fitted with resilient neoprene sleeves and resilient neoprene washers on at least one side of the assembly for isolating vibration transmission.

2. Submissions:

a. Submit type hydraulic test certificates/reports issued by laboratories that comply with PRE.B9.570 to the Contract Manager;

b. Submit for Approval the installation length, material, rated movement (axial extension, axial compression, lateral deflection, angular rotation, or any combination thereof) and pressure ratings upon the Contract Manager’s request.

**PLU1.M230.7 RUBBER FLEXIBLE CONNECTORS/EXPANSION JOINTS**

1. Use rubber flexible connectors for flush water and fire services water pipeworks at pump rooms and other locations for pipeline vibration elimination and use rubber expansion joints for flush water pipeworks passing through building expansion joints where shown on the Drawings and comply with the following requirements:

a. Be of double or multiple arch/sphere type;

b. Be able to sustain a system working pressure compatible with the pipework with which the connectors are connected. Unless otherwise specified, the system working pressure shall not be less than 16 bar, with a minimum test pressure of 1.5 times of the system working pressure and a minimum burst pressure of 55 bar;

c. Be non-toxic, corrosion and abrasion resistant and of sufficient length for effective isolation of vibration;

d. Be fitted with corrosion resistant steel or ductile iron floating flanges to BS EN 1092-1 or 2;

e. Include a flexible tube made of multiple layers of high tensile fabric reinforcement with EPDM, neoprene or synthetic rubber cover and liner. Tube end shall be of locked bead construction with steel wire bead ring and raised face;

f. Be equipped with guide rod assembly to prevent damage from excessive movement. The assembly shall consist of guide rod plates, guide rods and steel washers, and shall be fitted with resilient neoprene sleeves and resilient neoprene washers on at least one side of the assembly for isolating vibration transmission.

2. Submissions:
a. Submit type hydraulic test certificates/reports issued by laboratories that comply with PRE.B9.570;

b. Submit for Approval the installation length, material, rated movement (axial extension, axial compression, lateral deflection, angular rotation, or any combination thereof) and pressure ratings upon the Contract Manager’s request.

**PLU1.M240.7 CHLORINATED POLYVINYL CHLORIDE (CPVC) PIPES AND FITTINGS**

1. Pipes: comply with ASTM F441/F441M (Schedules 40 or 80);
2. Fittings: comply with ASTM F438 (Schedule 40 socket) and ASTM F437 (Schedule 80 threaded) or ASTM F439 (Schedule 80 socket) for pipe fittings;
3. System: comply with ASTM D2846;
4. Colour: white unless approved by the Contract Manager;
5. Jointing compound: all socket type joints shall be made up employing appropriate primers and solvent cement that comply with ASTM F656 and ASTM F493 respectively;
6. Provide pipe markings for Schedule 40 or 80 pipe in accordance with ASTM F441/F441M including the manufacturer name (or trade mark), the nominal pipe size, the material designation, the pipe schedule and the pressure rating;
7. Outdoor CPVC pipe and fittings shall be protected from ultraviolet attack by ultraviolet resistant paint or other effective means as recommended by the manufacturer;
8. Bending to CPVC pipe of diameter exceeding 25 mm is not allowed. Where there is site restriction and subject to the Contract Manager’s approval, bending to CPVC pipe of diameter equal to or less than 25mm may be carried out only in strict accordance with manufacturer’s instructions;
9. Mock-up or demonstration of CPVC pipe installation shall be carried out on the Site for the Contract Manager’s inspection and approval prior to the commencement of installation works.

**FLANGES**

**PLU1.M310.7 FLANGES**

Conform to BS EN 1092-1, 2 and 3 PN16 or PN25 to suit the pressure rating of the system.

**PLU1.M320.7 PUDDLE FLANGES**

1. Unless otherwise specified or Approved, the following pipe connections and all accessories for setting into the tanks shall be provided:

<table>
<thead>
<tr>
<th>Pipe Connection</th>
<th>Connection Fittings</th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td></td>
</tr>
</tbody>
</table>
### PIPE BRACKETS AND SLEEVES

**PLU1.M410.7 PIPE BRACKETS**

1. Be of sufficient strength to take the load with no noticeable deflection with clips detachable without disturbing the fixing;
2. Be of stainless steel at least to BS EN 10088-3 Grade 1.4301 unless otherwise specified;
3. Be welded to stainless steel rods/angles and lined with plastic which fitted between the pipe and the bracket;
4. Bolts, nuts and washers of the pipe brackets: stainless steel at least to BS EN 10088-3 Grade 1.4301;
5. Pattern, type and fixing ends/anchors of the pipe brackets: suitable for mounting onto the surface to which they are fixed;
6. Submit sample of the pipe brackets and anchors for the Contract Manager's approval prior to installation.

**PLU1.M420.7 PIPE BRACKET WITH VIBRATION ISOLATOR**

1. Vibration isolator:
   - Unless otherwise specified or approved by the Contract Manager, vibration isolator shall contain a steel spring with minimum 8mm pad of neoprene in series and enclosed in hanger box. The neoprene element shall be moulded with a rod isolation bushing that passes through the isolator hanger box. Spring diameter and isolator hanger box hole sizes shall be large enough to permit the hanger rod to swing through a 30 degrees arc before contacting the edge of the hole and short-circuiting the spring. The minimum static deflection of the spring shall be 20 mm;
   - Select vibration isolator in accordance with manufacturer's recommendations and taking into account the weight distribution of the pipework, pipe anchor points, guide etc. so as to produce uniform deflections and to ensure that the vibration and noise generated from associated pipework would be isolated and would not be transmitted to other parts of the building, in particular, to avoid causing nuisance to the tenants of the domestic flats;
   - Be responsible for and submit calculation to verify the correctness of selection and overall suitability of every vibration isolator as shown in the Drawings or specified in clause PLU1.W310 (3).
2. Pipe bracket:
   - Details of the pipe bracket to be in accordance with PLU1.M410 wherever applicable;
3. Connection between vibration isolator and pipe bracket:

<table>
<thead>
<tr>
<th>c. Drain</th>
<th>1092-1 respectively</th>
<th>EN 1092-2 and BS EN 1092-1 respectively.</th>
<th>connection to BS EN 1092-2 and BS EN 1092-1 respectively.</th>
</tr>
</thead>
<tbody>

<td></td>
</tr>
</tbody>
</table>
Secure the pipe bracket firmly to the vibration isolator in accordance with manufacturer's recommendations.

**PLU1.M430.7 PIPE SLEEVES**

1. Diameter of pipe sleeves: as shown on the Drawings, otherwise at least one size larger than the pipe that passes through;
2. Except for pipes as given in sub-clause (3) below:
   a. For pipes passing through walls, slabs etc. which separate different fire compartments, use sleeves of galvanized steel to BS EN 10255 medium grade for pipe diameter below 150mm and carbon steel to BS EN 10217-1 for pipe diameter up to and above 150 mm. Pre-fabricated sleeves of hot dipped galvanized steel to BS EN 10346 can be used for pipe diameter up to and above 150mm subject to the Contract Manager's approval;
   b. For pipes passing through walls, slabs etc. within the same fire compartment, use sleeves of UPVC pipe to BS 3505 or BS EN ISO 14522;
   c. Where UPVC pipe passes through fire rated walls and floor slabs, provide an Approved type fire collar to BS 476-20 with equal or higher fire resistant rating than that of the walls and slabs;
3. For pipes passing through external basement walls where there is ground water pressure, use gunmetal or stainless steel to BS EN 10088-1 Grade 1.4301 or spheroidal graphite cast iron (ductile iron) to BS EN 545 puddle sleeves cast in basement wall for pipe connection.

**STRAINERS**

**PLU1.M510.7 STRAINERS**

1. Be of Y-type or U-type (Bucket/Basket type) as shown on the Drawings with minimum free flow area ratio of 2 and the maximum aperture size to be of diameter 1.5mm for strainers of nominal size 100mm or below and of diameter 3.0mm for strainers of nominal size 150mm or above, unless otherwise specified;
2. Have the same nominal sizes as the pipes in which they are connected and shall be suitable for both working and test pressures of the pipework in which they are installed;
3. Be constructed of materials suitable for the required working and test pressures and temperature of the fluid carried with the minimum standards as indicated below:
   a. For nominal sizes up to and including 65mm (fresh water and fire services water application):
      i. Body & cover: bronze to BS EN 1982 CuSn5Zn5Pb5 or CB491K or CC491K;
      ii. Screen: stainless steel to BS EN 10088-1 Grade 1.4401.
   b. For nominal sizes up to and including 65mm (flush water application):
      i. Body & cover: stainless steel to BS EN 10088-1 Grade 1.4401;
      ii. Screen: Stainless steel to BS EN 10088-1 Grade 1.4401.
   c. For nominal sizes above 65 mm (fresh water, fire services and flush water application):
      i. Body & cover: grey cast iron to BS EN 1561 EN-GJL-250, or spheroidal graphite cast iron (ductile iron) to BS EN 1563 EN-GJS-400-15;
      ii. Screen: stainless steel to BS EN 10088-1 Grade 1.4401;
      iii. Drain plug: malleable iron;
iv. Stud and Nut: stainless steel to BS EN 10088-1 Grade 1.4401;

v. Grey cast iron components shall be coated with an epoxy based material as specified in PLU1.M610.

4. All bronze type strainers shall be of screwed female end connection to BS 21 in conjunction with BS EN 10226-1 and all grey cast iron type strainers shall be of flanged end connection to BS EN 1092-2;

5. U-type strainer shall be equipped with quick release cover composed of clamper and hand nuts which shall be so designed that the basket can be taken out for cleaning without using tools. Appropriate safety mechanism shall be incorporated in the quick release cover;

6. Submit test certificates/reports issued by laboratories that comply with PRE.B9.570 confirming that the strainers have been tested in conformity with this Specification.

VALVES

PLU1.M610.7 GENERAL

1. Be designed and constructed of materials suitable for both the working and test pressure of the pipework in which they are installed and the temperature of the fluid carried. Be capable of withstanding system working pressure and maximum static pressure that may arise upon failure of the associated pressure reducing devices. Unless otherwise specified, all valves shall have a system working pressure of not less than 16 bar;

2. Comply with the following standards:

<table>
<thead>
<tr>
<th>Valve</th>
<th>For nominal sizes up to and including 65mm</th>
<th>For nominal sizes above 65 mm</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

3. Be pressure tested in accordance with the relevant British Standards/European Standards or international/national standards by the valve manufacturer before leaving the factory. Valves of the same type shall be from the same manufacturer;

4. Be of the type approved by the Water Authority. Submit type test certificates/reports issued by laboratories that comply with PRE.B9.570 confirming that the valves have been tested in conformity with this Specification. Provide the following type test certificates/reports upon the Contract Manager’s request, wherever appropriate:

a. Test certificates for valves in compliance with the standards quoted in sub-clause (2) above;

b. Test certificates on composition analysis, chemical, physical and mechanical properties of the metallic materials for valves;
c. Test certificates for resilient seating material and epoxy coating showing compliance with the physical property and thickness requirements of this Specification;

d. In case of valves in fresh and fire services water application, test certificates issued by Water Research Centre of UK or an equivalent organization for non-metallic materials of resilient seating and epoxy coating, showing compliance with the full tests of effect on water quality to BS 6920 and suitable for fresh and fire services water usage.

5. Be of the same nominal size as the pipe in which they are installed except those for flow or pressure control such as modulating float valves or pressure reducing valves as shown on the Drawings;

6. Manually operated valves shall be closed by turning the handwheel in a clockwise direction when facing the handwheel. The handwheel shall be made of malleable iron or of composition having metal insert for securing positively to the stem;

7. Be located, as far as practicable, at convenient positions of operation from the floor unless otherwise specified or approved by the Contract Manager;

8. All valves shall be provided with an indicator to show the open and shut position;

9. Valves and cocks for installation in screwed joined pipework shall have taper screwed ends. Flanges of flanged valves shall be BS EN 1092-2 for PN16 rating or otherwise specified.

10. All copper alloy valves shall be of screw female end connection to BS 21 in conjunction with BS EN 10226-1 and all grey cast iron and spheroidal graphite cast iron (ductile iron) valves shall be of the flanged end connections to BS EN 1092-2 and their bolts and nuts shall be to BS EN 1515-1;

11. Grey cast iron and spheroidal graphite cast iron (ductile iron) parts of all valves shall be coated with an epoxy based material both on internal and external surfaces. The following minimum thickness of epoxy coating shall apply:

<table>
<thead>
<tr>
<th>Part</th>
<th>Electrostatically Fusion Powder Coated (μm)</th>
<th>Airless Sprayed Application (μm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>i. Flat and pressurised parts</td>
<td>250</td>
<td>400</td>
</tr>
<tr>
<td>ii. Convex outer edges</td>
<td>150</td>
<td>300</td>
</tr>
</tbody>
</table>

12. Be robust and capable of withstanding hard water.

**PLU1.M620.7 VALVES FOR FRESH AND FIRE SERVICES APPLICATION**

Be constructed to the following minimum standards, wherever applicable:

1. For nominal sizes up to and including 65mm:
   a. Body, bonnet and disc: bronze to BS EN 1982 CuSn5Zn5Pb5 or CB491K or CC491K;
   b. Stem: brass to high tensile brass to BS EN 12163.

2. For nominal sizes above 65mm:
   a. Body and bonnet: grey cast iron to BS EN 1561 EN-GIL-250, or spheroidal graphite cast iron (ductile iron) to BS EN 1563 EN-GJS-400-15;
   b. Disc or seat:
      i. Solid or trimmed with bronze to BS EN 1982 CuSn5Zn5Pb5 or CB491K or CC491K;
ii. Resilient material to BS EN 681-1, Type WA, Hardness Category "70" with nominal thickness of minimum 1.5mm on the non-seating areas and 4.0mm on the seating areas, and in case for fresh and fire services water application, showing compliance with full tests of effect on water quality to BS 6920.

c. Stem:
   i. For underground application or gate valve installed in fresh water or street fire hydrant system, stainless steel to BS EN 10088-3 Grade 1.4057;
   ii. For applications other than that mentioned in sub-clause (2)(c)(i) above, brass to high tensile brass to BS EN 12163 or stainless steel to BS EN 10088-3 Grade 1.4301, 1.4401, 1.4006, 1.4005, 1.4021 or 1.4057.

PLU1.M630.7 VALVES FOR FLUSH WATER APPLICATIONS

Be constructed to the following minimum standards, wherever applicable:

1. For nominal sizes up to and including 65 mm: use UPVC ball valves
2. For nominal sizes 65 mm and above:
   a. Body and bonnet: grey cast iron to BS EN 1561 EN-GJL-250, or spheroidal graphite cast iron (ductile iron) to BS EN 1563 EN-GJS-400-15;
   b. Disc or seat:
      i. Solid or trimmed with zinc free bronze to BS EN 1982 CuSn10 or trimmed with austenitic chromium nickel stainless steel or austenitic chromium nickel molybdenum stainless steel to BS EN 10283 Grade 1.4308 or 1.4408;
      ii. Resilient material to BS EN 681-1, Type WA, Hardness Category "70" with nominal thickness of minimum 1.5 mm on the non-seating areas and 4.0mm on the seating areas.
   c. Stem: stainless steel to BS EN 10088-3 Grade 1.4301 or 1.4401 or 1.4057.

PLU1.M640.7 NON-RETURN VALVES

1. Be of hinged swing or recoil type suitable for horizontal installations and spring type shall be of globe or wafer type, suitable for both vertical and horizontal installations unless otherwise specified or indicated on Drawings. Hinge pins and springs shall be of stainless steel;
2. Be of spring type or recoil type, unless otherwise approved by the Contract Manager, if the non-return valve is installed at pump discharge or with a water head exceeding 15 m to ensure silent shut-off operation;
3. Bronze swing non-return valves shall have screwed type cap and cast iron swing non-return valves shall have the cap and body bolted together to ensure a strong, tight closure;
4. Be designed to close before reversal of flow starts;
5. Recoil or spring type non-return valves shall have a flow area not less than the cross-sectional area of the connected pipework and shall be non-slam in operations;
6. Wafer type spring non-return valves will be acceptable, provided the body ends are capable of matching connecting flanges complying with the requirements of BS EN 1092-1, -2 and -3.

PLU1.M650.7 GATE AND GLOBE VALVES

1. Types:
a. Gate valves: full way solid or split wedge disc type with rising or non-rising stem;
b. Globe valves: straight globe type with rising stem;

2. Provided with an indicator to show the open and shut position at critical locations for cast iron valves as shown on Drawings;

3. For copper alloy type valves, the bonnet shall be of the screwed type with ample threads to ensure positive sealing to the body;

4. For grey cast iron and spheroidal graphite cast iron (ductile iron) type valve, the body and bonnet shall be bolted together and the disc shall be guided;

5. The gland shall be fitted with non-asbestos packing and shall be bolted for grey cast iron and spheroidal graphite cast iron (ductile iron) valves;

PLU1.M660.7 BALL VALVES

Use UPVC type ball valves which comply with the following:

1. Valve components:
   a. UPVC;
   b. Ball center-pivoted, smooth and spherical with a circular orifice, and seated on resilient seating suitable for tight shut off;
   c. Stem one-piece with O-ring made of Ethylene Propylene Diene Monomer (EPDM) for positive sealing of the body.

2. Valve operation:
   a. By wrench turned in a clockwise direction to close when facing the wrench;
   b. At fully open position of valve, wrench to be mounted parallel to the flow of passage through the ball;
   c. Wrench to fully close valve at a quarter turn;
   d. Provide suitable stops for both fully open and fully closed positions of valve.

3. Valve end connections and pressure standards:
   a. Socket or union suitable for directly connecting the pipe to which it is installed;
   b. Suitable for both the working and test pressure of the pipework in which it is installed with system working pressure of at least 10 bar at 35°C unless otherwise specified. Be capable of withstanding system working pressure and maximum static pressure that may arise upon failure of the associated pressure reducing devices;
   c. Testing Method to BS 1010-2.

4. Test certificate/report
   a. Submit type test certificates/reports issued by laboratories that comply with PRE.B9.570 confirming that the valves have been tested in conformity with sub-clause 3(c).

PLU1.M680.7 DRAW OFF TAPS AND STOP VALVES

Comply with BS 1010-2, unless otherwise specified or approved by the Contract Manager. Be of screw down type, easy-clean pattern body surface, stop valves shall be with chromium plated unless otherwise approved by the Contract Manager. Submit sample for Approval prior to installation;
PLU1.M690.7 BALL FLOAT VALVES FOR FLUSHING TANKS

Be of diaphragm type, plastic body to BS 1212-3 with rubber or plastic diaphragm, unless otherwise approved by the Contract Manager and be suitable for high, medium or low pressure as required. Be suitably coated to prevent corrosion on metal parts. Submit valve sample for Approval prior to installation.

FIXED RATIO TYPE PRESSURE REDUCING VALVE

PLU1.M910.7 PERFORMANCE REQUIREMENTS

1. Comply with the following requirements:
   a. Able to maintain the outlet pressure as a fixed ratio of the inlet pressure, independent of the magnitude of the inlet pressure and the water flow across the valve;
   b. Of a size and pressure ratio as specified on the Drawings;
   c. With an operating pressure range suitable for the particular application and a rated system working pressure not less than 16 bar;

2. Submit details of the pressure reduction against flow rate and inlet pressure performance curve and submit test certificates/reports issued by laboratories that comply with PRE.B9.570 confirming that the valve has been tested in accordance with the requirements of this Specification.

PLU1.M920.7 VALVE CONSTRUCTION

Be of gunmetal body to BS EN 1982 CuSn5Zn5Pb5 (CC491K) for fresh and flush water or stainless steel body to BS EN 10283 Grade 1.4308 for fresh water and to BS EN 10283 Grade 1.4408 for flush water:

1. Have a piston of straight through design, constructed of stainless steel at least to BS EN 10088-3 Grade 1.4301 for fresh water a BS EN 10088-3 Grade 1.4401 for flush water unless otherwise approved by the Contract Manager;

2. With seats and O-ring seals of high grade synthetic rubber;

3. Be provided with an arrow on the exterior to indicate the direction of flow;

4. Valves of nominal sizes up to and including 50mm shall be of the screwed female end connection to BS 21 in conjunction with BS EN 10226-1. Valves of nominal sizes above 50mm shall be of the flanged end connection to BS EN 1092-1 and -2 and their bolts and nuts shall be to BS EN 1515-1.

CISTERNs AND TANKS

PLU1.M1110.7 GENERAL

1. For fresh water system, be made of non-toxic materials and approved by the Water Authority;

2. The cisterns and tanks shall be provided with safety access to the roof of the tank and railings on the roof of the tank as shown on the Drawings for maintenance and cleansing.
STAINLESS STEEL CISTERNs, FIBRE GLASS WATER TANKs, COVERS, TANKs AND CYLINDERS

1. For capacity equal to 1000 litres and below, be made of stainless steel to BS EN 10088-3 Grade 1.4301 for fresh water, fire services water and rainwater harvesting systems or to BS EN 10088-3 Grade 1.4401 for flush water system or be made of fibreglass reinforced plastic with minimum 3 mm thickness for fresh water, fire services water, flush water and rainwater harvesting systems;

2. For capacity above 1000 litres, be made of fibreglass reinforced plastic, manufactured to BS EN 13923;

3. Flat bottom and a top cover with suitable reinforcing and bracing;

4. Be non-insulated with no external bracings, ribs, hoops or supporting wires required;

5. Structure calculation shall be submitted if the capacity of fibre glass water tank exceeds 5000 litres.

CISTERN / TANK COVERS

1. For stainless steel water tanks, be fitted with stainless steel access covers and frames, the grading and thickness of stainless steel shall be the same as stainless steel water tanks;

2. For concrete fresh water, fire services water and rainwater harvesting water tanks, be fitted with stainless steel double sealed access covers and frames, the grading of stainless steel shall be BS EN 10088-3 Grade 1.4301 and with minimum thickness of 3 mm;

3. For concrete flush water tanks, be fitted with stainless steel access covers and frames, the grading of stainless steel shall be to BS EN 10088-3 Grade 1.4401 and with minimum thickness of 3 mm;

4. For fibre glass water tanks, be fitted with fibre glass access covers, the thickness of fibre glass shall be the same as fibre glass water tanks.

STREET FIRE HYDRANTS

PERFORMANCE REQUIREMENTS

1. Be of pedestal type complying with the requirements of FSD;

2. Be of an accepted standard pattern with two 65 mm outlets and one 100 mm outlet;

3. Be capable of delivering not less than 2000 litres per minute (33.3 l/s) with a minimum running pressure of 170 kPa at the outlet when tested in accordance with the provision of BS 1042 with one 65 mm outlet working;

4. The minimum output as stated in sub-clause (3) above shall be made available from two 65 mm outlets of a system delivering at same time, i.e. a total output of not less than 4000 litres per minute (66.7 l/s) at 170 kPa;

5. The maximum pressure drop through the street fire hydrant shall not be greater than 380 kPa at a flow of 66.7 l/s with two 65 mm outlets delivering at the same time;

6. Be capable of withstanding a hydraulic pressure of 25 bar;

7. Should either flow or pressure performance as specified in sub-clause (3) or (4) above is found unsatisfactory in flow test resulting from the pressure drop across the street fire hydrant, the hydrant shall be replaced at no additional cost to the Contract.
**HYDRANT CONSTRUCTION**

Be constructed of materials with the following minimum standards:

1. Hydrant body: ferrous casting to BS EN 1561 - Grey Cast-iron Castings, Grade EN-GJL-250 (5.1301) or BS EN 1563 spheroidal graphite cast iron (ductile iron) with a density of not less than 7200 kg/m³;

2. Caps: spheroidal graphite cast iron (ductile iron) casting to BS EN 1563 of Grade EN-GJS-450-10;

3. Inlet: 150mm PN16 flange to BS EN 1092-2;

4. Outlet pieces: bronze casting to BS EN 1982 for CuSn10Pb10-C (CC480K) with zinc content not exceeding 2%; two 65 mm and one 100 mm male thread outlets to BS 336;

5. Screw for fixing outlet pieces: M20 stainless steel countersunk square head type to BS EN 10088-3 Grade 1.4301 with the square head being cut off after the tightening of the screws;

6. Rubber gaskets to BS EN 681-1:
   a. 2 mm thick rubber insertion between the body and the outlet pieces; and
   b. 6 mm thick rubber insertion between the outlet pieces and the caps.

7. Chains: stainless steel chains attaching the caps to the hydrant body to BS EN 10088-3 Grade 1.4301;

8. Internal protection: coating to BS EN 10300 Category 1, grade c or BS 3416 type 1;

9. Painting:
   a. One coat primer of epoxy resin with aluminium mastic paint (of colour different from the undercoat);
   b. One undercoat of epoxy resin paint of grey colour with a minimum total dry film thickness of 280 µm (including the coating thickness of item (a);
   c. One finishing coat of epoxy resin paint of colour to suit FSD requirements.

**TEST CERTIFICATE**

Submit test certificate / report for hydraulic pressure test, ferrous and non-ferrous castings, coatings and dimensions from laboratories that comply with PRE.B9.570 confirming that the street fire hydrant has been tested conforming to this Specification.
WORKMANSHIP

GENERAL

PLU1.W010.7 SITE STORAGE
1. Prior to installation, store all materials properly in accordance with the manufacturer's instructions to afford maximum protection against weather, corrosion, mechanical damage and other causes;
2. Store all pipes with closed ends;
3. Store pipes and fittings under cover and clear of a levelled, well-drained and maintained hard-standing ground;
4. Remove all damaged materials from site immediately.

PLU1.W020.7 SITE CLEANLINESS
1. Clean all pipes and fittings before erection to remove all scale, burrs, furs, sand, slag etc.;
2. Maintain cleanliness throughout erection by covering the exposed ends of the pipework.

PLU1.W030.7 PIPEWORK INSTALLATION
Unless otherwise specified, carry out pipe joint installation in accordance with Section 6 of BS 6700.

PLU1.W040.7 PIPEWORK ROUTING
1. Co-ordinate the pipework installation with the work of other trades, services and structural beams and to allow for diversion of pipework to ascertain that the overall pipework is installed in a neat and tidy manner;
2. Cross-over of pipe to be kept minimum;
3. Avoid pipe runs above electrical installation as far as practicable;
4. Drawings supplied are diagrammatic and indicate only the approximate location and manner in which the pipework is to be installed.
5. Labeling system shall be provided on pipes inside pump rooms and at the lowest and highest locations of typical floors. Legibly marked with the black or white letters and arrows to indicate the type of service and direction of flow.

PLU1.W050.7 VENTING
1. Automatic air vents shall be provided as specified and at all high points of the system as shown on the Drawings;
2. Connections to the service pipes shall be made at the highest point to ensure complete venting. Automatic air vents shall be mounted so that the inlet connection is in an exact vertical plane. A lock shield valve shall be located between the service pipe and the automatic air vent;
3. Automatic air vents for water systems shall have bodies of brass, gunmetal or malleable iron, non-ferrous or stainless steel floats and guides, and noncorrodible valves and rubber seats. Connections to the pipework shall be via a screwed BSP (British Standard Parallel) or NPT (National Pipe Thread Tapered Thread) connection.
PLU1.W060.7  EASE OF DISMANTLING

Unless otherwise Approved, do not embed pipes in concrete or grout in or install in such a way as to make alterations difficult at a later date.

PLU1.W070.7  BENDS AND OFFSETS OF COPPER PIPEWORK

1. Bends and offsets of up to 90° can be formed in pipe sizes 15mm to 28mm provided they:
   a. Have a minimum centre line radius of more than or equal to 3.5 times the pipe diameter;
   b. Are only formed using tools specifically designed for that purpose, i.e. spring benders and formers;
   c. Are free of deformation that may restrict water flow.

2. Bends and offsets of up to 30° and have a minimum centre line radius of more than or equal to 3.5 times the pipe diameter can be formed in pipe sizes less than or equal to 28mm by heat bending / annealing techniques without the need for bending tools;

3. Where building design permits, offsets shall be achieved using 45° in preference to 90° bends.

4. The installations location of bends and offsets for the above mentioned shall be subjected to the Contract Manager approval.

PLU1.W080.7  COPPER PIPEWORK REQUIRING POLYETHYLENE SHEATH

1. Do not remove or damage the polyethylene sheath where bends are formed in copper pipes with factory applied polyethylene sheath;

2. Terminate factory applied polyethylene sheath at a consistent/uniform distance not more than twice the diameter of the pipe from the connecting copper fitting body.

PLU1.W090.7  UNDERGROUND PIPES

Follow procedures and requirements specified in Worksection DRA2 for excavation of underground pipes directly in trench.

PLU1.W100.7  PIPES ON FLAT ROOFS AND CANOPIES

Support pipes on flat roofs and canopies at least 150 mm above roof and canopy finish on concrete blocks with pipe clamps.

PLU1.W110.7  INSTALLATION CONTRACTOR AND ATTENDANCE FOR INSPECTION BY THE WATER AUTHORITY

Carry out all plumbing installation works mentioned in this Specification and shown on the Drawings, including, if applicable, connection work to the water town mains by a contractor or licensed plumber as approved by the Water Authority. Submit all necessary applications and forms to the Water Authority and attend upon their representative for the purpose of tests and inspections for the plumbing installation.

PLU1.W120.7  REGISTERED FIRE SERVICES CONTRACTOR

Employ a registered Fire Services Contractor to carry out the installation work, subsequent testing and commissioning and make necessary submissions to FSD for the fire services installation carried out by Main Contractor such as street fire hydrant system and up-feed riser pipe to storage/transfer tank.
PIPE JOINT

PLU1.W210.7 GENERAL
1. Unless otherwise specified, store, handle and joint pipes and fittings in accordance with manufacturer's recommendations;
2. Do not make pipe joints in the thickness of any wall, floor, ceiling or beam;
3. Provide expansion joint for all pipework passing through any building expansion joint.

PLU1.W220.7 JOINTING GALVANIZED STEEL PIPES
1. Unless otherwise Approved, joint galvanized steel pipes of sizes up to and including 100mm with screwed fittings. Use screwed flanges only for connection to flanged end valves or equipment;
2. Unless otherwise Approved, joint galvanized steel pipes of size of 150mm and above with screwed fittings, screwed flanges or flanged fittings;
3. Do not joint galvanized steel pipes by welding unless approved by the Contract Manager;
4. Screwed fittings shall have pipe threads complying with BS 21 in conjunction with BS EN 10226-1. Screwed joints shall have tapered threads and shall be made with Approved jointing material.
5. As an alternative to flanged and screwed joints, grooved end mechanical couplings may be employed subject to the approval of the Contract Manager,
   a. Before couplings are assembled, pipe ends and outsides of gaskets shall be lightly coated with suitable lubricant or graphite paste to facilitate installation;
   b. Pipe grooving shall be carried out by using proprietary grooving machine and in accordance with the pipe coupling manufacturer's latest specifications. The grooving shall be roll-grooved without the removal of any metal. Zinc coating damaged during the grooving operation of galvanized steel pipe shall be rectified by scrubbing clean the affected area and coated with a zinc rich galvanizing paint as recommended by the pipe manufacturer's subject to the approval by the Contract Manager;
   c. Unless otherwise specified, all mechanical couplings and fittings shall have a minimum system working pressure of not less than 1600kPa and the testing pressure shall not be less than 1.5 times the system working pressure;
   d. The electrical continuity of the mechanical couplings shall be effective and shall be verified by site measurement;
   e. The mechanical couplings and fittings shall comply with standards acceptable to Fire Services Department (FSD);
   f. The entire coupling installation shall be in accordance with the latest published selected manufacturer's recommendations.

PLU1.W230.7 JOINTING DUCTILE IRON PIPES
Unless otherwise specified, joint all ductile iron pipes as follows:
1. For above ground installation: with screwed flanges or flanged fittings;
2. For below ground installation: with flexible push-on type connection joints;
3. At master water meter and check meter positions: with slip-on flange adaptor in accordance with the requirements of Water Authority and as shown on Drawings;
4. Equip slip-on flange adaptor with guide rod assembly between flanges consisting of guide rod plates, at least three guide rods each of minimum 16mm diameter and washers all as shown on the Drawings. The guide rod assembly shall be made of stainless steel at least to BS EN 10088-3 Grade 1.4401. After installation of slip-on flange adaptor, fix and leave the guide rod assembly in position to prevent damage to the adaptor from excessive movement;

5. Provide durable marking on the pipe body to indicate the installed position of the slip-on flange adaptor for future checking of any dislocation of the adaptor;

6. After installation of all slip-on flange adaptors in a master water meter room or a check water meter cupboard/chamber, the Contract Manager shall select one installed slip-on type flange adaptor to be disconnected for checking the lap length of the adaptor on the pipe against the manufacturer's recommendation. Upon the Contract Manager's satisfaction on the lap length, connect the ductile iron pipes of the master water meter room or check water meter cupboard/chamber to the water supply.

PLU1.W250.7 JOINTING COPPER PIPEWORK WITH COPPER ALLOY CAPILLARY FITTINGS BY BRAZING
Follow the following procedures:
1. Apply flux to the tube spigot and fitting socket when brazing;
2. Remove residual flux after brazing.

PLU1.W260.7 JOINTING COPPER PIPEWORK BY SOLDERING
Follow the following procedures:
1. Remove copper oxide and dirt from pipe spigot and fitting socket prior to the application of soldering flux;
2. Apply flux sparsely and remove excess flux prior to heating;
3. Clean pipe joints with a damp cloth on completion to remove flux residues.

PLU1.W270.7 CAPILLARY TYPE JOINTS AND FITTINGS OF SHEATHED COPPER PIPEWORK
Fit "clip-on" type preformed polyethylene sheaths to cover the capillary type joints and fittings after jointing of the pipework.

PLU1.W290.7 JOINTING STAINLESS STEEL PIPES
1. Unless otherwise Approved, joint stainless steel pipes with nominal outside diameter up to and including 54mm with compatible stainless steel non-welding type fittings with stainless steel O-rings or nitrile rubber (NBR) O-rings and silicone gaskets.
2. Unless otherwise Approved, joint stainless steel pipes with nominal outside diameter above 54mm with compatible stainless steel non-welding type fittings with couplings and silicone gaskets.
3. Joint stainless steel pipes to ductile iron pipes with purpose made stainless steel flange adaptor in accordance with the manufacturer's recommendations.
4. All pipe installation to be carried out in strict accordance with the manufacturer's instructions. In addition to the requirements on Trade Tested Workers as specified in PRE.B6.065, all workers carrying out stainless steel pipes installation shall have received relevant training and be certified by recognised local institution, trade union or the pipe supplier.
5. All pipes shall be cut to square ends, free from harmful burrs and be prepared in accordance with the manufacturer's recommendations. Purpose made equipment recommended by the manufacturer shall be used for cutting the pipes and shall be submitted for the Contract Manager's approval.

6. All grooves on the pipes shall be roll-formed in accordance with the manufacturer's standards and recommendations. Purpose made equipment recommended by the manufacturer shall be used for forming the grooves and shall be submitted for the Contract Manager's approval.

PLU1.W291.7  JOINTING UNPLASTICIZED PVC (UPVC) PIPES

1. All pipes shall be cut to square ends, free from harmful burrs and be prepared in accordance with the manufacturer's recommendations. Purpose made equipment recommended by the manufacturer shall be used for cutting the pipes and shall be submitted for the Contract Manager's approval.

2. All UPVC pipes shall joint with sockets and fittings and as recommended by the UPVC manufacturer.

3. Solvent cement joints shall be used for all pipeworks. All the surfaces shall be cleaned with abrasive paper and spirit cleaner. When applying solvent, heat shall be avoided as the cement may dry before chemical bonding between the two surfaces is completed. Mating surfaces shall be turned for even spread of the solvent. Excessive cement shall be wiped off quickly.

4. Flanged joints on water services shall be used where solvent welding is not practicable and at locations to facilitate dismantling. Neoprene ring gaskets provided or approved by the manufacturer shall be used between flanges. The jointing compound must be in accordance with manufacturer's recommendation.

PLU1.W292.7  JOINTING CHLORINATED PVC (CPVC) PIPES

1. Use jointing compound as recommended by the manufacturer of the pipes and fittings. For pipe size above 50mm, primer is needed to prepare the bonding area for the additional of the cement. Refer to ASTM D2855 and to ASTM F402 for safety handling;

2. For solvent cement joints, the solvent cement set and cure time shall be strictly conformed to the manufacturer's instructions; whereas, the required prolonged set and cure time shall be consulted and acquired from the manufacturer when the relative humidity is higher than 85% and/or the ambient temperature is below 10ºC;

3. After the pipework is installed and all solvent cement is fully cured, the system shall be pressure tested and checked for leaks using water. The method to test the water leakage of the system shall be carried out in accordance with the manufacturer's recommendations.

PLU1.W293.7  JOINTING CHLORINATED PVC (CPVC) PIPES TO DUCTILE IRON PIPES

1. Use CPVC flange joint as recommended by the manufacturer of the pipes and fittings for jointing CPVC pipes to ductile iron pipes of compatible size;

2. Flange joints shall incorporate an electrometric gasket between the mating faces to provide for seal. The gasket selected must be full-faced and have the hardness and thickness recommended by the manufacturer;

3. Flange joints shall be carefully aligned and the bolts inserted through matching holes. A flat washer shall be used beneath each nut and bolt head. The required bolt torque shall be carried out in strict accordance with the manufacturer's instructions.
JOINTING CHLORINATED PVC (CPVC) PIPES TO UNPLASTICIZED PVC (UPVC) PIPES

1. Use jointing compound as recommended by the manufacturer of the pipes and fittings for jointing CPVC pipes to UPVC pipes of compatible size. For pipe size above 50 mm, primer is needed to prepare the bonding area for the additional of the cement. Refer to ASTM D2855 and to ASTM F402 for safety handling;

2. Joint CPVC pipes to UPVC pipes of incompatible size with purpose made CPVC adaptor in accordance with the manufacturer's recommendations;

3. For solvent cement joints, the solvent cement set and cure time shall be strictly conformed to the manufacturer’s instructions; whereas, the required prolonged set and cure time shall be consulted and acquired from the manufacturer when the relative humidity is higher than 85% and/or the ambient temperature is below 10ºC;

4. For threaded pipe fittings, all taper pipe threads shall be gauged in accordance with ASTM F1498;

5. After the pipework is installed and all solvent cement is fully cured, the system shall be pressure tested and checked for leaks using water. The method to test the water leakage of the system shall be carried out in accordance with the manufacturer's recommendations.

PIPEWORK SUPPORTS

GENERAL

1. Support pipework in such a manner as to allow adequate movement for expansion and contraction;

2. Add neoprene or rubber to BS ISO 2028 vibration isolation pad of 6 mm thick between the pipe and bracket for the section of up-feed riser pipe running through the floor from outside the pump room to where the flexible connector is installed;

3. Do not mount pipe bracket inside pump room on wall and ceiling as far as practicable. If unavoidable, add neoprene or rubber to BS ISO 2028 vibration isolation pad of 6mm thick between the pipe and bracket for brackets mounted on wall; and add vibration isolator as PLU1.M420 for brackets mounted to ceiling or steel support frames;

4. Do not fix pipe bracket to copper pipe by means of brazing or soldering;

5. Provide pipe brackets at both sides of a metal valve installed in uPVC pipes of any size and other types of pipes with nominal size of 80mm or above;

6. Provide pipe brackets at both sides of a turning point of uPVC flush water pipe riser and down pipe at communal area;

7. Provide pipe brackets at both sides of a turning point before and after the check water meter position with slip-on flange adaptors installed.

8. Provide duct foot bend fittings and support at the lowest end of water risers of 80mm diameter and above. Fittings shall be constructed of materials suitable for use in the system and shall be capable of withstanding the system working pressure. Fittings shall be connected to the riser pipes with flange joints.
PLU1.W320.7  PIPE BRACKET INTERVALS

Install pipe bracket at intervals not exceeding those shown in the following table for straight runs, and with not less than one bracket per length of pipe. Short length of pipe can be without pipe bracket if approved by the Contract Manager. Support all pipework to ensure that it is free from excessive stress due to the weight of its contents, its own dead weight, and dynamic forces due to liquid movement and take particular care to ensure that the branch is not supporting the riser.

PLU1.W330.7  ADDITIONAL REQUIREMENTS INSIDE MASTER WATER METER ROOM AND IN OPEN TRENCH FOR WATER SUPPLY PIPES

1. Support pipes and valves at required levels by Grade 20 precast concrete wedges, blocks or cradles, or by other methods approved by the Contract Manager. Provide at least one support for each section of pipe and for each valve. The spacing between supports shall not exceed 3 m. Provide mounting brackets to support, and to constraint and limit movement of pipes;

2. Support bends and tees at required levels by Grade 20 concrete thrust blocks; and embed bends and tees in Grade 20 concrete surround for the full length of each thrust block. For vertical bends and tees where thrust blocks cannot be used, provide pipe brackets at both ends, if applicable, of each bend and tee to restrain and limit the movement of pipes;

3. All supports and brackets shall not obstruct the fixing and unfixing of bolts and nuts in the disconnection and reassembly of flange joints;

4. All concrete supports shall be anchored onto the floor by dowel bars except removable concrete supports at check meter positions as required by the Water Authority;

5. Design and submit layout and structural details of all concrete supports and sizes of mounting brackets to the Contract Manager for approval prior to any pipework installation.
PIE SLEEVE

PLU1.W410.7  FIXING PIPE SLEEVES
1. Where pipes pass through walls, beams and floor/ceiling slabs, provide and fix sleeves with uniform annular clearance to allow for expansion and movement of pipe;
2. For pipes passing through walls and beams, fix sleeves that flush with the finished surfaces;
3. For pipe passing through floor slabs, fix sleeves in position with 100 mm projection above finished floor level and flush with the underside of the floor.

PLU1.W420.7  CAULKING PIPE SLEEVES AND PUDDLE SLEEVES
1. For metal sleeves used in walls and slabs within the same fire compartment, fill the full length of annular space between the sleeve and the pipe with mineral wool or Approved equivalent materials. Caulk both ends with mastic sealant;
2. For metal sleeves used in fire-rated walls and slabs within the same fire compartment, fill the full length of annular space between the sleeve and the pipe with non-flammable mineral wool or Approved equivalent materials. Caulk both ends with fire-rated mastic sealant which is durable and effective in sound insulation to maintain the required FRP of the walls/floor slabs;
3. For metal sleeves used in walls and slabs between fire compartments, fill the full length of annular space between the sleeve and the pipe with non-flammable mineral wool or Approved equivalent materials. Caulk both ends with fire-rated mastic sealant which is durable and effective in sound insulation to maintain the required FRP of the walls/floor slabs;
4. For puddle sleeves passing through external basement walls, gap between the sleeve and pipework shall be filled with mastic sealant approved by the Contract Manager.

PAINTING

PLU1.W510.7  GENERAL
Paint all pipes where specified in accordance with Worksection FIN7.

INSTALLATION OF VALVES

PLU1.W610.7  GENERAL
Unless otherwise specified, install the valve in accordance with manufacturer's recommendations.

PLU1.W620.7  NON-RETURN VALVE
When valve is installed vertically, ensure water flow is in an upward direction.

STREET FIRE HYDRANTS

PLU1.W720.7  FIXING
Install the street fire hydrant and associated valves as shown on the drawings given in the Water Authority Standard Drawings [Section 1 – Mainlaying] and FSD requirements.
PLU1.W730.7  **ANNUAL INSPECTION, FINAL ACCEPTANCE TEST AND CERTIFICATE OF FIRE SERVICE INSTALLATIONS AND EQUIPMENT**

1. Carry out annual inspection in accordance with Fire Services Department (FSD)'s requirements;

2. Comply with the followings at the end of the Maintenance Period:
   a. Maintain the street fire hydrants in good condition;
   b. Carry out the final acceptance test for the street fire hydrants;
   c. Submit the Certificate of Fire Service Installations and Equipment (F.S. 251) to FSD.

3. Submit a copy of the Certificate (F.S. 251) to the Contract Manager within 14 days after the annual inspection and the final acceptance test respectively;

4. Copy, frame and display the Certificate (F.S. 251) together with a list of the fire services installation and equipment in a prominent area in accordance with the Contract Manager's instruction.

**TANKS**

PLU1.W810.7  **CONNECTION TO CONCRETE TANKS**

Unless otherwise specified or Approved, use puddle flange in accordance to PLU1.M320 for connection to tank.

**CLEANING THE INSTALLATION**

PLU1.W910.7  **GENERAL**

1. Clean out all the water mains of inside service before they are put into operation as follows:
   a. For fresh water mains of inside service, clean and sterilize the systems to the satisfaction of the Water Authority before they are put into operation. The Water Authority - Circular Letter no. 6/2002 or the latest prevailing recommendation from the Water Authority on the cleaning and sterilization process shall be followed. Arrange with the Waterworks Chemists of the Water Authority to collect bacteriological and chemical samples for analysis.

2. Clean out all the completed water tanks and supply pipework after completion of the cleaning of the water mains of inside service in sub-clause (1) above and before phased completion of the Works or completion of the Works as follows:
   a. Clean the completed water tanks, supply pipework and cisterns according to PLU1.W920 - PLU1.W950;
   b. The sequence of cleaning starts with the sump tank at the G/F, then the roof tanks, the pipework and finally the water tanks at the individual flats and rooms with installed water supply pipework and cisterns;

3. The requirement on cleaning during Maintenance Period shall be in accordance with PLU1.W960.

4. Witness and endorse the cleaning and sterilization process by the Contract Manager's representative and the Contractor's representative.
PROCEDURE FOR CLEANING FRESH WATER AND FLUSH WATER SUMP, TRANSFER, ROOF, RAINWATER COLLECTION AND RAINWATER MIXING TANKS

1. For the cleaning required under sub-clause PLU1.W910 (2)(a), clean all fresh water and flush water sump, transfer and roof tanks as follows:
   a. Stop the pumps;
   b. Turn off the inlet and outlet valves of the water tank;
   c. Turn on the washout valve and drain the water tank completely. The Contractor shall carefully monitor the draining process and the flow condition so that the drainage system and the buffer tank will not overflow;
   d. Thoroughly clean the inside walls, ceiling and the bottom of the water tank and the inlet/outlet pipes with fresh water;
   e. Spray with water to ensure that all dirt and debris are removed and drained away;
   f. Take 2 sets of record photographs of the tank after cleaning;
   g. Turn off the washout valve;
   h. Fill the tank with water by turning on the inlet valve;
   i. Turn on all the outlet valves;
   j. Start the pump.

2. For the cleaning required under sub-clause PLU1.W960 (2)(b), clean all fresh water sump, transfer and roof tanks as follows:
   a. Stop the pumps;
   b. Turn off the inlet and outlet valves of the water tank;
   c. Turn on the washout valve and drain the water tank completely. The Contractor shall carefully monitor the draining process and the flow condition so that the drainage system and the buffer tank will not overflow;
   d. Thoroughly clean the inside walls, ceiling and the bottom of the water tank and the inlet/outlet pipes with fresh water;
   e. Spray with water to ensure that all dirt and debris are removed and drained away;
   f. Turn off the washout valve;
   g. Scrub the water tank thoroughly with a solution of chloride of lime or bleaching powder containing 50mg/l of chlorine solution;
   h. Rinse the water tank thoroughly with fresh water;
   i. Take 2 sets of record photographs of the tank after cleaning;
   j. Drain away the water through the washout pipe;
   k. Fill the tank with water by turning on the inlet valve;
   l. Turn on all the outlet valves;
   m. Start the pump.

3. For the cleaning required under sub-clause PLU1.W910 (2)(a), clean all rainwater collection and rainwater mixing tanks in accordance with sub-clause PLU1.W920 (1). Before the cleaning, shut-off the vortex filter to stop rainwater flowing into rainwater collection tank. Open the vortex filter after completion of the cleaning process.
PLU1.W930.7 PROCEDURE FOR CLEANING INDIRECT FRESH WATER SUPPLY PIPEWORK

1. For the cleaning required under sub-clause PLU1.W910 (2)(a), clean the indirect fresh water supply pipework as follows:
   a. Check that the roof tank is cleaned and filled with water;
   b. Turn on all the main gate valves of the down-feed system at the roof level or the floor below roof and the provided booster pump if any;
   c. Check, if applicable, that the break tank is cleaned and filled with water;
   d. Turn on the gate valves in front of water meters;
   e. Turn on the water taps of the individual flats/non-domestic units at the lowest supply point of each down-feed pipe and the floor above Pressure Reducing Valve (PRV) system or break tank, if applicable, for at least 5 minutes and then turn off;
   f. Turn on all taps at each of the remaining flats/non-domestic units for at least 2 minutes. Check for satisfactory flow at taps and submit the satisfactory record;
   g. If flow is unsatisfactory, clean the strainer/aerator of the taps or carry out necessary repair at the taps and re-test until flow is satisfactory.

2. For the cleaning required under sub-clause PLU1.W960 (2)(b), clean the indirect fresh water supply pipework as follows:
   a. Check that the roof tank (and the sump tank if the volume of the pipework to be cleaned exceeds the volume of the roof tank) is cleaned and filled with a homogeneous solution of chloride of lime for sterilization. The concentration of the solution has to meet the requirement that when the indirect fresh water supply pipework is filled up with water, the chlorine in the water will be 50 mg/l;
   b. Turn on all the main gate valves of the down-feed system at the roof level or the floor below roof and the provided booster pump if any;
   c. Check, if applicable, that the break tank is cleaned and filled with water;
   d. Turn on the gate valves in front of water meters;
   e. Turn on all taps at all locations until the presence of chlorine is confirmed via test kit approved by the Contract Manager, then shut off the taps;
   f. Keep the indirect fresh water supply pipework under sterilization for 2 hours;
   g. Thoroughly flush the indirect fresh water supply pipework with fresh water. All taps at all locations shall be turned on to ensure the entire pipework is thoroughly flushed with fresh water. Ensure all taps are closed after flushing;
   h. Test at the supply point nearest to the roof tank and the lowest supply point to confirm the residual chlorine level is below 5mg/l after flushing. The test shall be carried out by a laboratory that complies with PRE.B9.570. Then resume the system to normal operation condition.

PLU1.W940.7 PROCEDURE FOR CLEANING DIRECT FRESH WATER SUPPLY SYSTEM

Clean direct fresh water supply system as follows:
1. Turn on all the main gate valves of supply feed pipe at the G/F or 1/F level;
2. Turn on the gate valves in front of water meters;
3. Turn on all taps at individual flats/non-domestic for at least 2 minutes;
4. Check for satisfactory flow at taps;
5. If flow is unsatisfactory, clean the strainer/aerator of the taps or carry out necessary repair at the taps and re-test until flow is satisfactory.

**PROCEDURE FOR CLEANING FLUSH WATER SYSTEM**

Clean flush water system as follows:

1. Check that the roof tank is cleaned and filled with water;
2. Turn on all the main gate valves of the down-feed system at the roof level and, if applicable, to the break tank;
3. Check, if applicable, that the break tank is cleaned and filled with water;
4. Turn on all inlet valves of flushing cistern in each flat/non-domestic;
5. Start flushing to water cisterns with the top most floor and then downwards;
6. Flush the water cisterns at the lowest floor of the down feed system and the floor above Pressure Reducing Valve (PRV) system or transfer tank, if applicable twice, and at the remaining floors twice;
7. Check for satisfactory flow at the water inlet, water discharge and any leaks at cisterns;
8. If the flow is unsatisfactory, carry out repair at the cistern and re-test until flow is satisfactory.

**CLEANING DURING MAINTENANCE PERIOD**

1. Pursuant to and without affecting the generality of GCC Clause 10.1,
   a. Execute all Maintenance Works as are instructed by the Contract Manager during the Maintenance Period to the water supply system;
   b. Include further cleaning out of water tanks and Maintenance Works to the supply pipework, as may be necessitated by:
      i. Incomplete cleaning out prior to phased completion of the Works or completion of the Works;
      ii. Works and/or materials not in conformity with the Contract; and
2. Clean out all the completed fresh water tanks and indirect fresh water supply pipework at a date to be instructed by the Contract Manager before occupation of a New Building or a part of a New Building:
   a. Submit a detailed cleaning action plan demonstrated with vertical plumbing line diagram showing the scope of cleaning and sterilization, the locations where the residual chlorine level will be tested, the test kit to be used for verifying the residual chlorine level and the calculation of amount of dosage of chlorine or other approved chemicals for the Contract Manager's approval prior to commence the cleaning;
   b. Clean the completed fresh water tanks and indirect fresh water supply pipework according to PLU1.W920 - PLU1.W930;
   c. The sequence of cleaning starts with the sump tank at the G/F, then the roof tanks, the pipework and finally the water tanks at the individual flats and rooms with installed water supply pipework.

**PROTECTION**

**SEALING THE SYSTEM**

Seal off ends of pipes and openings during construction to prevent entry of foreign matter into the system.
PLU1.W1020.7 **VALVES AND TAPS**
House valves and taps installed in public areas or those not intended for public use in vandal-resistant and corrosion-resistant enclosures.

PLU1.W1030.7 **PROTECTION OF UNDERGROUND PIPES**
1. Protect underground pipes against corrosion and against mechanical damage;
2. Clean pipework after joining it and treat it with two coats of good quality bituminous paint to BS 3416 and wrap it with petrolatum tape for protection against corrosion due to water, salts, soil organics and rest it on concrete bed, sand or sieved soil or in concrete haunch or concrete surround before the trench is backfilled;
3. Pressure test all underground pipework before the application of bituminous paint and petrolatum tape.

PLU1.W1040.7 **PIPES PASSING UNDER ROADS**
Where top of the pipe is less than 900 mm from finish level, surround the pipe by concrete in accordance to the Water Authority's requirement.

**WORKS OUTSIDE SITE BOUNDARY**

PLU1.W1110.7 **CONNECTION BY THE WATER AUTHORITY**
Cap the ends of main pipes to prepare for connection to street mains by the Water Authority if the project is not under Helping Business Programme.

PLU1.W1120.7 **NOTIFY THE WATER AUTHORITY FOR INSPECTION**
Notify the Water Authority to inspect completed pipework and valve pit prior to backfilling.

**CONNECTION OF UNDERGROUND WATER SUPPLY MAINS TO EXISTING IN-SERVICE MAINS**

PLU1.W1210.7 **PROCEDURE**
Connect to the supply mains as follows:
1. Submit proposed re-arrangement or tee-off (if any) to the Contract Manager for approval at least 24 hours prior to execution;
2. Identify existing live fresh, flush, and fire service supply mains by:
   a. Inspect as-built record drawings;
   b. Verify by valve operation. Close all the valves of the pipes and turn on valve of each pipe one by one to identify the type of each water pipes;
   c. Paint underground pipeworks of fresh, flush and fire service supply mains at both sides of isolating gate valves in colours as stated in FIN7.W2510.
3. Test turbidity to confirm salt water mains in accordance with PLU1.T110;
4. Provide temporary cover and lockable device for isolating valve pits;
5. Submit findings of the identification for inspection and confirmation by Estate Management Division;
6. Submit to Estate Management Division Form DCMP-F741 together with the Water Authority's Form 46 Part IV for making connections to existing in service supply mains within Housing Department estates;
7. Upon receipt of Part B of Form DCMP-F741, proceed with connection works;

8. Upon connection to supply mains, complete Part C of Form DCMP-F741 and submit to Estate Management Division together with a copy of Certificate Regarding Water Supply Connection issued by the Water Authority for record;

9. Remove temporary cover of the isolating valve pits after completion of the connection of supply mains.

PLU1.W1220.7 INSPECTION OF CONNECTION

Check all connected pipework to supply mains by valve operation. Close all the valves of the pipes and turn on valve of each pipe one by one to identify the type of each water pipe.
TESTING

GENERAL

PLU1.T010.7 PRE-TEST CLEANING
Before installations are subjected to inspection, testing and subsequent handover, clean thoroughly the entire installation internally and externally. Flush out all water installations with clean water. During the flushing operation, make provision to exclude filters, pumps, meters and any other item of plant which could be damaged during the cleaning operation.

PLU1.T020.7 PERFORMANCE TESTS, ADJUSTMENTS AND COMMISSIONING
1. Carry out complete performance tests for all equipment and systems installed, make all necessary adjustments including the setting of adjustable type pressure reducing valve and commission the installations in accordance with the manufacturers' instructions and to the satisfaction of the Contract Manager;
2. Prior to any tests, submit detailed procedures and a programme for testing and commissioning for the Contract Manager's approval;
3. Submit test reports to the Contract Manager for approval.

PLU1.T030.7 TEST INSTRUMENTS
1. Supply all instruments required for inspection and testing of the installation;
2. Include, but not limited to, the following instruments required for inspection and testing purpose:
   a. Measuring tape;
   b. Hand pump;
   c. Pressure gauge;
   d. Water flow gauge.

PLU1.T040.7 TESTING OF CONCEALED AND UNDERGROUND PIPEWORK
Before cover up of the pipework, invite the Contract Manager representative to check the pipework and witness for water pressure test in accordance with PLU1.T050. Result of water pressure test shall be satisfactory before cover up of the pipework. Submit test report for record within a week of the satisfactory test.

PLU1.T050.7 WATER PRESSURE TEST
1. Test water systems and circuits hydraulically to a minimum pressure of 1.5 times the system working pressure or a minimum of 10 bar whichever is the higher for a period of not less than one hour without leaks appearing;
2. Provide whatever hoses or drainage channels that are required to safely discharge the test water while carrying out these tests in order to ensure that no damage to the building and property will be caused by the test water;
3. Following the above, carry out a normal working test during which adjustments and regulation of valves shall be effected and each tap and shower shall be visually check for satisfactory rate of flow.
PLU1.T060.7  FSD INSPECTION AND WITNESS OF TESTS

Make necessary applications including submission of Form 501 to Fire Services Department and attend upon their representative for the purpose of tests and inspections for the fire services installation carried out by Main Contractor such as street fire hydrant system, up-feed riser pipe to storage/transfer tank.

PLU1.T070.7  WATER QUALITY TEST

Test on the quality of potable water for human consumption shall be carried out on each potable water system to the satisfaction of the Contract Manager and comply with the following:

1. Carry out the test after completion of the cleaning of the plumbing installation as specified in PLU1.W910 (2) to the satisfaction of the Contract Manager of the respective potable water supply system;

2. Take samples from a selection of the water outlets used to supply potable water for human consumption in accordance with ISO 5667, but shall include samples taken at all the farthest point(s) of use in the distribution system from the storage tank, and at each potable water supply tank for human consumption in the building;

3. Analysis of the samples shall be carried out by a laboratory that complies with PRE.B9.570 according to the water quality requirements specified in the Water Authority's Quality Water Recognition Scheme for Buildings;

4. In case the samples failed to comply with the water quality requirements as referred to in sub-clause (3), carry out investigation on the cause(s) and submit investigation results and details of all necessary rectification works to the Contract Manager for approval before carrying out of the approved rectification works. Arrange re-test(s) to ensure compliance of water quality requirements after completion of the rectification works. Bear all cost and expense in connection with the aforesaid investigation, rectification works and re-test(s) are the direct consequence of a conclusion from any test result(s) of the sample(s) taken at the user end of the first valve from the site boundary that water from the Water Authority failed to comply with the water quality requirements as referred to in sub-clause (3);

5. Submit the detailed report on the selection of sampling points, sampling techniques, handling of water samples, water quality test results with original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements as referred to in sub-clause (3) and the investigation results and approved rectification works as referred to in sub-clause (4) for the Contract Manager's approval within 2 months from the date of the completion to the satisfaction of the Contract Manager of the cleaning of the plumbing installation as specified in PLU1.W910 (2) of the respective potable water supply system.

TESTING TURBIDITY FOR CONNECTION OF UNDERGROUND WATER MAINS TO EXISTING IN-SERVICE MAINS

PLU1.T110.7  TESTING PRIOR TO CONNECTION OF SUPPLY MAINS

Test fresh, flush and fire service supply mains prior to connection works as required by PLU1.W1210.

PLU1.T120.7  PROCEDURE

Test for development of white turbidity to identify salt water mains to satisfaction of the Contract Manager, as follows:
1. Collect two 10 ml samples in clean McCartney bottles from the supply mains under investigation;

2. Add two drops of barium chloride solution to one sample;

3. Shake to mix contents and wait for approximately 3 minutes for turbidity to develop;

4. Compare with the other sample for increase in white turbidity (which would indicate the presence of salt water);

5. In doubtful cases, seek record drawings as well as laboratory services for confirmation.
PLU2 SANITARY APPLIANCES

MATERIALS

GENERAL

PLU2.M010.7 SAMPLES
Comply with the requirements of PRE.B9.410 by submitting samples of the specified sanitary fittings for Approval.

PLU2.M020.7 STANDARDS
Ensure sanitary appliances submitted for Approval comply with the following standards as applicable:

1. Vitreous china:
   a. To BS 3402:1969;
   b. Colour: white unless otherwise specified;
   c. Ensuite, complete with all necessary fittings.
2. Waste and bath overflow chains and stays:
   a. To BS 3380:1982;
   b. Material: chromium plated brass.
3. Taps and combination tap assemblies:
   a. To BS 5412:1996;
   b. Material: chromium plated brass.

PLU2.M030.7 SANITARY APPLIANCES FOR STANDARD SCHOOLS
As scheduled on Drawings or Approved equivalent.

WCS AND CISTERNS

PLU2.M110.7 SINGLE FLUSH CLOSE-COUPLED WC SUITES
1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed WC suites including their component float operated valves and flushing valves as a whole assembly for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name/model name, type of trap and job reference of the product;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. When the WC suites are supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:
- Original or a certified true copy of the ISO 9001 certificate for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by a certification body or by the QCM. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a multilateral recognition arrangement with HKAS.

v. Installation instruction of WC suites including the fixing of the flushing apparatus, the tools and method for tightening and connecting of pipes and components.

b. For single flush close-coupled WC suites used in domestic blocks, except for the ancillary facilities at lower floors, submit original or a certified true copy of the product conformity certificate to the "Product Conformity Certification Scheme for Close-coupled Water Closet Suites with 6 Litre Flushing Capacity" (PCCS-WC) published by the Hong Kong Institution of Plumbing and Drainage Limited. The product conformity certificate shall be issued by a certification body accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a multilateral recognition arrangement with HKAS. If a photocopy of the product conformity certificate is submitted, it shall be certified true by the certification body or by the QCM:

i. The product conformity certificate shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a) above or at a time not later than 12 months from the date of commencement of the Works;

ii. In the event that the product conformity certificate has not been submitted for CM's information, CM may order the removal of materials or delivered products off Site. The Contractor shall bear all associated costs and no extension of time will be allowed.

c. Submit a summary of the test results under the audit testing of the PCCS-WC. The summary shall be prepared by the accredited laboratory carried out the testing or the certified manufacturer. If so directed by CM, submit a full set of the audit test reports to CM for record;

d. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(b) for CM's information unless the test requirements are covered by the scope of the PCCS-WC:

i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works or at an earlier date for domestic blocks subject to CM's consideration on the track records as maintained by the Housing Department;

ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);

iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, the Contractor shall remove all delivered materials off Site and bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:

a. Close-coupled WC suite to Class 2 of BS EN 997:2003 suitable for salt water with quality of vitreous china to BS 3402:1969 comprising:

i. Vitreous china washdown WC pan:

- Horizontal outlet to BS EN 33:2011;
- Colour: as shown on Drawings or to Approval;
- Fixing to be in accordance with PLU2.M610;
- Length and size to fit design layout.

ii. Vitreous china flushing cistern:
- Close-coupled type as part of WC suite with maximum flushing capacity of 6 litres;
- Clearly marked internally with an indelible line to show the intended volume of flush, together with an indication of that volume;
- All necessary fixings with stainless steel grade 304 screws/bolts.

iii. Flushing apparatus:
- Valve type flushing apparatus;
- Overflow pipe and discharge to external;
- Flushing mechanism (push button) with protective coating;
- Without lid attachment to allow free lifting of the cover without damaging the flushing apparatus;
- The design of the components and fixing details shall prevent bursting and flooding when the connecting component fails;
- Properties of plastic materials shall be functional and durable in sustaining mechanical, dimensional and chemical stability, and suitable for use with salt water.

iv. Seat and cover:
- Plastic single ring to BS 1254:1981 (except the requirements on dimensions);
- Colour: as shown on Drawings to match WC pan;
- Complete with necessary fixings.

b. The quality and performance requirements are as follows:

i. WC pan:

</tbody>
</table>

Where any of the verifications fail to meet the acceptance standards, either:

i. Remove the representative batch off Site; or

ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

---

**PLU2.M115.7 DUAL FLUSH CLOSE-COUPLED WC SUITES**

1. Submission Requirements:

   a. At sample submission and approval stage, submit a sample of the proposed WC suites including their component float operated valves and flushing valves as a whole assembly for CM's approval together with all the following substantiation for CM's information:

      i. Catalogue, brand name/model name, type of trap and job reference of the product;

      ii. Name, address and contact person of the local supplier;

      iii. Name, address and contact person of the manufacturer;

      iv. When the WC suites are supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:
- Original or a certified true copy of the ISO 9001 certificate for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by a certification body or by the QCM. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a multilateral recognition arrangement with HKAS.

v. Installation instruction of WC suites including the fixing of the flushing apparatus, the tools and method for tightening and connecting of pipes and components.

b. For dual flush close-coupled WC suites used in domestic blocks, except for the ancillary facilities at lower floors, submit original or a certified true copy of the product conformity certificate to the "Product Conformity Certification Scheme for Close-coupled Water Closet Suites with 6 Litre Flushing Capacity" (PCCS-WC) published by the Hong Kong Institute of Plumbing and Drainage Limited. The product conformity certificate shall be issued by a certification body accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a multilateral recognition arrangement with HKAS. If a photocopy of the product conformity certificate is submitted, it shall be certified true by the certification body or by the QCM:

i. The product conformity certificate shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a) above or at a time not later than 12 months from the date of commencement of the Works;

ii. In the event that the product conformity certificate has not been submitted for CM's information, CM may order the removal of materials or delivered products off Site. The Contractor shall bear all associated costs and no extension of time will be allowed.

c. Submit a summary of the test results under the audit testing of the PCCS-WC. The summary shall be prepared by the accredited laboratory carried out the testing or the certified manufacturer. If so directed by CM, submit a full set of the audit test reports to CM for record;

d. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(b) for CM's information unless the test requirements are covered by the scope of the PCCS-WC:

i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works or at an earlier date for domestic blocks subject to CM's consideration on the track records as maintained by the Housing Department;

ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);

iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, the Contractor shall remove all delivered materials off Site and bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:

a. Close-coupled WC suite to Class 2 of BS EN 997:2003 suitable for salt water with quality of vitreous china to BS 3402:1969 comprising:

i. Vitreous china washdown WC pan:
   - Horizontal outlet to BS EN 33:2011;
   - Colour: as shown on Drawings or to Approval;
   - Fixing to be in accordance with PLU2.M610;
- Length and size to fit design layout.

ii. Vitreous china flushing cistern:
- Close-coupled type as part of WC suite with dual flush combining a maximum flush of 6 litres and a reduced flush no greater than two-thirds of the maximum flush volume;
- Clearly marked internally with an indelible line to show the intended volume of flush, together with an indication of that volume;
- All necessary fixings with stainless steel grade 304 screws/bolts.

iii. Flushing apparatus:
- Valve type flushing apparatus;
- Overflow pipe and discharge to external;
- Flushing mechanism (push button) with protective coating;
- Without lid attachment to allow free lifting of the cover without damaging the flushing apparatus;
- The design of the components and fixing details shall prevent bursting and flooding when the connecting component fails;
- Properties of plastic materials shall be functional and durable in sustaining mechanical, dimensional and chemical stability, and suitable for use with salt water.

iv. Seat and cover:
- Plastic single ring to BS 1254:1981 (except the requirements on dimensions);
- Colour: as shown on Drawings to match WC pan;
- Complete with necessary fixings.

b. The quality and performance requirements are as follows:

i. WC pan:

### 3. On Site Delivery Verification:

a. At delivery stage, submit the following documents:

i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a);

ii. Original or certified true copy of the Certificate of Origin for every batch of delivery. One batch being the material quantity covered under each delivery note;

iii. Delivery notes for all material delivered to Site.

b. Carry out and submit report on the following verifications for WC suites upon delivery on Site. Prior to carrying out the verifications, inform CM's representatives who may present to witness the verifications:

i. Method:

<table>
<thead>
<tr>
<th>Verification Items</th>

<td>1 sample from every 200 nos. of WC pans from each batch</td>
<td>Material delivered to Site under one Delivery Note</td>
</tr>
</tbody>
</table>

c. Where any of the verifications fail to meet the acceptance standards, either:
   i. Remove the representative batch off Site; or
   ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

**PLU2.M120.7 WC PAN**

Comprising:
1. Vitreous china washdown pan with horizontal outlet to BS 5503:Part 3:1990;

**PLU2.M130.7 SQUATTING WC**

Vitreous china washdown WC pan with integral treads and loose trap for fitting at floor level.
PLU2.M140.7  CISTERNS
To BS 1125:1987, comprising:
1. Flushing apparatus: valveless syphonic;
2. uPVC discharge pipe to BS 3505:1986 or BSEN 1452 Parts 1-5:2000;
3. Ball valve and overflow;
4. Type and material: low level plastic, high level plastic or low level vitreous china as shown on Drawings.

URINALS AND CISTERNS

PLU2.M210.7  BOWL URINAL SUITE
Comprising:
1. Vitreous china bowl to BS 5520:1977:
   a. Inlet supply: top for surface fixed pipework or back for concealed pipeworks;
   b. Non-corroding, concealed, screw fixed brackets;
   c. Colour: as shown on Drawings or to Approval.
2. Plastics waste outlet, 40 mm nominal size with backnut and plastics or stainless steel domed outlet grating.

PLU2.M220.7  FIRE CLAY SLAB URINALS
Fire clay slab type with graded single channel, outlet and grating and fluted non-slip treads:
1. Arrangement and dimensions as shown on the Drawings;
2. Water supply, waste disposal fittings as shown on the Drawings.

PLU2.M230.7  STAINLESS STEEL SLAB URINAL
To BS 4880:Part 1:1973 and:
1. Stainless steel spreaders, flush pipes and brackets;
2. Copper alloy outlet, 65 mm nominal size with backnut and hinged domed outlet grating;
3. Automatic plastics flushing cistern: to BS 1876:1990 non-corroding screw to the wall metal fixings;
4. Water supply fittings: as shown on Drawings;

PLU2.M240.7  CISTERNS
Comprising:
1. Vitreous china automatic flushing cistern to BS 1876:1990;
2. Chromium plated flush pipe and fixing clips;
3. Surface fixed or concealed chromium plated spreader;
4. Colour: as shown on Drawings and to match urinal.
WASH BASINS AND SINKS

PLU2.M310.7 WALL HUNG OR COUNTER TOP OR SEMI-RECESSED WASH BASINS

1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed
      material for CM's approval together with all the following substantiation for
      CM's information:
      i. Catalogue, brand name/model name and job reference of the product;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. When the wash basins are supplied for domestic blocks, except for the
          ancillary facilities at lower floors, also include the followings in the
          submission:
          - Original or a certified true copy of the ISO 9001 certificate for the
            manufacturing plant. If a copy of the ISO certificate is submitted, it
            shall be certified true by a certification body or by the QCM. The
            certification body shall either be accredited by the Hong Kong
            Accreditation Service (HKAS) or an accreditation body which has
            entered into a mutual recognition agreement with HKAS.
   b. Submit original or certified true copy (issued or certified by the laboratory
      that complies with PRE.B9.570) of the test reports showing full compliance
      with the requirements of sub-clause (2)(b) for CM's information:
      i. The date of the test shall be generally within three years prior to the
         notified date for commencement of the Works;
      ii. The test reports shall either be submitted at the sample submission and
          approval stage as mentioned in sub-clause (1)(a), or at a time not later
          than the delivery of the material as mentioned in sub-clause (3)(a);
      iii. In the event that no test report has been submitted for CM's information
          when the materials are delivered to Site, remove all delivered materials
          off Site, bear all associated costs and no extension of time will be
          allowed.
   c. Submit catalogue and test report (original or certified true copy issued or
      certified by the laboratory that complies with PRE.B9.570) showing
      compliance with sub-clause (2)(b)(v) for the proprietary screw anchors or
      threaded rods as specified in sub-clause (2)(a)(iii) for CM's agreement not
      later than the delivery of the material as mentioned in sub-clause (3)(a).

2. Quality Requirements:
   a. Vitreous china wall hung or counter top or semi-recessed wash basin
      comprising:
      i. Vitreous china wash basin to BS 1188:1974, with single faucet hole to
         CM's approval for monoblock basin mixer with aerator, pop up waste
         and flexible supply pipes:
         - Type: wall hung or counter top or semi-recessed as shown on
           Drawings;
         - Colour: as shown on Drawings or to Approval;
         - Size to fit design layout and with sufficient space between the wall
           surface and the basin mixer for the operation of the pop up waste.
      ii. Fixing for counter top or semi-recessed wash basins: in accordance with
          manufacturer's recommendations approved by CM;
iii. Fixing for wall-hung wash basins: proprietary screw anchors or threaded rods with flexible washers, plastic plugs (other types to be Approved) and all necessary fixing accessories to suit the site conditions.

b. The quality and performance requirements are as follows:

**PLU2.M320.7 STAINLESS STEEL SINK**

Stainless steel non-magnetic and corrosive resistant and to BS 1244:Part 2:1988, comprising:

1. Bowl and drainer of steel grade 304S15 to BS 1449:Part 2:1983 with mill surface finish No.2A or with AISI 304 18/8, complete with 90 mm waste fittings, insert clips; rubber underlining; 0.8 mm thickness, polished finish;
2. Type: sit-on or inset type with number of bowls and drains as shown on Drawings;
3. Chromium plated brass chain and stay with rubber plug;
4. Pierced waste outlet to accommodate waste fitting;
5. Stainless steel drain outlets consisting of stainless steel strainer and fixing screws with PVC couplings for connection to 40 mm diameter PVC bottle traps and pipes;
6. Sound deadening pads fitted underneath sink and drainer;
7. 25 mm x 1.6 mm thick stainless steel earthing lug for equipotential bonding connection, or otherwise as indicated on Drawings.
BATHS AND SHOWERS

PLU2.M410.7 PORCELAIN ENAMELLED CAST IRON BATHS

1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed material for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name/model name and job reference of the product;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. When the cast iron baths are supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:
         - Original or a certified true copy of the ISO 9001 certificate for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by a certification body or by the QCM. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.
   b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(b) for CM's information:
      i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works;
      ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);
      iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:
   a. Porcelain enamelled cast iron bath to BS 1189:1986 comprising:
      i. Porcelain enamelled cast iron non-apron type bath with non-slip surface:
         - Colour: as shown on Drawings or to Approval.
      ii. Adjustable cast iron feet capable of raising top of bath to the height as shown on Drawings;
      iii. Chromium plated brass bath pop up drain and flexible overflow assembly;
      iv. 1.5 mm removable enamelled pressed steel apron with skirting and fixing devices:
         - Colour: as shown on Drawings to match the bath.
   b. The quality and performance requirements are as follows:
      i. Cast iron bath tub and waste bodies:
         | Items               | Test Method                        | Acceptance Standards                  | Remark                        |
         |---------------------|------------------------------------|---------------------------------------|-------------------------------|
         | Visual Inspection   | Cl. 3.3, 3.4 and 3.5 of BS 1189:1986 | Cl. 3.3, 3.4 and 3.5 of BS 1189:1986   | • All items are applicable to the bath. |
         | Dimensional Check   |                                    |                                       | • Visual inspection           |
- Overall Dimensions
  Cl. 6 of BS 1189:1986.
  Length = L + 5 mm, -10 mm.
  Width = W ± 5 mm.
  where L, W are dimensions shown on Drawings.

- Connecting Dimensions
  Cl. 4.1 of BS 1189:1986 on dimensions H, D1, D2, D4 & a.
  Table 1 of BS 1189:1986.

- Dimensional Deviations
  Cl. 8.1 to 8.6 and App. B5 of BS 1189:1986
  Cl. 7 of BS 1189:1986.

- Functional Characteristics
  Cl. 7 of BS 1189:1986.
  Cl. 3.2.1 to 3.2.6 of BS 1189:1986.

Pop Up Waste Assembly
- Waste Plugs
  See Test Method No. 1 as given in (b)(ii) below
  Minimum 95% volume of water shall be left in the bath.

- Coating Appearance
  Cl. 6.1.1 of BS 4641:1986
  Cl. 6.1.1 of BS 4641:1986

- Overflow Body - Coating Appearance
  Cl. 6.1.1 of BS 4641:1986
  Cl. 6.1.1 of BS 4641:1986

Rigidity
  Test 1 to 5 of Cl. B.6 of BS 1390:1990
  Same as the requirements stipulated in columns Type 1, Grade 22 of Table 4 of BS 1390:1990.

Impact Resistance
  Cl. B.7 of BS 1390:1990, (drop height to be 1.4 m)
  Cl. B.7.2 of BS 1390:1990

ii. Test Method No. 1:
- Operate the pop up drain five times;
- Close the waste plug. Check if it is watertight fit in the waste body by filling 50 mm depth of water at 25 ±1°C into the bath and observe for sign of water leakage 5 min. later. There shall be no sign of leakage. Drain the water and repeat the test if leakage is found. The specimen fails the test if watertightness cannot be achieved after three attempts;
- Fill the bath with known volume of water at 32 ±1°C up to 400 mm depth, measured at mid-length of the bath. This procedure shall be completed in less than 5 minutes;
- Maintain the temperature at 32 ±1°C during the test;
- Measure volume of the water left in the bath after 1 hour.

3. On Site Delivery Verification:
   a. At delivery stage, submit the following documents:
      i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a);
      ii. Original or certified true copy of the Certificate of Origin for every batch of delivery. One batch being the material quantity covered under each delivery note;
      iii. Delivery notes for all material delivered to Site.
   b. Carry out and submit report on the following verifications for baths upon delivery on Site. Prior to carrying out the verifications, inform CM’s representatives who may present to witness the verifications:
i. **Method:**

<table>
<thead>
<tr>
<th>Verification Items</th>

</table>

c. Where any of the verifications fail to meet the acceptance standards, either:

i. Remove the representative batch off Site; or

ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

**PLU2.M420.7 VITREOUS CHINA SHOWER TRAYS**

Vitreous china, to BS 6340:Part 8:1985:

1. Length and size to fit design layout;

2. Colour: as shown on Drawings or to Approval.

**PLU2.M430.7 ACRYLIC SHOWER CUBICLE, SHOWER TRAY AND SLIDING SHOWER DOOR**

1. Submission Requirements:

   a. At sample submission and approval stage, submit a sample of the proposed material for CM’s approval together with all the following substantiation for CM’s information:

      i. Catalogue, brand name/model name and job reference of the product;

      ii. Name, address and contact person of the local supplier;

      iii. Name, address and contact person of the manufacturer;

      iv. When the shower cubicle and shower trays are supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:

         - Original or a certified true copy of the ISO 9001 certificate for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by a certification body or by the QCM. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.

   b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(b) for CM’s information:
i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works;

ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);

iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:

i. Acrylic shower cubicle or shower tray:
   - Length and size to fit design layout;
   - Colour: as shown on Drawings or to Approval;
   - Flat shower tray with adjustable feet and removable front panel. The shower trays shall be premounted and can be adjusted easily in height. The front panel shall be fixed at the frame by concealed clip system.

ii. Sliding shower door:
   - Number and size of doors as shown on Drawings;
   - Fully framed shower enclosure constructed of PVC coated or powder coated epoxy finished aluminium framing with 5 mm thick (minimum) clear tempered safety glass and magnetic closure device;
   - Adjustability of the panel by two mounting profiles;
   - Ball-bearing wheels for the panels to enable easy sliding of the doors;
   - Door panels should be demountable for easy cleaning.

b. The quality and performance requirements are as follows:

i. Shower cubicle or shower tray:

</tbody>
</table>

### ii. Test on endurance performance of sliding door:

- Install the specimen unit according to the manufacturer’s specification;
- Connect the test door at the hand-grip position to mechanical system (see cycling test mechanism below) capable of producing a uniform back and forth movement to the test door;
- Move the test door back and forth over a full travel distance for 100,000 cycles;
- Set the speed of operation of the test door between successive open/close cycles to a minimum of 5 seconds and a maximum of 10 seconds.

### iii. Cycling test mechanism:

- The mechanism shall provide smooth opening of the test door and return of the test door to the closed position;
- The mechanism shall be capable of providing 100,000 continuous cycles of open / close;
- Means shall be provided for recording the number of operating cycles;
- Check for damages, examine and record the wear and tear conditions and carry out “Ease of Sliding Test” after 5,000, 10,000, 20,000 cycles and therefore after every 20,000 cycles.

### 3. On Site Delivery Verification:
SANITARY APPLIANCES

PLU2 > MATERIALS

a. At delivery stage, submit the following documents:
   i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a);
   ii. Original or certified true copy of the Certificate of Origin for every batch of delivery. One batch being the material quantity covered under each delivery note;
   iii. Delivery notes for all material delivered to Site.

b. Carry out and submit report on the following verifications for shower cubicle and tray upon delivery on Site. Prior to carrying out the verifications, inform CM's representatives who may present to witness the verifications:
   i. Method:
      | Verification Items | Method       | Acceptance Standards                  |
      |-------------------|--------------|---------------------------------------|
      | Dimension Check   | By measurement | Same as CM's Approved sample         |
      | Surface Quality   | Visual       | No discolouration, no damage, no staining, no blemish, acceptable colour consistency |
   
   ii. Frequency:
      | Verification Items | Sampling Frequency | Representative Batch                  |
      |-------------------|---------------------|---------------------------------------|
      | Dimension Check   | 1 sample from each batch | Material delivered to Site under one Delivery Note |
      | Surface Quality   | 1 sample from each batch | Material delivered to Site under one Delivery Note |

   c. Where any of the verifications fail to meet the acceptance standards, either:
   i. Remove the representative batch off Site; or
   ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

ANCILLARY MATERIALS

PLU2.M510.7
MIXERS (BATH/SHOWER, BASIN AND KITCHEN SINK) AND SHOWER HANDSETS

1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed mixers and shower handsets for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name/model name and job reference;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. Approval by the Water Supplies Department for the mixers;
v. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agent/distributor in Hong Kong or document from the supplier showing the appointment of the manufacturer and manufacturer's agreement for the production of the proposed product;

vi. Nominal flow rates of mixers and shower head;

vii. Calculation in accordance to the method described in BEAM Plus to demonstrate that the use of the proposed mixers and shower head in the project will lead to an annual saving of consumption of potable water of not less than 20%;

viii. When the mixers and shower handsets are supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:

- Two identical panels with accessories mounted on boards similar to the one maintained by the Housing Department showing the quality and components for the mixers and shower handsets;

- Original or certified true copies of certification to ISO 9001 and ISO 14001 for the manufacturing plant. If the mixers and shower handsets are not manufactured in the same plant, the certification is required for all manufacturing plants. If a copy of the ISO certificate is submitted, it shall be certified true by the certification bodies or by the QCM. The certification bodies shall be as follows:

<table>
<thead>
<tr>
<th>ISO</th>
<th>Certification Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISO 9001</td>
<td>The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
<tr>
<td>ISO 14001</td>
<td>The certification body shall be accredited by the Hong Kong Accreditation Service (HKAS), or the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS.</td>
</tr>
</tbody>
</table>

b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the performance requirements of sub-clauses (2)(a)(iii), (2)(b)(iv), (2)(c)(v) and (2)(d)(iv) for CM’s information:

i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works or at an earlier date for domestic blocks subject to CM’s consideration on the track records as maintained by the Housing Department;

ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);

iii. In the event that no test report has been submitted for CM’s information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:

a. Mixer (Bath/Shower):

i. Design and construction requirements:

- Bath mixer: single lever wall mounted type with double outlets and diverter for shower point connection with removable type aerator/strainer at the spout of the bath mixer;
- Shower mixer: single lever wall mounted type with single outlet for shower point connection;
- All taps identified for use on hot and cold water with either colour coding and/or character identification;
- Corrosion resisting copper alloy with chrome plated finish to body of mixer;
- Threaded end connection to mixer suitable for directly connecting the pipe to which it is installed. S-connection to be covered;
- Nominal size of the mixer as shown on the Drawings.

ii. Pressure and temperature requirements:
- Suitability for both working and test pressure and temperature of the plumbing system in which it is installed and complying with BS 1415:Part 1:1976 on pressure requirements;
- Total pressure drop across the mixer with the hot water tap fully open and cold water tap fully closed not more than 0.25 bar at 7 l/min.

iii. Performance requirements:

<td></td>
<td></td>
</tr>
</tbody>
</table>

iv. Method No. 1:
- For Shower Mixer:
  • Refer to Appendix PLU2/I for arrangement of the testing set-up;
  • To test hot water side:
Set the lever handle of the mixer valve so that hot water side is fully open and cold water side is fully close. Allow maximum flow of water at 25°C ± 1°C and 7 l/min. ±2% to pass through the sample at the hot water side. Take reading of the pressure gauges to an accuracy of 2%.

Pressure drop should be taken as the difference in flow pressure between the inlet and outlet.

- For Bath Mixer:
  - Refer to Appendix PLU2/I for arrangement of the testing set-up;
  - Allow water at 25°C ± 1°C to pass through the sample at 7 l/min. ±2%;
  - To test hot water side:
    The diverter shall be set so that water is discharged only through the connection to the shower hose. Set the lever handle of the mixer valve so that hot water side is fully open and cold water side is fully close. Allow maximum flow of water at 25°C ± 1°C and 7 l/min. ±2% to pass through the sample at the hot water side. Take reading of the pressure gauges to an accuracy of 2%.
    Pressure drop should be taken as the difference in flow pressure between the inlet and outlet.

b. Mixer (Basin):
   i. Chromium plated brass monoblock basin mixer with non-ferrous or corrosion resisting pop-up waste and flexible hose assembly with stainless steel wire braiding;
   ii. Design and construction requirements:
      - Lever type fitted with removable type aerator/strainer at the spout;
      - Fixing to be in accordance with PLU2.M610.
   iii. Water efficiency requirements:
      - Grade 2 under the Voluntary Water Efficiency Labelling Scheme on Water Taps by Water Supplies Department with nominal flow rate not less than 6 litres/minute; and
      - The nominal flow rate shall satisfy the calculation in sub-clause (1)(a)(vii).
   iv. Performance requirements:

### Flow Rate Test

In accordance with the testing methodology of "Flow Rate Test" specified in Water Supplies Department's "Voluntary Water Efficiency Labelling Scheme on Water Taps".

Flow rate to sub-clause 2(b)(iii).

The variation of the actual flow rates under dynamic pressures 150 kPa, 250 kPa and 350 kPa shall be within ±1 litre/minute of the nominal flow rate registered under Water Supplies Department's "Voluntary Water Efficiency Labelling Scheme on Water Taps".

The maximum difference between the highest and lowest average flow rates is not to exceed 2.0 litres/minute.

**d. Shower Handset:**

i. **Shower Handsets consisting:**
   - 1000 mm shower rail;
   - 1500 mm flexible plastic shower hose;
   - Shower head with adjustable spray pattern;
   - Soap dish.

ii. **Shower hose:**
   - Design and construction requirements:
     - Corrosion resistant, flexible and of durable construction with lock nut/adapter at both ends for connection to mixer and shower head;
     - 1500 mm long.
   - Pressure and temperature requirements:
     - Suitability for both the working and test pressure and temperature of the plumbing system in which it is installed.

iii. **Shower head:**
   - Design and construction requirements:
     - Hand shower type, corrosion resistant and of durable construction with threaded ends for connecting to a shower hose.
   - Pressure and temperature requirements:
     - Suitability for both working and test pressure and temperature of the plumbing system in which it is installed.
   - Water efficiency requirements:
- Grade 1 under the Voluntary Water Efficiency Labelling Scheme on Showers for Bathing under Water Supplies Department with nominal flow rate not less than 7 litres/minute; and

- The nominal flow rate shall satisfy the calculation in sub-clause (1)(a)(vii).

<td>Hot Water Resistance Test</td>
<td>Please refer to Method No. 2 as given below.</td>
<td>The maximum temperature measured at the shower head shall not be greater than 45°C and the maximum temperature measured at the shower hose shall not be greater than 55°C. No visual defect e.g. melting of any component. The sample shall be able to pass Flow Rate Test after being cooled for 5 minutes. No leakage or defect found in hydraulic test.</td>
</tr>
</tbody>
</table>

v. Method No. 2:

- Allow hot water at 76°C ± 1°C to pass through the sample for five minutes at a rate of 7 l/min.;
- Four random points evenly distributed across the surface of the shower head (two points at the handle) and four points along the length of the hose, measure the temperature at these locations to the nearest 0.1°C while the hot water is still running;
- Visually examine the sample for defect;
- Stop the hot water running, let the sample be cooled down to 25°C ± 1°C for five minutes;
- Carry out Flow Rate Test to the sample again;
- The hose shall also be subject to a static hydraulic pressure test of 5 bars for one minute. Observe for any sign of leakage and defect.

e. When the mixers and shower handset are supplied for domestic blocks, standard of visual quality shall be comparable with the benchmark samples maintained by the Housing Department.

3. On Site Delivery Verification:
   a. At delivery stage, submit the following documents:
      i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a);
      ii. Original or certified true copy of the Certificate of Origin for every batch of delivery. One batch being the material quantity covered under each delivery note;
      iii. Delivery notes for all material delivered to Site.
   b. Carry out and submit report on the following verifications for mixers and shower handsets upon delivery on Site. Prior to carrying out the verifications, inform CM’s representatives who may present to witness the verifications:
      i. Method:

<table>
<thead>
<tr>
<th>Verification Items</th>
<th>Method</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Surface Quality</td>
<td>Visual</td>
<td>No damage, no staining, no blemish, appearance same as CM’s Approved sample.</td>
</tr>
<tr>
<td>Logo and label check</td>
<td>Visual</td>
<td>Same as CM’s Approval sample</td>
</tr>
</tbody>
</table>

   ii. Frequency:

<table>
<thead>
<tr>
<th>Verification Items</th>
<th>Sampling Frequency</th>
<th>Representative Batch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Surface Quality</td>
<td>1 sample from each batch</td>
<td>Same batch of material delivered to Site under one Delivery Note</td>
</tr>
<tr>
<td>Logo and label check</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

c. Where any of the verifications fail to meet the acceptance standards, either:
   i. Remove the representative batch off Site; or
   ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

**PLU2.M530.7 VITREOUS CHINA SOAP HOLDERS**

Vitreous china, semi-recessed type with drain spout on descending rim:

1. Length and size to fit design layout;
2. Colour: as shown on Drawings or to Approval.

**PLU2.M540.7**  
**STAINLESS STEEL TOILET PAPER HOLDER**  
Stainless Steel, surface mount type, polished surface with plastic roller, size as shown on Drawings.

**PLU2.M550.7**  
**VITREOUS CHINA TOILET PAPER HOLDER**  
Vitreous china, surface mount type, with plastic roller, size as shown on Drawings.

**FIXING AND POINTING MATERIALS**

**PLU2.M610.7**  
**FIXINGS**  
Provide the following as applicable to the sanitary appliances and mixers being fixed:

1. Fixings:
   a. Stainless steel grade 304 screws and plastic caps with plastic plugs or;
   b. Proprietary fixing screws and plastic caps with plastic plugs supplied by the same manufacturer of the sanitary appliances subject to CM’s approval.

2. Fixing screws for WC pan and mixers shall be non-ferrous or corrosion resisting materials.

**PLU2.M620.7**  
**WC PAN BEDDING MATERIAL**  
White cement.

**PLU2.M630.7**  
**POINTING GROUT**  
White cement.

**PLU2.M640.7**  
**SILICONE SEALANT**  
As WAT5.M170.
WORKMANSHIP

GENERAL

PLU2.W010.7  
BRITISH STANDARD
Comply with BS 8000:Part 13:1989, unless specified otherwise in respect of the following:
1. Materials handling and preparation (section 2);
2. Installation of sanitary appliances (sub-section 3.2);
3. Protection (sub-section 3.3).

PLU2.W020.7  
HANDLING, STORAGE AND PROTECTION OF APPLIANCES
1. Store components off a levelled, well-drained and maintained hard-standing ground and in a manner which will not result in damage. Protect components from the weather;
2. Prevent contact with harmful elements, such as water, mud, plaster, cement etc;
3. Retain protective coverings in position for as long as possible and in place during fixing wherever practicable;
4. Use dust sheets or polythene sheets as protection when items do not have manufacturer's own packaging;
5. Prevent pre-finished surfaces from rubbing together;
6. Replace any units which have been chipped or scratched either before or after fixing.

JOINTS

PLU2.W110.7  
SEALANT JOINTS
Seal joints in accordance with Worksection WAT5 and BS 8000:Part 13:1989, paragraph 3.2.3.

FIXING WC SUITES

PLU2.W210.7  
PEDESTAL WC PANS
1. Set pan correctly in relation to finished floor level by using bedding materials;
2. Fix pan securely to floor using fixings in PLU2.M610;
3. The fixing screws shall not damage the waterproofing in the floor slab.

PLU2.W220.7  
SQUATTING WC PANS
Bed on concrete floor in cement and sand bedding mortar and joint to soil pipe in similar mortar.

PLU2.W230.7  
HIGH OR LOW LEVEL FLUSHING CISTERNS
Fix at heights as recommended by the pan manufacturer on brackets screwed to the wall or with stainless steel screws and plastics plugs. Fix supplementary support brackets where supplied by the manufacturer.
PLU2.W240.7  **CLOSE-COUPLED FLUSHING CISTERNs**
Fix to WC pan with bracket and bolts supplied by the manufacturer and to wall with stainless steel screws and plastic plugs.

PLU2.W250.7  **SYPHONS AND VALVES TO FLUSHING CISTERNs**
Assemble and adjust syphon and operating mechanism; fit float operated valve for fixing to water supply and union for connection to overflow.

PLU2.W260.7  **FLUSH PIPES**
Assemble and adjust so that they empty completely after each flush.

**FIXING URINALS**

PLU2.W310.7  **SLAB TYPE**
1. Bed channel outlet to waste connector in proprietary jointing compound;
2. Bed treads in cement sand mortar (1 : 3) with fall towards channel;
3. Fill space behind slabs with cement sand mortar (1 : 5);
4. Rake out joints to a depth of 5 mm and point flush using a proprietary, white grout. Joint width to be 3 mm maximum.

PLU2.W320.7  **BOWL TYPE**
Fix bowl and division to wall at centres shown on Drawings using brackets, concealed hangers or screws supplied by manufacturer.

PLU2.W330.7  **FLUSHING CISTERNs**
Fix at heights as shown on Drawings on brackets securely fixed to the wall or with stainless steel and plastics plugs. Fix supplementary support brackets where supplied by the manufacturer.

**FIXING BASINS**

PLU2.W410.7  **COUNTER TOP OR SEMI-RECESSED WASH BASINS**
1. Seat and fix according to the manufacturer's recommendations approved by CM;
2. Height of rim above finished floor level as shown on Drawings.

PLU2.W420.7  **WALL-HUNG WASH BASINS**
1. Fix wash basins directly to walls by installing proprietary screw anchors or threaded rods with flexible washers, plastic plugs (other types to be Approved) to pre-formed fixing holes at the back of the basins;
2. Height of rim above finished floor level as shown on Drawings.

**FIXING BATHS AND SHOWERS**

PLU2.W510.7  **BATHS**
Fix in accordance with the manufacturer's instructions.
CLEARANCE FOR BATH TRAPS
Pack where necessary to set the bath at a height to suit the depth of trap.

BATH OVERFLOW
Connect bath overflow to waste trap with proprietary trap connector or union.

FIXING SHOWER DOORS
Fix in accordance with manufacturer's instructions and with neoprene gasket seal between components and floor/wall.

FIXING SHOWER CUBICLE AND SHOWER TRAY
1. For vitreous china shower tray, fix in accordance with arrangement drawings. In-situ joints are to be watertight.
2. For acrylic shower tray, fix in accordance with manufacturer's instructions.

TAPS AND VALVES

TAPS AND MIXERS FITTED TO SANITARY APPLIANCES
Fix in position shown on Drawings or as Instructed using fixings in PLU2.M610. Fix hot taps on the left unless otherwise Instructed. Loosen and re-tighten the joint between body and head prior to fixing.

FLEXIBLE HOSE ASSEMBLY WITH STAINLESS STEEL WIRE BRAIDING
1. Follow the installation method of the flexible hose recommended by the flexible hose supplier;
2. Comply with the following for the installation of the flexible hose:
   a. Avoid twisting of the flexible hose during the installation;
   b. Use suitable length of flexible hose which is not too long to cause unnecessary bending or too short to cause tension. Allow a slight slack on the straight length of the flexible hose as illustrated at Appendix PLU/II to this Worksection;
   c. Observe minimum bending radius recommended by the flexible hose supplier if bending of the flexible hose is inevitable;
   d. Avoid acute bending of the flexible hose. Bending shall be formed by a specially made 90O bend component supplied by the flexible hose supplier; and
   e. Use two wrenches in tightening the hose to the connection points of water supply pipes. Hold the flexible hose steady with one wrench while tighten the hose nut to the connection point with the other wrench as illustrated at Appendix PLU/II to this Worksection.
3. Replace any damaged, kinked, severely twisted or deformed flexible hose.

WASTE OUTLETS

BEDDING
Bed waste outlets to wash basins, sinks and baths in proprietary jointing compound.
ANCILLARY FIXINGS

PLU2.W810.7 SOAP HOLDERS
Fix with cement sand mortar to location as specified on Drawings.

PLU2.W820.7 TOILET PAPER HOLDERS
1. Fix vitreous china toilet paper holders with cement sand mortar to location as specified on Drawings;
2. Fix stainless steel toilet paper holders with stainless steel and plastic plugs to location as specified on Drawings.

EQUIPOTENTIAL BONDING

PLU2.W910.7 EQUIPOTENTIAL BONDING TO STAINLESS STEEL SINKS
1. Provide equipotential bonding connection for stainless steel sinks by:
   a. Weld one end of the earthing lug to sink; and
   b. Form a 5 mm diameter hole at the other end of the earthing lug for connection of bonding conductor by the Nominated Sub-contractor for Electrical Installation.
2. As COM2.W465 (6).

TOLERANCES

PLU2.W1100.7 GENERAL
Refer to Appendix H "Schedule of Tolerances" to this Specification.
TESTING

SURVEILLANCE TESTS FOR WCS

PLU2.T110.7 SURVEILLANCE TESTS FOR WC SUITES

1. Test Arrangements:
   a. When Instructed, surveillance tests shall be carried out by CM's Representative, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the followings pertaining to surveillance tests:
      i. Provide attendance on the Site;
      ii. Provide, deliver and collect samples etc. as directed by CM or as specified.

2. Testing Samples:
   a. Provide one set of test sample from the batch of material delivered to Site under the delivery note as specified in PLU2.M110 (3)(a) for single flush WC suites or PLU2.M115 (3)(a) for dual flush WC suites or as instructed by CM;
   b. One set of test sample shall consist of three specimens of WC pan, two specimens of cisterns, float-operated valves and flushing devices, or as instructed by CM.

3. Testing methods:
   a. As per PLU2.M110 (2)(b) for single flush WC suites;
   b. As per PLU2.M115 (2)(b) for dual flush WC suites.

4. Non-compliance:
   a. In the event that the testing sample fails to meet the testing requirements, follow either one of the following actions:
      i. Remove the representative batch off Site; or
      ii. Carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 on three separate samples selected by the CM from the representative batch. In case of any one sample fails the re-test, remove the representative batch off Site.
   b. When the representative batch is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3)(a) in a laboratory that complies with the requirements stated in PRE.B9.570 for one sample selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clause (4)(a);
   c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.
SURVEILLANCE TESTS FOR MIXERS
(BATH/SHOWER/BASIN/KITCHEN SINK) AND
SHOWER HANDSET

PLU2.T310.7 SURVEILLANCE TESTS
1. Test Arrangements:
   a. When Instructed, surveillance tests shall be carried out by CM's Representative, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the followings pertaining to surveillance tests:
      i. Provide attendance on the Site;
      ii. Provide, deliver and collect samples etc. as directed by CM or as specified.

2. Testing Samples:
   a. Provide one set of test sample from the batch of material delivered to Site under the delivery note as specified in PLU2.M510 (3)(a) or as instructed by CM;
   b. One set of test sample shall consist of two specimens of either bath/shower mixers, basin mixers, kitchen sink mixers, shower handsets, and the accessories, or as instructed by CM.

3. Testing methods:
   a. As per PLU2.M510 (2)(a)(iii) for bath/shower mixer;
   b. As per PLU2.M510 (2)(b)(iv) for basin mixer and flexible hose assembly with stainless steel wire braiding;
   c. As per PLU2.M510 (2)(c)(v) for kitchen sink mixer and flexible hose assembly with stainless steel wire braiding;
   d. As per PLU2.M510 (2)(d)(iv) for shower handset.

4. Non-compliance:
   a. In the event that the testing samples for any type of mixer or shower handset fails to meet the testing requirements, follow either one of the following actions:
      i. Remove the representative batch of that type of mixer or shower handset off Site; or
      ii. Carry out re-test for the representative batch of that type of mixer or shower handset in accordance with the testing methods as specified in sub-clauses (3)(a), (3)(b), (3)(c) or (3)(d) in a laboratory that complies with the requirements stated in PRE.B9.570 on three separate samples selected by the CM from the representative batch. In case of any one sample fails the re-test, remove the representative batch of that type of mixer or shower handset off Site.
   b. When the representative batch of mixer or shower handset is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clauses (3)(a), (3)(b), (3)(c) or (3)(d) in a laboratory that complies with the requirements stated in PRE.B9.570 for one sample selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clauses (4)(a);
   c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.

TIM1     CARPENTRY AND JOINERY

MATERIALS

GENERAL

TIM1.M010.7     TIMBER QUALITY GENERALLY
To BS 1186:Part 1:1991, of mature growth, properly seasoned, sawn square and:
1. Free from wood wasp holes, large loose or dead knots, splits or other strength
   reducing defects;
2. The use of timber containing pin holes and worm holes will be permitted
   provided their extent is slight, in a small number of pieces, there is no active
   infestation, the strength of members is not impaired and they do not appear on
   the finished faces of joinery work.

TIM1.M020.7     STORAGE
1. Store timber in a dry, well ventilated place and protected from the weather;
2. Stack timber in such a manner as to prevent distortion.

TIM1.M030.7     AVERAGE PERMISSIBLE MOISTURE CONTENT
For timber incorporated into the work:
1. The average permissible moisture content is as follows:
   a. Internal timber for use in air-conditioned space: 8% to 12%;
   b. Internal timber generally: 13% to 17%;
   c. Timbers with one face to the exterior of the building and one face to the
      interior (e.g. window frames): 13% to 17%;
   d. External timbers (e.g. fencing etc): 13% to 19%.
2. Measure the moisture content of timber using an electrical resistance moisture

TIM1.M040.7     EXPOSED GRAIN FINISH
Submit samples of timber for joinery for Approval where the grain is to be left
exposed or where the surfaces are to be varnished or similarly treated.

TIM1.M050.7     SOFTWOOD FOR CARPENTRY
1. To be of Cedar, Spruce or China Fir, or other as specified on Drawings;
2. Approval to be sought before use.

TIM1.M060.7     HARDWOOD FOR CARPENTRY AND JOINERY
1. Generally, to be best quality "San Cheung" (Kapore), Ash Wood or other
   hardwood as approved;
2. Use is permitted of best quality "Ying Muk" (Druen) for grounds and other
   similar backing pieces where not exceeding 1250 mm² sectional area;
3. To have minimum average density of 620 kg/m³ at 15% moisture content.
TIM1.M070.7 TEAK
To have minimum relative density of 650 kg/m³ at 15% moisture content.

TIM1.M080.7 FIRE RATED DOOR
1. Fire rated timber doors including frames, hinges, door closers and any other hardware complied with either set of standards below:
2. Test report shall be provided to indicate that the material, product or construction is capable of resisting the action of fire for the specified period. The test shall be carried out and the test report shall be prepared by a laboratory recognised by the Hong Kong Laboratory Accreditation Scheme.

TIMBER FLOORING

TIM1.M110.7 TIMBER STRIP FLOORING
Species and minimum finished thickness: as shown on Drawings.

TIM1.M120.7 WOOD BLOCK FLOORING
1. Species and minimum finished thickness: as shown on Drawings;
2. Block size: as shown on Drawings.

TIMBER BOARDING AND ISOLATED TRIMS

TIM1.M210.7 WOOD TRIMS
To BS 1186:Part 3:1990:
1. Timber species: as shown on Drawings.
2. Classification:
   a. Class CSH - Suitable for high quality finish or specialised trims;
   b. Classes 2 & 3 - Suitable for general purposes and a painted finish.
3. Surface category: exposed;
4. Profile sections as detailed on Drawings.

TIM1.M220.7 SKIRTINGS
1. Species and timber size: as shown on Drawings;
2. Profile: with arrised top edge.

WOOD-BASED PANEL PRODUCTS

TIM1.M310.7 PLYWOOD
1. To BS 6566:1985 and of the following grades, as specified:
   a. "Grade 1 veneer" - hardwood, teak or beech faced as specified on Drawings, for natural finish;
   b. "Grade 2 veneer" - luan faced for painting.
2. Generally, the bonding adhesive between veneers to be resin adhesive classified as moisture and weather resistant (MR) in BS 1203:1979. Use phenol formaldehyde resin adhesive classified as weather and boil proof (WBP) in BS 1203:1979, externally or in areas of high humidity.

3. Nominal standard thickness of plywood are: 3, 4, 5, 6, 9, 12, 15, 18 and 25 mm.

TIM1.M320.7 MARINE PLYWOOD
To BS 1088:1966 and BS 4079:1966, bonded with Type WBP adhesive between plies.

TIM1.M330.7 BLOCKBOARD
To BS 3444:1992, with Grade 1 or 2 veneer as specified, and bonded with Type MR adhesive.

TIM1.M340.7 HARDBOARD
To BS 1142:Part 2:1989, Type: "Standard (S)" or "Tempered (TN)".

TIM1.M350.7 INSULATING BOARD (SOFTBOARD)
To BS 1142:Part 3:1989, Type SBN.

TIM1.M360.7 MEDIUM DENSITY FIBREBOARD (MDF)
To BS 1142:1989:
1. Board type: moisture resistant grade (MDFMR) with density in excess of 600 kg/m³;
2. Thickness: as shown or scheduled on Drawings;
3. Fabrication:
   a. Cut panel to size and profile edges, as shown on Drawings;
   b. Fix panel with parallel threaded screws, threaded to the head of the screw, in pre-drilled pilot holes not less than 25 mm on the face or 70 mm on the edge from the corners of panel.

TIM1.M370.7 WOOD CHIPBOARD
To BS 5669, Type I Standard, unsanded or sanded, as specified.
Veneered chipboard to be an Approved proprietary brand.

NON-TIMBER QUILT, SHEET AND BOARD PRODUCTS

TIM1.M410.7 GLASS FIBRE INSULATION QUILT
Lightweight bonded mat weighing 12 kg/m³ uncompressed.

TIM1.M420.7 GLASS FIBRE INSULATION BOARD
Semi-rigid resin-bonded glass fibre board weighing 45-48 kg/m³.

TIM1.M430.7 POLYSTYRENE BOARD
To BS 3837, Type N, unless otherwise specified.
TIM1.M440.7  EXTRUDED POLYSTYRENE INSULATION BOARD
1. To be used for domestic flats only;
2. An Approved insulation board having the following properties:
   a. Thermal conductivity (K value): 0.031 W/mº K (at 31ºC);
   b. Density: 32 (minimum) - 35 kg/m³;
   c. Coefficient of linear thermal expansion: 70 x 10⁻⁶ m/(mºC);
   d. Compressive strength: 300 kPa;
   e. Water absorption: <1 % volume;
   f. Water vapour transmission: 35 ng/Pa.sm².
3. Cell structure and properties: closed cell, maximum size 2.5 mm, resistant to heat transfer and moisture.

TIM1.M450.7  PVC AND ACRYLIC SHEET
An Approved type:
1. Material: PVC or acrylic;
2. Colour: as shown on Drawings;
3. Thickness: as shown on Drawings.

TIM1.M460.7  CEMENT BOARD
Do not use.

TIM1.M470.7  LAMINATED PLASTIC SHEET
To BS EN 438:Part 1 & 2:1991:
1. Class: HGP and VGP;
2. Colour/sheen: as shown on Drawings;
3. Thickness: as shown on Drawings;
4. Submit sample for Approval.

TIM1.M480.7  ACOUSTIC TILES
1. To be of an Approved proprietary brand meeting the requirements of CP 290:1973 and manufactured from the following materials:
   a. Wood or other organic fibre insulating board to BS 1142:1989, 12 mm (minimum) thick for 300 x 300 mm tiles;
   b. Mineral fibre or wool insulating board 12 mm (minimum) thick for 400 x 400 mm tiles;
   c. Approved multi-purpose, dimensionally stable building board 6 mm (minimum) thick.
2. To have a plain, perforated or fissured surface with a factory applied decorative finish. The edges to be square, bevelled, or bevelled and grooved to suit the suspension system;
3. Provide a certificate from the manufacturer confirming that the tiles are asbestos free.
FIXINGS AND FASTENINGS

TIM1.M610.7  NAILS GENERALLY

Lengths of nails:
1. To be not more than total thickness of sections to be joined less 5 mm, or not less than twice the thickness of section through which nails are driven;
2. Where the thickness of the outer section through which nails are being driven is less than half that of the section to which nailing is being done, the depth of penetration of the nails into the latter to be not less than 10 times the diameter of the nails being used.

TIM1.M620.7  STEEL NAILS

To BS 1202:Part 1:1974, with "bright" finish, unless otherwise specified.

TIM1.M630.7  WOOD SCREWS GENERALLY

Lengths of screws:
1. To be not more than total thickness of sections to be joined, less 5 mm, or not less than one and a half times the thickness of section through which the screws are driven;
2. Where the thickness of the outer section being screwed is less than half that of the section to which screwing is being done, the depth of penetration of the screwing into the latter to be not less than the thickness of the outer section.

TIM1.M640.7  WOOD SCREWS

To BS 1210:1963:
1. Material: brass, stainless steel, alloy or other non-corroding metal;
2. Head shape: counter sunk, unless otherwise specified.

TIM1.M650.7  SCREW CUPS

To BS 1494:Part 2:1967:Table 13, surface pattern, brass or stainless steel, as specified.

TIM1.M660.7  MASONRY NAILS AND DRIVE PINS

1. To be as specified;
2. Obtain Approval before use.

TIM1.M670.7  EXPLOSIVE CARTRIDGE FIXINGS

1. Obtain Approval before use;
2. All fixings to be in accordance with the Factories and Industrial Undertakings (Cartridge-Operated Fixing tools) Regulations.

TIM1.M680.7  PLUGS FOR FIXINGS

1. To hard base materials: proprietary plugs of plastic, soft metal, fibre or similar;
2. To soft base materials: proprietary fixings designed specifically for the particular situation;
3. Do not use plugs containing asbestos.
CRAMPS FOR FIXING DOOR AND WINDOW FRAMES TO MASONRY

30 x 3 mm galvanised steel flat cramps, 250 mm girth, turned up 75 mm minimum at one end and twice drilled to suit No. 12 gauge screws and fanged at other end.

EXPANDING ANCHOR FOR FIXING DOOR AND WINDOW FRAMES TO CONCRETE

1. Not less than 10 mm diameter proprietary expanding anchor, consisting of zinc electro-plated steel screw and zinc electro-plated steel sleeve. The anchor and sleeve shall be from the same manufacturer and packaged and supplied as a complete unit;
2. Minimum 30 mm effective anchorage depth in concrete. Application and fixing shall be in strict compliance with the manufacturer's recommendations.

EXPANDING ANCHOR FOR FIXING DOOR TO PANEL WALL

1. Not less than 10 mm diameter proprietary expanding anchor, consisting of zinc electro-plated steel screw and polyamide sleeve. The anchor and sleeve shall be from the same manufacturer and packaged and supplied as a complete unit;
2. Minimum 50 mm effective anchorage depth in panel wall. Application and fixing shall be in strict compliance with the manufacturer's recommendations.

ADHESIVES FOR WOOD

1. In compliance with the prescribed limits of VOC content as set out in the Air Pollution Control (Volatile Organic compounds) Regulation;
2. For internal use: synthetic resin adhesive to BS 1204:Part 1:1979, class MR moisture resistant and moderately weather-resistant;
3. For external use and internal use under very damp conditions: synthetic resin adhesive to BS 1204:Part 1:1979, class WBP weather-proof and boil-proof;
4. For fixing laminated plastic sheet: synthetic resin adhesive to BS 1204:Parts 1 and 2:1979, class WBP weather-proof and boil-proof;
5. Use a "warm-setting" grade of adhesive where the temperature exceeds 25°C;
6. Do not use animal glues.

WOOD PRESERVATIVE AND PESTICIDAL COATING

A specified in Worksection FIN7.

MOSQUITO GAUZE

1. Materials:
   a. Plastic covered glass fibre;
   b. Copper wire.
2. Mesh size: as shown on Drawings.
WORKMANSHIP

GENERAL

TIM.W010.7  GENERALLY

TIM.W020.7  TIMBER GENERALLY
1. Cut timber to required sizes and lengths as soon as practicable after the Works are begun;
2. Store cut timber dry under cover so that the air can circulate freely around it;
3. Stack cut timber off a levelled, well-drained and maintained hard-standing ground and in such a manner as to prevent distortion.

TIM.W030.7  TIMBER DIMENSIONS
1. Dimensions of sections shown on Drawings are finished sizes. Allow for planing and sanding faces to finished sizes;
2. Sawn timber sections must hold at least the full dimensions specified;
3. Check site dimensions before prefabrication joinery fittings.

TIM.W040.7  FINISH TO JOINERY
1. Plane timber for joinery on all faces;
2. Finish exposed faces to a fine glass-papered surface and round arrises to 1 mm radius.

TIM.W050.7  FRAMED JOINERY GENERALLY
1. Ensure faces of framed joints are square and driven together to give a close, accurate fit;
2. Prepare and frame up joinery work with dry joints and store until required for fixing;
3. Before fixing, open up all joints and put together with white lead and wedge up. Replace any sections that have warped or developed shakes or other defects.

TIM.W060.7  RUNNING BONDED JOINTS
To be cross-tongued, using teak tongues. Use double tongues for work over 40 mm thick.

TIM.W070.7  PROTECTION OF FINISHED JOINERY
Protect from damage or discolouration.

TIM.W080.7  PROTOTYPES
Prepare prototypes and obtain Approval for repetitive fittings before starting fabrication.
**APPLICATION OF WOOD PRESERVATIVE AND PESTICIDAL COATING**

1. As specified in Worksection FIN7;
2. Apply pesticide coating to the entire surface of timber forming all parts of doors, including frames and architraves all in accordance with FIN7.M140 and FIN7.W1410.

**SECUARING TIMBER SECTIONS**

**GENERAL**
1. Plug and screw or secure timber sections by Approved means;
2. Check location of buried services before fixing to walls and other surfaces.

**NAILING GENERALLY**
1. Nail timber sections securely to the backing and ensure nails do not split the timber. Remove and replace any split timber;
2. Punch nail heads below timber surfaces visible in the completed work.

**NAILING TIMBER WEATHER BOARDING**

Nail weather boarding to timber framing with not less than two corrosion proofed nails in the width of each board at each framing member.

**EXPLOSIVE CARTRIDGE FIXINGS**

1. Use tools only of the indirect acting type, with pins and cartridges complying with the manufacturer's tool specification;
2. Ensure tools are operated only by persons holding a certificate of competency in the use of that tool.

**SCREWING**

When specified:
1. Screw timber sections to the backing including drilling pilot holes and countersinking heads flush with timber surface;
2. Use screwdriver to insert screws to full depth. Do not insert screws by hammer;
3. Countersink screw heads, a minimum of 5 mm below timber surfaces to be left with a natural finish. Glue in timber pellets to match the colour grain of the finished surface. Finish off flush with face.

**FIXING PLASTIC SHEETS**

Ensure all wood-based core materials for fixing laminated plastic sheets to have average moisture content of 8% to 12%.

**ACOUSTIC TILES**

Fix acoustic tiles and the like:
1. To timber battens with brass or other non-ferrous lost head nails as TIM1.M610 for fixing laminated plastic sheets;
2. Direct to continuous sub-base by means of an Approved adhesive used in accordance with the manufacturer's recommendations;
3. Fix to metal frame in accordance with manufacturer's recommendations and Approved shop drawings.

LAYING FLOORING

TIM1.W210.7 LAYING BOARDED OR STRIP FLOORING ON CONCRETE SUB-BASE
1. Work to sub-base:
   a. Lay at 350 mm centres, 50 x 40 mm timber battens pre-treated with wood preservative;
   b. Fix battens to sub-base with one of the following methods as shown on the Drawings:
      i. Plug and screw;
      ii. Proprietary floor clips, to suit battern size, spaced at 400 mm centres along length of batten and levelled, aligned and fixed in accordance with the manufacturer's instructions.
2. Laying flooring:
   a. Cross-tongue heading joints and stagger not less than two board widths apart;
   b. Cramp flooring as the work proceeds, to ensure tight and accurate fit along the whole length of the joint;
   c. Fix flooring with galvanized, sheradised or cadmium-plated wire nails;
   d. Face nail square edged flooring at each support with one nail placed just above the tongue and driven on skew. Punch nail heads flush.

TIM1.W220.7 LAYING WOOD BLOCK FLOORING
1. Work to sub-base:
   a. Ensure base to receive flooring is clean and dry.
2. Laying flooring:
   a. Fix blocks to screed with an Approved cold bitumen/rubber emulsion adhesive;
   b. Lay blocks to herringbone or basket pattern, as specified, with straight border two blocks (minimum) wide;
   c. Provide 5 mm expansion gap at perimeter of areas of wood block flooring, and fill with one of the following as specified:
      i. Cork strip;
      ii. Foam rubber strip.
3. Finishing flooring:
   a. Sand surface of wood block flooring with an electric surfacing machine using various grades of abrasive paper to obtain a smooth even surface ready to receive sealer or polish;
   b. Surfacing machine to be fitted with dust bag to control release of dust.

TIM1.W230.7 LAYING MOSAIC PARQUET FLOORING
1. Work to sub-base:
   a. Wood float finish and level tolerance of screeded base as Worksection FIN3;
   b. Ensure base to receive flooring is clean and dry.
2. Laying flooring:
a. On one coat of an Approved rubber emulsion adhesive applied to the base and back of the parquet with a serrated trowel;
b. To a basket pattern with straight borders three fingers (minimum) wide at junctions with different floor finishes.

3. Finishing flooring:
a. Sand surface of parquet flooring with an electric surfacing machine using various grades of abrasive paper to obtain a smooth even surface ready to receive sealer or polish;
b. Surfacing machine to be fitted with dust bag to control release of dust.

TIMBER DOOR AND CUPBOARD CONSTRUCTION

TIM1.W310.7 LEDGED DOORS
Construct hardwood ledged doors as follows:
1. Vertical boarding: 20 mm minimum thick, tongued and grooved in about 150 mm widths, v-jointed on face side;
2. Ledges:
   a. 5 mm thicker than boarding thickness;
   b. 100 mm wide for top ledge and 175 mm wide for middle and bottom ledges.
3. Nail boarding to ledges and screw ends of ledges to boarding.

TIM1.W320.7 LEDGED AND BRACED DOORS
Construct hardwood ledged and diagonal braced doors as follows:
1. Vertical boarding: 20 mm minimum thick, tongued and grooved in about 150 mm widths, v-jointed on face side;
2. Ledges:
   a. 5 mm thicker than vertical boarding thickness;
   b. 100 mm wide for top ledge and 175 mm wide for middle and bottom ledges.
3. Braces: 5 mm thicker than boarding thickness and 100 mm wide;
4. Nail boarding to ledges and screw ends of ledges to boarding. House braces to ledges and screw ends to boarding.

TIM1.W330.7 FRAMED, LEDGED AND BRACED DOORS
Construct hardwood doors as follows:
1. Framing: 45 mm minimum thickness with
   a. 115 mm wide stiles and top rail;
   b. 225 mm wide middle and bottom rails; and
   c. 100 mm wide braces.
2. Vertical boarding: 20 mm minimum thick, tongued and grooved in about 150 mm widths, v-jointed on face side.

TIM1.W340.7 PANELLED DOORS
Construct hardwood doors as follows except where indicated otherwise on Drawings:
1. Framing: 40 mm minimum thick, with 100 mm wide stiles, top rail and muntins and, 200 mm wide middle and bottom rails;
2. Flat panels: 20 mm thick;
3. Groove, rebate or leave open framing, as detailed on the Drawings for panels or glass.

**TIM1.W350.7 TIMBER FLUSH DOORS**

Construct doors as follows except where indicated otherwise on Drawings:

1. Facing material and grade:
   a. 3.2 mm standard hardboard;
   b. 5 mm plywood for painting;
   c. 5 mm hardwood or teak faced plywood for natural finish;
   d. Class HG laminated plastic bonded to 5 mm plywood.

2. Timber sizes; stiles and rails: width 75 mm generally; 100 mm wide for doors exceeding 900 mm wide or 2000 mm high;

3. Core infill:
   a. Hollow core: 25 mm horizontal battens at 150 mm centres, with blocking for lock fixing, door closers, and other ironmongery as specified;
   b. Solid core: 25 mm vertical battens tightly cramped together with the door facings fully bonded both sides.

4. Door lipping:
   a. Timber species: hardwood or teak, unless otherwise specified;
   b. 12 mm thick glued to all edges, generally;
   c. 25 mm thick to meeting edges of folding doors and meeting edges and heels of swing doors, rebated or rounded as detailed on Drawings.

**TIM1.W360.7 CUPBOARD DOORS**

Construct doors as specified except where indicated otherwise on drawings:

1. Plywood or blockboard panel, teak lipped on all edges. Faced both sides with laminated plastic sheet or prepared for painting.

**TIM1.W370.7 CUPBOARD DRAWERS**

Construct drawers as detailed on Drawings and comprising unless indicated otherwise:

1. Front: 20 mm thick teak, hardwood or plywood as indicated;
2. Sides and back: 15 mm thick hardwood or plywood as indicated;
3. Bottom: 5 mm thick plywood;
4. Construction: dovetail and frame together with bottom housed on three sides. Set drawers to slide on or with 15 x 15 mm hardwood screwed runners as indicated.

**TIM1.W380.7 OPENING IN FLUSH DOORS**

Provide lippings to openings as follows:

1. Timber species: hardwood;
   a. Class: 2 or 3;
   b. Exposure: exposed.
3. Timber sizes: 13 mm minimum thickness, including after rebating for glazing, but strictly in accordance with details.

**TIM1.W390.7 GLAZING BEADS**

1. Timber species: hardwood;
   a. Class: 2 or 3;
   b. Exposure: exposed.
3. Timber sizes: 13 mm minimum thickness after rebating but strictly in accordance with details;
4. Construction: mitre corners and fix glazing beads with brass screw and cups where shown on Drawings.

**FIXING DOOR AND WINDOW FRAMES**

**TIM1.W410.7 FIXING DOOR AND WINDOW FRAMES TO MASONRY**

Fix cramps to frames at 900 mm maximum centres with upper and lower cramps 300 mm maximum from the end of the jamb using two 12 SG screws and build in the other end.

**TIM1.W420.7 FIXING DOOR AND WINDOW FRAMES TO CONCRETE**

Secure frames to concrete walls with bolts at 900 mm maximum centres with the upper and lower bolts 300 mm (maximum) centres from the ends of the jamb, and fixed in accordance with the bolt manufacturers recommendations.

**TIM1.W430.7 ARCHITRAVES**

Architraves to be one length between angles. Mitre architraves at angle joints.

**FIXING SKIRTINGS**

**TIM1.W510.7 SKIRTINGS**

Secure to walls on sawn hardwood grounds.
WATERPROOFING

MATERIALS

MASTIC ASPHALT

WAT1.M010.7 MASTIC ASPHALT FOR ROOFING
To BS 6925:1988, Type R988 with limestone aggregate and manufactured with asphaltic cement specified under Table 1:
1. Column B (bitumen); or
2. Column T25 (25% ± 5% refined lake asphalt).

WAT1.M020.7 MASTIC ASPHALT FOR TANKING AND DAMP-PROOFING
To BS 6925:1988, Type T1097 with limestone aggregate and manufactured with asphaltic cement specified under Table 1:
1. Column B (bitumen); or
2. Column T25 (25% ± 5% refined lake asphalt).

ANCILLARY MATERIALS

WAT1.M110.7 ISOLATING MEMBRANE
Black sheathing felt to BS 747:1994:
1. Class: 4A(i); 
2. Minimum weight: 17 kg per 810 mm wide by 25 m long roll.

WAT1.M120.7 BITUMEN DRESSING COMPOUND
Cut-back bitumen to BS 3690:Part 1:1989, Grade: 50 sec. at 40°C or other Approved grade.

WAT1.M130.7 REINFORCEMENT FOR KEYING ASPHALT
Plain expanded metal lath to BS 1369:Part 1:1987:
1. Thickness of lath: minimum 0.46 mm;
2. Size: minimum 10 mm across short way of mesh;
3. Weight: not less than 2.25 kg/m² ± 15%;

WAT1.M140.7 BITUMEN SOLUTION PRIMER FOR METAL
A proprietary type of thin black bitumen priming solution designed to provide a base for bituminous waterproofing coatings.

WAT1.M150.7 MORTAR FOR BEDDING CONCRETE ROOFING TILES
Cement and sand, 1 : 3, as Worksection MAS3.
WAT1.M160.7  RUBBING SAND
Clean sand passing a 600 micron BS Test Sieve but retained on one of 300 microns.

SOLAR PROTECTION

WAT1.M210.7  GRANITE CHIPPINGS
Best quality grey granite, free from brown and partially decomposed stone, graded to pass a BS Test Sieve of mesh size 5 mm but be retained on a sieve of mesh size 2.36 mm.

WAT1.M220.7  WHITE STONE CHIPPINGS
Baak Shek chippings, graded to pass a BS Test Sieve of mesh size 5 mm but be retained on a sieve of mesh size 2.36 mm.

WAT1.M230.7  SOLAR REFLECTIVE PAINT
1. An Approved bituminous based, aluminium paint; or
2. An Approved paint compatible with bituminous surfaces;
3. Do not used in dirty atmospheres which require periodical renewal.

WAT1.M240.7  INSULATION
Extruded polystyrene board to BS 3837:Part 2:1990 and:
1. CFC and HCFC free Zero Ozone Depletion Factor type;
2. Thermal conductivity (k): within range 0.025 to 0.034 W/mK;
3. Minimum compressive strength: 300 kPa;
4. With rebated edges;
5. Thickness: as indicated in the Drawings.

WAT1.M250.7  CONCRETE ROOFING TILES
1. Precast, vibrated concrete of cement, sand and dust-free aggregate, graded from 10 mm to 5 mm, mixed in the proportions of 1 : 2 : 4, cast into flat tiles;
2. Size: as shown on Drawings.

WAT1.M260.7  INSULATING ROOFING TILES
1. 300 mm or 400 mm square by 40 mm thick;
2. Density: 1250 kg/m³ ± 10%;
3. With a hard upper surface, suited to foot traffic;
4. Not five legged tiles.
WORKMANSHIP

GENERAL

WAT1.W010.7 CODE OF PRACTICE FOR ASPHALT ROOFING

WAT1.W020.7 CODE OF PRACTICE FOR ASPHALT TANKING AND DAMP PROOF COURSES

WAT1.W030.7 SUITABILITY OF BASE
Before laying asphalt ensure that:
1. The base is to even falls with no areas which will pond;
2. Surfaces to be covered are firmly fixed, clean, dry, smooth, free from contaminants, voids and protrusions;
3. All service pipes, pipe ducts, fittings, etc. which will penetrate the asphalt are in place and have been prepared as specified;
4. All cut and preformed chases are complete and not less than 25 mm x 25 mm in size;
5. External angles are chamfered where required to maintain the thickness of the asphalt coating.

PREPARATION

WAT1.W110.7 HEATING
1. Break blocks into pieces of suitable size, carefully stack in the cauldron or mixer, and gradually heat to a temperature not exceeding 230°C;
2. Agitate the asphalt continuously to prevent local overheating;
3. Provide suitable thermometers to ensure that the asphalt is heated to the correct temperature.

WAT1.W120.7 TRANSPORTING
1. Ensure asphalt is free from contamination;
2. Transport asphalt from the cauldron or mixer in buckets which have been coated with a fine, inert dust or cement;
3. Do not use ashes or oil to coat buckets.

WAT1.W130.7 LAYING ISOLATING MEMBRANE
On all surfaces less than 30° from the horizontal:
1. Loose lay black sheathing felt without sealing to the structure immediately prior to laying asphalt;
2. Lap 75 mm at joints.
WAT1.W140.7 **FIXING REINFORCEMENT**

Securely fix expanded metal lathing reinforcement with plugs and galvanized staples at 150 mm centres in both directions to:

1. Any vertical surface exceeding 300 mm in height;
2. Sloping surfaces exceeding 30° from the horizontal;
3. All timber surfaces to receive asphalt. Fix lathing to timber over the isolating layer;
4. Fixing lathing with long side of diamond horizontal, pitch of horizontal strands inclined upwards and butt jointed to continue mesh pattern;
5. Fix edges and stitch butt joints with staples at 75 mm centres.

WAT1.W150.7 **PRIMING METAL SURFACES TO RECEIVE ASPHALT**

1. Ensure surfaces are dry, clean, and free from dust, dirt, grease or other material which may affect adhesion;
2. Apply one coat of black bitumen priming solution as recommended by the manufacturer.

WAT1.W210.7 **LAY ASPHALT**

1. To falls where indicated on the Drawings;
2. With separate coats breaking joint by at least 150 mm for horizontal work and 75 mm for vertical work;
3. To wood or metal gauges on horizontal surfaces to ensure the correct thickness of each coat;
4. Finish asphalt to a smooth flat surface, free from lipping, scars and other imperfections.

WAT1.W220.7 **ASPHALT THICKNESSES AND NUMBERS OF COATS**

1. Lay asphalt in accordance with the following table:

<table>
<thead>
<tr>
<th>Situation</th>
<th>Number of Coats</th>
<th>Minimum Total Thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Horizontal roof surfaces and slopes not exceeding 30°</td>
<td>2</td>
<td>20 mm</td>
</tr>
<tr>
<td>b. Skirtings, upstands, drips and on slopes exceeding 30°</td>
<td>2</td>
<td>13 mm</td>
</tr>
<tr>
<td>c. Horizontal tanking or damp proof courses (except in the thickness of walls)</td>
<td>3</td>
<td>30 mm</td>
</tr>
<tr>
<td>d. Skirtings, upstands and drips greater than 300 mm in height and vertical tanking.</td>
<td>3</td>
<td>20 mm</td>
</tr>
<tr>
<td>e. Damp proof course in the thickness of walls.</td>
<td>1</td>
<td>15 mm</td>
</tr>
</tbody>
</table>

2. Situations 1 and 3: apply specified number of coats of equal thickness;
3. Situations 2 and 4: apply first coat thinly by metal trowel, in small dabs to completely cover surface and ensure full adhesion. Succeeding coat(s) to be applied by float.
ASPHALT WORK

WAT1.W230.7 MAKING GOOD BLOWS ETC
Pierce any blows formed during laying by the entrapment of air or moisture, and make good the affected part whilst the asphalt is still hot.

WAT1.W240.7 INTERNAL ANGLES
Form asphalt fillets at internal angles between horizontal and vertical surfaces as follows:
1. Applied in two coats of equal thickness;
2. Not less than 50 mm wide on face;
3. Continuous with the surfaces.

WAT1.W250.7 EXTERNAL ANGLES
Maintain the full thickness of asphalt specified at external angles between horizontal and vertical surfaces or between sloping surfaces.

WAT1.W260.7 SKIRTINGS
Unless shown otherwise on Drawings, form skirtings to a height above the finished roof level of 150 mm, with the top edge weathered and tucked into a groove with minimum dimensions of 25 mm deep × 25 mm.

WAT1.W270.7 RAINWATER OUTLETS
1. Prime flanges of roof outlets with bitumen solution prior to applying asphalt;
2. Neatly dress asphalt into rainwater outlets and seal as required.

WAT1.W280.7 FLASHINGS TO RAINWATER OUTLETS
Carefully embed flashings into the first coat of asphalt and dress the second over it.

WAT1.W290.7 PIPES PASSING THROUGH ASPHALT ROOFS
1. Spot weld expanded metal lathing reinforcement to the sleeves of pipes passing through roofs and thoroughly clean and prime metal surfaces with bitumen solution;
2. Neatly dress asphalt around sleeves to a minimum height of 150 mm;
3. Form an asphalt angle fillet not less than 50 mm wide on face at the bottom.

FINISHING ASPHALT

WAT1.W310.7 ROOF SURFACES
Immediately on completion of laying and while the asphalt is still warm:
1. Rub sand well into the surface of the asphalt, using a clean, wooden float. Do not use a brush or broom to spread the sand;
2. Ensure that the entire horizontal surface of asphalt is treated. Do not sand-rub vertical surfaces or the finished surface of roofing asphalt which is to be surfaced with paving asphalt;
3. Prevent sand from spreading over exposed edges of bay.

WAT1.W320.7 TANKING AND DAMP PROOF COURSES
Finish with a light dusting of cement.
**WAT1.W330.7 DAMP PROOF COURSING WITHIN WALLS**
Embed granite chippings in the surface of the asphalt, whilst it is still hot, and leave proud of the surface to form a key.

**SOLAR PROTECTION**

**WAT1.W410.7 STONE CHIPPINGS**
1. Dress surface with bitumen compound applied at the rate of 3 kg/m²;
2. Spread stone chippings immediately at the rate of 15 kg/m² and lightly roll in. Remove any surplus chippings.

**WAT1.W420.7 SOLAR REFLECTIVE PAINT**
To unprotected surfaces:
1. Apply two coats at rates recommended by the manufacturer;
2. Allow the first coat to dry thoroughly before application of the second coat;
3. Maintain free from damage and other surface defects.

**WAT1.W430.7 BEDDING CONCRETE ROOFING TILES**
Bed tiles in mortar, thickness as indicated on drawings.

**WAT1.W440.7 BEDDING INSULATING ROOFING TILES**
Loose lay the tiles, pour hot bitumen between the joints and point.

**WAT1.W450.7 EXPANSION JOINTS**
Allow for expansion with:
1. A 75 mm space around perimeters, filled with bitumen;
2. 25 mm joints every 9 m² or per smalller area as shown on Drawings, filled with hot bitumen.

**WAT1.W460.7 TRAFFIC ON ROOF TILING**
Do not allow traffic on newly laid roofs until four days have elapsed since the completion of laying. Permit only light traffic for further period of ten days.

**LAYING ROOF INSULATION**

**WAT1.W510.7 EXTRUDED POLYSTYRENE ROOF INSULATION**
1. Support slab on both sides of cut whilst cutting to size;
2. Apply hot bitumen bonding compound to asphalt surface;
3. Allow bonding compound to become cool and tacky before laying insulation;
4. Lay insulant with staggered butt joints and apply pressure to ensure a continuous bond. Leave a 75 mm wide gap at abutment of insulant with vertical surfaces.
TESTING

SAMPLING AND TESTING MASTIC ASPHALT

WAT1.T010.7  GENERAL
1. Sampling and testing of mastic asphalt to be in accordance with BS 5284:1993;
2. Take a minimum 3 kg sample from each 10 tonnes of block material delivered to
   site and deliver to an Approved testing laboratory, as directed by the CM.

WAT1.T020.7  RESULTS
Ensure results are in accordance with BS 6925:1988. In the event of any asphalt
failing to meet the specified requirements submit for CM's agreement detailed
proposals for taking up and replacing defective material.

ON-SITE VERIFICATION TESTS

WAT1.T030.7  WATER FLOOD TEST TO ROOF INSTALLATION
As WAT6.T125.
WAT2 BITUMEN FELT ROOFING

MATERIALS

ROOFING FELT

WAT2.M010.7 UNDERLAYERS
One of the followings:
1. Bitumen felt to BS 747:1994
   a. Type: 3B;
   b. Nominal weight: 1.8 kg/m².
2. An Approved high performance elastomeric felt:
   a. With polyester reinforcement;
   b. Minimum core weight: 125 g/m²;
   c. With sanded finish.

WAT2.M020.7 TOP LAYER (CAP SHEET)
An Approved high performance elastomeric felt:
1. With polyester reinforcement;
2. Minimum core weight: 250 g/m²;
3. Finish:
   a. With mineral self finish where chippings are not required to be used;
   b. With sanded finish, where chippings are required to be used.

WAT2.M030.7 CERTIFICATION
Ensure that all rolls of felt delivered to site bear the manufacturer's trade mark and certification of their BS Type where applicable.

ANCILLARY MATERIALS

WAT2.M105.7 ADHESIVE AND ADHESIVE PRIMER GENERALLY
In compliance with the prescribed limits of VOC content as set out in the Air Pollution Control (Volatile Organic compounds) Regulation.

WAT2.M110.7 PRIMER
Unless otherwise recommended by the manufacturer of the bonding compound, cut-back bitumen with:
1. Maximum volatile solvent content: 60% by weight;
WAT2.M120.7 **BONDING COMPOUND**
Bitumen based adhesive for hot application and with the following softening points and penetration classifications:
1. For roofs with slopes up to and including 5°: 85/25 or 95/25;
2. For roofs with slopes over 5°: 115/15.

WAT2.M130.7 **COMPOUND FOR BEDDING CHIPPINGS**
Hot applied cut-back bitumen to BS 3690:Part 1:1989: Table 2; Grade: 50 sec at 40°C.

WAT2.M140.7 **NAILS**
For fixing felt to timber decks:
1. Material: galvanized steel or non-ferrous metal;
2. Length: 20 mm;
3. Shank diameter: 3 mm;
4. Head diameter: 11 mm.

WAT2.M150.7 **ROOF VENTS**
Plastic or non-ferrous metal of a proprietary type.

WAT2.M160.7 **RAINWATER OUTLETs**
1. A proprietary type; or
2. 450 mm x 450 mm x 1.8 mm thick lead slate perforated for and soldered to a 150 mm long outlet pipe of 1.8 mm thick lead to suit the internal bore of the rainwater downpipe.

WAT2.M170.7 **EDGE TRIM**
Non-ferrous trim pre-drilled for fixing with screws or nails.

WAT2.M180.7 **PIPE SLEEVES**
Comprising:
1. 450 mm x 450 mm x 1.8 mm thick lead slate perforated for and soldered to 150 mm high by 1.8 mm thick lead to clear the external diameter of the pipe;
2. Proprietary moulded plastic or rubber collar.

WAT2.M190.7 **MASTIC ASPHALT FOR FILLETS**
To BS 6925:1988, Type R988 with limestone aggregate and manufactured with asphaltic cement specified under Table 1, column T25 (25% ± 5%) refined lake asphalt.

**SOLAR PROTECTION**

WAT2.M210.7 **STONE CHIPPINGS**
1. Light coloured, hard and free from brown or partially decomposed stone;
2. Graded from 5 mm to 3 mm.
SAMPLES

WAT2.M410.7 SAMPLES

Submit samples of the following for Approval in accordance with the requirements of PRE.B9.410:
1. Elastomeric felts;
2. Roof vents;
3. Bonding compound;
4. Rainwater outlets;
5. Edge trims;
6. Pipe sleeves;
7. Stone chippings.
WORKMANSHIP

GENERAL

WAT2.W010.7 STANDARD
Lay bitumen felt roofing generally in accordance with BS 8217:1994.

PREPARATION FOR LAYING

WAT2.W110.7 CONDITION OF BASE
Before starting work, ensure that the base is clean and dry.

WAT2.W120.7 SETTING OUT FLAT ROOFS
1. Lay the first layer of felt at and parallel to the lower edge or eaves;
2. Lay subsequent layers in a similar manner to ensure that the laps do not obstruct the flow of water.

WAT2.W130.7 SETTING OUT PITCHED ROOFS
1. Lay felt in the direction of the slope;
2. Lay sheets with the exposed edges away from the prevailing wind.

WAT2.W140.7 MASTIC ASPHALT FILLETS
Form asphalt fillets in accordance with CP 144: Part 4:1970.

LAYING FELT

WAT2.W210.7 NUMBER OF LAYERS
Provide:
1. Two underlayers;
2. One top layer;
3. A surface dressing when not self finished.

WAT2.W220.7 LAPS
1. Lap felt 75 mm at side joints;
2. Lap felt 100 mm at end of each length;
3. Lay successive layers to break joint.

WAT2.W230.7 APPLYING BONDING COMPOUND
1. Do not heat bonding compound to a temperature greater than 220°C and provide thermometers to ensure accurate control of temperature;
2. Lay compound evenly at a temperature sufficient to ensure a satisfactory bond (180°C minimum unless stated otherwise by the manufacturer's site work instructions).
WAT2.W240.7 LAYING PROCEDURE FOR CONCRETE ROOFS
1. Brush apply one coat of bitumen primer at the rate recommended by the manufacturer and allow to dry for at least 24 hours;
2. Partially bond first layer of felt to the base with bonding compound applied at the perimeter and in spots or strips at a rate of 0.5 kg/m²;
3. Roll first layer with a roller of 70 kg minimum weight, whilst the bonding compound is still hot and remove any compound squeezed out at the edges;
4. Fully bond subsequent layers in a continuous, even coating of bonding compound, applied at the rate of 1.5 kg/m² to the layer below;
5. Roll in accordance with sub-clause (3).

WAT2.W250.7 LAYING PROCEDURE FOR TIMBER ROOFS
1. Nail the first layer at 50 mm centres along all laps at a distance of 20 mm from the edge and elsewhere in rows 150 mm apart, in a staggered pattern at 300 mm centres;
2. Fully bond subsequent layers in a continuous, even coating of bonding compound, applied at the rate of 1.5 kg/m² to the layer below;
3. Roll bonded layers with a roller of 70 kg minimum weight whilst the bonding compound is still hot and remove any compound squeezed out at the edges.

WAT2.W260.7 SKIRTINGS ON CONCRETE ROOFS
1. Form 75 mm wide mastic asphalt fillet at base of skirting in two coats;
2. Carry up felt underlayers to form an upstand a minimum of 150 mm above the level of the roof;
3. Cover upstand with a mineral faced felt skirting of same weight and type as capping sheet;
4. Provide and fix a lead apron flashing over the felted upstand in accordance with Worksection WAT4 and as detailed on the Drawings.

WAT2.W270.7 SKIRTINGS ON TIMBER ROOFS
1. Provide a 200 mm timber upstand and fix securely to the roof deck with a timber angle fillet, measuring 75 mm on its exposed face, at its base;
2. Dress each layer of roofing felt over the upstand;
3. Provide and fix a lead apron flashing over the felted upstand in accordance with Worksection WAT4 and as detailed on the Drawings.

WAT2.W280.7 VERGES AND GUTTERS
1. Provide and fix a non-ferrous metal trim with compatible screws or nails and bond between layers of felt. Form a drip or dress into gutters as shown on Drawings; or
2. Form a welted drip.

WAT2.W290.7 RAINWATER OUTLETS
1. Lay roofing so that all falls and currents are directed towards rainwater outlets;
2. For proprietary rainwater outlet, dress all layers into the outlet and seal with bonding compound;
3. For perforated lead slate, dress flange of fabricated lead slate in between layers of felt, prime and seal with bonding compound.
WAT2.W300.7  PIPES PASSING THROUGH ROOF

1. Cut and fit roofing around pipes;
2. Dress flange of sleeve between second and third layers, prime and seal in hot bonding compound;
3. Fit plastic or rubber collar with a 75 mm minimum lap over the upstand of the pipe sleeve.

SOLAR PROTECTION

WAT2.W410.7  APPLYING CHIPPINGS

To areas without mineralised self finish:

1. Dress surface with bitumen compound at the rate of 3 kg/m²;
2. Evenly spread chippings at the rate of 15 kg/m² immediately after applying bitumen compound and lightly roll in;
3. Remove any loose chippings.
SINGLE PLY ROOFING

GENERAL

CONTRACTOR'S RESPONSIBILITIES
Take responsibility for the supply, delivery and fixing of single ply roofing membrane system including:
1. Satisfying the performance requirements of this Worksection;
2. Selecting, in conjunction with manufacturers and their licenced specialist fixing contractors, the most appropriate system for the proposed structure and conditions of operation for the specified life of the membrane;
3. The method and frequency of attachment where ballasting is not required, taking into account all predictable conditions of wind uplift, calculated in accordance with WAT3.M070;
4. Insulation layers where indicated in the Drawings;
5. Ballasting layers, where indicated in the Drawings.

MEMBRANE TYPE
The Contractor may tender for and supply any of the membrane types specified in this Worksection. If an alternative type of material is proposed, then it must comply with the general requirements of this Worksection and be Approved.

DESIGN LIFE
The roof membrane is required to remain watertight, under its original service conditions, for a period of not less than 20 years.

FIRE PERFORMANCE
The required fire performance classification (when tested in accordance with BS 476:Part 3:1975) of the membrane when applied to the substrates and in the circumstances that apply to this Contract is specified in Project Specific Specification.

THERMAL INSULATION
Incorporate a CFC and HCFC free Zero Ozone Depletion Factor type thermal insulation layer to produce a minimum U value for the roof area as specified in Project Specific Specification.

WIND UPLIFT
Comply with the Code of Practice on Wind Effects in Hong Kong. The proposed methods of securing the membrane must ensure that the membrane and any other part of the roofing system, will not be damaged or dislodged by any predictable wind condition.

CHEMICAL RESISTANCE
When the membrane is likely to come into contact with chemicals, it must be resistant to chemicals throughout its anticipated life.
SHEET MEMBRANES

WAT3.M110.7 REINFORCED POLYVINYL CHLORIDE (PVC)
An Approved proprietary product and as specified from the following:
1. Minimum thickness: 1.2 mm;
2. Minimum cover to reinforcement fabric: 0.4 mm;
3. Colour: light grey;
4. Finish: smooth and free of creases, folds, tears and other visible defects which may adversely affect the watertightness of the membrane;
5. Reinforcement fabric:
   a. Unwoven polyester or glass fibre for adhesive fixed and ballasted systems;
   b. Woven polyester for mechanically fixed systems.
6. Method of jointing: solvent or hot air welding;
7. Method of attachment:
   a. Full or partial bonding to the substrate;
   b. Loose laid and ballasted;
   c. Mechanically fixed.

WAT3.M120.7 CHLORINATED POLYETHYLENE (CPE)
An Approved proprietary product and as specified from the following:
1. Minimum thickness: 1.2 mm;
2. Minimum thickness of polyester backing fleece (where provided): 0.9 mm;
3. Colour: light grey;
4. Finish: free of creases and other surface defects which may adversely affect the watertightness of the membrane;
5. Reinforcement fabric (where provided): woven polyester;
6. Method of jointing: hot air or solvent welding;
7. Method of attachment:
   a. Full or partial bonding to the substrate;
   b. Loose laid and ballasted;
   c. Mechanically fixed.

WAT3.M130.7 FLEXIBLE CHLOROSULPHONATED POLYETHYLENE (CSM)
An Approved proprietary product, reinforced with woven polyester scrim for mechanically attached and ballasted systems or with a backing laminated for fully adhered systems, and as specified from the following:
1. Minimum thickness: 1.15 mm for mechanical attachment and 0.9 mm for fully adhered;
2. Minimum thickness of cover to fabric reinforcement, where provided: 0.3 mm;
3. Colour: white or light grey;
4. Finish: smooth and free of creases, folds, tears and other visible defects which may adversely affect the watertightness of the membrane;
5. Method of jointing: hot air welding only;
6. Method of attachment:
a. Full or partial bonding to the substrate;
b. Loose laid and ballasted;
c. Mechanically fixed.

**WAT3.M140.7 POLYVINYL CHLORIDE/ETHYLENE VINYL-ACETATE TERPOLYMER (FLEXIBLE VET)**

An Approved proprietary product, homogeneous or reinforced with fleece backing, and as specified from the following:

1. Minimum thickness:
   a. Unbacked, homogeneous: 1.2 mm;
   b. With backing: 2.2 mm.
2. Minimum cover to reinforcement, when provided: 0.4 mm;
3. Colour: white or light grey;
4. Finish: smooth and free of creases, folds, tears and other visible defects which may adversely affect the watertightness of the membrane;
5. Method of jointing: solvent or hot air welding;
6. Method of attachment:
   a. Full or partial bonding to the substrate;
   b. Loose laid and ballasted;
   c. Mechanically fixed.

**WAT3.M150.7 ETHYLENE PROPYLENE DIENE MONOMER (EPDM)**

An Approved proprietary product, unreinforced and as specified from the following:

1. Minimum thickness: 1.0 mm;
2. Colour: black;
3. Finish: smooth and free of creases, folds, tears and other visible defects which may adversely affect the watertightness of the membrane;
4. Method of jointing: solvent based adhesives, proprietary adhesive tapes or hot-melt adhesive systems as appropriate;
5. Method of attachment:
   a. Full or partial bonding to substrate;
   b. Loose laid and ballasted;
   c. Mechanically fixed.

**ANCILLARY MATERIALS**

**WAT3.M210.7 GENERAL**

1. Ancillary materials, including adhesives, sealants, solvents, preformed corners, flashing materials, pipe sleeves and collars etc, must either be a part of the selected membrane system or be fully compatible with it and recommended for their intended use by the membrane manufacturer;

2. Adhesives, adhesive primer, sealant, and sealant primer shall be in compliance with the prescribed limits of VOC content as set out in the Air Pollution Control (Volatile Organic Compound) Regulation.
WAT3.M220.7  **ISOLATION QUILT**
For isolating the membrane from possible physical damage from the substrate or from ballasting layers:
1. Material: needled, non-woven polyester;
2. Minimum weight: 200 g/m².

WAT3.M230.7  **BALLAST GRAVEL**
Clean, large, well rounded stones, in the range 20 mm to 40 mm, without fines or sharps.

WAT3.M240.7  **PAVERS**
Precast concrete:
1. Size: 600 mm × 600 mm × 50 mm minimum thickness;
2. Weight: 110 kg/m² ± 10%.

WAT3.M250.7  **THERMAL INSULATION FOR INVERTED ROOF**
Extruded polystyrene board to BS 3837:Part 2:1990 and:
1. CFC and HCFC free Zero Ozone Depletion Factor type;
2. Thermal conductivity (k): within range 0.025 to 0.034 W/mK;
3. Minimum compressive strength: 300 kPa;
4. With rebated edges;
5. Thickness: as indicated in the Drawings.

WAT3.M260.7  **CEMENT**

WAT3.M270.7  **SAND**
As specified in MAS3.M110.

WAT3.M280.7  **MORTAR FOR BEDDING CONCRETE ROOFING TILES**
Cement and sand, 1: 4 mix.

**SAMPLES**

WAT3.M310.7  **SAMPLES**
Submit samples of the following for Approval in accordance with the requirements of PRE.B9.410:
1. Sheet membrane;
2. Adhesives;
3. Mechanical fixings;
4. Isolation quilt;
5. Ballast;
6. Thermal insulant.
WORKMANSHIP

GENERAL

WAT3.W010.7  APPROVED FIXING SUB-CONTRACTOR

Employ a specialist sub-contractor, for the fixing of single ply roofing, who is:

1. Licensed by the membrane manufacturer to fix his material and whose operatives are appropriately trained in all aspects of the work;
2. Operating a Quality Assurance system certified under ISO 9001 or an Approved equivalent scheme.

WAT3.W020.7  SURVEY

Ensure that the Approved specialist sub-contractor carries out a survey of the roof area prior to the commencement of fixing for the purpose of confirming the surfaces are acceptable and comply with the manufacturers recommendations for the application of the membrane. Submit such confirmation to the CM, in writing, at least 7 days before laying of the membrane starts on Site.

WAT3.W030.7  HANDLING AND STORAGE OF MATERIALS

Handle and store materials strictly in accordance with the manufacturer's recommendations and:

1. Keep sheeting rolls in clean, dry, cool accommodation, clear of the ground;
2. Store solvents, adhesives and any other material having a low flashpoint in secure, well ventilated accommodation which will ensure that there is no danger of accidental or deliberate ignition.

WAT3.W040.7  SUBSTRATE PREPARATION

1. Ensure that all substrates on which membranes are to be directly laid, have a smooth, even surface, free of protrusions, oil and grease and are dry and free of dust;
2. Remove all nibs of concrete and cement;
3. Carry out priming, sealing, crack filling and other preparation where necessary all in accordance with manufacturer's instructions;
4. Insulation must be lightly butted and any fasteners brought level to the surface.

WAT3.W050.7  FIXING GENERALLY

Fix roofing materials:

1. Strictly in accordance with the manufacturer's recommendations;
2. In accordance with this Specification except where this Specification is over-ridden by the manufacturer's recommendations, which must be regarded as paramount;
3. Ensure all junctions, joint details such as skirtings, coverings to kerbs, edges, expansion joints etc., and the joints around pipes, rainwater outlets and the like are properly executed;
4. Before commencing work, demonstrate on site compatibility of all adhesives and materials which must be certified as compatible by the supplier/manufacturer in writing;
5. Inform the CM upon completion of each layer of roofing system for inspection before execution of next layer.

WAT3.W060.7 PLACING BALLAST LAYER
Place isolation quilt over the roofing membrane, where required, and:
1. Carefully distribute gravel ballast, over areas as shown on Drawings, in a layer not less than 50 mm thick;
2. Place precast concrete pavers, on areas as shown on Drawings, taking care not to damage the membrane;
3. Commence placing the ballast layer concurrently with laying of the roofing membrane, ensuring that sufficient ballast is in place at the end of each day’s work to prevent the dislodgement of any previously laid area of membrane.

WAT3.W070.7 PROTECTION OF THE COMPLETED MEMBRANE
Protect the completed membrane and:
1. Do not use the roof as a working platform and do not use the roof surface for the storage or mixing of materials;
2. Exercise care when handling builder’s plant and scaffolding in the vicinity of the membrane;
3. Ensure that paint, oil, fuel, solvents or any other material, which may damage the membrane, do not come into contact with it.

WAT3.W080.7 BEDDING CONCRETE ROOFING TILES
As WAT1.W430.

WAT3.W090.7 TRAFFIC ON ROOF TILING
Do not allow traffic on newly laid roofs until four days have elapsed since completion of laying. Permit only light traffic for a further period of ten days.

WAT3.W100.7 MAINTENANCE MANUAL
Upon completion of work, submit one maintenance manual identifying:
1. Protect name;
2. Location and date;
3. Type of coating system applied;
4. Surfaces to which applied including sketches where necessary;
5. Recommendations for periodic inspections, care and maintenance;
6. Common causes of damage;
7. Instructions for temporary patching until permanent repair can be made.
TESTING

ON-SITE VERIFICATION TESTS

WAT3.T010.7 WATER FLOOD TEST TO ROOF INSTALLATION
As WAT6.T125.
WAT4 FLASHINGS

MATERIALS

METAL SHEET

WAT4.M010.7 LEAD SHEET
To BS 1178:1982, code number: 4.

WAT4.M020.7 ALUMINIUM SHEET
To BS 1470:1987:
1. Thickness: 0.9 mm;
2. Grade: 1050A;
3. Temper grade: O.

ANCILLARY MATERIALS

WAT4.M110.7 BITUMINOUS PAINT
To BS 6949:1991, Type 1.

WAT4.M120.7 ISOLATING TAPE
Self adhesive plastic tape.

SAMPLES

WAT4.M210.7 SAMPLES
Submit samples of the following for Approval in accordance with the requirements of PRE.B9.410:
1. Metal sheet;
2. Bituminous paint;
3. Isolating tape.
WORKMANSHIP

FIXING METAL FLASHINGS

WAT4.W010.7 LEAD FLASHINGS
1. Form from sheets not more than 1500 mm long;
2. Let flashings into walls a minimum of 25 mm;
3. Secure with lead wedges and point with cement mortar;
4. Form 100 mm laps at joints in flashing;
5. Secure the lower edge with lead tacks at 750 mm minimum centres.

WAT4.W020.7 ALUMINIUM FLASHINGS
1. Form from sheets not more than 2000 mm long;
2. Let flashings into walls a minimum of 25 mm;
3. Secure with aluminium wedges and point with cement mortar;
4. Form a lap and a single lock welt at all joints;
5. Fold the lower edge under to provide additional stiffness.

WAT4.W030.7 ALUMINIUM IN CONTACT WITH CEMENTITIOUS MATERIALS
Coat with bituminous paint after forming any bends.

WAT4.W040.7 PREVENTION OF ELECTROLYTIC CORROSION
1. Prevent contact in the completed work between aluminium alloys and copper alloys, nickel, lead or stainless steel;
2. Where such contact is unavoidable, coat the contact surfaces with bituminous paint, isolating tape or other Approved means.
WAT5 SEALANTS

MATERIALS

JOINT FILLERS

WAT5.M010.7 JOINT FILLER
A waterproof, compressible, non-extruding, pre-moulded type, with a high recovery factor after compression, at temperatures below 50°C and Approved.

WAT5.M020.7 BACK-UP MATERIAL
Approved preformed cellular strip material which may also act as a bond breaker.

WAT5.M030.7 BOND BREAKER
Proprietary tape or similar strip material, as recommended by the sealant manufacturer, for use where a back-up material is either not used or does not perform as a bond breaker.

WAT5.M040.7 BACKING RODS FOR PRECAST FACADE UNITS
Polyethylene foam or Approved equivalent.

SEALANTS

WAT5.M110.7 GENERAL
1. Sealants, sealant primers and caulking compound shall be in compliance with the prescribed limit of VOC content as set out in the Air Pollution Control (VOC) Regulation;
2. All sealants are subject to Approval, as specified in WAT5.M210.

WAT5.M120.7 TWO PART POLYSULPHIDE BASED SEALANT
To BS 4254:1983.

WAT5.M130.7 ONE PART GUN GRADE POLYSULPHIDE BASED SEALANT
To BS 5215:1986.

WAT5.M140.7 BUTYL MASTIC
Proprietary product.

WAT5.M150.7 ONE PART POLYURETHANE SEALANT
To BS 4254:1983, BS 5215:1986 and BS 5889:1989:
1. Grade: 1-part polyurethane or Approved equivalent;
2. Colour: standard grade or to Approval;
3. Elongation at break: to ISO 8339;
4. Paintability: well paintable;
5. Joint movement capacity: ±25%.

**WAT5.M160.7**  
**ONE PART GUN GRADE SILICONE BASED SEALANT**  
To BS 5889:1989, Type A satisfying the test for adhesion and tensile modulus after heat ageing specified in BS 4254:1983 and BS 5215:1986.

**WAT5.M170.7**  
**ONE PART GUN GRADE SILICONE BASED SEALANT**  
To BS 5889:1989, Type B.

**WAT5.M180.7**  
**JOINT SEALANT FOR PRECAST FACADE UNITS**  
Unless otherwise approved, construction sealant (Type F), design and selection to follow BS 6093:1993 and BS 6213:1982, and offering the following properties:

1. Movement capability of 25% (Class 25) in accordance with ISO 11600;
2. Tensile modules not exceeding 0.4 N/mm² at 23°C.

**WAT5.M190.7**  
**PRIMER FOR SEALANTS**  
As supplied and recommended by the sealant manufacturer.

**SAMPLES**

**WAT5.M210.7**  
**SAMPLES**

1. Submit samples of the following for Approval in accordance with the requirements of **PRE.B9.410**:  
   a. Joint fillers, bond breakers and back-up materials;
   b. Sealants.

2. Do not confirm orders until Approval has been obtained. Keep Approved samples at the place agreed by the CM for comparison with materials used in the works, which must conform with the samples set aside. Where there is a choice of material, colour or texture, submit samples for Approval. When Instructed, submit technical literature for materials specified.

**SCHEDULE OF SEALANTS**

WORKMANSHIP

FORMING JOINTS IN CONCRETE CONSTRUCTION

WAT5.W010.7 GENERAL
Construct joints strictly in accordance with Drawings and manufacturer's recommendations.

WAT5.W020.7 PREPARATION OF JOINT
Keep edges true, free from cracks, spalling or other imperfections. Ensure that edges of joints are clean, dry and free from dust or grease.

WAT5.W030.7 PLACING CONCRETE AROUND JOINTS
Do not place concrete on both sides of a movement joint simultaneously.

WAT5.W040.7 JOINT FILLER IN CONCRETE
1. Fix to concrete with bituminous adhesive before casting the adjoining bay;
2. Form the joint sealing slot by casting in a removable former.

APPLYING SEALANTS

WAT5.W110.7 GENERAL
Apply sealants in accordance with BS 6213:1982 and:
1. Surfaces must be dry, clean and free of dust and oil. Application temperature between +5°C to 80°C;
2. Ensure that they are properly pressed home;
3. Finish with a smooth, regular surface;
4. Mask adjoining surfaces which would be impossible to clean if smeared with sealant;
5. Remove all excess sealant and smears caused by sealants, solvents, primers etc; used in sealing works, immediately and entirely from adjacent materials as the work proceeds.

WAT5.W120.7 PRIMING
Treat surfaces with a primer where recommended by the sealant manufacturer.

WAT5.W130.7 BOND BREAKERS
Apply bond breakers and back-up material where necessary to control the depth of the sealant, to facilitate tooling of the sealant and to prevent bonding to the back of the joint.

WAT5.W140.7 MIXING TWO PART SEALANTS
Mix according to the manufacturer's instructions and until colour is uniform throughout.
APPLYING SEALANTS TO PRECAST FACADE UNITS

WAT5.W210.7 GENERAL
Comply with other applicable requirements of this Worksection.

WAT5.W220.7 TWO STAGE JOINTS
When a two-stage joint is adopted, protect all sealant materials used in areas accessible to the public with non-shrink mortar or other Approved methods.

WAT5.W230.7 JOINT WIDTH
Unless otherwise Approved, the installed joint width must not be less than 6 mm nor greater than 30 mm.

WAT5.W240.7 SEALANT DEPTH

<table>

WAT6  PROPRIETARY WATERPROOFING SYSTEMS

MATERIALS

COLD LIQUID APPLIED FLEXIBLE WATERPROOFING SYSTEM

WAT6.M010.7 COLD LIQUID APPLIED FLEXIBLE WATERPROOFING SYSTEM FOR BATHROOM, KITCHEN AND REFUSE STORAGE AND MATERIAL RECOVERY ROOM

1. Submission Requirements:
   a. At sample submission and approval stages, submit a sample of the proposed material for CM’s approval together with all the following substantiation for CM’s information:
      i. Catalogue, brand name/model name and job reference of the material;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agent/distributor in Hong Kong or document from the supplier showing the appointment of the manufacturer and manufacturer's agreement for the production of the proposed product;
      v. Detailed Method Statement for the installation of the cold liquid applied flexible waterproofing system, showing all work procedures from the preparation of background through to the completion of the overlaid finishes;
      vi. Data sheet for minimum coverage rate of the waterproofing system and product identification number;
      vii. When the cold liquid applied flexible waterproofing systems are supplied for domestic blocks, except for the ancillary facilities at lower floors, also include the followings in the submission:
         - Original or a certified true copy of the ISO 9001 certificate for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by a certification body or by the QCM. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.
   b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(f) for CM’s information:
      i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works;
      ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);
iii. In the event that no test report has been submitted for CM’s information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:
   a. Suitable for use in the intended areas of application;
   b. Compatible with all contacting surfaces and materials;
   c. Crack-bridging capability up to 2 mm;
   d. All components of the waterproofing system are non-toxic and do not cause any hazard or injury to operatives and occupants or to others in the vicinity of the Site;
   e. Applicable in a cold liquid form;
   f. The properties requirements are as follows:

<table>
<thead>
<tr>
<th>Properties</th>
<th>Acceptance Standards</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Waterproofing Quality</td>
<td>No sign of leakage or anomalies</td>
<td>Refer sub-clause (g) for method.</td>

<td>Refer sub-clause (k) for method.</td>
</tr>
</tbody>
</table>

   g. Waterproofing quality test:
      i. Fabricate a carton box of size approximately 300 mm x 300 mm x 250 mm high without a top. Use a piece of 400 mm long x 72 mm wide adhesive tape at the bottom to seal the box. The carton box should be strong enough to stand in its own weight;
      ii. Apply the number of coats of waterproofing material, with a minimum of two coats, and in thickness(es) (record in the test report), both in accordance with the manufacturer's recommendation, to the inside surface of the carton box;
      iii. Allow to cure under conditions at 23 ± 2°C with 50 ± 5% relative humidity for 7 days or at such a period recommended by the waterproofing membrane manufacturer (record in the test report);
      iv. Upon expiration of the curing period, pour approximately 150 mm depth of 3% sodium chloride solution into the carton box and maintain for 60 minutes;
      v. Examine the bottom and sides of the carton box for any sign of leakage and other anomalies.

   h. Compatibility test with Approved tile adhesive:
To BS5980:1980 Appendix D with the following modifications:

i. Level a jig as stated in BS5980:1980, Appendix D.2.1 on a firm surface by the levelling screws in the base and spirit level;

ii. Place a 101 mm x 101 mm x 9 mm standard test piece tile, biscuit face uppermost, into the jig located against the outer L-shaped stop;

iii. Bond it to one side of a 75 mm x 75 mm x 8 mm test piece tile in the jig with epoxy, use a spirit level and apply light pressure to level the top face, and ensure that the smaller tile is located against its inner L-shaped stop;

iv. Remove the jig and allow the epoxy to cure;

v. Apply the number of coats of waterproofing material, with a minimum of two coats, and in thickness(es), both in accordance with the manufacturer's recommendation, on the standard test piece tiles;

vi. Allow the waterproofing membrane to cure at 23 ± 2°C with 50 ± 5% relative humidity for 7 days or at such a period recommended by the waterproofing membrane manufacturer;

vii. A layer of Approved tile adhesive in thickness as recommended by the tile adhesive manufacturer shall be applied over the cured waterproofing membrane which have been embedded in standard test piece tiles. The final bed thickness of tile adhesive and waterproofing membrane (record in the test report) shall be the aggregate total of the required thicknesses of the both materials;

viii. Prepare 10 of such assembled samples and cure them for 14 days under laboratory condition i.e. 23 ± 2°C with 45% to 70% relative humidity. Prepare 10 more samples and cure them for 7 days under laboratory condition followed by immersing the samples in water for 7 days;

ix. Upon expiration of the curing (and immersion) period, insert the sample in the test unit holder mounted in the tensile testing machine, and subject the unit to a tensile stress at a crosshead speed of 5 mm to 6 mm/minute until failure occurs.

i. Compatibility test with Approved panel wall partition system:

i. Apply the moisture sealer to four pieces of 390 mm x 390 mm Approved panel wall partitions as recommended by the manufacturer of the panel wall partitions;

ii. Apply the number of coats of waterproofing material, with a minimum of two coats, and in thickness(es), both in accordance with the manufacturer's recommendation, on the surface of each panel wall partition with moisture sealer;

iii. Allow the waterproofing membrane to cure at 23 ± 2°C with a relative humidity of 50 ± 5% for 14 days or at such period recommended by the manufacturer;

iv. Attach a 200 mm x 200 mm pull head onto the surface of the waterproofing membrane by a suitable adhesive resin;

v. Connect the pull head to a pull-off testing equipment. The pull-off equipment shall be capable of increasing the load steadily without jerking at a rate of 5 to 6 mm/minute, and must be provided with a measurement device which shall retain the maximum load to the nearest 10N. The measurement inaccuracy of the equipment must be less than 2%, in accordance with the accuracy Grade 2 of BS 1610:Part 1:1985;

vi. Apply a tensile force gradually by the pull-off equipment;

vii. Repeat the steps iv to vi until the pull-off test to all four tiles are completed.

j. Pull-off strength test:
To BS 8204:Part 3:1993 Annex B.3 with modifications to determine the bonding strength of the waterproofing material by means of pull-off test:

i. Test apparatus:
   - Metal disc of steel or aluminium alloy measured 50 ± 0.5 mm in diameter and not less than 15 mm thick, and with a means of connecting its center to the loading device as stated in sub-clause below;
   - Loading device which is capable of applying a gradually increasing load at a rate of 1.5 kN to 2.5 kN per minute up to 10 kN;
   - Measuring instrument which is readable to the nearest 25N and capable of measuring the magnitude of the applied load to an accuracy of ± 3%;
   - Ring mould measured 52 mm to 57 mm in outside diameter, 15 ± 5 mm high and 1 mm to 3 mm in wall thickness;
   - Conditioning room at 20 ± 3º C and 55 ± 5% relative humidity;
   - Coring machine with 50 mm diameter core bit;
   - Equipment for mixing and casting of a concrete panel;
   - Plywood mould of 700 mm x 300 mm x 200 mm for casting the concrete panel;
   - Epoxy resin for fixing the disc to the surface of flooring mix;
   - Mould oil.

ii. Preparation of concrete panel:
   - Paint the mould oil properly on all internal surfaces of the plywood mould by means of paintbrush;
   - Mix a batch of about 0.05 m³ concrete using a pan mixer;
   - Use the scoop to place the concrete in the mould in four approximately equal layers and compact each layer by means of compacting bar. The direction of casting is perpendicular to the length of the mould;
   - After completion of compaction, the excessive concrete shall be removed and the top surface shall be trowelled using a scraper;
   - The trowelled surface of the panel shall be wrapped completely with polythene;
   - Demould the concrete panel after 24 hours;
   - By means of coring machine, drill a 50 mm diameter core hole into a mould face of panel to the depth of 15 mm;
   - Remove any loose material and dry the concrete surface using a hair dryer;
   - Use epoxy resin to glue the 50 mm diameter disc to the cored surface;
   - Connect the loading device perpendicular to the disc and carry out the test by applying a steadily increasing load at the rate of 1.5 kN to 2.5 kN per minute until failure occurs. If the tensile strength is greater than 2 N/mm², the panel would be applicable for the subsequent testing mentioned in sub-clause (2)(j)(iii) below.

iii. Determination of bonding strength:
   - Brush the concrete test surface vigorously with a wire brush under a stream of water and leave to dry for 24 hours;
- Apply the number of coats of waterproofing material, with a minimum of two coats, and in thickness(es) (record in the test report), both in accordance to manufacturer's recommendation, onto the concrete surface and leave to cure;
- During the procedure of making and testing of test samples, the environmental condition should be controlled at 20 ± 3°C and 55 ± 5% relative humidity;
- Use epoxy resin to glue the 50 mm diameter disc to the waterproofing membrane;
- Test 6 samples after the waterproofing membrane has been laid for at least 14 days;
- Connect the loading device perpendicular to the disc and apply a steadily increasing load at the rate of 1.5 kN to 2.5 kN per minute until failure occurs.

iv. Results:
- Divide the maximum load by the test area, i.e. the area of the waterproofing membrane in contact with the flooring mix and concrete surface, and express the results to the nearest 0.1 N/mm²;
- Calculate the mean values for the six samples tested.

k. Elongation property test:

3. On Site Delivery Verification:

a. At delivery stage, submit the following documents:
   i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a);
   ii. Original or certified true copy of the Certificate of Origin for every batch of delivery. One batch being the material quantity covered under each delivery note;
   iii. Delivery notes for all material delivered to Site.

b. Carry out and submit report on the following verifications for waterproofing material upon delivery on Site. Prior to carrying out the verifications, inform CM's representatives who may present to witness the verifications:
   i. Method:

<table>
<thead>
<tr>
<th>Verification Items</th>
<th>Method</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manufacturer's Certificate of Origin &amp; Delivery Note</td>
<td>Document Check</td>
<td>From an Approved origin with information of product identification numbers</td>
</tr>
<tr>
<td>Product Identification Number</td>
<td>Document Check</td>
<td>Same as CM's Approved sample</td>
</tr>
<tr>
<td>Expiry Date</td>
<td>Check information printed on the packaging</td>
<td>Not expired</td>
</tr>
</tbody>
</table>

ii. Frequency:

One set of verification should be carried out for every delivery of cold liquid applied flexible waterproofing material delivered to Site under each Delivery Note submitted in sub-clause (3)(a).

c. Where any of the verifications fail to meet the Acceptance Standards, either:
i. Remove the representative batch off Site; or

ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

CEMENTITIOUS WATERPROOFING SYSTEM

WAT6.M110.7 CEMENTITIOUS WATERPROOFING SYSTEM FOR HARDENED CONCRETE

1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed material for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name/model name, job reference and original manufacturer's technical data of materials and system;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agents/distributors in Hong Kong or document from the supplier showing the appointment of the manufacturer and manufacturer's agreement for the production of the proposed product;
      v. Detailed method statement and the project specific shop drawings for the application of the waterproofing system.
   b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(f) for CM's information:
      i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works;
      ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material to Site;
      iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:
   a. Proprietary hydrophobic waterproofing system for application to hardened concrete;
   b. Capable of waterproofing static cracks and capillaries;
   c. Compatible with host concrete;
   d. Non-toxic;
   e. Suit the situation on which it is to be used;
   f. The materials used in the proprietary tanking system can withstand the project specific sub-surface water conditions for the lift pit and basement wall.
SHEET OR LIQUID MEMBRANE WATERPROOFING SYSTEMS

WAT6.M220.7 SHEET OR LIQUID MEMBRANE WATERPROOFING SYSTEMS FOR ROOFING, EXTERNAL TANKING AND LIFT PIT

1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed material for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name/model name, job reference and original manufacturer's technical data of materials and system;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agents/distributors in Hong Kong or document from the supplier showing the appointment of the manufacturer and manufacturer's agreement for the production of the proposed product;
      v. Detailed method statement and the project specific shop drawings for the installation of proprietary waterproofing system for roofing and external tanking, showing all work procedures of the proposed system;
      vi. When the systems are supplied for domestic blocks also include the followings in the submission:
         - Original or a certified true copy of the ISO 9001 certificate for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by a certification body or by the QCM. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS.
   b. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(b) for CM's information:
      i. The date of the test shall be generally within three years prior to the notified date for commencement of the Works;
      ii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);
      iii. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:
   a. Proprietary sheet membrane waterproofing systems for use in roofing, lift pit external tanking and other external tanking as well as proprietary liquid membrane waterproofing systems for use in lift pit external tanking and other external tanking shall:
      i. Remain intact and waterproof throughout the warranty period;
      ii. Provide with adequate means of dealing with condensation and thermal movement; and
      iii. Suit the types of roof access without impairment of performance;
iv. Include the proprietary sheet or liquid membrane waterproofing materials and all ancillary materials, insulation materials, screeding, roofing tiles and other protective treatments necessary to satisfactorily complete the roofing and external tanking systems. All materials to be in accordance with manufacturer’s specification unless otherwise specified.

b. The materials used in the proprietary tanking system can withstand the project specific sub-surface water conditions for the lift pit and basement wall.

3. On Site Delivery Verification:
   a. At delivery stage, submit the following documents:
      i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a);
      ii. Original or certified true copy of Certificate of Origin for every batch of delivery. One batch being the material quantity covered under each delivery note;
      iii. Delivery notes for all material delivered to Site.
   b. Carry out and submit report on the following verification for proprietary waterproofing systems upon delivery on Site. Prior to carrying out the verifications, inform CM’s representatives who may present to witness the verifications:
      i. Method:
         | Verification Items                     | Method                | Acceptance Standards                           |
         |----------------------------------------|-----------------------|-----------------------------------------------|
         | Manufacturer's Certificate of Origin & | Document Check        | From an Approved origin with information of    |
         | Delivery Note                          |                       | product identification numbers                |
         | Product Identification Number          | Document Check        | As Approved                                    |
         | Expiry Date                            | Check information    | Not expired                                    |
         |                                        | printed on the packing|                                               |
      ii. Frequency:
         One set of verification should be carried out for every delivery of proprietary waterproofing systems for roofing and external tanking material delivered to Site under each Delivery Note submitted in sub-clause (3)(a).
   c. Where any of the verifications fail to meet the Acceptance Standards, either:
      i. Remove the representative batch off Site; or
      ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

WAT6.M240.7 ANCILLARY MATERIALS

1. Ensure ancillary materials including adhesives, sealants, solvents, preformed corners, flashing materials, pipe sleeves and collars, ballast, gravels, isolation quilt, protective coatings etc., must be either a part of the waterproofing membrane system or fully compatible with it and recommended for their intended use by the membrane manufacturer;
2. Adhesives, adhesive primer, sealant, and sealant primer shall be in compliance with the prescribed limits of VOC content as set out in the Air Pollution Control (Volatile Organic Compound) Regulation.

WAT6.M250.7  INSULATION MATERIALS
1. Obtain extruded polystyrene board with rebate edges, CFC and HCFC free zero Ozone Depletion Factor type to BS 3837:Part 2:1990;
2. Ensure insulation materials to be extra high duty grade with minimum compressive strength at 300kPa, thermal conductivity (k) within the range 0.025 to 0.034 W/mK and in thickness to the requirement as indicated in the drawings to complete system installation and to meet minimum insulation value for the roof as required;
3. Notwithstanding WAT6.M220 (2)(a), insulation materials can be obtained from other suppliers but must be certified as fully compatible to the system by the membrane manufacturer.

WAT6.M260.7  ROOFING TILES & OTHER FINISHING MATERIALS
1. For accessible roof of public emergency and maintenance and where specified in drawings, use concrete roofing tiles and fittings to BS 473,550:1990. Size and thickness to finishing schedule of drawings;
2. For accessible roof as podium / garden and general public access and where specified in drawings, use tiles or other finishing materials as stated in finishing schedule of drawings;
3. For non-accessible roof: as WAT6.W290;
4. Notwithstanding WAT6.M220 (2)(a), roofing tiles and other finishing materials for accessible roof can be obtained from other suppliers but must be certified as fully compatible to the system by the membrane manufacturer.

WAT6.M270.7  MAINTENANCE MANUAL
Upon completion of the work, submit 2 copies (1 hard copy and 1 soft copy at PDF format in CD) of maintenance manual identified with project name, location and date and containing the followings:
1. Type of system applied;
2. Surface to which the system was applied;
3. Shop drawings in related to waterproofing works for the particular project;
4. Recommendations for periodic inspections, care and maintenance;
5. Identification of common cause of damage with instructions for temporary patching until permanent repair can be made.
WORKMANSHIP

APPLYING COLD LIQUID APPLIED FLEXIBLE WATERPROOFING SYSTEM

WAT6.W010.7 GENERAL
Prepare and apply the Approved cold liquid applied flexible waterproofing system strictly in accordance with the manufacturer's recommendations.

WAT6.W012.7 CONSTRUCTION MOCK-UP
1. Prior to commencing installation of the cold liquid applied flexible waterproofing system to typical domestic floors, construct a full size construction mock-up on actual working surface of a bathroom and kitchen in accordance with PRE.B9.440 showing:
   a. Background preparation strictly in accordance with the manufacturer's recommendation on all types of substrates;
   b. All layers of the waterproofing system up to and including the finishes;
   c. Junction details with adjacent construction complete with sealant works etc.
2. Obtain Approval before commencement of installation;
3. Maintain the Approved construction mock-up as a workmanship benchmark. Obtain CM's agreement before dismantling the construction mock-up.

WAT6.W015.7 STORAGE
Store the Approved waterproofing material on Site or in the Contractor's workshops etc in a cool, well ventilated, and covered storage accommodation, or in a manner in accordance with the manufacturer's recommendations.

WAT6.W020.7 PREPARATION
Ensure surfaces to receive the Approved waterproofing system are:
1. Finished with a power-floated or steel-trowelled finish for concrete floor, or an equivalent acceptable to the waterproofing manufacturer;
2. Free of dirt, dust, oil, excessive moisture and other contaminants prior to application;
3. Free of holes, gaps or cracks;
4. Formed with non-shrink cement-sand angle fillet at junctions of walls and floors before application of waterproofing materials.

WAT6.W025.7 COATS OF APPLICATION
Apply a minimum of two coats, or more in accordance with the manufacturer's recommendations, with the thickness of each coat strictly in accordance with the manufacturer's recommendations.

WAT6.W030.7 OVERCOAT
Allow a minimum of 24 hours, or longer period in accordance with the manufacturer's recommendations from the completion of the first coat for drying. Ensure the first film shows no crissing, crawling, sinking, lifting or wrinkling before second coat application.
WAT6.W040.7 LAYING FINISHES
Inspect the cured waterproofing layers prior to laying finishes. Lay finishes or protective layer without delay after the inspection to prevent damage to the cured waterproofing system.

WAT6.W050.7 HEALTH AND SAFETY
Do not use materials or working practices which would result in any hazard or injury to operatives or to others in the vicinity of the Site.

WAT6.W060.7 COLOUR
Apply each coat of the waterproofing material in a different colour as directed by the CM where a range of colours is available from the waterproofing system.

MIXING AND APPLYING CEMENTITIOUS WATERPROOFING SYSTEM

WAT6.W110.7 GENERAL
Prepare, mix and apply system in accordance with the manufacturer's recommendations.

WAT6.W120.7 CURING AND PROTECTION
In accordance with manufacturer's instructions.

APPLYING SHEET OR LIQUID MEMBRANE WATERPROOFING SYSTEMS

WAT6.W210.7 GENERAL
1. Engage Applicator, corresponding to the proposed proprietary waterproofing systems, to install the proprietary waterproofing systems for roofing and external tanking comprising of the proprietary waterproofing materials, insulation and roofing finishes including priming, sealing, crack filling and other necessary materials, flashings etc. with details all in accordance with manufacturer's specifications and recommendations;
2. Obtain CM's consent prior to application;
3. Obtain CM's consent prior to laying finishes on waterproofing materials;
4. Take particular care to ensure that all junctions, expansion joints, penetration around pipes, rainwater outlets, gutters and the like are properly executed;
5. Comply with the proprietary roofing and external tanking systems' requirements according to the manufacturer's instruction.

WAT6.W220.7 SURFACES PREPARATION
1. Prior to laying of the roofing and external tanking system, inspect and repair as required to provide proper substrate surfaces to receive waterproofing materials;
2. Remove protrusions and contaminants such as grease, oil, etc. from the surfaces;
3. For roofing, ensure the base is to even falls to the rainwater outlets with no area which will pond;
4. Complete all cuts and preformed chases, external angles chamfered and internal angles fillet including all fixings that will penetrate the roofing or external tanking membrane are in place unless otherwise specified in details of shop drawings.

**WAT6.W230.7  FREE OF MOISTURE**

For roofing and external tanking systems:

1. Do not carry out any work when there is surface moisture;
2. Take all necessary precautions to ensure the integrity of the proposed system is maintained;
3. Comply with the proprietary roofing and external tanking systems' requirements as stated in the manufacturer's instruction.

**WAT6.W240.7  COMPATIBILITY**

Before commencing work, demonstrate on Site that all adhesives and materials, including sealants, insulation and subsequent laid on materials, are fully compatible and certified by the Agent / Applicator in writing to CM.

**WAT6.W250.7  PROTECTION OF EXISTING ROOF**

1. Protect all roofing outlets to prevent debris falling into rainwater pipes;
2. Open and clear the outlets at the end of the working day and sweep the roof clean to ensure effective drainage;
3. Protect all pipeworks, ducting and other services running on top of existing roof including pipe supports.

**WAT6.W255.7  APPLYING PROPRIETARY WATERPROOFING SYSTEMS**

Ensure the spreading rate of the proprietary materials is in accordance with the manufacturer's instruction.

**WAT6.W260.7  ADHESIVE**

1. Where required, apply adhesive strictly in accordance with the waterproofing manufacturer's recommendations. All manufacturer's data about the shelf-life of adhesives must be noted, and no attempt should be made to use materials which are no longer fit for use;
2. Prohibit the spreading of adhesive over excessive large areas and / or subsequent over setting before placing of sheets.

**WAT6.W270.7  BUBBLES**

If bubbles formed in the membrane, submit the proprietary manufacturer's repair method for Approval before repairing. Otherwise, strip and clear the whole area and prepare the surface again and re-execute the work.

**WAT6.W280.7  FINISHES TO ACCESSIBLE ROOFS (MAINTENANCE & PUBLIC TRAFFIC)**

When indicated as accessible roof on Drawings, design the roofing system to allow for increased wear due to frequent foot traffic and protect the roofing system by finishing materials as specified.
FINISHES TO NON-ACCESSIBLE ROOFS (MAINTENANCE TRAFFIC)
When indicated as non-accessible roof on Drawings and as exposed system, protect roofing with a solar protection "light-reflective" paint or other protective finishes applicable to the particular proprietary roofing system except where it is a self-finished material or otherwise specified.

PROTECTION OF ROOFING AND EXTERNAL TANKING SYSTEM
1. Do not allow traffic on roof until 4 days after completion of tiling and permit only light traffic for a further 10 days;
2. Protect all completed tanking system during backfilling operation.

ROOF VENT
When specified, install approved proprietary roof vents in accordance with the manufacturer's recommendations and make good the roof covering up to and around the vents.

INSULATION
Ensure insulation board shall either have integrally bonded hard surfaces on both sides or be protected by inert hard sheeting or screed in accordance with the proprietary waterproofing system.

INSPECTION
Inform CM's representative for inspection upon the completion of each layer of the roofing and external tanking system and prior to commencing installation of the next layer of construction including screed, insulation and finishes etc.
TESTING

ON-SITE VERIFICATION TESTS

WAT6.T010.7 WATER SPRAY TEST TO INTERNAL INSTALLATIONS

1. Testing Arrangements
   a. Carry out water spray test to all completed internal waterproofed areas after application of finishes. Tests to be witnessed and endorsed by the Contractor's representative and the CM's representative;
   b. Carry out joint inspection at the location being tested and at the floor below to check there is no seepage on the soffit within half an hour to two hours after the test;
   c. Submit three copies of the test reports, or other number of copies as required by the CM for the water spray tests for record.

2. Testing Locations:
   a. Test to the following percentages:
      i. 100% to all areas or rooms installed with waterproofing such as bathrooms, changing rooms, balconies etc.;
      ii. 100% or other percentage as approved by the CM for other areas or rooms such as kitchens, refuse rooms etc.

3. Testing Methods:
   a. Use a common domestic telephone type shower head fitted to a 13 mm diameter supply pipe delivering a water pressure of 210 to 240 kPa (30 to 35 psi). Locate the pressure gauge at a distance not exceeding 1500 mm from the shower head;
   b. Apply water by moving shower head to and fro along test surface at a perpendicular distance of between 300 mm and 600 mm;
   c. Carry out the following water spray test to walls and floors at the shower area after application of finishes:

      | Location            | Area to be Tested          | Test Method                                                                 | Acceptance Criteria                                                                 |
      |---------------------|-----------------------------|------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
      | Bathroom shower area| Walls and floor at shower area | Spray water evenly for 5 minutes to the walls surrounding the shower area up to the height of the top of the waterproofing membrane. | - no ponding; - Water falls towards the floor drain; - no seepage through wall or floor; - no seepage at pipe sleeves; - no seepage at traps, connectors and outlets. |

   d. Carry out the following water spray test which applies to all waterproofed walls and floors after application of finishes. Include those in the bathrooms, toilets, kitchens, balconies, refuse rooms etc, but exclude those at shower areas in sub-clause (3)(c), roofs and lift pits (refer to other relevant clauses in WAT6).
### Location | Area to be Tested | Testing Method | Acceptance Criteria
--- | --- | --- | ---
Bathroom, Kitchen, Refuse room etc | Walls, floors, floor drains and pipe sleeves. | Spray water evenly for 2 minutes to the walls up to the top of the waterproofing membrane and to any pipe sleeves that are installed at a higher level. Spray water for a further 1 minute directly onto the non cast-in floor drain (if provided). | - no ponding.  
- falls towards the floor drain.  
- no seepage through the wall or floor;  
- no seepage at pipe sleeves;  
- no seepage at trap, connectors and outlets.

e. Non-compliance:
   
a. In the event that any test fails to meet the requirements:
   
i. Carry out remedial works subject to Approval and re-test until all the criteria specified has been satisfied;

ii. Bear all costs of remedial works and the re-test. No extension of time will be allowed.

### WATER FLOOD TEST TO ROOF INSTALLATIONS

1. Testing Arrangements:
   
a. Carry out water flood test to roofing at CM’s direction;

b. Allow a Direct Testing Contractor (DTC) to carry out non-destructive tests to verify the watertightness of the roofing system;

c. Provide all necessary attendance on the DTC including the requirements stated in sub-clause (3);

d. Allow the DTC access to carry out infra-red scanning testing during the 24 to 48 hour period immediately following the draining of the roof area under test;

e. Obtain from DTC test reports for the water flood test for record. The original report including the infra-red scanning results shall be sent directly by the DTC to the CM.

2. Testing Samples:
   
a. Entire installed roofing system including canopy unless Instructed otherwise.

3. Testing Methods:
   
a. Seal all outlets and construct suitable dam walls to compartmentalize large roof areas. Do not permit any debris to enter into drainage pipeworks;

b. Carefully flood the roofs to levels agreed with the CM, generally no less than 150 mm, but in no case higher than existing curb levels and maintain for 24 hours;

c. Mark the top water level at clearly visible locations and regularly inspect for leaks;

d. Slowly drain roofs and remove all outlet blockages and dam walls.

4. Non-compliance:
a. In the event of test failure:
   i. Submit to CM detailed proposals for remedial measures;
   ii. Carry out subsequent repairs and flood tests and further infra-red scanning tests until the roof is watertight;
   iii. Bear all associated costs and expense of any subsequent flood testing including subsequent infra-red scanning tests. No extension of time will be allowed.

DRA1 DRAINAGE ABOVE GROUND

MATERIALS

PIPES AND FITTINGS FOR SURFACE WATER DRAINAGE

DRA1.M010.7 CAST IRON RAINWATER PIPES, GUTTERS AND FITTINGS
1. Pipes and fittings:
   a. To BS 416:Part 1:1990;
   b. With type A or B sockets;
   c. Without ears and coated.
2. Gutters:
   a. To BS 416:Part 1:1990;
   b. Section: half round or ogee.

DRA1.M020.7 PLASTIC RAINWATER PIPES, GUTTERS AND FITTINGS
1. For pipes equal to and not exceeding 80 mm diameter: to BS 4576:1989 and for pipes exceeding 80 mm diameter: to BS 4514:1983;
2. Alternative: other Approved rainwater system;
3. Unless otherwise Approved, do not interchange individual manufacturer's plastic pipe products.

DRA1.M030.7 RAINWATER OUTLETS
2. Cast aluminium rainwater side outlets:
   b. Type: two-way outlet;
   c. Accessories: clamping ring, removable grating and screw thread adaptor for cast iron pipes.
3. uPVC rainwater outlet to BS 4576:1989:
   An Approved proprietary type complete with sealing flange and screw fixed flat or domed grating.
4. Stainless steel rainwater outlets:
   a. Stainless steel (Grade 304) flat removable grating; and
   b. Stainless steel (Grade 304) frame or chromium plated brass frame.
**PIPS AND FITTINGS FOR FOUL WATER DRAINAGE**

**DRA1.M110.7 CAST IRON SOIL, WASTE AND VENTILATING PIPES AND FITTINGS**

1. For pipes not exceeding and equal to 150 mm diameter:
   a. To BS 416:Part 1:1990;
   b. With Type A or B sockets;
   c. Without ears and coated.

2. For pipes of 225 mm diameter: to BS 437:2008.

3. For pipes exceeding 225 mm diameter: to BS 4622:1970.

**DRA1.M120.7 SPIGOT SPUN PIPES**

Obtain from an Approved manufacturer.

**DRA1.M150.7 UPVC PIPES AND FITTINGS**

1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed uPVC pipes and fittings for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name/model name and job reference of the material;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agent/distributor in Hong Kong or document from the supplier showing the appointment of the manufacturer and manufacturer's agreement for the production of the proposed product;
      v. When the uPVC pipes and fittings are supplied for domestic blocks, also include the followings in the submission:
         - Two identical sample boards similar to the one maintained by the Housing Department showing the quality, detail technical information and application procedures for the proposed uPVC pipes and fittings;
         - Original or a certified true copy of the ISO 9001 certificate for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by a certification body or by the QCM. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a multilateral recognition arrangement with HKAS.
   b. For uPVC pipes and fittings used in domestic blocks, submit original or a certified true copy of the product conformity certificate to the "Product Conformity Certification Scheme for UPVC Pipes and Fittings for Foul Water Drainage above Ground" (PCCS-UP) published by the Hong Kong Institution of Plumbing and Drainage Limited. The product conformity certificate shall be issued by a certification body accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a multilateral recognition arrangement with HKAS. If a photocopy of the product conformity certificate is submitted, it shall be certified true by the certification body or by the QCM:
i. The product conformity certificate shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a) above or at a time not later than 12 months from the date of commencement of the Works;

ii. In the event that the product conformity certificate has not been submitted for CM’s information, CM may order the removal of materials or delivered products off Site. The Contractor shall bear all associated costs and no extension of time will be allowed.

c. Submit a summary of the test results under the audit testing of the PCCS-UP. The summary shall be prepared by the accredited laboratory carried out the testing or the certified manufacturer. If so directed by CM, submit a full set of the audit test reports to CM for record.

d. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(f) for the representative items in sub-clause (1)(d)(i) for CM’s information unless the test requirements are covered by the scope of the PCCS-UP:

i. - Pipes: 50 mm Ø pipe and 100 mm Ø pipe;
   - Fittings: 32 mm Ø 88° Bend, 40 mm Ø 88° Bend W/I.O., 50 mm Ø 88° Junction W/I.O., 80 mm Ø 88° W/I.O., 100 mm Ø 88° Bend W/I.O. and 100 mm Ø 150 x 100 Reducer Fittings;
   - Traps: 40 mm and 50 mm Ø traps including bottle trap, U-trap and W-trap;
   - Two-way floor drain;
   - 100mm Ø W.C. Connector;
   - Adhesive for pipe joint.

ii. The date of the test shall be generally within five years prior to the notified date for commencement of the Works or at an earlier date for domestic blocks subject to CM's consideration on the track records as maintained by the Housing Department;

iii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);

iv. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, the Contractor shall remove all delivered materials off Site and bear all associated costs and no extension of time will be allowed.

e. Unless otherwise specified, pipes and fittings for use in the Works shall be to either BS standards or BS EN standards. Propose either BS standards or BS EN standards for all pipes and fittings for CM’s approval. Only the Approved standards shall be used for the Works unless the piping components are not covered by the Approved standard.

2. Quality Requirements:

a. Provide from a single source;

b. uPVC pipes and fittings to:

   i. BS standards BS 4514:1983, BS 5255:1989 and BS 3943:1979; or
   ii. BS EN standards BS EN 1329-1:2000 and BS EN 274-1:2000;

c. uPVC W.C. connector pipes to BS 5627:1984;

d. Adhesive for pipe joint to BS 4346-3:1982;

e. Colour: to Approval;
The quality and performance requirements are as follows:

i. Pipes, fittings and traps to BS standards:

<table>

| Water and Air Tightness under Deflection | BS 5627:1984 Clause 9.3 | No loss of pressure |

### iv. Adhesive for pipe joint:

| Chemical Composition | Manufacturer’s certificate | Meet the stated chemical property requirements |
When the pipes and fittings are supplied for domestic blocks, standard of visual quality of pipes and fittings shall be comparable with the benchmark samples maintained by the Housing Department;

h. Anti-siphon traps are to be fitted with a one way valve disk of corrosion-resistant metal or alloy, e.g. brass or stainless steel. Corrosion resistant coating, e.g. chromium plating, is not acceptable. The one way valve disk is to be affixed with a similar metal or alloy pin complete with a rubber gasket. Ensure that pipes and fittings, including the anti-siphon traps, are suitable for their intended use, particularly where hot liquids and chemicals etc. may be discharged into the system.

3. On Site Delivery Verification:

a. At delivery stage, submit the following information for CM’s approval:

i. Written confirmation that the material delivered to Site is in accordance with the Approved sample submitted under sub-clause (1)(a);

ii. Relevant import/export documents from overseas and from Mainland China, original or certified true copy of Certificate of Origin for every batch of delivery. One batch being the material quantity covered under each delivery note;

iii. Delivery notes for all material delivered to Site.

b. Carry out and submit report on the following verifications for uPVC pipes and fittings upon delivery on Site. Prior to carrying out the verifications, inform CM’s representatives who may present to witness the verifications:

i. Method:

<table>
<thead>
<tr>
<th>Verification Items</th>
<th>Method</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Diameter and Wall Thickness Check</td>
<td>By measurement</td>
<td>DRA1.M150 (2)(f) - dimensions</td>
</tr>
<tr>
<td>Surface Quality</td>
<td>Visual</td>
<td>No discolouration, no damage, no staining, no blemish, acceptable colour consistency</td>
</tr>
<tr>
<td>Logo &amp; Label Check</td>
<td>Visual</td>
<td>Same as CM’s Approved sample.</td>
</tr>
</tbody>
</table>

ii. Frequency:
c. Where any of the verifications fail to meet the acceptance standards, either:
   i. Remove the representative batch off Site; or
   ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

### DRA1.M160.7 BALLOON GRATING / VENT COWL
Of an Approved proprietary brand and either:
1. Galvanized steel wire or copper wire; or
2. uPVC or polypropylene, as shown on the Drawings.

### DRA1.M170.7 VERTICAL GRATINGS FOR DOMESTIC FLATS
Approved uPVC 40 mm diameter vertical grating to BS 5255:1989 or to BS EN 1329-1:2000.

### DRA1.M180.7 UPVC TWO-WAY FLOOR DRAIN OUTLET
1. Comprise of the following:
   a. uPVC horizontal drain pipe with sealing flange;
   b. uPVC adaptor unit for vertical grating. The adaptor unit shall have built-in drainage fall towards downstream, and shall allow easy removal of vertical grating by unscrewing the fixing screws after the installation for maintenance purpose. Its spigot connecting to the drainpipe may also be cut short to suit the thickness of the wall finishes;
   c. uPVC adjustable horizontal grating unit with sealing flange and removable horizontal grating, and shall allow for cutting low to suit finished floor level;
   d. 2 Nos. uPVC gratings for vertical and horizontal use complete with stainless steel screws.
2. Submit a sample for CM's approval.

### BRACKETS AND FIXINGS

### DRA1.M210.7 PIPE BRACKETS
1. Stainless steel of Grade 304 for components including bolts, nuts, washers and hangers shall be at least to BS EN 10088-3 grade 1.4301 unless otherwise specified;
2. Pattern and type to suit the type of pipe and the surface to which they are to be fixed, as shown on the Drawings, including where appropriate:
a. Flanged ends for building in;
b. Plain round ends for fixing in drilled holes with an Approved grout;
c. Approved expanding bolts or stud anchors for fixing to concrete, brickwork etc.;
d. Threaded ends for fixing to steelwork, or wood, or panel wall with plug as required;
e. Countersunk-holed face plates for screwing to wood or plugs, or panel wall with plug;
f. Brackets lined with resilient plastic at pipe clamps for plastic pipes, plastic coated pipes and cast iron pipes.

DRA1.M220.7 BOLTS FOR CAST IRON AND STEEL PIPEWORKS
Brass, cadmium plated steel or other non-corrodible metal.

DRA1.M230.7 BOLTS FOR SOIL STACK ACCESS DOORS FOR CAST IRON AND STEEL PIPEWORKS
Gunmetal.

DRA1.M240.7 WOOD SCREWS
Brass to BS 1210:1963, with countersunk heads and of a length sufficient to ensure a secure fixing.

DRA1.M250.7 PLUGS
1. For fixing to:
   a. Hard materials: proprietary plastic, fibre, soft metal or similar;
   b. Friable materials, plasterboard and the like: proprietary fixings specially designed for the purpose.
2. Do not use wooden plugs or plugs containing asbestos.

PIPE SLEEVES AND COVER PLATES

DRA1.M310.7 PVC PIPE SLEEVES FOR CASTING OR BUILDING IN
To BS 3505:1986 and with 2 to 12 mm clearance to allow for expansion and movement of pipe.

DRA1.M320.7 FIRE RESISTING PIPE SLEEVES
Medium duty galvanized mild steel pipe sleeve to BS 1387:1985 with 20 mm clearance.

DRA1.M330.7 CAST IRON OR MILD STEEL PIPE SLEEVES
Cast iron or 2.5 mm thick mild steel sleeve galvanized after fabrication with 2 - 12 mm clearance.

DRA1.M340.7 PIPE SLEEVES FOR BASEMENT WALLS
For pipes passing through external basement walls where ground water pressure is significant, provide:
1. A short length of cast iron pipe as sleeve with split bolt on puddle flange and with socket on outside;
2. A cast iron plug drilled to take long screw and back nuts as necessary.

DRA1.M350.7  PROTECTIVE TAPE
An Approved petroleum based tape.

JOINTING MATERIALS

DRA1.M405.7  GENERAL
Primer, caulking compound and all materials for jointing PVC pipes shall be in compliance with the prescribed limits of VOC content as set out in the Air Pollution Control (Volatile Organic Compound) Regulation.

DRA1.M410.7  JOINTING RINGS, COUPLINGS AND ADAPTORS GENERALLY
Of types recommended by the manufacturer of the pipes being jointed.

DRA1.M420.7  GASKIN
Tarred spun yarn or hemp.

DRA1.M430.7  COLD CAULKING COMPOUND
An Approved proprietary brand.

DRA1.M450.7  MORTAR
Cement and sand, 1:2, mixed in accordance with Worksection MAS3.

DRA1.M460.7  JOINTING COMPOUND FOR SCREWED JOINTS
An Approved proprietary brand.

DRA1.M470.7  PIPE THREAD TAPE
Unsintered PTFE tape to BS 4375:1968 of an Approved proprietary brand.

DRA1.M480.7  PRIMER FOR THREADED JOINT TO STEEL PIPES
An Approved non-toxic anti-corrosion epoxy base polyamide primer.

SUNDRIES MATERIALS

DRA1.M510.7  FIRE SEALING SYSTEM FOR UPVC PIPES PASSING THROUGH FIRE RESISTING STRUCTURES
1. Fire sealing system complied with BS 476:Part 20:1987;
2. Test report shall be provided to indicate that the material and the installation is capable of resisting the action of fire for the specified period. The test shall be carried out and the test report shall be prepared by a laboratory recognised by the Hong Kong Laboratory Accreditation Scheme;
3. Shop drawings including manufacturers’ recommendations for fire stopping system installation shall be submitted for CM’s approval prior to commencement of work.
WORKMANSHIP

GENERAL

DRA1.W010.7 INSPECTION OF PIPES AND FITTINGS
Inspect pipes and fittings inside and out before fixing, reject any which appears defective.

DRA1.W020.7 HANDLING AND STORAGE
1. Store rubber jointing rings in protective bags and do not expose them to sunlight. Avoid any deformation;
2. Store pipes and fittings under cover and clear of a levelled, well-drained and maintained hard-standing ground;
3. Stack pipes without resting them on their sockets.

FIXING PIPES

DRA1.W110.7 GENERAL
1. Fix pipes and fittings securely with fixings and fastenings appropriate to the location and the material;
2. Do not use branch pipes that connect to vertical pipes as pipe supports;
3. Avoid pipe runs above electrical switchgear and at locations which may cause obstruction inside pump rooms.

DRA1.W120.7 INSTALLING FOUL DRAINAGE ABOVE GROUND

DRA1.W130.7 THERMAL MOVEMENT
1. Make adequate provision to control and/or allow for thermal movement in the length of pipes and gutters depending on material specified and in accordance with details shown on the Drawings;
2. Provide expansion joints in plastic pipes by means of loops or other methods in accordance with the manufacturer's recommendations.

DRA1.W140.7 PIPES ACCESSIBLE TO VERMIN
Place vertical pipes in situations which are accessible to rodents at least 100 mm away from any adjacent wall or pipe, to a minimum height from ground level of 1500 mm.

DRA1.W150.7 PROVISION FOR ACCESS FOR CAST IRON AND STEEL PIPOERWORKS
Provide bolted access doors or inspection units to all branches and bends (other than ventilating and anti-syphon pipes) and at the foot of main soil stacks. Fit access doors to cast iron soil stacks with gunmetal bolts and rubber gaskets.

DRA1.W160.7 SPACING OF PIPE SUPPORTS
Space pipe supports as follows and in all cases, use not less than one fixing per length of pipe or as approved by CM:
### Pipes

---

**DRA1.W170.7**  
**EMBEDDED PIPES**

Do not cast in or build pipes into chases in walls and floors unless this is unavoidable or directed, in which case:

1. Coat all pipes which come into direct contact with concrete with an Approved petroleum based tape;
2. Ensure that there are no joints in straight pipes built in other than elbows.

**DRA1.W180.7**  
**PIPES ON FLAT ROOFS AND CANOPIES**

Support pipes on flat roofs and canopies at least 150 mm above roof and canopy finish on concrete blocks with pipe clamps.

**DRA1.W190.7**  
**FIXING CAST IRON GUTTERS**

1. Fix cast iron gutters with screwed brackets at 1000 mm (maximum) centres to falls of 1 in 300 (minimum);
2. Joint gutters with jointing compound and bolt together.

**DRA1.W200.7**  
**FIXING PLASTIC GUTTERS**

Fix gutters with screwed gutter brackets:

1. At 1000 mm (maximum) centres;
2. Generally to falls of 1 in 300 (minimum).

**DRA1.W210.7**  
**FIXING UPVC TWO-WAY FLOOR DRAIN OUTLET**

1. Cast in uPVC horizontal drain pipe at the correct level fall and alignment as shown on the Drawings and to suit the thickness of wall and floor finishes;
2. Fix uPVC adaptor unit to the horizontal drain pipe. Cut the length of spigot if necessary where it connects onto the hopper of the drainpipe to suit the thickness of wall finishes, and ensure to maintain a minimum 8 mm of overlap between the spigot and the connecting hopper of the drainpipe;
3. Fix uPVC adjustable horizontal grating unit to the adaptor. Cut down the height of the unit if necessary to suit the finished floor level;
4. Ensure the fixing as mentioned in sub-clauses (2) and (3) above are to manufacturer's recommendations and all joints are watertight;
5. Seal the joints between the adaptor unit and wall tiles, and the joints between adjustable horizontal grating unit and floor tiles;
6. Install gratings to adaptor unit and adjustable horizontal grating unit with stainless steel screws.

**JOINTING PIPES AND FITTINGS**

**DRA1.W310.7**  JOINTING PIPES AND FITTINGS GENERALLY
Carry out all pipe joints in accordance with the manufacturer's instructions and do not allow jointing material to project into bore of pipes or fittings.

**DRA1.W320.7**  CUTTING PIPES AND GUTTERS
Cut ends of pipes and gutters clean and square, chamfering internally or externally if required using equipment appropriate to the material.

**DRA1.W330.7**  JOINTS BETWEEN DISSIMILAR METALS
1. Make joints between different metals with proper adaptors;
2. Avoid contact between certain dissimilar metals as follows:
   a. Aluminium alloys with copper alloys, nickel, lead or stainless steel;
   b. Iron and steel with copper alloys;
   c. Zinc with copper alloys. In particular avoid the direct contact of copper with galvanized iron or steel pipes;
   d. If unavoidable, use gunmetal joints between the dissimilar metals.

**DRA1.W340.7**  PIPES REQUIRING CORROSION PROTECTION
Fix pipes requiring protection against corrosion with a 40 mm (minimum) clearance between pipe, structure and adjacent surfaces. Avoid fixing such pipes at internal angles.

**DRA1.W350.7**  CAST IRON SPIGOT AND SOCKET PIPES
1. Joint pipes with cold caulking compound in accordance with manufacturer's instruction;
2. Do not allow the jointing material projecting into bore of pipes or fittings.

**DRA1.W360.7**  CAST IRON SPUN SPIGOT PIPES
1. Joint pipes with flexible joints in accordance with the manufacturer's recommendations;
2. Do not joint the pipes with molten lead.

**DRA1.W370.7**  JOINTING STEEL PIPES GENERALLY
Joint steel pipes with screwed sockets:
1. With jointing compound or pipe thread tape;
2. Cutting threads with a tapered die. Threads found to be cut too deep will be rejected;
3. Paint all threaded surfaces with one coat of non-toxic anti-corrosion epoxy base polymide primer or red oxide primer as **DRA1.M480** and one coat compatible finish.
DRA1.W380.7 JOINTING STEEL PIPES TO CAST IRON PIPES
Joint steel pipes to sockets of cast iron pipes with cold caulking compound in accordance with manufacturer's instruction.

DRA1.W390.7 JOINTING PIPES TO CLAY PIPE SOCKETS
Joint pipes to clay spigot and socket pipes with gaskin and mortar.

DRA1.W400.7 JOINTING PLASTIC PIPES TO OTHER MATERIALS
Joint plastic pipes to pipes of other materials with proprietary adaptors.

PIPES PENETRATING THE BUILDING STRUCTURE

DRA1.W510.7 PIPES PASSING THROUGH WALLS AND FLOORS
Cast or build in PVC sleeves as detailed on the Drawings, and:
1. Finish sleeves flush with the finished face of walls and ceilings and projecting 100 mm above finished floor level;
2. Point with Approved mastic sealant if required to be watertight;
3. Do not split PVC sleeves.

DRA1.W520.7 PIPES PASSING THROUGH FIRE RESISTING STRUCTURES
Where pipes pass through fire rated walls or floors:
1. Cast or build in galvanized mild steel pipe sleeve with 20 mm clearance;
2. Finish sleeves flush with the finished face of walls and ceilings. Projection above finished floor level according to manufacturer's instruction;
3. Well caulk void between pipe and sleeve for the full length with non-flammable mineral wool or other products having equivalent functions or performance, point with Approved fire-rated sealant to maintain the required FPR of the wall/floor slab.

DRA1.W530.7 UPVC PIPES PASSING THROUGH FIRE RESISTING STRUCTURES
Where uPVC pipes pass through fire rated walls or floors:
1. Cast or build in galvanized mild steel pipe sleeve as shown on the Drawings;
2. Finish sleeves flush with the finished face of walls and ceilings. Projection above finished floor level according to manufacturer's instruction;
3. Well caulk void between pipe and sleeve for the full length with mineral wool or sealant in accordance with manufacturer's recommendation;
4. Install the fire sealing system in accordance with manufacturer's instruction to maintain the required FPR of the wall/floor slab.

DRA1.W540.7 PIPES PASSING THROUGH BASEMENT WALLS
1. Where pipes pass through external basement walls:
   a. Cast or build in with 2-12 mm clearance, a cast iron or mild steel sleeve;
   b. Caulk space and point both ends with Approved mastic sealant.
2. Where pipes pass through external basement walls and ground water pressure is significant:
   a. Cast or build in short length of cast iron pipe as sleeve with split bolt on puddle flange and with socket on outside;
b. Well caulk socket around pipe with yarn and lead including providing a cast iron plug drilled to take long screw and back nuts if necessary;

c. Point inside with an Approved mastic sealant.

PROTECTION

DRA1.W610.7 SEALING THE SYSTEM
Prevent entry of foreign matter into any system by sealing off ends of pipes and openings during construction.

TOLERANCES

DRA1.W710.7 GENERAL
Refer to Appendix H "Schedule of Tolerances" to this Specification.

PIPELINE CONNECTION IDENTIFICATION

DRA1.W810.7 PIPEWORK CONNECTION IDENTIFICATION
1. Provide a temporary colour band around the circumference of the open end(s) of installed aboveground pipes to be connected to the underground pipes which discharge to manholes and back inlet gully trap. The colour and width of the band are as follows:

<table>
<thead>
<tr>
<th>Type of Drain Pipe</th>
<th>Colour</th>
<th>Width of Colour Band</th>
</tr>
</thead>
<tbody>
<tr>
<td>Storm water</td>
<td>White</td>

</table>

2. Upon the completion of drainage works, provide attendance and materials to facilitate inspection by CM's representatives of the connection of aboveground pipes to manholes and back inlet gully trap.
TESTING

ON-SITE VERIFICATION TESTS

DRA1.T110.7 TESTING FOR SURFACE WATER DRAINAGE

1. Testing Arrangements:
   a. Carry out test in the presence of the CM’s representatives;
   b. Provide clean water and appropriate apparatus for testing.

2. Testing Samples
   a. Test pipes as soon as practical after the completion of each section of pipework and before any work is concealed.

3. Testing Methods:
   a. Ensure that all pipe runs are clear of obstructions by visual examination, or by throwing a ball into the pipework or other method Approved by CM before testing;
   b. For internal pipes, pour water into the pipes and check for water leakage;
   c. Acceptance standard: no visual sign of leakage can be observed;
   d. Submit three copies, or other number of copies as directed by the CM, of the testing reports for the tests carried out, in a format to be agreed with the CM, within 1 week upon completion of testing for Approval.

4. Non-compliance:
   a. In the event that any test fails to meet the requirements:
      i. Locate and make good all defects;
      ii. Re-test to satisfaction of the CM;
      iii. Bear all costs of remedial works and the re-test. No extension of time will be allowed.

TEST PROCEDURES FOR FOUL DRAINAGE

DRA1.T210.7 TESTING FOR FOUL WATER DRAINAGE

1. Testing Arrangements:
   a. Carry out test to the installed foul water drainage pipework. Test to be carried out in the presence of the CM’s representative;
   b. Submit method statements for testing, together with details of appropriate type of testing equipment, for Approval by CM;
   c. Provide clean water, colour solution and appropriate apparatus for testing;
   d. Ensure colour solution do not stain or damage the installed permanent work including tile, tile grout, pipe and fittings etc. Clean and remove water stain on the surface of the finishes and pipework, caused by the test if any, carefully.

2. Testing Samples:
   a. Test pipes as soon as practical after the completion of each section of pipework and before the installation of the kitchen sinks, wc pans, wash hand basins and the associated bottle traps in accordance with the following requirements:
i. For foul water drainage pipe above the level of the lowest sanitary appliance, one test for every 50 domestic flats or part thereof;

ii. For foul water drainage pipe below the level of the lowest sanitary appliance, one test for every 20 pipes or part thereof.

b. Each test section and the exact extent of the pipework arrangement for each test shall be determined by CM.

3. Testing Methods:

a. Ensure that all pipe runs are clear of obstructions by visual examination, or by throwing a ball into the pipework or other method Approved by CM before testing;

b. Test foul water drainage pipe above the level of the lowest sanitary appliance in accordance with either air test or water test as follows:

i. Air Test to BS 5572:1994, in particular:
   - Fully charge water seals of all sanitary appliances;
   - Insert test plugs in open ends of pipework being tested;
   - Test with air using Approved testing equipment, at a pressure equal to 38 mm water gauge;
   - Acceptance standard: the testing pressure specified above can be maintained for 3 minutes;

ii. Water Test:
   - Maximum height of each test section to be one storey high;
   - Disconnect P-traps from the floor drains and insert plugs to the open ends of the P-traps;
   - Insert upstand pipes to extend the w.c. soil pipe, the washing machine P-trap, the wash hand basin and the kitchen sink bottle traps, such that the tops of the extended pipes are about 150 mm higher than the top of the horizontal anti-syphonage pipe (asp) installed at the external wall;
   - Plug the lower end of both the soil and waste pipe and the main ventilating pipe being tested;
   - Fill pipework with coloured water up to the tops of the upstand pipes;
   - Acceptance standard: no visual sign of leakage shall be observed within 5 minutes after the coloured water has topped the upstand pipes;
   - Make good the pipework after testing in accordance with method Approved by CM, e.g. using slip or plain coupling fittings.

c. Water test foul water drainage pipe below the level of the lowest sanitary appliance up to the first underground manhole to be generally in accordance with BS 5572:1994 and as follows:

i. Inspect the whole section of pipework to ensure no visual defects are found;

ii. Insert test plug in the lower end of pipe within the first underground manhole;

iii. Fill pipe with water up to flood level of lowest sanitary appliance or to a maximum static head of 5 m measured from the plugged end;

iv. Acceptance standard: no visual sign of leakage can be observed within 15 minutes after the filling of water.

d. Submit three copies, or other number of copies as directed by the CM, of the testing reports for the tests carried out, in a format to be agreed with the CM, within 1 week upon completion of testing for Approval.
4. Non-compliance:
   a. In the event that any one set of the test as specified in sub-clauses (3)(b) & (3)(c) above fails to meet the requirements:
      i. Take three separate samples for re-test of the same type of pipework arrangement that failed the test;
      ii. In the event of any failure on the re-test, take 3 additional samples of the same type of pipework arrangement for further re-tests. Repeat the re-test until all samples are tested satisfactorily to the acceptance standards of the air test as stated in (3)(b)(i) or the water test as stated in (3)(b)(ii) of (3)(c)(iv) as appropriate;
      iii. Rectify all pipeworks that failed the tests;
      iv. Re-test all rectified pipeworks to satisfaction of the CM;
      v. Bear all associated costs, including re-tests and rectification works, and no extension of time will be allowed.

DRA1.T220.7 REPETITIVE FLUSHING TEST (RFT) FOR COMMON W-TRAP SYSTEM

1. Testing Arrangements:
   a. Carry out test to the installed foul water drainage pipework at sample flat(s) / mock-up flat(s) fitted with sanitary fitments in accordance with sub-clause (3) below, and in the presence of the CM's representative. The sample flat(s) / mock-up flat(s) shall be selected by CM's representative;
   b. Prepare the result for CM's submission to ICU for record;
   c. Provide clean water, detergent and appropriate apparatus for testing. Submit the details of the appropriate type of testing equipment to CM for approval;
   d. Clean and remove dirt / blockage on the pipework and fitments, which may affect the test result.

2. Testing Samples:
   a. Test the pipes and fitments connected to the common W-tap system as soon as practical after the completion of the pipework installation for shower areas and wash hand basins of the various flat types of selected sample flat(s) / mock-up flat(s) including the installation of the wash hand basins completed with the associated bottle traps;
   b. One test for each W-trap connected to the floor drain in bathroom / kitchen of each flat type of selected sample flat(s) / mock-up flat(s);
   c. One set of tests for each flat type of drainage arrangement for the selected sample flat(s) / mock-up flat(s). The number of selected sample flat(s) / mock-up flat(s) shall be determined by CM.

3. Testing Methods:
   a. Ensure that all pipe runs are clear of obstructions by visual examination or other method. Obtain CM's approval before commencing the test;
   b. Carry out test to the 40 mm diameter W-trap connected to wash hand basin as follows:
      i. Measure and mark the water level of the wash hand basin filled up with approximate 6 litres of water;
      ii. Measure and control the speed of water flowing from the tap of the wash hand basin at 0.15 litre per second;
      iii. Fill the wash hand basin with water to reach the marked level;
iv. Add 10 gram of detergent into the water and stir it well to form a soap solution. Do not beat up the soap solution to create a large amount of foam;

v. Unplug the outlet of the wash hand basin and turn on the tap to flush all the residual foam (if any) out of the wash hand basin simultaneously. The time taken to flush out all the residual foam should be from 30 seconds to 1 minute;

vi. Observe and record any overflowing of foam from the floor drain;

vii. Repeat the test cycle as described in sub-clauses (b)(i) to (b)(vi) above for 7 times and observe any foam flooding from the floor drain;

viii. Acceptance standard: no visual sign of overflowing of foam from the floor drain is observed throughout the 7 test cycles. If any foam discharges outside the vertical grating and floods the bathroom or kitchen floor in any one test cycle, it is not required to continue with the remaining test cycles and the test is deemed to be failed.

c. Carry out test to the 50 mm diameter W-trap connected to the shower area as follows:

i. Measure and control the speed of water flowing from the shower head at 0.1 litre per second;

ii. Fill the shower area with water to reach approximate 40 mm deep measured at lowest point;

iii. Add 10 gram of detergent into the water and stir it well to form a soap solution. Do not beat up the soap solution to create a large amount of foam;

iv. Unplug the outlet of the shower area and flush all the residual foam with water from shower head (if any) out of the shower area simultaneously. The time taken to flush out all the residual foam should be from 1 minute to 2 minutes;

v. Observe and record any overflowing of foam from the floor drain;

vi. Repeat the test cycle as described in sub-clauses (c)(i) to (c)(v) above for 10 times and observe any foam flooding from the floor drain;

vii. Acceptance standard: no visual sign of overflowing of foam from the floor drain is observed throughout the 10 test cycles. If any foam discharges outside the vertical grating and floods the bathroom or kitchen floor in any one test cycle, it is not required to continue with the remaining test cycles and the test is deemed to be failed.

d. Within one week upon completion of the tests, submit for Approval three copies of test reports or other number of copies of test reports as directed by the CM. Agree with CM the format of the test report.

4. Non-compliance:

a. In the event that any one set of the test as specified in sub-clauses (3)(b) and (3)(c) above has failed to meet the requirements, carry out re-testing as follows:

i. Record the no. of the test cycle for which the test has failed;

ii. Clean out the pipeworks and check the pipe alignment and arrangement;

iii. Take the same pipework arrangement that has failed the test for re-test in accordance with sub-clause (3) above.

b. In the event that the same pipework arrangement has failed the re-test, carry out further tests as follows:

i. Take the pipework arrangement of other selected flats for testing;
ii. Carry out the tests in accordance with sub-clause (3) until all selected samples have satisfactorily fulfilled the acceptance standards stated in sub-clauses (3)(b)(viii) or (3)(c)(vii) as appropriate;

iii. Rectify all pipeworks that have failed the tests as instructed by CM;

iv. Re-test all rectified pipeworks to satisfaction of the CM;

v. Bear all associated costs including costs for carrying out re-tests and rectification works, and no extension of time will be allowed.

**DRA1.T230.7 MULTIPLE FLUSHING TEST (MFT) FOR COMMON W-TRAP SYSTEM**

1. Testing Arrangements:
   a. Carry out test to the installed foul water drainage pipework fitted with sanitary fitments and connected to the manholes in accordance with sub-clause (3) below, and in the presence of the CM's representative;
   b. Carry out the test procedure simultaneously in each flat served by the same soil and waste stack at 6 selected floors as determined by CM;
   c. Provide clean water, detergent and appropriate apparatus for testing. Submit the details of the appropriate type of testing equipment to CM for approval;
   d. Clean and remove dirts / blockage on the pipework and fitments, which may affect the test result.

2. Testing Samples:
   a. Test the pipes and fitments connected to common W-tap system as soon as practical after the completion of the installation of the pipework and fitments of all the flats served by the selected soil and waste stack(s);
   b. Only one set of tests for the selected soil and waste stack as determined by the CM;
   c. One test for each W-trap connected to the floor drain in bathroom / kitchen of each flat at the 6 selected floors as determined by the CM. The selected floors shall include the lowest 2 floors served by soil and waste stack, 3 other consecutive floors share the same cross vent / balancing pipe of the soil and waste stack and one extra floor from other levels of the same soil and waste stack.

3. Testing Methods:
   a. Ensure that all pipe runs are clear of obstructions by visual examination or other method. Obtain CM's approval before commencing the test;
   b. Carry out test to the 40 mm diameter W-trap connected to wash hand basin as follows:
      i. Measure and mark the water level of the wash hand basin filled up with approximate 6 litres of water;
      ii. Measure and control the speed of water flowing from the tap of the wash hand basin at 0.15 litre per second;
      iii. Ensure sufficient supply of flush water is available for refilling the cistern of water closet after flushing;
      iv. Fill the wash hand basin with water to reach the marked level;
      v. Add 10 gram of detergent into the water and stir it well to form a soap solution. Do not beat up the soap solution to create a large amount of foam;
      vi. Unplug the outlet of the wash hand basin and turn on the tap to flush all the residual foam (if any) out of the wash hand basin and flush the water closet simultaneously at all 6 selected floors. The time taken to flush out all the residual foam in wash hand basin should be from 30 seconds to 1 minute;
vii. Observe any abnormal flow speed of discharge from wash hand basins and record any overflowing of foam from the floor drain and any bubbling / flooding from the water closet;

viii. Repeat the test cycles as described in sub-clauses (b)(i) to (b)(vii) for 3 times and observe any foam flooding from the floor drain and any bubbling / flooding from the water closet;

ix. Acceptance standard: no visual sign of overflowing of foam from the floor drain or bubbling / flooding from the water closet can be observed throughout the 3 test cycles. If any foam discharges outside the vertical grating and floods the bathroom or kitchen floor in any one test cycle, or there is bubbling / flooding from the water closet in any one test cycle, it is not required to continue with the remaining test cycles and the test is deemed to be failed.

c. Carry out test to the 50 mm diameter W-trap connected to shower area as follows:

i. Measure and control the speed of water flowing from the shower head at 0.1 litre per second;

ii. Ensure sufficient supply of flush water is available for refilling the cistern of water closet after flushing;

iii. Fill the shower area with water to reach approximate 40 mm deep measured at lowest point;

iv. Add 10 gram of detergent into the water and stir it well to form a soap solution. Do not beat up the soap solution to create a large amount of foam;

v. Unplug the outlet of the shower area and flush all the residual foam with water from shower head (if any) out of the shower area and flush the water closet simultaneously. The time taken to flush out all the residual foam from the shower area should be from 1 minute to 2 minutes;

vi. Observe any abnormal flow speed of discharge from shower areas and record any overflowing of foam from the floor drain and any bubbling / flooding from the water closet;

vii. Repeat the test cycle as described in sub-clause (c)(i) to (c)(vi) for 3 times and observe any foam overflowing from the floor drain and any bubbling / flooding from the water closet;

viii. Acceptance standard: no visual sign of overflowing of foam from the floor drain is observed throughout the 3 test cycles. If any foam discharges outside the vertical grating and floods the bathroom or kitchen floor in any one test cycle, or there is any bubbling / flooding from the water closet in any one test cycle, it is not required to continue with the remaining test cycles and the test is deemed to be failed.

d. Within one week upon completion of the tests, submit for Approval three copies of test reports or other number of copies of test reports as directed by the CM. Agree with CM the format of the report;

e. Prepare the findings for CM’s submission to ICU for record.

4. Non-compliance:

a. In the event that any one set of the test as specified in sub-clauses (3)(b) and (3)(c) above has failed to meet the requirements, carry out re-testing as follows:

i. Record the no. of test cycle for which the test has failed;

ii. Clean out the pipeworks and check the pipe alignment and arrangement;

iii. Take the same selected soil and waste stack that has failed the test for re-test in accordance with sub-clause (3) above.
b. In the event that the same selected soil and waste stack has failed the re-test, carry out further tests as follows:
   i. Take the pipework arrangement of other selected soil and waste stack for testing;
   ii. Carry out the tests in accordance with sub-clause (3) above until all selected samples have satisfactorily fulfilled the acceptance standards stated in sub-clauses (3)(b) (ix) or (3)(c)(viii) as appropriate;
   iii. Rectify all pipeworks that have failed the tests as instructed by CM;
   iv. Re-test all rectified pipeworks to satisfaction of the CM;
   v. Bear all associated costs including costs for carrying out re-tests and rectification works, and no extension of time will be allowed.

SURVEILLANCE TESTS FOR UPVC DRAINAGE PIPES AND FITTINGS

DRA1.T310.7  SURVEILLANCE TESTS

1. Testing Arrangements:
   a. When Instructed, surveillance tests shall be carried out by CM's Representative, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the followings pertaining to surveillance tests:
      i. Provide attendance on the Site;
      ii. Provide, deliver and collect samples etc. as directed by CM or as specified.

2. Testing Samples:
   a. Provide one set of test sample from the batch of material delivered to Site under the delivery note as specified in DRA1.M150 (3)(a)(ii) or as instructed by CM;
   b. One set of test sample shall consist of pipes and fittings sufficient to carry out test in DRA1.M150 (2)(f)(i) and (iii) or (2)(f)(ii) and (iii) or as instructed by CM.

3. Testing methods:
   As per DRA1.M150 (2)(f).

4. Non-compliance:
   a. In the event that the testing samples fail to meet the testing requirements, follow either one of the following actions:
      i. Remove the representative batch off Site; or
      ii. Carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 on three separate sets of samples selected by the CM from the representative batch. In case of any one sample fails the re-test, remove the representative batch off Site.

   b. When the representative batch of uPVC pipes and fittings is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 for one sample selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clauses (4)(a);
c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.
DRA2 M010.7 APPLICATION OF OTHER WORKSECTIONS

The following works and materials must comply with the following Worksections:
1. Handrailings, ladders, stairs, metal flooring, toe plates and safety chains:
   a. Worksection MEW for works carried out under site formation / road and drainage works and slopeworks contracts; or
   b. Worksection MET1 for all other works not mentioned in sub-clause (1)(a) above.
2. Earthworks: Worksection EAR1;
3. Concrete and reinforcement: Worksections CON1 and CON3 respectively;
4. Formwork: Worksection FOR;

DRA2 M020.7 DEFINITIONS

In this Section, pipes for drainage works are defined as pipes for conveying sewage or surface water.

PIPES AND FITTINGS

DRA2 M110.7 PRECAST CONCRETE PIPES AND FITTINGS

Complying with BS 5911-1:2002 and having flexible, spigot and socket joints.

DRA2 M120.7 VITRIFIED CLAY PIPES AND FITTINGS

Complying with BS 65:1991 (2003) and:
1. Of the normal glazed, chemical resistant type;
2. With flexible mechanical joints.

DRA2 M130.7 DUCTILE IRON PIPES AND FITTINGS

Complying with BS 4772:1988 and:
1. Lined internally with cement mortar;
2. Coated externally with a bituminous coating.

DRA2 M140.7 FLEXIBLE JOINTS FOR DUCTILE IRON PIPES AND FITTINGS

Push fit type and capable of withstanding:
1. A minimum angular deflection of 4º;
2. A minimum withdrawal of 38 mm when there is no deflection of the joint.
DRAINAGE BELOW GROUND

DRA2.M150.7 FLANGED JOINTS FOR DUCTILE IRON PIPES AND FITTINGS

DRA2.M160.7 DUCTILE IRON PIPES TO BE BUILT IN
Provide puddle flanges by welding to pipes which are to be built into structures.

DRA2.M170.7 GREY IRON PIPES AND FITTINGS
Complying with BS 4622:1970.

DRA2.M180.7 SUB-SOIL PIPES AND FITTINGS
1. Vitrified clay pipes and fittings complying with BS 65:1991 and of the normal glazed, chemical resistant type with plain ends and flexible sleeved joints;
2. Precast porous concrete pipes complying with BS 5911 Part 114:1992;

DRA2.M190.7 UPVC GRAVITY SEWAGE AND SURFACE WATER PIPES AND FITTINGS
Complying with the following:
1. Pipes from 110 mm to 160 mm in diameter: BS 4660:2000;

DRA2.M200.7 JOINTING SYSTEM FOR UPVC PIPES AND FITTINGS
Solvent welded, spigot and socket joints.

DRA2.M210.7 JOINTING SYSTEM FOR UPVC PIPES AND FITTINGS
Flexible spigot and socket joints with elastomeric joint rings.

DRA2.M220.7 UPVC PRESSURE PIPES AND FITTINGS
Complying with BS 3506:1969:
1. Class: dependant on the pressure rating;
2. With joints and fittings complying with the following:

DRA2.M230.7 CAST IRON PIPES AND FITTINGS
Complying with BS 437:1978.

JOINTING MATERIALS

DRA2.M305.7 GENERAL
Caulking compound and all solvent cement for jointing uPVC pressure pipes shall be in compliance with the prescribed limits of VOC content as set out in the Air Pollution Control (Volatile Organic Compound) Regulation.
DRA2.M310.7  SOLVENT CEMENT FOR UPVC PRESSURE PIPES

DRA2.M320.7  ELASTOMERIC JOINT RINGS
To BS EN 681-1:1996, Type WC and:
1. Compatible with the type of joint;
2. Unless otherwise Approved, obtained from the same manufacturer as the joint.

DRA2.M330.7  ELASTOMERIC JOINT RINGS FOR FLANGED PIPES
Of the inside diameter, bolt circle type, and:
1. Natural rubber;
2. 3.2 mm thick, with other dimensions in accordance with BS 4865:Part 1:1989.

DRA2.M340.7  DETACHABLE COUPLINGS AND FLANGE ADAPTERS
Approved proprietary type and capable of accommodating the angular deflection and straight draw stated in the following table:

<table>
<thead>
<tr>
<th>Nominal Diameter of Pipe</th>
<th>Angular Deflection</th>
<th>Straight Draw</th>
<th>Angular Deflection</th>
<th>Straight Draw</th>
</tr>

</table>

DRA2.M350.7  JOINTING RINGS
Of types recommended by the manufacturer of the pipes being jointed.

DRA2.M360.7  LEAD
Molten lead.

DRA2.M370.7  GASKIN
Tarred spun yarn or hemp.

DRA2.M380.7  COLD CAULKING COMPOUND
An Approved proprietary brand.
BOLTS, NUTS AND WASHERS

DRA2.M410.7 GENERAL
Ensure that all bolts and nuts are compatible with the type of joint and, unless otherwise Approved, obtained from the same manufacturer as the joint.

DRA2.M420.7 FLANGED JOINTS, DETACHABLE COUPLINGS AND FLANGE ADAPTORS
Complying with the following:
1. ISO metric, black, hexagon bolts, screws and nuts: BS 4190:2001;
2. Metal washers: BS 4320:1968;
3. Coating to bolts, nuts and washers: hot dip galvanised, or treated as otherwise Approved.

DRA2.M430.7 STAINLESS STEEL
1. Bolts and nuts: to BS EN ISO 3506-1&2:1998, Steel grade A4 and property Class 80;

DRA2.M440.7 SPHEROIDAL GRAPHITE IRON BOLTS
Grade 500/7 metal, complying with BS 2789:1985.

BEDDING, HAUNCHING AND SURROUNDING MATERIALS

DRA2.M510.7 AGGREGATES FOR GRANULAR BED AND GRANULAR FILL
1. Granular bed to be Type A material and granular fill to be Type B material;
2. Type A or Type B material to be hard, clean, crushed slag, gravel, crushed rock, crushed concrete or crushed inert demolition material and:
   a. Having the ten percent fines values of at least 50 kN;
   b. Material passing the 425 μm BS test sieve to be non-plastic when tested in accordance with BS 1377:Part 2:1990 (as modified in accordance with Geospec 3);
   c. Having a grading within the limits of the following table:
Range of grading of Type A and Type B materials

<table>
<thead>
<tr>
<th>BS test sieve</th>
<th>Percentage by mass passing</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metric</td>
<td>Type A</td>

</tbody>
</table>

d. Obtained from an Approved source.

3. Aggregates for granular bed to have the compaction fraction values stated in DRA2.T290.

**DRA2.M520.7 JOINT FILLER**

For joints in concrete bed, haunch and surround:

1. A firm, single thickness, non-rotting filler;

2. Unless otherwise specified in the Drawings, the thicknesses of joint filler are shown in the following table:

<table>
<thead>
<tr>
<th>Joint Filler for Concrete Bed, Haunch and Surround</th>
</tr>
</thead>
<tbody>

</table>

**DRA2.M530.7 COMPRESSIBLE PADDING**

For insertion between pipes and supports: bitumen damp-proof sheeting to BS 743: 1970.

**DRA2.M540.7 CONCRETE**

1. Concrete grade 20/20 as Worksection CON1, unless otherwise specified;

2. The aggregate for such Grade 20 concrete to be natural stone, crushed rock or crushed concrete and to comply with the following minimum cementitious content:

<table>
<thead>
<tr>

MANHOLES, CHAMBERS AND GULLIES

DRA2.M610.7 PRECAST CONCRETE MANHOLES
To BS 5911-3:2002, with cover slabs and reducing slabs reinforced as required to comply with the load test requirements stated in BS 5911-3:2002 and with rebated joints.

DRA2.M620.7 PRECAST CONCRETE CHAMBERS AND GULLIES
To BS 5911:Part 2:1982 with:
1. Cover slabs reinforced as required to comply with the load test requirements stated in BS 5911:Part 2:1982;
2. Rebated joints between precast units;
3. Types of cement used in manufacture either:
   a. As stated in BS 5911:Part 2:1982; or
   b. A combination of PFA and PC or PFAC to BS EN 197-1:2000 in which the PFA does not exceed 40% by mass of the total cementitious content.

DRA2.M630.7 VITRIFIED CLAY GULLIES

DRA2.M640.7 STEP IRONS
To BS 1247:1990 and:
1. Manufactured from malleable cast iron to BS 6681:1986;
2. Hot dip galvanised.

DRA2.M650.7 COVERS, GULLY GRATINGS AND OVERFLOW WEIRS
Grade EN-GJL-150 cast iron to BS EN 1561:1997 and:
1. With nuts and bolts complying with BS 4190:2001;
2. Cleanly cast, free from air holes, sand holes, voids due to shrinkage, gas inclusions or other causes, cold shuts and chill and neatly dressed and fettled;
3. With dimensions as indicated on the Drawings;
4. With manufacturer’s name cast integrally with the unit in a raised form, protected with bituminous coating. Covers shall have the raised design as shown on the Drawings;
5. Capable of withstanding the minimum test loads and having the minimum masses given in the following tables as appropriate:

**DUCTILE IRON MANHOLE COVERS AND FRAMES**

Spheroidal graphite cast iron (ductile iron) of grades EN-GJS-500-7 to BS EN 1563:1997 and:

1. Conform to the relevant requirements of BS EN 124:1994;
2. Bolts for loosely coupling separate sections of covers shall be stainless steel hexagon headed complete with hexagon nuts, of grade 302 or 304 to BS 970:Part 1:1996 with dimensions complying with BS 4190:2001;
3. Cleanly cast, free from air holes, sand holes, voids due to shrinkage, gas inclusions or other causes, cold shuts, chill and any surface defects and neatly dressed and fettled;

4. With dimensions as indicated on the Drawings and have sharp edges removed;

5. Covers shall have the raised design as shown on the Drawings with manufacturer's name cast integrally with the unit in a raised form. All markings shall be clearly legible;

6. Coated with 2 layers of black non-toxic water-based bituminous coating to BS 3416:1991 after thoroughly cleaned to remove moulding sands, rust or any other impurity. The coating shall be free of bare patches or lack of adhesion;

7. Compatible with their seatings which shall be manufactured in such a way to ensure stability and quietness in use;

8. Bedding material for manhole frames shall be non-shrinkage with compressive strength exceeding 30 N/mm²;

9. Capable of withstanding the minimum test loads and having the minimum masses given in the following table:

<table>
<thead>
<tr>

**VALVES**

**DRA2.M710.7 GENERAL**

Ensure:

1. Handwheels and tee keys turn in a clockwise direction to close the valve;

2. Handwheels have a smooth rim with the direction of opening and closing clearly cast in;

3. The opening effort required at any point on the handwheel does not exceed 250 N when operated against the full unbalanced pressure;

4. Extension stems are of the same grade of stainless steel as the stems and are connected by muff couplings;

5. Handwheels, tee keys, headstocks, guide brackets for stems, supporting brackets, surface boxes and other fittings are cast iron to BS EN 1561:1997.

**DRA2.M720.7 GATE VALVES**

Double flange ended, solid wedge type, to BS 5150:1990 and with:

1. A nominal pressure designation of PN 16 and PN 16 flanges to BS 4504: Part 3:1989;

2. Bodies and wedges of cast iron to BS EN 1561:1997, grade EN-GJL-220 with renewable seat rings made from gunmetal to BS 1400:1985, grade LG2;

3. Stem nuts made from gunmetal to BS 1400:1985, grade LG2;

4. Stems of aluminium bronze to BS 2874:1986, grade CA 104;
5. Stainless steel assembly bolts, as DRA2.M430;
6. Outside screw rising stems with perspex protection tubes and open/close indicators;
7. A fitted plate showing the position of the valve in the closed, quarter closed, half closed, three quarters closed and fully open positions.

**DRA2.M730.7 CHAINS FOR CHAIN OPERATED GATE VALVES**

**DRA2.M740.7 FLAP VALVES**
With the following:
1. Frames and flaps of cast iron to BS EN 1561:1997, grade EN-GJL-220;
2. Sealing faces and hinge pins of gunmetal to BS 1400:1985, grade LG2;
3. The flap hung with double hinges, secured with hinge pins.

**DRA2.M750.7 FLANGE MOUNTING FLAP VALVES**
With flanges PN 16 to BS 4504:Section 3.1:1989.

**DRA2.M760.7 SLUDGE VALVES**
With the following:
1. Bodies and valve sections of cast iron to BS EN 1561:1997, grade EN-GJL-220;
2. Sealing faces and stem nuts of gunmetal to BS 1400:1985, grade LG2;
3. Stems of aluminium bronze to BS 2874:1986, grade CA 104, operating through non-rising stem nuts, housed in bridges bolted over the body sections;

**DRA2.M770.7 AIR VALVES**
Dual orifice elongated body type, with a small orifice valve for releasing air at working pressure, a large orifice valve for allowing air to pass at atmospheric pressure during emptying and filling of the pipework and:
1. A pressure rating to 3 bars;
2. The bodies and covers of small and large orifice valves in cast iron to BS EN 1561:1997, grade EN-GJL-220;
4. Small orifice valves with an adjustable Vitron orifice button to ensure positive sealing and:
   a. Valve inlet size: 75 mm;
   b. Valve outlet size: 25 mm;
   c. Venting orifice size: 5 mm.
5. Large orifice valves with a Buna-N seat and a valve inlet and outlet size of 75 mm.

**DRA2.M780.7 BOLTS AND NUTS FOR SECURING VALVES**
Indented stainless steel foundation bolts, as DRA2.M430.
ANCILLARY MATERIALS

DRA2.M810.7 ANTI-CORROSION TAPE
Approved proprietary type of a rubber/bitumen compound with a fabric reinforcement, backed with a PVC film, and:
1. With a high resistance to cathodic disbonding, acids and alkalis;
2. Having the minimum properties stated in the following table:

<table>
<thead>
<tr>
<th>Property</th>
<th>Minimum Value (except where stated)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Type 1 (for pipes below 700 mm diameter)</td>

</tbody>
</table>

DRA2.M820.7 PRIMER AND MASTIC FILLER FOR USE WITH ANTI-CORROSION TAPE
An Approved type recommended by the tape manufacturer and compatible with the tape.

DRA2.M830.7 BITUMINOUS COATINGS FOR HOT APPLICATION
For the protection of iron and steel, including suitable primers where required: to BS 4147:1980 (1987), Type I, grade C.

DRA2.M840.7 BLACK BITUMEN COATING FOR COLD APPLICATION
To BS 3416:1991, Type II.

DRA2.M850.7 BITUMINOUS COATINGS FOR REPAIRS
Compatible with the adjacent coating.

DRA2.M860.7 POLYETHYLENE SHEETING
Impermeable sheeting, 0.125 mm thick.

DRA2.M870.7 GROUT FOR FILLING REBATES AND BOX-OUTS
An Approved proprietary type containing a non-shrink additive.
DRA2.M880.7 **FOAM CONCRETE FILLING FOR ABANDONED SYSTEMS**

Composed of PC (or PFAC), fine aggregate obtained from natural or recycled aggregate, water, admixtures for accelerating or retarding the setting time and a foaming agent to reduce the density and to produce a flowing, self levelling material.

DRA2.M890.7 **GROUT FILLING FOR ABANDONED SYSTEMS**

A mixture of one part PC, 15 parts PFA and the minimum of water necessary to achieve a consistency suitable for flowing into pipes, culverts, manholes and voids, without the addition of sand or admixtures unless otherwise Approved.

DRA2.M900.7 **CONCRETE FOR THRUST AND ANCHOR BLOCKS**

Concrete grade 20/20 as Worksection CON1. Aggregates for the concrete shall be natural stone, crushed concrete or recycled aggregates.

DRA2.M910.7 **MORTAR**

Consisting of (by mass):

1. 1 part cement (complying with CON1); to
2. 3 parts of fine aggregate (sand or crushed rock to BS 1200:1967 and passing a 5 mm BS Test Sieve); with
3. The minimum amount of water to achieve a consistency suited to the required work.

DRA2.M920.7 **MARKER BLOCKS**

Precast in grade 20/20 concrete as Worksection CON1 and:

1. Size: 150 mm × 150 mm × 150 mm;
2. With the letters ‘CD’ marked on the upper surface;
3. With a hook cast into the lower surface.

**SUBMISSIONS**

DRA2.M1010.7 **PIPES, JOINTS AND FITTINGS**

Submit the following to the CM at least 14 days before the first delivery of the material to the Site:

1. Manufacturer’s literature including details of:
   a. Manufacturing process;
   b. Pressure and temperature ratings;
   c. Permissible values of straight draw and angular deflection of flexible joints;
   d. Recommendations for handling, storage, laying, jointing and repair;
   e. Drilling and tapping equipment for connections to pipes.
2. A certificate showing the manufacturer’s name, the date and place of manufacture and showing that the material complies with the requirements of this specification and including the results of any tests specified. Submit such a certificate for each batch of material delivered to Site.

DRA2.M1020.7 **ANTI-CORROSION TAPE AND JOINT FILLER**

Submit the following to the CM at least 14 days before the first delivery of the material to the Site:
1. Manufacturer's literature for anti-corrosion tape;

2. Certificates for anti-corrosion tape and joint filler delivered to Site showing the manufacturer's name, the date and place of manufacture and showing that the material complies with the requirements of this specification and including the results of any tests specified. Submit such certificates for each batch of material delivered to Site.

DRA2.M1030.7 AGGREGATES FOR GRANULAR BED
At least 14 days before the first delivery of any aggregate to the Site and thereafter each time the source is changed, submit to the CM, a certificate for each type of aggregate showing its source and that it complies with the requirements of this specification and including the results of any tests specified.

DRA2.M1040.7 MANHOLES, CHAMBERS AND GULLIES
At least 14 days before the first delivery of the material to the Site and thereafter, with each batch delivered to the Site, submit the following to the CM:

1. A certificate for each type of manhole and chamber unit and for each type of gully, showing the manufacturer's name, the date and place of manufacture and showing that the material complies with the requirements of this specification and including the results of any tests specified;

2. A certificate for step irons, showing the manufacturer's name, the date and place of manufacture and showing that they comply with the requirements of this specification and including the results of any tests specified;

3. A certificate for each type of manhole cover, gully grating and kerb overflow weir, showing the manufacturer's name, the date and place of manufacture and showing that the material complies with the requirements of this specification and including the results of any tests specified.

DRA2.M1050.7 VALVES
Submit the following particulars to the CM at least 28 days before the first delivery of the material to the Site:

1. Manufacturer's literature, including details of:
   a. Materials;
   b. Pressure ratings;
   c. Recommendations for handling, storage and installation;

2. Drawings showing details of the valves, including lengths of stems and details of handwheels, tee keys, extension stems, headstocks, guide brackets for stems, supporting brackets, surface boxes and other fittings, and positions and sizes of rebates and box-outs.

DRA2.M1060.7 CONCRETE AND GROUT FILLING FOR ABANDONED INSTALLATIONS
At least 7 days before grouting starts, submit to the CM, the following particulars of the foam concrete and grouting procedure for filling abandoned pipes, culverts, manholes and voids:

1. Proportions of each constituent;

2. Source of supply;

3. Details of mixing;

4. Setting time;

5. Strength;
6. Shrinkage expected (for PC/PFA grout);
7. Details of mixing and grouting equipment;
8. Method of grouting including details of trials.
WORKMANSHIP

GENERAL

DRA2.W010.7 DIVERSIONS OF FLOW
Unless otherwise permitted by the CM, submit particulars of any proposed procedures for the diversion of any existing flows, at least 14 days before the diversion starts.

TRANSPORT, HANDLING AND STORAGE

DRA2.W110.7 PIPES, JOINTS AND FITTINGS GENERALLY
Transport, handle and store pipes, joints and fittings in accordance with the manufacturer's recommendations and:
1. In a manner which will not result in their damage, deformation or contamination;
2. Protect pipes, joints and fittings from damage;
3. Do not use any damaged pipes, joints and fittings in the permanent work unless otherwise Approved;
4. Handle pipes and fittings manually or by using lifting appliances or chains, wire rope or canvas slings of a type recommended by the manufacturer and agreed by the CM and:
   a. Do not use hooks;
   b. Place slings around the pipes and fittings and provide padding at the points of contact between pipes and fittings and metal lifting appliances and slings;
   c. Do not handle pipes by means of metal slings passed through the pipes.
5. Do not subject pipes and fittings to rough handling, shock loading, or dropping and do not roll down ramps unless otherwise Approved, in which case the ramps must be padded.

DRA2.W120.7 UPVC PIPES, JOINTS AND FITTINGS
Protect from exposure to conditions which may affect the material.

DRA2.W130.7 BOLTS AND NUTS
Ensure bolts and nuts are packed in sealed metal containers.

DRA2.W140.7 ELASTOMERIC JOINT RINGS
1. Ensure elastomeric joint rings are packed in bags and that lubricant for joints is stored in sealed containers, marked to identify the contents;
2. Protect the rings and lubricant from conditions which may affect the material.

DRA2.W150.7 STORING PIPES
1. Store pipes horizontally at least 75 mm above the ground on wedged timber bearers. Securely wedge the bottom layers and the outer pipes in each layer to prevent sideways movement;
2. Store spigot and socket pipes with the sockets alternating and in such a manner that loads are not applied to the sockets;
3. Do not allow the stacks to exceed 2 m in height unless recommended by the manufacturer or otherwise Approved;

4. Do not string pipes out along the route of the pipeline unless otherwise approved.

**DRA2.W160.7**

**STORING ANTI-CORROSION TAPE AND JOINT FILLER**

Store in accordance with the manufacturer's recommendations in a dry, weatherproof store with a raised floor.

**DRA2.W170.7**

**GRANULAR BEDDING MATERIALS**

Do not handle aggregates for granular bedding in a manner which will result in the mixing of the different types and sizes, or in contamination of the aggregates. Store different types and sizes of aggregates in separate stockpiles.

**DRA2.W180.7**

**MANHOLES, CHAMBERS AND GULLIES**

1. Lift units for manholes, chambers and gullies only at the lifting points recommended by the manufacturer and do not subject them to rough handling, shock loading or dropping;

2. Store units off the ground on level supports which will not result in their damage, deformation or contamination. Protect all units from damage and do not use damaged units in the permanent work unless otherwise Approved.

**DRA2.W190.7**

**STORING COVERS, GRATINGS AND KERB OVERFLOW WEIRS**

Store manhole covers, gully gratings, kerb overflow weirs and valves, including fittings, off the ground on level supports which will not result in their damage, deformation or contamination. Protect all units from damage and do not use damaged units in the permanent work unless otherwise Approved.

### EXCAVATION

**DRA2.W210.7**

**GENERAL**

Only commence the excavation of a trench when the nature, location and size of existing utilities which may be affected by the excavation have been ascertained and the setting out details have been Approved.

**DRA2.W220.7**

**TRENCH WIDTH**

Do not exceed the relevant effective trench widths stated in the following table for the different diameters of pipe:

<table>
<thead>
<tr>
<th>Nominal Diameter of Pipe (mm)</th>
<th>Effective Trench Width (mm)</th>
<th>Nominal Diameter of Pipe (mm)</th>
<th>Effective Trench Width (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>550</td>
<td>1125</td>
<td>2200</td>
</tr>
<tr>
<td>150</td>
<td>600</td>
<td>1200</td>
<td>2300</td>
</tr>
<tr>
<td>225</td>
<td>700</td>
<td>1350</td>
<td>2450</td>
</tr>
<tr>
<td>300</td>
<td>750</td>
<td>1500</td>
<td>2600</td>
</tr>
<tr>
<td>375</td>
<td>1050</td>
<td>1650</td>
<td>2800</td>
</tr>
<tr>
<td>450</td>
<td>1150</td>
<td>1800</td>
<td>2950</td>
</tr>
<tr>
<td>525</td>
<td>1200</td>
<td>1950</td>
<td>3150</td>
</tr>
<tr>
<td>600</td>
<td>1350</td>
<td>2100</td>
<td>3350</td>
</tr>
</tbody>
</table>
Measure the effective trench width as stated in the Contract.

**LAYING AND BEDDING PIPES**

**DRA2.W310.7 GENERAL**

Allow the CM to inspect the trenches, bedding, pipes, joints, fittings and valves before pipelaying for drainage works starts. Inform the CM 24 hours, or such shorter period as may be agreed by the CM, before pipelaying starts in any part of the permanent work and obtain his permission to commence.

**DRA2.W320.7 INSPECTION**

Inspect pipes, joints, fittings and valves, including internal and external coatings, immediately before and after pipelaying. Inspect valves to ensure that they are in working order and are capable of being fully opened and closed. Remove all deleterious material and repair all damage immediately before and after pipelaying.

**DRA2.W330.7 CLEANLINESS**

Keep the inside of pipelines clean and free from water, dirt, stones, debris and other deleterious material. Except when pipes are being jointed, seal the open ends of pipelines with a wooden plug or by other Approved methods.

**DRA2.W340.7 FLOTATION**

Undertake measures to prevent the flotation of pipes.

**DRA2.W350.7 LAYING PIPES**

Lay, test and backfill to follow as closely as possible on the excavation of the trench and:

1. Unless otherwise permitted by the CM, lay pipelines in an uphill direction with the sockets facing uphill;
2. Lay pipes in such a manner that water will not pond in locations with zero or shallow gradients and such that the pipes will comply with the specified tolerances.

**DRA2.W360.7 BEDDING PIPES**

1. Clean surfaces on which pipes will be laid and remove any objects which may damage the pipes before they are laid;
2. Shape the bottoms of trenches on which pipes will be laid directly, to support the pipes uniformly along the length of the barrel;
3. Dig holes to prevent pipes from resting on their sockets and to allow the pipes to be jointed.
DRA2.W370.7 BLANK ENDS

Mark the ends of pipes which do not terminate at a manhole, chamber, gully or structure with marker blocks, and:

1. Connect the marker block to the plug at the end of the pipe with a wire;
2. Set the marker block flush with the surface of the adjacent permanent works.

CUTTING PIPES

DRA2.W410.7 GENERAL

Cut pipes and prepare ends in accordance with the manufacturer's recommendations, using purpose made equipment recommended by the manufacturer or otherwise Approved for cutting the pipes and:

1. Cut ends of pipes square or to the correct angle;
2. Do not damage the pipe coatings;
3. Trim and chamfer the cut ends to suit the type of joint;
4. Cut pipes which terminate at the inside face of underground structure such that the end of the pipe is flush with the face.

DRA2.W420.7 ELASTOMERIC JOINTS

Trim and chamfer cut ends in such a manner that elastomeric joint rings will not be damaged by them.

DRA2.W430.7 CLOSING LENGTHS

Do not cut pipes requiring to be cut to form closing lengths until adjacent pipes have been laid and jointed and the length to be cut can be accurately measured.

DRA2.W440.7 PRECAST CONCRETE PIPES

Cut reinforcement in precast concrete pipes which are to be cut, back flush with the concrete and protect with epoxy resin or by other Approved methods.

JOINTING PIPES AND FITTINGS

DRA2.W510.7 GENERAL

Joint pipes in accordance with the manufacturer's recommendations, using Approved equipment and materials recommended by the manufacturer and:

1. Inspect the pipes, joints, fittings and valves, including internal and external coatings, immediately before and after jointing. Remove deleterious material and repair any damage immediately before and after jointing. Clean surfaces which are to be jointed immediately before jointing and clean out pipes with clean water;
2. Ensure all joints in pipelines are watertight;
3. Ensure the width of gaps at joints are in accordance with the manufacturer's recommendations and achieved by marking the outside of the pipe, by using metal feelers or by other Approved methods. Check the position of elastomeric joint rings with by using metal feelers after jointing;
4. Protect gaps at joints in pipes, after jointing, using Approved methods, to prevent dirt, stones or other material from entering the joint.
DRA2.W520.7 FLANGED JOINTS
Correctly orientate bolt holes in flanged joints and joints incorporating bolted components before the bolts are tightened and:
1. Orient holes in flanged joints symmetrically about the vertical diameter, with no bolt holes on the vertical diameter;
2. Position elastomeric joint rings so they will not protrude into the bore of the pipe, temporarily fixing to the face of the flange using the minimum amount of adhesive of a type recommended by the manufacturer. Do not use jointing compound or paste for this purpose;
3. Use the correct size of bolts and nuts and lubricate the threads before tightening using the correct size of spanner. Tighten the bolts to the torque recommended by the manufacturer in diametrically opposite pairs, working around the bolt circle.

DRA2.W530.7 FLEXIBLE COLLAR JOINTS
1. Place elastomeric joint rings in position inside the grooves of the sleeve;
2. Mark each pipe with a location mark at a distance of half the length of the sleeve, minus 3 mm from the end;
3. Smear the ends of the pipes well with lubricant over a distance of at least 100 mm from the end of the pipe;
4. Place the sleeve on the end of the laid pipe and push home to the location mark on the pipe;
5. Place the pipe which is to be jointed to the laid pipe in the sleeve and push home to the location mark.

DRA2.W540.7 PUSH-IN JOINTS
Make push-in joints by smearing the elastomeric joint ring with lubricant and placing the ring in position on the spigot end of the pipe. Place the spigot in the socket of the laid pipe and push home.

DRA2.W550.7 DETACHABLE JOINTS
1. Place both cast iron flanges, the elastomeric joint rings and the central collar over the ends of the pipes before the pipes are placed to the required line and level, leaving a gap of between 5 mm and 6 mm between the ends of the pipes;
2. Move the flanges, elastomeric joint rings and central collar into position at the ends of the pipes, the central collar being placed centrally over the gap between the ends of the pipes before the bolts are tightened.

DRA2.W560.7 FLANGE ADAPTERS
Make joints by placing the flange adapter on the plain end of the pipe before tightening the bolts.

DRA2.W570.7 SOLVENT WELDED JOINTS
Make solvent welded joints by applying solvent cement to the pipes to be jointed, pushing the pipes home and:
1. Do not apply excess solvent and remove surplus cement after jointing;
2. Do not place in the trench, solvent welded pipes jointed outside the trench, until the solvent setting period recommended by the manufacturer has elapsed;
3. Additionally, do not allow any material or thing, contaminated by the solvent to remain in the pipe or in the trench.
**DRA2.W580.7 ELECTROCHEMICAL INSULATION**

Insulate all bolts, nuts and washers from electrochemical interaction with dissimilar metals by non-metallic washers and sleeves.

**DRA2.W590.7 PROTECTION OF FLANGED JOINTS, DETACHABLE COUPLINGS AND FLANGE ADAPTERS**

1. Clean the joint, including bolts and nuts, to remove all moisture, dust, oil grease and deleterious material;
2. Paint nuts and bolts with two coats of bituminous paint and coat the joint with primer;
3. Apply mastic filler in such a manner that all depressions, corners and voids between the bolts and the nuts are filled and a smooth surface is available on which to apply the anti-corrosion tape;
4. Apply at least two layers of anti-corrosion tape to all parts of the joint and to the adjacent pipe for at least 200 mm beyond each end of the joint. Apply the tape in accordance with the manufacturer's recommendations, wrapping it spirally around the joint and the pipe with at least 55% overlap per spiral;
5. Mould the tape manually after application to take up the contours of the parts being protected.

**DRA2.W600.7 CAST IRON PIPES**

Join pipes with either of the following:

1. Gaskin and caulked lead:
   
   Line properly and bring each pipe to the correct level. Wedge up the spigot end concentrically with its respective socket. Tightly caulk the socket with tarred yarn and leave unfilled the required depth for lead. Do not allow the depth of tarred yarn caulking to exceed one quarter of the total depth of the socket. When the tarred yarn has been tightly caulked home, place a jointing ring around the barrel and against the face of the socket. Then pour molten pig lead in to fill the remainder of the socket. Solidly caulk the lead all round the joint with suitable tools and hammers of not less than 1.8 kg weight. Dry the pipes perfectly before making the lead run joints. Use not less than the following quantities of lead in jointing the various sizes of pipes:
   
   a. 2.70 kg for 100 mm internal diameter;
   b. 4.10 kg for 150 mm internal diameter.

2. Cold caulking compound:
   
   Carry out all pipe joints in accordance with the manufacturer's instructions and do not allow jointing material to project into the bore of pipes or fittings.

3. Flexible joints of Approved type:
   
   Carry out all pipe joints in accordance with the manufacturer's recommendations.

**REPAIRS TO COATINGS AND LININGS**

**DRA2.W710.7 GENERAL**

Do not repair damage to coatings and linings unless permitted by the CM. If permitted, carry out repairs using Approved materials recommended by the manufacturer.
THRUST AND ANCHOR BLOCKS

DRA2.W810.7 GENERAL
Use thrust and anchor blocks to resist forces at bends, branches and stopends in pressure pipelines, except where self anchoring joints are used.

DRA2.W820.7 EXCAVATION
Cast the bearing faces or other faces as indicated on the drawings, directly against undisturbed ground and:
1. Trim the faces of excavations to remove all loose material before concreting;
2. Carry out any excavation required for the block beyond the trench width after the pipe or fitting has been jointed;
3. Fill any excess excavation beyond the face of the block with concrete of the same grade as the block.

DRA2.W830.7 APPLYING PRESSURE
Do not apply internal pressure to the pipeline until thrust and anchor blocks have developed the specified grade strength.

BED, HAUNCH AND SURROUND

DRA2.W910.7 GRANULAR BED
1. Deposit aggregates for granular bed in the trench in layers not exceeding 150 mm thick for the complete width of the trench. Compact each layer using a plate vibrator or by other Approved methods;
2. Dig holes in the granular bed to prevent pipes resting on the sockets and to allow the pipes to be jointed. Lay the pipes directly on the granular bed without using any form of temporary support;
3. After the pipes have been jointed, deposit aggregate in layers not exceeding 150 mm thick, equally on both sides of the pipe to the level indicated on the drawings for the complete width of the trench. Compact each layer using a plate vibrator or by other Approved methods.

DRA2.W920.7 CONCRETE BED, HAUNCH AND SURROUND
1. Place polyethylene sheeting or a blinding layer on the trench bottom before concreting;
2. Support pipes at the required level by grade 20/20 as Worksection CON1, precast concrete wedges, blocks or cradles or by other Approved methods. Place one support adjacent to each end of each pipe and at intervals between these supports not exceeding 3 m. Place compressible sheeting between pipes and the supports;
3. Form flexible joints in the concrete bed, haunch and surround at flexible joints in pipelines. Place joint filler next to the flexible joint in the pipeline to extend for the complete thickness of the bed, haunch and surround;
4. Place concrete evenly over the complete width of the bed and over the complete length of the pipe being concreted up to a level of 25 mm below the underside of the pipe. Then place concrete on one side of the pipe only and work it under the pipe until the concrete spreads under it. Then place concrete equally on both sides of the pipe to the level indicated on the drawings.
DRA2.W930.7  PIPES UNDER ROADS
Protect pipes which are 1 m or less below the surface of a carriageway by concrete surround.

DRA2.W940.7  FILL MATERIAL SURROUND
Deposit fill material surround to pipelines as EAR1.W1410 and EAR1.W1420.

TOLERANCES

DRA2.W1010.7  GENERAL
Refer to Appendix H "Schedule of Tolerances" to this Specification.

CONNECTIONS

DRA2.W1110.7  CONNECTIONS TO STRUCTURES
1. Ensure that the joints between pipes and structures into which they are built are watertight. Remove protective coatings over the length to be built in and do not build pipe collars and sockets into structures;
2. Provide two flexible joints in pipelines adjacent to the outside faces of the structures into which they are built, with the distances from the outside face of the structure to the first joint and from the first joint to the second joint as specified in the following table:

<table>
<thead>
<tr>
<th>Diameter of Pipe</th>
<th>Position of First Flexible Joint from Structure</th>
<th>Distance of Second Flexible Joint</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not exceeding 450 mm</td>
<td>Minimum 450 mm - 800 mm</td>
<td>Maximum 900 mm - 1200 mm</td>
</tr>
<tr>
<td>Exceeding 450 mm but not exceeding 1050 mm</td>
<td>150 mm 500 mm or diameter of pipe whichever is less</td>
<td>900 mm - 1200 mm</td>
</tr>
<tr>
<td>Exceeding 1050 mm</td>
<td>1500 mm - 1800 mm</td>
<td></td>
</tr>
</tbody>
</table>
3. Temporarily seal the ends of pipes which are built in to structures with a blank flange, brickwork or timber boarding as instructed by the CM. The temporary seals shall be left in position until the CM instructs their removal.

DRA2.W1120.7  SADDLE CONNECTIONS TO CONCRETE AND CLAY PIPES
Connect the saddle to concrete and vitrified clay pipes by bedding the saddle on a cement mortar bed and forming a cement mortar fillet to provide at least 50 mm cover to the base of the saddle.

DRA2.W1130.7  SPLAY CUT CONNECTIONS TO CONCRETE AND CLAY PIPES
Where pipes are to be connected to concrete or clay pipes without a Y-junction or purpose made pipe saddle:
1. Cut the pipe on the splay to form a junction such that the incoming pipe is at an angle of between 30° and 60° to the main pipe, upstream of the joint. Cut the hole in the main pipe to an elliptical shape suited to the cut end of the branch pipe. Cut the branch pipe to a length such that:
   a. The cut end of the pipe rests on the outside barrel of the main pipe; and
   b. The cut pipe does not project inside the main pipe.
2. Seal the joint between the cut pipe and the main pipe externally and unless otherwise Approved, internally flush with the main pipe, with mortar.

DRA2.W1140.7 **SADDLE CONNECTIONS TO UPVC PIPES**
Fix uPVC pipe saddles to uPVC pipes using a purpose-made mechanical clip or solvent cement of a type recommended by the manufacturer and Approved.

DRA2.W1150.7 **BRANCH PIPELINES**
Unless otherwise Approved, connect branch pipelines to main pipelines using Y-junctions of the same type and strength as the stronger of the pipes being jointed and of an angle between 30° and 45°.

DRA2.W1160.7 **RECORDING POSITIONS OF JUNCTIONS**
Measure the positions of pipe junctions relative to the manhole or structure immediately downstream and record before backfilling.

DRA2.W1170.7 **CONNECTING PIPES NOT REQUIRED FOR IMMEDIATE USE**
Seal the ends of connecting pipes not required for immediate use with a blank flange, brickwork or other Approved methods and measure and record their positions before backfilling.

**MANHOLES, CHAMBERS, GULLIES AND CHANNELS**

DRA2.W1210.7 **MANHOLES, CHAMBERS AND GULLIES**
1. Construct bases, inverts and benching for precast concrete manholes using grade 20/20 as in Worksection CON1 unless otherwise specified in Drawings;
2. Set precast concrete units for manholes and chambers vertically with step irons staggered and vertically aligned above each other. Seal joints between precast units and lifting holes with cement mortar, removing any excess and pointing the joints;
3. Fill concrete surround to gullies up to the sides of the excavation;
4. Set the frames for manhole covers and gully gratings to the same level of the surrounding surface, allowing for falls and cambers, using brickwork or concrete as shown on the drawings; and
   a. Do not exceed three courses of brickwork below frames;
   b. Use concrete of a minimum grade of 20/20 as in Worksection CON1.

DRA2.W1220.7 **FILLING AROUND MANHOLES AND CHAMBERS**
1. Fill excavations around manholes and chambers in carriageways using grade 10/40 concrete as Worksection CON1;
2. Fill around other manholes and chambers with fine fill material.
DRA2.W1230.7 CONCRETE OPEN CHANNELS
Construct the top surfaces of side walls of concrete open channels to the same levels as the adjoining permanent works. Fill any excess excavation beyond the channel walls with grade 10/40 concrete, as Worksection CON1.

INSTALLING VALVES

DRA2.W1310.7 GENERAL
Install valves in accordance with the manufacturer's recommendations and in the closed position.

DRA2.W1320.7 BOX-OUTS AND REBATES
Fill box-outs and rebates for valve frames and other gaps between frames and concrete surfaces with cement mortar.

DRA2.W1330.7 CLEANING AND CHECKING
After installation, clean valves, lightly grease moving parts and check for ease of operation. Leave valves in the closed position.

DRA2.W1340.7 AIR VALVES
Provide air valves with isolating gate valves.

PIPPES AND MANHOLES TO BE ABANDONED

DRA2.W1410.7 INSTALLATIONS NOT EXCEEDING 1.2M DEEP BENEATH CARRIAGeways OR NOT EXCEEDING 1M DEEP BENEATH OTHER AREAS
If the top of a pipe or culvert, or the bottom of a manhole, chamber or gully, which is to be abandoned is at a depth not exceeding 1.2 m below the finished ground level for carriageways or not exceeding 1.0 m below the finished ground level for areas other than carriageways whichever is applicable, remove and dispose of the pipe, manhole, chamber or gully unless otherwise Approved. Fill the void with foam concrete, granular fill material or special fill material as directed by the CM. Recycled aggregate may be used for filling the void subject to CM’s Approval.

DRA2.W1420.7 INSTALLATIONS EXCEEDING 1.2M DEEP BENEATH CARRIAGeways OR EXCEEDING 1M DEEP BENEATH OTHER AREAS
If the top of a pipe or culvert, or the bottom of a manhole, chamber or gully, which is to be abandoned is at a depth exceeding 1.2 m below the finished ground level for carriageways or exceeding 1.0 m below the finished ground level for areas other than carriageways whichever is applicable:

1. Demolish the manholes, chambers and gullies to at least 1.2 m and 1.0 m below the finished ground level for carriageways and areas other than carriageways respectively unless otherwise indicated on the drawings;

2. Seal the lowest points of abandoned pipelines with concrete, bricks or other Approved methods;

3. Fill abandoned pipes, culverts, manholes, chambers and gullies with foam concrete or grout, by pumping or by gravity, starting from the lowest point on the system and continuing until all voids are completely filled.
CLeanIng Pipelines

Dra2.w1510.7 TIMING
Carry out cleaning:
1. After the pipeline has been tested;
2. After temporary works required for testing have been removed and any parts of the pipeline removed for testing have been reconnected;
3. Not more than 7 days before the pipeline is handed over.

Dra2.w1520.7 PROCEDURE
Clean pipelines by high pressure water jetting, pigging or by other Approved methods and clean and wash manholes and chambers.

InspecTion of Pipelines

Dra2.w1610.7 GENERAL
Unless otherwise permitted by the CM, check the cleanliness, bore, linearity and joints of pipelines of 450 mm diameter or less by pulling a mandrel through the completed pipeline, or parts of the pipeline if so Approved. The mandrel must be 750 mm long and 12 mm less in diameter than the nominal diameter of the pipe.

Dra2.w1620.7 TEMPORARY COLOUR IDENTIFICATION
1. Provide a temporary colour band around the circumference of the open end(s) of installed underground pipes to be terminated at a manhole, chamber, gully or structure which cannot be cast before or when the pipes are laid. The colour and width of the band are as follows:

<table>
<thead>
<tr>
<th>Type of Drain Pipe</th>
<th>Colour</th>
<th>Width of Colour Band</th>
</tr>
</thead>
<tbody>
<tr>
<td>Storm water</td>
<td>White</td>
<td>75 mm</td>
</tr>
<tr>
<td>Waste water</td>
<td>Yellow</td>
<td>75 mm</td>
</tr>
<tr>
<td>Foul water</td>
<td>Green</td>
<td>75 mm</td>
</tr>
</tbody>
</table>

2. Paint identification colour mark on the top and the edge of the access opening of the manhole and back inlet gully trap to which one or more pipe(s) cannot be connected when the manhole is cast. The colour and size of the mark are as follows:

<table>
<thead>
<tr>
<th>Type of Manhole / Back Inlet Gully Trap (B.I.G.T.)</th>
<th>Colour</th>
<th>Size of Each Colour Mark</th>
</tr>
</thead>
<tbody>
<tr>
<td>Storm water (manhole)</td>
<td>White</td>
<td>200 mm x 100 mm</td>
</tr>
<tr>
<td>Foul water (manhole)</td>
<td>Green</td>
<td>200 mm x 100 mm</td>
</tr>
<tr>
<td>Storm water (B.I.G.T.)</td>
<td>White</td>
<td>200 mm x 100 mm</td>
</tr>
<tr>
<td>Waste water (B.I.G.T.)</td>
<td>Yellow</td>
<td>200 mm x 100 mm</td>
</tr>
</tbody>
</table>
CLOSED CIRCUIT TELEVISION (CCTV) INSPECTION

DRA2.W1710.7 SCOPE
Carry out CCTV inspection for the pipelines as listed below, in accordance with the remaining clauses in this sub-section:
1. Horizontal underground pipelines;
2. Vertical and horizontal pipelines up to first domestic floor level of the buildings including the easy bends underground and above ground;
3. Manholes, gullies, inspection chambers and catchpits;
4. Pipelines as shown on Drawings.

DRA2.W1720.7 SUBMISSIONS
At least 28 days before the inspection starts, submit the following particulars of the proposed procedure for CCTV inspections to the CM:
1. Name of the CCTV survey contractor and experience of his staff delegated to carry out or supervise the inspections;
2. Details of equipment;
3. Details of the format of the report;
4. Examples of video films, compact disc - recordable and photographs obtained from inspections employing the same equipment.

DRA2.W1730.7 EQUIPMENT
Provide the following equipment:
1. A CCTV colour camera with integral lighting unit. The camera must be of a type designed and constructed for the specified purpose, capable of operating in 100% relative humidity and fitted with a rotating mirror for complete circumferential viewing. The system must be capable of producing an accurate, clear, high quality picture of the entire periphery of the pipe on the monitor screen and recording tape. The camera and lighting unit must be mounted on a self-propelled crawler or on skids linked to a manual or power operated winch;
2. A monitor screen which displays the camera view during the inspection and which is housed in covered accommodation with facilities for inspection by the CM and others;
3. A screen writer which displays, on the monitor screen, details of the inspection, including the date, location, pipe material, pipe diameter, direction of view and comments on the condition of the pipe;
4. A measuring device which displays the camera location automatically on the monitor screen and is capable of measuring to within an accuracy of 0.1% of the length of the pipeline or to ±0.3 m, whichever is the greater;
5. A control unit which controls the camera movement, lighting intensity, focusing and recording;
6. A video recording system approved by the CM to record the inspection and information displayed on the monitor screen;
7. A digital camera capable of producing photographs with a superimposed date.

DRA2.W1740.7 PROCEDURE
1. Move the camera through the pipeline at the following speed:
   a. Not exceeding 0.1 m/s for pipes of diameter less than or equal to 200 mm;
b. Not exceeding 0.15 m/s for pipes of diameter exceeding 200 mm; or

c. Such speed as agreed by the CM to enable all details to be extracted from the
video recording system.

2. If the camera cannot pass through the complete pipeline in one operation, carry
out the inspection from both ends of the pipeline;

3. Stop the camera whenever instructed to do so by the CM to allow his inspection;

4. Ensure that the video recording system is operated during the complete
inspection to provide a continuous record of the inspection and information on
the monitor screen. Record in the video record a location signboard supported at
each end of the pipeline;

5. Take photographs of the monitor screen for continuing and point defects,
blocked areas of pipelines and whenever instructed;

6. Submit a duplicate copy of the video and a preliminary report recording the work
done of the day and defects identified to the CM's Representative at end of each
day;

7. Rectify all identified blocked or defective pipelines. Re-inspect the rectified
pipelines with video record.

DRA2.W1750.7 RECORDING RESULTS

Keep a record of the inspections on Site and submit 3 copies of the report to the CM,
within 7 days of the completion of the inspection and same for the re-inspection,
containing the following details:

1. A key map showing the pipelines inspected and associated manholes, chambers
and structures;

2. Tables listing details of inspection, including date, location, pipe material, pipe
diameter, chainage, manholes, junctions and other features and the condition of
the pipes and joints, illustrated by a coding system in accordance with the 'Manual
of Sewer Condition Classification' 4th Edition (2003), published by the
UK National Water Council;

3. A summary showing the number, position and type of defects in each pipeline
inspected. The summary shall include photographs to illustrate degree of mortar
loss, size of a crack/fracture, size of a void or any other quantifiable defect. A
suitable metric scale shall be included and be clearly visible and in focus within
the photograph.

DRA2.W1760.7 VIDEO AND PHOTOGRAPHS

Submit 3 copies, to the CM, at the same time as the report:

1. Video providing a continuous record of the inspection and information on the
monitor screen. The media shall be of high quality, new and unused before
recording and shall be of a digital format (DVD+/R or CD-R) or Video Home
System (VHS) format, subject to approval of the CM; and

2. 3R size photographs of the monitor screen, including the date and the chainage,
mounted in photograph albums.

PROTECTION

DRA2.W1805.7 HOT DIP GALVANIZING

1. Unless otherwise specified, galvanized coatings to be applied by hot-dip
galvanizing to be in accordance with BS EN ISO 1461:2009 with minimum
mean coating thickness of 45 microns to 85 microns depending on thickness of
article as stipulated in Table 3 of BS EN ISO 1461:2009, unless otherwise
specified. The coating thickness to comply with the following Table:
<table>
<thead>
<tr>
<th>Article Thickness</th>
<th>Minimum Mean Coating Thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt; 6 mm</td>
<td>85 µm</td>
</tr>
<tr>
<td>&gt; 3 mm to ≤ 6 mm</td>
<td>70 µm</td>
</tr>
<tr>
<td>≥ 1.5 mm to ≤ 3 mm</td>
<td>55 µm</td>
</tr>
<tr>
<td>&lt; 1.5 mm</td>
<td>45 µm</td>
</tr>
</tbody>
</table>

2. Unless Approved, all components are to be galvanized after welding, drilling and cutting operations are complete;

3. All hot dip galvanizing, including the galvanizing work specified in other Worksections, is to be carried out by galvanizers with ISO 9001 certification. Submit the name of galvanizer for Approval;

4. Submit original invoice/delivery note and galvanizing certification for each delivery. These documents shall include the following information:
   a. Project title/number;
   b. Name of galvanizer;
   c. Types and dimensions of articles;
   d. Quantities.

5. Attach a durable identification tape to each batch of galvanized articles indicating the project title, galvanizing certification number and name of galvanizer.

**DRA2.W1810.7** ANTI-CORROSION TAPE
Apply anti-corrosion tape to all valves, flanged joints, slip-on couplings and flange adapters.

**WORKS OUTSIDE SITE BOUNDARY**

**DRA2.W1910.7** APPROVED CONTRACTOR FOR PUBLIC WORKS
Underground drainage works required to be carried out by a contractor or sub-contractor who is on the current List of Approved Contractors for Public Works for Roads and Drains are specified in *Project Specific Specification*.

**DRA2.W1920.7** SPECIFICATION
Carry out the works specified under DRA2.W1910 in accordance with Sections 5, 6, 13, 14, 16, 19 and 23 of the Hong Kong Government General Specification for Civil Engineering Works (2006 Edition) and its amendments published 42 days prior to the date for the return of tenders unless otherwise specified.

**DRA2.W1930.7** INSPECTION
1. Initial Site Inspection
   a. Notify the CM to arrange with Drainage Services Department for an initial site inspection of the works before backfilling to pipelines or covering up. Allow the CM to give one week advance notice by fax for this inspection.

2. Handing Over Inspection
   a. Notify the CM to arrange with Drainage Services Department for a handing over inspection when all works for the drainage connections are completed and ready for handing over. Allow the CM to give one week advance notice by fax for this inspection.
DRA2.W1940.7 RECORD DRAWINGS AND TEST REPORTS

Provide the following as-constructed records to the CM for submitting to Drainage Services Department:

1. Material quality records (brand name, grade, class etc.);
2. Acceptance test records (water test etc.);
3. Colour closed circuit television survey report; and
4. As-built record drawings.
TESTING

GENERAL

DRA2.T010.7 SUBMISSIONS
At least 14 days before the start of testing, submit the following details relating to pipeline testing to the CM:
1. Name of testing laboratory accredited by HOKLAS for the relevant tests, if available;
2. Test equipment and method of setting up the equipment;
3. Calibration certificates for pressure gauges;
4. Procedure for carrying out the test;
5. Programme for testing.

DRA2.T020.7 QUALITY ASSURANCE SCHEMES
Tests stated in this Worksection may be reduced in number as agreed by the CM if such materials or articles delivered to Site satisfy the following conditions:
1. To bear the stamps of the registered certification trade mark of the BA Institution, known as the BS Kitemark; or
2. To be covered by a manufacturer's quality assurance scheme stated in the Contract or approved by the CM.

TESTING PIPES

DRA2.T110.7 DEFINITION OF 'BATCH'
A batch of pipes or fittings is any quantity of pipes or fittings of the same type and nominal diameter, manufactured by the same manufacturer, covered by the same certificates as stipulated under DRA2.M1010 delivered to the Site.

DRA2.T120.7 SAMPLES
Provide one sample of pipe or fitting from each 50 pipes or fittings or part thereof in a batch unless:
1. Such materials or articles delivered to Site satisfy the conditions stipulated in DRA2.T020 (1) & (2); and
2. Smaller quantities are agreed by the CM.

DRA2.T130.7 TESTING PROCEDURES
Unless otherwise Approved, test each sample of pipes and fittings in accordance with the relevant British Standard, as follows:
1. Concrete pipes and fittings: BS 5911-1:2002;
2. Vitrified clay pipes, fittings and joints: BS 65:1991 (2003);
3. Ductile iron pipes and fittings: BS 4772:1988;
5. uPVC pipes for industrial purposes: BS 3506:1969;
6. uPVC underground drain pipes and fittings: BS 4660:2000;
7. uPVC pipes and fittings for gravity sewers: BS 5481:1977 (1989);

DRA2.T140.7 NON-COMPLIANCE
1. If the result of any test required in accordance with the relevant British Standard does not comply with the specified requirements for the test, provide one additional sample from the same batch and carry out additional tests for the property;
2. The batch will be considered as not complying with the specified requirements for the property if the result of any additional test does not comply with the specified requirements for the property.

TESTING AGGREGATES FOR GRANULAR BED

DRA2.T210.7 DEFINITION OF 'BATCH'
Any quantity of aggregates for granular bed of the same type, produced at the same time, in the same place, covered by the same certificates and delivered to the Site at any one time.

DRA2.T220.7 SAMPLES
Unless otherwise permitted by the CM, provide one sample of aggregates for granular bed from each batch delivered to Site as follows:
1. Size: 40 kg;
3. With a moisture content representative of the moisture content of the batch.

DRA2.T230.7 TEST FOR PARTICLE SIZE DISTRIBUTION
Test each sample in accordance with BS 812:Section 103.1:1985.

DRA2.T240.7 TEST FOR TEN PERCENT FINES VALUE
Test each sample in accordance with BS 812:Part 111:1990.

DRA2.T250.7 TEST FOR COMPACTION FRACTION VALUE - EQUIPMENT
Provide the following equipment:
1. A steel open-ended cylinder, 150 mm internal diameter by 250 mm high, with a wall thickness of not less than 3.5 mm;
2. A steel rammer of 40 mm diameter weighing approximately 1 kg;
3. A steel rule calibrated to 1 mm.

DRA2.T260.7 TEST FOR COMPACTION FRACTION VALUE - PROCEDURE
1. Place the sample on a clean surface and divide by quartering or by using a riffle box to obtain a specimen weighing approximately 10 kg;
2. Place the cylinder on a firm, level surface and fill, without tamping, with material taken from the sample. Strike off surplus material level with the top of the cylinder and clear from the area around the cylinder;
3. Lift the cylinder clear of the contents and place it alongside the material;
4. Replace approximately one quarter in the cylinder and compact using the rammer until no further compaction can be achieved. Repeat this procedure for each of the remaining three quarters of the material and compact the top of the material as level as possible;

5. Measure the distance from the top of the cylinder to the top surface of the material to the nearest 1 mm.

**DRA2.T270.7 TEST FOR COMPACTION FRACTION VALUE - CALCULATION**

Calculate the compaction fraction value of the material from the following equation:

\[
\text{Compaction fraction value} = \frac{d}{h}
\]

where:

- \( d \) is the distance from the top of the cylinder to the top surface of the material (mm);
- \( h \) is the height of the cylinder (mm).

**DRA2.T280.7 TEST FOR COMPACTION FRACTION VALUE - RESULTS**

Report the following:

1. Identification of sample;
2. The compaction fraction value to the nearest 0.01;
3. The source and type of material;
4. Date of the test;
5. That the test method used was in accordance with this specification.

**DRA2.T290.7 COMPLIANCE CRITERIA**

The results of tests for compaction fraction value tests must comply with the following requirements:

1. Maximum compaction fraction value for bed for pipes not exceeding 300 mm nominal diameter: 0.3;
2. Maximum compaction fraction value for bed for pipes exceeding 300 mm nominal diameter: 0.15.

**TESTING PRECAST CONCRETE UNITS FOR MANHOLES, CHAMBERS AND GULLIES**

**DRA2.T310.7 DEFINITION OF 'BATCH'**

Any quantity of precast concrete units for manholes, chambers or gullies of the same type and size, manufactured by the same manufacturer, covered by the same certificates as stipulated under DRA2.M1040 (1) delivered to the Site.

**DRA2.T320.7 SAMPLES**

Unless otherwise permitted by the CM, provide one sample of precast units for manholes, chambers or gullies from each 50 precast concrete units, or part thereof, in a batch.

**DRA2.T330.7 METHODS OF TEST**

Unless otherwise permitted by the CM, test each sample of the precast concrete units for manholes, chambers and gullies in accordance with the relevant British Standard as follows:
1. Precast concrete units for manholes: BS 5911-3:2002;

**DRA2.T340.7 NON-COMPLIANCE**

1. If the result of any test required in accordance with the relevant British Standard does not comply with the specified requirements for the test, provide one additional sample from the same batch and carry out additional tests for the property;
2. The batch will be considered as not complying with the specified requirements for the property if the result of any additional test does not comply with the specified requirements for the property.

**TESTING MANHOLE COVERS, GULLY GRATINGS AND KERB OVERFLOW WEIRS**

**DRA2.T410.7 DEFINITION OF 'BATCH'**

Any quantity of manhole covers, gully gratings and kerb overflow weirs of the same type, manufactured by the same manufacturer, covered by the same certificates as stipulated under DRA2.M1040 (3) delivered to the Site.

**DRA2.T420.7 SAMPLES**

Provide one sample of manhole covers, gully gratings or kerb overflow weirs from each 20 covers, gratings or weirs, or part thereof in a batch.

**DRA2.T430.7 PROCEDURE**

Weigh each sample of manhole covers, gully grating and kerb overflow weirs and load test manhole covers and, gully gratings by the method described in the remainder of this Sub-section, to the loads stated in the tables in clause DRA2.M650.

**DRA2.T440.7 EQUIPMENT FOR LOAD TESTING**

Provide the following equipment:

1. The manufacturer's recommended for the manhole cover or gully grating or a fabricated test frame of an Approved type which will simulate the normal conditions of use of the cover or grating;
2. A circular hardwood bearing block faced with hard rubber or other resilient material, the diameter of which is as stated in the relevant table in clause DRA2.M650 and which is sufficiently rigid to ensure that the load is equally distributed over the whole area of the block;
3. Test loads;
4. Equipment for measuring the loads applied, readable and accurate to 0.05t or 2% of the specified test load, whichever is greater.

**DRA2.T450.7 LOAD TEST PROCEDURE**

1. Rigidly support the full bearing area of the frame;
2. Place the cover or grating in the frame and place the bearing block centrally on the cover or grating;
3. Apply the specified test load without shock;
4. Maintain the specified test load for at least 30 seconds and then remove it.
DRA2.T460.7 LOAD TEST RESULTS
Report the following:
1. Identification of sample;
2. The load applied to the nearest 0.05t or 2% of the specified test load, whichever is the greater;
3. Details of any fracture or cracks;
4. That the test method used was in accordance with this specification.

DRA2.T470.7 COMPLIANCE CRITERION FOR RESISTANCE TO FRACTURE OF COVERS AND GRATINGS
Manhole covers and gully gratings must withstand the specified test load without fracture or cracking.

DRA2.T480.7 NON-COMPLIANCE FOR MASS OF COVERS, GRATINGS AND WEIR
If any manhole cover, gully grating or kerb overflow weir does not comply with the specified requirements for mass:
1. Weigh every cover, grating and weir in the batch to determine its mass;
2. Do not use any cover, grating and weir not complying with the specified requirement for mass in the permanent work.

DRA2.T490.7 NON-COMPLIANCE FOR RESISTANCE TO FRACTURE OF COVERS AND GRATINGS
If any manhole cover or gully grating does not comply with the specified requirements for resistance to fracture:
1. Provide two additional samples from the same batch and test to determine their resistance to fracture;
2. The batch will be considered as not complying with the specified requirements for resistance to fracture if the result of any additional test does not comply with the specified requirements for resistance to fracture.

TESTING GRAVITY PIPELINES

DRA2.T510.7 TESTS ON SEWAGE PIPELINES GENERALLY
Test gravity pipelines for sewage by the methods and at the times stated in the following table:

<table>
<thead>
<tr>
<th>Diameter of Pipe</th>
<th>Time of Test</th>
<th>Method of Test</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not exceeding 900 mm</td>
<td>As sub-clause (1) Note</td>
<td>Water test or air test</td>
</tr>
<tr>
<td></td>
<td>As sub-clause (2)</td>
<td>Water test or air test</td>
</tr>
<tr>
<td></td>
<td>As sub-clause (3)</td>
<td>Infiltration test</td>

Note: Applicable to pipe section laid in a depth > 4.5 m. Pipe sections laid in a depth ≤ 4.5 m are not required to be tested at this stage with the specified method.
1. After the pipes have been jointed and the bedding has been placed and immediately before haunch or surround is placed or fill material is deposited;

2. After haunch and surround has been placed and fill material has been deposited and compacted;

3. Test to the following details:
   a. Not more than 7 days before the pipeline is to be handed over to other departments as specified by the CM; or
   b. Not more than 7 days before the pipeline is to be handed over when required by the CM pursuant to BS 8301:1985, clause 25.7.2.

**DRA2.T520.7 TESTS ON SURFACE WATER PIPELINES GENERALLY**

Test gravity pipelines for surface water by the methods and at the times stated in the following table:

<table>
<thead>
<tr>
<th>Diameter of Pipe</th>
<th>Time of Test</th>
<th>Method of Test</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not exceeding 900 mm</td>
<td>As sub-clause (2)</td>

<td>As sub-clause (1)</td>
<td>Visual inspection</td>
</tr>
<tr>
<td></td>
<td>As sub-clause (2)</td>
<td>Water test or air test</td>
</tr>
</tbody>
</table>

1. After the pipes have been jointed and the bedding has been placed and immediately before haunch or surround is placed or fill material is deposited;

2. After haunch and surround has been placed and fill material has been deposited and compacted.

**DRA2.T530.7 WATER AND AIR TESTS GENERALLY**

Carry out the tests on the complete pipeline between manholes, chambers and structures and do not test pipelines in parts unless Approved or unless the specified test pressure would otherwise be exceeded. Test short branch pipelines with the main pipeline and long branch pipelines separately.

**DRA2.T540.7 INFILTRATION TESTS GENERALLY**

Carry out tests on the complete pipeline between manholes, chambers and structures, including manholes, chambers and branches within the system unless otherwise agreed by the CM.

**DRA2.T550.7 EQUIPMENT**

Provide the following:

1. Expanding disc stoppers, air bags or other Approved methods of sealing pipes;
2. Struts and wedges;
3. Force pump for water test;
4. Standpipe for water test;
5. Measuring vessel for water test, readable and accurate to 0.01 litre;
6. U-tube for air test;
7. Trolleys to obtain access inside pipelines for visual inspections and mechanical fans to ensure that an adequate air supply is available. Provide engine driven fans with a flexible exhaust or other methods of keeping exhaust fumes clear of the fresh air intake.
DRA2.T560.7  PREPARATION
Before tests and inspections:
1. Remove debris and water from the pipeline;
2. Seal openings to the pipeline using expanding disc stoppers, air bags or other Approved methods and secure seals against movement.

DRA2.T570.7  WATER TEST PROCEDURE
1. Test pipe of diameter up to and including 300 mm in accordance with BS 8301:1985, clause 25.6.2; or
2. For pipe of diameter larger than 300 mm or works to be handed over to other departments as specified by the CM, carry out the test as follows:
   a. Fill the pipeline with water and keep it filled for two hours before testing starts to allow absorption to take place;
   b. Apply a test pressure at the standpipe of 1.2 m head above the soffit of the pipe, at the high end, and maintain it for 30 minutes. Do not exceed a 6 m head of water at the invert of the low end of the pipe;
   c. Top up the head of water at the standpipe at 5-minute intervals during the test and fill to the specified head at the end of the test period. Measure the amounts of water added to the standpipe using the measuring vessel;
   d. Measure the leakage of water from the pipeline by the amount of water added to maintain the specified head of water.

DRA2.T580.7  WATER TEST CALCULATION
Calculate the permitted leakage of water from the pipeline from the equation:

\[ \text{permitted leakage} = d \times l \times \frac{t}{60} \text{ litre} \]

where:
   d. is the internal diameter of the pipe (m);
   l. is the length of the pipeline tested (m);
   t. is the test period (min).

DRA2.T590.7  AIR TEST PROCEDURE
Carry out the test as follows:
1. Pump air into the pipeline until a test pressure of slightly more than 100 mm is registered on a U-tube manometer connected to the pipeline. Allow five minutes for the stabilisation of the air temperature and then adjust the air pressure to 100 mm of water;
2. Read the pressure from the U-tube at the end of a five-minute period, without further pumping.

DRA2.T600.7  VISUAL INSPECTION
Examine the inside of the pipeline visually and record infiltration or damage to pipes.

DRA2.T610.7  INFILTRATION TEST PROCEDURE
1. Test in accordance with BS 8301:1985, clause 25.7.6; or
2. Test in accordance with BS 8005:Part 1:1987, clause 13.6 for works to be handed over to other departments as specified by the CM.
DRAINAGE BELOW GROUND

**DRA2.T620.7 REPORTING OF RESULTS**

Report the following:

1. The nominal internal diameter of the pipe;
2. The location and the length of the pipeline tested to the nearest 0.3 m;
3. The test pressure applied during the water test to the nearest 0.01 m and during the air test to the nearest 1 mm head of water;
4. The test period to the nearest 1 minute;
5. The leakage and permitted leakage for the water test to the nearest 0.1 litre;
6. The amount of infiltration for the infiltration test to the nearest 0.1 litre;
7. Details of any discernible leakage of water from the pipe or from any joint during the water test;
8. That the test method used was in accordance with this specification.

**DRA2.T630.7 COMPLIANCE CRITERIA**

The results of tests on gravity pipelines must comply with the following requirements:

1. The leakage of water from the pipeline, determined by the water test must not exceed the permitted leakage calculated in accordance with clause DRA2.T580;
2. There must be no discernible leakage from the pipe or from any joint during the water test;
3. The air pressure must remain above 75 mm head of water at the end of the air test;
4. There must be no infiltration or damage to the pipes or joints as determined by the visual inspection.

**DRA2.T640.7 NON-COMPLIANCE**

If the result of any test on gravity pipelines does not comply with the specified requirements for the test, investigate the reason and carry out the necessary Approved replacement or remedial work. Retest the pipeline.

**PRESSURE PIPELINES**

**DRA2.T710.7 TIMING OF TESTS**

1. Test the pipeline at the following times:
   a. After the pipes have been jointed and the bedding has been placed and immediately before haunch or surround is placed or fill material is deposited;
   b. After haunch and surround has been placed and fill material has been deposited and compacted.
2. Do not carry out the tests covered in sub-clause (1)(a) above on parts of a pipeline unless permitted by the CM or unless the specified test pressure would otherwise be exceeded. Carry out the test covered by sub-clause (1)(b) above on the complete pipeline.

**DRA2.T720.7 TEST PRESSURES**

Carry out tests to 1.5 times the maximum working pressure in the part of the pipeline being tested unless otherwise specified in the Drawings.
DRA2.T730.7 SIMULTANEOUS TESTING
Do not carry out testing on more than one pipeline in the same trench.

DRA2.T740.7 ALTERNATIVE TEST METHODS
Do not substitute tests on individual joints for the tests required by this specification unless permitted by the CM, in which case the CM will approve the method of testing and the compliance criteria.

DRA2.T750.7 EQUIPMENT
Provide the following:
1. Blank flanges or caps;
2. Struts and wedges;
3. Temporary concrete blocks or other anchors;
4. Force pump;
5. Pressure gauge, readable and accurate to 0.01 m head of water and either the conventional circular type of at least 300 mm diameter or a digital indicator type;
6. Measuring vessel, readable and accurate to 0.01 litre.

DRA2.T760.7 PROCEDURE
Carry out the test as follows:
1. Clean pipes and valves and check the operation of the valves. Isolate air valves;
2. Fix blank flanges or caps to the ends of the pipeline or to the part of the pipeline to be tested. Do not make tests against closed valves unless otherwise Approved;
3. Secure blank flanges and end caps and closed valves against which tests are to be made with struts and wedges against temporary concrete blocks or other anchors. Ensure the blocks are completed and sufficiently hardened and that thrust and anchor blocks, pipe straps and other devices required too prevent movement of the pipes and fittings are completed, before testing begins;
4. Fill the pipeline with water and remove all the air, taking measures during filling to provide free outlets for air and to prevent water hammer;
5. Increase the pressure in the pipeline to working pressure and allow it to remain filled at this pressure for 2 hours to allow absorption to take place and to achieve conditions which are as stable as practicable;
6. Increase the pressure in the pipeline slowly by pumping water into the pipeline using a force pump until the specified test pressure is reached at the lowest part of the pipeline being tested;
7. Maintain the specified test pressure in the pipeline, using the force pump if necessary, for a period of at least one hour;
8. At the end of the one hour period, increase the pressure, if necessary, to the specified test pressure and disconnect pumps and water supply points;
9. Leave the pipeline in this condition for a test period of one hour, no water being allowed to enter the pipeline during the test period;
10. Record the pressure in the pipeline at the end of the test period;
11. Reconnect the pumps and water supply points and increase the pressure to the specified test pressure;
12. Draw water from the pipeline until the pressure in the pipeline is the same as at the end of the test period. Measure the leakage of water from the pipeline as the amount of water drawn off.
DRA2.T770.7  CALCULATION

1. Calculate the average test pressure (P) as the average of the specified test pressure and the pressure at the end of the test period;
2. Calculate the permitted leakage of water from the pipeline during the pressure test from the equation:

\[ \text{permitted leakage} = d \times l \times \frac{t}{120} \times P \text{ litre} \]

where:
- \(d\) is the nominal internal diameter of the pipe (m);
- \(l\) is the length of the pipeline tested (km);
- \(t\) is the test period (hr);
- \(P\) is the average test pressure (m).

DRA2.T780.7  REPORTING OF RESULTS

Report the following:
1. The nominal internal diameter of the pipe;
2. The location and length of the pipeline to the nearest 0.3 m;
3. The test period to the nearest one minute;
4. The specified test pressure to the nearest 0.01 m head of water;
5. The pressure at the end of the test period to the nearest 0.01 m head of water;
6. The average test pressure to the nearest 0.01 m head of water;
7. The leakage and permitted leakage to the nearest 0.1 litre;
8. Details of any discernible leakage of water from the pipeline during the test;
9. That the test method used was in accordance with this specification.

DRA2.T790.7  COMPLIANCE CRITERIA

The results of tests on pressure pipelines must comply with the following requirements:
1. The leakage of water from the pipeline, determined by the pressure test, must not exceed the permitted leakage calculated in accordance with clause DRA2.T770;
2. There must be no discernible leakage of water from the pipeline or from any joint during the pressure test.

DRA2.T800.7  NON-COMPLIANCE

If the result of any test on pressure pipelines does not comply with the specified requirements for the test, investigate the reason and carry out the necessary Approved replacement or remedial work. Retest the pipeline.

SUB-BASES, BITUMINOUS ROADWAYS AND RELATED FOOTPATHS

DESIGN

DESIGN PARAMETERS

EXT1.D010.7 SUB-BASE AND BITUMINOUS ROADBASE MATERIALS
1. Sub-base and bituminous roadbase materials to be recipe mixes. Laboratory design mixes other than those for sub-base and bituminous roadbase materials must be made and tested as part of the design procedure at an Approved laboratory;
2. Unless otherwise permitted by the CM, carry out mix designs and associated tests in the presence of the CM. Notify the CM at least 7 days, or a shorter period agreed with the CM, before carrying out the mix designs.

EXT1.D020.7 BITUMINOUS MATERIALS
1. Consisting of
   a. Coarse and fine aggregates as EXT1.M410;
   b. Filler as EXT1.M420; and
   c. Bitumen as EXT1.M430.
2. With particle size distribution within the limits stated in the table to EXT1.M410;
3. With properties as stated in the following table:

<table>
<thead>
<tr>
<th>Properties of designed bituminous materials</th>
<th>Type of bituminous material</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Base course</td>
</tr>
<tr>
<td>Nominal maximum aggregate size (mm)</td>
<td>37.5</td>
</tr>
<tr>
<td>Minimum Marshall stability (kN)</td>
<td>10.0</td>
</tr>
<tr>
<td>Maximum flow value (mm)</td>
<td>4.0</td>
</tr>
<tr>
<td>Minimum voids in mineral aggregate as a percentage of total bulk volume</td>
<td>12.5</td>
</tr>
<tr>
<td>Air voids in mix as a percentage of total bulk volume</td>
<td>3.0 - 5.0</td>
</tr>
</tbody>
</table>
4. Design bituminous materials of all aggregate sizes, other than bituminous roadbase material, in accordance with the Marshall Method of Mix Design stated in the Asphalt Institute Handbook 'MS - 2 Mix Design Methods for Asphalt Concrete and other Hot-mix Types' 1984 with modifications only if agreed by the CM. The compaction standard must be 75 blows per side;

5. Ensure design procedures for bituminous friction course material comply with sub-clause (4) except for mixing and compaction temperatures that must be consistent with bitumen viscosities of 900 ± 100 centistokes and 2000 ± 200 centistokes respectively.
MATERIALS

DEFINITIONS

EXT1.M010.7  NORMINAL MAXIMUM AGGREGATE SIZE
The smallest BS sieve size for which the upper limit of the percentage of the aggregate by mass passing is 100%.

SUBMISSIONS

EXT1.M110.7  DETAILS OF AGGREGATES, FILLER AND BITUME FOR BITUMINOUS MATERIALS
1. Submit details, to the CM, of the following particulars of the aggregates filler and bitumen proposed for use in bituminous materials:
   a. A certificate from the manufacturer for each nominal maximum aggregate size showing the source of the aggregate and confirming that the aggregate complies with the requirement stated in this Specification;
   b. A certificate from the manufacturer for each type of filler showing the manufacturer's name, the date and place of manufacture and confirming that the filler complies with the requirements stated in this Specification and including test reports for particle size distribution; and
   c. A certificate from the bitumen manufacturer, showing the manufacturer's name, the date and place of manufacture and confirming that the bitumen complies with the requirements stated in this Specification, including a temperature-viscosity relationship for the bitumen, and including test reports for:
      i. Relative density;
      ii. Softening point;
      iii. Penetration;
      iv. Ductility;
      v. Retained penetration after thin film oven test;
      vi. Solubility;
      vii. Viscosity;
      viii. Loss on heating;
      ix. Wax content.
2. Submit particulars, including certificates, to the CM at the time stated in EXT1.M120 (3);
3. Submit, at intervals agreed with the CM, further certificates and test reports showing material's compliance with this Specification;
4. Test reports shall show the properties of aggregates, filler and bitumen for bituminous materials as determined by the methods stated in the following table:

<table>
<thead>
<tr>
<th>Testing Aggregates, Filler and Bitumen for Bituminous Materials</th>
<th>Material</th>
<th>Property</th>
<th>Method of Testing</th>

</tr>
</tbody>
</table>
### DETAILS OF MIXES FOR SUB-BASE AND BITUMINOUS MATERIALS

1. Submit details to the CM of the following particulars for the sub-base material and bituminous roadbase materials:
   a. Source and type of aggregates;
   b. Grading details in tabular and graphical form;
   c. Details of each mixing plant proposed for use.

2. In addition submit, to the CM, details of the following particulars for bituminous materials:
   a. Certified copies of work sheets for mix designs that include the relative density of the mixed aggregates;
   b. Source of bitumen; and
   c. If requested by the CM, past test records of the same mix produced in the same plant.

3. Submit particulars to the CM at least 21 days before
   a. Trial areas are constructed; or
   b. The mix is placed in the permanent work if trial areas are not required.

### PARTICULARS OF RECYCLED SUB-BASE MATERIAL

Submit details to the CM of the following particulars for the recycled sub-base material:

1. Details of the recycling plant, and test results for:
   a. Ten percent fines value;
   b. Soundness value;
   c. CBR value;
   d. Content of contaminant in percentage by mass;
   e. Water-soluble sulphate content;
   f. Organic material content; and

2. Grading details in tabular and graphical form.
DETAILS OF SUPPLIER
Submit the name of the supplier and the location of each plant from which it is proposed to obtain sub-base material and bituminous materials to the CM at the time stated in EXT1.M120 (3).

METHOD OF LAYING AND COMPACTING
Submit to the CM
1. The following particulars of the proposed methods of laying and compacting sub-bases and bituminous materials
   a. Details of constructional plant; and
   b. Programme and rate of working.
2. Particulars at the time stated in EXT1.M120 (3).

SAMPLES

SUB-BASE MATERIAL, AGGREGATE FILLER AND BITUMEN
Submit one sample of each type of sub-base material, and one sample of each type of aggregate, filler and bitumen for bituminous material to the CM at the same time as submission of particulars.

SUB-BASE MATERIALS

SUB-BASE
Crushed rock with the properties stated in the following table. Sub-base material passing the 425 micron BS Test Sieve, when tested as EXT1.T130 (4), shall be non-plastic.

<table>
<thead>
<tr>
<th>Properties</th>
<th>BS Test Sieve</th>
<th>Percentage by mass passing</th>
</tr>
</thead>
<tbody>
<tr>
<td>Particle size distribution</td>
<td>75 mm</td>
<td>100</td>

<tr>
<td></td>
<td>37.5 mm</td>
<td>85 - 100</td>
</tr>
<tr>
<td></td>
<td>20 mm</td>
<td>60 - 85</td>
</tr>
<tr>
<td></td>
<td>10 mm</td>
<td>40 - 70</td>
</tr>
<tr>
<td></td>
<td>5 mm</td>
<td>25 - 45</td>
</tr>
<tr>
<td></td>
<td>600 microns</td>
<td>8 - 22</td>
</tr>
<tr>
<td></td>
<td>75 microns</td>
<td>0 - 10</td>
</tr>
<tr>
<td>Ten percent fines value</td>
<td></td>
<td>&gt; 50 kN</td>
</tr>
</tbody>
</table>

RECYCLED SUB-BASE
1. Recycled sub-base material shall be crushed rock, crushed concrete or clean crushed inert demolition material and may contain up to 12.5% by mass of natural sand, which passes the 5 mm BS test sieve. The material may lie within the grading limits of the following Table, and not be gap graded:
### Recycled sub-base - Permissible range of particle size distribution

<table>
<thead>
<tr>
<th>Properties</th>
<th>BS test sieve</th>
<th>Percentage by mass passing</th>
</tr>
</thead>
<tbody>
<tr>
<td>Particle size distribution</td>
<td>75 mm</td>
<td>100</td>
</tr>
<tr>
<td></td>
<td>37.5 mm</td>
<td>85 - 100</td>
</tr>
<tr>
<td></td>
<td>20 mm</td>
<td>60 - 85</td>
</tr>
<tr>
<td></td>
<td>10 mm</td>
<td>40 - 70</td>
</tr>
<tr>
<td></td>

<td>25 - 45</td>
</tr>
<tr>
<td></td>
<td>600 μm</td>
<td>8 - 22</td>
</tr>
<tr>
<td></td>
<td>75 μm</td>
<td>0 - 10</td>
</tr>
</tbody>
</table>

2. The material shall have a ten percent fines value of 50 kN or more when tested in accordance with EXT1.T140 (3);

3. The material passing the 425 μm BS test sieve shall be non-plastic when tested in accordance with EXT1.T140 (4);

4. The aggregate shall be considered suitable if it has a soundness value greater than 65;

5. The material shall have a water-soluble sulphate content of less than 1.9 g of sulphate (expressed as SO₃) per litre, if used within 500 mm of cement-bound material, concrete pavements, concrete structures or concrete products;

6. The material shall have a minimum laboratory CBR value of 30% or such other higher value as specified by the Contract Manager;

7. The material shall not contain quantities of contaminants in excess of the percentages given in the following Table unless otherwise approved by the Contract Manager:

<table>
<thead>
<tr>
<th>Allowable contamination of recycled sub-base material</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sub-base type</td>
</tr>
<tr>
<td>Recycled sub-base</td>
</tr>
</tbody>
</table>

8. In the event that there is a shortage of supply of recycled aggregates, virgin aggregates can be used in lieu of recycled aggregates in the sub-base material subject to CM's approval.

### BITUMINOUS MATERIALS

#### EXT1.M410.7 AGGREGATES FOR BITUMINOUS MATERIALS

1. Coarse aggregate

   Crushed rock all retained on a 5 mm BS Test Sieve and with the properties stated in the following table:

<table>

2. Fine aggregate
Crushed rock, river sand or a mixture of crushed rock and river sand all passing 5 mm BS test sieve. Water absorption of fine aggregate must not exceed 2.0%.

3. For mix design purposes, ensure the combined grading of aggregates for bituminous materials is such that the particle size distribution lies within the limits stated in the following table:

**EXT1.M420.7 FILLER**
Free flowing, dry before addition to the bituminous mixture and

1. Type
   a. Filler for bituminous materials to be crushed rock filler, PC, PFAC, PFA or hydrated lime;
   b. Filler for bituminous friction course material to contain hydrated lime; the amount of hydrated lime, expressed as a percentage by mass of the total aggregates, at least 1.5%.
2. Material  
   a. PC to BS EN 197-1:2000;  
   b. PFAC to BS EN 197-1:2000;  
   c. PFA to BS 3892:Part 1:1997 except that the criterion for maximum water requirement does not apply;  
   d. Crushed rock filler and hydrated lime to ASTM D 242-85.

EXT1.M430.7 BITUMEN  
Bituminous materials:  
1. To ASTM D 946-82, Grade 60-70, with a softening point exceeding 44°C and less than 55°C;  
2. The wax content of the bitumen shall comply with requirements for Grade A specified in JTG F40-2004;  
3. Unless otherwise permitted by the CM, blending and mixing of bitumen must be carried out at an Approved refinery.

EXT1.M440.7 EMULSION  
Bituminous emulsion  
1. Anionic bituminous emulsion to BS 434 Part 1:1984, Table 1, Class A1-40; or  
2. Cationic bituminous emulsion to BS 434 Part 1:1984, Table 2, Class K1-40.

EXT1.M450.7 PRIMER  
Bituminous priming material of medium curing-grade cutback bitumen to ASTM D 2027-76, Table 1, Class MC-30.
WORKMANSHIP

GENERAL

EXT1.W010.7 USE OF APPROVED MIX
1. Do not place bituminous material in the permanent work until the mix has been Approved;
2. Do not change the materials and methods of production used in producing the Approved mixes and the methods of construction used in trial areas unless permitted by the CM.

EXT1.W020.7 HANDLING AND STORAGE
1. Store
   a. Bagged cement in a dry, weatherproof store with a raised floor. Identify each delivery, store separately and use in order of delivery;
   b. Bulk cement and PFA in dry, weatherproof silos. Identify and store separately different types and materials from different sources. Clearly mark silos to identify contents.
2. Do not handle or store sub-base and bituminous materials in a manner that results in mixing of the different types and sizes, or in segregation or contamination of the materials;
3. Do not store bituminous materials in heated surge bins for more than 12 hours or in transport vehicles for more than 3 hours, unless otherwise permitted by the CM;
4. Do not store bituminous friction course material in surge bins for more than 30 minutes.

EXT1.W030.7 TRANSPORING
1. Protect sub-base material and bituminous materials with covers during transportation and before laying;
2. Use heavy canvas or a similar insulating material for covering bituminous materials;
3. Completely cover the material with covers and ensure a secure fixing to minimise loss of heat and protect the materials from contamination by dust or other deleterious materials;
4. Transport sub-base material and bituminous materials in clean vehicles with smooth trays and sides;
5. The trays of vehicles transporting bituminous materials may be lubricated with soap solution or light oil sprayed on the trays. Do not lubricate vehicles transporting bituminous friction course material with light oil.

MIXING

EXT1.W110.7 PLANT
1. Ensure
   a. The mixing plant for bituminous materials has at least four separate cold feed bins for preliminary cold batching of the coarse and fine aggregates, and a rotary drum dryer that continuously agitates the aggregates during the heating and drying process. After passing through the dryer, the aggregates must be screened into at least four hot storage bins before mixing;
   b. Bituminous heating and storage tanks are fitted with circulating pumps to ensure an even temperature throughout the tanks;
SUB-BASES, BITUMINOUS ROADWAYS AND......

2. Alternative methods of mixing bituminous materials may be used when Approved.

EXT1.W120.7 SUB-BASE AND BITUMINOUS MATERIALS

1. Carry out mixing of sub-base material and mixing of bituminous materials before delivery to the Site at Approved mixing plants. Plants to be designed and operated to produce uniform mixes which comply with the specified requirements;

2. Measure aggregates and filler for bituminous materials to an accuracy of ± 3.0% by mass. The aggregate moisture content after drying not to exceed 0.4% by mass;

3. Ensure that aggregates and filler are uniformly coated with bitumen by the continued mixing of the bituminous materials for the necessary period;

4. Ensure bituminous materials comply with the temperature requirements as stated in the following table during and after mixing:

<table>
<thead>
<tr>

PRELIMINARY WORK

EXT1.W210.7 INSTALLATION OF UTILITIES

1. Pipes, cables, manholes, chambers, gullies and other utilities below carriageways must be completed and fill material deposited and compacted in trenches before the carriageway is constructed. Protect openings to manholes, chambers and gullies by temporary covers or by other methods agreed by the CM;

2. Do not fix in position covers, frames and other hardware that will prevent continuous laying of bituminous materials for roadbase and base course until such work is complete;

3. After the penultimate layer of bituminous material has been laid and compacted, cut out the layers of asphalt, remove temporary covers and install the permanent covers, frames and other hardware;
4. Carry out finishing around covers, frames and other hardware using bituminous material of the same type as that for adjacent surfaces, unless otherwise permitted by the CM. Compact the material in layers not exceeding 50 mm thick, using handrammers or mechanical equipment to the underside of the wearing course or friction course.

**LAYING AND COMPACTING**

**EXT1.W310.7 SUB-BASE MATERIAL**

1. Lay and compact sub-base material in a manner that does not result in segregation of the material and with a moisture content that achieves the compaction stated at sub-clause (6) below. The moisture content must not be less than 2%;

2. Lay sub-base material in layers that when compacted do not exceed 225 mm thick. If the final compacted thickness of the sub-base exceeds 225 mm, lay the material in two or more layers, with a minimum thickness for each layer of 100 mm and, if the layers are of unequal thickness, the lowest layer the thickest;

3. Evenly spread each layer of sub-base material immediately after placing in position. Compact immediately after spreading;

4. As a minimum requirement use the compaction plant specified at EXT1.W360 (1) for compaction of sub-base material;

5. Obtain permission from the CM before placing the next layer on each layer of compacted sub-base material;

6. Compact sub-base material to obtain a relative compaction of at least 95% maximum dry density throughout;

7. Maintain the surface of each layer of sub-base in a compacted condition until the next layer of sub-base material or roadbase material is laid. Do not disturb the surface by the use of construction plant or other vehicles, and keep free from ridges, cracks, loose material, pot-holes, ruts or other defects.

**EXT1.W320.7 RECYCLED SUB-BASE MATERIAL**

1. Lay and compact in a manner which will not result in segregation of the material and at a moisture content which allows the compaction stated in sub-clause (7) to be achieved. The moisture content shall not be less than 2%;

2. The recycled sub-base shall consist of an upper layer of virgin sub-base material overlying an underlying layer of recycled sub-base material. The ratio of the thickness of the recycled sub-base layer to that of the virgin sub-base layer shall be approximately 6 to 4. During laying and compaction, the thickness of each of these two layers shall take into account the layer thickness requirements given in sub-clause (3) below;

3. Lay recycled sub-base material in layers in such a manner that the compacted thickness of each layer will not exceed 225 mm. If the specified final compacted thickness of the sub-base exceeds 225 mm, the material shall be laid in two or more layers; the minimum thickness of each layer shall be 100 mm and, if the layers are of unequal thickness, the lowest layer shall be the thickest;

4. Evenly spread each layer of recycled sub-base material immediately after placing in position. Compact immediately after spreading;

5. As a minimum requirement, use the compaction plant specified at EXT1.W360 (1) for compaction of recycled sub-base material;

6. Obtain the permission of the CM before the next layer is placed on each layer of compacted recycled sub-base material;

7. Compact recycled sub-base material to obtain a relative compaction of at least 95% maximum dry density throughout;

8. Maintain the surface of each layer of recycled sub-base in a compacted condition until the next layer of sub-base material or roadbase material is laid. Do not disturb the surface by constructional plant or other vehicles, and keep free from ridges, cracks, loose material, pot-holes, ruts or other defects.
EXT1.W330.7 BITUMINOUS MATERIALS

1. Do not lay bituminous materials during periods of wet weather or when ponded water is present on the underlying surface unless in the opinion of the CM, the works will not be adversely affected;

2. Do not lay
   a. Bituminous wearing course material when the ambient air temperature is below 8°C;
   b. Bituminous friction course material when the ambient air temperature is below 10°C. Measure temperatures in the shade near to the surface on which laying is to be carried out.

3. Ensure surfaces to receive bituminous materials are clean, free from mud, grit and other deleterious material;

4. When Instructed apply a tack coat of bituminous emulsion to surfaces on or against which bituminous materials will be laid as follows:
   a. Apply tack coat evenly at a rate of between 0.4 L/m² and 0.6 L/m² using a spray machine complying with BS 434 Part 2:1984;
   b. Do not lay bituminous materials until the tack coat has cured;
   c. Only allow construction plant and other vehicles necessary to lay the bituminous materials to run on the tack coat.

5. When Approved, surfaces of existing carriageways may be regulated before application of overlaying bituminous material. In this case ensure
   a. Bituminous regulating course material is Approved as complying with the requirements of the 10 mm nominal maximum aggregate size wearing course material as stated in the table to EXT1.M410 (3);
   b. Regulating course material is laid by paving machines unless laying by manual methods is Instructed.

6. Ensure bituminous materials comply with the temperature requirements stated in the table to EXT1.W120 during laying and compaction.

EXT1.W340.7 LAYING BY PAVING MACHINE

1. Unless otherwise permitted by the CM place and spread bituminous materials using a self-propelled paving machine with a screw auger and attached screed capable of spreading and laying the material to the full width required and of giving initial compaction to the material and finishing it to a level suitable for subsequent compacting operations;

2. Paving machines may be fitted with cut-off shoes or extensions to limit or extend the width of the screed; do not use screed extensions unless the screw auger is extended in accordance with the manufacturer’s recommendations. Ensure the surface texture produced by paving machines is free from segregation and from pushing or dragging marks;

3. Place bituminous materials laid by paving machines directly from the vehicles transporting the material into the hopper of the paving machine. Ensure delivery of materials to the paving machine and laying of the materials is at a uniform rate appropriate to the capacity of the paving machine and compaction plant;

4. When any delay in laying operations occurs remove the paving machine and the uncompacted cold material and form a transverse joint as stated in EXT1.W370;

5. Ensure paving machines working in echelon are as close as practicable; machines must not be more than 30 m apart unless a longitudinal joint is formed as EXT1.W370;

6. Only use manual placing of materials on freshly laid surfaces for the purpose of locally correcting levels as paving operations proceed and before compaction by rolling is commenced.
EXT1.W350.7 **LAYING BY MANUAL METHODS**

Only lay bituminous materials by manual methods if in the opinion of the CM, the use of a paving machine is impracticable. If Approved, bituminous materials may be laid by manual methods in the following situations:

1. In courses of irregular shape and varying thickness;
2. In confined locations;
3. Adjacent to expansion joints, covers, frames and other hardware; and,
4. In reinstatements to trenches.

EXT1.W360.7 **COMPACTING**

1. As a minimum requirement use compaction plant to compact bituminous roadbase, base course, regulating course, wearing course and sub-base material as follows:
   a. i. A smooth three steel-wheeled roller with a mass of between 6 t and 12 t, or a vibratory tandem steel-wheeled roller with an effective mass of between 6 t and 12 t; and
   ii. A smooth pneumatic tyred-roller with a mass of between 12 t and 25 t, and with not less than seven overlapping wheels which have tyres that are capable of having pressures varying between 300 MPa and 800 MPa; and
   iii. Suitable mechanical rammers and hand tools; or
   b. Other Approved types of rollers, vibrating plates, or other similar plant necessary to produce the required degree of compaction.
2. Initially roll bituminous roadbase, base course, regulating course and wearing course materials with a steel-wheeled roller operated in a longitudinal direction along the carriageway with the driving wheels nearest the paving machine;
3. Remove all roller marks from the surface of bituminous roadbase, base course and wearing course materials with either a smooth-wheeled dead-weight roller or a smooth-wheeled vibratory roller in non-vibrating mode;
4. Compact bituminous friction course material using rollers as sub-clause (1)(a) above without the application of vibration; roller must not have an excessive film of water over the front and rear wheels. Compact bituminous friction course material until all roller marks are removed and compaction is complete;
5. Do not park rollers on newly laid or compacted bituminous materials;

EXT1.W370.7 **JOINTING BITUMINOUS MATERIALS**

1. Ensure the screed of the paving machine overlaps previously laid strips of bituminous material by at least 50 mm and is sufficiently high so that compaction produces a smooth dense flush joint. Push back bituminous materials overlapping the previously laid strip to the edge of the previously laid strip and remove excess material;
2. Form longitudinal joints in friction or wearing courses to coincide with the position of the lane-markings unless otherwise permitted by the CM;
3. Form a prepared joint between hot bituminous material and cold material or existing bituminous material at a temperature below the minimum specified laying temperature;
4. Ensure the distance between prepared
   a. Longitudinal joints in different layers is at least 150 mm;
   b. Transverse joints in different layers is at least 500 mm.
5. Form prepared joints in base course and wearing course as follows:
a. Cut back the face of the cold material or existing bituminous material for a minimum distance of twice the depth of the layer or 100 mm, whichever is greater; cut a vertical face for the full depth of the layer;

b. Remove all loosened materials and coat with bituminous emulsion; do not apply the bituminous emulsion beyond the edges of the joint;

c. Lay and compact the hot bituminous materials against the coated face with a joint formed as stated in this clause.

6. Unless otherwise permitted by the CM, do not coat friction course joints with bituminous emulsion.

**PERMISSIBLE TOLERANCES**

**EXT1.W410.7 CARRIAGEWAY ALIGNMENT**

Form carriageway edgelines within the following tolerances from the dimensions indicated on the Drawings:

1. Generally within 25 mm;
2. Adjacent edges of structures within 6 mm.

**EXT1.W420.7 CARRIAGEWAY LEVELS**

Refer to Appendix H "Schedule of Tolerances” to this Specification.

**EXT1.W430.7 COVERS, FRAMES AND OTHER HARDWARE**

Set in position to ensure

1. The level of covers, frames and other hardware are not lower than, and not more than 5 mm higher than the surface of the adjacent carriageway;
2. The level of gully gratings are not higher than, and not more than 5 mm lower than the surface of the adjacent carriageway.

**PROTECTION**

**EXT1.W510.7 SURFACES OF SUB-BASES AND BITUMINOUS CARRIAGEWAYS**

1. Keep the surface of each layer of sub-base material and bituminous materials clean and free from deleterious material. When Instructed apply bituminous priming coat to the final surface of the sub-base layer at a rate of between 0.9 L/m² and 1.1 L/m²;
2. Do not permit the use of carriageway layers under construction by construction plant or vehicles other than those which in the opinion of the CM are essential for construction purposes;
3. Unless otherwise permitted by the CM, do not permit the use of bituminous courses by construction plant or other vehicles until 6 hours after the material has been laid and compacted.

**WORKS OUTSIDE SITE BOUNDARY**

**EXT1.W610.7 APPROVED CONTRACTOR FOR PUBLIC WORKS**

Road and footway works required to be carried out by a contractor or sub-contractor who is on the current List of Approved Contractors for Public Works for Roads and Drains are specified in Project Specific Specification.

**EXT1.W620.7 SPECIFICATION**

Carry out the works specified under EXT1.W610 in accordance with Section 9 of the Hong Kong Government General Specification for Civil Engineering Works (2006 Edition) and its amendments published 42 days prior to the date for the return of tenders unless otherwise specified.
EXT1.W630.7  HAN DING OVER INSPECTION
Notify the CM to arrange with Highways Department for a joint handing over inspection. Allow the CM to give at least 2 working days advance notice for this inspection.

EXT1.W640.7  RECORD DRAWINGS AND TEST REPORTS
Provide as-built record drawings and all test reports to the CM for submitting to Highways Department.
TESTING

BITUMINOUS CARRIAGEWAY TRIALS

EXT1.T010.7 TRIAL AREAS
1. Construct trial areas of each type and layer of bituminous materials to demonstrate that the proposed materials, mixes, methods of production and methods of construction are capable of producing a carriageway which complies with the specified requirements except in the following circumstances:
   a. With approval of the CM in the case that the area of work is less than 200 m²; or
   b. When the materials are supplied by contractors included in Development Bureau's Special Contractors List of Supply of Bituminous Pavement Materials and Construction of Special Bituminous Surfacing and paving works are carried out by contractors on the List of Approved Contractors for Public Works under the Roads and Drainage Category.
2. Unless otherwise Instructed, construct the trial areas as part of the permanent carriageway at locations agreed by the CM;
3. Trial area size:
   a. Width of each trial area not less than one lane of carriageway;
   b. Length of each trial area not less than 60 m unless otherwise approved by the CM.
4. Construct trial areas using the same materials, mixes, methods of production and methods of construction as the details submitted to the CM. Deliver materials in not less than two loads;
5. Inform the CM 48 hours before constructing trial areas, or at a interval agreed by the CM;
6. Obtain the CM's permission before each layer of material is placed in the trial area;
7. Give the CM sufficient time to determine whether the specified requirements have been produced in the trial area before further material of the same type is placed in the permanent carriageway;
8. Protect trial areas from damage and leave in position unless the CM instructs their removal. Do not remove trial areas which form part of the permanent carriageway and which comply with the specified requirements.

EXT1.T020.7 SAMPLES OF MATERIALS USED IN TRIAL AREAS
1. Provide one sample of bituminous materials, excluding bituminous roadbase materials, from each mix used in trial areas. Method of sampling as stated in the table to EXT1.T030;
2. Cut ten cores from each layer of base course and wearing course in trial areas. Method of taking core as EXT1.T510.

EXT1.T030.7 SAMPLING AND TEST METHODS FOR TRIAL AREAS
1. Test each sample of bituminous material taken as EXT1.T020 to determine the properties stated in the following table;
2. Where the layer is to form part of the permanent work, test each layer of bituminous material in trial areas, excluding bituminous roadbase material, as EXT1.W420 to determine the level of the surface;
3. Test the layer which will form the final layer of the carriageway in each trial area as EXT1.T610 and EXT1.T620 to determine the surface regularity, if the layer is to form part of the permanent work;
4. Test the friction course layer in each trial area as EXT1.T710 to EXT1.T730 to determine the texture depth and permeability;
5. Test cores as EXT1.T510 to EXT1.T540 to determine the compacted layer thickness and air void content.

**EXT1.T040.7 COMPLIANCE CRITERIA**

The properties of the materials, the levels of the surface, compaction, surface regularity, texture depth and permeability of bituminous materials laid in the trial areas must comply with the specified requirements for the permanent carriageway.

**EXT1.T050.7 NON-COMPLIANCE**

1. In the event of non-compliance of any trial area test with the specified requirements submit details of proposed changes to the materials, mixes, methods of production or construction required to meet the compliance criteria. Construct further trial areas as necessary until the result of every test on trial areas complies with the specified requirements for the trial areas;

2. Unless otherwise permitted by the CM, remove trial areas, or parts of trial areas, which do not comply with the specified requirements for the trial area.

**EXT1.T060.7 APPROVED MIX**

1. A mix for bituminous materials other than bituminous roadbase material which complies with the specified requirements for designed mixes and for trial areas will be regarded as an Approved mix;

2. The Approved gradation envelope for bituminous materials other than bituminous roadbase material will be the gradation envelope found by applying the tolerances stated in the following table to the particle size distribution of the Approved mix:

Specification Library 2014 Edition
3. The Approved bitumen content range for bituminous materials other than bituminous roadbase material will be the bitumen content range formed by applying a tolerance of ±0.5% to the bitumen content of the Approved mix.

### SUB-BASE MATERIALS

#### EXT1.T110.7 Batches for Testing

A batch of sub-base material is a quantity not exceeding 250 m³ of sub-base material of the same type and same mix produced at the same mixing plant, and delivered to the Site.

#### EXT1.T120.7 Samples for Testing

1. Unless otherwise permitted by the CM, provide one sample of each type of sub-base material from each batch of sub-base material delivered to the Site;
2. Sample size at least 50 kg;

#### EXT1.T130.7 Test Methods

1. Test each sample of sub-base materials to determine the particle size distribution, ten percent fines value, maximum dry density, optimum moisture content and plasticity index of the portion passing a 425 micron BS Test Sieve;
2. Method of testing for particle size distribution to BS 812:Section 103.1:1985;
3. Method of testing for ten percent fines to BS 812:Part 111:1990, except that the sample must be soaked in water at room temperature for 24 hours and not be oven-dried before testing;
4. Method of testing for plasticity index comply with Geospec 3, Test Method 6.1, except that same preparation must be by wet sieving the material over a 425 μm BS test sieve;
5. Method of testing for maximum dry density and optimum moisture content comply with Geospec 3, Test Method 10.1, 10.2, 10.3, 10.4, 10.5, 10.6, 10.7 or 10.8 and EAR1.T310 to EAR1.T370, whichever as Instructed.

#### EXT1.T140.7 Test Methods - Recycled Sub-Base Material

1. Test each sample of recycled sub-base material to determine the particle size distribution, ten percent fines value, maximum dry density, optimum moisture content, plasticity index of the portion passing a 425 μm BS test sieve, CBR value, soundness value, water-soluble sulphate content and percentage of contaminants as defined in EXT1.M320 (7);
2. Method of testing for particle size distribution to BS 812:Section 103.1:1985;
3. Method of testing for ten percent fines value to BS 812:Part 111:1990, except that the sample shall be soaked in water at room temperature for 24 hours and shall not be oven-dried before testing;
4. Method of testing for plasticity index to be in accordance with Geospec 3, Test Method 6.1, except that sample preparation shall be by wet sieving the material over a 425 μm BS test sieve;
5. Method of testing for maximum dry density and optimum moisture content to be in accordance with Geospec 3, Test Method 10.1, 10.2, 10.3, 10.4, 10.5, 10.6, 10.7 or 10.8, and EAR1.T310 to EAR1.T370, whichever as Instructed;
6. Soundness value to be determined in accordance with BS 812:Part 121:1989;
7. Water-soluble sulphate content to be determined in accordance with Geospec 3;
8. The maximum organic material content to be determined in accordance with Geospec 3;

9. The maximum metals and foreign material content to be determined in accordance with the following procedure:
   a. Using the sampling procedure detailed in BS 812:Part 101:1984, obtain a sample of the aggregate containing at least 500 particles. Sort the particles manually into the following separate fractions:
      i. Concrete and dense or normal weight aggregates;
      ii. Brick, mortar, lightweight block and lightweight aggregate;
      iii. Asphalt, bitumen, tar and mixtures of these materials with aggregate;
      iv. Wood;
      v. Glass;
      vi. Metal;
      vii. Other foreign material such as clay lumps and plastics.
   b. Because of the adherence of dust or ash, break some particles where necessary to make a positive identification. Weigh the resulting fractions and express as a percentage of the total weight of material;
   c. Note lightweight block materials as a separate category if more than 1% by volume (approx. 5 pieces in 500) is detected. Take record of ultra-lightweight materials (e.g. insulation) if more than 1% by volume (5 pieces in 500) is identified.

10. Determine CBR value in accordance with Geospec 3 with surcharge discs. Test the material at the density and moisture content likely to develop in equilibrium pavement conditions, which shall be taken as being the density relating to an uniform air voids content of 5% and the optimum moisture content determined in compliance with BS 5835:Part 1:1980.

**EXT1.T150.7 DETERMINATION OF RELATIVE COMPACTION**

1. Test each area of sub-base which contains sub-base material of the same type and same mix produced at the same mixing plant and which is laid and compacted in a single layer in one day to determine the relative compaction. Carry out tests after the sub-base material has been laid and compacted in the final position;
2. Carry out two tests on each area of 1000 m² or part thereof laid and compacted each day;
3. Carry out tests at positions which in the opinion of the CM are representative of the area of compacted sub-base as a whole;
4. Comply with the method of testing for relative compaction as **EAR1.T530**.

**EXT1.T160.7 COMPLIANCE CRITERIA FOR RELATIVE COMPACTION**
The results of tests for relative compaction of sub-base must comply with the requirements specified at **EXT1.W310** (6).

**EXT1.T170.7 NON-COMPLIANCE OF RELATIVE COMPACTION**
In the event of non-compliance of any test for relative compaction of sub-base with the specified requirements, recompact the area and carry out two additional tests for relative compaction of sub-base on the area.
BITUMINOUS MATERIALS OTHER THAN BITUMINOUS FRICTION COURSE MATERIAL

EXT1.T310.7 Batches for Testing
A batch of bituminous materials other than bituminous friction coarse material is a quantity not exceeding the limits stated in the following table of bituminous materials of the same type and same mix produced at the same mixing plant in one day:

<table>
<thead>
<tr>
<th>Material</th>
<th>Maximum batch size</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wearing course</td>
<td>100 t</td>
</tr>
<tr>
<td>Base course</td>
<td>150 t</td>
</tr>
<tr>
<td>Roadbase</td>
<td>200 t</td>
</tr>
</tbody>
</table>

EXT1.T320.7 Samples for Testing
1. Provide one sample of bituminous materials other than bituminous friction course material from each batch unless otherwise required by the CM;
2. Sample size of each as stated in the following table:

<table>
<thead>
<tr>
<th>Material</th>
<th>Minimum size of sample (kg)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wearing course (10 mm nominal maximum aggregated size)</td>
<td>10</td>
</tr>
<tr>
<td>Wearing course (20 mm nominal maximum aggregate size)</td>
<td>16</td>
</tr>
<tr>
<td>Base course</td>
<td>24</td>
</tr>
<tr>
<td>Roadbase</td>
<td>24</td>
</tr>
</tbody>
</table>

3. Take samples at the mixing plant or at the location where the bituminous material will be laid as instructed. When applicable, take samples at the mixing plant from the delivery vehicle immediately after loading from the plant or from the surge bin. When applicable, take samples at the location where the bituminous materials will be laid from the delivery vehicle;
4. Unless otherwise agreed by the CM the method of sampling to comply with ASTM D 979-89.

EXT1.T330.7 Test Methods
1. Test each sample of bituminous materials taken as EXT1.T320 (1) to determine the particle size distribution, bitumen content, Rice's specific gravity and bulk specific gravity;
2. The method of testing to comply with the following:
   a. Particle size distribution: ASTM C 136-96a with modifications and ASTM C 117-95, Method B;
   b. Bitumen content: ASTM D 6307-05 or ASTM D 2172-95, Method A;
3. For particle size distribution tests in accordance with ASTM C 136-96a, the modifications are:
   a. Use sieves to BS 410:1986 instead of sieves to ASTM E 11-95;
b. Reduce each sample of bituminous materials taken as stated in EXT1.T330 to a test specimen of suitable size as follows:

<table>
<thead>
<tr>
<th>Nominal Maximum Aggregate Size (mm)</th>
<th>Minimum Sample Size (kg)</th>
</tr>
</thead>
<tbody>
<tr>
<td>37.5</td>
<td>2.5</td>
</tr>
<tr>
<td>28.0</td>
<td>2.0</td>
</tr>
<tr>
<td>20.0</td>
<td>1.5</td>
</tr>
<tr>
<td>10.0</td>
<td>1.0</td>
</tr>
</tbody>
</table>

4. The residual pressure manometer specified in ASTM D 2041-94 may be replaced by a vacuum gauge.

**EXT1.T340.7 COMPLIANCE CRITERIA**

1. The results of tests on bituminous materials other than bituminous roadbase and friction course materials must comply with the following requirements:
   a. The particle size distribution must be such that not more than two points on the particle size distribution curve are outside the Approved gradation envelopes determined as EXT1.T060 (2). The percentage passing the 75 micron BS test sieve must not exceed the Approved design value by more than 3%;
   b. The bitumen content must be within the Approved bitumen content range determined as EXT1.T060 (3).

2. The results of tests on bituminous roadbase material must comply with the following requirements:
   a. The particle size distribution must be such that not more than two points on the particle size distribution curve are outside the design limits as stated in EXT1.M410 (3). The percentage passing the 75 micron BS test sieve must not exceed 8% as specified in EXT1.M410 (3);
   b. The bitumen content must be within the allowable bitumen content range as specified in EXT1.M410 (3).

**BITUMINOUS FRICTION COURSE MATERIAL**

**EXT1.T410.7 BATCHES FOR TESTING**

A batch of bituminous friction course material is a quantity not exceeding 100 tonnes of bituminous friction course material of the same mix produced at the same mixing plant in one day.

**EXT1.T420.7 SAMPLES FOR TESTING**

1. Provide one sample of bituminous friction course material from each batch of bituminous friction course material;
2. The size of each sample must be at least 15 kg;
3. Take samples at the mixing plant from the delivery vehicle immediately after loading from the plant or from the surge bin;
4. Unless otherwise agreed by the CM the method of sampling to comply with ASTM D 979-89.

**EXT1.T430.7 TEST METHODS**

1. Test each sample of bituminous friction course material to determine the particle size distribution and bitumen content;
2. The method of testing to comply with the following:
   a. Particle size distribution: ASTM C 136-96a with modifications and ASTM C 117-95, Method B;
   b. Bitumen content: ASTM D 2172-95, Method A.
3. For particle size distribution tests in accordance with ASTM C 136-96a, the modifications are:
   a. Use sieves to BS 410:1986 instead of sieves to ASTM E 11-95;
   b. Reduce each sample of bituminous materials taken as stated in EXT1.T420 to a test specimen of suitable size as follows:

<table>
<thead>
<tr>
<th>Nominal Maximum Aggregate Size (mm)</th>
<th>Minimum Sample Size (kg)</th>
</tr>
</thead>
<tbody>
<tr>
<td>37.5</td>
<td>2.5</td>
</tr>
<tr>
<td>28.0</td>
<td>2.0</td>
</tr>
<tr>
<td>20.0</td>
<td>1.5</td>
</tr>
<tr>
<td>10.0</td>
<td>1.0</td>
</tr>
</tbody>
</table>

**EXT1.T440.7 COMPLIANCE CRITERIA**

The results of test on bituminous friction course material must comply with the following requirements:

1. The particle size distribution must be within the Approved gradation envelopes as EXT1.T060 (2);
2. The bitumen content must be within the Approved bitumen content range determined as EXT1.T060 (3).

**CORES FROM BITUMINOUS ROADWAYS**

**EXT1.T510.7 SAMPLE LOCATIONS AND METHODOLOGY**

1. Test each area of roadbase, base course and wearing course which contains bituminous material of the same type and same mix produced at the same mixing plant and which is laid and compacted in a single layer in one day to determine the compacted layer thickness;
2. Unless otherwise Approved, divide each area of bituminous material to be tested into approximately equal sub-areas as stated in the following table. Take one core at random from each sub-area:

<table>
<thead>
<tr>
<th>Area of bituminous material laid and compacted in one day</th>
<th>No. of sub-areas/cores</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt; 5 000 m²</td>
<td>4</td>
</tr>
<tr>
<td>5 000 - 10 000 m²</td>
<td>10</td>
</tr>
<tr>
<td>&gt; 10 000 m²</td>
<td>20</td>
</tr>
</tbody>
</table>

3. Do not take cores from within 300 mm of covers, frames and other hardware, or construction joints in the bituminous material;
4. Take cores with a mechanically operated coring machine;
5. Core sizes
   a. 150 mm diameter for bituminous material with a designed layer thickness of 40 mm or greater;
   b. 100 mm diameter for bituminous material with a designed layer thickness of less than 40 mm.
6. Take cores as soon as practicable but not later than 48 hours after completion of the paving operation;
7. If agreed by the CM, the sampling rate for roadbase may be applied to wearing and base courses;
8. Fill holes formed by taking cores with compatible bituminous material as soon as practicable after the core has been taken.

**EXT1.T520.7 TEST METHOD**

1. Measure each bituminous material core to determine the compacted layer thickness of the bituminous material and test to determine the air void content;
2. Method of testing for air void content complying with ASTM D 3203-94.

**EXT1.T530.7 COMPLIANCE CRITERIA**

The results of tests on bituminous material cores must comply with the following requirements:

1. The average air void content of the cores taken from an area of bituminous base course or wearing course material must be not less than 3.0% and not greater than 6.0%;
2. The air void content of each core taken from an area of bituminous base course or wearing course material must be not less than 2.5% and not greater than 7.5%;
3. The air void content of each core taken from an area of bituminous roadbase material must not be not less than 3.0% and not greater than 9.0%;
4. The compacted layer thickness as measured from each core must comply with the thickness requirements and be compatible with the levels of tolerances stated in EXT1.W420.

**EXT1.T540.7 NON-COMPLIANCE**

1. If the result of any test for air void content of cores does not comply with the specified requirements for air void content, carry out the following procedures:
   a. Take four additional cores, from each sub-area for which the original core did not comply with the specified requirements for air void content. Take the cores at locations evenly spaced through the sub-area so that in the opinion of the CM they are representative of the sub-area as a whole;
   b. Test each additional core to determine the air void content and average the test results of the additional cores from the same sub-area;
   c. The average air void content of the sub-area thus obtained replaces the original air void content of the respective sub-area. Use the new average air void content calculation of the area of bituminous material tested for compliance checking.
2. If the air void content of any of the four additional cores determined as EXT1.T520 (2) is less than 2.5% or greater than 7.5% for bituminous base course material and bituminous wearing course material, or less than 3.0% or greater than 9.0% for bituminous roadbase material, the sub-area from which the cores were taken will be considered as not complying with the specified requirements;
3. The area of bituminous material tested will be considered as not complying with the specified requirements for average air void content if the average air void content of the cores taken from the area does not comply with the specified requirements for average air void content;
4. If the results of any tests for compacted layer thickness of cores is not compatible with the requirements as stated in the table to EXT1.W420, take four additional cores from the same sub-area and determine the average compacted layer thickness. Take the cores at locations evenly spaced throughout the sub-area so that in the opinion of the CM they are representative of the sub-area as a whole;
5. If the average compacted layer thickness determined as sub-clause (4) above is not in accordance with the permitted compacted layer thickness as EXT1.T530 (4), the sub-area from which the cores were taken will be considered as not complying with the specified requirements.
SURFACE REGULARITY

EXT1.T610.7 DEFINITION AND TEST METHODS
Carry out the following testing to determine the surface regularity:
1. The surface regularity of the final layer of the pavement will be determined by measuring the number of irregularities in the surface. An irregularity is defined as when the gap between the surface of the carriageway, and a 3 m straight-edge placed on the surface of the carriageway, exceeds the specified amount. Measured irregularities will be in millimeters perpendicular to the straight-edge;
2. The longitudinal surface regularity of carriageways with a total length of 75 m or more may be measured using a rolling straight-edge of the type designed by the UK Transport and Road Research Laboratory. The longitudinal surface regularity of carriageways, with a total length of less than 75 m, and the transverse surface regularity of carriageways will be measured using a 3 m straight-edge;
3. The longitudinal surface regularity will be measured along lines parallel to the longitudinal axis of the carriageway and approximately 1 m from the near side edge of each carriageway lane. The transverse surface regularity will be measured along lines at right angles to the longitudinal axis on the carriageway at 10 m intervals along the length of the carriageway.

EXT1.T620.7 COMPLIANCE CRITERIA
The results of tests for surface regularity of carriageways must comply with the following requirements
1. The size and number of irregularities in the longitudinal direction must not exceed the size and permitted number of irregularities stated in the following table:

<table>
<thead>
<tr>
<th>Total length of carriageway</th>
<th>Size of irregularity</th>
<th>Permitted number of irregularities (Category A road)</th>
<th>Permitted number of irregularities (Category B road)</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt; 75 m</td>
<td>&gt; 4 mm</td>
<td>(9 x total length)/75</td>
<td>(18 x total length)/75</td>
</tr>
<tr>
<td></td>
<td>&gt; 7 mm</td>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>75 m – 300 m</td>
<td>&gt; 4 mm</td>
<td>9 in any 75 m length</td>
<td>18 in any 75 m length</td>
</tr>
<tr>
<td></td>
<td>&gt; 7 mm</td>
<td>1 in any 75 m length</td>
<td>2 in any 75 m length</td>
</tr>
<tr>
<td>&gt; 300 m</td>
<td>&gt; 4 mm</td>
<td>20 in any 300 m length</td>
<td>40 in any 300 m length</td>
</tr>
<tr>
<td></td>
<td></td>
<td>9 in any 75 m length</td>
<td>18 in any 75 m length</td>
</tr>
<tr>
<td></td>
<td>&gt; 7 mm</td>
<td>2 in any 300 m length</td>
<td>4 in any 300 m length</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1 in any 75 m length</td>
<td>2 in any 75 m length</td>
</tr>
</tbody>
</table>

Notes to table:
a. Category A roads are roads with a legal speed limit greater than 70 kilometers per hour; all other roads are Category B roads;
b. Irregularities greater than 7 mm will also be counted as greater than 4 mm;
c. No irregularity greater than 10 mm will be permitted.
2. No irregularity exceeding 4 mm in a 3 m length in the transverse direction for Category A roads and no irregularity exceeding 7 mm in a 3 m length in the transverse direction for Category B roads will be permitted.
TEXTURE DEPTH AND PERMEABILITY

EXT1.T710.7 TEST LOCATIONS AND METHODOLOGY

Carry out testing to determine the texture depth and permeability. The method of testing will be as follows

1. Unless otherwise agreed by the CM each area of friction course to be tested will be divided into approximately equal sub-areas as stated in the following table. Tests for texture depth and permeability will be carried out on each sub-area at positions which in the opinion of the CM are representative of the sub-area of friction course as a whole. No measurement will be taken within 300 mm of the longitudinal edge of the carriageway;

2. If agreed by the CM the number of tests for texture depth and permeability may be reduced to the minimum stated in the following table:

<table>
<thead>
<tr>
<th>Area of bituminous material laid and compacted in one day</th>
<th>No of sub-areas/tests</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt; 5,000 m²</td>
<td>10</td>
</tr>
<tr>
<td>5,000 - 10,000 m²</td>
<td>15</td>
</tr>
<tr>
<td>&gt; 10,000 m²</td>
<td>20</td>
</tr>
</tbody>
</table>

3. Test will be carried out before the area of friction course is used by Constructional Plant or other vehicles;

4. The test method for the determination of the permeability of friction course material measures the time taken for 150 ml of water to drain into the material:

   a. Apparatus
      i. A non-porous ring with an internal diameter of 150 mm ± 2 mm, and a minimum height of 20 mm;
      ii. Suitable sealant for sealing one end of the ring onto the friction course surface;
      iii. A measuring cylinder for measuring 150 ml of water to an accuracy of 1 ml;
      iv. Two containers, each suitable for containing and pouring 150 ml of water;
      v. A stop watch.

   b. Procedure
      i. The test location will be carefully inspected and any unusual features recorded;
      ii. One end of the ring will be placed on the friction course at the location to be tested, and the interface sealed with sealant to prevent any leakage of water;
      iii. Two volumes of water of 150 ml each will be prepared using the measuring cylinder and the two containers;
      iv. One 150 ml measure of water will be poured into the ring quickly and steadily without spillage;
      v. As soon as all of the water has drained into the friction course, the second 150 ml of water will be poured into the ring quickly and steadily without spillage, and at the same time the stop watch started;
      vi. The time taken for the second 150 ml of water to drain into the friction course surface will be recorded.

   c. The following information will be recorded
      i. The test location;
ii. The time taken for the second 150 ml of water to drain into the friction course surface, to the nearest one second;

iii. That the test was carried out in accordance with this Specification.

5. The test method for determination of the texture depth of carriageways covers the determination of the texture depth of carriageways by the sand patch test:

a. Material dry natural sand, with a rounded particle shape, which has been washed and then screened such that it meets the grading stated in the following table:

<table>
<thead>
<tr>
<th>Grading of Sand</th>
<th>BS test sieve</th>
<th>Percentage by mass passing</th>
</tr>
</thead>
<tbody>
<tr>
<td>600 microns</td>
<td>100</td>
<td></td>
</tr>
<tr>
<td>300 microns</td>
<td>95 - 100</td>
<td></td>
</tr>
<tr>
<td>150 microns</td>
<td>0 - 6</td>
<td></td>
</tr>
</tbody>
</table>

b. Apparatus
i. A soft brush;
ii. A robust measuring cylinder having an internal diameter of 20 ± 2 mm and a flat top surface such that its internal volume is 25 ± 0.1 ml;
iii. A flat wooden disc of 65 mm diameter with a 1.5 mm thick hard rubber disc attached to one face and a handle fixed to the other face;
iv. A steel rule calibrated to 1 mm;
v. A suitable wind shield;
vii. A steel straight edge for screeding off the measuring cylinder;
viii. A steel-wire brush.

c. Procedure
i. The test location will be at least 300 mm square. It will be vigorously brushed ten times in two directions at right angles using the steel wire brush, and then dried and swept clean with the soft brush;
ii. Sand will be poured into the measuring cylinder to fill it to overflowing, and any excess sand will be screened off using the straight edge. All sand on the outside of the cylinder will be removed, taking care not to drop any sand onto the test location. Alternatively, this step in the procedure may be carried out in a laboratory, and the sand transferred to a suitable container ready for pouring;
iii. The measured volume of sand will be poured onto the centre of the test location through the funnel to form a heap. The wind shield will be used to protect the test location if required;
iv. The sand will be spread outwards with a circular motion over the test location, using the rubber-face disc with its face parallel to the surface of the carriageway. This will be continued until the patch of sand is approximately circular and will spread outwards no more;
v. The size of the circular patch of sand will be measured to the nearest 1 mm along three diameters which are aligned at approximately 120 degrees to each other;
vi. If the difference between the maximum and minimum of the three measurements exceeds 20% of the average of the three measurements, then all the measurements will be discarded and the test repeated at an adjacent location;
vii. The test will be repeated for all the ten test locations for each section of carriageway lane.

d. Method of calculation
i. The texture depth (T) for each test will be calculated from the equation 
   \[ T = \frac{31000}{D^2} \text{ mm} \]
   Where D is the average of the three diameter measurements of the sand 
   patch calculated to the nearest 1 mm;

ii. The average texture depth for the ten tests will be calculated.

e. The following information will be recorded

i. The test location;

ii. The average diameter of the sand patch for each test to the nearest 1 mm;

iii. The texture depth for each test to the nearest 0.1 mm;

iv. The average texture depth to the nearest 0.1 mm;

v. That the test was carried out in accordance with this Specification.

EXT1.T720.7 COMPLIANCE CRITERIA FOR TEXTURE DEPTH

The results of tests for texture depth on an area of friction course must comply with 
the following requirements:

1. The average texture depth not less than 1.5 mm;

2. Not more than one of the tests for texture depth giving a result of less than 
   1.2 mm will be permitted.

EXT1.T730.7 COMPLIANCE CRITERIA FOR PERMEABILITY

The time for 150 ml of water to drain into the friction course in the permeability test 
as stated in EXT1.T710 must not exceed 30 seconds.
EXT2 CONCRETE CARRIAGEWAYS

MATERIALS

GENERAL

APPLICATION OF OTHER WORKSECTIONS
Comply with the relevant provisions of the following Sections unless otherwise specified in this Worksection:
1. Concrete: Worksection CON1;
2. Formwork and finishes to concrete:
   a. Worksection FOR for works carried out under site formation / road and drainage works contract; or
   b. Worksection CON2 for all other works not mentioned in sub-clause (2)(a) above.
3. Reinforcement: Worksection CON3;
4. Curing compound: Worksection CON1;

CONCRETE

CONCRETE FOR CARRIAGEWAY CONSTRUCTION
Complying with the following requirements:
1. Designed mix, grade: 40/20;
2. Containing either PFAC, or a minimum of 265 kg of PC plus a minimum of 85 kg of PFA per m³ of compacted concrete;
3. At least 30% by mass content of fine aggregate to total aggregate;
4. Workability, in terms of designed slump value: not exceeding 30 mm;
5. Minimum cementitious content: 350 kg/m³.

ANCILLARY MATERIALS

GENERAL
Adhesives, adhesive primer, sealant, sealant primer, and caulking material shall be in compliance with the prescribed limits of VOC content as set out in the Air Pollution Control (Volatile Organic Compound) Regulation.

REINFORCEMENT
Steel fabric to BS 4483:1998:
1. Manufactured from steel wire to BS 4482:1985;
2. Having a type 2 bond classification.

DOWEL BARS, TIE BARS, CRADLES AND TIE BARS FOR CRADLES
Plain, round steel bars to CS2:1995 and:
1. Grade 250;
2. With dowel bars straight and with both ends sawn square and burrs removed;
3. With tie bars straight and with one end sawn square and burrs removed.
EXT2.M230.7 CEMENT MORTAR
Consisting of:
1. 1 part cement (complying with CON1) to 3 parts of fine aggregate (sand or crushed rock to BS 1200:1976 and passing a 5 mm BS Test Sieve); and
2. The minimum amount of water to achieve a consistency suited to the required work.

EXT2.M240.7 FINE AGGREGATE FOR CONCRETE
1. Clean, hard and durable crushed rock in accordance with CON1;
2. Do not use natural sand unless with prior agreement of the CM.

EXT2.M250.7 COARSE AGGREGATE FOR CONCRETE
1. Clean, hard, durable crushed rock complying with BS 882:1992;
2. Ten percent fines values of at least 100 kN;
3. Water absorption not exceeding 0.8%;
4. Flakiness index not exceeding 35%.

EXT2.M260.7 POLYETHYLENE SHEETING
Impermeable and having a nominal thickness of 0.125 mm.

EXT2.M270.7 JOINT FILLER
Approved proprietary type consisting of a firm, compressible, single thickness, non-rotting filler.

EXT2.M280.7 JOINT SEALANT
Cold poured, two part polymer based sealant to BS 5212 Part 1:1990:Type N, and:
1. Suited to the climatic conditions of Hong Kong, performing effectively over a temperature range of 0°C to 60°C;
2. For use in conjunction with Approved proprietary types of primers and caulking material as recommended by the joint sealant manufacturer.

EXT2.M290.7 BOND BREAKER TAPE
Of an Approved proprietary type recommended by the joint sealant manufacturer and comprising a polyethylene film with adhesive applied to one side and covering the full width of the groove.

EXT2.M300.7 GROOVE FORMING STRIP
Of an Approved proprietary type:
1. Comprising a firm compressible strip of either:
   a. Ethylene vinyl acetate foam with a density of at least 90 kg/m³; or
   b. Synthetic rubber.
2. 25 mm deep and 5 mm thick;
3. Sufficiently rigid to remain in position during concreting without deforming or stretching.

EXT2.M310.7 ADHESIVE FOR GROOVE FORMING STRIP
An Approved proprietary type recommended by the groove forming strip manufacturer.

EXT2.M320.7 SLEEVES FOR DOWEL BARS AND TIE BARS
Manufactured from PVC and:
1. With a wall thickness not exceeding 1.5 mm;
2. Of an internal diameter allowing a tight fit to the bars.
EXT2.M330.7  EPOXY RESIN GROUT
An Approved proprietary type.

SUBMISSIONS

EXT2.M410.7  GENERAL
Submit the particulars and certificates required for Approval under the terms of this sub-section, at least 14 days before the first delivery of the material to the Site. Submit certificates for each batch of the material delivered to the Site.

EXT2.M420.7  JOINT FILLER
Submit manufacturer's literature and a certificate for Approval, showing:
1. The manufacturer's name;
2. The date and place of manufacture;
3. That the joint filler complies with the requirements of this Specification and including results of tests for:
   a. Disintegration and shrinkage;
   b. Recovery value and reduction in mass;
   c. Extrusion.

EXT2.M430.7  JOINT SEALANT
Submit manufacturer's literature for Approval, including:
1. The manufacturer's name;
2. Details of the method and time required for mixing the different components;
3. A certificate showing the date and place of manufacture, that the sealant complies with this Specification and results of tests for:
   a. Application life;
   b. Tack-free time;
   c. Resistance to flow;
   d. Recovery;
   e. Adhesion and cohesion in tension and compression;
   f. Resistance to heat ageing.

EXT2.M440.7  GROOVE FORMING STRIP
Submit manufacturer's literature and a certificate for Approval, showing:
1. The manufacturer's name;
2. The date and place of manufacture;
3. That the groove forming strip complies with this Specification;
4. The results of tests for density.

EXT2.M450.7  JOINT SEALANT PRIMER
Submit particulars of the following for Approval:
1. Caulking material for joint sealant;
2. Adhesive for groove forming strip;
3. Bond breaker tape;
4. Sleeves for dowel bars and tie bars.

EXT2.M460.7  SAMPLES
Submit samples of the following proposed materials for Approval at the same time as the particulars of the material:
1. Polyethylene sheeting;
2. Joint filler;
3. Bond breaker tape;
4. Groove forming strip;
5. Sleeves for dowel bars, including compressible filler, and for tie bars.
WORKMANSHIP

MATERIAL

EXT2.W010.7 SUBMISSION FOR APPROVAL
Submit particulars of proposed methods of construction of concrete carriageways, for Approval at least 7 days before the construction of the trial length.

STORAGE OF MATERIALS

EXT2.W110.7 JOINT SEALANT ETC
1. Store joint sealant, and adhesive for groove forming strip:
   a. In sealed containers, marked to identify the contents;
   b. Protected from exposure to conditions which may adversely affect the material;
   c. In accordance with the manufacturer's recommendations.
2. Do not use materials after their recommended shelf life has been exceeded.

EXT2.W120.7 POLYETHYLENE SHEETING ETC
Store polyethylene sheeting, joint filler, bond breaker tape, groove forming strip and sleeves for dowel bars and tie bars in accordance with the manufacturer's recommendations in a dry, weatherproof store, with a raised floor. Store joint filler in sealed plastic bags and do not expose to moisture or the air.

PRELIMINARY WORK

EXT2.W210.7 INSTALLATION OF UTILITIES
Complete pipes, cables, manholes, chambers, gullies and other utilities below concrete carriageways and:
1. Deposit and compact fill material in trenches before carriageway is constructed;
2. Protect openings to manholes, chambers and gullies by the use of temporary covers or other Approved means.

EXT2.W220.7 BOX-OUT CONSTRUCTION
Form box-outs in concrete carriageways for covers, frames and other hardware for fixing in position after the main slab has been cast and before the infill slab is concreted.

EXT2.W230.7 FORMATION AND SUB-BASE
Start the construction of concrete carriageways as soon as practicable after the formation or sub-base has been completed and protect the following until construction of the carriageway starts:
1. Formation: as EAR1.W2320;

EXT2.W240.7 CONCRETING PERMANENT CARRIAGEWAY
1. Do not place concrete in the permanent carriageway, other than in the trial length, until the results of every test on the trial length complies with the specified requirements for the trial length;
2. Concrete may be placed in the permanent carriageway before the results of compressive tests on the trial mix are available, provided that the result of every other test on the trial mix and the trial length complies with the specified requirements for trial mix concrete and for the trial length.

**EXT2.W250.7 CHANGES IN MATERIALS AND METHODS OF CONSTRUCTION**

Unless permitted by the CM, do not change the materials, mix design, methods of production and methods of construction used to produce a trial length which complies with the specified requirements.

**EXT2.W260.7 LAYING POLYTHENE SHEETING**

Lay polythene sheeting flat and without creases below concrete carriageways, making laps at least 300 mm and leaving no gaps at the edges of bays.

**FORMWORK**

**EXT2.W310.7 FORMWORK**

1. Unless otherwise Approved, use steel formwork for concrete carriageways.
2. Do not place concrete against excavated surfaces or against kerbs unless permitted by the CM.

**EXT2.W320.7 FINISHES**

As struck from the formwork, with an even surface, without grout runs and:

1. Transverse and longitudinal joints:
   a. Maximum permitted abrupt irregularities: 3 mm;
   b. Maximum permitted gradual irregularities: 5 mm in 2 m.

2. Other edges of the carriageway:
   a. Maximum permitted abrupt irregularities: 5 mm;
   b. Maximum permitted gradual irregularities: 10 mm in 2 m.

**EXT2.W330.7 REMOVAL OF FORMWORK**

Do not loosen or remove formwork to excavated surfaces and kerbs until at least 7 hours after concreting has been completed.

**PLACING AND COMPACTING CONCRETE**

**EXT2.W410.7 GENERAL**

Unless otherwise Approved, place concrete continuously between the joints in the concrete carriageway.

**EXT2.W420.7 UNREINFORCED SLABS**

Place and compact concrete to the full thickness of the slab in one operation.

**EXT2.W430.7 REINFORCED SLABS**

Unless otherwise Approved:

1. Place and compact concrete to the level of the reinforcement as shown on the Drawings;
2. Place the fabric reinforcement in position and place and compact concrete to the remaining thickness of the slab;
3. Ensure that the time between compaction of the first layer and placing of the remaining layer does not exceed 30 minutes unless, in the opinion of the CM, the concrete already placed is sufficiently workable and his permission has been obtained. Where such permission is not given, form a construction joint as CON1.W510 to CON1.W570 and do not place concrete against concrete already laid for at least 24 hours unless permitted by the CM.

EXT2.W440.7 **INFILL SLABS**
1. Place and compact concrete in infill slabs around covers, frames and other hardware after they have been fixed in position;
2. Do not place and compact concrete in infill slabs at the same time as the concrete in the main slab.

## CONSTRUCTION JOINTS

EXT2.W510.7 **GENERAL**
Form construction joints only where Approved or in cases of emergency, if concreting is interrupted by bad weather, plant breakdown or similar circumstances. Do not form construction joints within 2.5 m of an existing or planned expansion or contraction joint.

EXT2.W520.7 **TRANSVERSE CONSTRUCTION JOINTS**
Form by either:
1. Using formwork and cast-in tie bars; or
2. Breaking back from an unformed edge and fixing the tie bars and sleeves with epoxy resin grout in drilled holes.

## SURFACE FINISH

EXT2.W610.7 **STRIKING OFF**
Unless combined double beam compactor levellers are being used, strike the concrete off after compaction to slightly above the levels of the formwork and regulate the surface by the use of a regulating machine or a vibrating beam.

EXT2.W620.7 **REGULATING MACHINES**
Use purpose made regulating machines that are:
1. Spanning the full width of the slab, either transversely or obliquely;
2. Equipped with at least two oscillating-type transverse screeds;
3. Supported on a carriage.

EXT2.W630.7 **VIBRATING BEAMS**
Must:
1. Have a steel or aluminium surface;
2. Be mounted on a separate carriage;
3. Be driven by a motor to provide a vibration frequency of at least 3500 cycles per minute.

EXT2.W640.7 **SCRAPING STRAIGHT-EDGES**
After regulation by regulating machine or vibrating beam:
1. Regulate the surface of the carriageway with at least two passes of a scraping straight-edge with a blade length of at least 1.8 m;
2. Where scraping straight-edges operate in conjunction with regulating machines, ensure that they pass across the surface at right angles to the longitudinal axis of the carriageway;
3. If the surface is torn by the straight-edge, regulate again using the regulation machine or vibrating beam and then by the scraping straight-edge.

**EXT2.W650.7 REGULATION OF SMALL AREAS**
1. Use wooden floats to tamp and regulate small areas of the carriageway, as Approved;
2. Do not use steel trowels or floats.

**SURFACE TEXTURING**

**EXT2.W710.7 GENERAL**
After the surface of the concrete carriageway has been regulated and before the application of curing compound, texture the surface by brushing with a wire broom, except for surface channels and the edges of slabs which do not require to be textured.

**EXT2.W720.7 WIRE BROOMS FOR SURFACE TEXTURING**
1. Use wire brooms which:
   a. Are at least 450 mm wide;
   b. Have two rows of tufts 20 mm apart with the tufts in each row in line with the gaps in the other and at 10 mm centres;
   c. Have tufts containing an average of 14 wires, each of 32 gauge and initially 100 mm long.
2. Replace the broom if any of the tufts wears down to 90 mm.

**EXT2.W730.7 PROCEDURE**
Produce the surface texture by brushing evenly across the slab, in one direction, at right angles to the longitudinal axis of the carriageway. Carry out brushing after the moisture film has disappeared from the concrete surface and before the initial set is complete.

**CURING CONCRETE**

**EXT2.W810.7 CURING METHODS**
Protect the surfaces and edges of concrete carriageways by one of the methods stated in CON1.W1410 to CON1.W1490. Apply curing compound, if used, to the surface immediately after texturing and to the edges immediately after the formwork has been removed.

**FORMING MOVEMENT JOINTS**

**EXT2.W910.7 GENERAL**
1. Use materials for joints in concrete carriageways in accordance with the manufacturer’s recommendations or as otherwise specified herein;
2. Form joints perpendicular to the top surface of the slab.

**EXT2.W920.7 FIXING DOWEL BARS**
Securely fix dowel bars, tie bars and their sleeves in position through holes in the formwork before concreting and ensure:
1. Bars are parallel to the top surface of the slab and to each other;
2. Bars at transverse joints are parallel to the adjacent longitudinal joint or to the longitudinal axis of the carriageway if there is no longitudinal joint, or to other lines as Instructed.
Fixing Joint Filler

Cut joint filler to size before fixing and:
1. Securely fix in position to the existing concrete surface before concreting;
2. Ensure that there are no gaps between the joint filler and the formation;
3. Cut holes in the filler for dowel bars to form a sliding fit to the sleeved bar.

Transverse Joints Generally

Ensure that transverse joints are straight and perpendicular to the longitudinal axis of the carriageway, unless otherwise permitted by the CM.

Forming Transverse Joints

Form transverse expansion and contraction joints at the locations marked on the Drawings and ensure that:
1. The joints are continued across the longitudinal joints and are in line and of the same type on both sides of the longitudinal joint;
2. The joints are continued through kerbs, edgings and quadrants, their foundation and backing where they must be of the same dimensions and materials as the transverse joints, with the omission of the dowel bars;
3. Additional contraction joints are formed at intervals not exceeding 4 m;
4. The joint filler and groove sealant in expansion joints provides complete separation of adjacent slabs.

Longitudinal Joints

Form longitudinal joints only where shown on the Drawings.

Isolation Joints

Form isolation joints at manholes and chambers.

Forming Grooves Generally

Ensure that the grooves for joint sealant:
1. Are straight;
2. Have parallel sides perpendicular to the top surface of the slab;
3. Have a flat bottom surface, parallel to the top surface of the slab.

Transverse Expansion and Isolation Joint Grooves

Form by sawing the groove to the width and depth shown on the Drawings not less than 7 days after concreting. Ensure that the grooves are located directly above the joint filler such that its upper surface is entirely contained within the groove.

Transverse Contraction Joint Grooves

Form using one of the following methods:
1. Method 1:
   a. Saw an initial groove as soon as practicable after concreting without spalling the edges;
   b. Ensure that the width of the initial groove is less than that required for the final groove and its depth is between $\frac{1}{4}$ and $\frac{1}{3}$ of the thickness of the slab;
   c. Saw the final groove to the width and depth shown on the Drawings not less than 7 days after concreting;
   d. Ensure that the centre lines of the initial and the final grooves coincide.
2. Method 2: saw the final groove to the width and depth shown on the Drawings as soon as practicable after concreting, without spalling the edges.
EXT2.W1010.7 GROOVES AT TRANSVERSE CONSTRUCTION JOINTS
Form by fixing groove forming strip, with adhesive, to concrete already placed before concreting the adjacent slab.

EXT2.W1020.7 PROTECTION OF GROOVES
Before permanent sealing, protect grooves from contamination by temporary sealing strip or by other Approved methods.

EXT2.W1030.7 GROOVE CONDITION PRIOR TO SEALING
Ensure that the groove is clean and dry at the time of applying the primer and the joint sealant.

EXT2.W1040.7 SEALING JOINTS
Unless otherwise Approved, carry out the permanent sealing of joints at least 7 days after concreting and:
1. Immediately before permanent sealing, remove groove forming strips, temporary seals, dirt and loose material from the groove and the sides and clean and roughen the groove with water jetting, sand blasting or other Approved methods;
2. Where the joint sealant is not required to extend to the bottom of the groove, firmly pack caulkimg material into the bottom of the groove;
3. Fix bond breaker tape continuously and evenly along the bottom of the groove for its full width and length;
4. Apply primer to the sides of the groove in accordance with the manufacturer’s recommendations;
5. Apply joint sealant between the minimum and maximum drying times of the primer recommended by the manufacturer and:
   a. Mix the components of the sealer thoroughly in accordance with the manufacturer’s recommendations, using a power operated paddle mixer for sufficient time to produce a homogeneous mass without entrapped air;
   b. Dispense the sealant into the groove as soon as practicable after mixing and within the time recommended by the manufacturer.

EXT2.W1050.7 FINISHING JOINTS
Remove excess joint sealant, using a purpose made finishing tool, so that the finished surface of the sealant is between 4 mm and 6 mm below the surface of the slab.

PROTECTION

EXT2.W1110.7 PEDESTRIAN LOADS
Immediately after the application of the concrete curing system:
1. Fence the carriageway off from pedestrian traffic; and
2. Cover the carriageway with protective sheeting, lapped and held securely in position in such a manner as to prevent damage to the carriageway, for at least 24 hours.

EXT2.W1120.7 LOADS FROM PLANT AND MATERIALS
Do not apply loads from materials not forming part of the permanent works or from construction plant and other vehicles until:
1. At least 7 days after concreting;
2. All joints have been permanently or temporarily sealed or protected.
TOLERANCES

EXT2.W1210.7  GENERAL
Refer to Appendix H "Schedule of Tolerances" to this Specification.

WORKS OUTSIDE SITE BOUNDARY

EXT2.W1310.7  APPROVED CONTRACTOR FOR PUBLIC WORKS
Concrete carriageway works required to be carried out by a contractor or sub-contractor who is on the current List of Approved Contractors for Public Works for Roads and Drains are specified in Project Specific Specification.

EXT2.W1320.7  SPECIFICATION
Carry out the works specified under EXT2.W1310 in accordance with Sections 6, 10, 14, 15 and 16 of the Hong Kong Government General Specification for Civil Engineering Works (2006 Edition) and its amendments published 42 days prior to the date for the return of tenders unless otherwise specified.

EXT2.W1330.7  HANDING OVER INSPECTION
Notify the CM to arrange with Highways Department for a joint handing over inspection. Allow the CM to give at least 2 working days advance notice for this inspection.

EXT2.W1340.7  RECORD DRAWINGS AND TEST REPORTS
Provide as-built record drawings and all test reports to the CM for submitting to Highways Department.
TESTING

TRIAL MIX CONCRETE

EXT2.T010.7 WORKABILITY
Ensure that trial mix concrete complies with the following requirements:
1. Each of the six slump values: not exceeding 40 mm;
2. Average of the six slump values: not exceeding 35 mm.

TRIAL LENGTH OF CARRIAGEWAY

EXT2.T110.7 GENERAL
1. Construct a trial length of carriageway to demonstrate that the proposed materials, mix design, methods of production and methods of construction will produce a carriageway complying with the Drawings and this Specification;
2. For construction of the trial length, use all the materials, mix design, methods of production and methods of construction submitted for Approval;
3. Construct the trial length over a width of two bays and include at least one expansion joint, one contraction joint and the longitudinal joint between the bays.

EXT2.T120.7 LOCATION
Unless shown otherwise on the Drawings, construct the trial length as the first 30 m of the permanent carriageway, or such other length as Approved.

EXT2.T130.7 NOTIFICATION
Inform the CM at least 48 hours, or whatever shorter period is agreed with him, before commencing the construction of the trial length.

EXT2.T140.7 COMPLETION
Complete the trial length in sufficient time before the permanent carriageway is constructed to allow the CM a period of at least 7 days to determine if the specified requirements have been complied with in the trial length.

EXT2.T150.7 PROTECTION
1. Protect the trial length from damage and retain it in position unless otherwise Instructed;
2. Do not remove a trial length which forms part of the permanent carriageway and which complies with the specified requirements.

TESTS ON THE TRIAL LENGTH

EXT2.T210.7 ALIGNMENT, LEVEL, SURFACE REGULARITY AND TEXTURE DEPTH
1. Survey the trial length to determine the accuracy of the alignment and level;
2. Test the surface regularity as EXT2.T810 to EXT2.T850;
3. Test the texture depth as EXT2.T910 to EXT2.T1010.

EXT2.T220.7 CONCRETE CORES
1. Take concrete cores from the trial length to determine:
   a. The thickness of the slab;
   b. The positions of the reinforcement and the joint components;
c. The amount of segregation of the constituents;
d. The amount of voids.

2. Take, prepare, inspect and test the cores as EXT2.T310 to EXT2.T340.

**EXT2.T230.7 COMPLIANCE CRITERIA**

The results of tests on trial lengths must comply with the following:

1. Alignment, levels and slab thickness: as EXT2.W1210;
2. Surface regularity: as EXT2.T850;
3. Texture depth: as EXT2.T1010;
4. Positions of reinforcement and joint components: refer to Appendix H "Schedule of Tolerances" to this Specification;

**EXT2.T240.7 NON-COMPLIANCE**

If the result of any test on the trial length does not comply with the specified requirements:

1. Submit particulars of proposed changes to the materials, mix design, methods of production or methods of construction to the CM;
2. Construct further trial lengths until the result of every test on the trial length complies with the specified requirements;
3. Make further trial mixes unless, in the opinion of the CM, non-compliance was not due to the trial mix.

**EXT2.T250.7 FAILED TRIAL LENGTHS**

Unless otherwise permitted by the CM, remove trial lengths, or parts of trial lengths, which do not comply with the specified requirements.

**TESTING CORES FROM TRIAL LENGTHS**

**EXT2.T310.7 TAKING CORES**

Take cores in accordance with CS1:2010 as follows:

1. Take cores as soon as the concrete has hardened sufficiently for them to be taken;
2. Provide two cores from each bay and one core from each joint from positions as Instructed;
3. Take 150 mm diameter cores unless otherwise Approved to the full depth of the slab.

**EXT2.T320.7 REINSTATEMENT**

1. Reinstate core holes using the Approved concrete mix;
2. Repair joints as Instructed.

**EXT2.T330.7 INSPECTION**

Prepare and inspect cores in accordance with CS1:2010 to determine:

1. The thickness of the slab and the positions of the reinforcement and joint components;
2. Evidence of segregation of the constituents and the presence of voids.

**EXT2.T340.7 COMPLIANCE CRITERIA**

Cores must not exhibit honeycombing which means interconnected voids arising from, for example, inadequate compaction or lack of mortar.
CONCRETE CARRIAGeways  EXT2 > TESTING

CONCRETE

EXT2.T410.7  GENERAL
Test to determine the workability and compressive strength in accordance with CON1.T510 to CON1.T670 except in respect of the provisions of the following clauses in this sub-section.

EXT2.T420.7  COMPLIANCE CRITERIA - WORKABILITY
The average slump value of the two specimens taken from one sample of concrete must not exceed that Approved by more than 10 mm.

EXT2.T430.7  SAMPLING FOR COMPRESSIVE STRENGTH TESTING
Provide one sample of concrete from each 25 m³ or 25 batches of concrete, or from the amount of concrete produced each day, whichever is the less.

MATERIALS FOR JOINTS

EXT2.T510.7  DEFINITION OF "BATCH"
A batch of joint filler or joint sealant is defined as any quantity of the material of the same type, manufactured by the same manufacturer, covered by the same certificates and delivered to the Site at any one time.

EXT2.T520.7  SAMPLING
1. Provide one sample of each type of joint filler and sealant at the same time as particulars of the material are submitted to the CM;
2. Unless otherwise permitted by the CM, provide one sample of each material from each batch delivered to the Site;
3. Unless otherwise permitted by the CM, provide one sample of mixed joint sealant on each day that joints are sealed;
4. Size of sample of joint filler: sufficient to permit testing in accordance with this Specification;
5. Take samples of unmixed joint sealant and associated primers from sealed containers delivered to the Site. Take samples of mixed joint sealant immediately before the sealant is applied to the joint. Sample in accordance with BS 2499:Part 3:1993, taking samples of the following sizes:
   a. Unmixed joint sealant: 1 kg;
   b. Mixed joint sealant: 1.5 kg;
   c. Primer for joint sealant: 1 litre.

TESTING JOINT FILLER

EXT2.T610.7  TESTING LABORATORY
Employ a laboratory accredited by HOKLAS to carry out the relevant tests.

EXT2.T620.7  SCOPE OF TESTS
Test samples of joint filler, in accordance with the following clauses in this sub-section, to determine the recovery value, the reduction in mass and the extrusion.

EXT2.T630.7  APPARATUS
Use the following apparatus to carry out the tests:
1. Equipment for measuring the plan dimensions of the joint filler, accurate to 0.5 mm;
2. Equipment for measuring the thickness of the joint filler, accurate to 0.1 mm;
3. A balance, accurate to 0.1% of the specimen mass;
4. A compression test machine complying with BS 1610:Part 1:1992, with auxiliary platens, 100 mm × 100 mm and a minimum thickness of 13 mm;
5. An extrusion mould, open on one side only and rigidly fixed to a base plate and:
   a. 100 mm × 100 mm (+0.5 mm, -0.0 mm) internal dimensions;
   b. Sufficiently deep to test the specimen;
   c. Provided with a close fitting pressure plate which fits, without binding;
   d. Provided with a horizontal measuring dial gauge or device, readable and accurate to 0.1 mm.

**EXT2.T640.7 COMPRESSION AND RECOVERY TEST**

Carry out the test as follows:
1. Prepare four specimens from the sample, each 100 mm × 100 mm (±2.5 mm);
2. Measure the thickness (t₁) of the four specimens to the nearest 0.1 mm and weigh two specimens to within 0.1% of their mass (m₁);
3. Subject each specimen to three applications of load in the compression test machine at 24 hour intervals. During each application of the load, compress the specimen to 50% of its original thickness at a strain rate of 1.3 mm per minute. Ensure that the load required to achieve the compression is at least 0.07 N/mm² and does not exceed 10 N/mm². Release the load as soon as the specified compression is achieved;
4. After the third application of the load, allow a recovery period of 30 minutes and then measure the thickness (t₂) of each specimen to the nearest 0.1 mm;
5. Reweight the two previously weighed specimens to within 0.1% of their mass (m₂).

**EXT2.T650.7 EXTRUSION TEST**

Carry out the test as follows:
1. Prepare one specimen, 100 mm × 100 mm (±0.5 mm);
2. Measure the thickness of the specimen to the nearest 0.1 mm;
3. Place the specimen in the extrusion mould and subject it to one application of the load as EXT2.T640 (3). Measure the extrusion at the open side of the mould to the nearest 0.1 mm, with the gauge or device, when the specimen is compressed to 50% of the original thickness and before the load is released.

**EXT2.T660.7 CALCULATION**

1. Calculate the recovery value (R) for each specimen from the following equation:
   \[ R = \frac{t_2}{t_1} \times 100 \% \]
   Where:
   \( t_1 \) is the original thickness of the specimen (mm);
   \( t_2 \) is the thickness of the specimen after the third application of load (mm);
2. Calculate the reduction in mass (M) of each specimen from the following equation:
   \[ M = \frac{(m_1 - m_2)}{m_1} \times 100 \% \]
   Where:
   \( m_1 \) is the original mass of the specimen (g);
   \( m_2 \) is the mass of the specimen after the third application of load (g).

**EXT2.T670.7 TEST RESULTS**

Report the following to the CM:
1. Type and source of filler;
2. The recovery values to the nearest 0.5%;
3. The reductions in mass to the nearest 0.1%;
4. The extrusion to the nearest 0.1 mm;
5. That the test methods used were in accordance with this Specification.

EXT2.T680.7 COMPLIANCE CRITERIA
The results of tests on joint filler must comply with the following requirements:
1. Each of the four specimens in the in the compression and recovery test must have a recovery value of at least 70% and the reduction in mass of the two new specimens must not exceed 1%;
2. The extrusion of the free edge of the specimen must not exceed 6 mm as determined by the extrusion test.

TESTING SEALANTS

EXT2.T710.7 TEST METHOD
Test sealants in accordance with BS 5212:Part 3:1990, for:
1. Application life;
2. Tack-free time;
3. Resistance to flow;
4. Recovery;
5. Adhesion and cohesion in compression and tension;
6. Resistance to heat ageing.

SURFACE REGULARITY

EXT2.T810.7 GENERAL
Carry out testing to determine the surface regularity.

EXT2.T820.7 SCOPE OF THE TEST
1. The surface regularity of the carriageway will be determined by measuring the number of irregularities in the surface;
2. An irregularity is defined as a gap between the surface of the carriageway and a 3 m straight edge placed on the carriageway exceeding the specified amount;
3. Irregularities are measured in millimetres, perpendicular to the straight edge.

EXT2.T830.7 TEST METHODS
1. The longitudinal surface regularity of carriageways with a total length of 75 m or more may be measured using a rolling straight-edge of the type designed by the UK Transport and Road Research Laboratory;
2. The longitudinal surface regularity of carriageways with a total length not exceeding 75 m and the transverse regularity of all carriageways will be measured using a 3 m straight-edge.

EXT2.T840.7 PROCEDURE
1. The longitudinal surface regularity will be measured along lines parallel to the longitudinal axis of the carriageway and approximately 1 m from the near side edge of each carriageway lane;
2. The transverse surface regularity will be measured along lines at right angles to the longitudinal axis of the carriageway at 10 m intervals along the length of the carriageway.

EXT2.T850.7 COMPLIANCE CRITERIA
1. The maximum number of irregularities in the longitudinal direction must not exceed those stated in the following table:
Permitted Irregularities in the Longitudinal Direction

<table>
<thead>
<tr>
<th>Total Length of Carriageway</th>
<th>Size of Irregularity</th>
<th>Permitted N° of Irregularities (Category A Road)</th>
<th>Permitted N° of Irregularities (Category B Road)</th>

</tr>
</tbody>
</table>

Notes:

a. Category A roads are those with a legal speed limit greater than 70 kilometres/hour, all other roads being Category B;

b. Irregularities greater than 7 mm will also be counted as being greater than 4 mm;

c. No irregularity is to exceed 10 mm;

2. There must be no irregularity exceeding 4 mm in a 3 m length in the transverse direction for Category A roads and no irregularity exceeding 7 mm in a 3 m length in a transverse direction for Category B roads.

TEXTURE DEPTH

EXT2.T910.7 GENERAL
Carry out testing to determine the texture depth.

EXT2.T920.7 SCOPE OF THE TEST
The texture depth of concrete carriageways will be determined by the sand patch test.

EXT2.T930.7 TIMING OF THE TEST
Testing will be carried out at least 2 days after the surface texturing has been carried out and before the area is used by construction plant or other vehicles.

EXT2.T940.7 TEST LOCATIONS
Each carriageway lane will be divided into sections of equal length not exceeding 150 m and testing will be carried out at 10 locations on each section at approximately equal spacing. No measurement will be taken within 300 mm of the longitudinal edges of the sections.

EXT2.T950.7 PROVISION OF TEST APPARATUS AND MATERIALS
Provide all apparatus and materials for the test to be carried out as EXT2.T960 and EXT2.T970.

EXT2.T960.7 SAND FOR THE TEST
Provide dry, natural sand, with a rounded shape, which has been washed and then screened so that it meets the grading stated in the following table:

<table>
<thead>
<tr>
<th>Grading of Sand</th>
<th>Test Sieve to BS 410:1986</th>
<th>Percentage by Mass Passing</th>
</tr>
</thead>
<tbody>
<tr>
<td>600 microns</td>
<td>100</td>
<td></td>
</tr>
</tbody>
</table>
EXT2.T970.7 **APPARATUS**
The test will be carried out using the following:
1. A soft brush;
2. A robust measuring cylinder having an internal diameter of 20 mm ± 2 mm and a flat top surface, such that its internal volume is 25 ml ± 0.1 ml;
3. A flat wooden disc of 65 ± 2 mm diameter with a 1.5 mm minimum thickness hard rubber disc attached to one face and a handle fixed to the other face;
4. A steel rule calibrated to 1 mm;
5. A suitable wind shield;
6. A funnel with an outlet tube at least 100 mm long with a bore of between 4 mm and 6 mm and capable of accepting a volume of at least 200 ml;
7. A steel straight-edge for screeding off the measuring cylinder;
8. A steel-wire brush.

EXT2.T980.7 **PROCEDURE**
The test will be carried out as follows:
1. The test location which will be at least 300 mm square will be vigorously brushed at least 10 times in two directions at right angles, using the steel-wire brush, then dried and swept clean with the soft brush;
2. Sand will be poured into the measuring cylinder to fill it to overflowing and any excess screeded off using the straight-edge. All sand on the outside of the cylinder will be removed without dropping any onto the test location. This step of the procedure may, alternatively, be carried out in the laboratory and the sand transferred to a suitable container, ready for pouring;
3. The measured volume of sand will be poured onto the centre of the test location, through the funnel to form a heap, using the wind shield to protect the test location, if necessary;
4. The sand will be spread outwards with a circular motion over the test location, using the rubber faced disc with its face parallel to the carriageway. This will be continued until the patch of sand is approximately circular and will spread outwards no more;
5. The size of the sand patch will be measured to the nearest 1 mm along three diameters which are aligned at approximately 120° to each other;
6. If the difference between the maximum and minimum of the three measurements exceeds 20% of the average of the three measurements, then all the measurements will be discarded and the test repeated in an adjacent location;
7. The test will be repeated for all the 10 test locations for each section of carriageway lane.

EXT2.T990.7 **CALCULATION**
1. The texture depth (T) for each test will be calculated from the equation:
   \[ T = \frac{31000}{D^2} \text{ mm} \]
   Where:
   - D is the average of the three diameter measurements of the sand patch calculated to the nearest mm;
2. The average texture depth for the 10 tests will be calculated.

EXT2.T1000.7 **TEST REPORT**
The test report will comprise the following:
1. Test location;
2. The average diameter of the sand patch for each test to the nearest 1 mm;
3. The texture depth for each test to the nearest 0.1 mm;
4. The average texture depth to the nearest 0.1 mm;
5. Confirmation that the test was carried out in accordance with this Specification.

**EXT2.T1010.7 COMPLIANCE CRITERIA**

The results for each section of carriageway lane must comply with the following requirements:
1. Average texture depth: not less than 0.7 mm; and
2. Not more than one of the 10 measured texture depths less than 0.6 mm.
EXT3 PATHS AND PAVED AREAS

MATERIALS

GENERAL

EXT3.M010.7 APPLICATION OF OTHER SECTIONS
Where applicable comply with the relevant provisions of the following Worksections unless otherwise specified in this Worksection:
1. Earthworks: Worksection EA1;
2. Sub-bases and bituminous materials: Worksection EXT1;
3. Concrete pavings (including formwork, reinforcement, concreting, jointing and finishing): Worksection EXT2.

EXT3.M020.7 DEFINITION
1. The term "paving unit" is used in this Specification to describe a precast concrete paving slab or interlocking block;
2. Paving units are classified as either Grade A or Grade B in accordance with the following:
   a. Grade A paving units shall comply with all clauses of EXT3;
   b. Grade B paving units shall comply with all clauses of EXT3 except for those requirements specified for Grade A paving units only.

EXT3.M030.7 DETAILS OF UNITS
Submit the following particulars for Approval at least 14 days before commencement of laying:
1. Name and address of manufacturer;
2. Original certification or a certified true copy of the certification to ISO 9001 for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by the certification body or by the QCM. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS;
3. A certificate from the manufacturer showing the manufacturer's name and the date and place of manufacture and including results of tests for:
   a. Compressive strength of concrete cubes at 28 days;
   b. Compressive strength of interlocking blocks; and
4. A certificate from the manufacturer showing the source and the particle size distribution of the recycled aggregates;
5. Drawings showing the layout of the units within the paved area;
6. A certificate from the manufacturer showing the results of the following tests for Grade A paving units:
   a. Dimensional deviations of paving slabs to BS 7263-1:2001;
   b. Dimensional deviations of paving blocks to BS 6717:2001;
   c. Slip/skid resistance value of paving slabs to BS EN 1344:2002;
   d. Slip/skid resistance value of paving blocks to BS EN 1344:2002 or unpolished slip/skid resistance value of paving block to BS 6717:2001;
   e. 24-hour cold water absorption value of paving slabs and blocks to AS/NZS 4456.14:1997; and
7. For interlocking concrete blocks, a statement of compliance from the manufacturer showing that the manufacturer has put in place a system to assure that the paving units contain 20% to 25% of recycled glass cullet by weight of the total aggregates. The statement of compliance shall be issued by an independent assessment body with recognized status (e.g. Hong Kong Productivity Council, Hong Kong Quality Assurance Agency, etc.) and it will only be valid within 6 months from the date of statement issue date. The independent assessment body shall be approved by the CM;

8. Where percentage of recycled aggregates as specified in EXT3.M130 cannot be fully complied with due to shortage in supply of recycled aggregates in the market, the Contractor shall submit the following additional particulars to the CM:
   a. a written confirmation from the manufacturer confirming the shortage in supply of recycled aggregates in the market; and
   b. proposed quantities of paving units for which recycled aggregates as specified in EXT3.M130 cannot be fully complied with.

EXT3.M040.7 SAMPLES
1. Submit samples of each type of paving units showing the actual size, colour, variation in colour, finish/texture as specified, and general characteristics of the appearance for Approval of the source and type of the units at the same time as the particulars of the units are submitted;
2. The submitted samples of Grade A paving units shall be subject to a visual inspection by the CM and in compliance with the following requirements:
   a. The samples shall not have significant visible differences in colour and texture between samples when examined in accordance with BS 6717:2001;
   b. The samples shall not exhibit defects such as cracking, flaking or dislodging of aggregates when examined in accordance with BS 6717:2001;
   c. Fine materials shall not be easily dislodged from the surfaces of any samples during gentle manual handling; and
   d. The samples shall have sharp and straight edges without any defect.

PAVING MATERIAL

EXT3.M110.7 CONCRETE
As specified in Worksection EXT2: designed mix grade: 30/20.

EXT3.M120.7 BITUMINOUS MATERIALS
As specified in Worksection EXT1.

EXT3.M130.7 INTERLOCKING CONCRETE BLOCKS
1. Concrete grade:
   a. Blocks used in footways and cycle tracks: Grade 30/10;
   b. Blocks used in areas subject to vehicular access: Grade 45/10.
2. Aggregates:
   a. The aggregates shall contain not less than 70% by weight of recycled aggregates;
   b. The recycled fine aggregates shall constitute not less than 40% by weight of the total recycled aggregates. The recycled glass cullet shall be included as recycled fine aggregates and shall constitute 20% to 25% by weight of the total aggregates;
   c. The recycled glass cullet shall all pass a 3.35 mm BS test sieve and shall be integrated with other constituents in such a manner that there is no sharp edge nor burr exposed to put the pedestrian at risk when the paving unit surface is eroded;
d. Coarse recycled aggregates shall be retained on a 5 mm BS test sieve;

e. Fine recycled aggregates shall all pass a 5 mm BS test sieve;

f. The recycled aggregates shall contain not more than 0.5% of wood and other materials less dense than water by using the manual sorting test method in accordance with BRE Digest 433;

g. The recycled aggregates shall contain not more than 1% of other foreign materials (e.g. metals, plastics, clay lumps, asphalt and tar etc.) by using the manual sorting test method in accordance with BRE Digest 433;

h. The recycled aggregates, except recycled glass cullet, shall be crushed inert construction and demolition materials produced from the crushing plant of the Civil Engineering and Development Department or other local sources approved by the CM;

i. The recycled glass cullet shall be produced from glass waste from local sources approved by the CM;

j. The nominal maximum aggregate size for concrete in precast units shall be 10 mm.

3. Dimensions:
   a. Size: as shown on Drawings;
   b. Chamfers: not to exceed 5 mm unless otherwise approved by the CM.

4. Shape: rectangular;

5. Vertical nibs:
   a. Provide at least one nib on one of the stretcher faces and one nib on one of the header faces;
   b. Depth of nib to be less than the width of the joint;
   c. Do not include nibs into working dimensions.

6. Colour:
   a. As shown on Drawings and consistent over the paved area, stable and fade resistant under any outdoor climate situations;
   b. Colour pigments for Grade A paving units shall comply with the following requirements unless otherwise approved by the CM:
      i. To BS EN 12878:2005;
      ii. Be UV-stable; and
      iii. Be composed of iron oxides, chrome oxide, titanium oxide or cobalt aluminium oxide.

7. Abrasion resistance for Grade A paving units: not more than 23 mm to BS 6717:2001;

8. Each precast unit shall bear an inscribed mark for the identification purpose that the unit contains recycled glass cullet of 20% to 25% by weight of the total aggregates;

9. Notwithstanding sub-clause (2) above,
   a. The Contractor may propose for the CM's approval the use of recycled fine aggregates without recycled glass cullet in the concrete where there is shortage of supply of recycled glass cullet; and/or
   b. The Contractor may propose for the CM's approval the use of virgin aggregates in lieu of recycled aggregates in the concrete when there is a shortage of supply of recycled aggregates.

10. Notwithstanding sub-clause (2) above, subject to the CM's agreement, the Contractor may use recycled fine aggregates without recycled glass cullet in the concrete for the minor repair works to existing concrete pavers;

11. Meeting the test requirements specified;

12. For tactile blocks, slip-resistant tested to ASTM C1028-96 of minimum coefficient of friction 0.67 under wet condition.
**PRECAST CONCRETE PAVING SLABS**

1. Concrete grade: 30/10;
2. Aggregates:
   a. The aggregates shall contain not less than 70% by weight of recycled aggregates;
   b. The recycled fine aggregates shall constitute not less than 40% by weight of the total recycled aggregates;
   c. Coarse recycled aggregates shall be retained on a 5 mm BS test sieve;
   d. Fine recycled aggregates shall all pass a 5 mm BS test sieve;
   e. The recycled aggregates shall contain not more than 0.5% of wood and other materials less dense than water by using the manual sorting test method in accordance with BRE Digest 433;
   f. The recycled aggregates shall contain not more than 1% of other foreign materials (e.g. metals, plastics, clay lumps, asphalt and tar, glass etc.) by using the manual sorting test method in accordance with BRE Digest 433;
   g. The recycled aggregates shall be crushed inert construction and demolition materials produced from the crushing plant of the Civil Engineering and Development Department or other local sources approved by the CM.
3. Dimensions:
   a. Size: as shown on Drawings;
   b. Chamfers: not exceeding 5 mm unless otherwise approved by the CM.
4. Shape: as shown on Drawings;
5. Vertical nibs:
   a. Provide at least one nib on one of the stretcher faces and one nib on one of the header faces;
   b. Depth of nib to be less than the width of the joint;
   c. Do not include nibs into working dimensions.
6. Colour:
   a. As shown on Drawings and consistent over the paved area, stable and fade resistant under any outdoor climate situations;
   b. Colour pigments for Grade A paving units shall comply with the following requirements unless otherwise approved by the CM:
      i. To BS EN 12878:2005;
      ii. Be UV-stable; and
      iii. Be composed of iron oxides, chrome oxide, titanium oxide or cobalt aluminium oxide.
7. Abrasion resistance for Grade A paving units: not more than 23 mm to BS 6717:2001;
8. Notwithstanding sub-clause (2) above, the Contractor may propose for the CM’s approval the use of 100% virgin aggregates, or a mix of any proportions of virgin aggregates and recycled aggregates, in the concrete when there is a shortage of supply of recycled aggregates;
9. Meeting the test requirements specified;
10. For tactile paving slab, slip-resistant tested to ASTM C1028-96 of minimum coefficient of friction 0.67 under wet condition.

**CLAY BRICK PAVERS**

1. To consist essentially of clay or other argillaceous material, and be dried and fired at a high temperature with exposed faces of an extruded, wire cut or pressed finish to the required shape;
2. Dimensions:
   a. Size: as shown on Drawings;
   b. Chamfers: not exceeding 7 mm;
3. Shape: as shown on Drawings;
4. Vertical nibs:
   a. Provide at least one nib on one of the stretcher faces and one nib on one of the header faces;
   b. Depth of nib to be less than the width of the joint;
   c. Do not include nibs into working dimensions.
5. Colour: as shown on Drawings and consistent over the paved area;
6. Type: to BS 6677:Part 1:1986 and as shown on Drawings.

**BEDDING, POINTING AND SEALING MATERIALS**

**EXT3.M210.7 BEDDING SAND**

Sand with:
1. Moisture content exceeding 4% but not more than 8% at time of laying;
2. Particle size distribution as stated in the following table:

<table>
<thead>
<tr>
<th>Particle size distribution of sand for bedding precast units</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>BS test sieve size</td>
<td>Percentage by mass passing</td>
</tr>
<tr>
<td>10 mm</td>

</tbody>
</table>

**EXT3.M220.7 JOINT FILLING SAND**

Sand with:
1. A moisture content less than 0.5% at time of filling joints;
2. A particle size distribution as stated in the following table:

<table>
<thead>
<tr>
<th>Particle size distribution of sand for filling joints between precast units</th>
<th></th>

</tbody>
</table>

**EXT3.M230.7 CEMENT MORTAR SEALING**

Consisting of:
1. One part of cement to three parts of fine aggregate by volume together with the minimum amount of water necessary to achieve a consistency suitable for the required work;
2. Fine aggregate of sand or crushed rock to BS 1200:1976 passing a 5 mm BS Test Sieve;
3. Colouring pigment as Approved.

**EXT3.M240.7 POLYTHENE SHEETING**

Impermeable and having a nominal thickness of 0.125 mm.

**ACCURACY AND TOLERANCES**

**EXT3.M310.7 GENERAL**

Refer to Appendix H "Schedule of Tolerances" to this Specification.
WORKMANSHIP

HANDLING AND STORAGE

EXT3.W010.7 PRECAST UNITS
1. Handle and store units on pallets to avoid damage to corners and chamfered edges;
2. Store pallets on a levelled, well-drained and maintained hard-standing ground and in a manner which will not result in damage or contamination of the units;
3. Protect the units from damage and do not use damaged units unless permitted by the CM.

EXT3.W020.7 SAND
Store sand for filling joints between units in waterproof bags and keep under cover until used.

LAYING IN-SITU CONCRETE PAVING

EXT3.W110.7 LAYING
Lay insitu concrete paved areas in bays not exceeding 20 m².

EXT3.W120.7 FINISH
Finish concrete surfaces as follows:
1. Method of producing finish: levelling the surface of the compacted concrete with a screed board, wood floating or power floating the surface and brushing the surface with a stiff brush;
2. Abrupt irregularities permitted: brush marks < 3 mm
3. Gradual irregularities permitted: < 10 mm in 2 m
4. Specific requirement: Rough Texture.

LAYING BITUMINOUS PAVING

EXT3.W210.7 LAYING
1. Lay and compact bituminous materials for footways, cycletracks and paved areas with steel-wheeled and pneumatic-tyred rollers. Compaction shall start before the temperature of the newly laid material falls below 100°C and shall continue until all roller marks have been removed. For locations where rollers cannot operate effectively, compact the bituminous material by hand-operated mechanical compaction plant approved by the CM;
2. Take cores in accordance with EXT1.T510 for the checking of air void content and compacted layer thickness of the bituminous material for works with area of not less than 200 m². For works with area smaller than 200 m² but greater than 50 m², at least 2 cores shall be taken from each layer of bituminous material laid. For works with area less than 50 m², no coring is required unless otherwise instructed by the CM;
3. Test the cores taken in accordance with sub-clause (2) to determine the air void content. The average air void content of the cores shall be not less than 3% nor greater than 9%. If the test result does not comply with the specified requirement, 2 additional cores shall be taken at locations agreed by the CM and the average air void content determined from these 2 cores shall replace the original value for compliance checking. Notwithstanding this, no cores shall have an air void content of less than 2.5% nor greater than 10%;
4. Measure each core taken from the final surfacing layer to determine the compacted layer thickness that shall not deviate by more than 5 mm from the specified thickness. If the measured thickness does not comply with the requirement, 2 additional cores shall be taken at locations agreed by the CM and the average thickness determined from these 2 cores shall replace the original measured value for compliance checking;

5. If no bulk sample is taken for determination of the Rice's specific gravity, the corresponding value obtained from the mix design shall be used in determining the air void content of the core unless other value is suggested by the Contractor and agreed by the Contract Manager;

6. If either the air void content or the compacted thickness of the core is outside the specified limits, the sub-area from which the cores were taken shall be considered as not complying with the requirements specified in this clause.

Laying Clay Brick Pavers

EXT3.W310.7 Laying

1. Do not lay clay brick pavers until the layout has been Approved;

2. Commence laying clay brick pavers in the permanent area after the layout and the method of construction have been Approved, and the trial area is constructed to the satisfaction of the CM pursuant to the specified requirements;

3. Lay clay brick pavers in herringbone pattern with a header course at 90 degrees to all edge restraints, except where adjacent to flush concrete restraining beams and public utility access covers;

5. Lay all full units first and ensure the best laying face is chosen;

6. For clay brick pavers laying over concrete aprons surrounding public utility access covers, lay on a bed of fresh mortar of one part cement to three parts sand, where a minimum bedding sand thickness as specified in EXT3.W470 cannot be achieved.

Laying Precast Concrete Units

EXT3.W410.7 LAYOUT

1. Submit particulars of proposed method of construction for Approval and arrange a trial area to be constructed on site;

2. Commence laying paving slabs or interlocking blocks in the permanent area after the layout and the method of construction have been Approved, and the trial area is constructed to the satisfaction of the CM pursuant to the specified requirements.

EXT3.W420.7 Kerbs and Edgings

1. Complete bedding of kerbs and edgings prior to laying paving units;

2. Ensure concrete used for insitu concrete kerbs and edgings reaches the compressive strength of at least 20 MPa before units are laid.

EXT3.W430.7 Precautionary Measures for Drainage

Ensure measures are taken to prevent drainage across or through the area of paving during laying, bedding and compaction of the units.

EXT3.W440.7 Formation Level

1. Lay units as soon as practicable after completion of formation layers(s);

2. Protect formation until laying of units commences as Worksection EAR1.
INTERLOCKING BLOCK PATTERN
Lay interlocking blocks for carriageways and paved areas where vehicles will have access to a herring-bone pattern unless otherwise stated in the Contract.

CUTTING UNITS
Where cutting of units is required use a mechanical cutting device. Ensure quality of any cut edge is as that for uncut edge with a true line and free from chips and cracks.

BEDDING LAYER
Lay bedding layer as follows:

1. Lay a layer of sand, screeded and tamped to a uniform depth, over the complete width of the area to be paved. The quantity of sand must be sufficient to permit screeding to waste and to achieve a tamped thickness which exceeds 20 mm and does not exceed 30 mm;
2. Do not disturb the sand layer by additional compaction, foot-marks or other damage after the layer has been screeded and tamped to the required level and before the units are laid;
3. Do not screed and tamp sand more than 1 m in advance of the units which have been laid.

BEDDING PAVING SLABS
Lay paving slabs as follows:

1. Lay on the prepared sand layer immediately after screeding and tamping in such a manner that the sand is not disturbed;
2. Adjust slabs to form uniform joints between 2 mm and 3 mm wide and bed into the final position using a wooden mallet or a plate vibrator fitted with a rubber base-pad;
3. Do not bed paving slabs closer than 1 m behind the laying edge other than on completion of the paved area against a kerb or edging;
4. Carry out final levelling of the slabs as soon as practicable after bedding and before changes in the moisture content of the prepared sand layer occur;
5. Remove and replace damage paving slabs immediately.

BEDDING INTERLOCKING BLOCKS
Lay interlocking blocks as follows:

1. Lay on the prepared sand layer immediately after screeding and tamping in such a manner that the sand is not disturbed. Lay interlocking blocks individually on the prepared sand layer by manual methods or in clusters by mechanical methods;
2. Lay in such a manner that the blocks are not in direct contact with each other and that uniform joints of between 2 mm and 3 mm wide are formed. Bed interlocking blocks flush by at least two passes of a heavy-duty plate compactor fitted with a rubber-pad;
3. Do not bed blocks closer than 1 m behind the laying edge other than on completion of the paved area, against a kerb or edging;
4. Carry out final levelling of the blocks as soon as practicable after bedding and before changes in the moisture content of the prepared sand layer occur;
5. Remove and replace damaged interlocking blocks immediately.

JOINT FILLING AND COMPACTION OF UNITS
1. After the units have been bedded, spread sand for filling the joints over the surface of the units and brush into the joints in such a manner that all joints are completely filled;
2. Fill joints as soon as practicable after bedding and on the day the units are laid and bedded;
3. Further compact paved areas by at least two passes of a plate compactor fitted with a rubber base-pad after filling the joints to ensure that the joints are completely filled. Add sand as required and compact into the joints;

4. Compact carriageways and paved areas to which vehicles will have access by either one of the following way and add sand as required and brush and compact into the joints:
   a. At least ten evenly-spaced passes of a pneumatic tyred roller having a gross weight of between 10 tonnes and 12 tonnes;
   b. A plate compactor which shall have the following capacity:
      i. Minimum plate area of 0.25 m²;
      ii. Minimum effective force per unit area of plate of 75 kN/m²;
      iii. Frequency of 65 – 100 Hz; and
      iv. Minimum mass of 200 kg.

5. Remove excess sand after completion of compaction;
6. Remove and replace damage units immediately.

EXT3.W510.7 SEALING AT ABUTMENTS
Place pigmented mortar or concrete matching colour of paving units, unless otherwise instructed, to the full depth of units to form a seal between units and adjacent kerbs, edgings, quadrants, covers, frames etc.

EXT3.W520.7 REINSTATEMENT
Where excavation is to be carried out in paved areas constructed of paving slabs or interlocking blocks, extract the units as follows:
1. Use manual methods for a distance of at least 300 mm beyond the limit of the excavation;
2. Thoroughly clean unbroken units to remove all sand and deleterious material. Stack the units on pallets for re-use;
3. Re-lay units to be re-used in accordance with the relevant requirements of this Worksection.

PROTECTION

EXT3.W610.7 PAVED AREA SURFACES
Do not permit the use of footways, cycle tracks and other paved areas by constructional plant or vehicles other than those which, in the opinion of the CM, are essential in the construction of subsequent work. In any case do not use such plant and vehicles that will damage or overload the surface.

ACCURACY AND TOLERANCES

EXT3.W710.7 GENERAL
Refer to Appendix H "Schedule of Tolerances" to this Specification.

WORKS OUTSIDE SITE BOUNDARY

EXT3.W810.7 APPROVED CONTRACTOR FOR PUBLIC WORKS
Path and paving works required to be carried out by a contractor or sub-contractor who is on the current List of Approved Contractors for Public Works for Roads and Drains are specified in Project Specific Specification.
EXT3.W820.7 SPECIFICATION
Carry out the works specified under EXT3.W810 in accordance with Sections 6, 9, 10, 11, 14, 15, 16 and 18 of the Hong Kong Government General Specification for Civil Engineering Works (2006 Edition) and its amendments published 42 days prior to the date for the return of tenders unless otherwise specified.

EXT3.W830.7 HANDING OVER INSPECTION
Notify the CM to arrange with Highways Department for a joint handing over inspection. Allow the CM to give at least 2 working days advance notice for this inspection.

EXT3.W840.7 RECORD DRAWINGS AND TEST REPORTS
Provide as-built record drawings and all test reports to the CM for submitting to Highways Department.
TESTING

GENERAL

EXT3.T010.7 QUALITY ASSURANCE SCHEMES
Tests stated in this Worksection may be reduced in number as agreed by the CM if such materials or articles delivered to Site satisfy the following conditions:
1. To bear the stamps of the registered certification trade mark of the BA Institution, known as the BS Kitemark; or
2. To be covered by a manufacturer's quality assurance scheme stated in the Contract or approved by the CM.

CHARACTERISTIC COMPRRESSIVE STRENGTH OF INTERLOCKING BLOCKS

EXT3.T110.7 DEFINITION OF 'BATCH'
1. A batch of interlocking blocks is any quantity of interlocking blocks of the same type, size and finish, of the same concrete grade, manufactured in the same place, covered by the same certificates stipulated under EXT3.M030 (2) delivered to the Site;
2. Interlocking blocks of different colours can be grouped together to form a batch provided that they are manufactured with the same type of materials and production methods.

EXT3.T120.7 SAMPLES FOR TESTING
1. Provide one sample of interlocking blocks from every 1000 m² of interlocking blocks, or part thereof, in a batch;
2. Number of interlocking blocks in each sample: 8;
3. Carry out sampling at random so that the sample comprises interlocking blocks that are distributed throughout the batch.

EXT3.T130.7 TEST PROCEDURE
Test each sample to determine the characteristic compressive strength at 28 days by means of a load test as follows:
1. Apparatus:
   a. A compression test machine complying with CS1:2010. Bearing faces of the platens on the test machine must be at least as large as the interlocking blocks and with a flatness tolerance of 0.05 mm;
   b. If a test machine with platens smaller than the interlocking blocks is used, auxiliary plates of adequate size must be placed centrally between the platens and the interlocking block to be tested. The flatness tolerance of the bearing faces of the auxiliary platens measured in accordance with CS1:2010 must not be more than 0.05 mm and the thickness of the plates at least 25 mm;
   c. Two pieces of packing, each with a thickness of between 5 mm and 6 mm and dimensions exceeding the interlocking block by between 15 mm and 25 mm. Use plywood, chipboard or medium density hardboard packing.
2. Adopt the following procedure:
   a. Cap the interlocking block on the running surface and underside with a suitable capping material in accordance with Clause 15.5.2 of CS1:2010 and immerse in water for at least 24 hours before compression;
b. Place the interlocking block symmetrically on the lower platen of the test machine, between the two pieces of packing with the running surface facing upwards;

c. Apply the load without shock and steadily increase at a constant rate within a stress range of between 150 kPa/s and 700 kPa/s;

d. Record the load at which the interlocking block fractures as the breaking load;

e. Repeat the test for the other blocks.

**EXT3.T140.7 CALCULATIONS**

Make calculations in accordance with the following:

1. Calculate the compressive strength \( C \) of each interlocking block from the equation:

\[
C = \frac{W}{A} \times \frac{2.5}{1.5 + \frac{L}{H}} \text{ MPa}
\]

Where:
- \( W \) is the breaking load (N)
- \( A \) is the nominal gross plan area based on the manufacturing dimensions of the interlocking blocks or the area of the tested portion if the interlocking block size is reduced for testing (mm\(^2\))
- \( L \) is the lesser of the two plan dimensions (mm)
- \( H \) is the thickness of the block (mm)

2. Calculate the unbiased standard deviation \( s \) from the following equation:

\[
s = \sqrt{\frac{\sum C^2 - n(Cm)^2}{n - 1}} \text{ MPa}
\]

Where:
- \( n \) is the number of interlocking blocks in each sample
- \( \sum C^2 \) is the sum of the square of the compressive strengths of the \( n \) interlocking blocks (MPa)
- \( Cm \) is the average of the compressive strengths of the \( n \) interlocking blocks

3. Calculate the characteristic strength \( Cc \) of the batch from the following equation:

\[
Cc = Cm - 1.65s \text{ MPa}
\]

Where:
- \( Cm \) is the average of the compressive strengths of the \( n \) interlocking blocks and stated in (2) above
- \( s \) is the unbiased standard deviation as stated in (2) above.

**EXT3.T150.7 REPORTING**

Report on the following:

1. Source, name of manufacturer and type of blocks;
2. Identification marks of blocks;
3. Date of manufacture of blocks;
4. Nominal gross plan area of each block to the nearest 100 mm\(^2\);
5. Nominal height of each block to the nearest mm;
6. Breaking load of each block to the nearest kN;
7. Compressive strength of each block to the nearest MPa;
8. Average of the eight compressive strengths to the nearest MPa;
9. Unbiased standard deviation to the nearest MPa;
10. Characteristic compressive strength to the nearest MPa;
11. That the test method used was in accordance with this Specification.

**EXT3.T160.7**  
**COMPLIANCE CRITERIA**

The characteristic compressive strength of the interlocking blocks sample must be:

1. 30 MPa for blocks in footways and cycle tracks; and
2. 45 MPa for blocks in carriageways and paved areas to which vehicles will have access.

**TRANSVERSE BREAKING LOAD OF CLAY BRICK PAVERS**

**EXT3.T210.7**  
**DEFINITION OF "BATCH"**

A batch of clay brick pavers is any quantity of pavers of the same type and size, of the same strength, manufactured in the same place, covered by the same certificates and delivered to the Site at any one time.

**EXT3.T220.7**  
**SAMPLES FOR TESTING**

1. No bulk sample shall represent more than 10,000 pavers from the same batch;
2. The sample size of each bulk sample of each type of clay brick pavers for each test shall be as stated in BS 6677:Part 1:1986 Appendix B1.

**EXT3.T230.7**  
**TEST PROCEDURE**

Test clay brick pavers in accordance with the procedures laid down in BS 6677:Part 1:1986.

**EXT3.T240.7**  
**CALCULATIONS**

Calculate the mean transverse breaking load of the sample to the nearest 0.1 kN.

**EXT3.T250.7**  
**REPORTING**

Report on the following:
1. Source, name of manufacturer and type of pavers;
2. Identification marks of pavers;
3. Date of manufacture of pavers;
4. Nominal length, width and height of each paver to the nearest mm;
5. Transverse breaking load of each paver to the nearest 0.1 kN;
6. Mean transverse breaking load of the pavers to the nearest 0.1 kN;
7. That the test method used was in accordance with this Specification.

**EXT3.T260.7**  
**COMPLIANCE CRITERIA**

1. The mean transverse breaking load of pavers from the sample must be not less than the value given for the appropriate type in the following table;
2. The transverse breaking load of each paver must be not less than the value given for the appropriate type in the following table:

<table>
<thead>
<tr>
<th>Type of Paver</th>
<th>Minimum mean Transverse Breaking Load (kN)</th>
<th>Minimum Individual Transverse Breaking Load (kN)</th>
</tr>
</thead>
<tbody>
<tr>
<td>PA</td>
<td>3.0</td>
<td>2.0</td>
</tr>
<tr>
<td>PB</td>
<td>7.0</td>
<td>4.0</td>
</tr>
</tbody>
</table>
BENDING STRENGTH OF PRECAST CONCRETE PAVING SLABS

EXT3.T310.7 DEFINITION OF "BATCH"
1. A batch of precast concrete paving slabs is any quantity of paving slabs of the same type, size and finish, of the same concrete grade, manufactured in the same place covered by the same certificates stipulated under EXT3.M030 (2) delivered to the Site;
2. Paving slabs of different colours can be grouped together to form a batch provided that they are manufactured with the same type of materials and production methods.

EXT3.T320.7 SAMPLES FOR TESTING
1. Provide one sample of paving slabs from every 1000 m² of paving slabs, or part thereof, in a batch;
2. Number of paving slabs in each sample: 8;
3. Carry out sampling at random so that the sample comprises paving slabs that are distributed throughout the batch.

EXT3.T330.7 TEST PROCEDURE
Test precast concrete paving slabs in accordance with the procedures laid down in BS 7263-1:2001:Annex E.

EXT3.T340.7 CALCULATIONS
Calculate the mean strength of the sample to the nearest 0.1 MPa.

EXT3.T350.7 REPORTING
Report on the following:
1. Source, name of manufacturer and type of paving slabs;
2. Identification marks of paving slabs;
3. Date of manufacture of paving slabs;
4. Nominal length, width and height of each paving slab to the nearest mm;
5. Failure load of each paving slab to the nearest 0.1 kN;
6. Strength of each paving slab to the nearest 0.1 MPa;
7. Mean strength of the three paving slabs tested to the nearest 0.1 MPa;
8. That the test method used was in accordance with this Specification.

EXT3.T360.7 COMPLIANCE CRITERIA
1. The mean bending strength of a sample of paving slabs shall not be less than 3.7 MPa; and
2. Bending strengths of individual slabs shall not be less than 3.0 MPa.

ADDITIONAL TESTS FOR GRADE A PAVING UNITS

EXT3.T410.7 DEFINITION OF "BATCH"
1. A batch of paving units is any quantity of paving units of the same type, size and finish, of the same concrete grade, manufactured in the same place covered by the same certificates and delivered to the Site at any one time;
2. Paving units of different colours can be grouped together to form their respective batches provided that they are manufactured with the same type of materials and production methods.
**EXT3.T420.7 SAMPLES FOR TESTING**

1. Provide one sample of Grade A paving units from every 1000 m² of the paving units, or part thereof, in a batch, each for the following tests:

<table>
<thead>
<tr>
<th>Test</th>
<th>Number of paving units in each sample</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Dimensional deviation</td>
<td>8</td>
</tr>
<tr>
<td>b. Slip/Skid resistance</td>
<td>5</td>
</tr>
<tr>
<td>c. Water absorption value</td>
<td>10</td>
</tr>
</tbody>
</table>

2. Carry out sampling at random so that the sample comprises paving units that are distributed throughout the batch;

3. The sample can be used for other tests.

**EXT3.T430.7 DIMENSIONAL DEVIATION**

1. Carry out the test as follows:
   a. Measure the overall dimensions and thickness of each sample of paving blocks to BS 6717:2001;
   b. Measure the overall dimensions and thickness of each sample of paving slabs to BS 7263-1:2001.

2. Compliance criteria:
   Tolerances for the dimensions of each individual paving unit shall be within ± 2 mm for length and width, and ± 3 mm for thickness.

**EXT3.T440.7 SLIP/SKID RESISTANCE**

1. Test the slip/skid resistance of each sample of paving units to BS EN 1344:2002;

2. Compliance criteria:
   The mean slip/skid resistance of a sample is specified in Project Specific Specification.

**EXT3.T450.7 WATER ABSORPTION VALUE**

1. Carry out the test as follows:
   a. Test the 24-hour cold water absorption value of each sample of paving units to AS/NZS 4456.14:1997;
   b. Calculate the characteristic water absorption value (Wc) from the following equation:

   \[ Wc = Wm + 1.65 \times Xs \%
   \]

   Where:
   - Wm is the average water absorption rate of the sample;
   - Xs is the unbiased standard deviation as stated in AS/NZS 4456.2:1997.

2. Compliance criteria:
   The sample shall have a characteristic water absorption value not more than 6% by 24-hour cold immersion method to AS/NZS 4456.14:1997.

**SURVEILLANCE TESTS FOR TACTILE BLOCKS AND PAVING SLABS**

**EXT3.T510.7 SURVEILLANCE TEST FOR TACTILE INTERLOCKING CONCRETE BLOCKS**

1. Test Arrangements:
   a. When Instructed, surveillance tests shall be carried out by CM's Representative, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the followings pertaining to surveillance tests:
i. Provide attendance on the Site;
ii. Provide, deliver and collect samples etc. as specified or as directed by CM.

2. Testing Samples:
   a. Provide one set of test sample for each type of tactile blocks from the batch of material delivered to Site under one delivery note or as instructed by CM;
   b. One set of test sample shall consist of three tactile interlocking concrete blocks.

3. Testing methods:
   As per EXT3.M130 (12).

4. Non-compliance:
   a. In the event that the testing samples fail to meet the testing requirements, follow either one of the following actions:
      i. Remove the representative batch off Site; or
      ii. Carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 on three separate sets of samples selected by the CM from the representative batch. In case of any one sample fails the re-test, remove the representative batch off Site.
   b. When the representative batch of tactile interlocking concrete blocks is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 for one sample selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clause (4)(a);
   c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.

EXT3.T520.7 SURVEILLANCE TEST FOR TACTILE PRECAST CONCRETE PAVING SLABS

1. Test Arrangements:
   a. When Instructed, surveillance tests shall be carried out by CM's Representative, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the followings pertaining to surveillance tests:
      i. Provide attendance on the Site;
      ii. Provide, deliver and collect samples etc. as specified or as directed by CM.

2. Testing Samples:
   a. Provide one set of test sample for each type of tactile paving slabs from the batch of material delivered to Site under one delivery note or as instructed by CM;
   b. One set of test sample shall consist of three tactile precast concrete paving slabs.

3. Testing methods:
   As per EXT3.M140 (10).

4. Non-compliance:
   a. In the event that the testing samples fail to meet the testing requirements, follow either one of the following actions:
      i. Remove the representative batch off Site; or
ii. Carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 on three separate sets of samples selected by the CM from the representative batch. In case of any one sample fails the re-test, remove the representative batch off Site.

b. When the representative batch of tactile precast concrete paving slabs is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 for one sample selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clause (4)(a);

c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.
EXT4 ROUTE INDICATORS

MATERIALS

GENERAL

EXT4.M010.7 STATUTORY REQUIREMENTS
Comply with the following:
1. Road Traffic Ordinance, Cap 374;
2. Road Tunnels (Government) Ordinance, Cap 368; and
3. All their subsidiary legislation.

EXT4.M020.7 DESIGN
Design traffic signs, including letters, characters, numbers, symbols and borders in accordance with the conditions and restrictions imposed by the Commissioner for Transport.

EXT4.M030.7 COMPATIBILITY OF MATERIALS
Ensure all materials used in traffic sign construction are mutually compatible with each other.

SUBMISSIONS

EXT4.M110.7 TRAFFIC SIGNS
Submit to the CM the following details at least 14 days prior to fabrication:
1. Manufacturer's name;
2. Details of materials and finishes to be used in the manufacture of the signs.

EXT4.M120.7 ILLUMINATION OF SIGNS
As scheduled or shown on Drawings.

MATERIALS FOR TRAFFIC SIGNS

EXT4.M210.7 STANDARDS
Comply with BS EN 12899:Part 1:2001 except that the requirements for marking signs shall not be applied.

EXT4.M220.7 GENERAL
1. Use only galvanized bolts, nuts, screws and rivets with traffic signs secured to galvanized pedestrian guard railing;
2. Insulate aluminium fixings from ferrous materials with an Approved type non-conductive insulator at least 2 mm thick.

EXT4.M230.7 HOT FINISHED SEAMLESS TUBES

EXT4.M240.7 HOT ROLLED SECTIONS
EXT4.M250.7 HOT ROLLED STRUCTURAL STEEL SECTIONS

EXT4.M260.7 WELDABLE STRUCTURAL STEELS
To BS 4360:1986.

EXT4.M270.7 STAINLESS STEEL
To BS EN 10088-2:2005, Grade 1.4401.

EXT4.M280.7 STAINLESS STEEL TUBES
To BS 6362:1990, suitable for threading in accordance with BS 21:1985; grade: 304 S 11.

EXT4.M290.7 ALUMINIUM ALLOY
Free from defects and surface blemishes and in accordance with the following:
1. Grade: EN AW-6082 in the T6, T651 or T62 tempers;

EXT4.M300.7 WROUGHT ALUMINIUM AND ALUMINIUM ALLOYS SUITABLE FOR GENERAL ENGINEERING PURPOSES

EXT4.M310.7 FACES FOR TRAFFIC SIGNS
Background letters, characters, numerals, symbols and borders to:
1. Be clear cut, sharp edged and free from cracks;
2. Be matched for colour;
3. Provide a uniform appearance by day and by night.

EXT4.M320.7 BACKING PLATES AND SPILL SCREENS
1. Material: aluminium;
2. Thickness: 3 mm.

EXT4.M330.7 RETROREFLECTIVE SHEETING
Class Ref 1 or Class Ref 2 material to BS EN 12899:Part 1:2001, Tables 8 and 9 or Type IX material complying with ASTM D 4956-05.

EXT4.M340.7 NON-RETROREFLECTIVE SHEETING

EXT4.M350.7 PLASTIC SHEETING
An Approved proprietary type.

FIXINGS FOR TRAFFIC SIGNS
EXT4.M410.7 GENERAL
Ensure fixing materials are compatible to the materials that they are to be fixed.
EXT4.M420.7  ISO METRIC BLACK HEXAGON BOLTS, SCREWS AND NUTS
To BS 4190:2001.

EXT4.M430.7  ISO METRIC BLACK CUP AND COUNTERSUNK HEAD BOLTS AND SCREWS WITH HEXAGON NUTS
To BS 4933:1973.

EXT4.M440.7  METAL WASHERS
To BS 4320:1968.

EXT4.M450.7  RIVETS
To BS 4620:1970.

EXT4.M460.7  BANDING
Stainless steel.

EXT4.M470.7  WROUGHT ALUMINIUM AND ALUMINIUM ALLOYS
Rivet, bolt and screw stock to BS 1473:1972.

EXT4.M480.7  CARBON, CARBON MANGANESE AND STAINLESS STEELS
Specific requirements, general inspection and testing procedures to BS EN ISO 3560-1:2009 for bolts, screws and studs, and to BS EN ISO 3506-2:2009 for nuts.

EXT4.M490.7  BOLT LENGTH
The thread position of bolt to project through the nut by a minimum of one thread and a maximum of four threads.

EXT4.M500.7  RAG AND INDENTED BOLTS

EXT4.M510.7  EXPANSION AND RESIN BONDED BOLTS
An Approved proprietary type capable of withstanding the design loading.

PAINT TO TRAFFIC SIGN FACES

EXT4.M610.7  GENERAL

EXT4.M620.7  PAINTED FINISH
For the following areas on the sign face:
1. Colour: homogeneous and uniform, to BS 381C:1996 and referenced as follows:

<table>
<thead>
<tr>
<th>Colour</th>
<th>Reference Number</th>
<th>Colour Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>537</td>
<td>Signal Red</td>
</tr>
<tr>
<td>Orange</td>
<td>557</td>
<td>Light Orange</td>
</tr>
<tr>
<td>Yellow</td>
<td>355</td>
<td>Lemon Yellow</td>
</tr>
<tr>
<td>Blue</td>
<td>109</td>
<td>Middle Blue</td>
</tr>
<tr>
<td>Green</td>
<td>225</td>
<td>Light Brunswick Green</td>
</tr>
</tbody>
</table>

2. Black:
   a. Type: non-reflective;
   b. Luminance factor: maximum 0.03, measured in accordance with BS EN 12899:Part 1:2001.
MATERIALS FOR ROAD STUDS

EXT4.M710.7 ROAD STUDS
1. To Road Traffic Ordinance, Cap 374 and its subsidiary legislation;
2. An Approved proprietary type;
3. Permanent reflecting road studs to be used as lane line markers on dual carriageway trunk roads and primary distributor roads must be a type to which traffic cylinders of an Approved type can be attached. The method of attachment must be such that the traffic cylinder can be easily detached from the road stud;
4. Temporary reflecting road studs to be used as markers for temporary traffic routes must be yellow.

EXT4.M720.7 BITUMEN GROUT FOR ROAD STUDS
1. Comprising:
   a. Bitumen:
      i. Bitumen content: 25 to 30% of the total mass;
   b. Hydrated lime filler:
      i. Percentage by mass of hydrated lime passing a 75 micron BS test sieve: minimum of 85%.
2. Properties:
   a. Penetration at 25°C: 12±4;
   b. Softening point: 105°C ± 5°C;
   c. Specific gravity: not to exceed 1.8.
WORKMANSHIP

DELIVERY AND STORAGE OF MATERIALS

EXT4.W010.7 TRAFFIC SIGNS
Store sheets in a dry, weatherproof store in a manner which will not result in damage or deformation. Separate traffic signs which are stored together by the use of slip sheets.

FABRICATION OF TRAFFIC SIGNS

EXT4.W110.7 POSTS
1. Colour:
   a. Beacons at zebra crossings: paint with alternate black and white stripes;
   b. Other posts:
      i. Paint grey in accordance with BS 5252F:1976, Code 18B19; or
      ii. Galvanize to BS EN ISO 1461:2009 and comply with EXT7.W020. Treat galvanized areas affected by cutting and drilling using an Approved method;
2. Length:
   a. Posts supporting external luminaries: length protruding above top of signs to be as short as practicable;
   b. Other posts: must not protrude above the top of signs.

EXT4.W120.7 BACKING PLATES
1. For signs not exceeding 1200 mm high x 2400 mm wide fabricate from a single sheet;
2. For signs exceeding 1200 mm high x 2400 mm long use a minimum number of sheets, rectangular in shape and approximately the same size;
3. Drill holes in the backing plate prior to painting or the application of retroreflective or non-reflective sheeting.

EXT4.W130.7 SPILL SCREENS
1. Extend spill screens to the entire width of the backing plate;
2. Cut corners to the same radius as the corners of the backing plate;
3. Consider spill screens to be part of the backing plate and design stiffeners and mountings to accommodate the combined size.

EXT4.W140.7 FACES FOR TRAFFIC SIGNS
1. Fabricate from a single sheet of retroreflective or non-retroreflective plastic sheeting unless otherwise instructed;
2. If more than one sheet is required, keep the number of sheets used to a minimum;
3. Fix sheeting material, including letters, characters, numerals, symbols and borders using adhesive. Ensure there are no bubbles, creases, cracks or other blemishes;
4. Fix in accordance with the manufacturer's instructions.

EXT4.W150.7 LACQUER COATINGS
1. Apply to the face of traffic signs at the time of manufacture.
2. Ensure coatings are uniform and continuous.
PAINT TO TRAFFIC SIGN FACES
1. Thoroughly clean and pre-treat, by anodising, using and etching primer or another Approved process, the traffic sign face prior to painting or stoveing;
2. Apply a minimum of one undercoat and one finishing coat of paint and stove to a thickness of 0.0315 mm - 0.0375 mm of enamel over a minimum thickness of 0.025 mm of primer. Where light colours are applied over dark colours, apply a minimum of two coats. Ensure the final surface has a uniform thickness, an egg-shell flat finish and is smooth and free from defects.

ASSEMBLY OF TRAFFIC SIGNS

JOINTS
Weld or join using brackets, nuts, bolts and washers where joints for framework and stiffeners are not an integral part of the backing plate.

FIXINGS
1. Spacing of rivets and other fixings to be uniform and not to exceed 150 mm around the outside edge of the sheet and 300 mm on cross braces;
2. Use an additional neoprene, nylon or other Approved material washer to protect face of sign from metal nuts, bolts, washers and screws.

COVER PLATES FOR FIXINGS
Use a material of the same colour as the part of the face in which it is in contact.

CONNECTIONS TO ROAD LIGHTING COLUMNS
When fixing traffic signs to columns do not drill columns.

BACKING PLATES
1. Connect to posts by an Approved method;
2. Drill holes if ferrous components before finishes are applied.

LACQUER COATINGS
Apply to the edges of holes drilled in plates with plastic sheeting immediately before fixings are inserted.

COVERING OF TRAFFIC SIGNS

GENERAL
1. Ensure coverings are sufficiently opaque to prevent reflection from the covered sign. Do not remove coverings until Instructed;
2. Unless otherwise Instructed, blank out the faces of traffic signs which have been erected but do not relate either wholly or in part to the traffic situation in operation.

METHOD OF COVERING
Where required blank out traffic signs using the following methods:
1. A 1.5 mm thick sheet compatible with the sign material;
2. A self-adhesive plastic film if the sign is to be covered for a period of more than 12 months;
3. An Approved loose cover sheet.

FIXING COVER SHEETS
1. Fix using 5 mm diameter stainless steel bolts, washers and nuts or non-ferrous rivets at maximum 600 mm spacing;
2. Pass bolts through 5 x 12 mm diameter plastic distance piece between the face of the sign and the cover plate;
3. Fill holes remaining on the finished face of the sign using blocked rivets;
4. Colour rivet face by an Approved method.

**EXT4.W340.7 PLASTIC FILM**
Fix and remove in accordance with the manufacturer's recommendations. Ensure that the self-adhesive plastic film is compatible with the material it is to be adhered to.

**EXT4.W350.7 LOOSE COVERS**
Fasten securely to the back of the sign. Do not apply tape or adhesive material to the face of the sign.

**INSTALLATION OF ROAD STUDS**

**EXT4.W410.7 ROAD STUDS**
1. Install in accordance with the manufacturer's recommendations;
2. Do not install road studs until concrete work has reached the specified grade strength;
3. Ensure surfaces to which bonded road studs are to be fixed are clean, and free from dust, grease and other deleterious matter prior to installation of the road studs.

**EXT4.W420.7 DEPRESSIBLE ROAD STUDS**
Fix in place with bitumen grout.
TESTING

TESTING TRAFFIC SIGNS

EXT4.T010.7 TESTING
In accordance with BS 873: Part 1:1983 and:
1. The number of signs tested to be as Instructed or indicated on the Drawings;
2. The number and type of tests to be carried out on the traffic signs to be as Instructed;
3. Carry out testing in such a manner that will not cause damage to the traffic signs;
4. Carry out testing at an Approved laboratory.

EXT4.T020.7 COMPLIANCE CRITERIA
The results of tests of traffic signs must comply with BS 873:Part 1:1983.
EXT5  KERBS, EDGINGS AND QUADRANTS

MATERIALS

KERBS, EDGINGS AND QUADRANTS

EXT5.M010.7  INSITU CONCRETE
1. Kerbs, edgings and quadrants: concrete grade 30/20;

EXT5.M020.7  PRECAST CONCRETE
Hydraulically pressed and complying with BS 7263:Part 1:1990, excluding the testing of water absorption and:
1. Nominal length of kerbs: 1000 mm;
2. Nominal length of edgings: 750 mm.

EXT5.M030.7  GRANITE
Kerbs, edgings and quadrants:
1. Worked straight or circular;
2. Corners: square;
3. Top front and back edges: parallel;
4. Ends: chisel-dress square to form a close butt-joint with adjacent kerbs and:
   a. Depth on the front face: 140 mm minimum;
   b. Depth on the back face and full width of the top face: 75 mm minimum.
5. Length: 600 mm minimum.
WORKMANSHIP

PRECAST CONCRETE AND GRANITE KERBS, EDGINGS AND QUADRANTS

EXT5.W010.7 LAYING
1. Lay on a regulating layer of cement mortar;
2. Thickness: 10 mm minimum and not exceeding 40 mm.

EXT5.W020.7 JOINTS
1. Generally:
   a. Not exceeding 10 mm in width;
   b. Filled and flush pointed with cement mortar.
2. Expansion joints on bridge decks: as shown on the Drawings;
3. Transverse expansion and contraction joints laid on or adjacent to concrete carriageways: in accordance with Worksection EXT2.

EXT5.W030.7 RADIUS KERBS
Use for kerbs less than 10 m external radius.

INSITU KERBS, EDGINGS AND QUADRANTS

EXT5.W110.7 LAYING
Construct in accordance with BS 5931:1980 and lay using an Approved type of automatic extrusion machine or by other Approved alternative method.

EXT5.W120.7 FINISHING
1. Kerbs, quadrants and edgings must have regular sides, edges, arrises and chamfers;
2. Finish concrete surfaces as follows:
   a. Method of producing finish: levelling the surface of the compacted concrete with a screed board and steel trowelling the surface under firm pressure or power floating the surface;
   b. Abrupt irregularities permitted: Nil;
   c. Gradual irregularities permitted: <5 mm in 2 m;
   d. Specific requirement: Uniform, dense and smooth surface, free from trowel marks. No staining or discolouration.
3. Do not finish or dress kerbs, edges and quadrants with cement mortar.

EXT5.W130.7 JOINTS
1. Generally: flush pointed with cement mortar;
2. Contraction joints: form at intervals not greater than 4 m;
3. Transverse expansion and contraction joints laid on or adjacent to concrete carriageways: in accordance with Worksection EXT2.

ACCURACY AND TOLERANCES

EXT5.W210.7 GENERAL
Refer to Appendix H "Schedule of Tolerances" to this Specification.
WORKS OUTSIDE SITE BOUNDARY

EXT5.W310.7  APPROVED CONTRACTOR FOR PUBLIC WORKS
Kerbs, edging and quadrant works required to be carried out by a contractor or sub-contractor who is on the current List of Approved Contractors for Public Works for Roads and Drains are specified in Project Specific Specification.

EXT5.W320.7  SPECIFICATION
Carry out the works specified under EXT5.W310 in accordance with Sections 6, 9, 10, 11, 14, 15, 16 and 18 of the Hong Kong Government General Specification for Civil Engineering Works (2006 Edition) and its amendments published 42 days prior to the date for the return of tenders unless otherwise specified.

EXT5.W330.7  HANDING OVER INSPECTION
Notify the CM to arrange with Highways Department for a joint handing over inspection. Allow the CM to give at least 2 working days advance notice for this inspection.

EXT5.W340.7  RECORD DRAWINGS AND TEST REPORTS
Provide as-built record drawings and all test reports to the CM for submitting to Highways Department.
EXT6 CONCRETE PROFILE BARRIERS

MATERIALS

EXT6.M010.7 CONCRETE MIX
Grade 30/20 as Worksection CON1.

EXT6.M020.7 FORMWORK
Use steel formwork unless otherwise permitted by the CM. Do not loosen or remove formwork until at least 7 hours after completion of concreting.

EXT6.M030.7 CONCRETE FINISH
Finish concrete surfaces as follows:
1. Unformed concrete surfaces, Class U5, as follows:
   a. Method of producing finish: Level the surface of the compacted concrete with a screed board, wood float or power float the surface and steel trowel the surface under firm pressure or power float the surface;
   b. Abrupt irregularities permitted: nil;
   c. Gradual irregularities permitted: < 5 mm in 2 m;
   d. Specific requirements: uniform, dense and smooth surface, free from trowel marks, no staining or discolouration.
2. Concrete surfaces for transverse joints, use Class F3 as follows:
   a. Type of formwork normally used: plywood;
      Note: formwork of this type will normally produce a concrete surface which complies with the characteristics of finish stated but other types of formwork may be used to produce the specified finish.
   b. Formwork pattern: pattern of formwork joints and tie holes as stated in sub-clauses (4) and (5) below;
   c. Abrupt irregularities permitted: < 3 mm;
   d. Gradual irregularities permitted: < 5 mm in 2 m;
   e. Specific requirements: even surface, no grout runs.
3. Exposed concrete surfaces, use Class F5 as follows:
   a. Type of formwork normally used: sealed plywood Note: formwork of this type will normally produce a concrete surface which complies with the characteristics of finish stated but other types of formwork may be used to produce the specified finish;
   b. Formwork pattern: pattern of formwork joints and tie holes as stated in sub-clauses (4) and (5) below;
   c. Abrupt irregularities permitted: < 2 mm;
   d. Gradual irregularities permitted: < 3 mm in 2 m;
   e. Specific requirements: even surface, uniform, dense and smooth surface, no grout runs, no grain pattern, no crazing, no blemishes, no staining or discolouration.
4. Panel joints: formwork panels for the finishes in sub-clauses (2) and (3) above shall be the same size and shall form a regular pattern approved by the CM. The lines of joints between panels shall be straight and continuous, horizontal and vertical, or inclined to suit the pattern of profiled formwork, and shall be coincident with construction joints and other joints and with recesses in the concrete surface. The number of make-up pieces shall be kept to a minimum;
5. Tie holes: holes left by formwork ties and components in concrete surfaces with the finishes in sub-clauses (2) and (3) above shall be in line horizontally and vertically and shall form a regular pattern approved by the CM. Unless otherwise permitted by the CM, holes in profiled formwork shall be located in such a manner that the holes are completely within recesses in the concrete surface.

**EXT6.M040.7 JOINTS IN CONCRETE PROFILE BARRIERS**

Form joints:
1. At locations which coincide with expansion or construction joints in the adjoining structure or carriageway; or
2. At intervals not exceeding 12 m, whichever is less; and
3. In accordance with the appropriate provisions of Worksection CON6.

**EXT6.M050.7 PROTECTIVE POLYTHENE SHEETING**

Impermeable polythene sheeting with a nominal thickness of 0.125 mm.

**EXT6.M060.7 CEMENT MORTAR**

Cement mortar consisting of one part of cement to three parts of fine aggregate by volume together with the minimum amount of water necessary to achieve a consistency suitable for the required work. Fine aggregates to be sand or crushed rock to BS 1200:1976 passing a 5 mm BS Test Sieve.
WORKMANSHIP

CONSTRUCTION OF PROFILE BARRIERS

EXT6.W010.7  SLIP-FORMED CONCRETE PROFILE BARRIERS
Construct by slip-form machine between sliding forms to BS 5931:1980. Slip-form machines to comply with BS 5931:1980, Appendix A.

EXT6.W020.7  PRECAST CONCRETE PROFILE BARRIERS
Lay on a cement mortar regulating layer, 10 – 40 mm thick.

SUBMISSIONS

EXT6.W110.7  PARTICULARS OF CONCRETE PROFILE BARRIERS
Submit the following particulars to the CM of the proposed methods of construction of the concrete profile barriers at least 14 days before construction of the concrete profile barriers starts:
1. Particulars of formwork for insitu construction using fixed forms as stated in:
   a. Worksection FOR for works carried out under site formation / road and drainage works contracts; or
   b. Worksection CON2 for all other works not mentioned in sub-clause (1)(a) above.
2. Details of slip-form machine for insitu construction between sliding forms; and
3. Methods of manufacture, handling, transport, storing and fixing in position of precast units.

PROTECTION OF WORKS

EXT6.W210.7  PROTECTION
1. Immediately after the formwork has been removed or the curing compound applied, protect concrete profile barriers with polythene sheeting for at least 24 hours from exposure to conditions which may adversely affect the concrete;
2. Ensure the sheeting is lapped and held securely in position in a manner that will not damage the concrete surface.

TOLERANCES

EXT6.W310.7  GENERAL
1. Refer to Appendix H 'Schedule of Tolerances' to this Specification;
2. Form a smooth alignment of the barriers.
TESTING

TRIALS

EXT6.T010.7  TRIAL LENGTHS
1. Construct trial lengths to demonstrate that the proposed materials, mixes, methods of production and methods of construction will produce concrete profile barriers complying with this Specification;
2. Construct trial length:
   a. In a location separate from the permanent concrete profile barrier; or
   b. Over the first 25 m of the permanent concrete profile barrier; as Instructed;
3. Allow the CM sufficient time, at least 7 days, to determine whether the specified requirements have been produced in the trial area before further material of the same type is used to construct the concrete profile barrier;
4. Construct trial lengths using the same materials, mixes, method of production and methods of construction as the details submitted to the CM;
5. Inform the CM at least 24 hours before constructing trial lengths, or at another interval agreed by the CM;
6. Unless otherwise Instructed to remove, protect trial lengths from damage and leave in position. Do not remove trial lengths which form part of the permanent barrier and which comply with this Specification.

EXT6.T020.7  SAMPLING AND TEST METHODS FOR TRIAL LENGTHS
1. Test the trial length to determine the accuracy of the alignment, the level and the finish of the concrete surface;
2. Cut cores from the trial length to determine the amount of segregation of the constituents and the presence of voids. Take cores as EXT6.T070.

EXT6.T030.7  COMPLIANCE CRITERIA
1. Alignment and levels of barrier: as EXT6.W310;
2. Finish of concrete surface: as the appropriate provisions of EXT6.M030;
3. Amount of segregation of constituent materials and the presence of voids: as the appropriate provisions of Worksection EXT2.

EXT6.T040.7  NON-COMPLIANCE
1. In the event of non-compliance of any trial length with the specified requirements, submit details of proposed changes to the materials, mixes, methods of production or construction, required to meet the compliance criteria. Construct further trial areas as necessary until the result of every test on trial lengths complies with the specified requirements;
2. Unless otherwise Instructed remove trial lengths, or parts of the trial lengths, which do not comply with the specified requirements for the trial length.

EXT6.T050.7  USE IN THE PERMANENT WORKS
1. Notwithstanding the requirements of sub-clause (2) do not place concrete in the permanent barriers until the result of all the tests on the trial length confirm the specified requirements for the trial length;
2. Concrete may be placed in the permanent barriers before the results of tests for compressive strength of the trial mix are available, provided that the result of every other test or the trial mix and trial length complies with the specified requirements for trial mix concrete and for the trial length.
EXT6.T060.7  SPECIFICATION CHANGES
Unless otherwise permitted by the CM do not change the materials, mixes, methods of production and construction required to meet the compliance criteria. Construct further trial lengths to demonstrate compliance of any proposed changes, unless otherwise Instructed.

EXT6.T070.7  CONCRETE CORES FROM TRIAL LENGTHS
1. Provide two concrete cores from each trial length of concrete profile barriers, taken from positions as Instructed;
2. Samples, testing and compliance criteria for concrete cores from trial lengths: as Worksection EXT2.
EXT7 UNTENSIONED BEAM BARRIERS

MATERIALS

SUBMISSIONS

EXT7.M010.7 DETAILS
Submit details of the following, for Approval, at least 14 days prior to installation of beams:
1. A certificate for each batch of beams delivered to Site from the manufacturer in the format of BS 4360:1986 stating the manufacturer's name, the date and place of manufacture and showing that the beams comply with the requirements of this Specification, including the carbon equivalent values;

EXT7.M020.7 SAMPLES
Submit samples of the following beam barrier materials for Approval of the source and type.
1. Beams;
2. Posts, cleats and struts;
3. Bolts, nuts and washers.

MATERIALS

EXT7.M110.7 UNTENSIONED BEAM BARRIERS
1. Where applicable, steelworks to Worksection STW for works to be handed over to other government departments upon completion as stated in the Contract unless otherwise stated;
2. Steel plates to BS 1449-1.1:1991, Type BHR, and BS EN 10149-3:1996, Grade S315NC capable of withstanding a tensile force of at least 300 kN which will not deflect by more than 40 mm when loaded centrally with a point load of 1 t over a simply supported span of 3 m;
3. Hot dip galvanized with a minimum coating thickness of 85 µm.

EXT7.M120.7 BOLT SLOTS IN BEAMS FOR CONNECTION POSTS
1. Prepare in the workshop by cold saw-cutting;
2. Spacing: 2 m or 4 m as shown on the Drawings;
3. Hot dip galvanized with a minimum coating thickness of 70 µm.

EXT7.M140.7 WELDS FOR END BEAM SECTIONS
Full-penetration butt welds.

EXT7.M150.7 CONCRETE FOR FOOTINGS
As Worksection CON1 and:
1. Concrete mix: Grade 20/20;
2. Finish: Class U5 as EXT7.M170.

EXT7.M160.7 CONCRETE FOR ANCHOR BLOCKS
Grade 20/20 as Worksection CON1.
FINISH TO CONCRETE SURFACES OF ANCHOR BLOCKS
Finish concrete surfaces as follows:
1. Formed finishes:

POSTS

POSTS FOR UNTENSIONED BEAM BARRIERS
1. Grade 43A steel to BS 4360:1986;
2. Hot dip galvanized with a minimum coating thickness of 85 µm.

POSTS FABRICATED FROM HOLLOW SECTIONS
1. Seal by welding mild steel sealing plates over the open ends;
2. Plate thickness: 3 mm.

FIXINGS

CLEATS AND STRUTS
1. Fabricated from angle sections to BS 4:1980;
2. Material: weldable structural steel to BS 4360:1986:Grade 43A;
3. Hot dip galvanized with a minimum coating thickness of 85 µm.

BOLTS
To BS 4190:2001, and:
1. Size: M 16;
2. Strength: Grade 4.6;
3. Bolts for beam splicing, connecting beams to posts and for connecting beams to cleats: round or button-headed with oval shoulders;
4. Other bolt types: ISO metric black hexagon type;
5. Hot dip galvanized with a minimum coating thickness of 55 µm;
6. Bolt length: such that the threaded portion of each bolt projects through the nut by not more than four threads;
7. Rag, indented and expansion bolts and resin bonded bolts: Approved proprietary type and capable of withstanding the design loading.

NUTS
To BS 4190:2001, and:
1. Strength: Grade 4 or 5;
2. Hot dip galvanized with a minimum coating thickness of 55 µm;
3. Tapped 0.4 mm oversized to accommodate galvanized coating.

WASHERS
Black, mild steel to BS 4320:1968, Form E, F or G and manufactured from steel to BS 1449-1.1:1991 and BS EN 10149-3:1996, Grade S315NC.

PLAIN WASHERS
1. Of dimensions suitable for use with M 16 bolts and nuts;
2. Thickness: 2 mm;
3. Hot-dip galvanized with a minimum coating thickness of 55 µm.
EXT7.M360.7  SHAPED WASHERS
To BS 3468:1986 and shaped to fit the curvature of circular hollow sections used as posts:
1. Material: cast iron;
2. Thickness: 5 mm minimum.
WORKMANSHIP

GENERAL

EXT7.W010.7 STORAGE AND PROTECTION
1. Store beams and posts off the ground on level supports in a manner which will not damage, deform or contaminate the materials;
2. Protect beams and posts from damage and ensure that damaged materials are not used in permanent work unless permitted by the CM.

EXT7.W020.7 HOT DIP GALVANIZING
1. Unless otherwise specified, galvanized coatings to be applied by hot-dip galvanizing to be in accordance with BS EN ISO 1461:2009 with minimum mean coating thickness of 45 microns to 85 microns depending on thickness of article as stipulated in Table 3 of BS EN ISO 1461:2009, unless otherwise specified. The coating thickness to comply with the following Table:

<table>
<thead>
<tr>
<th>Article Thickness</th>
<th>Minimum Mean Coating Thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt; 6 mm</td>
<td>85 µm</td>
</tr>
<tr>
<td>&gt; 3 mm to ≤ 6 mm</td>
<td>70 µm</td>
</tr>
<tr>
<td>≥ 1.5 mm to ≤ 3 mm</td>
<td>55 µm</td>
</tr>
<tr>
<td>&lt; 1.5 mm</td>
<td>45 µm</td>
</tr>
</tbody>
</table>

2. Unless Approved, all components are to be galvanized after welding, drilling and cutting operations are complete;
3. All hot dip galvanizing is to be carried out by galvanizers with ISO 9001 certification. Submit the name of galvanizer for Approval;
4. Submit original invoice/delivery note and galvanizing certification for each delivery. These documents shall include the following information:
   a. Project title/number;
   b. Name of galvanizer;
   c. Types and dimensions of articles;
   d. Quantities.
5. Attach a durable identification tape to each batch of galvanized articles indicating the project title, galvanizing certification number and name of galvanizer.

FORMING FOOTINGS

EXT7.W110.7 COMPACTED EARTH FOOTINGS
1. Deposit and compact the following to obtain a relative compaction of at least 95% throughout:
   a. Sub-base material: to the bottom 250 mm of the foundation pit;
   b. Fine fill material: to the remainder of the pit;
2. Posts: securely fix in position during deposition and compaction of the fill material.

EXT7.W120.7 CONCRETE FOOTINGS
1. Ensure the top surface of the footings is finished level with the adjoining ground;
2. Posts:
   a. Surround posts with polyethylene sheeting prior to placing of concrete;
b. Ensure posts are securely fixed in position during concreting.

CONSTRUCTION OF BEAM BARRIERS

EXT7.W210.7 GENERAL
Untensioned beam barriers when delivered to site must be ready for assembly. Beams and posts shall be free from blisters, flux, uncoated spots and other defects.

EXT7.W220.7 INSTALLATION AND FIXING
1. Install beam barriers to a smooth alignment and within 10 mm of the position and height as shown on the Drawings. Ensure transition sections provide a smooth and uniform transition;
2. Curve in the workshop those beams to be installed to a radius less than 45 m;
3. Use rag, indented, expansion or resin bonded bolts for fixing to concrete. Fit bolts into pockets and fill with cement mortar or resin grout;
4. Bolt beam barriers to metalwork.

TOLERANCES

EXT7.W310.7 GENERAL
Refer to Appendix H 'Schedule of Tolerances' to this Specification.
EXT8 ROAD MARKING

MATERIALS

GENERAL

EXT8.M010.7 ROAD MARKING
Road markings are white or yellow continuous or intermittent lines, letters, characters, figures, arrows or symbols marked on the carriageway to guide road users and pedestrian.

EXT8.M020.7 SKID RESISTANCE
The minimum skid resistance of road marking materials when measured in accordance with the method contained in Annex D of BS EN 1436:1998 shall be Class S1.

EXT8.M030.7 FUNCTIONAL LIFE
The functional life of the road-marking material shall be at least 1 year after laying is carried out as defined in BS EN 1436:1998.

THERMOPLASTIC MATERIALS

EXT8.M110.7 HOT APPLIED THERMOPLASTIC MATERIAL
1. Unless otherwise specified in Drawings, use either one of the following materials:
   a. Type 'A' - Standard hot applied thermoplastic material;
   b. Type 'B' - Alkyd resin hot applied thermoplastic material.
2. Complying with BS EN 1871:2000, with particular attention to the following material properties:
   a. Softening point: Class SP2 when tested in accordance with Annex F of BS EN 1871:2000;
   b. Luminance factor: Class LF4 for white material and Class LF2 for yellow material when tested in accordance with Annex E of BS EN 1871:2000.
3. Solvent-free marking substance supplied in block, granular or powder forms, which can be heated to a molten state and then applied with an appropriate hand or mechanical applicator, and form a cohesive film by cooling;
4. With solid glass beads to BS EN 1423:1998 of reflective index conforming to Class A when determined in accordance with Annex A of BS EN 1423:1998 so that not less than 25% of the volume of material comprises glass beads;
5. Colour: as shown on Drawings.

EXT8.M120.7 CERTIFICATION
When required by the CM, submit, 14 days before the commencement of the Works, a test certificate prepared and signed by an independent laboratory, showing the manufacturer's name, the place and date of manufacture and certifying that samples taken from the road marking materials to be used in the Contract have been tested and are in compliance with the specified standards.
PREFORMED MATERIALS

EXT8.M210.7 COLD APPLIED ROAD MARKINGS
1. An Approved proprietary type with glass beads to BS EN 1423:1998 of reflective index conforming to Class A when determined in accordance with Annex A of BS EN 1423:1998, applied during manufacture;
2. Colour: as shown on Drawings.

EXT8.M250.7 COLD PLASTIC ROAD MARKINGS
To BS EN 1871:2000. The luminance factor shall be Class LF4 for white material and Class LF2 for yellow material when applied at the manufacturer's state thickness and tested in accordance with Annex A of BS EN 1871:2000.

PAINT

EXT8.M310.7 ROAD MARKING PAINT
1. To BS EN 1871:2000, in particular the following:
   a. Luminance factor: Class LF6 for white material and Class LF2 for yellow material when tested in accordance with Annex A of BS EN 1871:2000;
   b. Difference in luminance factor after UV ageing: Class UV1;
   c. Difference in luminance factor after bleed resistance test: Class BR1.
2. Colour: as shown on Drawings.

ANCILLARY MATERIALS

EXT8.M410.7 TACK COAT
Compatible with the road marking material.

EXT8.M420.7 REFLECTIVE GLASS BEADS FOR SURFACE APPLICATION
WORKMANSHIP

PREPARATION FOR ROAD MARKING

EXT8.W010.7 ROAD CONDITION
Ensure that the road surface is clean, dry and free from any loose detritus, mud, old and/or flaking road marking materials or similar extraneous matters.

EXT8.W020.7 CLEANING
When directed, remove oil and grease by high pressure water jetting, shot blasting, grinding or other Approved methods.

EXT8.W030.7 BITUMINOUS SURFACES
No surface preparation is required to bituminous road surfaces which have not been opened to traffic.

EXT8.W040.7 CONCRETE SURFACES
1. If the road has not previously been opened to traffic, remove all curing compound and laitance from the road surface by wire brushing or other Approved method;
2. Apply a tack coat to the road surface in accordance with the manufacturer's recommendations.

EXT8.W050.7 EXISTING ROAD MARKINGS
1. Where road markings are to be replaced by material of a different type, remove the existing material by high pressure water jetting, shot blasting, grinding or other Approved methods; do not mask the existing markings using black paint or similar method;
2. Where road markings are to be replaced by material of a similar type, roughen the existing marking by an Approved method until the thickness of the existing material is reduced by approximately 50%;
3. Carry out the removal or roughening of existing road markings adjacent to any longitudinal or transverse joint by an Approved method which will not damage the joint.

LAYING THERMOPLASTIC MATERIALS

EXT8.W110.7 SUPPLY, DELIVERY AND STORAGE
Ensure that road marking materials are supplied, delivered and stored in accordance with the following:
1. Thermoplastic materials: each container shall be clearly and indelibly marked with the following information:
   a. The name, trade mark or other means of identification of the manufacturer;
   b. Batch number;
   c. Date of manufacturer;
   d. The number and date of the Standard, i.e. BS EN 1871:2000;
   e. Whether reflectorized;
   f. Colour (white, yellow or black);
   g. Chemical description and type of resin;
   h. Maximum application temperature and maximum safe heating temperature;
   i. Relative density;
ROAD MARKING  EXT8 > WORKMANSHIP

j. The class of its content if applicable;
k. A warning about the use of lead pigment if applicable.

2. Road marking paint material: shall be discarded after expiry of the shelf life;
3. Preformed material: in accordance with the manufacturer's recommendations.

EXT8.W120.7  CODE OF PRACTICE
Prepare thermoplastic road marking materials on site and lay in accordance with clauses 4 and 5 of BS 3262: Part 3:1989.

EXT8.W130.7  AMBIENT CONDITIONS
Do not lay road markings when:
1. The road surface is wet; or
2. When the ambient air temperature in the shade is below 10º C.

EXT8.W140.7  LAYING PLANT
Ensure that the apparatus employed for the laying of road markings is capable of producing markings to a uniform thickness and width. The marking must have clean edges and be free from streaks, lumps and blisters.

EXT8.W150.7  THICKNESS
Thickness of road markings laid and measured in accordance with Appendices B of BS 3262: Part 3:1989:
1. Screed markings: 4 mm;
2. Sprayed markings
   (other than yellow edge lines): ≥1.5 mm;
3. Sprayed yellow edge lines: ≥0.8 mm.

LAYING PREFORMED MATERIAL

EXT8.W210.7  LAYING COLD APPLIED ROAD MARKINGS
Lay:
1. In accordance with the manufacturer's recommendations;
2. When the surface of the carriageway is dry;
3. To a thickness of at least 1.5 mm.

APPLYING ROAD-MARKING PAINT

EXT8.W240.7  APPLICATION OF ROAD-MARKING PAINT
1. Use road-marking plant only where the use of other road marking material, such as thermoplastic, will affect the functional performance of the road markings and with the written approval of the CM;
2. Apply in accordance with the manufacturer's recommendation;
3. Do not apply road-marking paint for temporary road markings and covering up existing road markings.

PERFORMANCE REQUIREMENTS

EXT8.W270.7  ROAD MARKING PERFORMANCE FOR ROAD USERS
Comply with BS EN 1436:1998, in particular the followings:
1. Minimum luminance coefficient under diffuse illumination: Class Q2 and Q3 on asphaltic surface and concrete surface respectively for white markings, and Class Q1 for yellow markings when measured in accordance with Annex A of BS EN 1436:1998;

2. Minimum coefficient of retroreflected luminance for dry road markings: Class R2 and R1 for permanent white and yellow markings respectively, and Class R3 for temporary markings when measured in accordance with Annex B of BS EN 1436:1998;

TEMPORARY ROAD MARKINGS

EXT8.W310.7 GENERAL
1. Use cold-applied performed material for temporary road markings;
2. Use proprietary black tape approved by the CM for covering up existing road markings temporarily during the course of road works;
3. Remove temporary road markings.

EXT8.W320.7 DISPOSAL
Dispose of temporary markings after removal and:
1. Remove all traces of tape from the surface of the carriageway;
2. Make good any existing, permanent road markings to Approval and so that it is safe for traffic to use the road.

REMOVAL OF EXISTING ROAD MARKINGS

EXT8.W360.7 REMOVAL OF EXISTING ROAD MARKINGS BY SHOT-BLASTING
Where directed by the CM to remove the existing road marking by steel shot-blasting, use Approved self-propelled shot-blasting machine with a minimum cleaning path of 350 mm.

TOLERANCES

EXT8.W410.7 GENERAL
Refer to Appendix H "Schedule of Tolerances" to this Specification.
EXT9  FENCING, GATES AND GUARDRAILS

MATERIALS

GENERAL

EXT9.M010.7 ALTERNATIVE DESIGN
The Contractor may offer an alternative design for the pedestrian guard railing or that which is to be erected as temporary works and shown on the Drawings or detailed in this Specification. Such design must be in accordance with BS 7818, Table 1, Class C.

EXT9.M020.7 SUBMISSIONS
Submit the following details to the CM at least 28 days prior to fabrication:
1. A certificate from the manufacturer stating their name, date and place of manufacture and a statement confirming that the materials comply with the requirements of this Specification; and
2. Details of alternative design proposals as EXT9.M010 where applicable.

EXT9.M030.7 SAMPLES
Submit with the other details required by EXT9.M020 samples of the following for Approval of source and type:
1. Each type of pedestrian guard railing to be used;
2. Mesh infill;
3. Each type of bolt, nut and washer to be used in the fabrication.

FENCING

EXT9.M120.7 GALVANIZED STEEL WIRE FOR FENCING
To BS 4102:1990.

EXT9.M130.7 GALVANIZED WIRE NETTING FENCING
To BS 1485:1983 or of Approved local manufacture.

CONCRETE POSTS

EXT9.M210.7 PRECAST CONCRETE FENCING POSTS
Reinforced concrete to dimensions shown on the Drawings and the following:
1. Concrete: Grade 25/10 as Worksection CON1;
2. Reinforcement: as Worksection CON3;
3. Finish: fair faced as Worksection CON2.

STEEL AND ALUMINIUM FOR GATES, POSTS AND GUARD RAILS

EXT9.M310.7 HOT FINISHED SEAMLESS STEEL TUBES
To BS 6323:Part 31982.
FENCING, GATES AND GUARDRAILS

EXT9 > MATERIALS

EXT9.M320.7 STEEL TUBES AND TUBULARS SUITABLE FOR SCREWING TO BS 21 PIPE THREADS
To BS 1387:1985.

EXT9.M330.7 HOT ROLLED STEEL SECTIONS

EXT9.M340.7 HOT ROLLED STRUCTURAL STEEL SECTIONS (EQUAL AND UNEQUAL ANGLES)

EXT9.M350.7 WELDABLE STRUCTURAL STEELS
To BS 4360:1986.

EXT9.M360.7 STAINLESS STEEL
To BS EN 10088-2:2005, Grade 1.4401.

EXT9.M370.7 STAINLESS STEEL TUBES
To BS 6362:1990 Grade 316 S 31, and a type suitable for threading in accordance with BS 21:1985.

EXT9.M380.7 ALUMINIUM
1. Grade: H30TF;

EXT9.M390.7 WROUGHT ALUMINIUM AND ALUMINIUM ALLOYS SUITABLE FOR GENERAL ENGINEERING PURPOSES
1. Plate, sheet and strip: to BS 1470:1987;
2. Drawn tube: to BS 1471:1972;

FIXINGS

EXT9.M410.7 TYPE
1. Use only galvanized bolts, nuts, screws and rivets with galvanized pedestrian guard railing;
2. Insulate aluminium fixings from ferrous materials with an Approved type non-conductive insulator at least 2 mm thick.

EXT9.M420.7 ISO METRIC BLACK HEXAGON BOLTS, SCREWS AND NUTS
To BS 4190:1967.

EXT9.M430.7 ISO METRIC BLACK CUP AND COUNTERSUNK HEAD BOLTS AND SCREWS WITH HEXAGONAL NUTS
To BS 4933:1973.

EXT9.M440.7 METAL WASHERS
To BS 4320:1968.

EXT9.M450.7 RIVETS

EXT9.M460.7 RIVET, BOLT AND SCREW STOCK
Wrought aluminium and aluminium alloys to BS 1473:1972.
EXT9.M470.7  BOLT LENGTH
The thread position of bolt to project through the nut by a minimum of one thread
and a maximum of four threads.

EXT9.M480.7  RAG, INDENTED, EXPANSION AND RESIN BONDED BOLTS
An Approved proprietary type capable of withstanding the design loading.

INFILL PANELS FOR GUARD RAILINGS

EXT9.M510.7  MESH INFILL PANELS
To BS 4483:1985 and free from surface defects, surface irregularities and mesh
misalignment.
WORKMANSHIP

ERECTING FENCING

EXT9.W010.7 LOCATION
Erect fencing to lines and levels as shown on the Drawings.

EXT9.W020.7 ERECTION
Comply with BS 1722:Part 1:1986:Section 3 in respect of:
1. Level of top of fence (sub-section 3.1);
2. Fixing posts and struts (sub-section 3.2);
3. Fixing fencing infill (sub-section 3.3);
4. Fixing gates within fencing (sub-section 3.4);
5. Renovation of damaged coatings (sub-section 3.5).

EXT9.W030.7 FIXING
1. Fix selvage wires at top, bottom and mid points of fencing and strain tight to each straining post by means of eye bolts or other suitable straining device;
2. Strain fence between straining posts and secure to straining and intermediate posts using galvanized mild steel flats fixed with galvanized mild steel bolts, nuts and washers.

FABRICATION, PROTECTION AND INSTALLATION OF PEDESTRIAN GUARD RAILING

EXT9.W110.7 STORAGE AND PROTECTION
1. Store and protect guard railing off the ground on level supports in a manner that will not result in damage, deformation or contamination;
2. Do not use any damaged guard railing in the permanent works unless permitted by CM.

EXT9.W120.7 WELDING
1. Unless otherwise permitted by the CM, do not make welded joints after galvanizing. Where permitted, ensure welded areas are free from scale and slag and treated with an alternative zinc-coating system;
2. Type of weld: fillet;
3. Ensure welded surfaces are clean and flush, prior to application of the protective coating.

EXT9.W130.7 HOT DIP GALVANIZING
Hot dip galvanize all steel components forming pedestrian guard railing to BS EN ISO 1461:2009 with minimum mean coating thickness of 45 microns to 85 microns depending on thickness of article as stipulated in Table 3 of BS EN ISO 1461:2009, unless otherwise specified. Galvanize components after welding, drilling and cutting operations are complete. The coating thickness to comply with the following Table:

<table>
<thead>
<tr>
<th>Article Thickness</th>
<th>Minimum Mean Coating Thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt; 6 mm</td>
<td>85 μm</td>
</tr>
<tr>
<td>&gt; 3 mm to ≤ 6 mm</td>
<td>70 μm</td>
</tr>
</tbody>
</table>

Specification Library 2014 Edition
**EXT9.W140.7 INSTALLATION**

1. Use guard railing curved in the workshop for radii of less than 45 m. Do not use straight lengths in this application;
2. Fix guard railing to concrete using rag, indented, expansion or resin bonded bolts. Fix bolts into pockets and fill with cement mortar or resin grout;
3. Bolt fix guard railing to metalwork.

**EXT9.W210.7 GENERAL**

Refer to Appendix H "Schedule of Tolerances" to this Specification.

**MATERIALS**

**PLAY/FITNESS EQUIPMENT**

**EXT10.M010.7**  PLAY/FITNESS EQUIPMENT

1. Play/fitness equipment in the Specification refers to a proprietary play and/or fitness equipment item which shall be designed, supplied and installed by an Approved sub-contractor selected by the Contractor from the list of HD play and fitness equipment agents/suppliers as approved by the HD Play Equipment Review Board which can be obtained from the CM;

2. Type and function of play equipment including suitable theme play equipment for target user group(s) aged 2-5 and/or 5-12 separately and fitness equipment in area as specified in Project Specific Specification, and safety margin/use zone all in accordance with international standards of safety, namely European Standard EN1176, and/or ASTM F1487 standard of the USA, shall be as shown and/or defined on the Drawings.

**EXT10.M015.7**  DESIGN SUBMISSION

1. Unless the CM instructs otherwise, submit to the CM at the time as specified in the Project Specific Specification at least 3 design proposals provided by different agents/suppliers from the list stated in sub-clause (1) of EXT10.M010 for the designated play/fitness area(s) for the CM's selection and approval. Each design proposal shall:
   a. Include suitable play/fitness equipment, fixing details and other builder's works requirements in compliance with the Drawings and the requirements stated in EXT10.M010 and this clause; and
   b. Provide information on the place of origin, name of manufacturer, brand name, model number, manufacturer's instruction on installation procedures.

Each design proposal shall also be accompanied with a quotation from the respective agents/suppliers. The Contractor shall be responsible for the identification of agents/suppliers, preparation of invitation documents and invitation of quotations. Sufficient time shall be allowed for agents/suppliers to prepare and return their quotations. The quotation closing date and time, and location of the quotation box of the Contractor for deposition of quotations shall be specified in the invitation of quotations. Make invitation to the CM at least 14 days before the quotation closing date for his arrangement of representation to witness the opening of quotations at the Contractor's office. Quotations received shall be opened promptly after the specified closing date and time. Opening of the quotations shall be witnessed by at least two representatives of the Contractor and two CMR;

2. Re-submit revised design proposals, quotations, drawings and relevant information where commented or considered necessary by the CM;

3. Upon notification in writing by the CM of his selected and approved design proposal (a copy of the Contractor's submitted quotation in respect of the Approved design proposal may be attached with the CM's notification for the sake of reference), engage the agent/supplier providing the play/fitness equipment of the Approved design proposal as the Approved sub-contractor for the design, supply and installation of the Approved play/fitness equipment provided that the actual cost of procuring each of the Approved play/fitness equipment shall not exceed the amount shown on the quotation submitted to the CM for the Approved design proposal;
4. If, prior to entering into sub-contract with the agent/supplier providing the Approved play/fitness equipment, it becomes apparent to the Contractor that the actual cost of any of the Approved play/fitness equipment exceeds the amount shown on the quotation submitted to the CM for the Approved design proposal for whatever reasons, give immediate notice to the CM for further instruction. Any claim for additional costs due to higher actual costs than the quotation submitted to the CM for the Approved design proposal arising from or after entering into sub-contract with the agent/supplier providing the Approved play/fitness equipment shall not be considered. Submit certified true copy of the sub-contract(s) to substantiate the actual costs of the procurement of the Approved play/fitness equipment;

5. In addition to sub-clause (1) above, the CM may at his own discretion before or after the Contractor's submissions in sub-clause (1), obtain design proposals and quotations directly from agents/suppliers of play/fitness equipment and instruct the Contractor as appropriate;

6. Within 28 days from the date of the CM's notification of selection and approval of the design proposal, submit detailed information comprising shop drawings and fixing details of the play/fitness equipment for the CM's approval;

7. The type and function of play/fitness equipment in sub-clauses (1) and (2) of this clause shall include suitable equipment with detailed components as specified in Project Specific Specification;

8. The design, supply, installation and operation of the play equipment shall comply with international standards of safety. Those international standards of safety are namely European Standard EN1176, and/or ASTM F1487 standard of the USA for all aspects including safety margin/use zone, critical fall height (or the free height of fall), separation of age group etc. Document and certifications issued by the accredited international testing laboratory to prove that the equipment is in compliance with recognised international standards shall be submitted;

9. The designated play/fitness areas and the play/fitness equipment shall each be designed to be also accessible to people with disabilities and in compliance with the Americans with Disabilities Act Accessibility Guidelines for Building and Facilities (ADAAG) or equivalent. Physical barriers shall be provided as far as practicable to separate equipment for different age groups in those areas;

10. Prior to installation, the Contractor shall provide evidence to the CM that the Approved design proposal has been vetted and certified to be in compliance with the international standards of safety in sub-clause (8) by a Playground Safety Inspector who shall possess qualification obtained from the Playright Children's Play Association or equivalent and shall be appointed by the Approved sub-contractor for the design, supply and installation of the play/fitness equipment. Such vetting and certification shall take into account all elements within the designated play/fitness area including furniture, lamp pole, bollard, boundary fence and planter wall etc. as shown on the Drawings. Re-submit design proposal for approval where amendments are necessary;

11. Bilingual signage in Chinese and English for all designated play/fitness areas to indicate the correct user groups and the correct ways to use the play/fitness equipment shall be provided as shown on the Drawings.

EXT10.M020.7  WARRANTY

The Contractor and the Approved sub-contractor for the design, supply and installation of the play/fitness equipment shall each warrant to the Employer in respect of the play/fitness equipment as detailed in Clause SCC7.6 of the Special Conditions of Contract. In particular, the structural integrity of the play/fitness equipment, and the timber parts and polyethylene components thereof shall be subjected to specific periods of warranty.
PLAY SURFACES - BALL COURT SURFACES

EXT10.M110.7 BALL COURT SURFACES
As scheduled on Drawings.

EXT10.M120.7 INTERNAL BALL COURT SURFACING
An Approved proprietary product.

EXT10.M130.7 EXTERNAL BALL COURT SURFACING
An Approved proprietary product.

EXT10.M140.7 MARKING PAINT FOR BALL COURT SURFACES
An Approved proprietary product.

ADHESIVE AND FIXINGS FOR BALL COURT SURFACING

EXT10.M210.7 ADHESIVES
1. As recommended by the ball court surfacing manufacturer;
2. Adhesives and adhesive primer shall be in compliance with the prescribed limits of VOC content as set out in the Air Pollution Control (Volatile Organic Compound) Regulation.

EXT10.M220.7 FIXINGS
As recommended by the ball court surfacing manufacturer.

PLAY SURFACES - IMPACT ABSORBING SURFACING MATERIALS (IASM)

EXT10.M310.7 GENERAL REQUIREMENTS
1. The extent of IASM is shown on the Drawing and shall include safety margin/use zone, underneath and surrounding of the play/fitness equipment;
2. In addition to compliance with other requirements stipulated in the Specification for IASM, IASM shall comply with the manufacturers' recommendations for safety, design and installation requirements of the play/fitness equipment under which the surfacing material is to be installed.

EXT10.M320.7 QUALITY REQUIREMENTS
1. The quality requirements of IASM are as follows:
   a. A proprietary prefabricated synthetic rubber or Ethylene-Propylene-Diene-Monomer (EPDM) product, details as specified by the manufacturer, to comply in all aspects with BS 7188:1998 and BS EN 1177:1998 and be tested by a recognized laboratory. The laboratory shall be accredited under the Hong Kong Laboratory Accreditation Scheme (HOKLAS) or by an accreditation body with mutual recognition arrangements with HOKLAS for performing the tests on IASM. The laboratory shall issue the test results on HOKLAS endorsed test certificates with written certification or equivalent. The full scope of accreditation shall be submitted for CM's approval and acceptance;
   b. Must suit and cater for the "critical fall height" (as defined in BS EN 1177:1998) of the play/fitness equipment on which it is placed. The "critical fall height" shall be greater than the "free height of fall" (as defined in BS EN 1177:1998) or the "fall height" (as defined by ASTM F 1487-00) of the play/fitness equipment.
2. When instructed by CM, collect sample (minimum 4 whole pieces for each thickness) from the Site prior to the installation of IASM for laboratory tests in accordance with BS EN 1177:1998 and BS 7188:1998 by a laboratory accredited under the Hong Kong Laboratory Accreditation Scheme (HOKLAS) or by an accreditation body with mutual recognition arrangements with HOKLAS for, but not limited to, the following performance of the IASM:
   a. Critical fall height;
   b. Resistance to indentation;
   c. Ease of ignition.
   The laboratory shall issue the test results on HOKLAS or by an accreditation body with mutual recognition arrangements with HOKLAS endorsed test certificates with written certification.

**EXT10.M330.7 DESIGN SUBMISSION**

1. Unless the CM instructs otherwise, submit to the CM at the time as specified in the Project Specific Specification at least 3 design proposals from different agents/suppliers for the IASM to be laid in the designated play/fitness area(s) for the CM's selection and approval. The agents/suppliers to be proposed by the Contractor for such purpose shall be directly appointed by the IASM manufacturer as his approved installation agent and have at least 5 years' proven experience with the same manufacturer in supplying and installing IASM in similar local projects in Hong Kong. Each design proposal shall:
   a. Include suitable IASM, fixing details and other builder's works requirements in compliance with the Drawings, the requirements stated in EXT10.M310, EXT10.M320 and this clause; and
   b. Provide information on the place of origin and date of manufacturing of EPDM product including manufacturer's instruction on correct installation, maintenance and inspection procedures of the selected proprietary product.
   Each design proposal shall also be accompanied with a quotation from the respective agents/suppliers. The Contractor shall be responsible for the identification of agents/suppliers, preparation of invitation documents and invitation of quotations. Sufficient time shall be allowed for agents/suppliers to prepare and return their quotations. The quotation closing date and time, and location of the quotation box of the Contractor for deposition of quotations shall be specified in the invitation of quotations. Make invitation to the CM at least 14 days before the quotation closing date for his arrangement of representation to witness the opening of quotations at the Contractor's office. Quotations received shall be opened promptly after the specified closing date and time. Opening of the quotations shall be witnessed by at least two representatives of the Contractor and two CMR;

2. Re-submit revised design proposals, quotations, drawings and relevant information where commented or considered necessary by the CM;

3. Upon notification in writing by the CM of his selected and approved design proposal (a copy of the Contractor's submitted quotation in respect of the Approved design proposal may be attached with the CM's notification for the sake of reference), engage the agent/supplier providing the IASM of the Approved design proposal as the Approved sub-contractor for the design, supply and installation of the Approved IASM provided that the actual cost of procuring each of the Approved IASM shall not exceed the amount shown on the quotation submitted to the CM for the Approved design proposal;
4. If, prior to entering into sub-contract with the agent/supplier providing the Approved IASM, it becomes apparent to the Contractor that the actual cost of any of the Approved IASM exceeds the amount shown on the quotation submitted to the CM for the Approved design proposal for whatever reasons, give immediate notice to the CM for further instruction. Any claim for additional costs due to higher actual costs than the quotation submitted to the CM for the Approved design proposal arising from or after entering into subcontract with the agent/supplier providing the Approved IASM shall not be considered. Submit certified true copy of the sub-contract(s) to substantiate the actual costs of the procurement of the Approved IASM;

5. In addition to sub-clause (1) above, the CM may at his own discretion before or after the Contractor's submissions in sub-clause (1), obtain design proposals and quotations directly from agents/suppliers of IASM and instruct the Contractor as appropriate;

6. The design, supply and installation of the Approved IASM shall comply with international standards of safety. Those international standards of safety are namely European Standard BS 7188:1998 and BS EN 1177:1998 or ASTM F1487-00 standard of the USA for all aspects including critical fall height etc. Document and certifications issued by the accredited international testing laboratory to prove that the IASM is in compliance with recognised international standards shall be submitted. Submit samples of IASM with test certificates to the CM for approval prior to ordering/purchasing.

EXT10.M340.7 DELIVERY
1. The IASM delivered to the Site shall be labelled in batch with place of origin and date of manufacturing etc. by the manufacturer and in good condition with intact packaging by the manufacturer. Any batch/lot/piece of the IASM that was manufactured earlier than a period of 12 months before delivery to the Site shall not be accepted or installed;

2. Submit written confirmation from the manufacturer of the place of origin (such that the delivered materials shall be provided by the manufacturer for submission, for its identification and specified performance,) and relevant documentary evidence such as Delivery Note and Laboratory Test Certificate with batch numbers.

EXT10.M350.7 WARRANTY
The Contractor and Approved sub-contractor for the design, supply and installation of the IASM shall each warrant to the Employer in respect of the IASM as detailed in Clause SCC7.6 of the Special Conditions of Contract.

EXT10.M360.7 APPLICATION OF OTHER SECTIONS
Where applicable, comply with the relevant provisions of the following Worksections unless otherwise specified in this Worksection:
1. Earthworks: Worksection EAR1;
2. Sub-bases and bituminous materials: Worksection EXT1;
3. Concrete pavings (including formwork, reinforcement, concreting, jointing and finishing): Worksection EXT2.
WORKMANSHIP

GENERAL

EXT10.W010.7 HANDLING AND STORAGE
Handle and store equipment and surfacing materials carefully and in a manner that:
1. Prevents damage to pre-finished surfaces;
2. Retains protective coverings in position for as long as possible;
3. Prevents contact with harmful elements.

EXT10.W020.7 BUILDER'S WORK IN CONNECTION
As specified in Project Specific Specification.

EXT10.W030.7 FIXING, ASSEMBLING AND LAYING
Carry out any fixing, assembling or laying in accordance with the manufacturer's instructions.

INSTALLATION OF PLAY/FITNESS EQUIPMENT

EXT10.W110.7 GENERAL
1. Install play/fitness equipment in accordance with manufacturer's instructions, which should comply with BS EN 1176:Part 7:1998 or ASTM F1487;
2. All materials and workmanship shall be of the respective character, quality or kind required by this Contract and shall be subjected to such examinations, measurements or tests as required by this Contract or as ordered by CM. The measurements and tests are to be carried out by the Contractor;
3. The Contractor shall submit to the CM upon the arrival of the play/fitness equipment and signage on Site, the original or certified true copy of manufacturers' certificates and invoices for verification of the origin of the play/fitness equipment and signage delivered to the Site against the Approved design proposal as stated in EXT10.M015.

EXT10.W120.7 INSTALLATION
1. Ensure play/fitness equipment is placed and fixed in the position and in accordance with safety margin/use zone requirement whether shown on the Drawings or to manufacturer's recommendation;
2. Before installing any play/fitness equipment, check and ensure that all permanent draw pits, catch pits, manhole covers and surface channels shall be located outside the safety margin/use zone of the designated play/fitness area as shown on the Drawings and/or Approved design proposal as stated in EXT10.M015. If any permanent draw pits, catch pits, manhole covers or surface channels are found within the safety margin/use zone of the play area, revise the Approved design proposal as necessary to avoid them and re-submit to the CM for approval. Allow sufficient time for any associated checking, re-submission and CM's approval;
3. Upon completion of the installation of play/fitness equipment, the Contractor shall provide evidence to the CM that all the installed play/fitness equipment on the Site have been inspected and certified to be in compliance with the international standards of safety and the Approved design proposal as stated in EXT10.M015 by a Playground Safety Inspector who shall possess qualification obtained from the Playright Children's Play Association or equivalent.
**EXISTING PLAY/FITNESS EQUIPMENT**

Dismantle and set aside in a secure enclosure. Re-assemble once the playground surface has been completed.

**LAYING OF BALL COURT SURFACES**

**GENERAL**

Lay the ball court surfaces in accordance with manufacturer's instructions.

**INSPECTION PRIOR TO LAYING SURFACING MATERIALS**

1. Inspect existing surface to ascertain suitability to receive the surfacing materials. Ensure the existing surface is clean, free from defects, projections and deleterious material that would affect the laying of the surfacing materials;
2. Carry out all works necessary to ensure correct installation of the surfacing materials;
3. Where applicable, obtain manufacturer's/specialist sub-contractor's agreement to suitability of the bed prior to laying the surfacing materials.

**SURFACES PREPARATION**

1. Sweep, clean and prepare base removing all dirt, grease and loose or other extraneous matter;
2. Cut out and fill, using material compatible with the base, all cracks, hollows or other imperfections;
3. Ensure that the base is dry prior to surfacing materials being laid.

**DRAINAGE**

Lay base to falls and levels as shown on the Drawings.

**LAYING**

1. Recess all fixing bolts and eyelets below the surfacing materials;
2. Ensure no gaps are left between the surfacing materials and the adjoining hard surface;
3. Cut and fit the surfacing materials to form a close and neat joint around edge and all upstands;
4. Ensure the finished surfacing is even and free from irregularities or projections.

**GROUND CLEARANCE**

Maintain sufficient ground clearance under all equipment. Adjust height of equipment or level of base if necessary.

**ADHESIVES**

Ensure all adhesive and jointing materials used are compatible with the ball court surface and the base material.

**LINE MARKING FOR BALL COURT SURFACES**

Employ a specialist recommended by the marking paint supplier to apply line marking in accordance with the paint manufacturer's instructions.
INSTALLATION OF IMPACT ABSORBING SURFACING MATERIALS (IASM)

EXT10.W310.7 GENERAL INSTALLATION REQUIREMENTS
Install the IASM in strict compliance with manufacturer's instructions and specification.

EXT10.W320.7 SAMPLES AND DATA
1. Submit samples of the IASM, adhesives and fixings for CM's approval before installation;
2. Before the installation works, submit material safety data for the adhesive in connection with the installation/laying of the IASM accompanied with the manufacturer's requirements and recommendation on safety precautionary measures.

EXT10.W330.7 SURFACING MATERIAL AND ITS FOUNDATION
1. Lay the IASM in accordance with manufacturer's instructions and ensure all adhesive and jointing materials used are compatible with the IASM and the base material;
2. Prepare the base and foundation properly to receive the IASM in accordance with the manufacturer's requirements;
3. The surfacing material shall fit the designated play/fitness area as shown on the Drawings with no gap and level difference between adjoining IASM units and between the peripheral IASM units and its surrounding surface, and shall also fit closely around all play/fitness equipment (and its posts/fittings).

EXT10.W340.7 DRAINAGE
Install subsurface drainage under the IASM as specified in Project Specific Specification and in accordance with the Drawings.
TESTING

ON-SITE VERIFICATION TEST

EXT10.T010.7  IN-SITU DROP TEST

1. Upon completion of installation of the IASM, carry out the in-situ drop test on critical fall height in accordance with the latest version of BS EN 1177 at random sampling of not more than 5% by area, to be agreed by the CM, for each thickness category of IASM installed, inclusive of all ingress/egress, landing zone of the play/fitness equipment and submit to CM the in-situ drop test results on HOKLAS endorsed test certificates with written certification;

2. Exact locations for carrying out the in-situ test shall be verified by the CM;

3. Re-conduct the in-situ drop test(s) on the IASM again should the in-situ drop test fail, and be responsible for all the costs incurred for the retesting so required.
EXT11 EXISTING VEGETATION TREATMENT

MATERIALS

GENERAL

**EXT11.M010.7 ANTI-DESICCANT SPRAY**
Anti-desiccant spray to be approved proprietary water dispersed plastic spray type.

**EXT11.M020.7 HESSIAN BINDING**
Hessian binding to be natural woven jute, natural brown colour, 150 to 200 mm wide in a continuous roll.

**EXT11.M030.7 JUTE STRING**
Jute string to be braided jute fibres, total 3 mm diameter, natural brown colour.
WORKMANSHIP

GENERAL

SCOPE OF EXISTING VEGETATION TREATMENT
The extent of works required, conditions of site, tree felling, vegetation treatment, weed and creeper removal etc. and any individual plants requiring treatment and/or transplanting are detailed and shown on Drawings, or as Instructed by CM.

PRE-TENDER INSPECTION
Prior to tendering inspect the site to confirm the extent of the works and that maintenance works specified can properly be carried out.

TOOLS AND EQUIPMENT
Ensure tools and equipment used are sharp and appropriate for the works specified.

EROSION
Carry out all operations taking precautions to prevent erosion and slippage of slopes.

PRESERVATION OF EXISTING TREES AND SHRUBS

PROTECTION OF EXISTING VEGETATIONS
1. Protect all existing trees, palms, bamboos and other vegetations as shown on Drawings, unless specified or instructed to be pruned or felled by CM;
2. Protect the branch structure, crown and root zone of all existing trees, palms and bamboos to be retained and any overhanging vegetation, unless specified or Instructed to be pruned;
3. Erect necessary structural support constructed with GMS hollow sections or I-beams as directed by CM when working around existing trees to ensure their structural stability and proper growth throughout the construction period.

PROTECTION FOR PRESERVED TREES
Exercise the greatest care to avoid any damage to the preserved trees by complying with the following:
1. Take all necessary precautions to ensure that:
   a. No nails or other fixings shall be driven into the trees, including the exposed tree roots;
   b. No fencing, services, or signs other than the identification labels or markings required under sub-clause (5) of PRE.B8.1116 shall be attached to any part of the trees;
   c. No trees shall be used as anchorages for ropes or chains used in guying or pulling or for equipment used for removing stumps, roots or other trees, or for any other purposes;
   d. No soil, materials, equipment or machinery shall be stockpiled or stored within the tree protection zones;
   e. No site offices, workshops, canteens, containers or similar structures shall be installed within the tree protection zones;
   f. Petrol, oil, bitumen, creosote, cement and other materials likely to be injurious to the trees shall be kept away from the tree protection zones, and any accidental spills of these materials shall be cleaned up immediately;
g. Excessive water shall be drained away from the tree protection zones to prevent damage to tree roots by asphyxiation;

h. The surface on slopes shall be shaped so that water will not drain to the tree trunks but bypass them;

i. No passage or parking of vehicles and no operation of equipment or machinery shall take place within the tree protection zones unless otherwise agreed by the CM;

j. No stripping of surface vegetation or top layer of soil, and no paving or earth filling shall be carried out within the tree protection zones unless otherwise agreed by the CM;

k. No fires shall be lit within the tree protection zones or in a position where the flames will likely extend to within 5 m of foliage, branches or trunks of the trees, taking into consideration the size of the fire and the wind direction;

l. No concrete mixing, gas tank filling, paintbrush and tool cleaning, or equipment maintenance shall be carried out within the tree protection zones;

m. Any necessary scarification or cultivation within the tree protection zones shall be carried out carefully by hand so as not to cause damage to the trees, in particular the bark and the roots;

n. Any equipment, in particular delivery vehicles, overhead cranes, excavation machines, drilling rigs and piling rigs, shall be carefully operated so as not to cause striking of the trunks, branches, foliage or root collars of the trees;

o. The trees to be felled that are adjacent to, or that lie within a continuous canopy of, the preserved trees, shall be carefully removed, and if necessary in sections but not using bulldozers in any circumstances, so as not to cause damage to the preserved trees such as scraping bark off trunks or breaking branches of trees;

p. Do not use herbicides that can leach through the soil, such as the products containing sodium chlorate, and any other herbicides that are injurious to the trees when it is necessary to use herbicides to kill any vegetation;

q. Make allowance for the slope of the ground so that damaging materials such as concrete washings, mortar or diesel oil cannot run towards the trees;

r. Do not use alkaline clays or limestones for filling or paving. Mix concrete on a thick plastic tarpaulin or outside the Site and rinse the mixing trucks out on the Site, so as not to cause changes, in particular increases, in soil pH;

s. Haul away all building debris and chemical wastes for proper disposal. In any circumstances, do not burn or bury them on the Site and do not dispose them by pouring them on the soil within the Site.

2. Repair any damage to the trees in accordance with the requirements stipulated in EXT11.W712;

3. Where the passage or parking of vehicles or the operation of equipment or machinery within the tree protection zones as referred to in sub-clause (1)(i) above is considered necessary and is agreed by the CM, carry out the following measures to reduce soil compaction:

a. Minimise the traffic of the vehicles, equipment or machinery;

b. Confine the passage or parking of vehicles or operation of equipment or machinery to the areas laid with temporary protective mulching and also with double, overlapping, thick metal sheet coverings, or other materials of equivalent strength as agreed by the CM, placed on top.

4. Where it is necessary to clear the existing undergrowth within the tree protection zones to allow access and visibility for, and operation of any construction work, comply with the following:

a. Prune shrubs and grass or cut other herbaceous plants to a height of not less than 50 mm above the ground level that they shall not be pulled out by equipment in any circumstances;

b. Obtain CM's agreement prior to commencing the vegetation clearance.

5. Protect the preserved trees, where necessary, from increased exposure to sun and wind due to removal of adjacent trees;
6. Align all routes of the overhead services within the Site and all access routes to the Site or within the Site away from the preserved trees as far as possible and seek the CM's approval to the alignment;

7. Report to the CM of any preserved tree having structural defects or unhealthy or decaying symptoms which may pose danger to the public if the tree falls.

**EXT11.W060.7** PHOTOGRAPHIC RECORD OF EXISTING TREES

1. Provide a full set of photographs of each individually numbered tree as shown on Drawings or as Instructed at the commencement of the Works for the CM's agreement on the existing conditions of the trees. Comply with the following requirements for the photographs:
   a. All photographs shall be date-stamped to indicate the dates that the photographs are taken and shall be well-annotated; and
   b. The photograph of each tree shall show clearly the whole tree as far as possible, the identification number of the tree, and the status of the tree as identified by the labelling or marking system on the Site.

2. Update the photographic record of the non-OVT taken in accordance with sub-clause (5)(e)(iv) of **PRE.B8.1116** and submit a report on the updated photographic record to the CM at every three months intervals. Comply with the following requirements for the photographic record:
   a. Each of the reports shall comprise all preserved non-OVT;
   b. Each of the reports shall be in the form of an A4-sized, bound document which shall bear a report cover indicating the Contract number, Contract title, and date of the report;
   c. The format of the reports shall be agreed by the CM prior to the submission of the first report;
   d. All photographs shall be date-stamped to indicate the dates that the photographs are taken and shall be well-annotated;
   e. The photograph of each tree shall show clearly the whole tree as far as possible, the identification number of the tree, and the status of the tree as identified by the labelling or marking system on the Site as required in sub-clause (5) of **PRE.B8.1116**;
   f. Each of the reports shall include details of any damage caused to the trees and any signs of health deterioration of the trees in the reporting period, accompanied with photographic record of the damage and the tree deterioration.

**EXT11.W062.7** RECORD OF OLD AND VALUABLE TREE

1. Engage the Independent Tree Specialist (ITS) to prepare and submit the monitoring reports on the OVT in accordance with the following requirements:
   a. The timetable for submission of reports shall be as follows:

<table>
<thead>
<tr>
<th>Period</th>
<th>Frequency of submission of monitoring reports</th>
<th>Time frames for submission of monitoring reports</th>
</tr>
</thead>
<tbody>
<tr>
<td>From the date of commencement of the employment of the ITS to the day immediately before the day of commencement of the Aftercare to the Old and Valuable Tree.</td>
<td>At monthly intervals</td>
<td>Within the first week of each month</td>
</tr>
<tr>
<td>The period for the Aftercare to the Old and Valuable Tree stated in the Contract</td>
<td>At bimonthly (every two months) intervals</td>
<td>Within the first week of every two months</td>
</tr>
</tbody>
</table>
b. The reports shall be in the form of an A4-sized, bound document which shall bear a report cover indicating the Contract number, Contract title, and date of the report and shall be signed by the ITS;

c. The format of the reports shall be agreed by the CM prior to the submission of the first report.

2. Submit method statements for the work, the site activities, and the precautionary or mitigation measures in respect of the OVT, as described in the following items:

a. Work planned to be carried out to each of the OVT in the next reporting period, including but not limited to the recommended arboricultural work as part of tree maintenance, repair to damage or health deterioration, or precautionary or mitigation measures against damage by site activities;

b. Other site activities planned to be carried out within the tree protection zone of each of the OVT in the next reporting period, including but not limited to the tree preservation and protection work stipulated in PRE.B8 and EXT11;

c. Potential damage to the OVT by the site activities planned to be carried in the next reporting period and proposed precautionary or mitigation measures; and

d. Any other details relevant and specific to the purpose of the reports.

3. Obtain CM's approval prior to the commencement of such works/activities, and ensure that the ITS shall carry out the following:

a. Provide arboricultural advice in the preparation of the method statements referred to in sub-clause (2) above and the preparation of any reports on repair of damage of the OVT;

b. Supervise arboricultural work to the OVT;

c. Provide on-site advice in relation to site control within the tree protection zones of the OVT and at their adjacent areas.

EXT11.W075.7 WATERING EXISTING VEGETATION

Water existing vegetation with non-toxic water to keep it in a healthy condition; during the dry season, water at least three time per week at the rate of 10 litres per sq. m.

EXT11.W085.7 PRUNING OF EXISTING TREES

1. Do not carry out pruning to the preserved trees without the prior approval of the CM unless the pruning work is required under the Contract or is directed by the CM. Notify the CM of any preserved trees whose branches interfere with the Works and thus require pruning. Carry out the approved pruning work during the site clearance stage unless otherwise instructed or agreed by the CM;

2. Comply with the following when carrying out the pruning work:

a. Provide all necessary tools and equipment, and physical support, and take all necessary safety precautions to protect the people engaged in the pruning work as well as the people and property in the vicinity;

b. For all pruning work to the OVT, the extent of pruning shall be agreed between the ITS and the CM on the Site prior to the commencement of the pruning work and the pruning work shall only be carried out under the supervision of the ITS;

c. Carry out all pruning work in accordance with good horticultural practice and the recommendations of BS 3998;

d. Do the pruning and removal of branches by using sharp, clean implements to give a single flat, sloping face;

e. Trim ragged, rough edges of bark or wood cleanly from around wounds with a sharp knife to the minimum extent that is necessary so as to hasten wound closure, and cut twigs less than 15 mm diameter with sharp secateurs;
f. Carry out pruning with the cut just above and sloping away from an outward-facing healthy bud, and carry out the removal of branch by having the final cut of the last branch segment made just outside the branch collar when it is present or at an angle being the mirror image of the branch bark ridge when there is no branch collar, so that no part of the stem is damaged or torn, and no snags or stumps are left;

g. Remove large branches in stages beginning with the removal of the main weight of the branch from perimeter of crown in towards the trunk and with the final cut of the last branch segment made in a way as described in sub-clause (2)(f) above, without leaving a stub and damaging the bark;

h. Make all cuts to avoid splintering or tearing of bark that would catch water and encourage rot, and cut back cracks, cavities or rotten wood with a clean, sharp implement to remove the dead, damaged and decayed tissue without damaging the living tissue;

i. Do not carry out topping, which is cutting off all of the top branches to the same height, in any circumstances;

j. Unless otherwise instructed by the CM, leave any cuts or wounds uncovered instead of painting them with wound dressing or coating so as to avoid water retention and disease development;

k. Remove any material pruned from the trees away from the Site as soon as possible; and

l. Reinstate any adjacent areas affected by the pruning work.

**CONTROL OF PEST AND DISEASE FOR EXISTING TREES**

1. Take all necessary precautionary measures to protect the preserved trees from pest and disease attack, and all necessary control measures to eradicate pest and disease from the infected trees in the execution of the Works;

2. Before commencing the application of the pest and disease control measures, submit the method statements for the control measures to the CM for approval:
   a. The method statements for the pest and disease control measures shall cover, amongst other aspects as required by the CM, the pesticide or fungicide to be used and any other necessary associated arboricultural work to the infected areas.

3. Commence the application of the control measures only after obtaining the CM's approval to the method statements;

4. Comply with the following requirements in applying the pest and disease control measures:
   a. Adopt environmental friendly measures; and
   b. Follow strictly the safety precautions as the manufacturer's instruction in using pesticide or fungicide so as to avoid causing danger or harm to the public and the environment.

**SITE CLEARANCE**

**GENERAL**

1. Clear all existing vegetated areas of all rubbish, waste materials and felled timber, including any generated from the works specified herein;

2. Clear all debris, rubbish, silt etc. from drainage channels, catchpits and grilles thereon;

3. Clear each part of the site at times and to the extent required by this Specification and as Instructed;

4. Remove cleared materials from site to a properly designated tip.

**UNDERGROWTH CUTTING**

Carry out a complete undergrowth cut and clear scrub and bushes by hand or by Approved mechanical means.
EXISTING VEGETATION TREATMENT

CREEPER CLEARANCE
Clear all wild creepers entwining existing trees and shrubs and grub up their entire root systems.

REMOVAL OF EXISTING TREES

GENERAL
Fell diseased and dead trees as shown on the Drawings or as Instructed.

TREE REMOVAL
Completely remove the tree including the stump to the extent of the depth of the root system below ground, by hand, machine hacking or grubbing out.

LARGE TREES IN CONFINED SPACES
Carefully take down in sections any large trees in confined spaces or near other trees which are to be retained.

PROTECTION MEASURES FOR TREES TO BE FELLED/TRANSPLANTED
The limits of site clearance shall be agreed by the CM on the Site before site clearance commences. Comply with the following requirements in respect of tree removal, either by felling or by transplanting:

1. In respect of tree felling, comply with the following:
   a. Fell only those trees earmarked for such under the Contract and labelled for such on the Site pursuant to sub-clause (5) of PRE.B8.1116 or those as directed or approved by the CM;
   b. Take all necessary precautions to protect the people engaged in the tree felling work as well as the people and property in the vicinity;
   c. Fell the trees by cutting them near the ground, with their stumps ground rather than pulled so that the roots of the nearby plants to be retained are not injured;
   d. Remove the stumps and rootballs of the felled trees carefully to avoid causing damage to the roots of the nearby plants to be retained, where it is necessary to have such removal as directed by the CM;
   e. Remove all debris, wood, and roots where necessary pursuant to sub-clause (1)(d) above, from the trees felled from the Site as soon as possible.

2. In respect of tree transplanting either within or off the Site, comply with the following:
   a. Transplant only those trees earmarked for such under the Contract and labelled for such on the Site pursuant to sub-clause (5) of PRE.B8.1116 or those as directed or approved by the CM;
   b. Commence any work related to tree transplanting on the Site only after having complied with the requirements stipulated to be completed prior to commencing the tree transplanting work.

3. Where it is found necessary for the completion of the Works to remove, either by felling or by transplanting, any trees other than those earmarked for such under the Contract or those directed or approved for such during the progress of the Works by the CM, carry out the following:
   a. Report to the CM the necessity of such tree removal;
   b. Provide all reasonable assistance as required by the CM in the tree survey and the justification for the proposed tree removal with substantiation and the necessary details such as method statement, site formation plan and architectural or engineering drawings, for the CM’s preparation of the tree felling or transplanting application for the tree removal.
TRANSPLANTING EXISTING TREES AND PALMS

**EXT11.W310.7 GENERAL**
1. Carry out tree transplantation in accordance with true horticultural practice and use specialist equipment as required;
2. Wrap trunk and large lower branches with hessian binding, as **EXT11.M020**, and tie with jute string, as **EXT11.M030**, at least one day prior to rootball preparation;
3. Sever lateral roots in stages over a period of at least 8 weeks prior to transplantation when Instructed;
4. Treat all trees transplanted as new planting with respect to planting methods and defects liability except that any replacements as **SLW9.W130** will be limited to the normal maximum size commercially available for that plant species;
5. Protect trees during transportation as **SLW1.W210** (1).

**EXT11.W320.7 IMMEDIATE TRANSPLANTATION**
Transplant existing semi-mature trees, within two hours of uplifting, either:
1. To their final positions; or
2. To Contractor's temporary store as Instructed.

**EXT11.W330.7 ROOTBALLS**
Keep rootballs intact with the soil to the minimum sizes as shown on the Drawings and wrapped in hessian.

**EXT11.W340.7 WATERING**
1. Fill tree pit with water and allow to drain before planting;
2. Keep the whole tree, including rootball and heissan binding, moist at all times;
3. Water the transplanted trees (thoroughly soaked into the rootball soil) everyday during the first three months after transplant to keep them in healthy condition, irrespective of temperature, except in periods of heavy rainfall as determined by the CM.;
4. Afterwards, water to field capacity the area covered by the spread of transplanted trees three times per week or as Instructed by the CM.

**EXT11.W350.7 CROWN THINNING**
Carry out limited crown thinning prior to rootball preparation, to those trees scheduled and/or shown on the Drawings, as Worksection **SLWS8**. Retain form and shape of tree.

**EXT11.W360.7 ANTI-DESICCANT SPRAY APPLICATION**
Prior to rootball preparation spray trees thoroughly when required, covering whole of leaves, branches and trunks:
Apply spray in accordance with manufacturer's instructions.

TRANSPLANTING EXISTING SHRUBS AND BAMBOOS

**EXT11.W410.7 GENERAL**
Treat all shrubs transplanted as new planting with respect to planting methods and defects liability except that any replacements, as **SLW9.W130**, will be limited to the normal maximum size commercially available for that plant species.

**EXT11.W420.7 TRANSPLANTATION**
Transplant existing shrubs and bamboos within two hours of uplifting either:
1. To their final positions as shown on Drawing or as Instructed; or
2. To Contractor's temporary store as Instructed.

**ROOTBALLS**

Keep rootballs intact with the soil to a minimum size of 750 mm diameter and 450 mm depth and wrapped with hessian. Transplant in a suitable size basket and keep moist at all times.

**EXISTING SHRUBS**

**PRUNING**

Prune existing shrubs as SLW9.W430 unless otherwise Instructed.

**EXISTING GRASSED AREAS**

**REINSTATEMENT**

Reinstate existing grassed areas including levelling, grass seeding and post planting operations as Worksection SLW7.

**CUTTING**

Cut grass, on existing grassed areas, to 25 mm sward and make subsequent cuts as SLW9.W410.

**TREATMENT/REPLACEMENT OF DAMAGED TREES AND SHRUBS**

**RESPONSIBILITY**

Accept responsibility and costs of treatment or replacement of existing trees/shrubs arising from the execution of the works whether on or surrounding the site.

**REPAIR OF DAMAGE TO EXISTING TREES AND OTHER AFFECTED PLANTS**

1. Carry out all necessary work of repair of any damage to the preserved trees and any other damaged plants within the Site together with the necessary mitigation landscape works to reinstate the affected land. Bear all costs for all necessary work of repair of damage and reinstatement works if the necessity for such work is, in the opinion of the CM, due to neglect or failure on the part of the Contractor to comply with any obligation expressed or implied on the Contractor's part under the Contract;

2. The work of repair of damage as referred to in sub-clause (1) above shall include the following:
   a. All necessary arboricultural work to the preserved trees and any other damaged plants, which may include:
      i. Tree surgery work to remove dead, damaged, diseased or hazardous parts, to repair wounds, or to provide cables or braces for additional support;
      ii. Watering and/or mulching in case of water deficiency;
      iii. Applying appropriate fertilizers in case of nutrient deficiency;
      iv. Applying appropriate pest and disease control measures in case of pest and disease attack.
   b. The replacement planting pursuant to sub-clause (7) below for the trees and any other plants damaged to an extent as described in sub-clause (6) below and the subsequent Establishment Works for the new plants for 2 years, when instructed by the CM; and
c. Any other reinstatement work necessary to bring the damaged plants to their original condition prior to the occurrence of the damage, as directed by the CM.

3. Notify the CM of any damage to the preserved trees and other affected plants within the same day of the occurrence of damage and submit to the CM within 24 hours of the occurrence of damage, a report comprising the following information in a format agreed by CM:
   a. The timing of the damage;
   b. The nature and extent of the damage;
   c. Photographic records of the damage;
   d. The proposed work of repair of the damage; and
   e. The proposed protection measures to avoid recurrence of similar incident.

4. When directed by the CM, firm up and secure all dislodged trees and any other dislodged plants and treat all wounds of the damaged plants within 3 days of the occurrence of the damage;

5. Save as stated in sub-clause (4) above, do not carry out any work of repair of the damage prior to the CM's acceptance of the report as required in sub-clause (3) above;

6. Provide replacement planting of the damaged trees and any other affected plants under the following circumstances:
   a. In the opinion of the ITS in the case of an OVT or CM in the case of a non-OVT, the damaged plants are dead;
   b. In the opinion of the ITS in the case of an OVT or the CM in the case of a non-OVT, the trees or other affected plants have been substantially damaged and have become moribund, resulting in one or more of the following conditions:
      i. Imminent plant death within the coming growing season is predicted;
      ii. The structural integrity of the damaged trees or other affected plants is permanently compromised and consequently the trees or other affected plants become an irreparable public hazard;
      iii. Any major parts of the damaged trees or other affected plants have been lost and consequently their form, habit and balance have been grossly altered so that their function cannot be reasonably recovered or the trees or other affected plants are causing harm to other preserved trees.

7. When instructed by the CM, carry out the following:
   a. Carry out the replacement planting of new plants to compensate for the damaged plants including any damaged OVT in accordance with the following requirements:
      i. Complete the replacement planting within 28 days from the CM's instruction or other time duration as agreed by the CM;
ii. For the replacement planting for the damaged plants including any damaged OVT, plant new plants of the same species and of similar size and form as the damaged plants prior to the damage, or provide other alternative replacement planting together with the necessary mitigation landscape works to reinstate the affected land as agreed by the CM.

EXT11.W714.7 AFTERCARE TO OLD AND VALUABLE TREE
1. Provide the Aftercare to the Old and Valuable Tree for the period as stated in the Contract;
2. Perform the following during the period for the Aftercare to the Old and Valuable Tree referred to in sub-clause (1) above:
   a. Ensure that the ITS shall prepare and submit monitoring reports on the OVT comprising the details and within the time frames as stipulated in EXT11.W062; the requirements of the report format shall be in accordance with sub-clause (6) of PRE.B8.1116;
   b. Ensure that the ITS shall conduct a final survey of the OVT and a final site survey and final soil tests of its tree protection zone, and submit a report on the same comprising the details and within the time frames as stipulated in EXT11.W062; the requirements of the report format shall be in accordance with sub-clause (6) of PRE.B8.1116; and
   c. Carry out any tree maintenance work, work of repair to damage or health deterioration, or precautionary or mitigation measures against damage, to the OVT as recommended by the ITS in the monitoring reports referred to in sub-clause (2)(a) above, or in the report on final tree survey/ final site survey/final soil tests referred to in sub-clause (2)(b) above, or in any other written advice given by the ITS during the period for the Aftercare to the Old and Valuable Tree.

EXT11.W716.7 ESTABLISHMENT OPERATIONS DURING AFTERCARE PERIOD
During the Aftercare Period, carry out the operations as scheduled below applicable to the Old and Valuable Tree, and in accordance with this Specification:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Anticipated No.</th>
<th>Timing</th>
</tr>
</thead>
<tbody>
<tr>
<td>Watering</td>
<td>180</td>
<td>Min. twice per week during dry seasons, or as Instructed.</td>
</tr>
<tr>
<td>Fertilizing</td>
<td>2</td>
<td>Once per year as Instructed.</td>
</tr>
<tr>
<td>Soil aeration</td>
<td>2</td>
<td>Immediately after fertilizer application.</td>
</tr>
<tr>
<td>Checking and adjusting tree ties</td>
<td>12</td>
<td>Check every two months; adjust/replace as necessary.</td>
</tr>
<tr>
<td>Pruning</td>
<td>Min 2</td>
<td>As Instructed.</td>
</tr>
<tr>
<td>Pesticide</td>
<td>As required</td>
<td>Check monthly; treat immediately.</td>
</tr>
<tr>
<td>Fungicide</td>
<td>As required</td>
<td>Check monthly; treat immediately.</td>
</tr>
<tr>
<td>Typhoon damage; assessment and repair</td>
<td>As required</td>
<td>As specified.</td>
</tr>
</tbody>
</table>

EXT11.W720.7 CIRCUMSTANCES FOR TREE/SHRUB REPLACEMENT
Provide replacement trees for those existing trees/shrubs which were to be retained in the following circumstances:
1. Death of the existing tree/shrub;
2. Substantial damage resulting in a condition that tree/shrub-death is confidently predicted within one year or that the tree/shrub’s structural integrity is permanently compromised and consequently is a public hazard;
3. Substantial damage resulting in a condition that the form, habit and balance of the tree/shrub has been grossly spoiled.

EXT11.W730.7 REPLACEMENT TREES/SHRUBS

Replacement trees/shrubs as near as is technically possible to the stature and species as that existing at Contract commencement will be specified.
**EXT12 EARTHWORKS**

**MATERIALS**

**EXISTING SOILS**

**EXT12.M010.7 GENERAL**
1. Prior to tender, inspect the existing subsoil and topsoil to ensure that it is acceptable for the work specified herein;
2. No claims shall subsequently be considered in respect of existing soils which would relieve the Contractor of his responsibilities under Worksection SLW9 of this Specification.

**EXT12.M020.7 EXISTING SUBSOIL**
Existing subsoil consists mainly of granular DG, generally derived from original deposits.

**EXT12.M030.7 DG AS PLANTING MEDIUM**
Soil as EXT12.M02 for planting and grassing has in certain areas been roughly spread by others, and forms the basic constituent of fabricated soil, when mixed with other materials, for planting areas at existing ground levels, and areas already made up.

**IMPORTED SOILS**

**EXT12.M110.7 SUBSOIL**
Subsoil to be evenly textured, good clean granular DG containing no stones larger than 100 mm in any dimension, nor any deleterious matter.

**EXT12.M120.7 DG AS PLANTING MEDIUM**
DG as planting medium to be evenly textured, granular soil free from weeds, deleterious matter, and stones larger than 50 mm in any dimension.

**SOIL CONDITIONERS**

**EXT12.M210.7 MANUFACTURED SOIL CONDITIONER**
Manufactured soil conditioner to be properly composted organic material with the following characteristics:
1. Fine, free flowing consistency;
2. Stable composition;
3. Not capable of raising the temperature of the treated soil more than 5°C above the temperature of the untreated soil;
4. Not made with materials that are known to contain pathogens or other toxic materials injurious to plants, humans, or animals;
5. Giving off neither toxic nor obnoxious fumes;
6. With a pH value between 6.5 and 7.75;
7. With a moisture content of less than 80% (moisture weight as a proportion of overall weight);
8. With an organic matter content of not less than 85% (dry matter);
9. With a carbon to nitrogen ratio between 20 and 55.
EXT12.M220.7 CERTIFICATION
Prior to first use and for every 300 m³ of the soil conditioner as EXT12.M210 delivered to Site, produce within 14 calendar days of taking the samples, Certificates of Analysis, from an Approved laboratory stating:
1. pH (H₂O) value;
2. Moisture content (calculated as the loss in weight between the dry weight and the overall weight as a percentage of the overall weight);
3. Organic matter content (dry weight);
4. Organic carbon content (using loss of ignition `Ashing' method of testing);
5. Nitrogen content (`Kjeldahl' Method);

EXT12.M230.7 SAND
Sand to be clean, sharp graded agricultural sand 4 mm down to dust.

EXT12.M240.7 COMPOST
Compost as shown on Drawings, to be:
1. Manufactured soil conditioner: as EXT12.M210, with a Certificate of Analysis as EXT12.M220; and/or

EXT12.M245.7 ANIMAL MANURE
Animal manure as shown on Drawings, to be:
1. Well rotted, fully mature and without smell;

EXT12.M250.7 SYNTHETIC SOIL CONDITIONER
Synthetic soil conditioner to be free flowing synthetic acrylamide polymer crystals, 2-4 mm in diameter when dry:
1. Capable of absorbing water and nutrients in gel form swelling to 30-40 times original dry weight;
2. Having a minimum effective life of 15 years when used in the soil.

EXT12.M260.7 COCO PEAT
Coco peat to be finely textured fibrous material derived from the husk of the coconut.

EXT12.M270.7 SOIL BINDER
Soil binder to be an Approved proprietary type and consisted of a binding medium applied in aqueous suspension by spraying onto the surface of the soil to stabilise and condition the soil. The binding agent shall not be injurious to plant growth.

FABRICATED SOILS

EXT12.M310.7 GENERAL MIX
Fabricated soils as shown on Drawings, to be:
1. Comprise a mixture of:
   a. 3 parts DG, as EXT12.M030; or EXT12.M120; and
   b. 1 part manufactured soil conditioner, as EXT12.M210; or
   c. 1 part animal manure, as EXT12.M245.
2. Comprise a soil which sustains healthy plant growth in a variety of landscape situations free from pernicious weeds, roots, clay lumps, non soil material and chemical contamination, and possessing the following characteristics:
   a. Major nutrients:
i. pH value between 5.5 and 6.5;
ii. Organic matter more than 4%;
iii. Nitrogen content more than 0.2%;
iv. Extractable phosphorus content more than 45 mg/kg;
v. Extractable potassium content more than 240 mg/kg;
vi. Extractable magnesium content more than 80 mg/kg.

b. Stone content:
   i. Maximum size in any direction: 50 mm;
   ii. Maximum content of 2 mm – 50 mm stones: 35% of dry weight of topsoil volume of which stone sizes 2 mm to 5 mm must not exceed 20% of overall stone content dry weight.

c. Soil texture content:
   i. Sand (0.05 - 2.0 mm): maximum 75%, minimum 20%;
   ii. Silt (0.002 - 0.05 mm): maximum 60%, minimum 5%;
   iii. Clay (less than 0.002 mm): maximum 25%, minimum 5%.

**EXT12.M320.7 LIGHTWEIGHT MIX**
Lightweight soil to comprise a mixture of:
1. 2 parts DG, as EXT12.M120;
2. 1 part manufactured soil conditioner, as EXT12.M210;
3. 1 part vermiculite or volcanic pellets, with a particle size of 5-10 mm.

**EXT12.M330.7 SOIL FILLING MIX FOR USE IN GRASS PAVING SYSTEM**
Soil filling mix as shown on Drawings, for use in reinforced grass surfaces which are to receive either grass seed as SLW7.M270 or turves as SLW7.M110, to comprise of:
1. 4 parts DG, as EXT12.M030 or EXT12.M120;
2. 1 part manufactured soil conditioner, as EXT12.M210;
3. 2 parts sand as EXT12.M230;
4. Quick release fertilizer as SLW1.M130 at a rate of 300 g/m³.

**BOULDERS AND ROCKS**

**EXT12.M410.7 GRANITE**
Granite boulders and rocks to have a natural, weathered appearance, free from blasting and drill marks, obtained from a local source and:
1. Shape: rounded;
2. Size: various, ranging from a minimum of 750 x 600 x 500 mm to a maximum size of 1800 x 1200 x 900 mm;

**EXT12.M420.7 SERPENTINE**
Serpentine boulders and rocks to comprise hard, metamorphic rock (normally obtained from Taiwan):
1. Size: various, ranging from a minimum of 500 x 500 x 500 mm to a maximum of 1800 x 1200 x 900 mm;
2. Colour: strongly veined blue and white.

**EXT12.M430.7 GREAT LAKE ROCK**
Great lake rocks to be from the Great Lake (Tai Hu), near Suzhou, or from other Approved regions of China, and:
1. Each rock being of one piece;
2. Appearance: slender, with folds and a large number of holes on the surface and containing such shapes as "deep hollows", "eye holes", "twists" and "strange grooves" without visual defects;
3. Colour: blackish grey;
4. Size: various, ranging from a minimum 800 x 500 x 300 mm to a maximum of 3000 x 1200 x 900 mm.

EXT12.M440.7 REJECTS
Remove, at own expense, any boulders and rocks rejected by the CM.
WORKMANSHIP

GENERAL

EXT12.W010.7 STOCKPILES
1. Obtain Approval of stockpile areas prior to the commencement of any stockpiling of materials;
2. Stabilise firmly all materials stockpiled against wind blow and erosion by water, at all times.

SUBSOIL PREPARATION

EXT12.W110.7 GRADING
Grade existing subsoil to final formation levels:
1. 300 mm below finished levels in shrub areas;
2. 125 mm below finished levels in grass areas;
3. Form to free flowing contours without water collecting hollows.

EXT12.W120.7 CLEANING EXISTING SUBSOIL
1. Remove rubbish, weeds, metal, deleterious material, and all stones exceeding 50 mm in any dimension from existing subsoil, to a depth of 300 mm;
2. Backfill any voids left by this operation with imported subsoil, as EXT12.M110.

EXT12.W130.7 RIPPING
Rip subsoil prior to spreading topsoil:
1. At 500 mm centres to a depth of 300 mm or as shown on Drawings, to improve water and air movement;
2. Removing from site all obstructions to cultivation, or deleterious material brought to the surface;
3. Backfilling any voids left by this operation with imported subsoil, as EXT12.M110;
4. Do not rip ground at a slope exceeding 15° to the horizontal.

PREPARATION OF PLANTING MEDIA

EXT12.W210.7 CONTAMINATED GROUND
Obtain Approval to confirm the location and volume of all areas contaminated by petrol, or other toxic substances, and:
1. Excavate all such contaminated ground to be planted or sown to 500 mm below the depths specified in EXT12.W410;
2. Remove the contaminated material to a properly designated tip;
3. Backfill all such excavated areas with fabricated soil, as EXT12.M310.

EXT12.W220.7 CLEANING EXISTING DG AS PLANTING MEDIUM
Remove rubbish, weeds, metal, deleterious material, and all stones exceeding 50 mm in any dimension from existing subsoil, as EXT12.M020, to a depth of:
1. 400 mm in shrub areas;
2. 250 mm in grassed areas.
EXT12.W230.7 FABRICATED SOIL MIX
Where the finished levels comprise existing DG as EXT12.M030, mix with manufactured soil conditioner as EXT12.M210, and/or animal manure, as EXT12.M245 to form Fabricated Soil, as EXT12.M310, to the depths given in EXT12.W410. Take samples and test the same for every 1,000 m² of planting area or part thereof.

EXT12.W240.7 POLYMER MIX
Mix thoroughly, fully hydrated synthetic soil conditioner, as EXT12.M250, at a rate of 1.5 kg dry polymer to 1 m³ fabricated soil, as EXT12.M310, and incorporate 600 gms of slow release fertilizer, as SLW1.M110.

EXT12.W250.7 COMPOST MIX
Mix thoroughly 50 mm thick layer of compost, as EXT12.M240, into the top 150 mm of topsoil or fabricated soil.

EXT12.W260.7 RAISING NITROGEN CONTENT
Mix slow or controlled release nitrogen fertilizer at the rate calculated using the formula:

\[ F = \frac{11,400 \times B}{Z} \]

where

- \( F \) = Fertilizer required in gm/sq.m.
- \( B \) = Nitrogen deficiency in percent.
- \( Z \) = Nitrogen content of fertilizer in percent.

EXT12.W270.7 RAISING PH LEVEL
Add limestone, as SLW1.M150, at the rate of 100 g/m² per application as required to raise pH of fabricated soil to within the range 5.5 to 6.5.

EXT12.W280.7 LOWERING PH LEVEL
Thoroughly mix in appropriate quantities of either:
1. Sulphate of ammonia (during periods of wet weather only);
2. Natural sphagnum peat moss with pH of 4 to 4.5.

EXT12.W290.7 INCREASING ORGANIC MATTER CONTENT
Add, as a separate operation, either manufactured soil conditioner, as EXT12.M210, or Coco Peat, as EXT12.M260, to the fabricated soil at the rate of 5 mm thickness for each 1% shortfall in organic matter content, spread over the deficient area and thoroughly mix through the full depth of the fabricated soil.

MAKING UP LEVELS

EXT12.W310.7 FABRICATED SOIL
Where the levels are required to be made up to the finished level, import fabricated soil, as EXT12.M310, and spread and grade to the depths given in EXT12.W410.

EXT12.W320.7 POLYMER MIX
Import polymer mix, as EXT12.W240, to make up levels to the depths given in EXT12.W410, in the locations as shown on Drawings.

EXT12.W330.7 GENERAL SOIL FILLING IN GRASS PAVING SYSTEM
Fill openings of the grass paving system, in the location as shown on Drawings, with:
1. Soil filling mix, as EXT12.M330 to receive turves as SLW7.M110 for turf finish; or
2. Grass seed and soil filling mix as SLW7.M270 for grass seed finish.

DEPTHS OF PLANTING MEDIA

EXT12.W410.7 FABRICATED SOIL
Provide to the depth(s) for the following planting situations:
1. Shrub and ground-cover areas: 300 mm;
2. Grassed areas: 125 mm;
3. Tree pits: as SLW2.W250.

FINAL GRADING

EXT12.W510.7 GENERAL
Grade all areas to free flowing contours and without humps or water collecting hollows.

EXT12.W520.7 PLANT BEDS
Slightly mound plant beds to levels shown on the Drawings ±150 mm at the top of the mound.

EXT12.W530.7 BEHIND RETAINING WALLS
Finish soil levels, immediately behind retaining walls, 75 mm ±25 mm below the top of the wall after settlement.

EXT12.W540.7 ADJACENT PAVED AREAS
1. Finish soil 25 mm ±25 mm below adjacent paving to plant beds at ground level;
2. Finish soil flush +25 mm -0 mm with adjacent paving to grassed areas at ground level.

EXT12.W550.7 GRASS PAVING SYSTEM
The turf finish or grass seed finish of the grass paving system to flush with the surrounding finished levels, or to depths to suit the system in use and/or as shown on Drawings, with allowance of settlement.

BACKFILLING RAISED PLANTERS WITH IMPERMEABLE BASES

EXT12.W610.7 PROCEDURE
1. Spread drainage layer in accordance with Worksection EXT13 in the bottom of the container;
2. Place filter layer, as EXT13.M110, over aggregate;
3. Place planting medium in 250 mm ±25 mm thick layers, lightly consolidating each layer before spreading the next;
4. Fill ground level containers to 50 mm ±10 mm below the top with fabricated soil, as EXT12.M310;
5. Fill podium level containers with lightweight soil, as EXT12.M320;
6. Leave the surface smooth and level to receive plants.

BOULDERS AND ROCKS

EXT12.W710.7 PLACING
Place boulders in the required positions during backfilling but prior to planting.
EXT12.W720.7  **FIXING GRANITE AND SERPENTINE BOULDERS**  
Ensure complete stability, with 25% by volume of the boulder below finished ground level to the satisfaction of the CM.

EXT12.W730.7  **FIXING GREAT LAKE ROCKS**  
Place rocks in their required positions, prior to planting, in locations as directed by the CM on site, and:
1. For rocks at least 3000 mm high x 1200 mm long x 900 mm wide, place in a concrete base 1200 mm long x 900 mm wide x 300 mm deep;
2. For rocks at least 3000 mm high x 1200 mm long x 900 mm wide, place and wedge with small rocks to prevent movement, with 25% by volume of the boulder below finished ground level to the satisfaction of the CM.

**SURPLUS MATERIAL**

EXT12.W810.7  **REMOVAL**  
Remove all surplus soils, arising from the Works to a properly designated tip.
DRAINAGE TO PLANTERS

MATERIALS

DRAINAGE LAYER

EXT13.M010.7 AGGREGATE
Aggregate to be clean stone, 25 – 50 mm diameter.

EXT13.M020.7 LIGHTWEIGHT AGGREGATE
Lightweight aggregate to be clean clinker, or other Approved equivalent material.
1. Size: 20 – 50 mm diameter;
2. Density: 500 kg per m³ maximum weight when compacted.

FILTER LAYER

EXT13.M110.7 FILTER LAYER
Permeable, non-woven, thermally bonded geotextile, type not affected by acids, alkalis, bacteria, humidity, or rotting, with the following characteristics:
1. Tensile strength in accordance with BS 6906:Part 1:1987: mean peak strength to be not less than 3.5 kN/m; elongation to be not more than 40%;
2. CBR puncture resistance in accordance with BS 6906:Part 4:1989: mean peak strength to be not less than 500 N;
3. Permeability in accordance with BS 6906:Part 3:1989: mean flow rate at 100 mm head to be not less than 130 litres/m² second.
WORKMANSHIP

DRAINAGE LAYER

EXT13.W010.7 CLEANING OUT WEEPHOLES
Prior to placing the drainage layer clean out all weepholes. When drainage layer has been placed by others, prior to any soiling operations, clean out all weepholes taking care not to damage any rodent grilles. Advise CM of any weepholes which cannot be cleared or are missing.

EXT13.W020.7 LEVELS
Place the base of the drainage layer level (+0 mm - 25 mm) with the bottom of weepholes.

EXT13.W030.7 PRECAST CONCRETE / PORTABLE PLANT BOXES
Lay drainage layers evenly over the base of precast concrete / portable plant boxes to compacted depths indicated below:

<table>
<thead>
<tr>
<th>Plant Box</th>
<th>Aggregate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Height (mm)</td>
<td>Position</td>
</tr>
<tr>
<td>750 or less</td>
<td>Ground level</td>
</tr>
<tr>
<td>Above 750</td>
<td>Ground level</td>
</tr>
<tr>
<td>750 or less</td>
<td>Podium level</td>
</tr>
<tr>
<td>Above 750</td>
<td>Podium level</td>
</tr>
</tbody>
</table>

EXT13.W040.7 IN-SITU CONCRETE PLANTERS WITH IMPERMEABLE BASES
Lay drainage layers evenly over base of in-situ concrete plant boxes with impermeable bases to compacted depths indicated below:

<table>
<thead>
<tr>
<th>Plant Box</th>
<th>Aggregate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Height not exceeding (mm)</td>
<td>Position</td>
</tr>
<tr>
<td>750 or less</td>
<td>Ground level</td>
</tr>
<tr>
<td>Above 750</td>
<td>Ground level</td>
</tr>
<tr>
<td>750 or less</td>
<td>Podium level</td>
</tr>
<tr>
<td>Above 750</td>
<td>Podium level</td>
</tr>
</tbody>
</table>

EXT13.W050.7 IN-SITU CONCRETE PLANTERS WITH PERMEABLE BASES
Form drainage strips of aggregate along back of perimeter walls of in-situ concrete planters with permeable bases to dimensions and in positions indicated below:

<table>
<thead>
<tr>
<th>Plant Box Type</th>
<th>Aggregate (EXT13.M010)</th>
</tr>
</thead>
<tbody>
<tr>

<td>200 x 200 high</td>
</tr>
<tr>
<td>Sloping</td>
<td>200 x 200 high</td>
</tr>
<tr>
<td>Level &amp; sloping</td>
<td>200 x 200 high x 500 long</td>
</tr>
</tbody>
</table>
FILTER LAYER

EXT13.W110.7 APPLICATION
Cover all drainage aggregate, where exposed to soil, with filter layer, as EXT13.M110. Lap joints between sheets and overlap other materials by 200 mm.
**EXT14 HYDROSEEDING MATERIALS**

**GENERAL**

**EXT14.M010.7 SCOPE**
The application, by high pressure spraying, of a specified mixture of grass seed, fertilizer, mulch and other additives in aqueous suspension.

**EXT14.M020.7 METHOD STATEMENT**
Submit to the CM, at least 14 days before starting hydroseeding operations, details of materials to be used and method of application to be employed. Include the following:

1. Species and rate of application of seed;
2. Type and rate of application of fertilizer, mulch, soil stabiliser and soil conditioner;
3. Type and colour of dye;
4. Type of protective fabric material, and
5. Details of the company employed to carry out the hydroseeding;
6. Equipment to be used.

**SEED MIXES**

**EXT14.M110.7 BASIC MINIMUM SEED MIX FOR USE BETWEEN APRIL AND AUGUST**
30 g/m² (spreading rate) mix comprising:

<table>
<thead>
<tr>
<th>Species</th>
<th>Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cynodon dactylon (Bermuda grass)</td>
<td>13 – 15 g/m²</td>
</tr>
<tr>
<td>Paspalum notatum (Bahia grass)</td>
<td>8 – 10 g/m²</td>
</tr>
<tr>
<td>Others selected from &quot;other recommended species&quot; listed at EXT14.M120</td>
<td>0 – 4 g/m²</td>
</tr>
<tr>
<td>Tree species selected from EXT14.M140</td>
<td>5 g/m²</td>
</tr>
</tbody>
</table>

**EXT14.M120.7 OTHER RECOMMENDED SPECIES**
1. Chloris gayana (Rhodes grass);
2. Eragrostis curvula (Weeping love grass) (not more than 2%);
3. Eremochloa ophiuroides (Centipede grass);
4. Cenchrus ciliaris (Buffel grass).

**EXT14.M130.7 BASIC MINIMUM SEED MIX FOR USE BETWEEN SEPTEMBER AND MARCH**
35 g/m² (spreading rate) mix comprising:

<table>
<thead>
<tr>
<th>Species</th>
<th>Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cynodon dactylon (Bermuda grass)</td>
<td>15 g/m²</td>
</tr>
<tr>
<td>Paspalum notatum (Bahia grass)</td>
<td>10 g/m²</td>
</tr>
</tbody>
</table>
### HYDROSEEDING M140.7 TREE SPECIES
A minimum of four of the following:
1. Acacia confusa;
2. Eucalyptus citriodora;
3. Eucalyptus robusta;
4. Tristania conferta;
5. Casuarina equisetifolia.

### HYDROSEEDING M150.7 GERMINATION
Germination capacity of each variety to be at least 80%.

### HYDROSEEDING M160.7 PURITY
1. Purity of each variety to be greater than 90%;
2. Total weed seed content not more than 0.5%;
3. Other crop seed not more than 1%.

### HYDROSEEDING M170.7 CERTIFICATION
Provide a certificate of testing, no less than 14 days before hydroseeding starts, stating:
1. Date of tests (within 6 months of hydroseeding);
2. Species variety;
3. Percentage germination (with date of assessment);
4. Percentage composition by weight (with statement of impurities).

### ANCILLARY MATERIALS

#### HYDROSEEDING M210.7 FERTILIZER INCLUDED IN THE HYDROSEEDING MIX
A soluble compound fertilizer in the ratio 15:15:15 NPK, or similar Approved compound applied at a rate of at least 100 g/m² in the hydroseeding mix.

#### HYDROSEEDING M220.7 DYE, SOIL STABILIZER AND SOIL CONDITIONER
An Approved type, non-injurious to plant growth.

#### HYDROSEEDING M230.7 MULCH FOR HYDROSEEDING
A proprietary type manufactured from cellulose or paper based materials for application at a minimum rate of 170 g/m².

#### HYDROSEEDING M240.7 PROTECTIVE FABRIC MATERIAL FOR HYDROSEEDING
An Approved proprietary type of degradable fabric that does not degrade within 100 days after application or until the specified grass cover has been established.

#### HYDROSEEDING M250.7 HYDROSEEDING POST-PLANTING FERTILIZER
Consisting of 15:15:15 (nitrogen/phosphorus/potassium) mix or an Approved equivalent.

<table>

</tbody>
</table>
WORKMANSHIP

GENERAL

EXT14.W010.7 PROGRAMME
1. Carry out hydroseeding between 1st March and 31st August. Hydroseeding outside this period may be Approved on condition that any additional maintenance requirements specified by the CM are carried out at the Contractor’s expense;
2. Carry out hydroseeding during damp overcast conditions, but not during rain or periods of strong winds.

EXT14.W020.7 STORING GRASS SEED
Store grass seed in bags off the ground in a clean, dry, well ventilated location free from vermin. Carry out prolonged storage under controlled conditions of temperature and humidity.

EXT14.W030.7 STORING FERTILIZER
Store fertilizer off the ground in sealed waterproof bags and protect from exposure to conditions which may adversely affect the fertilizer.

EXT14.W040.7 HYDROSEEDING EQUIPMENT
Use hydroseeding plant for application of mix.

PREPARATION

EXT14.W110.7 SURFACE FINISH
1. Clear away rubbish and vegetation from areas to be hydroseeded and form site to the levels indicated;
2. Lightly scarify to leave a coarse, open textured surface, level with (+25 mm -0 mm) adjoining hard surfaces;
3. Carry out finishing work by machines across the direction of slope;
4. Do not leave vehicle track marks or bucket teeth marks parallel to the line of maximum gradient of the slope.

EXT14.W120.7 CULTIVATION
1. Cultivate areas less steep than 1:2 to a depth of 125 mm and bring to a 25 mm deep fine tilth by Approved mechanical means or by hand raking;
2. Remove all stones larger than 30 mm in any dimension;
3. If necessary, carry out regrading of the surface to conform to the prescribed finished levels and create free flowing contours free from humps and water collecting hollows;
4. Finish final level (+25 mm -0 mm) with any adjacent hard surfaces.

EXT14.W130.7 CULTIVATION ON EMBANKMENTS
Do not cultivate the existing soil on embankments with slopes of 1:2 or steeper, to ensure that the slope remains stable and to prevent erosion.

EXT14.W140.7 WATERING
When Instructed thoroughly moisten the previously prepared soil prior to hydroseeding, and use a fine spray hose attachment to avoid soil erosion and run off.
PREPARING TREE SEEDS
1. Soak all tree seeds to be included in the hydroseeding mix (except Acacia Species) in water at room temperature, for 4 to 8 hours immediately before mixing with other ingredients of the hydroseeding mix;
2. Immerse seeds of Acacia confusa in water, bring water to boil, remove seeds immediately and mix seeds with other ingredients of the hydroseeding mix.

APPLICATION

MIXING
1. Thoroughly mix materials for hydroseeding on site in the hydroseeding equipment immediately before spraying, ensuring that seed is not damaged;
2. Blend in water at the rate of 5 litres/m² to form an aqueous gel solution, unless otherwise instructed.

APPLYING SOIL BINDERS
1. Apply soil binders as EXT12.M270 at the rate recommended by the manufacturer, modified as necessary to suit conditions in Hong Kong;
2. Use dye to demonstrate that adequate cover has been achieved unless otherwise instructed due to the fact that run off or water courses are coloured to an unacceptable level.

SPRAYING HYDROSEEDING SOLUTION
Spray the solution by high pressure pump to evenly cover the area and:
1. Constantly agitate the hydroseeding mixture during spraying to keep it homogeneous and avoid blockage to pipes;
2. Ensure that material is not lost during application due to run off.

POST APPLICATION OPERATIONS

PATCHING UP
1. Where hydroseeded areas do not show 90% cover over any 10 m² area, 28 days after hydroseeding:
   a. Respray areas where, in the opinion of the CM germination has been unsuccessful;
   b. Respray areas affected by repairs to washout and gullies and other erosion on slopes.
2. Patch up areas which, in the opinion of the CM, are not accessible or are too small for the use of a hydroseeder, by broadcasting seeding as follows:
   a. Lightly scarify the area with a rake or similar implement;
   b. Broadcast the seed and fertilizer over the area at a rate of not less than 75 g/m² (±5%);
   c. Cover the seed by lightly working into the surface or by spreading sufficient soil to just cover the seed;
   d. Carry out broadcast seeding using Bermuda grass (Cynodon dactylon), perennial ryegrass (Lolium perenne) or carpet grass (Axonopus compressus).

PROTECTION OF HYDROSEEDING
1. Following hydroseeding, including patching up, cover the area with biodegradable erosion resistant fabric, as EXT14.M240 and fix securely with 100 mm long staples at 1000 mm staggered centres, with a minimum of 150 mm overlap between adjacent sheets of fabric sufficient to avoid local erosion;
2. On sloping ground lay fabric along the greatest slope and fully adhere to the hydroseeded surface by sprinkling with water with an Approved spray;
3. Do not permit walking on areas that have been hydroseeded unless for fixing protective material and for patching up.

**EXT14.W330.7 WATERING DURING DRY WEATHER**

During dry weather water hydroseeded slopes to encourage germination and growth of the grass as follows:

1. During periods of dry weather determine watering requirements with the CM twice weekly;
2. Thoroughly water areas as necessary or as instructed and complete watering within 24 hours of receiving such instruction;
3. Use fresh water only for the works;
4. When required obtain an analysis of the water to be used for Approval;
5. Apply water using an Approved hose or sprinkler so as not to erode the slope;
6. Make good any erosion of hydroseeding that may occur.

**EXT14.W340.7 APPLYING POST-PLANTING FERTILIZER**

Apply post-planting fertilizer at a rate of 50 g/m² (±5%) between two months and nine months after application of hydroseeding and, unless otherwise permitted by the CM, during the period 1st March and 31st August.

**EXT14.W350.7 CUTTING**

1. Reduce by cutting to a height of 100 mm when the grass sward is 300 mm high;
2. Rake off and dispose of all cuttings within 24 hours of cut.

**TESTING GRASS COVER**

**EXT14.W410.7 TESTING**

1. Attend with CM when carrying out tests to determine grass cover 100 days after grassing and at the end of the Establishment Period;
2. The number of tests will be determined by the CM in locations which, in his opinion, are representative of the grassed area as a whole;
3. Mark out an approximately square area of 10 m² at each test location and cut grass to a height of 300 mm if necessary;
4. Measure the percentage of bare ground, other than rock and other hard material, in each 10 m² test area.

**EXT14.W420.7 ACCEPTANCE CRITERIA**

1. Hydroseeding to achieve a cover by grass species of at least 90% of the surface area of each 10 m² of the area to be hydroseeded within 100 days after the area has been hydroseeded;
2. Grass cover to be healthy, vigorous and free from perennial and other weeds.

**EXT14.W430.7 NON-COMPLIANCE**

If the result of any test for grass cover does not comply with the specified requirements for grass cover, re-hydroseed or reseed the area as EXT14.W310 (1) or (2), as instructed depending upon the size of the defective area.
EXT15 MISCELLANEOUS EXTERNAL WORKS

DESIGN

GENERAL

EXT15.D010.7 EXTERNAL FURNITURE
External furniture in this Specification refers to a series of proprietary external furniture comprising, but not be limited to, seating bench, litter bin, chess table set, table tennis table, bollard and bicycle rack, in accordance with the performance requirements and design intent as specified.

EXT15.D020.7 DESIGN SUBMISSION

1. Unless the CM instructs otherwise, submit to the CM at the time as specified in the Project Specific Specification at least 3 design proposals from different agents/suppliers for the external furniture specified in EXT15.M010 to EXT15.M060 meeting with the requirements as specified in the Specification and shown on the design intent Drawing(s) for the CM’s selection and approval. Each design proposal shall include plans, elevations, sections and details, and the following information:
   a. The place of origin of the external furniture, name of manufacturer, brand name, model number, manufacturer's instruction on installation procedures;
   b. Product details and descriptions etc. with detailed layout drawing indicating the relationship of the furniture to the surrounding external works;
   c. Materials, colours, sizes, dimensions, assemblage and fixing of various components of the external furniture and other items as instructed by the CM and/or as shown on the design intent Drawing(s);
   d. Minimum design loading for seating bench, chess chair, chess table and table tennis table;
   e. Copy of structural calculation by RSE verifying the proposed minimum design loading for the external furniture. The copy of the structural calculation shall be certified true by the QCM;
   f. Builder's works requirements and method statement on fixing the external furniture to the substrate, wall or pavement surface;
   g. Test certificates for the specified tests in clauses EXT15.M110 and EXT15.M120, where appropriate.

Each design proposal shall also be accompanied with a quotation from the respective agents/suppliers. The Contractor shall be responsible for the identification of agents/suppliers, preparation of invitation documents and invitation of quotations. Sufficient time shall be allowed for agents/suppliers to prepare and return their quotations. The quotation closing date and time, and location of the quotation box of the Contractor for deposition of quotations shall be specified in the invitation of quotations. Make invitation to the CM at least 14 days before the quotation closing date for his arrangement of representation to witness the opening of quotations at the Contractor's office. Quotations received shall be opened promptly after the specified closing date and time. Opening of the quotations shall be witnessed by at least two representatives of the Contractor and two CMR;

2. Re-submit revised design proposals, quotations, drawings and relevant information where commented or considered necessary by the CM;
3. Upon notification in writing by the CM of his selected and approved design proposal among the submitted design proposals (a copy of the Contractor's submitted quotation in respect of the Approved design proposal may be attached with the CM's notification for the sake of reference), engage the respective agents/suppliers for the supply and installation of the external furniture of the Approved design proposal provided that the actual cost of procuring each of the Approved external furniture shall not exceed the amount shown on the quotation submitted to the CM for the Approved design proposal;

4. If, prior to entering into sub-contract with the agents/suppliers providing the Approved external furniture, it becomes apparent to the Contractor that the actual cost of any of the Approved external furniture exceeds the amount shown on the quotation submitted to the CM for the Approved design proposal for whatever reasons, give immediate notice to the CM for further instruction. Any claim for additional costs due to higher actual costs than the quotation submitted to the CM for the Approved design proposal arising from or after entering into sub-contract with the agent/supplier providing the Approved external furniture shall not be considered. Submit certified true copy of the sub-contract(s) to substantiate the actual costs of the procurement of the Approved external furniture;

5. In addition to sub-clause (1) above, the CM may at his own discretion before or after the Contractor's submissions in sub-clause (1), obtain design proposals and quotations directly from agents/suppliers of external furniture and instruct the Contractor as appropriate;

6. Within 28 days from the date of the CM's notification of selection and approval of the design proposal, submit detailed information comprising shop drawings and fixing details of the external furniture for the CM's approval;

7. Allow at least 6 months for the process of ordering, material delivery and installation.

EXT15.D030.7 SAMPLE SUBMISSION
After being notified in writing by the CM of his selected and approved design proposal and before ordering of the products, submit samples of the components of the external furniture showing their physical properties such as material, colour, texture and fixing details etc. for the CM's approval.

EXT15.D040.7 DELIVERY
Submit original or certified true copies of Certificate of Origin for the external furniture delivered to the Site.
MATERIAL

EXTERNAL FURNITURE

EXT15.M010.7 SEATING BENCH
1. Seating bench: as specified in Project Specific Specification;
2. The design of the seating bench shall fit for purpose. The product shall be rigid, well supported and not prone to deformation. The components shall have no sharp edge, corner and projections etc.;
3. Material used shall be able to withstand cigarette burns and discolouring from exposure to ultraviolet radiation from the sun. There shall be no toxic emission upon combustion of any components and parts;
4. Allow a range of colours on materials used for CM’s selection.

EXT15.M020.7 LITTER BIN
1. Litter bin: as specified in Project Specific Specification;
2. Provide litter bin with ash tray at designated smoking areas only as specified by CM and/or shown on the landscape layout plan;
3. The design of the litter bin shall fit for purpose. The product shall be rigid, well supported and not prone to deformation. The components shall have no sharp edge, corner and projections etc.;
4. Materials used must be able to withstand cigarette burns and discolouring from exposure to ultraviolet radiation from the sun. There shall be no toxic emission upon combustion of any components and parts;
5. Allow a range of colours on materials used for CM’s selection.

EXT15.M030.7 CHESS TABLE SET
1. Chess table set: as specified in Project Specific Specification;
2. Allow at least one seating place for wheelchair user to access the chess table;
3. The design of the chess table set shall fit for purpose. The product shall be rigid, well supported and not prone to deformation. The components shall have no sharp edge, corner and projections etc.;
4. Materials used shall be able to withstand cigarette burns and discolouring from exposure to ultraviolet radiation from the sun. There shall be no toxic emission upon combustion of any components and parts;
5. Allow a range of colours on materials used for CM’s selection.

EXT15.M040.7 BOLLARD
1. Bollard: as specified in Project Specific Specification;
2. The design of the bollard shall fit for purpose. The product shall be rigid, well supported and not prone to deformation. The components shall have no sharp edge, corner and projections etc.;
3. Materials used shall be able to withstand cigarette burns and discolouring from exposure to ultraviolet radiation from the sun. There shall be no toxic emission upon combustion of any components and parts;
4. Allow a range of colours on materials used for CM’s selection;
5. Avoid protruding projections and loose-fixed component parts that are easy to be stolen.

EXT15.M050.7 TABLE TENNIS TABLE
1. Table tennis table: as specified in Project Specific Specification;
2. The design of the table tennis table shall fit for purpose. The product shall be rigid, well supported and not prone to deformation. The components shall have no sharp edge, corner and projections etc.;

3. Materials used must be able to withstand cigarette burns and discolouring from exposure to ultraviolet radiation from the sun. There shall be no toxic emission upon combustion of any components and parts;

4. Allow a range of colours on materials used for CM's selection.

EXT15.M060.7 BICYCLE RACK
1. Bicycle rack: as specified in Project Specific Specification;
2. The design of the bicycle rack shall fit for purpose. The product shall be rigid, well supported and not prone to deformation. The components shall have no sharp edge, corner and projections etc.;
3. Materials used shall be able to withstand cigarette burns and discolouring from exposure to ultraviolet radiation from the sun. There shall be no toxic emission upon combustion of any components and parts;
4. Allow a range of colours on materials used for CM’s selection.

COMPONENTS OF EXTERNAL FURNITURE

EXT15.M110.7 RECYCLED PLASTIC
Shall have fastness grade of 5 of ISO 105-A03:1993 when tested to BS EN ISO 4892-2:2006 Method A under the following conditions:
1. Back-standard temperature: (60±3)°C.
2. Spray cycle:
   a. Duration of spraying: 18 minutes; and
   b. Dry interval between spraying: 102 minutes.
3. Relative humidity: (65±5)%;
4. Exposure time: 1000 hours.

EXT15.M120.7 FINISHES TO GALVANIZED MILD STEEL
Show no sign of rusting when tested to ASTM B117-97:2009 for 1000 hours.
WORKMANSHIP

GENERAL

EXT15.W010.7 HANDLING AND STORAGE
Handle and store all external furniture carefully and in a manner that:
1. Prevent damage to pre-finished surfaces;
2. Retain protective coverings in position for as long as possible;
3. Prevent contact with harmful elements.

EXT15.W020.7 FIXING, ASSEMBLING AND LAYING
1. Carry out any fixing, assembling or installation in accordance with the manufacturer's instructions;
2. Ensure all external furniture is/are placed and fixed in the position as set out in the Drawings, and in accordance with manufacturer's recommendation;
3. Avoid exposing the base plate which may cause potential hazard in hurting the feet of pedestrians.

INSTALLATION OF EXTERNAL FURNITURE

EXT15.W110.7 SEATING BENCH
Install seating bench in accordance with manufacturer's specifications and instructions.

EXT15.W120.7 LITTER BIN
Install litter bin in accordance with manufacturer's specifications and instructions.

EXT15.W130.7 CHESS TABLE SET
Install chess table set in accordance with manufacturer's specifications and instructions.

EXT15.W140.7 TABLE TENNIS TABLE
1. Assemble table tennis table in accordance with manufacturer's specifications and instructions;
2. Location of the table tennis table to be advised by CM;
3. The table tennis table shall be firmly fixed to the ground or be secured against displacement either by its own weight or by anchoring. The table tennis table installed in accordance with the manufacturer's instructions shall withstand without any displacement or toppling over a horizontal force of 1.5 kN per meter length of the table structure, applied in the middle of the highest part of the structure (excluding the net), in both the length and the width of the table.

EXT15.W150.7 BOLLARD
1. Install bollard onto the pavement surface in accordance with manufacturer's specifications and instructions;
2. Should the installed bollard become off-plumbed due to ground settlement and/or soil displacement etc., the Contractor shall rectify the situation where applies to ensure the bollard is firmly upright.

EXT15.W160.7 BICYCLE RACK
1. Assemble bicycle rack in accordance with manufacturer's specifications and instructions;
2. Install bicycle rack with the adjacent pavement surface in accordance with manufacturer's specifications and instructions.

CON1 INSITU CONCRETE

MATERIALS

GENERAL

CON1.M010.7 STANDARD
Unless otherwise specified, comply with 'Code of Practice for Structural Use of Concrete 2013' issued by the Buildings Department, BS8007:1987 and BS5400:Part 4:1990 as appropriate.

CON1.M020.7 STATUS OF THE SPECIFICATION
Where any clauses in this Specification vary from the Regulations of the HKQAA "Quality Scheme for the Production and Supply of Concrete", the clauses in this Specification shall take precedence.

CON1.M025.7 STATUS OF THE WORKSECTION
Worksection EXT2 takes precedence over this Worksection for the construction of the concrete carriageways and bus terminus as indicated on the Drawings.

CON1.M030.7 GRADES OF CONCRETE
In this Specification:
1. The grade of Designed mix concrete is denoted by the characteristic strength in MPa and the nominal maximum size of aggregate in mm with suffix "D";
2. The grade of Standardised designed mix concrete is denoted by the characteristic strength in MPa and the nominal maximum size of aggregate in mm with suffix "S";
3. The characteristic strength of Designed mix concrete with any type of cement is the 28 day cube strength below which not more than 5% of the test results are expected to fall;
4. For any clause of this Section where no suffice "D" or "S" is indicated in the concrete grade, the requirements of that particular clause shall deem to apply to both Designed mix and Standardised designed mix concrete;
5. Obtain CM's approval prior to the use of concrete of grade above 60 in the Works;
6. Where any grade of concrete is designated in other Worksections of this Specification, in Drawings, in design guidelines, in Bills of Quantities or in any other documents relating to this Contract, as one of the grades listed in column (1) of the Table below, such grade is deemed to be the grade of concrete set out in the corresponding column (2) below:

CON1.M040.7 CEMENTITIOUS CONTENT

Cementitious content of concrete, for the purpose of this Specification, is defined as:

1. The mass of cement per cubic metre of compacted concrete if sub-clause (2) is not applicable; or

2. The combined mass of the mass of cement and the mass of either pulverised fuel ash (PFA) or ground granulated blastfurnace slag (GGBS) per cubic metre of compacted concrete, if either PFA or GGBS is used as a partial cement replacement.

CON1.M110.7 SUBMISSIONS

Submit to the CM for provisional approval, a sample for each type of cement, PFA and GGBS together with a certificate issued by an Approved laboratory not more than six months before the submission, showing the followings:

1. For each type of cement:
   a. The manufacturer's name;
   b. The date and place of manufacture;
   c. With test results that the cement complies with the requirements of this Specification.

2. For PFA:
   a. The manufacturer's name (it must be stated explicitly if high lime PFA, as defined in CON1.M150 (1)(b), is submitted);
   b. The date and place of manufacture;
   c. With test results that the PFA complies with the requirements of this Specification and the tests required in Clause 14.1 of BS 3892:Part 1:1997.

3. For GGBS:
   a. The manufacturer's name;
   b. The date and place of manufacture;
   c. With test results that the GGBS complies with the requirements of this Specification and the tests required for factory production control as stipulated in CON1.M180.

CON1.M120.7 PORTLAND CEMENT (PC)

1. To BS EN 197-1:2000: type CEM I with strength class of cement for structural concrete to be 52.5N, unless otherwise approved by the CM;
2. Comply with the limiting values given in Table NC.1 of National annex NC of BS EN 197-1:2000 for acceptance inspection of cement at delivery.

**CON1.M130.7**

**SULPHATE RESISTING PORTLAND CEMENT (SRPC)**

To BS 4027:1980.

**CON1.M140.7**

**HIGH ALUMINA CEMENT (HAC)**

Do not use high alumina cement in structural concrete.

**CON1.M150.7**

**PULVERISED FUEL ASH (PFA)**

To BS3892:Part 1:1997 with the following modifications:

1. Lime content in PFA:
   a. PFA shall contain up to 10% total lime content; or
   b. High lime PFA shall contain up to 20% total lime content and with soundness value not more than 10 mm.

2. Water requirement and strength factor at 28 days: not requirements of this Specification, but the values as determined shall be stated in the certificates for submission;

3. Cement to be used to determine water requirement, strength factor at 28 days, soundness and initial setting time: Portland cement CEM I (strength class 52.5N) to BS EN 197-1.

**CON1.M160.7**

**PORTLAND FLY ASH CEMENT (PFAC)**

1. To BS EN 197-1:2000: types CEM II/A-V and CEM II/B-V with strength class of cement for structural concrete to be 42.5N or higher, unless otherwise approved by the CM;

2. Comply with the limiting values given in Table NC.1 of National annex NC of BS EN 197-1:2000 for acceptance inspection of cement at delivery.

**CON1.M170.7**

**USE OF PULVERISED FUEL ASH**

1. Incorporate PFA to Portland cement (PC) only, as a partial cement replacement:
   a. In all structural concrete for foundation works including caissons, bored piles, caisson caps, pile caps (including pile caps to driven piles), tie beams and footings of all structures. PFA content to be 35% by mass of the cementitious content of the concrete;
   b. In all structural concrete shown as PFA concrete up to grade 60D on the Drawings. PFA content to be 25% by mass of the cementitious content of the concrete;
   c. In all concrete, with the exception of sprayed concrete, for external works including concrete carriageway, other paving and hard landscaping unless otherwise specified. PFA content to be 25% by mass of the cementitious content of the concrete;
   d. Notwithstanding the minimum striking period stipulated in CON2.W630, submit for the CM's agreement on the striking period of vertical formwork for PFA concrete in sub-clauses (1)(b) and (1)(c) above but in no case less than 1 day.

2. At the discretion of the Contractor and where approved by the CM, incorporate PFA to PC as a partial cement replacement in structural concrete not shown as PFA concrete on the Drawings. PFA content to be 25% by mass of the cementitious content of the concrete;

3. Prior to the use of PFA concrete in sub-clause (2) above:
a. Carry out necessary tests and trials to provide evidence to the satisfaction of the CM that the use of PFA concrete shall not adversely affect the construction cycle, curing of the concrete and the application of finishes; and

b. Submit details for sub-clause (3)(a) before carrying out the tests and trials for the Approval of the CM.

4. PFAC may be used where PFA concrete with PFA content of 25% by mass of the cementitious content of concrete is specified or permitted;

5. Use of PC in the works specified in sub-clauses (1)(a) to (1)(c) above may be accepted provided that:
   a. Satisfactory evidence can be furnished to the CM showing that supply of PFA or PFAC from all available sources cannot be obtained;
   b. The highest grade of PC concrete for caissons and bored piles shall not exceed 35/20D. For pile caps or footings and transfer structures submit a detailed method statement of the proposed temperature control and monitoring strategy as stipulated in CON1.W470 to the CM for approval at least 7 days before concreting;
   c. Where necessary, submit re-design of the foundation works resulting from such a change to the CM for approval at least 21 days before commencement of affected works. Submit re-design according to PIL1.D030 and any other requirement as detailed elsewhere in this Specification;
   d. Be liable for any additional cost or time as a result of any such change. The Surveyor shall, if he considers that there is a saving in cost arising from any such change determine the sum which in his opinion shall be deducted from the contract sum as result of such saving and certify in accordance with the General Conditions of Contract.

**CON1.M180.7 GROUND GRANULATED BLASTFURNACE SLAG (GGBS)**

To BS EN 15167-1:2006 with the following modifications:

1. Cement to be used to determine initial setting time and activity indices at 7 days and 28 days: Portland cement CEM I (strength class 52.5N) to BS EN 197-1:2000;

2. Factory production control: In the absence of autocontrol testing, proof of the GGBS manufacturer's testing on the quality control for Class S95 in accordance with Chinese National Standard GB/T 18046:2008 is acceptable.

**CON1.M190.7 USE OF GGBS IN PRECAST CONCRETE FACADE**

1. Incorporate GGBS as a partial replacement of Portland cement (PC) in the production of precast concrete facade;

2. GGBS content to be 35% by mass of the cementitious content of the concrete;

3. Subject to the CM's approval, the use of PC concrete as a contingency in sub-clause (1) above may be permitted if satisfactory evidence can be furnished to the CM showing that the normal production cycle of facade cannot be maintained in cold season.

**AGGREGATES**

**CON1.M210.7 SUBMISSIONS**

Submit to the CM, for provisional approval, a sample of each type of aggregate and a certificate for each nominal maximum aggregate size showing:

1. The name of the quarry/locality of the aggregate and documentary evidence from the supplier for subsequent verification;
2. Where available, evidence that the aggregates from the same source have been used in other HA Contracts in the past 12 months;
3. That the aggregate complies with the requirements of this Specification;
4. Test results of all the typical properties listed in Appendix A of BS 882:1992 with the following validity period on the test data:
   a. Not older than three months:
      i. Grading;
      ii. Silt, clay and dust content;
      iii. Shell content; and
      iv. Acid soluble sulphate content.
   b. Not older than six months:
      i. All other properties.
5. Test results of dry particle density, foreign materials content and sulphate content for recycled coarse aggregates.

CON1.M215.7 RECYCLED COARSE AGGREGATES
1. Use recycled coarse aggregates produced by crushing old concrete and complying with the requirements in CON1.T410 for external works as specified in the Contract or as permitted by the CM. The concrete shall be with 100% recycled coarse aggregates for grade strength 20 MPa and 20% for grade strengths 25-35 MPa. Recycled coarse aggregates shall not be used in concrete above grade strength 35 MPa for Portland cement concrete and 30 MPa for PFA concrete;
2. Thoroughly wet recycled coarse aggregates before use;
3. Store recycled coarse aggregates in separate stockpiles or silos to prevent inadvertent mixing with natural aggregates. Provide a separate compartment for recycled coarse aggregates in the batching plant;
4. Obtain recycled coarse aggregates for incorporation into the Works from Approved source as specified or permitted by the CM.

CON1.M220.7 SOURCES OF AGGREGATES
1. Obtain crushed rock aggregates for each Approved Designed mix from a single Approved source which may be either an Approved quarry or an Approved source of rock;
2. Where the aggregates are obtained through a crushing plant, the rock from which the aggregates for the Approved Designed mix are obtained must be from the same single Approved source;
3. Obtain natural sand fine aggregates for each Approved Designed mix from a single Approved locality within a defined boundary agreed with the CM;
4. Clear overburden as far as practicable from the working area prior to rock excavation. Overburden is defined as all unwanted material including vegetation, top soil and material of varying degrees of decomposition from the parent rock. The latter category may appear as intrusive bands between volumes of massive rock;
5. Remove rock from igneous intrusions as far as practicable from the working area;
6. Incorporate sufficient scalping and screening facilities in the aggregate production plant to remove all overburden from the aggregates;
7. Keep separate in clearly defined areas the materials both before and after processing where the aggregate production plant is rock from more than one quarry or rock source.
CON1.M230.7 COARSE AGGREGATE
Clean, hard, durable crushed rock complying with BS 882:1992 except for the requirement of Aggregate Impact Value.

CON1.M240.7 FINE AGGREGATE
1. Clean, hard durable crushed rock, complying with BS 882:1992 except that the NOTE in Table 4 of that British Standard shall not apply;
2. Do not use natural sand unless with prior agreement of the CM.

CON1.M250.7 ALL-IN AGGREGATE
Do not use all-in aggregate.

CON1.M260.7 LIGHTWEIGHT AGGREGATE
To BS 3797:1990 except not to use clinker and furnace bottom ash.

CON1.M270.7 AGGREGATES FOR AQUEOUS LIQUID RETAINING STRUCTURES
Having a water absorption, as measured in accordance with BS 812:Part 2:1975 of not greater than 3%.

CON1.M280.7 GRADING OF COMBINED AGGREGATES
The grading of the combined fine and coarse aggregates must ensure a dense concrete of suitable workability, using the specified proportions of cement and water.

WATER

CON1.M310.7 WATER
1. In accordance with PRE.B10.1210 to PRE.B10.1260 or PRE.C11.090 as appropriate, and;
2. Use only clean fresh water from Water Supplies Department mains supply for making concrete. Unless otherwise specified, do not use recycled water;
3. If the water from Water Supplies Department mains supply is not available, submit to the CM for provisional approval:
   a. The source of water;
   b. A certificate showing that the water complies with the requirement of this Specification.
4. Where specified in the Contract, use recycled water to make concrete for minor structures.

CON1.M320.7 RECYCLED WATER
1. Where specified on the Drawings, use recycled water in the mixing of concrete of grade strength not exceeding 30 MPa for minor structures, including ground pavings not subjected to vehicular traffic, footpaths, benches and stools, planter walls and non-structural concrete fill;
2. Produce recycled water by combining clean fresh water from Water Supplies Department mains supply with wash water from mixer washout operations in compliance with the properties specified in CON1.T330;
ADMIXTURES

CON1.M410.7 ADMI XTURES GENERALLY
Ensure that the chloride ion content of admixtures for concrete containing embedded metal or for concrete made with SRPC does not exceed 2% by mass of the admixture or 0.03% by mass of the cement, whichever is the less.

CON1.M420.7 SUBMISSIONS
Submit to the CM for provisional approval:
1. Manufacturer's information on admixtures;
2. Confirmation from the manufacturer that the admixtures comply with the requirements of this Specification;
3. Details of toxicity, proposed dosage, detrimental effects, if any, of under-dosage or over-dosage;
4. Details of chloride content and method of adding to the concrete mix;
5. One sample of each type of admixtures.

CON1.M430.7 PIGMENTS FOR PORTLAND CEMENT AND PORTLAND CEMENT PRODUCTS
To BS 1014:1975.

CON1.M440.7 ADMI XTURES AND SUPERPLASTICISERS

CURING COMPOUNDS

CON1.M510.7 GENERAL
1. Of an Approved type and:
   a. Having an efficiency index of at least 85% when tested to BS 7542:1992;
   b. Either wax or aluminised resin based and containing a fugitive dye.
2. Do not use curing compound containing organic solvents for public roads and bus terminuses which are to be handed over to the Highways Department of the HKSAR on completion.

CON1.M520.7 SUBMISSIONS
Submit to the CM for provisional approval:
1. Manufacturer's information on curing compounds showing that the curing compounds comply with the requirements of this Specification;
2. Test certificates prepared by an Approved testing laboratory, to show that the curing compounds will provide the required efficiency index;
3. A sample of each type of curing compound.

CON1.M530.7 PROPERTIES
The compound when applied according to the manufacturer's recommendations must:
1. Be stable and impervious to evaporation of water from the concrete surface within 60 minutes after application;
2. Not react chemically with the concrete to be cured and not crack, peel or disintegrate within 1 week after application;
3. Degrade completely within 3 weeks after application.

**CON1.M540.7** **CONCRETE CARRIAGEWAY CONSTRUCTION**
Non-pigmented liquid resin or wax-resin based membrane curing compound of a proprietary brand, and available both with and without a fugitive dye.

**CON1.M550.7** **STRUCTURES TO CONTAIN POTABLE WATER**
Concrete curing compound for use on concrete surfaces against which potable or fresh water will be stored or conveyed must be non-toxic and incapable of imparting a taste to the water.

**ANCILLARY MATERIALS**

**CON1.M610.7** **UNDERLAYS TO CONCRETE PAVINGS AND SLABS ON HARDCORE**
Either:
1. Subsoil grade reinforced waterproof building paper to BS 1521:1972, grade B1F;
   or
2. 0.125 mm nominal thick impermeable polythene sheet.

**CON1.M620.7** **POLYETHYLENE SHEETING FOR CURING**
Impermeable and of a minimum thickness of 0.125 mm.

**CON1.M630.7** **WATERPROOF ADHESIVE TAPE**
Of proprietary manufacture.

**CON1.M640.7** **BITUMASTIC PAINT**
Tar based complying with BS 1070:1993, type B.

**CON1.M650.7** **REPAIR MORTAR**
1. Of proprietary manufacture and certified to the “Product Conformity Certification Scheme for Repair Mortars” (PCCS-RM) published by the Hong Kong Concrete Institute. The product conformity certificate shall be issued by a certification body accredited by Hong Kong Accreditation Service (HKAS) or its Multilateral Recognition Arrangement (MRA) partners;
2. Cement based product comprising Portland cement, fines /sand, admixture and/or non-shrink additives packed in bags and complying with the performance characteristics given in the Table below:

<table>
<thead>
<tr>
<th>Properties</th>
<th>Testing method</th>
<th>Performance characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compressive strength at 28 days (MPa)</td>
<td>CS1: Section 12, using 100 mm cube test specimens</td>
<td>≥ grade strength of parent concrete + 7</td>
</tr>
<tr>
<td>Elastic modulus (GPa)</td>
<td>CS1: Section 17</td>
<td>≥ 23</td>
</tr>
<tr>
<td>Chloride ion content</td>
<td>CS1: Section 21</td>
<td>≤ 0.05%</td>
</tr>
</tbody>
</table>
3. The repair mortar shall not release substances hazardous to health, hygiene and environment.

4. Submit the following for CM's information:
   a. The original or a certified true copy of the product conformity certificate to PCCS-RM stipulated in sub-clause (1). Certified true copy shall be certified true by the issuer of the original copy or by the QCM;
   b. A summary of the results on tests stipulated in the 'initial type test' and 'audit testing' of the PCCS-RM. The summary shall be prepared by the accredited laboratory who carried out the testing or by the certified manufacturer. If so directed by CM, submit a full set of the audit test reports to CM for information.

CON1.M660.7 LOW VISCOSITY POLYMER RESIN
Of proprietary manufacture.

CON1.M670.7 EPOXY RESIN FOR INJECTION
Of proprietary manufacture.

CON1.M680.7 CAST IN STEEL INSERT CHANNELS
As MET1.M080.

SOURCES OF SUPPLY OF CONCRETE

CON1.M710.7 READY MIXED CONCRETE
Ready-mixed concrete and any concrete batched off site, may be used only with Approval and must comply with all requirements of this Specification in respect of materials, quality and strength of such concrete.

CON1.M720.7 SUBMISSION FOR APPROVAL
1. Submit the following information to CM for approval, upon commencement of the Contract or during the course of Contract when concrete supply from a new source is to be used, at a minimum time specified in sub-clause (2):
   a. A statement advising whether the concrete is to be site-batched or ready-mixed. In case on-site concrete batching is proposed, submit further details to the CM on suitability of the plant in relation with statutory requirements and possible effects on adjoining localities;
   b. The name(s) of the proposed concrete supplier(s) as specified in CON1.M730 (who may be the Contractor) and details of the concrete supply;
   c. The name of each supplier’s Quality Representative taking specific responsibility and authority for ensuring compliance with the requirements of the following:
      i. “Quality Scheme for the Production and Supply of Concrete” (QSPSC) issued by the Hong Kong Quality Assurance Agency (HKQAA);
      ii. ISO 14001 on environmental management.
2. The time of submission for Approval for the respective concrete shall be at least:
a. Concrete to be ready-mixed: 7 days before placing concrete or 7 days before the trial mixes if trial mixes are made;
b. Concrete to be site-batched: 52 days for the first submission and a further 45 days for each re-submission before the commencement of batching plant erection.

3. Where provisional approval has been given by the CM on site-batched concrete supply, submit to CM for approval the following documents certified by Registered Structural Engineer for the on-site concrete batching plant:
   a. Location plan of the on-site concrete batching plant;
   b. General arrangement plans with adequate details for construction;
   c. Structural and foundation plans and calculations;
   d. Approval from relevant Government Departments, where applicable.

4. Do not commence plant erection without written approval from CM;
5. Submit Form ICU 13 to CM for approval on commencement of operation of the plant at least 22 days before completion of plant erection;
6. Programme the Works by taking into account of the submission and re-submissions that may be required under sub-clauses (3) to (5);
7. Comply with sub-clauses (3) to (6) for any subsequent relocation of the on-site concrete batching plant.

**CON1.M730.7 SUPPLIER'S CERTIFICATE**

1. Obtain concrete only from suppliers who have achieved the following certification in respect of each batching plant supplying concrete under the Contract:
   a. QSPSC as stipulated in CON1.M720 for concrete production;
   b. ISO 14001 for environmental management.

2. Submit a copy of the certificates as stated in sub-clause (1) above in respect of each batching plant to the CM. All certification bodies shall be accredited by:
   a. The Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS to QSPSC in the category of product certification system;
   b. The HKAS or the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS to ISO 14001 in the category of environmental management system.

3. Newly erected batching plant shall be deemed to have achieved the certification valid for the following period if evidence is provided to CM that the concrete supplier has given written notice to the concerned certification body:
   a. QSPSC: in accordance with the Administrative Regulations of QSPSC;
   b. ISO 14001: not more than 2 months or such lesser time that is required for assessment and certification.

**CON1.M740.7 WITHDRAWAL OF CERTIFICATION**

In the event that certification in CON1.M730 is not obtained, suspended or withdrawn in respect of any supplier or batching plant supplying concrete under the Contract:

1. Inform the CM immediately and cease using concrete from that supplier or batching plant;
2. Do not resume the supply of concrete from that supplier or batching plant without Approval, notwithstanding any suspended or withdrawn certification being subsequently reinstated.

**CON1.M750.7 SITE BATCHING**

Where site batching plant is used, concrete supply from plants as defined in **CON1.M760** below may be acceptable under the following conditions provided that evidence can be furnished to the CM showing that supply from other sources, including the contingency measure proposal as required under **CON1.M1110** complying with **CON1.M730** cannot be obtained:

1. At the first two months from commencement before operation of the site batching plant;
2. After dismantling of the site batching plant with only minor concrete work including small concrete structures still outstanding.

**CON1.M760.7 SITE BATCHING PLANT**

Concrete supplied by the following plants may be acceptable if **CON1.M750** as given above is satisfied:

1. Plants operated in another Housing Authority contract by the same Contractor, and having achieved certification under the QSPSC for concrete production and ISO 14001 for environmental management as approved by CM. Evidence must also be furnished to the CM to show that the proposal shall not affect the progress and works on the projects with the proposed plants;
2. Plants operated within the Contract, without a QSPSC and/or ISO 14001 certificate may only supply concrete under the condition as stated in sub-clause (2) of **CON1.M750**, provided that the following requirements are satisfied:
   a. The operation of the plants is to comply with the Technical Regulations of QSPSC and ISO 14001 for environmental management;
   b. Minor specific deviations from the Technical Regulations to cater for smaller plants may be acceptable. These may include tolerance on weighing equipments and use of single hopper for all constituent materials. All deviations must be submitted to the CM for approval;
   c. An Independent Qualified Person (IQP) holding the qualification of MHKIE, MInsttE or MICE shall be engaged and is responsible for monitoring the quality standards of the said plant. IQP is required to submit monthly statement to CM to confirm that the required quality standards and environmental management system are maintained. Submit details of IQP to CM for approval.

**CONCRETE MIXES GENERALLY**

**CON1.M810.7 CHLORIDE CONTENT**

The total chloride content of the concrete must not exceed the limits shown in the Table below, expressed as a percentage relationship between chloride ion and cementitious content of mix:

<table>
<thead>
<tr>
<th>Type of concrete</th>
<th>Maximum total chloride content %</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prestressed concrete, Steam cured structural concrete</td>
<td>0.1</td>
</tr>
<tr>
<td>Reinforced concrete, Concrete with embedded metal</td>
<td>0.35</td>
</tr>
</tbody>
</table>
Concrete made with SRPC 0.2

CON1.M820.7 DESIGNED MIXES
Use Designed mixes for all concrete.

CON1.M830.7 USE OF SULPHATE RESISTING PORTLAND CEMENT
Do not use pulverised fuel ash with sulphate resisting Portland cement.

CON1.M840.7 USE OF PFA AND PFAC
Do not use pulverised fuel ash in addition to Portland fly ash cement.

CON1.M850.7 CONTROL OF ALKALI-AGGREGATE REACTIONS
1. Submit measures to control the occurrence of alkali-aggregate reaction in concrete for Approval;
2. In the absence of alternative proposals, the reactive alkali of concrete expressed as the equivalent sodium oxide (Na₂O) per cubic metre of concrete shall not exceed 3.0 kg:
   a. The equivalent Na₂O shall be calculated by the expression:
      \[ \text{Equivalent Na}_2\text{O} = A + B + C \]
      where
      - A is the sum of the acid-soluble alkalis (expressed as equivalent Na₂O) of cement, admixtures and water;
      - B is equal to either 1/6 the total alkalis of PFA or 1/2 the total alkalis of GGBS (expressed as equivalent Na₂O); and
      - C is equal to 0.76 times the chloride ion (Cl⁻) of the aggregate.
   b. The acid-soluble alkali content of the cement shall be determined in accordance with BS EN 196-21:1992 and shall be taken as the average of the latest 25 daily determinations of equivalent sodium oxide plus twice the standard deviation of the results;
   c. The acid-soluble alkali content of admixtures shall be determined in accordance with BS 1881:Part 124:1988;
   d. The acid-soluble alkali content of water shall be determined in accordance with BS EN 1008:2002;
   e. The total alkali content of the PFA or the GGBS shall be determined in accordance with BS EN 196-21:1992 and shall be taken as the average of 25 weekly determinations plus twice the standard deviation of the results. For a casting yard where there are less than twenty-five weekly determinations available, use the average and the standard deviation of all the available weekly determinations for calculation;
   f. The equivalent Na₂O content of the coarse and fine aggregates shall be calculated from the quantity of Cl⁻ present which shall be measured in accordance with BS 812:Part 117:1988.
3. Submit the following particulars for each concrete mix:
   a. At Contract commencement:
      i. HOKLAS-endorsed test certificates, issued in less than six months’ time from the Date of Commencement, giving the results of tests required in sub-clauses (2)(b) to (2)(f) above;
      ii. Calculation of the reactive alkali of the proposed mix.
   b. At quarterly intervals after Approval:
i. HOKLAS-endorsed test certificates giving the results of tests required in sub-clauses (2)(b) to (2)(f) above;

ii. Any further calculations necessary to demonstrate that the mix continues to comply with the limit on reactive alkali.

4. When Instructed, arrange for the parallel sampling of constituent materials in sub-clauses (2)(b) to (2)(f) by the HDMTL or the DTC for testing.

NO FINES CONCRETE

CON1.M910.7 COMPOSITION
1. Cement: Portland cement;
2. Aggregate: nominal maximum size 20 mm of which not more than 15% by mass is retained on a 20 mm BS test sieve, and not more than 10% by mass passes a 10 mm BS test sieve.

CON1.M920.7 AGGREGATE/CEMENT CONTENT RATIO
Lying within the range 10 to 15 by weight.

CON1.M930.7 CEMENT CONTENT
The cement content is such that each particle of aggregate is coated with cement paste but the compacted concrete has an open texture which permits the flow of water through the hardened concrete.

STANDARDISED DESIGNED MIX PROPORTIONS

CON1.M1010.7 CEMENT
To be Portland cement type CEM I in BS EN 197-1:2000.

CON1.M1020.7 MIX PROPORTIONS
1. Except for concrete with recycled coarse aggregates, select the mix proportions for standardised designed mix concrete from Tables A and B below. Select the appropriate content of water and water-reducing admixtures in accordance with CON1.M1170 and CON1.M1040 respectively. If mix proportions are so selected, no trial mixes as stipulated in CON1.T010 to CON1.T120 are required:

a. Fine aggregates to be within the limits of grading M in BS 882:1992;
b. Do not derive fine aggregates from concrete rubble;
c. Conduct laboratory trial mix for concrete with recycled coarse aggregates in accordance with CON1.T050 prior to Approval.

CON1.M1030.7 CONTRACTOR'S RESPONSIBILITY
Notwithstanding full compliance with the other provisions of this Worksection, the Contractor's attention is drawn to his full responsibility in ensuring compliance with the strength, workability and all other requirements for Designed mixes, taking due consideration of the characteristics of the materials used in the mix, and the Specification provisions allowed for Contractor's design within specified ranges.

CON1.M1040.7 USE OF ADMIXTURES
Do not use admixtures, other than water-reducing admixtures, without Approval.

CON1.M1110.7 SUBMISSIONS
Submit details of mix design to the CM for provisional Approval at least 7 days before trial mixes are made or, if trial mixes are not required, at least 7 days before the mix is placed in the permanent work. Include the following:

1. Quantities of each constituent per m³ of compacted concrete;
2. Details of aggregates, including specific gravities and absorbencies, in support of sub-clause (1)(a) above;
3. Nominal grading details of fine and coarse aggregates in tabular and graphic form;
4. Nominal grading details, in tabular and graphic form, of the combined aggregate;
5. Free water/cement ratio by weight;
6. Designed workability, in terms of designed slump value or designed flow value;
7. Type of plant to be used, location of offsite ready-mixed plant, and a contingency proposal to demonstrate that continuous and adequate supply of concrete can be secured in the event of disruption to the planned supply. Include in such proposal measures to mitigate sudden break down of concrete supply during concreting;

8. System of mixing, i.e. what proportion of the minimum required mixing time will be carried out at the batching plant;

9. Total chloride ion content of mix.

**CON1.M1120.7 MAXIMUM CEMENT CONTENT**

The cementitious content of any mix must not exceed:

1. 420 kg/m³ for concrete without any PFA or GGBS content, used for aqueous liquid retaining structures;

2. 450 kg/m³ for concrete containing either (a) PFA and PC, or (b) GGBS and PC or (c) PFAC, used for aqueous liquid retaining structures;

3. 550 kg/m³ for concrete used for any other structure.

**CON1.M1130.7 MINIMUM CEMENTITIOUS CONTENT**

Design mix of Grade 20 or greater in reinforced concrete or prestressed concrete to have the required minimum cementitious content, in kg/m³, given in the Table below:

<table>
<thead>
<tr>
<th>PC/PFA/GGBS Reinforced Concrete</th>
<th>Grade Strength (MPa)</th>

**CON1.M1150.7 AQUEOUS LIQUID RETAINING STRUCTURES**

Subject to the limits set out in the Table to CON1.M1130 above the minimum cementitious content for aqueous liquid retaining structures is 325 kg/m³.

**CON1.M1160.7 INCREASING CEMENTITIOUS CONTENT**

After Approval of the designed mixes, the Approved cementitious content may be increased by up to 20 kg/m³ without the CM's consent, provided that the specified maximum and minimum limits for cementitious content are maintained.

**CON1.M1170.7 MAXIMUM WATER/CEMENT RATIO**

Do not exceed the following maximum free water to cementitious material ratio figures for concrete grades 20D and above:

1. Unreinforced concrete: 0.60;

2. Reinforced concrete: 0.55 or the ratio stipulated in Table 4.2 of 'Code of Practice for Structural Use of Concrete 2004' issued by the Buildings Department, whichever is the less;

3. Aqueous liquid retaining concrete: 0.50.
MINIMUM SLUMP VALUE
The designed slump value must not be less than 75 mm except:
1. Blinding, unreinforced mass concrete and road pavement concrete;
2. Where otherwise agreed by the CM.

CEMENT CONTENT IN CONCRETE WITH PFA OR GGBS
1. When PFA is used as a partial cement replacement and incorporated into the concrete as a separate material, ensure that:
   a. For foundation works, 65% by mass of the cementitious content of the mix is Portland cement to BS EN 197-1:2000: type CEM I;
   b. For all other works, 75% by mass of the cementitious content of the mix is Portland cement to BS EN 197-1:2000: type CEM I.
2. When GGBS is used as a partial cement replacement and incorporated into the concrete as a separate material for the production of precast concrete facade, ensure that 65% by mass of the cementitious content of the mix is Portland cement to BS EN 197-1:2000: type CEM I.

ADJUSTMENT OF FINE AGGREGATES IN DESIGNED MIXES
After Approval of the designed mixes, the Approved fine aggregate content may be adjusted without the CM’s consent up to a maximum of ±20 kg per 100 kg of cementitious content provided that the adjusted mixes comply with all requirements of this Specification in respect of materials, quality and strength of such mixes.

MATERIALS FOR REMEDIAL WORK

GENERAL
Obtain Approval for all materials for remedial work.
WORKMANSHIP

HANDLING AND STORAGE OF MATERIALS

CON1.W010.7 BAGGED CEMENT
Store cement in bags:
1. In a dry, weatherproof store with a raised floor;
2. Cover every stock of more than 20 bags of cement or dry pulverized fuel ash (PFA) or dry ground granulated blast furnace slag (GGBS) entirely with impervious sheeting or place them in an area sheltered on the top and the three sides;
3. With each delivery identified and kept separate;
4. For use in the order of delivery.

CON1.W020.7 BULK CEMENT, PFA AND GGBS
Store bulk cement, PFA and GGBS:
1. In dry, weatherproof and closed silos fitted with overflow detection device so that when the silo is approaching overflowing, a high level audible alarm is triggered and the material filling stops automatically within one minute. Do not overfill silos;
2. Carry out the loading, unloading, transfer, handling or storage of bulk cement or dry PFA or dry GGBS; or any cement or dry PFA during or after the debagging process in a totally enclosed system or facility and fit any vent or exhaust with fabric filter or equivalent air pollution control system or equipment;
3. Of different types and from different sources in separate silos clearly marked to identify the different contents of each.

CON1.W030.7 AGGREGATES
1. Do not handle or store aggregates in a manner which will result in the mixing of different types and sizes or in the segregation or contamination of the aggregates;
2. Store different types and sizes of aggregates in separate hoppers or in separate stockpiles. Provide the stockpiles with well drained concrete floors and dividing walls of sufficient height to keep the different aggregates separate.

CON1.W040.7 ADMIXTURES AND CURING COMPOUNDS
1. Store admixtures and curing compounds:
   a. In sealed containers, marked to identify the contents;
   b. Protected from exposure to conditions which may affect the material;
   c. In accordance with the manufacturers’ recommendations.
2. Do not use the materials after the recommended shelf life has been exceeded.
BATCHING AND MIXING CONCRETE

CON1.W110.7 Batching Plant
1. Maintain the weighing mechanisms for all batching plant in good working order and ensure their accuracy is maintained within the tolerances given in the "Quality Scheme for the Production and Supply of Concrete" (QSPSC) issued by the Hong Kong Quality Assurance Agency (HKQAA). Check them against accurate weights and volumes at least once per month when required by the CM. Use separate weighing equipment for cement and aggregates. Arrange for calibration of all weighing mechanisms, water meters and admixture dispensers at three monthly intervals by an Approved independent consultant;
2. Obtain Approval for all dispensing equipment for admixtures which shall be accurate to within ±5% of the quantity of any admixture being used. The weights of cement, PFA, water and each size of aggregate as indicated by the mechanisms employed shall be accurate to within ±2% of the respective weights per batch agreed by the CM.

CON1.W120.7 Allowance for Water Content of Aggregates
Adjust the weights fine and coarse aggregates to allow for the free water contained in them.

CON1.W130.7 Quantity of Water
Add that quantity of water to the mix required to produce concrete of the Approved workability.

CON1.W140.7 Concrete Mixing Plant
Mixing plant must comply with BS 1305:1974 and BS 4251:1980 for batch and truck type concrete mixers respectively, and the requirement in BS 4251:1980 for revolution counters on truck mixer drum is not mandatory.

CON1.W150.7 Mixing Concrete
1. Comply with the mixer manufacturer’s recommended batch capacity, method of loading, mixing time and speed of operation and do not change mixing time without Approval;
2. For production of concrete using bagged cement, dry PFA or dry GGBS in a standard bag (not exceeding 50 kg), carry out de-bagging, batching and mixing processes in an area sheltered on the top and the three sides.

CON1.W160.7 Cement from Differing Sources
Do not use cement from differing sources without Approval:
1. In the same pour;
2. In the same structure.

CON1.W170.7 Remixing
Do not remix partially hardened concrete with or without additional cement, aggregate or water.

CON1.W180.7 Truck Mixed Concrete
When using truck mixed concrete:
1. Add water at the batching plant as agreed by the CM;
2. Do not add water in transit;
3. Do not add water at the Site without Approval.

**CON1.W190.7 CLEANSLINESS OF MIXER**

1. Do not load mixer in excess of its rated capacity and empty the mixer before recharging;
2. Clean mixers which have been out of use for more than 30 minutes before fresh concrete is mixed; and whenever there is a change in the type of cement being used.

**CON1.W200.7 LIGHT-WEIGHT CONCRETE**

Mix and place light-weight concrete as indicated on the Drawings in accordance with the aggregate manufacturer's instructions and as required by the CM.

**CON1.W210.7 WATERPROOF CONCRETE**

For concrete specified as "waterproof," incorporate water-proofing material strictly in accordance with the manufacturer's instructions, and complying with aqueous liquid retaining concrete.

**SITE RECORDS**

**CON1.W310.7 REQUIREMENT**

1. Provide delivery notes on Site, relating to each delivery of concrete available for inspection by the CM at all times and containing the following information:
   a. Serial number of delivery note;
   b. Date;
   c. Name of supplier and location of batching and mixing plant;
   d. Registration number of delivery vehicle;
   e. Name of purchaser;
   f. Name and location of the Site;
   g. Sources and actual quantities of each constituent, including admixtures, if any;
   h. Designation of concrete mix and approved workability value;
   i. Quantity of concrete;
   j. Time of introduction of cement to the mix.

2. Keep records of concreting operations on the Site available for inspection by the CM at all times, and containing the following details:
   a. Date;
   b. Designation of concrete mix and approved workability value;
   c. Serial number of delivery note;
   d. Arrival time of delivery vehicle;
   e. Time of completion of discharge;
   f. Position where concrete is placed;
   g. Results of workability tests in terms of measured slump or flow table values as appropriate;
   h. Details of test cubes markings, and whether test cubes were taken from the delivery;
i. Total quantity of each concrete mix placed that day;

j. Temperature of fresh concrete when it is placed in position where temperature control is required in accordance with CON1.W470. (For practical reasons the CM may accept that the temperature of concrete measured immediately before it is place in position is taken as the temperature of concrete when it is placed in position.)

3. For public roads and bus terminuses which will become the properties of the Highways Department of the HKSAR after the handing over of the works, submit all the related Delivery Notes and record book to the Employer on completion of the Works.

TRANSPORTING AND PLACING CONCRETE

CON1.W410.7 GENERAL
1. Transport and place concrete by Approved methods which ensure that there is no contamination, segregation or loss of the constituent materials;
2. Place and compact concrete in such a way as to avoid disturbance to the formwork and reinforcement. Where sections of the work are carried out in lifts, support the reinforcement projecting above the lift being cast to prevent movement of the bars during the casting and setting of the concrete.

CON1.W420.7 CONCRETE BATCHED OFF-SITE
For concrete batched off-site:
1. Carry the concrete in purpose made agitators operating continuously, or in truck mixers;
2. Submit to the CM for verification details of the methods for agitating the concrete during transport and immediately prior to placing.

CON1.W430.7 CLEANLINESS
1. Clean all areas where concrete is to be placed and, except for concrete placed under water, remove all standing water immediately before placing the concrete;
2. Protect slab formwork surfaces from concrete droppings and spillage during concreting.

CON1.W440.7 APPROVAL BEFORE PLACING CONCRETE
1. Do not place concrete in any part of the structure until Approval has been given;
2. Obtain Approval again if concreting is not started within 24 hours of Approval being given.

CON1.W450.7 PROCEDURE
1. Place concrete continuously between construction joints as close as practicable to its final position;
2. Do not allow concrete to free fall in excess of 2.7 m unless otherwise Approved;
3. Deposit concrete in horizontal layers to a compacted depth not exceeding 450 mm where internal vibrators are used or 150 mm in all other cases unless otherwise Approved. Do not force concrete into place by vibrator;
4. Do not place fresh concrete against insitu concrete which has been in position for more than 30 minutes unless the insitu concrete has been kept damp with a layer of wet hessian and protected from the weather to the satisfaction of the CM;
5. When insitu concrete has been in place for 4 hours or in the opinion of the CM the concrete has stiffened to such an extent that it no longer responds to the action of an internal vibrator, do not place further concrete against it for a further 20 hours unless otherwise Approved and form a construction joint in accordance with CON1.W510 to CON1.W570 as appropriate;

6. Compact concrete in its final position within 2½ hours of the introduction of cement to the mix. Concrete, which in the opinion of the CM is no longer sufficiently workable, will be rejected;

7. Place concrete by skip or such other Approved methods as specified by the requirements of the Specifications;

8. Do not place concrete in flowing water.

CON1.W460.7 USE OF TRUNKING AND CHUTES
Keep trunking or chutes clean and use them in such a way as to avoid segregation.

CON1.W470.7 TEMPERATURE CONTROL IN MASSIVE STRUCTURAL ELEMENTS
1. Submit to the CM for approval details of measures on control of fresh concrete to a temperature not higher than 30°C for mixes of grade strength greater than 20 MPa. The CM may reject any concrete for which the temperature, as measured on Site by the DTC, exceeds 30°C;

2. Submit the followings to the CM for approval on the temperature control for massive structural elements as specified in the Project Specific Specification at least two months before concreting:
   a. A method statement of the proposed temperature control; and
   b. A monitoring strategy and its substantiation.

FORMING CONSTRUCTION JOINTS

CON1.W510.7 LOCATION OF JOINTS
1. Obtain Approval for the position and details of any construction joints not specified in the Contract;

2. Arrange such joints so as to minimise the possibility of the occurrence of shrinkage cracks;

3. Arrange construction joints horizontally or vertically unless otherwise Approved.

CON1.W520.7 AQUEOUS LIQUID RETAINING STRUCTURES
1. Cast the bottom slab and walls of aqueous liquid retaining structures in one operation where no pre-determined construction joints are specified, unless otherwise Approved;

2. Where construction joints are shown on Drawings, provide Approved proprietary type waterstops at construction joints and:
   a. Securely fix waterstops in position to formwork in such a manner that compaction of the concrete will not be affected;
   b. Make in-situ joints in waterstops using methods and equipment recommended by the manufacturer;
   c. Protect exposed waterstops from exposure to conditions that may affect the waterstops; and
   d. Keep the waterstops free from rust, hydrocarbons and other deleterious material.
CON1.W530.7 WALLS AND COLUMNS
Finish the upper surface of lifts of concrete walls and columns horizontally and clean the formwork of adhering concrete before the next lift is placed.

CON1.W540.7 EXPOSING AGGREGATE
Remove laitance and all loose material and expose the aggregate by an Approved method as soon as is practical after casting, but:
1. Where an air jet is used—allow a minimum period of 4 hours after casting to elapse;
2. Where a water jet is used—allow a minimum period of 12 hours after casting to elapse.

CON1.W550.7 FOOTINGS AND PILE CAPS PREPARED BY OTHERS
Where the footings or pile caps have been constructed by others:
1. Hack off and expose aggregate by an Approved method of all construction joints of columns and walls on footings and pile caps prepared by a previous contractor;
2. Remove the cement slurry coating on column and wall starter bars.

CON1.W560.7 PLACING ADJACENT CONCRETE
Ensure the surface of the construction joint is clean and moist when fresh concrete is placed against it.

CON1.W570.7 INTERRUPTED POURS
If placing of concrete has to be unexpectedly stopped, form construction joints in accordance with the provisions of the preceding clauses of this subsection.

CON1.W580.7 CONSTRUCTION JOINTS FOR CONCRETE CARRIAGeway AND PAVED AREA
Arrange construction joints normal to the axis or plane of the element being constructed unless otherwise permitted by the CM.

COMPACTION

CON1.W610.7 GENERAL
Compact concrete to produce a dense homogeneous mass with vibrators unless otherwise Approved and:
1. Provide types of vibrating equipment which will effectively compact the concrete;
2. Provide a sufficient number of vibrators in serviceable condition on Site to ensure that reserves are always immediately available in the event of breakdowns.

CON1.W620.7 VIBRATING EQUIPMENT
To BS 2769:Part 2:1984 and:
1. Internal vibrators: operating at a minimum of 10,000 cycles per minute;
2. External vibrators: operating at a minimum of 3,000 cycles per minute;
3. Vibrating tables: operating at a minimum of 5,000 oscillations per minute may be used for pre-cast elements subject to Approval;
4. Do not use external clamp-on type vibrators without Approval.

**CON1.W630.7 USING VIBRATORS**

Use vibrators in such a manner that vibration is applied continuously and systematically during placing of the concrete until the expulsion of air has practically ceased and:

1. Do not use vibrators in a manner which will result in segregation;
2. Do not apply vibration by way of the reinforcement;
3. Where vibrators of the immersion type are used, avoid all contact with reinforcement, formwork and inserts as far as is practicable;
4. Do no use vibration as a means of distributing concrete into position.

**CON1.W640.7 NEW CONCRETE**

Do not vibrate concrete between 4 and 24 hours after compaction.

**CON1.W650.7 COMPACTING NO-FINES CONCRETE**

Compact using a minimum amount of punning.

**PUMPING CONCRETE**

**CON1.W710.7 CM'S APPROVAL**

Do not use concrete pumps without prior Approval.

**CON1.W720.7 PUMPING EQUIPMENT**

Operate and maintain concrete pumps in accordance with the manufacturer's recommendations and:

1. Keep pumps and pipelines maintained in a clean condition;
2. Do not use pipelines with internal surfaces of aluminium;
3. Ensure joints in pipelines are tightly fixed and do not permit grout loss.

**CON1.W730.7 PIPELINES**

Position concrete pumps such that pipelines are as short and straight as practicable and require as little repositioning as practicable and arrange bends in such a manner that the concrete, formwork, reinforcement or built-in components are not disturbed.

**CON1.W740.7 LUBRICATING PIPELINES**

Lubricate pipelines by passing cement grout or concrete through the pipeline before the concrete is pumped. Do not place the initial discharge of pumped concrete in the permanent work.

**PLACING CONCRETE UNDER WATER**

**CON1.W810.7 GENERAL**

Do not place concrete underwater without prior Approval.
CON1.W820.7 STANDARD
Place underwater concrete in accordance with the recommendations given in BS 8004:1986.

CON1.W830.7 TREMIES
Securely support tremies used to place concrete in position and ensure the joints are watertight. Use a temporary seal of an Approved type to keep the water and the concrete separate at the start of concreting.

CON1.W840.7 PROCEDURE
After the concrete is flowing, raise the tremie in a manner agreed by the CM and:
1. Keep the lower end of the tremie immersed in the concrete to a depth of a least 1m;
2. Prevent water, mud and other deleterious material from entering the tremie after concreting has started.

CON1.W850.7 DEALING WITH BLOCKAGES
Unless otherwise permitted by the CM, stop concreting immediately if the tremie becomes blocked or is removed from the concrete and:
1. Do not recommence concreting for at least 24 hours without Approval;
2. Remove contaminated concrete before concreting recommences.

CON1.W860.7 SURCHARGE AND CONTAMINATED CONCRETE
1. Surcharge concrete placed by tremie above the specified level by an amount which is sufficient to allow for the removal of any contaminated concrete;
2. Remove contaminated concrete.

LAYING HOLLOW BLOCK FOR SLABS

CON1.W910.7 GENERAL
See CON2.W300.

WATERTIGHT BASEMENT CONSTRUCTION

CON1.W1010.7 GENERAL
Ensure that the completed work is free from leaks and damp patches.

CON1.W1020.7 BLINDING LAYER
Lay blinding layer to the grade and thickness shown on the Drawings, to form a clean and dry base for the main structural slab, ensuring that there is no loss of cement to, nor gain of water from the base.

CON1.W1030.7 WATER/VAPOUR PROOF MEMBRANE
Exercise special care to prepare the surface for application of asphalt waterproofing in accordance with Worksection WAT1 and to avoid damage to the membrane after application.
**FORMWORK TIES**

Use only formwork-ties which leave no open holes through the concrete.

**CONCRETE SUPPLY**

If ready-mixed concrete is used, supply to the site at regular intervals.

**CONSTRUCTION JOINTS**

1. Provide waterstops as specified in CON6.M210 and CON6.W210 to CON6.W230 for all construction joints, plan the positions of the construction joints according to planned daily production of concrete and keep their number to a minimum;

2. Position the joint between the base slab and the walls a minimum of 250 mm above the top of the base slab.

**GROUND WATER**

Keep ground water levels below the blinding level so that the cast concrete will not be subjected to water pressure until it has attained sufficient strength.

**REMEDIAL WORK TO LEAKS ETC.**

Carry out remedial work required to eliminate any leaks and damp patches that occur, and obtain Approval of method to be used.

### MASS CONCRETE RETAINING WALLS

**CONCRETE GRADE**

Grade 20/20, unless otherwise specified.

**ADDED STONES AND BOULDERS**

The addition of granite stones or boulders will be Approved provided that their weight does not exceed 20% of that of the finished concrete and that any two stones or boulders are spaced at a clear distance of at least 225 mm.

**WEEP HOLES**

Build in 75 mm diameter plastic weep pipes through the full thickness of walls, falling to the outside and spaced at staggered centres of 1.5 m.

**TEMPERATURE CONTROL**

Comply with the provisions of CON1.W470 when specified grade strength greater than 20 MPa.

### GROUND SLABS

**LAYING UNDERLAYS TO SLABS LAID ON HARDCORE**

Lap and tape underlays at least 300 mm at joints.

**BLINDING LAYER**

Unless otherwise specified, provide a blinding layer of Grade 15/20 concrete to underside of all reinforced concrete works in contact with earth to the following thicknesses:
1. Pilecaps and footings: 75 mm;
2. All other cases: 50 mm.

KICKERS

WALLS AND COLUMNS
See CON2.W410 to CON2.W440.

CURING

METHODS OF CURING - GENERAL
1. Immediately after compaction, protect finished concrete against the harmful effects of weather, running water and drying out;
2. Close any cracks developed on the concrete surface immediately while the concrete is still plastic with suitable methods such as trowelling and brushing before curing;
3. Ensure proper protection by using one of the following methods which are minimum requirements and apply them for the minimum periods stated in CON1.W1490:
   a. Method A (as CON1.W1420): For all concrete slabs in domestic floors and transfer structures except for areas which in the opinion of the CM are of such irregular shape which renders the method impractical;
   b. Method F (as CON1.W1470): For caps or footings where the least dimension exceeds 500 mm;
   c. Methods B, C, D or E (as CON1.W1430 to CON1.W1460): At the Contractor's option for all other concrete elements including domestic floor slabs and transfer structures with irregular shapes.
4. Where concrete is to be kept moist by spraying water for curing methods stipulated in sub-clause (3), or during temporary removal of the protection to facilitate construction stipulated in CON1.W1500, take due consideration and necessary measures to avoid thermal shock to the concrete.

CURING - METHOD A
Cover the concrete with waterproof Approved tarpaulin sheets of good quality and condition suitable for the intended purpose, and:
1. Make tarpaulin sheets to size to suit the shape, size and number of slab panels such that the number of tarpaulin sheets to cover the area is as few as is practical;
2. Lap tarpaulin sheets 600 mm (minimum) at joints;
3. Effectively hold down the tarpaulin sheets during the curing period in such a manner as not to damage the concrete surface;
4. Ensure the concrete is constantly moist;
5. For strips not more than 300 mm wide around walls or columns, use hessian or similar absorbent material in lieu of tarpaulin sheets and keep constantly wet.

CURING - METHOD B
Except for surfaces against which concrete or applied finishes have subsequently to be placed, cure the concrete by the application of an Approved liquid curing compound and apply:
1. By means of a low-pressure spray at the rate recommended by the manufacturer;
2. On horizontal surfaces immediately after finishing the concrete;
3. On vertical surfaces immediately after removing the formwork.

**CON1.W1440.7 CURING - METHOD C**

After thoroughly wetting, cover the concrete with polyethylene sheeting, lapped and securely held in position in such a manner as not to damage the concrete surface, and ensure the concrete is kept constantly moist.

**CON1.W1450.7 CURING - METHOD D**

Cover the concrete with a layer of fine aggregate minimum 25 mm thick, then hessian, sacking, canvas or similar absorbent material, lapped and securely held in position in such a manner as not to damage the concrete surface. Keep this covering layer constantly wet.

**CON1.W1460.7 CURING - METHOD E**

1. Cover the concrete with polythene sheeting, lapped and securely held in position in such a manner as not to damage the concrete surface, until the concrete has hardened sufficiently for water curing to be carried out;
2. Water cure by spraying the concrete surface continuously with water or by ponding immediately after the sheeting is removed.

**CON1.W1470.7 CURING - METHOD F**

After thoroughly wetting the concrete, cover with polyethylene sheeting, lapped and securely held in position in such a manner as not to damage the concrete surface, and ensure the concrete is kept moist. For horizontal concrete surfaces where this process cannot be practically carried out, such as at columns and walls with starter bars, cover the surfaces with a layer of fine aggregate at least 100 mm thick.

**CON1.W1480.7 PROTECTION OF NEW CONCRETE FROM THE WEATHER**

Provide adequate amount of polyethylene sheets to protect freshly placed concrete against heavy rain as required or directed by the CM.

**CON1.W1490.7 MINIMUM PERIODS OF PROTECTION FOR CONCRETE**

1. Maintain the following minimum curing periods after the concrete has been placed:

<table>
<thead>
<tr>
<th>Type of Structure</th>
<th>Method of Protection</th>
<th>Minimum Period of Protection of Concrete</th>
<th>Minimum Period of Protection (Days)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>

<tr>
<td></td>
<td>F</td>
<td>10</td>
<td>10</td>
</tr>
<tr>
<td>Others</td>
<td>B</td>
<td>7</td>
<td>7</td>
</tr>
</tbody>
</table>
2. The figures given in the above table may be reduced by the number of days during which formwork has been left in place.

**CON1.W1500.7  TEMPORARY REMOVAL OF PROTECTION**
Where protection to concrete slabs must temporarily be removed to facilitate setting out or other follow-up operations, ensure that the exposed concrete is adequately sprayed with water and kept moist for the duration of these operations and that the protective covering is restored as soon as practicable.

**CON1.W1510.7  ENHANCED CURING CONTROL IN ROOF SLAB**
1. In addition to the curing measures in CON1.W1410, provide the following enhanced curing control to the roof slab of domestic blocks:
   a. Artificial fogging from nozzles to the concrete slab surface immediately after concrete is cast until the slab is properly protected;
   b. Ensure that the protection is implemented at the shortest possible time but shall not be more than two hours under all circumstances.
2. Where specified in Project Specific Specification, cast the wing slabs and central core slab in separate pours and allow for late cast strips between the slabs.

**LOADING NEW CONCRETE STRUCTURES**

**CON1.W1610.7  LIMITATIONS**
Unless otherwise specified, do not subject concrete at any time to a loading which will induce a compressive stress exceeding 33% of the compressive strength of the concrete at the time of loading, or of the grade strength whichever is the least and:
1. When determining the loading, make due allowance for the self-weight of the concrete;
2. For the purpose of this clause, the assessment of the strength of concrete and the stresses produced by the loads is subject to Approval.

**WORKED FINISHES TO CONCRETE**

**CON1.W1710.7  TYPES OF FINISH**
Apply to the following finishes where shown or scheduled on the Drawings and execute in an Approved manner:
1. Wood float: to give an even textured surface;
2. Steel trowel or power float: to give a smooth untextured surface;
3. Scratch with a stiff brush: to give a slightly roughened even texture;
4. Tamp with the edge of a board: to give an even texture of parallel ribs.

**CON1.W1720.7  ADDED CEMENT OR WATER**
Do not, without Approval:
1. Wet the surface to assist working;
2. Add cement to produce the specified finish.
CON1.W1730.7 PROTECTION OF LIVING ROOM FLOORS
Protect from damage the power float finish of all living room floor slabs of domestic flats. Obtain Approval for method of protection.

APPLIED SURFACE FINISHES

CON1.W1810.7 HARDENING
Where shown or scheduled on the Drawings mix the concrete with an Approved hardening admixture in accordance with the manufacturer's recommendations.

CON1.W1820.7 SURFACE HARDENING
Where shown or scheduled on the Drawings, apply an Approved liquid surface hardener in accordance with the manufacturer's recommendations.

CON1.W1830.7 METALLIC OR MINERAL TREATMENTS
Where shown or scheduled on the Drawings, apply an Approved metallic or mineral surface treatment in accordance with the manufacturer's recommendations.

CRACK REPAIR

CON1.W1910.7 GENERAL
All visual cracks to hardened structural and non-structural concrete in domestic and non-domestic buildings discovered during the construction period and/or Maintenance Period, whether they are less than, equal to or greater than the calculated maximum crack width as stated in Code of Practice for Structural Use of Concrete 2013, shall be regarded as defects, imperfections or faults for which the Contractor is liable under GCC Clause 10.3(2), unless such cracks are proved by the Contractor to be due to a design fault of the Authority. If any cracks prove to be due to a design fault of the Authority, then the expense incurred in any investigation and remedial work carried out by the Contractor, as hereunder specified, will be valued in accordance with GCC Clause 10.3(3).

CON1.W1920.7 INVESTIGATION
Investigate all visual cracks as directed by the CM and repair in accordance with the classification methods described in the Table contained in CON1.W1990.

CON1.W1930.7 METHOD STATEMENT
Before commencement of repairs to cracks, submit, for Approval, a method statement detailing the materials and methods to be used.

CON1.W1940.7 CONTRACTOR'S RESPONSIBILITY
1. Take responsibility for initiating the inspection of cracks and the programming of subsequent remedial repairs to ensure all such cracks are repaired before hand-over of the structures to the Authority;
2. Likewise define and repair all visible cracks discovered during the Maintenance Period in accordance with the remaining clauses in this Section.

CON1.W1950.7 PROCEDURE FOR CLASSIFICATION - TYPE OF MEMBER
Types of elements are classified in this specification as follows:
1. (U) All concrete placed below ground level which is not part of a water-retaining structure or water barrier;
2. (S) Slabs (including ribbed slabs): horizontal or inclined elements of concrete in which two dimensions in the horizontal or inclined plane exceed the dimension in the vertical plane;
3. (B) Beams: horizontal elements of concrete in which one dimension in the horizontal plane exceeds the other dimension in the horizontal plane and also exceeds the dimension in the vertical plane;
4. (W) Walls: vertical elements of concrete in which one dimension in the vertical plane and one dimension in the horizontal plane both exceed the other dimension in the horizontal plane;
5. (C) Columns: vertical elements in which one dimension in the vertical plane exceeds the other two dimensions in the horizontal plane.

**CON1.W1960.7**  
**PROCEDURE FOR CLASSIFICATION - WIDTH OF CRACK**

Determine the width of the crack at the surface of the concrete with the aid of a transparent sheet on which lines of different width are printed or by examining the crack with a low power microscope incorporating a measuring graticule. The classifications of crack width in this specification are:

1. F: maximum width at any point 0.3 mm or less.
2. C: maximum width at any point greater than 0.3 mm.

**CON1.W1970.7**  
**PROCEDURE FOR CLASSIFICATION - DEPTH OF CRACK**

Determine the depth of a crack in one of the following ways:

1. Slabs: observe whether water on the top surface of the slab passes through the crack and can be seen as a moistened patch on the underside of the slab:
   a. If water is seen to pass through the slab, the crack is deemed to be a through crack of type T;
   b. In all other cases it is deemed to be a non-through crack of type NT.
2. In all other elements, if the line of the crack on one surface can be traced on another surface parallel to the first surface or in the case of a beam, if the crack can be seen to traverse two adjacent surfaces in different planes, it is deemed to be a through crack of type T;
3. If a crack follows an irregular pattern on one surface of an element only and is branched at least two points it is deemed to be a non-through crack of type NT.

**CON1.W1980.7**  
**METHODS OF REMEDIAL REPAIR**

Use the following permissible methods for rectifying cracks according to the overall classification of the crack as given in the table in CON1.W1990:

1. Simply surface seal the crack by brushing into it, wherever it is visible, a coat of heavy grade bitumastic paint or other approved durable inert waterproof material;
2. Fill the crack by brushing in dry cement and moistening after the treatment;
3. Brush cement grout or cement paint into the crack until it appears to be filled;
4. Cut a V-groove and fill with repair mortar, applied in accordance with the manufacturer's recommendations, or other equivalent Approved material;
5. Seal by arranging for a low viscosity polymer resin to flow, under the influence of gravity or injection, into the crack to fill it and harden;
6. Inject epoxy resin under pressure into the crack until it exudes at weep holes located so as to ensure that when this occurs the crack may reasonably be expected to have been completely filled and all air to have been displaced by resin; and

7. Apply the method in sub-clause (6), and a coat of heavy grade bitumastic paint over the surface of the crack or other method as approved by CM.

CON1.W1990.7  REPAIR ACCORDING TO CLASSIFICATION

Carry out crack repair according to the treatment method in the following table unless otherwise instructed by CM:

<table>

TOLERANCES

CON1.W2010.7  GENERAL

1. For tolerances other than civil engineering works and slopeworks, refer to:
   a. Code of Practice for Structural Use of Concrete 2013 published by the BD;
   b. Appendix H "Schedule of Tolerances" to this Specification;
   c. Where any ambiguity, discrepancy or conflict arises between sub-clauses 1(a) and 1(b) above, the provisions given in Appendix H shall prevail.

2. For any abrupt projections in excess of 5 mm at inner surfaces of liftwell walls:
   a. Use Approved non-shrink cementitious material to form a hard smooth surface to splay the abrupt projections, to an angle of not less than 75º from the horizontal plane, and extend for a distance of not less than 20 mm;
b. Submit remedial details for the CM’s approval.

3. For civil engineering works and slopeworks, tolerances given in this Worksection should be read in conjunction with additional tolerances given in Worksection FOR. Tolerances on joints:
   a. The best fit straight line of straight joints shall be within 25 mm of a specified line. The line of straight joints shall be within 10 mm of the best fit straight line;
   b. The best fit curved line of curved joints shall be as agreed by the CM and shall be within 25 mm of the specified line. The line of curved joints shall be within 10 mm of the best fit curved line;
   c. Joints shall be continuous across intersections of joints to within 5 mm of the best fit straight lines or best fit curved lines of each joint.
TESTING

TRIALS OF DESIGNED MIXES

CON1.T010.7 REQUIREMENT FOR TRIAL MIXES
1. Trial mixes are not required for Designed mix of grade strength 20 MPa and below;
2. Where a Designed mix of grade strength above 20 MPa is to be used, carry out trial mixes to determine the suitability of the proposed mix proportions for production of concrete of the required quality, at the intended workability for compaction of the concrete in the position, shape and location as described on the Drawings.

CON1.T020.7 TIMING OF TRIALS
Prepare trial mixes on receipt of the provisional Approval of the mix design and complete at least 35 days before commencement of concreting.

CON1.T030.7 PLANT AND LABORATORY TRIALS
Testing arrangements:
1. Make trial mixes for mix designs details under CON1.M1110 using the plant proposed for the Works for Plant Trials and in an Approved Laboratory for Laboratory Mix Trials. Sample the concrete, make and test concrete cubes in accordance with CS1:2010;
2. Plant Trials may be required, if test or trial mix data for designed mix of the proposed grade with similar materials to that of the proposed mix and produced in plant other than that proposed for the Works are submitted and are acceptable to the CM;
3. Laboratory Mix Trials may be required, if test or trial mix data for designed mix of similar grade or with different materials to that of the proposed mix and produced in plant proposed for the Works are submitted and are acceptable to the CM;
4. Laboratory Mix Trials may be required in addition to Plant Trials, if no satisfactory test or trial mix data for designed mix concrete or if test or trial mix data submitted do not demonstrate the suitability of the proposed plant and mix design.

CON1.T040.7 PROCEDURE OF PLANT TRIALS
Testing samples:
1. Make one trial mix on each of three different days for each mix design using materials typical of the proposed supply, the volume of each to be at least 60% of the nominal volume of the mixer’s discharge;
2. Take three samples on each day from each mix in accordance with the sampling method stipulated in CS1:2010;
3. Allow sufficient size of each sample for the following:
   a. Carry out one slump test or one flow table test as instructed by the CM to determine the workability;
   b. Make two test cubes for compressive strength test at 28 days.
4. For the GGBS concrete in the production of precast facade, make two additional test cubes on each day for compressive strength test at the time of demoulding.
**PROCEDURE OF LABORATORY MIX TRIALS**

Testing samples:
1. Make 3 separate batches of concrete for each mix design using materials typical of the proposed supply;
2. Take one sample from each batch in accordance with the sampling method stipulated in CS1:2010;
3. Allow sufficient size of each sample for the following:
   a. Carry out two slump tests or two flow table tests as instructed by the CM to determine the workability;
   b. Make six test cubes for compressive strength test at 28 days.

**STANDARD FOR APPROVAL OF PLANT TRIALS**

1. The results of tests for compressive strength at 28 days of the test cubes must comply with the following requirements:
   a. The average strength of the eighteen test cubes exceeds the specified characteristic strength by at least 12 MPa;
   b. The compressive strength of each individual test cube exceeds the specified characteristic strength by at least 5 MPa.
2. The results of tests for workability must comply with the following requirements:
   a. Slump test:
      i. The range of the three measured slump values for each day must not exceed 20% of the average of the three measured slump values;
      ii. The average of the nine measured slump values for the three days must fall within ±20 mm or ±25% of the designed slump value, whichever is the greater.
   b. Flow table test:
      i. The range of the three measured flow values for each day must not exceed 70 mm;
      ii. The average of the nine measured flow values for the three days must fall within ±50 mm of the designed flow value.
3. The results of tests for compressive strength of concrete in precast facade at demoulding of the test cubes must comply with the following requirement:
   a. The compressive strength of each individual test cube attains a compressive strength of at least 15 MPa.

**STANDARD FOR APPROVAL OF LABORATORY MIX TRIALS**

1. Except for concrete of grade strength 20 MPa with recycled coarse aggregates, the results of tests for compressive strength at 28 days of the test cubes must comply with the following requirements:
   a. The average strength of the eighteen test cubes exceeds the specified grade strength by at least 14 MPa, or 10 MPa if test data submitted show that the operating standard deviation of the proposed plant does not exceed 5.5 MPa and the data are acceptable to the CM;
   b. The compressive strength of each individual test cube exceeds the specified grade strength by at least 7 MPa, or 3 MPa if test data submitted show that the operating standard deviation of the proposed plant does not exceed 5.5 MPa and the data are acceptable to the CM.
2. For concrete of grade strength 20 MPa with recycled coarse aggregates, the compressive strength of each individual test cube at 28 days shall exceed the specified grade strength by at least 6 MPa;
3. The results of tests for workability must comply with the following requirements:
   a. Slump test: the average of the six measured slump values for the three batches must fall within ±20 mm or ±25% of the designed slump value, whichever is the greater;
   b. Flow table test: the average of the six measured flow values for the three batches must fall within ±50 mm of the designed flow value.

**CON1.T085.7 PROVISIONAL APPROVAL OF PLANT AND LABORATORY MIX TRIALS**

Provisional approval of the proposed mixes based on 7-days cube results may be given provided that the following are satisfied:

1. Prepare test cubes (from the corresponding batch of concrete taken for 28-days strength test) for compressive strength test at 7 days in accordance with CON1.T040 and CON1.T050;

2. The results of tests for compressive strength at 7 days of the test cubes must comply with CON1.T070 and CON1.T080 except that the specified grade strength (and the difference between average strength/individual compressive strength and specified grade strength) given in CON1.T070 and CON1.T080 can be reduced by 25%;

3. The results of tests for workability comply with the specified requirements;

4. If the results of tests for compressive strength at 28 days of the test cubes are subsequently found not to comply with CON1.T070 and CON1.T080, the provisional approval of concrete shall be nullified. The concrete cast for the works based on the provisional approval shall be deemed to be unacceptable and where necessary, carry out Approved remedial works and bear all the cost and time of such works.

**CON1.T090.7 NON-COMPLIANCE**

If the result of any test for workability or strength of trial mix concrete does not comply with the specified requirements, further trial mixes are to be made until the results of every test complies with the specified requirements of trial mix concrete.

**CON1.T100.7 VARIATIONS TO APPROVED MIXES**

When the mix has been Approved do not make variations in the proportions and sources of materials or in the type, size and grading of aggregates without the consent of the CM, who may require further trial mixes to be made.

**CON1.T110.7 PRACTICAL TESTS FOR SUITABILITY OF THE MIX**

The CM may also require practical tests to be made on Site by filling trial moulds or by pumping to confirm the suitability of the mix for the Works. Ensure that, in such tests, the type of plant used for mixing, transporting and placing, the method of compaction used, the formwork face to the mould and the size and disposition of reinforcement are similar in all respects to those intended for use in the Works.

**CON1.T120.7 CERTIFIED EVIDENCE OF MIX SUITABILITY**

Trial mixes need not be made, if test or trial mix data for designed mix of the proposed grade with similar materials to that of the proposed mix and produced in the plant proposed for the Works are submitted and are acceptable to the CM.
SAMPLING AND TESTING GENERALLY

CON1.T205.7 GENERAL

When Instructed:

1. Arrange and provide attendance necessary for the sampling of cement, PFA, GGBS, aggregates (excluding recycled aggregates) and other concrete constituent materials by the DTC; and

2. Submit the samples to the CM in accordance with CON1.T220 to CON1.T240.

CON1.T210.7 DEFINITION OF "BATCH"

In this Specification:

1. A batch of cement, PFA, GGBS, aggregate, admixture or curing compound is defined as any quantity of the material of the same type, manufactured or produced at the same time in the same place, covered by the same certificates and delivered to the site, or stored at the ready-mixed concrete plant, at any one time;

2. A batch of fresh concrete for testing purposes is as defined in clause 1.2 of CS1:2010.

CON1.T220.7 SAMPLES FOR TESTING BY DIRECT TESTING CONTRACTOR (DTC)

When Instructed, arrange and submit to the CM, one sample of each type of material, from each specified concreting day that the concrete is placed in the permanent work, for testing by Direct Testing Contractors (DTC) employed by the Housing Authority.

CON1.T230.7 TESTING PROGRAMME

For recycled aggregates to be tested by DTC, ascertain and allow sufficient time for carrying out the tests and issue of test results by DTC.

CON1.T240.7 SAMPLE SIZES

When Instructed, take samples of the sizes and using the methods of sampling stated in the Table below:

<table>
<thead>
<tr>
<th>Material</th>
<th>Size of Sample</th>
<th>Method of Sampling</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cement</td>
<td>20 kg</td>

</tbody>
</table>
SAMPLING

CON1.T320.7 COARSE AND FINE AGGREGATES
1. Except for recycled coarse aggregates, the DTC shall sample coarse and fine aggregates at each stockpile and carry out sieve analyses only when instructed by the CM;
2. For recycled coarse aggregates from a particular source, the DTC shall carry out tests stipulated in CON1.T410 once at the start of the Contract and at weekly intervals thereafter.

CON1.T330.7 WATER FOR MAKING CONCRETE
1. If clean fresh water from Water Supplies Department mains supply is not available, provide:
   a. One sample of water at the same time as particulars of the water are submitted to the CM in accordance with PRE.B10.1230 or PRE.C11.090 as appropriate; and
   b. One sample of water, for testing by the DTC, during each month that the concrete is being placed in the permanent work unless otherwise Approved.
2. For recycled water specified in CON1.M320:
   a. Arrange to use laboratories which has obtained HOKLAS accreditation to carry out the required tests, unless otherwise permitted by the CM;
   b. Obtain samples of recycled water at each batching plant for testing by the Approved laboratory according to the test frequency in the following table:

<table>
<thead>
<tr>
<th>Property</th>
<th>Limit</th>
<th>Test method</th>
<th>Test frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>(i) Density</td>
<td>≤ 1,030 kg/m³</td>
<td>BS 718:1991 Appendix E (Alternative test method may be used subject to the CM's approval)</td>
<td>At least once per day</td>
</tr>
<tr>
<td>(ii) Initial setting time of cement with recycled water</td>
<td>Deviation not earlier than 1 hour and not later than 1.5 hour as from that of control cubes (Test in parallel with those using recycled water is required on control cubes using clean fresh water only to determine the initial setting time and the deviation)</td>
<td>BS EN 196-3:1995</td>
<td>Once every 3 months for the first year; once every 6 months for subsequent years</td>
</tr>
<tr>
<td>(iii) Chloride content (as Cl)</td>
<td>≤ 500 ppm</td>
<td>American Public Health Association (APHA) Standard, APHA 4500-Cl-B, 18th edition (1992)</td>
<td>Once every week for the first two months; once every month for subsequent months</td>
</tr>
<tr>
<td>- Prestressed concrete or steam cured structural concrete</td>
<td>≤ 1,000 ppm</td>
<td>APHA 4500-Cl-B, 18th edition (1992)</td>
<td></td>
</tr>
<tr>
<td>- Concrete with reinforcement or other embedded metal</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>(iv) Sulphate content (as SO₄²⁻)</td>
<td>≤ 3,000 ppm</td>
<td>APHA 4500-SO₄²⁻-C, 18th edition (1992)</td>
<td></td>
</tr>
</tbody>
</table>
c. Submit test reports to the CM to show that the recycled water is in compliance with this Specification;

d. If the test results do not comply with the limits:

i. Suspend the use of recycled water immediately and carry out investigation to propose remedial works;

ii. Submit two sets of consecutive satisfactory test results taken from the same source for CM's consideration to resume the use of recycled water for subsequent concrete mixing.

CON1.T340.7 FRESH CONCRETE

Testing arrangements:

1. Sampling of concrete for testing will be carried out by the DTC in accordance with the requirements given in CS1:2010 and as follows:

a. Location of batches to be sampled: as required by the CM;

b. The times of day at which samples are taken will be at random;

c. Frequency of sampling for compressive strength testing:

i. Except for concrete of grade strength 20 MPa with recycled coarse aggregates, the sampling rates are as set out in the table below, provided that a minimum of one sample is taken from each mix of concrete produced on any one day. Where the type of structure is not specified all concrete is deemed to be for 'other types' of structure;

<table>
<thead>
<tr>
<th>Types of Structure</th>
<th>Approximate quantity of concrete to be represented by each sample</th>
</tr>
</thead>
<tbody>
<tr>
<td>Masts, Cantilevers with span ≥3 m, Prestressed elements, Columns and shear walls, Transfer beams and transfer plates, other critical elements</td>
<td>10 m³ or 10 batches whichever is the smaller volume</td>
</tr>
<tr>
<td>Other types</td>
<td>25 m³ or 25 batches whichever is the smaller volume</td>
</tr>
<tr>
<td>Solid rafts, Pile caps, Mass concrete</td>
<td>100 m³ or 100 batches whichever is the smaller volume</td>
</tr>
</tbody>
</table>

ii. For concrete of grade strength 20 MPa with recycled coarse aggregates, make four test cubes for compressive strength testing on each concreting day, two to be tested at 7 days and two at 28 days;

iii. For concrete of grade 15/20 or below, take a minimum of one sample per 100 m³, irrespective of concreting day, for compressive strength test.

d. To determine the workability of the concrete: one sample of concrete from each batch of concrete;

e. The CM may agree to a reduced frequency of sampling for exceptionally large pours;

f. For concrete used for construction of hoardings and associated covered walkways and gantries, the frequency of sampling stated in the sub-clauses (1)(c) and 1(d) above may be reduced at the discretion of the CM.
2. Sampling of GGBS concrete in the production of precast facade for testing will be carried out by an Approved testing laboratory appointed by the Contractor as stated in CON7.T110 in accordance with sub-clause (1) above.

CON1.T350.7 FACILITIES FOR SAMPLING FRESH CONCRETE

Provide, at the normal point or points of discharge of the mixer, a mobile shelter/shelters to accommodate workability test and cube making processes.

TESTS ON AGGREGATES

CON1.T410.7 STANDARD

1. The DTC shall test recycled coarse aggregates for the following properties:

<table>
<thead>
<tr>
<th>Requirements</th>
<th>Limits</th>
<th>Testing Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum dry particle density</td>
<td>2000 kg/m³</td>
<td>BS 812:Part 2:1995</td>
</tr>
<tr>
<td>Maximum water absorption</td>
<td>10%</td>
<td>BS 812:Part 2:1995</td>
</tr>
<tr>
<td>Maximum content of wood and other material less dense than water (by mass)</td>
<td>0.5%</td>
<td>Manual sorting in accordance with BRE Digest 433</td>
</tr>
<tr>
<td>Maximum content of other foreign material (e.g. metals, plastics, clay lumps, asphalt and tar, glass etc.) (by mass)</td>
<td>1%</td>
<td>Manual sorting in accordance with BRE Digest 433</td>
</tr>
<tr>
<td>Maximum fines (by mass)</td>
<td>4%</td>
<td>BS 812:Section 103.1:1985</td>
</tr>
<tr>
<td>Maximum content of sand (&lt;4 mm) (by mass)</td>
<td>5% m/m</td>
<td>BS 812:Section 103.1:1985</td>
</tr>
<tr>
<td>Maximum content of sulphate (by mass)</td>
<td>1% m/m</td>
<td>BS 812:Part 118:1988</td>
</tr>
<tr>
<td>Flakiness index</td>
<td>40%</td>
<td>BS 812:Section 105.1:1989</td>
</tr>
<tr>
<td>10% fines test</td>
<td>100 kN</td>
<td>BS 812:Part 111:1990</td>
</tr>
<tr>
<td>Grading</td>
<td>Table 3 of BS 882:1992 for single-sized 20 mm and 10 mm aggregates</td>
<td>BS 812:Part 111:1990</td>
</tr>
<tr>
<td>Maximum chloride content</td>
<td>Table 7 of BS 882:1992 - 0.05% by mass of chloride ion of combined aggregate</td>
<td>BS 812:Part 111:1990</td>
</tr>
</tbody>
</table>

2. Limits of acceptance in accordance with the values in the Table above.

CON1.T420.7 FURTHER ANALYSIS

The CM may require further analysis, including submission stated in CON1.M210, to be made if there is any alteration to the type of aggregate.
TESTS FOR WORKABILITY

CON1.T510.7  STANDARD

Testing arrangements:

1. Sample for workability testing shall:
   a. Be in accordance with CS1:2010;
   b. Not be taken from the first 0.3 m³ and the last 0.3 m³ of concrete discharged from the truck;
   c. Be remixed and divided into two specimens. Each specimen shall be tested by DTC to determine the workability of the concrete either by the slump test or by the flow table test all in accordance with CS1:2010.

2. Unless otherwise specified by the CM, adopt the testing method for workability as below:

<table>
<thead>
<tr>
<th>Normal Workability</th>
<th>High Workability</th>
</tr>
</thead>
<tbody>
<tr>
<td>(designed slump value</td>
<td>(designed flow value</td>
</tr>
<tr>
<td>from 20 mm to 175 mm)</td>
<td>from 340 mm to 600 mm)</td>
</tr>
<tr>
<td>Slump Test</td>
<td>Flow Table Test</td>
</tr>
</tbody>
</table>

3. Notwithstanding the sampling requirement specified in sub-clause (1)(b) above, the first 0.3 m³ discharged concrete may be used in the Works provided that:
   a. The discharged concrete is properly protected from contamination to CM’s satisfaction; and
   b. The measured workability of the concrete is in compliance with this Specification.

CON1.T520.7  ACCEPTANCE VALUES FOR APPROVED MIXES

1. The Approved workability value is that used to produce the mix Approved under CON1.T010 to CON1.T120;

2. For standardised designed mixes: the average of two measured slumps shall be within the corresponding range specified in Table A of CON1.M1020;

3. For designed mixes:
   a. Where slump test is used to determine the workability, the average of the two measured slumps must fall within ±25 mm or ±33% of the Approved designed slump value, whichever is greater, and no correction to the nearest 5 mm shall be made in determining the average of the measured slumps and the acceptance limits;
   b. Where flow table test is used, the average of the two measured flow values must fall within ±50 mm of the Approved designed flow value, and no correction to the nearest 10 mm shall be made in determining the average of the measured flow values.

4. The CM may reject any concrete for which the measured workability falls outside the limits specified in sub-clauses (2) and (3) as appropriate.

TESTS FOR COMPRRESSIVE STRENGTH

CON1.T610.7  STANDARD FOR CUBE TESTS

Testing arrangements:

1. For compressive strength testing, the DTC will take samples, make, cure and test concrete cubes of 100 mm size in accordance with CS1:2010;
2. For compressive strength testing of GGBS concrete in precast facade, the Approved testing laboratory as stated in CON7.T110 will take samples, make, cure and test concrete cubes of 100 mm size in accordance with CS1:2010.

CON1.T620.7  
SAMPLES FROM DESIGNED MIXES

Testing samples:
1. Take two cubes from a single sample taken from a batch of concrete selected at random as follows:
   a. At the point of discharge from the mixer; or,
   b. In the case of ready-mixed concrete, at the point of discharge from the delivery vehicle; or
   c. Elsewhere as directed by the CM;
   d. In no case to be from the first 0.3 m³ of concrete discharged from the truck.

2. Radio Frequency Identification (RFID) tag to be provided and installed on the surface of each cube by the Direct Testing Contractor, to authenticate the identity of the cube throughout the whole testing process. A typical RFID tag is shown on Sketch no. RFID/TAG/SK-01;

3. On completion of curing for 28 days, the two tagged cubes will be tested and the average of the two results taken as the test result;

4. If requested, or if the CM instructs that the concrete be tested for compressive strength at ages other than 28 days, provide additional samples;

5. Take cubes with installed RFID tags for 7 day work cube compressive strength tests at a frequency of 2 cubes per concrete mix used per day for all concreting days, or at any other frequency as considered appropriate by the CM.

CON1.T630.7  
RESULTS FOR DESIGNED MIXES

1. The results of tests for compressive strength at 28 days of designed mix concrete must comply with the following requirements:
   a. Individual test results: to comply with the strength determined from limits given in Column A in the Table to CON1.T650 below;
   b. Average strength determined from any group of four consecutive test results: to comply with the strength determined from limits given in Column B in the Table in CON1.T650 below. Where there are less than four available test results, treat the average of the first two or first three consecutive test results in the same manner as groups of four consecutive test results.

2. If the difference between the compressive strengths of 2 test cubes made from one sample of designed mix concrete exceeds 15% but does not exceed 20% of the test result:
   a. Use the higher of the compressive strengths of the 2 test cubes to assess compliance as stated in sub-clause (1)(a) above; and
   b. Do not use the test results for that sample to assess compliance as set out in sub-clause (1)(b) above nor to calculate the standard deviation.

3. If the difference between the compressive strengths of 2 test cubes made from one sample of designed mix concrete exceeds 20% of the test result:
   a. Discard the test result for that sample; and
   b. Propose investigation for Approval to establish if the concrete represented by the sample is acceptable or not.

CON1.T640.7  
COMPLIANCE CRITERIA FOR CONCRETE MIXES

1. Except for concrete of grade strength 20 MPa with recycled coarse aggregates,
a. Apply compliance criteria C3 given in the table to CON1.T650 for concrete of grade below 20;

b. Adopt compliance criteria C2 under the following conditions for concrete of grade 20 and above:
   i. Where there is sufficient previous production data using similar materials from the same plant under similar supervision to establish that the standard deviation for at least 40 test results will not exceed 5.5 MPa; or
   ii. Where the calculated standard deviation of 40 previous consecutive test results does not exceed 5.5 MPa.

c. Adopt compliance criteria C1 if compliance criteria C2 in sub-clause (1)(b) is not applicable;

d. For concrete grade 20 and above, the standard deviation is the standard deviation for each mix of concrete to be calculated after every test result using the last 40 test results judged by the same compliance criteria. Apply compliance criteria C2 to subsequent test results if the standard deviation does not exceed 5.5 MPa. Apply compliance criteria C1 to subsequent test results if the standard deviation exceeds 5.5 MPa.

2. For concrete of grade strength 20 MPa with recycled coarse aggregates, the result of any test for compressive strength shall not be less than:
   a. 70% of the grade strength when tested at 7 days; or
   b. The grade strength when tested at 28 days.

<td>2 MPa</td>
<td>7 MPa</td>
</tr>
<tr>
<td></td>
<td>C2</td>
<td>2 MPa</td>
<td>5 MPa</td>
</tr>
</tbody>
</table>

### NON-COMPLIANCE OF DESIGNED MIXES

1. When the calculated standard deviation of a set of 40 consecutive test results of concrete judged by compliance requirement C2 exceeds 5.5 MPa, adopt compliance requirement C1 in the table to CON1.T650 for all subsequent concrete of the same mix regardless of the results of any subsequent standard deviation calculation, unless otherwise Approved;

2. When the calculated standard deviation exceeds 8.5 MPa, place no further concrete in the permanent work until an investigation of the materials, mix design and methods of production has been carried out and measures have been taken which, in the opinion of the CM, will result in restoring a satisfactory standard of quality control;

3. If the compliance requirement is changed from C1 to C2 or from C2 to C1, in the table to CON1.T650, apply the new compliance requirement from the 35th day after making the last pair of test cubes in the set of 40 on which the decision to change was based. For the purpose of sub-clause CON1.T630 (1)(b), treat test results immediately before and after the change separately;
4. If the average strength determined from any group of four consecutive test results, or the first two or first three consecutive test results if applicable, fails to meet the requirement of Column B in Table CON1.T650, then all the concrete in all the batches represented by the samples to be deemed defective. For the purposes of this clause the batches of concrete represented by a group of two, three or four consecutive test results include the batches from which the first and last samples in the group were taken together with all the intervening batches.

Provided that when there is a period exceeding two weeks between any two consecutive test results in a group the CM may direct that the test results immediately before and immediately after the intervening period be treated separately;

5. If any individual test result fails to meet the requirement in Column A of the Table to CON1.T650, then that result may be considered to represent only the particular batch of concrete from which the sample was taken, provided that the average of any 4 consecutive results in which the individual test result appears satisfy the requirement of Column B of the Table.

CON1.T670.7 FURTHER TESTS ON DESIGNED MIX CONCRETE
If the strength requirements of this Specification are not satisfied, comply with any Instruction of the CM for further testing, including chemical analysis of samples of hardened concrete in the structure, that he considers necessary.

CORE TESTING

CON1.T710.7 GENERAL
Provide all necessary facilities and attendance for coring and testing of concrete cores carried out by DTC.

CON1.T720.7 STANDARD
1. Comply with CS1:2010 in respect of the method of preparing, inspecting and testing concrete cores to determine compressive strength;

2. Witness the sampling of cores by the DTC who shall avoid the following concrete as far as practicable:
   a. The top 50 mm or 20% layer of concrete in a lift, whichever is the greater, where the depth of lift is less than 1.5 m;
   b. The top 300 mm layer of concrete in a lift, where the depth of lift is 1.5 m or more.

3. Agree with the CM on the section of the core samples to be selected as test specimens, including those cores sampled from concrete in thin lift where such layer stated in sub-clause (2) cannot be avoided.

CON1.T730.7 SIZE AND NUMBER OF ROUTINE CORE TEST SAMPLES
Testing samples:
1. When instructed, provide necessary facilities and attendance to the taking of 3 Nos. or 12 Nos. of core samples by the DTC from the finished concrete work for each concreting day, at locations decided by the CM, for test as follows:
   a. 150 mm diameter core samples: 40 mm aggregate concrete;
   b. 100 mm diameter core samples: all other cases;
   c. The length of core samples shall be at least 95% of the core diameter.
CON1.T740.7  AGE OF CORE SAMPLES
Do not take cores for strength test at ages less than 28 days and do not make any adjustment to the measured strength in respect of the age of the core when tested.

CON1.T750.7  REQUIREMENT FOR FURTHER CORE SAMPLES
Carry out further concrete core tests if any of the followings apply:

1. Failure of recycled aggregate:
   Should a test result on recycled aggregate used in the concrete fail to meet any of the properties as stipulated in CON1.T410, comply with any instruction of the CM for the taking of three core samples (these cores are exclusive from the routine core tests in CON1.T730), in each concreting day for further tests and bear all the cost and time of such extra work.

2. Low concrete core strength:
   Where 3 core samples have been taken in accordance with CON1.T730 or CON1.T750 (1), and the estimated insitu cube strength of any individual core is less than 85% of the specified grade strength, comply with any instruction of the CM for the taking of additional core samples to make up a total of 12 numbers of core samples in the same concreting day for further tests. Allow the time without any claim for extension of time and bear all the costs for such extra work.

3. Failure of concrete cube test:
   If concrete represented by test cubes in any concreting day fails to meet the standard of acceptance specified in CON1.T640 and CON1.T650, comply with any instruction of the CM for the taking of additional core samples (in addition to the routine cores required under CON1.T730) to make up a total of 12 numbers of cores in the same concreting day for further tests. Allow the time without any claim for extension of time and bear all costs for such extra work.

CON1.T760.7  ASSESSING COMPRRESSIVE TESTS ON CORES
In assessing the results of compressive tests on cores (other than Type 1(c) and Type 3 piles), the total concrete for the concreting day represented by the cores is deemed not to comply with this Specification if the strength of the core, when adjusted for length/diameter ratio and converted to estimated insitu cube strength in accordance with CS1:2010, is either:

1. Less than 85% of the specified grade strength, for an average result of twelve cores; or
2. Less than 75% of the specified grade strength for any individual result.

CON1.T770.7  MAKING GOOD CORE HOLES
Make good core holes to Approval with cement mortar or concrete of similar strength to that originally specified for the parent concrete.

ADDITIONAL TESTS

CON1.T810.7  GENERAL
1. During the progress of the Works, the CM has the power to order tests other than cube tests and core tests. Comply with CS1:2010 or with the relevant British Standard and Code of Practice where CS1:2010 does not apply;
2. The method of sampling, preparing and testing of hardened concrete to determine cement content is to be in accordance with CS1:2010.
CON1.T820.7 CEMENT CONTENT TEST
Test all core samples taken in the same concreting day to determine the cement content. The estimated in-situ cube strength of any individual core taken in accordance with CON1.T710 to CON1.T760 be less than 85% of the specified strength. The test to be carried out after the completion of the core compression test and by the Direct Testing Contractors employed by the Housing Authority.

CON1.T830.7 NON-COMPLIANCE OF CEMENT CONTENT TEST
Should the average of the test results of all core samples taken in the same concreting day be less than 83% of the minimum cement content stated in CON1.M1130 to CON1.M1160, the total concrete for the concreting day represented by these samples to be deemed not to comply with Specification.

CON1.T840.7 AQUEOUS LIQUID RETAINING STRUCTURES
Test aqueous liquid retaining structures such as water tanks in accordance with clause 9.2 of BS 8007:1987.

FAILURE TO MEET REQUIRED CRITERIA

CON1.T910.7 AQUEOUS LIQUID RETAINING STRUCTURES
Non-compliance:
1. If any aqueous liquid retaining structure fails to meet the requirements of CON1.T630, CON1.T640 or CON1.T650 or evidence of seepage is observed during testing according to CON1.T840, then the structure is deemed defective.

TESTS FOR REPAIR MORTAR

CON1.T1010.7 SAMPLES FROM REPAIR MORTAR
When Instructed, take testing samples in accordance with the following sub-clauses:
1. A set of two 100 mm or a set of three 70.7 mm cubes from a single sample taken from a batch of repair mortar selected at random for compressive strength test for each testing age as directed by the CM;
2. RFID tag to be provided and installed on the surface of each cube by the Direct Testing Contractor, to authenticate the identity of the cube throughout the whole testing process. A typical RFID tag is shown on Sketch no. RFID/TAG/SK-01;
3. Take the average of the cube results in the set as the test result.

TESTS ON GGBS

CON1.T1110.7 PURCHASER TESTS
1. Employ an Approved testing laboratory as stipulated in CON7.W010 for carrying out the tests to verify the physical and chemical properties of GGBS in accordance with BS EN 15167-1:2006 before production of the precast facade units;
2. Submit the test reports to the CM in accordance with CON7.T010.
INVESTIGATION BY EXTENSIVE CORE TESTING

CON1.T1210.7 GENERAL
1. When concrete is deemed not complying with this Specification as assessed in accordance with CON1.T750 or CON1.T830, the CM shall issue a condemnation letter;
2. Apply the procedure in CON1.T1220 to CON1.T1260 to investigate the extent of non-compliance and re-execute the works;
3. The provisions stated hereinafter shall be without prejudice to the Employer’s right, the CM’s power and the Contractor’s obligations in connection with the removal of unsatisfactory material and work, and subsequent re-execution of work under the Contract.

CON1.T1220.7 INVESTIGATION AND REPORTS
1. Within 14 days from the date of condemnation letter issued by the CM, submit the followings for Approval:
   a. A statement of request to identify the extent of non-complying concrete in the affected structural elements on the concreting day(s) as stated in the condemnation letter;
   b. An investigation plan as stipulated in CON1.T1230;
   c. A statement of undertaking to complete the investigation and re-execution of works within a duration agreed by the CM; and
   d. A statement of confirmation to bear all costs and time so incurred in connection with or arising from the investigation.
2. Confirm in writing to accept the conditions, if any, as stipulated by the CM related to the Approval in sub-clause (1) before the investigation proceeds;
3. Within 7 days upon completion of the investigation, report to the CM with details as stipulated in CON1.T1250 for Approval;
4. Confirm in writing to accept the conditions, if any, as stipulated by the CM related to the Approval in sub-clause (3) before re-execution of works proceeds; and
5. Within 7 days upon completion of the re-execution of works, report to the CM with details as stipulated in CON1.T1260.

CON1.T1230.7 INVESTIGATION PLAN SUBMISSION
The investigation plan shall be endorsed by an Approved RSE and shall include the following details:
1. Delineation of concrete to be investigated;
2. Method statement of the extensive core testing and the details of a HOKLAS accredited laboratory, to be approved by the CM, responsible for sampling and carrying out the compressive strength test;
3. Volume of concrete represented by each core; and
4. Programme of the investigation works.

CON1.T1240.7 ASSESSMENT CRITERIA
1. Include the twelve cores taken in accordance with CON1.T750 in addition to the cores obtained from the investigation plan in identifying the extent of non-complying concrete; and
2. The volume of concrete represented by an individual core is deemed not to comply with this Specification if the following test result of the individual core applies:
   a. Criterion applicable to all the cores: The estimated in-situ cube strength is less than 85% of the specified grade strength; and
   b. Criterion applicable to the twelve cores in sub-clause (1): The cement content is less than 83% of the minimum cement content stated in CON1.M1130 to CON1.M1160.

CON1.T1250.7 INVESTIGATION REPORT SUBMISSION
Submit an investigation report, endorsed by the Approved RSE in CON1.T1230, with the following details:
1. Delineation of non-complying concrete;
2. Method statement for the re-execution of works; and
3. Programme of the re-execution of works including verification testings.

CON1.T1260.7 RE-EXECUTION OF WORKS REPORT SUBMISSION
Submit a report, substantiated by results of verification testings and endorsed by the Approved RSE in CON1.T1230, to confirm that the Works subsequent to the re-execution of works comply with this Specification.

CON2 FORMWORK

DESIGN

FORMWORK DESIGN GENERALLY

CON2.D010.7 LOADINGS
Design and construct falsework and formwork to withstand any combination of the following loadings and to maintain the position and shape of the formwork to achieve the required shape and finish of the hardened concrete:

1. Total weight of formwork, falsework and wet concrete;
2. Construction loads including dynamic effects of placing, compacting and construction traffic;
3. Wind loads in accordance with the Code of Practice on Wind Effects in Hong Kong 2004 issued by the Buildings Department;
4. Any other relevant loading described in BS 5975:1982.

CON2.D020.7 STANDARD
Comply with the requirements of BS 5975:1982 regarding design, construction and dismantling of falsework and formwork.

CON2.D030.7 INCLINED SURFACES
Provide formwork to the top surface of concrete where inclined at a slope exceeding 15° to the horizontal.

CON2.D040.7 DISMANTLING AND REMOVAL
Design falsework and formwork so that they can be dismantled and removed without disturbing or overloading the finished concrete work or the structure.

CON2.D050.7 BRIDGE AND TRANSFER STRUCTURE CONSTRUCTION
1. Appoint a Registered Structural Engineer to design and control the temporary works for the construction of the bridge and the transfer structure;
2. The submission shall include drawings and supporting calculations and shall be submitted to the CM not less than 4 weeks before the Contractor proposes to put such work in hand. Do not commence the proposed work without the prior consent of the CM. Such consent shall, however, in no way relieve the Contractor of any of his responsibilities for the design of the falsework;
3. Monitor falsework levels and make any necessary adjustments for settlement or other deflection or movements;
4. Unless otherwise approved by the CM, the falsework supporting system for the transfer structure shall be carried down directly to the pile cap levels and shall not impose any additional loadings on the floors, columns and walls.

CON2.D060.7 FORMWORK FOR STRUCTURAL WALLS IN DOMESTIC BLOCKS
1. Design and use large panel formwork, in accordance with CON2.D310, for all structural walls in domestic floors between first domestic floor level and main roof level;
2. For domestic blocks without rotational symmetry and where the use of large panel formwork at critical areas of a domestic floor would lead to an unacceptable prolonged construction cycle, the Contractor may propose the use of small panel metal formwork, together with justification in the submission stipulated in CON2.D240, for CM's approval.

FALSEWORK SPANNING PUBLIC HIGHWAYS

CON2.D110.7 DESIGN RESPONSIBILITY
Employ a Registered Structural Engineer to take responsibility for the design and construction of all temporary works and falsework spanning public highways. No consent or dissent of the CM will relieve the Contractor of his sole responsibility for the falsework design, construction and obtaining Approval.

CON2.D120.7 FALSEWORK SPANNING A PUBLIC HIGHWAY
Ensure the falsework system does not interfere with normal traffic flow and does not reduce the width of the traffic lanes. Design clearances to falsework spanning a public highway in accordance with Section 35 of the Transport Planning and Design Manual Volume 2 - Highway Design Characteristics.

CON2.D130.7 APPROVALS
1. Take responsibility for obtaining all necessary approvals of any proposed falsework design and construction, through the Authority, from the Highways Department, the Commissioner of Police and the Commissioner for Transport;
2. Do not commence any temporary works, including falsework spanning a public highway, unless the falsework design and construction method has been approved by the Highways Department and Commissioner of Police and Commissioner for Transport.

SUBMISSIONS

CON2.D210.7 TIMING
Submit details of formwork and falsework to the CM for information before commencement of construction.

CON2.D220.7 FALSEWORK SPANNING A PUBLIC HIGHWAY
Submit proposals for falsework spanning a public highway to the CM in the form of proper, numbered, fully dimensioned drawings accompanied by full structural calculations endorsed by the Contractor's Registered Structural Engineer. Make any amendments required by the CM and submit copies to the CM in order to obtain all necessary approvals from the Highways Department and Commissioners. See also CON2.D130 (2) above.

CON2.D230.7 PLYWOOD SHEATHING
Before commencement of the superstructure and where the sheathing is timber plywood, submit for Approval, details of the method of identifying and recording the number of uses to which the sheathing will be subjected to. Upon Approval, provide all labour and equipment and carry out marking and recording to the satisfaction of the CM.
**CON2.D240.7 LARGE PANEL FORMWORK AND SMALL PANEL METAL FORMWORK FOR DOMESTIC BLOCK**

Submit the following information for CM’s approval:

1. Details of the system, including drawings and calculations;
2. Details of safety requirements regarding the designated storage yard for large panel formwork as stipulated in PRE.B8.262;
3. Details for holding down and stabilising the panels of the wallforms including horizontal ties at the top of wallforms;
4. Details of kicker construction, both for precast kicker blocks and cast-in-situ kickers, including proposed bedding and grouting material for precast kicker blocks;
5. Details of metal formwork, and its fixings, for slab edges which form an integral part of wall elevations;
6. Proposals for curing and protecting the concrete;
7. Method statement for placing and compacting the concrete;
8. Details of any relaxation to the minimum periods for retaining formwork and falsework in position before striking as stated in CON2.W630 which may be required to suit the proposed formwork systems;
9. Details of assembling and striking of any small panel metal formwork, including the maintenance of the panels for repeated uses;
10. Documentary evidence, such as previous project references, indicating that the finished concrete surface produced by the small panel metal formwork is not to be of a lesser standard than that produced by the large panel formwork, together with a method statement for applying skim coat to the wall joints in accordance with CON2.W315.

**CON2.D250.7 BRIDGE AND TRANSFER STRUCTURE CONSTRUCTION**

Submit the following details of formwork and falsework to the CM at least 4 weeks before commencement of construction:

1. Details of the system, including drawings and calculations;
2. Details of holding down and stabilising the system including horizontal ties;
3. Method statement for construction of the structure;
4. Proposal for curing and protecting the concrete; and
5. Method statement for placing and compacting the concrete.

**CON2.D260.7 INSPECTION RECORDS**

Submit records of inspection on the completed formwork and falsework to the CM for information before carrying out any further works that may affect the stability of the formwork and falsework. Such records are to be certified by a contractor’s superintendent holding qualification equivalent to TCP Grade T4 in civil or structural engineering discipline.

**DESIGN OF LARGE PANEL FORMWORK FOR DOMESTIC BLOCK**

**CON2.D310.7 GENERAL DEFINITION**

Large panel formwork refers to metal formwork complying clauses CON2.D320 to CON2.D450.
**CON2.D320.7 WALLS NOT EXCEEDING 7.5 M LONG**
For walls not exceeding 7.5 m long, design the whole of the formwork assembly for one face of the wall per storey as one complete reusable panel.

**CON2.D330.7 WALLS EXCEEDING 7.5 M LONG WITHOUT OPENINGS**
For walls exceeding 7.5 m long, without door or window openings, design the whole of the formwork assembly, for one face of the wall per storey, as one or two complete reusable panels.

**CON2.D340.7 WALLS EXCEEDING 7.5 M LONG WITH OPENINGS**
For walls exceeding 7.5 m long with door/window openings, the whole of the formwork assembly for one face of the wall per storey may comprise a no. of panels provided that any joints between panels must fall within the width of the door/window openings.

**CON2.D350.7 JUNCTIONS**
At any wall junction, where it is not practicable to position the edge of the formwork assembly at the junction, position the edge at a clear distance of not more than 300 mm from the junction line.

**CON2.D360.7 USE OF OTHER TYPES OF FORMWORK**
Where it is not practicable to use large panel formwork, e.g. at staircases, columns at wall ends etc, adopt other types of formwork, including small panel metal formwork or traditional formwork, and submit details for Approval.

**CON2.D370.7 JOINTS IN SHEATHING**
1. Design the sheathing of the formwork free of horizontal joints;
2. Position any vertical joints at minimum 1 m centres maintaining a continuous smooth surface across the joints.

**CON2.D380.7 BACKING STRUCTURE**
Support the sheathing with a backing structure of metal or other Approved material.

**CON2.D390.7 SEALING BASE OF WALLFORMS**
With the exception of where in-situ monolithic kickers are used, seal the toes of all wallforms with a compressible rubber hose placed between the floor slab and the base of the wallform, backed with a cement mortar seal to prevent grout loss.

**CON2.D400.7 TOP BRACING**
Securely brace every panel of wallform at the top by at least two horizontal ties to ensure vertical alignment.

**CON2.D410.7 SLAB EDGES**
Fabricate slab edge formwork in metal to match the wallform system where any part of a wall is formed as a slab edge.

**CON2.D420.7 ACCESS WALKWAY**
In addition to GCC Clauses 7.1(2):
1. Provide continuous walkway around the edges of the building under construction. Working platforms and table forms may be used;
2. Comply with details of safety requirements regarding working platforms as stipulated in PRE.B8.262;

3. Provide a minimum walkway width of at least 1000 mm with a minimum width of 650 mm at joints with any adjacent walkway. The walkway must be close boarded or planked in timber of 25 mm minimum thickness, plated or of metalwork;

4. Provide toe boards to a minimum height of 200 mm on the platform side where a person or object could fall for more than two metres;

5. Read this Specification in conjunction with drawing No. SES/LP/S/EG001 in Appendix B which details the access walkway.

CON2.D430.7 OTHER TYPES OF FORMWORK - ACCESS WALKWAY
Propose and provide alternative platforms and access walkway and maintain continuity where large panel formwork is not used in accordance with CON2.D360 and obtain Approval before use, provided that the alternative is not of a lesser standard in conforming to the requirements in CON2.D420.

CON2.D440.7 PATENT WALLFORM SYSTEMS
Obtain prior Approval for use of patent wallform systems not complying with this Specification, provided that the finished products produced by such system proposed are not to be of a lesser standard than that produced by formwork conforming to the above formwork design requirements.

CON2.D450.7 ALTERNATIVE GROUT SEALING SYSTEMS
Obtain Approval before using any alternative grout sealing system:

1. The CM may Approve any other proposed system, provided that the Contractor can demonstrate that the finished product provided can match the requirements of the Specification before commencement of construction;

2. At any time the CM may withdraw such Approval of the proposed system if he considers that it will fail to produce the required finished product;

3. In such a case, revert to the system described in this Specification. No monetary claims whatsoever will be entertained or extensions of time granted in the event of such a withdrawal of Approval.

DESIGN OF SMALL PANEL METAL FORMWORK FOR DOMESTIC BLOCK

CON2.D510.7 GENERAL DEFINITION
Small panel metal formwork, e.g. aluminium formwork, refers to small metal formwork complying clauses CON2.D520 to CON2.D600.

CON2.D520.7 JUNCTIONS
As CON2.D350.

CON2.D530.7 JOINTS IN SHEATHING
Maintain a continuous smooth surface across all horizontal and vertical joints.

CON2.D540.7 BACKING STRUCTURE
As CON2.D380.
CON2.D550.7  SEALING BASE OF WALLFORMS
As CON2.D390.

CON2.D560.7  TOP BRACING
1. For walls not exceeding 7.5 m long, securely brace each wallform at the top by at least two horizontal ties to ensure vertical alignment;
2. For walls exceeding 7.5 m long, securely brace each wallform at the top by at least four horizontal ties to ensure vertical alignment.

CON2.D570.7  SLAB EDGES
As CON2.D410.

CON2.D580.7  ACCESS WALKWAY
As CON2.D420.

CON2.D590.7  PATENT WALLFORM SYSTEMS
As CON2.D440.

CON2.D600.7  ALTERNATIVE GROUT SEALING SYSTEMS
As CON2.D450.
MATERIALS

DEFINITIONS

CON2.M010.7 FORMWORK OR FORM
That section of the temporary works used to give the required shape and support to
poured concrete, consisting of sheathing material in direct contact with the concrete
and joists or stringers that directly support the sheathing.

CON2.M020.7 FALSEWORK
Any temporary structure used to support a permanent structure while it is not self-
supporting.

CON2.M030.7 TRADITIONAL FORMWORK
Formwork assembled from individual elements comprising sheathing material as
described in BS 5975:1982 and separate backing structure supporting the sheathing.

CON2.M040.7 PERMANENT OR LEFT IN FORMWORK
Formwork designed to remain in position as part of the permanent work.

CON2.M050.7 LARGE PANEL FORMWORK
Formwork as CON2.D310.

CON2.M060.7 SMALL PANEL METAL FORMWORK
Formwork as CON2.D510.

CON2.M080.7 TIMBER FOR FORMWORK
Use sustainable timber as specified in PRE.B8.2450 and reuse timber whenever
possible as specified in PRE.B8.2460.

SHEATHING

CON2.M110.7 SUITABLE MATERIALS
Material against which the concrete will be cast must be suitable for providing the
specified concrete finish, formed for example, in metal, timber, plywood, film faced
plywood or plastic.

ANCILLARY MATERIALS

CON2.M210.7 RELEASE AGENT
An Approved type which will not:
1. Stain or colour the concrete;
2. Affect the adhesion between the concrete and any subsequent finishings.
CON2.M220.7 SURFACE RETARDERS
An Approved type which will not stain or colour the concrete.

CON2.M230.7 HOLLOW CONCRETE BLOCKS FOR SLABS
Manufactured as follows:
1. Concrete:
   a. Mix comprising cement, granite fines and granite aggregate passing a 10 mm sieve but retained on a 5 mm sieve;
   b. Grade: 20/10.
2. Dimensions:
   a. Outer casing and web: 25 mm thick;
   b. With a 25 mm x 5 mm groove formed along both sides for key.

CON2.M240.7 PRECAST KICKER BLOCKS
Of solid construction and:
1. Cast in the same grade of concrete as the wall into which they are to be cast. Provide evidence of the grade of concrete to CM for approval;
2. Having a length of 100 mm parallel to the wall face, the same thickness as the wall and a minimum height of 75 mm above the highest slab abutting the wall at the level at which the kicker is formed.

MATERIAL FOR SEALING FORMWORK TIE HOLES

CON2.M250.7 MORTAR
Shall be:
1. One-part prebagged non-shrink cementitious mortar made by mixing on Site with water to form a trowellable consistency in application;
2. In accordance with mortar manufacturer's specified application procedures (including bond cost if required by the mortar manufacturer);
3. All mortar shall be subject to tests specified in CON2.T110, CON2.T120, CON2.T130, CON2.T140 (2), CON2.T150 and CON2.T160 before approval by the CM.

CON2.M260.7 POLYURETHANE FOAM
1. The polyurethane foam shall be formed from a system of components which expands and sets to become a rigid foam;
2. The polyurethane foam shall be subjected to watertightness test specified in CON2.T140 (1) & (2)(b), before approval by the CM.
WORKMANSHIP

HANDLING AND STORAGE

CON2.W010.7 FORMWORK
1. For superstructure works:
   a. Store formwork, including large panel formwork and small panel metal formwork, off a levelled, well-drained and maintained hard-standing ground on level supports and in a manner which will not result in damage, deformation or contamination;
   b. Store large panel formwork and small panel metal formwork safely and securely with struts or supports according to the method statement approved;
   c. Comply with details of safety requirements regarding prevention of falling objects as stipulated in PRE.B8.262.
2. For works other than that in sub-clause (1):
   a. Store formwork off the ground on level supports and in a manner which will not result in damage or deformation to the formwork or in contamination of the formwork.

CON2.W020.7 ANCILLARY MATERIALS
Store:
1. Release agents and surface retarders in sealed containers marked to identify the contents and protected from exposure to conditions which may affect the material;
2. All materials in accordance with the manufacturer’s recommendations and do not use the materials after the recommended shelf life has been exceeded.

SAFETY AND PROTECTION

CON2.W110.7 PERIMETER WALKWAY
Do not stack any materials or debris on the perimeter formwork walkway at any time.

ERECTING FORMWORK

CON2.W210.7 CHECKING AND INSPECTION
Check the alignment of all kickers and wallforms prior to concreting and:
1. Allow the CM to inspect the completed formwork before any work, including fixing reinforcement adjacent to formwork, makes access for inspection difficult;
2. Inform the CM 24 hours, or sooner if agreed with the CM, before carrying out such work.

CON2.W220.7 KICKERS
Fix wall and column forms tightly against kickers by an Approved method.
CON2.W230.7 JOINTS
Construct joints between formwork panels, stop ends and adjoining concrete to prevent loss of grout. Cut formwork in such a manner that reinforcement and built-in components passing through the formwork are maintained in position and grout loss is prevented.

CON2.W240.7 TEMPORARY ACCESS
Provide temporary openings in the formwork for cleaning or inspection if required.

CON2.W250.7 PIPE SLEEVES ETC
1. Provide galvanised mild steel or PVC pipe sleeves through floors and walls etc as required for all trades as specified elsewhere;
2. Fix pipe sleeves, inserts, void formers and box outs to specified sizes and in correct positions before placing concrete. Do not cut hardened concrete to provide holes or chases unless otherwise approved;
3. Do not use polystyrene for void formers or box outs larger than 150 mm x 150 mm x 150 mm unless otherwise approved.

CON2.W260.7 FORMWORK FIXINGS GENERALLY
Do not allow any devices for securing formwork and falsework to remain within the specified concrete cover.

CON2.W270.7 FORMWORK TIES
Fix formwork ties and components in such a manner that they do not touch reinforcement or any other built-in component. Any part left in the concrete must be at least 40 mm or the specified nominal cover to the reinforcement, whichever is greater, from the concrete surface.

CON2.W280.7 TIES IN STRUCTURAL ELEMENTS WITH WATERTIGHT FUNCTION
1. Use only ties which leave no open holes through the concrete having a watertight function, including:
   a. Aqueous liquid retaining structures;
   b. All structural elements constructed below finished ground level; and
   c. Roof parapets below the upturn level of waterproofing membrane as shown on Drawings.
2. Provide precautionary measures, which may be nylon, epoxy, plastics or other dielectric material coating, to ties left in aqueous liquid retaining structures to avoid damaging the epoxy coating of reinforcement bar.

CON2.W290.7 FORMING CONSTRUCTION JOINTS
Ensure formwork to construction joints is rigid and accommodates projecting reinforcement without bending or displacement.

CON2.W300.7 LAYING HOLLOW BLOCKS FOR SLABS
1. Do not use blocks within 28 days of their being cast;
2. Lay on formwork in straight rows with butt joints;
3. Seal exposed, open ends with similar concrete to a depth of 25 mm.
CON2.W310.7 JOINTS IN LARGE PANEL FORMWORK
Ensure close contact between the edges of panels used on the same wall side, with maximum tolerance measured perpendicular to the wall not to exceed 3 mm after concreting.

CON2.W315.7 JOINTS IN SMALL PANEL METAL FORMWORK
1. Ensure close contact between the edges of panels used on the same wall side, with maximum tolerance on abrupt changes/irregularities of a continuous fair-face finished concrete surface measured perpendicular to the wall tightened to not to exceed 2 mm after concreting;
2. Unless otherwise instructed by the CM, apply skim coat as specified in FIN7.M790 to the wall joints to cover up and smoothen any abrupt changes/irregularities notwithstanding that the tolerance on abrupt changes/irregularities is met. Bear all associated costs and no extension of time shall be allowed.

CON2.W320.7 ARRISES
Erect formwork to provide smooth arrises free from damage and cracks.

KICKERS FOR LARGE PANEL FORMWORK AND SMALL PANEL METAL FORMWORK

CON2.W410.7 DEFINITIONS
For the purposes of this Worksection the following apply:
1. An external wall is defined as a complete length or section of a wall which is abutted by a floor slab on one side only, at the level where the kicker is formed;
2. An internal wall is defined as a complete length or section of a wall which is abutted by floor slabs on both sides, at the level where the kicker is formed.

CON2.W420.7 PROVISION OF KICKERS
Provide kickers at the toes of all walls constructed by large panel formwork and/or small panel metal formwork for the purpose of maintaining correct alignment and preventing grout loss.

CON2.W430.7 KICKERS FOR EXTERNAL WALLS
1. Form in-situ kicker, using metal formwork, monolithically with the floor slab abutting the wall in one continuous casting operation;
2. The concrete grade of the kicker shall be the same as that of the abutting floor slab and the dimensional details are as follows:
   a. Length: over the whole length of the wall;
   b. Thickness: same as that of the wall;
   c. Top level: 100 mm above the highest level of the abutting floor slab.

CON2.W440.7 KICKERS FOR INTERNAL WALLS
Use evenly spaced precast blocks as specified in CON2.M240 to form the kickers of internal walls, with a minimum of two blocks provided per wall as follows:
1. Place the kicker blocks in position after the slabs abutting walls have been cast and bed to the correct level using an approved bedding material;
2. Fix the blocks firmly to the top of the slabs either by cast in or drilled anchor bolts. Fill any voids around bolts with an Approved grouting material. Ensure fixings prevent blocks being displaced during the wall construction;

3. Adjust reinforcement locally, and only with prior Approval, to enable precast kicker blocks to be fixed.

WORK BELOW GROUND

CON2.W510.7
FORMING AGAINST EXCAVATION FACES
Do not cast concrete below ground against sides of excavation unless with the CM's prior Approval.

STRIKING FORMWORK

CON2.W610.7
GENERAL
Strike formwork and falsework without disturbing, damaging or overloading the finished concrete work or the structure and without affecting other formwork and falsework.

CON2.W620.7
CONTRACTOR'S RESPONSIBILITY
Notwithstanding any other clauses in this Specification accept sole responsibility for the safe removal of formwork and falsework.

CON2.W630.7
MINIMUM PERIODS BEFORE STRIKING
Minimum periods for retaining formwork and falsework in position are as follows:

<table>
<thead>
<tr>
<th>Striking Time</th>
<th>Type of Formwork and Falsework</th>
<th>Period</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Inclined formwork to top Surfaces</td>
<td>12 hours</td>
</tr>
<tr>
<td></td>
<td>Vertical formwork to columns, beams and walls (unloaded)</td>
<td>16 hours</td>
</tr>
<tr>
<td></td>
<td>Soffit formwork to Slabs (Props left under)</td>
<td>3 days</td>
</tr>
<tr>
<td></td>
<td>Props to slabs (unloaded)</td>
<td>7 days</td>
</tr>
<tr>
<td></td>
<td>Soffit formwork to beams (Prop left under)</td>
<td>7 days</td>
</tr>
<tr>
<td></td>
<td>Props to beams (unloaded)</td>
<td>16 days</td>
</tr>
<tr>
<td></td>
<td>Prop to cantilevers (unloaded)</td>
<td>28 days</td>
</tr>
</tbody>
</table>

CON2.W640.7
STRIKING AT LOW TEMPERATURE
Obtain instructions from the CM for increased striking times of formwork at lower temperatures. The periods stated in CON2.W630 are for Portland cement at 15°C ambient temperature and the conditions stated in the table.

CON2.W650.7
STRIKING LARGE PANEL FORMWORK AND SMALL PANEL METAL FORMWORK
Alternative minimum periods before striking large panel formwork and small panel metal formwork may be Approved, if the design allows, provided that:

1. Props for soffits of insitu slabs or combined precast and insitu slab construction, must remain in place for a minimum of five days and until the concrete has achieved two thirds of the required 28 day crushing strength;
2. The props supporting the floor immediately below the cast slab or soffit must remain in place for a minimum period of 2½ days after the upper floor is concreted and until the concrete has achieved a crushing strength of 10 MPa, or twice the stress to which the concrete will be subjected, whichever is the greater. No re-propping is permitted within the minimum periods;

3. In the event that a request for relaxation of the minimum periods before striking, if any, is not accepted by the CM, the design of the formwork system is deemed to have been prepared on the basis of the minimum periods detailed in CON2.W630 or this sub-clause, provided the conditions referred to are complied with;

4. As evidence that concrete placed insitu or in combined precast and insitu slabs has attained the minimum strengths specified, from test results obtained from the laboratory established on site in accordance with the requirements for testing contained in the Preliminaries PRE.B9 of this Specification.

CON2.W660.7 BACK PROPPING SOFFITS
Where the props are to be left in place whilst the soffit formwork to slabs and beams are removed, design such props either to remain in position throughout the striking process without having to be temporarily removed or alternatively, if agreed by the CM, so that a few can be removed at a time and replaced immediately.

CON2.W670.7 LOADING THE STRUCTURE
Do not place construction loads on any unshored portion of the structure under construction. Agree the number of floors requiring propping with the CM, according to the design loads of such floors.

TRIAL PANELS

CON2.W710.7 SAMPLES
Provide samples of any exposed formed or worked finishes required, and obtain Approval.

CON2.W720.7 CONSTRUCTION OF TRIAL PANEL
Subject to CM's instruction, construct on Site a trial panel before the commencement of typical floor construction as detailed in the Project Specific Specification to demonstrate that the proposed formwork and falsework system is adequate in providing the required quality standard of finishes to concrete.

CON2.W730.7 SUB-STANDARD TRIALS
Should the finish to the trial panels not be to the standard specified and not to the satisfaction of the CM, modify the formwork system and construct further trial panels until, in the opinion of the CM, the finish to the concrete produced is satisfactory. Adopt the formwork system producing the required finish as the standard for all subsequent formwork used.

STANDARD PANEL

CON2.W810.7 INSITU STANDARD PANEL
As soon as is practical after commencement of superstructure work, select a sample area from the insitu works as being representative of the minimum standard of the specified finish for inspection by the CM. Upon agreement in writing by the CM the finish to the sample area will become the minimum standard for that specified finish for all subsequent concrete.
FORMED FINISHES FOR CONCRETE

CON2.W910.7 TYPE A : ROUGH BOARD FINISH
1. Formwork or formwork linings to consist of Approved rough textured seasoned wood boards with moisture content of between 10% and 20%;
2. Arrange boards of varying textures to give uniform overall effect;
3. Assemble boards to prevent leakage of grout between them;
4. Soak formwork with water before erecting, and keep damp until concrete is placed;
5. Position cover spacers and bolts to the satisfaction of the CM;
6. The number of uses of formwork lining will be limited to its ability to provide the required finish;
7. The finish to be left as struck. Do not make good until inspected by the CM;
8. Discoloration will not be permitted;
9. Fill minor voids and irregularities on surfaces with a matching mortar to Approval, using a sponge rubber face float.

CON2.W920.7 TYPE B : FAIR-FACED FINISH
1. Produce an even finish with a sheet material (e.g. plywood);
2. Arrange panels in pattern as specified;
3. The finish to be left as struck. Submit method statement for rectification works for approval prior to carrying out any remedial works. Do not make good until inspected by the CM;
4. Blowholes not exceeding 10 mm diameter will be permitted, but otherwise surface to be free from voids, honey-combing or other large defects;
5. Variations in colour will be permitted when the finished concrete is to receive an applied decoration;
6. Make good small defects, and fill blowholes and formwork tie holes with Approved materials.

MAINTENANCE OF FORMWORK

CON2.W1010.7 PREPARATION FOR RE-USE
Clean and repair formwork which has been previously used before it is re-erected.

CON2.W1020.7 DAMAGED AND DETERIORATED FORMWORK
Do not re-use formwork where strength and composition has so far deteriorated due to repeated use that, in the opinion of the CM, it will no longer adequately perform its function in accordance with the Specification but remove it from Site.

CON2.W1030.7 RUBBER SEALS
Properly maintain the rubber hose seals and replace when required or as Instructed but in no case subject seals to more than nine uses.

CON2.W1040.7 RE-USE OF TIMBER FORMWORK
Do not subject plywood sheathing to formwork to more than nine uses, irrespective of the use of one or both faces of such sheathing.
SEALING FORMWORK TIE HOLES

CON2.W1110.7 GENERAL
Seal all tie holes left in walls by formwork ties and components in accordance with Sketch no. SES/TB/S/SK-001/A.

CON2.W1120.7 SEALING THE TIE HOLES
1. Procedures for external walls with tile finishes:
   a. Knock out the PVC tubing;
   b. Drive in and secure a piece of minimum 30 mm thick cork at 40 mm from each end of a formwork tie hole;
   c. Wet thoroughly to achieve saturation and clean concrete surfaces inside the hole to remove dust and loose materials prior to applying mortar (and bond coat if required by the mortar manufacturer);
   d. Using the cork as a backing, apply and completely fill the hole ends by prebagged non-shrink cementitious mortar as described and Approved in accordance with CON2.M250;
   e. Cure the mortar to CON1.W1410 or in accordance with the mortar manufacturer's recommendations as Approved by the CM.

2. Procedures for external walls without tile finishes:
   a. Knock out the PVC tubing;
   b. Clean thoroughly concrete surfaces inside the hole to remove dust and loose materials prior to applying polyurethane foam;
   c. Drive in and secure a piece of minimum 30 mm thick cork at 40 mm from the external side of the wall;
   d. Using the cork as a backing, apply the polyurethane foam Approved by the CM in accordance with CON2.M260 from the internal side of the wall in such quantity that it expands, fills the hole entirely and moves it way out away from the backing cork. Allow adequate time for full development and setting of the foam rigidity as recommended by the manufacturer;
   e. Cut back all excess polyurethane foam by 40 mm from the internal side of the wall. Remove all traces of foam remaining on the hole concrete surfaces;
   f. Repeat procedures as described in CON2.W1120 (1)(c) to (1)(e) for application of mortar (and bond coat if required by the mortar manufacturer) at either end of the hole.

3. Procedures for internal walls:
   a. Knock out the PVC tubing;
   b. Wet thoroughly to achieve saturation and clean concrete surfaces inside the hole to remove dust and loose materials prior to applying mortar (and bond coat if required by the mortar manufacturer);
   c. Apply and completely fill the hole by prebagged non-shrink cementitious mortar as described and Approved in accordance with CON2.M250;
   d. Cure the mortar to CON1.W1410 or in accordance with the mortar manufacturer's recommendations as Approved by the CM.

TOLERANCES

CON2.W1210.7 GENERAL
Refer to Appendix H "Schedule of Tolerances" to this Specification.
TESTING

TESTING OF MORTAR FOR SEALING FORMWORK TIE HOLES

CON2.T110.7 LABORATORY TESTING
1. Submission requirements:
   a. Submit technical details and test reports done by Approved local independent testing laboratory at Contractor's own costs to demonstrate the following mortar characteristics:
      i. 1-4% of change in height of specimen tested to ASTM C827 - 95a(97);
      ii. Minimum value of 200 seconds for Figg air permeability.
2. Testing samples:
   a. Submit samples of mortar for carrying out one set of the tests as stated in CON2.T110 (1) by the Direct Testing Contractor to demonstrate the mortar characteristics for Approval and thereafter every 750 kg of mortar to be used on site for routine monitoring test as instructed by the CM;
   b. Unless otherwise Approved or specified elsewhere, testing of mortar shall be carried out by the Direct Testing Contractor;
   c. Allow sufficient time for testing of the materials by the Direct Testing Contractor.

CON2.T120.7 TESTING FOR CHARACTERISTICS OF MORTAR
Testing methods:
1. Early change in height test: test shall be carried out to C827 - 95a(97) as specified by American Society for Testing and Materials;
2. Permeability test: the permeability of the mortar shall be determined by the modified Figg air permeability test described in "Improvements to the Figg method for determining the air permeability of concrete" Cather, Figg, Marsden and O'Brien. Mag. Conc. Res 36 No. 129 Dec 1984. The specimen shall be a 100 mm cast cube conditioned at a temperature of 27± 2°C and 55± 5% relative humidity, demoulded 72 hours after casting and kept in the same environment for a further 18 days. The permeability test shall be carried out after conditioning at 50°C for 14 days.

CON2.T130.7 REQUIREMENT FOR FURTHER TEST
Non-compliance:
1. Two additional tests shall be carried out by the Direct Testing Contractor for each failure of the laboratory test result obtained for any one mortar characteristic;
2. The mortar is considered as not complying with the specified property if the result of any additional test fails to comply with the specified requirements for the property;
3. Submit another mortar for Approval.
CON2.T140.7 WATERTIGHTNESS TEST ON SITE

1. All watertightness tests made on Site are at Contractor's own costs, time and to be witnessed and certified both by the CM and the Contractor's representative. Testing procedures to carry out watertightness test as follows:

   a. Construct working platforms where necessary for carrying out water test safely;

   b. A continuous jet of water is to be sprayed from a nozzle at water pressure of 210 to 240 KPa at the nozzle inlet to the joint and along the longitudinal axis of the formwork tie hole for a minimum of 5 minutes. The nozzle shall be stationary while an observer inspects carefully on the indoor side of the formwork tie hole with the assistance of adequate lighting where necessary. The nozzle used for the tests shall be to the requirements of Architectural Aluminium Manufacturers' Association (AAMA) 501.2-83, unless otherwise Approved.

2. Before sealing any formwork tie holes, carry out watertightness test on Site for the following:

   a. Watertightness test for mortar only: the CM to select 10 nos. of formwork tie holes sealed with mortar at one end of hole only and without polyurethane, prepared in accordance with CON2.W1120. Watertightness test to be applied on the mortar side for a minimum of 5 minutes;

   b. Watertightness test for polyurethane foam only: the CM to select 10 nos. of formwork tie holes sealed with polyurethane foam only and without mortar, prepared in accordance with CON2.W1120 (2)(a) to (2)(f). Watertightness test to be applied on the cork side for a minimum of 5 minutes.

3. Carry out watertightness test for completely sealed formwork tie holes on Site for 10% of formwork tie holes at each floor of every block sealed complete in accordance with CON2.W1120 (1) or CON2.W1120 (2) and selected by the CM. Watertightness test to be applied on one side of a wall only (external side if applicable) for a minimum of 5 minutes.

CON2.T150.7 FAILURE OF WATERTIGHTNESS TEST

If sign of water seeping through the hole, including sign of damp patches, is observed on the opposite side of the wall face subject to test during the test and within the subsequent 2 hours after the test, the watertightness test is deemed to have failed.

CON2.T160.7 ADDITIONAL TESTS UPON FAILURE OF WATERTIGHTNESS TEST

Is carried out in accordance with the following procedures:

1. For any one hole failed for the watertightness test made in accordance with CON2.T140 (2)(a) or (2)(b), two additional holes are selected by the CM for watertightness test in accordance with CON2.T140 (1);

2. The mortar or polyurethane foam is considered not complying with the specified field watertightness requirements when result of any additional test made upon mortar or polyurethane foam respectively according to CON2.T140 (2)(a) or (2)(b) fails in accordance with CON2.T150;

3. For any tests carried out according to CON2.T140 (3) and fails in accordance with CON2.T150 the Contractor shall carry out further tests progressively as described in CON2.T160 (1) above until all tests are successful.

CON2.T170.7 MAKE GOOD FORMWORK TIE HOLES

The work is carried out in accordance to the followings:
1. Make good all formwork tie holes which have failed the watertightness test carried out in accordance with CON2.T140 (3) and CON2.T160 (3) to CM's satisfaction at Contractor's own costs and time;

2. All repaired holes shall be subject to watertightness test as specified in CON2.T140 (1).

**CON2.T180.7 BLOWHOLES**

All blowholes shall be filled with one-part prebagged non-shrink cementitious mortar Approved in CON2.M250.
CON3  REINFORCEMENT

MATERIALS

REINFORCEMENT GENERALLY

CON3.M010.7  STOCKIST'S OR SUPPLIER'S CERTIFICATION

Submission requirements:
1. For bar reinforcement, submit certificates from quality assured stockist and/or supplier to demonstrate that the bar reinforcement supplied complies with the requirements of CS2: 2012 Section 4.
2. For fabric reinforcement, submit a certificate from the manufacturer to the CM, stating:
   a. That the fabric reinforcement supplied has been tested and complies with the requirements of BS 4449:2005, BS 4483:2005 and this Specification;
   b. Evidence that the cold reduced steel wire in fabric reinforcement has complied with the bond classification as specified in BS 4449:2005.

CON3.M020.7  VERIFICATION OF SOURCE

When Instructed provide evidence that each load of steel reinforcement which includes the bars for fabric reinforcement delivered to site forms part of the same consignment and originates from the same source as that in respect of which the specimen and the manufacturer's certificate relate.

CON3.M030.7  QUALITY ASSURANCE SCHEME FOR FABRIC REINFORCEMENT

1. Obtain a quality assurance scheme from the manufacturer and submit for Approval. Details of the scheme must include a routine inspection complying with BS 8666:2005 Annex A;
2. Unless the quality assurance scheme has been certified under ISO 9001, it shall be assessed by an Approved third party certification authority who shall audit the manufacturer's inspection records in accordance with BS 8666:2005 Annex B. If Instructed, submit the audit report to the CM.

CON3.M035.7  PRODUCT CONFORMITY CERTIFICATION SCHEME FOR FABRIC REINFORCEMENT

1. Submit original or a certified true copy of the product conformity certificate to the "Product Conformity Certification Scheme For Mesh Reinforcements" (PCCS-MR) published by the Hong Kong Concrete Institute. The product conformity certificate shall be issued by a certification body accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a multilateral recognition arrangement with HKAS. If a photocopy of the product conformity certificate is submitted, it shall be certified true by the certification body or by the QCM;
2. The product conformity certificate shall either be submitted before the first delivery to Site or precast concrete casting yard whichever the earlier, or at a time not later than 12 months from the date of commencement of the Works;
3. When directed by CM, submit full set of original or certified true copy of the test reports under the audit testing of the PCCS-MR;
a. The test reports shall be issued by a laboratory accredited by Hong Kong Laboratory Accreditation Scheme (HOKLAS) or an accredited laboratory which has entered into a mutual recognition arrangement with HOKLAS, showing full compliance with the requirements of PCCS-MR. If a photocopy of the test report is submitted, it shall be certified true by the accredited laboratory carried out the testing or by the QCM;

b. The date of the test report shall be within three years prior to the date of commencement of the Works.

CON3.M040.7  COLOUR CODE SYSTEM OF REINFORCEMENT
Submit for Approval a colour code system in the Quality Control System as stipulated in PRE.B8.1425 for identification of reinforcement unloaded to designated areas by the Contractor on Site:

1. For different batches, as defined in CON3.T010, before any testing:
   a. Use white, yellow, blue, grey or other specific colours at the ends of reinforcement bar as directed by the CM;
   b. Avoid to use any colours similar to rust and do not use green and/or red colours.

2. For each batch available with all test results, including the re-test results as permitted in the Specification, add:
   a. Green colour: for reinforcement conforming to the Specification;
   b. Red colour: for reinforcement not conforming to the Specification.

REINFORCEMENT

CON3.M110.7  BAR REINFORCEMENT
Quality requirements:
1. Hot rolled steel bars: to CS2:2012;

CON3.M130.7  FABRIC REINFORCEMENT
Quality Requirements: to BS4483:2005.

CON3.M140.7  REPLACING FABRIC REINFORCEMENT TO BAR REINFORCEMENT
Do not replace the fabric reinforcement by bar reinforcement. Where bar reinforcement proposed for replacement in the event of non-availability of fabric reinforcement, the bar reinforcement proposed for replacement conforming with the equivalent standards set for fabric reinforcement as shown on drawings will be acceptable subject to Approval.

ANCILLARY MATERIALS

CON3.M210.7  COVER SPACERS
Quality requirements:
1. Unless specified elsewhere, type as shown on Standard Drawing STD/DF/S/EG001 or STD/DF/S/EG001/A as appropriate, and as small as practicable, consistent with their purposes, capable of supporting the weight of reinforcement and construction loads without breaking, deforming or overturning;
2. Be one of the following types:
   a. Plastic: Approved type(s);
   b. Concrete (for foundations only): precast or proprietary concrete of strength and durability not less than that of the surrounding concrete. Provide evidence of the grade of concrete to CM for approval.

CON3.M220.7 CHAIRS AND SUPPORTS
Quality requirements:
1. To BS7973:Part 1:2001;
2. Unless otherwise shown on the Drawings, to be steel with plastic-coated feet or Approved anti-rust treatment if not properly protected by concrete. Steel is cut and bent to BS8666:2005.

CON3.M230.7 REINFORCEMENT TYING WIRE
Quality requirements:
1. Diameter of annealed iron wire:
   a. For bars up to and including 16 mm diameter: 0.9 mm;
   b. For bars of 20 mm diameter and over: 1.2 mm.

EPOXY COATED REINFORCEMENT

CON3.M250.7 MANUFACTURER'S DOCUMENT AND TEST RESULTS
Submission requirements:
1. Submit the following particulars, including certificates and test results, for each batch of epoxy coated reinforcement bars at least 60 days before the first delivery of the epoxy coated reinforcement bars to Site:
   a. Name and location of the coating factory;
   b. Mill sheets of the steel reinforcement bars complying with CS2:2012;
   c. Date and place of the coating application;
   d. Certificate of the coating materials in compliance with BS 7295:Part1:1990, including:
      i. Corrosion resistance;
      ii. Chemical resistance;
      iii. Cathodic disbonding of coating;
      iv. Adhesion;
      v. Abrasion resistance;
      vi. Impact strength;
      vii. Hardness.
   e. A contingency plan for dealing with epoxy coated reinforcement bars which are found to be non-conforming to the requirements of Worksection CON3.
2. Re-submit the particulars in sub-clause (1)(d) when the relevant tests have been carried out over 5 years or when there are changes in the composition of the coating materials, whichever the earlier.

CON3.M260.7 EPOXY COATING TO REINFORCEMENT
Quality requirements:
2. Epoxy coating applied by electrostatic spray method to BS 7295:Part 1:1990 at a factory approved by CM;
3. The bond classification of coated bars determined in bond performance tests not less than that of uncoated bars.

CON3.M270.7 CHAIRS, SUPPORTS AND SPACERS
Quality requirements:
1. Steel coated with nylon, epoxy, plastics or other dielectric material for epoxy coated reinforcement.

CON3.M280.7 TYING WIRE
Quality requirements:
1. 1.6 mm diameter soft annealed steel wire coated with nylon, epoxy, plastic or other dielectric material.

MECHANICAL COUPLER

CON3.M310.7 TYPE OF MECHANICAL COUPLER
Quality Requirements of mechanical coupler: Type 1 mechanical coupler as stipulated in the Code of Practice for Structural Use of Concrete 2013 published by the Buildings Department.

CON3.M320.7 SUBMISSION
Submit the following details to the CM for approval at least 30 days prior to the commencement of the mechanical coupler works:
1. The name and model number of the mechanical coupler;
2. The name of the manufacturer and the address of manufacturing factory;

CON3.M330.7 QUALITY ASSURANCE SCHEME FOR MECHANICAL COUPLER
Details of quality assurance scheme for mechanical coupler shall be in accordance with the Project Specific Specification.
WORKMANSHIP

GENERAL

CON3.W010.7 STORAGE OF REINFORCEMENT

Store:
1. All reinforcement clear of a levelled, well-drained and maintained hard-standing ground in a manner that will avoid damage, deformation and contamination of the reinforcement;
2. Fabric reinforcement horizontally;
3. Different types and sizes of reinforcement separately.

CON3.W015.7 STORAGE OF FABRIC REINFORCEMENT IN FACTORY/STOCKYARD

Provide a fenced-off area in the manufacturer’s factory or stockyard for the exclusive storage of fabric reinforcement.

CON3.W020.7 SURFACE CONDITION OF REINFORCING STEEL

Clean and free from loose mill scale, loose rust, oil, grease or any substance, which in the opinion of the CM, is likely to reduce the bond or affect the reinforcement or concrete chemically.

CON3.W030.7 CONTAMINATED OR HEAVILY RUSTED REINFORCEMENT

Remove contaminated or heavily rusted reinforcement from Site unless it has been cleaned or satisfactorily treated by an Approved method.

CON3.W040.7 PROTECTION OF EXPOSED REINFORCEMENT

Where specified or instructed by the CM, protect reinforcement left exposed after completion of the Works by the specified method or by other Approved methods.

CON3.W050.7 COLOUR MARKINGS OF REINFORCEMENT BY STOCKISTS OR SUPPLIERS PRIOR TO DELIVERY

1. Obtain reinforcement preferably without red and green colour markings from stockists/suppliers;
2. If reinforcement with red colour marking, or with a colour marking covering a previous red colour, or with green colour marking is to be supplied:
   a. Provide in advance an explanation to the CM before delivery to Site. In addition, for reinforcement with red colour marking or a colour marking covering a previous red colour, provide to the CM before delivery to Site confirmation each from the Contractor and the stockist/supplier that as far as it is aware, the reinforcement is not non compliant with CS2 and/or rejected by other project;
   b. The CM may refuse entry of reinforcement to Site if:
      i. No explanation is provided in advance; or
      ii. The provided explanation is not satisfactory.
**FIXING REINFORCEMENT**

**CON3.W110.7 CUTTING AND BENDING REINFORCEMENT**

Reinforcement bars are to be cut and bent in accordance with the dimensional requirements of BS 8666:2005 unless otherwise shown on Drawing.

**CON3.W120.7 COLD BENDING**

Bend bars cold, using a proprietary bending machine, and do not rebend unless permitted by the CM.

**CON3.W130.7 SECURING REINFORCEMENT**

1. Secure with tying wire of the correct gauge for the sizes of bars, steel clips of an Approved type, or where Approved, by tack welding;
2. Ensure that the tying wire, including the wire ends, tying devices and clips do not encroach into the nominal cover to the reinforcement;
3. Demonstrate the adequacy of the system employed when Instructed;
4. Submit method statement on the fabrication of reinforcement cages of Barrette or Large Diameter Bored Piles to the CM for approval. The method statement shall include:
   a. Set-up of the fabrication yard;
   b. Step-by-step procedures of reinforcement cage fabrication;
   c. Stability support system;
   d. Working platform arrangement;
   e. Safety plan.
5. The Contractor shall refer to the conceptual method for fixing single layer of reinforcement bars for Large Diameter Bored Piles as shown in Drawings No. CPT/LDBP/S/SK-001 to SK-004 and the conceptual method for fixing double layers of reinforcement bars for Large Diameter Bored Piles as shown in Drawings No. CPT/LDBP/S/SK-101 to SK-106 in Appendix C to this Specification. The Drawings are for reference only and are given in good faith without prejudice to the Contractor’s responsibilities and liability under the Contract;
6. Riggers with Silver Card will also be accepted as skilled trade tested workers for fixing of U-bolts for the reinforcement cages.

**CON3.W140.7 LOCATING REINFORCEMENT**

Provide sufficient cover spacers, chairs and supports, having regard to Table 3 of BS 8000:Part 2:Section 2.2:1990, to maintain the reinforcement in its correct location and to maintain the specified cover at all positions.

**CON3.W150.7 WELDING**

1. Do not weld bars without Approval;
2. Where Approved, weld in accordance with BS EN ISO 17660-1:2006, and the relevant parts of Code of Practice for Structural Use of Concrete 2013.

**CON3.W160.7 CONCRETE COVER**

Refer to Appendix H "Schedule of Tolerances" to this Specification.
CON3.W170.7 COMPLIANCE WITH DRAWINGS

Check that completed reinforcement complies with the drawings, in particular with respect to:

1. Bar conditions;
2. Size of bars;
3. Provision of trimming bars;
4. Number of bars;
5. Spacing;
6. Cover.

CON3.W180.7 CM'S INSPECTION

1. Ensure all completed reinforcement is inspected by the CM before carrying out any work, including erecting any formwork adjacent to the reinforcement, which makes access for inspection difficult;
2. Notify the CM 24 hours, or a shorter period agreed by the CM, prior to carrying out such work.

TOLERANCES

CON3.W210.7 GENERAL

Refer to Appendix H "Schedule of Tolerances" to this Specification.

EPOXY COATED REINFORCEMENT

CON3.W220.7 HANDLING OF REINFORCEMENT

1. Do not subject the reinforcement to rough handling, shock loading or dropping from a height;
2. Lift epoxy coated reinforcement with nylon, rope or padded slings and lift bundles with strongback or with multiple supports to prevent abrasion.

CON3.W230.7 STORAGE OF REINFORCEMENT

Store on wooden or padded cribbing.

CON3.W240.7 CUTTING AND BENDING REINFORCEMENT

1. Bend epoxy coated reinforcement cold;
2. Provide padded supports for bar cutting and bar bending equipment for epoxy coated reinforcement and fit all contact areas of the equipment with nylon or plastic mandrels.

CON3.W250.7 REPAIRS TO EPOXY COATING ON SITE

1. Do not use the epoxy reinforcement in the permanent work if the coating is delaminated, split or damaged:
   a. At any point by an amount exceeding 25 mm² in area or 50 mm in length;
   b. At more than three points in a 1 m length by amounts each even not exceeding 25 mm² in area and 50 mm in length;
   c. At more than six points in the cut and bent length of a bar by amounts each even not exceeding 25 mm² in area or 50 mm in length.
2. Repair all cut ends and damaged areas not exceeding 25 mm² in area or 50 mm in length with patching material applied in accordance with manufacturer's recommendations;

3. Carry out repairs to epoxy coatings within 8 hours of cutting or damage and remove traces of rust from the surface of the reinforcement before carrying out the repair.

**MECHANICAL COUPLER**

**CON3.W30.7 QUALIFIED SUPERVISION**

1. Assign a Mechanical Coupler Quality Control Co-ordinator (MCQCC), with a minimum qualification and experience of a Grade T3 TCP under the Registered Contractor’s stream in the CoPSS, to:
   a. Supervise mechanical splice works and ensure that these are all carried out in accordance with approved plans and comply with the requirements on quality and workmanship;
   b. Devise inspection check list of the mechanical couplers works; and
   c. Provide full time continuous supervision of the manufacturing process of the connecting ends of the steel reinforcing bars and the installation of steel reinforcing bars to the mechanical couplers;

2. Submit the details of the MCQCC and the inspection check list for Approval;

3. Submit a quality supervision plan to CM for Approval;

4. The duties of MCQCC can be taken up by SQCC as stipulated in PRE.B6.130.

**CON3.W320.7 INSPECTION LOG BOOK**

1. Record the following details in an inspection log book:
   a. The names and qualifications of the supervisory personnel assigned by the CM and by the Contractor as stipulated in CON3.W310;
   b. The date, time, items inspected and inspection results.

2. Keep the inspection log book on Site for CM’s inspection when required and submit the inspection log book to CM upon completion of the mechanical splice works.
TESTING

DEFINITIONS

CON3.T010.7  BATCH OF BAR REINFORCEMENT
1. Subject to the maximum tonnage in sub-clause (2) below, a batch of bar reinforcement is the quantity of bar reinforcement delivered to Site within a week under one delivery order, of one nominal diameter, and one steel grade and produced by the same manufacturer;
2. The maximum tonnage of a batch shall not exceed:
   a. For bars of diameter 20 mm and above: 200 tonnes;
   b. For bars of diameter less than 20 mm: 100 tonnes.

CON3.T020.7  BATCH AND LOT OF FABRIC REINFORCEMENT
1. A batch of fabric reinforcement is any quantity of fabric reinforcement of the same grade, produced by the same manufacturer with defined bar pattern, covered by the same mill and testing certificates and produced and properly identified by the CM in an Approved fenced off area in factory or in the stockholder's yard under one consignment;
2. A lot of fabric reinforcement is any quantity of fabric reinforcement of the same grade, produced by the same manufacturer with defined bar pattern, covered by the same mill and testing certificates and delivered to Site at any one time.

CON3.T025.7  BATCH OF MECHANICAL COUPLER
In this Specification, a batch of mechanical coupler is any quantity of coupler of the same type and size delivered to the Site as one consignment and covered by the same mill and testing certificates.

CON3.T030.7  TESTING BY DIRECT TESTING CONTRACTOR (DTC) AND HOUSING DEPARTMENT'S MATERIALS TESTING LABORATORY (HDMTL)
Unless otherwise Approved or specified elsewhere, provide reinforcement samples to the CM for testing by the DTC or HDMTL.

CON3.T040.7  TESTING PROGRAMME
1. Allow sufficient time for the testing of specimens;
2. Do not cut, bend, fix or incorporate steel reinforcement into permanent works until all relevant test specimens have successfully passed all tests carried out by the DTC and HDMTL.

PURCHASERS TESTING

CON3.T110.7  RATE OF SAMPLING
1. For bar reinforcement, provide adequate test specimens from each batch delivered to the Site in accordance with CS2:2012. The number of test specimens taken from each batch and the rate of sampling shall be in accordance with Table 10 of CS2:2012;
2. For fabric reinforcement in factory/stockholder's yard, provide samples from each batch as follows:
<table>
<thead>
<tr>
<th>Size of Batch</th>
<th>No. of Samples per Batch</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - 50 tonnes</td>
<td>1</td>
</tr>
<tr>
<td>Each additional 50 tonnes or part of 50 tonnes</td>
<td>1</td>
</tr>
</tbody>
</table>

3. For reinforcement used for construction of hoardings and associated covered walkways and gantries, the rate of sampling stated in the sub-clauses (1) and (2) above may be reduced at the discretion of the CM.

**CON3.T120.7 PROCEDURE**

Testing arrangement:

1. Under the supervision of the CM,
   a. Cut and take test specimens selected at random from bar reinforcement on Site or samples selected at random from fabric reinforcement (from the same fabric, if feasible) in factory/stockholder's yard;
   b. Ensure size of specimens/samples to be:
      i. Bar reinforcement: each specimen to be minimum 1 m long;
      ii. Fabric reinforcement: each sample to be 1.2 m long x 1.2 m wide containing at least three wires in each direction.
   c. Appropriately mark and deliver the test specimens or samples to the DTC for testing.

**CON3.T130.7 TESTING BY HDMTL**

Testing samples:

1. Provide additional bar reinforcement specimens to HDMTL for test as follows:
   a. Take specimens from bars adjacent to those from which specimens have been cut for testing by the DTC;
   b. Rate of sampling: approximately one-fifth of the rate specified in CON3.T110 with same number of test specimens or samples;
   c. Size of specimens/samples: in accordance with CON3.T120;
   d. Scope, number of tests and method of testing as specified in CON3.T210 and CON3.T220.
2. Provide additional samples from fabric reinforcement in factory/stockholder's yard under the same testing regime in sub-clause (1).

**CON3.T140.7 ADDITIONAL SAMPLES OF FABRIC REINFORCEMENT DELIVERED TO SITE**

When Instructed, provide additional samples of fabric reinforcement for testing by DTC. The rate of sampling shall be minimum one sample for every total 100 tonnes of fabric reinforcement delivered to Site, irrespective of batches/consignments numbers assigned in the factory/stockholder's yard. Each sample so selected by the CM represents the particular lot delivered to Site.

**TESTING BY DTC**

**CON3.T210.7 SCOPE AND NUMBER OF TESTS**

Testing samples:
1. Tests will be carried out on each specimen of bar reinforcement in accordance with CS2:2012;
2. Number of tests on each specimen of bar reinforcement in accordance with Table 10 of CS2:2012;
3. Tests will be carried out on each sample of fabric reinforcement to determine:
   a. Yield stress;
   b. Elongation;
   c. Tensile strength;
   d. Rebending and/or bending properties;
   e. Unit mass;
   f. Pitch dimension.
4. Number of tests on each sample of fabric reinforcement as follow:

<table>
<thead>
<tr>
<th>Description</th>
<th>Type and Number of Tests</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Tensile</td>
</tr>
<tr>
<td>Steel fabric</td>
<td></td>
</tr>
<tr>
<td>- fabric sheet</td>
<td>-</td>
</tr>
<tr>
<td>- longitudinal wire</td>
<td>1</td>
</tr>
<tr>
<td>- transverse wire</td>
<td>1</td>
</tr>
</tbody>
</table>

**CON3.T220.7 METHODS OF TESTING**

Tests will be carried out at a temperature between 5°C to 30°C and in accordance with the following standards:
1. CS2:2012: for hot rolled steel bars;
2. BS4449:2005: for cold reduced steel bars;

**COMPLIANCE**

**CON3.T310.7 COMPLIANCE CRITERIA - BAR REINFORCEMENT**

A batch of bar reinforcement is deemed to comply with the specification if the test results meet the requirements of CS2:2012. Any non-complying batch of bar reinforcement is to be removed from Site.

**CON3.T320.7 COMPLIANCE CRITERIA - FABRIC REINFORCEMENT**

1. For fabric reinforcement in factory/stockholder's yard, a batch is considered as not complying with the specified requirements for grade strength if the yield stress in any tensile test carried out on any sample taken from the batch is less than 93% of the specified grade strength. The non-complying batch is not to be delivered to Site;
2. For fabric reinforcement delivered to Site, a lot is considered as not complying with the specified requirements for grade strength if the yield stress in any tensile test carried out on any sample taken from the lot is less than 93% of the specified grade strength. The non-complying lot is to be removed from Site;
3. If the yield stress in any tensile test for fabric reinforcement in sub-clauses (1) and (2) is less than the specified grade strength but equal to or greater than 93% of the specified grade strength, provide additional samples from the same batch or lot for additional test on yield stress. The number of additional samples is to be in accordance with CON3.T110.

RE-TESTS

CON3.T410.7 REQUIREMENTS FOR BAR REINFORCEMENT

Non-compliance:
1. If the result of any test for bar reinforcement does not comply with the specified requirements for the property, provide additional test specimens from the same batch for additional tests for the property in accordance with CS2:2012. The number of additional specimens must be as stated in CS2:2012.

CON3.T420.7 REQUIREMENTS FOR FABRIC REINFORCEMENT

Non-compliance:
1. If the result of any test for fabric reinforcement for elongation, tensile strength, bending, rebending, unit mass and pitch dimension does not comply with the specified requirements for the property, provide additional samples from the same batch for additional tests for the property. The number of additional samples is the total number of samples taken in accordance with CON3.T110 and each additional sample shall comprise 2 pieces of 1200 mm x 1200 mm fabric reinforcement;
2. Test in accordance with the following:
   a. Number of tests on each additional sample of fabric reinforcement in accordance with the following table:

<table>
<thead>
<tr>
<th>Description</th>
<th>Type and Number of Tests</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Tensile</td>
</tr>
<tr>
<td>Steel fabric</td>
<td></td>
</tr>
<tr>
<td>- fabric sheet</td>
<td>-</td>
</tr>
<tr>
<td>- longitudinal</td>
<td>2</td>
</tr>
<tr>
<td>- transverse</td>
<td>2</td>
</tr>
</tbody>
</table>

CON3.T430.7 STANDARD FOR REJECTION

The batch or lot of reinforcement is considered as not complying with the specified requirements for any particular property if the result of any additional test does not comply with the specified requirements for that property, then:
1. The non-complying batch of bar reinforcement or lot of fabric reinforcement shall be removed from Site;
2. The non-complying batch of fabric reinforcement in the factory/stockholder’s yard shall not be delivered to Site.
EPOXY COATED REINFORCEMENT

CON3.T440.7 ADDITIONAL TEST SPECIMENS FOR EPOXY COATING TEST FOR EACH BATCH
1. Provide and cut 2 test specimens each two metre length from each batch of reinforcement, as directed by CM for epoxy coating tests;
2. Cut each specimen at least 1 m from the ends of a 12 m length bar and select test specimens from different bundles of the reinforcement batch.

CON3.T450.7 TESTING OF THE EPOXY COATING
The DTC shall carry out thickness, adhesion and continuity tests on each additional test specimen as selected in accordance with CON3.T440:
1. Perform the tests in accordance with the following Standards:
   a. Adhesion and continuity tests: to BS 7295:Part 1:1990 with 180° bend test replaced by 90°;
   b. Thickness test for bars of 12 mm diameter or below: to Method No. 6Aa of BS 3900:Part C5:1992;
   c. Thickness test for bars of 16 mm diameter or above to: Method No. 6Aa or No. 6Ab of BS 3900:Part C5:1992.
2. Carry out tests on specimens within a temperature range of between 5 degree Celsius and 30 degree Celsius;
3. Take 5 pairs of readings along two opposite sides of each specimen for thickness test (a total of ten recorded measurements per bar). A single recorded thickness measurement is the average of three individual reading obtained in between the ribs of three consecutive deformations;
4. Perform two bend tests for adhesion at a uniform rate within 15 seconds.

CON3.T460.7 COMPLIANCE CRITERIA FOR EPOXY COATINGS TO REINFORCEMENT
Results of tests for thickness, adhesion and continuity for epoxy coatings to reinforcement to comply with the following requirements:
1. All coating thickness measured from the 2 specimens not less than 0.13 mm. The average of the recorded thickness measurements of coating not less than 0.18 mm and not exceed 0.30 mm;
2. Cracking or debonding of the coating not visible to the unaided eye on any part of the bent bar;

CON3.T470.7 NON-COMPLIANCE FOR THICKNESS, ADHESION AND CONTINUITY TESTS
1. Retests of specimens of the same batch are permitted if one test specimen fails to meet the coating thickness, coating adhesion or coating continuity requirements;
2. Take two further specimens from the same batch for the test or tests in which the original specimens failed;
3. The batch is deemed to comply with the specification if both additional specimens pass the retests;
4. The batch is deemed not to comply with the specification if either or both specimens fails in the retests;
5. Reject and remove the non-complying batch from Site.
CON3.T480.7 TIME REQUIRED FOR TESTING OF THE EPOXY COATED REINFORCEMENT

1. Allow minimum 20 working days for the availability of test results after delivery of the test specimens to the DTC;

2. Do not use the epoxy coated reinforcement until the relevant test specimens have passed all tests.

MECHANICAL COUPLER

CON3.T510.7 RATE OF SAMPLING

Provide test specimens, each with two reinforcing bars of the relevant diameter either threaded or grouted in sleeve in accordance with the manufacturer’s recommended assembly method, from each batch for testing by DTC as follows:

<table>
<thead>
<tr>
<th>Size of batch (No.)</th>
<th>Number of test specimens Without ductility requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 100</td>
<td>3</td>
</tr>
<tr>
<td>100 – 500</td>
<td>6</td>
</tr>
<tr>
<td>Exceeding 500</td>
<td>9</td>
</tr>
</tbody>
</table>

CON3.T520.7 METHOD OF TESTING

The testing for splicing assemblies without ductility requirement shall be in accordance with the Code of Practice for Structural Use of Concrete 2013 published by the Buildings Department.

CON3.T530.7 COMPLIANCE CRITERIA

1. A batch of mechanical coupler without ductility requirement is deemed to comply with the specification if all the splicing assemblies comply with the following criteria:
   a. Tensile strength: > 287.5 N/mm² for grade 250, > 529 N/mm² for grade 460, > 540 N/mm² for grade 500B, and > 575 N/mm² for grade 500C;
   b. Permanent elongation: ≤0.1 mm after loading to 60% of the characteristic yield strength of the reinforcement;

2. Any non-complying batch is to be removed from Site.

CON3.T540.7 TIME REQUIRED FOR TESTING

1. Allow minimum 15 days for the availability of test results after delivery of the test specimens to the DTC;

2. Do not use the mechanical couplers until the relevant test specimens have passed all tests.
CON4  PRECAST CONCRETE

DESIGN

DESIGN PARAMETERS

CON4.D010.7  PRECAST CONCRETE
1. Design in accordance with this Worksection and Worksection CON1;
2. Where any ambiguity, discrepancy or conflict arises between this Worksection and any clauses in any other Worksections of this Specification, ensure that the provisions of this Worksection prevail.

CON4.D020.7  STRUCTURAL JOINT DESIGN
Design structural joints between precast concrete units and insitu concrete to transmit the worst anticipated combination of moment, shear, axial force, temperature stresses, shrinkage, creep and torsion in accordance with Worksection CON1 unless specified otherwise.

CON4.D030.7  STEEL LIFTING FRAMES
Design and construct steel lifting frames in accordance with the Code of Practice for the Structural Use of Steel 2011 issued by the Buildings Department.

CON4.D040.7  LIFTING POINTS
Submit for Approval the proposed positions of lifting holes and/or points of attachment of lifting slings to precast concrete units if not shown on the Drawings.

DRAWINGS AND CALCULATIONS

CON4.D110.7  GENERAL
All drawings and calculations relating to the structural design must be prepared and signed by a Registered Structural Engineer who is registered under the Buildings Department.

DESIGN SUBMISSIONS

CON4.D210.7  GENERAL

CON4.D220.7  PROGRAMME FOR SUBMISSIONS
Agree a programme for all submissions during the Contract with the CM prior to the notified date for commencement of Works.

CON4.D230.7  SHOP DRAWINGS
Unless otherwise agreed, submit five sets of fully dimensioned shop drawings for Approval in accordance with CON4.D220.
JOINTS

CON4.D310.7 JOINTS
For application of back-up materials, bond breakers and sealants, see Worksection WAT5.

CON4.D320.7 GASKETS
Gasket may be used in weatherproofing joint provided that:
1. The joint is horizontal; and
2. The gasket is always under compression.

CON4.D330.7 MORTAR STOPS
Use backing rods or other Approved method as mortar stops in grouting panel joints when necessary.

WEATHERPROOF JOINTS

CON4.D410.7 JOINT DESIGN
Design weatherproof external joints to ensure airtightness and watertightness and in accordance with BS 6093:1993.

CON4.D420.7 TYPES OF JOINT
Use weatherproof joints of one of the following types and in accordance with BS 6093:1993:
1. Sealed joint (one-stage joint);
2. Drained joint (two-stage joint).

CON4.D430.7 DESIGN WIDTH OF JOINTS
Design the joint width in accordance with BS 6093:1993 and BS 6213:1982.

CON4.D440.7 CONTRACTOR'S RESPONSIBILITY
Approval of the proposed jointing system including the weatherproofing materials does not relieve the Contractor from any liability on the performance of the joints.

MODIFICATIONS TO THE BUILDING STRUCTURE

CON4.D510.7 CONTRACTOR'S RESPONSIBILITY
The Contractor's responsibility for the design of his proposed modification is covered under GCC Clauses 5.15 and 11.8 and the Appendix E to the Specification.

CON4.D520.7 COMPLIANCE WITH GUIDELINES AND REGULATIONS
Any proposed structural modifications must comply with the following:
1. The relevant structural design guidelines published by the Housing Department and included as Appendix E to this Specification; and
2. The Regulations currently in use.
CON4.D530.7  REINFORCEMENT CHANGES

Obtain CM's approval for any proposed changes to reinforcement details, as shown on the Drawings, required to suit the proposed method of casting and installation.
MATERIALS

GENERAL

CON4.M010.7 SUBSTITUTION OF NON-STRUCTURAL CONCRETE
Submission requirements:
1. Submit for Approval any proposal to substitute non-structural insitu concrete or non-structural partitions, excluding panel wall partitions, with precast concrete.

CON4.M020.7 PRECAST CONCRETE
Where precast work is proposed and Approved, comply with the relevant provisions of:
1. Worksection CON1;
2. Worksection CON2 or FOR; and
3. Worksection CON3.

CON4.M030.7 STANDARD DOMESTIC PRECAST CONCRETE COMPONENTS
See Worksection CON7.

CON4.M040.7 OFF-SITE MANUFACTURE
Obtain Approval for off-site manufacture. For precast concrete components of standard domestic blocks, see CON7.D010.

SUBMISSIONS

CON4.M110.7 GENERAL
Submit the following details for Approval:
1. Drawings, calculations and any other information indicating the location and/or element of precast concrete and any changes resulting from the use of precast concrete;
2. Calculations which show all loading imposed on the precast concrete due to lifting, handling, stacking, shock or any other reason, complies with the relevant British Standards, unless specified otherwise;
3. A method for identifying and recording the daily production of precast concrete units and their final position after installation;
4. The joints required between the proposed precast concrete and insitu concrete;
5. Drawings and calculations of lifting frames for precast units where specified.

CON4.M120.7 REINFORCEMENT CHANGES
Obtain prior Approval for any proposed changes to reinforcement details, as shown on the Drawings and/or to the bar bending schedules, required to suit the proposed method of casting and installation.
**CONCRETE GRADE**

**CON4.M210.7** **CONCRETE FOR LINTELS**
Cast precast lintels in concrete Grade 35/20, unless otherwise specified.

**CON4.M220.7** **CONCRETE FOR STAIRS**
Cast precast stairs in concrete Grade 35/20, unless otherwise specified.

**CON4.M222.7** **CONCRETE FOR REFUSE CHUTE**
Cast precast refuse chute in concrete Grade 35/20, unless otherwise specified.

**NON-SHRINK GROUT FOR PRECAST STAIRS**

**CON4.M230.7** **APPROVED MIX**
For non-shrink grout, the submitted grout mix shall have the specified characteristic as stated in CON4.M260. Submit samples of non-shrink grout for carrying out the tests as stated in CON4.M260 by the Direct Testing Contractor for Approval.

**CON4.M240.7** **CONSTITUENT MATERIALS OF NON-SHRINK GROUT**
To be a pre-packaged cement base product which contains Portland cement, selected sand and non-shrink additives.

**CON4.M250.7** **WATER/POWDER RATIO OR WATER CONTENT**
For pre-packaged non-shrink grout product, comply with the manufacturer's recommendations.

**CON4.M260.7** **NON-SHRINK GROUT**
Quality requirements:
1. To be pre-packaged cement based product which contains Portland cement, selected sand and non-shrink additives with the following required properties:
   a. A 28 days strength equal to or higher than the grade of the adjoining structures. The compressive strength shall be determined by compressive strength test as CON4.T080;
   b. Chloride content of grout shall not exceed 0.1% by mass of the cement. Submit documentary evidence that the summation of chloride contents of constituent materials complies with the aforesaid requirement;
   c. Setting time of the non-shrink grout when tested in accordance with ASTM C953 - 87(97) shall be greater than 1 hour for initial set and be less than 24 hours for final set;
   d. Free expansion within 24 hours shall be of maximum 4% when measured in accordance with ASTM C827 - 95a(97). Expansion between 3 to 28 days when measured in accordance with ASTM C1090 - 96 shall be between 0% to 0.4%.

**CON4.M270.7** **CONCRETE WITH NON-SHRINK ADDITIVES**
Submit for Approval and:
1. Maximum aggregate size: 10 mm;
2. Grade strength: a 28 days strength equal to or higher than the grade strength of the adjoining structure;
3. To comply with the manufacturer's recommendations on non-shrink additives;
4. Do not contain chlorides.

WEATHER PROOF JOINTS

CON4.M310.7 GENERAL
Weatherproofing materials to comply with BS 6093:1993 and subject to Approval.

CON4.M320.7 SEALANTS
As WAT5.M180.

CON4.M330.7 MORTAR STOP BACKING RODS
Polyethylene foam or other Approved.

CON4.M340.7 DETAILS OF WEATHERPROOFING
Submission requirements:
WORKMANSHIP

CASTING PRECAST UNITS

CON4.W005.7 QUALITY SYSTEMS AND QUALIFIED SUPERVISION
Comply with CON7.W010 to CON7.W120 and relevant provisions of Worksection CON7 on quality systems and qualified supervision for precast works.

CON4.W010.7 PLACING CONCRETE
Cast precast concrete in a single pour unless otherwise Approved.

CASTING LINTELS

CON4.W110.7 GENERAL
Except where unusual or exceptional loading conditions apply or specified elsewhere, construct lintels as shown below:

<table>
<thead>
<tr>
<th>Lintels</th>
<th>Clear Span (metres)</th>
<th>Depth of Lintel (mm)</th>
<th>No. and diameter of mild steel bars per 105 mm (or part) in width</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - 1</td>
<td>150</td>
<td>one 12 mm</td>
<td></td>
</tr>
<tr>
<td>1 - 2</td>
<td>225</td>
<td>one 16 mm</td>
<td></td>
</tr>
<tr>
<td>2 - 3</td>
<td>300</td>
<td>one 20 mm</td>
<td></td>
</tr>
</tbody>
</table>

CON4.W120.7 COVER TO REINFORCEMENT
Unless otherwise specified, provide 25 mm minimum concrete cover to steel bar reinforcement.

CON4.W130.7 BEARING ALLOWANCE
Unless otherwise specified, allow for a minimum bearing of 150 mm over its full width at each end.

CASTING STAIRS

CON4.W210.7 CONSTRUCTION
Construct stairs in accordance with details given on the Drawing.

CON4.W220.7 FORMWORK
As CON2.W920, unless otherwise specified.
CURING

CON4.W310.7 GENERAL
Cure concrete in accordance with CON1.W1410 to CON1.W1490, unless otherwise Approved.

CON4.W320.7 OTHER CURING METHODS
Carry out a full scale trial, where curing methods other than those specified in CON4.W310 are proposed, to demonstrate satisfactory performance. Obtain Approval before precast concrete work commences.

STORAGE, TRANSPORTATION AND LIFTING OF UNITS

CON4.W410.7 STRENGTH OF UNITS
Unless otherwise specified, do not lift precast units for at least 24 hours after casting or until the concrete has attained a strength adequate to resist the resultant stresses without inducing cracking or other damage to the concrete.

CON4.W420.7 STORING UNITS
1. For superstructure works:
   a. Store units on a levelled, well-drained and maintained hard-standing ground which will not result in damage, contamination or injury to others, and separate using Approved methods. Store different types of precast units separately. Protect as necessary from the weather and from staining;

2. For works other than that in sub-clause (1):
   a. Store units on a clean, firm base and separate using Approved methods. Store different types of precast units separately. Protect as necessary from the weather and from staining.

CON4.W430.7 DAMAGED UNITS
Replace or repair all units damaged by handling, hoisting into position or during transporting.

EREECTING PRECAST UNITS

CON4.W510.7 STANDARD AND SEQUENCE
Erect precast units in accordance with BS 5531:1988 and in an Approved sequence.

CON4.W520.7 TEMPORARY BRACING
Provide temporary bracing to units where appropriate.

CON4.W530.7 DOWEL FIXINGS FOR PRECAST STAIRS
Locate box cutouts of precast stairs over cast-in dowel bars and fill with non-shrink grout.
BEDDING AND JOINTING PRECAST STAIRS

Bed and joint precast stairs in non-shrink grout or cement mortar where shown on Drawings.

ACCURACY AND TOLERANCES

GENERAL

1. Refer to:
   a. Code of Practice for Precast Concrete Construction 2003 published by the BD;
   b. Appendix H "Schedule of Tolerances" to this Specification.
2. Where any ambiguity, discrepancy or conflict arises between sub-clauses (1)(a) and (1)(b) above, the provisions given in Appendix H shall prevail.

IDENTIFICATION FOR PRECAST UNITS

IDENTIFICATIONS AND RECORDS

Submit a method for identifying and recording the daily production of precast concrete units and their final position after installation.

DEFECTS

MINOR CHIPPING

Subject to Approval, carry out repairs to minor chipping only by patching up after installation.

OTHER REPAIRS

For repairs to other damaged units, carry out any repair work to the satisfaction of the CM.
TESTING

SAMPLING AND TESTING

CON4.T010.7  FULL SCALE MOCK UP
Where required by the CM, provide full scale mock up to demonstrate that the precast units and the system of joints proposed are adequate, all to the satisfaction of the CM.

CON4.T020.7  WATERTIGHTNESS TEST
Before Approval to use precast concrete as CON4.M110, carry out watertightness test on the mock up on the precast unit of a particular type, with the jointing system in place.

CON4.T030.7  SAMPLING FOR WATERTIGHTNESS TEST
Testing samples:
1. Carry out full scale watertightness test on the precast unit of a particular type, with the jointing system in place, at the rate of 0.5% or each type proposed or one precast unit, whichever is the greater.

CON4.T040.7  AGREED TEST PROCEDURES
Test with a water pressure, duration, frequency and procedure as agreed by the CM.

CON4.T050.7  CRITERIA FOR FAILURE
The precast units and joints will be deemed failures if any sign of water seeping through the joints or the body of the cast unit, including signs of damp patches, is observed during the test.

CON4.T060.7  REMEDIAL ACTION
Non-compliance:
1. Upon failure of the watertightness test as CON4.T050:
   a. Remove the precast unit and scrape out all jointing materials;
   b. Redesign the precast unit or the jointing system, if the CM considers appropriate; and
   c. Reconstruct and retest as directed by the CM.

CON4.T070.7  TESTING GROUT
Testing method and testing samples:
1. Test grout in accordance with CS1:2010 as follows:
   a. Test to be carried out by the DTC;
   b. Test a minimum of one pair of concrete cubes for each day of grouting;
   c. The strength of 100 mm cubes of grout must not be less than the grade strength of the adjoining concrete.
CON4.T080.7 COMPRESSION TEST FOR NON-SHRINK GROUT
1. The 7 & 28 days compressive strength test shall be carried out by Direct Testing Contractor;
2. Prepare specimens in accordance with BS6319:Part 1:1983 except to keep materials, moulds and specimens at 27°C ± 2°C and at a relative humidity of 55% ± 5%;
3. Unless otherwise specified, leave specimens in moulds and cover them with polythene for 3 days before demoulding;
4. The compressive strength of the specimens shall be determined in accordance with BS6319:Part 2:1983 except that the cube size shall be 100 mm.

TESTING FIXINGS

CON4.T110.7 TENSILE TESTING
Testing method:

CON4.T120.7 SHEAR TESTING
Testing method:
CON5  PRECAST FACADE UNITS (CONTRACTOR'S DESIGN) FOR STANDARD DOMESTIC DESIGN

GENERAL

CON5.D010.7  RELEVANCE OF OTHER SPECIFICATION WORKSECTIONS
1. Design and construct precast concrete facades for standard domestic blocks in accordance with this Worksection and with the relevant provisions of the following Worksections:
   a. CON1, Insitu Concrete;
   b. CON2, Formwork;
   c. CON3, Reinforcement.
2. Where any ambiguity, discrepancy or conflict arises between this Worksection, and any clauses in any other Worksections of this Specification, ensure that the provisions of this Worksection prevail.

CON5.D020.7  STANDARD
Comply particularly with CON1.M010.

SCOPE OF THE WORK

CON5.D110.7  GENERAL
1. Refer to the Drawings for the definition of the extent of the precast concrete facades including window installation;
2. For off-Site casting, co-ordinate with the precast facade supplier for the installation of windows, pre-formed holes, surface finishes, earthing lugs as shown on the Drawings;
3. Include the following with the precast concrete facades delivered to or fabricated on Site:
   a. Precast concrete panel as shown on the Drawings;
   b. Aluminium or uPVC window obtained from a supplier approved by CM;
   c. Pre-formed holes for the installation of drainage pipes;
   d. Earthing lugs as shown on the Drawings;
   e. Concealed electrical PVC conduit system installations as shown on Drawings and as specified; and
   f. A certificate indicating the date of casting.
   g. Work completion certificate for pre-installed electrical conduit system installation.
INSITU CONCRETE ELEMENTS INCLUDED

In addition to the precast elements shown on the Drawings, any insitu concrete facades at F1 and roof-minus-one floors and any other floor indicated as such on the Drawings, designed and cast as insitu concrete, also form part of the whole precast concrete facade system. For such insitu facade elements, comply with Worksections CON1, CON2, CON3 and CON6 of this Specification and those provisions of this Worksection as may apply to insitu facades.

SCOPE OF THE DESIGN

Include the following in the scope of the design of the precast concrete facade system:

1. The structural design of the facade units to the dimensions shown on the Drawings;
2. The design of the structural connections by which the facade units are joined monolithically with the building structure;
3. The design of one-stage weatherproof joints between the facade units and the building structure;
4. The design of the connection to the supporting system for the air conditioning unit as shown on the Drawings, (maximum net weight 100 kg);
5. The design of the fixing of the windows to the openings;
6. The design of electrical conduit system installation.

DESIGN PARAMETERS

GENERAL

Design the facade units generally as a one-piece design.

MINIMUM THICKNESSES

Design each facade unit with the line of the inner side of the unit fixed as shown on the Drawings and:

1. With a general minimum thickness of not less than 150 mm;
2. With the thickness of the ledge for the air conditioning hood not less than 125 mm.

OVERHANG AT BASE OF UNITS

Incorporate a 575 mm overhang at the base of each facade unit designed monolithically with the wall of that facade unit.

WINDOW OPENINGS

Design openings for windows in the facade unit:

1. To the dimensions shown on the Drawings;
2. Restrained at the top with a beam and at either side with a wall or a post.

LOADINGS

Design facade units to sustain all possible loadings acting upon the units. In particular, take the following loading conditions into account:

1. Dead loads and superimposed loads;
2. Wind loads in accordance with the Code of Practice on Wind Effects in Hong Kong 2004 issued by the Buildings Department except that the total pressure coefficient (Cp) is 1.4;

3. Eccentric loads which arise either as a result of the centre of gravity of the facade units being offset from the support or from random inaccuracies occurring during construction. Allow a minimum of 25 mm eccentricity in the design for such random inaccuracies;

4. Tensile loads if the facade units are designed to be hung from the top or from the sides;

5. Buckling loads if the facade units are subject to vertical compression;

6. Temperature stresses;

7. Temporary loads which arise during demoulding, storage, lifting, transporting and erection of the facade units. In particular, design for the complex stresses arising out of lifting from stacked position into lifting position.

CON5.D260.7 MINIMUM CONCRETE GRADE
For facade units: Grade 35/20.

CON5.D270.7 CONCRETE COVER TO REINFORCEMENT
Minimum cover to reinforcing bars in facade units:
1. External face: 30 mm;
2. Internal face: 25 mm.

CON5.D280.7 LIFTING AND LOCATING DEVICES
1. Design lifting and location devices for embedding or fixing to the facade units in accordance with the Code of Practice for Precast Concrete Construction 2003 issued by the BD;
2. Allow a minimum safety factor of 4 for lifting inserts under normal circumstances;
3. Check and make necessary provisions in the facade units to prevent local rupture or cracking as a result of using lifting and locating devices.

CON5.D290.7 LOCATION POINTS
1. Make provision on each facade unit for locating, plumbing and levelling to the designed location within acceptable tolerance limits;
2. Include details of location points as part of the submission under sub-clause (7) of CON5.D860.

CON5.D300.7 PERMANENT CONNECTIONS
Design permanent structural connections using one, or a combination of both, of the following methods:
1. Insitu connection by which the facade units are joined monolithically with the building structure;
2. Mechanical connections by which the facade units are secured to the building structure at attachment points using brackets, cleats and fixings.

CON5.D310.7 ERECTION RESTRAINTS
1. Design vertical and horizontal restraints for temporary connections of the facade units to the main structure such that displacement of the facade unit cannot occur before making the permanent structural connection;
2. Design horizontal restraint to resist a minimum horizontal live load of ± 0.5 kN/m run acting at 1.5 m from the base of the facade unit.

CON5.D320.7 ADJUSTMENT DEVICES
1. Provide the facade units with separate vertical and horizontal adjustment devices;
2. Do not use adjustment devices in the vertical plane for horizontal location devices or horizontal restraint and do not design such devices to take any permanent shear (horizontal) loads;
3. Do not design any adjustment devices in the horizontal plane to take permanent vertical loads.

CON5.D330.7 STRUCTURAL SUPPORT
1. Design the facade units at each floor to derive their support from the building structure at the same floor via the specified permanent structural connections;
2. Do not allow any permanent loading from the facade units to be transferred to the facade units above or below.

INSITU CONNECTION DESIGN

CON5.D410.7 GENERAL
Design the insitu connection as CON5.D130:
1. To withstand the stresses induced by the facade units described in CON5.D250, sub-clauses (1) to (6);
2. To be watertight;
3. In concrete of the same grade as that for the precast units.

CON5.D420.7 REINFORCEMENT, SHEAR CONNECTORS ETC
Ensure reinforcement, shear connectors, etc used for the insitu connection design are adequately embedded or anchored into the building structure.

CON5.D430.7 VERTICAL CONNECTIONS
For vertical insitu connections:
1. If the minimum dimension of the void to be in filled is more than 150 mm, use non-shrink grout or concrete with non-shrinking additives;
2. If the minimum dimension of the void is less than 150 mm, use only non-shrink grout.

CON5.D440.7 HORIZONTAL CONNECTIONS
Concrete with non-shrinking additives may be permitted for horizontal insitu connections, in lieu of non-shrink grout, subject to the provisions of CON5.M050.

MECHANICAL CONNECTIONS

CON5.D510.7 GENERAL
Design the mechanical connections referred to in sub-clause (2) of CON5.D130 to withstand the stresses transmitted by the facade units to the building structure, described in CON5.D250 sub-clauses (1) to (6), in one of the following two groups:
1. Tying back fixing;
2. Location fixing.

CON5.D520.7 LOAD BEARING FIXINGS
Adopt load bearing fixing where the facade unit is designed to bear upon the building structure. Design the fixing so that the supporting area is adequate to carry the weight of the facade unit.

CON5.D530.7 TYING BACK FIXINGS
Adopt tying back fixing for securing the facade units into position. Design the fixing and the facade units to sustain the forces due to the restraint of the relative movement between the facade units and the building structure including movements cause by the effect of temperature, moisture movement, shrinkage and creep based on Hong Kong conditions.

CON5.D540.7 LOCATION FIXINGS
Adopt location fixing for positioning and levelling the facade unit before it is connected. Allow for all handling and positioning loads.

CON5.D550.7 TYPES OF ATTACHMENT TO STRUCTURE
1. Fix the facade units to the building structure by one of the following methods:
   a. Cast in anchorages (Type A);
   b. Grouted in dowel bars (Type B);
   c. Expanding anchorages (Type C).
2. Comply with CON5.D530 to CON5.D540 for Type A and B anchorages;
3. For Type C anchorages, submit manufacturer's certificates and conduct pull out tests to check compliance with manufacturer's recommendations;
4. Submit for Approval any proposed alternative anchorage methods.

CON5.D560.7 LINKS BETWEEN ANCHORAGES
Angle cleats may be used to form the link between anchorages. Assembly adjustments may be made in three dimensions using horizontal and vertical slotted holes. Submit for Approval any proposed alternative devices to link between anchorages.

CON5.D570.7 CONCEALMENT OF FIXINGS
Conceal all permanent fixing connections by Approved methods.

CON5.D580.7 RESISTANCE TO CORROSION
All metal parts of connections must either be:
1. Corrosion resistant, being constructed of non-ferrous metal or stainless steel but avoiding any contact of such materials with the reinforcement; or
2. Protected against corrosion by an Approved method.
WEATHERPROOF JOINTS

CON5.D610.7 GENERAL
Design weatherproof joints between the facade units and the structure or between two adjacent facade units to ensure air and water tightness and in accordance with BS 6093:1993 and include joint seals in accordance with CON5.M110 and CON5.M120.

CON5.D620.7 TYPES OF JOINT
Use weatherproof joints of one of the following types:
1. Sealed joint (one-stage joint);
2. Drained joint (two-stage joint).

CON5.D630.7 DESIGN WIDTH OF JOINTS
Design the joint width in accordance with BS 6093:1993 and BS 6213:1982.

CON5.D640.7 COMBINATIONS OF JOINT TYPE AND STRUCTURAL CONNECTIONS
Use only the following combinations of weatherproof joint and permanent structural connection in the design of the precast concrete facades:
1. Either one-stage or two-stage weatherproof joint with in situ connections specified in CON5.D300 (1);
2. Two-stage weatherproof joint with mechanical connections specified in CON5.D300 (2).

CON5.D650.7 CONTRACTOR'S RESPONSIBILITY
Approval of the proposed jointing system including the weatherproofing materials does not relieve the Contractor from any liability on the performance of the joints.

MODIFICATIONS TO THE BUILDING STRUCTURE

CON5.D710.7 CONTRACTOR'S RESPONSIBILITY
The Contractor's responsibility for the design of his proposed modification is covered under GCC Clauses 5.15 and 11.8 and the Appendix E to the Specification.

CON5.D720.7 TYPES OF MODIFICATION
Modification to the design of the building structure to accommodate the precast facade design is permitted under the following circumstances subject to detailed submissions and Approval:
1. Modification for constructing the permanent structural connections. Reinforcement may be required to be relocated and/or added to the building structure provided that the resulting reinforcement arrangements produce an equivalent or higher overall design strength to that of the original structure;
2. Modification to incorporate the weatherproof joints. Grooves may be required to be formed provided that the resulting section produces an equivalent or higher overall design strength to that of the original structure.

CON5.D730.7 COMPLIANCE WITH GUIDELINES AND REGULATIONS
Any proposed structural modifications to accommodate the precast concrete facade design must comply with the Regulations currently in use.
CON5.D740.7 WIND LOADINGS
For the purposes of designing for wind, the values and requirements must be not less than those specified in relevant structural design guidelines published by the Housing Department and included as Appendix E to this Specification.

SUBMISSIONS

CON5.D810.7 TENDER DESIGN PROPOSAL
Submit for Approval, full details of tender design proposals including drawings, layouts, details, calculations and any other information required by the CM.

CON5.D820.7 REGISTERED STRUCTURAL ENGINEER
All structural drawings, layouts, details and calculations submitted to the CM, including those submitted with tender, must be prepared and signed by a Registered Structural Engineer registered under Buildings Department of Hong Kong Government.

CON5.D830.7 PROGRAMME FOR SUBMISSIONS
Agree a programme for all submissions during the Contract to the CM prior to the notified date for commencement of Works. Include in the programme, the CM's undertaking to reply to design submissions within the following periods:
1. Initial submission - Within 28 days;
2. Resubmission - Within 14 days.

CON5.D850.7 SHOP DRAWINGS
Within two months of the notified date for commencement of the Works, submit five sets of fully dimensioned shop drawings for each type of facade unit, including shop drawings for windows to COM2.D210 and electrical conduit system complete with its accessories, for approval.

CON5.D860.7 DRAWINGS AND METHOD STATEMENT
Within two months of the notified date for commencement of the works, submit, for agreement, the following items:
1. Design of moulds, layout arrangements, casting methods (horizontal or vertical), tilting mechanism (if any), demoulding methods and the provision for attachments of openings for window fixing;
2. The complete procedures for fabrication, curing, demoulding, application of finishes, lifting, transporting, storage, erection and installation of weatherproof joints;
3. Method of protecting the facade units from damage at all times;
4. Minimum concrete strength required for the facade units for demoulding, handling, storage, transportation and erection;
5. Position and design of lifting points;
6. Calculated weights of the facade units.

CON5.D870.7 METHOD OF FIXING WINDOWS
Within two months of the notified date for the commencement of the Works, submit for agreement, the method of fixing window frames or windows before casting of the facade units commences. Obtain either aluminium or uPVC windows from a supplier approved by CM.
CON5.D880.7 DETAILS OF WEATHERPROOFING
Within two months of the notified dated for the commencement of the Works, submit details of weatherproofing materials in accordance with CON5.M110 and CON5.M120 for Approval, including technical information, samples, test reports and proven performance records of proposed materials.

CON5.D890.7 QUALITY ASSURANCE SCHEME
Within two months of the notified date for the commencement of the Works, submit details of the Quality Assurance Scheme for manufacturing the facade units, in accordance with CON5.W030 to CON5.W050 as applicable, for Approval.

CON5.D900.7 QUALITY CONTROL PROCEDURES
Within three months from the notified date for commencement of Works, submit for Approval, details of quality control procedures for erection of the facade units in accordance with CON5.W640.

CON5.D910.7 PROGRAMMES
Within one month of the notified date for the commencement of the Works, submit, for agreement:
1. When instructed by the CM, the programme for the design and the testing of the trial samples of the facade units;
2. The programme for manufacture of the facade units showing the rate of production for each month and the dates for clearing the area of casting yard and associated plant upon completion of the manufacture of the facade units;
3. The programme for the erection of facade units in accordance with CON5.W610.

CON5.D920.7 LOADING OF INSITU STRUCTURAL MEMBERS
Submit calculations to demonstrate that the insitu structural members are not subject to excessive stresses arising from the erection method of the facade units and to demonstrate the adequacy of any temporary supports which may be required.

SUBMISSIONS FOR PRECASTING

CON5.D1010.7 PRELIMINARY DESIGN
Submit preliminary design of moulds indicating the material to be used, layout arrangements, casting methods (horizontal or vertical), tilting mechanism (if any), demoulding methods of the main and side panels of the moulds and the provision for attachments of openings for window fixing.

CON5.D1020.7 METHOD STATEMENTS
Submit a method statement:
1. Describing the complete procedures for fabrication, curing, demoulding, application of finishes, lifting, transporting, storage, erection including fixing, grouting and installation of weatherproof joints;
2. Designed to ensure the dimensional accuracy both of the facade units and the structural elements adjoining them.

CON5.D1030.7 CASTING FACILITIES
Submit for Approval in accordance with CON5.W010.
CON5.D1040.7 PRELIMINARY PROGRAMME

Submit a preliminary programme for the design, manufacture, erection, testing and full size trial samples of the facade units including dates for clearing the area of any on-Site casting yard and associated plant upon completion of manufacture of the facade units.
MATERIALS

NON-SHRINK GROUT AND CONCRETE

CON5.M010.7  APPROVED MIX
For non-shrink grout, the submitted grout mix shall have the specified characteristic as stated in CON5.M040. Submit samples of non-shrink grout for carrying out the tests as stated in CON5.M040 by the Approved testing laboratory.

CON5.M020.7  CONSTITUENT MATERIALS OF NON-SHRINK GROUT
To be a pre-packaged cement base product which contains Portland cement, selected sand and non-shrink additives.

CON5.M030.7  WATER/POWDER RATIO OR WATER CONTENT
For pre-packaged non-shrink grout product, comply with the manufacturer's recommendations.

CON5.M040.7  NON-SHRINK GROUT
Quality requirements:
1. To be pre-packaged cement base product with the following required properties:
   a. A 28 days strength equal to or higher than the grade of the adjoining structures. The compressive strength shall be determined by compressive strength test as CON5.T260;
   b. Chloride content of grout shall not exceed 0.1% by mass of the cement. Submit documentary evidence that the summation of chloride contents of constituent materials complies with the aforesaid requirement;
   c. Setting time of the non-shrink grout when tested in accordance with ASTM C953 - 87(97) shall be greater than 1 hour for initial set and be less than 24 hours for final set;
   d. Free expansion within 24 hours shall be of maximum 4% when measured in accordance with ASTM C827 - 95a(97). Expansion between 3 to 28 days when measured in accordance with ASTM C1090 - 96 shall be between 0% to 0.4%.

CON5.M050.7  CONCRETE WITH NON-SHRINK ADDITIVES
Submit for Approval and:
1. Maximum aggregate size: 10 mm;
2. Grade strength: a 28 days strength equal to or higher than the grade strength of the adjoining structure;
3. To comply with the manufacturer's recommendations on non-shrink additives;
4. Do not contain chlorides.

WEATHERPROOFING

CON5.M110.7  GENERAL
Quality requirements:
1. Weatherproofing materials to comply with BS 6093:1993 and subject to Approval.

**CON5.M120.7 SEALANTS**
As shown or scheduled on the Drawings as WAT5.M180.

**CON5.M130.7 MORTAR STOP BACKING RODS**
Polyethylene foam or other Approved.

**CONDUIT SYSTEM**

**CON5.M210.7 STANDARDS**
1. For rigid plain polyvinyl chloride (PVC) conduits, conduit fittings and PVC boxes, comply with the following British Standards:

<table>
<thead>
<tr>
<th>Conduits and Fittings</th>
<th>British Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>PVC conduits:</td>
<td>BS 6099:Section 2.2:1982(1988)</td>
</tr>
</tbody>
</table>

2. Ensure that all PVC conduits, fittings and boxes are of the same make.

**CON5.M220.7 COLOUR**
PVC conduits, fittings and boxes: white in colour.

**CON5.M230.7 FLAME RESISTANCE**
PVC conduits, fittings and boxes: non-flame-propagating and self-extinguishing.

**CON5.M240.7 TEMPERATURE CLASSIFICATION**
1. For all PVC conduits, fittings and boxes, comply with the temperature classification of -5 in accordance with BS 6099:Section 2.2:1982(1988);
2. For PVC conduits, where the ambient temperature at the country of manufacture is likely to be below -5ºC, the temperature classification is -25.

**RIGID PLAIN PVC CONDUITS**

**CON5.M310.7 CONSTRUCTION AND SIZE**
1. PVC conduits: rigid, plain and of a non-threadable type;
2. Nominal diameter of PVC conduits: within the range of 20 mm to 32 mm unless otherwise specified.

**CON5.M320.7 MECHANICAL PROPERTIES**
PVC conduits are:
1. Of heavy mechanical strength;

CON5.M330.7 TYPE-TESTING FOR ELECTRICAL PVC CONDUITS
1. Rigid plain PVC conduits shall be type-tested for complete compliance with BS 6099:Section 2.2:1982(1988) by an Independent Accredited Laboratory or an Independent Short-Circuit Testing Organisation;
2. Upon request from CM, provide documentary evidence that the batch/consignment of PVC conduits delivered to Site have satisfied the requirement as stipulated in the relevant British Standards mentioned in sub-clause (1) above.

PVC CONDUIT FITTINGS

CON5.M410.7 CONSTRUCTION
1. Use plain, moulded slip-type couplers and expansion type couplers to BS 4607:Part 5:1982 (1988) in the jointing of conduits;

CON5.M420.7 TYPE-TESTING FOR ELECTRICAL PVC CONDUIT FITTINGS
1. PVC conduit fittings shall be type-tested for complete compliance with the following British Standards by an Independent Accredited Laboratory or an Independent Short-Circuit Testing Organisation:

<table>
<thead>
<tr>
<th>PVC Conduit Fittings</th>
<th>British Standards</th>
</tr>
</thead>
</table>

2. Upon request from CM, provide documentary evidence that the batch/consignment of PVC conduit fittings delivered to Site have satisfied the requirement as stipulated in the relevant British Standards mentioned in sub-clause (1) above.

PVC CIRCULAR CONDUIT BOXES, PVC BOXES FOR ELECTRICAL ACCESSORIES AND PVC ADAPTABLE BOXES

CON5.M510.7 CONSTRUCTION AND DIMENSIONS
1. For PVC boxes and their covers, comply with the relevant British Standard specification listed in CON5.M210;
2. Fit all screw holes with metal inserts. Except for PVC adaptable boxes, provide each box with a brass earthing terminal complete with screw for the connection of circuit protective conductor (CPC);
3. Ceiling-mounted circular conduit boxes: deep pattern type having an internal depth of not less than 60 mm;
4. For extension rings, comply with BS 4607:Part 5:1982 (1988);
5. Mould each PVC box in one piece;
CON5.M520.7  MECHANICAL PROPERTIES

1. For PVC boxes, comply with the requirements for mechanical properties stated in the relevant British Standard specification listed in CON5.M210;

2. PVC adaptable boxes are:
   a. Moulded;
   b. Of sufficient mechanical strength to withstand forces encountered in concealed conduit wiring system application;
   c. Complete with provision for prevention of deformation of the boxes where necessary.

3. Plastic boxes are of:
   a. Dimensions: can be interchangeable with steel boxes;
   b. Wall thickness: 2 mm minimum;
   c. Cover sizes: larger than the adaptable box on each edge by at least 5 mm.

4. Where considerable heat is produced, fit boxes for the suspension of luminaires or other equipment with steel insert clips;

5. Do not use plastic boxes where:
   a. Temperature of the box is likely to exceed 60ºC;
   b. The mass suspended from the box exceeds 3 kg.

CON5.M530.7  TYPE-TESTING FOR ELECTRICAL PVC CONDUIT BOXES

1. PVC circular conduit boxes, PVC boxes for electrical accessories and PVC adaptable boxes shall be type-tested for complete compliance with the following British Standards by an Independent Accredited Laboratory or an Independent Short-Circuit Testing Organisation:

<table>
<thead>
<tr>
<th>PVC Conduit Boxes</th>
<th>British Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>PVC circular conduit boxes</td>
<td>BS 4607:Part 5:1982(1988) with the following conditions:</td>
</tr>
<tr>
<td></td>
<td>a. The marking of the PVC circular conduit boxes shall be 60/10 kg.</td>
</tr>
<tr>
<td></td>
<td>b. The PVC circular conduit boxes shall be type-tested to 10 kg suspended load.</td>
</tr>
<tr>
<td></td>
<td>Clause 6 Dimensions</td>
</tr>
<tr>
<td></td>
<td>Clause 7.3 Safety on impact test</td>
</tr>
<tr>
<td></td>
<td>Clause 8 Resistance to heat</td>
</tr>
<tr>
<td></td>
<td>Clause 9 Resistance to burning</td>
</tr>
<tr>
<td></td>
<td>Clause 10 Insulting characteristics</td>
</tr>
</tbody>
</table>

2. Upon request from CM, provide documentary evidence that the batch/consignment of PVC conduit boxes delivered to Site have satisfied the requirement as stipulated in the relevant British Standards mentioned in sub-clause (1) above.
WORKMANSHIP

GENERAL

CON5.W010.7 CASTING YARD
Within one month from the notified date for commencement of the Works, submit for Approval on the following:

1. For on-Site casting:
   a. The location of casting yard for manufacture of precast concrete components;
   b. Details of plant and equipment including the location, boom radii and lifting capacities of cranes, gantry capacities, curing facilities, number of moulds and means of transporting the concrete components within the Site.

2. For off-Site casting:
   a. The name, casting yard address with street maps and job reference of the manufacturer and the followings:
      i. Details of organisation structure and top management;
      ii. Self-certified true copy of the business licence of the manufacturer;
      iii. Annual production capacity of the casting yard in terms of concrete volume, numbers of products and the current workload;
      iv. Details of the Quality Assurance Scheme required in CON5.W030;
      v. Details of the audit plan and previous audit report, if any, carried out by the Precast Concrete Construction Auditing Consultant required in CON5.W050;
      vi. Details of compliance with requirements of this specification on batching plant and concrete mixes in accordance with Worksection CON1;
      vii. Test results for quality tests being carried out for the precast concrete components to demonstrate the compliance with requirements of this specification;
      viii. Other details of construction quality as required in CON5.W090 (1).

   b. Scaled and dimensioned layout plan of the casting yard with fenced boundaries showing the office, the production lines for the products including hardstanding and covered casting yards, disposition of steel moulds, vibration plant, handling and lifting plants, steam or hot air curing room/facilities, storage areas for finished products, steel reinforcement storage and bending yards, storage sheds for incoming materials, samples room, batching plant if any, testing laboratory, concrete cubes curing facilities, means of transporting the concrete components to the Site;

   c. The laboratory for carrying out the tests and issuing test certificates shall be approved by the Housing Department, or accredited either by Hong Kong Accreditation Scheme (HKAS) under the Hong Kong Laboratory Accreditation Scheme (HOKLAS), or an equivalent organization which has signed a mutual recognition agreement with HOKLAS. All expenses/costs related to the tests carried out by the laboratory shall be borne by the Contractor.

CON5.W015.7 MANAGEMENT SCHEMES FOR OFF-SITE CASTING
1. Ensure that the casting yards for the off-Site casting of precast concrete components are operating on the following management schemes:
PRECAST FACADE UNITS (CONTRACTOR'S......)

CON5 > WORKMANSHIP

a. An Environmental Management Scheme certified under ISO 14001;
b. An Occupational Health and Safety Management Scheme certified under OHSAS 18001.

2. Submit the original or certified true copy of the respective certificates for the manufacturing plant within the following time frame:
a. ISO 14001: At not later than 15 days before the commencement of the production of precast concrete components;
b. OHSAS 18001: At not later than 12 months from the date of commencement of the Works.

3. When the photocopy of certificate is submitted, it shall be certified by the certification body or by the QCM. The certification body shall be accredited by the Hong Kong Accreditation Service (HKAS), or the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS for the respective certification.

CON5.W020.7 QUALITY ASSURANCE SCHEME FOR OFF-SITE CASTING
Ensure that casting yards for the off-Site casting of units are operating on an Approved Quality Assurance Scheme in accordance with CON5.W030 to CON5.W050.

CON5.W025.7 QUALITY ASSURANCE FOR ON-SITE CASTING
Within two months from the notified date for the commencement of the Works, submit for Approval details of the Quality Assurance Scheme for manufacturing the precast concrete components, in accordance with CON5.W030 to CON5.W040 as applicable.

CON5.W030.7 QUALITY ASSURANCE SCHEME
1. Ensure that the facade units are manufactured under a Quality Assurance Scheme which covers the following items and is certified under ISO 9001:
a. Quality control tests of materials, including proprietary products such as lifting anchors for handling precast concrete components;
b. Calibration of laboratory equipment for quality control tests;
c. Efficiency and proper operation of equipment at the casting yard;
d. Production process;
e. Sampling/testing procedures and requirements by an independent Approved laboratory;
f. Quality control procedures including the frequency and extent of inspection by manufacturer's staff and independent parties;
g. Regular audits at a minimum frequency of once per month by manufacturer's staff and independent parties.
2. Endorse the Quality Assurance Scheme and submit to CM for approval at least 15 days before the commencement of the production of precast concrete facade.

CON5.W035.7 PRECAST CONCRETE CONSTRUCTION AUDITING CONSULTANT
1. Select a consultant on the Architectural and Associated Consultants Selection Board's (AACSBB) List of Structural Engineering Consultants (the "List") for CM's approval as the Precast Concrete Construction Auditing Consultant to carry out technical audits at the manufacturer's factory in accordance with the Code of Practice for Precast Concrete Construction issued by the BD;
2. A Precast Concrete Construction Auditing Consultant on the "List" in sub-clause (1) appointed by the manufacturer may be proposed for Approval;
3. Notify the CM immediately if there is any subsequent change of the Precast Concrete Construction Auditing Consultant during the course of services.

**CON5.W040.7 QUALIFIED SUPERVISION**

1. Assign a Precast Quality Control Manager (PQCM), with a minimum qualification and experience of a Grade T4 TCP in the civil or structural engineering discipline under the Registered Contractor's stream in the CoPSS, to certify all control documentation or test certificates required for the QA Scheme;

2. Assign a Precast Quality Control Co-ordinator (PQCC), with a minimum qualification and experience of a Grade T3 TCP under the Registered Contractor's stream in the CoPSS, to provide continuous supervision of the precast concrete production works at the casting yard;

3. Submit the details of the PQCM and the PQCC for Approval. For on-Site casting, it is permissible for the PQCM to be the same person as the QCM and the PQCC to be the same person as the SQCC;

4. Provide attendance to an RSE who is nominated by the CM, to carry out audit checks to the casting yard at least once every month;

5. The Authorized Signatory as stipulated in PRE.B6.060 is to carry out inspection and audit checks to the casting yard at least once every month and submit a monthly audit report to the RSE as stipulated in sub-clause (4) above and then to the CM for endorsement and onward submission to ICU.

**CON5.W050.7 RECTIFICATION TO QUALITY NON-COMPLIANCE**

1. For off-Site casting in CON5.W010 (2), the manufacturer shall be under regular technical audits in a manner as stipulated in CON5.W030 (5) and supervision of CM's Representative resident at the manufacturer's factory;

2. The Contractor shall:
   a. Ensure that the manufacturer shall rectify any non-conformance to the Specification revealed by the audit or the supervision of CM's Representative resident at manufacturer's factory and if necessary, modify the QA Scheme and temporarily suspend the manufacture of the precast facade panels until the non-conformance is rectified;
   b. Report to the CM of the non-conformance and rectification carried out.

3. Notwithstanding sub-clause (2) above, bear full responsibility to assure that all the precast concrete components delivered to Site comply with the requirements of the Specification at all times.

**CON5.W055.7 INSPECTION LOG BOOK**

1. Record the followings in an inspection log book:
   a. The names and qualifications of the supervisory personnel assigned by the CM and by the Contractor as stipulated in CON5.W040;
   b. The details of concrete production, inspection, auditing and testing.

2. Keep the inspection log book in the casting yard and provide a duplicate of the inspection log book on Site for CM's inspection when required.

**CON5.W060.7 EQUIPMENT**

Ensure casting yards, erected on-Site or off-Site are equipped with all the necessary facilities, including efficient vibration plant, necessary curing facilities, storage, handling and lifting facilities to secure compliance with all the provisions of this Specification.
CON5.W070.7  USE OF CASTING YARD
Do not use any on-Site casting yard for manufacture of any components for other
sites. See PRE.B8.010.

CON5.W080.7  SUBMISSION AND PILOT PRODUCTION RUN BEFORE APPROVAL
1. Submission:
   a. Submit the shop drawings, for the production of the precast components for
      Approval, including any proposed changes to the products so as to suit
      individual production process/plant;
   b. Use concrete mix for the manufacture of precast components all in
      accordance with the requirements in Worksection CON1;
   c. Provide relevant information/samples associated with the proposed precast
      components for Approval including:
      i. Engraved manufacturer's logo and casting date;
      ii. Printed precast concrete components identity numbers on surface of
          products;
      iii. Schmidt hammer test certificate and covermeter tests record endorsed by
          the manufacturer's Quality Control Personnel;
      iv. Delivery Order/Invoice;
      v. Import and Export Manifests or Bill of Lading.

2. Before obtaining Approval for mass production, carry out a pilot production run
   with the CM on the proposed manufacturer to demonstrate the technical
   capability and effectiveness of the Quality Management System;

3. In the pilot production run:
   a. Provide, for each category of products:
      i. One sample with the reinforcement fixed in steel mould for the
         inspection of workmanship including reinforcement fixing and provision
         of bar spacers; and
      ii. One sample with concrete cast in steel mould for the inspection of
         conditions of the steel mould, checking of the finished sample and for
         carrying out the breaking up inspection in accordance with CON5.T710.
   b. Carry out trial run to demonstrate the manufacturing process including
      installation of windows, lifting operation, curing, storage, fixing of mosaic
      tiles, quality tests at factory laboratory, applied finishes and quality controls
      in accordance with the required drawings and specification;
   c. Carry out verification check for engraved logo, casting date, identity number,
      Schmidt hammer test certificate and covermeter tests record, dimensions,
      size, spacing, position of starter bars and finishes.

4. The pilot production run may not be required, if the following documents are
   submitted and are acceptable to the CM:
   a. Track records on similar types of precast concrete components supplied by
      the proposed manufacturer to other HA construction projects, within five
      years prior to the notified date for commencement of the Works; or
   b. In the absence of the track records, detailed records of the pilot production
      run for similar types of precast concrete components carried out in other HA
      construction projects, within five years prior to the notified date for
      commencement of the Works.
CON5.W090.7  FIRST JOINT INSPECTION AT MANUFACTURER'S FACTORY

1. Prior to mass production, carry out the first joint inspection between the Contractor and the CM at factory for Approval on the minimum standard of the product for all subsequent concrete and the specified finish. Arrange for the transportation and provide all facilities for the first joint inspection;

2. Provide samples, including those samples in CON5.W080 (3)(a) and those accepted samples in previous pilot production run carried out in accordance with CON5.W080, for Approval as being representative of the minimum standard of the product for all subsequent concrete and the specified finish;

3. Maintain accepted facade sample at a minimum of one number, or as directed by the CM, in an area in the factory and do not remove the accepted samples from the area unless otherwise instructed by the CM. Incorporate a further set of samples to the trial panel on Site;

4. Carry out further joint inspections as in CON5.T710.

PRODUCING PRECAST UNITS

CON5.W110.7  MOULDS

1. Construct moulds from steel or other materials to produce a standard suitable for the 'Surface finishes' specified in CON5.W310 to CON5.W350;

2. Construct and maintain moulds so that:
   a. Dismantling and re-assembly of moulds after each casting allows the production of subsequent facade units within permitted tolerance limits;
   b. The positioning of securing components and fixings etc. are within the permitted tolerances;
   c. Adequate stiffness for the control of dimensional tolerances is maintained.

CON5.W120.7  DEFECTIVE MOULDS

Replace any mould which fails to produce facade units within the permitted tolerance limits as specified in Appendix H, the “Schedule of Tolerances”, or to the standards of surface finishes as CON5.W310 to CON5.W350.

CON5.W130.7  HORIZONTAL CASTING

Provide moulds designed to facilitate horizontal casting with devices to enable rotation from horizontal to vertical through 90° so that the facade units can be lifted vertically on demoulding.

CON5.W140.7  USE OF RELEASE AGENTS

Apply mould release agent of an Approved type, to the surfaces of moulds either by brush or by spraying before the fixing of steel reinforcement at a rate in accordance with the manufacturer's recommendations.

CON5.W150.7  CONCRETING, COMPACTION AND CURING GENERALLY

See CON1.

CON5.W160.7  EXTERNAL VIBRATORS

Obtain Approval for the use of external vibrators.

CON5.W170.7  CURING BY APPLICATION OF HEAT

Obtain Approval for heat curing by means of steam, hot air, etc. and:
1. Ensure that the total chloride content of the concrete mix for facade units subject to heat curing, is less than 0.1% by weight of that of the cement;
2. Carry out a site trial to demonstrate the adequacy of the proposed method to the satisfaction of the CM.

CON5.W180.7 DEMOULDING GENERALLY
1. Unless otherwise Approved, do not disturb the facade units within 24 hours of casting;
2. Demould by means of an Approved method and:
   a. Do not use crowbars;
   b. Do not subject the mould to any form of impact.

CON5.W190.7 CONCRETE STRENGTH BEFORE DEMOULDING
1. Demould the facade units only after concrete has achieved the Approved strength;
2. To determine the concrete strength required for demoulding or handling:
   a. Make the necessary concrete cubes in pairs from the same batch of concrete used for casting the facade units and cure the concrete cubes under the same conditions as the concrete in the facade units;
   b. Specially identify the cubes and do not use them for normal quality control or for compliance testing;
   c. Determine the concrete cube strength by compression test as CON5.T210 and satisfy the CM that the concrete cubes have acquired the required strength before the demoulding or handling the facade units.
3. If Instructed, prepare beam specimens for determination of flexural strength for those facade units that are subject to bending during demoulding and lifting.

CON5.W200.7 IDENTIFICATION AND RECORDS
1. Mark all facade units with date of manufacture and a unique reference number;
2. Record in a master register the dates of casting, the concrete grades and the final locations of all facade units.

CON5.W210.7 HANDLING INSTRUCTIONS
If the facade units are designed for handling in a particular direction only, make this clear by means of instructions on shop drawings and appropriate markings on the facade units.

CON5.W220.7 REQUIREMENTS OF OTHER TRADES AND COMPONENTS
Incorporate the requirements of all trades such as blockouts, recesses, notches, embedded metal works or any other items before casting the facade units.

CON5.W230.7 WINDOWS FIXING TO FACADE UNITS
Fix window frames/windows complete with or without opening sashes before casting the facade units as specified in COM2 Worksection and:
1. Obtain Approval for the method of fixing window frames/windows;
2. Do not fix window frames/windows into preformed openings after casting;
3. For off-Site casting, co-ordinate with the PCF and window suppliers approved by CM.
SURFACE FINISHES

CON5.W310.7 EXTERNAL FACE
Finish outside faces except edges and overhang soffits to give an even textured surface suitable for fixing glazed ceramic tiles by adhesive, or cast the tiles into the mould as required by the Contract.

CON5.W320.7 EDGES AND OVERHANG SOFFIT
Finish top, edge and soffit of overhang to give a smooth untextured surface suitable for applying acrylic paint.

CON5.W330.7 INTERNAL FACE - LIVING/DINING/BEDROOMS
Finish to give:
1. A smooth untextured surface suitable for applying plastic emulsion paint for rental blocks;
2. An even textured surface suitable for receiving internal cement lime plaster for HOS blocks as required by the Contract.

CON5.W340.7 INTERNAL FACE - BATHROOM
Finish to give an even textured surface suitable for fixing glazed ceramic tiles in accordance with FIN5.W210 and FIN5.W220 as appropriate.

CON5.W345.7 INTERNAL FACE - KITCHEN
Finish to give an even textured surface suitable for fixing glazed ceramic tiles in accordance with FIN5.W210 and FIN5.W220 as appropriate.

CON5.W350.7 INTERNAL FACE - UTILITY AREA
Finish to give an even textured surface suitable for fixing glass mosaic tiles by adhesive.

ACCURACY AND TOLERANCES

CON5.W410.7 MANUFACTURING AND ERECTION TOLERANCES
1. Refer to:
   a. Code of Practice for Precast Concrete Construction 2003 published by the BD;
   b. Appendix H "Schedule of Tolerances" to this Specification.
2. Where any ambiguity, discrepancy or conflict arises between sub-clauses (1)(a) and (1)(b) above, the provisions given in Appendix H shall prevail.

CON5.W420.7 CHECKING TOLERANCES
Check the manufacturing dimensional tolerances of the facade units by an Approved method at a rate of 1 in every 10 facade units produced and report the result to CM within two days of checking.

CON5.W430.7 DEFECTIVE UNITS
1. Any facade unit that falls outside the tolerance limits is considered defective and must be replaced as instructed. Indelibly mark rejected facade units for identification purposes;
2. In the event of the CM agreeing to accept any defective facade unit, execute all necessary remedial and modification work to the CM’s satisfaction.

HANDLING, TRANSPORTATION AND STORAGE

CON5.W510.7 LIFTING FRAME
Lift facade units within the casting yard by means of a purpose-made steel lifting frame designed to the Code of Practice for the Structural Use of Steel 2011 issued by the Buildings Department.

CON5.W520.7 LIFTING INSERTS AND SUPPORTS
Determine exact number, size and location of lifting inserts and proper supports with locations for transportation and storage.

CON5.W522.7 TEMPORARY SUPPORTS FOR TRANSPORTATION AND STORAGE
Determine proper supports with locations for transportation and storage.

CON5.W530.7 INSPECTION
Inspect each facade unit before lifting to ensure that neither damage nor hazard occurs during lifting.

CON5.W540.7 LIFTING
During lifting, keep the facade units vertical and:
1. Ensure that all connections between the lifting frame and lifting points remain vertical as far as possible;
2. Lift the facade units only at appropriate lifting points as shown on the Approved shop drawings;
3. Locate lifting points that the line of the resistant force passes through the centre of gravity of the facade unit.

CON5.W550.7 LIFTING PLANT AND EQUIPMENT
1. Ensure plant used for lifting including cranes, hoists, lifting frames, hooks, etc possess adequate safety margins, are maintained in good working order and are regularly tested. Provide details of plant and maintenance records and current test certificates when required by the CM;
2. Maintain crane rope in a sound condition. Discard all frayed bridle ropes or slings;
3. Notwithstanding sub-clause (1) above, provide test certificates of lifting anchors to the CM in accordance with CON5.T810 to CON5.T850.

CON5.W560.7 STORING UNITS
1. Store the facade units in the vertical plane on a level, well drained and maintained concrete surface and protect against staining or physical damage;
2. Support the facade units by an Approved method to prevent their warping, bowing, chipping or cracking;
3. Store different types of facade units separately;
4. The facade units shall be supported by a device in storage area to prevent toppling. For off-site casting yards, racks shall be used and detailed in the submitted QA scheme.
CON5.W570.7 TRANSPORTING FROM CASTING YARD
Stack facade units vertically on vehicles during transportation from the casting yard and:
1. Support the units on special cradles so that the units are completely protected against damage and adverse stresses;
2. Provide the details of the support and the support locations to the CM for comment.

CON5.W580.7 LOADING AND OFF-LOADING
Carry out lifting for loading or off-loading the facade units in one movement. Lift off and re-position any facade unit which is not properly positioned after lifting, rather than levering it into place.

CON5.W590.7 TRANSPORT VEHICLES
Maintain lorries or trolleys used for the transportation of the facade units in a good condition. Ensure trolleys are equipped with suspension systems to minimise shock loading.

ERECTING UNITS

CON5.W610.7 PROGRAMME
Provide a programme for the erection of the facade units, showing the rate of erection for each month. Make due allowance for all restrictions on the age of concrete in the facade units for handling, storage, transportation and erection.

CON5.W620.7 SITE RECORDS
Provide, at the end of each week during erection of the facade units, records in a form to be agreed with the CM, showing:
1. Dates and the locations of structural connections completed;
2. Dates of removal and locations of props and temporary supports to the facade units.

CON5.W630.7 CM'S INSPECTION
Allow and facilitate inspection of the facade units at any time before erection and after installation.

CON5.W640.7 QUALITY CONTROL PROCEDURES
Carry out erection of the facade units under Approved quality control procedures covering the following:
1. Protective measures to avoid cracking and chipping of the facade units and damage to the applied finishes and to the built-in items such as window frames;
2. Checking the accuracy of the in situ structural members receiving the facade units, including location and level of all bearing surfaces, joints, bolts, horizontal and vertical restraining devices and adjustment devices. Carry out checking by means of a template or measurement frame or a similar Approved method;
3. Checking of erection tolerances;
4. Testing of the compressive strength of the grouting materials in accordance with CON5.T250.
CON5.W650.7  LIFTING UNITS INTO POSITION
1. Lift the facade units by steel lifting frame complying with CON5.W510;
2. Maintain all cables connecting the lifting frame and the lifting points of the facade units in a vertical direction. Provide the cables with devices for the adjustment of their length;
3. Do not allow devices such as sockets or bolts for lifting purposes to be used for fixing the facade units to the main structure.

CON5.W660.7  TEMPORARY SUPPORT
1. During fixing of the facade units, prop adjacent insitu structural members adequately to avoid excessive deflection or adverse stresses;
2. Maintain all temporary supports, props and restraints in position during casting of concrete/grout in the structural joint. Remove temporary supports, props and restraints upon satisfactory testing and calculation to Approval;
3. Unless specifically designed for, do not allow temporary support to be derived from the facade units fixed at lower floors;
4. For off-Site casting, co-ordinate with the supplier regarding the details of all temporary supports, props and inserts to suit the proposed lifting and installation method.

CON5.W670.7  UNITS DAMAGED ON TRANSPORTATION, LIFTING OR ERECTION
Replace any facade unit which has been damaged on transportation, lifting or erection.

CON5.W680.7  APPROVAL FOR PERMANENT FIXING
Do not carry out permanent jointing or connection between any facade unit and another, or to any part of the insitu structure, without prior Approval.

CON5.W690.7  PREPARING AND PLACING GROUTING MATERIALS
Obtain Approval for the method of preparing and placing grouting materials in structural joints between the facade units and insitu structural members.

DEFECTS

CON5.W710.7  MINOR CHIPPING
Carry out repairs only to minor chipping by patching up after installation subject to Approval.

CON5.W720.7  OTHER REPAIRS
The CM may at his discretion approve other proposals for repairs to damaged facade units. Carry out any repair work to the satisfaction of the CM.

CON5.W730.7  REJECTED PANELS
Replace any defective or damaged facade panels rejected by the CM.
JOINTS

CON5.W810.7 GENERAL
1. Prepare and construct joints strictly in accordance with the Drawings and in accordance with the relevant manufacturer's recommendations so as to provide continuous weathertightness of buildings and give a neat, uniform and smooth appearance;
2. For application of back-up materials, bond breakers and sealants, see Worksection WAT5.

CON5.W820.7 GASKETS
Gasket may be used in weatherproofing joint provided that:
1. The joint is horizontal; and
2. The gasket is always under compression.

CON5.W830.7 MORTAR STOPS
Use backing rods or other Approved method as mortar stops in grouting panel joints when necessary.

CON5.W840.7 JOINT WIDTH
Unless otherwise Approved, the installed joint width must not be less than 6 mm nor greater than 30 mm.

CONDUIT SYSTEM

CON5.W910.7 APPLICATION
Supply and install conceal rigid plain PVC conduit system complete with steel draw wires for precast concrete facade as indicated on the Drawings.

CON5.W920.7 SHOP DRAWINGS PREPARATION
Prepare shop drawings, co-ordinate and agree with the Nominated Sub-contractor for electrical installation and Supplier for precast concrete facade before submitting shop drawings for Approval.

CON5.W930.7 SUBMISSION AND APPROVAL
Submit for Approval technical details, samples and type-tested certificates for the conduit system as specified in clauses CON5.M330, CON5.M420 and CON5.M530.

CON5.W940.7 COMPLETION CERTIFICATION FOR ELECTRICAL CONDUIT SYSTEM INSTALLATION
1. All conduits, fittings and accessories installed have to be certified by at least Grade A2 of Registered Electrical Workers (REW);
2. When delivered to Site, the precast facade units must be accomplished with a Work Completion Certificate Form WR1(A) specified by Electrical and Mechanical Services Department which shall be duly signed by a Registered Electrical Contractor and a REW certifying that the conduit system installation is in full compliance with the Specification and the Code of Practice for the Electricity (Wiring) Regulations;
3. A single certificate can be issued for delivered lots of precast concrete components which are produced in each production lot. The certificate shall also carry information e.g. reference number etc. for traceability purpose;

4. Provide CM and the Nominated Sub-contractor for Electrical Installation each a copy of the Work Completion Certificate for record.

**CONDUIT AND WIRING INSTALLATION**

**CON5.W1010.7**  
**CONDUIT BENDS**  
Internal radius: At least 4 times the outside diameter of the conduit.

**CON5.W1020.7**  
**BENDING, JOINTING AND TERMINATING OF CONDUITS**  
Follow conduit manufacturers' recommendation for:
1. Method of carrying out the conduit bends and conduit joints;
2. Method of fixing conduits to boxes without spouts;
3. Use of tools and materials.
TESTING

SAMPLING AND TESTING GENERALLY

CON5.T010.7 RECORDS
1. Keep a complete record of all sampling and testing, in a form agreed with the CM;
2. Submit test reports and certificates to the CM within 14 days from the date of test.

CON5.T020.7 WITNESSING SAMPLING AND TESTING BY THE CM
The CM will witness any sampling and testing carried out under the Quality Assurance Scheme:
1. Make the records of sampling and testing available for inspection by CM or CM's Representative resident at manufacturer's factory;
2. The CM or CM's Representative resident at manufacturer's factory is entitled to reject individual facade unit represented by any failed test result on the facade unit.

CON5.T030.7 TESTS AT MANUFACTURER'S FACTORY
Provide samples, all necessary facilities and attendance to the CM or CMR resident at manufacturer's factory to carry out the following tests:
1. Schmidt hammer tests and covermeter tests on the construction quality of precast concrete components in accordance with PRE.B10.490;
2. Concrete constituent tests and concrete cube compression tests and bar and fabric reinforcement tests by HDMTL.

TRIAL UNITS

CON5.T110.7 GENERAL
Prior to mass production of the facade units:
1. Produce a full size trial sample for the Type T1 facade unit complete with joints, windows, glazing and the electrical conduit system installation etc. and all finishing at ground level for Approval;
2. Maintain the Approved sample facade unit as the yardstick for the standard and quality necessary for all facade units unless otherwise required under the terms of CON5.T120;
3. When construction of a trial panel is required in CON2.W720, structurally connect the trial sample to surrounding structural frames and with interfacing services as detailed on the Drawings.

CON5.T120.7 ADDITIONAL TRIAL UNITS
Non-compliance:
1. In the event that the trial sample, in the opinion of the CM, cannot represent any one of the other facade types due to different designs proposed or methods of manufacture and erection, the CM is entitled to order additional trial samples for those different facade types including the surrounding structural frames all at the Contractor's own expense and without detriment to the programme.
CON5.T130.7 PROTECTION AND DISPOSAL

Ensure that the Approved sample facade units remain undamaged and remove both the samples and surrounding structural frames upon the completion of erection of all facade units.

COMPRESSION TESTING

CON5.T210.7 GENERAL

Testing arrangements:

1. Carry out compression tests on concrete cubes, made from the concrete used for casting the facade units, by a testing laboratory erected on Site in accordance with PRE.B9.520 for on-Site casting or by an Approved testing laboratory appointed by the Contractor / manufacturer for off-Site casting;

2. All details, including sampling frequency, of the concrete cubes tests must be in accordance with Worksection CON1.

CON5.T220.7 FACILITIES FOR TESTING

Provide all necessary facilities and attendance as specified in clause PRE.B12.210 for concrete cores taken out from the completed facade units and tested by the Approved testing laboratory.

CON5.T230.7 SAMPLE SIZE

Testing samples:

1. The CM may select 1% of the total number of the facade units for core and compression testing;

2. Take concrete cores at the rate of three per facade unit so selected.

CON5.T240.7 TEST FAILURE AND FURTHER TESTING

Non-compliance:

1. Should any core fail the compression test:

   a. The facade unit from which the core was taken is deemed to have failed and is unacceptable;

   b. The CM may order further tests on cores taken from the failed facade units or other facade units cast from the same batch of concrete used for the failed units all at the Contractor's own expense;

   c. Use the following formula to calculate the number of facade units required for further testing:

      \[ \text{No. of further tests} = (n^2 - 2n + 3) \]

      where \( n \) is equal to the total number of unsuccessful tests, progressively until all tests are successful.

CON5.T250.7 TESTING GROUT

Test grout in accordance with CS1: 2010 as follows:

1. Test to be carried out by the DTC;

2. Test a minimum of one pair of concrete cubes for each day of grouting;

3. The strength of 100 mm cubes of grout must not be less than the grade strength of the adjoining concrete.
CON5.T260.7  COMPRESSION STRENGTH TEST FOR NON-SHRINK GROUT
As CON4.T080.

CON5.T280.7  COUTINHO RING TEST
Testing method:
1. The mould for this test shall be formed from steel to provide an annular specimen with an inner diameter of 115 ± 0.1 mm, an outer diameter of 175 ± 0.1 mm and a depth of 50 ± 0.1 mm;
2. The grout shall be mixed in accordance with the manufacturer's specification and placed within the mould. Materials, moulds and specimens shall be kept at a temperature of 27°C ± 2°C and a relative humidity of 55% ± 5%;
3. After 72 hours the outer mould ring shall be removed from the hardened grout specimen and the specimen with the inner ring still in place shall be returned to the conditioning environment.
4. The grout specimen shall be examined at 7, 14, 21 and 28 days and any cracking shall be reported.

LABORATORY WATERTIGHTNESS TEST

CON5.T310.7  NATURE AND PURPOSE OF TEST
Testing arrangements:
1. Prior to the Approval of the proposed jointing system, carry out the watertightness test at an Approved independent laboratory to demonstrate that the proposed jointing system within the facade unit resists water penetration as CON5.T450;
2. Where an insitu connection, specified in CON5.D410 to CON5.D440, is designed in combination with joint sealing compound specified in CON5.M120, carry out the watertightness test without the joint sealing compound in place to test the watertightness of the insitu connection.

CON5.T320.7  EXEMPTION FROM TEST
Laboratory testing of the proposed jointing system is not required if satisfactory test evidence relating to a similar joint system can be furnished to the CM. Test data for such a similar jointing system made from the Works or used on other Authority contracts may be accepted for this purpose.

CON5.T330.7  TEST PROCEDURE
Arrange for testing to be carried out generally in accordance with the procedure stipulated in BS 5368:Part 2:1980 with the following modifications:
1. Test specimen prepared according to the Drawings and submitted to the Approved independent laboratory for testing;
2. The water-spraying system employed according to method No.2 of BS 5368:Part 2:1980 but installed with additional nozzles to provide uniformity of water spray at the jointing system of the test specimen;
3. The spray set to apply water at a minimum rate of 5.0 litres/m²/min;
4. A maximum pressure difference Pmax maintained, as stated in BS 5368:Part 2:1980 Clause 8, of 1 kPa, together with the water spray for 15 minutes.
CON5.T340.7 JOINT PERFORMANCE
Do not cast or manufacture facade units prior to the proposed jointing system performing satisfactorily in the laboratory tests.

SITE WATERTIGHTNESS TESTS

CON5.T410.7 TESTING TRIAL UNIT
Testing arrangements:
1. Carry out watertightness tests to the jointing system of the full size trial samples specified in CON5.T110 in accordance with the procedures set out in CON5.T430;
2. Extend the watertightness tests to cover testing on joints of windows fixed to the full size trial sample all to the requirements specified in COM2.T210.

CON5.T420.7 TESTING INSTALLED JOINTS
Testing samples:
1. Carry out watertightness tests in accordance with the procedures set out in CON5.T430 to all joints of the properly installed facade units not connected monolithically to in-situ concrete at the rate of 50% of each particular type in locations as instructed by CM or CM's representatives;
2. Where a jointing system is constructed in combination with joint sealing compound specified in CON5.M120, carry out the watertightness test prior to the application of the sealing compound to test the watertightness of the joint.

CON5.T430.7 TEST PROCEDURE
Test joints of each selected facade unit according to the procedures as follows:
1. Construct working platforms where necessary for carrying out water test safely;
2. Working from the exterior, wet the facade unit selectively, starting from the lowest horizontal joint, followed by the vertical joints and then the horizontal joint above;
3. Spray a continuous jet of water from a nozzle at a water pressure of 210 to 240 kPa at the nozzle inlet to the joint and perpendicular to the face of the facade unit. Move the nozzle slowly along the joint, at a distance of 300 mm from it, for a period of 5 minutes in every 1.5 metre of joint length while an observer carefully inspects on the interior side of the facade unit with the assistance of adequate lighting where necessary;
4. Unless otherwise Approved, use a nozzle to the requirements of the Architectural Aluminium Manufacturer's Association (AAMA) 501.2-83;
5. Repeat the process specified in sub-clause (3) above on all joints and joint intersections using increments of exposed joint length not exceeding 1.5 metres upward until all the joints are covered.

CON5.T440.7 WITNESSES TO TEST
All watertightness tests carried out on Site must be witnessed and certified both by the CM and the Contractor's representative.

CON5.T450.7 FAILURE OF UNITS
The facade units and joints are deemed to have failed if signs of water seeping through the joints or through the facade unit, including signs of damp patches, are observed during the test and within the subsequent 2 hours after the test.
CON.T460.7 REMEDIAL WORK TO UNITS FOR RE-TEST AND ADDITIONAL TESTING

Non-compliance:

1. Carry out remedial work to facade units and joints which have failed the watertightness test. Methods of carrying out the remedial work are subject to Approval;

2. After the remedial work is completed, re-test the facade units and joints in accordance with the procedures set out in CON5.T430;

3. Repeat sub-clauses (1) & (2) above until the facade unit and joint comply with the specified criteria of watertightness;

4. For any one facade unit fails the watertightness test, carry out additional tests as follows:
   a. Select three additional samples as instructed by CM or CM's representatives for testing. Each sample shall comprise three facade units of the same type as the failed facade unit;
   b. Carry out watertightness test to the additional samples in accordance with the procedures set out in CON5.T430;
   c. When any facade unit fails the test, repeat sub-clauses (1) & (2) above until the facade unit and joint comply with the specified criteria of watertightness.

5. Repeat sub-clause (4) above until all testing facade units and joints have complied with specified criteria of watertightness;

6. Bear all associated costs for the re-tests and additional tests as specified in the above sub-clauses. No extension of time will be allowed.

TESTING FIXINGS

CON.T510.7 TENSILE TESTING

Testing method:

CON.T520.7 SHEAR TESTING

Testing method:

SURVEILLANCE INSPECTION

CON.T710.7 JOINT INSPECTION AT MANUFACTURER'S FACTORY AND BREAKING UP TEST

For off-site casting:

1. Arrange transportation for and carry out joint inspections between the Contractor and the CM at the manufacturer's factory at the notice of the CM;

2. Carry out up to 4 breaking-up tests:
   a. Provide a sample of precast standard facade unit randomly selected by CM's Representative, break up the unit for inspection and remove the broken unit after inspection;
   b. Carry out the following inspection in the presence of CM's Representative:
CON5.720.7 OPEN-UP INSPECTION ON SITE
Before installation of the precast facade unit, carry out open-up inspection on site up to 4 nos. per block:

1. Open up the cover of facade unit for a minimum area of 100 mm x 300 mm, at locations selected by CM's Representative, to expose reinforcement underneath for inspection of bar size, spacing, and where possible bar pattern, all in accordance with CON5.T710;

2. Reinstall the cover of the component by an Approved non-shrink grout after inspection.

LIFTING ANCHOR

CON5.810.7 DEFINITION OF BATCH
In this Specification, a batch is defined as any quantity of lifting anchor of the same type and same working load capacity, delivered to the casting yard as one consignment and covered by the same test certificate issued by the lifting anchor manufacturer.

CON5.820.7 TYPE AND LOAD CAPACITY
Unless otherwise specified on Drawings, lifting anchors shall be either eye anchor type or foot anchor type, and with a working load of 0.25 times the ultimate load capacity.

CON5.830.7 RATE OF SAMPLING
1. The rate of sampling for ultimate load capacity for each batch of lifting anchor shall be a minimum of one sample, which comprises three test specimens, for every 3,000 anchors or part thereof;

2. When Instructed, provide an additional sample comprising three test specimens for testing by DTC.

CON5.840.7 COMPLIANCE CRITERION
No test result of ultimate load capacity of individual test specimen shall be less than 4 times the working load as stipulated in CON5.820.
CON5.T850.7 SUBMISSION

Prior to the production of precast concrete components, provide test certificates issued by:

1. The lifting anchor manufacturer/agent supplier; and

2. An Approved testing laboratory employed by the manufacturer of precast concrete component on the ultimate load capacity of lifting anchors for each batch under the Quality Assurance System as stipulated in CON5.W030.
CON6 MOVEMENT JOINTS

MATERIALS

JOINT FILLERS

CON6.M010.7 COMPRESSIBLE JOINT FILLER
Quality requirements:
1. Firm, compressible, single thickness, non-rotting proprietary type approved by the CM.

CON6.M020.7 INORGANIC COMPRESSIBLE JOINT FILLERS, BOND BREAKERS AND BACKUP MATERIALS
Quality requirements:
1. Sheet form or strip and cord sections of an Approved type.

SEALANTS

CON6.M110.7 GENERAL
Refer to Worksection WAT5 for all sealants, primers, back-up materials and bond breakers.

WATER STOPS

CON6.M210.7 WATER STOPS
Quality requirements:
1. Of an Approved type made with prefabricated angle and intersection pieces with details on the type of materials required, its intended location and purpose of use as specified in the Project Specific Specification and on the Drawings.

PROPRIETARY EXPANSION JOINTS

CON6.M310.7 MECHANICAL EXPANSION JOINTS
Quality requirements:
1. From an Approved manufacturer with details on the type of materials required, its intended location and purpose of use as specified in the Project Specific Specification and on the Drawings.

ANCILLARY MATERIALS

CON6.M410.7 ADHESIVE FOR JOINT FILLER
Quality requirements:
1. Bituminous type recommended by the joint filler manufacturer.
WORKMANSHIP

GENERAL

CON6.W010.7 JOINT CONSTRUCTION
1. Construct joints strictly in accordance with the drawings and in accordance with the relevant manufacturer’s recommendations;
2. Keep edges true, free from cracks, spalling or other imperfections. Ensure that edges or joints are clean and free from dust or grease immediately before fixing fillers or applying sealants.

CON6.W020.7 APPLYING SEALANTS
Refer to the Workmanship section of Worksection WAT5 for the application of primers, back-up materials bond breakers and sealants.

MOVEMENT JOINTS

CON6.W110.7 FIXING JOINT FILLER
Fix joint filler to the concrete with bituminous adhesive before casting the adjoining bay. Form a sealing slot by casting in a removable former.

CON6.W120.7 PLACING CONCRETE
Do not place concrete on both sides of a movement joint simultaneously.

WATER STOPS

CON6.W210.7 INSTALLATION
Adequately install waterstops to ensure their correct position is maintained during concrete placement.

CON6.W220.7 JOINTING
Make all joints using hot or cold vulcanizing.

CON6.W230.7 CONCRETING
Compact concrete fully around waterstops to ensure that no voids or porous areas remain.
CON7 PRECAST CONCRETE COMPONENTS (ENGINEER'S DESIGN) FOR STANDARD DOMESTIC DESIGN

GENERAL

CON7.D010.7 SCOPE OF THE WORK
Precast concrete components specified in this Worksection include:
1. Precast concrete facades (including precast roof parapet) with window installation;
2. Semi-precast slabs;
3. Precast stairs; and
4. Precast concrete walls.

SUBMISSIONS

CON7.D110.7 LOADING OF INSITU STRUCTURAL MEMBERS
Submit calculations to demonstrate that the insitu structural members are not subject to excessive stresses arising from the erection method of the precast concrete components and to demonstrate the adequacy of any temporary supports which may be required.

FACADE - DESIGN PARAMETERS

CON7.D210.7 ERECTION RESTRAINTS
1. Design vertical and horizontal restraints for temporary connections of the facade to the main structure such that displacement of the facade unit cannot occur before making the permanent structural connection;
2. Design horizontal restraint to resist a minimum horizontal live load of ±0.5 kN/m run acting at 1.5 m from the base of the facade unit.

CON7.D220.7 ADJUSTMENT DEVICES
1. Provide the facade units with separate vertical and horizontal adjustment devices;
2. Do not use adjustment devices in the vertical plane for horizontal location devices or horizontal restraint and do not design such devices to take any permanent shear (horizontal) loads;
3. Do not design any adjustment devices in the horizontal plane to take permanent vertical loads.
MATERIALS

GENERAL

CON7.M010.7 RELEVANCE OF OTHER SPECIFICATION WORKSECTIONS
1. Construct precast concrete components for Standards Domestic in accordance with this Worksection and with the relevant provisions of the following Worksections:
   a. CON1, Insitu Concrete;
   b. CON2, Formwork;
   c. CON3, Reinforcement;
   d. CON4, Precast Concrete.
2. Construct aluminium window or uPVC window frames in accordance with Worksections COM2 or COM3 respectively;
3. Where any ambiguity, discrepancy or conflict arises between this Worksection and any clauses in any other Worksections of this Specification, ensure that the provisions of this Worksection prevail.

FACADE AND PRECAST CONCRETE WALLS - CONDUIT SYSTEM

CON7.M110.7 STANDARDS
1. For rigid plain polyvinyl chloride (PVC) conduits, conduit fittings and PVC boxes, comply with the following British Standards:

<table>
<thead>
<tr>
<th>Conduits and Fittings</th>
<th>British Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>PVC conduits:</td>
<td>BS 6099:Section 2.2:1982(1988)</td>
</tr>
<tr>
<td>accessories:</td>
<td></td>
</tr>
</tbody>
</table>

2. Ensure that all PVC conduits, fittings and boxes are of the same make.

CON7.M120.7 COLOUR
PVC conduits, fittings and boxes: white in colour.

CON7.M130.7 FLAME RESISTANCE
PVC conduits, fittings and boxes: non-flame-propagating and self-extinguishing.

CON7.M140.7 TEMPERATURE CLASSIFICATION
1. For all PVC conduits, fittings and boxes, comply with the temperature classification of -5 in accordance with BS 6099:Section 2.2:1982(1988);
2. For PVC conduits, where the ambient temperature at the country of manufacture is likely to be below -5°C, the temperature classification is -25.
FACADE AND PRECAST CONCRETE WALLS - RIGID PLAIN PVC CONDUITS

CON7.M210.7 CONSTRUCTION AND SIZE
1. PVC conduits: rigid, plain and of a non-threadable type;
2. Nominal diameter of PVC conduits: within the range of 20 mm to 32 mm unless otherwise specified.

CON7.M220.7 MECHANICAL PROPERTIES
PVC conduits are:
1. Of heavy mechanical strength;

CON7.M230.7 TYPE-TESTING FOR ELECTRICAL PVC CONDUITS
1. Rigid plain PVC conduits shall be type-tested for complete compliance with BS 6099:Section 2.2:1982(1988) by an Independent Accredited Laboratory or an Independent Short-Circuit Testing Organisation;
2. Upon request from CM, provide documentary evidence that the batch/consignment of PVC conduits delivered to Site have satisfied the requirement as stipulated in the relevant British Standards mentioned in sub-clause (1) above.

FACADE AND PRECAST CONCRETE WALLS - PVC CONDUIT FITTINGS

CON7.M310.7 CONSTRUCTION
1. Use plain, moulded slip-type couplers and expansion type couplers to BS 4607:Part 5:1982 (1988) in the jointing of conduits;

CON7.M320.7 TYPE-TESTING FOR ELECTRICAL PVC CONDUIT FITTINGS
1. PVC conduit fittings shall be type-tested for complete compliance with the following British Standards by an Independent Accredited Laboratory or an Independent Short-Circuit Testing Organisation:

<table>
<thead>
<tr>
<th>PVC Conduit Fittings</th>
<th>British Standards</th>
</tr>
</thead>
</table>

2. Upon request from CM, provide documentary evidence that the batch/consignment of PVC conduit fittings delivered to Site have satisfied the requirement as stipulated in the relevant British Standards mentioned in sub-clause (1) above.
FACADE AND PRECAST CONCRETE WALLS - PVC CIRCULAR CONDUIT BOXES, PVC BOXES FOR ELECTRICAL ACCESSORIES AND PVC ADAPTABLE BOXES

CON7.M410.7 CONSTRUCTION AND DIMENSIONS
1. For PVC boxes and their covers, comply with the relevant British Standard specification listed in CON7.M110;
2. Fit all screw holes with metal inserts. Other than for PVC adaptable boxes, provide each box with a brass earthing terminal complete with screw for the connection of circuit protective conductor (CPC);
3. Ceiling-mounted circular conduit boxes: Deep pattern type having an internal depth of not less than 60 mm. Extension rings shall comply with BS 4607:Part 5:1982 (1988);
4. Mould each PVC box in one piece;

CON7.M420.7 MECHANICAL PROPERTIES
1. For PVC boxes, comply with the requirements for mechanical properties stated in the relevant British Standard specification listed in CON7.M110;
2. PVC adaptable boxes are:
   a. Moulded;
   b. Of sufficient mechanical strength to withstand forces encountered in concealed conduit wiring system application;
   c. Complete with provision for prevention of deformation of the boxes where necessary.
3. Plastic boxes are of:
   a. Dimensions: can be interchangeable with steel boxes;
   b. Wall thickness: 2 mm minimum;
   c. Cover sizes: larger than the adaptable box on each edge by at least 5 mm.
4. Fit boxes for the suspension of luminaires or other equipment, where considerable heat will be produced with steel insert clips;
5. Do not use plastic boxes where:
   a. Temperature of the box is likely to exceed 60ºC; or
   b. The mass suspended from the box exceeds 3 kg.

CON7.M430.7 TYPE-TESTING FOR ELECTRICAL PVC CONDUIT BOXES
1. PVC circular conduit boxes, PVC boxes for electrical accessories and PVC adaptable boxes shall be type-tested for complete compliance with the following British Standards by an Independent Accredited Laboratory or an Independent Short-Circuit Testing Organisation:
<table>
<thead>
<tr>
<th>PVC Conduit Boxes</th>
<th>British Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>PVC circular conduit boxes</td>
<td>BS 4607:Part 5:1982(1988) with the following conditions:</td>
</tr>
<tr>
<td></td>
<td>a. The marking of the PVC circular conduit boxes shall be 60/10 kg;</td>
</tr>
<tr>
<td></td>
<td>b. The PVC circular conduit boxes shall be type-tested to 10 kg suspended load.</td>
</tr>
<tr>
<td></td>
<td>Clause 6   Dimensions</td>
</tr>
<tr>
<td></td>
<td>Clause 7.3   Safety on impact test</td>
</tr>
<tr>
<td></td>
<td>Clause 8   Resistance to heat</td>
</tr>
<tr>
<td></td>
<td>Clause 9   Resistance to burning</td>
</tr>
<tr>
<td></td>
<td>Clause 10   Insulating characteristics</td>
</tr>
</tbody>
</table>

2. Upon request from CM, provide documentary evidence that the batch/consignment of PVC conduit boxes delivered to Site have satisfied the requirement as stipulated in the relevant British Standards mentioned in sub-clause (1) above.
WORKMANSHIP

GENERAL

CON7.W010.7 CASTING YARD
Within one month from the notified date for commencement of the Works, submit for Approval on the following:

1. For on-Site casting:
   a. The location of casting yard for manufacture of precast concrete components;
   b. Details of plant and equipment including the location, boom radii and lifting capacities of cranes, gantry capacities, curing facilities, number of moulds and means of transporting the concrete components within the Site;

2. For off-Site casting:
   a. The name, casting yard address with street maps and job reference of the manufacturer and the followings:
      i. Details of organisation structure and top management;
      ii. Self-certified true copy of the business licence of the manufacturer;
      iii. Annual production capacity of the casting yard in terms of concrete volume, numbers of products and the current workload;
      iv. Details of the Quality Assurance Scheme required in CON7.W030;
   v. Details of the audit plan and previous audit report, if any, carried out by the Precast Concrete Construction Audit Consultant required in CON7.W060;
   vi. Details of compliance with requirements of this specification on batching plant and concrete mixes in accordance with Worksection CON1;
   vii. Test results for quality tests being carried out for the precast concrete components to demonstrate the compliance with requirements of this specification;
   viii. Other details of construction quality as required in CON7.W120 (1).
   
   b. Scaled and dimensioned layout plan of the casting yard with fenced boundaries showing the office, the production lines for the products including hardstanding and covered casting yards, disposition of steel moulds, vibration plant, handling and lifting plants, steam or hot air curing room/facilities, storage areas for finished products, steel reinforcement storage and bending yards, storage sheds for incoming materials, samples room, batching plant if any, testing laboratory, concrete cubes curing facilities, means of transporting the concrete components to the Site;

   c. The laboratory for carrying out the tests and issuing test certificates shall be approved by the Housing Department, or accredited either by Hong Kong Accreditation Scheme (HKAS) under the Hong Kong Laboratory Accreditation Scheme (HOKLAS), or an equivalent organization which has signed a mutual recognition agreement with HOKLAS. All expenses/costs related to the tests carried out by the laboratory shall be borne by the Contractor.

CON7.W015.7 MANAGEMENT SCHEMES FOR OFF-SITE CASTING

1. Ensure that the casting yards for the off-Site casting of precast concrete components are operating on the following management schemes:
a. An Environmental Management Scheme certified under ISO 14001;
b. An Occupational Health and Safety Management Scheme certified under OHSAS 18001.

2. Submit the original or certified true copy of the respective certificates for the manufacturing plant within the following time frame:
   a. ISO 14001: At not later than 15 days before the commencement of the production of precast concrete components;
   b. OHSAS 18001: At not later than 12 months from the date of commencement of the Works.

3. When the photocopy of certificate is submitted, it shall be certified by the certification body or by the QCM. The certification body shall be accredited by the Hong Kong Accreditation Service (HKAS), or the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS for the respective certification.

CON7.W020.7 QUALITY ASSURANCE FOR ON-SITE CASTING
Within two months from the notified date for the commencement of the Works, submit for Approval details of the Quality Assurance Scheme for manufacturing the precast concrete components, in accordance with CON7.W040 to CON7.W050 as applicable.

CON7.W030.7 QUALITY ASSURANCE FOR OFF-SITE CASTING
Ensure that casting yards for the off-Site casting of precast concrete components are operating on a Quality Assurance Scheme certified under ISO 9001 in accordance with CON7.W040 to CON7.W060.

CON7.W040.7 QUALITY ASSURANCE SCHEME
1. Ensure that the precast concrete components are manufactured under a Quality Assurance Scheme which covers the following items and is certified under ISO 9001:
   a. Quality control tests of materials, including proprietary products such as lifting anchors for handling precast concrete components;
   b. Calibration of laboratory equipment for quality control tests;
   c. Efficiency and proper operation of equipment at the casting yard;
   d. Production process;
   e. Sampling/testing procedures and requirements by an independent Approved laboratory;
   f. Quality control procedures including the frequency and extent of inspection by manufacturer’s staff and independent parties;
   g. Regular audits at a minimum frequency of once per month by manufacturer’s staff and independent parties.

2. Endorse the Quality Assurance Scheme and submit to CM for approval at least 15 days before the commencement of the production of precast concrete components.

CON7.W045.7 PRECAST CONCRETE CONSTRUCTION AUDITING CONSULTANT
1. Select a consultant on the Architectural and Associated Consultants Selection Board’s (AACSB) List of Structural Engineering Consultants (the "List") for CM’s approval as the Precast Concrete Construction Auditing Consultant to carry out technical audits at the manufacturer’s factory in accordance with the Code of Practice for Precast Concrete Construction issued by the BD;
2. A Precast Concrete Construction Auditing Consultant on the "List" in sub-clause (1) appointed by the manufacturer may be proposed for Approval;

3. Notify the CM immediately if there is any subsequent change of the Precast Concrete Construction Auditing Consultant during the course of services.

**CON7.W050.7 QUALIFIED SUPERVISION**

1. Assign a Precast Quality Control Manager (PQCM), with a minimum qualification and experience of a Grade T4 TCP in the civil or structural engineering discipline under the Registered Contractor’s stream in the CoPSS, to certify all control documentation or test certificates required for the QA Scheme;

2. Assign a Precast Quality Control Co-ordinator (PQCC), with a minimum qualification and experience of a Grade T3 TCP under the Registered Contractor’s stream in the CoPSS, to provide continuous supervision of the precast concrete production works at the casting yard;

3. Submit the details of the PQCM and the PQCC for Approval. For on-Site casting, it is permissible for the PQCM to be the same person as the QCM and the PQCC to be the same person as the SQCC;

4. Provide attendance to an RSE who is nominated by the CM, to carry out audit checks to the casting yard at least once every month;

5. The Authorized Signatory as stipulated in **PRE.B6.060** is to carry out inspection and audit checks to the casting yard at least once every month and submit a monthly audit report to the RSE as stipulated in sub-clause (4) above and then to the CM for endorsement and onward submission to ICU.

**CON7.W055.7 INSPECTION LOG BOOK**

1. Record the followings in an inspection log book:
   a. The names and qualifications of the supervisory personnel assigned by the CM and by the Contractor as stipulated in **CON7.W050**;
   b. The details of concrete production, inspection, auditing and testing.

2. Keep the inspection log book in the casting yard and provide a duplicate of the inspection log book on Site for CM’s inspection when required.

**CON7.W060.7 RECTIFICATION TO QUALITY NON-COMPLIANCE**

1. For off-Site casting in **CON7.W010** (2), the manufacturer shall be under regular technical audits in a manner as stipulated in **CON7.W040** (5) and supervision of CM’s Representative resident at the manufacturer’s factory;

2. The Contractor shall:
   a. Ensure that the manufacturer shall rectify any non-conformance to the Specification revealed by the audit or the supervision of CM’s resident representatives and if necessary, modify the QA Scheme and temporarily suspend the manufacture of the precast facade panels until the non-conformance is rectified;
   b. Report to the CM of the non-conformance and rectification carried out.

3. Notwithstanding sub-clause (2) above, bear full responsibility to assure that all the precast concrete components delivered to Site comply with the requirements of the Specification at all times.

**CON7.W070.7 DRAWINGS AND METHOD STATEMENT FOR ON-SITE CASTING**

Within two months of the notified date for commencement of the Works, submit, for agreement, the following items:
1. Details of moulds, layout arrangements, casting methods (horizontal or vertical),
tilting mechanism (if any), demoulding methods and the provision for
attachments of openings for window fixing (if any);

2. The complete procedures for fabrication, curing, demoulding, application of
finishes, lifting, transporting, storage, erection, grouting (if any);

3. Method of protecting the precast concrete components from damage at all times.

CON7.W080.7 PROGRAMME

Provide a programme for manufacture of the precast concrete components showing
the rate of production for each month. For on site precasting, the dates for clearing
the area of casting yard and associated plant upon completion of the manufacture of
the precast concrete components must also be shown.

CON7.W090.7 EQUIPMENT

Ensure casting yards, erected on-site or off-site are equipped with all the necessary
facilities, including efficient vibration plant, necessary curing facilities, storage,
handling and lifting facilities to secure compliance with all the provisions of this
Specification.

CON7.W100.7 USE OF CASTING YARD

Do not use any on-site casting yard for manufacture of any components for other
sites. See PRE.B8.010.

CON7.W110.7 SUBMISSION AND PILOT PRODUCTION RUN BEFORE APPROVAL

1. Submission:
   a. Submit the shop drawings, for the production of the precast components for
      Approval, including any proposed changes to the products so as to suit
      individual production process/plant;
   b. Use concrete mix for the manufacture of precast components all in
      accordance with the requirements in Worksection CON1;
   c. Provide relevant information/samples associated with the proposed precast
      components for Approval including:
      i. Engraved manufacturer's logo and casting date;
      ii. Printed precast concrete components identity numbers on surface of
          products;
      iii. Schmidt hammer test certificate and covermeter tests record endorsed by
           the manufacturer's Quality Control Personnel;
      iv. Delivery Order/Invoice;
   v. Import and Export Manifests or Bill of Lading.

2. Before obtaining Approval for mass production, carry out a pilot production run
   with CM's Representative on the proposed manufacturer to demonstrate the
   technical capability and effectiveness of the Quality Management System;

3. In the pilot production run:
   a. Provide, for each category of products:
      i. One sample with the reinforcement fixed in steel mould for the
         inspection of workmanship including reinforcement fixing and provision
         of bar spacers; and
      ii. One sample with concrete cast in steel mould for the inspection of
         conditions of the steel mould, checking of the finished sample and for
         carrying out the breaking up inspection in accordance with CON7.T510.
b. Carry out trial run to demonstrate the manufacturing process including installation of windows, lifting operation, curing, storage, fixing of mosaic tiles, quality tests at factory laboratory, applied finishes and quality controls in accordance with the required drawings and specification;

c. Carry out verification check for engraved logo, casting date, identity number, Schmidt hammer test certificate and covermeter tests record, dimensions, size, spacing, position of starter bars and finishes.

4. The pilot production run may not be required, if the following documents are submitted and are acceptable to the CM:

a. Track records on similar types of precast concrete components supplied by the proposed manufacturer to other HA construction projects, within five years prior to the notified date for commencement of the Works; or

b. In the absence of the track records, detailed records of the pilot production run for similar types of precast concrete components carried out in other HA construction projects, within five years prior to the notified date for commencement of the Works.

CON7.W120.7 FIRST JOINT INSPECTION AT MANUFACTURER'S FACTORY

1. Prior to mass production, carry out the first joint inspection between the Contractor and the CM at factory for Approval on the minimum standard of the product for all subsequent concrete and the specified finish. Arrange for the transportation and provide all facilities for the first joint inspection;

2. Provide samples, including those samples in CON7.W110 (3)(a) and those accepted samples in previous pilot production run carried out in accordance with CON7.W110, for Approval as being representative of the minimum standard of the product for all subsequent concrete and the specified finish;

3. Maintain accepted sample of facade and semi-precast slab at a minimum of one number, or as directed by the CM, in an area in the factory and do not remove the accepted samples from the area unless otherwise instructed by the CM. Incorporate a further set of samples to the trial panel on Site;

PRODUCING PRECAST UNITS

CON7.W210.7 MOULDS

Construct and maintain moulds so that:

1. Dismantling and re-assembly of moulds after each casting allows the production of subsequent precast components within permitted tolerance limits;

2. The positioning of securing components and fixings etc. are within the permitted tolerances;

3. Adequate stiffness for the control of dimensional tolerances is maintained.

CON7.W220.7 DEFECTIVE MOULDS

Replace any mould which fails to produce precast concrete components within the permitted tolerance limits as specified in Appendix H, the "Schedule of Tolerances".

CON7.W230.7 USE OF RELEASE AGENTS

Apply mould release agent of an Approved type, to the surfaces of moulds either by brush or by spraying before the fixing of steel reinforcement at a rate in accordance with the manufacturer's recommendations.
CON7.W240.7 CONCRETING, COMPACTION AND CURING GENERALLY
See CON1.

CON7.W250.7 EXTERNAL VIBRATORS
Obtain Approval for the use of external vibrators.

CON7.W260.7 CURING BY APPLICATION OF HEAT
Obtain Approval for heat curing by means of steam, hot air, etc. and:
1. Ensure that the total chloride content of the concrete mix for precast concrete components subject to heat curing, is less than 0.1% by weight of that of the cement;
2. Carry out a site trial to demonstrate the adequacy of the proposed method to the satisfaction of the CM.

CON7.W270.7 DEMOULDING GENERALLY
Demould by means of an Approved method and:
1. Do not use crowbars;
2. Do not subject the mould to any form of impact.

CON7.W280.7 CONCRETE STRENGTH BEFORE DEMOULDING
1. Demould the precast concrete components only after concrete has achieved the required strength;
2. To determine the concrete strength required for demoulding or handling:
   a. Make the necessary concrete cubes in pairs from the same batch of concrete used for casting the concrete components and cure the concrete cubes under the same conditions as the concrete in the precast concrete components;
   b. Specially identify the cubes and do not use them for normal quality control or for compliance testing;
   c. Determine the concrete cube strength by compression test as CON7.T110 and satisfy the CM that the concrete cubes have acquired the required strength before the demoulding or handling the precast concrete components.

CON7.W290.7 IDENTIFICATION AND RECORDS
1. Mark all precast concrete components with date of manufacture and a unique reference number;
2. Record in a master register the dates of casting, the concrete grades and the final locations of all precast concrete components.

CON7.W300.7 REQUIREMENTS OF OTHER TRADES AND COMPONENTS
Incorporate the requirements of all trades such as blockouts, recesses, notches, embedded metal works or any other items before casting the precast concrete components units.

ACCURACY AND TOLERANCES

CON7.W410.7 MANUFACTURING AND ERECTION TOLERANCES
1. Refer to:
a. Code of Practice for Precast Concrete Construction 2003 published by the BD;
b. Appendix H "Schedule of Tolerances" to this Specification.

2. Where any ambiguity, discrepancy or conflict arises between sub-clauses (1)(a) and (1)(b) above, the provisions given in Appendix H shall prevail.

CON7.W420.7 CHECKING TOLERANCES
Check the manufacturing dimensional tolerances of the precast concrete components by an Approved method for each type of components at a rate of 1 in every 10 units produced and report the result to CM within two days of checking.

CON7.W430.7 DEFECTIVE UNITS
1. Any precast concrete components that falls outside the tolerance limits is considered defective and must be replaced as Instructed. Indelible mark on rejected units for identification purposes;
2. In the event of the CM agreeing to accept any defective precast concrete components, execute all necessary remedial and modification work to the CM's satisfaction.

HANDLING, TRANSPORTATION AND STORAGE

CON7.W510.7 LIFTING FRAME
Lift precast concrete components within the casting yard by means of a purpose-made steel lifting frame designed to the Code of Practice for the Structural Use of Steel 2011 issued by the Buildings Department.

CON7.W520.7 INSPECTION
Inspect each precast concrete components before lifting to ensure that neither damage nor hazard occurs during lifting.

CON7.W530.7 LIFTING
Lift the precast concrete components only at appropriate lifting points as shown on the Drawings.

CON7.W540.7 LIFTING PLANT AND EQUIPMENT
1. Ensure plant used for lifting including cranes, hoists, lifting frames, hooks, etc possess adequate safety margins, are maintained in good working order and are regularly tested. Provide details of plant and maintenance records and current test certificates when required by the CM;
2. Maintain crane rope in a sound condition. Discard all frayed bridle ropes or slings;
3. Notwithstanding sub-clause (1) above, provide test certificates of lifting anchor to the CM in accordance with CON7.T610 to CON7.T650.

CON7.W550.7 LOADING AND OFF-LOADING
Carry out lifting for loading or off-loading the precast concrete components in one movement. Lift off and re-position any precast concrete components which is not properly positioned after lifting, rather than levering it into place.
CON7.W560.7 TRANSPORT VEHICLES
Maintain lorries or trolleys used for the transportation of the precast concrete components in a good condition. Ensure trolleys are equipped with suspension systems to minimize shock loading.

ERECTING UNITS

CON7.W610.7 PROGRAMME
Provide a programme for the erection of the precast concrete components showing the rate of erection for each month. Make due allowance for all restrictions on the age of concrete in the precast concrete components for handling, storage, transportation and erection.

CON7.W620.7 SITE RECORDS
Provide, at the end of each week during erection of the precast concrete components, records in a form to be agreed with the CM, showing:
1. Dates and the locations of structural connections completed;
2. Dates of removal and locations of props and temporary supports to the precast concrete components.

CON7.W630.7 CM'S INSPECTION
Allow and facilitate inspection of the precast concrete components at any time before erection and after installation.

CON7.W640.7 QUALITY CONTROL PROCEDURES
Within three months from the notified date of commencement of Works, submit for Approval, details of erection of the precast concrete components under Approved quality control procedures covering the following:
1. Protective measures to avoid cracking and chipping;
2. Checking the accuracy of the in situ structural members receiving the precast concrete components, including location and level of all bearing surfaces, joints, bolts, horizontal and vertical restraining devices and adjustment devices. Carry out checking by means of a template or measurement frame or a similar Approved method;
3. Checking of erection tolerances.

CON7.W650.7 LIFTING UNITS INTO POSITION
1. Lift the precast concrete components by steel lifting frame complying with CON7.W510;
2. Maintain all cables connecting the lifting frame and the lifting points of the precast concrete components in a vertical direction. Provide the cables with devices for the adjustment of their length;
3. Do not allow devices such as sockets or bolts for lifting purposes to be used for fixing the precast concrete components to the main structure.

CON7.W660.7 UNITS DAMAGED ON TRANSPORTATION, LIFTING OR ERECTION
Replace any precast concrete components which has been damaged on transportation, lifting or erection.
TRIAL UNIT

CON7.W710.7 GENERAL
Prior to mass production of the precast concrete component units:
1. Produce a full size trial sample for the facade unit and semi-precast slabs (if any) complete with joints, windows and glazing and the electrical conduit system installation and all finishing;
2. Maintain the Approved sample units as the yardstick for the standard and quality necessary for all precast concrete components;
3. When construction of a trial panel is required in CON2.W720, structurally connect the trial sample to surrounding structural frames and with interfacing services as detailed on the Drawings.

TRIAL ASSEMBLY

CON7.W750.7 PRECAST CONCRETE WALLS
Prior to full scale erection of precast concrete walls:
1. Erect the first floor precast concrete walls and the second floor semi-precast slabs (or formwork of in-situ slabs) complete with joints, concealed conduits, slab reinforcement, void formers and steel locking plates for CM's inspection and approval;
2. Apply Approved non-shrink cement mortar to all box-outs, joints, voids and cavities after dismantling of falseworks;
3. Maintain photographic records of the Approved trial assembly as the yardstick for the standard and quality necessary for all precast concrete walls.

PRODUCING PRECAST FACADE UNITS

CON7.W810.7 SCOPE OF WORK
For off-Site casting, co-ordinate with the precast concrete components supplier and include the following provisions with the precast concrete facades delivered to Site.
1. Aluminium windows or uPVC windows obtained from a supplier approved by CM in accordance with COM2.M005 or COM3.M010 respectively;
2. Pre-formed holes for the installation of drainage pipes;
3. Earthing lugs as shown on the Drawings;
4. Concealed electrical PVC conduit system installations as shown on the Drawings and as specified;
5. A certificate indicating the date of casting;
6. Work completion certificate for pre-installed electrical conduit system installation.

CON7.W820.7 MOULDS
Construct moulds from steel or other materials to produce a standard in accordance with the 'Surface finishes' specified in CON7.W850 to CON7.W900. Replace any mould which fails to comply with the standard.
CON7.W830.7 HORIZONTAL CASTING
Provide moulds designed to facilitate horizontal casting with devices to enable rotation from horizontal to vertical through 90° so that the facade units can be lifted vertically on demoulding.

CON7.W840.7 WINDOWS FIXING TO FACADE UNITS
Fix window frames/windows complete with or without opening sashes before casting the facade units as specified in COM2 Worksection and:
1. Obtain Approval for the method of fixing window frames/windows;
2. Do not fix window frames/windows into preformed openings after casting.

CON7.W850.7 SURFACE FINISHES TO EXTERNAL FACE
Finish outside faces except edges and overhang soffits to give an even textured surface suitable for fixing glazed ceramic tiles by adhesive, or cast the tiles into the mould.

CON7.W860.7 SURFACE FINISHES TO EDGES AND OVERHANG SOFFIT
Finish top, edge and soffit of overhang to give a smooth untextured surface suitable for applying acrylic paint.

CON7.W870.7 SURFACE FINISHES TO LIVING/DINING/BEDROOMS
Finish to give:
1. A smooth untextured surface suitable for applying plastic emulsion paint for rental blocks;
2. An even textured surface suitable for receiving internal cement lime plaster for HOS blocks as required by the Contract.

CON7.W880.7 SURFACE FINISHES TO BATHROOM
Finish to give an even textured surface suitable for fixing tiles by method as shown or specified on the Drawings.

CON7.W890.7 SURFACE FINISHES TO KITCHEN
Finish to give an even textured surface suitable for fixing tiles by method as shown or specified on the Drawings.

CON7.W900.7 SURFACE FINISHES TO UTILITY AREA
Finish to give an even textured surface suitable for fixing glass mosaic tiles by adhesive.

CON7.W910.7 STORING UNITS
1. Store the facade units in the vertical plane on a level, well drained and maintained concrete surface and protect against staining or physical damage;
2. Support the facade units by an Approved method to prevent their warping, bowing, chipping or cracking;
3. Store different types of facade units components separately;
4. The facade units shall be supported by a device in storage area to prevent toppling. For off-site casting yards, racks shall be used and detailed in the submitted QA scheme.
CON7.W920.7 TRANSPORTING FROM CASTING YARD
Stack facade units vertically, on vehicles during transportation from the casting yard and:
1. Support the facade units on special cradles so that the units are completely protected against damage and adverse stresses;
2. Provide the details of the support and the support locations to the CM for comment.

CON7.W930.7 PROTECTIVE MEASURE FOR ERECTING UNITS
Provide protective measures to avoid cracking and chipping of the facade units and damage to the applied finishes and to the built-in items such as window frames.

CON7.W940.7 TEMPORARY SUPPORT
1. During fixing of the facade units, prop adjacent in situ structural members adequately to avoid excessive deflection or adverse stresses;
2. Maintain all temporary supports, props and restraints in position during casting of concrete in the structural joint. Remove temporary supports, props and restraints upon satisfactory testing and calculation to Approval;
3. Unless specifically designed for, do not allow temporary support to be derived from the facade units fixed at lower floors;
4. For off-Site casting, co-ordinate with the supplier regarding the details of all temporary supports, props and inserts to suit the proposed lifting and installation method.

CON7.W950.7 APPROVAL FOR PERMANENT FIXING
Do not carry out permanent jointing or connection between any facade unit and another, or to any part of the in situ structure, without prior Approval.

CON7.W960.7 CONDUIT INSTALLATION
Supply and install conceal rigid plain PVC conduit system complete with steel draw wires for precast concrete facade as indicated on the Drawings.

CON7.W970.7 SHOP DRAWINGS OF CONDUITS
Prepare shop drawings, co-ordinate and agree with the Nominated Sub-contractor for electrical installation and Supplier for precast concrete facade before submitting shop drawings for Approval.

CON7.W980.7 SUBMISSION AND APPROVAL OF CONDUITS

CON7.W990.7 CONDUIT BENDS
Internal radius: at least 4 times the outside diameter of the conduit.

CON7.W1000.7 BENDING, JOINTING AND TERMINATING OF CONDUITS
Follow conduit manufacturers' recommendation for:
1. Method of carrying out the conduit bends and conduit joints;
2. Method of fixing conduits to boxes without spouts;
3. Use of tools and materials.
CON7.W1010.7  COMPLETION CERTIFICATION FOR ELECTRICAL CONDUIT SYSTEM INSTALLATION

1. All conduits and accessories installed have to be certified by at least Grade A2 of Registered Electrical Workers (REW);

2. When delivered to Site, the precast concrete components must be accompanied with a Work Completion Certificate Form WR1(A) specified by Electrical and Mechanical Services Department which shall be duly signed by a Registered Electrical Contractor and a REW certifying that the pre-installed conduit system installation is in full compliance with the Specification and the Code of Practice for the Electricity (Wiring) Regulations;

3. A single certificate can be issued for delivered lots of precast concrete components which are produced in each production lot. The certificate shall also carry information e.g. reference number etc. for traceability purpose;

4. Provide CM and the Nominated Sub-contractor for Electrical Installation each a copy of the Work Completion Certificate for record.

PRODUCING AND ERECTING SEMI-PRECAST SLAB

CON7.W1110.7  STORING AND TRANSPORTING

Unless otherwise Approved, the semi-precast slab must be stacked and separated by 75 mm x 75 mm timber joints to the full length of the elements symmetrically placed next to the lifting hook and vertically aligned.

CON7.W1120.7  CLEANSING AND CRACK INSPECTION BEFORE INSITU CONCRETE TOPPING

1. Remove all laitance, loose materials, dirt and grease from the top surface of the precast slab to the satisfaction of CM before applying insitu concrete topping:
   a. Use water jet with a minimum pressure of 10,000 kPa (100 bar) for cleansing;
   b. Maintain the cleansing as specified in sub-clause (a) above for a minimum period of 4 minutes per flat of about 30 m² and adjust the operation duration for different flat size.

2. After water-jet cleansing in sub-clause (1) above, check for cracks at the underside of semi-precast slab:
   a. Through cracks are deemed to exist if signs of water seepage or damp patches are observed at the bottom of semi-precast slab;

ERECTING PRECAST STAIRS

CON7.W1210.7  DOWEL FIXING

Locate box cutouts of precast stairs over cast-in dowel bars and fill with non-shrink grout.

CON7.W1220.7  BEDDING AND JOINTING

Bed and joint precast stairs in non-shrink grout or cement mortar where shown on Drawings.
PRODUCING AND ERECTING PRECAST CONCRETE WALLS

CON7.W1310.7 STORING AND TRANSPORTING
Unless otherwise Approved, the precast concrete walls must be stacked and separated by 75 mm x 75 mm timber joints to the full length of the elements symmetrically placed next to the lifting hook and vertically aligned.

CON7.W1320.7 CLEANSING AND INSPECTION OF JOINTS BEFORE POURING SLAB CONCRETE
1. Before fixing the concealed conduits and void formers, remove all laitance, loose materials, dirt and grease from the top of the precast concrete wall by using high pressure waterjet with minimum pressure of 10,000 Kpa (100 bar) to the satisfaction of CM;
