FWP1.1 THE WORKS

FWP1.1.010.7 SITE OF THE WORKS
The site of the Works is specified in Project Specific Specification.

FWP1.1.020.7 SCOPE OF THE WORKS

1. The works to be carried out under this Sub-contract shall include the whole of the materials and labour necessary for the complete fire services installation, water pump installation and rainwater treatment installation, and the maintenance of the same for twenty four (24) months following the certified completion date of the Main Works or any Section(s) of the Main Works, for the buildings/premises specified in Project Specific Specification all as shown on the Drawings and detailed in this Specification;

2. The fire services installation comprises fire hydrant/hosereel system, sprinkler system, alarm system, smoke and heat detection system, portable fire appliances etc, the water pump installation comprises fresh water pumps, flush water pumps, fire services feed pumps, rainwater pumps, automatic self cleaning strainers and the associated pipework, fittings, control and electrical work, etc, and the rainwater treatment installation comprises chlorinators, cartridge filters and the associated pipework, fittings, control and electrical work, etc. The complete installation shall mean, not only the major items of equipment and apparatus conveyed in this Specification, but all the incidental sundry components necessary for the complete execution of the works and for the proper operation of the installation with their labour charges, whether or not these supply components are mentioned in detail in the tender documents;

3. The rainwater treatment installation by the Sub-contractor is part of the rainwater harvesting system which also include the rainwater catchments areas, rainwater collection pipeworks and treated rainwater distribution system. The Sub-contractor shall coordinate with the Main Contractor for the completion of the whole rainwater harvesting system.

FWP1.1.030.7 SAMPLE FLATS AND SAMPLE WING

During the construction for domestic building blocks, a specified sample flats and wing located on a typical floor will be required to be completed by the Main Contractor including the flats, the corridor and the lift lobby etc.. The Sub-contractor shall complete the fire service installations such as fire hydrant, hose reel etc. in the specified sample flats and wing in co-ordination with the Main Contractor to cope with the sample flats and wing construction programme. The proposed samples and details of fire service installations in the sample flats and wing shall be submitted to the Contract Manager for Approval prior to commencement of works. The Sub-contractor shall be responsible for replacement of any fire services installations which are found damaged or deformed and to carrying out the necessary adjustments to restore to as-new condition before building completion.
FWP1.2 DOCUMENTATION

FWP1.2.010.7 DRAWINGS AND DOCUMENTS
1. Schedule of the Sub-contract Drawings is listed in the Appendix as specified in Project Specific Specification;
2. The tenderer's attention is also drawn to the latest revision of the following Standard Drawing and Document issued by the Housing Department which shall also be complied with where relevant:
3. The aforesaid Standard Drawings and Documents will be available for inspection at the office of Housing Department during normal office hours upon application to the Contract Manager;
4. The Sub-contract Drawings and the above Standard Drawings and Documents shall hereinafter be referred to as the Drawings.

FWP1.2.020.7 TECHNICAL INFORMATION SUPPLIED WITH TENDER
1. All technical information supplied with the tender, including the materials offered, is for tender assessment only;
2. Acceptance of the tender will not relieve the Sub-contractor of his responsibility for the proper working of the installation to meet the specified requirements in compliance with the Sub-contract documents to the entire satisfaction of the Contract Manager;
3. In the event of the installation being, in the opinion of the Contract Manager, not in compliance with the specified requirements, the Sub-contractor shall modify his design, replace any unsatisfactory materials and do everything necessary for compliance with the specified requirements at his own cost.

FWP1.2.030.7 DEFINITIONS AND ABBREVIATIONS
In this Specification the word "shall" is mandatory, the word "will" is informative, the word "should" is advisory, and the word "provide" means supply and fix, or supply and install. In addition, the following words shall have meanings herein assigned:
1. "Authority"
   Hong Kong Housing Authority.
2. "Indicated"
   Indicated elsewhere in the Specification or on the Drawings.
3. "Or Equal" or "Or Similar"
   Having similar characteristics and specification as regards type of construction, performance, general appearance and standard of quality of manufacture.
4. "FSD"
   The Fire Services Department of the Government of Hong Kong.
5. "BS"
   British Standards, including British Standard Specifications and British Standard Codes of Practice published by the British Standards Institution.
6. "EN"
   European Standard.
7. "BS EN"
European Standard adopted by the British Standards Institution to replace any relevant British Standard.

8. "LPC"
   Loss Prevention Council, United Kingdom.

9. "NFPA"
   National Fire Protection Association, USA.

10. "UL"
    Underwriters' Laboratory, USA.

11. "IEE Regulations"
    The "Regulations for Electrical Installations" 17th Edition or later published by the BSI and the IET.

12. "ASTM"
    American Society for Testing and Materials.

13. "ANSI"
    American National Standards Institute.

14. "PASS"
    Performance Assessment Scoring System.

15. "BEC"
    Code of Practice for Energy Efficiency of Building Services Installation.

**FWP1.2.040.7 REQUIREMENTS FOR SUB-CONTRACTOR'S DRAWINGS**

1. Size of Drawings:
   Drawings submitted by the Sub-contractor shall be of a standard size from A0 to A4 in accordance with BS EN ISO 5457. "As-fitted" drawings shall be of A0 or A1 size only.

2. Installation Drawings
   a. The Installation Drawings (See PRE.BS1.210) shall detail and dimension the following, where relevant:
      i. General layout drawings giving accurate and dimensioned locations of all plant and equipment included in the Sub-Contract;
      ii. Details showing arrangement of assemblies, piping and valve arrangements, connections and junctions between components, etc., which cannot be accurately defined on layout drawings;
      iii. Schematic diagrams for each system to confirm the principle of operation and operating conditions, provisions for testing and commissioning to be included;
      iv. Electrical details, including schematic diagrams for motor control panels, component layout, cable and conductor sizes, cabling arrangement, termination details, control & interlocking logic diagram;
      v. Fire detector and alarm positions and wiring routes with details and function;
      vi. Conduit and trunking routes with conduit/trunking sizes, showing all accessories, details of cables and circuit references;
      vii. Earthing and equipotential bonding system with details of conductor sizes and routing, bonding arrangement;
      viii. Label schedules, showing wording and formats for the labelling of equipment and distribution board circuits.
b. Operating and maintenance clearances for the equipment and their static and dynamic structural loading shall be shown on the installation drawings wherever necessary.

3. "As-fitted" Drawings

a. The "as-fitted" drawings shall be based on the full set of Approved Installation Drawings updated to show the actual positions and arrangement of all items installed. Any additional drawings which are considered necessary by the Contract Manager for showing the complete installation shall be included. The Drawings shall be drawn in black-ink lines on quality paper suitable for reproduction of prints;

b. "As-fitted" drawings shall include, but not be limited to, the following:

i. Site plan (showing street hydrant and underground pipe routes, water mains and pump room locations, rainwater treatment plant room locations etc.);

ii. Schematic piping diagram;

iii. Schematic wiring diagram;

iv. Block control diagram for fire services and water pump systems;

v. Block control diagram for rainwater treatment system;

vi. Operation sequence for fire services and water pump systems;

vii. Fire services layout plan;

viii. Pump / booster pump room layout plan;

ix. Rainwater treatment plant room layout plan;

x. Control cubicle layout;

xi. Details for other installations (such as water feature, etc.);

xii. Conduit drawings;

xiii. Other items as required by the Contract Manager.
FWP1.3  COMPLIANCE WITH REGULATIONS AND STANDARDS

FWP1.3.010.7  STATUTORY REGULATIONS

The Sub-contractor shall comply with all Regulations and requirements including those of the Government of Hong Kong, the Hong Kong Fire Services Department (FSD), the Water Authority, the Building Authority, the Electrical and Mechanical Services Department (EMSD) and Electricity Supply Company, together with any revisions or amendments made thereto, and shall be responsible for giving notifications to the appropriate Authorities and for paying all fees all in accordance with the Sub-contract. The following are particularly relevant:

1. The Fire Services Ordinance and its Regulations;
2. The Waterworks Ordinance and its Regulations;
3. The Electricity Ordinance and its Regulations;
4. The Noise Control Ordinance;
5. The Radiation Ordinance and its Regulations;
6. Codes of Practice for Minimum Fire Service Installations and Equipment and Inspection, Testing and Maintenance of Installations and Equipment, and Circular Letters issued by the Fire Services Department (hereinafter referred to as Fire Services CoP);
7. Circular Letters issued by the Fire Services Department;
8. Rules of Loss Prevention Council for Automatic Sprinkler Installations incorporating BS EN 12845 and relevant FSD circular letters (hereinafter referred to as LPC Sprinkler Rules);
9. The standard for fire detection and alarm systems BS 5839-1 and relevant FSD circular letters (hereinafter collectively referred to as AFA Rules);
10. Hong Kong Waterworks Standard Requirements and Circular Letters issued by the Water Authority;
11. Code of Practice for the Electricity (Wiring) Regulations (hereinafter referred to as the Electrical CoP);
12. Building Energy Efficiency Ordinance;

FWP1.3.020.7  STANDARDS AND PRACTICE

All materials and workmanship shall comply, where applicable, with all relevant sections, together with any revisions or amendments made thereto, of the following:

1. Relevant Worksections for Electrical Installation of Building Services Installation Specification of the HKHA Specification Library (hereinafter referred to as the HKHA Electrical Installation Specification) as specified in Project Specific Specification;
2. The BEC issued by the Electrical and Mechanical Services Department. The Sub-contractor shall provide necessary information and documents to the Contract Manager for preparation of submissions under the Building Energy Efficiency Ordinance;
3. The Supply Rules issued by the respective Supply Company currently in operation in Hong Kong;
4. Relevant Worksections of Building Works Specification of the HKHA Specification Library (hereinafter referred to as the HKHA Building Works Specification);

5. Appropriate British Standard Specification(s) (subject to FWP1.3.040). When a British Standard quoted in this Specification has been wholly or partially superseded by another equivalent or similar national / international standard, the Sub-contractor is allowed to offer material in compliance with the latter in lieu of the former for the Contract Manager's Approval, on condition that prior approval by the appropriate Authorities (where required) has already been given;

6. National Fire Protection Association codes/standards (hereinafter referred to as NFPA codes/standards);

FWP1.3.030.7 PRECEDENCE

In case of conflict between the requirements among the publications referred to in FWP1.3.010 and FWP1.3.020, interpretation shall be in accordance with the following order of precedence unless otherwise directed by the Contract Manager:

1. Ordinances and Regulations, Laws of Hong Kong;
2. Fire Services CoP and Circular Letters issued by the Fire Services Department;
3. Electrical CoP;
4. LPC Sprinkler Rules and AFA Rules;
5. The Specification and/or the Drawings;
6. HKHA Electrical Installation Specification;
7. Building Energy Code;
8. Supply Rules;
9. HKHA Building Works Specification;
10. British Standard Specifications and British Standard Codes of Practice;
11. NFPA codes/standards.

FWP1.3.040.7 APPLICATION OF BRITISH STANDARDS / INTERNATIONAL OR NATIONAL STANDARDS / CODES OF PRACTICE

1. Where the date / year of British Standards (BS) / International or National Standards / Codes of Practice (CoP) is not specified in the Specification, it shall be deemed to refer to any valid or latest version, and any applicable amendments to that version;

2. Where the date / year is specified, due to intended purposes, the specified version and any amendments to that version shall be complied with unless otherwise approved by the Contract Manager;

3. "Head standards" (HS) are not dated because they do not contain any technical content. However reference to a head standard invokes all relevant extant "parts" of that standard which are themselves dated. Reference to head standards is a practicable method of using a general BS reference in situations where detailed reference to each part would be cumbersome.
FWP1.4 MATERIALS

FWP1.4.010.7 METRIC UNITS
Unless otherwise specified, only materials of metric unit shall be used.

FWP1.4.020.7 SUBMISSIONS FOR APPROVAL
The Sub-contractor shall submit catalogues, technical information and samples of the materials proposed for Approval as required by the Contract Manager. (See PRE.BS1.350 and PRE.BS1.360).

FWP1.4.030.7 SAMPLES - SPECIAL REQUIREMENTS
In addition to the requirements of PRE.BS1.360 a sample of each type of sprinkler head, fire alarm call point, heat detector and smoke detector as included in the tender shall be submitted to the Contract Manager upon request. Tests to demonstrate the function of the equipment shall be conducted where required. Samples may be required immediately after submission of Tender and before tender recommendation or acceptance. The Tenderer shall be prepared to deliver the materials to the Contract Manager's office and collect after examination and demonstration.

FWP1.4.040.7 EQUIPMENT SCHEDULE
The Tenderer shall complete the Equipment Schedule attached to the Tender Document and also furnish the following information, as required by the Contract Manager:
1. Name of manufacturer, country of manufacture, type and catalogue number, and full technical performance details, of all major items of equipment offered;
2. Voltage of operation and current consumption of automatic smoke and heat detectors under:
   a. Normal conditions; and
   b. Alarm conditions.
3. Type and size of wiring for alarm circuits;
4. Evidence, or a signed statement, to the effect that all items of equipment are approved by FSD;
5. Copies of test certificates showing compliance with the specified standards of the offered equipment and materials issued by the British Standards Institution or any other recognized international testing authorities;
6. Illustrated technical brochures in English showing all major items of equipment and their installation requirements.

FWP1.4.050.7 ALTERNATIVE SOURCES OF SUPPLY
1. Items of equipment and materials for the Works included in the Equipment Schedule shall fully comply with the Specification and Drawings and the Tenderer is allowed to include up to three offers for any one item;
2. Following acceptance of the Tender the Contract Manager may accept alternative equipment and materials proposed by the Sub-contractor in writing provided always that they are fully in compliance with the Specification and Drawings without imposing any additional contractual and financial liabilities on the Authority. Save as aforesaid, alternatives to the agreed Equipment Schedule will not be accepted.
FWP1.4.060.7 EVIDENCE OF COUNTRY/PLACE OF MANUFACTURE

1. Documentary evidence to verify the country/place of manufacture and authenticity of the materials delivered to site or installed, shall be produced when required;

2. Such documentary evidence shall be in the form of purchase orders to, and shipment/delivery orders or produce certificates from, the manufacturers or the manufacturers' authorized agents in Hong Kong;

3. The materials, or the works employing such materials, will not be certified for payment until the required evidence has been produced to the satisfaction of the Contract Manager;

4. The Tenderer shall indicate in the 'Schedule of Information Supplied by the Tenderer' the country/place of manufacture of the materials being offered at the time of tendering.

FWP1.4.070.7 CONSISTENCY

All equipment of the same category shall preferably be of the same colour scheme throughout and shall be the product of the same manufacturer.

FWP1.4.080.7 ZINC FREE BRONZE

Where zinc free bronze is specified in the Specification, the zinc content shall not exceed 0.5%.

FWP1.4.090.7 USE OF ASBESTOS

Asbestos or products containing asbestos shall not be used without prior Approval.

FWP1.4.100.7 FIRE EXTINGUISHING MEDIA

Fire extinguishing media for any fire services equipment installation shall be of zero ozone depleting potential product. Upon request, the Sub-contractor shall produce evidence and document to prove that the fire extinguishing media is of zero ozone depleting potential product.

FWP1.4.110.7 SITE STORAGE

1. Tubes and all items of plant and equipment shall be delivered, stored, and maintained in perfect condition;

2. Tubes shall have their ends effectively sealed;

3. All plant and equipment shall be stored under weatherproof cover until they are required to be incorporated into the installation.
SUPERVISION

FWP1.5  SUPERVISION

FWP1.5.010.7  APPOINTMENT OF SUPERVISING ENGINEERS AND SITE SUPERVISORS

1. Immediately upon the award of the Sub-contract, the Sub-contractor shall appoint Supervising Engineer(s) and Site Supervisor(s) specified in this Specification, who shall be both English and Cantonese speaking and in the Sub-contractor's full-time employment for the supervision of the Sub-contract Works to the satisfaction of the Contract Manager;

2. Immediately after the award of the Sub-contract, the name, qualifications and curriculum vitae of the Supervising Engineer(s) and Site Supervisor(s) shall be submitted for Approval to the satisfaction of the Contract Manager;

3. None of the Supervising Engineer(s) and Site Supervisor(s) shall be removed from their respective duties without prior Approval;

4. In the event of any of them being unsatisfactory, in the opinion of the Contract Manager, or misconducting themselves, they shall be removed forthwith and be replaced by suitable substitutes to the Contract Manager's satisfaction within seven days from the Contract Manager's instruction in writing.

FWP1.5.020.7  SUPERVISING ENGINEERS

1. Unless otherwise specified, the Sub-contractor is to employ for the supervision of all works on Site, at least one qualified Supervising Engineer. The Supervising Engineer shall generally represent the Sub-contractor in all respects of the Sub-contract and assume the following duties:

   a. Co-ordinate and supervise the work in the Sub-contractor's office and the Site;

   b. Develop, in conjunction with the Main Contractor, schedules of installation drawings, builder's work drawings, material submission and delivery, statutory submissions, the programme of works and testing and commissioning programme, for approval by the Contract Manager;

   c. Liaison with the Contract Manager and other parties;

   d. Attend at the office of the Contract Manager for the finalisation of drawings and equipment selection;

   e. Attend progress meetings and co-ordination meetings;

   f. Monitor and supervise installation drawings submission, builder's work drawings submission, material submission and delivery, statutory submissions in accordance with the respective submission schedules approved by the Contract Manager. Submit progress reports to the Contract Manager monthly or at shorter intervals when such requested by the Contract Manager;

   g. Check and confirm the installation drawings, builder's work drawings and material submissions are suitable for the installation works and in compliance with the requirements of the Sub-contract;

   h. Examine, verify and confirm in writing to the Contract Manager on a monthly basis that the material delivered to the Site under the Sub-Contract has been approved by the Contract Manager;

   i. Certify all material delivery vouchers in accordance with PRE.B12.280 of the Main Contract;

   j. Prepare, in conjunction with the Main contractor, the delivery method statements for delivery of plant and equipment;
k. Undertake all site test and commissioning of the Sub-contract Works and endorse the test and commissioning reports to confirm that he is satisfied with the completeness, workmanship and performance of the installations which comply fully with the Sub-contract requirements, prior to submission to the Contract Manager.

2. Qualification requirements:
   At least one year of proven post qualification experience at supervisory level on fire services and water pump installations in buildings with the following qualification:
   a. Registered Professional Engineer (Mechanical, Fire or BS Discipline) under the Engineers Registration Ordinance; or
   b. Member of the Institution of Mechanical Engineers, UK; or
   c. Member of the Chartered Institution of Building Services Engineers, UK; or
   d. Member of the Hong Kong Institution of Engineers (Mechanical, Fire or BS Discipline) elected after 5 December 1975.

3. The Supervising Engineer shall be highly competent and experienced, and shall be given a high level of delegated authority such that he/she can take decisions, including those involving expenditure.

FWP1.5.030.7 SITE SUPERVISORS

1. Unless otherwise specified, the Sub-contractor is to employ at least one qualified Site Supervisor. The Site Supervisor shall be stationed on site;

2. Qualifications requirements:
   Mechanic with at least 3 years of practical experience in fire services and water pump installation.
FWP1.6 SUB-CONTRACTORS OBLIGATIONS

FWP1.6.010.7 RADIATION ORDINANCE - IONISATION TYPE SMOKE DETECTORS
The Sub-contractor shall hold a valid Radioactive Substances Licence granted by the Hong Kong Radiation Board and observe all conditions of licence, rules and regulations of the Radiation Ordinance and Radiation (Control of Radioactive Substances) Regulations in the storage, handling, installation, disposal etc. of ionisation type smoke detectors throughout the whole contract period and the subsequent Maintenance Period.

FWP1.6.020.7 OBTAINING FIRE CERTIFICATE
1. The Sub-contractor shall be responsible for giving notifications to the appropriate Authorities, attending necessary inspection and paying all fees levied, including them in the Tender Price, and also for collecting all necessary certificates and licences for the installation as soon as available, and delivering them to the Contract Manager;

2. The Sub-contractor shall also be responsible for amending FS installation drawings for submission of FSI/314 in accordance with the latest approved building plans certifying that the details and specifications of all installations shown on drawings are prescribed by the Fire Services Department and in accordance with all relevant rules and codes;

3. The Sub-contractor shall also be responsible for submission of FSI/501 to the Fire Services Department for all FS installations and the associated requirements including fireman's lifts.

FWP1.6.030.7 BUILDING SERVICES PERFORMANCE ASSESSMENT SCORING SYSTEM
1. The Housing Authority has adopted a Building Services Performance Assessment Scoring System (BSPASS) to assess the performance of building services Nominated Sub-contractors undertaking works for the Authority;

2. BSPASS will be operated in this Sub-contract and assessments by Building Services PASS Assessment Team (BSPAT) or other staff of the Housing Authority will be conducted at quarterly intervals or other intervals as required by the Contract Manager;

3. Upon the Contract Manager's notification, the Sub-contractor's authorised representative shall attend all such assessments;

4. The Sub-contractor shall provide all necessary attendance, and all necessary measuring instruments, in addition to those specified in PRE.BS1.630, etc. to facilitate the BSPASS assessment as stipulated in the relevant BSPASS manuals;

5. In addition, the Sub-contractor shall also provide labours for the opening up and re-fixing of the works, the operation of the equipment and the testing, etc. as required by the assessment.

FWP1.6.040.7 MODIFICATION WORKS IN NON-DOMESTIC PREMISES DURING MAINTENANCE PERIOD
1. During the Maintenance Period, the Employer may employ other workmen or contractors to carry out modification works pertaining to the installation to suit the fitting out works of the tenants;
2. The Sub-contractor shall provide the necessary attendance, including operation of the installation, as instructed by the Contract Manager to facilitate such modification works;

3. The costs of the attendance will be determined by a fair valuation made by the Contract Manager in conjunction with the Sub-contractor and paid for separately;

4. The employment of other workmen or contractors by the Employer for the modification of the installation shall not in any way relieve the Sub-contractor of his responsibilities for the maintenance and defects of the Works, other than those parts which have been modified by others, in accordance with the Contract.

FWP2.3  RAINWATER HARVESTING SYSTEM INSTALLATION FOR
DOMESTIC BLOCK

FWP2.3.1  SYSTEM DESCRIPTION
FWP2.3.1.010.7  GENERAL

FWP2.3.2  SYSTEM OPERATION
FWP2.3.2.010.7  SYSTEM CONTROL
FWP2.1  FIRE SERVICES INSTALLATION

FWP2.1.1  FIRE HYDRANT/HOSE REEL (FH/HR) INSTALLATION

FWP2.1.010.7  FH/HR SYSTEM DESCRIPTION

1. The FH/HR system comprises main risers, with Fire Services Inlets, supplying the fire hydrants on each floor and secondary risers supplying hose reels on each floor as shown on the Drawings;

2. The FH/HR system shall be fed from the fire services tank which will be erected by the Main Contractor;

3. Identical duty and standby intermediate booster pumps / fixed fire pumps as shown on the Drawings shall be used in the system to ensure sufficient pressure at each hose reel to provide a minimum jet stream of 6 m and an aggregate flow of not less than 900 l/min at any two hydrant outlets each with a flow of 450 l/min at a running pressure of not less than 350 kPa when the system is fed from the roof tank or with the fire engines boosting water into the Fire Services Inlet at a constant pressure of 800kPa upstream of the Inlet. Pressure reducing valves or self-contained pressure reducing hydrants shall be used wherever the pressure at any hydrant outlet is over 850 kPa;

4. The pressure at any fire hydrant shall in no case exceed 850 kPa. The running pressure at any hydrant outlet, when delivering 450 l/min, shall be not less than 350 kPa.

FWP2.1.020.7  FH/HR SYSTEM OPERATION

1. The system shall be inter-connected with the Fire Alarm and Control System in accordance with the Drawings and Specification;

2. The standby intermediate booster pump / fixed fire pump shall start when the pressure switch in the duty intermediate booster pump / fixed fire pump discharge does not sense a correct pressure within 15 seconds after the duty intermediate booster pump / fixed fire pump receives the “start” signal. The timer shall be adjustable from 0-2 minutes;

3. For intermediate booster pump, ‘pump running’ indicating light, alarm buzzer and fire pump ‘start/stop’ push buttons shall be provided adjacent to the fire services inlets;

4. The fire services alarm control panel shall start the fixed fire pump automatically upon receiving the call from any manual call point and once started, the fixed fire pump shall run continuously until it is stopped only manually at the pump control panel;

5. When the intermediate booster pump is independent of the fixed fire pump, it shall be controlled by the ‘start/stop’ push buttons adjacent to fire service inlets. Once started, the pump shall run continuously until stopped manually either at the ‘start/stop’ button adjacent to the same fire service inlet or at the pump control panel;

6. When the intermediate booster pump also serves as fixed fire pump, it shall be either started automatically upon receiving the call from any manual call point as stated in above paragraph 4, or by the ‘start/stop’ push buttons as stated in above paragraph 5. Once started, the pump shall run continuously until stopped manually either at the ‘start/stop’ push buttons adjacent to the same fire service inlet or at the pump control panel.
FWP2.1.030.7 SPRINKLER HEAD OVER REFUSE CHUTE AND AT REFUSE CHAMBER

1. Quartzoid bulb type sprinkler head shall be provided at the top of the refuse chute and at the refuse chamber;

2. The operating temperature of the sprinkler head shall be 57°C;

3. The isolating stop valves with micro switches shall be provided for the top of refuse chute and G/F Refuse Storage and Material Recovery Chamber (RS&MRC) to identify the valves at open/close status at the fire services alarm control panel. Security devices shall be provided to prevent tempering / unauthorized operation of the valves;

4. The flow switch provided to detect the operation of the sprinkler shall be of high sensitivity as in FWP11.6.040. The location and method of connection shall be submitted for Approval.

FWP2.1.040.7 PIPEWORK

1. Unless otherwise shown on Drawings, galvanised steel pipework and fittings complying with FWP3 and FWP4 shall be used;

2. The installation shall include all pipework and fittings fully installed as indicated on the Drawings.

FWP2.1.050.7 DUTY OF INTERMEDIATE BOOSTER PUMP / FIXED FIRE PUMP

1. The pressure of the intermediate booster pump / fixed fire pump shall fall progressively with the increase of flow, with the shut-off pressure being at the highest. The pump shall deliver not more than 150% of rated capacity at 65% of rated head and the shut-off head shall not exceed 130% of the rated head;

2. Overheating due to continuous operation at no system draw-off condition is not acceptable. By-pass device for excessive water flow to the suction tank shall be provided by the Sub-contractor. The leak off rate of the pump(s) to prevent overheating shall be determined by Sub-contractor;

3. The pump shall be able to deliver water at flow rate and pressure head as indicated on the Drawings;

4. The duty and standby intermediate booster pump / fixed fire pumps shall each be capable of providing an aggregate flow of not less than 900 l/min at any two hydrant outlets each with a flow of 450 l/min at a running pressure of not less than 350 kPa. The pressure at any hydrant shall in no case exceed 850 kPa;

5. The intermediate booster pump shall also be able to maintain the required aggregate flow and pressure at any two hydrants when water is pumped through the FS Inlet at a constant pressure of 800 kPa;

6. The sub-contractor shall be responsible for checking the pump duty operating head and capacity of flow based upon the characteristics of the pipework system and equipment actually installed. Any non-compliance with the design requirements found shall be notified to the Contract Manager;

7. Predicted total head, efficiency, required NPSH and power absorbed versus flow quantity curves shall be submitted. The curves shall commence at zero and be extended to show the performance at 150% of the rated capacity to demonstrate that the pump will be capable of meeting the full range of operating condition on site.
FWP2.1.060.7  TYPE OF INTERMEDIATE BOOSTER PUMP AND FIXED FIRE PUMP
1. The intermediate booster pump/ fixed fire pump shall be either horizontal split casing, end suction or horizontal/vertical multi-stage type as shown on the Drawings. Construction of the horizontal split casing or end suction pump shall permit removal of back cover, stuffing box and impeller without disturbance of suction/delivery pipework;
2. For installation with motor rating not exceeding 2.2 kW, close-coupled pumps may be accepted as alternative subject to Approval.

FWP2.1.070.7  MOTOR RATING OF INTERMEDIATE BOOSTER PUMP AND FIXED FIRE PUMP
The motor driving the intermediate booster pump / fixed fire pump shall be rated to give 20% more power in addition to the hydraulic power required for the rated flow of the system.

FWP2.1.2  FIRE SERVICES PUMP CONTROL CUBICLE

FWP2.1.2.010.7  APPROVAL OF LAYOUT
Unless otherwise Approved, prior to manufacture, control circuit and panel layout arrangement of the control cubicle shall be in accordance with the Drawings and FWP11.3, FWP11.4 and FWP11.5.

FWP2.1.2.020.7  MOTOR STARTER PROTECTION
The Sub-contractor shall advise the Contract Manager of the appropriate type and rating of the short circuit protective device to be used in conjunction with the motor starter in accordance with the motor starter manufacture's recommendation in order to achieve the specified type of co-ordination.

FWP2.1.3  FIRE ALARM AND CONTROL SYSTEM

FWP2.1.3.010.7  ALARM AND CONTROL SYSTEM
1. The Sub-contractor shall provide, install and connect up, by concealed PVC conduit system, fire alarm and control, sprinkler control panel and repeater panel in the location as shown on the Drawings. The fire services alarm control panel and associated repeater panel shall be of conventional electronic type acceptable to FSD unless otherwise approved by the Contract Manager;
2. The Sub-contractor shall provide the concealed PVC conduit system complete with wiring for and in connection with the fire alarm and control system, fire services alarm control panel and the sprinkler control;
3. The arrangement on the fire services alarm control panels shall be submitted for Approval. The system shall be operated from the 24V battery supply and direct link as mentioned in FWP2.1.3.040 if required;
4. Whenever necessary and subject to Approval, parts of the conduit system may be installed in galvanised steel surface conduit/trunking.

FWP2.1.3.020.7  MANUAL FIRE ALARM POINT
1. The manual fire alarm point shall comprise a manual fire alarm call point and an audible alarm point as shown on the Drawings;
2. The manual fire alarm call point shall be semi-flush mounted or surface mounted with the thickness of mounting box not more than 25 mm unless otherwise approved by Contract Manager. Its drip holes beneath the mounting box shall not be blocked.

FWP2.1.3.030.7 CIRCUITRY OF MANUAL FIRE ALARM POINTS
1. Wiring of the manual fire alarm points shall be divided into zones;
2. The manual fire alarm points in each floor shall form an individual zone;
3. The sprinkler head over refuse chute and at the refuse chamber shall each form a separate zone at the fire services alarm control panel;
4. The circuit of each zone shall be individually wired to the fire services alarm control panel;
5. Cables shall be clearly labelled by cable markers so as to be easily identified at the fire services alarm control panel to facilitate testing of each individual circuit.

FWP2.1.3.040.7 FIRE SERVICES ALARM CONTROL PANEL
1. Control and monitoring details shall be referred to the Drawings and FWP10 and submitted for Approval prior to installation;
2. A key box with glass front shall be installed next to the fire services alarm control panel or other location as directed by the Contract Manager. One set of properly labelled key for operation of the panel shall be provided in the key box. Another two sets of keys shall be provided to the Contract Manager;
3. The system shall operate from a 24V battery together with trickle charger. Batteries shall be of nickel-cadmium type;
   a. Trickle charger shall be of automatic type complete with indication lamps, fuses and suitable for a single phase 220V, 50Hz a.c. supply;
   b. The battery and charger shall each be housed in a well-ventilated painted cabinet of robust construction and made from galvanised sheet metal. In all cases, the battery shall be installed in a separate compartment from the charger. Details and calculation of the battery charger set shall be submitted for Approval.

FWP2.1.4 PORTABLE EQUIPMENT

FWP2.1.4.010.7 GENERAL
Fire extinguishers, sand buckets and fire blankets shall be provided if applicable and mounted in the positions as shown on the Drawings.

FWP2.1.4.020.7 FIRE EXTINGUISHERS INSIDE TRANSFORMER ROOM
The fire extinguishers inside the Transformer Rooms shall be supplied and installed by the Sub-contractor unless otherwise specified.

FWP2.1.5 SPRINKLER SYSTEM INSTALLATION

FWP2.1.5.010.7 SPRINKLER SYSTEM DESCRIPTION
1. The sprinkler system shall be designed as specified in Project Specific Specification;
2. The system is to provide an automatic fire fighting system using fresh water as the extinguishing medium within the areas as shown on the Drawings;

3. The system shall be fed from a sprinkler water tank located as specified in Project Specific Specification;

4. The Main Contractor will erect the sprinkler water tank;

5. The Sub-contractor shall carry out the installation work from this water tank onward including the connection of this system thereto;

6. The system shall comprise sprinkler pumps (if applicable), control valves, sprinkler inlet valves, non-return valves, risers, distribution pipes, range pipes, sprinkler heads, flow switches, pressure switches, drains, etc. together with all associated equipment, whether or not they are shown on the Drawings, necessary for a complete installation.

**FWP2.1.5.020.7 SPRINKLER SYSTEM OPERATION**

The sprinkler system will operate automatically and shall be inter-connected with the Fire Alarm and Control System. Should a sprinkler head located at any part of the area served by the sprinkler system on any level operates, the pressure switch, on sensing the pressure drop, shall start the sprinkler pump. The flow switch, on sensing the flow of water, shall actuate the fire services alarm control panels.

**FWP2.1.5.030.7 DUTY OF SPRINKLER PUMP**

1. For duty/standby pumps for sprinkler system, the pumps (including any orifice plates) must comply with the pressure/flow characteristics, suction lift requirement, close off maximum pressure and other relevant paragraphs in the LPC Sprinkler Rules;

2. The discharge rate of the jockey pump shall be less than that of the most hydraulically remote sprinkler head or discharge outlet, but in no case less than 25 l/min, and the pressure generated by the jockey pump shall not exceed the maximum allowable pressure permitted on the sprinkler system;

3. The Sub-contractor shall be responsible for checking the pump duty operating head and capacity of flow based upon the characteristics of the pipework system and equipment actually installed. Any non-compliance with the design requirements found shall be notified to the Contract Manager.

**FWP2.1.5.040.7 TYPE OF SPRINKLER PUMP**

1. The sprinkler pump shall be either horizontal split casing, end suction type or horizontal/ vertical multi-stage type having construction permitting removal of back cover, stuffing box and impeller without disturbance of suction/delivery pipework;

2. For jockey pumps, multi-stage pumps shall be used. The maximum number of stages acceptable is seven unless otherwise Approved;

3. For installation with motor rating not exceeding 2.2kW, close-coupled pumps may be accepted as an alternative subject to Approval.

**FWP2.1.5.050.7 PIPEWORK**

1. The installation shall include all pipework and fittings complying with FWP3 and FWP4, installed to LPC Sprinkler Rules and as indicated on the Drawings;

2. The distribution pipes as well as the range pipes shall run through beams as far as possible unless otherwise specified.

**FWP2.1.5.060.7 SPRINKLER HEADS**

1. The sprinkler heads shall be located as shown on the Drawings and they shall be of quartzoid bulb type, unless otherwise Approved;
2. Samples of each type of sprinkler heads shall be submitted for Approval before installation.

FWP2.1.5.070.7 SPRINKLER CONTROL VALVE SET
1. Each control valve set shall comprise:
   a. Main stop valve of gate type;
   b. Alarm valve of wet pipe;
   c. By-pass stop valve or duplicated alarm valve set for sprinkler system in compliance with LPC Sprinkler Rules, if applicable;
   d. Alarm devices, including water motor alarm and gong, pressure switch, etc.;
   e. Facilities for testing to suit Fire Services Department's requirements;
   f. Pressure gauges to indicate "upstream" and "downstream" system pressure;
   g. Retarding chamber or other device as necessary to prevent false alarm due to incoming pressure variations;
   h. Other equipment as necessary.
2. The control valve set shall be installed at the location as shown on the Drawings. All installation, materials and fixing bolts, etc. for mounting the equipment inside the cabinets or on walls as applicable shall be provided by the Sub-contractor;
3. The main stop valve location plate shall be as detailed in LPC Sprinkler Rules, but lettering shall be in both English and Chinese.

FWP2.1.5.080.7 WATER MOTOR ALARM AND GONG
Water motor alarm and gong shall be constructed of non-corrosive materials and shall have gong of not less than 250 mm in diameter, suitable for external installation. The water motor alarm gong shall be painted and labelled as required by the Fire Services Department.

FWP2.1.5.090.7 FLOW SWITCHES
1. Flow switches shall be installed to such positions as indicated on the Drawings;
2. Water flow alarm switches as detailed in LPC Rules for Sprinkler Installations shall be utilized for sending signal back to the fire alarm control and indicating panel to indicate which the location is under operation with both visual indication and audible alarm. LPC approved high sensitive water flow alarm switch capable of actuation by operation of one sprinkler head shall be used.

FWP2.1.5.100.7 DRAIN PIPE WORKS
Drain pipe works complete with supports and accessories, duly painted, shall be supplied and installed by the Sub-contractor, connecting various drain points of the sprinkler system to the nearest drains. The drain valve and drain pipe shall be not less than 25 mm in diameter, to allow the system to be efficiently drained if required.

FWP2.1.5.110.7 ORIFICE PLATE/LOCK-SHIELD VALVES
Notwithstanding that the orifice plate/lock-shield valve is not shown on the Drawings, the Sub-contractor shall provide the suitably sized orifice plate/lock-shield valve in the sprinkler system wherever necessary, to suit the pressure/flow characteristics of the sprinkler pump and to meet the requirements of LPC Sprinkler Rules.
FPW2.1.5.120.7 SPRINKLER AND CONTROL SYSTEM
1. The Sub-contractor shall provide concealed PVC conduit system complete with wiring for and in connection with the fire alarm and control system, fire services alarm control panel and fire services pump control cubicle all as shown on the Drawings;
2. The sprinkler panel and repeater panel shall be of conventional electronic type acceptable to FSD, unless otherwise approved by the Contract Manager. The arrangement on the panels shall be submitted for Approval. The system shall be operated from the 24V battery supply and direct telephone link as mentioned in FWP2.1.3.040 sub-clause (3);
3. Whenever necessary, and subject to Approval, parts of the conduit system may be installed in galvanised steel surface conduit/trunking.

FPW2.1.6 AUTOMATIC SMOKE AND HEAT DETECTION SYSTEM

FPW2.1.6.010.7 SYSTEM DESCRIPTION
1. Automatic smoke and heat detection system comprising smoke detectors, heat detector, visual alarm points, etc. shall be supplied and installed by the Sub-contractor as shown on the Drawings;
2. Smoke detector shall be of photoelectric type. The design and construction shall be of LPC approved type or other standards acceptable to FSD;
3. Heat detector installed shall be of combined fixed temperature and rate of rise type except in kitchen area which shall be of fixed temperature type. The design and construction shall be of LPC approved type or other standards acceptable to FSD;
4. The smoke/heat detection system shall be of "closed" circuit type.

FPW2.1.6.020.7 ALARM ANNUNCIATOR PANEL FOR AUTOMATIC SMOKE AND HEAT DETECTION SYSTEM
1. Where automatic smoke and heat detection (AFA) system is to be provided as indicated on the Drawings, the Sub-contractor shall provide, install and connect up, by concealed PVC conduit system, alarm annunciator panel(s) and repeater panel(s) at the locations shown on the Drawings;
2. The alarm annunciator panel and repeater panel shall be of conventional electronic type acceptable to FSD and compatible with the smoke/heat detector installed, unless otherwise approved by the Contract Manager;
3. The Sub-contractor shall provide the concealed PVC conduit system complete with wiring for and in connection with the fire alarm and control systems, fire services alarm control panel and the alarm annunciator panel;
4. Battery and charger
   a. The alarm annunciator panel shall be operated from a 24V battery together with trickle charger. Batteries shall be of nickel-cadmium type;
   b. The battery and the charger shall be housed in a well ventilated painted cabinet of robust construction and made from galvanised sheet metal;
   c. Trickle charger shall be of automatic type complete with indication lamps, fuses and suitable for a single phase 220V, 50Hz a.c. supply;
   d. In all cases, the battery shall be installed in a separate compartment from the charger. Details of the battery charger set shall be submitted for Approval.
5. Alarm annunciator panel
a. The alarm annunciator panel for domestic block and each of the ancillary facilities premises accommodated in the domestic block shall be separately provided. Associated battery supply and telephone link with Fire Services Communication Centre (FSCC) shall also be separated;

b. For the domestic block alone if AFA system is provided, the alarm annunciator panel shall be operated from the 24V battery supply and direct telephone link as mentioned in FWP2.1.3.040 sub-clause (3);

c. For each of the ancillary facilities premises, an AFA annunciator panel shall be installed at the main entrance of the premises with a fire signal to the alarm annunciator panel at G/F of the domestic block. Furthermore, a fire alarm signal for the AFA system shall be transmitted to the alarm annunciator panel for domestic block to actuate the FH/HR fire alarm bells. An additional fire alarm bell for the AFA system of each ancillary facilities premises shall also be installed on the outside wall of the building at ground floor.

6. The repeater AFA panel if required shall comprise full indicating lights showing all the features of the master panel;

7. The arrangement on the panels and construction details shall be submitted for Approval;

8. Whenever necessary and subject to Approval, parts of the conduit system may be installed in galvanised steel surface conduit/trunking;

9. The cost of rental and maintenance charge within the Maintenance Period for each of the telephone link shall be borne by the Sub-contractor.
FWP2.2  WATER PUMP INSTALLATION

FWP2.2.1  SYSTEM DESCRIPTION

FWP2.2.1.010.7  GENERAL

1. The water pump installation for each domestic block shall comprise the following as shown on the Drawings:
   a. Two sets of fresh water pump;
   b. Two sets of flush water pump;
   c. A fresh water booster pump system on Roof;
   d. Two sets of fire services feed pump;
   e. One set of night duty pump for fresh water;
   f. Two sets of rainwater irrigation pump system.

2. The water pump installation shall include all associated electrical works, pipework and system components such as pressure switches, pressure gauges, flexible connectors, gate valves, check valves and strainers as shown on the Drawings.

FWP2.2.1.020.7  SUB-CONTRACTOR’S RESPONSIBILITIES

1. The Sub-contractor shall be responsible for connecting the suction and discharge pipework to the puddle flanges at the sump tanks and the riser pipes connection point inside the pump room as shown on Drawings;

2. The Sub-contractor shall provide and install pressure reducing valves and modulating float valves at the fresh and flush water sump tanks as shown on the Drawings. Ball float valve shall also be provided and installed by the Sub-contractor at the fire services sump tank as shown on the Drawings;

3. The Sub-contractor shall provide, install and connect concealed PVC conduit system for water pump control.

FWP2.2.1.030.7  FRESH WATER BOOSTER PUMP SYSTEM

1. A fresh water booster pump system shall consist of the following:
   a. Three sets of fresh water booster pumps as specified in FWP6.2.025, two duties and one standby, coupled with induction motors as specified in FWP11.2, assembled in the manufacturer’s factory, suitable for variable speed drive control;
   b. Three sets of variable speed drive (VSD) units as specified in FWP11.3.030 consisting of multi-pump control microprocessors and variable frequency drives with static frequency inverters of appropriate rating to match with the pump motors, and whenever necessary, including an associated master multi-pump display and control panel board;
   c. A pump control cubicle as specified in FWP11.4 consisting of power supply, control and indication wiring circuits;
   d. A set of at least two nos. of stainless steel pneumatic pressure vessels as specified in FWP5.2.056 and of capacities as shown on Drawings;
   e. Pressure transducers as specified in FWP11.6.080 to hunt water discharge pressure and transmit feedback signal to the multi-pump control microprocessors in the VSD units; and
   f. Other necessary components for completing the system.
FWP2.2.2 SYSTEM OPERATION

FWP2.2.010.7 FRESH AND FLUSH WATER PUMP INSTALLATION

1. The pumps shall be operated by level control switches installed at the roof tanks of each block. The control schematic wiring diagram of the fresh and flush water pump installation is shown on the Drawings;

2. When the water level at the roof tank is 100 mm above the top of the outlet pipe, the low level control switch shall start the duty pump until the water level corresponding to the specified tank capacity is reached;

3. When the water level at sump tank falls to 150 mm above the top level of the suction pipe of the pump, the level control switch shall switch off the pump;

4. The audio alarm at the alarm panel outside the pump room shall be a buzzer rated for continuous operation with its sound audible at a distance of not less than 10 m and the visual alarm shall be a red indicating light;

5. For domestic blocks, daily automatic operation of full capacity duty pump at an adjustable preset time on or before 11 p.m. shall be incorporated in the fresh and flush water pump controls to fill up the roof water tanks for use over the night.

FWP2.2.020.7 FRESH WATER BOOSTER PUMP SYSTEM INSTALLATION

1. The fresh water booster pump system shall perform automatic multi-pump control functions as follows:

   a. To maintain preset constant water output pressure as specified on the Drawings by varying the motor running speed according to the feedback signals of corresponding pressure transducers at pump discharge side to meet system water flow demand;

   b. To switch on lagging pump when demand exceeding the maximum capacity of leading pump;

   c. To switch pump start-and-stop automatically according to the programme built in the multi-pump control microprocessor of the VSD unit for pump sequence operation and alternatively in order to maintain equal tear and wear of all pumps;

   d. To count the running hours of each pump and to perform automatic switching of pumps to avoid non-stop operation of any pump exceeding the preset maximum running hours in every on/off cycle;

   e. To utilize the associated pneumatic pressure vessels to keep pump running at zero demand for certain moment before pump stopping and to supply the least flow prior to pump starting to avoid quick start-and-stop of pump;

   f. To enable automatic switching of duty pump and trigger visual and audio alarm in case of any VSD fault and/or pump failure in running;

   g. To stop all pumps and trigger alarm for low water level at supply water tank.

2. The fresh water booster pump system shall comply with the following operating and installation requirements:

   a. All pumps in a booster pump system shall be capable of operating simultaneously regardless of their design function of duty and standby purposes;

   b. Each VSD unit is normally equipped with its own pressure transducer. For any system which feedback signal is grouped from one common pressure transducer for all pumps, a duplicate transducer capable of automatic changeover shall be provided as a standby;
c. When a master multi-pump display and control unit is necessary to fulfil the multi-pump control functions, an identical duplicate shall be provided in parallel with selector knob for easy changeover in case the master unit in use is found faulty. Both units shall be installed in either the pump control cubicle or a separate metal panel board;

d. Functions of the multi-pump control on every VSD unit in operation shall be maintained when one or more VSD units in the water booster system is/are isolated no matter being switched off manually or tripped automatically at fault. Failure of any individual system component including pump, VSD unit, master display and control unit and pressure transducer shall not cause total stoppage of the booster pump system;

e. Each pump shall be capable of switching on/off manually at its associated VSD unit;

f. The Sub-contractor shall submit calculations to demonstrate the inclusion of harmonic currents in arriving at the calculated cable losses within the maximum allowable limit in the BEC, for the final power circuit of the VSD units.

3. The following power supply and indications shall be provided in the booster pump control cubicle:

a. Switch isolator for each pump motor;

b. Contactor for emergency stop for each pump motor;

c. Automatic/OFF selector for VSD of each pump motor;

d. Multi-function electronic meter as specified in ELE4.4.5.040 for each pump motor;

e. Phase indication for each pump motor;

f. Pump running indication for each pump motor;

g. Visual and audio indication for pump fault coming from VSD of each pump motor;

h. Visual and audio indication for low water level at supply water tank;

i. Visual and audio indication for low pressure at discharge side.

4. Upon failure of one pump, the faulty pump shall be automatically switched off while at the same time an audio and visual alarm shall be given at the alarm panel outside the pump room on roof and repeated at the alarm panel outside the water pump room on G/F installed with Fresh Water Pump with clear label "Alarm for Roof Fresh Water Booster Pump System". The audio and visual alarm shall be same as that described in FWP2.2.2.010. Upon failure of the control system and when the system pressure has dropped to or below a pressure setting as shown on the Drawings, the audio and visual alarm shall also be actuated.

**FWP2.2.026.7 RAINWATER IRRIGATION PUMP SYSTEM INSTALLATION**

1. The pumps shall be under automatic control according to the cut-in/cut-out sequence as shown on the Drawings;

2. Upon failure of one pump, the faulty pump shall be automatically switched off while at the same time an audio and visual alarm shall be given at the alarm panel outside the pump room and repeated at the alarm panel outside the water pump room as shown on Drawings with clear label "Alarm for Rainwater Irrigation Pump System". The audio and visual alarm shall be same as that described in FWP2.2.2.010. Upon failure of the control system and when the system pressure has dropped to or below a pressure setting as shown on the Drawings, the audio and visual alarm shall also be actuated.
FWP2.2.030.7  FIRE SERVICES FEED PUMP INSTALLATION

1. The fire services feed pump shall be operated by level control switch(es) installed at the roof tank and sprinkler tank (if applicable). The control schematic wiring diagram of the fire services feed pump installation and fire services/sprinkler tank low level alarm system is shown on the Drawings;

2. When the water level at the roof tank, or sprinkler tank (if applicable), has fallen to three quarters full, the level control switch shall start the pump until the water level corresponding to the specified tank capacity is reached;

3. The level control switch at the sump tank shall be adjusted to switch off the pump when the sump water level falls to 150 mm above the top level of the suction pipe of the pump;

4. The audio alarm at the alarm panel outside the pump room shall be a buzzer rated for continuous operation with its sound audible at a distance of not less than 10 m and the visual alarm shall be a red indicating light;

5. A separate low level alarm control switch shall also be provided at the roof tank and sprinkler tank (if applicable). It shall actuate an audio and visual alarm at the alarm panel outside the pump room when the water level in the roof tank falls to half full. The visual signal at the alarm panel and the roof tank empty light on the front panel of the control cubicle shall be off automatically when the water level in the roof tank(s) reaches 100 mm above half full.

FWP2.2.040.7  CONTROL CUBICLE LAYOUT FOR FRESH/FLUSH WATER PUMPS, RAINWATER IRRIGATION PUMPS AND FOR FS FEED PUMP AND FS/SPRINKLER TANK LOW LEVEL ALARM SYSTEM

1. Unless otherwise Approved, control circuit and panel layout arrangement of the control cubicle shall be as shown on the Drawings;

2. The Sub-contractor shall advise the Contract Manager of the appropriate type and rating of the short circuit protective device to be used in conjunction with the motor starter in accordance with the motor starter manufacturer's recommendation in order to achieve the specified type of co-ordination.

FWP2.2.3  PUMPS

FWP2.3.010.7  PUMP DUTY

The fresh, flush, booster fresh and fire services water pumps shall be able to deliver water at flow rates and pressure heads as indicated on the Drawings.

FWP2.3.020.7  TYPE OF PUMPS

1. Fresh water pumps: horizontal/vertical multi-stage;

2. Flush water pumps: horizontal/vertical multi-stage;

3. Fire services feed pumps: horizontal/vertical end-suction/multi-stage;

4. Fresh water booster pumps: stamped stainless steel multi-stage vertical in-line pump for variable speed drive;

FWP2.3  RAINWATER HARVESTING
SYSTEM INSTALLATION FOR
DOMESTIC BLOCK

FWP2.3.1  SYSTEM DESCRIPTION

FWP2.3.1.010.7  GENERAL

1. The rainwater harvesting system (RWHS) installation shall comprise the following as shown on the Drawings:
   a. Chlorine Dosing;
   b. Cartridge Filter;
   c. Two number of 2-way Valves;
   d. Rainwater Irrigation Pumps;
   e. Control and Metering System.

2. The collected rainwater in the rainwater collection tank shall be treated by both chlorinated solution and cartridge filter before being fed to the 2-way valve, and finally to the irrigation points. Fresh water from break tank shall be fed to the irrigation points through another 2-way valve if the rainwater collected inside the collection tank is at low level. Control and metering system shall monitor the performance of the RWHS with monitoring measurements on the water and electricity consumptions.

3. The RWHS installation shall include all associated electrical works, pipework and system components as shown on the Drawings.

FWP2.3.2  SYSTEM OPERATION

FWP2.3.2.010.7  SYSTEM CONTROL

1. Water to the irrigation points being fed either from the rainwater collection tank or fresh water break tank shall be controlled by 2 number of inter-connected 2-way valves.

2. One inlet port of a 2-way valve shall be connected to the rainwater outlet pipe of the collection tank through a cartridge filter while the inlet port of another 2-way valve shall be connected to the fresh water supply through a break tank.

3. When the water level in the rainwater collection tank is above the preset low level, the level sensor shall issue a signal to allow rainwater instead of fresh water entering the 2-way valve connected to the rainwater outlet pipe of the collection tank through a cartridge filter.

4. When the water level in the rainwater collection tank is below the preset low level, the level sensor shall issue a signal to allow fresh water instead of rainwater entering the 2-way valve connected to the fresh water supply through a break tank.

5. The function of the two 2-way valves shall be electrically interlocked such that water is either fed from rainwater collection tank or fresh water break tank.

FWP3.1 MATERIALS

FWP3.1.1 GENERAL

FWP3.1.1.010.7 SUITABILITY FOR PURPOSE
All pipes and fittings shall be constructed of materials suitable for the required working and test pressures and temperatures of the fluid carried.

FWP3.1.1.020.7 CONFORMITY WITH SPECIFICATION
All pipes and fittings shall conform to the Specification. Alternative materials may be used only with prior Approval.

FWP3.1.1.030.7 PIPE SIZES
Pipe sizes indicated on the Drawings or in this Specification are nominal bores, with the exception of copper tube, for which the sizes indicated are nominal outside diameters.

FWP3.1.2 PIPEWORK

FWP3.1.2.010.7 DUCTILE IRON PIPES AND FITTINGS
1. Ductile iron pipes, pipe fittings and pipe flanges to BS EN 545;
2. Be capable of withstanding the concerned working pressure and maximum static pressure that may arise upon failure of the associated pressure reducing devices;
3. Be accepted by the Water Authority for the intended application. Produce type test certificate / report from an independent and reputable laboratory for the verification of compliance with this Specification upon request;
4. Slip on flange adaptors:
   a. Be provided at check meters positions;
   b. Be designed and manufactured to suit the pipework installation. The flanges shall comply with BS EN 1092-2 PN 16 or PN 25 as appropriate;
   c. Be made of ductile iron to BS EN 545 and shall be coated with epoxy externally and internally comply with BS EN 14901;
   d. Stud bolts and nuts of the flange adaptors shall be made of stainless steel to BS EN 10088-3-1.4401;
   e. Gaskets shall be made of Ethylene Propylene Diene Monomer (EPDM) If used for fresh water, it shall comply with BS 6920;
   f. Be equipped with guide rod assembly to prevent damage from excessive movement. The assembly shall consist of guide rod plates, guide rods and steel washers on both sides, and shall be fitted with resilient neoprene sleeves, resilient neoprene washers on at least one side of the assembly for isolating vibration transmission.
5. Be coated with metallic zinc and bitumen finishing externally to BS EN 545 and lined with cement mortar internally, or be coated with metallic zinc and epoxy externally and lined with cement mortar and epoxy internally. Epoxy coating shall be complied with BS EN 14901. Adoption of epoxy coating shall be subjected to the Contract Manager for Approval;
6. The minimum wall thickness of pipes and fittings shall be comply with the following table:

**FWP3.1.2.020.7 GALVANIZED STEEL PIPES AND FITTINGS**

1. Galvanised steel pipes to BS EN 10255 with screwing to BS EN 10226-1 and of medium grade for above ground installation and of heavy grade for below ground installation unless otherwise Specified or shown on the Drawings;

2. Galvanised malleable cast iron pipe fittings to BS 143 and 1256 or BS EN 10242;

3. Galvanised wrought steel pipe fittings (screwed BS 21R series thread) to BS EN 10241.

**FWP3.1.2.040.7 CARBON STEEL PIPES AND FITTINGS**

1. Carbon steel pipes of P195TR1 to BS EN 10216-1 and BS EN 10217-1 for operation in high pressure from 16 bar to 20 bar with dimensions to BS EN 10220;

2. Correlated fittings shall be butt welding type carbon steel for pressure purposes to BS EN 10253-1.

**FWP3.1.2.050.7 PIPEWORK APPLICATION**

Installations shall be carried out using the specifications indicated below unless otherwise specified elsewhere or shown on the Drawings:

### FWP3.1.3 PIPE FITTINGS

#### FWP3.1.3.010.7 STANDARD PIPE FITTINGS

1. Unless otherwise specified or Approved, only standard fittings and pipe fittings as appropriate shall be used;
2. Pipe fittings shall be of the same size as the pipework connected to them;
3. Pipe fittings fabricated on site, reducing bush and locally manufactured pipe fittings will not be accepted.

#### FWP3.1.3.020.7 LOCALLY MANUFACTURED PIPE FITTINGS

1. Where restricted site condition does not permit the use of standard pipe fittings, purpose made local fittings may be used only with prior Approval;
2. Local fittings shall be internally and externally painted with two coats of anti-corrosion materials and pressure tested as directed by the Contract Manager, prior to installation.

#### FWP3.1.3.030.7 BENDS

All bends shall be of long radius type unless otherwise approved; Short radius bends can be used for pipe size up to 50 mm diameter and for pipes installed in limited spaces.

#### FWP3.1.3.040.7 TEES

All tees shall be of the pitcher or twin elbow type, unless otherwise indicated or Approved.

#### FWP3.1.3.050.7 FLANGES

All flanges shall conform to BS EN 1092 and shall be of suitable pressure rating.

#### FWP3.1.3.060.7 REDUCERS

1. Pipe size changes shall be effected by reducers of appropriate length to minimize pressure loss or otherwise by reducing bends or tees;
2. In the case of suction lift, eccentric reducers shall be used at pump suction for air elimination.

#### FWP3.1.3.070.7 PIPE BRACKETS

1. Pipe brackets shall be of sufficient strength to take the load with no noticeable deflection with clips detachable without disturbing the fixing;
2. Samples or details of the pipe brackets shall be submitted for Approval prior to installation.
**FWP3.1.3.080.7 PROVISION OF SLEEVES**

All sleeves for openings in walls within a fire compartment shall be PVC. All sleeves for openings in walls and slab connecting the fire compartment with other fire compartments/public area shall be galvanized mild steel.

**FWP3.1.4 EXPANSION JOINTS AND FLEXIBLE CONNECTORS**

**FWP3.1.4.010.7 STAINLESS STEEL TYPE EXPANSION JOINTS**

1. Stainless steel expansion joints shall be used in fresh, rainwater and fire services water pipeworks passing through building expansion joints where shown on the Drawings, and they shall comply with the following requirements:
   a. Be of axial pattern bellows type and be able to withstand horizontal and vertical movement;
   b. Have screwed ends to BS 21 or BS EN 10226-1 or flanged ends to BS EN 1092 as appropriate to facilitate replacement;
   c. Be manufactured from stainless steel of Grade 1.4301 to BS EN 10088-1 or equivalent standard or other Approved material appropriate to the system;
   d. Be designed to withstand the test pressure of the system and maximum static pressure that may arise upon failure of the associated pressure reducing devices;
   e. Be equipped with guide rod assembly to prevent damage from excessive movement. The assembly shall consist of guide rods, rod plates and steel washers on both sides, and be fitted with resilient neoprene sleeves and resilient neoprene washers on at least one side of the assembly for isolating vibration transmission;
   f. Testing pressure of the expansion joints shall be not less than twice of the system pressure involved;
   g. All expansion joints shall be designed with a long cycle life to suit a pipe system with at least 20 years life expectancy and be installed properly without misalignment;
   h. The expansion joints shall be the type accepted by the Water Authority and FSD. For sprinkler system, the expansion joints shall be provided according to the requirement of LPC Sprinkler Rules;
   i. Anchors and guides shall be installed according to the recommendations of the expansion joint manufacturer and the details shall be submitted for Approval.

2. Submit the following for Approval upon the Contract Manager's request:
   a. Type hydraulic test certificates/reports from independent and reputable laboratories; and
   b. The installation lengths, materials, rated movements (axial extension, axial compression, lateral deflection, angular rotation, or any combination thereof) and pressure ratings of the expansion joints.

**FWP3.1.4.020.7 RUBBER FLEXIBLE CONNECTORS/EXPANSION JOINTS**

1. Rubber flexible connectors shall be used for pipeline vibration elimination in flush water and fire services water pipeworks at pump rooms and rubber expansion joints shall be used in only flush water pipework passing through building expansion joints. Rubber flexible connectors/expansion joints shall comply with the following requirements:
   a. Be of double or multiple arch/sphere type;
b. Be able to sustain a working pressure compatible with the piping system with which they are connected. Unless otherwise specified, the working pressure shall be no less than 16 bar with a minimum test pressure of 150% of the working pressure and a minimum burst pressure of 55 bar;

c. Be non-toxic, corrosion and abrasion resistant and of sufficient length for effective isolation of vibration;

d. Be fitted with corrosion resistant steel or ductile iron floating flanges to BS EN 1092;

e. Be provided with a flexible tube made of multiple layers of high tensile fabric reinforcement with EPDM, neoprene or synthetic rubber cover and liner. Tube end shall be of locked bead construction with steel wire bead ring and raised face;

f. Be equipped with control rod assembly to prevent damage from excessive movement. The assembly shall consist of guide rods, rod plates and steel washers on both sides, and be fitted with resilient neoprene sleeves and resilient neoprene washers on at least one side of the assembly for isolating vibration transmission.

2. Submit the following for Approval upon the Contract Manager's request:

a. Type hydraulic test certificates/reports from independent and reputable laboratories; and

b. The installation lengths, materials, rated movements (axial extension, axial compression, lateral deflection, angular rotation, or any combination thereof) and pressure ratings of the rubber flexible connectors.

FWP3.1.4.030.7 STAINLESS STEEL FLEXIBLE CONNECTORS

1. Stainless steel flexible connectors shall be used for pipeline vibration elimination in fresh water and rainwater pipework at pump room, and they shall comply with the following requirements:

a. Be of omega-shape, close pitch annular corrugation, and fabricated from stainless steel plates/sheets/strips;

b. Be able to sustain a working pressure compatible with the piping system with which they are connected. Unless otherwise specified, the working pressure shall be no less than 16 bar with a minimum test pressure of 150% of the working pressure and a minimum burst pressure of 40 bar;

c. Be provided with a bellow which shall be non-toxic, corrosion and abrasion resistant and complete with braiding. Appropriate heat treatment shall be conducted to release the internal stress imposed on the bellow during the forming process when the convolution of the bellow is not gradually formed by continuous rolling in shape;

d. Be of sufficient length for absorption of offset motion and effective isolation of vibration. The total stress on bellow due to internal pressure, offset motion and vibration shall not exceed the design endurance limit. Unless otherwise specified, the minimum rated lateral movement shall be as tabulated below:

<table>
<thead>
<tr>
<th>Nominal bore of braided bellow</th>
<th>Minimum rated lateral movement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 100 mm diameter</td>
<td>4 mm offset motion plus ±1 mm vibration</td>
</tr>
<tr>
<td>Above 100 mm diameter</td>
<td>6 mm offset motion plus ±1 mm vibration</td>
</tr>
</tbody>
</table>

e. Be comprised of the following component material unless otherwise specified and inert gas arc welding shall be used for the termination of bellow and braiding at the tube ends:
i. Bellow: austenitic chromium nickel or austenitic chromium nickel molybdenum stainless steel sheet to BS 1449:Part 2 or BS EN 10029, BS EN ISO 9445, BS EN 10048 and BS EN 10051 or BS EN 10095;

ii. Braiding: stainless steel wires or plates;

iii. Flange: corrosion resistant carbon steel.

f. Have any part which is in contact with the water of the same material as the bellow;

g. Unless otherwise specified, be of flanged end connection. Flanges shall comply with BS EN 1092;

h. Have identification markings for the brand name, model number, bellow material, braiding material, working pressure and bellow nominal diameter;

i. Be equipped with guide rod assembly to prevent damage from excessive movement. The assembly shall consist of guide rods, rod plates and steel washers on both sides, and be fitted with resilient neoprene sleeves and resilient neoprene washers on at least one side of the assembly for isolating vibration transmission.

2. Submit the following for Approval upon the Contract Manager's request:

a. Type hydraulic test certificates/reports from independent and reputable laboratories; and

b. The installation lengths, materials, rated movements (axial extension, axial compression, lateral deflection, angular rotation, or any combination thereof) and pressure ratings of the stainless steel flexible connectors.

**FWP3.1.5 STRAINERS**

**FWP3.1.5.010.7 TYPE AND APERTURE**

Strainer shall be of Y-type or U-type (Bucket/Basket type) as specified below, unless otherwise specified on Drawings. The minimum free flow area ratio shall be 2 and the maximum aperture size shall be of $\varnothing 1.5$ mm for strainers of nominal size 100 mm or below and of $\varnothing 3.0$ mm for strainers of nominal size 150 mm or above, unless otherwise specified.

**FWP3.1.5.020.7 SIZE AND PERFORMANCE**

Strainers shall have the same nominal sizes as the pipes in which they are connected and shall be suitable for both working and test pressures of the piping system in which they are installed. Unless otherwise specified all strainers shall have a working pressure of not less than 16 bar.

**FWP3.1.5.030.7 CONSTRUCTION**

1. Strainers shall be constructed of materials as specified below suitable for the required working and test pressures and temperature of the fluid carried. Better or equivalent materials may be offered for Approval;

2. At nominal sizes 65 mm and below:

a. For fresh water and fire services, use the following:

   i. Adoption: Y-type screwed joint;

   ii. Body and cover: bronze to BS EN 1982 CuSn5Zn5Pb5 or CB491K or CC491K;

   iii. Screen: stainless steel to BS EN 10088-1 Grade 1.4401.

b. For flush salt water, use the following:
i. Adoption: Y-type screwed joint;
ii. Body and cover: stainless steel to BS EN 10088-1 Grade 1.4401;
iii. Screen: stainless steel to BS EN 10088-1 Grade 1.4401.

3. At nominal sizes above 65 mm:
   a. For fire services, use the following:
      i. Adoption: Y-type flanged joint;
      ii. Body and cover: grey cast iron to BS EN 1561 EN-GJL-250 or spheroidal graphite cast iron (ductile iron) to BS EN 1563 EN-GJS-400-15;
      iii. Screen: stainless steel to BS EN 10088-1 Grade 1.4401;
      iv. Drain Plug: malleable iron;
      v. Stud and Nut: stainless steel to BS EN 10088-1 Grade 1.4401.
   b. For fresh water and flush salt water, use the following:
      i. Adoption: U-type flanged joint with quick release cover;
      ii. Body: grey cast iron to BS EN 1561 EN-GJL-250 or spheroidal graphite cast iron (ductile iron) to BS EN 1563 EN-GJS-400-15;
      iii. Cover: stainless steel to BS EN 10088-1 Grade 1.4401;
      iv. Screen: stainless steel to BS EN 10088-1 Grade 1.4401;
      v. Drain Plug: malleable iron;
      vi. Clamper, Stud and Nut: stainless steel to BS EN 10088-1 Grade 1.4401.

4. All cast iron components shall be coated with epoxy based material both on internal and external surfaces. The coating for use in fresh water shall be in compliance with BS 6920 or equivalent for potable use and to the satisfaction of the Water Authority;

5. U-type strainer shall be equipped with quick release cover composed of clamper and hand nuts which shall be so designed that the basket can be taken out for cleaning without using tools. Appropriate safety mechanism shall be incorporated in the quick release cover.

FWP3.1.5.040.7 END CONNECTIONS
Strainers of 65 mm or below shall be of screwed female end connection to BS EN 10226-1 (in conjunction with BS 21) and strainers of above 65 mm shall be of flanged end connection to BS EN 1092-2.

FWP3.1.5.050.7 CERTIFICATION
Type test certificates/report from independent and reputable laboratories confirming that the strainers have been tested conforming to this Specification shall be produced upon request.

FWP3.1.6 AUTOMATIC SELF-CLEANING STRAINER FOR FLUSH SALT WATER SUPPLY SYSTEM

FWP3.1.6.010.7 CONSTRUCTION
1. Unless otherwise approved by the Contract Manager, Automatic Self-Cleaning Strainer (Auto-Strainer) for flush salt water supply system shall comply with the following requirements:
a. Be consisted of hydraulically driven filter screen and self-cleaning assembly for removing dirt and grits, which shall be completed with control panel, differential pressure switch (DPS), timer of minimum 7 days settings and manual control switch, back-flush valve with automatic actuator, and other necessary components;

b. The Auto-Strainer body, filter screen and other wetted components shall be made of BS EN 10088-1 Grade 1.4401 stainless steel or other Approved corrosion resistant material suitable for salt water application;

c. Have PN16 flanged inlet and outlet connections;

d. Have a working pressure of not less than 16 bar, complete with manufacturer's factory test and submit to the Contract Manager a test certificate endorsed by the manufacturer upon delivery;

e. The maximum pressure drop through the strainer shall be less than 0.7 bar;

f. Perforation of the filter screen shall not be greater than 100 micron and the total free area of perforation shall not be less than 2 times the inner cross sectional area of the connecting pipe.

2. Prior to the time of material submission for Approval, the equipment shall have proven record of reliability in local or overseas application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.

FWP3.1.6.020.7 OPERATION AND CONTROL

1. The Auto-Strainer for flush salt water supply shall be capable of automatically and continuously filtering of dirt and grits without the need of manual cleaning for a pre-determined number of rinse cycles;

2. Unless otherwise approved by the Contract Manager, the self-cleaning assembly in the Auto-Strainer shall be provided with a control system consisting of control panel and factory-preset DPS as follows:

   a. The DPS shall detect the pressure differential between the water inlet and outlet due to the accumulation of dirt and grits on the filter screen;

   b. The control panel shall have indicators to show different modes of operation and status of automatic actuator. A resettable counter to display number of rinse cycles activated shall be provided.

3. Unless otherwise approved by the Contract Manager, a rinse cycle for removal of dirt and grits shall be operated as follows:

   a. A rinse cycle shall be initiated by the control system based on the preset pressure differential, or by adjustable timer, or by manual action. The timer should be adjustable within timing control range of at least 7 days;

   b. When the rinse cycle starts, the back-flush valve connected to atmospheric drain shall be opened by the automatic actuator;

   c. The self-cleaning assembly shall sweep the entire filter screen area to remove accumulated dirt and grits filtered out from the flush salt water;

   d. At the end of the rinse cycle, the back-flush valve shall be closed and the pressure differential shall return to a lower level;

   e. The duration of the rinse cycle shall be adjustable;

   f. The control system shall initiate an alarm upon a pre-determined number of consecutive rinse cycles. When the number of consecutive rinse cycles is reached, the control panel shall not activate further rinse cycles;

   g. The number of consecutive rinse cycles before initiation of alarm shall be adjustable.
FWP3.1.6.030.7 ALTERNATIVE DESIGN
Auto-Strainer with alternative design in construction and control will be accepted by
the Contract Manager subject to the Sub-contractor has demonstrated to the
satisfaction of the Contract Manager that the alternative Auto-Strainer is capable of
meeting the operation and performance requirements as specified in FWP3.1.6.010
and FWP3.1.6.020.
FWP3.2  INSTALLATION

FWP3.2.1  SITE HANDLING

FWP3.2.1.010.7  STORAGE

Prior to installation, all materials shall be stored properly in accordance with the manufacturer's instructions to afford maximum protection against weather, corrosion, mechanical damage and other causes. All pipes shall be stored with closed ends. All damaged materials shall be removed from site immediately.

FWP3.2.1.020.7  CLEANLINESS

All pipes and fittings shall be cleaned before erection with all scale, burrs, furs, sand, slag etc. removed. Cleanliness shall be maintained throughout erection by covering the exposed ends of pipework with a metal or plastic cap.

FWP3.2.2  PIPEWORK LAYOUT

FWP3.2.2.010.7  CO-ORDINATION OF PIPEWORK

The Drawings are diagrammatic and indicate only the approximate location and manner in which the pipework is to be installed. The Sub-contractor shall allow for any diversion to avoid structural beams and other services etc., ascertain the actual work involved and co-ordinate his pipework installation with the work of other trades and services.

FWP3.2.2.020.7  ROUTING AND GRADING OF PIPEWORK

Pipework shall, where applicable, follow the lines of walls and be graded to ensure venting and draining. A minimum clearance of 25 mm shall be maintained between the pipework and the finished mounting surface.

FWP3.2.2.030.7  ARRANGEMENT OF PIPEWORK

All pipework shall, be neatly arranged and mounted. For a number of pipes running close to one another, they shall be grouped and mounted on steel framed racks arranged so that the number of cross-over is minimum. All vertical pipes shall be plumbed.

FWP3.2.2.040.7  VENTING

Air vents of automatic type must be provided at all high points wherever required.

FWP3.2.2.050.7  DRAINING

1. All water pipework, except those for fire services, shall be fitted with 13 mm diameter key operated cocks, with hose unions, at low points in the system to facilitate drain down;

2. A 25 mm diameter drain cock with hose bib shall be provided between the check valve and the gate valve at the pump discharge to facilitate draining of the riser pipe.
PROVISION FOR DISMANTLING

1. Sufficient joints and fittings shall be provided to facilitate easy removal of pipes, valves, pumps, etc., for inspection and repair. Disconnecting flanges, or screwed unions as applicable, shall be provided at suitable locations and at valves, pumps, etc;

2. Pipes shall not be embedded in the concrete structure, or grouted in or otherwise installed in such a way as to make alterations difficult at a later date.

LOCATION OF STRAINERS

Install strainers in positions shown on the Drawings.

MANUFACTURERS INSTRUCTIONS

Installation, jointing, storage and handling of the pipes and fittings shall be in accordance with the manufacturer's recommendations.

LOCATION OF PIPE JOINTS

Pipe joints shall not be made in the thickness of any wall, floor, ceiling or beam.

JOINTING GALVANIZED STEEL PIPES

1. Unless otherwise Approved, galvanized steel pipes with diameter less than and equal to 150 mm shall be jointed with screwed fittings. Screwed flanges shall be employed only for connection to flanged end valves or equipment;

2. Unless otherwise Approved, galvanized steel pipes with diameter greater than 150 mm shall be jointed with screwed flanges or flanged fittings;

3. Jointing of steel pipes by welding shall only be used when Approved;

4. Screwed fittings shall have pipe threads complying with BS 21 or BS EN 10226-1. Screwed joints shall have tapered threads and shall be made with Approved jointing material. Where the cutting of threads removes the galvanising, an anti-corrosive sealing compound shall be applied to restore the integrity of the protective finish;

5. Galvanized steel pipes for fire services pipework can be jointed by mechanical couplings and fittings with the Approval of the Contract Manager.

JOINTING DUCTILE IRON PIPES

Unless otherwise specified, all ductile iron pipes shall be jointed:

1. For above ground installation: with screwed flanges or flanged fittings, stainless steel bolts and nuts of BS EN 10088-3 Grade 1.4401 for fresh and flush water pipes and fittings inside water pump room;

2. For below ground installation: with flexible push-on type connection joints.

MECHANICAL COUPLINGS AND FITTINGS FOR FIRE SERVICES SYSTEM

1. As an alternative to flanged and screwed joints, grooved end mechanical couplings may be employed subject to the Approval of the Contract Manager;
2. Mechanical couplings shall be hot dip galvanized, self-centering, engaged and locked in place onto the grooved or shouldered pipe and pipe fitting ends. The result shall be in a positive watertight couple providing some allowance for angular pipe deflection, contraction and expansion. Coupling housing clamps shall consist of two or more malleable iron castings or rolled steel or ductile iron segment holdings with a composition water sealing gasket so designed that the internal water pressure increases in the water tightness of the seal. Sealing gasket shall be selected for the service and working temperature according to the manufacturer's recommendations. The coupling assembly shall be securely held together by two or more zinc plated track head square or oval-neck heat-treated carbon steel bolts and nuts. All pipe fittings connected to mechanical pipe couplings shall have groove and shouldered ends. Flanged or threaded end valves may be used with grooved adapters;

3. Regarding material specification, specifications on components of mechanical couplings shall be as follows:
   a. For coupling housing material, ductile iron shall be to ASTM A536 or to BS 4772 or BS EN 1563 or other standards subject to the Contract Manager's Approval;
   b. Rubber gaskets shall be tested to the following specifications:
      i. Hardness: ASTM D2240;
      ii. Tensile testing: ASTM D412;
      iii. Compression: ASTM D395;

4. Before couplings are assembled, pipe ends and outsides of gaskets shall be lightly coated with suitable lubricant or graphite paste to facilitate installation;

5. Pipe grooving shall be carried out by using proprietary grooving machine and in accordance with the pipe coupling manufacturer's latest specifications. The grooving shall be roll-grooved without the removal of any metal. Zinc coating damaged during the grooving operation of galvanized steel pipe shall be rectified by scrubbing clean the affected area and coated with a zinc rich galvanizing paint approved by the Contract Manager;

6. Unless otherwise specified, all mechanical couplings and fittings shall have a minimum working pressure of not less than 16 bar and the testing pressure shall not be less than 1.5 times the working pressure;

7. The electrical continuity of the mechanical couplings shall be effective and shall be verified by site measurement;

8. The mechanical couplings and fittings shall comply with standards acceptable to FSD;

9. The entire coupling installation shall be in accordance with the latest published selected manufacturer's recommendations;

10. The sub-contractor shall obtain WSD's consent on project basis for adopting mechanical couplings and fittings for pipework installation.

FWP3.2.4  PIPEWORK SUPPORTS

FWP3.2.4.010.7  FIRE SERVICES INSTALLATION

1. Pipe bracket for fire services installation shall be of fixed type;
2. Neoprene or rubber vibration isolation pad of 6 mm thick shall be added between pipe and bracket for installation inside fire services pump room.
FWP3.2.4.020.7 WATER PUMP INSTALLATION

1. Pipe bracket for water feed pump/booster pump/pressure reducing valve installation inside water pump room and pressure reducing valve chamber shall be completed with vibration isolator in accordance with FWP3.2.4.060. Where it is impractical to provide vibration isolator in accordance with FWP3.2.4.060, 6 mm thick neoprene or rubber isolation pad between pipework and bracket or other means of vibration isolation shall be provided subject to Approval by the Contract Manager;

2. Fixed type pipe bracket shall be installed at anchor points of the pipework system to avoid pipe movement in critical areas such as at pump suction connecting to puddle flange of water tank, non-return valve at pump discharge side, etc. Means of vibration isolation such as neoprene/rubber pad between pipework and bracket has still to be provided;

3. The sub-contractor shall be responsible for selecting fixed type pipe brackets or brackets with vibration isolator, as appropriate, for the whole pipework system and installing in accordance with the manufacturer’s recommendations of brackets with vibration isolator to ensure that the vibration and noise generated from the pipework system would be isolated, in particular, to avoid causing nuisance to the tenants of the domestic flats.

FWP3.2.4.030.7 PERFORMANCE

All pipework shall be well supported so that it is free from excessive stress due to weight of its contents, its own dead weight, and dynamic forces due to liquid movement. Particular care should be taken with branches from vertical risers to ensure that the branch is not supporting the riser.

FWP3.2.4.040.7 PROVISION FOR MOVEMENT

Pipework shall be supported in such a manner as to allow adequate movement for expansion and contraction.

FWP3.2.4.050.7 FIXED TYPE PIPE BRACKET

1. Fixed type pipe bracket shall comprise pipe clip and hanger as follows:
   a. Pipe clip refers to the two halves components which are in direct contact with the pipework;
   b. Hanger refers to the component connecting the pipe clip for fixing onto the mounting structure/supports.

2. Components of the pipe brackets shall be not less than 3 mm thick. Materials of the pipe brackets shall be not less than those as specified below:
   a. Except for sprinkler pipework, pipe brackets for all pipeworks shall comply with the following requirements:
      i. All components including pipe clip, bolt, nut, washer, hanger and anchor bolt shall be made of stainless steel.
   b. Pipe brackets for sprinkler pipework shall comply with the following requirements:
      i. Pipe clip, bolt, nut and washer shall be made of stainless steel; and
      ii. Hanger and anchor bolt shall be made of galvanised mild steel.
   c. I-beam and U-channel for further supporting pipe brackets shall be made of mild steel with anti-corrosion painting;
   d. Stainless steel for components including pipe clip, bolt, nut, washer, hanger and anchor bolt shall be at least to BS EN 10088-3 grade 1.4301 unless otherwise specified.
3. Pipe brackets shall be arranged as close as possible to joints and changes of direction, with each bracket taking its share of the load and of sufficient strength to take the load with no noticeable deflection with clips detachable without disturbing the fixing. Brackets fixing to structure shall be fixed by at least two anchor bolts of adequate size. Samples or details of the pipe brackets shall be submitted for Approval prior to installation;

4. Supports shall be spaced at intervals as specified in FWP3.2.4.070;

5. For all pipeworks except sprinkler pipework where LPC Sprinkler Rules shall apply, the minimum bolt diameter for the clips and the minimum anchor bolt diameter for fixing the pipe hanger to the mounting structure/support at two or more points shall be as follows:

<table>
<thead>
<tr>
<th>Nominal Pipe Size (mm)</th>
<th>Minimum Bolt Diameter for Pipe Clips (mm)</th>
<th>Minimum Anchor Bolt Diameter for Hanger, Double Fixing (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>25 – 50</td>
<td>6</td>
<td>6</td>
</tr>
<tr>
<td>65 – 100</td>
<td>10</td>
<td>10</td>
</tr>
<tr>
<td>125 – 150</td>
<td>12</td>
<td>12</td>
</tr>
</tbody>
</table>

6. For pipe bracket and support interval designs other than those specified above, substantiation/calculation to demonstrate that the proposed bolt/anchor has sufficient strength to take up the load shall be submitted by the Sub-contractor for Approval by the Contract Manager.

**FWP3.2.4.060.7 PIPE BRACKET WITH VIBRATION ISOLATOR**

1. Vibration isolator:
   a. Vibration isolator shall contain a steel spring with minimum 8 mm pad of neoprene in series and enclosed in hanger box. The neoprene element shall be moulded with a rod isolation bushing that passes through the isolator hanger box. Spring diameter and isolator hanger box lower hole sizes shall be large enough to permit the hanger rod to swing through a 30 degree arc before contacting the edge of the hole and short circuiting the spring. The minimum static deflection of the spring shall be 20 mm;
   
   b. Unless otherwise Approved, vibration isolator shall be selected fully in accordance with manufacturer's guidelines and taken into account weight distribution of the pipework system, pipe anchor points, guide etc. to produce uniform deflections and to ensure that the vibration and noise generated from associated pipework system would be isolated and would not be transmitted to other parts of the building, in particular, to avoid causing nuisance to the tenants of the domestic flats;
   
   c. The Sub-contractor shall be responsible for and submit calculation to verify the correctness of selection and overall suitability of every vibration isolator for the pipework system.

2. Pipe bracket:
   
   Details of the pipe clip, bolt, nut, washer, hanger and anchor bolt shall be in accordance with those specified in FWP3.2.4.050 wherever applicable.

3. Connection between vibration isolator and pipe bracket:
   
   Unless approved by the Contract Manager, pipe bracket shall be secured firmly to the vibration isolator in accordance with the manufacturer's guidelines of the vibration isolator.
FWP3.2.4.070.7 SUPPORT INTERVALS

1. Supports shall be spaced at intervals not exceeding those shown in the following tables for straight runs, as defined in Table 2 of BS 8000:Part 15, with additional supports for bends and tees:

   a. Ductile iron pipes:

<table>
<thead>
<tr>
<th>Nominal pipe size (mm)</th>
<th>Spacing for horizontal runs</th>
<th>Spacing for vertical runs</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>2.7 m</td>
<td>2.7 m</td>
</tr>
<tr>
<td>100</td>
<td>2.7 m</td>
<td>2.7 m</td>
</tr>
<tr>
<td>150 &amp; above</td>
<td>3.6 m</td>
<td>3.6 m</td>
</tr>
</tbody>
</table>

   b. Galvanized steel pipes:

<table>
<thead>
<tr>
<th>Nominal pipe size (mm)</th>
<th>Spacing for horizontal runs</th>
<th>Spacing for vertical runs</th>
</tr>
</thead>
<tbody>
<tr>
<td>15</td>
<td>1.8 m</td>
<td>2.4 m</td>
</tr>
<tr>
<td>20 &amp; 25</td>
<td>2.4 m</td>
<td>3.0 m</td>
</tr>
<tr>
<td>32</td>
<td>2.7 m</td>
<td>3.0 m</td>
</tr>
<tr>
<td>40 &amp; 50</td>
<td>3.0 m</td>
<td>3.6 m</td>
</tr>
<tr>
<td>65 &amp; 80</td>
<td>3.6 m</td>
<td>4.5 m</td>
</tr>
<tr>
<td>100</td>
<td>3.9 m</td>
<td>4.5 m</td>
</tr>
<tr>
<td>125</td>
<td>4.5 m</td>
<td>5.0 m</td>
</tr>
<tr>
<td>150</td>
<td>4.5 m</td>
<td>5.0 m</td>
</tr>
</tbody>
</table>

2. Supports on ground for pipework inside water pump room for fresh and flush water service shall be of stainless steel of BS EN 10088-3 grade 1.4401.

FWP3.2.4.080.7 HANGERS FOR HORIZONTAL PIPEWORK

Unless otherwise specified, hangers for horizontal pipework at high level shall be supported from angle or channel irons, provided by the Sub-contractor, suitable for building-in or otherwise secured to the structure.

FWP3.2.5 INTEGRATION WITH STRUCTURE

FWP3.2.5.010.7 MARKING OUT

The Sub-contractor shall be responsible for marking the exact location of all holes/slots which will be cut by the Main Contractor where required and permitted.

FWP3.2.5.020.7 CLEARANCE OF HOLES

The holes, sleeves and slots reserved through walls/slabs/beams will be cleared and cleaned by the Main Contractor before handover to the Sub-contractor for use. The nails appertaining to concealed electrical boxes shall be cleared by the Sub-contractor subsequent to work completion and prior to execution of final painting work by the Main Contractor.
FWP3.2.5.030.7 FIXING PIPE SLEEVES
Where pipes pass through walls, beams, floors and ceiling, sleeves shall be provided. The Sub-contractor shall ascertain whether slots/holes are to be grouted later and shall fix galvanized steel/PVC sleeves with 2 to 12 mm clearance to allow for expansion and movement of pipe, as FWP3.1.3.080, immediately after pipe erection as follows:
1. Through walls and beams: fix sleeves flush with the finished surfaces;
2. Through floor slabs: fix sleeves in position with 100 mm projection above finished floor level and flush with the underside of the floor.

FWP3.2.5.040.7 CAULKING PIPE SLEEVES
Galvanized steel sleeves used in walls and slabs between fire compartments shall have the full length of annular space between the sleeve and the pipe filled with non-flammable mineral wool or Approved equivalent materials, pointed with Approved fire-rated sealant to maintain the required FRP of the walls / floor slabs, and are durable and effective in sound insulation.

FWP3.2.5.050.7 PIPE ENTRY TO BUILDINGS
Pipe entries into buildings shall be sealed and plugged with mastic compound after installation of pipework to prevent the ingress or egress of water or vermin.

FWP3.2.5.060.7 PROTECTION OF UNDERGROUND PIPES
1. Underground pipes shall be protected against corrosion;
2. Pipework shall be cleaned after jointing and treated with two coats of good quality bituminous paint and wrapped with petrolatum tape for protection against corrosion due to water, salts, soil organics, etc. before laying, and rested on sand or sieved soil before the trench is backfilled;
3. All underground pipework shall be pressure tested before the application of bituminous paint and the application of the petrolatum tape.

FWP3.2.5.070.7 PIPES PASSING THROUGH ASPHALT COVERED FLAT ROOFS
Where pipes pass through flat roofs covered with asphalt, the Sub-contractor shall, unless otherwise specified:
1. Cast or build in cast iron or galvanized mild steel sleeve, of internal diameter 20 mm (minimum) larger than the external diameter of the pipe concerned, projecting minimum 150 mm above roof finish;
2. Caulk space and fill both ends with fire-rated mastic sealant;
3. Cover tops of sleeves with lead collars or pre-fabricated 304 stainless steel collars of 1.5 mm thick to fit the pipe size and sleeve.

FWP4.1 VALVES - GENERAL

FWP4.1.010.7 GENERAL

1. All valves shall be designed and constructed of materials suitable for both the working and test pressures of the piping system in which they are installed and the temperature of the fluid carried. Unless otherwise specified, all valves shall have a working pressure of not less than 16 bar;

2. Valves of the same type shall be from the same manufacturer.

FWP4.1.020.7 STANDARD

Valves shall comply with the following standards:

<table>

FWP4.1.030.7 TESTING

All valves shall be pressure tested in accordance with the relevant British Standards / European Standards or equivalent international / national standards by the valve manufacturer before leaving the factory.

FWP4.1.040.7 CERTIFICATION

1. Be of the type accepted by the Water Authority as required by the statute;

2. Type test Certificate/Report from independent and reputable laboratories confirming that the valves have been tested conforming to this Specification shall be produced;

3. The following type test Certificates/Reports shall be provided upon request of the Contract Manager, wherever appropriate:
   a. Test certificates for valves in compliance with the Standards quoted in FWP4.1.020;
   b. Test certificates on composition analysis, chemical, physical and mechanical properties of the metallic materials for valves;
   c. Test certificates for resilient seating material and epoxy coating showing compliance with the physical property and thickness requirements of this Specification;
   d. In case of valves in potable water application, test certificates for non-metallic materials including resilient seating material and epoxy coating, showing compliance with the full tests of effect on water quality to BS 6920 and suitable for potable water usage issued by Water Research Centre of UK or an equivalent organisation.
FWP4.1.050.7  SIZE
All valves (except those for flow or pressure control such as modulating float valve and pressure reducing valve) shall have the same nominal size as the pipe in which they are installed unless otherwise specified.

FWP4.1.060.7  ROTATION
Manually operated valves shall be closed by turning the handwheel in a clockwise direction when facing the handwheel. All valves of cast iron body construction shall be provided with an indicator to show the open and shut position.

FWP4.1.070.7  LOCATION
All valves shall be located at convenient positions of operation from the floor.

FWP4.1.080.7  CONSTRUCTION
Valves shall be constructed to the following minimum specification; better or equivalent materials may be offered for Approval:

1. Specification A in FWP4.1.090:
   a. For nominal sizes up to and including 65 mm:
      i. Body, bonnet and disc
         Bronze to BS EN 1982 CuSn5Zn5Pb5 or CB491K or CC491K;
      ii. Stem
         Brass to high tensile brass to BS EN 12163.
   b. For nominal sizes above 65 mm:
      i. Body and bonnet
         Grey cast iron to BS EN 1561 EN-GJL-250, or spheroidal graphite cast iron (ductile iron) to BS EN 1563 EN-GJS-400-15;
      ii. Disc or Seat
         - Solid or trimmed with bronze to BS EN 1982 CuSn5Zn5Pb5 or CB491K or CC491K; or
         - Resilient material to BS EN 681-1, Type WA, Hardness Category “70” with nominal thickness of minimum 1.5mm on the non-seating areas and 4.0mm on the seating areas, and in case for fire services and fresh water application, showing compliance with full tests of effect on water quality to BS 6920.
      iii. Stem
         Brass to high tensile brass or leaded brass to BS EN 12163, or stainless steel to BS EN 10088-3 Number 1.4301, 1.4401, 1.4006, 1.4005, 1.4021 or 1.4057.

2. Specification B in FWP4.1.090:
   a. For nominal sizes up to and including 65mm
      i. Valve components:
         - UPVC;
         - Ball center-pivoted, smooth and spherical with a circular orifice, and seated on resilient seating suitable for tight shut off;
         - Stem one piece with O-ring made of Ethylene Propylene Diene Monomer (EPDM) for positive sealing of the body.
      ii. Valve operation:
- By wrench turned in a clockwise direction to close when facing the wrench;
- At fully open position of valve, wrench to be mounted parallel to the flow of passage through the ball;
- Wrench to fully close valve at a quarter turn;
- Provide suitable stops for both fully open and fully closed positions of valve.

iii Valve end connections and pressure standards:
- Socket or union suitable for directly connecting the pipe to which it is installed;
- Testing method to BS 1010-2.

b. For nominal sizes above 65 mm:
   i. Body and bonnet
      Grey cast iron to BS EN 1561 EN-GJL-250, or spheroidal graphite cast iron (ductile iron) to BS EN 1563 EN-GJS-400-15;
   ii. Disc or Seat
      - Solid or trimmed with zinc free bronze to BS EN 1982 CuSn10 or trimmed with austenitic chromium nickel stainless steel or austenitic chromium nickel molybdenum stainless steel to BS EN 10283 Number 1.4308 or 1.4408; or
      - Resilient material to BS EN 681-1, Type WA, Hardness Category "70" with nominal thickness of minimum 1.5mm on the non-seating areas and 4.0mm on the seating areas.
   iii. Stem
      Stainless steel to BS EN 10088-3 Number 1.4301 or 1.4401 or 1.4057.

FWP4.1.100.7 COATING FOR CAST IRON PARTS OF VALVES
1. Cast iron parts of all valves shall be coated with an epoxy based material both on internal and external surfaces. The following minimum thickness of epoxy coating shall apply:

<table>
<thead>
<tr>
<th>Electrostatically Fusion Powder Coated (μm)</th>
<th>Airless Sprayed Application (μm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flat and Pressurised Parts</td>
<td>250</td>

<tr>
<td>Convex Outer Edges</td>
<td>150</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----</td>
</tr>
</tbody>
</table>

2. The coating for use in fresh potable water shall comply with the requirement laid down in BS 6920 and be to the satisfaction of the Water Authority.
FWP4.2  GATE AND GLOBE VALVES

FWP4.2.010.7  TYPE
1. Gate valves shall be of the full way solid or split wedge disc type and globe valves shall be of the straight globe type;
2. Gate valves shall be handwheel operated with rising or non-rising stem;
3. Globe valves shall be handwheel operated with rising stem.

FWP4.2.020.7  DESIGN AND CONSTRUCTION
1. The valve body shall be robust and capable of withstanding hard wear;
2. For valves of bronze body construction, the bonnet shall be of the screwed type with ample threads to ensure positive sealing to the body;
3. For valves of grey cast iron body and spheroidal graphite cast iron (ductile iron) construction, the body and bonnet shall be bolted together and the disc shall be guided;
4. The gland shall be fitted with non-asbestos packing and shall be bolted for grey cast iron and spheroidal graphite cast iron (ductile iron) valves.

FWP4.2.030.7  END CONNECTIONS
1. All copper alloy valves shall be of the screwed female end connection and all cast iron valves shall be of the flanged end connections;
2. Threads in screwed end connection shall comply with BS 21 in conjunction with BS EN 10226-1 and flanges of flanged end connection shall comply with BS EN 1092-2 and their bolts and nuts shall be complied to BS EN 1515-1.
FWP4.3 BUTTERFLY VALVES

FWP4.3.010.7 TYPE
Butterfly valves shall be of the wafer type or grooved end type to BS EN 593 with resilient seat suitable for tight shut-off purpose and shall be used for fire services installation only.

FWP4.3.020.7 DESIGN AND CONSTRUCTION
1. Disc shall be concentric, rounded and hand-polished;
2. Shaft shall be one-piece throughout;
3. Unless otherwise specified, valves shall be operated by handwheel or wrench.

FWP4.3.030.7 END CONNECTIONS
The wafer body ends shall be capable of matching connecting flanges complying with the requirements of BS EN 1092-1, 2 and 3.
FWP4.4  NON-RETURN VALVES

FWP4.4.010.7  TYPE
1. Unless otherwise specified, non-return valves shall be of the hinged swing or recoil type for horizontal installation and spring type shall be of globe or wafer type suitable for both vertical and horizontal installations;
2. When the valve is installed vertically, the flow shall be in an upward direction;
3. When installed at the pump discharge with a water head exceeding 15 m, non-return valves shall be of the recoil or spring type to ensure silent shut-off operation;
4. Notwithstanding the requirements of clause FWP4.1.080, recoil or spring type check valve of cast iron or spheroidal graphite cast iron (ductile iron) body construction shall be acceptable for nominal size of 65mm or below.

FWP4.4.020.7  DESIGN AND CONSTRUCTION
1. Hinged swing type:
   a. The valve body shall be robust and capable of withstanding hard wear;
   b. Bronze swing non-return valves shall have screwed type cap and cast iron swing non-return valves shall have the cap and body bolted together to ensure a strong, tight closure;
   c. Hinge pins shall be of stainless steel;
   d. The valves shall be designed to close before reversal of flow starts.
2. Recoil type non-return valves shall have a flow area not less than the cross-sectional area of the connected pipework and shall be non-slam in operation;
3. Spring type:
   a. The valve body shall be robust and capable of withstanding hard wear;
   b. Springs shall be of stainless steel;
   c. The valves shall have a flow area not less than the cross-sectional area of the connected pipework and shall be non-slam in operation;
   d. The valves shall be designed to close before reversal of flow starts.

FWP4.4.030.7  END CONNECTIONS
1. End connections of non-return valves shall be as FWP4.2.030;
2. Wafer type spring non-return valves will be acceptable, provided the body ends are capable of matching connecting flanges complying with the requirements of BS EN 1092-1, 2 and 3.
FPW4.5  BALL FLOAT VALVES

FPW4.5.010.7  GENERAL
1. Unless otherwise specified, ball float valves shall have a working pressure of not less than 10 bar and be tested to 16 bar on the body;
2. Ball float valves of all sizes shall be accepted for fire services systems only;
3. For installations other than fire services system, only ball float valves of size less than 65mm shall be accepted.

FPW4.5.020.7  TYPE
Ball float valves shall be of the slow closing type, unless otherwise specified.

FPW4.5.030.7  DESIGN AND CONSTRUCTION
1. General:
   a. The valve body shall be robust and shaped to give a good flow pattern;
   b. The valve piston shall close in the direction of flow such that the pressure in the main will tend to keep the valve closed and that the piston seal is afforded protection from the flow by the piston;
   c. All internal parts shall be easily removable for maintenance with the face and piston seals easily replaced;
2. Fresh water and rainwater application: cast iron body with gunmetal piston, seat and guide;
3. Flush water application: cast iron body with zinc free bronze trimmed piston, seat and guide;
4. For nominal sizes below 65mm: bronze construction valves shall be accepted.

FPW4.5.040.7  BALL FLOATS
Ball floats shall be spherical or cylindrical, comply with BS 1968 and be constructed of tinned copper for fresh water application and of neoprene coated copper or stainless steel for flush water application.

FPW4.5.050.7  LEVER ARMS
Lever arms for flush water application shall be of stainless steel and of direct mechanical linkage type.

FPW4.5.060.7  BALL FLOAT VALVES FOR FLUSHING TANKS
Be of diaphragm type, plastic body to BS 1212-3 with rubber or plastic diaphragm, unless otherwise approved by the Contract Manager and be suitable for high, medium or low pressure as required. Be suitably coated to prevent corrosion on metal parts. Submit valve sample for Approval prior to installation.
FWP4.6 PRESSURE REDUCING VALVES (PILOT TYPE)

FWP4.6.010.7 TYPE
The pressure reducing valve shall be hydraulically operated, pilot-controlled type. The whole valve shall be assembled and tested by the manufacturer.

FWP4.6.020.7 OPERATION AND PERFORMANCE
1. The operating range shall be suitable for the particular application;
2. The valve shall maintain a constant reduced downstream pressure regardless of changes in upstream pressure or flow rates;
3. The pilot control system shall be provided with a strainer. The valve shall be flanged-end connection with flange to PN16. The main valve and its pilot control system shall contain no packing glands or stuffing boxes;
4. The valve shall reduce a higher inlet pressure to a steady downstream pressure regardless of fluctuations in flow rate and/or varying inlet pressure. The downstream pressure shall be adjustable and could be reduced down to a pressure suitable for the application. The valve shall be selected in such way that no cavitation shall occur within the anticipated flow and pressure ranges;
5. The amount of pressure reduction against various flow rates and inlet pressures shall comply with the requirements as indicated on the Drawings;
6. Performance curves showing the above characteristics shall be submitted to the Contract Manager upon request.

FWP4.6.030.7 MATERIAL
Material composition of every component of the valve shall be suitable for fresh or flush water use as in accordance with its application, and shall have the minimum standard as specified below for its intended purposes. Equivalent materials may be offered for Approval.
1. Body & bonnet
   Cast iron to BS EN 1561 (EN-GJL-250) or ductile iron to BS EN 1563. The body of the valve shall be coated with an epoxy based material both on internal and external surfaces.
2. Disc
   a. Solid or trimmed with bronze to BS EN 1982 (CuSn5 Zn 5Pb5) or ductile iron to BS EN 1563 for fresh water use;
   b. Solid or trimmed with zinc free bronze to BS EN 1982 (CuSn10) or trimmed with austenitic chromium nickel stainless steel or austenitic chromium nickel molybdenum stainless steel to BS EN 10283 or ductile iron to BS EN 1563 with the same coating of body for flush water use.
3. Seat
   a. Bronze trimmed as disc or stainless steel as disc for fresh water use;
   b. Zinc free bronze or stainless steel trimmed as disc for flush water use.
4. Stem
   a. High tensile brass or leaded brass to BS EN 12163 or 13% chromium stainless steel to BS EN 10088-3 for fresh water use;
b. Austemic chromium nickel stainless steel or austenitic chromium nickel molybdenum stainless steel to BS EN 10088-3 for flush water.

FWP4.6.040.7 PRESSURE

1. Each valve shall be hydraulic tested at 1.5 times the nominal pressure of the valve for a period of not less than 1 minute at the factory;

2. The valve shall be suitable for both the working and test pressure of the piping system in which they are installed. Unless otherwise specified or Approved, it shall have a working pressure of not less than 16 bar.

FWP4.6.050.7 CERTIFICATION

The valve shall be of the type acceptable to the Water Authority for fresh or flush water use as in accordance with its application. Type test certificate/report from independent and reputable laboratories for the verification of the hydraulic pressure requirements and material used shall be produced upon request.
**FWP4.8** MODULATING FLOAT VALVE AT FRESH AND FLUSH WATER SUMP TANK

**FWP4.8.010.7** GENERAL

1. The modulating float valve shall be hydraulically operated, pilot-control and of diaphragm. The whole valve shall be assembled and tested by the manufacturer;

2. The pilot control system shall be provided with a strainer. The valve shall be flanged-end connection with flange to BS EN 1092 PN16. The main valve and its pilot control system shall contain no packing glands or stuffing boxes. The ball float shall be spherical and comply with BS 1968. Lever arm /float connecting rod shall be of direct mechanical linkage type;

3. The valve shall be operated to modulate water flow into the tank in such way as to maintain predetermined water tank level within narrow limits. The valve shall be installed such that there is an air gap between the float and the pilot valve.

**FWP4.8.020.7** MATERIAL

Material composition of every component of the valve shall be suitable for fresh or flush water use as in accordance with its application, and shall have the minimum standard as specified below for its intended purposes. Equivalent materials may be offered for Approval;

1. Body & bonnet:
   
   Cast iron to BS EN 1561 (EN-GJL-250) or ductile iron to BS EN 1563. The body of the valve shall be coated with an epoxy based material both on internal and external surfaces;

2. Disc:
   
   a. Solid or trimmed with bronze to BS EN 1982 (CuSn5Zn5Pb5) or ductile iron to BS EN 1563 for fresh water use;
   
   b. Solid or trimmed with zinc free bronze to BS EN 1982 (CuSn10) or trimmed with austenitic chromium nickel stainless steel or austenitic chromium nickel molybdenum stainless steel to BS EN 10283 or ductile iron to BS EN 1563 with the same coating of body for flush water use.

3. Seat:
   
   a. Bronze or stainless steel trimmed as disc for fresh water use;
   
   b. Zinc free bronze or stainless steel trimmed as disc for flush water use.

4. Stem:
   
   a. High tensile brass or leaded brass to BS EN 12163 or 13% chromium stainless steel to BS EN 10088-3 for fresh water use;
   
   b. Austenitic chromium nickel stainless steel or austenitic chromium nickel molybdenum stainless steel to BS EN 10088-3 for flush water use.

5. Ball float:
   
   a. Spherical or cylindrical and comply with BS 1968;
   
   b. Constructed of tinned copper or stainless steel for fresh water application and of neoprene coated copper or stainless steel for flush water application.

6. Lever arm/float connecting rod for flush water application:

   Stainless steel.
FWP4.8.030.7 PRESSURE
The valve shall be suitable for both the working and test pressure of the piping system in which they are installed. Unless otherwise specified or Approved, it shall have a working pressure of not less than 16 bar.

FWP4.8.040.7 TEST CERTIFICATE
The valve shall be of the type acceptable to the Water Authority for fresh or flush water use as in accordance with its application. Type test certificate/report from an independent and reputable laboratory confirming that the valve has been tested conforming to this specification shall be produced upon request.
FWP4.9  BALL VALVES

FWP4.9.010.7  TYPE

Unless otherwise specified, the application of ball valves shall only be used for hose reel control valve in fire services installation and pipeline drain cock for pumpset, pressure switch and pressure vessel in water pump installation. Ball valves shall be of spherical bore with PTFE seats and directly operated by a lever. Lever shall be so mounted that it is parallel to the valve axis when the valve is in the fully open position. When the valve is in the fully closed position, the lever shall be at 90° to the valve axis.

FWP4.9.020.7  DESIGN AND CONSTRUCTION

1. Valves shall be robust and capable of withstanding hard wear;
2. Valves shall be constructed to the following minimum specification:
   a. Body and stem
      Brass to BS EN 12165 (CuZn40Pb2) with or without nickel/chromium plated,
   b. Seat bore
      Carbon steel to BS ISO 7121 or brass to BS EN 12165 (CuZn40Pb2);
   c. Lever handle
      Carbon steel or zinc plated steel with red plastic sleeve and open/close operating direction marking.
3. The lever retaining nut or screw of ball valves shall be permanently sealed with industrial type heavy duty threadlocking adhesive/sealant;
4. Valves shall have a working pressure of not less than 20 bar. The test pressures of valve body and seat shall be 1.5 and 1.1 times the maximum permissible working pressure respectively.

FWP4.9.030.7  END CONNECTIONS

1. Ball valves shall be of the screwed female end connection;
2. Threads in screwed end connection shall comply with BS 21 in conjunction with BS EN 10226-1.
FWP4.11 OTHER FITTINGS

FWP4.11.010.7 VORTEX INHIBITORS
Vortex inhibitors shall be LPC approved type with PN16 flanges and confirm to BS EN 12845. They shall be used for operation under positive head conditions.

FWP4.11.020.7 ORIFICE PLATES
1. Orifice plates for system balancing, pump churning water circuits, where applicable, shall be provided as required for proper commissioning of the systems. Wherever necessary to suit the pump performance in respect of system balance, orifice plates shall be provided even if they are not indicated on drawings;
2. Orifice plates shall be generally constructed and installed according to LPC Sprinkler Rules or other standards acceptable to FSD.
FWP4.12 SUBMERSIBLE BALL FLOAT VALVES

FWP4.12.010.7 DESIGN AND CONSTRUCTION

This valve is a non-modulating valve which controls the liquid level in tanks. This valve shall open fully when the liquid level reaches a preset low point and closes tight when the level reaches a preset high point.

FWP4.12.020.7 MAIN VALVE

The valve shall be hydraulically operated, single diaphragm-actuated, globe or angle pattern. The valve shall consist of three major components: the body with seat installed the cover with bearing installed, and the diaphragm assembly. The diaphragm assembly shall be the only moving part and shall form a sealed chamber in the upper portion of the valve, separating operating pressure from line pressure. Packing glands and/or stuffing boxes are not permitted and there shall be no pistons operating the main valve or pilot controls.

FWP4.12.030.7 MAIN VALVE BODY

1. No separate chambers shall be allowed between the main valve cover and body. Valve body and cover shall be bronze to BS EN 1982 CuSn5Zn5Pb5 of cast material. No fabrication or welding shall be used in the manufacturing process;

2. The valve shall contain a resilient, synthetic rubber disc and forming a tight seal against a single removable seat insert. The bronze disc guide shall be of the contoured type to permit smooth transition of flow and shall hold the disc firmly in place;

3. The diaphragm shall be nylon reinforced rubber assembly contains a non-magnetic 316 stainless steel stem, nut and spring of sufficient diameter to withstand high hydraulic pressures and shall be fully guided at both ends by a bearing in the valve cover and an integral bearing in the valve seat. The stem shall be drilled and tapped in the cover end to receive and affix such accessories as may be deemed necessary. The diaphragm assembly shall be the only moving part and shall form a sealed chamber in the upper portion of the valve, separating operating pressure from line pressure;

4. The flexible, non-wicking diaphragm shall consist of nylon fabric bonded with synthetic rubber compatible with the operating fluid. The centre hole for the main valve stem must be sealed. The diaphragm shall be fully supported in the valve body and cover by machined surfaces which support no less than one-half of the total surface area of the diaphragm in either the fully opened or fully closed position;

5. The main valve seat and the stem bearing in the valve cover shall be removable. The cover bearing and seat valves shall be threaded into the cover and body. The lower bearing of the valve stem shall be contained concentrically within the seat and shall be exposed to the flow on all sides to avoid deposits. To insure proper alignment of the valve stem, the valve body and cover shall be machined with a locating lip. Cover bearing, disc retainer, and seat shall be made of the same material. All necessary repairs and/or modifications other than replacement of the main valve body shall be possible without removing the valve from the pipeline.
FWP4.12.040.7 PILOT CONTROL SYSTEM

1. The valve pilot system shall contain a flow clean brass Y-strainer to BS EN 1982 with stainless steel screen to BS EN 10088-3. The strainer shall project into the flow stream. The eddies and current caused by this projection shall self clean the screen;

2. The float and float rod shall be stainless steel and float control shall be a rotary disc, plate-type pilot. The pilot shall direct supply pressure into the cover of the main valve to close it. Then vent the cover of the main valve to atmosphere to open the main valve;

3. The valve shall open wide when the float is at a low liquid level and close drip tight when the float is at a high liquid level. Once the pilot signals the main valve to open or to close, the valve shall travel through its entire stroke without additional movement of the pilot control.
FWP5   WATER TANKS

FWP5.3.020.7  RESPONSIBILITY OF SUB-CONTRACTOR ....................................................... 6
FWP5.3.030.7  VERIFICATION BY SUB-CONTRACTOR ......................................................... 6
FWP5.1  GENERAL

FWP5.1.010.7  COMPLIANCE WITH RULES/REGULATIONS

1. All fire services water tank installations including gravity tank/pump suction tank provided by the Sub-contractor shall comply with the LPC Sprinkler Rules;

2. All water tank installations provided by the Sub-contractor shall comply with the requirements of the Water Authority.
FWP5.2 PNEUMATIC PRESSURE VESSELS

FWP5.2.055.7 MILD STEEL PNEUMATIC PRESSURE VESSEL

1. The vessels shall be constructed of welded mild steel to BS EN 13831 or European Directive 97/23/EC or other approved standards. The internal mild steel surfaces of the vessels shall be coated at manufacturer's factory with a resin (such as epoxy resin) of anti-corrosion material suitable for use with potable water. The vessels shall be provided with appropriate certificate issued by an approved authority or laboratory to substantiate their suitability in potable water application;

2. The vessels shall be pre-charged with air or nitrogen at factory at a pressure suitable for the application. The pre-charged pressure shall be adjustable and charging port with non-return device shall be provided in each vessel;

3. Gas and water space shall be separated by a bladder made of rubber membrane, which must be acceptable to and acceptable to the Water Authority. There shall be no contact between the water and metal surface of the vessel;

4. The bladder shall be replaceable and made of rugged rubber membrane. Material of the membrane shall be flexible, non-porous, of resistance to acids and alkalis, non-toxic and free of impairing taste and odour;

5. Whereas for potable water use, rubber bladder shall be provided with type-tested certificate(s) issued by approved authority or laboratory acceptable to the Water Authority to substantiate its suitability in contact with potable water;

6. The vessel shall withstand a minimum working pressure according to system configuration and under no circumstances less than 10 bar. A manufacturer's test certificate for the test pressure of the vessel shall be submitted for Approval;

7. The vessels shall be provided with air bleed cock, pressure gauges and drain cock with drain pipe extension to the nearest drain point;

8. A test certificate for the test pressure of the pneumatic pressure vessel issued by the manufacturer shall be submitted to the Contract Manager's Approval;

9. An open-up inspection randomly chosen from one of the delivered vessels shall be carried out. If the opened-up vessel is found lack of internal coating of anti-corrosion material or any non-conformance, the Sub-contractor shall open up all delivered vessels for inspection with no additional charge. The conformed vessels shall be re-charged to a pressure suitable for the application. All non-conformed products shall be removed off site for replacement;

10. In addition to the Regular Monthly Visits as stipulated in FWP14.3.040, the Sub-contractor shall inspect every pneumatic pressure vessel bi-weekly to identify any sign of rupture of the internal bladder inside the vessel. The Sub-contractor is required to identify the tones of knocking at the upper and lower portions of the vessel and to check the pressure at the gas inlet point in order to ensure the health of the bladder.

FWP5.2.056.7 STAINLESS STEEL PNEUMATIC PRESSURE VESSEL

1. The construction of a welded stainless steel pneumatic pressure vessel shall be to BS EN 13831 or European Directive 97/23/EC or equivalent international standards. Body, flange, bolts and nuts shall be of AISI grade 304 stainless steel or better in corrosion resistivity. Whereas for salt water use, flange shall be of AISI grade 316 stainless steel;

2. The vessel shall be pre-charged with air or nitrogen at a pressure suitable for the application. The pre-charged pressure shall be adjustable. Gas charging port with non-return device shall be provided in each vessel;
3. Gas and water space shall be separated by a replaceable bag-type bladder. There shall be no contact between water and metal surface of the vessel;

4. The bladder shall be replaceable and made of rugged rubber membrane. Material of the membrane shall be flexible, non-porous, of resistant to acids and alkalis, non-toxic and free of impairing taste and odour;

5. Whereas for potable water use, rubber bladder shall be provided with type-tested certificate(s) issued by approved authority or laboratory acceptable to the Water Authority to substantiate its suitability in contact with potable water;

6. The vessel shall withstand a minimum working pressure according to system configuration and under no circumstances less than 8 bar. A manufacturer's test certificate for the test pressure of the vessel shall be submitted for Approval;

7. The vessel shall be provided with drain cock and drain pipe connected to the nearest drain point;

8. The Sub-contractor shall inspect every stainless steel pneumatic pressure vessel at the Regular Monthly Visits as stipulated in FWP14.3.040. The Sub-contractor is required to identify the tones of knocking at the upper and lower portions of the vessel and to check the pressure at the gas inlet point in order to ensure the health of the bladder.
FWP5.3  CONCRETE WATER TANKS

FWP5.3.010.7 RESPONSIBILITY OF MAIN CONTRACTOR
1. Water tanks forming part of the building construction, or of concrete, including overflow, drains and inlet piping shall be supplied and installed by the Main Contractor;
2. Puddle flanges at the water tank for inlet and outlet pipes shall be supplied and installed by the Main Contractor.

FWP5.3.020.7 RESPONSIBILITY OF SUB-CONTRACTOR
All other piping connections and valves shall be supplied and installed by the Sub-contractor as indicated on Drawings.

FWP5.3.030.7 VERIFICATION BY SUB-CONTRACTOR
The Sub-contractor shall check the construction drawings for concrete water tanks for fire service installations and water pump installations and verify their correctness for his installation purposes, or submit proposals for modification to the design, as necessary.
FWP6  PUMPSETS
FWP6.1 DESIGN AND SPECIFICATION

FWP6.1.010.7 COMPLIANCE WITH RULES/REGULATIONS
1. Pumps and pump installations for sprinkler systems shall comply with the detailed requirements of the LPC Sprinkler Rules;
2. Pumps and pump installations for hydrant/hosereel systems shall comply with Code of Practice for Minimum Fire Service Installations and Equipment published by Hong Kong Government and BS 5306: Part 1 wherever applicable.

FWP6.1.020.7 TYPE
1. The type of pump(s) required for any particular application is detailed in FWP2;
2. Only the type specified should be listed in the tender documents; alternative proposals may be submitted separately, together with a list of advantages for Approval;
3. All pumps shall be electric motor driven centrifugal pumps, unless otherwise specified.

FWP6.1.030.7 DUTY
1. The pump(s) shall be selected to suit the design requirements for capacity as indicated in FWP2 or Drawings;
2. The pump heads stated in FWP2 or Drawings are only for the reference of tendering purposes;
3. The Sub-contractor shall calculate the actual pump heads based upon the characteristics of the pipework systems including fittings, equipment and accessories and carry out such alterations as may be necessary to achieve the specified duty.

FWP6.1.040.7 PUMP CURVES
1. Predicted total Head/Quantity, required NPSH/Quantity, Efficiency/ Quantity, and Power Absorbed/Quantity Curves shall be supplied;
2. The curves shall commence at zero flow and be extended to show the performance at heads lower than the minimum head;
3. In general, the pump shall be selected to operate near its best efficiency point shown on the performance curves;
4. Unless otherwise specified, fresh and flush feed pumps selected to operate below the best efficiency point by a figure of 10% or more (in efficiency) will normally be unacceptable.

FWP6.1.050.7 MAXIMUM PUMP SPEED
1. Maximum speed of fresh and flush water pumps shall not exceed 25r/s;
2. Maximum speed of booster fresh water pumps shall not exceed 25r/s;
3. Maximum speed of fire services feed pumps shall not exceed 50r/s;
4. Unless otherwise specified, maximum pump speed shall not exceed 50r/s.
FWP6.2 CONSTRUCTION

GENERAL

1. All pump parts shall be constructed of materials suitable for the required working pressure, temperature and mechanical strength and also the liquid handled by the pump. The materials specified in this Section shall be of the minimum standard required. Better or equivalent materials may be offered for Approval (including alternative international/national standards);

2. Pump seals shall be mechanical seals for fresh water up-feed pumps, fire services water up-feed pumps, fresh water booster pumps, various fire services pumps as well as flush salt water up-feed pumps unless otherwise specified.

FRESH WATER/FIRE SERVICES PUMPS

1. Casing:
   Grey cast iron to BS EN 1561 EN-GJL-250, or JIS G5501FC250.

2. Impeller:
   a. Bronze casting to BS EN 1982 CuSn5Zn5Pb5, or CuSn10; or
   b. Bronze casting to JIS H5120-CAC406, JIS H5120-CAC502A; or
   c. Austenitic chromium nickel molybdenum stainless steel casting to BS 3100 grade 316, or BS EN 10283 grade 1.4408.

3. Diffuser (detachable):
   Grey cast iron to BS EN 1561 EN-GJL-250, or JIS G5501FC250.

4. Wearing ring:
   a. Grey cast iron to BS EN 1561 EN-GJL-250, or JIS G5501FC250; or
   b. Copper-tin alloy to BS EN 1982, or phosphor bronze to JIS H5120.

5. Shaft:
   Stainless steel to BS EN 10088-3 - 1.4301, or JIS SUS 304.

6. Sleeve:
   Stainless steel same as shaft or cast bronze.

7. Bearing bush (for vertical pump only):
   Tungsten carbide or silicon carbide.

8. Bearing for horizontal pump:
   Stainless steel.

9. Pump seals:
   Mechanical seal.

10. Other parts which may be in contact with water:
    Stainless steel or bronze.

11. Prior to the time of material submission for Approval, the equipment shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.
FWP6.2.025.7 FRESH WATER/RAINWATER IRRIGATION PUMPS

Unless otherwise specified, fresh water/rainwater irrigation pumps shall be of stamped stainless steel vertical multi-stage in-line type which shall comply with the following requirements:

1. Casing
   a. Casing shall be made of stainless steel of AISI grade 304 or better in corrosion resistivity, accurately machined and assembled with metal-to-metal joints;
   b. Suction and discharge ports shall be in line with one another.

2. Impellers and Diffusers
   a. Impellers and diffusers shall be made of stainless steel of AISI grade 304 or better in corrosion resistivity. They shall be welded to sufficient strength, mechanically balanced, and all water ways to be finished smooth;
   b. Each stage of the pump casing, diffusers and impellers shall be identical and interchangeable;
   c. Individual impeller lock nut with guides shall be of stainless steel.

3. Shaft, Bearing and Seal
   a. Shaft shall be made of stainless steel with water lubricant bearing bush at the suction casing;
   b. Bearings shall be made of ceramic, silicon carbide, and/or tungsten carbide where appropriate;
   c. Shaft seal shall be mechanical seal.

4. Motor Bracket, Mounting Foot, Tie Bolts and Nuts
   a. Motor bracket and mounting foot shall be made of cast iron coated with epoxy paint or of stainless steel;
   b. Tie bolts shall be made of high tensile steel with epoxy paint or of stainless steel;
   c. Nuts shall be made of stainless steel.

5. Pump Strength
   The pump shall be capable of withstanding a pressure of 1.5 times of the operating pressure or minimum 16 bar.

6. Reliability
   a. The pump shall be the product of a pump manufacturer who continuously manufactured similar type of products in the past 5 years;
   b. Prior to the time of material submission for Approval, the pump model shall have proven record of reliability in local application for a minimum continuous period of one year to the satisfaction of the Contract Manager.

7. For the pump with design flow rate larger than 6 l/s, the pump with construction and design as in FWP6.2.020 shall be also accepted.

FWP6.2.030.7 FLUSH WATER PUMPS

1. Casing:
   Stainless steel to BS 3100 grade 316 C16 or BS EN 10283 grade 1.4408, or JIS SCS14 or SCS14A.

2. Impeller:
   Stainless steel to BS 3100 grade 316 C16 or BS EN 10283 grade 1.4408, or JIS SCS14 or SCS14A.
3. Wearing ring:
   Stainless steel of grade 316.

4. Shaft:
   Stainless steel to BS EN10088-3 – 1.4401, or JIS SUS316.

5. Sleeve:
   Stainless steel of grade 316.

6. Diffuser (detachable):
   Stainless steel to BS 3100 grade 316 C16 or BS EN 10283 grade 1.4408, or JIS SCS14 or SCS14A.

7. Bearing for horizontal pump:
   Stainless Steel.

8. Bearing bush for vertical pump:
   Tungsten carbide or silicon carbide.

9. Pump seals:
   Mechanical Seal.

10. Parts which may be in contact with water:
    Stainless steel of grade 316.

11. No external painting is allowed for the pump body.

12. In-service records of stainless steel pumps shall be as specified in FWP6.8.010.

FWP6.2.035.7 JOCKEY PUMPS FOR FIRE SERVICE INSTALLATION

Unless otherwise specified, jockey pumps for fire service installation shall be constructed as per fresh water/fire service pumps as specified in FWP6.2.020, or as per fresh water booster pumps as specified in FWP6.2.025.

FWP6.2.040.7 SEWAGE/WASTE WATER/STORM WATER PUMPS

Sewage, waste water or storm water pumps shall be constructed of:

1. Casing
   Grey cast iron to BS EN 1561 EN-GJL-250 or JIS G5501FC250.

2. Impeller
   Grey cast iron to BS EN 1561 EN-GJL-250 or JIS G5501FC250.

3. Shaft
   a. Stainless steel to BS EN 10088-3 - 1.4301, or JIS SUS 304 for waste/storm water;
   b. Stainless steel to BS EN10088-3 - 1.4401, or JIS SUS316 for sewage.

FWP6.2.050.7 BORE WELL PUMPS

1. Bore well pumps for use with corrosive water shall be constructed of the same material specification as FWP6.2.030;

2. Bore well pumps for use with non-corrosive water shall be constructed of:
   a. Casing
      Grey cast iron to BS EN 1561EN-GJL-250, or JIS G5501FC250.
   b. Impeller
      Bronze to BS EN 1982 CuSn5Zn5Ph5, or JIS H5120-CAC406.
c. Shaft

Stainless steel to BS EN 10088-3 - 1.4301, or JIS SUS 304.
FWP6.3  PUMP TYPES

FWP6.3.010.7  HORIZONTAL SPLIT CASING PUMPS

1. Casing:
   a. The casing shall be of the volute type, of robust construction, split axially, accurately machined, with the suction and delivery connections mounting feet, bearing pedestals cast integrally in the lower half of the casing;
   b. The water passage ways shall be smooth, free from blow holes, sand pockets and other detrimental defects, to permit maximum efficiency;
   c. Means shall be provided to drain the casing;
   d. An air bleed cock at the upper most point of the casing shall also be provided;
   e. Flanges shall conform to BS EN 1092: HS PN16;
   f. The casing bolts shall be of corrosion resistant high strength steel.

2. Impeller:
   a. The impeller shall have sufficient strength at the boss to withstand all possible stresses that may be imposed by the drive;
   b. The impeller shall be machined to close limits, hand finished and balanced dynamically;
   c. The impeller is to be keyed to the shaft, and fixed in an axial position by corrosion resistant fixing nuts of the same material as the shaft, threaded opposite to rotation and secured by set screws or other means;
   d. Renewable guide rings are to be provided in the casing, keyed to prevent rotation by stainless steel pin;
   e. Wearing ring shall be straight type with close tolerance to permit minimum re-circulation.

3. Shaft:
   a. The shaft shall be of sufficient size and strength to withstand the impeller weight, the torque to be transmitted as well as the axial and radial load developed in operation;
   b. Shaft sleeves, if used, shall be keyed to prevent rotation and secured against axial movement.

4. Shaft Seal:
   a. Mechanical seal for pumps shall be provided as specified in FWP6.4.030.

FWP6.3.020.7  END SUCTION PUMPS

1. Casing:
   a. The casing shall be of the volute type and of robust construction;
   b. Suction and delivery flanges shall conform to BS EN 1092: HS PN16;
   c. Means shall be provided to bleed the air and drain the casing;
   d. The water passage ways shall be smooth, free from blow holes, sand pockets, and other detrimental defects to permit maximum efficiency;
   e. The casing bolts shall be of corrosion resistant high strength steel.

2. Impeller:
a. The impeller shall have sufficient strength to withstand all possible stress that may be imposed by the drive;

b. The impeller shall be of the shrouded type, dynamically balanced to ensure vibration free operation;

c. The impeller is to be keyed to the shaft, and fixed in an axial position by corrosion resistant fixing nuts of same material as the shaft, threaded opposite to rotation and secured by set screws or other means;

d. Renewable guide rings are to be provided in the casing, keyed to prevent rotation by stainless steel pin;

e. Wearing ring shall be straight type with close tolerance to permit minimum re-circulation.

3. Shaft:

a. The shaft shall be of sufficient size and strength to withstand the impeller weight, the torque to be transmitted as well as the axial and radial load developed in operation;

b. Shaft sleeves, if used, shall be keyed to prevent rotation and secured against axial movement.

4. Shaft Seal:

a. Mechanical seal for pumps shall be provided as specified in FWP6.4.030.

5. Close-coupled Pump:

For installation with motor rating not exceeding 2.2 kW, close-coupled pumps may be acceptable, subject to the Approval of the Contract Manager.

**FWP6.3.030.7 MULTI-STAGE PUMPS**

1. Casing:

a. Unless otherwise specified, multi-stage pumps shall be of the radially split casing type, with all casing parts kept together by external tie bolts and sealed against each other by gaskets or O-rings, suction and discharge flanges shall conform to BS EN 1092 PN16;

b. Wearing/split ring shall be provided between impeller, detachable diffuser, pump packing and pump casing;

c. Means shall be provided to bleed the air and drain the casing;

d. Pumps shall be vertically or horizontally mounted as specified in FWP2. For vertically mounted pump, the bearing bush shall be made of tungsten carbide or silicon carbide to minimise wear. Besides, stainless steel motor stool should be provided for vertically mounted stainless steel flush water pump.

2. Impeller:

a. The impellers shall have sufficient strength to withstand all possible stress that may be imposed by the drive;

b. The impellers shall be of the shrouded type, dynamically balanced using grinding machine to ensure vibration free operation;

c. The impellers shall be keyed to the shaft and fixed in an axial position by corrosion resistant fixing nuts of same material as the shaft, threaded opposite to rotation and secured by setscrews or other means.

3. Diffuser (detachable):

a. The diffuser should be the same material as casing with sufficient strength. It should be so designed to have even water passage to avoid turbulence;

b. Diffuser shall be detachable and prevented from rotation by an acceptable means;
c. A pin if so designed to withstand the diffuser from rotation shall be an integral part of the casing. Detachable pin fixed on the casing shall not be allowed.

4. Shaft:
   a. The shaft shall be of sufficient size and strength to withstand the impeller weight, the torque to be transmitted as well as the axial and radial load developed in operation;
   b. Shaft sleeves, if used, shall be keyed to prevent rotation and secured against axial movement.

5. Shaft seal:
   a. Mechanical seal for pumps shall be provided as specified in FWP6.4.030.

FWP6.3.040.7 SUBMERSIBLE SUMP PUMPS

1. Stage:
   Pump shall be of single stage centrifugal type.

2. Casing:
   a. The casing shall be of the volute type and robust construction;
   b. The water passage ways shall be smooth and free from blow holes and sand pockets;
   c. Casing bolts shall be of stainless steel.

3. Impeller:
   a. For sewage pumps, the impeller shall be of the non-clog type with minimum solid passage of 50 mm diameter, unless otherwise specified;
   b. For waste or storm water pumps, smaller solid passage impeller with suction strainer will be acceptable;
   c. The impeller shall be dynamically balanced for all hydraulic loads within the pumps operating range and shall be keyed to the shaft and secured in an axial position by corrosion resistant fixing nuts;
   d. Renewable wear rings shall be provided and shall be keyed to prevent rotation by stainless steel pin.

4. Shaft:
   a. The pump shall be of mono-block type with the impeller keyed to the motor shaft;
   b. The shaft shall be of sufficient size and strength to withstand the impeller weight, the torque to be transmitted as well as the axial and radial load developed in operation.

5. Shaft seal:
   a. Double mechanical seal lubricated by an oil chamber shall be provided;
   b. Lower seal faces shall be of tungsten carbide or other Approved hard metal;
   c. All components shall be of corrosion resistant materials with high quality stainless steel spring;
   d. Lower seal shall be protected from ingress of grits.

6. Bearing:
   a. The bearings shall be of the ball or roller type, oil or grease lubricated;
   b. Bearings shall have a minimum re-grease interval of 5000 hours.

7. Motor:
a. Motor shall be of the submersible type and conform to FWP11 of this Specification;
b. Built-in thermal protection to BS EN 60034-11 shall be provided for motor of rating exceeding 7.5 kW.

8. Cable:
a. The cable used inside sump shall be multi-core submersible cable and shall be of sufficient length without connections inside the sump;
b. Cable entry to the junction chamber of the motor shall be provided with strain relief clamp and seal gland.

9. Installation and accessories:
a. The pump shall be capable of being raised from or fixed back to the sump without the need to enter or drain the sump;
b. For installation with motor rating exceeding 2.0 kW, the pump shall be provided with slide rails, lifting chain and quick discharge connection;
c. For smaller installations, lifting chain and flexible hose-coupling connection will be acceptable.

10. Surface treatment:
All surfaces of pump and motor in contact with the fluid handled shall be treated with anti-corrosion primer or paint for additional protection.

FWP6.3.050.7 MULTI-STAGE SUBMERSIBLE PUMPS

1. Construction:
a. The pump and motor shall be of small diameter profile to suit the bore well size specified; arranged vertically with the discharge connection on top, followed by the pump, the suction port with strainer and the motor at the bottom;
b. The assembly is to be submerged below the lowest pumping level and suspended in the well by the discharge pipe;
c. Pump shall also be suitable for horizontal installation if specified in FWP2.

2. Casing:
a. Pump shall be made up of independent stage casing bowls, complete with diffuser vanes or inter-stage piece and sleeve bearing for the pump shaft and easily removable for servicing;
b. The water passage way shall be smooth to provide best efficiency.

3. Impeller:
a. Impeller shall be of axial, enclosed radial or mixed flow type, machined to close limit with smooth water passage and dynamically balanced;
b. The impellers shall be secured to the shaft by taper lock bushes or keys and fixed in the correct axial position by distance sleeve, shaft sleeves or the extended boss of the impeller, all keyed to prevent rotation;
c. Renewable guide rings shall be provided in the pump casing;
d. Guide rings shall be of straight type providing close radial running clearance.

4. Shaft and sleeve bearings:
a. Pump shaft shall be carried by sleeve bearings at both ends and intermediate stage positions, all lubricated by the fluid handled;
b. Downthrust shall be transmitted to and carried by the motor shaft, however, the pump shall be designed to carry momentary upthrust encountered under normal operation.
5. Motor:
   a. The submersible motor shall be a water-fitted squirrel cage induction motor and conform to FWP11;
   b. The motor shaft shall be connected to the pump shaft by a keyed sleeve coupling;
   c. A thrust bearing shall be located at the bottom end of the motor to absorb the axial thrust generated by the pump.

6. Cable:
   a. The cable inside the bore well shall be multi-core submersible cable and shall be of sufficient length without connections inside the well;
   b. The cable shall be secured to the discharge riser by corrosion resistant clips.

7. Accessories:
   a. Each pump shall be provided with a non-return valve immediately connected to the discharge of the pump;
   b. A pipe support clamp shall be provided at the top of the bore well for holding the discharge pipe and the pump.
FWP6.4 BEARINGS AND PACKINGS

FWP6.4.010.7 PUMP BEARINGS
1. All bearings shall be of types readily obtainable;
2. For horizontal mounted pumps, the bearings shall be of the sealed ball or roller type, oil or grease lubricated;
3. Means shall be provided to protect the bearing from ingress of dust and water;
4. Appropriate lubrication nipple/connections or oiler sump with drain plug shall be provided for maintenance purpose;
5. For fresh water pumps, the bearing housings shall be cast iron. For flush water and rainwater pumps, the bearing housing and cover shall be stainless steel to BS 3100 grade C16 or BS EN 10283 grade 1.4408, or JIS SCS14 or SCS14A. The bearing housing and covers shall be easily removable for service;
6. The bearing cover shall provide a suitable seal to contain grease/oil in the housing;
7. For vertical pumps, the bearing bush (thrust bearing) shall be made of tungsten carbide or silicon carbide.

FWP6.4.020.7 PUMP PACKING
1. All pump packing shall be in square plait braided construction and shall contain no asbestos. Sleeves shall be provided to prevent the packing rubbing against the shaft;
2. The braids shall not be liable to become loose or peel off throughout their life;
3. The packing shall be suitable for use in fresh water or flush water application;
4. Size of the packing shall be commensurate with the size of the pump;
5. The packing shall be made from any one of the following materials: aramid fibre, carbon yarn, PTFE or other non-asbestos fibres. It shall be impregnated with PTFE and/or heat resistant lubricants. Any coating that will lead to the particles being rubbed off is not acceptable;
6. The packing shall also satisfy the following requirements:
   a. Rated pH value: 5-9;
   b. Rated maximum operating speed: not less than 10 m/s;
   c. Rated maximum operating temperature: not less than 150°C.

FWP6.4.030.7 PUMP SEALS
1. For various fire services pumps and fresh water pumps, the materials of mechanical seal heads and seal seats, and the materials of seal faces, shall be suitable for conveying fresh water at a speed of 2900 rev/min for non-stop running up to 6 hours unless otherwise specified;
2. For flush water up-feed pumps, the materials of mechanical seal heads and seal seats, and the materials of seal faces, shall be suitable for conveying flush salt water at a speed of 2900 rev/min for non-stop running up to 6 hours unless otherwise specified;
3. For sewage and rainwater pumps, the materials of mechanical seal heads and seal seats, and the materials of seal faces, shall be suitable for conveying waster water at a speed of 2900 rev/min for non-stop running up to 6 hours unless otherwise specified.
FWP6.5  FITTINGS AND ACCESSORIES

FWP6.5.010.7  FITTINGS

Each pump shall be fitted with:
1. Valves: suction and discharge valves, strainer, and non-return valves as shown on the Drawings;
2. Cocks: suction and discharge gauge cocks of 10 mm BSP female thread;
3. Pressure gauges: pressure gauge as FWP11.6.060 complete with cock and coiled connector as sub-clause (2) above at the suction and discharge side of each surface mounted pump;
4. Gland drain where applicable: 25 mm or larger uPVC gland drain pipe which shall discharge to the nearest drain or waste pipe.

FWP6.5.020.7  COUPLINGS

1. Each pump, except "close-coupled" type, shall be fitted with a secure coupling and shaft guard. Mild steel coupling can be provided for stainless steel flush water pumps;
2. The coupling shall be of semi-flexible steel pin and rubber bush type, accurately aligned on site;
3. The Sub-contractor shall be required to demonstrate correct alignment prior to handover of the installation;
4. The couplings shall be totally enclosed by stainless steel see-through guard to prevent any direct contact of bodily parts.

FWP6.5.030.7  LUBRICATION FITTINGS

Each pump shall be fitted with appropriate lubrication fittings, where necessary.

FWP6.5.040.7  AIR BLEED COCKS

Each surface mounted pump shall be equipped with test and/or air bleed cocks of the high pressure type.

FWP6.5.050.7  LIFTING EYES

Vertical pumps of more than 200 kg in weight shall be provided with lifting eyes to facilitate maintenance and future replacement.

FWP6.5.060.7  IDENTIFICATION

A serial number for identification purpose should be indelibly marked or label fixed on the pump casing. An arrow indicating the normal direction of rotation shall be cast clearly on the pump casing or a brass arrow and plate engraved with the words "Direction of Rotation" shall be screwed to the pump casing near the coupling.

FWP6.5.070.7  MOTORS AND WIRING

Electrical motors and wiring shall comply with FWP11 and the relevant sections of the HKHA Electrical Installation Specification.
FWP6.6 INSTALLATION

FWP6.6.010.7 GENERAL
All pumps shall be installed as per manufacturers' recommendations and instructions and shall be carefully levelled and aligned by competent specialist before start-up.

FWP6.6.020.7 BASEPLATE
1. The pump and motor for all horizontal pumpset shall be mounted on a single baseplate constructed of stainless steel of grade 316; vertical pumpset shall be provided with integral base suitable for direct mounting onto the pump plinth;
2. The pump and motor of horizontal pumpset with motor rating exceeding 22 kW shall be secured with jack bolts or dowel pins as recommended by the motor manufacturer;
3. The baseplate shall be a stainless steel plate welded on a stainless steel channel base frame. The stainless steel plate shall not be deformed after welding;
4. The baseplate shall be sufficiently rigid and properly supported such that it will not deflect under the weight of the pump and motor. The pump set and baseplate shall be fixed in place by sufficient number of suitably sized anchor bolts cast or grouted in the concrete inertia block or pump base.

FWP6.6.030.7 VIBRATION ISOLATION
1. Pumpsets shall be provided with Approved vibration isolators to prevent the transmission of vibration to the building structure;
2. Vibration isolators shall be carefully selected and installed in accordance with manufacturers' recommendations and instructions;
3. For horizontal pumpsets, isolation cork will be acceptable for installations with motor rating up to and including 22 kW unless otherwise specified. For larger installations, spring isolators shall be provided;
4. For vertical pumpsets, isolation cork will be acceptable for all installations;
5. Isolation cork shall be in the form of cork panels installed under and around the whole concrete pump base. Cork panels shall be at least 50 mm thick and shall have a density suitable for the load they carry. Cork panels shall be entirely covered by waterproof paper prior to pouring of concrete for the pump base and after the pump base is formed, all exposed cork shall be sealed by mastic or bitumen;
6. Anti-vibration spring isolators shall have a rated deflection of not less than 38 mm unless otherwise specified. Each spring isolator shall consist of one or multiple steel helical coil springs, seated inside a robust cast iron or steel housing with an external-accessible adjustment bolt and lockout for levelling;
7. Spring isolators shall be laterally stable. Spring diameter shall be no less than 0.8 of the compressed height of the spring at rated load. Spring isolators shall have a minimum additional travel to solid equal to 25% of rated deflection. They shall have identification markings/colour codes for identification of rated load;
8. Spring isolators shall be integral with unadjustable neoprene sponge inserts between the projections of the upper and lower housing. Non-skid neoprene acoustical isolation pad of no less than 6 mm thick shall be properly bonded to the underside of the lower housing of the isolator;
9. Information as required in Clause 4.2 of BS 6414 shall be submitted for Approval;
10.
a. A fabricated steel framed reinforced concrete inertia base shall be provided to decrease the vibrational motion;
b. The inertia base shall have a minimum thickness of 150 mm and weight 1½ times that of the pump set;
c. Inertia bases for horizontal split casing pumps shall be large enough to provide support for suction and discharge bends rigidly connected to the pumps;
d. Each pump shall be connected to its pipework with Approved flexible connectors to prevent the transmission of vibration to the pipework;
e. Supports for piping between the pump and the flexible connectors shall be properly mounted whilst supports for piping after the flexible connectors shall be attached to structural members such as beams and columns in preference to floor slabs or walls and shall be provided with rubber or neoprene pads for vibration isolation.

11. The completed pump installation, when in operation, shall cause no noticeable or objectionable vibration transmission to any part of the building structure. In the event that undue vibration occurs, the Sub-contractor shall rectify the installation or replace the equipment as necessary at his own expenses to the satisfaction of the Contract Manager.
**FWP6.7 TESTING AND CERTIFICATION**

**FWP6.7.010.7 TEST**

Pumps shall be type-tested in accordance with the requirement of BS EN ISO 9906 or equivalent. Performance curves under tests shall be submitted for Approval.

**FWP6.7.015.7 PROVISION OF TEST PIECE FOR STAINLESS STEEL FLUSH WATER PUMP AND ATTENDANCE FOR INSPECTION AND TESTING**

1. A test piece, forming an integral part of the pump casing shall be provided for each stainless steel flush water pump. The size and shape of the test piece shall not be smaller than 25 mm diameter x 150 mm length. The test piece shall be suitable for conducting the following local tests:
   a. Tensile test;
   b. Test for the material composition.

2. The Sub-contractor shall provide assistance, instruments, machines, labour and other facilities necessary for cutting the test piece, open-up inspection and examining the quality of pump. The pump shall be randomly selected by the Contract Manager. The Sub-contractor shall arrange such inspection in his workshop or unless elsewhere Approved;

3. The expense of complying with the above requirements, including any transportation costs, tests etc. shall be borne by the Sub-contractor;

4. The Sub-contractor shall cut the test piece in the presence of the Contract Manager or his representatives and send it to a local designated laboratory for carrying out the material composition analysis and tensile testing;

5. The pumps shall be free from blow holes, sand pockets, cracks, welding, pitting, hammering marks, excessive machining / wearing and other detrimental defects;

6. If the selected pump fails either the tensile test or material composition test as mentioned in sub-clause (1) above or the open-up inspection, the entire batch of stainless steel flush water pumps shall be rejected. The Contract Manager or his representatives may at his discretion to call for further open-up inspection and material test on another pump as appropriate. The cost so arisen will be borne by the Sub-contractor;

7. For the rejected pumps, the Sub-contractor shall arrange free replacement of them in accordance with the Conditions of Contract, and no extension of time to the Contract period will be allowed.

**FWP6.7.020.7 PUMP CERTIFICATES**

1. Each pump shall be provided with a certificate issued and signed by the manufacturer. The certificate shall clearly record the pump model, serial number and the materials of the casing, shaft and impeller;

2. Each pump or each batch of pumps shall also be provided with a certificate on their place of manufacture. The certificate shall be issued by a recognized Chamber of Commerce of the place of manufacture concerned.
FWP6.8 DOCUMENTATION

FWP6.8.010.7 IN-SERVICE RECORDS FOR STAINLESS STEEL FLUSH WATER PUMPS

1. When instructed by the Contract Manager, the Sub-contractor shall submit full details and particular of in-service records established in local application for the pump offered to substantiate conformance with the Specification. Failure to submit full and complete details and particulars of in-service records or failure to allow sufficient time for site inspection may result in rejection of the pump offered;

2. The in-service records shall contain the following information:
   a. Place of manufacture of the materials and parts of the pump;
   b. Rated capacity of the pump, which shall not be less than 6 l/s and 70 m at 1450 rpm unless otherwise accepted by the Contract Manager;
   c. Period of continuous and satisfactory operation and maintenance which shall be at least six months prior to the time of tender submission; and
   d. Provision of a test piece for materials composition and tensile test and open-up inspection.

FWP6.8.020.7 WARRANTY FOR STAINLESS STEEL FLUSH WATER PUMPS

1. Each stainless steel pump shall be supplied with a certificate of warranty issued by its manufacturer guaranteeing to provide free replacement for defective parts, components or the pump as a whole against inferior materials, faulty design and/or workmanship for a period of five years commencing from the date of completion of the Section of the Works within the scope of which the pump is installed. Consumables items such as bearing, soft packing, wearing ring and sleeve are excluded from the warranty. The Sub-contractor shall submit the content and format of the letter of warranty for Approval before shipment;

2. Each pump shall also be supplied with a certificate issued by the manufacturer stating the chemical composition for the materials used for the pump casing, impeller, shaft and diffuser etc.;

3. Each pump shall be fixed with a metal nameplate showing the manufacturer’s name, serial number, pump head, flow rate, speed, rated power absorbed, material used and warranty expiry date. The Sub-contractor shall be responsible for collecting and punching the information on the nameplate;

4. The Sub-contractor shall also submit an undertaking issued by the local supplier of the pump guaranteeing to provide the following:
   a. Free labour and materials for replacing any parts, components or the pump as a whole found to be defective except consumables items; and
   b. Free on-site technical support during testing and commissioning and the 5-year warranty period.

 FWPP.1.160.7 CONTROLS ................................................................. 7
FWP7.1  SYSTEM EQUIPMENT

FWP7.1.010.7  GENERAL REQUIREMENT

1. The hydrant/hosereel system and the individual equipment installations shall comply with the Fire Services CoP, FSD Requirements and Circular Letter;
2. The Fire Service inlets, hydrant outlet valves, hosereels, related equipment fittings shall be approved by FSD;
3. Approval document/certificate issued by FSD shall be produced for inspection upon request;
4. The Fire Service inlets and hydrant outlets if not stamped with the British Standard Mark shall be accompanied with a valid letter of approval issued by the Water Authority;
5. Higher standards wherever required are described elsewhere in this Specification or on the Drawings.

FWP7.1.020.7  FIRE SERVICE INLETS AND HYDRANT OUTLETS

1. The Fire Service inlets and hydrant outlets shall conform with BS 5041: Part 1 and be of copper alloy construction except for the handwheel which shall be of cast iron or hard aluminium alloy;
2. The inlet and outlet fittings shall be supplied and manufactured to the quality of material, construction, and dimensions as detailed in the British Standard Specification listed:
   a. Globe & check valve of service rating 1000 kPa to BS 5154 or BS EN 12288;
   b. Male and female instantaneous terminals to BS 336;
   c. All fittings shall be tested to at least 2000 kPa.
3. Each hydrant outlet shall be tested at factory in accordance with manufacturer's quality assurance/control system. In particular, testing on the proper connection of hydrant outlet (female coupling) with male instantaneous coupling shall be carried out for each hydrant outlet to verify that the outlet connection is manufactured to BS 336. The dimensions of the male coupling used for the test shall comply with BS 336 which shall be verified by an independent and approved laboratory. The male coupling shall have means such as electroplated coating to detect unacceptable wearing due to its repeated use. Male coupling found to have signs of unacceptable wear shall not be used for testing. A water resistant and indelible label bearing the name or logo of the manufacturer and the signature of their quality controller shall be stuck on a conspicuous position on the body of hydrant outlet to denote the outlet which has passed the manufacturer's quality assurance/control system.

FWP7.1.030.7  FIRE SERVICE INLETS

Fire service inlets shall:
1. Be connected to the main riser and located as shown on the Drawings;
2. Be of twin type, comprising screw-down globe type stop valve with male screwed outlet of suitable bore and two horizontal male instantaneous inlet connections, complete with integral spring loaded non-return valves;
3. Have a separate non-return valve behind the inlets;
4. Have a metal plate with minimum 70 mm high marked "FIRE SERVICE INLET消防入水掣" or "SPRINKLER INLET 花灑入水掣" in RED letters in both English and Chinese characters using raised letterings, hung on each of inlet;
5. For intermediate booster pump systems only, a waterproof box comprising pump
start and stop push buttons; pump running indication light and alarm buzzer shall
be provided in the FSI cabinet for fire hydrant/hosereel system; (Details shall be
submitted for Approval prior to installation.);

6. Have an enclosure constructed by the Main Contractor.

FWP7.1.040.7 HYDRANT OUTLETS
Hydrant outlets shall:
1. Be single type;
2. Comprise screw-down globe type stop valve with male screwed inlet of suitable
bore and female instantaneous outlet;
3. Have the stop valve controlled by a handwheel to close in clockwise rotation
with the direction of open and close engraved on the wheel of the valve in both
English and Chinese characters;
4. Have outlet branches inclined 70 degrees from the centre line of the handwheel;
5. Have the coupling control located at the side of each outlet branch;
6. Have the name of the estate and the phase number together with the batch
number (e.g. SMP-5 for Sau Mau Ping Phase 5 batch 1), or the suitable
description of the contract, shall be indelibly marked on the body of the valve
but not on the handwheel for identification;
7. Be selected to carry out dimensional check and chemical composition test
against inferior materials and faulty workmanship as follows:
   a. A hydrant outlet from each batch delivered i.e. one per each delivery, shall
be randomly selected by the Contract Manager or his representative and then
sent to a local accredited laboratory designated by him for carrying out the
above checking and testing. The expense including any transportation cost,
checking and testing, etc. shall be borne by the Sub-contractor;
   b. If the selected hydrant outlet, fails either the dimensional check or chemical
composition test, the entire batch of the hydrant outlets shall be rejected.
The Contract Manager or his representative may at his discretion to call for
further checking and testing on another hydrant outlet if the manufacturer
can provide a satisfactory explanation of the deviations on the dimensional
check or chemical composition test. The cost so arisen will be borne by the
Sub-contractor;
   c. For the rejected batch of hydrant outlets, the Sub-contractor shall arrange
replacement of them free of charge to the Authority and no extension of time
to the Contract period will be allowed. The same batch of rejected hydrant
outlets cannot be re-submitted for use in all Authority's projects.

FWP7.1.050.7 VENTING AND DRAINING
All hydrant risers, shall be provided with automatic air relief valves of 25 mm size at
the highest points and drain valves at the lowest points of the systems.

FWP7.1.060.7 EARTHING OF RISING MAINS
Rising mains shall be effectively electrically earthed and joints, which are not
provided with electrical continuity, shall be bonded. Earthing and bonding shall be
in accordance with the Electrical CoP.
FWP7.1.070.7 PRESSURE REDUCING HYDRANT OUTLETS

1. Where pressure reducing valves are indicated for use in conjunction with hydrant outlets ("Parity" valves) they shall be incorporated in the hydrant outlet unit, shall be of the type controlled by the hydrant valve and have a relief connection to drain not smaller than 40 mm. Parity valves shall be installed as shown on the Drawings and on all hydrant outlets where the static or running pressure exceeds 850 kPa. Material of parity valve body shall be same as those of hydrant outlets;

2. Alternatively, the pressure reducing hydrant outlet can be in the form of self-contained type without the use of the parity valve and drain pipe. It shall be capable to reduce the running pressure and satisfy the flow test requirements. The pressure reducing mechanism of the valve shall be located at down stream of the valve seat. Pressure reduction shall be achieved by means of hydraulic pressure balancing with metal diaphragm. The 100% effectiveness pressure reducing performance shall be maintained at all times of operation.

FWP7.1.080.7 HOSEREELS

1. Hosereels shall be type-tested to BS EN671-1 or other recognized standard(s) and with FSD acceptance letter.

2. A hosereel shall be:
   a. of fixed or swinging type to suit site installation conditions or as indicated on the Drawings;
   b. drip free for the entire assembly;
   c. with drum to be constructed of diecast light alloy, or spindle of rigid construction with equivalent robust material(s), hydraulically balanced, free from denting and twisting, and finished red colour in enamel or epoxy powder coated;
   d. with a device to prevent overrun of the hose and a glandless centre seal at the hub and shaft;
   e. with permanently and firmly connected reinforced rubber or PVC hose tubing of 30 m in length and 19 mm in internal bore to be capable of withstanding a bursting pressure of not less than 2700 kPa and connected to hose reel shut-off nozzle as specified in FWP7.1.100;
   f. unless otherwise specified, with two-way ball valve as hose reel control valve, supported with WSD acceptance letter;
   g. with hose guide complete with nylon or similar runners adjacent to fixed type hose reel to enable the hose to be run out in any direction as required;
   h. with wall-mounting bracket to be capable of supporting the whole weight of the hose reel and tubing for the fixed type hose reel;
   i. with support brackets and swinging arm to enable the whole hose reel assembly to be swung to 180° in a horizontal plan for the swinging type hose reel;
   j. with two nos. of 30 mm wide white ring marking of completed circumference with durable paint indelibly marked on hose tubing, making the first marking at the connection point of the hose tightened to the hose reel drum/spindle and the second marking at the required minimum length of the hose, i.e. if the farthest point of the hose reel protected area is 24 m, the second marking shall be at 24 m measured from that of the first marking;
   k. with an operation instruction notice affixed to the wall in a prominent position adjacent to the hose reel or affixed on the outer surface of the hose reel door. If the hose reel is located in a recess to which a door is fitted, such notice shall be affixed immediately below the words 'FIRE HOSE REEL 消防喉轆' on the outer surface of the door. The operation instruction notice shall be submitted for Approval prior to installation.
3. The Sub-contractor shall coordinate with the Main Contractor to position a metal/plastic striker and a glass fronted box for housing the hose reel shut-off nozzle so that no undue obstruction will be imposed to the free use of the hose reel. The glass fronted box and the striker shall be supplied and installed by the Main Contractor.

**FWP7.1.100.7  PLASTIC HOSEREEL SHUT-OFF NOZZLE**

1. Hosereel nozzle shall have a 4.5 mm orifice and be fitted with a lever-operated two-way valve to open or shut off the jet. The valve shall not be spring-loaded;

2. The nozzle shall be constructed of PVC or high quality ABS plastics in red colour or other materials as approved by the Contract Manager. The surface of the nozzle shall be smooth;

3. The nozzle shall be coupled to the F.S. hose by at least four holding threads and further secured by means of a worm-drive clip or other devices as approved by the Contract Manager;

4. The nozzle shall be indelibly marked with the manufacturer's name or trademark for identification purpose;

5. Under the operating condition as specified in the Fire Services CoP issued by FSD, the nozzle shall be capable of delivering water in the form of a water jet with flow rate not less than 24 litre/min. and the range of the jet not less than 6 metres as in accordance with BS EN 671-1;

6. The nozzle shall be tested according to the following procedures:
   a. The nozzle is connected to a 19 mm diameter (internal bore) F.S. hose and secured by means of a worm-drive clip;
   b. Water is supplied to the nozzle with 8.5 bar pressure at inlet of the nozzle;
   c. Fully open the nozzle cock by hand for 5 second and then fully close the nozzle cock by hand for 5 second;
   d. Repeat the cycle of open/close the nozzle cock in item (6)(c) above for 500 times.

7. During the test specified in sub-clause (6) above, there shall not be any sign of water leakage, crack or damage in any part of the nozzle assembly, including connection to the F.S. hose;

8. The nozzle shall be approved by FSD. Type test reports/certificates from an independent and reputable laboratory for verification of compliance with the test requirement in sub-clauses (6) and (7) above shall be produced upon request.

**FWP7.1.110.7  OPERATION INSTRUCTION AND WARNING NOTICE FOR HOSEREEL**

1. The notice shall be clearly marked with the following standard wording in English and Chinese characters of at least 5 mm high in red lettering on white background. The wording of the Chinese characters shall follow Fire Services CoP and the Water Authority Circular Letter as below.

   **TO OPERATE FIRE HOSE REEL**

   使用消防喉轆

   (1) BREAK GLASS OF THE FIRE ALARM CALL POINT

   打爛火警鐘玻璃 (or)

   ACTUATE FIRE ALARM CALL POINT

   按動火警鐘掣

   (2) OPEN CONTROL VALVE BEFORE RUNNING OUT HOSE

   先開啟來水掣，再拉出膠喉
3. TURN ON WATER AT NOZZLE AND DIRECT JET AT BASE OF FIRE

將喉咀掣開啟，然後射向火之底部

(NOT SUITABLE FOR ELECTRICAL FIRES)

(不適用於電火)

USE OF WATER FROM FIRE SERVICES

FOR PURPOSES OTHER THAN FIRE

FIGHTING IS STRICTLY PROHIBITED

水務監督辦事處 Office of the Water Authority

2. The notice shall be made of 3 mm thick plastic material with engraved characters.

FWP7.1.120.7 CABINETS

1. Cabinets for the housing of fire service inlets, hydrant outlets, and hosereels, if specified, shall be provided by the Main Contractor;

2. The Sub-contractor shall furnish all necessary information to enable these cabinets to be designed and constructed including proposed dimensions for the cabinets and the dimensions, weights, etc. of the apparatus supplied by him;

3. Requirements for any special housings for electrical controls shall be included;

4. It should be noted that space may be required in hosereel cabinets for portable equipment, as indicated elsewhere;

5. Where hosereels are located in recesses to which doors are fitted, the doors (whether glazed or otherwise) shall be painted in red with the words "FIRE HOSE REEL 消防喉轆" prominent and easily identifiable from all lines of sight in the surrounding. The lettering of wording shall be of at least 50 mm high;

6. In the case of doors which can only be opened by pushing in first, they shall also be annotated "PUSH TO OPEN 推開";

7. Hosereel cabinets fitted with doors shall not be locked but shall be easily identified and opened in time of emergency.

FWP7.1.130.7 INSTALLATION MATERIALS

All installation materials, fixing bolts etc. for mounting the equipment except for the nozzle box and striker inside the cabinets or on walls as applicable shall be provided by the Sub-contractor.

FWP7.1.140.7 PIPEWORK INSTALLATION

The installation shall include all pipework and fittings fully installed as indicated on the drawings and as specified in Worksections FWP2 and FWP3 of this Specification.

FWP7.1.150.7 HYDRANT BOOSTER PUMPS, TANKS, ETC

Hydrant booster pumps, tanks, etc., where indicated, shall comply with the general requirements of Worksection FWP6 of this Specification.

FWP7.1.160.7 CONTROLS

Hydrant system controls, including control of booster pumps, shall be as detailed in Worksection FWP2 of this Specification.

FWP8.1 SYSTEM INSTALLATION

FWP8.1.010.7 STANDARDS
Sprinkler systems shall be installed in accordance with the latest edition of the following standards and with all amendments issued before tendering:
1. LPC Sprinkler Rules;
2. Fire Services CoP;
3. FSD Circular Letters.

FWP8.1.020.7 DEFINITION OF TERMS
For the definitions of terms used for sprinkler systems, reference should be made to the LPC Sprinkler Rules and Fire Services CoP.

FWP8.1.030.7 TYPES OF SYSTEMS
Types of Sprinkler systems are as defined in the LPC Sprinkler Rules and as Worksection FWP2 of this Specification.

FWP8.1.040.7 CLASSIFICATION OF FIRE HAZARD
LPC Sprinkler Rules define various classes of fire hazard according to the occupancy of the building to be protected. Reference should be made to this standard.

FWP8.1.050.7 CLASSIFICATION OF WATER SUPPLIES
Sprinkler systems are graded according to the number and type of water supplies available. Reference should be made to the LPC Sprinkler Rules.

FWP8.1.060.7 TYPE OF WATER
Unless otherwise indicated the sprinkler system shall be suitable for use with fresh water from the Water Authority.

FWP8.1.080.7 BRANCH CONNECTION TO WATER SUPPLY SYSTEM
Whenever a direct feed town mains, gravity tank or other supply systems are used to supply any sprinkler system, no branch connection for any other purpose, hosereels included, will be permitted.

FWP8.1.090.7 ANTI-POLLUTION VALVE FOR DIRECT CONNECTION TO TOWN MAINS
1. For sprinkler systems without water storage tanks and supplied from a direct connection to town mains, an anti-pollution valve to the Water Authority's Specification shall be fitted to the sprinkler installation at a point between the town mains connection and the fire service inlet;
2. The anti-pollution valve shall be installed in accordance with the relevant Circular Letter of FSD and the Water Authority requirements.

FWP8.1.100.7 SPRINKLERS
1. Sprinklers shall be approved by LPC or approved by similar widely recognised independent regulatory body acceptable to FSD. They shall not be altered in any respect, nor have any type of ornamentation or coating applied after leaving the production factory, except the anti-corrosion treatment accepted by the LPC Sprinkler Rules;
2. Sprinklers shall be constructed with the appropriate characteristics, to suit each particular application. Each one may be defined by any of the following characteristics:
   a. Nominal size of orifice;
   b. Type of heat-operated element;
   c. Operation temperature;
   d. Type of deflector.
3. Unless otherwise specified, sealed sprinklers shall be constructed with heat sensitive element;
4. Sprinklers installed on the false ceiling shall be of the flush pattern, pendant type, and be provided with an adjustable chromium plated metal ceiling masking plate to be installed flush with the false ceiling, with the yoke and heat sensitive element exposed below the false ceiling line.

FWP8.1.110.7 SPRINKLER GUARDS
In situations where sprinklers are liable to accidental or mechanical damage or where otherwise specified by FSD, sprinklers shall be protected by approved metal guards. Guards shall not be used in conjunction with ceiling type sprinklers.

FWP8.1.120.7 SPACING AND LOCATION OF SPRINKLERS
1. The Sub-contractor shall inform the Contract Manager immediately of any spacing or location of sprinklers which he knows will contravene the LPC Sprinkler Rules due to actual site conditions;
2. The Sub-contractor shall provide metal baffles of the correct size between sprinklers wherever required by the LPC Sprinkler Rules.

FWP8.1.130.7 SPARE SPRINKLERS
The Sub-Contractor shall provide a cabinet containing a minimum number of spare sprinklers as recommended by the LPC Sprinkler Rules or as required by Worksection FWP2 of this Specification. Sprinkler spanners shall be provided and kept in the painted steel cabinet.

FWP8.1.140.7 PIPEWORK INSTALLATION
1. Pipework installation for sprinkler systems shall be installed in accordance with the LPC Sprinkler Rules and, wherever applicable, with Worksections FWP3 and FWP4 of this Specification;
2. The Sub-contractor shall inform the Contract Manager immediately of any on-site situation which he knows will contravene the LPC Sprinkler Rules.

FWP8.1.150.7 PRESSURE GAUGES, VALVES, ALARM DEVICES
Pressure gauges, various types of valves and alarm devices shall be installed in accordance with the LPC Sprinkler Rules.

FWP8.1.160.7 CABINETS FOR CONTROL VALVE SETS AND FIRE SERVICE INLETS
1. Cabinets for housing the sprinkler control valve sets and fire service inlets will be provided by the Main Contractor. The Sub-contractor shall furnish all necessary dimensional information to enable these cabinets to be designed and constructed;
2. Construction of the Sprinkler Inlet shall be the same as "Fire Service Inlet" described in Worksection FWP7 of this Specification. Labelling and lettering shall be in accordance with Fire services CoP.
FWP8.1.170.7  PUMPS AND TANKS
Pump and tanks where applicable, shall comply with Worksections FWP5 and FWP6 of this Specification.

FWP8.1.180.7  CONTROLS
The control system, where applicable, shall comply with Worksection FWP10 of this Specification. All associated electrical wiring and installation shall comply with Worksection FWP11 of this Specification.

FWP8.1.190.7  NOTICES FOR SPRINKLER SYSTEM
All notices required by LPC Sprinkler Rules and/or Fire Services CoP shall be in both the English and Chinese languages.

FWP8.1.200.7  SPRINKLER SUBSIDIARY STOP VALVES MANAGEMENT SYSTEM
The Sub-contractor shall provide a sprinkler subsidiary stop valves (SSSV) management system including the followings:

1. Provide all necessary information of SSSV for each sprinkler system as required in the 'Log Book' provided and kept by the Estate Management of the employer after handover;

2. Each SSSV shall be provided with a pull-up seal security tag using steel wire-rope with pad lock and labelling with unique tag number and a warning label placed inside a durable and readable plastic bag;

3. Each SSSV shall have an identification label with estate code, block code, floor number and valve number assigned by the Estate Management for easy identification and traceability of records. For SSSV hidden inside false ceiling or covered up area, a label shall be posted at a prominent location to show the position of the hidden SSSV;

4. Each SSSV shall have a "Normal Open" weatherproof label attached to the valve body confirming the valve status;

5. A proper registry on the serial numbers of the security tag shall be kept and produced for inspection upon request;

6. The Sub-contractor shall carry out regular maintenance visits to ensure the system is in sound operating condition as described in FWP14; and

7. SSSV Management System shall include valves governing the sprinklers over the top of refuse chute and at ground floor refuse storage and material recovery chamber of the domestic blocks, not forming part of a sprinkler system.

FWP9.1 SYSTEM REQUIREMENTS

FWP9.1.010.7 GENERAL

1. Unless otherwise specified, gas extinguishing systems shall be of the total flooding type with a high pressure open-ended piping installation on the distribution side;

2. The automatic gas release mechanism shall be operated by means of fire detection units at the protected compartment or manually by a pull handle or push button as described below;

3. FM-200 shall be used for total flooding systems in normal occupied areas;

4. Where local application systems are specified they will normally use carbon dioxide gas as the extinguishing agent.

FWP9.1.020.7 FM-200 EXTINGUISHING SYSTEM

FM-200 system shall be designed and installed in accordance with UL Standard 1058, NFPA 2001 or BS ISO 14520 or other recognized established standards on Clean Agent Fire Extinguishing Systems acceptable to FSD, FSD requirements and Circular Letters.

FWP9.1.030.7 MATERIAL STANDARDS

Materials shall be to the appropriate British Standard and sized in standard metric dimensions. Where the installation is designed in accordance with NFPA codes/standards, the Sub-contractor shall show that the materials selected are in accordance with a British Standard not inferior to the standard recommended in the NFPA standard and that the metric sized materials are sized to give a performance of the system not inferior to the performance called for this Specification and the NFPA standard. The Sub-contractor shall also show that all components are compatible and that any variations in dimensions due to the use of metric sized components do not adversely affect the balance of the system.
FWP9.3  SYSTEM PERFORMANCE

FWP9.3.010.7  FM-200 TOTAL FLOODING SYSTEM
FM-200 total flooding system shall be designed to achieve an acceptable concentration in the protected compartment as stipulated in NFPA 2001 or any recognized system design manual from the manufacturer at room temperature. Discharge of gas shall be substantially completed within 10 seconds. Following discharge, the concentration of FM-200 shall develop throughout the protected compartment to achieve final extinguishment of fire within 60 seconds.

FWP9.3.020.7  RESPONSIBILITY
1. The enclosure to be protected and the position of the gas cylinders shall be as indicated on the Drawings. The layout of pipework and nozzles indicated on the Drawings is optional but if the Sub-contractor proposes any other layout he remains responsible for ensuring that the proposed layout is acceptable to the Contract Manager, that it will not obstruct any other services, and that necessary openings in the structure are permissible and are provided, by giving sufficient notice for them to be provided by the Main Contractor;

2. Notwithstanding that the Sub-contractor has demonstrated, by calculation, to the satisfaction of the Contract Manager, that the system will perform to the standard required, the Sub-contractor shall remain responsible for ensuring that under test the system does, in fact, perform in accordance with this Specifications.

FWP9.3.030.7  DESIGN CALCULATIONS
1. To justify the selection of components and pipe sizes for the system, the Sub-contractor shall provide with his tender either full mathematical calculations or computer model flow calculations. Where the computer programme does not show all calculation steps it will be necessary for the Sub-contractor to produce evidence that the computer programme produces a design that will perform in accordance with the Specification as indicated by Underwriters’ Laboratory listing or approved by any similar widely recognised independent regulatory body acceptable to the Contract Manager;

2.  
   a. The calculations shall be based on the equipment offered;
   b. Valves, syphon tubes, distribution valves as well as bends and junctions shall be represented in the calculations as equivalent lengths of pipe;
   c. The actual size and location of pipes and nozzles and the number of nozzles shall be designed on the basis of the calculated flow rates and terminal pressures required to ensure successful operation;
   d. The calculations or computer programme shall provide all the information necessary to complete the installation including the quantity of gas used to flood to the required concentration, the allowance for losses and the total quantity, the flow rate and start and end pressure of each section of pipe and the orifice size for each nozzle.

FWP9.3.040.7  COMPLETE WORKING SYSTEM
The Sub-contractor shall provide all the components necessary for full operation of the system in the automatic or manual mode regardless of whether or not such components are detailed on the Drawings or in this Specification.
FWP9.4  GAS STORAGE PRESSURE

FWP9.4.010.7  STORAGE
All the gas extinguishing agents shall be stored in rechargeable cylinders to hold the pressurized agents in liquid form at ambient temperature.

FWP9.4.020.7  FM-200
FM-200 cylinders shall be charged in accordance with NFPA 2001 or any recognized system design manual from the manufacturer acceptable to FSD.

FWP9.4.030.7  DESIGN
Gas cylinders, distribution pipework, valves, nozzles and fittings shall be manufactured to standards designed to withstand the maximum pressure of stored agent allowing for variations in ambient temperature.
FWP9.5  GAS CYLINDERS

FWP9.5.010.7  FM-200 CYLINDERS
1. FM-200 cylinders shall be of high-strength alloy steel construction that complies with the Department of Transportation regulation for refillable pressure vessels and conform to NFPA 2001;
2. The maximum storage gaseous agent at each gas cylinder shall be not more than 120kg. Each cylinder shall have a permanent nameplate indicates the agent, tare and gross weights, and super-pressurization level of the cylinder.

FWP9.5.020.7  CYLINDER MOUNTING
Cylinders shall be securely mounted in a frame bolted to the wall and arranged so that external parts may be readily inspected and corrosion cannot occur.

FWP9.5.030.7  CYLINDER OVER PRESSURE PROTECTION
Where pressure–operated cylinder valves are used, means shall be provided to vent any cylinder gas leakage. The means of pressure venting shall be arranged so as not to prevent reliable operation of the cylinder valve.

FWP9.5.040.7  CYLINDER ACCESSORIES
Each cylinder shall be complete with gas valve/actuator, pressure gauge, flexible hose, check valve and all other necessary accessories.

FWP9.5.050.7  CYLINDER CONTENTS MEASURING DEVICES
1. A device shall be provided for measuring the amount of liquid in the cylinder at any time;
2. This shall be done by a method which does not require the cylinder to be detached from the remainder of the plant;
3. If a weighing device of the type that requires suspension is proposed, means shall be provided above each cylinder for the attachment of the weighing device;
4. The contents of the cylinders may alternatively be checked by the use of a liquid level indicator of an Approved type.

FWP9.5.060.7  DISCHARGING FROM CYLINDERS
1. The liquid shall be discharged from the cylinder through a syphon tube;
2. The pressure of the liquid stored in the cylinder shall be such that freezing cannot take place at the lowest possible ambient temperature;
3. Means shall be provided to prevent gas discharging into empty containers and to prevent loss if the gas is released when any of the cylinders is disconnected.

FWP9.5.070.7  PAINTING CYLINDERS
Gas cylinders shall be painted signal red as specified in BS 381C in accordance with the requirements of BS 5252. The type of extinguishing agent, the tare weight, gross weight and liquid level at 25°C shall be clearly painted on each cylinder with white paint.
FWP9.6  SYSTEM RELEASE OPERATION

FWP9.6.010.7  AUTOMATIC RELEASE MECHANISM

1. Fire detection in the protected area shall be by means of ionization chamber smoke detectors and heat detectors as detailed in FWP2. The detectors, of sufficient number and suitably positioned to give duplicate coverage of the whole of the protected area, shall be connected in zones so that smoke or heat generated in any part of the area will activate two zones. The fire detection control panel and the detectors shall be compatible and the fire detection system shall comply with FWP10;

2. Activation of a detector on one zone shall cause alarm bells to sound. Activation of detectors on two zones shall cause a siren or Klaxon horn to sound to warn that, if the system is in the automatic mode, the extinguishing agent is about to be released. These warnings will also be activated by operation of the manual release;

3. The gas extinguishing control panel shall control and monitor the release system. It will include an automatic/manual lock-off unit controlled by keyswitches at each entrance to the protected area. Any one keyswitch shall be capable of switching the automatic system on or off. The manual release mechanism will remain operative whether the automatic system is on or off. A time delay unit shall be provided which shall be adjustable and lockable in the range 15 to 30 seconds. Relays shall be provided, to shut down ventilation and air-conditioning, to close openings and to switch off equipment as necessary. These relays will operate immediately when two zones of the fire detection system are activated or when the manual release is operated. Release of the gas will follow after the preset time delay.

FWP9.6.020.7  MANUAL RELEASE MECHANISM

A manual release unit shall be provided in a suitable position outside each entrance to the protected compartment. The manual release unit shall consist of a pull handle or push button mounted in a box with "break glass" cover. The box shall be so designed that its glass front may be readily replaced and that its front cover can be opened with a key for the purpose of operating the switch without breaking the glass.

FWP9.6.030.7  EMERGENCY RELEASE MECHANISM

An emergency release handle with direct mechanism shall be provided in an accessible position at or near the gas cylinders. The emergency release shall require no power supply to operate and it shall be provided with a removable pin to prevent accidental release of gas. Provision shall be made for operation of the emergency release to activate the relays to cause simultaneous shutdown of ventilation, air-conditioning, equipment etc. and to sound the alarm.

FWP9.6.040.7  GAS RELEASE MECHANISM

1. The operation of the gas release mechanism shall require minimum power from an external electrical, pneumatic or mechanical source and shall preferably be operated by a falling weight device. No springs shall be used in any position where their failure or fracture would prevent the correct operation of the gas release mechanism or cause the inadvertent release of the gas;

2. All release devices and mechanisms shall be designed for the working conditions they will encounter and shall not readily be rendered inoperative or susceptible to accidental operation. They shall have proper protection from mechanical, chemical or other damage that would render them inoperative.
FWP9.7 PIPEWORK AND FITTINGS

FWP9.7.010.7 GENERAL

All pipework shall be non-combustible and able to withstand the expected pressures and temperatures without damage. Specification of materials and installation shall conform to the relevant British Standards for the respective gas extinguishing agent used.

FWP9.7.020.7 FM-200 SYSTEMS

Pipes for FM-200 system shall be as follows:

1. For system pressure not more than 25 bars:
   a. Up to and including 65 mm: Galvanized steel pipes conforming to BS EN 10255, heavy grade, butt welded;
   b. All other sizes: Carbon steel pipes conforming to BS EN 10216-1, seamless, schedule 40 or ASTM A53, seamless, grade A.

2. For system pressure more than 25 bars:
   a. Up to and including 100 mm: Carbon steel pipes conforming to BS EN 10216-1, seamless, schedule 80 or ASTM A53, seamless, grade B.

FWP9.7.030.7 PIPE FITTINGS AND FLANGES

Pipe fittings and flanges shall be as specified in the following relevant Standards for the particular gas extinguishing installations in accordance with the pipe size and pressure of the system. The following British Standards are relevant:

| BS 3799 | Forged steel pipe fittings, screwed and socket-welding for the petroleum industry. |
| BS EN 10253-2 | Butt-welding pipe fittings. Non alloy and ferritic alloy steels with specific inspection requirements. |

FWP9.7.040.7 PIPE JOINTING

1. All pipework and fittings shall be free of burrs, spelter and rust and shall be galvanized inside and out;
2. Screwed threads shall conform to the dimensions specified in BS 21;
3. Screwed joints shall be made with PTFE tape or Approved equivalent but chemically inert to the extinguishing agent used;
4. Compressed fibre gaskets free of asbestos shall be used for flange joints.

FWP9.7.050.7 PIPEWORK SUPPORTS

1. Pipework supports shall be arranged as near as possible to joints and changes of direction and each support shall take its share of the load. The maximum space between supports to take into the total mass of pipe and extinguishing agent shall be as tabulated in sub-clause (2) but additional supports shall be provided where there are extra loads such as valves;
2. Maximum space between supports:

<table>
<thead>
<tr>
<th>Pipe size (mm)</th>
<th>15</th>
<th>20</th>
<th>25</th>
<th>32</th>
<th>40</th>
<th>50</th>
<th>80</th>
<th>100</th>
</tr>
</thead>
</table>

**DISCHARGE NOZZLES**

1. Discharge nozzles shall be of robust construction and designed for use with the expected working pressure and temperature without deformation. The discharge orifices shall be made of corrosion resistant metal and have a permanent marking for identification and to show the equivalent single orifice diameter;

2. Gas discharge nozzles shall be provided to distribute the gaseous agents uniformly throughout the protected spaces, the nozzles shall be discharged in either 180° or 360° patterns, depending on location. The nozzles shall be permanently marked to identify the manufacturer as well as the type and size of the orifice. The flow characteristics, area coverage, height limits, and minimum pressure of discharge nozzles shall be in accordance with the manufacturer's listed limitations;

3. Gas discharge nozzles shall be certified by UL / FM and approved by FSD for use in clean agent gas flooding fire extinguishing system.

**FLEXIBLE HOSE CONNECTIONS**

Flexible hose connections shall be selected, inspected and tested only by a suitably trained engineer or technician and shall be designed for service at the pressures and temperatures involved.

**PRESSURE RELIEF VALVES**

1. To prevent entrapment in pipework, a suitable excess pressure relief valve shall be provided at any section of high pressure piping blocked by valves at both ends and shall operate at the following pressures:
   - 2 times the maximum system pressure

2. Valves shall be capable of being opened when subjected to the maximum operating pressure and shall be so equipped that they can be opened manually. Valves for FM200 system constantly under pressure shall be designed for maximum working pressure plus a 50% safety factor.

**MANIFOLDS**

Manifolds shall be tested for a duration of minimum 5 minutes at the manufacturer's works to the following minimum pressures:

- 2 times the maximum system pressure.

**EARTHING**

Pipework shall be earthed to prevent build up of electrostatic charge.

**PAINTING**

Pipework shall be painted signal red as specified and illustrated in BS 381C in accordance with the requirements of BS 5252. Brass fittings shall be left unpainted.
FWP9.8 SYSTEM PROTECTION

FWP9.8.010.7 SECURITY OF FIXING
The whole gas discharge system including cylinders, pipework and nozzles shall be securely fixed to the structure with saddles or brackets correctly spaced so that all components will remain in place when subjected to the pressures and forces produced during discharge. Fixings shall allow for movement due to thermal expansion.

FWP9.8.020.7 GUARDING
The system shall be guarded so that it shall be impossible to obstruct the operation of any moving parts.
FWP9.9  INDICATOR LIGHTS, WARNING NOTICES AND LABELS

FWP9.9.010.7  GAS STORAGE COMPARTMENTS AND PROTECTED COMPARTMENTS

1. All gas storage compartments and compartments protected by a gas extinguishing system shall have a warning notice fixed on each entrance door to the compartment;

2. Configuration, lettering, colour and size of the notice shall be in accordance with the requirement of FSD for the respective gas extinguishing system;

3. The notice shall be made of sheet metal plate not less than 1.6 mm thick.

FWP9.9.020.7  TOTAL FLOODING SYSTEM

For a total flooding system, protecting a normally occupied area, which is designed to operate automatically when unoccupied but to be in the manual mode when occupied, the following warning lights shall be installed together with explanatory/warning notices in English and Chinese. Such notices shall be clearly legible and painted or engraved on substantial durable material. Warning lights and notices for systems other than as described above (e.g. local application systems or systems designed to be in the automatic mode when the area is occupied), shall be equally informative and suitably substantial and shall be arranged and worded either as specified in FWP2 or as agreed with the Contract Manager:

1. Inside the protected area: a flashing red light to indicate gas release imminent with a notice which shall read:
   "WARNING - FM-200 gas release imminent. Leave the room at once."

2. Outside each entrance to the protected area:
   a. A green light to show that the system is on manual control with automatic control locked off, with a notice which shall read:
      "Safe to enter. FM-200 fire extinguishing system on manual control. When room vacated switch to automatic control."
   b. An amber light to show that the system is on automatic control, with a notice which shall read:
      "Not safe to enter. FM-200 fire extinguishing system on automatic control. Switch to manual control before entering."
   c. A red light to show that the system has operated, with a notice which shall read:
      "DANGER - Do not enter. FM-200 gas discharged."

3. The manual/automatic lock off key switches, the manual release units and the emergency release handle shall all be labelled in English and Chinese so that it is clear what their purpose is and how to operate them.

FWP9.9.030.7  SYSTEM ODORISERS

Odorisers, where specified in FWP2, shall be capable of automatically treating the gas after release from the cylinder and shall be of citrus odour type, so that a hazardous atmosphere can be recognised at once. Where odorisers are provided, a suitable notice to the effect that anyone detecting the citrus odour should leave the area immediately and report the occurrence to a responsible person shall be provided worded in English and Chinese.

FWP10.1 GENERAL

FWP10.1.010.7 COMPONENTS AND EQUIPMENT COMPATIBILITY

1. All the devices, components and equipment used in the system shall be of highest quality and suitable for humid tropical working conditions;

2. They shall be fully compatible with one another throughout the whole system;

3. Special attention should be drawn to the compatibility between automatic detectors and control equipment and the Sub-contractor shall supply information of the detectors and the required electrical interface with the control and indicating equipment;

4. All the components in such a system shall preferably be from one principal system manufacturer and form one compatible system approved by the relevant widely recognised independent regulatory body with the approval of FSD;

5. Certificate to prove compatibility shall be produced upon request. Confirmation from panel manufacturer on compatibility of connected components will normally be acceptable;

6. Devices mounted at locations susceptible to weather conditions shall be of weatherproof type construction.
FWP10.2 MANUAL FIRE ALARM POINTS

FWP10.2.010.7 CONSTRUCTION

1. Manual fire alarm call point shall be of "break glass" type or other positive activation type complying with BS EN 54-11 or other standards acceptable to FSD;

2. The manual fire alarm call point shall comprise an electrical contact which will operate automatically upon breaking of the frangible glass element or by other positive activation;

3. For break glass type:
   a. The glass element shall be laminated with a protective plastic film or incorporated with suitable device so that, during operation, no ejected particle of the fractured glass element shall travel a distance exceeding the requirement stipulated in BS EN 54-11;
   b. The cover shall be locked in position with a special key and the glass element shall be clipped firmly into place;
   c. It shall be indelibly marked with "BS EN 54-11" whereas the the words "Fire: Break Glass 火警鐘掣" shall be permanently inscribed in English and Chinese on the front.

4. The manual fire alarm call point and the mounting box shall be of pleasing appearance and styling, constructed by non-corrodible materials and finished in signal red colour;

5. Manual fire alarm call point mounted at location susceptible to weather conditions shall be of weatherproof construction as shown on the Drawings.

FWP10.2.020.7 OPERATION

1. The manual fire alarm points shall be suitable for 24 V DC operation;

2. Contacts shall be of silver or Approved non-deteriorating alloy, normally-open or normally-close type to suit the alarm system as detailed in the Specification;

3. For manual fire alarm points compliance with BS EN 54-11, the voltage and current ratings of the contacts shall be marked on the call point, or alternatively, the call point shall be marked "connect only in accordance with the manufacturer's instructions" or equivalent wording;

4. Suitable means of earth continuity shall be provided between external circuits connected to the call point;

5. A concealed test device shall be included. The test device shall be so designed that use of a tool is necessary to give the alarm but without breaking the glass element during the test operation.

FWP10.2.030.7 CERTIFICATION

Type test/approval certificate from British Standards Institution or approving organisations recognised by FSD, Hong Kong shall be produced, upon request, to prove the manual fire alarm point complies with the British Standard.

FWP10.2.040.7 MOUNTING

The manual fire alarm call point shall be mounted on wall or as specified in Project Specific Specification at position within 900mm to 1200mm above finished floor level. It shall be suitable for direct connection to the concealed wiring system therein.
FWP10.3 HEAT DETECTORS

FWP10.3.010.7 STANDARD
Automatic heat detectors shall be of point-type complying with, BS EN 54-5 or other standards acceptable to FSD.

FWP10.3.020.7 TYPE
Detectors shall be of combined fixed temperature and rate-of-rise type except in high temperature areas such as kitchens or boiler rooms where, because the risk of false alarms caused by rapidly rising temperatures is high, detectors without a rate-of-rise element should be used.

FWP10.3.030.7 MOUNTING
1. Detector units shall be of flush or surface mounting type as indicated in the Specification or Drawings;
2. Detector units in suspended ceilings shall be flush mounted and shall, in the case of modular constructed ceilings, be co-ordinated into the ceiling layout.
FWP10.4 SMOKE DETECTORS

FWP10.4.010.7 STANDARD
1. Automatic smoke detectors shall comply with, BS EN 54-7 or other standards acceptable to FSD;
2. They shall function correctly at continuous ambient temperature between 0°C to 48°C, relative humidity between 20% to 95% continuous without condensation;
3. They shall be designed to assume protection rating of IP 43;
4. They shall also be suitable for stable operation in the Hong Kong climate especially where high humidity conditions may exist without constant air-conditioning.

FWP10.4.020.7 TYPE
1. Detector shall be photoelectric type unless otherwise specified;
2. If ionization type of detector is specified, it shall be of the type responding to both visible and invisible products of combustion and shall be of the radioactive isotope pattern having two ionisation chambers, one for detection and one for reference, connected in electronic circuits. Radiation level from the isotopes shall be within the safety limit specified by EURATOM i.e. less than 0.1 mrad/h at a distance of 100 mm. The combined radiation activity of each smoke detector shall not exceed 555 kBq for commercial/industrial buildings and 370 kBq for residential buildings.

FWP10.4.030.7 CONSTRUCTION
1. Detectors shall be housed in a corrosion-proof plug-in unit designed to be mounted pendant, surface or semi-recessed;
2. Removal of the unit from its base shall cause a fault alarm signal to be given;
3. Built-in wind-shields shall be provided to ensure that air currents of up to 10 m/s do not affect the proper operation of the detectors;
4. Each unit shall be fitted with an alarm condition indicator lamp and shall also have an auxiliary facility for connecting an extended alarm indicator lamp;
5. A built-in wire mesh shall be incorporated to prevent entry of insects into the interior.

FWP10.4.040.7 ELECTRONIC CIRCUITRY
1. For ionization type detector, the electronic circuitry may be of cold-cathode tube type, operating at low voltage d.c., or of solid-state type, operating at extra low voltage d.c.;
2. The quiescent current consumption of the unit shall be minimal and shall not exceed 100 microampere;
3. The printed circuit boards shall be varnished and protected against moisture and dust;
4. The internal electronic circuitry shall be of highest possible reliability and protected against voltage spikes and surges;
5. The detector shall be capable of operating satisfactorily under minimum variation of ±25% in supply voltage;
6. The circuitry shall also be protected against electromagnetic interference.
FWP10.4.050.7  ELECTRICAL CONTINUITY
The detector base shall be sealed with a plate during the installation period. This plate shall facilitate electrical continuity through the base such that the circuits can be tested or maintained.

FWP10.4.060.7  INSTALLATION
1. When a detector is concealed inside the false ceiling, a remote alarm indicator lamp shall be mounted at the ceiling level immediately below the hidden detector and visible from any unobstructed position of the area;
2. Where detectors are mounted at levels above 4 m they shall be capable of being removed and re-fixed from below by means of a special extended arm tool.

FWP10.4.070.7  REVERSIBLE RESPONSE TIME DELAY
Where signal integration feature is specified as to avoid the unwanted alarms caused by transient interferences, the smoke detector shall be characterised by a reversible response time delay from 15 to 30 seconds depending on the concentration of smoke continuously present before an alarm is initiated. Upon clearance of the transient interference within the time delay, the smoke detector shall resume its quiescent state without any alarm initiation.

FWP10.4.080.7  RADIATION LEVEL
For ionization type detector, the Sub-contractor shall submit the total American 241 radiation level to Hong Kong Radiation Board for approval on behalf of the Employer where necessary before practical completion of the works. The Sub-contractor shall also make all necessary arrangements, if required by the Hong Kong Radiation Board, for inspection of the installation by the authorized representatives of the Board.

FWP10.4.090.7  PROBE UNITS
Probe units for air duct insertion mounting shall be of robust corrosion-proof construction and capable of accurately sampling the air flowing in the duct over a wide range of velocities. Insertion of the probe shall cause negligible air flow head loss. Probe units shall be suitable for use with smoke detectors as specified above and shall be installed in the centre of a straight section of ducting that has a length at least 6 times its width.
FWP10.5 CONTROL AND INDICATING EQUIPMENT (CONTROL PANELS)

FWP10.5.010.7 DESCRIPTION
Control and indicating equipment (control panels) for sprinkler system, automatic smoke/heat detection system, and manual fire alarm points and signals shall comply with BS EN 54-4 and BS EN 54-2 or other standards acceptable to FSD. It shall be of robust construction in non-corrodible materials, with hinged front door having cylinder-type lock and keys.

FWP10.5.020.7 OPERATION
The equipment panel shall be equipped to suit the fire alarm system of which it forms a part and shall be compatible with all other system devices and components. Fire alarm signals may originate from manual fire alarm call points, heat detectors, smoke detectors, flow switches, pressure switches, FM200 extinguishing system alarm contacts, sprinkler system alarm contacts etc. as applicable. The connection of these devices in “zones” (alarm circuits) shall be as scheduled in FWP2 or on the Drawings.

FWP10.5.030.7 EQUIPMENT
The control and indicating equipment and the alarm circuits are DC operated with battery backup, should generally include the following basic equipment:

1. "Supply On" visual indicator;
2. "System On" visual indicator;
3. "System Isolated" visual indicator with buzzer;
4. "Fire" alarm visual indicator for each zone, red;
5. Alarm re-set button for each zone;
6. Alarm silencing switch, with local and remote warning buzzers and visual indicating lights;
7. Relays, terminal strips, wiring, labels, etc. for the proper operation of the whole system including detectors and alarm bells, etc.;
8. Auxiliary relay or additional relay contacts for automatic starting of fire booster pump etc. as detailed in FWP2;
9. Test facilities for each alarm zone;
10. Isolating switch for each alarm zone with light indication;
11. Indicator light and warning buzzer showing whether auto-starting of generator (where provided) disabled or not, emergency stop buttons for FS/SP pumps pressed, water tanks empty etc. as shown on the Drawings;
12. Key switch, indicator light and warning buzzer for testing of direct line connection (where provided) to a Fire Services Communication Centre.

FWP10.5.040.7 ALARM OPERATION
Upon operation of one or more trigger devices, the control equipment shall give a fire alarm by:

1. All internal alarm sounders in or near the indicating equipment;
2. All external alarm sounders;
3. A visible indication for each zone in which a trigger device operates;
4. A signal transmitted to a Fire Services Communication Centre, where a direct line connection is provided.

**FWP10.5.050.7 FAULT INDICATION**

1. Automatic alarm systems, and manual alarm systems where so indicated in FWP2, shall be arranged for continuous monitoring of all alarm circuits, including the wiring and the alarm signalling devices connected thereto;
2. The control equipment in this case shall be provided with suitable fault warning signals including an amber fault indicator for each alarm zone (alarm circuit) and a warning buzzer for sprinkler and AFA system;
3. Faults to be detected shall include open-circuits, short-circuits, and removal of signalling devices for sprinkler and AFA system;
4. Battery-operated systems shall be provided with a battery supply indicator mounted upon the indicating equipment.

**FWP10.5.060.7 INDICATOR LAMPS**

1. Indicator lamps shall be of voltage rating 20% higher than the applied voltage, and shall wherever possible be of extra low voltage type;
2. Where a.c. mains operation is required, indicator lamps shall be operated at extra low voltage via a step-down transformer and be suitably rated for long life and reliability.

**FWP10.5.070.7 RELAYS**

Relays shall be of "potted" type, or similarly protected against dust, and shall have solenoids with varnish-impregnated or plastic encapsulated windings.

**FWP10.5.080.7 CONTACTS**

Contacts shall be of silver and adequately rated. Additional contacts shall be provided as required for the operation of auxiliary controls.

**FWP10.5.090.7 VOLTAGE REGULATION**

1. The control equipment shall incorporate battery charger set with appropriate voltage regulators suitable for the rating of the interconnected trigger devices and the equipment shall incorporate overload cut-out or limiting devices to protect the external circuit against excess current;
2. Protection against earth leakage currents shall be provided in accordance with the Electrical CoP, latest Edition, if the equipment contains apparatus or conductors operating at a voltage exceeding extra low voltage.
FWP10.6  BATTERIES AND CHARGERS

FWP10.6.010.7  PERFORMANCE

1. The capacity of the battery and charger unit shall be as stated in FWP2 and the type shall be acceptable to FSD;

2. Unless otherwise specified, the battery and charger units shall be capable of maintaining the system in normal operation for a period at least 24 hours longer than the maximum period for which the premises are likely to remain unattended without recharging and thereafter shall remain capable of operating in the maximum "alarm" condition for at least 30 minutes only;

3. If the system is connected by an alternative standby supply such as an automatic started emergency generator approved by FSD, the capacity of the battery and charger unit may be reduced to that capable of maintaining the system in normal operation for 6 hours and thereafter capable of operating in the maximum "alarm" condition for at least 30 minutes.

FWP10.6.020.7  BATTERY TYPE

Batteries shall be of nickel-cadmium accumulator and ultra-low maintenance type requiring no water replenishment throughout the 20 years normal service life of the battery. The battery shall be of the highest quality materials complying with IEC 60623.

FWP10.6.030.7  BATTERY VOLTAGE

Where applicable the alarm system battery shall be of sufficient voltage to operate the remote indicator unit at the Fire Services Communications Centre via the alarm transmitter unit and the Telephone Company lines. If necessary a separate battery complete with separate charger, not exceeding 50V, shall be provided for this purpose.

FWP10.6.040.7  BATTERY CHARGERS

Battery chargers shall be of the automatic trickle charge type, with facility for manually-operated boost charge, capable of re-charging the battery from fully discharged to fully charged condition in not more than twenty four (24) hours. Battery overcurrent protection shall be provided to safeguard the battery against short-circuit. Instruments shall include voltmeter for battery voltage and ammeter for battery current.

FWP10.6.050.7  FAULT WARNING

The output of the rectifier shall be sufficient for the system to give visible and audible fault warnings upon failure of the battery and shall be capable of providing for additional alarm load arising from the operation of a trigger device in two separate zones.

FWP10.6.060.7  BATTERY/CHARGER MOUNTING

1. The battery and charger shall each be housed in a well ventilated and painted cabinet of robust construction and made from galvanised sheet metal. Trickle charger shall be of automatic type complete with indication lamps, fuses and suitable for a single phase 220V, 50 Hz a.c. supply. Detail of the battery charger set shall be submitted for Approval;

2. In all cases, the battery shall be installed in a separate compartment from the charger.
FWP10.7  FIRE ALARM BELLS AND CIRCUITS

FWP10.7.010.7  BELL LOCATION
The fire alarm bells shall be located as shown on the Drawings. Necessary adjustment to the bell locations and quantities to comply with relevant audibility requirements basing on the alarm bell characteristics shall be proposed and submitted by the Sub-contractor to the Contract Manager for Approval prior to installation.

FWP10.7.020.7  BELL PERFORMANCE
1. The sound generated by the bell shall be easily distinguishable from other bells;
2. Unless otherwise specified on the Drawings, each alarm bell shall be capable of producing a sound level of at least 90 dB(A) at 3 m from the location of installation.

FWP10.7.030.7  BELL CONSTRUCTION
1. Under-dome type iron clad bells, suitable for operation at 24 V DC system as stated on the Drawings and in FWP2 shall be used;
2. Alarm bells shall be of minimum 150 mm diameter gong;
3. Bells shall be of weatherproof construction if susceptible to weather conditions;
4. The bells shall have a suitable conduit entry.

FWP10.7.040.7  BELL FINISH
Bell domes shall be finished in signal red.

FWP10.7.050.7  BELL CIRCUITS
Bell circuits shall be separately fused at the control equipment.

FWP10.7.060.7  ALARM TRANSMITTERS
1. The alarm transmitter, where called for in FWP2 shall be of polarity reversal type compatible with the Remote Indicator Unit at FSD Fire Control;
2. The cost of the telephone line connection and rental charges within the Maintenance Period for the telephone line and for the remote indicating unit, shall be borne by the Sub-contractor.
FWP10.8  AUXILIARY SYSTEMS

FWP10.8.010.7  SYSTEM CONTROL

Control for the operation of auxiliary systems, including fire booster pumps, fire damper release mechanisms, door release mechanisms, smoke extraction fans, fireman's lift, etc., where called for in FWP2, shall comply with the general requirements of this Specification and the Sub-contractor shall carry out all associated electrical control wiring and connections unless otherwise indicated.

FWP10.8.020.7  AUXILIARY BATTERY

Where battery operation of auxiliary control systems is required, a separate nickel cadmium battery and charger for these systems shall be provided and suitably labelled for identification. The main fire alarm system battery shall not be connected directly to any auxiliary circuits other than those essential to the detection and alarm system.
FWP10.9 VISUAL FIRE ALARM

FWP10.9.010.7 SYSTEM
The visual alarm signal shall be in the form of a red flashing light and be located at prominent locations such that its effect can be seen from everywhere in the building when the fire alarm is activated. The visual fire alarm system shall conform to NFPA 72 or BS 5839: Part 1 and acceptable to FSD. Sample of the flashing red light shall be submitted for Approval.

FWP10.9.020.7 LABEL
Each red flashing light of the visual fire alarm system shall be provided with indication showing “FIRE ALARM 火警”. The height of the English letters and Chinese characters shall not be less than 10 mm and 15 mm respectively, or the size of the characters is acceptable to FSD.

FWP11.1 GENERAL INSTALLATION

FWP11.1.010.7 SPECIFICATION
1. The electrical equipment, installation materials, cables, wiring, and installation practice, shall comply with the Drawings and Specification;
2. For fire services installations, the use of fire resistant cables shall be in accordance with Fire Services CoP unless otherwise specified.

FWP11.1.020.7 ELECTRICITY SUPPLY
Unless otherwise specified, the complete electrical installation shall be suitable for operation under the supply system with nominal frequency of 50 Hz and nominal voltage of 380 V, 3 phase and 220 V, single phase within the variation limits as declared by the local Supply Companies.

FWP11.1.030.7 SERVICE CONDITIONS
The complete electrical installation shall be suitable for use under Hong Kong climatic condition with relative humidity and ambient temperature as shown below:
1. Relative Humidity: up to 0.99 saturation;
2. Ambient temperature: peak from minus 5°C to plus 40°C for 4 hours continuously with an average from 0°C to plus 35°C over a 24 hour period.

FWP11.1.040.7 WIRING SYSTEMS
1. All wirings in water pump rooms shall be in surface conduit/trunking system or by armoured cables as detailed in this Specification or as shown on the Drawings;
2. Wiring and cabling systems in other areas shall be of the type or types detailed elsewhere in this Specification and as shown on the Drawings;
3. Unless Approved for the purpose, cables and wires shall not be located in damp, wet and excessively hot locations, or exposed to gases, fumes, vapours, liquids and other agents having a detrimental effect on the conductors.

FWP11.1.050.7 CONDUCTOR SIZES
1. Conductor sizes for alarm circuit wiring to automatic detectors shall be in accordance with AFA Rules and may be smaller than the minimum called for in the Specification provided that satisfactory operation of the system is achieved and that the wiring is capable of being installed, and subsequently maintained, easily and without damage as well as approved by the Contract Manager. The installed conductor size shall also be in accordance with the recommendations of the panel and detector manufacturer;
2. Conductor sizes for other applications shall strictly comply with the Drawings and Specification.

FWP11.1.060.7 CONDUIT SYSTEMS
1. Conduits shall be of steel or PVC as specified in the Specification or Drawings;
2. Conduits shall be completely separated from those for all other services. Separate channels shall be used for any wiring using duct systems;
3. Conduits shall be routed and installed in such a way as to give maximum protection against mechanical damage. Where it is unavoidable to run conduits across other services conduits, water pipes, air conditioning ducts, etc., they shall be installed first and fixed closest to the structure;
4. Conduit routes shall avoid areas of high risk such as lift wells, open staircases and unenclosed vertical shafts;

5. Galvanized iron draw-wires of adequate size shall be provided in all empty conduits.

FWP11.1.070.7  **MICC CABLES**

1. MICC cables shall not be used on circuits involving the switching of inductive or capacitative loads where there is a possibility of insulation damage due to high voltage surges;

2. Where bare MICC cables are run on galvanized steel cable trays, and in other situations where contact between dissimilar metals may lead to electrolytic corrosion, electrical contact shall be prevented by using plastic-coated fixing saddles supplemented by properly fixed plastic spacers, or by other Approved means.

FWP11.1.080.7  **EXPOSED PLASTICS**

The use of wiring, cables or installed materials having plastic sheathing or finish or constructed predominantly of plastic, and not enclosed in metal, shall be avoided wherever possible. Plastic cable trunking, etc. will not be acceptable. MICC cables shall be of non-PVC-sheathed type.

FWP11.1.100.7  **IDENTIFICATION OF CONDUCTORS, CABLES AND CABLE DUCTS**

1. Identification of conductors and cables on L.V. and M.V. power circuits shall be in accordance with the Electrical CoP, except that ELV alarm circuit wiring shall be identified by the basic colour in red. If other colours are to be used, they shall be submitted for Approval. Colour tracers may be used, in addition, to distinguish cables one from another;

2. All surface conduits, cable ducts and cable trays, armoured cables, MICC cables etc., forming part of the Fire Service Installation provide by the Contractor, shall be colour coded in red in such a way as to permit ready identification. Banding by means of paint will be acceptable where this can be carried out permanently and effectively. Durable high quality red plastic self-adhesive tape may be used for armoured and MICC cables, applied at intervals not exceeding 3 m;

3. Suitable identification plates shall be provided on all electrical equipment giving voltage, current, wattage or other ratings and manufacturer's name, trademarks or other descriptive markings by which the organisation responsible for the product may be identified;

4. Each disconnecting means required for all electrical equipment and each electrical source of supply shall be legibly marked to indicate its purpose unless located and arranged such that the purpose is clearly self evident;

5. All markings and identifications shall be of sufficient durability to withstand the environmental effects.

FWP11.1.110.7  **CABLES CONNECTED TO OR IN CONTACT WITH BARE CONDUCTORS OR BUSBARS**

Cables connected to or in contact with bare conductors or busbars shall be in accordance with **ELE8.2.060** of HKHA Electrical Installation Specification.

FWP11.1.120.7  **EARTHING AND BONDING PROVISION**

The Sub-contractor shall provide all necessary earthing, equipotential and supplementary bonding in accordance with the Electrical CoP. The Sub-contractor shall provide 25 mm² PVC insulated copper bonding conductors from the termination gland at the main incoming fuse combination unit to the pump discharge pipes which shall be bonded by Approved clamps.
FWP11.1.130.7 POWER FACTOR AND TOTAL HARMONIC DISTORTION

1. For circuit with circuit protective device rating at or above 400A, single or three phase, the Sub-contractor shall be responsible for providing equipment as necessary to any pump control cubicle or motor for fresh and flush water pump installation, with or without variable speed drives, to improve the power factor to a minimum of 0.85 and restrict the total harmonic distortion of current to the value in accordance with the BEC;

2. Capacitor bank shall comply with IEC 60831-1 and IEC 60831-2 and shall be housed in a separate metal enclosure. Harmonic filter shall conform to IEC 61000-4-2, IEC 61000-4-3, IEC 61000-4-4 and IEC 61000-4-5 or other similar recognised international standards.
FWP11.2 MOTORS FOR PUMP DRIVES

FWP11.2.010.7 CONSTRUCTION

1. All electric motors shall be of squirrel-cage induction type and comply with BS EN 60034-1 or IEC 60034-1;
2. The stator windings shall be copper wire with Class F insulation to BS EN 60085 or IEC 60085 terminated in stud terminals;
3. The motors shall be totally-enclosed fan-cooled to BS EN 60034-6 or IEC 60034-6 IC411 and ingress protection to BS EN 60034-5 or IEC 60034-5 IP55 or better with cast iron frame, metal or polypropylene fan cover and metal terminal box. For motors of 15kW or less, aluminium alloy frame will also be acceptable;
4. Unless otherwise specified, the motors shall be foot-mounted to BS EN 60034-7 or IEC 60034-7;
5. For fresh water and flush water supply systems only, the motors for pump drives shall be of Class IE2 to IEC60034-30.

FWP11.2.020.7 RATING

The motors driving the fire services pumps including sprinkler and street fire hydrant pumps shall be rated to give 20% more power in addition to the hydraulic power required for the rated flow of the system while other pump motors shall be 15% more unless otherwise specified.

FWP11.2.030.7 METHOD OF STARTING

The method of motor starting shall be selected according to the characteristics of the pump and shall comply with the Electricity Supply Co's limitations on starting current. Unless otherwise indicated, the type of starter shall be as follows:

1. Up to 7.5 kW - Direct-on-line;
2. 11 kW to 55 kW - Star-delta;
3. Over 55 kW - Soft starter, for fresh/flush water pump motors and other pump motors; auto-transformer, for fire services water pump motors.

FWP11.2.040.7 NOISE LEVELS

1. The mean sound pressure level at free field conditions over a reflecting plane at one metre from the surface of every single machine due to transmission through air for fresh, booster fresh and flush water installation shall not exceed 70 dB(A) for motors of 75 kW or below;
2. The method of measurement of noise and vibration level generated by the motors shall comply with BS EN 60034-9 or IEC 60034-9 and BS EN 60034-14 or IEC 60034-14 respectively;
3. Manufacturers' type-test certificates and reports to verify the noise levels of motors shall be produced upon request by the Contract Manager.

FWP11.2.050.7 WARNING NOTICE

Motors under automatic control shall be provided with a prominent red notice on white ground, of durable material, with a size of not less than 300 x 300 mm inscribed in English and Chinese characters as follows:

DANGER 危险
THIS MOTOR IS AUTOMATICALLY CONTROLLED AND MAY START WITHOUT WARNING - ISOLATE BEFORE INSPECTION

此機乃自動操作 - 維修前請先關掣

Lettering shall be at least 25 mm high. The notice shall be displayed adjacent to each pumpset or each pair of pumpsets.

FWP11.2.060.7 EFFICIENCY

The nominal full-load motor efficiency, tested to BS EN 60034-2-1 or IEC 60034-2-1, shall be no less than those as shown in Table 5.1, Minimum Acceptable Nominal Full-load Motor Efficiency for Single-speed Polyphase Motors, of the BEC.
FWP11.3 MOTOR STARTERS

FWP11.3.010.7 DIRECT-ON-LINE, STAR-DELTA AND AUTO-TRANSFORMER STARTERS

1. Type:
   a. Unless otherwise indicated, each motor provided with an independent motor starter shall comply with BS EN 60947-4-1 or IEC 60947-4-1;
   b. The co-ordination requirement shall be type "2";
   c. The short circuit protective device shall be in accordance with the recommendation made by the motor starter manufacturer in order to achieve the specified type of co-ordination.

2. Contactors:
   a. The contactors in the motor starter circuit shall comply with BS EN 60947-4-1 or IEC 60947-4-1 suitable for a rated operational current at a utilisation category AC-3 of not less than the full load line current of the motor, capable of carrying out an intermittent duty of class 120;
   b. The rating of contactors for the star and delta circuit connections shall be selected in accordance with the contactor/starter manufacturer's recommendation;
   c. The star and delta contactors shall be electrically interlocked so that it is impossible for both contactors to close or be closed at the same time;
   d. The mechanical endurance of the contactors shall not be less than 1 million no-load operating cycles;
   e. The timers for star-delta and auto-transformer starters shall be adjusted for a maximum of 10 seconds with clear calibration;
   f. For auto-transformer starter, it shall comply with BS EN 60076 or IEC 60076 with class E insulation and shall be rated for a duty not less than 15 starts per hour.

3. Thermal overload relay:
   a. A thermal overload relay complying with BS EN 60947-4-1 or IEC 60947-4-1 shall be provided in each motor starter;
   b. The thermal overload relay shall have thermal elements for all three phases, trip contacts, adjustable trip current setting and manual reset push. It shall also provide protection against phase failure;
   c. The inverse time operating characteristics of the relay shall be submitted for Approval.

FWP11.3.020.7 SOFT STARTER

1. The soft starter shall employ microprocessor-controlled power electronics to regulate the starting torque of a motor in order to minimize mechanical shock during starting and stopping;

2. The soft starter shall conform to BS EN 60947-4-2 or IEC 60947-4-2 and utilization category of the soft starter shall be AC-53a or AC-53b. When utilization category AC-53b is adopted for the soft starter as stipulated in BS EN 60947-4-2 or IEC 60947-4-2, a bypass contactor shall be provided in the starter circuit to take up the motor load during the steady state operation of the motor. The transfer of the load from the soft starter to the bypass contactor and vice versa shall be automatically initiated;

3. The soft starter shall be type-tested to of BS EN 60947-4-2 or IEC 60947-4-2. Manufacturer's type test certificate shall be submitted for Approval;
4. The soft starter shall conform to BS EN 50081 or BS EN 61000-4 or relevant recognized international standards for electromagnetic compatibility requirement;

5. The duty of the soft starter shall be compatible with the power requirements of the electric motor concerned;

6. The soft starter's control circuit shall be completely independent of the power supply circuit for the motor and the same control module shall be used for all power ratings;

7. The soft starter shall be installed in the concerned motor control panel and protected by fast acting semi-conductor fuses against short circuit faults. The semi-conductor fuses shall conform to BS EN 60269-1 or IEC 60269-1 and BS EN 60269-4 or IEC 60269-4;

8. The pre-set starting current of the soft starter shall be compatible with the starting torque-speed characteristics of the concerned motor and loading;

9. A built-in LCD/LED display shall be provided for the soft starter to assist in setting-up and trouble-shooting. At least the following monitoring functions shall be indicated through the LCD/LED display:
   a. Fault conditions;
   b. Motor current; and
   c. Starter operation status.

10. All adjustable parameters shall be set by a keypad on the control module. The keypad shall be accessible without the need to open the cover of the motor control panel;

11. Modes of operation:
   a. The soft starter shall be provided with the following modes of operation and the transition shall be smooth with minimum current inrush and torque surges. Operation shall be as stipulated below:
      i. Soft start:
         The soft starter shall provide an acceleration ramp such that motor shall accelerate linearly with closed loop control during starting. The acceleration ramp time shall be adjustable up to 30 seconds.
      ii. Current limitation:
         It shall be provided with current limiting capability on the starting current of the motor. The maximum starting current limit of the motor shall be adjustable up to 5 times rated current.
      iii. Soft stop:
         A deceleration ramp shall be applied to the motor such that free-wheeling is prevented for a smooth deceleration with closed loop control during motor stopping. The deceleration ramp time shall be adjustable up to 60 seconds.
   b. The soft starter shall be rated for a duty not less than 15 starts and 15 stops per hour.

12. Protection:
   a. The following protective devices shall be provided for the soft starter:
      i. Motor overload even in a bypass configuration (adaptive to the motor thermal characteristics);
      ii. Phase unbalance/loss;
      iii. Phase reversal; and
      iv. Underload.
FWP11.3.030.7 VARIABLE SPEED DRIVE UNIT FOR BOOSTER PUMP SYSTEM

1. Variable speed drive (VSD) unit for booster pump system shall act as both motor starter and multi-pump sequence controller and be a complete product comprising:
   a. A variable frequency drive with static frequency inverter which generates a sinus evaluated pulse with stable modulated output voltage for varying pump motor speed; and
   b. A multi-pump control microprocessor which provides functions including setting of constant water output pressure, control of motor speed, automatic changeover of pumps, selection of various pump operation modes, protection against various faults, and storage of fault event records.

2. Product requirements:
   a. The VSD unit shall perform automatic multi-pump functions and comply with booster pump system operating and installation requirements as described in FWP2.2.2.020;
   b. The VSD unit shall comply with the general EMC (electromagnetic compatibility) regulations to BS EN 61800-3 or similar recognised international standards;
   c. The VSD unit shall incorporate with appropriate measure(s) to avoid undesirable high frequency noise generated from the driving motor and/or the VSD unit and to prevent interference with other electronic devices;
   d. The VSD unit shall contain buttons for switching on/off and allow manual operating mode for individual pump;
   e. The VSD unit shall contain buttons to input settings with password protection and LCD panel to display pump control parameters as follows:
      i. Discharge pressure value setting;
      ii. Operating frequency setting;
      iii. Switch interval for cyclic changeover setting;
      iv. Power on, run and fault indication;
      v. Running pressure value indication;
      vi. Running frequency indication;
      vii. Hours of operation log indication;
      viii. Error messages indication.
   f. The VSD unit shall provide automatic protections to the booster pump system as follows:
      i. To shut off all pumps at zero suction, high pressure overshoot and loss of pressure at discharge;
      ii. To protect pump motor from over-voltage, under-voltage, over-current, overload, overheat and loss of phase;
      iii. To protect frequency inverter from overheat;
      iv. To conduct automatic test-run at adjustable periods.
   g. The VSD unit shall activate audio and visual alarm for the following faults:
      i. Low suction pressure;
ii. Pump motor failure;
iii. Frequency inverter failure;
iv. Pressure transducer failure;
v. System failure.

h. The VSD unit shall provide dry contacts for the following remote monitoring outputs:
   i. Pump running status;
   ii. Common fault signal.

i. The VSD unit shall keep record of at least 5 nos. of last fault events for retrieval;

j. The VSD unit shall have dust and water ingress protection to at least IP55 for enclosure and cable connection;

k. The VSD unit shall be able to recover automatically after power failure.

3. Installation Requirements:
   a. Every VSD unit shall be able to set as master and perform full multi-pump control functions independently unless an associated master multi-pump display and control unit forms part of the control system and provides necessary control functions for multi-pump operation. When a master multi-pump display and control unit is necessary, an identical duplicate shall be provided in parallel with selector knob for easy changeover in case the master unit in use is found faulty;
   b. Every VSD unit shall be compatible with its connected motor so as not to result in excessive power loss or heat generation at the motor over entire speed range;
   c. All VSD units in a booster pump system shall be identical and automatically form an integrated multi-pump control system via interconnecting control cables;
   d. Input parameters on any VSD unit in the booster pump system shall be automatically synchronized to other VSD units;
   e. Pump running and fault status indications from each VSD unit shall be repeated on the pump control cubicle;
   f. VSD units shall be mounted individually on wall or enclosed collectively in a fan-ventilated metal cubicle mounted on wall unless the VSD unit and the pump motor forms an integrated design at factory;
   g. All non-armoured cables connecting from VSD unit to unit and from pressure transducer to VSD unit shall be enclosed in watertight flexible conduits and terminated in rigid box with glands and nuts;
   h. Control cables connecting to the VSD units shall be separated from power supply cables. The power supply cables shall be kept as short as possible and not be installed in parallel to the control cables;
   i. VSD multi-pump control shall be commissioned by the manufacturer's representative and set up with the optimum parameters in order to attain the best operating efficiency of the booster pump system.

4. Maintenance Requirements:
   a. User interface of the input panel on VSD unit and master multi-pump display and control unit when provided, shall be clear and simple to use;
b. Complete documentary of user manuals covering operation and maintenance procedures, and where necessary for future maintenance, data disk containing software, firmware, etc. for VSD unit shall be provided in the O&M Manual of Water Pump Installation. An extra on-site user manual shall be properly bound in plastic folder and kept in a durable wall hanging box inside each booster pump room;

c. Training shall be provided by the manufacturer's representatives on equipment setting, operational and maintenance aspects including essential trouble-shooting techniques;

d. In case any mal-function found, replacement of only faulty parts in VSD unit shall be possible, instead of total replacement.

5. Reliability

a. The VSD unit shall be the product of a manufacturer who has continuously manufactured similar type of products in the past 3 years;

b. The VSD unit shall have proven record of reliability of a minimum continuous period of one year prior to the time of material submission for Approval, in relevant application in local or overseas to the satisfaction of the Contract Manager.
FWP11.4 PUMP CONTROL CUBICLE

FWP11.4.010.7 LOCATION
In each fixed fire pump/intermediate booster pump room, sprinkler pump room, water pump room and those as shown on the Drawings, a pump control cubicle for each of the pumping systems shall be provided.

FWP11.4.020.7 CONSTRUCTION
1. The pump control cubicle shall be suitable for wall mounting with a degree of protection of at least IP42 to BS EN 60529;
2. The whole cubicle except for its front panels shall be made of galvanized sheet steel not less than 1.5 mm thick and formed in such a way as to give a rigid structure without cross struts. The cubicle opening shall be rolled up with curled edges in order to stop water ingress slipped into inner side of the cubicle. The front panels shall be of double-door construction and made of galvanized sheet steel not less than 2.0 mm thick;
3. The outer doors of the front panels shall be hinged permitting not less than 110 degrees opening and inserted with a durable clear transparent panel sealed by rubber gaskets. They shall be fitted with multi-point swing handle latches of watertight zinc alloy bodies with cam levers and locking bars but with no locks. The edges of the outer doors shall be fitted with neoprene rubber gaskets which at closing position, shall be tightly rested on the curled edges of the cubicle opening;
4. The inner doors of the front panels shall be hinged permitting 90 degrees opening and recessed in the cubicle with indication lights, selector switches, ammeters, isolating switches, etc. fitted on. The back sides of the inner panels shall be fitted with insulation boards to prevent direct exposure of live parts when opened. At closing position, the inner doors shall be fastened on the cubicle by stainless steel screws;
5. The cubicles shall have ventilation louvers for heat dissipation at lateral panels.

FWP11.4.030.7 FITTINGS
The pump control cubicle shall be complete with isolating switch, selector switch, indicating lights, starters, relays etc. as shown on the Drawings.

FWP11.4.040.7 FINISH
The inside and outside surfaces of the pump control cubicle shall be painted with one coat of primer, followed by a coat of stoved polyester-epoxy powder finish of an Approved colour which for fire services installations shall be of gloss signal-red.
FWP11.5  PUMP CONTROL CUBICLE COMPONENTS

FWP11.5.010.7  ISOLATING SWITCH
Unless otherwise specified, a triple pole isolating switch with removable neutral link shall be provided for the main supply to each pump motor. The isolating switch shall be in compliance with BS EN 60947-3 or IEC 60947-3 suitable for a rated operational current at a utilisation category of AC 23 of not less than the rated current of the motor circuit. It shall be fixed inside the control cubicle and operated by a handle fitted on the hinged front panel. Positive “ON” and “OFF” indication shall be provided.

FWP11.5.020.7  AMMETER AND CURRENT TRANSFORMER
Ammeter of moving iron type complete with a selector switch shall be provided in each control cubicle to indicate the current supplied to the motor. The ammeter shall comply with IEC 60051-1 with class index 2.5 and shall be of flush mounting type with 75 mm dial and external zero adjustment. The full scale deflection of the ammeter shall be about 200% of the rated current of the motor. Where necessary, current transformers of encapsulated type complying with IEC 60044-1 with an accuracy class I shall be provided for the supply to the ammeter.

FWP11.5.030.7  PUSH-BUTTON AND SELECTOR SWITCH
Push-button and selector switch for mounting on to control cubicle shall conform to EN 60947-1 and EN 60947-5-1 and shall be of splash-proof type with a thermal current rating of not less than 5A and the contacts shall be silver-plated. Push-button shall have a diameter of not less than 20 mm and shall be flush with its guard ring to prevent inadvertent operation. Selector switch shall be of rotary type with a handle of not less than 25 mm long.

FWP11.5.050.7  TIME SWITCH
Where specified, a time switch used for starting the pumping system at a predetermined time of a day shall be provided. The time switch shall be provided with 24-hour dial and battery backup or of other types as approved by the Contract Manager.

FWP11.5.060.7  INDICATION LIGHT
Unless otherwise specified or Approved, indication/pilot light shall conform to EN 60947-1 and EN 60947-5-1 and shall have built-in transformer complete with a 6V LED lamp and a plastic lens of suitable colour.

FWP11.5.070.7  CONTROL RELAY
Control relay, including time-delay relay shall be of contactor type in compliance with EN 60255-1-00 or IEC 60255-1-00 or other standards as approved by the Contract Manager. The relay shall have a thermal current rating of not less than 5A and its contacts shall be silver-plated. Shading ring shall be provided in the magnetic circuit to eliminate noise and vibration. The relay shall have a mechanical endurance of not less than 5 million operations.
FWP11.5.080.7 TERMINAL BLOCK

All control cables connected to the cubicle shall be terminated in feed-through terminal blocks with screw clamp connections and conforming to the following requirements and sleeve type cable markers shall be fitted to both ends of each length of cable:

1. Electrical and mechanical characteristics to be type tested to BS EN 60947-7-1 or IEC 60947-7-1;
2. Voltage rating 750V;
3. Moulding material to be melamine with low flammability as certified to UL94;
4. Designed for mounting directly on assembly rail to EN 50035;
5. All current carrying parts to be copper coated with tin lead alloy. Clamping yokes and screws to be zinc plated steel with additional protection by a chromate layer.

FWP11.5.090.7 PROGRAMMABLE LOGIC CONTROLLER

1. Execution:
   a. Upon Approval, Programmable Logic Controller (PLC) can be used to form part of the pump control wiring circuit in lieu of conventional control relays and time switches;
   b. The Sub-contractor shall complete the programming of the PLC and provide a comprehensive instruction manual for adjusting the pump control such as timer settings, etc. The sequence of control and values of settings in connection with the pump-set operation shall be saved as a switching program in a piece of EPROM (Erasable Programmable Read Only Memory). The steps for programming the switching program shall be literally printed in the instruction manual. Two programmed EPROMs (one socketed in the PLC and one spare) shall be provided for every pump control wiring circuit. Detailed instruction for replacing the EPROM and rebooting the PLC shall be included in the instruction manual;
   c. The Sub-contractor shall provide one spare set of PLC including the associated components such as expansion modules and power supply modules for every three sets of PLC of the same make and model to enable one-to-one replacement. However, one spare set of PLC shall be provided if the number of PLC of the same make and model installed is less than three. The spare unit(s) shall be tested, kept in original packings, and stored in lockable partitioned space inside pump control cubicle(s). Label(s) showing the storage location(s) of spare unit(s) shall be affixed prominently in cubicle(s) not storing the spare unit(s);
   d. The Sub-contractor shall provide two (2) times of free on-site services for modification of the PLC programming upon request of the Contract Manager within the Maintenance Period.

2. Product Requirements:
   a. The PLC shall be the product of a reputable manufacturer and commonly available in the local market;
   b. The PLC shall be capable of counting, regulating, archiving and performing timer and logic operation functions;
   c. The PLC shall be expandable in the number of digital and analogue input/output ports, 35mm DIN rail mounted, fitted with socketed EPROM module for ease of replacement, and provided with serial port for personal computer connection if required for programming and control setting adjustment;
d. The programmed PLC shall be password protected and possesses integrated data latch to protect current settings against loss in the event of a power failure;

e. Operating voltage: DC 24V;

f. Operating ambient temperature: 0°C to 55°C;

g. Operating ambient relative humidity: 5% to 95%; transient condensation permissible;

h. Storage temperature: -10°C to 70°C;

i. Radio interference suppression to BS EN 55011 (limit value class B);

j. Degree of protection: IP20 to BS EN 60529;

k. Certification to VDE0631, IEC 61131, UL or equivalent.
FWP11.6 CONTROLS AND GAUGES

FWP11.6.010.7 LEVEL CONTROL SWITCH FOR FRESH, FLUSH AND FIRE SERVICES WATER TANKS AND RAINWATER COLLECTION TANK

1. Level control shall be achieved by the use of weight and ball float, operating a remote mercury switch;
2. For roof tanks, the mercury switch shall be housed in a weatherproof type box to IP 54 or above, which is of non-metallic and corrosion resistant material and complete with locking facility;
3. Alternatively, or where specified, mercury switch encapsulated in corrosion proof float with "ON" and "OFF" control, as described in FWP11.6.020 below, may be used;
4. Level control switch shall cope with the chlorine concentration when used in the rainwater collection tank. The Sub-contractor shall demonstrate the compliance to the satisfaction of the Contract Manager.

FWP11.6.020.7 LEVEL REGULATOR FOR WASTE WATER, STORM WATER AND SEWAGE SUMP TANKS

Mercury switch encapsulated in corrosion proof float shall be used for level control. The float shall be freely suspended in the liquid of the sump tank by a waterproof multi-core PVC sheathed cable.

FWP11.6.030.7 LEVEL REGULATOR FOR DEEP BORE WELLS

Level control for deep bore well shall be of electrode type or magnetic type. Detailed information of the level control device shall be submitted for Approval prior to ordering.

FWP11.6.040.7 FLOW SWITCHES

1. For fire services alarm:
   a. Flow switches for fire services alarm shall be of vane type or as approved by the Contract Manager, and shall be approved by LPC and FSD;
   b. They shall be capable of withstanding a test pressure of 15 bar or 1.5 times of the maximum working pressure whichever is higher for not less than 2 hours without showing any sign of leakage;
   c. The sensitivity of the flow switch shall be such that it will respond to the water flow when even only one sprinkler head is in operation.
2. For general purposes:
   a. Flow switches for general purposes shall be of paddle type with magnetic switching mechanism or as approved by the Contract Manager;
   b. Paddles shall be made of stainless steel;
   c. Body materials shall be suitable for the purposes of applications against corrosion;
   d. The products shall be robust and durable for daily switching operations;
   e. They shall sustain a maximum operating pressure of 20 bar and be taken part in the water system tests mentioned in FWP14.1.060;
3. Contacts shall be suitable for the working voltage and current of the circuits controlled, and shall be plated with silver or Approved alloy.
FWP11.6.050.7 PRESSURE SWITCHES
1. Pressure switches shall have contacts plated with silver or Approved alloy rated to suit the working voltage and current of the circuits controlled and shall have independent adjustments for the cut-in and cut-out points and for the operating differential;
2. For fire services systems, pressure switches shall be LPC approved type or acceptable to FSD;
3. For flush water supply system, pressure switches shall be constructed of corrosion resistant material.

FWP11.6.060.7 PRESSURE GAUGES
Pressure gauges shall comply with BS EN 837-1 and have brass cases with dials not less than 100 mm diameter. They shall be calibrated in kPa to a maximum of not less than 1-1/3 times and not more than 2 times the operating pressure. Divisions of scale shall not exceed 20 kPa for a maximum scale value of 1,000 kPa, 50 kPa for a maximum scale value of 1,600 kPa and 100 kPa for maximum values in excess of 1,600 kPa. An isolating valve/cock shall be provided for each pressure gauge.

FWP11.6.070.7 EMERGENCY STOP SWITCH
An emergency stop switch of mushroom head push stop lock out type, coloured red shall be provided adjacent to each pump to stop the motor in case of emergency.

FWP11.6.080.7 PRESSURE TRANSUDCER FOR BOOSTER PUMP SYSTEM
1. Pressure transducer for booster pump system shall match with the variable speed drive (VSD) unit and fully cover the required operating parameters of the booster pump system using VSD control;
2. Unless otherwise Approved, enclosure and wetted parts of pressure transducer shall be made of Grade 316 stainless steel.
FWP11.7  L.V. SWITCHGEAR AND ASSOCIATED EQUIPMENT

FWP11.7.010.7  GENERAL

The Sub-contractor shall comply with all the latest requirements on equipment, materials and installation practice/method as specified in Worksection ELE3 of HKHA Electrical Installation Specification, within the scope of the works specified under this Sub-contract. Electrical installation mentioned therein shall mean electrical works for fire services and water pump installation.
FWP11.8  BUSBAR CHAMBERS AND BUSBAR TRUNKING SYSTEMS

FWP11.8.010.7  GENERAL

The Sub-contractor shall comply with all the latest requirements on equipment, materials and installation practice/method as specified in Worksection ELE6 of HKHA Electrical Installation Specification, within the scope of the works specified under this Sub-contract. Electrical installation mentioned therein shall mean electrical works for fire services and water pump installation.
FWP11.9 CABLES

FWP11.9.010.7 GENERAL

The Sub-contractor shall comply with all the latest requirements on equipment, materials and installation practice/method as specified in Worksection ELE7 of HKHA Electrical Installation Specification, within the scope of the works specified under this Sub-contract. Electrical installation mentioned therein shall mean electrical works for fire services and water pump installation.
FWP11.10 INSTALLATION OF POWER CABLES

FWP11.10.010.7 GENERAL

The Sub-contractor shall comply with all the latest requirements on equipment, materials and installation practice/method as specified in Worksection ELE8 of HKHA Electrical Installation Specification, within the scope of the works specified under this Sub-contract. Electrical installation mentioned therein shall mean electrical works for fire services and water pump installation.
FWP11.11 WIRING SYSTEM INSTALLATION IN STEEL CONDUITS

FWP11.11.010.7  GENERAL

The Sub-contractor shall comply with all the latest requirements on equipment, materials and installation practice/method as specified in Worksection ELE11 of HKHA Electrical Installation Specification, within the scope of the works specified under this Sub-contract. Electrical installation mentioned therein shall mean electrical works for fire services and water pump installation.
FWP11.12 WIRING SYSTEM INSTALLATION IN STEEL TRUNKING

FWP11.12.010.7 GENERAL

The Sub-contractor shall comply with all the latest requirements on equipment, materials and installation practice/method as specified in Worksection ELE12 of HKHA Electrical Installation Specification, within the scope of the works specified under this Sub-contract. Electrical installation mentioned therein shall mean electrical works for fire services and water pump installation.
FWP11.13 WIRING SYSTEM INSTALLATION IN PLASTIC CONDUIT OR PLASTIC TRUNKING

FWP11.13.010.7 GENERAL

The Sub-contractor shall comply with all the latest requirements on equipment, materials and installation practice/method as specified in Worksection ELE13 of HKHA Electrical Installation Specification, within the scope of the works specified under this Sub-contract. Electrical installation mentioned therein shall mean electrical works for fire services and water pump installation.
FWP11.14 EARTHING AND PROTECTION AGAINST INDIRECT CONTACT

FWP11.14.010.7 GENERAL

The Sub-contractor shall comply with all the latest requirements on equipment, materials and installation practice/method as specified in Worksection ELE17 of HKHA Electrical Installation Specification, within the scope of the works specified under this Sub-contract. Electrical installation mentioned therein shall mean electrical works for fire services and water pump installation.
FWP11.15 WIRING ACCESSORIES

FWP11.15.010.7 GENERAL

The Sub-contractor shall comply with all the latest requirements on equipment, materials and installation practice/method as specified in Worksection ELE20 of HKHA Electrical Installation Specification, within the scope of the works specified under this Sub-contract. Electrical installation mentioned therein shall mean electrical works for fire services and water pump installation.
FWP11.16 TESTING AND MAINTENANCE

FWP11.16.010.7 GENERAL

The Sub-contractor shall comply with all the latest requirements on equipment, materials and installation practice/method as specified in Worksection ELE30 of HKHA Electrical Installation Specification, within the scope of the works specified under this Sub-contract. Electrical installation mentioned therein shall mean electrical works for fire services and water pump installation.

FWP12.1 GENERAL

FWP12.1.010.7 DEFINITION
Portable equipment includes extinguishers, fixed sprayer units, fire blankets and any other fire service equipment used as an independent means for extinguishing a fire.

FWP12.1.020.7 APPROVAL
Only portable equipment in the list approved by the Director of Fire Services will be accepted.

FWP12.1.030.7 FIXING
All mounting fixtures and labour for installation shall be provided.

FWP12.1.040.7 CONTRACT MAINTENANCE
The Sub-contractor shall include for a Class 3 "Registered Fire Service Installation Contractor" for inspection, repair and maintenance of the portable equipment during the Contract and Maintenance Period.

FWP12.1.050.7 ACCEPTANCE
Portable fire services equipment including fire extinguishers and fixed sprayer units manufactured before the preceding year of contract completion shall not be accepted unless prior Approval from the Contract Manager is obtained.
FWP12.2  FIRE BLANKETS, SAND BUCKETS, ETC.

FWP12.2.010.7  LOCATION
Supply and distribute, sand buckets etc. in the positions shown on the Drawings.

FWP12.2.030.7  SAND AND FIRE BUCKETS
1. Sand buckets shall be of FSD accepted type;
2. Sand buckets with cover shall be of not less than 10 litres capacity and shall be galvanized steel and painted red.

FWP12.2.040.7  FIRE BLANKETS
Fire blankets shall be heavy duty type to BS 7944 and approved by FSD listed in the latest HKSAR Gazette.
FWP12.3 PORTABLE FIRE EXTINGUISHERS

FWP12.3.010.7 TYPE
1. The portable fire extinguishers shall be rechargeable hand operated extinguishers of water, carbon dioxide or dry powder type with capacity as specified;
2. Water and dry powder type extinguishers shall be cartridge operated and shall be fitted with replaceable gas cartridge inside the extinguisher cylinder.

FWP12.3.020.7 STANDARDS
All portable fire extinguishers shall be of FSD approved type listed in the latest HKSAR Gazette and shall comply with the standards as indicated below:

<table>
<thead>
<tr>
<th></th>
<th>Type of Extinguisher</th>
<th>Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Water type extinguisher</td>
<td>BS EN 3: Part 1 to 6 or BS EN 3: Part 7 to 10</td>
</tr>
<tr>
<td>2</td>
<td>Carbon dioxide fire extinguisher</td>
<td>BS EN 3: Part 1 to 6 or BS EN 3: Part 7 to 10 or UL 154</td>
</tr>
<tr>
<td>3</td>
<td>Dry power type fire extinguisher</td>
<td>BS EN 3: Part 1 to 6 or BS EN 3: Part 7 to 10 or UL 299</td>
</tr>
</tbody>
</table>

FWP12.3.030.7 OPERATION
All extinguishers shall operate without inversion. They shall be so designed with clear indication on whether they have been operated. A device shall be incorporated in the extinguishers to prevent inadvertent operation.

FWP12.3.040.7 APPROVAL LETTERS
Approval letters from FSD, Hong Kong shall be produced upon request to show that the fire extinguishers are approved by the Department.

FWP12.3.050.7 TYPE TEST CERTIFICATES
Type test certificates from British Standards Institution, organisations recognised by British Standards Institution or the Underwriters Laboratories Inc. shall be produced upon request to show that the fire extinguishers are in compliance with BS EN 3: Part 1 to 6 or BS EN 3: Part 7 to 10 or listed by UL basing on the investigation standards listed above.

FWP12.3.060.7 MARKING AND LABEL
1. All portable fire extinguishers shall be secured tightly with a label indicating the updated maintenance information in accordance with FSD’s requirements. The label shall be made of durable label approved by the Contract Manager;
2. Extinguishers shall be marked with the abbreviation of Hong Kong Housing Authority i.e. HKHA. The letters of the marking shall be 18 mm high and 12 mm wide and shall be painted on conspicuous position of the body subject to the Contract Manager’s Approval.
FWP12.4  FIXED SPRAYER UNITS

FWP12.4.010.7  TYPE

Fixed Sprayer units shall be self-contained automatically operated sprayer units to NFPA Standard 2001 or other standards where applicable, acceptable to FSD, clean agent type fitted with a sprinkler head which activates at 74 or 79°C approximately.

FWP12.4.020.7  IDENTIFICATION SYMBOLS

For rooms fitted with automatic extinguishers, identification symbols prescribed in Director of Fire Services Circular Letters shall be provided and fixed to each entrance door.

FWP13.1 PAINTING

FWP13.1.010.7 SCOPE
1. Pipework, installation and equipment shall be painted for the purpose of corrosion protection, restoration of the paint-work to "as-new" condition and identification of the various services or as specified;
2. Pipework, installation and equipment shall not be painted except the following or where specified:
   a. Ductile iron pipes inside pump rooms and water tank rooms;
   b. Galvanised mild steel (GMS) pipes outside pipe ducts and suspended ceilings; and
   c. Carbon steel pipes and mild steel pipes.

FWP13.1.020.7 GENERAL
1. Unless otherwise specified, Worksection FIN7 of the HKHA Specification Library shall be referred to for materials and workmanship of painting;
2. Pipework, installation and equipment shall be painted with the correct identification colours, colour code indications and, where appropriate, directional arrows;
3. Pipework, installation and equipment to be painted shall be cleaned, prime coated with the appropriate primer and completed with two coats of semi-gloss finishing in accordance with the manufacturer's recommendation. For GMS pipework, anti-corrosive primer suitable for galvanised steel shall be used;
4. All paints used shall comply with the prescribed limits of Volatile Organic Compound (VOC) content as set out in the Air Pollution Control (Volatile Organic Compound Regulation).

FWP13.1.030.7 UPVC PIPES
1. UPVC pipes shall not be painted except those exposed to sunlight, which shall be painted with white acrylic paint;
2. Self-adhesive colour bands shall be applied on each section of pipework for identification.

FWP13.1.040.7 DIRECTIONAL ARROWS
1. Directional arrows shall be painted on the pipes (except sprinkler pipes of less than 100 mm in diameter, drains, valves and fittings) on two visible sides at intervals not more than 6 m apart;
2. Directional arrows shall be white for dark background colours and shall be black for light background colours;
3. The length of the directional arrows shall be 150 mm and can be reduced to 75 mm for pipes equal to or less than 50 mm in diameter. The minimum body width of the arrow shall be 25 mm.

FWP13.1.050.7 IDENTIFICATION COLOUR CODE INDICATION
1. Unless otherwise specified, the identification colours, the colour code indications and the colour codes shall follow BS 1710 and BS 4800.
2. Unless otherwise specified, pipework shall be identified by painting or self-adhesive colour bands at suitable intervals not more than 6m apart as follows:
3. **Equipment and fittings shall be painted as follows:**

<table>
<thead>
<tr>
<th>Service Type</th>
<th>Colour Code Identification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fresh water pumps</td>
<td>Manufacturer's standard colour or Blue (18 E 53)</td>
</tr>
<tr>
<td>Flush water pumps</td>
<td>Manufacturer's standard colour or Green (12 D 45); no painting on stainless steel components</td>
</tr>
<tr>
<td>Fire Services pumps</td>
<td>Red (04 E 53)</td>
</tr>
<tr>
<td>Rainwater irrigation pumps</td>
<td>Manufacturer's standard colour or Black (00 E 53); no painting on stainless steel components</td>
</tr>
<tr>
<td>Valve body and handle</td>
<td>Manufacturer's standard colour</td>
</tr>
<tr>
<td>Pump Control Panel (fresh water)</td>
<td>Blue (18 E 53)</td>
</tr>
<tr>
<td>Pump Control Panel (flush water)</td>
<td>Green (12 D 45)</td>
</tr>
<tr>
<td>Pump Control Panel (fire services water)</td>
<td>Red (04 E 53)</td>
</tr>
<tr>
<td>Pump Control Panel (rainwater)</td>
<td>Black (00 E 53)</td>
</tr>
</tbody>
</table>

4. **GMS and ductile iron pipes inside pump rooms and water tank rooms shall be painted in lieu of colour bands as follows:**

<table>
<thead>
<tr>
<th>Service Type</th>
<th>Colour Code Identification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fresh Water</td>
<td>Blue (18 E 53)</td>
</tr>
<tr>
<td>Flushing Water</td>
<td>Green (12 D 45)</td>
</tr>
<tr>
<td>Rainwater pipes</td>
<td>Green (12 D 45) with black (00E 53) colour ring of approx. 100mm wide at suitable intervals not more than 6m apart</td>
</tr>
<tr>
<td>Fire services Water</td>
<td>Red (04 E 53)</td>
</tr>
</tbody>
</table>
FWP13.1.055.7 COLOUR BANDS
1. Colour bands shall be made of good quality, durable and self-adhesive PE sheet;
2. Colour bands for outdoor application shall be coated with UV inhibitor;
3. Colour bands shall be wrapped around the pipes with minimum 25 mm overlap;
4. Colour bands shall have minimum 3 years reputable local job references. The Contractor shall submit all relevant information and samples for Approval prior to ordering;
5. Combustible colour bands shall not be used in the Protected Means of Escape as defined in the Code of Practice for Fire Safety in Buildings published by the Building Department.

FWP13.1.065.7 LETTERING TO RAINWATER COLLECTION AND BREAK WATER TANKS
The following English letters with Chinese characters which shall be 75 mm high shall be painted on one conspicuous side of the rainwater collection tank and break water tank respectively by Main Contractor:
"Rainwater Collection Tank  雨水貯水缸"
"Break Water Tank  分隔水缸"

FWP13.1.070.7 AS-NEW CONDITION
At the time of handover the whole installation shall be in “as-new” condition. The Sub-contractor shall, during the course of the contract, protect all plant and equipment, and shall restore/repaint as necessary before contract completion.
FWP13.2 LABELS AND NOTICES

FWP13.2.010 LOCATION
Labels and/or notices shall be provided for all equipment, apparatus, fuses, terminals, lamps, switchgear, gauges, valves etc. wherever their provision will facilitate operation and maintenance of the installation, and where specified elsewhere.

FWP13.2.020 STATUTORY REQUIREMENTS
Labels and notices required by statutory requirements shall be inscribed accordingly whereas other labels shall indicate name and purpose of the equipment together with ratings and commissioned set values where applicable.

FWP13.2.030 MATERIAL FOR LABELS
Unless otherwise specified, labels shall be made of multi-layer bi-colour plastic material with red outer layer and white inner layer for fire services installation and with black outer layer and white inner layer for water pump installation. Lettering shall be engraved on the plastic material by cutting away the outer layer to the outline of the required letters, exposing the inner layer underneath.

FWP13.2.040 INSCRIPTION
Inscription of labels and engraving shall be in both English and Chinese characters. Details shall be submitted for Approval prior to engraving.

FWP13.2.050 WARNING NOTICES
Notices, with at least 25 mm high lettering, as detailed in FWP11.2.050 shall be prominently displayed adjacent to each surface pump set or pair of surface pump sets, or in a prominent location above underground sumps and wells for submersible or semi-submersible pump sets.

FWP13.2.080 FIXING
1. Labels and notices shall be fixed by screws. Where drilling and tapping of the equipment is impracticable, adhesive may be used subject to prior Approval;
2. For pipelines or valves, where applicable, labels shall be fixed on plastic claim loops.
FWP13.3  DRAWINGS AND DIAGRAMS

FWP13.3.010.7  WORKING DRAWINGS AND FRAMED SCHEMATIC DIAGRAMS

Floor plan and sectional elevation of the building showing fire services installations, schematic diagram of the pipe installation and schematic diagram of the electrical control system shall be provided and fixed properly to the satisfaction of the Contract Manager in the locations hereunder. The diagram shall be of A2 size minimum, unless otherwise Approved and each diagram shall be treated, such as with acrylic varnish, to prevent deterioration and mounted in an anodised aluminium frame with transparent plastic front plate of 3 mm minimum thickness and wooden backing board of 5 mm minimum thickness:

<table>
<thead>
<tr>
<th>Diagram</th>
<th>Location of Diagram</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>b.</td>
<td>Schematic wiring diagram for water level and pump control system. Adjacent to the rainwater harvesting system control panel</td>
</tr>
</tbody>
</table>

Floor plans and sectional elevations of building showing the locations of the fire services installation provided inside fire control room shall be of A3 size and fixed by folders. The folders shall be housed in a proper container constructed by acrylic plastic and mounted on wall.

FWP13.3.020.7  AS-FITTED DRAWINGS

Separate set of as-fitted drawings including Approved conduit shop drawings shall be provided for each of the systems/installations listed in FWP13.3.010 above, incorporating all amendments made during the course of this Contract on completion of the Works. The complete Approved set shall consist of three (3) print copies, three (3) set of electronic copy in AutoCAD Format and Adobe Portable Document Format and one (1) sepia of each of the drawings conforming approximately to one or other of the following standard sizes:

1. 841 x 1189 mm (AO)
2. 594 x 841  mm (A1)
3. 420 x 594  mm (A2)
4. 210 x 297 mm (A4)

Boxes with proper numbering shall be provided for printed drawings and labelled with the project name, fire services and water pump installation together with comprehensive drawing list.

FWP13.030.7  INSTRUCTION MANUALS AND TESTING AND COMMISSIONING REPORTS

1. The Sub-contractor shall submit the following documents and technical literature to the Contract Manager for the whole installation and equipment provided under this Sub-contract, including, but not limited to, the following (See PRE.BS1.200):
   a. Table of Content with numbering and index;
   b. System description;
   c. Operation instructions;
   d. Maintenance instructions;
   e. Highlights on special precautions/procedures/methods required on the use, operation, cleaning, servicing, maintenance, repair and replacement of any proprietary material and equipment installed. Requirements on proper use and operation, durability, safety and statutory side shall also be stated clearly;
   f. Supplier list for major equipments;
   g. Catalogue, user manual, operation and maintenance manual for the installation such as motor, pump (including pump curve showing the operating point), sprinkler control valve, AFA panel and motor starter, etc.;
   h. Plant and equipment catalogue and user manual as required by the Contract Manager;
   i. Priced list of recommended spares (see FWP13.040 below);
   j. Priced list of special tools;
   k. Copy of the certificate of warranty for those material, equipment and installation with warranty period last beyond Maintenance Period;
   l. Testing and commissioning reports of the installation and equipment provided;
   m. Emergency call and maintenance services;
   n. Other items as required by the Contract Manager.

2. Draft copies in Box files with proper numbering shall be provided and labelled with the project name and, fire services and water pumps installation for comment and Approval;

3. After Approval, the Sub-contractor shall submit three (3) sets of electronic copy (in compact disc) for all items above in Adobe Portable Document Format to the Contract Manager;

4. For the Rainwater Harvesting System, the Sub-contractor shall submit, in addition to the whole documents and technical literature a “Water Safety Plan” which addresses the requirements stipulated in Section 4.1 of Code of Practice for Prevention of Legionnaires' Disease.

FWP13.040.7  RECOMMENDED SPARES

The priced list of "Recommended Spares" referred to in FWP13.030 above shall include the following:

1. All bearings and bearing bushes;
2. All gaskets and jointing;
3. All seals, gland packings;
4. All filter cartridge and chemicals for rainwater harvesting system installation, etc.;

5. Other items as required by the Contract Manager.
FWP13.4 SPARES AND TOOLS

FWP13.4.010.7 WATER PUMP AND RAINWATER HARVESTING SYSTEM INSTALLATION

1. The Sub-contractor shall provide, for each Pump Room and rainwater harvesting system treatment facility room, one (1) complete set of spare fuses for each rating of fuse-switches or switch fuses installed including those fuses installed in the control circuit;

2. The Sub-contractor shall provide on the wall inside the Pump Room and rainwater harvesting system treatment facility room a wooden board with brass hooks and other device for holding the spare fuses for fuse switches or switch fuses;

3. The board shall be smoothed on both front and edges, and shall be painted to Approval;

4. Spare fuses for control circuit shall be properly fixed inside the control panel/cubicle;

5. The Sub-contractor shall provide the following spares for the rainwater harvesting system installations:
   a. One (1) complete set of spare filter cartridges for each cartridge filter installed in each rainwater harvesting system treatment facility room.

FWP13.4.020.7 FIRE SERVICES INSTALLATION

1. Tenders shall be deemed to have included sets of spare parts and special tools including spare sprinkler heads, replacement break glass plates, indicator lamps, special keys, fuses etc. as required by the Statutory Regulations and Standards in FWP1 of this Specification and for operation and maintenance of the plant and installation within the entire Maintenance Period. In addition a complete list of all replaceable parts with model number, part number and price shall be submitted together with the tender for purchase and use after the expiration of the Maintenance Period;

2. The Sub-contractor shall provide the following spares for the fire services installations in each building:
   a. Ten (10) of hose reel nozzles for each separate fire hydrant/hose reel system;
   b. Ten (10) glasses and two (2) keys of the break glass unit for each alarm system;
   c. Twenty-four (24) sprinkler heads for Ordinary Hazard installations and two (2) sprinkler spanners for each type of sprinkler used in each sprinkler system;
   d. One (1) complete set of spare fuses for each rating of fuse-switches or switch fuses installed in each Pump Room including fuses for control circuits.

| FWP14.6.030.7 REPLACEMENTS | .......................................................... | 20 |
| FWP14.6.040.7 CONDITIONS OF CONTRACT | .......................................................... | 20 |
FWP14.1 INITIAL TESTING AND COMMISSIONING

FWP14.1.010.7 PRE-TEST CLEANING
Before installations are subjected to inspection, testing and subsequent handover, the entire installation shall be thoroughly cleaned internally and externally. All water installations shall be flushed out with clean water. During the flushing operation provision shall be made to exclude filters, pumps, meters and any other item of plant which could be damaged during the cleaning operation.

FWP14.1.020.7 PERFORMANCE TESTS, ADJUSTMENTS AND COMMISSIONING
1. The Sub-contractor shall carry out complete performance tests for all equipment and systems installed by him, make all necessary adjustments, including setting all controls and checking the operation of all protective and safety devices, and commission the installations, in accordance with the manufacturers’ instructions, the requirements of the statutory rules and regulations and to the satisfaction of the Contract Manager before the installations will be accepted;
2. Prior to any tests, the Sub-contractor shall submit detailed procedures and a programme for testing and commissioning for Approval;
3. The test shall be witnessed by an authorised representative of the Contract Manager and a report shall be submitted for record purposes.

FWP14.1.030.7 PERIOD OF NOTICE
Forty-eight (48) hours notice shall be given by the Sub-contractor to the Contract Manager of his intention to carry out installation tests.

FWP14.1.040.7 TEST INSTRUMENTS
1. In addition to PRE.BS1.630 which specifies the provision of a set of measuring instruments for BSPASS and the Contract Manager’s Representatives’ use, which will be under the custody of the CMR, the Sub-contractor shall provide all necessary instruments used for measurement and testing of the installation. Except for manual/electric hydraulic pump with pressure gauge given in sub-clause (2)(o) and smoke canister for testing smoke detectors given in sub-clause (2)(p) below, the instruments used shall be calibrated with traceability to internationally or nationally recognized standards;
2. Instruments required for inspection and testing purpose whenever necessary shall include, but are not limited to, the followings:
   a. Measuring tape;
   b. Vernier caliper;
   c. Clamp-on ammeter;
   d. Multimeter;
   e. Multi-function electronic meter for measurement of current, voltage;
   f. Insulation resistance tester;
   g. Earth loop impedance tester;
   h. Pressure gauge;
   i. Fire hydrant flow gauge;
   j. Sound level meter;
   k. Dial gauge;
INITIAL TESTING AND COMMISSIONING

1. Digital stop watch;
m. Male instantaneous coupling to BS 336;
n. Manual/electric hydraulic pump with pressure gauge;
o. Smoke canister for testing smoke detectors;
p. Carpenter (spirit) level.

3. Each piece of instrument shall carry an indelible identification mark, and a label showing the due date for calibration (except otherwise calibration is specified not necessary);

4. The Sub-contractor shall submit evidence of calibration such as calibration certificates and records of calibration results of the instruments used for the Contract Manager's Approval when required. The Contract Manager may reject any instrument(s) which, in his opinion, is not suitable for the inspection or test and the Sub-contractor shall replace the instruments when required.

FWP14.1.050.7 LABOUR AND MATERIALS

1. The Sub-contractor shall despatch competent and experienced commissioning engineers and technicians to carry out the testing and commissioning of the installations;

2. All labour and materials necessary for carrying out the work shall be provided by the Sub-contractor, except that the Main Contractor will supply electricity and water as required;

3. The Sub-contractor shall supply any necessary diesel or other fuel oil for engine-driven pumps, sufficient test gases required for the discharge tests of the gas extinguishing system installations etc;

4. The Sub-contractor shall also replenish all fire extinguishing media and other materials expended or used during the tests and ensure that the entire installations are in "as new" condition at the conclusion of the tests.

FWP14.1.060.7 WATER SYSTEM TESTS

1. Water systems and circuits shall be tested hydraulically to a minimum pressure of 1000 kPa or 1.5 times the working pressure whichever is higher applied at the highest point of the system and held for a period of not less than 15 minutes for fire services installation (except sprinkler installation) and 24 hours for water feed pump installation without leaks appearing. For sprinkler installation, the hydraulic test for pipework shall be in accordance with the LPC Sprinkler Rules;

2. After flushing out the pipework, a flow test shall be performed on the hydrant/hose reel system in accordance with the Fire Services CoP;

3. A water supply test with the drain and test valves fully opened shall be made on the sprinkler system in accordance with the LPC Sprinkler Rules. An alarm test on the water gong shall also be carried out by opening the test valve to ensure that the alarm shall continuously sound in 30 seconds after the flow in the system is detected;

4. The Sub-contractor shall provide whatever hoses or drainage channels are required to safely remove the test water discharged while carrying out these tests in order to ensure that no damage to the building and property will be caused by the test water;

5. All welded joints shall be hammer tested and remain firm;

6. Following the above, a normal working test shall be carried out, during which time adjustments and regulation of valves shall be effected.
FWP14.1.070.7  ELECTRICAL AND ALARM SYSTEMS TESTS

1. Electrical Wiring systems shall be tested generally as required by the latest edition of the Electrical CoP and the HKHA Electrical Installation Specification. Low-voltage wiring shall be insulation tested to a d.c. voltage of twice the normal working voltage of the system. Any tests that are liable to cause damage to the delicate components such as those incorporating electronic circuits shall be carried out with the components disconnected;

2. For electrical power circuits other than those for fire services, tests shall include but not be limited to the measurement of power ratings, power factor and total harmonic distortion in order to ensure the systems are in compliance with the BEC;

3. Smoke detectors shall be checked for correct sensitivity settings by means of manufacturer's test set and for operation by simulated smoke tests using freon;

4. Rate-of-rise heat detectors shall be tested by gentle application of a heat source such as a hair dryer. Fixed temperature heat detectors must not be tested other than using simulated tests;

5. Battery capacity shall be tested by discharging through the alarm circuits and being charged via the incorporated charger unit. The specific gravity of the electrolyte shall be tested with a clean hydrometer;

6. The input d.c. supply to the alarm supervisory circuitry shall be checked for correct voltage and stability such as to match the signal and alarm triggering devices.

FWP14.1.080.7  GAS EXTINGUISHING SYSTEMS TESTS

1. Gas extinguishing system manifolds shall be tested in accordance with FWP9.7.090. Pipework shall be tested to a minimum of 1.5 times the operating pressure of the system;

2. Apart from the performance and electrical tests as indicated above, a discharge test using 10% of the required quantity of the extinguishing agent shall also be performed to ensure continuity of pipework and freedom of discharge through nozzles.

FWP14.1.090.7  FSD INSPECTION AND WITNESS OF TESTS

Additional tests, where not specified in the Specification, shall also be carried out to meet the requirements of the Fire Services CoP to the satisfaction of FSD. The Sub-contractor shall make all necessary applications to FSD and attend upon their representative for the purpose of these tests and inspections.

FWP14.1.100.7  PUMP ROOM NOISE LEVEL TESTS

1. Pump room noise levels shall be measured at the nearest noise sensitive receiver and corrected in accordance with the requirements stipulated in the "Technical Memorandum for the Assessment of Noise from Places other than Domestic Premises, Public Places or Construction Sites", hereinafter referred to as the "Technical Memorandum", issued by the Environmental Protection Department. A measurement report which shall be endorsed by an independent consultant employed by the Sub-contractor shall be submitted to the Contract Manager for Approval;

2. Sound level meters used for the measurements shall comply with the Standard specified in the "Technical Memorandum";

3. Both air and structure borne noises emanated from pump rooms shall be measured to verify their compliance with the requirements stipulated in the "Technical Memorandum" in all circumstances.
FWP14.1.105.7  72-HOUR RECORDING OF FRESH AND FLUSH WATER PUMP OPERATIONS
1. After completion of installation and tenant intake, 72-hour recording of fresh and flush water pump operations over Saturday and Sunday shall be carried out for each building block by the Sub-contractor using automatic recorders to confirm the properness of the pump control settings. The records shall show clearly the time and duration of individual pump operations and be submitted to the Contract Manager for approval;
2. Any control irregularities identified shall be remedied and further recordings shall be carried out until a proper 72-hour pump operation pattern is achieved to the satisfaction of the Contract Manager.

FWP14.1.110.7  TESTING AND COMMISSIONING REPORT
A testing and commissioning report shall be forwarded to the Contract Manager within fourteen days after completion of commissioning the installation. The report shall be verified and endorsed by the Supervising Engineer in accordance with FWP1.5.020 sub-clause (1).

FWP14.1.120.7  WATER QUALITY TESTS FOR RAINWATER HARVESTING SYSTEM INSTALLATION
1. The Sub-contractor shall carry out the first water quality test for the rainwater harvesting system installation after system commissioning to ensure that the water quality requirement has been satisfied. If rain is unavailable for the test, the Sub-contractor shall coordinate with the Main Contractor to pour fresh water supplied by the Main Contractor at catchment areas selected by the Contract Manager to facilitate the test. The second water quality tests shall be carried out after the tenth rainy day or at a specified date before the Contract Completion as instructed by the Contract Manager to monitor the stability of the water treatment performance subsequent to the first water quality test. Afterwards, regular water quality tests shall then be carried out during the Maintenance Period according to the frequency as specified in sub-clause (3) of FWP14.4.060;
2. The Sub-contractor shall make sure the harvested water quality to conform to the parameters of water quality requirement as follows or the latest requirements / standards as specified by the Water Authority, whichever is the stringent:

<table>

</table>

All testing parameters as specified above shall be tested by an accredited laboratory. If water sampling results are satisfactory, system can be operated with the current water treatment set point. For any incidence of unacceptable water quality, the system shall be suspended until the problem is solved and to the satisfaction of the Contract Manager;

3. The methods for collecting water samples and preservation and handling of water samples for testing Legionella and HCC shall comply with relevant internationally recognised standards, such as AS/NZS 2031, BS 7592, BS EN ISO 5667-3, or BS 6068-6.3;

4. The test plan and schedule detailing the sampling points and time shall be submitted to relevant government departments or the designated consultant for comments and acceptance if necessary as directed by the Contract Manager;

5. A testing report issued by the accredited laboratory shall be forwarded to the Contract Manager within fourteen days after completion of the water quality test.

**FWP14.1.130.7 TRAINING FOR RAINWATER HARVESTING SYSTEM INSTALLATION**

1. The Sub-Contractor shall provide 2 training courses as instructed by the Contract Manager on the operation and maintenance of the whole rainwater harvesting system installation;

2. The Sub-Contractor shall submit the operation and maintenance manual for the rainwater harvesting system installation and obtain an Approval for the manual by the Contract Manager prior to the commencement of the training courses;

3. One training course shall cover detailed operational procedures and steps and precautions for training operational and maintenance staff. The other training course shall cover brief description of the system and precautions for briefing management staff and/or non-technical staff. Training notes/manuals are required in both English and Chinese. At least 5 seats shall be given for each training course. Training Venue shall be on Site or other venues as instructed by the Contract Manager.
FWP14.2 MAINTENANCE PERIOD

FWP14.2.010.7 DEFINITION

The Sub-contractor shall furnish maintenance for the complete fire services installation and water pump installation for a period of twenty-four (24) months following the certified competition date of the Main Works or any Section(s) of the Main Works.
GENERAL MAINTENANCE

FWP14.3  GENERAL MAINTENANCE

FWP14.3.010.7  SCOPE
General maintenance shall comprise all items included in this sub-section.

FWP14.3.020.7  REPAIRS AND REPLACEMENTS
All repairs and replacements necessary to maintain the installations in good working order, including supply of materials and labour, carried out in accordance with the manufacturers’ recommendations/instructions to the satisfaction of the Contract Manager.

FWP14.3.030.7  CONSUMABLES
Supply of all normally consumable items including lubricants, cleaning materials, fire extinguishing media, fuses, lamps etc. as required.

FWP14.3.040.7  REGULAR MONTHLY VISITS
Regular monthly maintenance visits covering full inspection, lubrication, cleaning, adjustment, testing, and keeping all equipment in first class operating condition.

FWP14.3.050.7  RECORD OF SITE ATTENDANCES
1. To record all site attendance, on arrival and departure, for regular service visits or emergency breakdown call, together with details of the work carried out, in the record book held at the estate office;
2. To note comments, insert in the record book, and action accordingly;
3. A report in duplicate shall be sent to the Contract Manager immediately following a major repair, repeated breakdowns of service due to system or equipment fault of similar nature, or as and when required by the Contract Manager;
4. The report shall include the cause necessitating such a repair, the reasons for such a breakdown of service and the time and date of remedial action taken, of completion of repair and of the resumption of normal service;
5. A list of equipment replaced shall be attached to the report.

FWP14.3.060.7  SIGNING RECORD BOOK
1. For each routine or call out visit, during the Maintenance Period, the workman, on arrival at the Estate, shall report to the Estate Office and sign a "Fire Services and Water Pump Maintenance Record Book", which shall be submitted by the Sub-contractor and shall be kept by the officer-in-charge of the Estate;
2. At the time of signing, they shall note any message written in the book concerning the performance of the Fire Services and Water Pump Installations in the Estate, and shall take such action as may be required;
3. When leaving the Estate, the workman shall report to the officer-in-charge and enter in the "Fire Services and Water Pump Maintenance Record Book” a brief report on any work completed, or on the fact that they have found the system operating satisfactorily;
4. In general, the "Fire Services and Water Pump Maintenance Record Book” shall include, but not limited, to the following items:
   a. The name of the responsible person;
   b. Brief details of any servicing arrangement;
c. Dates and times of all alarms (genuine, practices, test or false) together with their causes where known;
d. Dates, times and types of all defects and faults;
e. Dates and types of all test and servicing;
f. Dates and times of all periods of disconnection;
g. All alteration to the system.

FWP14.3.070.7 **RESPONSE TIMES**
Immediate answering of breakdown calls, whether true or false, and attendance to such calls in accordance with the requirements stipulated below -

<table>
<thead>
<tr>
<th>Description</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arrival for maintenance in the case of interruption of fresh water supply</td>
<td>Within 1 hour</td>
</tr>
<tr>
<td>Arrival for maintenance in the case of interruption of flush water supply</td>
<td>Within 2 hours</td>
</tr>
<tr>
<td>Resumption of fresh water supply</td>
<td>Within 9 hours after inspection</td>
</tr>
<tr>
<td>Resumption of flush water supply</td>
<td>Within 20 hours after inspection</td>
</tr>
<tr>
<td>Arrival for maintenance for incidents not affecting fresh or flush water supply</td>
<td>Within 2 hours (3 hours if call from outlying islands) during normal working hours; Within 3 hours out of normal working hours</td>
</tr>
</tbody>
</table>

FWP14.3.080.7 **CONTACT POINTS**
In connection with FWP14.3.040 to FWP14.3.060 above, the Sub-contractor shall submit the name and telephone number of the responsible persons to be contacted 24-hours a day together with the proposed schedule for the monthly regular maintenance visits at the start of the Maintenance Period.

FWP14.3.090.7 **COMPETENCE OF ENGINEERS**
1. Despatch competent and experienced maintenance personnel equipped with the appropriate testing instruments, tools, equipment etc. to inspect, service, test, adjust and maintain the fire service, rainwater harvesting system and water pump installation in a satisfactory operating condition. Allow for carrying out such inspection, service, testing, adjustment and maintenance at a time outside normal office hours including general holidays;
2. Particularly in the case of complex fire service, rainwater harvesting system and water pump installations, arrange for at least two senior servicemen being thoroughly familiarised with all aspects of such installation to be responsible for inspection, maintenance and testing of the installation. In this type of installation the Sub-contractor must be prepared to provide a high level of service, allowing for more frequent servicing of environmentally sensitive equipment and when necessary, to ensure prompt rectification of the faults resulting in unacceptably high rate of false alarms all at the expense of the Sub-contractor.

FWP14.3.100.7 **24 HOUR ON-CALL SERVICE**
1. The Sub-contractor shall provide 24 hour on-call service at any time during the Maintenance Period;
2. The Contract Manager may instruct the Sub-contractor, in the Maintenance Period, via telephone, mobile phone, paging service or any other means as advised by the Sub-contractor and Approved by the Contract Manager, to attend to reported breakdowns, and the Sub-contractor shall dispatch competent technicians or such other suitable personnel, who shall arrive at site and shall carry out any necessary inspection, testing and repair work within the time specified under FWP14.3.070 and under all weather conditions. In the event that it is not possible to meet the requirement as stipulated in FWP14.3.070, the Sub-contractor shall explain immediately to the Contract Manager or his or her representatives the reason for such non-conformance;

3. The Sub-contractor shall submit to the Contract Manager for this purpose at least two names of English speaking representatives, who can be reached at any time of the day, with contact telephone numbers of direct lines, mobile phones or paging service for Approval;

4. Prior Approval shall also be obtained for any subsequent changes of representatives, contact telephone numbers etc. during the Maintenance Period at least two weeks before the change is effected.
PARTICULAR MAINTENANCE

FWP14.4 PARTICULAR MAINTENANCE

FWP14.4.010.7 FIRE DETECTION AND ALARM SYSTEM

1. The Sub-contractor shall visit the installation at least once every three months to carry out tests, repairs and adjustment. All environmentally sensitive devices e.g. smoke and heat detectors, electronic sensors, relay contacts, plug and socket contacts, printed circuit boards, edge connectors etc. shall be inspected, cleaned, adjusted, and calibrated. During the visits, the following tests and checks should be made:

2. A test sequence shall be carried out in accordance with the manufacturer's instructions. The test sequence shall prove:
   a. That the condition of the wiring, controls and indicating equipment of all zone circuits are in good working order;
   b. That the alarm condition on each zone will activate the common alarm circuits. If manual fire alarm call points are fitted the alarm conditions shall also be initiated by the operation of one such call point in each zone. A different manual fire alarm call point shall be used on each occasion and a record must be kept by the Sub-contractor;
   c. That activating the common alarm circuits will result in the operation of the alarm bells and the satisfactory transmission of the alarm signal to the appropriate Fire Services Communication Centre if equipped with a direct line connection;
   d. Also that activating the common alarm circuits will result in the starting/stopping of the ventilating fans and/or fire booster pumps as desired and result in the operation of any Fireman's lift, if control circuits for such operation are provided in the system.

3. The operation of alarm bells and the transmission of the alarm signal may be suppressed during tests 1 and 2. Tests 3 and 4 will prove that all system alarms and relevant controls are operating correctly;

4. In the course of the test sequence, the correct operation of all indicators including fault warnings and all alarm bells shall be noted and checked. All indicating lamps shall be checked and, if found defective, shall be replaced by the Sub-contractor at his expense;

5. About 20% of the detectors, chosen at random, with at least one unit in each zone shall be subjected to a simulated functional test. Smoke detectors shall be tested with freon and rate-of-rise heat detectors with an artificial heat source e.g. hair dryer respectively;

6. Battery and chargers shall be examined and tested to ensure they are in good and proper serviceable condition. Battery terminals and connectors shall be tightened and the former shall be cleaned and protected with petroleum jelly. Electrolyte shall be topped up as necessary and its specific gravity shall be measured and corrected to the appropriate value if required. Battery shall also be discharged and recharged to ensure compliance with the AFA Rules;

7. The d.c. power supply to the alarm supervisory circuitry shall be checked and adjusted for correct voltage and stability;

8. In addition to above, the direct line connection to the Fire Services Communication Centre shall be tested once every 2 weeks by the Sub-contractor.

FWP14.4.020.7 FIXED FIRE PROTECTION SYSTEMS USING GAS EXTINGUISHING AGENTS

The Sub-contractor shall visit each installation at least once every three months and carry out the following tests including necessary repairs and adjustments:
1. All electrical components, including cables, detectors, relays, alarm panel and bells, batteries etc. shall be tested and examined as specified in FWP14.4.010;

2. All automatic/manual release mechanism shall be checked and serviced in accordance with the manufacturer's instructions to ensure their proper operation. The Sub-contractor shall be responsible for ensuring that all such mechanisms are properly lubricated and kept free from corrosion;

3. All pipes and fittings shall be checked for leakage and corrosion and repaired or repainted as necessary. All valves shall be checked for freedom of operation and nozzles shall be cleaned by removing the dust, dirt and other obstacles deposited on them;

4. All cylinders containing the chemical extinguishing agents shall be checked to ensure that the contents are up to the specified standard and are so marked with paint on the outside of cylinders. The Sub-contractor shall recharge any cylinders to the specified content level if carbon dioxide cylinders are found to exhibit a 10% loss of content by weight except where the discharge (usually total) is due to genuine fire, false alarm or accident caused by others. However, where the discharge is due to a faulty detector or other part of the equipment the Sub-contractor shall recharge the system at his own expense;

5. All warning notices and operating instructions shall be checked to ensure that they are fixed in the proper position, are in a readable condition and are both in English and Chinese unless otherwise confirmed in writing by the Contract Manager;

6. All time delay and lock-off devices shall be inspected and tested to ensure that they are in correct working condition;

7. The coincident unit shall be checked for proper function by actuating detectors of two separate zones;

8. All ancillary functions of the system such as shutting off air-conditioning/ventilation plant, lowering fire shutters or curtains etc. shall be checked for proper operation.

FWP14.4.030.7 WATER PUMP INSTALLATION AND FIXED FIRE SERVICES SYSTEMS USING WATER

The Sub-contractor shall visit the fire services and water pump installation, including water pumps and the associated electrical works and controls, at least once every three months and carry out the following inspection, tests, adjustment and repairs:

1. All electrical components including cables, alarm panel and bells, batteries, control relays, starters etc. shall be inspected and tested as specified in FWP11 and FWP14.4.010 above;

2. All pipes and fittings shall be checked for leakage and corrosion and repaired or repainted as necessary. All valves shall be checked for freedom of operation, all control valves kept locked in the "open" position by strapping as applicable, inlet valves correctly bonded to earth, water supplies maintained in service etc.;

3. Inspection shall be carried out to ensure that all sprinkler heads are maintained in good working condition, clean and free from corrosion and are not covered with distemper, paint, dust, fluff etc. Any sprinkler heads found defective and suspected of being defective shall be replaced;

4. Water and air pressure gauges must be inspected to ensure that correct pressures are maintained. Gauges shall be calibrated at regular intervals. Water levels and air pressure in pressure tanks must be checked to ensure that they are maintained in proper condition;

5. An alarm test shall be made on the sprinkler system by opening the test valve and the time taken to sound the alarm gong noted. The alarm shall be allowed to ring for about 30 seconds in order to ascertain that it is not ringing intermittently. Any repairs or adjustment which may prove to be necessary after the test shall be carried out with no delay;
6. The alarm and functional signals shall be checked to ensure that they are properly transmitted to the central control and supervisory panel;

7. All metallic elevated, priming and pressure tanks constructed by the Sub-contractor shall be inspected for sediments, rust and corrosion. The Sub-contractor shall remove sediments, rust and repaint the corroded parts as necessary;

8. The Sub-contractor shall grease the valves, the bearing and other relevant mechanical parts of the pumps, motors and engines as recommended by the manufacturers. A test run of at least 10 minutes shall be performed on each pump to ensure the pumping systems are in satisfactory operating condition. Engine driven pumps shall be capable of being started in 30 seconds or less. All manual and automatic starting and control mechanism, components, switches etc. shall be checked for proper functioning;

9. The Sub-contractor shall replace, as required, all parts such as bearings, valve seats, packing etc. due to wear and tear. In addition the Sub-contractor shall maintain in good working order the engines, the motors and also the electrical power supply to the pumps to and from its electrical isolator or switch-fuse, including changeover switches (if any), starters, fixed and flexible conduits between isolator/switch-fuse and cables therein. The Sub-contractor shall also maintain all pump control pressure and level switches in good order and inspect circuitry as previously indicated for electrical systems;

10. All strainers shall be cleaned by the Sub-contractor.

FWP14.4.040.7 PORTABLE EQUIPMENT
1. Portable equipment if supplied and installed by the Sub-contractor shall be inspected and checked annually to ensure that they are in good working condition;

2. Any fire extinguishers and fixed sprayer units losing 10% of its nominal content by weight shall be recharged / replaced to the required standard.

FWP14.4.050.7 AUTOMATIC SELF CLEANING STRAINERS
1. The regular maintenance shall be based on the manufacturer recommendation. The Sub-Contractor shall submit the maintenance schedule to the Contract Manager for Approval;

2. The automatic self cleaning strainers shall be opened up for inspection and cleaning annually.

FWP14.4.060.7 RAINWATER HARVESTING SYSTEM INSTALLATION
1. The Sub-contractor shall provide the following maintenance service during the Maintenance Period:
   a. Check the condition of all components for the rainwater harvesting system installation according to the schedule as specified in sub-clause (2) of FWP14.4.060 and repair/replace the faulty component(s) as necessary;
   b. Conduct the water quality tests on the testing parameters according to the frequency as specified in sub-clause (3) of FWP14.4.060;
   c. Submit a monthly operation and maintenance report which shall record the operation data of the rainwater harvesting system installation including electricity, rainwater and fresh water consumption and the maintenance activities conducted for each month, every two month or each quarter;
   d. All monthly, bimonthly or quarterly activities shall be recorded in record book as specified in FWP14.3.060;
   e. Replenish all the necessary chemicals for the chlorine dosing system.
2. The maintenance schedules shall include, but not be limited to, the following components. The Sub-contractor shall submit a specific maintenance schedule including all the offered equipment and recommendations from the manufacturers for the Contract Manager’s Approval.

3. Sampling and testing of water quality parameters of treated rainwater shall be conducted monthly during rainy season (Apr – Sept) and quarterly during dry season (Oct – Mar).
   
a. Testing reports issued by the accredited laboratory shall be forwarded to the Contract Manager within fourteen days after completion of the water quality test;

b. If the testing results indicate that the testing samples exceeded the water quality standards as specified in sub-clause (2) of FWP14.1.120, the use of the rainwater harvesting system installation shall be suspended until the problem is resolved and to the satisfaction of the Contract Manager. System operation shall be investigated and subsequent re-sampling and testing shall be performed to confirm the results. Investigation report with remedial proposals shall be submitted for the Contract Manager's Approval prior to implementation of the proposed rectification works. The Sub-contractor shall be responsible for all the costs for investigation and rectification works;

c. Proper measures to prevent health risk or nuisances to the public (e.g. limit the irrigation time and frequency or suspension of the use of Rainwater Harvesting System) shall be carried out according to the nature of the problems and possible consequences.
FWP14.5  ANNUAL AND FINAL MAINTENANCE, TESTING AND HANOVER

FWP14.5.010.7  FIRE DETECTION AND ALARM SYSTEM
At the annual and final inspection, the Sub-contractor shall, in addition to the quarterly inspection and testing, take down all smoke detectors, clean them "in-situ" in accordance with the manufacturer's instructions, test them for correct operation with the manufacturer's test set before reinstating them for service. Any defective detectors shall be replaced or "factory cleaned" to the manufacturer's recommendation before reinstated for service. Any smoke detectors subjected to dust and dirt accumulating shall also be despatched for factory cleaning as instructed by the Contract Manager. All detectors removed for factory cleaning shall be replaced with spare units or alternatively a separate surveillance system shall be provided to cover the unprotected areas as resulted. All expenses for the above work shall be born by the Sub-contractor.

FWP14.5.020.7  FIXED FIRE PROTECTION SYSTEMS USING GAS EXTINGUISHING AGENTS
The Sub-contractor shall carry out the same amount of work as the quarterly inspection, testing and maintenance services.

FWP14.5.030.7  WATER PUMP INSTALLATION AND FIXED FIRE SERVICES SYSTEMS USING WATER
At the annual and final inspection, the Sub-contractor shall, in addition to the quarterly inspection and testing, carry out the following inspection, tests, adjustment and repairs as required:

1.  
   a. Inspection and testing and by means of wet drill on the hydrant and hosereel installation shall be carried out in accordance with the FSD requirement. The wet drill shall consist of coupling lengths of hose to two or more hydrants and opening the valve to produce water at the nozzles. Great care and precise liaison with all concerned must be exercised by the Sub-contractor to guard against flooding and water seepage. The Sub-contractor shall be liable to bear the full cost of any damage due to flooding and seepage. Hydrants not used at the wet drill shall each be fitted with a blank cap over the outlet, and checked by opening and closing the valve and spindle to ensure that they are free in operation;

   b. Testing of the pressure and flow of the water supply on the hydrant and hosereel installation should be done from the outlets at the highest point. The opening of two or more outlets and directing the water from the roof tanks should be sufficient to indicate the state of the water supply, but if there is any doubt as to the flow or pressure of the water, a more accurate test with suitable gauges should be carried out.

2. Each length of hose shall be uncoiled, laid out straight and examined;

3. The test shall be made with the drain and test valves in accordance with LPC Sprinkler Rules;

4. The concrete water tanks constructed by the Main Contractor shall be inspected for rusting and sediments. The sub-contractor shall inform the Contract Manager in writing if any cleaning and rectification on the tanks are necessary.
FWP14.5.040.7 PORTABLE EQUIPMENT
The Sub-contractor shall carry out annual and final inspection as FWP14.4.040.

FWP14.5.050.7 TESTS AT EXPIRY OF MAINTENANCE PERIOD
At the end of the Maintenance Period the Sub-contractor shall repeat the following tests to the satisfaction of the Contract Manager.

1. All function test for water pumps and pump control cubicles;
2. Cleaning all strainers.

FWP14.5.060.7 FINAL ACCEPTANCE TEST AND CERTIFICATE OF MAINTENANCE FOR FIRE SERVICES INSTALLATIONS
At the end of the Maintenance Period, the Sub-contractor shall ensure that the installations are in an "as-new" condition and shall carry out a final acceptance test for the fire services, rainwater treatment and water pump installation. A Certificate of Maintenance (FS 251) shall be submitted to FSD with a copy to the Contract Manager within 14 days after the annual and final tests. The certificate together with a list of the fire services installation and equipment shall also be copied, framed and displayed in a prominent area of each building concerned under the direction of the Contract Manager.

FWP14.5.070.7 HANDOVER
The services installations will not be deemed as acceptable for handover to the Contract Manager until each installation is in good working order and all "as-fitted" drawings, instruction and maintenance manuals, spare parts lists, test reports, test certificates etc. have been submitted to the Contract Manager.
FWP14.6 RESPONSIBILITIES

FWP14.6.010.7 SAFETY OF INSTALLATIONS
The Sub-contractor shall be responsible for all repairs necessary to maintain the installations in a safe, reliable and operative condition at all times. Ensure that servicing staff carry out necessary repairs immediately, utilising manufacturer's original replacement parts. Any component taken down for servicing shall be reinstated within 2 hours or otherwise replaced by a spare unit at the Sub-contractor's expense.

FWP14.6.020.7 INTERRUPTION OF FIRE SERVICES
The Sub-contractor shall ensure minimum interruption to the functioning of the fire service installation during each inspection, testing, repair or maintenance service. He shall inform FSD of the commencement and completion of each job whenever the disconnection, reconnection or testing of the fire services communication direct line is involved. Where any part of the fire service installation is out of service temporarily during the progress of work, the Sub-contractor shall place a suitable notice in a prominent position on the Control Panel so that the client is aware of the situation and FSD will not be called out unnecessarily. This is, however, not to be construed as an authority to leave any part inoperative for an undue length of time.

FWP14.6.030.7 REPLACEMENTS
1. The Sub-contractor shall, as and when instructed thereof by the Contract Manager, repair or replace at his own cost any part of the system proved to be defective by reason of Sub-contractor's negligence, faulty design, inadequate routine maintenance and supervision, workmanship or materials. No claim whatsoever shall be made by the Sub-contractor for such repair or replacement if it is within the scope of the Sub-contractor's responsibility;
2. Any renewals or repairs necessitated by reason of negligence or misuse of the equipment or by reason of any other cause beyond the Sub-contractor's control (with the exception of ordinary wear and tear) shall be carried out at an additional cost with prior notice to the Contract Manager.

FWP14.6.040.7 CONDITIONS OF CONTRACT
1. The maintenance and servicing works as described in FWP14 form part of the Main Works under Clause 8.3(2)(c) of the General Conditions of Main Contract;
2. The Sub-contractor's attention is drawn to Clause 5.13 of the General Conditions of Main Contract, which appertains throughout the Maintenance Period, and before commencing any work ordered under Clause 10.1 of the General Conditions of Main Contract, the Sub-contractor shall, at his own expense, make all suitable arrangements to avoid damage to property or installations provided by others.
FWP15 SYSTEM COMPONENTS
FWP15.1 SYSTEM COMPONENTS ........................................................................ 3
FWP15.1.010.7 CARTRIDGE FILTER ................................................................. 3
FWP15.1.020.7 CHLORINE DOSING ................................................................. 3
FWP15.1.030.7 FLOW METER .......................................................................... 4
FWP15.1.040.7 WATT-HOUR METERS ......................................................... 4
FWP15.1.050.7 CONTROL SYSTEM .............................................................. 4
FWP15.1.060.7 PRE-SETTLEMENT TANK ................................................... 5
FWP15.1.070.7 2-WAY VALVE ...................................................................... 5
FWP15.1 SYSTEM COMPONENTS

FWP15.1.010.7 CARTRIDGE FILTER

1. Cartridge filter shall be capable to remove 90% of all suspended particulate with diameter equals ten-micron or above;

2. The filter cells shall be assembled in cartridges for easy replacement on site;

3. The filter cells shall be so arranged that the water stream passes uniformly and proportionally through the filter cells. Provision shall be made to retain filter in position and prevent migration and settlement;

4. Filter vessel shall be made of stainless steel of BS EN 10088-1 grade 1.4301 (grade 304) or equivalent. All stainless steel components shall be mirror polished and electro polished to resist adhesion of dirt and scale;

5. Vessel shall be equipped with both automatic air vent and manual air vent;

6. Pressure gauges shall be mounted on vessel for reading the differential pressure before and after the filter for sensing blockage of filter;

7. Working pressure of cartridge filter shall not be less than 10 bar and the testing pressure shall be of 1.5 times of the working pressure;

8. Cartridge filter shall be preassembled and tested by the manufacturer with satisfactory results prior to delivery. Test report for each delivered cartridge filter shall be submitted to the Contract Manager for Approval.

FWP15.1.020.7 CHLORINE DOSING

1. The chlorine dosing system shall comprise of a chemical feed pump, probe type residual chlorine sensor, a chemical storage tank and associated pipework. The chlorine dosing system shall have adequate and adjustable chemical feed rate to achieve the required residual chlorine level under the system flow rate;

2. The chemical feed pump shall be of positive displacement reciprocating diaphragm design with a manually adjustable feed rate;

3. The chemical feed pump shall be gear-driven by close-coupled a.c. motor suitable for operation on the local power supply system. Each pump set shall be a self-contained package unit consisting of a pump, a driving motor and a totally enclosed gear case;

4. The probe type residual chlorine sensor shall conform to the standards of CE, UL listed and CUL;

5. The probe type residual chlorine sensor shall be able to continuously monitor the concentration of chlorine in the collected water at the rainwater collection tank and control the chlorine dosing system to automatically adjust the chemical feed rate once the residual chlorine level deviates from the pre-set values;

6. The probe type residual chlorine sensor shall cope with the concentration of chlorine and the Sub-contractor shall demonstrate the compliance to the satisfaction of the Contract Manager;

7. The chemical storage tank shall be made of a suitable material to contain sodium hypochlorite solution. The tank shall be capable to be replaced without interrupting the rainwater harvesting system installation;

8. Chlorination shall be effected by injecting dosage at the bottom of rainwater collection tank.
FWP15.1.030.7 FLOW METER

1. Flow meters shall be provided as shown on the Drawings. The installation of the flow meter shall follow the manufacturer's recommendation with sufficient length of straight pipe run both at the upstream and downstream piping;

2. The flow meter shall be of electromagnetic or ultrasonic type, and of the cumulative type, i.e. a cumulative volume of water passing through the device in litre or cubic meter, and shall be suitable for the chemical and physical properties of the fluids to be measured and suitable for both horizontal and vertical installations;

3. Each flow meter shall consist of the flow sensor, an integral signal converter/transmitter and a digital display unit. The flow sensor shall be installed in/on the water pipework without obstructing the flow. The protection class of the sensor and converter/transmitter housing shall be at least to IP 67 and IP 65 respectively. The flow meter shall have a constant accuracy to a maximum error of ±0.5% of the actual flow for flow velocity of greater than or equal to 0.5 m/s;

4. The flow meter shall conform to BS EN 61000-6-1, BS EN 61000-3-2, BS EN 61000-6-2, BS EN 61000-6-3 and BS EN 61000-6-4 or similar international standards on Electro-magnetic Compatibility (EMC) compliance for industrial and commercial applications.

FWP15.1.040.7 WATT-HOUR METERS

1. Watt-hour meters shall be provided by the Sub-contractor to monitor the electricity consumption of chlorine dosing equipment in Rainwater Harvesting System Treatment Facility Room and rainwater irrigation pumps when installed at strategic locations approved by the Contract Manager;

2. Watt-hour meters shall comply with IEC 62053-11 and shall have Class 2 accuracy calibrated at the normal working voltage and frequency.

FWP15.1.050.7 CONTROL SYSTEM

1. A control and metering system shall be provided and installed in each plant room for rainwater harvesting system installation to allow standalone control and monitoring of the entire rainwater harvesting system installation. The following functions, but not be limited to, shall be available and performed by the control system:
   a. Automatic control and monitoring upon receipt of monitoring signals from different equipment;
   b. Manage all circuits or signals from different equipment to be monitored, including chlorine dosing system, level control switches of the rainwater collection tank, 2-way valves and rainwater irrigation pump sets;

2. The control system shall monitor the status of rainwater collection tank level control switches to provide on/off control for the 2 number of inter-connected 2-way valves to control water being either fed from the rainwater collection tank or fresh water break tank as specified in FWP2.3.2.010;

3. The Sub-contractor shall provide a local control panel to monitor and allow manual control of the equipment at Rainwater Harvesting System Treatment Facility Room, which shall include, but not limited to the following:
   a. Local on/off switches for chlorine dosing system;
   b. Position indication for the 2-way valves (harvested rainwater / potable water / isolation);
   c. Audible and visual fault alarms for any fault of equipment monitored by the control panel, chlorine dosing system, rainwater collection tank level control switches and 2-way valves. The fault signal when triggered shall be transmitted to the security guard counter;
d. Full / empty status of rainwater collection tank;

e. Malfunction of chlorine dosing system;

f. Empty status of chlorine dosing system (if bleaching agent tank used);

g. Blockage of cartridge filter;

h. Opening status of inlet valve of rainwater collection tank;

i. Pressure reducing valve clogging.

4. The Sub-contractor shall provide a local control panel to monitor and allow manual control of the equipment at Rainwater Irrigation Pump Room, which shall include, but not be limited to the following:

a. Local on/off switches for rainwater irrigation pump sets;

b. Operation status indication lamps for rainwater irrigation pump sets;

c. Audible and visual fault alarms for rainwater irrigation pump sets. The fault signal when triggered shall be transmitted to the security guard counter;

d. Audible and visual alerts for the need to prime rainwater irrigation pump sets.

FWP15.1.060.7 PRE-SETTLEMENT TANK

1. A pre-settlement tank shall be provided by the Main Contractor inside the rainwater collection tank. Debris and leaves shall be separated from the collected rainwater there with sand and mud settling at the bottom of the pre-settlement tank. The collected rainwater shall overflow into the adjacent storage compartment through a coarse stainless steel screen. Stainless steel shall be of Grade 1.4301 (Grade 304) in accordance with BSEN 100881-1;

2. The Sub-contractor shall provide a perforated or wire mesh stainless steel bucket inside the pre-settlement tank. The bucket shall be easily taken out for removal of the collected debris. Stainless steel shall be of Grade 1.4301 (Grade 304) in accordance with BSEN 100881-1;

3. The bucket of the pre-settlement tank shall be divided into two (or more) mesh buckets each of different mesh sizes if it is too large to perform maintenance. The one closer to the inlet shall have larger mesh and its height shall be lower than the water inlet to avoid possible blocking by accumulated debris. The design of the bucket shall be approved by the Contract Manager.

FWP15.1.070.7 2-WAY VALVE

1. 2-way valve shall be an assembly consist of a valve, an actuator and a controller in a cartridge assembly;

2. 2-way valve shall be of on-off control operated by the actuator via controller and allow/prevent water flowing through the valve at on/off position respectively;

3. Valve shall be controlled by level control switches at rainwater collection tank as specified in FWP2.3.2.010;

4. The valve assembly shall operate at low voltage and be of low power consumption;

5. The valve assembly shall operate silently and without water hammer.

LTE1.1  SCOPE OF SPECIFICATION AND DEFINITIONS

LTE1.1.010.7  SCOPE OF SPECIFICATION
This Specification covers the lift and escalator installation undertaken for the Hong Kong Housing Authority.

LTE1.1.020.7  SPECIFICATION AND DRAWINGS
The lift and escalator installation shall comply in every respect with this Specification unless otherwise specified in the Project Specific Specification (PSS) and on the Drawings for a particular project, or modified by the written instructions of the Contract Manager.

LTE1.1.030.7  DEFINITIONS AND INTERPRETATIONS
In this Specification, the word "shall" is mandatory, the word "will" is informative, the word "should" is advisory and the word "provide" means supply and fix, or supply and install including testing and commissioning. In addition, the following words shall have meanings herein assigned:

1. "Sub-contractor"
The person, firm or company contracting for the Lift Installation, the Escalator Installation or the Lift and Escalator Installation including his or their personal representative, successors or permitted assigns.

2. "Electrical Sub-contractor"
The person, firm or company contracting for the Electrical Installation including his or their personal representatives, successors or permitted assigns.

3. "Regulations"
Any Ordinances or Regulations published by the Government, by-laws of any local or duly constituted authority and rules or regulations of public bodies and companies which may be applicable to the Sub-contract Works.

4. "Machine-room-less Lift"
A lift installation where all its driving machinery and safety components are installed inside the lift well and the requirement for a lift machine room is not necessary.
STATUTORY OBLIGATIONS AND REGULATIONS AND GENERAL PRACTICE

STATUTORY REGULATIONS

The Sub-contractor shall comply with all Regulations and requirements including those of the Government of the Hong Kong Special Administrative Region, the Hong Kong Fire Services Department (FSD), the Building Authority, the Electrical and Mechanical Services Department (EMSD) and the relevant Power Supply Company, together with any revisions or amendments made thereto, and shall be responsible for giving notifications to the appropriate Authorities and for paying all fees all in accordance with the Sub-contract. The followings are particularly relevant:

1. Statutory Obligations
   a. Lifts and Escalators Ordinance (Cap. 618);
   b. Building (Construction) Regulations, Building (Planning) Regulations and Buildings Ordinance (Cap. 123);
   c. Electricity Ordinance (Cap. 406);
   d. Noise Control Ordinance (Cap. 400);
   e. Security and Guarding Services Ordinance (Cap. 460);
   f. Factories and Industrial Undertakings (Guarding and Operation of Machinery) Regulations (Cap. 59Q);
   g. Building Energy Efficiency Ordinance (Cap. 610);
   h. Fire Service (Installations and Equipment) Regulations and Fire Services Ordinance (Cap. 95);
   i. Occupational Safety and Health Ordinance (Cap. 509);
   j. Other subsidiary legislation made under the above ordinances.

2. Codes of Practice, Circular Letters and Design Manuals
   a. Code of Practice on the Design and Construction of Lifts and Escalators, 2012 Edition, issued by the Electrical and Mechanical Services Department (hereinafter referred to as the Lift COP);
   b. Code of Practice for the Design and Construction of Buildings and Building Works for the Installation and Safe Use of Lifts and Escalators, 2011 Edition, issued by the Building Authority (hereinafter referred to as the Lift Building Works COP);
   c. Code of Practice for Fire Safety in Buildings, 2011 Edition, issued by the Building Authority (hereinafter referred to as the FS Code);
   d. Circular Letters relating to lifts and escalators, issued by the Electrical and Mechanical Services Department;
   e. Codes of Practice for Minimum Fire Service Installations and Equipment and Inspection, Testing and Maintenance of Installations and Equipment, April 2012 Edition (hereinafter referred to as the Fire Services COP), and Circular Letters issued by the Fire Services Department;
   f. Code of Practice for the Electricity (Wiring) Regulations, 2009 Edition, issued by the Electrical and Mechanical Services Department (hereinafter referred to as the Electrical CoP);
   g. Code of Practice for Lift Works and Escalator Works, 2012 Edition (hereinafter referred to as the Works Code);
h. Design Manual: Barrier Free Access 2008;
i. Code of Practice for Safety at Work (Lift and Escalator), issued by Occupational Safety and Health Branch, Labour Department, October 1997;

LTE1.2.020.7 GENERAL PRACTICE

All materials and workmanship shall comply, where applicable, with all relevant sections, together with any revisions or amendments made thereto, of the following:

1. Hong Kong Housing Authority Specification Library;
2. Approved national/international standards or appropriate British Standard Specifications. The technical standards quoted in this specification are summarized in Appendix LTE/I;
3. The Supply Rules issued by the relevant Power Supply Company currently in operation in Hong Kong;

LTE1.2.030.7 CASE OF CONFLICT

1. In case of conflict among the requirements of this Specification and any other requirements referred to in LTE1.2.010 and LTE1.2.020, interpretation shall be in accordance with the following order of preference:
   a. Law of Hong Kong;
   b. The Lift COP, Lift Building Works COP, BEC, Works Code, FS Code and Fire Services COP;
   c. The Drawings;
   d. This Specification Library of Lift and Escalator & its PSS Clauses;
   e. Other Hong Kong Housing Authority Specification Libraries;
   f. Supply Rules;
   g. Approved national / international standards or British Standard Specifications.

2. Notwithstanding sub-clause (1), in the event where the Drawings or this Specification stipulates more stringent requirements than, but still in compliance with, the COPs in sub-clause (1)(b) above, the Drawings or the Specification shall take the precedence over the COPs. Such requirements shall include, but not be limited to, the following clauses:

<table>
<thead>
<tr>
<th>Clause No.</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LTE2.1.010</td>
<td>Guide rail shall have machined guide surface.</td>
</tr>
<tr>

</tr>
</tbody>
</table>

**LTE1.2.040.7 CODE OF PRACTICE FOR ENERGY EFFICIENCY OF BUILDING SERVICE INSTALLATIONS**

1. The Sub-contractor shall provide necessary information and documents to the Contract Manager in accordance with BEC’s requirements;
2. The Sub-contractor shall attend, provide necessary equipment and carry out on site checks as required by the Contract Manager to verify the electrical measurements of lifts and escalators.
THE WORKS

LTE1.3.010.7 GENERAL
The Works under this Sub-contract is for the whole of the labour and all materials necessary to form a complete installation and such test, adjustments, commissioning, maintenance and servicing as prescribed. It shall include the responsibility for design work including the selection and suitability of purpose of material or equipment in compliance with the Specification and for the detailed design of the permanent works in accordance with the Sub-contract. It shall also include not only the major item of plant and equipment shown or specified but all the incidental sundry components necessary for the complete execution of the Sub-contract Works and for the proper operation of the installation, including the necessary labour, whether or not these sundry components are mentioned in detail in the Sub-contract.

LTE1.3.020.7 SITE OF THE WORKS
The Site of the Works is specified in Project Specific Specification.

LTE1.3.030.7 SCOPE OF THE WORKS
The Scope of the Works is specified in Project Specific Specification.

LTE1.3.035.7 TIME FOR COMPLETION AND DATE FOR HAND-OVER
The time for completion of the Works and date for hand-over of related working areas are specified in Project Specific Specification.

LTE1.3.040.7 SETTING OUT THE WORKS
The Sub-contractor shall set out the Works and shall be responsible for the accuracy of the same, including the positioning of all doors, guides, machines and machine bases.

LTE1.3.050.7 BUILDING WORKS TO BE PROVIDED BY THE SUB-CONTRACTOR
Building works to be provided by the Main Contractor and others are detailed in Part I - Preliminaries of the Specification included in the Sub-contract documents. The following works in connection with the lift and escalator installation shall be provided by the Sub-contractor:

1. Supporting steel works, inserts, fixing brackets etc. for supporting the lift machine in the lift machine room or in the lift well;
2. Shaft dividing steel work for supporting guide brackets etc.;
3. Mounting brackets, bearing plates etc. required for the installation of the escalator;
4. Red head bolts, inserts, fixing brackets etc. for landing door and guide rail brackets etc;
5. Permanent lights and socket outlets in each lift well and escalator machine pit; and
6. Ferrules projecting at least 50 mm above finished floor or slab to prevent objects from falling through openings situated above lift well and blind hoistway working platform.
LTE1.4 SUPERVISION AND SITE RECORDS

LTE1.4.010.7 APPOINTMENT OF SUPERVISING ENGINEERS AND SITE SUPERVISORS

1. Immediately upon the award of the Sub-contract, the Sub-contractor shall appoint Supervising Engineer(s) and Site Supervisor(s) specified in LTE1.4.020 and LTE1.4.030 who shall be both English and Cantonese speaking and in the Sub-contractor's full-time employment for the supervision of the Sub-contract Works to the satisfaction of the Contract Manager;

2. Immediately after the award of the Sub-contract, the name, qualifications and curriculum vitae of the Supervising Engineer(s) and Site Supervisor(s) shall be submitted for Approval to the satisfaction of the Contract Manager;

3. None of the Supervising Engineer(s) and Site Supervisor(s) shall be removed from their respective duties without prior Approval;

4. In the event of any of them being unsatisfactory, in the opinion of the Contract Manager, or misconducting themselves, they shall be removed forthwith and be replaced by suitable substitutes to the Contract Manager's satisfaction within seven days from the Contract Manager's instruction in writing.

LTE1.4.020.7 SUPERVISING ENGINEERS

1. Unless otherwise specified, the Sub-contractor is to employ for the supervision of all works on Site, at least one qualified Supervising Engineer. The Supervising Engineer shall generally represent the Sub-contractor in all respects of the Sub-contract and assume the following duties:

   a. Co-ordinate and supervise the work in the Sub-contractor's office and the Site;

   b. Develop, in conjunction with the Main Contractor, schedules of installation drawings, builder's work drawings, material submission and delivery, statutory submissions, the programme of works and testing and commissioning programme, for approval by the Contract Manager;

   c. Liaise with the Contract Manager and other parties;

   d. Attend at the office of the Contract Manager for the finalisation of drawings and equipment selection;

   e. Attend progress meetings and co-ordination meetings;

   f. Monitor and supervise installation drawings submission, builder's work drawings submission, material submission and delivery, statutory submissions in accordance with the respective submission schedules approved by the Contract Manager. Submit progress reports to the Contract Manager monthly or at shorter intervals when such requested by the Contract Manager;

   g. Check and confirm the installation drawings, builder's work drawings and material submissions are suitable for the installation works and in compliance with the requirements of the Sub-contract;

   h. Examine, verify and confirm in writing to the Contract Manager on a monthly basis that the material delivered to the Site under the Sub-Contract has been approved by the Contract Manager;

   i. Certify all material delivery vouchers in accordance with PRE.B12.280 of the Main Contract;
j. Prepare, in conjunction with the Main contractor, the delivery method statements for delivery of plant and equipment;

k. Supervise all site test and commissioning of the Sub-contract Works and submit the test and commissioning reports on time to confirm that he is satisfied with the completeness, workmanship and performance of the installations which comply fully with the Sub-contract requirements.

2. Qualification requirements:
   At least one year of proven post qualification experience at supervisory level in the installation and maintenance of lifts and escalators with the following qualification:
   a. Registered Professional Engineer (Electrical, Mechanical, Building Services and Control, Automation and Instrumentation Discipline) under the Engineers Registration Ordinance; and
   b. Member of the Hong Kong Institution of Engineers (Electrical, Mechanical, Building Services and Control, Automation and Instrumentation Discipline) elected after 5 December 1975; or
   c. Member (electrical, mechanical, building services and Control, Automation and Instrumentation discipline) of an overseas engineering institution which has signed agreements for the mutual recognition of qualifications with the Hong Kong Institution of Engineers.

3. The Supervising Engineer(s) shall be highly competent and experienced, and shall be given a high level of delegated authority such that they can take decisions, including those involving expenditure.

LTE1.4.030.7 SITE SUPERVISORS
1. Unless otherwise specified, the Sub-contractor is to employ at least one qualified Site Supervisor. The Site Supervisor shall be stationed on site;

2. Qualifications requirements:
   At least three years practical experience in the supervision of the installation and maintenance of lifts and escalators with Diploma/Certificate in Electrical, Electronic, Mechanical or Building Services Engineering.

LTE1.4.040.7 SITE RECORDS
1. The Sub-contractor is to arrange for a full set of prints to be kept on the Site showing the progress of the Works. Such prints shall be kept up-to-date. Daily labour strength report shall be submitted to the Contract Manager after the Sub-contractor's takeover of the lift well, machine rooms or escalator areas;

2. The Sub-contractor shall keep the Site records together with all relevant delivery vouchers of all plant and materials delivered to and removed from the Site for the inspection by the Main Contractor and the representatives of the Contract Manager.
LTE1.5 MATERIALS AND EQUIPMENT

LTE1.5.010.7 GENERAL

1. The design, construction and installation of lifts and escalators shall comply with the Regulations and requirements stated in LTE1.2.010 and LTE1.2.020, in particular the Lift COP, Lift Building Works COP and BEC;

2. Type approval/approval-in-principle for the proposed lifts/escalators and their safety components shall be obtained from the Director of Electrical and Mechanical Services and shall be available before commencement of installation.

LTE1.5.020.7 PROVEN RELIABILITY

1. All lift and escalator materials and equipment shall have proven reliability and in-service records established locally and/or overseas as specified in the ensuing sub-clauses;

2. The materials and equipment (except those stipulated in sub-clause (3)) which serve as in-service records of the lift/escalator system proposed shall comply with the following:

   a. Be of the same places of manufacture and in the same product ranges as those of the materials/equipment proposed; and

   b. Be of the same drive type as that proposed; and

   c. Be of the same rated load/capacity and rated speed specified or of higher and comparable rated load/capacity and rated speed; and

   d. Comply with the following requirements:

<table>
<thead>
<tr>
<th>Lift/escalator Type</th>
<th>Location of In-service Records</th>
<th>Minimum No. of Lifts/escalators serving as In-service Records</th>

</table>
Note 1: For those materials or equipment using innovative and green technology that can reduce the running active electrical power below the maximum allowable electrical power value stated in the BEC by 10% or more, this one year requirement can be relaxed to 6 months provided that the electrical power performance can be verified by a test report issued by an approved independent testing institution.

Note 2: For those materials or equipment using innovative and green technology that can reduce the running active electrical power below the maximum allowable electrical power value stated in the BEC by 20% or more, the required 4 nos. of lifts/escalators serving as in-service records can be installed in Hong Kong, Mainland China or overseas provided that the electrical power performance can be verified by a test report issued by an approved independent testing institution; and

e. Be compatible with other materials/equipment of the lift/escalator system proposed.

3. The materials and equipment which serve as in-service records of guide rail, safety gear, buffer (oil/spring type) and car safety gear acting upwards, counterweight safety gear or rope gripper serving as ascending car overspeed protection means of the lift system proposed or other equipment of which no part is in operation under normal circumstances shall comply with the following:

a. Be of the same places of manufacture and in the same product ranges as those of the materials/equipment proposed; and

b. Be of the same design, rated load/capacity and rated speed specified or of higher and comparable rated load/capacity and rated speed; and

c. Have been installed in Hong Kong, Mainland China or overseas in at least two numbers of lifts/escalators; and

d. Have been in continuous and satisfactory operation and maintenance for at least six months up to the time of tender submission; and

e. Be compatible with other materials/equipment of the lift/escalator system proposed.

4. For new safety requirements which are not required in existing lift/escalator systems but are required as the result of amendment of relevant Code(s) of Practice or Regulation(s), in-service record is generally not required at the time of implementation. However, when either one of the following conditions occurs, satisfactory in-service records shall be required:

a. The new safety requirements have been provided by the Sub-contractor in the number of lifts/escalators and in continuous operation for the period as stipulated in sub-clauses (2) or (3) above in Housing Authority projects;

b. Three years after the effective date for implementing the relevant amendment of Code(s) of Practice or Regulation(s).

5. If there is change of place of manufacture for materials/equipment with previously established in-service records, and the Sub-contractor is capable of producing certificates from the original manufacturer confirming that the materials/equipment to be supplied from the proposed new source have exactly the same design, material, construction and quality assurance/control standards together with an undertaking from the original manufacturer that they will be fully responsible for the product despite the change of manufacture, the requirement of two numbers installed in Hong Kong for one year for lifts of rated speed below 3.5 m/s and escalators of any speed as specified in sub-clause (2)(d) shall be waived;

6. The Sub-contractor shall submit full details and particulars of in-service records to substantiate conformance to the above requirements. The Sub-contractor shall arrange, upon request, site inspection of the lift and escalator installations which serve as in-service records. Failure to submit required details or allow sufficient time for assessment and site inspection may result in rejection of the tender;
7. For Mainland China and overseas in-service records, records of any accident, replacement and major repair and photos of the concerned material/equipment and proof of satisfactory operation and maintenance in writing by one of the following parties shall also be provided:
   a. Owner of the lift/escalator installation; or
   b. Property Management Agent of the property served by the lift/escalator installation; or
   c. Supplier/Contractor/Installer of the lift/escalator installation; or
   d. Maintenance Agent of the lift/escalator installation.
8. If the required information for Mainland China and overseas in-service record is provided by any of the parties listed in sub-clause (7)(c), service log of the past 12 or 6 months shall also be submitted depending on the applicability of sub-clause (2)(d) or (3)(d) to the material/equipment concerned. The Sub-contractor shall certify the authenticity of all the documents provided.

**EVIDENCE FOR COUNTRY/PLACE OF MANUFACTURE AND AUTHENTICITY OF MATERIALS**

1. The Sub-contractor shall, when required, produce documentary evidence to verify the country/place of manufacture and authenticity of the materials delivered to Site or installed. Such documentary evidence shall be in the form of purchase orders to, and shipment/delivery orders or product certificates from the manufacturers or the manufacturers’ authorized agents in Hong Kong. The materials or the Works employing such materials will not be certified for payment until the required evidence has been produced to the satisfaction of the Contract Manager;
2. The Tenderer shall indicate in the "Schedule of Information to be Supplied by the Tenderer" the country/place of manufacture of the materials being offered at the time of tendering.

**TEST CERTIFICATES / SUBSTANTIATION DOCUMENTS**

Test certificate for lift and escalator equipment complete with test reports and drawings where applicable, or other substantiation documents, shall be submitted to the Contract Manager, upon request, to prove the compliance with the Specification. In case the original documents are not produced in English or Chinese, an English or Chinese translation of the whole document, including related test reports and drawings, shall be produced and duly certified true by the issuing organization or an approved authority when required.

**SERVICE CONDITIONS**

In addition to the service conditions as specified in the relevant BS, all lift and escalator equipment shall also be suitable for use under Hong Kong climatic conditions with relative humidity and ambient temperature as shown below:
1. Relative humidity: up to 0.99 saturation;
2. Ambient temperature: peak from minus 5°C to plus 40°C for 4 hours continuously with an average from 0°C to plus 35°C over only 24 hours period.

**ASBESTOS NOT TO BE USED WITHOUT PRIOR APPROVAL**

Asbestos or equipment containing asbestos, including asbestos brake lining, shall not be used without the prior approval from the Contract Manager.
ON SITE WELDED COMPONENTS

1. The Sub-contractor shall submit a list of on-site welded components that are to be installed inside lift well for Contract Manager's record before commencement of the works;

2. The welding work for those on-site welded components shall be carried out by licensed welder or the holder of the Intermediate Trade Test Certificate in welding issued by Vocational Training Council or such equivalent training bodies as Approved;

3. The worker shall have experience on welding lift components for a period, or an aggregate period of, not less than one year. Experiences before or after passing the trade test are both acceptable;

4. The Sub-contractor shall maintain and submit a register of all the projects handled by individual trade tested welder to substantiate the compliance with the requirements stipulated in sub-clause (3) above for Contract Manager's approval before commencement of the works.

STAINLESS STEEL

1. Unless otherwise stated, stainless steel shall be of EN 10088-1 grade 1.4401 (grade 316) or equivalent;

2. Supplier of stainless steel shall provide mill certificates of the material to be used in the works.
LTE1.6 PACKING, STORAGE AND DELIVERY

LTE1.6.010.7 PACKING

1. All equipment, apparatus, materials and parts shall be delivered to the Site in a new condition, properly packed and protected against damage due to handling, adverse weather or other circumstances and they shall be kept in the packing cases or under protective coverings provided by the Sub-contractor until unpacking for use;

2. In the case of items of equipment and materials which originate outside Hong Kong:
   a. All items of equipment and materials shall be adequately and securely packed for safe transportation with due regard to the climatic conditions encountered in transit and on arrival, and also to the site conditions during storage on Site;
   b. The Sub-contractor shall, at the time of shipping each consignment of equipment, provide to the Contract Manager in duplicate, packing lists and Bills of Lading which shall contain full statements of the packages consigned, with particulars of the dimensions, weights, contents, shipping marks and approximate value of each package; and
   c. BS 1133 and its Supplements shall be used as a guide for the standard of packing and package required. All bright, polished or plated parts shall be treated with suitable rust inhibitor.

LTE1.6.020.7 STORAGE AND DELIVERY

1. Storage area at the Site for lift and escalator equipment will be made available by the Main Contractor twelve (12) months before the contract completion date for the respective Section of the Main Contract;

2. All lift and escalator equipment for each Section shall be delivered to the Site no later than seven (7) months before the contract completion date for the respective Section of the Main Contract, in order to cope with any possible advanced completion of the Main Works;

3. Notwithstanding the preceding paragraph, the Sub-contractor shall arrange storage and delivery of the equipment to suit the progress of the Main Works.

LTE1.6.030.7 PROTECTION OF THE WORKS

The Sub-contractor shall liaise with the Main Contractor to suitably protect, encase, cover up etc. as may be appropriate, all equipment, instruments, etc. installed by him against damage due to building operations, adverse weather or other causes and shall hand over the entire installation in a new and perfect condition to the satisfaction of the Contract Manager.

LTE1.6.040.7 TRANSPORTATION OF EQUIPMENT AND PLANT

1. The Sub-contractor shall liaise with the Main Contractor to ensure that there is adequate access available for transportation and delivery of the equipment and plant to be supplied by him at the time of transportation of the equipment to the required position;
2. The Sub-contractor shall submit the details of equipment delivery and hoisting route including any building work reserves required ten (10) months before the contract completion date for the respective Section of the Main Contract to the Contract Manager, via the Main Contractor, for approval. Should the Main Contractor be delayed or incur additional costs due to the Sub-contractor's failure to submit the required information in time then any expense arising will be the liability of the Sub-contractor.

LTE1.6.050.7 REPLACEMENT

Any items suffering damage in transit or on the Site shall be rejected and replaced without extra cost to the Employer. No item so rejected will be considered as a reason for failure to meet the time for completion of the Sub-contract Works.
LTE1.7 ELECTRICITY SUPPLY AND ELECTRICAL INSTALLATION

LTE1.7.010.7 ELECTRICITY SUPPLY

Unless otherwise specified, the equipment shall be rated for operation under the supply system with nominal frequency of 50Hz and nominal voltage of 380V, 3-phase and 220V, 1-phase within the variation limits as declared by the local Power Supply Companies.

LTE1.7.020.7 WIRING

1. All cables, trunkings, conduits and conduit fittings necessary for the power, lighting and indicator circuits shall comply with and be installed in accordance with the latest issue plus amendments of the Electrical CoP, the Lift COP and Hong Kong Housing Authority Specification Library;

2. All wirings installed in lift machine rooms, lift wells and escalator machine pits, other than travelling cables, shall be enclosed in galvanised steel conduits or steel trunkings.

LTE1.7.021.7 CABLE COLOR CODES

1. Electric cables complying with a national/international product standard shall have their design, construction and manufacture adhered to that particular standard in all aspects except the cable colour codes which shall be in line with the Electrical CoP unless otherwise stated;

2. For lift and escalator installation based on the new cable colour codes, the workers employed for carrying out the relevant electrical works shall have satisfied the Electrical & Mechanical Services Department's training requirements for the new cable colour codes.

LTE1.7.022.7 CORE IDENTIFICATION OF POWER CABLES

<table>
<thead>
<tr>
<th>Function of core</th>
<th>Colour code</th>
<th>Number code</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phase conductor of a single phase circuit</td>
<td>Brown</td>
<td>L</td>
</tr>
<tr>
<td>Phase conductor of a three-phase circuit</td>
<td>Phase L1: Brown, Phase L2: Black, Phase L3: Grey</td>
<td>L1 or L2 or L3 according to the phase concerned</td>
</tr>
<tr>
<td>Neutral conductor</td>
<td>Blue</td>
<td>N</td>
</tr>
</tbody>
</table>

Note: Cores used as protective conductors shall have an exclusive colour identification of green-and-yellow, unless otherwise stated.

LTE1.7.030.7 BONDING

1. All exposed conductive parts of the lift and escalator equipment shall be effectively bonded by protective conductors in accordance with the Lift COP and Electrical CoP;

2. The exposed conductive parts shall include the machine frames, controller frames, governor frames, guide rails, face plates of landing fixtures, casing of electrical safety devices, and other similar exposed conductive parts which carry electrical equipment;
3. For lift architrave with landing indicator having provided with proper bonding, no additional bonding is required and the Sub-contractor shall ensure the electrical continuity between architrave and landing indicator. For lift architrave without landing indicator, the Sub-contractor shall provide proper bonding through the building structural reinforcement or other appropriate means.

LTE1.7.040.7 LIFT WELL LIGHTING
1. The Sub-contractor shall install lighting in each lift well in surface steel conduit system. The lighting for each lift well shall comprise one lighting fitting not more than 500 mm from the lowest point in the lift well and the highest point of guided travel of the lift car with intermediate lighting fittings at 7 m maximum spacing. The position of each lighting fitting shall be such that servicing personnel can conveniently replace the lamp while standing on the top of the car;
2. The lighting fittings shall be at least 2x11W compact fluorescent bulkhead fittings with polycarbonate diffuser and controlled by 2-way lighting switches at lift machine room or maintenance access panel for machine-room-less lift, and at entrance to lift pit. Lighting switches at lift pit shall be of watertight construction. Sample of the lighting fitting shall be submitted for the Contract Manager's approval.

LTE1.7.050.7 EMERGENCY LIGHTS
1. Emergency lights of adequate illuminance shall be provided by the Sub-contractor in the lift machine room or at the maintenance access panel for machine-room-less lift, and in the lift car. These lights shall be operated by batteries automatically on failure of normal power supply and those lights in the lift machine room or at the maintenance access panel for machine-room-less lift shall be capable of being manually operated by a switch located at a convenient position in the lift machine room or at the maintenance access panel for machine-room-less lift respectively;
2. The batteries shall be capable of maintaining a supply to the connected emergency load for a minimum of two hours continuously, and shall be completed with self-contained and self-maintained trickle charger located within the lift machine room or lift well and at least one for each lift. The charger shall be capable of fully re-charging the batteries in not more than 12 hours.

LTE1.7.060.7 LIFT TRAVELLING CABLE
1. Lift travelling cable shall be of flat or circular PVC or rubber insulated type complying with BS EN 50214. Test certificate issued by an approved independent testing institution or the manufacturer shall be submitted to the Contract Manager to verify the compliance with the required standard;
2. Travelling cable of the flat type shall only be used where the freely suspended length does not exceed 35 m and the rated speed not exceeding 1.6 m/s unless the cable has integral strain-bearing members;
3. The travelling cable terminal box at lift car shall be positioned at car top;
4. Subject to the approval of the Contract Manager, travelling cable in full compliance with relevant national/international standards stipulated in the Lift COP, with the exception of constructional configuration, may be acceptable.

LTE1.7.070.7 SUPPRESSION OF RADIO AND TELEVISION INTERFERENCE
The lift and escalator installation shall be adequately suppressed against radio and television interference to limits laid down in BS EN 55014-1, or EN 12015 and EN 12016. Interference suppression components shall not be used in any part of the circuit where their failure might cause an unsafe condition.
**LTE1.7.080.7 ELECTRICAL MEASUREMENTS**

1. A connection box shall be provided adjacent to the lift/escalator control panel to facilitate connection of electrical measurement devices without stopping the lift. Drawing and connection detail shall be submitted for the Contract Managers' approval;

2. Electrical measurements including but not limited to those on current, kW, kVA, kWh, power factor and total harmonic distortion shall be carried out in the final testing for each lift and escalator according to BEC's requirements.
LTE1.8 TESTING AND MAINTENANCE

LTE1.8.010.7 TESTS AND CERTIFICATES

1. The Sub-contractor shall employ lift/escalator engineer(s) registered under the Lifts and Escalators Ordinance to undertake tests and examination of the complete installation, which shall include those specified in Annex D of BS EN 81-1 and clause 7.3 of BS EN 115-1, where relevant, and those recommended by the lift/escalator manufacturer;

2. A statement of conformity shall be provided relating to type tests issued by an approved independent testing institution for the equipment mentioned in clause 16.1.3 of BS EN 81-1 upon the Contract Manager's request;

3. For lift installation, progressive safety gear shall be tested with 100% loaded car to be operated by the governor at governor tripping speed unless complete type test certificate of the safety gear in accordance with clause F.3 of BS EN 81-1 from an approved independent testing institution is submitted to the satisfaction of the Contract Manager. In the latter case, the safety gear may be tested at reduced speed with 125% loaded car;

4. Safety certificate and examination report in a prescribed form as required by the Director of Electrical and Mechanical Services shall be submitted and properly signed by the Sub-contractor and his registered lift/escalator engineer as evidence that the installation has been properly tested;

5. The Sub-contractor shall be responsible for all necessary submissions to the EMSD and/or other authorities for the lift and escalator installation;

6. The Sub-contractor shall be required to separately demonstrate to the satisfaction of the Contract Manager the installation complies with the provision of LTE1.2.010 (1) of this Specification and the BEC;

7. All tests shall be conducted at the discretion of and in the presence of the Contract Manager;

8. The Sub-contractor shall obtain a use permit for each lift/escalator issued by the Electrical and Mechanical Services Department, before the installation is accepted by the Contract Manager;

9. The original lift/escalator use permit shall be permanently displayed inside each lift car or adjacent to each escalator when handed over to the Contract Manager on completion of the installation;

10. The Sub-contractor shall arrange for and pay any necessary fees for inspections and shall make such tests as are called for by any Regulations or Authorities and shall obtain all permits required. Any tests carried out shall be in the presence of the authorized representative of any such authority;

11. The Contract Manager will notify the Sub-contractor the nature of identity of the management agent(s) of the lifts/escalators at least one month before the completion date of respective lifts/escalators;

12. The Sub-contractor shall employ a Registered Electrical Worker registered under the Electricity Ordinance to prepare, sign and submit the test reports including the "WR1a" Form for the following electrical works:
   a. The lift well and escalator pit lighting and power socket circuitries starting from the power supply point installed by the electrical worker employed by the lift contractor.

13. The Sub-contractor shall employ a Registered Electrical Worker registered under the Electricity Ordinance to prepare, sign and submit the test reports for the following electrical works:
   a. The power supply circuitries from the main power supply point to the lift and escalator control panels.
**LTE1.8.020.7  FINAL TEST**

1. After having satisfied himself of the performance of the installation, the Sub-contractor shall demonstrate to the satisfaction of the Contract Manager that the installation, or part thereof as the case may be, complies with all the requirements of the Sub-contract Works;

2. The Sub-contractor shall provide the Contract Manager with at least seven (7) days' advance notice of such testing and shall provide all necessary facilities and instrument for the witnessing and checking of such tests, but this shall not relieve the Sub-contractor of his responsibility for testing and satisfying himself of the adequacy of the installation beforehand;

3. The Sub-contractor shall make complete records of the tests as carried out and when the tests have been successfully completed, he shall provide the Contract Manager with test records and reports; including those specified in the BEC, in duplicate in a form to be approved by Contract Manager;

4. Should the test results indicate that the plant or equipment is not functioning in a satisfactory manner or providing the requirements of the Specification, the Sub-contractor shall carry out at his own expense any alterations, replacements or adjustments as may be required to correct the faulty work. The Contract Manager's decision as to what constitutes a satisfactory test shall be final.

**LTE1.8.030.7  MAINTENANCE AND SERVICING**

1. The maintenance and servicing work required under this clause shall be deemed to include both preventive and corrective maintenance and servicing. Before commencing any work ordered under GCC Clause 10.1 of the Main Contract, the Sub-contractor shall, at his own expense, make all suitable arrangements to avoid damage to installations provided by others;

2. Further to the Sub-contractor's responsibility under Clause 7.1 of the General Conditions of the Sub-contract to maintain the Sub-contract Works, the Sub-contractor shall provide maintenance and servicing to the entire installation for a period of 24 months from the date of completion to the Main Works or of the relevant Section or part thereof as certified by the Contract Manager under the Main Contract Conditions. Such maintenance and servicing works shall include the following:

   a. To be responsible for any repairs necessary to maintain the equipment in good working order at all times;

   b. To dispatch competent and specially trained workmen once weekly during normal working hours to inspect, clean and lubricate as required, and where necessary adjust and maintain all machinery, controllers, doors, locks, guide rails, guide shoes, ropes, bearings and safety devices etc. in a smooth, quiet and safe operating condition;

   c. To supply all required lubricants, cleaning materials, rope preservatives etc.;

   d. To supply and replace all burnt out indicator lamps;
e. To provide 24-hour on-call service at any time during the Maintenance Period. The Contract Manager may instruct the Sub-contractor in the Maintenance Period via telephone, mobile phone, paging service or any other means as advised by the Sub-contractor and approved by the Contract Manager, to attend to reported breakdowns, and the Sub-contractor shall dispatch competent technicians or such other suitable personnel to carry out emergency maintenance or to attend to any reported breakdown within 25 minutes where trapping of passengers is involved and within 45 minutes where no trapping of passengers is involved, after receiving the call and under all weather condition. The Sub-contractor shall submit to the Contract Manager for this purpose, the contact telephone number(s) of the Service Call Centre or at least two names of English speaking representative, who can be reached at any time of the day, with contact telephone numbers of direct lines, mobile phones or paging service for approval. Prior approval shall also be obtained for any subsequent changes of representatives, contact telephone numbers etc. during the Maintenance Period at least two weeks before the change is effected;

f. To renew all wire ropes as when the Sub-contractor or the Contract Manager considers necessary to maintain an adequate factor of safety. The Contract Manager will adopt the criteria on discard of rope as laid down in Clause 4.8 in Section C in Works Code in determining whether replacement of rope is required;

g. To provide quarterly reports on the condition of the equipment for approval by Contract Manager;

h. To carry out periodic testing and examination of safety equipment of the installation as may be required by the provisions of any Regulation in force relating thereto and to provide copies of such test certificate, duly signed by a registered lift engineer or a registered escalator engineer as appropriate, regardless whether the lifts/escalators have been exempted from such Regulation;

i. To provide, repair or replace at no cost to the Employer such mechanical and electrical parts of the installation which the Sub-contractor or the Contract Manager considers necessary for the safe and proper operation of the installation;

j. To carry out, at the end of the Maintenance Period, a further test to demonstrate the performance characteristic of the installation, and any defects found shall be rectified by the Sub-contractor at his own cost as soon as practicable.

3. The maintenance and servicing works described above form part of the Works under GCC Clause 8.3(2)(c) of Main Contract;

4. Providing always that any renewals or repairs necessitated by misuse of the equipment or by reason of any other cause beyond the Sub-contractor's control with the exception of ordinary wear and tear shall be carried out by the Sub-contractor if so required by the Employer at an additional cost to be valued by the Surveyor;

5. All work under this maintenance and servicing provision shall be performed by competent personnel under the supervision and in the direct employment of the Sub-contractor;

6. A report in duplicate shall be sent to the Contract Manager immediately following a major repair, repeated breakdowns of service due to system or equipment fault of similar nature, or as and when required by the Contract Manager. The report shall include the cause necessitating such a repair, the reason of such a breakdown of service and the time and date of remedial action taken, of completion of repair and the normal service resumed. A list of equipment replaced shall be attached to the report. Reports on routine visits are not required except where necessary to draw attention to defects which could not be rectified during the routine visit;
7. The registered engineer/contractor shall ensure that details are properly recorded in the log-book in the specified form as required by the Director of Electrical and Mechanical Services, which is kept by the Officer-in-charge of the Estate, in accordance with the Lifts and Escalators Ordinance and the Works Code;

8. For each routine or callout visit on arrival at the Estate, the workman shall report to the Estate Management Office and sign the log-book which will be kept by the Officer-in-charge of the Estate:

a. At the time of signing, he shall note any message written in the book concerning the performance of any part of the lifts/escalators in the Estate, and shall take such action as may be required;

b. The workman shall also inspect the lifts/escalators in the Estate at the time of this regular inspection and make any repairs, replacements of adjustments as required, irrespective of whether or not such repair or re-adjustment is noted in the book;

c. When leaving the Estate, the workman shall report to the Officer-in-charge and enter in the log-book a brief report on any repairs, replacements or adjustments which have been carried out or on the fact that they have found the lifts/escalators operating satisfactorily.
MISCELLANEOUS

LTE1.9

SILENCE OF OPERATION

1. The installation shall be reasonably silent in operation under the conditions which they will be called upon to operate and, in any case shall be such that no unreasonable noise or vibration arising from the operation of the installation is discernible from the lift wells, machine rooms, landing doors, escalator machine pits or similar space in which the equipment is housed. The Sub-contractor shall take all necessary steps to ensure that the equipment provided by him is silent as described above and shall include in his Tender for such sound-absorbing, or anti-vibration materials or devices as are necessary to ensure a satisfactory degree of silence and absence of vibration in the structure of the building in full compliance with the Noise Control Ordinance. The Contract Manager's decision as to what constitutes satisfaction in this respect shall be final;

2. The Sub-contractor shall provide anti-vibration devices wherever lift or escalator equipment with moving part(s), including but not limited to diverter pulley, are mounted directly or indirectly onto the building structure;

3. If on completion the installation is not, in the Contract Manager's opinion, sufficiently silent the Sub-contractor shall, at no cost to the Employer, carry out such modifications or additions as may be required, until the system is made silent to the Contract Manager's satisfaction and the compliance with the Noise Control Ordinance.

FINISH

1. All ferrous metal work supplied by the Sub-contractor in out of the way locations such as lift well, lift pit, machine room and exterior of lift car, etc. shall be properly wire-brushed, cleared of rust, scale, dirt and grease prior to the application of rust inhibiting primer, with particular attention paid to the priming of outer surfaces of car doors, inner surfaces of landing doors, metal work associated with door assemblies, the underside and the framework of lift cars. Any part of the equipment, including guide rails, which requires greasing or oiling and any components which for functional reasons are supplied unpainted by the manufacturers shall not be painted;

2. All normally visible ferrous metal surfaces such as car ceiling, landing door and architraves etc. shall, unless otherwise specified, be finished with one coat of rust inhibiting primer and two finishing coats of enamel paint to a colour to be selected by the Contract Manager;

3. Non-ferrous surfaces and stainless steel surfaces shall not be painted;

4. All paints shall be of lead free formulation.

METRIC UNITS

Only materials in metric units shall be used unless otherwise specified.

WEIGHT OF EQUIPMENT

Before ordering equipment the Sub-contractor shall provide the Contract Manager with full details of the weight, dimensions and positioning of the equipment to be installed and the reaction forces imposed on the structural supports for the purpose of determination of floor loadings, etc..
LTE1.9.050.7 TECHNICAL INFORMATION SUPPLIED WITH TENDER AND SUB-CONTRACTOR’S RESPONSIBILITY

1. All technical information supplied with the tender, including the tenderer’s proposed design and the materials offered, is for tender assessment only;

2. Acceptance of the tender will not relieve the Sub-contractor of his responsibility for the proper working of the installation to meet the specified requirements in compliance with the Sub-contract documents to the entire satisfaction of the Contract Manager. In the event of the installation being, in the opinion of the Contract Manager, not in compliance with the specified requirements, the Sub-contractor shall modify his design, replace any unsatisfactory materials and do everything necessary for compliance with the specified requirements at his own cost.

LTE1.9.060.7 NUISANCE

The Sub-contractor shall comply with all Regulations and prevent nuisance from noise, water, smoke, dust, rubbish, mosquito breeding and all other similar causes.

LTE1.9.070.7 TEMPORARY USE

The Sub-contractor shall ensure that the installation shall not be used prior to the issue of the Certificate of Completion for purposes other than testing and commissioning of the installation unless otherwise approved by the Contract Manager.

LTE1.9.080.7 INSTRUMENTS

1. In addition to PRE.BS1.630 which specifies the provision of a set of measuring instruments for BSPASS and Contract Manager’s Representatives’ use, which will be under the custody of the CMR, the Sub-contractor shall provide all necessary instruments used for measurement and testing of the installation. The instruments used shall be capable of carrying out the measurement, test and inspection with the necessary accuracy and precision and calibrated with traceability to internationally or nationally recognised standards;

2. Each instrument shall carry an indelible identification and shall be attached with a label showing the due date for calibration;

3. The instruments shall include but are not limited to the followings:
   a. Multi-meter;
   b. Clamp meter;
   c. Multi-function electronic meter for measurement of current, voltage, power factor, kW, kVA, kVAr and kWh;
   d. Equipment for measurement of total harmonic distortion;
   e. Insulation tester;
   f. Lux meter;
   g. Carpenter (spirit) level;
   h. Sound level meter;
   i. Force gauge;
   j. Feeler gauge;
   k. Measuring tape;
   l. Vernier callipers;
   m. Tachometer;
   n. Test weight;
o. Ride comfort meter.

4. Upon request, the Sub-contractor shall submit calibration certificates or other evidence of calibration and records of calibration results for the Contract Manager's inspection;

5. The Contract Manager may reject any instrument(s) which in his opinion are not suitable for the measurement, test or inspection, and the Sub-contractor shall replace them with Approved types immediately when required.

LTE1.9.090.7 BUILDING SERVICES PERFORMANCE ASSESSMENT SCORING SYSTEM

The Housing Authority has adopted a Building Services Performance Assessment Scoring System (BSPASS) to assess the performance of building services Nominated Sub-contractors undertaking works for the Authority. BSPASS will be operated in this Sub-contract and assessments will be conducted at quarterly intervals or other intervals as required by the Contract Manager. The Sub-contractor shall provide all necessary attendance, and all necessary measuring instruments, in addition to those specified in PRE.BS1.630, etc. to facilitate the BSPASS assessment as stipulated in the relevant BSPASS manuals. In addition, the Sub-contractor shall also provide labours for the opening up and re-fixing of the works, the operation of the equipment and the testing, etc. as required by the assessment.

LTE1.9.100.7 PERFORMANCE ASSESSMENT SCHEME

The Housing Authority has adopted a Performance Assessment Scheme (PAS) to assess the performance of new lift/escalator installations for the Authority. PAS will be operated in this Sub-contract and assessment will be conducted at completion of the lift/escalator installations as required by the Contract Manager. Upon the Contract Manager's notification, the Sub-contractor's authorised representative shall attend such assessment. The Sub-contractor shall also provide labours for the opening up and re-fixing of the work, the operation of the equipment and the testings required by the Contract Manager. The necessary measuring equipment shall also be provided by the Sub-contractor.

LTE1.9.110.7 SAMPLE WING

During the construction for domestic building blocks, a specified sample wing located on a typical floor will be required to be completed by the Main Contractor including the flats, the corridor and the lift lobby etc. The Sub-contractor shall complete the installation of the architraves, the landing doors and landing door sills for the lift lobby in the specified sample wing in co-ordination with the Main Contractor to cope with the sample wing construction programme. The Sub-contractor shall be responsible to replace any architraves and landing door sills which are found damaged or deformed and to carry out the necessary adjustments to restore to as-new condition before building completion.

LTE1.9.120.7 OPERATION AND MAINTENANCE MANUAL AND "AS-FITTED" DRAWINGS

1. The Sub-contractor shall submit to the Contract Manager, the operation and maintenance manual which should include the following:
   a. Manufacturer's operation and service instructions for each item of equipment;
   b. Special precautions/procedures/methods required on the use, operation, cleaning, servicing, maintenance, repair and replacement of proprietary materials and equipment installed. Requirements on proper use and operation, durability, safety and statutory side shall be stated clearly;
   c. Catalogues and user manuals of equipment as required by the Contract Manager;
d. Electronic and hard copies of the testing and commissioning reports of the installation. Electronic copy of the reports shall be in Adobe Portable Document Format (PDF) in compact disc;

e. Original and duplicate of the certificate of warranty for any material, equipment or installation with warranty period last beyond Maintenance Period;

f. A comprehensive list of spare parts and special tools for individual equipment as recommended by the manufacturer for safe operation and proper maintenance of the complete installation.

2. The Sub-contractor shall submit to the Contract Manager, the "as-fitted" drawings chopped "as-fitted", which should include, but not be limited to, lift schedule, elevation and section, machine room layout plan, installation details with loading indicated at structural anchor points, sectional views of lift wells showing overhead run-bys, positions of safe spaces and locations of limit switches, and a register of major equipment showing the equipment identification, capacity, operating range, setting, power requirement, serial number, etc. "As-fitted" drawings shall be of A1 size only.

LTE2.1 GUIDES AND FIXING

LTE2.1.010.7 GUIDE RAILS

1. The lift car and counterweight shall each be guided by at least two rigid steel guide rails throughout their travel. Oil pans shall be provided and placed underneath the guide rails in the lift pit to collect oil drained from the guide rail in case of guide lubricated by oil;

2. Every such guide rail shall:
   a. Comply with BS 5655: Part 9 or BS EN 81-1 or ISO 7465 or other approved international standards;
   b. Be of adequate strength; and
   c. Have machined guide surface.

3. Test report issued by the manufacturer to verify the guide rail in compliance with BS 5655: Part 9 or BS EN 81-1 or ISO 7465 or other approved international standards shall be submitted to the Contract Manager upon request.

LTE2.1.020.7 GUIDE BRACKETS

1. Guide brackets shall be provided at suitable intervals in accordance with Clause 6.1.2 of the Lift COP, Section E, Part 1 and shall be embedded into the walls enclosing the liftway or fixed to such walls by one of the following methods:
   a. All holes for anchor bolts shall be drilled by rotary drill - this method shall be used as the standard practice for fixing guide rail brackets in reinforced concrete walls of more than 100 mm thick;
   b. Bolts grouted and embedded into the walls - this method shall only be used in special conditions, e.g. brick walled liftway, or reinforced walls of 100 mm thick or less, or as and when specified in the Project Specific Specification. The Sub-contractor shall submit builder's work drawings detailing the exact dimensions and locations of the holes for the bolts required. The Sub-contractor shall ensure that the holes reserved by the Main Contractor are properly and correctly positioned.

2. Wood or fibre blocks or plugs shall not be used for securing any guide brackets;

3. The fixing of the guides to their brackets and to the building shall permit compensation, either automatically or by simple adjustment, of effects due to normal settling of the building or shrinkage of concrete.
LTE2.2  CAR AND COUNTERWEIGHT BUFFERS

LTE2.2.010.7  BUFFERS

Buffers shall be installed at the bottom limit of travel for cars and counterweights in accordance with the following requirements:

1. Buffers of timber or rubber shall not be used;
2. Spring buffers or oil buffers shall be used for lifts having a contract speed not exceeding 1.00 m/s; and
3. Oil buffers shall be used for lifts having a contract speed exceeding 1.00 m/s;
4. Reduced buffer stroke shall not be used unless approved by the Contract Manager.

LTE2.2.020.7  TYPE TEST

The buffers shall be type tested to the requirements of Annex F.5 of BS EN 81-1 by an approved independent testing institution. Type test certificate to this effect shall be submitted to the Contract Manager upon request wherever applicable.
LTE2.3  COUNTERWEIGHTS

LTE2.3.010.7  GENERAL REQUIREMENTS

The counterweight shall be of metal and constructed from multiple sections, contained and secured with a steel frame, and shall equal to the weight of the complete car and approximately 40% of the rated load.

LTE2.3.020.7  GUIDE SHOES

1. At least four guide shoes, capable of being easily renewed or having renewable linings, shall be provided on the counterweight;

2. Guide shoes for counterweight shall be resiliently mounted. For lift speed of 2.5 m/s or above, the guide shoes for the counterweight shall be of the roller type. Any necessary lubrication shall be applied by automatic means.
LTE2.4 SUSPENSION

ROPE SPECIFICATIONS (LTE2.4.010.7)

1. Lift car suspension shall be by means of steel wire ropes of best quality, the size and number being in accordance with Clause 5.1 and Clause 5.2 of the Lift COP, Section E, Part 1;

2. The factor of safety for all suspension ropes shall comply with Clause 5.4.1 of the Lift COP, Section E, Part 1;

3. Test certificate issued by the manufacturer to verify that the steel wire rope is in compliance with EN 12385-1 and EN 12385-5, or ISO 4344 or other approved international standards shall be submitted to the Contract Manager;

4. The Sub-contractor shall submit the test certificates and test reports issued by a laboratory accredited by the Hong Kong Laboratory Accreditation Scheme (HOKLAS) or other recognized accredited laboratories to substantiate that the steel wire rope is in compliance with the standards as specified in sub-clause (3) above for Contract Manager’s approval;

5. The breakage or slackening of any one of the ropes shall cause the motor to stop by means of an electrical safety device in accordance with Clause 10.2 of the Lift COP, Section E, Part 1;

6. All pulley assemblies in the suspension rope system shall be completed with 'Temperature Indicating Strip' of appropriate temperature rating. The strips shall be of self-adhesive type, give irreversible colour change and permanently record the highest temperature of the pulley assemblies;

7. For lifts where the lift machine is more than 60 m above the lowest landing floor, either of the following requirements shall be complied with:
   a. Not less than 5 independent ropes shall be used for suspension and the nominal diameter of the ropes shall not be less than 10 mm;
   b. Not less than 8 independent ropes shall be used for suspension and the nominal diameter of the ropes shall not be less than 8 mm.

ROPE COMPENSATION (LTE2.4.030.7)

1. For travel over 30 m, compensation shall be provided by the Sub-contractor;

2. For lift speed at or below 2.5 m/s, quiet operating chains can be used as the means of compensation;

3. For speed exceeding 2.5 m/s, steel wire rope shall be hung between car and counterweight, passing round an idler tensioning pulley in lift pit and the tension shall be checked by an electric device in accordance with Clause 10.2 of the Lift COP, Section E, Part 1;

4. If rope compensation is used for lift with rated speed at or below 2.5 m/s, it shall also comply with the above requirements;

5. For the use of quiet operating chain for compensation, a guiding device system shall be provided. The guiding device system shall include a set of four rollers at a suitable location on each side of the chain loop at the lift pit, or equivalent and approved by the Contract Manager, to guide the movement and restrain excessive sway of the chain.
LTE2.5  TERMINAL STOPPING AND FINAL LIMIT SWITCHES

LTE2.5.010.7  TERMINAL STOPPING AND FINAL LIMIT SWITCHES TO BE PROVIDED

Each lift shall be provided with terminal stopping switches and final limit switches. They shall be positively operated by the movement of the car. These switches whether mounted on the car frame or in the lift well, shall be properly enclosed.

LTE2.5.020.7  TERMINAL STOPPING SWITCHES

Terminal stopping switches shall be arranged to stop the lift car automatically from any speed attained in normal operation within the top runby and bottom runby, independently of the operating device, the final limit switch and the buffers.

LTE2.5.030.7  FINAL LIMIT SWITCHES

The method of operation of final limit switches shall comply with Clause 6.3.3 of the Lift COP, Section E, Part 1.
LTE2.6 GUARDING

LTE2.6.010.7 GENERAL REQUIREMENTS

All dangerous accessible rotating and moving parts which would cause injury upon bodily contact, including but not limited to traction sheave, handwinding wheels, brake drums, pulleys, ropes etc., shall be effectively guarded against contact of bodily parts with metallic see-through guards. Guarding for handwinding wheels shall be easily removable without the use of tools. Removable metallic see-through guards shall be used for rotating and moving parts which require inspection during lift running. Where applicable, components should be designed to be inherently safe, obviating the need for external or removable guards.

LTE2.6.020.7 LIFT WELL PARTITION

1. Where two or more lifts are fixed in a common lift well, the Sub-contractor shall provide a rigid metal screen having a minimum height of 2500 mm across the whole depth of lift pit fixed at the bottom between any two lifts;

2. Where the horizontal distance between the edge of the roof of a car and an adjacent or its counterweight is less than 300 mm, rigid metal screen to partition each lift from the adjacent lift shall be erected by the Sub-contractor from the lift pit to the full height of the lift well and across whole depth of the lift well.

LTE2.6.030.7 COUNTERWEIGHT

1. Counterweights shall be guarded by means of a rigid metal screen extending from a position 300 mm above the lift pit floor to a position at least 2500 mm above the lift pit floor. It is permissible to raise the bottom of the counterweight screen to clear the compensating chain/rope/means or other equipment. The bottom of the counterweight screen shall be as low as possible and shall be at least 300 mm below the lowest parts of the counterweight resting on a fully compressed counterweight buffer;

2. Where oil buffers are fitted in the pit or when the compensating ropes or chains are used, metal screens for counterweight shall be so positioned that access for the maintenance and servicing of oil buffers and compensation ropes shall be provided.

LTE2.6.040.7 CAR TOP

1. Balustrade/Guardrail shall be provided to prevent accidental falling of people from car top where the horizontal distance between the edge of the car roof and the corresponding wall of the lift well exceeds 500 mm;

2. If the clearance between car landing sill and the wall of the lift well exceeds 150 mm, front guardrail and toe-board facing the door side, in addition to guardrails and toe-boards at other edges, shall be installed at the car top, and foothold shall be provided on the front of the car top. The guardrail shall be so designed and constructed to allow safe access to and egress from the car top.
LTE2.7  CAR FRAMES

LTE2.7.010.7  GENERAL REQUIREMENTS
1. Every lift car body shall be carried in a steel car frame sufficiently rigid to withstand the forces which will be applied in normal lift operation, in safety gear operation or impact of the car on its buffer without permanent deformation of the car frame;

2. The deflection of the members carrying the platform shall not exceed 1/1000 of their span under static conditions with the rated load evenly distributed over the platform.

LTE2.7.020.7  CAR GUIDE SHOES
1. At least four renewable guide shoes, two at the top and two at the bottom of the car frame shall be provided;

2. For lift speed exceeding 1 m/s, the guide shoes shall be resiliently mounted. For lift speed of 2.5 m/s or above, the guide shoes for the lift car shall be of the roller type. Any necessary lubrication shall be applied by automatic means.
LTE2.8  CAR ENCLOSURES

LTE2.8.010.7  NON-COMBUSTIBLE MATERIALS TO BE USED
Lift cars shall be constructed of non-combustible materials.

LTE2.8.020.7  CAR TO BE COMPLETELY ENCLOSED
1. The car of every lift shall be completely enclosed at the sides and on top and shall, save for any opening affording access thereto or for ventilation or emergency trap door, not have any openings or open work panels in the sides;
2. The interior height of car shall be 2,600 mm unless otherwise specified.

LTE2.8.030.7  PLATFORM LOADING
1. Car platforms shall be of framed construction. Platforms for passenger cars and passenger/freight cars shall be designed on the basis of rated load, this being evenly distributed. Platforms for freight cars shall be designed to suit the particular conditions of loading;
2. At least two coats of epoxy paint coating primer shall be applied to all parts of car platform, followed by at least two coats of finishing epoxy paint coating for marine application in accordance with the paint manufacturer’s recommendation. The same coating system shall also be applied to the internal surfaces of any cavities forming the integral part of the car platform;
3. If the car platform is made of stainless steel, epoxy paint is not required.

LTE2.8.040.7  INTERNAL CONSTRUCTION OF PASSENGER LIFT CARS
1. All passenger lift car walls, skirting and doors shall be constructed of at least 1.5 mm thick stainless steel sheet. Mild steel sheet lined with stainless steel shall not be acceptable. Car walls and doors shall be adequately stiffened by stainless steel ribs where required to provide a robust mechanical construction for heavy and rugged usage;
2. Handrails constructed of stainless steel shall be provided on three sides of the lift car extending to within 150 mm of all corners. The top of the handrail shall be at 900 mm above finished car floor The handrails shall comply with Figure 15 of Design Manual: Barrier Free Access 2008;
3. The finishes of the stainless steel sheets shall be hairline, satin, random embossed wavy line pattern or mirror finish, as approved by the Contract Manager and as shown on the Drawings. All fasteners for the fixing of stainless steel sheets shall be of stainless steel;
4. Hairline stainless steel ceiling or other ceiling as specified on the drawings shall be provided by the Sub-contractor. Compact fluorescent or Light Emitting Diode (LED) down lights shall be recess mounted;
5. A concealed high/low speed fan/blower shall be recessed above the car ceiling. Stainless steel air diffuser(s) complete with suitably angled deflectors shall be provided to discharge air evenly to the lift car. The opening of the diffuser should be adequately sized such that the air flow of the fan will not be obstructed. The fan shall be guarded against contact by finger from inside the lift car and from the lift car top. The fan shall be able to produce at least twenty air changes per hour of lift car volume with the lift car stationary and car door closed. The sound pressure level inside lift car with car door closed shall not exceed 60 dB(A) when the fan is producing air flow rate at twenty air changes per hour;
6. Car floor homogeneous tiles as indicated in the Drawings shall be supplied, cut to sizes and laid by the Main Contractor. The Sub-contractor shall make allowance for the weight of tiles and tile adhesive in sizing of lift equipment and shall obtain the exact weight from the Main Contractor. The Sub-contractor shall calculate the exact decoration load based upon the design materials and fixing details that suit the particular lift design in sizing of lift equipment;

7. A floor cover plate of at least 1 mm thick stainless steel sheet shall be provided on top of the car platform;

8. Prior to the application of tile adhesive by Main Contractor to the floor cover plate, the joint between car wall/skirting and the floor cover plate shall be sealed with a suitable mastic sealant or by other approved means to make a watertight joint.

**INTERNAL CONSTRUCTION OF PASSENGER/FREIGHT AND FREIGHT LIFT CARS**

1. Lift car walls, skirting, car doors, handrails and floor cover plate shall be constructed of stainless steel sheet. Mild steel sheet lined with stainless steel shall not be acceptable;

2. Thickness of the stainless steel sheet for car wall, skirting and car door shall be not less than 1.5 mm. The finishes of stainless steel sheet shall be of hairline, satin, random embossed or wavy line pattern, as approved by the Contract Manager. The car walls and doors shall be adequately stiffened by stainless steel ribs where required to provide a robust mechanical construction for heavy and rugged usage;

3. Floor coverings shall be slip-proof stainless steel chequer plate of at least 3 mm thick;

4. All fasteners for the fixing of stainless steel sheets shall be stainless steel;

5. The ceiling shall be painted finish with cream white colour;

6. The joint between the skirting and car panels, and between the skirting and car frame, shall be sealed with a suitable mastic sealant or by other approved means to make a watertight joint;

7. Handrails shall be provided on the three sides of the lift car extending to within 150 mm of all corners. The top of the handrails shall be at 900 mm above car floor. The handrails shall comply with Figure 15 of Design Manual: Barrier Free Access 2008;

8. Fully recessed fluorescent lights shall be completed with vandal-proof polycarbonate, white opal diffuser fixed to the casing with secret-head screws.

**TOE GUARD**

1. Each lift car shall be fitted with a toe guard in accordance with Clause 4.4 of the Lift COP, Section E, Part 1;

2. The toe guard shall be constructed of stainless steel, at least 1.5 mm thick and hairline finish;

3. A 150 mm high black and yellow warning strip by spray painting shall be provided at the top edge of the toe guard as shown on the Drawing.

**MAINTENANCE FACILITIES**

1. A 13A 3-pin shuttered type socket outlet to BS 1363-1 and BS 1363-2 shall be provided on both the top and bottom of the lift car;

2. A permanent light, suitably protected and separately switched, shall also be fitted on both the top and the bottom of the lift car.
LITE2.8.080.7 CAR ILLUMINATION AND PARKING
1. Lift car shall be illuminated to a level of not less than 120 lux at car floor level and on control devices. At least two independent sets of lighting control gear circuits and fittings shall be used;
2. The car shall park at the landing of its final call unless otherwise specified;
3. When no call is registered within an adjustable period of 2 minutes with the lift doors closed, the lift car's ventilation fan shall be shut off automatically until the lift car is activated again by passenger call. The automatic switch-off function to the ventilation fan shall not be operative during breakdown of the lift and with any passengers being trapped inside the lift car.

LITE2.8.090.7 EMERGENCY LIGHTING
1. Every lift car shall be provided with emergency lighting automatically illuminated in the event of failure of power supply to the lift;
2. At least two lighting fittings of independent control gear circuits in lift car shall be used to provide emergency lighting as well as normal lighting. The lamps shall be fed from the battery (in LITE1.7.050) automatically upon failure of normal lighting supply;
3. The emergency lighting shall be able to provide an illumination level of at least 5 lux at car floor level and on control devices.

LITE2.8.100.7 EMERGENCY SIGNAL
1. Every lift car shall be provided with an emergency signal which shall be operative from the lift car, visible and audible at the lift lobby on the main entrance floor;
2. The power supply to the emergency signal shall be fed from the batteries complying with LITE1.7.050 sub-clause (2).

LITE2.8.110.7 EMERGENCY TRAP DOOR
1. Each lift car shall be provided with an emergency trap door of minimum size 350 mm x 500 mm or of a size able to pass through a sphere of 400 mm in diameter vertically for communication purposes, which shall be in the roof. Construction details of the emergency trap door shall be submitted for the Contract Manager's approval prior to fabrication;
2. Emergency trap door shall:
   a. Not open towards the inside of the car;
   b. Be clear of any apparatus mounted above the roof of the lift car;
   c. Be held by suitable locking device which can be opened from outside the lift car without a key;
   d. Be provided with an electric safety device which functions as follows:
      i. Operate the alarm sounder and prevent operation of the lift and ventilation fan at car top under any one or both of the following conditions:
         - When the locking device in sub-clause (2)(c) ceases to be effective;
         - When the panel is open.
      ii. Stop the alarm sounder and restore operation of the lift and ventilation fan only when the locking device is effective and has been manually relocked.
   e. Be spot welded to car ceiling panel in accordance with Appendix I of the Lift COP, Section E, Part 1. Spot welding shall be carried out within two weeks following the completion of the FSD's inspection.
LTE2.9  CONTROL AND INDICATOR IN CAR

LTE2.9.010.7  CONTROL PANEL IN CAR

1. Each lift car shall have a flush mounted control panel on the right hand side of the car door when viewed from the car. The control panel shall be mounted such that essential lift control buttons (call registration buttons, alarm button and door open/close buttons) on this main control panel or the secondary car control panel shall be not less than 900 mm and not more than 1200 mm above the finished car floor;

2. The material for the panel shall be stainless steel with a thickness not less than 2.5 mm. The control panel shall be fixed onto the car panel by stainless steel secret-head screws;

3. The control panel shall comprise:
   a. Push buttons for the landings served;
   b. The alarm button shall be yellow in colour and identified by the symbol \( \square \) in accordance with Clause 11.2.3.1 of the Lift COP, Section E, Part 1 and with protection from being pushed accidentally. The alarm button shall also be in tactile bell shape;
   c. Door open and door close push buttons;
   d. The alarm, door open, and door close push buttons shall have labels, either engraved or embossed in both English and Chinese characters as follows:
      "Alarm 警鐘"
      "Door Open 開門"
      "Door Close 關門"
   e. A service ON/OFF key switch shall be provided, and shall have label, either engraved or embossed in both English and Chinese characters as follows:
      "Service Switch 維修掣"
      When the service switch is operated, the lift shall remain inoperative to facilitate service, cleaning and standby mode. The service switch shall be rendered ineffective unless the car has stopped or parked at a lift landing;
   f. A secondary car control panel shall, where shown on the Drawings, be flush mounted on the left hand side of the car door when viewed from the car. The panel shall comprise all control buttons as the main panel. Essential lift control buttons (call registration buttons, alarm buttons and door open buttons) on this secondary car control panel or the main car control panel shall be not less than 900 mm and not more than 1200 mm above the finished car floor.

LTE2.9.020.7  ATTENDANT CONTROL

1. Lifts shall be equipped with attendant control. The control panel mentioned in LTE2.9.010 shall also incorporate the following with proper labels:
   a. A key-operated attendant control switch; and
   b. A non-stop button for the purpose of by-passing landing calls, but the landing calls shall remain registered until answered. This button shall only be operative when the above key-operated attendant switch is switched on; and
   c. A high-low fan speed selector switch.
2. The button and switches specified in this clause together with the service on/off key switch specified in LTE2.9.010 (3)(e) shall be housed in a recessed stainless steel box with hinged lid which shall be key-locked.

LTE2.9.030.7 **ILLUMINATED INDICATOR**

An illuminated indicator, indicating the landing at which the car is stopped or passing, and up and down directional indication, and displaying pre-programmed messages/symbols shall be provided in the car. The indication fixture shall comply with LTE2.12.030 and pre-programmed with additional messages same as those verbal annunciations specified in LTE2.12.050 sub-clauses (5) and (6).

LTE2.9.040.7 **OVERLOAD DEVICE**

An overload device shall be installed for each lift (see LTE2.16).

LTE2.9.050.7 **PUSH BUTTONS**

1. Unless otherwise specified, all push buttons shall be flush with the control panel, and shall be vandal-proof of robust design, construction and suitable for heavy duty. The push buttons shall have a minimum dimension of 20 mm and shall be vandal-proof of robust design and construction, impact resistant and suitable for heavy use and integral with tactile braille and LED illuminators and shall be approved by the Contract Manager;

2. Braille and tactile markings of Arabic numerals and symbols shall be placed on the control buttons. Tactile markings shall have a minimum dimension of 15 mm high and be raised 1 mm minimum, and shall be of high contrasting colour background. Tactile marking in "star" shape shall be provided at the left hand side of the push button for the main entrance floor;

3. The Sub-contractor shall confirm with supporting document that a confirmation letter has been issued from a recognised organisation of the visually impaired to certify that the messages of the Braille and tactile markings on the model or type of the push buttons to be provided have already been proof read to be correct and readable for use by the visually impaired.

LTE2.9.060.7 **CAR TOP CONTROL**

A control station shall be fitted on top of the car and shall include:

1. A lighting switch and fan switch, with on/off position indicators, to control the lights and the fan in the lift car;

2. A bi-stable inspection switch marked "NORMAL" (正常) and "INSPECTION" (慢車) which when operated shall ensure that:
   
   a. It is not possible to control the car, including any automatic doors, from any other position;

   b. The car shall only travel at a speed not exceeding 0.63 m/s;

   c. The car shall not move until all safety devices are in, and remain in, the safe position;

   d. The movement of the car shall be dependent on a continuous pressure simultaneously on a "Common" push button and a "Up" or "Down" push button. These push buttons shall be protected against accidental operation and with the direction of movement clearly indicated. The words "UP" (上), "DOWN" (落) and "COMMON" (共通) or "U", "D" and "C" indicating the intended direction of motion shall be provided on or near the buttons.
3. A stopping device of "mushroom head, push to stop, pull to run" type, coloured red and marked with the word "STOP" (停止) which when operated shall stop the car immediately and it shall not be possible to move the car, including any automatic doors, from any other position, so placed that there can be no risk of error as to the stop position;

4. A switch lock on the inspection/operation switch at the car top or other similar device shall be installed.

LTE2.9.070.7 STOP SWITCH TO BE PROVIDED
Stop switches as specified in LTE2.9.060 (3) shall also be provided at the following locations:
1. Compartment separate from motor room or lift well where lift equipment is housed;
2. Where a lift machine and its controller are installed at different levels exceeding 600 mm, a stop switch shall be provided near the machine;
3. In the pit for each lift;
4. At the top of the pit cat ladder adjacent to the pit lighting switch.

LTE2.9.080.7 SOCKET TO BE PROVIDED IN PIT
A 13A 3-pin watertight socket outlet of the type specified in ELE20.3.020 shall be provided at the lift pit in compliance with Clause 9.6.2 of the Lift COP, Section E, Part 1.

LTE2.9.100.7 INTERCOM SYSTEM
1. Separate intercom system powered by battery shall be installed for each lift for communications between the lift car, the guard counter or location(s) as shown on the Drawings, the lift machine room or maintenance access panel for machine-room-less lift, and the lift car top. The intercom system shall be activated for communications by either pressing the alarm push button in the lift car once or by lifting the intercom handset(s) at the guard counter or location(s) as shown on the Drawings, or the lift machine room or maintenance access panel for machine-room-less lift, or the lift car top. Intercom handset shall be provided at each lift car top;
2. The associated equipment inside the lift car shall be flush mounted and complete with the intercom symbol shown in Fig. 3 of BS 5655: Part 7;
3. The intercom system shall function together with the lift alarm system as detailed in LTE2.21.

LTE2.9.110.7 LIFT CONTROL FEATURES IN CASE OF FAILURE OF NORMAL POWER SUPPLY FOR BUILDING WITH THE PROVISION OF EMERGENCY GENERATOR
1. In the event of failure of normal power supply and the emergency generator being actuated, all fireman's lifts in a building shall resume their normal operation immediately. Other lifts in the same building shall be stopped and, after an adjustable period up to 45 seconds, be sequentially started to return to the terminal floor one at a time before the next lift is started and remain stationary at that level to release the passengers. Emergency power will be available for the sequential returning of the lifts to the home landing while the fireman's lifts are in operation. To prevent the simultaneous starting of the non-fireman's lift and all the fireman's lifts, the starting of the non-fireman's lift shall be momentarily delayed when all the fireman's lifts are being started or about to be started. However, momentary delay of the movement of a non-fireman's lift during sequential returning is not allowed after the lift has started to move. The operation of the fireman's lifts shall not be affected in any case;
2. Under surge and starting load condition, the emergency generator will maintain the transient state voltage dip within 15% with 1.5 seconds recovery time. The lift system shall be capable for operation in safe working order under this transient variation limit;

3. The emergency generator system and a pair of voltage-free contacts terminated inside a surface mounted box inside the lift machine room or near the lift control panel will be provided by the Electrical Sub-contractor. The contacts shall be normally open and shall be closed only when the emergency generator is ready to pick up the connected load;

4. All lifts shall resume their normal operation automatically upon the reset of the above voltage-free contacts of the emergency generator system;

5. The Sub-contractor shall be responsible for all connection and control after these voltage-free contacts.

LTE2.9.120.7 LIFT CONTROL FEATURES IN CASE OF FAILURE OF NORMAL POWER SUPPLY FOR BUILDING WITHOUT THE PROVISION OF EMERGENCY GENERATOR

For lifts in a building without the provision of emergency generator, a complete battery back-up system normally maintained by trickle charger from A.C. source shall be provided to support passenger release operation in case of failure of normal power supply. The battery back-up system shall be of adequate capacity to move the lift car to the nearest landing either in up or down direction for passenger release.

LTE2.9.130.7 LIFT CONTROL FEATURES IN CASE OF SUPPLY VOLTAGE DIP WITHOUT ACTUATION OF EMERGENCY GENERATOR

1. In the event of supply voltage dip to less than 90% of normal and the emergency generator is not being actuated, the lifts in a building shall either continue their normal operation during the voltage dip or automatically resume normal operation after the voltage dip. In the latter case, the controller should carry out self-diagnosis and run other safety automatic routines as required by the manufacturer immediately after the voltage dip, return to home or the nearest landing either in up or down direction to resume normal operation. If self-diagnosis tests fail, the lift should not resume normal operation unless the system is checked by maintenance personnel;

2. When the lift restarts after resumption of normal supply, audio message specified in LTE2.12.050 sub-clauses (5) and (6) and visual signal must be provided in the lift car to inform the trapped passengers the status of the lift. The visual signal shall be the messages same as those verbal announcements specified in LTE2.12.050 sub-clauses (5) and (6) shown in dot-matrix LED type car position indicator.
LTE2.10 CCTV SYSTEM FOR LIFT CAR

LTE2.10.010.7 GENERAL

1. Colour Closed Circuit Television System (CCTVS) shall be provided for monitoring the lift cars with CCTV monitors in the lift machine room or at the maintenance access panel for machine-room-less lift. The Sub-contractor shall provide for each lift a CCTV camera at car top and a CCTV monitor in the lift machine room or at the maintenance access panel for machine-room-less lift complete with the associated wiring, video cables, amplifier, splitters, conduits etc. as required for lift car monitoring;

2. The Sub-contractor shall also provide for each lift a video cable terminated at a connection unit at high level of the main entrance floor lift lobby or otherwise as shown on the Drawings for connection to the local CCTV monitoring system by Electrical Sub-contractor. The corresponding CCTV monitors will be provided at the location(s) as shown in the Drawings by Electrical Sub-contractor;

3. If the Sub-contractor does not have a licence under the Security and Guarding Services Ordinance (Cap. 460) to carry out the CCTV installation and maintenance works in lifts described in this Specification, he shall sub-contract the works to a licensed security company and shall submit the name of the licensed security company to the Contract Manager.

LTE2.10.020.7 CCTV VIDEO CAMERA

The Sub-contractor shall supply and install in each lift a CCTV camera complete with a spur unit fused at 5A at the car ceiling as the power supply;

1. General
   a. The CCTV camera shall be of CCD video camera equipped with integral lens, CCD imager, electronic processing circuitry and synchronization pulse generation circuits;
   b. The camera shall be recess mounted under the lift car ceiling / false ceiling as shown in the Drawings. The metallic dome shaped vandal resistant camera housing shall be in the form of three-quarter of a sphere not greater than 120 mm diameter. The camera lens is fixed at the bottom of the spherical housing. The direction of the camera can be adjusted by turning the spherical housing with respect to the base through an eyeball action. The camera lens can be adjusted between an angle of 30° from vertical at any direction. It shall be small and housed in a robust camera housing. There shall be locking mechanism to fix the angle. Sample of the housing shall be submitted to the Contract Manager for approval prior to ordering;
   c. The camera lens shall be super wide angle type as follows:
      i. Focal length: F2.5 mm;
      ii. Aperture: F1.8 to F3.5;
      iii. Angular field of view: not less than 95° horizontal, 130° diagonal.
   d. All power, control and video cables connecting the camera with the housing shall be in plug-socket arrangement to facilitate easy removal of camera for maintenance;
   e. The camera shall be operated by a CCD imager of not smaller than 1/3”. The active picture element shall at least be 752 mm(H) × 582 mm(V). The camera shall satisfy the following minimum performance characteristics:
      i. Sensitivity shall be such that under a scene illuminance of 0.5 lux (at 2856K) with the F1.8 lens at the highest gain (i.e. AGC ON) and with a 75% highlight reflectance chart, full video output can be obtained;
ii. The horizontal resolution shall not be less than 450 TV lines and the depth of modulation of the test signal at 350 lines shall be greater than 30%.

f. The camera shall be provided with white clip control. If this is not field adjustable, the white “clipper” shall be factory adjusted to clip at 110% of video level;

g. The camera, in conjunction with the lens, shall be able to handle a scene contrast range of 30,000:1;

h. The camera shall be designed to operate continuously without switching off at 7V-15V d.c. supply or 24V a.c. supply or other extra low voltage supply fed from coaxial cable. Having been set up and installed, the camera shall operate within specification without adjustment for at least three months;

i. The camera shall be provided with electronic shutter for operating in wide range of lighting level;

j. The camera shall be provided with auto white balance function;

k. In situation where line synchronization is employed, the power supply to all cameras shall be from the same phase of the a.c. supply as that of the supply to the related equipment in the local CCTV monitoring system provided by the Electrical Sub-contractor.

2. Shading requirements

With the lens capped, the automatic black level control and automatic gain control circuitries defeated and fixed at the respective nominal levels, the black level variation shall not exceed 4% of peak video level in both the horizontal direction (line rate) and the vertical direction (field rate).

3. Noise

The video signal to noise ratio shall be better than 40dB unweighted.

4. Synchronisation

The video camera shall be provided with a built-in synchronisation generator which is selectable for roll-free vertical interval switching. Cameras connected to sequential switcher shall provide line lock function.

5. Colour system and scanning

The video camera shall be provided with the following colour and scanning systems:

a. CCIR 625-line, 50 fields/sec, PAL colour system;

b. Horizontal frequency: 15.625kHz;

c. Vertical frequency: 50Hz;

d. Interlace: 2:1;

6. Test signal

The video camera shall be provided with internal correction circuitry against the peaking of test signal. The test signal below 250 lines shall not be peaked.

7. Compatibility

The camera in lift car shall be compatible with the CCTV monitoring system provided by the Electrical Sub-contractor.

LTE2.10.030.7  CCTV MONITOR

1. The Sub-contractor shall provide for each lift a LCD type CCTV monitor adjacent to each lift alarm panel in the lift machine room or maintenance access panel for machine-room-less lift for monitoring the lift car. The CCTV monitor shall be compatible with the CCTV camera in lift car;
2. Size of the CCTV monitor shall be of at least 300 mm or otherwise specified on the Drawings. The screen shall be provided with anti-glare surface/coating and some means of protection allowing greater firmness;

3. The CCTV monitor shall be designed as a professional/industrial type with Mean Time Between Failure (MTBF) rate not less than 50,000 hours;

4. The CCTV monitor shall be suitable for 24 hours continuous operation;

5. The resolution shall be at least 1,280 x 1,024 pixels except for machine-room-less lift for which the resolution shall be at least 800x600 pixels;

6. Brightness shall not be less than 300 cd/m². The contrast ratio shall be at least 700:1;

7. The response time shall be not more than 8 ms. The pixel pitch shall be 0.3 mm or less. The display colours level shall not less than 16 million;

8. The horizontal and vertical viewing angle shall be at least 140/135 degrees;

9. The CCTV monitor shall be equipped with controls to adjust the basic settings, including brightness, contrast, vertical and horizontal position, vertical and horizontal size;

10. The CCTV monitor shall be completed with adjustable tilting angle wall mounted bracket and desk mounted support depending on the application on site.

**LTE2.10.040.7 VIDEO CABLE INSIDE LIFT WELL**

1. The Sub-contractor shall provide all necessary cabling and accessories including video cables, conduits, connection units, amplifier, splitters etc. as required so that the video signal from the CCTV cameras can be adequately transmitted to the CCTV monitors in the lift machine room or at the maintenance access panel for machine-room-less lift for monitoring the lift car;

2. The Sub-contractor shall provide for each lift a video cable from a connection unit at lift car ceiling to the lift travelling cable termination box. The Sub-contractor shall then connect the video cable in surface conduit from the lift travelling cable termination box to a connection unit at high level of the main entrance floor lift lobby or as shown on the Drawings. The video cable shall be integrated with the lift travelling cable or clipped to the lift travelling cable by cable tie clips at separation not exceeding 1000 mm. Sample of the cable tie clip shall be submitted to the Contract Manager for approval;

3. Video cable shall be of the coaxial type with inner conductor of annealed copper. The dielectric shall be polythene with a shield of copper braid. The cable shall be insulated with an overall sheath of PVC;

4. The attenuation characteristic of the video cable shall be better than:
   a. 1.1 dB/100 m at 1 MHz;
   b. 3.8 dB/100 m at 10 MHz;
   c. 13.5 dB/100 m at 100 MHz.

5. Other characteristics of the video cable shall be:
   a. Diameter of inner conductor not to be less than 0.76 mm;
   b. Nominal overall diameter not to be greater than 6.2 mm;
   c. Capacitance not to be more than 67 pF/m;
   d. Bending radius not to be more than 60 mm;
   e. Characteristic impedance to be 75 ohm ± 3 ohm;
   f. Return loss ratio to be better than 20 dB at 10 MHz.
PROVISION FOR LIFT FLOOR NUMBER DISPLAY SYSTEM FOR DOMESTIC BUILDING BLOCKS

1. For interfacing with the lift floor number display system, the Sub-contractor shall provide, for each lift in domestic building blocks, lift signals for floor location, up/down travel direction and lift alarm in the form of the following voltage free contacts rated at 500 mA maximum current and 25V maximum voltage, terminated in an interface metal box in Meter Room on Ground Floor or otherwise as shown on Drawings:
   a. One pair of N.O. contacts for each landing floor, to be closed only when the lift is at the floor which the contact is assigned. At any one time, only one pair of these contacts shall be closed;
   b. Two pairs of N.O. contacts for lift travel up/down directions, one to be closed when the lift is going up and the other to be closed when the lift is going down. Simultaneous closing of the two contacts shall not occur;
   c. One pair of N.O. contacts for lift alarm, to be closed when the lift emergency alarm push button is pressed.

2. An additional voltage free contacts for each lift shall also be provided in the interface metal box for connection to the central alarm system:
   a. One pair of N.O. contacts for lift alarm, to be closed when the lift emergency alarm push button is pressed.

3. All terminals for the dry contacts shall be properly labelled to indicate their functions;

4. The Sub-contractor is allowed to locate, if required, the equipment for converting serial data link from the lift controller to dry contact format in Meter Room on Ground Floor, subject to approval by the Contract Manager;

5. Subject to the Contract Manager's approval, it is acceptable that digital signals are used in lieu of the above dry contact signals, should an agreement be reached between the Sub-contractor and the Electrical Sub-contractor. In this case, the details of communication protocol, data format and the hardware interface shall be clearly defined by the two parties and submitted to the Contract Manager for approval.
LTE2.11  CAR DOORS AND LANDING DOORS

LTE2.11.010  GENERAL REQUIREMENTS

1. Any projections or recesses in the exposed parts of the car doors or landing doors shall not exceed 3 mm in order to avoid shearing and the clearance between sliding parts of the door and any fixed part of the car or landing entrance shall not exceed 6 mm to avoid trapping that may cause bodily injury;

2. Sliding car doors and landing doors shall be guided on two parallel edges of the door. The distance between the car and landing sills shall not exceed 30 mm;

3. The clear height of all car doors and landing doors shall be not less than 2100 mm unless otherwise specified;

4. Under normal circumstances, lift car doors shall not be opened automatically unless the car has attained the levelling accuracy specified in LTE2.20.050;

5. Door hangers and tracks together with their fixing for car and landing door shall be of steel or approved material of equivalent strength and be of robust construction. Means shall be provided to prevent the hangers from misaligning, jumping the tracks and jamming or displacement at the extremities of their travel;

6. Two guide blocks shall be fitted at the bottom of each door panel at appropriate positions to prevent twisting of door panel even after wear. Each guide block unit shall incorporate a robust safety flange extending downwards in the event of the collapse or breaking a drift of the normal rubbing surface of the guide block, the safety flange will prevent the bottom of the door panel from being pushed into the lift well;

7. Rollers shall be constructed of steel with sealed ball or roller bearings. An outer plastic lining on roller is acceptable;

8. Ropes shall be steel wire ropes to BS EN 12385-4 or equal and approved.

LTE2.11.020  CAR DOOR

1. Each car entrance shall be provided with a car door which shall extend the full height and width of the car opening. The top track of the door shall not obstruct the car entrance. The stainless steel car door finishes shall be of hairline, satin, random embossed or wavy line pattern, unless otherwise stated in the Project Specific Specification or Drawings;

2. Anti-hand/Anti-finger trapping device for minimizing the risk of dragging children's hands/fingers into the gaps between the car door panels and uprights shall be provided. The device shall immediately send a signal to stop the car door operation when it detects an obstacle in the door opening operation. The device shall be the type accepted by EMSD.

LTE2.11.030  LANDING DOOR

1. All landing openings in lift well enclosures shall be protected by doors which shall extend the full height and width of the landing opening. The top track of landing door shall not obstruct the entrance to the lift car. Every such door shall have a fire resistance rating of not less than 120 minutes with regard to integrity;
2. The landing doors on all floors, including G/F, shall be constructed of at least 1.5 mm thick stainless steel. The finishes of the stainless steel landing door shall be of hairline, satin, random embossed or wavy line pattern, as approved by the Contract Manager. Mild steel sheet lined with stainless steel shall not be acceptable. Sample of stainless steel shall be submitted for Approval prior to manufacture. The landing doors shall be adequately stiffened by stainless steel ribs where required to provide a robust mechanical construction for heavy and rugged usage.

LTE2.11.040.7 PASSENGER LIFT

Doors shall be two panels, centre opening with fully automatic power opening and closing. The speed of the door panels shall be reduced when approaching the ends of their travels during closing. Car door shall be re-opened upon actuation of the landing call button and before the car door has fully closed.

LTE2.11.050.7 PASSENGER/FREIGHT LIFT AND FREIGHT LIFT

1. Doors shall be centre opening, fully automatic power operated, horizontally sliding. For lifts with a rated load less than 1600 kg, the doors shall be two panels. The speed of the door panels shall be reduced when approaching the ends of their travels during closing. Car door shall be re-opened upon actuation of the landing call button and before the car door has fully closed;

2. The door panel shall be framed and reinforced to form a robust construction suitable for heavy and rugged usage;

3. For freight lifts, a timer shall be incorporated in the door opening circuitry to function as follows:
   a. Whenever the "DOOR OPEN" button on the car control panel is pressed, the doors shall remain open for a pre-set period of time adjustable by a timer between 30 seconds and 5 minutes. By the end of the period, a buzzer shall sound prior to the closing of the doors;
   b. Pressing of the "DOOR OPEN" button a second time shall set the timer for another period of time. However, pressing of the "DOOR CLOSE" button on the same control panel shall cause the doors to close immediately. The doors shall not remain open for the pre-set period of time, but operate normally unless the "DOOR OPEN" button is pressed.

4. An instruction in Chinese and English characters not less than 13 mm high engraved on a stainless steel plate of at least 1.5 mm thick notifying the user of this facility, shall be displayed conspicuously adjacent to the car control panel for freight lift.

LTE2.11.060.7 CAR DOOR LOCKING DEVICE

1. Every set of car door shall be provided with electrical safety device(s) which shall prevent the lift car from being started or kept in motion unless all car door panels are closed. It shall not be possible under normal operation to open a car door whilst the car is in motion. Operation of the lift with car door open is permitted under the conditions laid down in Clause 3.7.2 of the Lift COP, Section E, Part 1;

2. For centre-opening 2-panel car doors, each car door panel shall be provided with a separate door closed proving device;

3. Every set of car door shall be provided with an effective mechanical locking device and mechanically locked by at least 7 mm so that the door cannot be opened from inside the car unless the car is within the levelling zone (i.e. stopped or is levelling);

4. The positive locking of the mechanical car door lock shall be proved by an electrical safety device in conformity with Clause 10.2 of the Lift COP, Section E, Part 1 and shall precede the movement of the car;
5. The car door locking device shall be protected against deliberate misuse. The locking elements and their fixings shall be resistant to shock and shall be made of, or reinforced with, metal;

6. The engagement of the locking elements shall be achieved in such a way that a force in the opening direction of the door shall not diminish the effectiveness of locking. In the event that the locking action is effected by the action of spring, the spring shall act by compression and shall be guided and of such dimension that the coil is not compressed solid at the moment of unlocking. In the event of the spring no longer fulfilling its function, gravity shall not cause unlocking;

7. The locking device shall be protected against the risk of accumulation of dust, and tampering by external objects from below which could hinder its proper functioning;

8. The car door locking device shall comply with the minimum mechanical strength requirement as detailed in Clause 3.7.3 of the Lift COP, Section E, Part 1 such that at its locked position, the car door cannot be opened by itself, or by forcing open the door panels at any position by hands from inside the car, and/or by shaking of car door.

LTE2.11.070.7 LANDING DOOR LOCKING DEVICE
1. Landing door locking device shall be provided as detailed in Clause 3.7.1 and 3.7.3 of the Lift COP, Section E, Part 1;

2. The locking device shall be protected against the risk of accumulation of dust, and tampering by external objects from below which could hinder its proper functioning.

LTE2.11.080.7 DOOR LOCKING DEVICES TO BE INACCESSIBLE FROM LANDING AND CAR
All door locking devices and door switches, together with any associated actuating rods, levers or contacts, shall be so situated or protected as to be reasonably inaccessible from the landing and the car.

LTE2.11.090.7 PROTECTIVE DEVICE
1. Protective device shall be fitted to the leading edge of each face, made up of a car and landing door panel, which moves across the clear entrance, to stop, reverse and fully re-open the leading edge of each face in the event that the protective device is obstructed while closing. It shall be so designed and installed that for centre opening doors the obstruction of either leading edge when closing shall cause it to function;

2. The protective device shall extend from not more than 50 mm above the sill (measured to the extended position of the protective device) to a height of at least 1800 mm above the sill. The protective device shall be an individual device. It shall be separated from safety edge;

3. Safety edge shall be fully retractable;

4. The effect of the safety edge shall not be neutralized until the last 20 mm of travel of each door panel;

5. The safety edge when obstructed shall reverse the doors within the compliance (retractable length) of the safety edge. The safety edge when fully extended shall not protrude the door by more than 50 mm. The safety edge shall not obstruct the clear landing entrance specified on the Drawings when the car door is fully open. The force necessary to operate the safety edge shall not exceed 14.7 N. The safety edge shall be of robust ridged surface aluminium construction;
6. In addition to the safety edge, at least one detective device shall be provided for every lift to initiate automatic re-opening of the lift doors in the event of a person who is being struck or about to be struck, and the detective device shall be positioned at a height of not less than 500 mm and not more than 600 mm above the floor of the car. This protective device shall be provided as detailed in Clause 3.5.2.3 and 4.6.2.3 of the Lift COP, Section E, Part 1;

7. The detective device shall be of curtain type composed of not less than 24 infrared beams, or other technology approved by the Contract Manager. The detection field of the curtain shall cover the entire car opening width and extend from not more than 50 mm above the sill to a minimum height of 1800 mm above the sill. The electronic device shall be EMC compliance to the latest editions of EN 61000-6-3 for electromagnetic emission and EN 61000-6-1 for electromagnetic immunity; and

8. The detective device shall be inoperative when the fireman’s switch of the fireman’s lift is activated.

LTE2.11.100.7 LANDING DOOR KEY
The Sub-contractor shall supply two landing door keys for each block upon completion of the installation.

LTE2.11.110.7 EMERGENCY LANDING OPENING IN LIFT WELL
1. Where emergency landing openings are required in the lift well, these openings shall be securely locked and electrically interlocked with the lift safety circuit. These openings shall be of same size as the normal landing entrance and be provided with normal landing doors complete with architraves;

2. The following warning notice in English and Chinese characters not less than 25 mm high shall be embossed onto a 1 mm thick stainless steel plate which shall be fixed onto the door by strong adhesive, with the lower edge of the notice plate at least 1500 mm above finished floor level:

DANGER
UNAUTHORIZED ACCESS PROHIBITED
LIFTWELL RESCUE DOOR
CLOSE AND LOCK THIS DOOR

危險
不得擅進
升降機槽救生門
請關閉並緊鎖此門

LTE2.11.120.7 ARCHITRAVES
1. The Sub-contractor shall provide on all landing entrances, unless otherwise specified, architrave fabricated from at least 1.5 mm thick stainless steel sheet. Finishes of the landing architrave shall be of hairline, satin, random embossed or wavy line pattern, as approved by Contract Manager;

2. All surfaces of architrave shall be formed true and gaps between sections shall not be allowed. Bolts shall not be visible on the exposed surfaces of the architraves;
3. A stainless steel tactile-braille plate for the blind people shall be provided and fixed on both sides of the architraves on all floors at 1200 mm above finished floor level. The tactile markings shall be Arabic numerals of minimum 60 mm high and raised 1 mm. The tactile-braille plates shall be 100 mm square with raised letter or numeral and corresponding Braille. The Braille messages provided on the tactile-braille plates at the architraves on each floor shall also tally with those provided on the lift push buttons. The tactile-braille plates shall be fixed by both strong adhesive and spot-welding or stainless steel rivet at four corners of the plate;

4. The design and construction of the architrave shall have no sharp edges or projections which will cause bodily injury to passengers.

LTE2.11.130.7 APRON SHEET BELOW EACH LANDING

1. The Sub-contractor shall provide a galvanized steel sheet of at least 1.5 mm thick below each landing threshold to comply with Lift COP and Clause 3.5 of the Lift Building Work COP;

2. A 150 mm high black and yellow warning stripe by spray painting shall be provided at the top edge of apron sheet as shown on the Drawing.

LTE2.11.140.7 DOOR SILLS

1. Door sills shall be of robust construction and shall be rigidly fixed to withstand the passage of loads to be introduced into the car. The thickness of any section of the sill shall be not less than 3 mm;

2. Car door sills shall be constructed of stainless steel;

3. Landing door sills for passenger lifts shall be constructed of extruded aluminium except the ones at ground floor or at main entrance access which shall be constructed of stainless steel;

4. Landing doors sills for passenger/freight and freight lifts shall be constructed of stainless steel.

LTE2.11.150.7 MAXIMUM LIFT DOOR OPENING AND CLOSING TIME

Maximum lift door opening and closing time shall not exceed the following time specified:

<table>
<thead>
<tr>
<th>Total Door Width</th>
<th>Opening Time</th>
<th>Closing Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>800 mm</td>
<td>2.0 sec.</td>
<td>2.0 sec.</td>
</tr>
<tr>
<td>900 mm</td>
<td>2.2 sec.</td>
<td>2.3 sec.</td>
</tr>
<tr>
<td>1000 mm</td>
<td>2.3 sec.</td>
<td>2.7 sec.</td>
</tr>
<tr>
<td>1100 mm</td>
<td>2.5 sec.</td>
<td>3.0 sec.</td>
</tr>
</tbody>
</table>

LTE2.11.160.7 TYPE TEST

The landing door locking device shall be type tested to the requirement of Annex F.1 of BS EN 81-1 by an approved independent testing institution. The landing door shall be certified in accordance with the FS Code. In addition, fire test certificate for at least 1.5 mm thick landing door of 1100 mm wide by 2100 mm high stainless steel shall be provided. Documentary evidence on the above certification shall be submitted to the Contract Manager.
1. The access door to the working platform shall be a normal lift landing door complete with door locking device and architrave. The door shall be electrically interlocked with the lift safety circuit. The landing sill shall be installed such that the top level of the landing sill shall be the same level as that of the structural level of the working platform;

2. To avoid unauthorized entry to the working platform, on opening of the access door, the alarm sounders in the lift pit and the main entrance floor lift lobby shall sound continuously. A key-operated access door alarm overriding switch complete with appropriate label shall be provided in the lift machine room to override the door alarm system of the access door to the working platform. When the switch is put on the "override" position, the alarm sounders in the lift pit and the main entrance floor lift lobby shall not be activated by the operation of the access door to the hoisting rope inspection platform. A buzzer shall be provided adjacent to the door alarm overriding switch and the buzzer shall sound when the access door alarm overriding switch is put on the "override" position. The buzzer shall be silent if the overriding switch is put back to the "normal" position. The normal operation of the alarm button(s) inside the lift car cage shall not be affected by the operation of the access door alarm overriding switch;

3. On the access doors to the working platforms, the following warning notice in English and Chinese characters not less than 25 mm high and engraved on a 1 mm thick stainless steel sheet shall be provided. The notice plate shall be fixed by strong adhesive or rivets onto the access door, with the lower edge of the notice plate at least 1500 mm above finished floor level:

   DANGER
   UNAUTHORIZED ACCESS PROHIBITED
   LIFTWELL
   CLOSE AND LOCK THIS DOOR

   危險
   不得擅進
   升降機槽
   請關閉並緊鎖此門

4. Protection guards up to a height of 2.5 metres should be provided for all accessible moving hoisting or governor ropes. The design of the guards shall not affect the inspection work on the related ropes;

5. Ferrules which project at least 50 mm above the slab shall be provided for openings on the floor of the working platform. The gaps between the slab and the ferrules shall be water-sealed to prevent any water from directly dropping into the lift pit;

6. An emergency stopping device accessible on opening the access door, approximately 1.3 m above the floor of the working platform shall be provided to stop the lift and keep it stopped. This device shall be of the "push-to-stop, pull-to-run" type;

7. Wall mounted fluorescent light fittings shall be provided and mounted at 1800 mm above the working platform finished floor level such that the lux level on the floor level of the working platform should be at least 200 lux. A 5A lighting control switch accessible on opening the access door shall be provided;

8. A 13A socket outlet shall be provided.
LTE2.11.180.7  APRON SHEET BELOW CAR PLATFORM

A 150 mm high black and yellow warning strip by spray painting shall be provided at the top edge of apron sheet as shown on the Drawing.
LTE2.12 LANDING FIXTURES AND INDICATORS

LTE2.12.010.7 POSITIONING
1. A landing fixture shall be mounted adjacent to each lift landing entrance or between the landing entrances of duplex control lifts or group control lifts on the same floor or as shown on the drawings;
2. Landing indicators shall be provided at each lift landing and on other floors as shown on the Drawings.

LTE2.12.020.7 CALL BUTTON
1. The landing fixture shall consist of landing call button(s) and illuminated call acceptance signal. The landing call button(s) with LED illuminators shall be mounted such that the call button top is 1200 mm above finish floor level unless otherwise specified on Drawings and shall be vandal-proof of robust design and construction, impact resistant and suitable for heavy use and approved by Contract Manager;
2. The buttons shall be flush mounted on a stainless steel plate of with thickness not less than 2.5 mm. The plate shall be fixed by stainless steel secret-head screws;
3. The base box for call button shall be galvanised steel of thickness not less than 1.5 mm. Sample of the call button with the base box shall be submitted for the Contract Manager's approval;
4. Up/Down directional indications shall be engraved or embossed on the buttons or the mounting plate.

LTE2.12.030.7 LANDING INDICATORS
1. Landing indicator of dot-matrix type amber colour LED display, minimum 128 x 16 dots, actuated by reliable solid state circuitry shall be provided above each lift landing. The indicator shall be of robust design and impact resistance to a degree equivalent to that of polycarbonate material;
2. The indicator shall be able to display at least 32 messages. The dot-matrix display system shall be pre-programmed with the following messages/symbols to inform passengers the corresponding status of the lift:
   a. Landing at which the car is stopped or passing
   b. '超載 Overload';
   c. '滿載 Full Load';
   d. '暫停使用 Out of Service';
   e. '消防員使用中 Used by Firemen';
   f. '求助警鐘 Lift Alarm';
   g. '例行保養,暫停使用 Routine Maintenance (Out of Service)';
   h. '維修中,暫停使用 Under Maintenance (Out of Service)';
   i. '清潔中,暫停使用 Cleaning in Progress (Out of Service)';
   j. '停置狀態,暫停使用 Parking Mode (Out of Service)';
   k. '升降機故障 Lift Breakdown';
   l. '火警,請勿使用升降機 Fire (Do Not Use The Lift)';
m. Scrolling [UP] and [DOWN] arrow to indicate the lift travelling direction; and

n. Other messages/symbols as required by the Contract Manager.

The height of each character in the dot-matrix indicator shall be 50 mm minimum. The luminous intensity of the indicator shall be at least 3500 μcd.

3. Fire alarm dry contact /signal shall be provided by FS contractor in lift machine room for displaying the message '火警,請勿使用升降機 Fire (Do Not Use The Lift);

4. Messages/symbols of dot-matrix indicator shall be re-programmable such that changes, if required, can be effected to suit requirements arise after completion of the Works. Two (2) times of free messages/symbols revision within the Maintenance Period for the Contract shall be deemed to be included;

5. On floors served by only one lift, the landing indicators as described above for the other lifts shall be installed at their normal position where shown on the Drawings;

6. The base box for the landing indicators shall be galvanised steel of thickness not less than 1.5 mm thick. The box shall be adequately stiffened as necessary to avoid deformation after grouting by the Main Contractor. Sample of the floor indicator with the base box as well as the dot-matrix graphic layout and the pre-programmed messages shall be submitted for the Contract Manager's approval.

**LTE2.12.040.7 MANUAL HOMING SWITCH**

1. For each lift, a manual homing ON/OFF bi-stable switch to effect the home landing operation in compliance with Clause 10.3.1.5 of the Lift COP, Section E, Part 1 shall be provided at 2020 mm above finish floor level unless otherwise stated in the Drawings at home landing floor for each lift;

2. The switch shall be flush mounted, and properly labelled in both English and Chinese on a stainless steel cover plate of at least 1.5 mm thick with glass vision panel. The cover plate shall be hinged and lockable with a key;

3. Common key shall operate all locks on the cover plates for the homing switches of the same building block. Two master keys shall be provided for each building block to the Contract Manager upon completion of the earliest Section of the Sub-contract Works;

**LTE2.12.045.7 MANUAL PARKING SWITCH**

1. Except for single lift, a manual parking ON/OFF key switch to effect lift parking mode in compliance with the BEC shall be provided for each lift at the position immediately below the manual homing switch;

2. The manual parking ON/OFF key switch shall be flush mounted on a stainless steel cover plate of at least 1.5 mm thick, and shall have label, engraved or embossed in both English and Chinese characters as follows:

   "Parking Switch 停置掣"

3. Common key shall operate all parking switches of the same building block. The master keys for the parking switches shall be provided for each building block to the Contract Manager upon completion of the earliest Section of the Sub-contract Works;

4. When the parking switch is operated, the following automatic functions shall be performed for the lift:
   a. The message/symbol '停置狀態, 暫停使用 Parking Mode (Out of Service)' shall be displayed at all landing indicators;
   b. Car call buttons and landing call buttons shall become inoperative, and new car calls and landing calls shall not be registered;
c. The lift shall continue to operate until the already registered car calls and landing calls are answered;
d. The lift shall then return to the home landing for parking;
e. The lift doors shall open, then close after a few seconds and remain closed;
f. The alarm button and the door open button in the car shall remain operative;
g. The ventilation fan in the car shall be shut off;
h. Only one lighting circuit for the car shall remain on and the rest shall be shut off;
i. The fireman’s switch upon operation shall override the functions of the packing switch.

AUDIBLE SIGNALS AND VERBAL ANNUNCIATION

1. An audible signal shall be provided at the lift entrance to indicate the lift car arrival and its direction of travel. The audible signal shall sound once for up direction and twice for down direction, and shall activate before the arrival of the lift;

2. Before arrival and opening of lift doors, a verbal annunciation of "樓層 stopping floor; 請勿貼近機門 stand clear of door" in Cantonese, Putonghua and English shall be initiated inside the lift car;

3. An audible signal, distinguishable from that for sub-clause (1), such as buzz sound, shall be provided to signify the closing action of the doors on departure to alert people;

4. After closing of lift doors on departure, another verbal annunciation of "往上/下 going up/down" in Cantonese, Putonghua and English shall be provided before initiating the verbal annunciation in sub-clause (2);

5. When the lift restarts after resumption of normal supply, a verbal annunciation of "升降機正在重新啟動 Lift is restarting" in Cantonese, Putonghua and English shall be initiated inside the lift car repeatedly until the lift restarted;

6. When the lift is searching for or going to home/the nearest landing to resume normal operation, another verbal annunciation of "升降機正前往最近樓層 Lift is travelling to the nearest landing" in Cantonese, Putonghua and English shall be initiated inside the lift car repeatedly until the car arrived home/the nearest landing. When home/the nearest landing is arrived, another verbal annunciation of "升降機已回復正常操作，請按開門或目的地樓層按鈕 Lift has resumed normal operation, please press door open or destination floor button" in Cantonese, Putonghua and English shall be initiated once inside the lift car;

7. Script content of the verbal annunciations shall be re-programmable such that changes, if required, can be effected to suit requirements arise after completion of the Works. Two (2) times of free script revision within the Maintenance Period for the Contract shall be deemed to be included;

8. Volume of the audible signals and verbal annunciations in sub-clauses (1), (2), (3), (4), (5) and (6) shall be adjustable such that changes can be effected at no cost to the Employer to suit operational needs after completion of the Works. For sub-clauses (1) and (3), an automatic timer-controlled volume adjusting device shall be provided to produce two pre-set volume levels respectively for day and night operation modes;

9. The speaker for the audible signals and verbal annunciations shall be located at high level above the car control panel in the lift car.
LTE2.13  CAR CAPACITY AND LOADING

LTE2.13.010.7  PASSENGER LIFT
The relationship between rated load and maximum available car area of every passenger lift shall be as shown in Table 1 of Clause 4.2.1 of the Lift COP, Section E, Part 1.

LTE2.13.020.7  PASSENGER/FREIGHT LIFT AND FREIGHT LIFT
The minimum rated load for passenger/freight lifts and freight lifts shall be based on a load of not less than that for a passenger lift of the same net inside floor area.

LTE2.13.030.7  ADJUSTABLE DEVICE FOR BY-PASSING OF INTERMEDIATE LANDING CALLS
An adjustable device for bypassing of intermediate landing calls without their cancellation during a lift journey shall be provided for the lifts and preset to operate at 90% of the contract load value.
LTE2.14 LOAD PLATES, NOTICE BOARDS AND INSTRUCTIONS

LTE2.14.010.7 LOAD PLATE
1. A load plate giving the rated load of the lift shall be fitted in each lift car in a conspicuous position;
2. For passenger and passenger/freight lifts the rated load shall be given in kilograms and persons, each of which is regarded as weighing 75 kg;
3. For passenger/freight lift the number of passengers to be displayed shall comply with Clause 4.2.3 of the Lift COP, Section E, Part 1.

LTE2.14.020.7 NOTICES AND WARNING SIGNS
The following notice boards and warning signs shall be provided as detailed in the Project Specific Specification and Drawings:
1. In each car, the name of the lift company, telephone number, lift number, use permit, emergency instructions, inter-com symbol and user instruction shall be engraved onto stainless steel plate not less than 1.5 mm thick and fixed at the car panel by stainless steel secret-head screws as shown on the Drawings. Use permit shall be placed under clear acrylic plastic plate at least 5 mm thick and fixed rigidly by stainless steel secret-head screws at the location as shown on the Drawings.

"IN CASE OF FIRE DO NOT USE THE LIFT"
"如遇火警 切勿使用升降機"

2. In each car, the following English and Chinese characters not less than 15 mm high with graphic symbol shall be engraved onto stainless steel plate not less than 1.5 mm thick and fixed at the car panel by stainless steel secret-head screws as shown on the Drawings.

"KEEP CLEAR OF LIFT DOORS"
"小心升降機門"

3. In each car, the following English and Chinese characters not less than 10 mm high and a pictograph shall be engraved onto stainless steel plate of size as shown on the Drawings, not less than 1.5 mm thick and fixed rigidly onto the car panel by stainless steel secret-head screws at the location as shown on the Drawings.

4. The following information shall be engraved on a stainless steel plate not less than 1.5 mm thick fixed rigidly over the main entrance floor landing of each lift:
   a. Lift Number;
   b. Floors served; and
   c. Name of lift company and contact telephone no in case of emergency repair and breakdown, etc..

5. In each passenger/freight lift car, the following additional warning notices in English and Chinese characters not less than 25 mm high shall be engraved onto a stainless steel plate not less than 1.5 mm thick and fixed at the rear panel by stainless steel secret-head screws at the locations as shown on the Drawings:
   a. "LOADING AND UNLOADING BY INDUSTRIAL POWERED TRUCK IN LIFT CAR PROHIBITED"
      "嚴禁使用機動鏟車在升降機裝卸貨物"
b. "A SINGLE PIECE OF GOODS SHOULD NOT EXCEED xx kg"
   (Note: a quarter of the rated load of the lift)
   "每件貨物不准超過 xx 公斤"

6. In each freight lift car, the following additional warning notices in English and Chinese characters not less than 25 mm high shall be engraved onto a stainless steel plate not less than 1.5 mm thick and fixed at the rear panel by stainless steel secret-head screws at the locations as shown on the Drawings:
   a. "LOADING AND UNLOADING BY INDUSTRIAL POWERED TRUCK IN LIFT CAR PROHIBITED"
      "嚴禁使用機動鏟車在升降機裝卸貨物"
   b. "THIS IS A FREIGHT LIFT AND SHALL NOT BE USED AS A PASSENGER LIFT"
      "此乃載貨升降機，不准用作運載乘客"
   c. "A SINGLE PIECE OF GOODS SHOULD NOT EXCEED xx kg"
      (Note: a quarter of the rated load of the lift)
      "每件貨物不准超過 xx 公斤"

7. In each freight lift car, an instruction plate as detailed in LTE2.11.050 shall be provided;

8. At each landing the following English and Chinese characters not less than 15 mm high for sub-clause (8)(a) and not less than 10 mm high for sub-clause (8)(b) and a pictograph shall be engraved onto a stainless steel plate not less than 1.5 mm thick and fixed by the Main Contractor at the location as shown on the Drawings.
   a. "IN CASE OF FIRE DO NOT USE THE LIFT"
      "如遇火警 切勿使用升降機"
   b. "KEEP CLEAR OF LIFT DOORS"
      "小心升降機門"

9. At each landing of freight lift the following warning notices in English and Chinese characters not less than 25 mm high shall be provided by the Main Contractor:
   a. "LOADING AND UNLOADING BY INDUSTRIAL POWERED TRUCK IN LIFT CAR PROHIBITED"
      "嚴禁使用機動鏟車在升降機裝卸貨物"
   b. "THIS IS A FREIGHT LIFT AND SHALL NOT BE USED AS A PASSENGER LIFT"
      "此乃載貨升降機，不准用作運載乘客"
   c. "A SINGLE PIECE OF GOODS SHOULD NOT EXCEED xx kg"
      (Note: a quarter of the rated load of the lift)
      "每件貨物不准超過 xx 公斤"

10. In each car a 'DANGER, DO NOT FORCE OPEN LIFT DOORS' sign in English and Chinese characters with pictograph shall be engraved onto a stainless steel plate of not less than 1.5 mm thick and fixed rigidly by stainless steel secret-head screws at the location as shown on the Drawings. The size of the English and Chinese characters shall be as follows:
<table>
<thead>
<tr>
<th>English Letters</th>
<th>Chinese Characters</th>
<th>Minimum Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;DANGER&quot;</td>
<td>危险</td>
<td>10 mm</td>
</tr>
<tr>
<td>&quot;DO NOT FORCE OPEN LIFT DOORS&quot;</td>
<td>切勿强行打開升降機門</td>
<td>10 mm</td>
</tr>
</tbody>
</table>

11. In each lift car, a use permit board of design and construction as shown on the drawings and with size suitable for housing the use permit in compliance with EMSD’s requirements shall be fixed rigidly onto the car panel and at a height level so that the bottom of the board is at least 1 m above floor level and the top of the board is not higher than 1.8 m above floor level;

12. At each lift lobby where entry to the building can be gained, an appropriate number of International Symbol for Access for People with a Disability will be provided by the Main Contractor;

13. Approved electric shock treatment notice mounted in an anodised aluminium frame with transparent plastic front plate of 3 mm minimum thickness and wooden backing board of 5 mm minimum thickness shall be prominently displayed in each lift machine room;

14. The lift machinery and the lift control panels shall be properly labelled and identified with the lift number to facilitate working on the correct equipment safely;

15. Approved notice of safe working at lift pit shall be fixed with ties, screws or other suitable fasteners to the counterweight screen located at the lift pit of each lift;

16. At the highest landing entrance for each lift, a lift identification plate of not less than 1.5 mm thick stainless steel onto which the lift number is engraved shall be provided by the Main Contractor;

17. At the building entrance, the following English and Chinese characters in engraved wording on plate of minimum size 200 mm × 200 mm shall be provided by the Main Contractor:

<table>
<thead>
<tr>
<th>注意</th>
</tr>
</thead>
</table>

在本（大廈/停車場/商場/辦事處）設置的閉路電視系統會收錄影像作保安及管理用途，所收錄的資料將會依照個人資料（私隱）條例的規定處理。

**ATTENTION**

The CCTV System installed in this (building / carpark / shopping centre / office) will record video images for security and building management purposes. The recorded data will be processed in accordance with Personal Data (Privacy) Ordinance.
EMERGENCY RELEASE EQUIPMENT AND INSTRUCTIONS

A board or suitable container for the necessary tools, together with clear instructions on the method for moving the lift car and releasing passengers in an emergency shall be positioned in the machine room in a conspicuous manner. At least one set of such equipment and instruction shall be provided in each lift machine room. For machine-room-less lift, such equipment and instruction shall be provided at a location acceptable to the Contract Manager.
LTE2.15 SAFETY GEAR AND GOVERNOR

LTE2.15.010.7 PROVISION OF SAFETY GEAR
1. Every lift shall be provided with a safety gear attached to the car frame and placed beneath the car platform;
2. Where any space located below any liftway is accessible to persons, the counterweight, as well as the car, shall be provided with a safety gear if there is no solid pier below the counterweight extending down to solid ground.

LTE2.15.020.7 GENERAL REQUIREMENTS OF SAFETY GEAR
Safety gear shall comply with the following general requirements:
1. It shall only be possible to release car (or counterweight) safety gears by raising the car (or counterweight);
2. Each car or counterweight safety gear shall be operated by means of its own overspeed governor;
3. The application of the safety gear shall not cause the car platform to slope at more than 1 in 20 to the horizontal; and
4. It shall not be possible for vibration of the car frame to cause a safety gear to be applied.

LTE2.15.030.7 TYPE TEST OF SAFETY GEAR
The safety gear shall be type tested to the requirements of Annex F.3 of BS EN 81-1 by an approved independent testing institution. Type test certificate to this effect shall be submitted to the Contract Manager upon request.

LTE2.15.040.7 OVERSPEED GOVERNOR
The overspeed governor shall be of the centrifugal type and shall operate the safety gear in case the speed of the car reaches the tripping speed in accordance with Clause 5.12 of the Lift COP, Section E, Part 1.

LTE2.15.050.7 ELECTRICAL CHECKING ON OPERATION OF OVERSPEED GOVERNOR
The overspeed governor shall initiate the stopping of the lift machine before the car speed, either up or down, reaches the tripping speed of the governor in accordance with Clause 5.12.11 of the Lift COP, Section E, Part 1.

LTE2.15.060.7 GOVERNOR ROPES
The governor ropes shall not be less than 6 mm in diameter and shall be tensioned by a tensioning pulley. This pulley (or its tensioning weight) shall be guided.

LTE2.15.070.7 TYPE TEST OF GOVERNOR
The overspeed governor shall be type tested to the requirements of Annex F.4 of BS EN 81-1 by an approved independent testing institution. Type test certificate to this effect shall be submitted to the Contract Manager upon request.

LTE2.15.080.7 ASCENDING CAR OVERSPEED PROTECTION MEANS
Every traction drive lift shall be provided with ascending car overspeed protection means in accordance with the Lift COP. The ascending car overspeed protection means shall be type tested to the requirements of Annex F.7 of BS EN 81-1 or other approved international standards.
LTE2.15.090.7 UNINTENDED CAR MOVEMENT PROTECTION MEANS

Every traction drive lift shall be provided with unintended car movement protection means in accordance with the Lift COP.
LTE2.16 OVERLOAD DEVICE

LTE2.16.010.7 PROVISION OF OVERLOAD DEVICE
Every lift shall be provided with an overload device which shall be of fail safe design, or of such a design that the device shall not be damaged by excessive overloading, and shall operate when the load in the car is ten percent or more in excess of the rated load in respect of such lift.

LTE2.16.020.7 OPERATION OF OVERLOAD DEVICE
1. The overload device, when in operation, shall:
   a. Prevent any movement of the car;
   b. Prevent the closing of any power operated door whether fitted to the car or to the landing at which the car is resting;
   c. Give audible and visible signals;
   d. The audible and visual signals shall be positioned at the same level as the car position indicator;
   e. The visual signal shall have characters that are not visible when not operating and shows amber in colour when illuminated from behind with a flashing light when in operation; and
   f. The visible signal shall be in both English and Chinese characters as follow:
      "OVERLOAD"
      "超重"

2. The lift shall resume normal operation automatically on removal of overload. The overload device shall be inoperative whilst the lift car is in motion.

LTE2.16.030.7 FLOATING PLATFORM TYPE NOT ACCEPTABLE
Overload device installed on a floating platform is not acceptable.
LTE2.17 LIFT MACHINERY FOR ELECTRIC LIFT

LTE2.17.010.7 LIFT MOTOR
1. The main driving motor shall be of quiet running type, and shall be designed to operate for an unlimited period according to the expected duty of the lift;
2. Lift Motor ratings in terms of number of starts per hour shall be not less than those in the following Table:

<table>
<thead>
<tr>
<th>Rated speed, v in m/s</th>
<th>Number of starts per hour</th>
</tr>
</thead>
<tbody>
<tr>
<td>v ≤ 1.0</td>
<td>150</td>
</tr>
<tr>
<td>1.0 &lt; v ≤ 1.75</td>
<td>180</td>
</tr>
<tr>
<td>v &gt; 1.75</td>
<td>240</td>
</tr>
</tbody>
</table>

LTE2.17.020.7 REDUCTION GEAR
Conventional worm reduction gear shall be employed for geared lift machine. Helical or planetary reduction gear may be accepted provided that the gear system of the same speed range has proven satisfactory in-service record stipulated in LTE1.5.020.

LTE2.17.030.7 BEARINGS
Bearings for motor shall be of the sleeve ring type or ball bearing type with oil ring. Reduction gear box shall be provided with journal and thrust bearings suitable for the application.

LTE2.17.040.7 HAND WINDING FACILITIES
1. Provision shall be made for each lift whereby the lift car can be raised or lowered in an emergency by manual operation. The direction of winding corresponding to the raising and lowering of the lift car shall be clearly indicated;
2. The hand winding apparatus, when detachable and portable, shall be mounted in an accessible and conspicuous position in the machine room. If the detachable/portable apparatus is suitable for use with four or more lifts installed in the machine room, at least two sets of such apparatus shall be provided;
3. For lift where the manual effort to raise the car with its rated load exceeds 400 N, an emergency electrical operation device to permit emergency electrical operation in accordance with Clause 10.3.1.4 of the Lift COP, Section E, Part 1 shall be provided for each lift.

LTE2.17.050.7 BRAKES
Every lift machine shall be provided with a brake that is mechanically applied and electrically held off. The brake shall be capable of stopping the machine when the car is downward travelling at its rated speed with 125% rated load. It shall be fitted with an emergency release which shall remain open only while manual pressure is being applied.

LTE2.17.060.7 ELECTRIC SERVICE LIFT
Please refer to the specification requirements specified in the Project Specific Specification.
LTE2.17080.7 REGENERATIVE POWER

1. For every lift with lift motor rating of 18kW or above, controller/inverter/converter with appropriate facilities shall be provided to condition and feed the regenerative power induced during operation of the lift back to the power line for use by other lifts or electrical installations in the building;

2. Filtering facility shall be incorporated to ensure proper regenerative power quality such that the voltage and frequency shall not exceed ±6% and ±2% respectively of the rated supply in accordance with the Supply Rules of the concerned power supply company and that the extent of harmonic distortions shall comply with the concerned power supply company's requirements;

3. The Sub-contractor shall submit to the Contract Manager a report on the quality of the regenerative power upon completion of testing and commissioning of each lift to demonstrate compliance with the requirements of the concerned power supply company;

4. For the proposed controller/inverter/converter including filtering facility, compliance to the following requirements can be regarded as an acceptable alternative to the in-service record as required in LTE1.5.020 sub-clause (2)(d):
   a. The Sub-contractor shall provide an undertaking to keep adequate quantity of new spare parts of the controller/inverter/converter in stock in Hong Kong for immediate replacement in case of breakdown of the installed controller/inverter/converter;
   b. The Sub-contractor shall provide an undertaking to replace immediately instead of repair any faulty parts of the installed controller/inverter/converter so as to keep the down-time of the lift operation to the minimum in case of breakdown during the Maintenance Period; and
   c. The Sub-contractor shall provide an undertaking to upgrade/update the controller/inverter/converter software whenever upgrades/updates are released by the manufacturer within the Maintenance Period.
LTE2.18 CONTROLLER

LTE2.18.010.7 CONSTRUCTION

1. Unless otherwise specified, the controller shall be mounted in a ventilated steel cubicle with hinged doors at the front, in which all contactors, solenoids, relays, electronic cards and motor starting equipment, etc. shall be fitted;

2. Panels at the rear of the cubicle shall be of removable hinged type if access for routine maintenance at the rear is required.

LTE2.18.020.7 GENERAL REQUIREMENTS

1. The controller shall comply with the general requirements as stated in the Lift COP, Section E, Part 1 and the following features shall be included:
   a. Materials used in the construction of the control equipment shall not support combustion;
   b. The components shall be designed and mounted in a manner which facilitates inspection, maintenance, adjustment and replacement. Warnings shall be terminated in such a way that the wires are not damaged. Accessible terminals suitably marked, shall be provided for all cables;
   c. Control circuits shall be supplied through a double wound isolating transformer to BS EN 61558-1, and BS EN 61558-2-23 or IEC 61558-2-23;
   d. Where rectifier is used it shall be of the full wave silicon type fed from a transformer;
   e. The control circuit shall be protected by suitably rated miniature/moulded case circuit breakers or fuses to BS EN 60269-1 or BS 88-1, and BS HD 60269-2 or BS 88-2 independent of the protection of the mains circuits;
   f. The brake solenoid and any retiring cam shall operate on direct current;
   g. Motors connected to polyphase a.c. power supplies shall incorporate means to prevent the motor from being energised in the event of phase failure and/or phase reversal;
   h. A main switch shall be provided by the Electrical Sub-contractor for each lift capable of breaking the supply to the lift on all conductors and interrupting the highest current involved in normal conditions of use in accordance with Clause 9.4.1 of the Lift COP, Section E, Part 1;
   i. In the event of out of service of one of the lifts under duplex control or group control, the other lift(s) shall be able to remain in normal service while the out-of-service lift is under repair or servicing;

2. Insulation rubber mat complying with BS 921 shall be provided on the floor in front of, and also at the rear of the lift control panel and other electrical switchboards in the lift machine room, if access for routine maintenance at the rear is required, for better protection against electric shock.

LTE2.18.030.7 MICROPROCESSOR-BASED CONTROL

Microprocessor-based control shall include the following design features:

1. Interruption of the electrical supply to the lift shall not affect the system memory or software;

2. It shall be possible to change the supervisory control algorithm to meet a change in building use by re-programming the instruction memory;
3. It shall be possible to display information on the operational status of the lift and to locate fault by having means of access/test points on the controller, self-diagnosis circuits with visual indicator or equivalent means to facilitate ease of maintenance and quick repairing, and printed circuit board modules shall be used;

4. Multiplexing techniques may be employed to reduce the number of trailing cables normally required, if considered cost effective to do so.
LTE2.19  AUTOMATIC CONTROL SYSTEM

LTE2.19.010.7 DOWN COLLECTIVE CONTROL FOR SINGLE LIFT ("SIMPLEX" DOWN COLLECTIVE CONTROL)
1. All calls shall be stored in the system and answered in sequence regardless of the order in which they are registered;
2. When travelling in the "Up" direction, the car travels to the highest call, stopping at any intermediate floor for which a car call has been registered. On stopping for the highest call, preference is established for the "Down" direction;
3. When travelling downwards the car stops for all car and landing calls that have been registered. When all calls have been answered, the car remains with doors closed at the floor to which it last travelled.

LTE2.19.020.7 DOWN COLLECTIVE CONTROL FOR TWO INTER-CONNECTED LIFTS ("DUPLEX" DOWN COLLECTIVE CONTROL)
In addition to the features as required in LTE2.19.010, it shall include the following control features:
1. When both cars are away from the terminal floor and all calls have been answered, one car shall return automatically to the terminal floor and referred to as the "Next" car. The second car remains at the floor which it last deposited passengers and is referred to as the "Free" car. Both cars stand with doors closed;
2. With the cars standing with doors closed as described in sub-clause (1) above the first landing call shall be answered as follows:
   a. If a terminal floor call, by the "Next" car;
   b. If from any other floor, by the "Free" car.
      i. With the "Free" car answering calls, the "Next" car shall not start for "Down" calls behind the "Free" car until the "Free" car is descending;
      ii. Should the "Free" car return to the terminal floor and the doors close after a passenger comes in, the passenger shall be able to register a call and travel to any destination. With both cars standing at the terminal floor with doors closed, the "Next" car (i.e. the one that arrived first) shall answer the first landing call. Directional preference shall be maintained when a car stops for its last call until the doors close.

LTE2.19.030.7 FULL COLLECTIVE CONTROL FOR SINGLE LIFT
1. All calls shall be stored in the system and answered in sequence regardless of the order in which they are registered;
2. When the car is in motion in a given direction it shall travel to the further-most call, stopping at any intermediate floor for which a car call or landing call for the corresponding direction of travel has been registered;
3. Landing calls for the direction opposite to that in which the car is travelling shall be by-passed but will remain stored in the system to be answered when the car returns in the opposite direction;
4. When the car stops for the last call in its direction of travel, car preference is established for an adjustable period;
5. When all calls have been answered the car remains with doors closed at the floor to which it last travelled.
LTE2.19.040.7 FULL COLLECTIVE CONTROL FOR TWO INTER-CONNECTED LIFTS
In addition to the features as required in LTE2.19.030, it shall include the following supervisory feature:

1. When both cars are away from the terminal floor and all calls have been answered, one car shall return automatically to the terminal floor and is referred to as the "Next" car. The second car remains at the floor to which it last travelled and is referred to as the "Free" car. Both cars stand with doors closed;

2. With the "Free" car answering calls, the "Next" car shall not start for "Up" calls or "Down" calls behind the "Free" car until the "Free" car is descending. If the "Free" car is delayed the controller shall operate to dispatch the "Next" car;

3. With both car standing at the terminal floor with doors closed the "Next" car shall answer the first landing call; and

4. Should the "Free" car return to the terminal floor and the doors close after a passenger comes in, the passenger shall be able to register a call and travel to any destination.

LTE2.19.045.7 FULL COLLECTIVE CONTROL FOR MORE THAN TWO INTER-CONNECTED LIFTS
In addition to the features required in LTE2.19.030, the control shall include features similar to those in LTE2.19.040 and shall deploy lift to answer landing call(s) with due consideration of the current car locations, car calls registered and travelling directions etc. so as to optimise the passenger waiting time and even out the lift usage.

LTE2.19.050.7 DOUBLE DUPLEX DOWN COLLECTIVE CONTROL
1. Double Duplex Down Collective Control shall be provided as shown on the Drawings for three lifts arranged in two groups serving two different floor zones (i.e. lower zone and higher zone). Two of the three lifts shall serve the high and low zones respectively while the remaining one serves both zones;

2. The Double Duplex Down Collective Control system shall be capable of achieving the followings:-
   a. In case of landing call(s) registered at the lower zone, the group control system shall deploy the low-zone lift or the two-zone lift or both to answer the call(s) with due consideration of the current car locations, car calls registered and travelling directions so as to optimize the passenger waiting time and even out the lift usage;
   b. In case of landing call(s) registered at the higher zone, the group control system shall deploy the high-zone lift or the two-zone lift or both to answer the call(s) with due consideration of the current car locations, car calls registered and travelling directions so as to optimize the passenger waiting time and even out the lift usage;
   c. In case there are simultaneous landing calls registered at the lower zone and at the higher zone, the group control system shall deploy one or two or all of the three lifts to answer the landing calls with due consideration of the current car locations, car calls registered and travelling directions so as to optimize the passenger waiting time and even out the lift usage.
LTE2.20 LIFT POWER SYSTEM AND LEVELLING

LTE2.20.010.7 GENERAL REQUIREMENT
Lift power system shall be AC variable voltage variable frequency (ACVVF) system using gearless drive.

LTE2.20.050.7 LEVELLING ACCURACY
Levelling accuracy of the lift system shall not exceed ± 10 mm.

LTE2.20.060.7 AUTOMATIC RE-LEVELLING
Automatic re-levelling shall be provided for lift of rated speed of 2.5 m/s and above and for lift where the lift machine is more than 60 m above the lowest landing door, to maintain the accuracy of stopping at landing within ± 10 mm such that the transient overshooting value of ± 20 mm should not be exceeded at any time including during loading and unloading of the lift car.

LTE2.20.070.7 MAXIMUM ALLOWABLE ELECTRICAL POWER, TOTAL HARMONIC DISTORTION AND TOTAL POWER FACTOR OF LIFTS
The maximum allowable electrical power, total harmonic distortion and total power factor of each lift shall comply with the requirements stipulated in the BEC.

LTE2.20.080.7 MAXIMUM STARTING KVA, MAXIMUM STARTING KW AND MAXIMUM REGENERATIVE POWER OF LIFTS
The maximum starting kVA, maximum starting kW and maximum regenerative power of lifts shall comply with the table below:

<table>
<thead>
<tr>
<th>Rated Load</th>
<th>Rated Speed (m/s)</th>
<th>Maximum Starting (kVA)</th>
<th>Maximum Starting (kW)</th>
<th>Maximum Regenerative Power (kW)</th>
</tr>

LTE2.21 LIFT ALARM SYSTEM

LTE2.21.010.7 GENERAL REQUIREMENTS

1. The Sub-contractor shall supply and install a lift alarm system including all sensing devices, cabling, flexible conduits, alarm sounders, batteries, indication panels and accessories;

2. This system shall operate as follows:
   a. Alarm sounders shall be provided on top of the lift car, in the main entrance lift lobby, in the guard counter or location(s) as shown on the Drawings, and in the lift machine room or at the maintenance access panel for machine-room-less lift. These alarm sounders shall be connected to the emergency battery normally maintained by trickle charger from A.C. source;
   b. These alarm sounders shall be arranged to sound as long as the alarm push button inside the car is being pressed;
   c. Alarm sounders shall be of electronic type with the following two-tone pattern:
      - Low frequency: 600Hz (±15%)  Duration: 600 ms (±20%)
      - High frequency: 920Hz (±15%)  Duration: 300 ms (±20%)
      The alarm sounders shall be impact resistant, suitable for conduit entry and with a finish colour approved by the Contract Manager. Alarm sounders for outdoor installation shall be weatherproof to IP 65;
   d. An emergency alarm push button together with an intercom shall be provided in the lift car and be connected to the guard counter or location(s) as shown on the Drawings, and the lift machine room or maintenance access panel for machine-room-less lift. Alarm sounder, indication light and intercom connected to the lift car shall be provided in the guard counter or location(s) as shown on the Drawings, and in the lift machine room or maintenance access panel for machine-room-less lift. An alarm sounder connected to the alarm push button in the lift car shall also be provided at the main entrance lift lobby and at the lift pit;
   e. The alarm sounders shall sound and the indication lights shall be lit if the alarm push button is pressed. The indication lights shall remain on until they are manually reset by activation of a reset button inside the guard counter/main entrance lift lobby or as shown on the Drawings upon releasing of trapped passengers. The hook switch of an intercom handset shall not be used as the indication lights reset button. The sound generated by the alarm sounders shall be distinguishable from that of fire alarms;
   f. An indication light for acknowledgment shall be provided in the lift car. The indication light for acknowledgment shall be in the form of a blinking light adjacent to the intercom speaker and the following notice shall be provided next to the blinking light:
      "When light blinks, it indicates your emergency call has already been received. Please be patient and wait for the rescue."
      "此燈閃亮時，表示已收到求救信息，請耐心等候救援"
      The indication light for acknowledgment shall blink after the manual activation of an acknowledgment switch located in the guard counter/main entrance lift lobby. The blinking shall continue until the acknowledgment switch is reset.
g. Separate lift alarm/indication/intercom system shall be provided for each lift. In the lift machine room, separate lift alarm/indication/intercom panels constructed of 1.5 mm thick hairline stainless steel shall be provided for each lift adjacent to each lift control panel. In the guard counter/main entrance lift lobby, a combined lift alarm/indication/intercom panel constructed of 1.5 mm thick hairline stainless steel shall be provided;

h. A pair of voltage free contacts for each lift shall be provided and terminated as shown on the Drawings for connection to the local alarm system by others. The contacts shall be normally open and shall close when the alarm push button in lift car is being pressed;

i. The lift alarm system for all lifts shall be provided as detailed in Clause 10.3.3 of the Lift COP, Section E, Part 1;

j. For each of the lifts, a lift failure indication light shall be provided in the guard counter/main entrance lift lobby as shown on the Drawings. The lift failure indication light shall be lit and the alarm sounder in the guard counter/main entrance lift lobby mentioned in LTE2.21.010 (2)(a) shall sound when the lift is caused to stop under the following fault conditions:

i. Actuation of any safety devices, e.g. the stopping device and inspection operation switch on the car roof, but excluding the lift door safety devices;

ii. Power supply failure for lifts; or

iii. Malfunction of ventilation fan for the lift well, when applicable.

The alarm sounder shall continue to sound until manually muted by activation of the reset button in LTE2.21.010 (2)(i). The lift failure indication light shall remain on until the fault is cleared and the actuated safety devices resume to the normal condition.

LTE2.21.020.7 CABLELING FACILITIES BY ELECTRICAL SUB-CONTRACTOR

The Electrical Sub-contractor will be responsible for the provision of the portion of concealed conduit and accessories for the lift alarm system as shown on the Drawings.

LTE2.21.030.7 FLOOD ALARM SYSTEM FOR LIFT TOWER

1. In addition to requirements of lift alarm system specified in clause LTE2.21.010, the Sub-contractor shall supply and install a flood alarm system for lift tower to detect the occurrence of flooding in lift pit and alert the management office / maintenance personnel to take remedial action;

2. The alarm sounder at the main entrance lobby of lift tower and guard counter of nearby domestic block shall sound upon actuation of water level sensor of the flood alarm system at the pre-set high level due to flooding of the lift pit. The alarm sounder at guard counter shall continue to sound until manually muted by activation of the reset button at guard counter of nearby block. The alarm sounder at the main entrance lobby of lift tower shall remain on until manually muted by activation of the reset button at local lift alarm indication panel in the lift machine room of lift tower or at the maintenance access panel for machine-room-less lift;

3. Separate flood alarm indication light for each lift pit shall be provided at master lift alarm indication panel at guard counter of the nearby domestic block/estate management office and local lift alarm indication panel in the lift machine room of lift tower or at the maintenance access panel for machine-room-less lift. The flood alarm indication light shall remain on until water level sensor resume to normal condition;
4. A pair of voltage free contacts for flood alarm of each lift pit shall be provided and terminated as shown on the Drawings for connection to the local alarm system of the nearby domestic block by others. The contacts shall be normally open and shall close when the water level sensor at lift pit is actuated.
LTE2.22 FIRE SERVICES REQUIREMENTS

LTE2.22.010.7 FIREMAN'S LIFTS

Where called for in the Project Specific Specification or on the Drawings, fireman's lift(s) shall be provided which shall satisfy the following conditions:

1. Lift well openings shall be provided with automatic self-closing fire-resisting doors;
2. It shall be of a minimum size of 1.35 m² net internal floor area of car, with a minimum rated load of 680 kg;
3. It shall be provided with a suitable control switch at the designated point of entry to enable the Fire Services Department to gain immediate control over the lift and return it to the designated point of entry, such switch shall isolate the lift from control by the public. The fireman switch shall be flush mounted on a stainless steel plate of thickness not less than 2.5 mm;
4. The speed of the lift shall be such that it shall reach the highest landing in not more than one minute;
5. It shall be suitably indicated by the words "Fireman's Lift" in English and Chinese characters;
6. All landings doors shall be automatic self-closing;
7. For every refuge floor except that provided at the main roof of a building, the lift doors of the fireman's lifts shall not be open onto the refuge floor in normal operation and shall be locked at all times until automatically released on actuation of the fireman's switch.
LTE2.23 REQUERIEMENTS ON RIDING COMFORT

LTE2.23.010.7 RIDING COMFORT

1. All lift installation shall comply with the following riding comfort criteria:

<table>
<thead>
<tr>
<th>Maximum Jerk (m/s³)</th>
<th>Maximum Lift Car Vibration (cm/s²)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>X - Axis</td>
</tr>
<tr>
<td>2.2</td>
<td>25</td>
</tr>
</tbody>
</table>

2. The Z-axis is along the lift travel direction and the X-axis and Y-axis are on the horizontal plane;

3. Upon completion of the lift installation, the Sub-contractor shall carry out riding comfort measurement for each lift. Measurement results shall be submitted to the Contract Manager for record. The Sub-contractor shall propose and carry out remedies to the installation if the measurement result exceeds the criteria in sub-clause (1);

4. Riding comfort measurement shall be conducted with the lift car carrying rated load and travelling in both upward and downward directions;

5. Re-measurement shall be carried out by the Sub-contractor after any remedy to show compliance with the criteria in sub-clause (1).
LTE2.24 REQUIREMENTS ON HOMING OPERATION IN LIFT TOWER

LTE2.24.010.7 HOMING OPERATION IN LIFT TOWER

1. The lifts at lift tower shall home at the terminal floor;

2. For lifts at lift tower provided with flood alarm system, the lifts shall go to upper floor and the lift car doors shall be opened for passenger release upon activation of water level sensor of flood alarm system. The lifts then stop at that landing level with lift car doors closed and lift car lighting on. The door open push button inside lift car can still remain functional;

3. The lifts shall start to resume operation only until the water level sensor of flood alarm system resume to normal;

4. In case the lift(s) in lift tower also serve as fireman's lift(s), the above operation shall still be applied to the lift(s) provided that the lift(s) can resume operation upon the activation of Fireman's Switch.
LTE2.25 PARTICULAR REQUIREMENTS FOR MACHINE-ROOM-LESS LIFT

LTE2.25.010.7 STATUTORY REQUIREMENTS
1. The machine-room-less lift shall be of a type approved by the Electrical and Mechanical Services Department;
2. The passenger rescue operation for the machine-room-less lift shall be accepted by the Fire Services Department;
3. The Sub-contractor shall be responsible for preparing and arranging all necessary submissions to the relevant authorities and providing all necessary information and assistance to the Contract Manager for applying for approval and exemptions/modifications of the statutory codes and requirements, where applicable.

LTE2.25.020.7 GENERAL REQUIREMENTS
1. Maintenance, repair, major alteration, replacement and examination of the overspeed governor and machine shall be able to be carried out on the car roof safely and efficiently;
2. Tripping and re-setting of the overspeed governor shall be able to be remotely controlled outside the lift well or where required at a position approved by the Contract Manager;
3. The motor brake shall be able to be remotely released by hand outside the lift well or where required at a location approved by the Contract Manager. A constant manual effort is required to keep the brake open;
4. In any case, the over-travel of the lift car above the upper terminal landing floor level shall not exceed a dimension that will hinder the release of passengers in a safe manner;
5. Sufficient energy efficient lighting with battery back-up shall be provided for illumination of the overspeed governor, motor brake and machine in the lift well;
6. Lift motor located in lift pit is not acceptable.

LTE2.25.030.7 LIFT WELL VENTILATION
1. A ventilation system for the lift well of machine-room-less lift shall be provided as shown on the Drawings. A ventilation fan adequately sized to maintain the temperature inside the lift well below 40°C shall be provided as shown on the Drawings. The motor of the ventilation fan shall be protected to IP55 minimum and suitable for continuous running;
2. The operation of the ventilation fan shall be controlled by both a temperature sensor installed in the lift well and a timer in the maintenance access panel. The status and fault indication of ventilation fan shall be provided at the maintenance access panel. An independent by-pass ON/OFF switch in maintenance access panel for each ventilation fan for the lift well shall be provided for maintenance purpose;
3. For ventilation system to be installed by the Sub-contractor, the Sub-contractor shall submit calculation to verify that the proposed ventilation fan can maintain the temperature inside lift well below 40°C. The Main Contractor will provide relevant building information and heat load data of the lift well to facilitate the design calculation. The calculation together with the control arrangement of the ventilation fan shall be submitted to Contract Manager for approval;
4. For ventilation system to be installed by the Main Contractor, the Sub-contractor shall provide information for heat dissipation of the lift machine.
LIFT CONTROL PANEL

1. The controller for machine-room-less lift shall be mounted in a ventilated stainless steel lift control panel, in which all contactors, solenoids, relays, electronic cards and motor starting equipment, etc. shall be fitted.

2. When the lift control panel is located outside the lift well, a maintenance access panel constructed of stainless steel frame and stainless steel sheet of minimum 1.5 mm thick shall be provided by the Sub-contractor to enclose and protect the lift control panel, the lift alarm/indication/intercom panel, the CCTV monitor, the 2-way lift well lighting switch, the emergency light switches, the lift well ventilation fan switches, timer and indication lights, flood alarm indication lights etc. Position of the lift control panel and enclosure shall be as specified in the specification and/or on the drawings. The door(s) of the enclosure shall be hinged at the front, shall not open towards the lift control panel, shall be fitted with a lock which can be locked without a key from outside and only accessible by authorised person. It shall bear on the outside face a notice in English and Chinese in letters and characters not less than 25 mm high as follows:

UNAUTHORISED OPENING PROHIBITED
LIFT CONTROL PANEL
CLOSE AND LOCK THIS DOOR

3. When the lift control panel is located inside the lift well, it shall be located at a position that will enable the lift maintenance personnel to carry out inspection and maintenance work in a safe and efficient manner. All necessary working platform and access to the lift control panel shall be provided by the Sub-contractor. A thermal protection device shall be provided by the Sub-contractor to stop the lift car and return to a landing when the lift control panel has reached a pre-set temperature level. At a suitable location outside the lift well, a maintenance access panel constructed of stainless steel frame and stainless steel sheet of minimum 1.5 mm thick with hinged lockable door(s) shall be provided by the Sub-contractor to enclose and protect the lift alarm/indication/intercom panel, the CCTV monitor, the 2-way lift well lighting switch, the emergency light switches, the lift well ventilation fan switches, timer and indication lights, flood alarm indication lights etc.;

4. The door of the enclosure located outside the lift well shall be so constructed that the CCTV monitor inside the enclosure can be visible from the outside through safety glass of 6 mm minimum thickness complying to BS 952-1 and BS 952-2, BS EN 81-1 or equivalent;

5. Additional wall thickness to embed the enclosure located outside the lift well while maintaining the fire resistance period requirement for the wall will be provided by the Main Contractor as necessary.

LIFTS FOR OUTDOOR APPLICATION

1. When the lift is susceptible to outdoor weather, all the lift equipment of the lift shall be suitable for outdoor use;

2. The metal work of the lift installation other than moving parts shall be adequately protected against corrosion by suitable and approved epoxy paint coating system, hot dip galvanising or factory applied finish;

3. Lift components, such as limit switches, car door and landing door locks etc., shall be protected by drip-proof enclosure or suitable watertight cover;

4. Electrical wirings and accessories shall be of water-proof type at least IP54.
Please refer to the specification requirements specified in the Project Specific Specification.

LTE3.1 STEPS

LTE3.1.010.7 HORIZONTAL STEPS
1. The surface of the steps shall be horizontal at all positions exposed to passenger;
2. Yellow demarcation on minimum three borders of each step shall be provided by durable and wear resistant material such as yellow moulded resin demarcation cleats. The width of the demarcation strips on step shall be at least 20 mm for the strips at the back and shall be at least 13 mm for the strips on the two sides.

LTE3.1.020.7 INTEGRAL DIE-CAST ALUMINIUM OR STAINLESS STEEL STEP TREAD AND RISER
1. The step treads shall be die-cast aluminium or stainless steel of EN 10088-1 grade 1.4301 (grade 304) with closely spaced cleats designed to provide a secure foothold, the latter being grooved parallel to the travel of the steps to mesh with the comb at the entrance and exit;
2. The step risers shall also be die-cast aluminium or stainless steel of EN 10088-1 grade 1.4301 (grade 304) integral with the step treads and shall include vertical cleats designed to pass between the cleats of the tread in the adjacent steps thus providing a combing action with minimum clearances.

LTE3.1.030.7 ROLLERS
Each step shall be supported on four synthetic or rubber tyred ball bearing rollers, grease sealed for life and so mounted that tilting and rocking of steps is prevented whilst ensuring smooth and quiet operation in service.

LTE3.1.040.7 END TRAVELS
At the ends of the escalators the steps shall travel in a substantially horizontal direction for the minimum distances in accordance with Clause 6.1.2 of the Lift COP, Section E, Part 4.

LTE3.1.050.7 RUNNING CLEARANCE
All steps running clearances shall comply with the requirements as laid down in Clauses 7.1 and 7.2 of the Lift COP, Section E, Part 4.

LTE3.1.060.7 TYPE TEST
1. The steps shall be type tested in accordance with clause 5.3.3.2 and 5.3.3.3 of BS EN 115-1 by an Approved independent testing institution;
2. Type test certificate to this effect shall be submitted to the Contract Manager upon request.

LTE3.1.070.7 NOMINAL WIDTH OF ESCALATOR STEPS
The nominal width of escalator steps shall be 1000 mm unless otherwise specified in the Project Specific Specification.
LTE3.2  STEP CHAINS

LTE3.2.010.7  STEP CHAINS
1. The steps shall be driven by at least two steel link chains of which at least one shall be located on each side of the step;
2. The step chains shall be of endless roller type and modular construction. Each module shall comprise not more than 4 rollers.

LTE3.2.020.7  MATERIALS
The step chains shall be made of high tensile steel links with hardened and ground pins.

LTE3.2.030.7  QUIET OPERATION
The rollers shall accurately engage with the drive sprockets to ensure smooth and quiet operation.
LTE3.3 TRACKS

LTE3.3.010.7 CURVED SECTIONS
All the curved sections of the tracks shall be manufactured in aluminium pressure die-castings or steel.

LTE3.3.020.7 STRAIGHT SECTIONS
The straight sections of the tracks shall be of steel or aluminium extrusions. These extrusions shall essentially be channels forming both running surfaces and guards over the trailing rollers.

LTE3.3.030.7 DESIGN
The entire tracking system shall be so designed that in the unlikely event of a step chain breaking, there shall be no likelihood of the steps lifting out of place.
LTE3.4  LANDING OPENINGS AND
LANDING PLATES

LTE3.4.010.7  OPENINGS
Floor openings will be provided by the Main Contractor on both upper and lower
landings. The Sub-contractor shall submit builder's work drawings detailing the
exact dimensions and locations of the openings.

LTE3.4.020.7  LANDING PLATES
Removable floor landing plates to harmonise with the comb shall be provided by the
Sub-contractor over the openings to give access to the machinery for maintenance
purpose. These landing plates shall be of stainless steel or wear-resistant aluminium
alloy and shall afford a secure foothold.
COMB

LTE3.5

LTE3.5.010.7  COMB

Combs shall be provided at the top and bottom landings and shall be of wear-resistant aluminium alloy or stainless steel with anti-slip pattern.

LTE3.5.020.7  COMB TEETH SECTION

1. The comb sections shall have fine pitch teeth to allow the cleats of the step tread to pass them with minimum clearance. The comb teeth sections shall be made of synthetic resin or metal or equivalent materials, and shall be adjustable vertically and horizontally, and readily replaceable. The width of each comb teeth section shall be not more than 200 mm;

2. The teeth of every comb teeth section shall be so meshed with and set into the slots of the step tread and pallets that the points of such teeth are always below the upper surface of such tread surface.
LTE3.6 BALUSTRADING

LTE3.6.010.7 BALUSTRADES

Solid balustrades possessing sufficient mechanical strength in compliance with Clause 1.1.5.3 of the Lift COP, Section E, Part 4 shall be installed on each side of the escalator and shall consist of the following components:

1. The skirting panels shall be vertical and constructed of smooth hairline finish stainless steel with thickness of not less than 2 mm. Embossed, perforated or roughly textured materials shall not be used;

2. The interior profile shall be of hairline finish stainless steel with thickness of not less than 2 mm. The interior profile and the balustrade interior panelling shall have an angle of inclination of at least 25° to the horizontal;

3. Unless otherwise specified, the interior panelling shall be of hairline finish stainless steel with thickness of not less than 1.5 mm. The balustrade panel shall be of splinter free one-layer safety glass of thickness not less than 6 mm. Lighting shall be provided along and underneath the handrails except for slim type balustrade decking design and stainless steel type balustrade decking design;

4. The balustrade decking shall be of hairline finish stainless steel. The decking is to be situated under the handrail and forms the top cover of the balustrade panelling;

5. The newel including the handrails shall project beyond the root of the comb teeth by at least 600 mm in longitudinal direction;

6. Stainless steel specified for skirting, interior profile, interior and exterior panelling and decking shall be stainless steel of EN 10088-1 grade 1.4301 (grade 304) or equivalent.

Please refer to specification requirements specified in Project Specific Specification.

LTE3.6.020.7 BRUSH BRISTLE TYPE DEFLECTOR DEVICE

Approved brush bristle type deflector devices shall be provided along the full length of the lower part of the skirting panels on each side.

LTE3.6.030.7 EXTERNAL CLADDING

1. Unless otherwise specified, metal enclosure with sufficient mechanical strength in compliance with Clause 1.1 of the Lift COP, Section E, Part 4 shall be provided. The extent of metal enclosure shall cover the balustrade exterior panelling, machine pits and underside of the truss;

2. Unless otherwise specified, the Main Contractor will install stainless steel cladding onto the metal enclosure. The Sub-contractor shall coordinate with the Main Contractor and submit the method and details of fixing of stainless steel cladding onto the metal enclosure for the Contract Manager's approval. The Sub-contractor shall also allow reasonable time in his programme for the Main Contractor to complete the external cladding.

Please refer to the specification requirements specified in the Project Specific Specification.

LTE3.6.040.7 OBSTRUCTION GUARD FOR ESCALATOR

Obstruction guard will be provided by the Main Contractor for adjacent building obstacles and criss-cross escalators. The Sub-contractor shall indicate on the builder's work drawings the constructions and positioning of the guards in accordance with Clause 1.2.3 of the Lift COP, Section E, Part 4.
Please refer to the specification requirements specified in the Project Specific Specification.

**LTE3.6.050.7 SILICONE SPRAY**

Approved silicone spray or platform coating shall be applied before substantial completion. Silicone spray shall be applied during the Maintenance Period at a regular interval of not more than 2 months to the escalator balustrade where it may come into contact with feet and shoes to reduce the friction at these areas for passenger safety unless platform coating is applied.
LTE3.7 HANDRAILS

LTE3.7.010.7 RUBBER HANDRAIL
The handrails shall be constructed of multi-layered canvas with the exposed surface covered with smooth black abrasion resistant rubber which shall be vulcanised into an endless loop.

LTE3.7.020.7 SPEED
The handrails shall move in the same direction of the steps. The speed of the handrail is permitted to deviate from the speed of the steps within the limits of 0% to +2%.

LTE3.7.030.7 SAFETY GUARD
Safety guards shall be provided where the handrails enter and leave the escalator newels. In addition to being protected by the automatic operation of the handrail entry safety guard, the point of entry of the handrail into the newel shall be so configured as to prevent the pinching of fingers, hands or other objects. Handrail entry designs which form part of the continuous profile of the balustrade decking or which are considered by the Contract Manager as vulnerable to the pinching of fingers, hands or other objects are not acceptable.

LTE3.7.040.7 HANDRAIL GUIDES
The handrail guides shall be in specially formed aluminium or steel section to allow easy movement of the handrail but properly shaped as to retain the handrail in its place.
LTE3.8 TRUSS

LTE3.8.010.7 CONSTRUCTION

The lattice type structural steel truss shall be a rigid steel fabricated structure and shall be capable of carrying a full complement of passengers together with the machinery of the escalator, the balustrades and the exterior covering. The factor of safety used in the design of the truss shall not be less than 5 basing on the static load.

LTE3.8.020.7 MACHINERY PIT

The upper section of the truss shall contain the drive machine and shall be fitted with a trap door.
LTE3.9  LUBRICATION

LTE3.9.010.7  LUBRICATION
Effective means for lubricating the bearings and moving parts as required shall be provided with easy access. Oil pump shall be provided for the automatic lubrication of steel chains.

LTE3.9.020.7  OIL PANS
Oil tight drip pans shall be provided for the entire length of the escalator to contain any wasted lubricant within the truss. When necessary, the oil tight drip pans shall be removable to give access to both the machinery space and the return station for maintenance.
LTE3.10  DRIVING MACHINERY

LTE3.10.010.7  INDEPENDENT DRIVING MACHINE
Each escalator shall be independently driven.

LTE3.10.020.7  REDUCTION GEAR
1. The driving machine shall be a worm reduction gear, helical reduction gear or planetary gear with a drive motor situated in the machinery pit at the upper landing. It shall be connected by chains or other proven means to the main drive shaft of the escalator;
2. The reduction gear shall be housed in a substantial cast iron housing which shall also hold the lubricant.

LTE3.10.030.7  MOTOR
1. The motor shall be three-phase A.C. squirrel cage, induction motor of continuous rating, reversible type with high starting torque and low starting current and specially designed for escalator application;
2. The motor speed shall not exceed 1,500 revolutions per minute.

LTE3.10.040.7  CAPACITY
The A.C. squirrel cage motor shall be of ample capacity, free from objectionable noise and vibrations when in operation.

LTE3.10.050.7  ESCALATOR SPEED
The escalator speed shall be continuously adjustable from a minimum value of 0.17 m/s to a maximum value of 0.5 m/s. A key switch shall be provided in or near the control panel to adjust the speed manually and on continuous basis.

LTE3.10.060.7  BEARINGS
The motor shall be fitted with grease lubricated ball bearings.
LTE3.11 BRAKING SYSTEM

LTE3.11.010.7 OPERATIONAL BRAKE
1. Each escalator shall be provided with an operational brake which is mechanically applied and electrically held off type and of sufficient capacity to effectively bring the escalator to rest within the stopping distance in accordance with Clause 8.4.4.2 of the Lift COP, Section E, Part 4 when travelling at full contract speed in either direction;
2. Operational brake shall be located on the driving machine or the main drive shaft;
3. When springs are used to apply brake shoes, such springs shall be in compression and adequately supported and guarded.

LTE3.11.020.7 AUXILIARY BRAKE
Auxiliary brake of mechanical (friction) type shall be provided and function in accordance with Clause 8.6.1 and Clauses 8.6.2, 8.6.3 and 8.6.4 of the Lift COP, Section E, Part 4.

LTE3.11.030.7 HANDWINDING
If a handwinding device is provided, it shall be suitably marked for "UP" and "DOWN" operation in both English and Chinese characters. The handwinding device shall be used in conjunction with a brake release device for the operational brake and shall be easily accessible and safe to operate.
**LTE3.12  FOOTLIGHTS AND STEP LIGHTS UNDER LANDING**

**LTE3.12.010.7  FOOTLIGHTS**
Footlights shall be provided on either side of the interior of the skirting at both upper and lower landings and energy efficient fluorescent or LED luminaries shall be used.

**LTE3.12.020.7  STEP LIGHTS UNDER LANDINGS**
Energy efficient fluorescent or LED lighting shall be provided underneath landings to illuminate the clearance between steps, steps and skirting, steps and comb, at the horizontal step portion of the escalator. The colour of these lights shall be automatically switched to green at landings where passengers can gain entry, and red at landings where passengers cannot gain entry. Green and red coloured lightings shall be provided at each landing to allow change of escalator travelling direction.

**LTE3.12.030.7  REPLACEMENT OF LAMP BULB/TUBE**
Facility shall be incorporated for the replacement of lamp bulb or fluorescent tube.
LTE3.13 SUPPORT BEAMS

LTE3.13.010.7 STRUCTURAL SUPPORTS
Structural supporting beams will be provided by the Main Contractor at the top and bottom landings. Intermediate support will not be provided unless otherwise shown on the Drawings. The Sub-contractor shall submit for the Contract Manager’s approval the exact locations and dimensions of the structural supports and the reaction forces to be imposed on the same.

LTE3.13.020.7 MOUNTING FACILITIES
All other supports and mounting facilities, e.g. mounting brackets, bearing plates, etc. required for the installation of the escalator shall be provided by the Sub-contractor.

LTE3.13.030.7 INTERMEDIATE SUPPORT FOR ESCALATOR
Please refer to the specification requirements specified in the Project Specific Specification.
LTE3.14  SAFETY DEVICES

LTE3.14.010.7  SAFETY DEVICES

Safety devices shall be provided in accordance with the Lift COP, Section E, Part 4 and comprise the following minimum features:

1. A stopping device shall be provided at the driving and return stations and machinery space inside the truss where means of access is provided. The stopping device does not need to be provided in the machinery space if a main switch according to Clause 9.4 of the Lift COP, Section E, Part 4 is located therein and is sufficiently close to the machinery. The stopping device shall:
   a. Be of mushroom head, push to stop, pull to run type, coloured red and suitably protected against accidental operation;
   b. Be conspicuously and permanently marked "STOP" in both English and Chinese characters.

2. An emergency stopping device shall be provided in conspicuous and easily accessible position at or near to each landing of the escalator. The emergency stopping device shall be a red button suitably protected against accidental operation and conspicuously and permanently marked "STOP" in both English and Chinese characters;

3. A broken step chain safety device shall be incorporated as part of the tension carriage, and it shall operate if the bottom sprocket moves unduly in either direction in the event of either or both step chains breaking or becoming unduly lengthened due to wear of the pins, or tension in either chain dropping below a pre-determined value. The operation of this device shall remove power and applies the operational brake;

4. If the chain or belt between the driving machine and the escalator main drive shaft breaks, a broken drive chain device shall be provided which shall cause the electrical supply to motor to be disconnected and shall cause the operational brake as well as the auxiliary brake to operate;

5. Broken handrail device shall be situated inside the balustrades on either side at the lower end of the incline, and shall actuate and cause the escalator to stop if either or both handrails break;

6. A non-reversing and overspeed protective device shall be arranged to prevent a travelling escalator to slow unduly or attempts to reverse its direction of travel or to overspeed in accordance with Clauses 8.5.1 and 8.5.2 of the Lift COP, Section E, Part 4;

7. Comb obstruction device shall be provided on either side of each comb to stop the escalator if any object is caught between a step and the teeth of the comb;

8. Skirting switches, actuated by a passenger’s foot or other foreign object trapped between a step and the skirting, shall be provided to stop the escalator. Skirting switches shall be provided at each side of the skirting at the points of upper lower transition from incline to horizontal, and at the inclined section in accordance with Clause 1.1.5.5(d) of the Lift COP, Section E, Part 4;

9. A handrail switch shall be provided at each handrail entry guard which shall stop the escalator if foreign objects are trapped;

10. A protective device for sagging of steps shall be provided to stop the escalator when any part of the steps is sagging such that meshing of the combs is no longer ensured at the point at which the steps enter the landings;

11. Escalators connected to 3-phase A.C. power supply shall incorporate phase protective relay to prevent the units running in the event of phase failure and phase reversal;

12. Motor overload relay shall be fitted to protect the motor against overload;
13. Monitoring devices for synchronisation of handrails and steps shall be provided to detect out of synchronism of handrails and steps. In the event of out of synchronism, an alarm shall be sounded to alert the security guards in the vicinity to stop the escalator manually.

LTE3.14.020.7 OPERATION OF SAFETY DEVICE

The operation of any of the safety devices mentioned in LTE3.14.010 shall cause the electrical supply to the driving motor to be disconnected and the operational brake to operate bringing the escalator to rest. All switching-off operations mentioned in sub-clauses (1) to (10) of LTE3.14.010 shall be effected by electrical safety devices in conformity with Clause 10.2 of the Lift COP, Section E, Part 4.
LTE3.15 CONTROL AND INSPECTION STATION

LTE3.15.010.7 STATION POSITION
A control station shall be provided at both the upper and lower landing newel, which shall contain a directional switch, an alarm and a foot light switch. The station shall be so positioned as to enable any person operating any of the switches to afford a full view of the escalator.

LTE3.15.020.7 INSPECTION CONTROL DEVICE
1. Inspection control device shall be provided at the upper and lower landing by means of portable control device in accordance with Clause 10.3.5 of the Lift COP, Section E, Part 4.

2. When the portable control device is operated, the movement of the escalator shall be dependent on a continuous pressure simultaneously on a "Common" push button and a "Up" or "Down" push button. A stopping device of "mushroom head, push to stop, pull to run" type and coloured red shall be provided in the inspection control device. These push buttons and stopping device shall be protected against accidental operation and with the direction of movement clearly indicated.

LTE3.15.030.7 TYPE OF SWITCHES
The up and down directional starting switch and the footlight switch shall be of key-operated spring off type.

LTE3.15.040.7 MARKINGS
All switches shall be clearly marked in both English and Chinese characters.
LTE3.16  CONTROLLER

LTE3.16.010.7  CONTENTS
The controller shall be a self-contained unit containing all the necessary electrical switchgear, contactors, relays and electronic controller cards, etc.

LTE3.16.020.7  LOCATION
The controller housed in a cabinet shall be located in the upper landing, and provision shall be made for easy access for maintenance.
LTE3.17 MAINTENANCE FACILITIES

LTE3.17.010.7 MACHINE PIT LIGHT
A permanent light, suitably guarded, shall be provided in each machine pit by the Sub-contractor, and which can be switched without passing over or reaching over any part of the machinery.

LTE3.17.020.7 SOCKET OUTLET
A 13 amp. 3 pin socket outlet of the type specified in ELE20.3.020 shall be provided in each escalator machine pit by the Sub-contractor.

LTE3.17.030.7 NOTICE
1. A permanent notice reading "Danger, unauthorised access prohibited" and the equivalent in Chinese characters shall be conspicuously fixed on each access door to machinery space. The characters shall not be less than 25 mm high;
2. The name of the manufacturer, the Sub-contractor's name and telephone number and the escalator identification number shall be displayed at the landings.
LTE3.18  ALARM DEVICE

LTE3.18.010.7  ALARM SOUNDER
An alarm sounder shall be provided in the machinery space and shall sound when any of the safety devices mentioned in LTE3.14.010 operates.

LTE3.18.020.7  TYPE OF ALARM SOUNDER
1. The alarm sounders shall be of electronic type with the following two-tone pattern:
   a. Low frequency: 600 Hz (±15%) & duration: 600 ms (±20%);
   b. High frequency: 920 Hz (±15%) & duration: 300 ms (±20%).
2. The alarm sounders shall be impact resistant, suitable for conduit entry. Alarm sounder for outdoor installation shall be weatherproof to IP 65.
LTE3.19 REQUIREMENTS FOR WEATHER-PROOF ESCALATORS

LTE3.19.010.7 GENERAL
Weather-proof escalators shall comply with the specification requirements as detailed in LTE3.19.020 to LTE3.19.090.

LTE3.19.020.7 PROTECTION
Unless otherwise specified, the escalator(s) will be protected by canopy or other similar structure constructed by the Main Contractor as shown on the Drawings.

LTE3.19.030.7 PROTECTION AGAINST CORROSION FOR TRUSS AND METAL WORK OF ESCALATOR

1. The entire truss and metal work of the escalator other than moving parts shall be adequately protected against corrosion for service in wet conditions either by epoxy paint coating system designed for marine application or by hot dip galvanising;

2. When epoxy paint coating system is employed, the surface of the complete truss and metal work shall be prepared and treated in accordance with the epoxy paint coating manufacturer's recommendation:
   a. All rust and dirt on the surface of the truss and metal work shall be removed by wire brushing, and the truss and metal work shall be thoroughly degreased by degreasing solvent prior to the application of any paint coating;
   b. The number, thickness and method of application of paint coating shall be in accordance with the epoxy paint coating manufacturer's recommendation and at least three coats of epoxy paint coating system primer shall be applied followed by at least three coats of finishing epoxy paint coating;
   c. Each coat of paint shall be thoroughly dried before application of next coat.

3. When hot dip galvanising is employed, the complete truss and metal work shall be thoroughly cleaned and degreased by degreasing solvent, and followed by hot dip galvanising to BS EN ISO 1461;

4. Information of the epoxy coating system or hot dip galvanising including details of surface preparation, method of application, number of coatings and details of paints shall be submitted for the Contract Manager's approval prior to manufacture;

5. All the cleansing, degreasing, painting and galvanising processes shall be carried out at the factory, and painting of truss and metal work at site is not permitted except for touching up of damaged coating during installation on Site:
   a. Welding carried out on site on the truss or any metal work that will damage the protective coating is not permitted unless prior approval is given by the Contract Manager;
   b. Where rust appears on the truss or metal work due to damage of protective coating, it must be thoroughly removed by wire brush, degreased and followed by the application of the same number of paint coatings as in the factory or the application of two coats of cold galvanising paints to the satisfaction of the Contract Manager.
REQUIREMENTS FOR WEATHER-PROOF......

LTE3.19

PROTECTION AGAINST CORROSION FOR MOVING PARTS

1. Moving parts of the escalator including step driving chains, sprocket gears, etc. which require greasing or oiling and any metal components which for functional reasons shall not be painted. These parts shall be constructed of non-corrosive materials such as stainless steel or heavily electroplated with non-corrosive materials such as nickel or chromium. These moving parts shall be adequately lubricated all the time by automatic oilers and suitably protected against water from entering into them;

2. All ball or roller bearings such as those installed on the step driving chain and driving mechanism shall be of sealed type.

WATER-OIL SEPARATOR

Device for separation of oil and water shall be provided when water ingress into the escalator can mix with the oil in the lubrication system or the lubrication system is of re-circulating type.

MOTOR AND CONTROLLER

The motor and the controller cabinet shall be, at least, of drip-proof type to IP23. Watertight cover shall be provided on all bearings.

ELECTRICAL WIRINGS AND ACCESSORIES

All wiring subject to water ingress shall have water-proof terminations. Junction boxes, switches, sockets and alarm bells shall be water-proof type at least IP54.

DRAINAGE

The Sub-contractor shall provide proper drainage facilities for the escalator. A permanent drain point will be provided by the Main Contractor at the bottom escalator pit;

An alarm giving a warning of flooding at the lowest escalator pit coupled with a timer to stop the escalator after a preset time shall be provided by the Sub-contractor.

LEVEL SWITCH AT BOTTOM LANDING MACHINE PIT

A level switch shall be provided at the bottom landing machine pit to switch off the escalator in the event water collected in pit reaches a pre-determined level.
LTE3.20 SIGNS AND PICTOGRAPHS

LTE3.20.010.7 PICTOGRAPHS

1. Pictographs and notices in accordance with Clause 11.1 of the Lift COP, Section E, Part 4 shall be provided in a conspicuous position at each escalator landing and at either sides of the mid-point of the inclined section of the escalator;

2. Pictographs for "Do not ride on escalator handrail" shall also be provided;

3. The minimum size of the pictographs shall be 100 mm x 100 mm;

4. Corresponding instruction for use of hand winding device and brake release device shall be available in the driving station, and the direction of travel of the escalator shall be indicated clearly.
LTE3.21 MAXIMUM ALLOWABLE ELECTRICAL POWER, TOTAL HARMONIC DISTORTION AND TOTAL POWER FACTOR

LTE3.21.010.7 MAXIMUM ALLOWABLE ELECTRICAL POWER, TOTAL HARMONIC DISTORTION AND TOTAL POWER FACTOR OF ESCALATORS AND PASSENGER CONVEYORS

The maximum allowable electrical power, total harmonic distortion and total power factor of each escalator and passenger conveyor shall comply with the requirements stipulated in the BEC.
**LTE3.22 AUDIBLE DEVICE OF ESCALATOR FOR THE VISUALLY IMPAIRED**

**LTE3.22.010.7 AUDIBLE DEVICE FOR THE VISUALLY IMPAIRED**

1. A device generating audible "ticking" signals shall be provided for each escalator to enable the visually impaired to distinguish between escalator steps moving towards and away from them. The device shall also enable the visually impaired to distinguish between adjacent escalators with steps moving in different directions;

2. The driving unit of the audible device shall be housed in a rigid enclosure and mounted inside the escalator machine pit. The speakers of the device shall be flush mounted at the skirting of the upper and lower landings of each escalator;

3. The audible device shall be suitable for operation at an ambient temperature of not less than 60ºC;

4. The sound level of the audible "ticking" signal emitted by the speaker of the audible device at each landing shall be adjustable, with a maximum output of 70 dB;

5. Frequency of the "ticking" sound shall be adjustable from 70/minute (step moving towards the visually impaired) to 800/minute (steps moving away from the visually impaired). The frequency of the "ticking" sound shall be automatically reversed when the direction of step movement of the escalator is reversed;

6. Technical data and fixing location of the audible device shall be submitted to the Contract Manager for approval;

7. The audible device shall be disabled manually if required.

**LTE3.22.020.7 AUDIO ALERT SYSTEM**

1. The Contractor shall provide audio alert system for each escalator consisting of an MP3 player, an audio amplifier, loudspeakers and associated equipment for safety messages broadcasting. Each message shall be announced in the order of Cantonese, Putonghua and English;

2. The system shall consist of an MP3 player which acts as the storage of message to be broadcast and as the signal source of the system, an audio amplifier to drive loudspeaker(s) in the escalator, and a built-in monitoring loudspeaker for system testing;

3. A loudspeaker shall be installed on the right side (in direction of escalator) of the balustrade at both landings of the escalator but only the one at the "entry" landing (in accordance with the direction the escalator is running in) shall be active. For high rise escalator with emergency stop button(s) installed at the inclined section, additional loudspeaker(s) shall be provided at the location(s) where the emergency stop button(s) are installed;

4. The MP3 player shall be set to "repeat play" the pre-recorded safety message continuously with the operation direction of the escalator for 'going up', 'going down' and 'please hold the handrail';

5. A pre-recorded message to alert passengers to hold the handrail that the escalator is going to stop shall be broadcasted from all the loudspeakers when the escalator is stopping. This message shall override the safety message as mentioned in sub-clause 4 above;

6. A 24 hour on/off timer shall be provided to enable/disable the message broadcast as described in sub-clause 4 at the predetermined time automatically;
7. An override switch shall be provided inside the newel control box at the lower landing of escalator for turning off the system manually when required;
8. Message change is effected through downloading the new message to the flash memory of the MP3 player;
9. The MP3 player shall comply with the following requirements:
   a. Storage space: minimum 20 minutes of message time when encoded in Windows Media Audio (WMA) format at 80kbps or MP3s at 128kbps.
   b. Supported Formats: MP3, WMA
   c. Play Mode: repeat all
   d. Signal-to-Noise Ratio: 90 dB or higher
   e. Frequency range: 20 Hz to 20 kHz
   f. Line or headphone output: 0 dBm min.
   g. USB (1.1 or 2.0) Transfer: 2 GB memory
   h. Operating System Supported: Microsoft Windows 98/ME/2000/XP/Vista/Window 7
10. The amplifiers shall comply with the following requirements:
   a. Frequency Response: 100Hz-15kHz (-3dB)
   b. S/N ratio: >80dB
   c. Output Power: 10 W rms min. at 8Ω
   d. Output Protection: Overload & short circuit
   e. Sensitivity: 0 dBm at rated power at 1 kHz
   f. Distortion: <1% at rated power at 1 kHz
   Volume control shall be provided to facilitate playback level adjustment.
   Built-in monitoring loudspeaker with on/off switch shall be provided for system testing.
11. The loudspeakers shall have water-proof diaphragm meeting the following requirements:
   a. Frequency Response: 125Hz-13kHz (-10dB)
   b. Impedance: 8Ω or higher
   c. SPL at 1 kHz, 1 m, 1 W: 90 dB±3 dB
   d. Power Handling: 3 W minimum
12. The audio alert system shall be disabled manually if required.
LTE3.23 SERVICE-ON-DEMAND ESCALATOR CONTROL

LTE3.23.010.7 GENERAL REQUIREMENTS
1. All Escalators shall be of service-on-demand (SOD) by means of motion sensor. The motion sensor shall be installed at least 1.3 m before the comb intersection line. The escalator shall accelerate from crawling to its rated speed automatically and shall start to accelerate before the person reaches the comb intersection line of escalator. Construction measures shall discourage circumvention of the control elements. The escalator shall start automatically from crawl speed upon detection of personnel movement within landing zone of the escalator;

2. The escalator shall be reduced to a crawl speed automatically after a preset period of time (which shall be adjustable) which shall be at least the anticipated passenger transfer time plus 10 seconds after the passenger has actuated the motion sensor at exit.

LTE3.23.020.7 MOTION SENSOR AT EXIT
Motion sensor shall also be installed at exit of the service-on-demand escalator to detect whether there is any passenger approaching the escalator in opposite direction. Upon detection of passenger approaching the escalator in opposite direction, the escalator shall immediately start up from crawl speed to rated speed and run in the predetermined direction for an adjustable period of not less than 10 seconds. Concurrently audible signal shall be provided to alert the passenger not to step onto the escalator.

LTE3.23.030.7 VISIBLE SIGNAL SYSTEM
1. A clear visible signal system shall be provided at both ends indicating to the user whether the escalator is available for use, and its direction of travel. Electronic signage display shall also be provided at each of the ingress/egress point of escalator in order to notify the users of the travel direction;

2. The indicator for the visible signal system shall be dot-matrix type tricolour (red, green and amber) LED display, minimum 128 x 16 dots, actuated by reliable solid state circuitry. The indicator shall be of robust design and impact resistance to a degree equivalent to that of polycarbonate material;

3. The indicator shall be able to display at least 32 messages. The dot-matrix display system shall be pre-programmed with the following messages/symbols to inform passengers the corresponding status of the escalator:
   a. '暫停使用 Out of Service';
   b. '例行保養,暫停使用 Routine Maintenance (Out of Service)';
   c. '維修中,暫停使用 Under Maintenance (Out of Service)';
   d. '清潔中,暫停使用 Cleaning in Progress (Out of Service)';
   e. Symbols to indicate the escalator travelling direction; and
   f. Other messages/symbols as required by the Contract Manager.

The height of each character in the dot-matrix indicator shall be 50 mm minimum. The luminous intensity of the indicator shall be at least 3500 μcd.

4. Messages/symbols of dot-matrix indicator shall be re-programmable such that changes, if required, can be effected to suit requirements arise after completion of the Works. Two (2) times of free messages/symbols revision within the Maintenance Period for the Contract shall be deemed to be included.
5. The box for the indicators shall be galvanised steel of thickness not less than 1.5 mm thick. Sample of the floor indicator with the base box as well as the dot-matrix graphic layout and the pre-programmed messages shall be submitted for the Contract Manager’s approval.

BRI BRIDGE WORKS

DESIGN

GENERAL

BRLD010.7 DEFINITIONS
1. Schedule of bearings: the schedule of bearings stated in the Contract;
2. Type of bridge bearing: a term used to identify bridge bearings of exactly the same design and same capacity for all bearing loads, movements and rotations;
3. Fabricated movement joint: a manufactured assembly, including nosings, designed to carry traffic smoothly over a movement joint and to seal the joint against the ingress of water and debris;
4. Movement joint: a permanent joint or hinge throat which allows expansion, contraction or angular rotation to occur;
5. Movement joint formed in place: a movement joint formed during construction of a structure to permit adjacent structural elements to move relative to each other without damage.

BRIDGE BEARINGS

BRLD110.7 GENERAL
1. Bridge bearings shall be designed by the Contractor;
2. The design and manufacture of bridge bearings and the materials used shall comply with BS 5400:Part 9:1983, including the guidance notes, except as stated in BRLD120 and BRLD130. Inspection and maintenance of bridge bearings shall be easy to carry out and the bearings shall be easily replaceable;
3. The maximum bearing stress in concrete underlying or overlying a bridge bearing under the design load at the ultimate limit state shall not exceed 40% of the specified grade strength of the concrete. Higher bearing stresses may be adopted provided that in the opinion of the CM sufficient steel reinforcement is provided to resist the resulting bursting forces and that the bearing stresses are within the limits stated in Clause 7.2.3.3 of BS 5400:Part 4:1990;
4. The deflection of bridge bearings which have a specified zero horizontal movement in a particular direction shall not exceed 1 mm in that direction under the maximum horizontal loadings.

BRLD120.7 SLIDING BEARINGS
1. Clause 4.3.4.2 of BS 5400:Part 9:1983:Section 9.2 shall not apply to sliding bearings;
2. Stainless steel sliding surfaces of sliding bearings which are attached to backing plates by mechanical fasteners instead of continuous welding along the edges shall be bonded to the backing over the full area and supplemented with peripheral sealing if necessary. Mechanical fixing with peripheral sealing only shall not be used.
**ELASTOMERIC BEARINGS**

The requirements for use of elastomer in elastomeric bearings at sub-zero temperatures stated in Clause 3.7.1 of BS 5400:Part 9:1983:Section 9.2 shall not apply.

**GUIDES FOR BEARINGS**

The clearance between guides and complementary sliding surfaces of a guide bearing shall not exceed 1 mm.

**FIXINGS FOR BEARINGS**

1. Except for elastomeric bearings, bridge bearings, including bearings which are not required to provide horizontal restraint, shall be fixed to the superstructure and substructure with mechanical fixings or by other methods approved by the CM. The friction between the bearing and the superstructure or substructure may be used to resist the horizontal forces provided that a factor or safety of at least 2 is applied to the proven coefficient of friction and that the worst combination of vertical load and horizontal load is considered;

2. The ultimate capacity of the mechanical fixings for bridge bearings shall not be less than the worst combination of loading at ultimate limit state stated in the schedule of bearings.

**PROTECTIVE COATINGS**

Metal components of bridge bearings shall be protected against corrosion by a protective coating complying with, and selected in accordance with, BS 5493:1977. For the purpose of selecting the coating system, the environment shall be classified as 'exterior exposed - polluted coastal' and the typical time to first maintenance shall be 'very long' (20 years or more).

**MARKING**

1. Bridge bearings shall be marked by the manufacturer either with the type numbers stated in the schedule of bearings or with the manufacturer’s own type or other numbers. A schedule shall be provided which relates the manufacturer’s own type or other numbers to the type numbers stated in the schedule of bearings;

2. The design movement directions and magnitudes and the axes of bearing shall be marked on the upper faces of bridge bearings to facilitate checking of the installation. Movement indicators shall be provided for sliding and roller bearings to permit checking of movement of the bearings before and after installation.

**MOVEMENT JOINTS**

**MOVEMENT JOINTS FORMED IN PLACE**

Movement joints formed in place shall comply with Worksection CON6 except as stated in this Worksection.

**DESIGN CRITERIA FOR FABRICATED MOVEMENT JOINTS**

1. Fabricated movement joints shall be a proprietary type approved by the CM;

2. Fabricated movement joints shall be capable of withstanding the following loads, either separately or in combination:

   a. Vertically: two 112.5 kN wheel loads, 1 m apart, each spread over a contact area giving an average pressure of 1 MPa and applied in such a manner as to produce the worst possible effect;
b. Horizontally: a traction force of 75 kN/m run of the joint applied perpendicular to the alignment of the joint, together with any forces arising from strain of the joint.

Allowance for additional loading due to impact is not necessary.

3. Fabricated movement joints shall be capable of accommodating the movements and rotations as specified in the Project Specific Specification without damaging the joint and without loading the supporting structure with forces which arise from strain of the joint exceeding 5 kN/m run of the joint;

4. Facilities shall be provided in fabricated movement joints for easy clearance of grit or silt entering slots, grooves or channels forming or associated with the joint;

5. Surfaces of fabricated movement joints which will be exposed at finished road level shall be treated to provide a resistance to skidding not less than that of the adjacent road surface;

6. Fabricated movement joints shall not impair the riding quality of the road surface for vehicular traffic and the passage of vehicular traffic shall not cause undue noise or vibration. The size of gaps, including gaps sealed with flexible material, on the riding surface of the joint shall not exceed 65 mm;

7. The passage of pedestrians and cyclists shall not be impeded or endangered by fabricated movement joints.

BRI.D230.7 FIXINGS FOR FABRICATED MOVEMENT JOINTS

1. The holding down and fixing arrangements for fabricated movement joints shall be capable of withstanding the loads stated in BRI.D220 (2). The diameter of bolts fixed as double row bolts on one side shall be at least 12 mm and the diameter of other holding down bolts and studs shall be at least 16 mm;

2. Fixings for fabricated movement joints shall be compatible with the reinforcement in the underlying concrete. Any revisions to the reinforcement required to suit the fixings shall be designed by the Contractor and submitted to the CM for Approval.

SUBMISSIONS

BRI.D310.7 BRIDGE BEARINGS

Certificates shall be submitted for each batch of bridge bearings delivered to the Site. The following particulars shall be submitted to the CM at least 28 days before Approval of the bridge bearings is required:

1. Details of type of bridge bearings, including materials, and the name and address of the manufacturer;

2. Design calculations, including:
   a. Calculations of bearing stresses above and below the bearings;
   b. Calculations for bursting or other necessary additional or revised reinforcement;
   c. Calculations to show that the bearings comply with the requirements of BS5400:Part 9:1983.

3. Shop drawings and drawings of any additional or revised reinforcement details;

4. Certificate for each type of bridge bearing showing the manufacturer's name, the date and place of manufacture and showing that the bridge bearings comply with the requirements stated in the Contract and including results of:
   a. Friction tests;
   b. Load tests;
c. Tests on elastomers;
d. Quick production tests;
e. Stiffness tests.
5. Values of stiffness in compression and in shear of elastomeric bearings;
6. Details of fixings to superstructures and substructures;
7. Details of protective coatings;
8. Methods of installation;
9. Programme of manufacture, testing and delivery, including name and address of testing laboratory.

BRLD320.7 MOVEMENT JOINTS
The following particulars shall be submitted to the CM at least 28 days before construction of the movement joints starts:
1. Details of type of movement joints and the name and address of the manufacturer;
2. Design calculations and drawings;
3. Details of fixings, including the size, length and spacing of holding down bolts and any necessary revisions to the reinforcement;
4. Details of materials for making good adjoining road surfaces and nosings, including reinforcement, jointing and curing details;
5. Programme of manufacture, testing and delivery;
6. For fabricated movement joints, a written undertaking from the supplier that he will install the proposed movement joint.
MATERIALS

WATERPROOFING

BRL.M010.7  PREFABRICATED SHEETING
1. Prefabricated sheeting for waterproofing shall be a proprietary type approved by the CM;
2. Prefabricated sheeting shall not rot or support the growth of mildew and shall be compatible with the materials with which it is in contact. Prefabricated sheeting which will be exposed to sunlight after installation shall be of a type which is unaffected by ultraviolet light;
3. Prefabricated sheeting shall have a tensile strength, pliability and puncture resistance such that the sheeting will withstand the stresses induced during handling and laying without damage. The elongation properties of prefabricated sheeting shall be such that the sheeting can accommodate the creep, shrinkage and thermal movements of concrete without distress;
4. Prefabricated bituminous sheeting shall be a self-adhesive, self-sealing type and shall have a thickness of at least 1.2 mm;
5. Prefabricated rubberised base sheeting shall be of a type which is unaffected by fuel, oils or grease;
6. Primers and mastic for prefabricated sheeting shall be a proprietary type recommended by the sheeting manufacturer and approved by the CM.

BRL.M020.7  BENTONITE PANELS
1. Bentonite panels shall consist of bentonite filler enclosed in self-degradable boards. The panels shall have a permeability of less than $1 \times 10^{-7}$ mm/sec under simulated test conditions similar to those of the as-built conditions. The performance of bentonite panels shall not be affected by contaminants present in the groundwater;
2. Bentonite panels for slabs less than 200 mm thick or with soil cover of less than 450 mm shall be special panels with specific provision for swelling to prevent lifting of the slab;
3. Bentonite joint seal and bentonite granules shall be a proprietary type recommended by the bentonite panel manufacturer and approved by the CM;
4. Polyethylene sheeting for use with bentonite panels shall be a heavy duty type.

BRL.M030.7  BITUMINOUS PAINT
Bituminous paint for waterproofing shall be cut-back bitumen complying with BS 3690:Part 1:1989. The bitumen shall have a viscosity grade as determined by a standard tar viscometer within the range 25-50 seconds with a coverage of 0.5 L/m². Primers for bituminous paint shall be a proprietary type recommended by the bituminous paint manufacturer and approved by the CM.

BRIDGE BEARINGS

BRL.M110.7  HOLDING DOWN BOLTS
Holding down bolts for bridge bearings shall be of stainless steel and a proprietary type approved by the CM.
BRI.M120.7 CEMENT MORTAR, GROUT AND ADHESIVE

1. Cement mortar for bedding and construction of unreinforced plinths for bridge bearings shall be a proprietary non-shrink type approved by the CM having a grade strength of at least 50 MPa;

2. Chemical-resin mortar for the construction of plinths for bridge bearings shall be a proprietary non-shrink type approved by the CM having a grade strength of at least 50 MPa;

3. Grout for grouting base plates and holding down bolts shall be a proprietary non-shrink cementitious type approved by the CM having a grade strength of at least 50 MPa. The grout shall be flowable and shall not bleed or segregate. The suitability of the grout shall be demonstrated by site trials to the satisfaction of the CM. Chemical-resin based grout shall not be used;

4. Adhesive and chemical resin mortars for locating and bedding elastomeric bridge bearings shall be a proprietary type approved by the CM. They shall be compatible with the elastomer.

BRI.M130.7 DOWEL BARS

VEHICULAR PARAPETS

BRI.M210.7 GENERAL

Vehicular parapets shall be of the types shown on the Drawings.

BRI.M220.7 STEEL

1. Steel for vehicular parapets, including weldings, shall comply with Worksection STW except clauses STW.T410 to STW.T430 and clauses STW.T450 to STW.T910. The requirements for testing of materials and welded components shall follow clauses BRI.T410 to BRI.T840;

2. Protective treatment to steel for vehicular parapets shall comply with Worksection STW and shall be applied after welding, drilling and cutting is complete.

BRI.M230.7 ALUMINIUM

1. Aluminium for vehicular parapets shall comply with the following or equivalent approved by the CM:
   a. Wrought aluminium and aluminium alloys for general engineering purposes:
      ii. Rivet, bolt and screw stock: BS 1473:1972;

2. Aluminium shall be anodised to Grade AA 25 in accordance with BS EN 12373:Part 1:2001 or equivalent approved by the CM;

3. Welding of aluminium for vehicular parapets shall comply with BS EN 1011:Part 4:2000 or equivalent approved by the CM.
BRI.M240.7 STAINLESS STEEL NUTS, BOLTS AND WASHERS
Stainless steel bolts, nuts and washers for vehicular parapets shall be grade A4 - 80 and shall comply with BS EN ISO 3506:Part 1:1998 and BS EN ISO 3506:Part 2:1998 or equivalent approved by the CM.

BRI.M250.7 HOLDING DOWN BOLTS
Holding down bolts for vehicular parapets shall be a proprietary type approved by the CM.

BRI.M260.7 GROUT
Grout for holding down bolts for vehicular parapets shall be based on polyester resins and shall be a proprietary type approved by the CM. Epoxy resin based grout shall not be used.

MOVEMENT JOINTS

BRI.M310.7 JOINT FILLER
Joint filler for movement joints formed in place shall be non-absorbent.

BRI.M320.7 JOINT SEALANT
1. Joint sealant for movement joints formed in place shall be a polysulphide-based sealant. Polyurethane-based sealant shall not be used unless approved by the CM;
2. Joint sealant shall be resistant to attack by petrol, diesel oil, dilute acids and alkalis, synthetic and mineral oils, hydraulic fluids and paraffin. The sealant shall have a transverse butt joint movement range for repeated cyclic movement of at least 25% of the width of the joint.

BRI.M330.7 COMPRESSION SEALS
Compression seals shall be a proprietary type approved by the CM and shall be manufactured from natural rubber, neoprene or other synthetic material. Compression seals shall have the dimensions specified by the manufacturer for each joint width.

BRI.M340.7 PVC CAPPING STRIP
PVC capping strip shall be a proprietary type approved by the CM.

BRI.M350.7 HOLDING DOWN BOLTS
Holding-down bolts for movement joints shall be a proprietary type approved by the CM.

BRI.M360.7 GROUT
Grout for holding-down bolts for movement joints shall be based on polyester resins and shall be a proprietary type approved by the CM. Epoxy-resin based grout shall not be used.
SUBMISSIONS

**BRL.M410.7 WATERPROOFING SYSTEMS**

Certificates shall be submitted for each batch of the material delivered to the Site. The following particulars, including certificates, shall be submitted to the CM at least 14 days before the first delivery of the material to the Site:

1. Manufacturer's literature and a certificate for prefabricated sheeting showing the manufacturer's name, the date and place of manufacture and showing that the prefabricated sheeting complies with the requirements stated in this Specification including results of tests for:
   a. Tensile strength;
   b. Pliability;
   c. Puncture resistance;
   d. Elongation.

2. Manufacturer's literature and a certificate for bentonite panels showing the manufacturer's name, the date and place of manufacture and showing that the bentonite panels comply with the requirements stated in this Specification and including results of tests for permeability;

3. Manufacturer's literature and a certificate for bituminous paint showing the manufacturer's name, the date and place of manufacturer and showing that the bituminous paint complies with the requirements stated in this Specification and including results of tests for viscosity;

4. Particulars of primers and mastic for prefabricated sheeting, bentonite joint seal and bentonite granules and primers for bituminous paint;

5. Method of laying prefabricated sheeting and bentonite panels.

**BRL.M420.7 SAMPLES FOR WATERPROOFING SYSTEMS**

Samples of the following proposed materials for waterproofing systems shall be submitted to the CM at the same time as particulars of the materials are submitted:

1. Prefabricated sheeting;
2. Bentonite panels.

**BRL.M430.7 SAMPLES FOR VEHICULAR PARAPETS**

Samples for the proposed posts and rails for vehicular parapets shall be submitted to the CM at least 14 days before installation of the parapets starts.
WORKMANSHIP

DELIVERY AND STORAGE

BRI.W010.7 DELIVERY OF BENTONITE PANELS FOR WATERPROOFING
Bentonite panels shall be delivered in original unbroken packages bearing the manufacturer's label.

BRI.W020.7 STORAGE OF WATERPROOFING MATERIALS
1. Prefabricated sheeting and bentonite panels shall be stored in accordance with the manufacturers' recommendations in a dry weather proof store with a raised floor;
2. Bituminous paint shall be stored in sealed containers marked to identify the contents and protected from exposure to conditions which may affect the bituminous paint. The bituminous paint shall be stored in accordance with the manufacturer's recommendations and shall not be used after the recommended shelf life has been exceeded.

BRI.W030.7 STORAGE OF BRIDGE BEARINGS
Bridge bearings shall be stored off a levelled, well drained and maintained hard- standing ground on level supports and in a manner which will not result in damage or deformation to the bearings or in contamination of the bearings.

BRI.W040.7 STORAGE OF VEHICULAR PARAPETS
Vehicular parapets shall be stored off a levelled, well drained and maintained hard- standing ground on level supports and in a manner which will not result in damage or deformation to the parapets or in contamination of the parapets.

BRI.W050.7 STORAGE OF FABRICATED MOVEMENT JOINTS
Fabricated movement joints shall be stored off a levelled, well drained and maintained hard-standing ground on level supports and in a manner which will not result in damage or deformation to the movement joint or in contamination of the movement joint.

INSTALLATION OF WATERPROOFING SYSTEMS

BRI.W110.7 GENERAL
Waterproofing systems shall be laid in accordance with the manufacturer's recommendations.

BRI.W120.7 PREPARATION
1. Surfaces on which waterproofing systems will be laid shall be clean, dry and free from voids, loose aggregate, sharp protrusions, projecting tying wire, release agents and other substances which are likely to damage or affect the waterproofing system;
2. Before waterproofing systems are laid on concrete surfaces the concrete surface shall have been cured for at least 7 days and shall be cleaned with a broom and sealed with one coat of primer. Primed surfaces shall not be covered until the solvent constituent has evaporated. Water shall be allowed to evaporate from primers containing bituminous emulsion before the surface is covered. Primed surfaces shall be protected from contamination.

**BRI.W130.7**  
**PREFABRICATED SHEETING**

1. Prefabricated sheeting shall be laid one sheet at a time from low points and drains towards high points. The sheeting shall be firmly and tightly brought into contact with the primer or underlying sheeting;

2. Laps shall be formed at joints between individual sheets of prefabricated sheeting. Unless otherwise approved by the CM, end laps shall be at least 150 mm and side laps shall be at least 100 mm. Joints shall be arranged in such a manner that the number of layers of sheeting at any joint does not exceed three;

3. The perimeter of prefabricated sheeting laid each day shall be sealed with a trowelled bead of mastic;

4. A double layer of prefabricated sheeting shall be laid around pipes, posts or other components which pass through the sheeting and the edges shall be sealed with a trowelled bead of mastic.

**BRI.W140.7**  
**BENTONITE PANELS**

1. Bentonite panels shall not be laid in water or during wet weather;

2. Immediately before bentonite panels are laid on a surface, joints and cracks in the surface shall be sealed with bentonite joint seal;

3. Polyethylene sheeting shall be laid below and above bentonite panels to prevent prehydration. Laps of at least 100 mm shall be formed at joints in the sheeting;

4. Laps shall be formed at the edges of bentonite panels or the edges shall be closely butted together and the seam filled with loose bentonite granules;

5. Bentonite panels shall not be fixed to the underlying surface unless permitted by the CM, if permitted, the method of fixing shall be by 25 mm masonry washerhead nails or by other methods agreed by the CM;

6. Bentonite panels shall be laid continuously around wall bases and corners. Flat panels shall not be folded or bent if the panels will be damaged or bentonite filler will be lost;

7. Bentonite which is exposed at the edges of bentonite panels cut to fit around pipes, posts or other components which pass through the panel shall be taped or sealed by other methods agreed by the CM to prevent loss of the bentonite filler. The joint between panels and the pipe, post or components shall be sealed with a continuous bentonite seal;

8. Exposed bentonite panels shall be protected from moisture by polyethylene sheeting unless panels with a water repellent coating are used. The sheeting shall be removed before fill materials is deposited. As soon as practicable after each course of panels has been laid, fill material shall be deposited and compacted up to a level which is within 50 mm of the top edge of the panel;

9. Damaged or expanded bentonite panels shall be replaced before being covered by the permanent work.

**BRI.W150.7**  
**BITUMINOUS PAINT**

Surfaces to which bituminous paint will be applied shall be treated with a primer before the paint is applied if recommended by the paint manufacturer. Bituminous paint shall be applied in two coats; the first coat shall be allowed to dry before the second coat is applied.
INSTALLATION OF BRIDGE BEARINGS

BRI.W210.7 GENERAL
Bridge bearings shall be installed as recommended in BS 5400:Part 9:1983 and as in this sub-section.

BRI.W220.7 PRE-ASSEMBLED BEARINGS
Bridge bearings which have been pre-assembled shall not be dismantled unless approved by the CM.

BRI.W230.7 LEVELS
The levels of substructures shown on the drawings, on which bridge bearings will be installed shall be adjusted to suit the thickness of the bearing so that the superstructure will be at the specified level after completion.

BRI.W240.7 SETTING AND LOCKING BEARINGS
1. Bridge bearings, other than elastomeric bridge bearings, shall be set level on substructures using only a thin layer of cementitious mortar, unless the CM permits the bearings to be set on plinths. If setting on plinths is permitted, the plinths shall be constructed of cementitious mortar or grout, unless otherwise approved by the CM, and the thickness of such plinths shall be at least 25 mm and shall not exceed 40 mm. If approved by the CM, the plinths may not be constructed of chemical resin mortar, having a thickness of at least 5 mm and not exceeding 10 mm;

2. Elastomeric bearings shall be set directly on the substructure. A thin layer of cementitious mortar may be used to level the surface if the substructure is concrete. Elastomeric bearings shall not be set in position by grouting between the substructure and the underside of the bearing;

3. The top surface of bridge bearings which will support precast concrete or other prefabricated beams shall be covered with a thin layer of cementitious mortar immediately before the beam is placed. The beam shall be temporarily supported on folding wedges or by other methods agreed by the CM until the mortar has achieved sufficient strength to transmit the weight of the beam to the bearings; the temporary supports shall then be removed;

4. Temporary locking devices for bridge bearings shall be removed before post-tensioned superstructures are stressed. Temporary locking devices for other types of superstructures shall be removed at times agreed by the CM.

INSTALLATION OF VEHICULAR PARAPETS

BRI.W310.7 GENERAL
Vehicular parapets shall be installed to a smooth alignment and with the posts vertical.

BRI.W320.7 FIXING AND GROUTING
Grouting shall be carried out by setting the vehicular parapets in position and grouting the gap between the vehicular parapets and the structure. Vehicular parapets shall be held in position until connections and fixings are complete and until the fixings have gained sufficient strength.
INSTALLATION OF FABRICATED MOVEMENT JOINTS

BRI.W410.7 GENERAL
Fabricated movement joints shall be installed in accordance with the manufacturer's recommendations. The installation shall be carried out by the supplier of the movement joint.

BRI.W420.7 PREPARATION
The vertical faces of recesses in bridge decks for fabricated movement joints shall be formed by saw-cutting. Holding-down bolts shall be cast into the concrete for direct mounting of the joints unless the CM permits the bolts to be grouted. If grouting is permitted, the grouting shall be carried out by setting the movement joint in position and grouting the gap between the movement joint and the structure. Rebates and pockets for subsequent trimming to line and level or for holding-down bolts shall not be used unless permitted by the CM.

BRI.W430.7 BEDDING AND FIXING
1. The bedding to fabricated movement joints shall be formed such that there shall be no gaps between the joints and the bedding;
2. Relative movement between components and supports of a fabricated movement joint shall be prevented during installation of the joint and during placing and hardening of concrete and mortar under the components. Joint components shall be free to move longitudinally relative to each other;
3. When one side of a fabricated movement joint is being set, the other side shall be free from longitudinal restraint. Strongbacks or templates used to locate the side of a joint shall not be fixed to both sides at any one time.

BRI.W440.7 ROAD SURFACES ADJOINING JOINTS
1. The gap between fabricated movement joints and the adjoining road surface or nosing shall be made good after installation of the joint with material which has properties as similar as practicable to those of the material in the adjoining road surface;
2. Bituminous road surfaces shall be made good with a bituminous mixture or elastomeric concrete. Concrete road surfaces shall be made good with a cementitious matrix reinforced with metal or glass fibres or with elastomeric or polymer concrete. Epoxy resin mortar shall not be used;
3. Elastomeric and polymer concrete shall be prepared, laid and cured in accordance with the manufacturer's recommendations.

BRI.W450.7 PROTECTION
1. The permission of the CM shall be obtained before constructional plant or other vehicles cross a fabricated movement joint or the adjacent road surface;
2. Constructional plant or other vehicles shall not cross fabricated movement joints or adjacent road surfaces until installation of the joint is complete unless permitted by the CM. If permitted, ramps shall be provided to allow the vehicles to cross without loads being applied to the joint.
MOVEMENT JOINTS FORMED IN PLACE

BRI.W510.7  FORMING JOINTS
Gaps forming part of movement joints formed in place shall be filled with joint filler fixed in position with adhesive. The edge of the joint filler shall be covered with bond breaker tape or a PVC capping strip.

BRI.W520.7  FORMING GROOVES
Grooves for joint sealant and compression seals for movement joints formed in place shall be formed by saw cutting.

BRI.W530.7  SEALING GROOVES
Grooves for movement joints formed in place shall be sealed with joint sealant or with a compression seal.

TOLERANCES

BRI.W610.7  GENERAL
Refer to Appendix H 'Schedule of Tolerances' to this Specification.
TESTING

TESTING BRIDGE BEARINGS GENERALLY

BRI.T010.7 DEFINITION OF BATCH
A batch of bridge bearings is any quantity of bridge bearings of the same type fabricated by the same manufacturer and which for the purpose of testing elastomeric bearings contains the same type of elastomer.

BRI.T020.7 LABORATORY
Bridge bearings shall be tested by the Contractor at a laboratory approved by the CM.

BRI.T030.7 NOTICE TO THE CM
The Contractor shall inform the CM of the date and place of testing at least 28 days before testing starts.

BRI.T040.7 CHANGES TO PROCEDURES
The specified procedure for testing bridge bearings shall not be changed unless permitted by the CM.

BRI.T050.7 REPORTS
The reports of tests on bridge bearings shall include load/deflection graphs and shall be submitted to the CM for Approval at least 28 days before installation of the bridge bearings starts.

FRICTION TESTS ON BRIDGE BEARINGS

BRI.T110.7 SAMPLING
One sample of bridge bearing shall be provided from each batch of sliding bearings and from each batch of other types of bridge bearings which contain sliding parts.

BRI.T120.7 TEST METHOD
The friction test shall be carried out on each sample of bridge bearing to determine the coefficient of friction, flatness, bonding properties and resistance to mechanical damage. The method of testing shall be in accordance with this sub-section.

BRI.T130.7 TEMPERATURE
The friction test shall be carried out at room temperature.

BRI.T140.7 EQUIPMENT
The following equipment is required:
1. Compression testing rig;
2. Test loads;
3. Equipment for measuring the loads applied, readable and accurate to within 2% of the measured load;
4. Equipment for measuring movement, readable and accurate to 0.01 mm;
5. Lubricant of the same type as will be used in service.

**BRI.T150.7 PROCEDURE**

The procedure shall be as follows:

1. The PTFE surface of the bearing shall be lubricated with the lubricant;

2. Two sets of sliding surfaces shall be mounted back to back between the platens of the compression testing rig with the stainless steel sliding surfaces in the centre. A vertical load equal to the permanent load stated in the schedule of bearings shall be applied for 1 hour;

3. A horizontal load shall then be applied steadily and without shock to the pair of stainless steel sliding surfaces and shall be increased at a rate of 0.2% of the vertical load per minute until movement occurs between the sliding surfaces. The maximum horizontal load sufficient to cause movement of at least 25 mm between the stainless steel and PTFE sliding surfaces at a rate not exceeding 50 mm/min shall be recorded;

4. The loads shall be removed;

5. The sliding surfaces shall be removed from the rig and inspected.

**BRI.T160.7 CALCULATION**

The coefficient of friction shall be calculated from the equation:

\[
\text{Coefficient of friction} = \frac{\text{maximum horizontal force}}{2 \times \text{vertical load}}
\]

**BRI.T170.7 REPORTING RESULTS**

The following shall be reported:

1. Name of bearing manufacturer;

2. Details of bearing and sliding surfaces;

3. The vertical load applied;

4. The maximum horizontal force applied;

5. The total movement and rate of movement at the maximum horizontal force applied;

6. The coefficient of friction to two significant figures;

7. Details of any damage to the sliding surfaces;

8. That the test method used was in accordance with this Specification.

**BRI.T180.7 COMPLIANCE CRITERIA**

The results of friction tests for bridge bearings shall comply with the following requirements:

1. The coefficient of friction in any test position shall not exceed 0.04;

2. The flatness of the stainless steel shall be within the specified limits after testing;

3. The bond to the backing plate shall be unaffected by the friction test;

4. The PTFE shall be free from mechanical damage after testing.
TESTING NON-ELASTOMERIC BEARINGS

BRI.T210.7 SAMPLING
One sample of bridge bearing shall be provided from each batch of bridge bearings other than elastomeric bearings.

BRI.T220.7 TEST METHODS
1. Carry out vertical load tests and horizontal load tests on each sample of bridge bearing. The test loads shall be the serviceability limit stated loads;
2. Carry out additional tests with test loads up to the ultimate limit state loads, if stated in the Project Specific Specification;
3. The method of testing shall be in accordance with Clause 7.2(b)(1) of the guidance notes to BS 5400:Part 9:1983:Section 9.2.

BRI.T230.7 COMPLIANCE CRITERIA
The results of tests on bridge bearings other than elastomeric bearings shall comply with the requirements stated in Clause (b)(1) of the guidance notes to BS 5400:Part 9:1983:Section 9.2.

TESTING ELASTOMERIC BEARINGS

BRI.T310.7 SAMPLING
1. Except as stated in sub-clause (2), one sample of elastomeric bearing shall be provided from each batch of elastomeric bearings for testing by the "Quick Production Test";
2. Samples shall not be provided for the "Quick Production Test" if in the opinion of the CM there is sufficient evidence that tests have been carried out within the previous 18 months on identical materials and that the results of the tests comply with the specified requirements for the test;
3. Two samples of elastomeric bearings shall be provided from each batch of ten or part thereof of elastomeric bearings to determine the stiffness in compression and stiffness in shear.

BRI.T320.7 TEST METHODS
1. Each sample of elastomeric bearing shall be tested to determine the physical and weathering properties of the elastomer and the bond of the elastomer to metal. The method of testing shall be the "Quick Production Test" in accordance with the guidance notes to BS 5400:Part 9:1983:Section 9.2;
2. One sample of elastomeric bearing provided as BRI.T310(3) shall be tested to determine the stiffness in compression and the other sample shall be tested to determine that stiffness in shear. The method of testing to determine the stiffness in compression shall be in accordance with Clause 7.2(b)(2) of the guidance notes to BS 5400:Part 9:1983:Section 9.2. The method of testing to determine the stiffness in shear shall be in accordance with BS 5400:Part 9:1983:Section 9.2, Appendix A.

BRI.T330.7 COMPLIANCE CRITERIA
The results of tests on elastomeric bearings shall comply with the following requirements:
1. There shall be no evidence of surface flaws in the bearings during or after the test;
2. There shall be no irregularities in the deflected shape of laminated bearings during or after the test;
3. The stiffness in compression shall be within 20% of the value quoted by the manufacturer and approved by the CM;
4. The stiffness in shear shall be within 20% of the value quoted by the manufacturer and approved by the CM.

**TESTING VEHICULAR PARAPETS GENERALLY**

**BRI.T410.7** DEFINITION OF BATCH
A batch of vehicular parapets is the amount of parapet materials which is completed or delivered to the site at any one time. Submit to the CM a list of the parts of vehicular parapets included in each batch at least 7 days before testing starts.

**BRI.T420.7** SAMPLING
Select samples from positions which in the opinion of the CM are representative of the batch as a whole. CM shall inform the Contractor of the samples selected for testing at least 3 days before testing starts.

**BRI.T430.7** TEST PROCEDURE
1. Carry out the relevant tests stated in **BRI.T510** to **BRI.T840** on each batch of vehicular parapets;
2. Inform the CM at least 7 days before tests are carried out.

**TESTING PARAPET MATERIALS**

**BRI.T510.7** SAMPLING
The frequency of tests and results of material test shall conform to BS 6779:Part 1:1998, Table 3 for steel parapets and Table 4 for aluminium parapets.

**BRI.T520.7** TENSILE AND IMPACT TESTING
Carry out the tensile test and Charpy impact test of materials for vehicular parapets in accordance with BS EN 10002:Part 1:2001 and BS EN 10045:Part 1:1990 respectively or equivalent approved by the CM.

**BRI.T530.7** QUALITY GRADING
Carry out quality grading of vehicular parapet materials which have not been tested for quality grades by the manufacturer in accordance with BS 5400: Part 6:1980 as appropriate.

**TESTING FASTENERS**

**BRI.T610.7** TENSILE TESTING
TESTING WELDED COMPONENTS OF VEHICULAR PARAPETS

**GENERAL**

1. Carry out inspection and testing of welds for components of vehicular parapets on each batch after cleaning and before application of hot dip galvanising and other protective treatment. Carry out de-burring, dressing, grinding, machining and peening after the visual inspection for cracks, surface pores and joint fit-up and before other inspections and tests are carried out;

2. Visual examination and testing shall be carried out by a testing consultant approved by the CM.

**NON-DESTRUCTIVE TESTING**

Inspect all welds visually and examine 10% of welds for vehicular parapets visually in accordance with the techniques in BS EN 970:1997 or equivalent approved by the CM. Carry out non-destructive testing on a proportion of welds after visual inspection.

1. Non-destructive testing of welds for components of vehicular parapets shall comply with the following:
   a. For the components of vehicular parapets which are butt welded or fillet welded with nominal leg length greater than 12 mm, 10% of welds for each type of components shall be examined by ultrasonic testing in accordance with BS EN 1714:1998 or equivalent approved by the CM;
   b. 10% of the welds other than that mentioned in sub-clause (a) shall be tested as follows:
      i. Magnetic particle flaw detection to joints in steel parapet in accordance with BS EN ISO 9934:Part 1:2001 or equivalent approved by the CM; or
      ii. Liquid penetrant method to welds in aluminium parapet in accordance with BS EN 571: Part 1:1997 or equivalent approved by the CM.

2. Inspect welds for vehicular parapets which have been fabricated and tested by non-destructive testing in the fabricator’s works visually for cracks when the vehicular parapets are delivered to the Site. If welding quality of the vehicular parapets is in doubt, test 5% of the welds by magnetic particle flaw detection in accordance with BS EN ISO 9934:Part 1:2001 or equivalent approved by the CM. Make good the surface protection of vehicular parapets to the satisfaction of the CM after the tests.

**COMPLIANCE CRITERIA**

1. Welds shall be inspected, examined and tested for compliance with BS 6779:Part 1:1998, Clauses 9.4.3.1.2 to 9.4.3.1.4;

2. For the butt welds to be tested, the individual pores shall be less than 2.5 mm diameter and the localized pores shall be less than 3% by the area;

3. The width of defect of buried slag shall be less than 1.5 mm;

4. Linear groups of inclusions are acceptable provided that adjacent groups shall be separated by a distance of at least 4 times and 6 times the length of longest defect for parent metal thickness less than 20 mm and larger than 20 mm respectively.

**NON-COMPLIANCE**

1. If result of any test on weld does not comply with the requirements stated in BRL.T730, carry out the test on additional samples from the batch. The number of additional tests shall be twice the number of original tests;
2. The batch is considered as not complying with the compliance criteria if the result of any additional test does not comply with the compliance criteria;
3. If the batch is not complying with the compliance criteria, the Contractor may propose to carry out 100% testing on the batch at his own costs and no extension of time shall be entertained;
4. If the result of every additional test complies with the compliance criteria, only those parts of the samples from which the testing samples selected have failed in the original tests shall be considered as not complying with the compliance criteria.

TESTING METAL VEHICULAR PARAPET POSTS

BRI.T810.7 SAMPLING
The frequency of destructive testing shall be as stated in the following table:

<table>
<thead>
<tr>
<th>No.of posts per batch</th>
<th>No. of posts to be tested per batch</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;150</td>
<td>1</td>
</tr>
<tr>
<td>150-300</td>
<td>1</td>
</tr>
<tr>
<td>&gt;300</td>
<td>1 for each 300 posts or remaining part thereof</td>
</tr>
</tbody>
</table>

(The CM may waive this testing requirements if satisfactory tests within 3 months are provided)

BRI.T820.7 TEST METHODS
Carry out destructive static testing of metal vehicular parapet posts in accordance with the procedures stated in Annex E of BS 6779:Part 1:1998.

BRI.T830.7 COMPLIANCE CRITERIA
The results of test on post shall comply with the following criteria:
1. The post shall sustain a moment of 1.05 times its theoretical moment of resistance (product of nominal yield stress and plastic modulus) at its critical section without failure;
2. The material thickness, effective weld throat sizes and external dimensions of the post shall be within the tolerances.

BRI.T840.7 NON-COMPLIANCE
1. In the event that any of the compliance criteria as stated in BRI.T830 are not met, select further two posts from the same batch of posts and test;
2. If any further test fails to meet the compliance criteria, the whole batch shall be rejected.

BSW WORK FOR ELECTRICAL AND MECHANICAL INSTALLATIONS

MATERIALS

GENERAL

BSW.M010.7 APPLICATION OF OTHER WORKSECTIONS
The following works and materials shall comply with the Worksections stated, unless otherwise stated in this Worksection:

1. Earthworks shall comply with Worksection EAR1;
2. Materials for grout shall comply with Worksection GRO.

BSW.M020.7 DEFINITIONS
Concealed electrical conduit system is an electrical conduit system, including all bends, couplers, bushes, saddles, boxes, covers, plugs, draw wires and other conduit fittings, which is cast into concrete or fixed in chases in brickwork with a minimum cover of 20 mm or which is laid directly in the ground.

CONDUITS, DUCTS AND ANCILLARY MATERIALS

BSW.M110.7 ELECTRICAL CONDUITS AND FITTINGS
1. Electrical conduits and fittings shall comply with BS 4568:Parts 1 and 2:1970 and shall have Class 4 heavy protection inside and outside. Conduits shall be heavy gauge with screw-end construction in steel and shall have an external diameter of at least 20 mm. Conduits shall be longitudinally welded;
2. Metal boxes for enclosing electrical accessories shall comply with BS 4662:1970 and shall have heavy protection inside and outside. The boxes shall be of preferred sizes and shall be 35 mm or 47 mm deep as appropriate. Circular ceiling boxes of deep pattern shall comply with BS 4568:Part 2:1970 and shall have Class 4 heavy protection inside and outside. The boxes shall be at least 60 mm deep internally;
3. Circular boxes, dome covers and hook covers shall be cast iron. Bushes and plugs shall be brass.

BSW.M120.7 CABLE DUCTS AND FITTINGS
1. UPVC cable ducts for installation above ground or for casting into concrete shall be Class 0 UPVC pipes complying with BS 3506:1969. Cable ducts for installation below ground shall be Class B UPVC pipes complying with BS 3506:1969;
3. Steel cable ducts shall be steel tubes complying with BS 1387:1985, medium series, screwed and socketed tubes and shall have screwed sockets suitable for screwing to BS 21:1985, Table 2 pipe threads. The tubes, sockets, clamps and saddles for ducts shall be galvanized in accordance with BS EN ISO 1461:1999 complying with STW.M410.

BSW.M130.7 PAINT FOR CONDUIT AND DUCT SYSTEMS

1. Bituminous paint for steel conduits and steel cable ducts shall comply with BS 3416:1991, Type 1;
2. Anti-rust paint for concealed electrical conduits systems shall be a proprietary type approved by the CM;
3. Zinc chromate primer for cable duct systems shall comply with BS 4652:1971;
4. Galvanizing paint for cable duct systems shall be a proprietary type approved by the CM.

BSW.M140.7 FIRE BARRIERS

Internal fire barriers shall be a type offering adequate fire resistance for the application. The material shall be approved by the CM in compliance with Fire Services Department requirements and shall be resistant to fire, smoke, gas and water.

BSW.M150.7 CEMENT GROUT

The different types of cement grout for electrical and mechanical installations shall consist of Portland cement, sand and PFA in the proportions by mass stated in the following table, together with the minimum amount of water necessary to achieve a consistency suitable for completely filling the voids. The mix shall contain a non-shrink admixture:

<table>

WORKMANSHIP

STORAGE OF MATERIALS

BSW.W010.7 CONDUIT AND CABLE DUCT SYSTEMS
Materials for concealed electrical conduit systems and for cable duct systems shall be stored in accordance with the manufacturer’s recommendations in a dry weatherproof store.

HOLES AND RECESSES

BSW.W110.7 GENERAL
Holes and recesses shall be left in structures for electrical and mechanical installations. If instructed by the CM, holes and recesses shall be cut in structures for electrical and mechanical installations.

BSW.W120.7 TEMPORARY COVERS
Holes and recesses in internal floors, stairways and platforms shall be protected with temporary covers or by other methods agreed by the CM until the electrical and mechanical installation starts. Holes and recesses in roofs, external walls and external floors shall be sealed with watertight temporary covers until the electrical and mechanical installation starts.

BSW.W130.7 MAKING GOOD
Holes in structures shall be filled and made good after electrical and mechanical installations are complete. Holes left in structural elements designated as fire barriers shall be sealed to at least the same degree of fire resistance as the structural element.

FIRE BARRIERS

BSW.W210.7 LOCATION
Internal fire barriers shall be constructed in service channels, service shafts and service ducts for electrical and mechanical installations at the following locations:
1. At points of intersection with structural elements designated as fire barriers;
2. At 5 m centres in vertical and inclined shafts, and at intersections with floor slabs;
3. At termination points and open ends.

CONCEALED ELECTRICAL CONDUIT SYSTEMS

BSW.W310.7 CONSTRUCTION
Concealed electrical conduit systems which are shown diagrammatically in the Contract shall be constructed as follows:
1. Concealed electrical conduit systems shall be mechanically and electrically continuous and shall be effectively earthed;
2. Principal conduit runs shall be either vertical or horizontal. Tee pieces and elbows, including those with provision for inspection, shall not be used unless approved by the CM;

3. Joints shall be made using coupler units into which the ends of the conduits shall be inserted and tightened. Running couplings shall not be used unless permitted by the CM. If permitted, the couplings shall be made by screwing each of the conduits half way into the coupler with a hexagonal lock nut against each end of the coupler;

4. Adaptable boxes shall be provided at:
   a. Every second bend;
   b. After a bend and a straight run of 10 m or less;
   c. Every 15 m in straight runs.

5. Adaptable boxes for conduits installed in floor screeds shall have lids set flush with the adjacent floor. The boxes shall be covered with the same material as the remainder of the floor and shall remain accessible at all times;

6. The clearance between conduits entering adaptable boxes and between adjacent or parallel conduits shall be at least the nominal maximum coarse aggregate size of the concrete plus 5 mm.

BSW.W320.7 INSTALLATION

1. Concealed electrical conduit systems shall be arranged and installed in accordance with best trade practice and in such a manner that all cables can be drawn with ease and without damage;

2. Bends in concealed electrical conduit systems shall be formed by using proprietary bending equipment of a type agreed by the CM. Connections and other work shall be carried out using purpose made equipment;

3. Conduits shall not be bent by more than 90° and the internal radius at bends shall be at least 2.5 times the external diameter of the conduit. Conduits shall not be flattened at bends;

4. Burrs and sharp edges shall be removed from the ends of conduits before installation;

5. Concealed electrical conduit systems which are to be cast into concrete shall be fastened to the reinforcement with tying wire of the same type used for the reinforcement. The conduit systems shall not be positioned between the reinforcement and the outside face of the concrete unless permitted by the CM;

6. Conduit boxes shall be of a compatible size and shall have a single extension ring of the required depth if the plaster finish exceeds 13 mm thick. Multiple extension rings shall not be used.

BSW.W330.7 TERMINATIONS

Screw fitting couplers shall be provided at each end of conduits which terminate in distribution boards, busbar chambers, motor starters, cable ducts, boxes or similar termination points. The item at which the conduit terminates shall be drilled with an unthreaded clearance hole to receive a brass male bush. The bush shall be screwed into the coupler from the inside of the item in such a manner that the surface of the item is gripped between the coupler and the bush. The threads shall be at least half the length of the coupler.
BSW.W340.7 PROTECTION
1. Concealed electrical conduit systems shall have special arrangements designed by the Contractor to permit movement of conduits to take place on each side of movement joints in structures. A separate circuit protective conductor shall be installed to maintain effective electrical continuity across the joint. The protective conductor shall have a cross-sectional area rated to suit the largest live conductor to be drawn into the conduit;

2. Steel conduit systems laid in contact with or adjacent to other metal work shall have efficient and permanent metallic connection made between the conduit and the metal work;

3. Underground steel conduits and conduits in contact with soil shall be painted with two coats of bituminous paint before installation;

4. Exposed threads and damage to protective coatings of conduit systems shall be painted with two coats of anti-rust paint;

5. Conduits shall be laid in such a manner that accumulation of condensed moisture in the conduit system is prevented. Measures shall be taken to prevent water from entering the system;

6. Water, moisture and deleterious material shall be prevented from entering permanent and temporary terminations in concealed electrical conduit systems, including conduit boxes, by using conduit stopping plugs of a type approved by the CM. Paper or rags shall not be used.

BSW.W350.7 CLEANING SYSTEMS
After installation, concealed electrical conduit systems shall be swabbed out with draw-in tapes and absorbent cloth of a type agreed by the CM. All obstructions shall be removed and draw wires shall be installed. After cleaning, exposed conduit ends shall be sealed as BSW.W340 (6).

CABLE DUCT SYSTEMS

BSW.W410.7 INSTALLATION
1. Changes in direction in cable duct systems shall be constructed in such a manner that the cables in the duct will have radii of curvature of at least 800 mm. Ducts entering draw-in pits shall be on the same horizontal plane as the draw-in pit;

2. UPVC cable ducts shall be jointed in accordance with the manufacturer's recommendations;

3. Steel cable ducts shall be jointed using screwed galvanized sockets and spun yarn or by an equivalent method approved by the CM such that the jointed pipes abut. The threads shall be painted with two coats of bituminous paint. Internal rags and burrs shall be removed to provide a smooth bore through joints in the cable duct system;

4. Surface mounted cable ducts shall be secured by galvanized steel clamps or saddles at spacings not exceeding 3 m.

BSW.W420.7 PROTECTION
1. After jointing, exposed bare metal in cable duct systems shall be cleaned and painted with two coats of zinc chromate primer and two coats of galvanizing paint;

2. Surface mounted galvanized steel cable ducts shall be cleaned and painted after fittings and jointings have been completed.
BSW.W430.7 CLEANING
After jointing, cable duct systems shall be cleaned internally by scrubbing with a cylindrical brush of a type agreed by the CM. The ends of ducts, including ends of ducts in draw-in pits and spare ducts, shall be fitted with tapered hardwood plugs to prevent water, moisture and deleterious material from entering the system and a 6 mm diameter nylon draw line shall be installed. The plugs shall be centrally drilled for the draw line and the draw line shall be secured by a knot tied on the outer face of the plug to leave at least 1500 mm of surplus line at each plug.

EXCAVATION AND FILLING FOR EARTHING SYSTEMS

BSW.W510.7 EXCAVATION
Pits and trenches for electrical earthing systems shall be excavated at positions and at the times instructed by the CM.

BSW.W520.7 BACKFILLING
After the electrical earthing systems have been installed fill material shall be deposited and compacted in the pits and trenches to a depth of 300 mm above the electrical earthing system. Fill material shall be sand or fine fill material which has been selected from the excavated material, and which is free from stones retained on a 20 mm BS test sieve. Fill material shall be compacted by handrammers in a manner approved by the CM.

GROUTING

BSW.W610.7 GENERAL REQUIREMENTS
Grouting to structural steelwork, machine bases, crane rails, electrical and mechanical equipment and other electrical and mechanical installations shall comply with the following;

1. Grouting shall be carried out at the times instructed by the CM and shall be completed within 7 days of the instruction unless otherwise permitted by the CM;

2. The permission of the CM shall be obtained before items or equipment are grouted. The Contractor shall inform the CM 3 days, or such shorter period agreed by the CM, before grouting starts and shall allow the CM sufficient time to inspect the work which is to be grouted;

3. Concrete surfaces shall be scabbled to remove laitance and loose material and to expose the aggregate before the item or equipment is installed in position;

4. The voids to be grouted shall be cleaned and thoroughly wetted immediately before grouting. Excess water shall be removed by using a compressed air jet or by other methods agreed by the CM;

5. Grout shall be mixed and placed by methods agreed by the CM;

6. If grouting is to be carried out in two operations, holding down bolts shall be grouted into preformed pockets and sufficient time shall be allowed for the grout to cure and for the bolts to be tensioned before the remaining voids are grouted;

7. Exposed grout surfaces shall have a uniform, dense and smooth surface free from trowel marks and which is produced by steel trowelling the surface under firm pressure. The exposed surfaces shall be cured by either:

   a. Using a liquid curing compound applied to the surface by a low-pressure spray until a continuous visible covering is achieved; or
b. Covering the surface with hessian or sacking. The hessian or sacking shall be lapped and securely held in position and shall be kept damp for at least 4 days.

**COMPLETION AND PROTECTION**

**BSW.W710.7 COMPLETION**

Work shall be completed to the following conditions before structures are made available to others for electrical and mechanical installations:

1. The structures shall be clean, dry and free from dust. Work which in the opinion of the CM will produce large quantities of dust shall be complete;
2. Holes and recesses, concealed electrical conduit systems and cable duct systems required for the installation shall be complete. Concrete surfaces on which items and equipment are to be installed shall be scabbled;
3. Plinths, trenches, louvres, openings and similar work shall be complete and shall have hardened sufficiently to allow the installation to proceed;
4. Floors and slabs shall be complete to the specified finishes except that floor tiles shall not be laid until after the installation is complete;
5. Plant rooms shall be complete, including fixtures and fittings, to a secure and weatherproof condition. Two sets of door keys for the plant room shall be provided for the CM;
6. Paintwork and similar finishes in plant rooms shall be complete to undercoat level. Final coats shall not be applied until after the installation is complete;
7. Temporary power supplies and connections required for the installation shall be complete. The supply shall be metered and shall be 346V, 3 phase supply of 20A maximum rating. Temporary power supplies shall be provided for the periods stated in the Project Specific Specification.

**BSW.W720.7 PROTECTION**

1. Structures in which electrical and mechanical installations are being carried out shall be maintained in a clean, dry condition, free from dust, during the installation;
2. The dust level in plant rooms shall be kept to a minimum by using industrial dust extractors of a type agreed by the CM during and after the installation. Temporary screens shall be installed to separate dust-affected areas from the installations or temporary covers shall be installed around the installation.

**TOLERANCES**

**BSW.W810.7 GENERAL**

Refer to Appendix H "Schedule of Tolerances" to this Specification.

**INSPECTION**

**BSW.W910.7 GENERAL**

1. The Contractor shall allow the CM to inspect the following work for electrical and mechanical installations:
   a. Completed concealed electrical conduit systems, cable duct systems, electrical earthing systems and items and equipment which are to be grouted or covered up;
b. Items and equipment which are to be tested;

c. Structures which are to be made available for electrical and mechanical installations.

2. The Contractor shall inform the CM three days, or such shorter period agreed by the CM, before work is covered up, tested or made available.
TESTING

EARTHING CONTINUITY

BSW.T010.7 TIMING
Concealed electrical conduit systems shall be tested to determine the earthing continuity. The system shall be tested:
1. Before the system is cast in concrete or covered up;
2. After the system is cast in concrete or covered up;
3. After electrical wiring which is installed by the Contractor is complete.

BSW.T020.7 TEST METHODS
Unless otherwise approved by the CM the method of testing shall be in accordance with Appendix 15 to the IEE Wiring Regulations, 15th Edition, 1981 issued by the Institution of Electrical Engineers.

BSW.T030.7 COMPLIANCE CRITERIA
The results of tests for earthing continuity shall comply with the IEE Wiring Regulations, 15th Edition, 1981 issued by the Institution of Electrical Engineers.

LOAD TESTS ON BEAMS AND JOISTS

BSW.T110.7 GENERAL
1. Load tests shall be carried out on lifting beams, rolled steel joists and lifting hooks which are installed by the Contractor;
2. Testing shall be carried out by an independent testing consultant approved by the CM and by using methods approved by the CM;
3. A certificate showing the results of the load tests and signed by the testing agent shall be submitted to the CM within 14 days of the test.

BSW.T120.7 COMPLIANCE CRITERIA
The results of tests on lifting beams, rolled steel joists and lifting hooks shall comply with the Factories and Industrial Undertakings (Lifting Appliances and Lifting Gear) Regulations, 1978 issued by the Labour Department.

SITE CLEARANCE

MATERIALS

MATERIALS ARISING FROM SITE CLEARANCES

CLE.M010.7 MATERIALS ARISING FROM SITE CLEARANCES REQUIRED BY THE AUTHORITY

Take up, take down, transport to store, as applicable, the items resulting from the site clearance that are required by the Authority as specified in the Project Specific Specification.
WORKMANSHIP

DEMOLITION

CLE.W010.7 EXTENT
1. The Contractor shall demolish, break up and remove walls and superficial obstructions down to ground level on the Site in the way of or otherwise affected by the Works and ensuring compliance with the requirements of CLE.W130 and CLE.W160. He shall clear each part of the site at times and to the extent required or approved by the CM;

2. Where the Contractor is required to demolish buildings and structures, he shall demolish down to ground level only those parts which are scheduled for removal on the Drawings or which he is directed to remove by the CM.

CLE.W020.7 SURVEY
Structures which are to be demolished shall be surveyed by the Contractor, and the result given to the CM for information, before demolition starts.

CLE.W030.7 METHOD
Particulars of the proposed methods of carrying out demolition work shall be submitted to the CM for information at least 14 days before the demolition starts.

CLE.W040.7 PROTECTION
1. Areas adjacent to demolition work shall be protected from damage resulting from the demolition;

2. During demolition the Contractor shall take every precaution to protect the roadway, embankment and all other existing works from damage and to ensure the safety of his workmen and the general public;

3. Any damage beyond that so required shall be made good by the Contractor at his own expense.

CLE.W050.7 SALVAGED MATERIALS
The maximum quantity of material shall be salvaged and all material for re-use shall be cleaned and stacked on the Site, and the debris removed to an Approved dump.

SITE CLEARANCE

CLE.W110.7 STORAGE OF AND DAMAGE TO MATERIALS FOR RE-USE
1. Items which are to be re-used or taken to store shall be dismantled and removed by a suitable method so as to avoid damage or minimise the damage if this is unavoidable. The items shall be cleaned before re-use or taking to store;

2. Items which are to be re-used in the Works shall be kept in stores provided by the Contractor;

3. Items which are to be taken to the Authority's store shall be delivered by the Contractor. See CLE.M010;
4. Materials or equipment which are to be re-used or taken to store and which are
damaged due to the Contractor's negligence shall be repaired by the Contractor
by a method agreed by the CM. Materials or equipment which are lost or which
in the opinion of the CM are not capable of being repaired satisfactorily shall be
replaced by the Contractor.

CLE.W120.7  DISCONNECTION OF UTILITIES

The Contractor shall make all arrangements with and obtain the necessary approvals
from the relevant authorities for disconnecting utilities inside and outside the Site.
The ends of disconnected utilities shall be made good and sealed; the positions of the
ends shall be marked with marker posts or by other methods agreed by the CM.

CLE.W130.7  UNDERGROUND STRUCTURES AND CHAMBER

Disused underground structures and chambers shall be filled and compacted as
directed by the CM.

CLE.W140.7  ABANDONED PIPES AND MANHOLE

Comply with the requirements of Worksection DRA as appropriate.

CLE.W150.7  EARTHWORKS AND BLASTING

Comply with the requirements of Worksection EAR as appropriate.

CLE.W160.7  EXISTING TREES

1. The roots of trees and shrubs which have been cut down shall be grubbed up.
   Branches shall not be removed from trees which are to be retained unless
   permitted by the CM, if permitted, the branches shall be removed in accordance
   with BS 3998:1989 and the cut surfaces shall be treated with a wound sealant
   approved by the CM;
2. Where shown on the Drawings or directed by the CM trees shall be uprooted or
cut down as near to ground level as possible. All felled timber shall be removed
from the Site;
3. Holes left by stumps and roots shall be filled with suitable material and
   compacted as specified.

CLE.W170.7  DISPOSAL

Except for items which are to be re-used or taken to store; demolished items, trees,
shrubs, vegetation, boulders, debris, rubbish and other items arising from site
clearance shall be disposed of by the Contractor and become the property of the
Contractor when they are removed from the Site.

CLE.W180.7  REINSTATEMENT

Unless otherwise permitted by the CM, areas affected by site clearance shall be
reinstated as follows:
1. Fine fill material shall be deposited and compacted in voids which are left in the
   ground;
2. Holes which are left in structures and pavements shall be made good using
   materials similar to that in the adjoining area;
3. The ends of fences, walls structures, utilities and other items shall be made good
   in such a manner that the affected part will not corrode or deteriorate, and will
   remain stable;
4. Straining posts shall be fixed at the end of strained fences which have been cut
   and the fences shall be restrained.

FENCING

MATERIALS

GENERAL

FEN.M010.7 OTHER RELATED SPECIFICATION WORKSECTIONS
The appropriate materials and workmanship requirements specified in the following Worksections apply to this Worksection unless otherwise stated herein:
1. Handrailing shall comply with Worksection MEW;
2. Earthworks shall comply with Worksection EAR1;
3. Pedestrian guardrailing shall comply with Worksection MEW;
4. Formwork and finishes to concrete shall comply with Worksection FOR;
5. Reinforcement shall comply with Worksection CON3;
6. Concrete shall comply with Worksection CON1;
7. Steelwork, including protective treatment, shall comply with Worksection STW;
8. Vehicular parapets shall comply with Worksection BRI.

FEN.M020.7 DETAILS OF FENCING
1. The following particulars of the proposed fencing shall be submitted to the CM:
   a. Drawings showing the fabrication details of gates; and,
   b. Details of the source, type and properties of the proposed materials.
2. The particulars of the proposed fencing shall be submitted to the CM at least 14 days before the fencing is erected.

FEN.M030.7 SAMPLES
The following samples of the proposed materials shall be submitted to the CM at the same time as the details of the proposed fencing are submitted:
1. Each type of wire and fitting;
2. Chain link;
3. Plywood;
4. Precast concrete, steel and timber posts;
5. Fixings.

FENCING MATERIALS

FEN.M110.7 WIRE
1. Wire for fencing shall be galvanized mild steel complying with BS 4102:1990;
2. Barbed wire shall consist of two line wires and point wire formed in accordance with BS 4102:1990, Clause 4.1;
FEN.M120.7  **CHAIN LINK FENCING**
Chain link fence shall comply with BS 1722:Part 1:1986 unless otherwise stated in this Worksection.

FEN.M130.7  **PLYWOOD FOR HOARDINGS**
Plywood for hoardings shall comply with BS 6566:1985 and shall have a Grade 2 veneer. The bonding adhesive between veneers shall be phenol formaldehyde resin adhesive classified as weather-proof and boil-proof in accordance with BS 1203:1979.

FEN.M140.7  **TIMBER**
1. Timber for fencing shall be of mature growth and shall be seasoned and free from large, loose or dead knots, wood wasp holes, infestation, splits and other defects which will reduce the strength or produce blemishes. The moisture content in timber at the time of fabrication shall not exceed 20%;
2. Hardwood shall be 'San Cheung' (Kapore) and shall have a density of at least 720 kg/m³ at 15% moisture content;
3. Softwood shall be cedar, spruce or China fir;
4. Timber which is not to be painted shall be preserved with coal tar creosote. The creosote shall comply with BS 144 and shall be applied by pressure impregnation in accordance with BS 144.

FEN.M150.7  **STEEL**
Steel for fencing shall comply with the following:
2. Hot rolled structural steel sections:

FEN.M160.7  **FIXINGS**
1. Bolts, nuts and washers for fencing shall comply with the following:
   a. ISO metric black hexagon bolts, screws and nuts: BS 4190:1967;
   b. ISO metric black cup and countersunk head, bolts and screws with hexagon nuts: BS 4933:1973;
   c. Metal washers for general engineering purposes: BS 4320:1968;
2. The length of bolts shall be such that the threaded portion of each bolt projects through the nut by at least one thread and by not more than four threads;
3. Fittings, including eye bolt strainers, cleats, winding brackets, stretcher bars, extension arms, hook bolts and base plates shall be galvanized mild steel;
4. Bolts, nuts, washers and fittings for fixing to concrete and timber shall be galvanized. Bolts, nuts, washers and fittings for fixing to steel shall have the same protective treatment as the steel;
5. Staples shall be D-section galvanized wire.
FEN.M170.7 CONCRETE POSTS
1. Concrete posts and struts for fencing shall be precast using Grade 30/10 concrete as Worksection CON1. The finish to formed surfaces shall be Class F4 and the finish to unformed surfaces shall be Class U5 as Worksection FOR. The tops of posts and all arrises shall be rounded or chamfered;
2. Reinforcement for concrete posts and struts shall be Grade 250 plain round steel bars as Worksection CON3.

FEN.M180.7 GATES
1. Steel gates shall be of welded construction. The frame shall be square with the corners mitred or saddled;
2. Chain link infilling in gates shall be of the same type and size as in the adjoining fence and shall be attached to the framework by stretcher bars.

POST FOUNDATION CONCRETE

FEN.M210.7 CONCRETE
Grade 30/20 concrete as Worksection CON1.
WORKMANSHIP

GENERAL

FEN.W010.7 STORAGE AND PROTECTION
1. Plywood and timber posts, rails and struts for fencing shall be stored on level supports in a dry weatherproof store;
2. Gates and concrete and steel posts and struts for fencing shall be stored off the ground on level supports and in a manner which will not result in damage or deformation to the materials or in contamination of the materials;
3. Fencing shall be protected from damage and damaged fencing shall not be used in the permanent work unless permitted by the CM.

FABRICATION OF FENCING

FEN.W110.7 FABRICATING STEELWORK
Steelwork for fencing shall be fabricated in accordance with BS 5950:Part 2:1992.

FEN.W120.7 GALVANIZING STEEL
1. Steel which is to be galvanized shall be hot-dip galvanized in accordance with BS EN ISO 1461:1999 to a minimum coating thickness of 70 µm;
2. Unless Approved, all components are to be galvanized after welding, drilling and cutting are complete;
3. All hot dip galvanizing is to be carried out by galvanizers with ISO 9001 certification. Submit the name of galvanizer for Approval;
4. Submit original invoice/delivery note and galvanizing certification for each delivery. These documents shall include the following information:
   a. Project title/number;
   b. Name of galvanizer;
   c. Types and dimensions of articles;
   d. Quantities.
5. Attach a durable identification tape to each batch of galvanized articles indicating the project title, galvanizing certification number and name of galvanizer.

FEN.W130.7 WELDING STEEL
1. Welds to steel for fencing shall be full depth fillet welds. Weld surfaces shall be clean and flush before application of the protective coating;
2. Steel shall not be welded after galvanizing unless permitted by the CM, if permitted, the welded areas shall be free from scale and slag and shall be treated with an alternative galvanizing or zinc coating system approved by the CM.
ERECTING FENCING

FEN.W210.7 LOCATION
Erect fencing to lines and levels shown on the Drawings.

FEN.W220.7 ALIGNMENT
Fencing shall be erected to a smooth alignment with no abrupt irregularities. The ground shall be trimmed or filled in such a manner that the bottom of the fence will approximately follow the level of the ground. The distance between the bottom of chain link mesh and hoardings and the ground shall not exceed 100 mm.

FEN.W230.7 LOCATION OF POSTS
1. Straining posts for fencing shall be provided at all ends and corners, at changes in direction, at abrupt changes in level, at gate posts and at intervals not exceeding 30 m along straight lengths of fencing. Struts shall be fitted to straining posts in the direction of each wire secured to the post;
2. Intermediate posts shall be provided at intervals not exceeding 3.5 m.

FEN.W240.7 ERECTING FENCING POSTS AND STRUTS
1. Posts and struts for fencing shall be set in excavations for foundations and the excavations shall be filled with concrete as FEN.M210 up to 50 mm below ground level;
2. Struts shall be fitted into slots in timber posts and concrete posts; struts shall be bolted to steel posts;
3. The ground surface around posts shall be made good with the same material as in the adjoining area.

FEN.W250.7 FIXING FENCING WIRE
1. Line wire, chain link mesh and barbed wire for fencing shall be strained tightly between straining posts. Winding brackets shall be used for straining between steel posts and winding brackets or eye bolt strainers shall be used for straining between concrete and timber posts. The tension in the wire on each side of straining posts shall be equal. Wire shall not be strained until at least 14 days after concrete has been placed in the foundation;
2. Chain link mesh shall be secured at each straining post by a stretcher bar and shall be tied to the line wire by tying wire at 150 mm intervals;
3. Each line wire and each line of barbed wire shall be secured to each intermediate post by one of the following methods as stated in the following table:
   a. A hairpin staple shall be passed through a hole in the post and secured to the wire by three complete turns on each side of the post;
   b. A stirrup shall be passed through a hole in the post and the ends bent over twice;
   c. The wire shall be threaded through a hole in the post;
   d. The wire shall be stapled to the post;
   e. A hook bolt shall be passed through a hole in the post and secured with a nut and washer.
Method of securing wire to intermediate posts

**FEN.W260.7 FIXING TIMBER FENCING**

The ends of timber rails for fencing shall be closely butted together and the rails shall be securely nailed to each post. The ends of plywood sheets in hoardings shall be closely butted together and the sheets shall be securely nailed to each post and to the horizontal rails.

**FEN.W270.7 FIXING GATES**

1. Gates shall be installed after the fence wire is in place and strained, so as to eliminate the possibility of the gates being pulled out of alignment;
2. Gates shall be hung truly plumb to ensure they will open and close easily.

**FEN.W280.7 TOLERANCES**

Refer to Appendix H "Schedule of Tolerances" to this Specification.

FOR FORMWORK

DESIGN

GENERAL

FOR.D010.7 STANDARD
Comply with the requirements of BS 5975:1982 regarding design, construction and dismantling of falsework and formwork.

FOR.D020.7 DEFINITIONS
In this Specification, the following definitions apply:

1. Class: a term used to identify the different types and standards of formed, unformed and treated finishes;

2. Falsework: a temporary structure used to support formwork and a permanent structure until the permanent structure is self-supporting;

3. Formed finish: the finish of the concrete surface produced by the use of formwork;

4. Formwork: the mould against which concrete is cast and which gives the shape and finish to the concrete surface;

5. Permanent formwork: formwork designed to remain in position as part of the permanent work;

6. Profiled formwork: formwork designed to produce a ribbed or patterned finish on the concrete surface;

7. Sealed plywood: plywood which has been sealed with a factory-applied film of phenolic resin or plastic material;

8. Spatterdash: a mixture of cement, coarse sand, granite fines and water, used as a rendering on concrete surfaces;

9. Treated finish: the finish of the concrete surface produced by a treatment applied to a formed or unformed finish;

10. Unformed finish: the finish of the concrete surface produced without formwork and by working the concrete surface before the concrete has hardened.

FOR.D030.7 BRIDGE CONSTRUCTION
1. Appoint a Registered Structural Engineer to design and control the temporary works for the construction of the bridge;

2. The submission shall include drawings and supporting calculations and shall be submitted to the CM not less than 4 weeks before the Contractor proposes to put such work in hand. Do not commence the proposed work without the prior consent of the CM. Such consent shall, however, in no way relieve the Contractor of any of his responsibilities for the design of the falsework;

3. Monitor falsework levels and make any necessary adjustments for settlement or other deflection or movements.

FOR.D040.7 SUBMISSIONS
See FOR.M310.
DESIGNED PARAMETERS

FOR.D110.7  GENERAL
Falsework and formwork shall be designed and constructed to maintain the position and shape of the formwork such that the hardened concrete surface complies with the characteristics of finish and other requirements of this Specification. Allowance shall be made for cambers.

FOR.D120.7  LOADINGS
Design and construct falsework and formwork to withstand any combination of the following loadings and to maintain the position and shape of the formwork to achieve the required shape and finish of the hardened concrete:
1. Total weight of formwork, falsework and wet concrete;
2. Construction loads including dynamic effects of placing, compacting and construction traffic;
3. Wind loads in accordance with the Code of Practice on Wind Effects in Hong Kong 2004 issued by the Buildings Department;
4. Any other relevant loading described in BS 5975:1982.

FOR.D130.7  INCLINED SURFACES
Formwork shall be used to form the top surface of concrete inclined at a slope exceeding 15° to the horizontal unless it can be demonstrated that the specified finish will be produced without the use of formwork. Formwork to top surfaces shall be anchored to prevent flotation.

FOR.D140.7  DISMANTLING AND REMOVAL
Falsework and formwork shall be capable of being dismantled and removed without shock, disturbance, damage or loading to the concrete and in such a manner that the specified requirements for removing or leaving in position side formwork, soffit formwork and props will be achieved without disturbing other formwork or props.

FOR.D150.7  PANEL JOINTS
Formwork panels for Class F2, F3, F4 and F5 finishes shall be the same size and shall form a regular pattern approved by the CM. The lines of joints between panels shall be straight and continuous, horizontal and vertical, or inclined to suit the pattern of profiled formwork, and shall be coincident with construction joints and other joints and with recesses in the concrete surface. The number of make-up pieces shall be kept to a minimum.

FOR.D160.7  TIE HOLES
Holes left by formwork ties and components in concrete surfaces with Class F2, F3, F4 and F5 finishes shall be in line horizontally and vertically and shall form a regular pattern approved by the CM. Unless otherwise permitted by the CM, holes in profiled formwork shall be located in such a manner that the holes are completely within recesses in the concrete surface.

FOR.D170.7  EXTERNAL ANGLES
Unless otherwise stated in the Contract or permitted by the CM, chamfers shall be provided for all external angles of 90° or less in concrete surfaces with Class F2, F3, F4 and F5 finishes shall not be made up of a series of flats unless permitted by the CM.
FOR.D180.7 CURVED SURFACES
Formwork for curved concrete surfaces with Class F2, F3, F4 and F5 finishes shall not be made up of a series of flats unless permitted by the CM.

FALSEWORK SPANNING PUBLIC HIGHWAYS

FOR.D210.7 DESIGN RESPONSIBILITY
Employ a Registered Structural Engineer to take responsibility for the design and construction of all temporary works and falsework spanning public highways. No consent or dissent of the CM will relieve the Contractor of his sole responsibility for the falsework design, construction and obtaining Approval.

FOR.D220.7 GENERAL DESIGN REQUIREMENTS
Ensure the falsework system does not interfere with normal traffic flow and does not reduce the width of the traffic lanes. Design clearances to falsework spanning a public highway in accordance with Section 35 of the Transport Planning and Design Manual Volume 2 - Highway Design Characteristics.

FOR.D230.7 APPROVALS
1. Take responsibility for obtaining all necessary approvals of any proposed falsework design and construction, through the Authority, from the Highways Department, the Commissioner of Police and the Commissioner for Transport;
2. Do not commence any temporary works, including falsework spanning a public Highway, unless the falsework design and construction method has been approved by the Highways Department, Commissioner of Police and Commissioner for Transport.

FOR.D240.7 SUBMISSIONS
Submit proposals for falsework spanning a public highway to the CM in the form of proper, numbered, fully dimensioned drawings accompanied by full structural calculations endorsed by the Contractor's Registered Structural Engineer. Make any amendments required by the CM and submit copies to the CM in order to obtain all necessary approvals from the Highways Department, Commissioner of Police and Commissioner for Transport.
MATERIALS

SHEATHING MATERIALS

FOR.M010.7 GENERAL
Formwork shall be timber, metal, plastic or other material which will produce the specified finish. Materials used as formers for profiled formwork, chamfers, splays, rebates and other features shall be such that they produce the same finish as the main formwork. Tropical hardwood is strictly prohibited for use in the formwork and falsework.

FOR.M020.7 PLYWOOD
Plywood for formwork shall have a close, uniform grain and the edges shall be sealed with barrier paint, polyurethane varnish or other impermeable material.

FOR.M030.7 FACES FOR CLASS F4 AND F5 FINISHES
The faces of formwork for Class F4 and F5 finishes shall have a uniform texture and a matt, not a shiny or polished, surface. The edges of the formwork shall be straight and square.

RELEASE AGENTS

FOR.M110.7 GENERAL
Release agents shall be:
1. A proprietary type approved by the CM. Release agents containing mineral oils shall not be used. Barrier paint, polyurethane varnish, wax or other materials shall not be used instead of a release agent;
2. A type which will not stain or colour the concrete and which will not affect the bond between the concrete and subsequent coverings. Release agents other than those which incorporate a surface retarder to produce a Class T1 finish shall be a type which will not affect the hardening of the concrete.

FOR.M120.7 POTABLE AND FRESH WATER RETAINING STRUCTURES
Release agents used on formwork for water retaining structures for potable and fresh water shall be non-toxic and shall not impart a taste to the water.

FOR.M130.7 STEEL FORMWORK
Release agents used on steel formwork shall contain a rust-inhibiting agent.

FOR.M140.7 CLASS F4 AND F5 FINISHES
1. Release agents used on formwork for Class F4 and F5 finishes shall be a chemical release agent;
2. On areas of formwork which in the opinion of the CM are likely to be affected by pedestrian traffic, rain or dust, release agents for Class F4 and F5 finishes shall be a type which evaporates to leave a dry film on the formwork, unless protection from such effects is provided;
3. Each type of release agent used on formwork for Class F4 and F5 finishes shall be obtained from one manufacturer and different types of release agent shall not be used on formwork for the same element.

ANCILLARY MATERIALS

FOR.M210.7 FORMWORK TIES
1. Formwork ties and components shall be a type such that any removable part can be removed without damaging the concrete; any part left in the concrete shall be at least 40 mm or the specified nominal cover to the reinforcement, whichever is greater, from the concrete surface;
2. Unless otherwise permitted by the CM, formwork ties and components used with profiled formwork shall be a type such that holes left by the ties and components are small enough to be located completely within the recesses in the concrete surface.

FOR.M220.7 COVER SPACERS
See Worksection CON3.

FOR.M230.7 CEMENT MORTAR FOR REMEDIAL WORK
Materials for cement mortar shall comply with Worksection CON1 and:
1. Cement mortar for filling blowholes shall consist of cement and fine aggregate together with the minimum amount of water necessary to achieve a consistency suitable for completely filling the blowholes;
2. Cement mortar for filling holes left by formwork ties and components shall consist of 1 part of cement to 3 parts of fine aggregate, together with the minimum amount of water necessary to achieve a consistency suitable for compacting the mortar into the holes; the mix shall contain a non-shrink admixture;
3. Cement mortar for filling blowholes and holes left by formwork ties and components in concrete surfaces with Class F4 and F5 finishes shall be the same colour as the hardened concrete; light-coloured sand or white cement may be used for this purpose.

FOR.M240.7 SURFACE RETARDERS
Surface retarders shall be a proprietary type approved by the CM and shall be a type which will not stain or colour the concrete.

FOR.M250.7 ABRASIVES
Abrasives for blasting shall be grit or other materials approved by the CM and shall not contain any iron, clay or other materials which will stain or colour the concrete.

FOR.M260.7 SPATTERDASH
Spatterdash shall consist of cement and coarse sand or granite fines in the proportion 1:2 by volume mixed with the minimum amount of water necessary to achieve the consistency of a thick slurry.

SUBMISSIONS

FOR.M310.7 SCHEDULE OF SUBMISSIONS
1. General
a. Particulars and samples of the proposed materials and methods of construction for Class F4, F5, U5 and T finishes shall be submitted to the CM as marked 'x' in the following table:

b. The same particulars shall be submitted for other Classes of finish if required by the CM.

2. Bridge construction

Submit the following details of formwork and falsework to the CM:

a. Details of the system, including drawings and calculations;

b. Details of holding down and stabilising the system including horizontal ties;

c. Method statement for construction of the bridge;

d. Proposal for curing and protecting the concrete; and

e. Method statement for placing and compacting the concrete.

FOR.M320.7 TIMING OF SUBMISSIONS

1. General

The particulars and samples for formed finishes shall be submitted at least 14 days before the relevant formwork, including formwork for trial panels, is fabricated. The particulars and samples for unformed and treated finishes shall be submitted at least 14 days before the relevant element, including trial panels, is concreted.
2. Bridge Construction
   Refer to Project Specific Specification.
WORKMANSHIP

STORAGE OF MATERIALS

FOR.W010.7 FORMWORK GENERALLY
Formwork shall be stored off the ground on level supports and in a manner which will not result in damage or deformation to the formwork or in contamination of the formwork.

FOR.W020.7 CLASS F4 AND F5
Formwork for Class F4 and F5 finishes shall be covered and protected from exposure to conditions which may affect the formwork.

FOR.W030.7 RELEASE AGENTS AND SURFACE RETARDERS
Release agents and surface retarders shall be stored in sealed containers marked to identify the contents and protected from exposure to conditions which may affect the material. The materials shall be stored in accordance with the manufacturers' recommendations and shall not be used after the recommended shelf life has been exceeded.

CONSTRUCTING AND ERECTING FORMWORK

FOR.W110.7 GENERAL
Formwork shall not have any splits, cracks or other defects. The faces and edges of formwork shall be clean and formwork faces shall be free of projecting nails.

FOR.W120.7 REUSE OF FORMWORK
Formwork which has been previously used shall be repaired and the edges resealed before it is erected. Formwork which in the opinion of the CM has deteriorated to an extent such that it will not produce the specified finish shall not be used for that Class or a higher Class of finish.

FOR.W130.7 JOINTS AND GAPS
Formwork shall be firmly supported and individual panels shall be rigid. Joints between formwork panels, stop ends and adjoining concrete shall be tight and shall not permit grout loss. Gaps shall be sealed with gaskets, filler, sealant or tape before the application of release agents.

FOR.W140.7 CUTTING FORMWORK
Formwork shall be cut in such a manner that reinforcement and built-in components passing through the formwork are maintained in position; the joints shall be tight and shall not permit grout loss.

FOR.W150.7 FORMERS ETC
Formers for profiled formwork, chamfers, splays, rebates and other features shall be rigidly and evenly fixed to the formwork along the complete length and shall not permit grout loss.
FOR.W160.7  BUILT-IN COMPONENTS, VOID FORMERS AND BOX-OUTS
Built-in components, void formers and box-outs shall be fixed in position before concreting. Unless permitted by the CM, void formers and box-outs shall not be used instead of built-in components. Polystyrene shall not be used for void formers and box-outs unless permitted by the CM.

FOR.W170.7  FORMWORK TIES AND COMPONENTS
Formwork ties and components shall be fixed in such a manner that they do not touch reinforcement or built-in components. Formwork ties and components shall fit rigidly against formwork faces and shall not permit grout loss.

FOR.W180.7  TEMPORARY OPENINGS
If required for cleaning or inspection, temporary openings shall be provided in the formwork.

CLASS F4 AND F5 FINISHES

FOR.W210.7  GENERAL
Each type of formwork for Class F4 and F5 finishes shall obtained from one source and different types of formwork shall not be mixed unless permitted by the CM. Damaged formwork shall not be used unless permitted by the CM. Parts of steel formwork which will be in contact with concrete shall be free from rust.

FOR.W220.7  JOINTS
For concrete surfaces with Class F4 and F5 finishes, joints between formwork panels shall be sealed with foamed rubber strips. The foamed rubber strips shall be sufficiently compressible to form a grout-tight joint. The width of the resulting gap between the panels shall not be greater than 1 mm and the sealing strips shall not protrude proud of the surface of the formwork panels. Alternatively, subject to the approval of the CM, joints between formwork panels may be sealed with an Approved filler provided the butting edges of the panels are smooth and the resulting gap between the panels is not wider than 1 mm. Joints between formwork panels shall not be sealed by tape fixed to the formwork faces.

FOR.W230.7  PROTECTION
Formwork for Class F4 and F5 finishes shall be protected from spillages, rust marks and stains.

APPLYING RELEASE AGENTS

FOR.W310.7  USE OF RELEASE AGENTS
A release agent shall be used on all formwork other than permanent formwork and formwork on which a surface retarder is used to produce a Class T1 finish.

FOR.W320.7  PREPARATION
Formwork faces shall be cleaned before release agents are applied. Concrete, reinforcement and built-in components shall not be contaminated by release agents.
FOR.W330.7 APPLICATION
The release agent shall be applied by the method and at the rate of application recommended by the manufacturer or as demonstrated to be satisfactory by use in the trial panel.

FOR.W340.7 CLASS F4 AND F5 FINISHES
Release agents shall be applied to formwork for Class F4 and F5 finishes after the formwork has been erected and before the reinforcement is fixed or, if this is not practicable, immediately before the formwork is erected. The release agent covering shall be complete and uniform.

INSPECTION

FOR.W410.7 GENERAL
The Contractor shall allow the CM to inspect the complete formwork and reinforcement, including trial panels, before carrying out any work, including fixing reinforcement adjacent to formwork and erecting formwork adjacent to reinforcement, which will make access to erecting formwork adjacent to reinforcement, which will make access to the formwork faces or reinforcement difficult. The Contractor shall inform the CM 24 hours, or such shorter period agreed by the CM, before carrying out such work.

FOR.W420.7 CLASS F4 AND F5 FINISHES
The Contractor shall allow the CM to inspect formwork for Class F4 and F5 finishes before it is erected and shall inform the CM 24 hours, or such shorter period agreed by the CM, before erecting the formwork.

REMOVAL OF FALSEWORK AND FORMWORK

FOR.W510.7 MINIMUM TIMES BEFORE REMOVAL
Except as stated in FOR.W530, falsework and formwork shall not be loosened or removed before the minimum times stated in the following table:

<table>
<thead>
<tr>
<th>Type of falsework or formwork</th>
<th>Class F1, F2, F3 and F4 finishes</th>
<th>Class F5 finish</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Concrete without PFA</td>
<td>Concrete with PFA</td>
</tr>
<tr>
<td>Vertical (non-profiled)</td>
<td>12 hours</td>
<td>15 hours</td>
</tr>
<tr>
<td>(profiled)</td>
<td>7 days</td>
<td>7 days</td>
</tr>
<tr>
<td>Inclined to top surfaces</td>
<td>12 hours</td>

</tr>
<tr>
<td>Soffits of slabs (props left in)</td>
<td>4 days</td>
<td>4 days</td>
</tr>
<tr>
<td>Soffits of beams (props left in)</td>
<td>7 days</td>
<td>7 days</td>
</tr>
<tr>
<td>Props to slabs</td>
<td>10 days</td>
<td>10 days</td>
</tr>
<tr>
<td>Props to beams</td>
<td>14 days</td>
<td>14 days</td>
</tr>
<tr>
<td>Props to cantilevers</td>
<td>28 days</td>
<td>28 days</td>
</tr>
</tbody>
</table>
The times stated are for a minimum ambient temperature of 15°C, for elements without superimposed loads and for concrete containing PC, PFAC or both PC and PFA not exceeding the PC replacement level as specified in the Contract. If other conditions apply, particulars of proposed changes to the minimum times shall be submitted to the CM for approval.

FOR.W520.7 WATER RETAINING STRUCTURES
For the purpose of determining the minimum times for loosening or removing falsework and formwork, copings at the tope of columns in water retaining structures shall be classified as slabs and roof slabs in water retaining structures shall be classified as beams.

FOR.W530.7 CONCRETE IN FLEXURE
Falsework and formwork supporting concrete in flexure may be loosened or removed when the strength of the concrete in that element is 10 MPa or twice the stress to which it will be subjected, whichever is greater, provided that deflection which in the opinion of the CM is unacceptable will not result and that superimposed loads will not be applied. The strength of the concrete shall be determined from tests on test cubes which have been made with concrete from the same pour and which have been cured by the same method and under similar conditions as the concrete in the element.

FOR.W540.7 REMOVING FORMWORK
1. Formwork shall be removed without hammering or levering to the concrete and in such a manner that there is no shock, disturbance, damage or loading to the concrete. Side formwork shall be removed without disturbing soffit formwork and soffit formwork shall be removed without disturbing props except as provided for in sub-clause (2);
2. Individual props may be removed to allow the removal of soffit formwork provided that the formwork has been designed accordingly and that each prop is replaced as soon as the formwork has been removed.

FOR.W550.7 CLASS F5 FINISHES
Falsework and formwork for Class F5 finishes shall be loosened and removed in a continuous operation and in accordance with a consistent programme agreed by the CM. All formwork shall be loosened before individual panels are removed and all formwork shall be removed within the programmed period. Individual panels or make-up pieces shall not be left in position.

FOR.W560.7 FORMWORK FOR REUSE
After removal, formwork which is intended for re-use shall be cleaned and stored as FOR.W010 and FOR.W020.

CLASSIFICATION OF FINISHES

FOR.W610.7 FORMED FINISHES
1. The characteristics of each class of formed finish shall be as stated in the following table:
### Classification of Formed Finishes

<table>
<thead>
<tr>
<th>Class of finish</th>
<th>Type of formwork normally used</th>
<th>Characteristics of finish</th>
<th>Specific requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Formwork pattern</td>
<td>Abrupt irregularities permitted</td>
</tr>
<tr>
<td>F1</td>
<td>Sawn timber</td>
<td>Not required</td>
<td>&lt; 10 mm</td>
</tr>
<tr>
<td>F2</td>
<td>Plywood</td>
<td>Pattern of formwork joints and tie holes as stated in</td>
<td>&lt; 5 mm</td>
</tr>
<tr>
<td>F3</td>
<td></td>
<td>Clauses, FOR.D150</td>
<td>&lt; 3 mm</td>
</tr>
<tr>
<td>F4</td>
<td>Sealed plywood</td>
<td>Pattern of formwork joints and tie holes as stated in</td>
<td>&lt; 3 mm</td>
</tr>
<tr>
<td>F5</td>
<td></td>
<td>&lt; 2 mm</td>
<td>&lt; 3 mm in 2 m</td>
</tr>
</tbody>
</table>

2. Formwork of the type stated in the table in sub-clause (1), will normally produce a concrete surface which complies with the characteristics of finish stated but other types of formwork may be used to produce the specified finish.

### FOR.W620.7 UNFORMED FINISHES

The characteristics of each class of unformed finish shall be as stated in the following table:

<table>
<thead>
<tr>
<th>Class of finish</th>
<th>Method of producing finish</th>
<th>Characteristics of finish</th>
<th>Specific requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Abrupt irregularities permitted</td>
<td>Gradual irregularities permitted</td>
</tr>

</tr>
</tbody>
</table>
U5  | Forming a Class U3 finish and steel trawelling the surface under firm pressure or power floating the surface | Nil | < 5 mm in 2 m | Uniform, dense and smooth surface, free from trowel marks No staining or discoloration

FOR.W630.7  

**TREATED FINISHES**

The characteristics of each class of treated finish shall be as stated in the following table:

<table>
<thead>
<tr>
<th>Classification of Treated Finishes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class of finish</td>
</tr>
<tr>
<td>-----------------</td>
</tr>
<tr>
<td>T1</td>
</tr>
<tr>
<td>T2</td>

<tr>
<td>T3</td>
</tr>
<tr>
<td>T4</td>
</tr>
<tr>
<td>T5</td>
</tr>
<tr>
<td>T6</td>
</tr>
</tbody>
</table>

FOR.W640.7  

**APPLICATION OF FINISHES**

The Class of formed and unformed finish required for different concrete surfaces shall be as stated in the following table unless otherwise stated in the Drawings. The high Class of finish shall start at least 150 mm below the finish ground level for concrete surfaces which are partly buried:

<table>
<thead>
<tr>
<th>Description of surface</th>
<th>Class of finish</th>
</tr>
</thead>
<tbody>
<tr>

<td>F3</td>
</tr>
</tbody>
</table>
### UNFORMED FINISHES

**FOR.W710.7 GENERAL**

Unformed finishes shall be produced by the methods stated in the table in FOR.W620.

**FOR.W720.7 CLASS U4 FINISH**

Brushing to produce a Class U4 finish shall be carried out in straight lines in a direction agreed by the CM; brushing shall be carried out when the concrete has hardened sufficiently for the float marks to be removed and for the ridges to be formed without displacing the aggregate.

**FOR.W730.7 FLOATING AND TROWELLING**

Floating and trowelling shall not be carried out until the concrete has hardened sufficiently to allow the specified finish to be produced with the minimum amount of floating and trowelling such that excess laitance is not produced.

**FOR.W740.7 CONCRETE CARRIAGEWAYS**

Surface finish to concrete carriageways shall comply with Worksection EXT2.
TREATED FINISHES

FOR.W810.7 GENERAL
1. Treated finishes shall be produced by constructing a concrete surface with a Class F3 or U3 finish as appropriate and applying the treatment to the surface by the methods stated in the table in FOR.W630;
2. The treatment shall be applied in a continuous operation in accordance with a consistent programme agreed by the CM.

FOR.W820.7 CLASS T1 FINISH
1. Washing and brushing to produce a Class T1 finish shall not be carried out until the concrete has hardened sufficiently for the cement matrix to be removed without disturbing the coarse aggregate. After washing and brushing have been completed and the concrete surface has hardened, the surface shall be cleaned;
2. The cement matrix shall not be removed or the aggregate exposed by mechanical methods unless permitted by the CM;
3. Class T1 finishes may be produced by using a surface retarder applied to the formwork or to the concrete surface. The surface retarder applied to the formwork or to the concrete surface. The surface retarder shall be applied by the method and at the rate of application recommended by the manufacturer, or as demonstrated to be satisfactory by use on the trial panel;
4. Plywood to which a surface retarder is to be applied shall be sealed with barrier paint, polyurethane varnish or other impermeable material agreed by the CM. The formwork shall be removed in small sections and the coarse aggregate exposed by washing and brushing the concrete surface;
5. Unless permitted by the CM, formwork to which a surface retarder has been applied shall not be re-used unless a surface retarder is to be used again on the formwork. Formwork to which a surface retarder has been applied and which is to be re-used shall be cleaned before the retarder is applied.

FOR.W830.7 CLASS T2 AND T3 FINISHES
Point tooling to produce Class T2 finishes and bush hammering to produce Class T3 finishes shall be carried out evenly in small areas and not in distinct lines. Tooling and hammering shall not start until at least 7 days after concreting.

FOR.W840.7 CLASS T4 FINISH
Hammering or chiselling to produce a Class T4 finish shall be applied from only one direction, and only either hammering or chiselling shall be applied on any one face. Hammering and chiselling shall not start until at least 14 days after concreting.

FOR.W850.7 CLASS T5 AND T6 FINISHES
Blasting to produce Class T5 and T6 finishes shall not be carried out until the concrete has hardened sufficiently for the cement matrix to be removed without disturbing the coarse aggregate. Adjacent surfaces shall be protected from blasting and dust shall be controlled by screens and by water-spraying.
INSPECTION AND COMPLIANCE OF FINISHES

FOR.W910.7 INSPECTION
1. Before any subsequent work is carried out on a concrete surface, the surface shall be inspected by the CM to determine if the specified finish has been produced. Formed finishes shall be inspected as soon as the formwork has been removed;
2. Blowholes or holes left by formwork ties and components shall not be filled and spatterdash or other coverings shall not be applied before the inspection; any such filling or covering carried out before the inspection may be rejected.

FOR.W920.7 COMPLIANCE STANDARD
1. Concrete surfaces shall have the characteristics stated in tables in FOR.W610 and FOR.W620 for the different Classes of formed and unformed finish before any subsequent work is carried out on the concrete surface and shall have the characteristics stated in the table in FOR.W630 for the different Classes of treated finish;
2. The CM shall determine if the specified finish has been produced and may use the trial panels as a means of comparison;
3. Abrupt irregularities shall be measured by direct measurement. Gradual irregularities shall be measured using a 2 m long straight edge on surfaces intended to be flat and by a method agreed by the CM on other surfaces.

REMEDIAL AND REPAIR WORK

FOR.W1010.7 GENERAL
1. Remedial or repair work shall not be carried out on concrete surfaces unless permitted by the CM; any such work carried out without permission may be rejected;
2. Filling of blowholes and holes left by formwork ties and components shall be carried out as soon as practicable after the CM has inspected the finish and with the minimum interruption to curing.

FOR.W1020.7 BLOWHOLES
Blowholes exceeding 3 mm in size in water retaining structures and watertight structures, and blowholes exceeding 10 mm in size in other structures shall be filled with cement mortar. The size of blowholes shall be the maximum dimension measured across the hole on the concrete surface. If the number and size of blowholes in concrete surfaces with Class F3, F4 and F5 finishes is in the opinion of the CM greater than in the trial panel the blowholes shall be filled, unless in the opinion of the CM filling is not required.

FOR.W1030.7 FORMWORK TIE HOLES
Holes left by formwork ties and components shall be cleaned and filled by ramming cement mortar into the holes in layers. Holes in concrete surfaces with a Class F5 finish shall be filled to a level slightly below the concrete surface; the holes shall not be overfilled and rubbed down.

FOR.W1040.7 APPLYING SPATTERDASH
1. Spatterdash shall be thrown with a hand trowel onto the surface to a thickness not exceeding 6 mm and shall cover at least 60% of the area which is to be plastered or rendered. Spatterdash shall be wetted one hour after application and shall be allowed to cure and harden before under coats are applied;
2. Spatterdash shall be applied as soon as practicable after the CM has inspected the finish and after the concrete surface has been cleaned and wetted.

FOR.W1050.7 CRACK REPAIR
See Worksection CON1.

PROTECTION OF FINISHES

FOR.W1110.7 GENERAL
Materials, constructional plant or other vehicles shall not use or be placed on or against concrete surfaces unless permitted by the CM.

FOR.W1120.7 CLASS F4, F5, U5 AND T FINISHES
Concrete surfaces with Class F4, F5, U5 and T finishes shall be:

1. Protected from running water, spillages, rust-marks and stains by covering the surface with polyethylene sheeting or timber or by other methods agreed by the CM. Protection from rust-marks caused by reinforcement bars shall be by polyethylene sleeves tied to the bars or by coating the bars with cement slurry; the bars shall not be coated with oil or grease;

2. Protected from damage by securing timber battens to the surface, by erecting barriers or fences or by other methods agreed by the CM.

FOR.W1130.7 CLASS F5 FINISH
Concrete surfaces with a Class 5 finish shall be protected from exposure to extreme variations in weather conditions for at least 14 days after the formwork has been removed.

TRIAL PANELS

FOR.W1210.7 GENERAL

1. A trial panel shall be constructed for each Class F4, F5, U5 and T finish to demonstrate that the proposed materials, mix design, methods of production and methods of construction, including curing and removal of formwork, will produce the specified finish;

2. Trial panels for Class F4 and F5 finishes shall be constructed before the relevant formwork for the permanent work is erected, and trial panels for Class U5 and T finishes shall be constructed before the relevant permanent work is concreted. The trial panels shall be constructed at least 4 weeks before the relevant permanent work is carried out;

3. The Contractor shall inform the CM at least 24 hours, or such shorter period agreed by the CM, before constructing trial panels;

4. Trial panels shall be constructed using the materials, mix design, methods of production and methods of construction, including curing and removal of formwork, submitted to the CM;

5. Trial panels shall be horizontal, vertical or inclined as appropriate and shall be constructed at locations agreed by the CM. Unless otherwise stated in the Contract, each trial panel shall be not less than 2 m by 2 m by 300 mm thick, and shall contain reinforcement representative of the most congested reinforcement which will be used in the permanent work. Trial panels shall incorporate formwork ties and components, horizontal joints, vertical joints, chamfers, splays, rebates and other features representative of those which will be used in the permanent work;
6. Trial panels shall be protected from damage and shall be left in position until the CM instructs their removal.

**FOR.W1220.7  NON-COMPLIANCE OF TRIAL PANELS**

If in the opinion of the CM the specified finish has not been produced in the trial panel, particulars of proposed changes to the materials, mix design, methods of production or methods of construction shall be submitted to the CM, further trial panels shall be constructed until the specified finish is produced in the trial panel. Further trial mixes shall be made unless in the opinion of the CM non-compliance of the trial panel was not due to the concrete mix.

**FOR.W1230.7  COMMENCEMENT OF FORMWORK AND CONCRETING**

Formwork for Class F4 and F5 finishes shall not be erected and elements with Class U5 and T finishes shall not be concreted until in the opinion of the CM the specified finish has been produced in the trial panel.

**FOR.W1240.7  CHANGES IN MATERIALS AND METHODS**

Unless permitted by the CM, the materials, mix design, methods of production or methods of construction, including curing and removal of formwork, used to produce the specified finish in trial panels shall not be changed.

MARINE WORKS

MATERIALS

GENERAL

MAR.M010.7 APPLICATION OF OTHER WORKSECTIONS

The works and materials specified below shall comply with the Worksections stated, unless otherwise stated in this Worksection:

1. Pipes and fittings, including gaskets, internal linings, external coatings and anticorrosion tape, for submarine outfalls shall comply with Worksection DRA2;
2. Fill material for marine works shall comply with Worksection EAR;
3. Formwork and finishes to concrete shall comply with Worksection FOR;
4. Steel reinforcement shall comply with Worksection CON3;
5. Concrete shall comply with Appendix B entitled "Recommended Specification for Concrete in Marine Environment" of the Port Works Design Manual to address the corrosion of reinforced concrete for marine structures and also shall comply with Worksection CON1 in general.

MAR.M020.7 DEFINITIONS

1. Reclamation: the formation of land over an area of foreshore, sea bed, tidal inlet or river, including the adjoining areas, by the deposition of fill material to the limits shown in the Drawings;
2. Marine structures: seawalls, revetments, breakwaters, jetties, quay walls, dolphins, docks, slipways, beacons, lighthouses, landing steps for berthing of vessels and other similar structures;
3. Final surface of any work: the surface to which the work is to be finished.

FILL MATERIAL

MAR.M110.7 PARTICLE SIZE DISTRIBUTION

The different types of fill material for marine works shall either be Type 1, Type 2, rock or public fill as specified in the Contract and shall have the particle size distributions within the ranges stated in the table in clause EAR1.M220 and in the following table unless otherwise stated in the Contract:

<table>
<thead>
<tr>
<th>Type of fill material</th>
<th>Percentage by mass passing</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Size</td>
</tr>
<tr>
<td></td>
<td>700 mm</td>
</tr>
<tr>
<td>Underwater fill material (Type 1)</td>
<td>-</td>
</tr>
<tr>
<td>Underwater fill material (Type 2)</td>
<td>-</td>
</tr>
</tbody>
</table>
MAR.M120.7 UNDERWATER FILL MATERIAL (TYPE 1)
Underwater fill material (Type 1) shall consist of natural material extracted from the sea bed or a river bed.

MAR.M130.7 UNDERWATER FILL MATERIAL (TYPE 2)
Underwater fill material (Type 2) shall consist of material which has a coefficient of uniformity exceeding 5 and a plasticity index not exceeding 12.

MAR.M140.7 ROCK FILL MATERIAL (GRADE 75)
Rock fill material (Grade 75) shall consist of pieces of hard, durable rock which are free from cracks, veins, discoloration and other evidence of decomposition.

MAR.M150.7 ROCK FILL MATERIAL (GRADE 700)
Rock fill material (Grade 700) shall consist of pieces of rock which are free from cracks, veins and similar defects and of which in the opinion of the CM not more than 30% by mass shall be discoloured or show other evidence of decomposition.

MAR.M160.7 SUBMISSIONS
Submit details of the sources and properties of fill material specified in this subsection to the CM, at least 14 days before deposition of the fill material starts.

MAR.M170.7 IMPORTATION OF SAND
1. Where the Contractor intends to import sand as defined in the Contract from the People's Republic of China (PRC) by barges, he shall submit to the CM for Approval a proposal containing the information as referred to in sub-clause (2) below for the delivery of sand from any source in PRC waters to the Site at least 28 days prior to its delivery. Within a reasonable time of being required to do so, provide to the CM such further particulars as may be required by the CM to enable the CM to make a proper decision on the proposal. Approval by the CM shall not relieve the Contractor of any obligation or liability under the Contract;

2. The proposal shall contain the following information:
   a. The source of the sand, grading curves and test results for contamination of heavy metals or any other test required by the CM or as are necessary to confirm compliance with the Specification;
   b. The name and licence number of each barge to be engaged in transporting the sand, and the company name, address, telephone and fax number and contact person of their appointed Hong Kong shipping agent;
   c. Details of all permits and authorizations, original versions of which the relevant PRC and Hong Kong authorities require to be carried on each barge. The original versions of the documents normally required shall include but not be limited to the following:

   PRC Authorities
   Certificate of ship Nationality
   Certificate of Survey

   Certificate of Navigation (Government of the Hong Kong Special Administrative Region, Government of the Macau Special Administrative Region and PRC)
Route Approval
Clearance Certificate
Pass for entering HK and Macau
Custom Supervision Book of Small Craft (Government of the Hong Kong Special Administrative Region, Government of the Macau Special Administrative Region and PRC)
Master and Chief Engineer Certificates
Seamans’ ID Cards/Record Books
Permit for Sand Exportation
Hong Kong Authorities
Arrival Report (Marine Department)
Arrival Clearance, Vessel and Crew (Immigration Department)
Cargo Manifest (Customs & Excise Department)
Sand Permit (Civil Engineering Development Department)
Departure Clearance (Marine Department)
Departure Clearance (Immigration Department)

3. All sand imported from PRC for incorporation into the Works shall be obtained from the source approved under the above sub-clause (1);

4. On each occasion sand is delivered by barge to the Site, produce to the satisfaction of the CM documentary evidence that the sand is from the source approved under the above sub-clause (1);

5. Requirement for proof of third party insurance cover:

Vessels transporting sand from China will be required to have third party risk insurance valid for Hong Kong waters and to carry a certified true copy of the third party insurance certificate on board the vessel.

6. Requirement for route approval:

To minimise the adverse effects on marine traffic, the Contractor intending to import sand material from China in barges will be required before the sand importation starts, to apply to the Director of Marine to obtain Approval for the transportation routes to be used. Guidance on the approval procedures is given below:

a. Sand imported from China should be transported to the Hong Kong destination site by the shortest and most direct route possible;

b. Routes which are under heavy marine traffic usage include Ma Wan and Kap Shui Mun Channels, the Central Harbour, the East Lamma Channel, the Adamasta Channel and Lei Yue Mun. It is intended that these routes will not generally be available to an unlimited number of barges transporting sand. However, if sand barges must traverse these busy waters the number of such vessels allowed to do so will be strictly limited;

c. To minimise the volume of individual vessels used, the Contractor is encouraged to use large rather than small vessels;

d. The Contractor intending to import sand from China in barges must apply to the Director of Marine for Approval of the transportation routes as soon as possible and certainly before any sand importation starts;

e. When making an application the following information will be required:

i. The site of the reclamation and Contract name and number;

ii. The total quantity of sand to be transported and the planned daily/monthly tonnage amounts to be transported;
iii. The proposed route;
iv. The number of vessels to be used plus their tonnage capacities and identities;
v. The frequency of vessel trips;
vii. The name and address of the Hong Kong agent;
vii. Details of third party risk insurance coverage for the vessels.
f. The Director of Marine will establish a working committee to advise him on individual applications for route approval. The committee membership will include concerned government departments, the Hong Kong Pilot's Association and selected port user groups. In considering applications for route approval, the Director of Marine will take into account the location of the reclamation and existing traffic levels;
g. Once route approval has been given, the marine traffic effects of the sand transportation will be monitored. The information gained from monitoring marine traffic, including marine traffic unrelated to a particular project, will be used by the Director of Marine to verify that the traffic level generated by that particular project is acceptable, needs adjusting downwards or could be set at higher levels;
h. Approved applications will stipulate a requirement for the applicant to forward to the Director of Marine on a monthly basis the following information:
i. The site of the reclamation and Contract name and number;
ii. The monthly amount in tonnage of sand transported;
iii. The number of vessels used plus their tonnage capacities and identities;
iv. The frequency of vessel trips;
v. The route used.

ROCK ARMOUR

MAR.M210.7 MAXIMUM AND MINIMUM MASSES

1. The different types of rock armour shall have the maximum and minimum masses as stated in the following table:

<table>
<thead>
<tr>
<th>Type of fill material</th>
<th>Mass of individual piece of rock (kg)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Maximum</td>
</tr>
<tr>
<td>Rock armour (Type 1)</td>
<td>1500</td>
</tr>
<tr>
<td>Rock armour (Type 2)</td>
<td>2000</td>
</tr>
<tr>
<td>Rock armour (Type 3)</td>
<td>2500</td>
</tr>
<tr>
<td>Rock armour (Type 4)</td>
<td>3000</td>
</tr>
<tr>
<td>Rock armour (Type 5)</td>
<td>4000</td>
</tr>
<tr>
<td>Rock armour (Type 6)</td>
<td>5000</td>
</tr>
<tr>
<td>Rock armour (Type 7)</td>
<td>6500</td>
</tr>
</tbody>
</table>

2. At least 50% in number of the individual pieces shall have a mass exceeding the mean of the specified maximum and minimum masses.

MAR.M220.7 PROPERTIES

Rock armour shall consist of rock having the properties stated in the following table:
### Properties of rock for rock armour

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specific gravity</td>
<td>( \geq 2.6 )</td>
</tr>
<tr>
<td>Water absorption</td>
<td>( \leq 3% )</td>
</tr>
<tr>
<td>Aggregate impact value (in dry condition)</td>
<td>( \leq 30% )</td>
</tr>
<tr>
<td>Ten percent fines value (in dry condition)</td>
<td>( \geq 100 \text{kN} )</td>
</tr>
<tr>
<td>Soundness</td>
<td>loss in mass after five cycles not exceeding 12% for sodium sulphate and 18% for magnesium sulphate</td>
</tr>
<tr>
<td>Aggregate abrasion value</td>
<td>( \leq 15% )</td>
</tr>
</tbody>
</table>

and shall comply with the following requirements:

1. The maximum size of rock shall not be greater than twice the minimum dimension;
2. Each piece of rock shall be free from cracks, veins and similar defects;
3. In the opinion of the CM not more than 20% in number of the individual pieces shall be discoloured or show other evidence of decomposition.

### MAR.M230.7 SUBMISSIONS

Submit details of the sources and properties of rock armour specified in this sub-section to the CM, at least 14 days before placing of the rock armour starts.

### STONES

#### MAR.M310.7 FACING STONES

1. Facing stones to seawalls and pitched slopes shall consist of pieces of hard, durable fresh granite, free from cracks, veins, and similar defects. Facing stones shall be uniform in size, shape and colour, roughly squared and hammer dressed such that they will fit together without the use of quarry spalls or surface pinning;
2. Facing stones for vertical concrete seawalls shall be at least 300 mm wide on the face, at least 300 mm from back to front and shall be of a height which will allow the stones to be laid in 300 mm to 400 mm courses.

#### MAR.M320.7 BERMSTONES

1. Bermstones for seawalls and revetments shall consist of pieces of sound fresh rock, free from cracks, veins and similar defects;
2. Bermstones for vertical seawalls shall be at least 1000 kg in mass and when placed in position shall be roughly rectangular on plan and between 450 mm and 750 mm thick.

#### MAR.M330.7 LEVELLING STONES

Stones for levelling founding layers for marine structures shall be rock fill material (Grade 75) as stated in MAR.M140.
FENDERING SYSTEMS

MAR.M410.7 TIMBER SPECIES AND PROPERTIES

Timber for fendering systems shall be Selangan Batu species, also known as Yacal and Balau, or a similar species of hardwood visually stress graded to the HS (Hardwood Structural) grade of BS 5756:1980. The species shall comply with the strength requirements for strength class SC8 or SC9 as stated in BS 5628:Part 2:1985, shall be resistant to mechanical wearing and marine borer attack, and shall comply with the requirements stated in the following table:

<table>
<thead>
<tr>
<th>Property</th>
<th>Minimum value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oven dry density</td>
<td>655 kg/m³</td>
</tr>
<tr>
<td>Static bending at rupture</td>
<td>56 MPa</td>
</tr>
<tr>
<td>Modulus of elasticity under bending</td>
<td>8700 MPa</td>
</tr>
<tr>
<td>Hardness (Janka indentation test)</td>
<td>3200 N</td>
</tr>
<tr>
<td>Compressive stress parallel to grain at maximum load</td>
<td>29 MPa</td>
</tr>
<tr>
<td>Shear stress parallel to grain at maximum load</td>
<td>6.5 MPa</td>
</tr>
</tbody>
</table>

MAR.M420.7 TREATMENT OF TIMBER

Kempas, Kapur and other hardwoods which are less resistant in a marine environment shall be pressure treated with creosote in accordance with BS 144 and BS 5589:1989 or with copper, chrome and arsenic (CCA) salts in accordance with BS 4072:1987. The minimum net retention for pressure creosoting shall be 130 kg/m³ and the minimum net dry salt retention for treatment with CCA shall be 30 kg/m³.

MAR.M430.7 RUBBER FOR FENDERS

Rubber for fenders shall be natural or synthetic rubber, resistant to ageing, weathering and wearing, homogeneous and free from defective impurities, pores or cracks, and shall have the properties stated in the following table:

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
<th>Test method and condition Part No. of BS 903</th>
</tr>
</thead>
<tbody>
<tr>
<td>Density</td>
<td>1100 kg/m³ to 1300 kg/m³</td>
<td>Part A1:1980</td>
</tr>
<tr>
<td>Hardness (International rubber hardness degrees)</td>
<td>≤72</td>
<td>Part A26:1969 Method N</td>
</tr>
<tr>
<td>Tensile strength</td>
<td>≥16 N/mm²</td>
<td>Part A2:1989</td>
</tr>
<tr>
<td>Elongation change</td>
<td>≥350%</td>
<td>Part A2:1989</td>
</tr>
<tr>
<td>After accelerated air ageing test:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Hardness (increase in IRHD)</td>
<td>≤8º</td>
<td>Part A19:1986 Method A at 70°C × 96 hours</td>
</tr>
<tr>
<td>Reduction in tensile strength</td>
<td>≤20%</td>
<td></td>
</tr>
<tr>
<td>Reduction in elongation</td>
<td>≤20%</td>
<td></td>
</tr>
<tr>
<td>Oil resistance (measured by volume change percentage):</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Industrial gasoline</td>
<td>± 60%</td>
<td>Part A16:1987 at 23°C × 22 hours</td>
</tr>
<tr>
<td>Heavy oil</td>
<td>± 20%</td>
<td></td>
</tr>
</tbody>
</table>
### MAR.M440.7  SUBMISSIONS FOR FENDERING MATERIALS

1. For timber:
   a. The following particulars shall be submitted to the CM at least 30 days before the first delivery of the timber to the Site:
      i. Species and grade of timber;
      ii. Name and address of timber supplier;
      iii. Method of pressure treatment and amount of net retention;
   b. Each batch of the timber delivered to the Site shall be accompanied by a certificate issued by a forestry authority approved by the CM or a bill of lading certifying the country of origin, method of pressure treatment, and grade and species of timber;

2. For rubber:
   a. The following particulars shall be submitted to the CM for approval of the source and type of rubber fenders at least 30 days before the first delivery of the rubber fenders to the Site:
      i. Manufacturer's literature, including a list of physical properties of the rubber for the fenders;
      ii. A report on compression load tests and characteristic load-deflection and energy deflection curves;
   b. A certificate showing the manufacturer's name, the date and place of manufacture and showing that the rubber fenders, including the rubber used in manufacturing the fenders, comply with the requirements stated in the Contract, shall be submitted for each batch of rubber fenders delivered to the Site.

### IRON AND STEEL FITTINGS

### MAR.M510.7  CAST IRON

Cast iron for bollards, pump house screens and screen guides shall be Grade 150 or 180 complying with BS 1452:1990.

### MAR.M520.7  BOLTS AND NUTS

1. Mild steel bolts and nuts shall comply with BS 3692:1967;
2. Stainless steel bolts and nuts shall comply with Grade A4 and property class 80 of BS 6105:1981.

### MAR.M530.7  WASHERS

1. Mild steel washers shall comply with BS 4320:1968;

MAR.M540.7 MILD STEEL CHAIN
Mild steel chain shall be grade 30 steel complying with BS 6405:1984.

MAR.M550.7 STAINLESS STEEL FITTINGS
Stainless steel for chains, railings, cat ladders, pumphouse screens and screen guides, mooring eyes and other marine fittings shall be grade 316 austenitic steel complying with the following:

SUBMARINE OUTFALLS

MAR.M610.7 PRECAST CONCRETE PIPES
Precast concrete pipes for submarine outfalls shall comply with BS 5911:Part 100:1988 and shall have gasket type flexible rebated joints with clamps and bolts.

MAR.M620.7 CLAMPS AND BOLTS
The clamps and bolts shall be cast steel complying with BS 3100:1976 and shall be painted with two coats of coal tar epoxy of a type approved by the CM to a dry film thickness of 300 microns.

MAR.M630.7 GASKETS
Gaskets for joints in precast concrete pipes shall be type D (drainage) rubber gaskets complying with BS 2494:1990. The rubber gaskets shall be moulded jointless in ring moulds and shall not contain any reclaimed rubber.

MAR.M640.7 EPOXY RESIN
Epoxy resin for joints between precast concrete pipes shall be a type approved by the CM.

MAR.M650.7 MARKER BUOYS
Marker buoys shall be a hard plastic type approved by the CM.

MAR.M660.7 SUBMISSIONS
1. The following particulars of the proposed materials and methods of construction for submarine outfalls shall be submitted to the CM:
   a. Methods of lifting, laying, jointing and testing pipes;
   b. Manufacturer's literature;
   c. A certificate for pipes and pipe joints showing the manufacturer's name, the date and place of manufacture and showing that the pipes comply with the requirements stated in this Specification and including the results of load tests.
2. The particulars shall be submitted to the CM at least 14 days before the first delivery of the material to the Site. Certificates shall be submitted for each batch of the material delivered to the Site.

**ANCILLARY MATERIALS**

**MAR.M710.7 JOINT FILLER FOR SLIP JOINTS**

1. Joint filler for slip joints in seawalls shall consist of three plies of Type 1B fine granule surfaced bitumen felt of 1.4kg/m² nominal mass in accordance with BS 747:1994;

2. Adhesive for use with joint filler shall be a proprietary type recommended by the joint filler manufacturer and approved by the CM;

3. The following particulars shall be submitted to the CM at least 14 days before the first delivery of the material to the Site:
   a. Details of joint filler, including manufacturer's literature;
   b. Method of fixing and application of the materials.

**MAR.M720.7 PRIMING PAINT**

1. Priming coat for temporary tide gauges shall be lead based priming paint complying with BS 2523:1966. Undercoat and finishing coat for temporary tide gauges shall be micaceous iron oxide paint complying with BS 3981:1976;

2. Primer for steel fittings for fendering systems shall be lead based primer complying with BS 2523:1966.

**MAR.M730.7 BITUMINOUS PAINT**

Bituminous paint for fendering systems shall comply with BS 3416:1991.

**MAR.M740.7 CREOSOTE**

Creosote for pressure treatment of timber shall be Type 2 coal tar creosote as stated in BS 144:Part 1:1990.
WORKMANSHIP

SUBMISSIONS PRIOR TO COMMENCEMENT OF WORK

MAR.W010.7 MARINE WORKS GENERALLY
The following particulars shall be submitted to the CM at least 14 days before marine works start:

1. Any conditions or restrictions imposed by the Director of Marine and other authorities, including copies of applications, licences, permits, and correspondence;
2. Details of methods for controlling marine traffic.

MAR.W020.7 DREDGING
The following particulars shall be submitted to the CM at least 14 days before dredging starts:

1. Type and capacity of dredgers;
2. Methods of anchorage and positioning of dredgers;
3. Sequence and rate of working;
4. Arrangements for the transportation and disposal of dredged material.

MAR.W030.7 DEPOSITION OF FILL MATERIAL
1. The following particulars of the proposed materials and methods of deposition of fill material shall be submitted to the CM:
   a. Details of Constructional Plant and transport;
   b. Methods of deposition and compaction of fill material;
   c. Methods of controlling the moisture content of fill material;
   d. Sequence and rate of working;
2. The following particulars shall also be submitted if the proposed method involves deposition of fill material by hydraulic method:
   a. Layout plan showing the pumpline alignments and positions of the discharge points;
   b. Calculations of the rate and duration of discharge;
   c. Details of containment bunds and tailwater drainage systems;
3. The particulars shall be submitted to the CM at least 14 days before deposition of fill material starts.

MAR.W040.7 LIFTING SEAWALL BLOCKS, COPING AND WAVE DEFLECTORS
Particulars of the proposed methods and devices to be used for lifting precast concrete seawall blocks, seawall copings and wave deflectors shall be submitted to the CM at least 14 days before lifting starts.
HANDLING AND STORAGE OF MATERIALS

MAR.W110.7 STORAGE OF FILL AND DREDGED MATERIAL
Fill material and dredged material shall not be stockpiled on the foreshore, seabed or river bed within the Site unless permitted by the CM.

MAR.W120.7 FILL MATERIAL
1. Fill material shall not be handled or stored in a manner which will result in segregation, deterioration, erosion or instability of the material;
2. Different types of fill material shall be kept separate from each other.

MAR.W130.7 PRECAST CONCRETE COMPONENTS
1. Precast concrete seawall blocks, copings and wave deflectors shall be stored in such a manner that identification markings can be easily seen;
2. Precast concrete seawall blocks, copings and wave deflectors shall be stored on level supports and in a manner which will not result in damage or deformation to the units or in contamination of the units. The units shall be protected from damage and damaged units shall not be used in the permanent work unless permitted by the CM.

MAR.W140.7 TIMBER FOR FENDERING
1. Timber for fendering systems shall be stored off the ground on level supports and shall be protected from exposure to conditions which cause reduction in the moisture content in the material;
2. Timber which is treated with preservatives shall not be stored on or adjacent to concrete surfaces which form part of the permanent work;
3. Safety precautions as recommended by the timber treatment company shall be observed in the handling of treated timber. Treated wood offcuts shall be buried in a suitable location, or burnt in an open area and the ashes buried;
4. Safety precautions as recommended by the supplier of wood preservatives shall be observed in the handling of the wood preservatives.

MAR.W150.7 RUBBER FOR FENDERING
1. Rubber fenders and fittings shall be left in their original packing until required for placing. All rubber surfaces shall be protected against damage;
2. Rubber fenders shall be handled with nylon slings of a size agreed by the CM or by other methods agreed by the CM.

EXECUTION OF MARINE WORKS GENERALLY

MAR.W210.7 NOTIFICATION
Before commencing marine works, provide the CM with evidence that the Director of Marine has been notified of the proposed works in accordance with Section 70 of the Shipping and Port Control Regulations, Chapter 313.
MAR.W220.7 **MARKING**

Marine works and any part of the Site in which marine works are carried out shall be marked with flags, marker buoys and lights in accordance with the International Association of Lighthouse Authorities Maritime Buoyage System (current edition as adopted by Marine Department) for Region A and in a manner agreed by the CM. Red flags shall be at least 0.7 m square and marker buoys shall be a type, size and colour Approved by the CM. Lights shall be either fixed red lights or quick flashing yellow lights visible all round the horizon at a distance of 2 km.

MAR.W230.7 **MARINE TRAFFIC AND WATERFRONT OPERATIONS**

1. Marine traffic and the operation of public and private concerns in areas adjacent to the Site shall not be obstructed by the activities of the Contractor;
2. Make all arrangements with and obtain the necessary approvals from the Director of Marine and any other relevant authority for temporary marine traffic arrangements and control.

MAR.W240.7 **TEMPORARY TIDE GAUGES**

1. Temporary tide gauges shall be mounted vertically and firmly on rigid supports at locations agreed by the CM and shall be calibrated, levelled and fixed to give tidal readings within an accuracy of 20 mm;
2. Temporary tide gauges shall be made of 50 mm thick hardwood and shall be at least 250 mm by 3200 mm in size. The gauges shall be painted on the marked faces with alternate 100 mm stripes in red and white and shall be marked and numbered in black at 0.5 m intervals over the tidal range from 0.0 m to +3.0 m C.D. The painting applied shall consist of one primary coat, one undercoat and one finishing coat.

MAR.W250.7 **WORK BOATS**

1. Work boats shall be motorised boats equipped with a rain shelter and capable of carrying at least six passengers;
2. Work boats shall be licensed under the Merchant Shipping (Launches and Ferry Vessels) Regulations, Chapter 281 and shall be manned and maintained in good seaworthy condition;
3. Work boats shall be kept available for use by the CM for supervision, inspection and measurement during normal working hours and at other times when the Contractor is working.

MAR.W260.7 **REMOVAL OF FLOATING DEBRIS**

Floating debris within the Site arising from any source shall be collected and disposed of by the Contractor at regular intervals agreed by the CM. Floating debris shall be prevented from dispersing outside the Site.

MAR.W270.7 **SURVEYS**

1. Surveys for dredging and deposition of fill material shall be carried out using echo sounders of 200 kHz to 220 kHz frequency or by other methods agreed by the CM;
2. The initial survey for dredging shall be carried out within 30 days before dredging starts;
3. The final survey for dredging shall be carried out within 30 days after dredging has been completed;
4. The initial survey for deposition of fill material shall be taken as being the same as the final survey for dredging, or the final survey for the underlying layer of fill material as appropriate, except as stated in sub-clause (5) below;
5. If the final survey for dredging or the final survey for the underlying layer of fill material was carried out more than 30 days before deposition of the next layer of fill material starts, the initial survey for deposition of fill material shall be carried out within 30 days before deposition of the layer of fill material starts;

6. The final survey for deposition of fill material for the first layers, intermediate layers, and final layers of underwater foundations shall be carried out within 30 days after deposition of fill material has been completed. The final survey for final layers other than those of underwater foundations shall be carried out at least 30 days and not more than 90 days after deposition of fill material has been completed.

MAR.W280.7  UNSUITABLE OR DETERIORATED FILL MATERIAL

1. Fill material which has been used or is required for use in the permanent work and which is allowed to become unsuitable such that in the opinion of the CM it no longer complies with the specified requirements for that type of material shall be replaced or dealt with by methods agreed by the CM;

2. The material which is to be replaced shall be disposed of by the Contractor.

MAR.W290.7  CONCRETING IN TIDAL LOCATIONS

Concreting in locations affected by tides shall be carried out in dry conditions unless otherwise permitted by the CM. After concreting is complete, the top of the concrete shall be covered with polyethylene sheets fixed to the formwork.

DREDGING

MAR.W310.7  MARINE PLANT AND EQUIPMENT

1. Two weeks before commencement of any marine works, submit to the CM for approval the proposed methods of working and the marine plant and equipment to be used;

2. The marine plant and equipment to be used on the Works shall meet the requirement in MAR.W320 and shall be operated to achieve the water quality requirements. Provide all necessary facilities to the CM for inspecting or checking such plant and equipment and shall not use such plant and equipment for the execution of the Works without the agreement of the CM. When instructed by CM, carry out trials of any plant and equipment to prove their suitability;

3. After commencement of the Works, if the plant and equipment or work methods are in the opinion of the CM causing unacceptable adverse impacts which can be checked against the Technical Memorandum on Effluent Standards issued under the Water Pollution Control Ordinance, initiate immediately remedial measures so as to halt such deterioration when notified by the CM in writing. If the Contractor fails to initiate remedial measures, the CM may stop the Works. Where such remedial measures include the use of additional or alternative plant and equipment, do not use such plant and equipment on the Works until agreed by the CM. Where remedial measures include maintenance or modification of previously approved plant and equipment, do not use such plant and equipment on the Works until such maintenance or modification is completed and the adequacy of the maintenance or modification is demonstrated to the satisfaction of the CM;

4. Comply with the conditions of dumping permits obtained from the Director of Environmental Protection. Display the permits prominently displayed in the Chinese and English language on site and also on the dredgers and barges.
AVOIDANCE OF POLLUTION DURING DREDGING, TRANSPORTING AND DUMPING OF MARINE MUD

1. Include pollution avoidance measures but not be limited to the following:
   a. Design and maintain all equipment to minimise the risk of silt and other contaminants being released into the water column or deposited in locations other than designated location;
   b. Design and maintain mechanical grabs to avoid spillage and seal tightly grabs while being lifted;
   c. Where trailing suction hopper dredgers for dredging of marine mud are in use, do not permit overflow from the dredger and the operation of lean mixture overboard systems permitted unless expressly approved by the CM in consultation with the Director of Environmental Protection;
   d. Use cutterheads of suction dredgers suitable for the material being excavated and design cutterheads to minimise overbreak and sedimentation around the cutter;
   e. All vessels shall be sized such that adequate clearance is maintained between vessels and the sea bed at all states of the tide to ensure that undue turbidity is not generated by turbulence from vessel movement or propeller wash;
   f. Repair all pipe leakages promptly and do not operate plant with leaking pipes;
   g. Before moving the vessels which are used for transporting dredged materials, clean excess material from the decks and exposed fittings of vessels and never dump the excess materials into the sea except at the approved locations;
   h. Maintain adequate freeboard on barges to ensure that decks are not washed by wave action;
   i. Monitor all vessels transporting material to ensure that no dumping outside the Approved location takes place. Keep and produce logs and other records to demonstrate compliance and that journey times are consistent with designated locations and submit copies of such records to the CM;
   j. Fit all bottom dumping vessels with tight fitting seals to their bottom openings to prevent leakage of material;
   k. Control loading of barges and hoppers to prevent splashing of dredged material to the surrounding water, and do not fill vessels to a level which will cause overflowing of material or polluted water during loading or transportation; and
   l. The CM may monitor any or all vessels transporting material to check that no dumping outside the Approved location nor loss of material during transportation takes place. Provide all reasonable assistance to the CM for this purpose.

2. Obtain all necessary dumping permits and dispose the dredged marine mud at a disposal site as designated in the dumping permit.

3. When dredging, transporting and disposing of contaminated marine mud, implement adequate measures for the avoidance of pollution which shall include but not be limited to the following:
   a. Engage a suitable grab dredger with closed watertight grab to undertake dredging of contaminated marine mud;
   b. Use split barge of not less than 750 m³ capacity, well maintained and capable of rapid opening and discharge at the disposal site to transport contaminated marine mud;
   c. Place the material into the disposal pit by bottom dumping;
d. Ensure discharge from split barges only within a radius of 100 metres of centre of the area allocated for the disposal of contaminated marine mud;

e. Discharge rapidly and then close immediately the hoppers, do not wash out material adhering to the sides of the hopper and keep the hopper closed until the barge next returns to the disposal site; and

f. Anchor the dumping vessel throughout the dumping operation.

4. Ensure that all marine mud is disposed of at the Approved locations. Ensure accurate positioning of vessels before discharge and submit proposals for accurate position control at disposal sites to the CM for approval before commencing dredging and dumping;

5. Ensure that all unsuitable material is disposed of at the Approved landfill or other designated location;

6. Employ vessels equipped with automatic self-monitoring devices as specified by the Director of Environmental Protection for disposal operation, co-operate with and facilitate the Director of Environmental Protection to inspect the device and retrieve the record stored in the device on a regular basis;

7. Provide experienced full time personnel on board all dumping vessels to ensure that appropriate methods to minimise pollution are implemented.

MAR.W330.7 PROTECTION OF WATER QUALITY AT WATER INTAKES

When dredging mud or placing fill in the vicinity of water intakes, protect the water intake by surrounding it with a suitable silt screen to prevent excessive suspended solids from entering the intake. Design the silt screen to ensure that the concentration of suspended solids entering the intake meets intake user requirements.

MAR.W340.7 SILT CURTAINS

1. If silt curtains shall be used to contain sediment losses during dredging and placing fill, design, install and maintain the silt curtains to minimise the impacts on the water quality and the protection of water quality at water intakes as described in MAR.W330. Submit the design and specification of silt curtains to the CM for approval.

2. Form silt curtains from tough, abrasion resistant, permeable membranes, suitable for the purpose, supported on floating booms in such a way as to ensure that the sediment plume shall be restricted to within the limit of the works area;

3. Form and install the silt curtain in such a way that tidal rise and fall are accommodated, with the silt curtains always extend from the surface to the bottom of the water column. The removal and reinstallation of such curtains during typhoon conditions shall be as agreed with the Director of Marine.

4. Regularly inspect the silt curtains and check that they are moored and marked to avoid danger to marine traffic. Repair any damage to the silt curtain promptly and stop the works until the repair is effected to the satisfaction of the CM.

MAR.W350.7 REFUSE CONTAINMENT BOOMS AND FLOATING REFUSE

1. Provide and install refuse containment booms before commencing public dumping to confine the floating debris arising within the site as a result of public dumping. Submit details of the refuse containment booms to the CM for approval before their use on site;

2. Remove refuses, timber debris, or oil contamination contained in public dump materials. Segregate all inert construction waste material suitable for reclamations. Dispose of all non-inert construction waste material at a public landfill;

3. Plastic buoys for the refuse booms will be provided by the Employer. Collect the plastic buoys from the Civil Engineering Development Department Technical Services Division's Store at North Point, clean and return after use;
4. Provide adequate sinker blocks and lit marker buoys to ensure that the booms are visible above the water line and securely anchored. The lights on the marker buoys shall be quick flashing yellow light visible all round the horizon at a distance of at least 2 km. Submit details to the CM for approval. The maximum spacing between the flashing yellow light shall be 30 metres. Properly maintain and operate the booms to the satisfaction of the CM throughout the progress of public dumping of the Site and replace the same if necessary when they are under repair or beyond repair;

5. Deploy sufficient sampans and labour for collecting floating refuse and preventing floating refuse within the Site from drifting into public waters. The frequency of collecting floating refuse shall be as agreed by the CM. Dispose of floating refuse collected off Site.

6. Make due allowance in programming the public dumping for the provision, installation, operation and maintenance of the refuse booms and the regular collection of the floating refuse throughout the progress of the reclamation work.

MAR.W360.7 CM'S PERMISSION
The permission of the CM shall be obtained before dredging starts in any area.

MAR.W370.7 PROCEDURE AND SEQUENCE
Dredging shall be carried out in such a manner and sequence that semi-fluid or disturbed seabed or foundation material will not accumulate in dredged areas.

MAR.W380.7 SAMPLING OF DREDGED MATERIAL
During dredging, samples shall be taken from the dredged materials for inspection and determination of the sand content. Notify the CM if there is any sudden or significant change in the properties of dredged material.

MAR.W390.7 DISPOSAL
Dredged material shall be disposed of by the Contractor in the dumping ground stated in the Contract.

DEPOSITION OF FILL MATERIAL BELOW +2.5mPD

MAR.W410.7 CM'S PERMISSION
The permission of the CM shall be obtained before deposition of the fill material starts in any area.

MAR.W420.7 DEPOSITING FILL MATERIAL
1. Fill material shall be deposited in a manner and sequence such that minimum lateral displacement of the underlying material will be induced and such that slopes are stable at all times;

2. The methods and Constructional Plant used for deposition of fill material shall be such that segregation of the material does not result. Fill material shall not be deposited by end-tipping unless permitted by the CM;

3. Fill material for blanketing layers and drainage layers shall be deposited uniformly by a method agreed by the CM.
MAR.W430.7 DEPOSITING FILL MATERIAL IN DREDGED TRENCHES
1. The first layer of fill material in dredged trenches for seawalls, revetments and breakwaters shall be deposited as soon as practicable after the dredged profile has been agreed by the CM. The dredged trench shall be substantially free from silt and debris before deposition of fill material starts;
2. Subsequent layers of fill material shall be deposited as soon as practicable after the profile of the underlying layer of fill material has been agreed by the CM.

MAR.W440.7 DEPOSITING ROCK FILL MATERIAL ADJACENT TO STRUCTURES AND UTILITIES
1. Rock fill material deposited adjacent to or above structures, piles or pedestals shall be hand packed or placed by a method approved by the CM;
2. Rock fill material deposited around utilities, including pipes for submarine outfalls, shall be hand packed or placed by a method approved by the CM and shall be brought up to the specified level equally on both sides;
3. Rock fill material deposited directly on geotextile shall be deposited in such a manner that the geotextile is not ruptured.

DEPOSITION OF ROCK ARMOUR

MAR.W510.7 GENERAL
Each piece of rock armour shall be placed individually and shall not be deposited by tipping, dumping or dropping.

MAR.W520.7 BREAKWATERS, REVETMENTS ETC
Rock armour for breakwaters, revetments and similar structures shall be deposited by working from the bottom to the top of a section in such a manner and sequence that the individual rock pieces interlock and do not segregate. The interstices shall be kept free from small fragments of rock.

MAR.W530.7 DEPOSITING ROCK ARMOUR ON GEOTEXTILE
Rock armour deposited directly on geotextile shall be deposited in such a manner that the geotextile is not ruptured.

LEVELLING AND COMPACTION OF FILL MATERIAL

MAR.W610.7 UNDERWATER FOUNDATIONS
The top surface of rock fill material in foundations for structures or pipes shall be thoroughly tamped with a concrete block weighing at least 10 t dropped through a height of at least 300 mm or by other methods agreed by the CM. The voids at the top of the foundation shall be filled with rock fill material (Grade 75).
CONSTRUCTION OF MARINE STRUCTURES
GENERALLY

MAR.W710.7 CONSTRUCTING SEAWALL BLOCKS, COPINGS AND WAVE DEFLECTORS
1. Formwork or moulds for precast concrete seawall blocks, copings and wave deflectors shall not be loosened or removed in less than 12 hours after completion of concreting;
2. Precast concrete seawall blocks, copings and wave deflectors shall be marked with the date of casting, identification reference and orientation in the structure. The letters and figures used for marking shall be at least 75 mm high and shall be sufficiently durable to be legible until the unit is placed in the final position;
3. Key holes in precast concrete seawall blocks, copings and wave deflectors shall be kept free from soil, aggregates, concrete and other materials before and after the blocks are set in position.

MAR.W720.7 SETTING SEAWALL BLOCKS
1. Seawalls constructed with precast concrete seawall blocks shall be constructed in layers between slip joints. The blocks shall be set in close contact with each other. Packing pieces shall not be used unless permitted by the CM;
2. The permission of the CM shall be obtained before the next layer is placed on each completed layer of blocks.

MAR.W730.7 FACING STONES
1. Facing stones to seawalls and revetments shall be built up one course at a time. The stones shall be thoroughly washed and cleaned with fresh water before placing and shall be set in 1:3 cement mortar. In vertical concrete seawalls there shall be at least one header stone to each square metre of facework. Header stones shall be staggered in alternate courses;
2. Concrete backing behind facing stones shall be placed as soon as each course of facing stones has been completed.

MAR.W740.7 SLIP JOINTS IN SEAWALLS
1. Slip joints in seawalls shall be straight and vertical and shall be perpendicular to the face of the seawall. The joints shall extend through the seawall from the coping down to the foundation;
2. Joint filler shall be cut to size before fixing and shall be securely fixed in position to the existing surface with adhesive. Concrete to the adjacent section of seawall shall be placed directly against the joint filler.

MAR.W750.7 FILLING CHANNELS IN SEAWALL BLOCKS
The channels in precast concrete seawall blocks and backing to seawalls shall be filled with rock pieces of sizes between 20 mm to 40 mm.

MAR.W760.7 CONCRETE COPINGS TO SEAWALLS
Concrete copings to seawalls shall be constructed in lengths of at least 5 m and not more than 10 m.

MAR.W770.7 BERMSTONES
1. Bermstones shall be placed as soon as practicable after toe blocks have been set in position or fill material has been deposited at the toe of marine structures;
2. Bermstones shall be set in close contact with each other and with the structure. The longitudinal axis of bermstones shall be perpendicular to the alignment of the structure on plan.

MAR.W780.7 BAGGED CONCRETE

1. Bagged concrete shall consist of hessian or canvas bags filled to approximately 70% full with Grade 30/10 concrete;
2. The bags shall be filled and the open ends tied or sewn up immediately before placing;
3. The bags shall be placed in brick bond fashion and flattened into position. The open ends of the bags shall be directed away from the outside surface and the spaces between bags and between layers of bags shall be kept as small as practicable. Bags shall not be disturbed after placing.

MAR.W790.7 TIMBERWORK FOR FENDERING

1. The finished surfaces of timber for fendering systems shall be free from irregularities. The timber shall not be cut by force splitting;
2. Timber which is to be pressure treated with preservatives shall be machined to the specified dimensions, sizes and shapes before treatment;
3. Drilling of holes and cutting of notches and recesses in timber shall be completed before painting and installation starts;
4. Pieces of timber shall not be jointed to form a member for the fendering system unless otherwise shown on the Drawings;
5. Unless otherwise permitted by the CM, pressure treated timber shall not be cut or drilled for holes after the treatment process. If cutting or drilling is permitted, surfaces exposed by cutting or drilling shall be field-treated as stated in sub-clauses (6) and (7);
6. Exposed surfaces of timber treated with creosote shall be field-treated by brushing, spraying or dipping with hot creosote;
7. Exposed surfaces of timber treated with CCA salts shall be field-treated by brushing or dipping with either a 100 g/L solution of the wood preservative or a solution suitable for after-fabrication treatment as recommended in BS 4072:1987.

MAR.W800.7 PAINTING TIMBER FENDERING

1. Timber members in fendering systems shall be painted with two coats of bituminous paint before installation;
2. Steel fittings for fendering systems, other than the threaded portions of bolts, nuts and other fittings, shall be painted with one coat of primer and two coats of bituminous paint before installation. The minimum thickness of each coat shall be 300 microns;
3. Bolt heads, shanks and nuts on the outer face of timber fendering systems shall be recessed into notches at a distance of 25 mm below the surface of the fenders. The notches shall be filled flush with the surface with a sealant composed of one part bitumen and two parts cement.

MAR.W810.7 INSTALLING RUBBER FENDERS

Timber or steel base templates shall be used to position anchor bolts for rubber fenders.
CONSTRUCTION OF SUBMARINE OUTFALLS

MAR.W910.7 LAYING OUTFALL PIPES
1. Pipes for submarine outfalls shall be marked with fluorescent paint such that the sequence of laying will be seen on underwater photographs. The letters and numbers used for marking shall be at least 100 mm high and shall be painted in orange on a white background;
2. Before submarine outfall pipes are laid, a guide rail of mild steel channel or other material agreed by the CM, painted with fluorescent paint, shall be laid on the levelling stones to provide a visible aid for laying pipes;
3. During construction of submarine outfalls, the open ends of the outfall pipes and riser pipes shall be temporarily capped by a method agreed by the CM to prevent the entry of silt or fill material.

MAR.W920.7 MARKER BLOCKS
1. Concrete marker blocks for submarine outfalls shall be placed on top of the fill material along the alignment of the pipeline as soon as deposition of fill material has been completed;
2. Concrete marker blocks shall be marked with fluorescent paint. The letters and numbers used for marking shall be at least 100 mm high and shall be painted in orange on a white background;
3. Concrete marker blocks shall be linked by coloured nylon ropes of at least 25 mm diameter.

MAR.W930.7 DIFFUSER PIPES
Epoxy resin joints between riser pipes and diffuser pipes shall be made in dry conditions.

MAR.W940.7 DIFFUSER CAPS
1. Diffuser caps shall be placed on top of the open ends of riser pipes and precast end plates shall be placed on the open end of the outfall within 7 days after the pipeline has been tested;
2. Marker buoys shall be tied to the diffuser caps with 1 m long nylon ropes of 6 mm diameter.

TOLERANCES

MAR.W1010.7 GENERAL
Refer to Appendix H 'Schedule of Tolerances' to this Specification.
TESTING

TRIALS FOR SUBMARINE OUTFALLS

MAR.T010.7 GENERAL
1. A trial shall be carried out to demonstrate that the proposed methods of lifting, laying and jointing pipes for submarine outfalls, including jointing of riser pipes to the diffuser pipes, comply with the specified requirements. The trial shall include a demonstration by a method agreed by the CM that the joints between the riser pipes and the diffuser pipes are sufficiently strong to withstand the forces which will be applied during construction of the submarine outfall;
2. The trial shall be carried out at least 14 days before pipelaying starts.

MAR.T020.7 TRIAL RESULTS
If in the opinion of the CM the proposed methods of lifting, laying and jointing the pipes as demonstrated by the outfall trial do not comply with the specified requirements, particulars of proposed changes shall be submitted to the CM. Further trials shall be carried out until in the opinion of the CM the methods are satisfactory.

MAR.T030.7 COMMENCEMENT OF PIPELAYING
Pipelaying for submarine outfalls shall not start until in the opinion of the CM the methods of lifting, laying and jointing pipes as demonstrated by the submarine outfall trial are satisfactory.

DREDGED MATERIAL

MAR.T110.7 SAMPLING
1. Areas being dredged shall be divided into a grid at 15 m intervals. One sample of dredged material shall be provided from each point on the grid at 2 m depth intervals. Additional samples shall be provided from positions instructed by the CM if there appears to be any change in the quality of the dredged material;
2. The mass of each sample shall be at least 1 kg. The method of sampling shall be as agreed by the CM.

MAR.T120.7 TEST METHOD
Each sample of dredged material shall be tested for sand content to the satisfaction of the CM. The test shall be carried out by an independent laboratory appointed by the Contractor and approved by the CM. The method of testing for sand content shall be as agreed by the CM.

FILL MATERIAL

MAR.T210.7 DEFINITION OF "BATCH"
A batch of fill material for marine works is any quantity of fill material for marine works of the same type and which in the opinion of the CM has similar properties throughout.
MAR.T220.7  SAMPLING
1. One sample of each type of fill material for marine works shall be provided at the same time as particulars of the material are submitted to the CM. Unless otherwise agreed by the CM, one sample of each type of fill material for marine works shall be provided from each batch;
2. The size of samples and the method of sampling shall be in accordance with the Testing section of Worksection EAR.

MAR.T230.7  TEST METHODS
1. Each sample of fill material shall be tested to determine the particle size distribution, plasticity index and coefficient of uniformity;
2. The method of testing shall be in accordance with the following:
   a. Particle size distribution: as Worksection EAR;
   b. Plasticity index: as Test Method 6.1 of Geospec 3;
   c. Coefficient of uniformity: as Worksection EAR.

MAR.T240.7  NON-COMPLIANCE
1. If the result of any test for particle size distribution, plasticity index or coefficient of uniformity of fill material for marine works does not comply with the specified requirements for the property, two additional samples shall be provided from the same batch and additional tests for the property shall be carried out;
2. The batch shall be considered as not complying with the specified requirements for the property if the result of any additional test does not comply with such requirements.

ROCK ARMOUR

MAR.T310.7  DEFINITION OF "BATCH"
A batch of rock armour is any quantity of rock armour of the same type and which in the opinion of the CM has similar properties throughout.

MAR.T320.7  SAMPLING ROCK FOR ROCK ARMOUR
1. One sample of each proposed type of rock for rock armour shall be provided at the same time as particulars of the material are submitted to the CM;
2. If instructed by the CM, a representative example of each type of rock for rock armour, broken down into appropriate sizes, shall be provided for testing.

MAR.T330.7  TEST METHODS FOR ROCK FOR ROCK ARMOUR
1. Each sample of rock for rock armour shall be tested to determine the specific gravity, water absorption, aggregate impact value, ten percent fines value, aggregate abrasion value and soundness;
2. The method of testing shall be in accordance with the following:
   d. Ten percent fines value: BS 812:Part 111:1990;
   e. Aggregate abrasion value: BS 812:Part 113:1990;
MAR.T340.7  SAMPLING ROCK ARMOUR
1. One sample piece of each type of rock armour shall be provided for the dropping test from each 100 pieces or part thereof of that type delivered to the Site;
2. One sample piece of each type of rock armour of the specified minimum size and one piece of the specified maximum size shall be provided for checking the sizes of material;
3. The sample pieces of the specified minimum and maximum sizes shall be mounted on individual plinths at locations agreed by the CM. The design and detail of the plinths shall be prepared by the Contractor and agreed by the CM.

MAR.T350.7  TESTING ROCK ARMOUR
1. Each sample piece of rock armour shall be tested by the dropping test to determine the resistance to fracture;
2. The dropping test shall be carried out with the largest cross-section of the specimen horizontal. The specimen shall be dropped from a vertical height, to the underside of the specimen, of 1.5 m onto a steel plate. The steel plate shall be at least 20 mm thick and shall be firmly bedded on a level concrete base.

MAR.T360.7  NON-COMPLIANCE OF ROCK FOR ROCK ARMOUR
1. If the result of any test for specific gravity, water absorption, aggregate impact value, ten percent fines value, aggregate abrasion value or soundness of rock for rock armour does not comply with the specified requirements for the property, two additional samples shall be provided from the same batch and additional tests for the property shall be carried out;
2. The batch shall be considered as not complying with specified requirements for the property if the result of any additional test does not comply with such requirements.

MAR.T370.7  NON-COMPLIANCE OF ROCK ARMOUR
1. If a sample piece of rock armour fractures as a result of the dropping test, nine additional sample pieces of rock armour from the same group of 100 pieces or part thereof shall be tested. If any of these sample pieces fracture as a result of the dropping test, every piece of rock armour in the same group shall be tested. Only those pieces of rock armour passing the dropping test shall be used;
2. A specimen is deemed to fracture if:
   a. Cracking occurs after dropping;
   b. The difference in masses of the original specimen and the largest single piece after dropping exceeds 1% of the mass of the original specimen.

TIMBER FOR FENDERING SYSTEMS

MAR.T410.7  DEFINITION OF "BATCH"
A batch of timber for fendering systems is any quantity of timber for fendering systems of the same grade and species and from the same source, covered by the same test certificates and bills of lading.

MAR.T420.7  SAMPLING
One sample of timber for fendering systems shall be provided at the same time as particulars of the material are submitted to the CM. Unless otherwise permitted by the CM, six samples shall be provided from each batch of timber for fendering systems delivered to the Site.
MAR.T430.7 TEST METHODS
1. For fendering systems delivered to the Site, the samples shall be provided in pairs taken from three separate balks of timber. Each sample shall be 1000 mm \( \times \) 50 mm \( \times \) 50 mm and shall be cut with the longest dimension parallel to the grain and the two shorter dimensions tangential and radial to the growth rings;
2. Each sample of timber for fendering systems shall be tested to determine the oven dry density, static bending at rupture, modulus of elasticity under bending, hardness, compressive stress parallel to grain at maximum load and shear stress parallel to grain at maximum load;
3. The method of testing, including the Janka indentation test for hardness, shall be in accordance with BS 373:1957 except that the specimens shall be tested at a moisture content of at least 25%.

MAR.T440.7 COMPLIANCE CRITERIA
The results of Janka indentation tests and tests for maximum shear parallel to grain of timber for fendering systems shall comply with the following requirements:
1. Each of the results of Janka indentation tests on the end face, radial face and tangential face shall comply with the requirements stated in the table in MAR.M410;
2. Each of the results of tests for shear parallel to grain on the radial face and tangential face shall comply with the requirements stated in the table in MAR.M410.

MAR.T450.7 NON-COMPLIANCE
1. If the result of any test for oven dry density, static bending at rupture, modulus of elasticity under bending, hardness, compressive stress parallel to grain at maximum load or shear stress parallel to grain at maximum load, of timber for fendering systems does not comply with the specified requirements for the property, three additional pairs of samples shall be provided from the same batch and additional tests for the property shall be carried out;
2. The batch shall be considered as not complying with the specified requirements for the property if the result of any additional test does not comply with the specified requirements for the property.

RUBBER FENDERS

MAR.T510.7 DEFINITION OF "BATCH"
A batch of rubber fenders is any quantity of rubber fenders of the same type and from the same source, covered by the same test certificates.

MAR.T520.7 SAMPLING
Unless otherwise permitted by the CM, one sample shall be provided from each 50 rubber fenders or part thereof delivered to the Site.

MAR.T530.7 TEST METHOD
1. Each sample of rubber fenders shall be compression load tested either at a laboratory approved by the CM or at the manufacturer’s workshop in the presence of the representative of a Government body or other organization approved by the CM;
2. Each sample of rubber fenders shall be subjected to three complete load cycles at a rate of 200 mm \( \pm \) 20 mm per minute to 50% deflection. The results of the test shall be shown on a load-deflection curve and on an energy-deflection curve.
MAR.T540.7  COMPLIANCE CRITERIA
The result of compression load tests on rubber fenders shall comply with the following requirements:

1. The sample shall not show any visible sign of cracks or permanent deformation in shape;

2. The height of each sample one minute after releasing the third compression load shall be at least 95% of the original height;

3. The recovery in height shall be as stated in sub-clause (2) for the repeated compression test;

4. For each loading cycle, the deflection as measured from the load-deflection curve and the energy-deflection curve shall not deviate by more than 10% from the deflection at the same load on the characteristic curves provided by the manufacturer.

MAR.T550.7  NON-COMPLIANCE

1. If the result of any compression load test on rubber fenders does not comply with the specified requirements stated in MAR.T540, two additional samples shall be provided from the same batch and additional tests for the property shall be carried out;

2. The batch shall be considered as not complying with specified requirements for the property if the result of any additional test does not comply with such requirements.

SUBMARINE OUTFALLS

MAR.T610.7  TEST METHODS

1. Submarine outfalls shall be tested to determine if there is any blockage or leakage;

2. Precast end plates and diffuser caps shall be removed before the outfall is tested;

3. The outfall shall be cleaned by high velocity water jets or by other electromechanical methods agreed by the CM. Riser pipes and diffuser pipes shall be cleaned by high capacity grit suction pumps or by other methods agreed by the CM;

4. The outfall shall be tested for blockages by pulling a mandrel approved by the CM through the outfall between manholes and between manholes and the end of the outfall. The mandrel shall be 750 mm long and 12 mm less in diameter than the nominal diameter of the pipe;

5. Riser pipes and diffuser pipes shall be tested for blockages and leakage by pumping dyed water through the outfall and inspecting the discharge plume at each riser pipe. Precast end plates shall be replaced before the test is carried out.

MAR.T620.7  COMPLIANCE CRITERIA

There shall be no blockage or leakage in submarine outfalls, including riser pipes and diffuser pipes.

MAR.T630.7  NON-COMPLIANCE

If the result of any test for blockage or leakage does not comply with the specified requirements for the test, the blockage shall be removed, or the leakage shall be repaired, by methods approved by the CM, or the outfall or diffuser pipes shall be repaired or replaced by methods approved by the CM. The submarine outfall shall be retested for blockage or leakage.

MEW METALWORK

MATERIALS

GENERAL REQUIREMENTS FOR GUARD RAILING

MEW.M010.7 ALTERNATIVE DESIGN FOR PEDESTRIAN GUARD RAILING
The Contractor may offer an alternative design for the pedestrian guard railing or that which is to be erected as temporary works and shown on the drawings or detailed in this Specification. Such design must be in accordance with BS 3049:1976, Table 1, Class C.

MEW.M020.7 SUBMISSION OF GUARD RAILING DETAILS
Submit the following details to the CM at least 28 days prior to fabrication:
1. A certificate from the manufacturer stating their name, date and place of manufacture and a statement confirming that the materials comply with the requirements of this Specification; and
2. Details of alternative design proposals as MEW.M010 where applicable.

MEW.M030.7 SAMPLES OF GUARD RAILING
Submit with the other details required at MEW.M020 samples of the following for Approval of source and type:
1. Each type of pedestrian guard railing to be used;
2. Mesh infill;
3. Each type of bolt, nut and washer to be used in the fabrication.

GENERAL REQUIREMENTS FOR METAL HANDRAILING, STAIRS, LADDERS AND FLOORING

MEW.M110.7 CONTRACTOR'S DESIGN
Handrailing, ladders, stairs and flooring which are to be designed by the Contractor shall comply with the following requirements:
1. Handrailing shall be capable of withstanding a horizontal loading of 740 N/m. The deflection of handrailing shall not exceed 1 in 200 at mid-span;
2. Stairs shall be designed for a live loading of 5 kPa;
3. Flooring shall be designed for a live loading of 5 kPa. The deflection of flooring shall not exceed 1/200 of the span.

MEW.M120.7 SUBMISSION OF PARTICULARS
The following particulars of the proposed handrailing, ladders, stairs and flooring shall be submitted to the CM at least 14 days before fabrication starts:
1. Details of manufacturer's name and place of manufacture;
2. A certificate showing that the materials comply with the requirements stated in the Contract;
3. Drawings showing layout and details of handrailing, including positions of the different types of standards;
4. Drawings showing details of ladders, stairs, toe plates and safety chains;
5. Drawing showing layout and details of flooring, including positions and size of panels and supports;
6. Details of methods of fixing and of rag, indented, expansion and resin bonded bolts, including manufacturer’s literature; and
7. Design details as MEW.M110.

MEW.M130.7 SAMPLES
The following samples of the proposed handrailing, ladders, stairs and flooring shall be submitted to the CM at least 14 days before the relevant work starts as instructed:
1. Handrails;
2. Standards;
3. Ladders, including rungs;
4. Toe plates;
5. Flooring and curbs;
6. Safety chains; and
7. Rag, indented, expansion and resin bonded bolts.

STEEL AND ALUMINIUM FOR PEDESTRIAN GUARD RAILING

MEW.M210.7 HOT FINISHED SEAMLESS STEEL TUBES

MEW.M220.7 STEEL TUBES AND TUBULARS SUITABLE FOR SCREWING TO BS 21 PIPE THREADS
Complying with BS 1387:1985.

MEW.M230.7 HOT ROLLED STEEL SECTIONS

MEW.M240.7 HOT ROLLED STRUCTURAL STEEL SECTIONS (EQUAL AND UNEQUAL ANGLES)

MEW.M250.7 WELDABLE STRUCTURAL STEELS
Complying with BS 4360:1986.

MEW.M260.7 STAINLESS STEEL
Complying with BS EN 10088-2:2005, Grade 1.4401.

MEW.M270.7 STAINLESS STEEL TUBES
To BS 6362:1990 Grade 316 S 31, and a type suitable for threading in accordance with BS 21:1985.
MEW.M280.7 **ALUMINIUM ALLOY**

1. Grade: EN AW-6082 in the T6, T651 or T62 tempers;

MEW.M290.7 **WROUGHT ALUMINIUM AND ALUMINIUM ALLOYS SUITABLE FOR GENERAL ENGINEERING PURPOSES**

**STEEL AND ALUMINIUM FOR HANDRAILING, LADDERS, STAIRS AND FLOORING**

MEW.M310.7 **STEEL**

Steel for handrailing, ladders, stairs and flooring shall comply with the following:

3. Hot rolled structural steel sections:

MEW.M320.7 **STAINLESS STEEL**

MEW.M330.7 **ALUMINIUM**

1. Aluminium for handrailing, ladders, stairs and flooring shall be type H 30 TF and shall comply with the following:
   Wrought aluminium and aluminium alloys for general engineering purposes:
   a. Plate, sheet and strip: to BS 1470:1987;
   b. Drawn tube: to BS 1471:1972;
2. Aluminium shall be anodised to Grade AA 25 in accordance with BS 1615:1987.
FIXINGS AND MESH INFILL FOR PEDESTRIAN GUARD RAILING

MEW.M410.7 TYPE
1. Use only galvanized bolts, nuts, screws and rivets with galvanized pedestrian guard railing;
2. Insulate aluminium fixings from ferrous materials with an Approved type non-conductive insulator at least 2 mm thick.

MEW.M420.7 ISO METRIC BLACK HEXAGON BOLTS, SCREWS AND NUTS

MEW.M430.7 ISO METRIC BLACK CUP AND COUNTERSUNK HEAD BOLTS AND SCREWS WITH HEXAGONAL NUTS

MEW.M440.7 METAL WASHERS
Complying with BS 4320:1968.

MEW.M450.7 RIVETS

MEW.M460.7 RIVET, BOLT AND SCREW STOCK
Wrought aluminium and aluminium alloys complying with BS 1473:1972.

MEW.M470.7 BOLT LENGTH
The threaded portion of bolt to project through the nut by a minimum of one thread and maximum of four threads.

MEW.M480.7 RAG, INDENTED, EXPANSION AND RESIN BONDED BOLTS
An Approved proprietary type capable of withstanding the design loading.

MEW.M490.7 MESH INFILL PANELS
To BS 4483:1998 and free from surface defects, surface irregularities and mesh misalignment.

FIXINGS AND BEDDING MORTAR FOR HANDRAILING, LADDERS, STAIRS AND FLOORING

MEW.M510.7 FIXINGS
1. Bolts, nuts, screws, washers and rivets shall comply with the following:
   a. ISO metric black hexagon bolts, screws and nuts to BS 4190:2001;
   b. ISO metric black cup and countersunk headbolts and screws with hexagonal nuts to BS 4933:1973;
   c. Metal washers for general engineering purposes to BS 4320:1968;
   d. Rivets for general engineering purposes to BS 4620:1970 (1988);
e. Wrought aluminium and aluminium alloys for general engineering purposes: rivet, bolt and screw stock to BS 1473:1972;

2. The length of bolts shall be such that the threaded portion of each bolt projects through the nut by at least one thread and by not more than four threads;

3. Rag, indented bolts, expansion bolts and resin bonded bolts shall be a proprietary type approved by the CM and shall be capable of withstanding the design working load;

4. Galvanized bolts, nuts, screws, washers and rivets shall be used with galvanized handrail, ladders, stairs and flooring and aluminium bolts, nuts, screws, washers and rivets shall be used with aluminium handrail, ladders, stairs and flooring; stainless steel bolts, nuts, screws, washers and rivets shall be used with other types of handrail, ladders stairs and flooring. Bolts, nuts screws and washers shall be insulated from aluminium by non-metallic washers and sleeves.

MEW.M520.7 CEMENT MORTAR

1. Mortar for grouting fixing bolts shall consist of 1 part of cement to 3 parts of sand together with the minimum amount of water necessary to achieve a consistency suitable for completely filling the bolt holes. The mix shall contain a non-shrink admixture;

2. Resin grout shall be an Approved proprietary type and shall contain a non-shrink admixture;

3. Mortar for building in curbs for metal flooring shall consist of 1 part of cement to 3 parts of sand together with the minimum amount of water necessary to achieve a consistency suitable for the work. The mix shall contain a non-shrink admixture.
WORKMANSHIP

FABRICATION, PROTECTION AND INSTALLATION OF PEDESTRIAN GUARD RAILING

MEW.W010.7 STORAGE AND PROTECTION
1. Store and protect guard railing off the ground on level supports in a manner that will not result in damage, deformation or contamination;
2. Do not use any damaged guard railing in the permanent works unless permitted by CM.

MEW.W020.7 WELDING
1. Unless otherwise permitted by the CM, do not make welded joints after galvanizing. Where permitted, ensure welded areas are free from scale and slag and treated with an alternative zinc-coating system;
2. Type of weld: fillet;
3. Ensure welded surfaces are clean and flush, prior to application of the protective coating.

MEW.W030.7 GALVANIZING
1. Hot dip galvanize all steel components forming pedestrian guard railing in accordance with BS EN ISO 1461:1999 with a minimum coating thickness of 70 µm;
2. Unless Approved, all components are to be galvanized after welding, drilling and cutting operations are complete;
3. All hot dip galvanizing is to be carried out by galvanizers with ISO 9001 certification. Submit the name of galvanizer for Approval;
4. Submit original invoice/delivery note and galvanizing certification for each delivery. These documents shall include the following information:
   a. Project title/number;
   b. Name of galvanizer;
   c. Types and dimensions of articles;
   d. Quantities.
5. Attach a durable identification tape to each batch of galvanized articles indicating the project title, galvanizing certification number and name of galvanizer.

MEW.W040.7 INSTALLATION
1. Install guard railing to a smooth alignment within 10 mm of the line, position and height shown on the drawings;
2. Use guard railing curved in the workshop for radii of less than 45 m. Do not use straight lengths in this application;
3. Fix guard railing to concrete using rag, indented, expansion or resin bonded bolts. Fix bolts into pockets and fill with cement mortar or resin grout;
4. Bolt fix guard railing to metalwork.
FABRICATION OF HANDRAILING, LADDERS, STAIRS AND FLOORING

MEW.W110.7 FABRICATION OF STEELWORK
Steelwork for handrailings, ladders, stairs and flooring shall be fabricated in accordance with BS 5950:Part 2:1992.

MEW.W120.7 GALVANIZING STEEL
1. Steel which is to be galvanized shall be hot-dip galvanized in accordance with BS EN ISO 1461:1999 with a minimum coating thickness of 70 µm;
2. Unless Approved, all components are to be galvanized after welding, drilling and cutting operations are complete;
3. All hot dip galvanizing is to be carried out by galvanizers with ISO 9001 certification. Submit the name of galvanizer for Approval;
4. Submit original invoice/delivery note and galvanizing certification for each delivery. These documents shall include the following information:
   a. Project title/number;
   b. Name of galvanizer;
   c. Types and dimensions of articles;
   d. Quantities.
5. Attach a durable identification tape to each batch of galvanized articles indicating the project title, galvanizing certification number and name of galvanizer.

MEW.W130.7 WELDING STEEL
1. Welds to steel for handrailings, ladders, stairs and flooring shall be full depth fillet welds. The welded surface shall be clean and flush before application of the protective coating;
2. Steel shall not be welded after galvanizing unless permitted by the CM, if permitted, the welded areas shall be free from scale and slag and shall be treated with an appropriate coating system approved by the CM which is compatible with the protective system of the parent material.

MEW.W140.7 FABRICATION OF HANDRAILING
Handrailings shall be discontinued at movement joints in structures. The spaces between standards shall be regular and shall not exceed 1.6 m. Curved handrailings shall not be made up of a series of straights.

MEW.W150.7 FABRICATION OF LADDERS
1. Ladders shall comply with BS 4211:1987;
2. Steel ladders shall be hot-dip galvanized;
3. Aluminium ladders shall be Grade 6082 aluminium;
4. Rungs, extended stringers, safety cages and brackets shall be welded to the stringers of ladders;
5. Rungs on aluminium ladders shall have longitudinal grooves and pressed aluminium alloy caps shall be fixed to open ends.

MEW.W160.7 FABRICATION OF STAIRS
MEW.W170.7  FABRICATION OF FLOORING

1. The shape of each panel of flooring shall be such that the panel can be easily moved. The mass of each panel shall not exceed 40 kg. Where intermediate supports are provided to support flooring they shall be capable of being removed to provide the specified clear opening;

2. Curbs shall be provided in concrete surfaces for flooring;

3. Cut-outs in flooring shall be neatly shaped and shall be provided with toe-plates. Cut-outs in open mesh flooring shall be trimmed with edge bars welded to the bearing bars. The clearance between the edge of cut-outs and the components passing through the cut-out shall not exceed 30 mm;

4. The bearing bars in open mesh flooring shall be welded to the nosing bars. The transverse bars shall be riveted or welded to the bearing bars. Panels of open mesh flooring shall be secured with adjustable fixing clips;

5. Chequer plate flooring shall have a non-slip pattern of a type approved by the CM and shall be provided with lifting holes. The flooring shall be secured to curbs by countersunk screws.

MEW.W180.7  FABRICATION OF TOE PLATES

Toe-plates shall be fixed to handrail standards by brackets and shall be bolted or welded to stairs and flooring.

MEW.W190.7  FABRICATION OF SAFETY CHAINS

1. Safety chains shall comply with BS 4942:1981 and shall be capable of withstanding a breaking force of 30 kN and a proof force of 15 kN;

2. Steel safety chains shall be 8 mm nominal size, Grade M4 non-calibrated chain Type 1 and shall be hot dip galvanized;

3. The links of stainless steel safety chains shall be welded and shall have an internal length exceeding 45 mm and an internal width of between 12 mm and 18 mm. Fins caused by welding shall be removed;

4. Hooks on chains shall be fitted with a sprung securing device.

STORAGE, PROTECTION AND INSTALLATION OF HANDRAILING, LADDERS, STAIRS AND FLOORING

MEW.W210.7  STORAGE AND PROTECTION

Handrailing and flooring shall be stored on level supports in a dry weatherproof store and in a manner which will not result in damage or deformation to the materials or in contamination of the materials. Handrailing, ladders, stairs and flooring shall be protected from damage and damaged handrailing, ladders, stairs and flooring shall not be used in the permanent work unless permitted by the CM.

MEW.W220.7  INSTALLATION OF HANDRAILING, LADDERS AND STAIRS

1. Handrailing shall be installed to a smooth alignment;

2. Handrail standards, flanges, ladders and stairs shall be bolted to metalwork and shall be fixed to concrete using rag, indented, expansion or resin bonded bolts. The bolts shall be fitted into pockets left in the concrete and the pockets shall be filled with cement mortar or resin grout.
MEW.W230.7 INSTALLATION OF FLOORING
1. Flooring and curbs shall be flush with the adjoining surfaces;
2. Curbs shall be fitted into rebates left in the concrete and the rebates shall be filled with cement mortar;
3. Flooring shall be closely butted and the gap between panels and curbs, adjacent panels and other surfaces shall not exceed 10 mm.

MEW.W240.7 TOLERANCES
Refer to Appendix H 'Schedule of Tolerances' to this Specification.

MRY MASONRY WALLING

MATERIALS

GENERAL

MRY.M010.7 STONE FOR MASONRY
Local granite free from defects which will adversely affect the strength or appearance of the masonry.

MRY.M020.7 CEMENT MORTAR
Consisting of:
1. 1 part PC (complying with CON1);
2. 3 parts of fine aggregate (clean, hard, durable crushed rock having the particle size distribution given below:

3. The minimum of water to achieve a consistency suited to the required work.

SUBMISSIONS

MRY.M110.7 SAMPLES OF MATERIALS
Submit to the CM samples of each type of stone for masonry for approval of source and type at least 14 days before the masonry work starts.
WORKMANSHIP

GENERAL

MRY.W010.7 TRAIL PANNELS
Construct a trial panel for each type of masonry:
1. To demonstrate that the proposed materials will produce brickwork or blockwork which complies with the specified requirements;
2. At least 14 days before the relevant work starts;
3. Using the materials submitted to the Engineer;
4. Inform the Engineer 24 hours, or such shorter period agreed by the CM, before constructing trial panels;
5. Each trial panel shall be 1 m x 1 m and shall be constructed at a location agreed by the CM;
6. Trial panels shall be used as a means of comparison against which the CM shall determine the compliance or otherwise of the masonry in the permanent work. Trial panels shall be protected from damage and shall be left in position until the CM instructs their removal.

MRY.W020.7 NON-COMPLIANCE OF MASONRY
If in the opinion of the CM the brickwork or blockwork in the trial panel does not comply with the specified requirements for masonry, particulars of proposed changes to the materials and methods of construction shall be submitted to the CM; further trial panels shall be constructed until the trial panel complies with the specified requirements.

MRY.W030.7 COMMENCEMENT OF MASONRY
Masonry shall not commence until in the opinion of the CM trial panel complies with the specified requirements.

MRY.W040.7 CHANGES IN MATERIALS
Unless permitted by the CM, the materials used to produce a trial panel which complies with the specified requirements shall not be changed.

HANDLING AND STORAGE OF MATERIALS

MRY.W110.7 HANDLING AND STORAGE OF STONE
Transport stone for ashlar stone walling with the minimum amount of handling and stack in the vehicle using packing pieces to prevent damage. Store the stone in stacks on battens and protected from exposure to rain.
RUBBLE STONE WALLING

MRY.W210.7 PREPARATION OF STONE
1. Roughly cut stones for random rubble walling in irregular shapes between 75 mm and 300 mm high, at least 75 mm deep and between 75 mm and 600 mm long on bed. The length or depth on bed of each stone shall be greater than the height;

2. Trim stones for squared rubble walling roughly square to between 75 mm and 300 mm high, varying in 75 mm stages. Each stone shall be between 100 mm and 150 mm deep and between 100 mm and 600 mm long on bed. The length or depth on bed of each stone shall be greater than the height;

3. Trim the stones roughly square for square coursed rubble walling as stated in Clause MRY.W210 (2) to suit courses of regular height varying from 150 mm to 250 mm.

MRY.W220.7 LAYING AND JOINTING
1. Lay dry the stones in rubble stone walling in a full even bed of cement mortar; all joints shall be filled and shall be between 5 mm and 15 mm wide;

2. Bond together the stones of random shapes and sizes in random rubble walling over each face of the wall. Select the stones and rough dress them to keep joint widths to a minimum. Provided at least one bonding stone of minimum size 450 mm x 150 mm, carried through the full thickness of the wall per square metre. Provide not more than 3 stones adjacent to a vertical joint;

3. Bond roughly squared stones of random sizes together in square rubble walling with continuous straight horizontal joints. Keep the number of vertical joints to a minimum;

4. Lay roughly squared stones in square coursed walling as stated in clause MRY.W220 (3) but bring up courses at centres not exceeding 750 mm to line up with quoin and jamb stones;

5. Construct squared rubble walling exceeding 300 mm thick and faced one side in accordance with the following requirements:
   a. Provide roughly squared stone at least 300 mm thick with a backing of random rubble;
   b. Regularly space at least two bonding stones per square metre and carry them through the full thickness of the wall or at least 450 mm into the backing, whichever is less.

6. Construct squared rubble walling exceeding 300 mm thick and faced both sides in accordance with the following requirements:
   a. Provide roughly squared stone at least 150 mm thick with a core of random rubble;
   b. Provided bonding stones as stated in clause MRY.W220 (5) but carry them through the full thickness of the wall or 450 mm into the core.

MRY.W230.7 POINTING
Raked out joints in rubble stone walling to a depth of 15 mm as the work proceeds. Pointed the joints in cement mortar on completion with a flush, weathered or recessed joint as required.
ASHLAR STONE WALLING

MRY.W310.7  PREPARATION OF STONE
Dress the exposed faces and joint faces of each stone for ashlar stone walling square and true, free from hollows or rough areas. Finish exposed faces to a finely squared dressed surface. Stones shall be at least 300 mm high. Clearly mark each stone to indicate its position in the finished work.

MRY.W320.7  LAYING AND JOINTING
Lay stones in ashlar stone walling on a full, even bed of mortar. Form all joints 5 mm wide and fill all joints and shall be 5 mm wide. Lay stones to bond together throughout the wall, and to the backing, using projecting bonding stones.

MRY.W330.7  POINTING
Rake joints in ashlar stone walling to a depth of 15 mm as the work proceeds and point the joints with a flush joint on completion using cement mortar.

PROTECTION OF MASONRY

MRY.W410.7  GENERAL
Protect newly erected masonry from exposure to conditions which may adversely affect the masonry. Cover arrises, projections and similar features with protective sheeting lapped and securely held in position. Keep facework clean at all times.

WALL TIES FOR MASONRY

MRY.W510.7  GENERAL
1. Fix wall ties in masonry which is to face an existing or newly constructed wall at a rate of 5 per m². Fix the ties 100 mm into the wall and 75 mm into the masonry.
2. Fix wall ties between the ends of walls and concrete or brickwork at centres of at least 450 mm vertically. Project the ties 250 mm into the masonry.

TOLERANCES

MRY.W610.7  GENERAL
Refer to Appendix H 'Schedule of Tolerances' to this Specification.

PSC  PRESTRESSING CONCRETE

MATERIALS

GENERAL

PSC.M010.7 APPLICATION OF OTHER WORKSECTIONS
Materials for grout for prestressing systems shall comply with Worksection CON1 except as stated in this Worksection.

PSC.M020.7 DEFINITIONS
1. Duct: a void formed in the concrete to accommodate a prestressing tendon;
2. Prestressing components: the components used in a prestressing system, including anchorages, grips, tendon deflectors, couplers, wedges, swages, nuts and other devices used to grip the prestressing tendon;
3. Prestressing tendon:
   a. An individual steel wire, wire strand or alloy steel bar in a duct; or
   b. An individual steel wire, wire strand or alloy steel bar not in a duct; or
   c. A group of steel wires or wire strands in a duct; used in a prestressing system.
4. Sheath: a tube or lining which is used to form a duct and which is left in place.

PRESTRESSING TENDONS

PSC.M110.7 WIRE
1. High tensile steel wire and strand shall comply with BS 5896:1980, supplied in coils sufficiently large in diameter to ensure that the steel wire and wire strand will pay off straight;
2. Grease for unbonded strand shall contain a corrosive inhibitor.

PSC.M120.7 BARS
Hot rolled and processed high tensile alloy steel bars shall comply with BS 4486:1980. All alloy steel bars must be straight.

COMPONENTS

PSC.M210.7 GENERAL
Prestressing components shall be proprietary type approved by the CM.

PSC.M220.7 ANCHORAGES
Prestressing anchorages shall comply with BS 4447:1973 and shall allow a minimum of 25 mm cover to cropped ends of prestressing tendons.
PSC.M230.7 SHEATHS AND DEVIATOR PIPES

1. Sheaths shall be an Approved proprietary type and shall be steel or other material approved by the CM. Sheaths shall be rigid and strong enough to retain their shape during fixing and concreting and to withstand forces from the prestressing tendons without damage;

2. For the sheath made of steel, the sheath shall be hot-dip galvanized to BS EN ISO 1461:1999;

3. For the sheath made of material other than steel, the sheath shall be non-metallic type;

4. Sheaths for external prestressing shall be continuous between anchorages and shall be airtight and watertight under the working conditions;

5. Results of tests on duct friction during tendon stressing shall be provided to the CM. It shall be demonstrated that at least 2 mm thickness of sheath will remain on completion of the stressing operation;

6. If the deviator pipes for external prestressing sheaths are made of steel, the deviator pipes shall be hot-dip galvanized to BS EN ISO 1461:1999. Additional protection in the form of Paint System "E" to STW.W650 shall be applied to all surfaces of the deviator pipes.

PSC.M240.7 DUCTS

The design of ducts shall allow for the grout to be injected from either end. There shall be no sudden change in the diameter of the duct.

PSC.M250.7 TAPS AND VENTS FOR GROUT

1. Taps for grout vents in ducts shall be a proprietary type, approved by the CM, and shall allow closure of the vents without loss of pressure in the duct. Vents to be used as grout entry points shall be threaded or fitted with screw connectors or other similar devices for connection to grout pumps;

2. All vents and vent connections shall have an internal diameter no less than 25 mm and shall be clearly identified by labelling.

PSC.M260.7 GROUT

1. Grout for prestressing systems shall consist of Portland cement and water. Sand, PFA and admixtures shall not be used unless permitted by the CM;

2. Grout shall have a minimum crushing strength of 25 MPa at 7 days;

3. The amount of bleeding of grout shall not exceed 2% in the first 3 hours and shall not exceed 4% in total. The water shall be reabsorbed by the grout during the 24 hours after mixing;

4. Free expansion of grout shall not exceed 10% at the ambient temperature;

5. The maximum total chloride content of grout, expressed as a percentage relationship between the chloride ion and the cementitious content by mass in the grout, shall not exceed 0.1%;

6. The maximum water/cement ratio of the grout shall be 0.40;

7. Where admixture is permitted by the CM, grout shall be non-shrink mix and comply with the following requirements:
   a. The free expansion of the grout shall be within a range from 0% to +5%;
   b. The admixtures shall not contain chlorides, thiocyanides, nitrates, formats, sulphates or other ingredients which may cause the grout to promote corrosion of the prestressing steel by rusting, pitting or stress corrosion;
   c. The admixture shall not segregate and shall be uniform in colour;
d. The admixture shall comply with BS EN 934:2009 Part 2 or Part 4 but full account shall be taken of their effects on the finished product;
e. The dosage shall be within the range recommended by the supplier and shall not exceed 5% of the weight of the cement.

SUBMISSIONS

PSC.M310.7 PRESTRESSING SYSTEMS
The following particulars shall be submitted to the CM for approval at least 8 weeks before the Approval is required:
1. Details of the prestressing system, including prestressing tendons, prestressing components, sheaths and tensioning apparatus;
2. Sequence of prestressing and ends of prestressing tendons from which prestress will be applied if not stated in the Contract;
3. Calculated values of:
   a. Each type of loss of prestress. Calculations for loss of prestress due to creep shall be based on the information stated in the Specification and Drawings;
   b. Prestressing tendon forces;
   c. Extensions of prestressing tendons and details of the method of measuring the extensions.
4. A certificate showing that the tensioning apparatus has been tested and calibrated by an agent approved by the CM within a period of two years before the apparatus is to be used;
5. Any alterations to the reinforcement or additional reinforcement required to allow for primary bursting effects;
6. Details of corrosion protection required for the prestressing system, including the type of grease for unbonded strand and type of corrosion inhibitor to be adopted;
7. Details of the format of tensioning schedules and of reports of tensioning operations, grouting operations and testing of duct friction.

PSC.M320.7 TENDONS
A certificate shall be submitted to the CM for each batch of prestressing tendons delivered to the Site and at least 28 days before installation of the prestressing tendons starts, showing the manufacturer's name, the date and place of manufacture and showing that the prestressing tendons comply with the requirements stated in the Contract and including details of:
1. Cast analysis;
2. Diameter, cross-sectional area and unit mass;
3. Results of tests for mechanical properties, including the characteristic breaking load, characteristic 0.1% load, elongation at maximum load, relaxation and modulus of elasticity;
4. Results of tests for ductility of prestressing wires.

PSC.M330.7 GROUT MIX AND GROUTING PROCEDURE
The following particulars of proposed grout mix and grouting procedure shall be submitted to the CM at least 7 days before trial mixes for grout are made:
1. Water:cement ratio by mass;
2. Details of mixing and grouting equipment;
3. Method of quality control during grout injection;
4. Details of grouting trials.

**PSC.M340.7 SAMPLES**

Samples of the following proposed items shall be submitted to the CM at the same time as particulars of the prestressing systems are submitted:

1. Prestressing tendons;
2. Prestressing components;
3. Sheaths;
4. Grout vents and taps.
WORKMANSHIP

HANDLING AND STORAGE OF MATERIALS

PSC.W010.7 HANDLING TENDONS
Prestressing tendons shall not be subjected to rough handling, shock loading or dropping from a height.

PSC.W020.7 HANDLING COMPONENTS
Prestressing components shall be handled in accordance with the manufacturer’s recommendations.

PSC.W030.7 STORAGE
1. Each prestressing tendon shall be tagged with a number to identify the coil or bundle number of the prestressing tendon used;
2. Prestressing tendons and sheaths shall be stored off the ground on level supports and in a manner which will not result in damage or deformation to the materials or in contamination of the materials;
3. Different types and sizes of prestressing tendons, prestressing components and sheaths shall be stored separately;
4. Prestressing tendons, prestressing components and sheaths shall not be stored on or adjacent to concrete surfaces which form part of the permanent work;
5. Prestressing tendons, prestressing components and sheaths shall be protected from exposure to conditions which may affect the material.

INSTALLING PRESTRESSING SYSTEMS

GENERALLY

PSC.W110.7 SURFACE CONDITION OF TENDONS AND COMPONENTS
1. Prestressing tendons, prestressing components and sheaths shall be clean at the time of installation and shall be free from loose mill scale, loose rust, pitting, grease or any substance which in the opinion of the CM is likely to reduce the bond or affect the prestressing tendons, prestressing components, sheaths, concrete or grout chemically. The prestressing tendons, prestressing components and sheaths shall be maintained in this condition until concrete or grout is placed around them;
2. If the surface condition of the prestressing tendons, prestressing components or sheaths deteriorates such that it does not comply with the requirements stated in sub-clause (1), the prestressing tendons, prestressing components, or sheaths shall be cleaned or dealt with by other methods agreed by the CM.

PSC.W120.7 SAFETY
Prestressing operations shall be carried out in such a manner that persons and property are not endangered by any sudden release of the energy stored in a stressed prestressing tendon.
LOCATION OF TENDONS AND COMPONENTS

Prestressing tendons, prestressing components and sheaths shall be accurately located and maintained in the correct position during all operations. Supports shall be placed at a maximum spacing of 600 mm.

TOLERANCES

Refer to Appendix H 'Schedule of Tolerances' to this Specification.

INSPECTION

The Contractor shall allow the CM to inspect the completed prestressing system before carrying out any work, including concreting and grouting, which will make access to the prestressing system difficult. The Contractor shall inform the CM 24 hours, or such shorter period agreed by the CM, before carrying out such work.

INSTALLATION OF PRESTRESSING TENDONS

GENERAL

Prestressing tendons from each batch shall not be installed until testing of the batch has been completed.

WIRES

1. Steel wires, wire strands and alloy steel bars which will be tensioned in one operation shall be taken from the same batch;
2. Individual steel wires and wire strands in the same duct shall not be twisted together. Strands which have become unravelled shall not be used.

ALLOY BARS

Unless permitted by the CM, alloy steel bars which have become bent shall not be straightened. Small adjustments for straightness may be made provided that the straightening is carried out at the ambient temperature by non-mechanical methods and provided that no force is applied on the threaded portion. Bars which have become bent in the threaded portion shall not be used.

DAMAGED TENDONS

Prestressing tendons which have been damaged mechanically or by work-hardening or heating shall not be used. After manufacture, prestressing tendons shall not be welded and heat treatment, work-hardening, galvanizing and other metallic coatings shall not be applied.

CUTTING

Prestressing tendons shall be cut using either a high speed abrasive cutting wheel or a friction saw or by other methods agreed by the CM. Flame cutting shall not be used.

JOINTS

Joints in prestressing tendons shall be made using couplers fixed in accordance with the manufacturer's recommendations.
COMPONENTS

PSC.W310.7 USE OF COMPONENTS GENERALLY
Prestressing components shall be used in accordance with the manufacturer’s recommendations.

PSC.W320.7 INSTALLING SHEATHS
1. At the time of tensioning, sheaths shall be free from dents or other irregularities which may affect tensioning;
2. Joints in sheaths shall be formed using sleeve connectors and adequately sealed by tape against ingress of concrete, grout and any other materials into the ducts. Joints in adjacent sheaths shall be staggered by at least 300 mm. Use of joints shall be kept to a minimum where practicable.

PSC.W330.7 GROUT VENTS AND TAPS
1. Grout vents and taps shall be provided at the following positions:
   a. All crests of the prestressing tendon profile and 400 mm on each side of each crest;
   b. All low points of the prestressing profile;
   c. All anchorages;
   d. Intervals not exceeding 15 m;
   e. Beyond each intermediate crest in the direction of grout flow at the point where the duct is one half diameter lower than the crest (but not further than 1 m), and elsewhere as required by the CM.
2. Vents shall not be placed at positions where they will be blocked by the prestressing tendons after tensioning;
3. Vents at high points shall be extended to a minimum of 500 mm above the highest point of the duct profile.

TENSIONING TENDONS

PSC.W410.7 GENERAL
1. Apparatus for tensioning of prestressing tendons shall be a type such that a controlled total force is imposed gradually and such that excessive secondary stresses are not induced in the prestressing tendons and prestressing components or in the structure or element to which prestress is being applied;
2. Prestressing tendons shall be securely attached to jacks and tensioning apparatus;
3. Steel wires or wire strands which are tensioned simultaneously shall be approximately the same length between anchorage points;
4. The force in the prestressing tendons during tensioning shall be measured by direct reading load cells or obtained indirectly from pressure gauges fitted in the hydraulic system. Load measuring devices shall be accurate to within 2%;
5. The extension of prestressing tendons and any movement of prestressing tendons in the gripping devices shall be measured during tensioning. The elongation of prestressing tendons shall be measured to an accuracy of 2% or 2 mm, whichever is the more accurate;
6. Tensioning apparatus and load measuring devices shall be calibrated before tensioning starts and at regular intervals agreed by the CM. The calibration certificate shall be obtained from an approved testing laboratory once every 6 months;
7. The force in the prestressing tendons shall not be transferred to the concrete until the concrete has reached the specified transfer strength;

8. The capacity of pressure gauges, when used together with the load cell as a load indicator, shall be sufficient in capacity such that the working pressure lies within the central half of the range of the gauges;

9. The time of transfer will be determined by successful testing of a batch of minimum 3 test cubes. If the test result of any individual cube in the initial batch indicates that the concrete has not attained the required strength, a further batch of cubes shall be tested at a later stage. This process shall be repeated until a batch of cubes successfully passes the strength test.

PSC.W420.7 PRETENSIONING

1. The stress in prestressing tendons shall be fully maintained during the period between pretensioning and transfer of stress. Transfer of stress shall take place gradually to minimise shock or damage to the transmission length and shall be carried out in conjunction with the release of any hold-down and hold-up forces in tendon deflectors;

2. In the long-line method of pretensioning, locator plates shall be distributed throughout the length of the bed to ensure that the steel wires or wire strands are maintained in the correct positions during concreting. Units which are made in line shall be free to slide in the direction of their length to permit transfer of the prestressing force to the concrete along the whole line;

3. Moulds used in the individual mould system of pretensioning shall be sufficiently rigid to provide the reaction to the prestressing force without excessive distortion;

4. Tendon deflectors in contact with pretensioned prestressing tendons of single steel wire or wire strand shall have a radius of at least five times the prestressing tendon diameter for steel wire and at least ten times the prestressing tendon diameter for wire strand. The total angle of deflection shall not exceed 15°. If a system is used such that friction develops between prestressing tendons and tendon deflectors, the friction force shall be determined by a test procedure agreed by the CM and any necessary allowance shall be made;

5. The tendon shall be covered with sleeves of PVC or other approved material where these materials are specified as debonded from the concrete. Tape ends of the sleeves to the tendon shall prevent the ingress of grout;

6. When the temperature of the pretensioning steel is below 10° C at the time of tensioning, steel elongation computations shall allow for the increase in temperature of the steel between the time of tensioning and the time when the concrete takes its initial set;

7. The tendons shall be trimmed to flush with the face of the concrete with the specified protection applied to their ends;

8. The precast prestressed members shall be indelibly marked to show the specific information related to its manufacturer.

PSC.W430.7 POST-TENSIONING

1. A tensioning schedule shall be submitted to the CM for Approval at least 48 hours before each post-tensioning operation starts. The schedule shall include the proposed sequence of tensioning the prestressing tendons, the required pretensioning loads and the calculated extensions of the prestressing tendons;

2. Spacers used with post-tensioned steel wire or wire strand which are not tensioned simultaneously shall be sufficiently rigid to ensure that they will not be displaced during successive tensioning operations;

3. If both ends of the prestressing tendon are free to move, a demonstration shall be carried out before post-tensioning starts to show that all prestressing tendons are free to move in the ducts;
4. Post-tensioning shall be carried out in such a manner that the stress in the prestressing tendons increases at a gradual and steady rate. The sequence of tensioning prestressing tendons and the ends of prestressing tendons from which prestress will be applied shall be as stated in the Contract or as approved by the CM;

5. For each element of a structure being stressed, post-tensioning of the prestressing tendons shall be carried out until the required prestress to that element has been reached. Tensioning of each prestressing tendon shall be carried out continuously until the required tendon loads or extensions have been reached. If tensioning is stopped for more than 2 days, particulars of any proposals for remedial or other work shall be submitted to the CM for Approval and tensioning shall not recommence until the Approved work has been carried out;

6. Measurements of extensions shall not commence until any slack in the prestressing tendon has been taken up. If the design permits, the draw-in of prestressing tendons at the non-jacking end shall also be measured. The tensioning shall be applied in increments of load and the extensions shall be measured at each increment. The average measured extension of the prestressing tendons shall be within 5% of the calculated extension and the measured extension of individual prestressing tendons shall be within 10% of the calculated extension;

7. If the tendon deflector in contact with a post-tensioned prestressing tendon has a radius of less than 50 times the diameter of the prestressing tendon or if the total angle of deflection exceeds 15°, the loss of strength of the prestressing tendon shall be determined by a test procedure agreed by the CM and any necessary allowance shall be made;

8. Post-tensioned prestressing tendons shall be cut at a distance from the anchorage of at least one diameter or 10 mm, whichever is greater. Unless otherwise permitted by the CM the tendons shall not be cut until at least 1 day after stressing, if the tendon is to be cut before grouting, or alternatively, at least 3 days after grouting.

PSC.W440.7  PROTECTION OF EXTERNAL TENDONS AND COMPONENTS
External prestressing tendons and anchorages shall be protected in their permanent positions from mechanical damage or corrosion until the permanent protection is applied.

PSC.W450.7  RECORDS
Records of tensioning operations shall be kept by the Contractor on the Site and a report shall be submitted to the CM within 24 hours of each tensioning operation. The report shall contain the following details:

1. Location of tensioning operations;
2. Coil, heat and bundle numbers of strand used;
3. Date and time of starting and completing tensioning operations;
4. Weather conditions;
5. Technical personnel supervising or carrying out tensioning operations;
6. Prestressing tendon reference numbers;
7. Tensioning apparatus identification;
8. Measured extensions;
9. Pressure gauge or load cell readings;
10. Amount of draw-in.
GROUTING

PSC.W510.7 GENERAL
Grouting of prestressing tendons shall be effective such that the duct is completely filled, and the prestressing tendon is completely surrounded, with grout.

PSC.W520.7 EQUIPMENT
1. Grout for prestressing tendons shall be mixed by a machine capable of producing a homogeneous colloidal grout and of keeping the grout in slow continuous agitation after mixing and until the grouting operation starts;
2. Grouting equipment shall be capable of continuous operation with little variation of pressure and shall include a system of recirculating the grout when grouting is not in progress;
3. Grout pumps shall be fitted with a safety valve to prevent pressure from rising above 2 MPa at any point within the grouting system including the sheaths. The connection of the pump to the duct shall be by a screw connector or other positive method. Baffles to the pump shall be fitted with 1.18 mm sieve strainers. Suction circuits shall be airtight;
4. Grouting equipment shall be thoroughly washed through with clean water after every series of grouting operations and at the end of use each day.

PSC.W530.7 INJECTION GENERALLY
The permission of the CM shall be obtained before prestressing tendons are grouted. If grouting is not started within 24 hours of permission having been given, the permission shall again be obtained from the CM.

PSC.W540.7 TIMING
Grouting of prestressing tendons shall be carried out as soon as practicable, and not more than 5 days, after tensioning of the prestressing tendons.

PSC.W550.7 PREPARATION
1. A check shall be made to ensure that the ducts, vents, inlets and outlets are capable of accepting injection of grout. This shall be done by blowing through the system with dry, oil-free air and testing each vent in turn;
2. All ducts shall be kept free of standing water at all times and shall be thoroughly clean and dry before grouting;
3. All anchorages shall be sealed by caps and fitted with grouting connections and vents. Sealing of anchorages shall be protected against damage at all times.

PSC.W560.7 PROCEDURE
1. Grout shall be used within 30 minutes of mixing unless a retarder is incorporated in the grout. If a retarder is used, the time shall be determined by a test procedure agreed by the CM;
2. The grout pressure applied shall be as low as practicable and shall not exceed 1 MPa. Grout shall be injected from the lower ends of ducts. Grout injection shall be continuous and steady and shall be at a rate which will avoid grout segregation and trapping air in the duct. Grout shall be allowed to flow from each of the grout vents until its consistency is equivalent to that of the grout injected. After the last grout vent has been closed, the pressure shall be maintained at 0.5 MPa for 5 minutes. The injection vent shall then be closed under pressure.
PSC.W570.7  BLOCKAGE OR BREAKDOWN
If there is any blockage or breakdown or if the grout injection is interrupted, the duct shall immediately be thoroughly washed with clean water and blown dry with oil-free compressed air. Regrouting shall start as soon as practicable.

PSC.W580.7  PROTECTION
Grouted ducts shall not be subject to shock or vibration within 24 hours of grouting.

PSC.W590.7  INSPECTION
The level of grout in grout vents shall be inspected and made good as agreed by the CM. Making good shall not be carried out until at least 2 days after grouting.

PSC.W600.7  RECORDS
Records of grouting operations for prestressing systems shall be kept by the Contractor on Site and a report shall be submitted to the CM within 3 days of each grouting operation. The report shall contain the following details:
1. Location of grouting operations;
2. Date and time of starting and completing grouting operations;
3. Weather conditions;
4. Technical personnel supervising or carrying out grouting operations;
5. Prestressing tendon reference numbers;
6. Grout mix, including any admixtures;
7. Grout injection pressure;
8. Volume of grout used;
9. Details of any interruptions and topping up.
TESTING

TRIAL MIXES FOR GROUT

PSC.T010.7  GENERAL
1. A trial mix for grout for prestressing systems shall be made to demonstrate that the proposed materials, grout mix and methods of production will produce grout which complies with the specified requirements;
2. The trial mixes shall be completed at least 35 days before the grout mix is used in the permanent work;
3. The Contractor shall inform the CM at least 24 hours, or such shorter period as may be agreed by the CM, before making trial mixes;
4. Trial mixes shall be made using the materials, grout mix and methods of production submitted to the CM.

PSC.T020.7  SAMPLING
1. One sample of grout shall be provided from the trial mix to determine the amount of bleeding and free expansion of the grout. The method of sampling shall be as stated in PSC.T710 (2);
2. One sample of grout shall be provided from the trial mix to determine the crushing strength of the grout. The method of sampling shall be as stated in PSC.T810 (2).

PSC.T030.7  TESTING PROCEDURE
1. Each sample of grout taken as stated in PSC.T020 (1) shall be tested to determine the amount of bleeding and free expansion. The method of testing shall be as stated in PSC.T720;
2. Each sample of grout taken as stated in PSC.T020 (2) shall be tested to determine the crushing strength. The method of testing shall be as stated in PSC.T820.

PSC.T040.7  NON-COMPLIANCE
If the result of any test for amount of bleeding, free expansion or crushing strength of trial mixes does not comply with the specified requirements for the property, particulars of proposed changes to the materials, grout mix or methods of production shall be submitted to the CM. Further trial mixes shall be made until the result of every test complies with the specified requirements for the property.

PSC.T050.7  USE OF NON-COMPLYING MIXES IN OTHER TRIALS
If grouting trials are carried out using the non-complying trial mix, further grouting trials shall be carried out unless in the opinion of the CM the changes to the materials, grout mix or methods of production will not affect the results of the previous grouting trials.
GROUTING TRIALS

PSC.T110.7 GENERAL
1. Grouting trials for grout for prestressing systems shall be carried out to demonstrate that the proposed materials, grout mix, methods of production and methods of construction will produce a grouted duct which complies with the specified requirements. The number and details of grouting trials shall be as stated in the Contract;
2. Grouting trials shall be completed at least 21 days before installation of the prestressing components in the permanent works;
3. The Contractor shall inform the CM 24 hours, or such shorter period agreed by the CM, before carrying out grouting trials;
4. Grouting trials shall be carried out using the materials, grout mix, methods of production and methods of construction submitted to the CM;
5. The profile of ducts and the method of support for grouting trials shall be as agreed by the CM. Vents shall be provided in ducts and tendons shall be pulled tight;
6. Grouting trials which do not form part of the permanent work shall be removed;
7. The grouting trial shall incorporate all relevant parts and components as if these relevant parts and components will be used in the actual prestressing system.

PSC.T120.7 PROCEDURE
Three sections selected by the CM shall be cut from the grouted duct and inspected not less than 2 hours after the grout used in the grouting trial has achieved its final set. Each cut section shall be 300 mm long. The external sheath of the cut sections shall be removed for inspection of the cut sections.

PSC.T130.7 COMPLIANCE CRITERIA
The sections of grouted duct cut in grouting trials shall be completely filled, and the prestressing tendon shall be completely surrounded with grout.

PSC.T140.7 NON-COMPLIANCE
If the result of any test on sections of grouted duct in grouting trials does not comply with the specified requirements for the test, or if in the opinion of the CM any aspect of the grouting procedure as demonstrated by the grouting trial is unsatisfactory, particulars of proposed changes to the materials, grout mix, methods of production or methods of construction shall be submitted to the CM. Further grouting trials shall be carried out until the result of every test on sections of grouted duct complies with the specified requirements for the test and until in the opinion of the CM every aspect of the grouting procedure is satisfactory. Further trial mixes for grout shall be made unless, in the opinion of the CM, non-compliance of the grouting trial was not due to the grout mix.

APPROVED GROUT MIXES

PSC.T210.7 DEFINITION
A grout mix which complies with the specified requirements for trial mixes for grout and for grouting trials shall become an Approved grout mix.

PSC.T220.7 COMMENCEMENT OF GROUTING
Grouting shall not proceed until the grout mix has been approved by the CM.
PSC.T230.7 DEVIATION FROM APPROVED MIX
The materials, grout mix, methods of production or methods of construction used to produce an Approved grout mix shall not be changed, unless permitted by the CM.

TESTING PRESTRESSED UNITS

PSC.T310.7 GENERAL
Comply with Worksection CON1.

TESTING PRESTRESSING TENDONS

PSC.T410.7 DEFINITION OF "BATCH"
A batch of prestressing tendons is any quantity of prestressing tendons of the same type, size and grade, manufactured by the same manufacturer, covered by the same certificates and delivered to the Site at any one time.

PSC.T420.7 SAMPLING
Samples of prestressing tendons shall be provided from each batch of prestressing tendons delivered to the Site and at least 28 days before installation of the prestressing tendons starts. The number of samples to be provided from each batch shall be as stated in the following table:

<table>
<thead>
<tr>
<th>Description</th>
<th>Size of batch</th>
<th>No. of samples per batch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Steel wire</td>
<td>0 - 50 tonnes</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>Exceeding 50 tonnes</td>
<td>1 for each of 50 tonnes or part thereof</td>
</tr>
<tr>
<td>Wire strand and alloy</td>
<td>0 - 100 tonnes</td>
<td>1</td>
</tr>
<tr>
<td>Steel bar</td>
<td>Exceeding 100 tonnes</td>
<td>1 for each 100 tonnes or part thereof</td>
</tr>
</tbody>
</table>

PSC.T430.7 SPECIMENS
1. The number of specimens in each sample shall be 15;
2. Each specimen shall be 1.5 metres long and straight;
3. Each specimen shall be taken from different coils or bars in the batch. The ends of specimens shall be cut square without unravelling of wires before delivery to the laboratory.

PSC.T440.7 PROCEDURES
1. Each specimen of prestressing tendon shall be tested to determine the characteristic breaking load, characteristic 0.1% proof load, elongation at maximum load, diameter, cross-sectional area, unit mass and modulus of elasticity. Each specimen of prestressing wire shall also be tested to determine the ductility;
2. Except that tests shall be carried out on specimens having a temperature of between 5°C and 30°C, the method of testing shall be in accordance with the following:
   a. High tensile steel wire and strand for the prestressing of concrete to BS 5896:1980;
b. Hot rolled and hot rolled and processed high tensile alloy steel bars for the prestressing of concrete to BS 4486:1980.

PSC.T450.7 COMPLIANCE CRITERIA
1. The standard deviations of the results of tests for characteristic breaking load and characteristic 0.1% proof load, expressed as equivalent stress values, of prestressing tendons shall not exceed the following:
   a. Tensile strength: 55 MPa;
   b. 0.1% proof stress: 60 MPa.
2. The statistical interpretation of the test results shall be in accordance with BS 2846:Part 3:1975, Table 3 and BS 2846:Part 4:1976, Table E, both for a one-sided tolerance interval of 0.95 and for a confidence level of 0.95.

PSC.T460.7 NON-COMPLIANCE CRITERIA
1. If the result of any test for elongation at maximum load, diameter, cross-sectional area, unit mass, modulus of elasticity or ductility of prestressing tendons does not comply with the specified requirements for the property, one additional sample shall be provided from the same batch and additional tests for the property shall be carried out;
2. The number of specimens in the additional sample shall be 15;
3. The batch shall be considered as not complying with the specified requirements for the property if the result of any additional test does not comply with the specified requirements for the property.

DUCT FRICTION

PSC.T510.7 GENERAL
The number and details of tests to determine the duct friction in prestressing systems shall be as follows:

PSC.T520.7 PROCEDURE
1. Prestressing tendons shall be tensioned from one end and the tendon forces shall be measured at both the jacking and non-jacking ends;
2. The tendon force at the non-jacking end shall be measured by a load-measuring device of a type approved by the CM. A direct reading load cell or a dummy jack is considered to be suitable as a load-measuring device. The load-measuring device shall be sufficiently rigid to ensure that the movement of the prestressing tendon at the non-jacking end under the specified tendon force is not excessive. The deflection of the load-measuring device shall be measured to an accuracy of 0.5 mm. A load-measuring device with a deflection exceeding 10 mm under the maximum load shall not be used;
3. The prestressing tendon shall be tensioned to the specified tendon force in equal increments and the tendon extensions at the jacking end and the tendon force and tendon movement at the non-jacking end shall be measured to within 5 mm. The number of load increments shall be suited to the tensioning operation but shall be at least five.

PSC.T530.7 COMPLIANCE CRITERIA
The force at the non-jacking end of the prestressing tendon determined in the duct friction test shall be within +10% and -5% of the calculated value.
REPORTING OF TEST RESULTS

Reports of duct friction tests shall be submitted to the CM within 3 days of each test. The report shall contain the following details:

1. Details stated in the Preliminaries;
2. Prestressing tendon reference numbers;
3. Graph showing tendon forces at jacking end against tendon forces at non-jacking end;
4. Comparison between the calculated tendon forces at the non-jacking end and the measured values.

TESTING GROUT GENERALLY

DEFINITION OF "BATCH"

A batch of grout for prestressing systems is any quantity of grout produced in one cycle of operations of a mixer.

TESTING GROUT FOR BLEEDING AND FREE EXPANSION

SAMPLING

1. For each grout mix one sample of grout shall be provided from each 25 batches of grout, or from the amount of grout produced in a day, whichever is the lesser, to determine the amount of bleeding and free expansion of the grout;
2. Samples shall be provided and testing commenced within 1 hour after the grout has been mixed. Samples shall be protected from rain before the tests for amount of bleeding and free expansion are carried out.

PROCEDURE

1. Each sample of grout taken as stated in PSC.T710 shall be divided into three specimens. Each specimen shall be tested to determine the amount of bleeding and free expansion;
2. A portion of each specimen shall be placed in a covered cylinder with a diameter of 100 ± 10 mm, to a depth of 100 ± 5 mm and the amount of bleeding and free expansion measured by a scale fixed to the outside of the cylinder.

NON-COMPLIANCE

If the result of any test for amount of bleeding or free expansion of grout for prestressing systems does not comply with the specified requirements for the property, particulars of proposed changes to the materials, grout mix or methods of production shall be submitted to the CM. Further trial mixes shall be made and further grouting trials shall be carried out unless otherwise permitted by the CM.

TESTING GROUT FOR CRUSHING STRENGTH

SAMPLING

1. For each grout mix one sample of grout shall be provided from each 25 batches of grout, or from the amount of grout produced in a day, whichever is the lesser, to determine the crushing strength of the grout;
2. Samples shall be provided not more than 1 hour after the grout has been mixed and shall be protected from rain before test cubes are made.

**PSC.T820.7**  
**PROCEDURE**  
1. Two 100 mm test cubes shall be made from each sample of grout. Each pair of test cubes shall be tested to determine the crushing strength at 7 days;  
2. The method of making, curing and testing the test cubes, and the calculations of the test results, shall be as stated in Worksection CON1, except that compaction of the grout is not required.

**PSC.T830.7**  
**NON-COMPLIANCE**  
If the result of any test for crushing strength of grout for prestressing systems does not comply with the specified requirements for crushing strength, particulars of proposed changes to the materials, grout mix or methods of production shall be submitted to the CM. Further trial mixes shall be made and further grouting trials shall be carried out unless otherwise permitted by the CM.

STW STEELWORK

MATERIALS

STANDARDS

STW.M010.7 GENERAL STEELWORK

STW.M020.7 STEELWORK FOR BRIDGEBRIDGES
Comply with BS 5400:Part 6:1980, except in respect of the following amendments:
1. Content pages: delete '6.3.1 General';
2. Page 2, Clause 3.1.4.1, lines 5, 8 and 14: delete 'C of DD21' and insert 'L1 of BS 5996:1980';
3. Page 2, Clause 3.1.4.1, line 10 and Clause 3.1.4.2, line 3: delete 'DD21' and insert BS 5996:1980;
4. Page 3, Clause 4.2.1, line 1: delete '4.4.2' and insert '4.2.2';
5. Page 3, Clause 4.3.3(e), line 1: delete line 1 of text and insert 'the hardness of the edge is reduced to less than 350 HV 30 of BS 427:1990 by a suitable heat treatment';
7. Page 5, Clause 4.14: delete and insert: 'The Contractor shall determine the dead load camber of beams required to comply with the requirements of STW.W120. The camber of plate girders shall be formed by either of the two following alternatives, whichever is stated in the Contract:
   Type A cambering
   - Camber introduced by welding the flanges pressed against a web plate cut to a smooth cambered profile;
   or
   Type B cambering
   - Camber introduced by connecting straight sections of girder with the change of slope at their junctions;
Type A
   - Camber shall be used if the alternative to be used is not stated in the Contract;
   with
Type B
   - cambering the junction shall not be positioned at bolted connections';
8. Page 6, Clause 5.2.2, line 2: delete 'DD21' and insert 'BS 5996:1980';
9. Page 7, Clause 5.5.2, paragraph 3, line 3: delete 'grider; and insert 'girder';
10. Page 9, Clause 6.3.1: delete Clause 6.3.1;
11. Page 15, Table 5, column 3, Member component 4: delete 'G=0' and insert 'G=D'.

Specification Library 2014 Edition STW /5
STW.M030.7  PROTECTION OF STEELWORK
Protection of steelwork against corrosion shall comply with BS 5493:1977.

STEEL

STW.M110.7  STRUCTURAL STEEL GENERALLY
Structural steel shall comply with BS 4360:1986, including Clause B7 at Appendix B, and with BS 5950:Part 2:1992, Section 2.1 or BS 5400:Part 6:1980, Section 3.1 as appropriate.

STW.M120.7  HOT ROLLED SECTIONS
Hot rolled sections complying with BS 4:Part 1:1980, BS 4848:Part 2:1991, BS 4848:Part 4:1972 (1986) or BS 4848:Part 5:1980 shall not be replaced with sections complying with other standards unless approved by the CM. If approved, the sections shall have equivalent properties, and the dimensional tolerances shall comply with the relevant British Standard.

STW.M130.7  RIVETS
Steel rivet bars for the manufacture of steel rivets shall comply with BS 5400:Part 6:1980, Appendix A.

STW.M140.7  SHEAR CONNECTORS
Steel for headed stud type shear connectors shall have a yield stress of at least 385 N/mm² and a tensile strength of at least 495 N/mm². Steel for other types of shear connectors shall comply with BS 4360:1986.

STW.M150.7  CASTINGS AND CAST STEEL PINS
Carbon manganese steel castings shall comply with BS EN 10293:2005.

STW.M160.7  FORGINGS AND FORGED STEEL PINS
Steel forgings and forged steel pins shall comply with BS 29:1976.

STW.M170.7  STAINLESS STEEL

STW.M180.7  ROLLED STEEL PINS
Rolled steel pins, including those made from slabs, shall comply with BS 970:Part 1:1996 or BS 4360:1986, grades 43, 50 or 55.
CAST IRON

STW.M210.7 GREY IRON
Grey cast iron shall comply with BS 1452:1990, grade 10.

STW.M220.7 MALLEABLE CAST IRON
Malleable cast iron shall comply with BS 6681:1986.

STW.M230.7 SPHEROIDAL OR NODULAR CAST IRON
Spheroidal or nodular cast iron shall comply with BS 2789:1985.

CONNECTIONS

STW.M310.7 BOLTS, SCREWS AND NUTS
Bolts, screws and nuts shall comply with the British Standards and strength grades stated in the following table unless other strength grades or British Standards are stated on the Drawings or elsewhere in this Worksection:

<table>
<thead>
<tr>
<th>Type of bolts, screws and nuts</th>
<th>British Standard</th>
<th>Strength grade of bolt</th>

STW.M320.7 STAINLESS STEEL BOLTS AND NUTS

STW.M330.7 WASHERS
1. Washers for high strength friction grip bolts and nuts shall comply with the following:
a. High strength friction grip bolts and associated nuts and washers for structural engineering:
   ii. Higher grade bolts and nuts and general grade washers: BS 4395:Part 2:1969;

2. Plain washers for other bolts, screws and nuts shall comply with BS 4320:1968; tapered washers for other bolts, screws and nuts shall comply with BS 3410:1961.

STW.M340.7 WELDING CONSUMABLES

1. Welding consumables used in metal-arc welding of grades of steel complying with BS 4360:1986 shall comply with BS 5135:1984. Welding consumables used in the fusion of steel castings shall comply with BS 4570:1985. Welding consumables used in metal-arc welding of austenitic stainless steels shall comply with BS 4677:1984;

2. Welding consumables and the procedures used shall be such that the mechanical properties of the deposited weld metal shall not be less than the respective minimum values of the parent metal being welded;

3. Welding consumables used with grades of steel other than those complying with BS 4360:1986 shall be such that the performance requirements stated in BS 5400:Part 6:1980, Table 1 or BS 5950:Part 2:1992, Table 1 as appropriate are achieved.

METAL COATINGS TO STEELWORK

STW.M410.7 GALVANIZING

1. Unless otherwise specified, galvanized coatings to be applied by hot-dip galvanizing to be in accordance with BS EN ISO 1461:1999. The coating thickness to comply with the following Table:-

<table>
<thead>
<tr>
<th>Article Thickness</th>
<th>Minimum Mean Coating Thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td>≥ 6 mm</td>
<td>85 µm</td>
</tr>
<tr>
<td>3 mm to &lt; 6 mm</td>
<td>70 µm</td>
</tr>
<tr>
<td>1.5 mm to &lt; 3 mm</td>
<td>55 µm</td>
</tr>
<tr>
<td>&lt; 1.5 mm</td>
<td>45 µm</td>
</tr>
</tbody>
</table>

2. Unless Approved, all components are to be galvanized after fabrication and welding;

3. All hot dip galvanizing, including the galvanizing work specified in other Worksections, is to be carried out by galvanizers with ISO 9001 certification. Submit the name of galvanizer for Approval;

4. Submit original invoice/delivery note and galvanizing certification for each delivery. These documents shall include the following information:
   a. Project title/number;
   b. Name of galvanizer;
   c. Types and dimensions of articles;
   d. Quantities.
5. Attach a durable identification tape to each batch of galvanized articles indicating the project title, galvanizing certification number and name of galvanizer.

STW.M420.7  SHERARDIZING
Sherardized zinc coatings shall comply with BS 4921:1988, Table 1, Class 1.

STW.M430.7  SPRAYED ZINC AND ALUMINUM
Sprayed zinc and aluminium coatings shall comply with BS 2569:Part 1:1964. The nominal coating thickness shall be 100 microns. Sprayed metal shall be pre-treated with product CP1 and sealed product CP3C in accordance with BS 5493:1977.

STW.M440.7  ELECTROPLATED ZINC AND CADMIUM
Electroplated zinc and cadmium coatings on threaded components with a diameter not exceeding 36 mm shall comply with BS 3382:Parts 1 and 2:1961. The coating thickness shall be at least 5 microns.

STW.M450.7  THREADED COMPONENTS
Allowance for the thickness of the metal coating shall be made in the sizes of the threads of metal coated threaded components. Nuts shall not be tapped oversize by more than 0.4 mm. Metal coated HSFG bolts and nuts shall not be tapped oversize unless Approved.

PAINT

STW.M510.7  GENERAL
Paint shall be supplied in sealed containers of not more than 5 litres capacity. Each container shall be marked on the side to show the following:
1. The name of the manufacturer;
2. The paint manufacturer's reference number;
3. Intended purposes, type of pigment and binder;
4. Batch number, date of manufacture, expiry date and pot life; and
5. Colour, gloss, drying times and flash point.

STW.M520.7  STANDARD
1. Paint for steelwork shall comply with BS 5493:1977, Section 2, Table 4;
2. Organic zinc-rich paint shall comply with BS 4652:1971;
3. The Volatile Organic Compound (VOC) content of all paint applied on surfaces of steelwork shall comply with the VOC limits stipulated in the Air Pollution Control (Volatile Organic Compounds) Regulation.

STW.M530.7  LEAD BASED PAINTS
Shall not be used for finishing coats.
ANCILLARY MATERIALS

STW.M610.7 GROUT FOR COLUMN BASES

1. Grout for bedding steel bases and for filling bolt pockets and pocket bases shall be based on PC and shall have the same grade strength as the surrounding foundation concrete. The grout shall contain a non-metallic expanding admixture and shall have a total chloride content of not more than 0.1% by mass of cement;

2. Grout for bedding steel bases and for filling bolt pockets shall be a proprietary type approved by the CM and shall be suitable for filling the space by pouring under a suitable head. The proportions of the grout shall be in accordance with the manufacturer's recommendations;

3. A dry packed mortar may be used for bedding steel bases which exceed 75 mm thick. The mortar shall consist of 1 part by weight of cement of 2 parts by weight of fine aggregate together with the minimum amount of water necessary to achieve a consistency suitable for thorough ramming against supports such that the space is completely filled;

4. Grout for filling pocket bases shall be a mix Approved by the CM with a nominal maximum aggregate size of 10 mm.

STW.M620.7 LUBRICANT

Lubricant for lubricating nut threads of HSFG bolts shall be a wax based type Approved by the CM. Machine oil and other free flowing lubricants shall not be used.

SUBMISSIONS

STW.M710.7 STEEL

1. The manufacturer's certificates for steel shall be submitted to the CM in accordance with BS 4360:1986, Clause 12 and Appendix B6;

2. The certificates shall be submitted to the CM not more than 2 days after the steel has been delivered to the place of fabrication.

STW.M720.7 DRAWINGS

1. Two sets of drawings of the steelwork shall be submitted to the CM. The drawings shall show details of the following:
   a. Steelwork and welds, including any stud welds, marked with the relevant welding procedures;
   b. Joints or non-standard welds proposed by the Contractor;
   c. Locations and methods of removal of any temporary welded attachments proposed by the Contractor;
   d. Edges of steelwork complying with BS 5400:Part 6:1980 to be formed by flame cutting or shearing procedures complying with BS 5400:Part 6:1980, Clause 4.3.3 (a), (d) and (e) with the edges marked with the procedures to be used;
   e. Parts of steelwork complying with BS 5400:Part 6:1980 to be worked by hot processes complying with BS 5400:Part 6:1980, Clause 4.8, 4.9 or 4.10 with the parts marked with the processes to be used;

2. The drawings shall be submitted to the CM for Approval at least 6 weeks before fabrication of the steelwork starts. Drawings shall not be Approved until all procedures and details shown on the drawings have been approved by the CM;
3. A print and a diazo film of the Approved drawings shall be submitted to the CM at least 7 days before fabrication of the steelwork starts.

**STW.M730.7  DELIVERY**

1. The following particulars of steelwork fabricated off the Site shall be submitted to the CM:
   a. Expected and actual arrival dates;
   b. Name of carrier;
   c. Duplicate copies of bill of lading and packing list for steelwork transported by sea;
   d. Duplicate copies of delivery note and a list showing the marking and weight of each component for steelwork transported by land;

2. The particulars of expected arrival date and name of carrier shall be submitted to the CM at least 14 days before the due date; other particulars shall be submitted to the CM within 3 days after delivery of the steelwork to the Site.

**STW.M740.7  ERECTION**

1. The following particulars of the proposed method of erecting steelwork shall be submitted to the CM:
   a. Sequence and method of erection of steelwork;
   b. Method of lifting and handling the components;
   c. Method of preventing damage to protective coatings on steelwork during handling;
   d. Procedure for aligning, levelling and plumbing steelwork, including temporary supports and methods of making beddings for column bases;
   e. Sequence of casting concrete bonded to the steelwork;

2. The particulars shall be submitted to the CM at least 6 weeks before erection of the steelwork starts.

**STW.M750.7  WELDER CERTIFICATES**

1. Certificates endorsed by inspecting authority Approved by the CM shall be submitted to the CM to show that each welder has been Approved in accordance with BS 4570:1985, BS EN 287:Part 1:1992 or BS 4872:Part 1:1982 as appropriate. The extent of approval of the welder shall be appropriate to the categories of welds which he will carry out;

2. The welder certificates shall be submitted at least 4 weeks before fabrication of the steelwork starts.

**STW.M760.7  WELDING PROCEDURES**

The particulars of the proposed welding procedures as specified in Project Specific Specification shall be submitted to the CM at the same time as welder certificates are submitted.

**STW.M770.7  STUD WELDING, FLAME CUTTING AND SHEARING**

1. The following particulars of the proposed stud welding, flame cutting and shearing procedures for steelwork complying with BS 5400:Part 6:1980 shall be submitted to the CM:
   a. Procedures for stud welding, flame cutting and shearing processes complying BS 5400:Part 6:1980, Clause 4.3.3 (a), (d) or (c);
b. Documentation endorsed by an inspecting authority Approved by the CM to show that the stud welding, flame cutting or shearing procedure has complied with the procedure trial requirements stated in STW.T020 (4) in previous tests; report of procedure trials as stated in STW.T060 (2) if procedure trials are required under STW.T010 (1).

2. The particulars shall be submitted to the CM at least 6 weeks before fabrication of the steelwork starts.

STW.M780.7 PREPARATION FOR GALVANIZING
Particulars of the method of plugging vent holes required for hot-dip galvanizing hollow or box sections shall be submitted to the CM at least 3 weeks before fabrication of the steelwork starts.

STW.M790.7 NON-DESTRUCTIVE TESTING
Particulars of the proposed method for carrying out non-destructive testing on welds shall be submitted to the CM at least 4 weeks before the tests start.

STW.M800.7 INSPECTING AUTHORITY
The name of the proposed inspecting authority endorsing welder certificates and records of approval tests for welding procedures shall be submitted to the CM. The name shall be submitted at least 3 weeks before approval tests start or, if approval tests are not required, at the same time as the welder certificates are submitted.

STW.M810.7 TESTING CONSULTANT
The name of the proposed testing consultant stated in STW.T210 shall be submitted to the CM at least 3 weeks before the testing consultant commences work.

STW.M820.7 PAINTS
The following particulars of the proposed paints and associated products shall be submitted to the CM at least 6 weeks before painting starts:

1. Name of manufacturer;
2. Duplicate copies of the manufacturer's data sheets including temperature, humidity and other conditions at the workshop or on the Site under which the paint is to be applied; and
3. Manufacturer's product specifications, product range and technical information.

SAMPLES

STW.M910.7 STEEL
A sample of blast cleaned steel plate shall be submitted to the CM for Approval at least 14 days before blast cleaning starts. The sample shall be 150 mm x 150 mm x 6 mm and shall be enclosed in a sealed, colourless, transparent wrapping. The grade of steel and the method of blasting shall be representative of those which will be used in the permanent work.

STW.M920.7 PAINTING SYSTEM
Two samples of painted tin plates for each painting system shall be submitted to the CM at least 14 days before painting starts. Each plate shall be 150 mm x 75 mm x 1 mm and shall have smooth edges and 10 mm corner radii. The plates shall be brush cleaned and painted on one face with the painting system in such a manner that each coat is stepped back from the underlying coat in equal strips. The degree of gloss of the finishing coat shall be as agreed by the CM.
STW.M930.7  FIXINGS

Samples of each type of nut, bolt, washer, stud and rivet shall be provided within 3 days after the material is delivered to the Site.
WORKMANSHIP

HANDLING, STORAGE AND TRANSPORT

STW.W010.7  HANDLING STEELWORK
1. Steelwork shall not be subject to rough handling, shock loading or dropping from a height;
2. During handling and transport of coated steelwork, the steelwork shall be separated from wires and lashings by rubber padding in such a manner that the coatings are not damaged or discoloured. Free ends shall be stiffened, measures shall be taken to prevent permanent distortion and machined surfaces and faying surfaces shall be protected;
3. Steelwork shall not be lifted from the painting bed until the last applied coating is sufficiently dry or cured for handling.

STW.W020.7  PACKING OF SMALL COMPONENTS
Rivets, bolts, nuts, washers, screws and small plates and articles shall be packed in containers marked to identify the contents.

STW.W030.7  STORAGE OF STEELWORK
1. Steelwork shall be stored off the ground on level supports in well drained areas in a manner which will not result in damage or deformation to the steelwork or coatings or in contamination of the steelwork or coatings. Packings shall be placed between steelwork which is stacked;
2. Covered places in which steelwork is stacked shall be ventilated;
3. Different types and sizes of steelwork shall be stored separately;
4. Steelwork shall not be stored on or adjacent to concrete surfaces which form part of the permanent work;
5. Steelwork shall be protected from exposure to conditions which may affect the steelwork or coatings;
6. Wet paint films, steelwork surfaces which are to be primed or overcoated and joint surfaces which are to be assembled shall be protected from exposure to conditions which may affect the film or surface. Undercoats which contain anatase titanium dioxide shall be protected from exposure to direct sunlight;
7. Except as stated in sub-clauses (8) and (9) steelwork shall be stored in an enclosed workshop and protected from conditions which may affect the steelwork after the steelwork has been cleaned as stated in STW.W510 until the following times:
   a. When the second undercoat to painted steelwork has hard dried;
   b. When the coating process to galvanized, electroplated or metal sprayed steelwork has been completed;
   c. When the sealer to metal sprayed and sealed steelwork has been completely absorbed;
   d. When the first undercoat to metal sprayed and painted steelwork has hard dried.
8. Primed steelwork surfaces may be exposed outside the enclosed workshop for a period not exceeding two weeks;
9. Micaceous iron oxide undercoats to steelwork may be exposed outside the enclosed workshop for a minimum period necessary to move the steelwork from one part of the workshop to the other; the undercoated surfaces shall be covered when the steelwork is being moved.

STW.W040.7 STORAGE OF PAINT

Paint and associated materials shall be stored in sealed containers marked as stated in STW.M510 and protected from exposure to conditions which may affect the materials. The materials shall be stored in accordance with the manufacturers' recommendations and shall not be used after the recommended expiry date has been exceeded. The materials shall be stored in a locked store.

FABRICATION GENERALLY

STW.W110.7 STANDARDS

1. Comply with BS 5950:Part 2:1992, Sections 3 and 4 for general steelwork except where stated in this Worksection;

STW.W120.7 ALLOWANCES FOR DEFORMATION

Allowances shall be made for the deformation due to permanent loads and the process and sequence of fabrication, erection and construction such that steelwork is completed to within the specified tolerances.

STW.W130.7 COMPATIBILITY OF DIMENSIONS

The compatibility of the dimensions and setting-out data of steelwork shall be verified by the Contractor before the materials for steelwork are ordered.

FABRICATION - WELDING, HEATING AND CUTTING

STW.W210.7 GENERAL

1. Welding, heating or thermal cutting processes which give off toxic or irritant gases shall not be used unless permitted by the CM; if permitted, precautions, including the provision of exhaust ventilation, breathing apparatus and display of warning signs, shall be taken to enable the work to be carried out in safe conditions. Welding, heating or thermal cutting shall not be carried out within 2 m of lead-based, cadmium or carbonaceous coatings;
2. Pre-setting, pre-bending, skip welding, back-step techniques and other measures shall be taken as necessary to counteract shrinkage or distortion due to welding, gouging, thermal cutting or heat treatment.

STW.W220.7 WELDERS

Welding shall be carried out by welders who possess a valid welding certificate for the appropriate category of welding. A welder shall cease to carry out welding if any of the circumstances stated in BS 4570:1985, Clause 21.1 or BS 4872:Part 1:1982, Clause 6 as appropriate occurs, or the requirements stated in BS EN 287:Part 1:1992, Clause 10.1 are not satisfied.

STW.W230.7 BUTT WELDS

1. Butt welds shall be complete penetration butt welds made between fusion faces;
2. Butt welds in each component part shall be completed before the final assembly of built-up assemblies.

**STW.W240.7 STAINLESS STEEL**

Welding of austenitic stainless steel shall be carried out in accordance with BS 4677:1984.

**STW.W250.7 TEMPORARY WELDS**

1. Temporary welded attachments shall not be used unless permitted by the CM;
2. Temporary welded attachments, when permitted by the CM to be used, shall be removed by cutting with a flame torch 3 mm above the surface of the steel member when not required any longer. The excess metal protruding above the parent plate surface shall be removed by grinding and finished flush.

**FABRICATION - BOLTED CONNECTIONS**

**STW.W310.7 LENGTH OF BOLTS**

1. The length of HSFG bolts shall comply with BS 4604:Part 1:1970 or BS 4604:Part 2:1970 as appropriate;
2. The length of bolts complying with BS 3692:1967, BS 4190:2001 and BS 4933:1973 shall be such that the end of the bolt will project above the nut by at least one thread, but by not more than one nominal bolt diameter, after tightening.

**STW.W320.7 LENGTH OF THREADS**

The length of threads on bolts shall be determined in accordance with BS 3692:1967, BS 4190:2001, BS 4395:Part 1:1969, BS 4395 Part 2:1969, BS 4395 Part 3:1973 or BS 4933:1973 as appropriate. If additional locknuts or other nuts are specified, the thread length shall be increased by one nominal bolt diameter for each additional nut.

**STW.W330.7 NUTS**

Nuts shall not be used with bolts or screws which comply with a different Standard.

**STW.W340.7 WASHERS**

Washers for HSFG bolts shall be provided in accordance with BS 4604:Part 1:1970 or BS 4604:Part 2:1970 as appropriate. Washers shall be provided for bolts complying with BS 3692:1967, BS 4190:2001 and BS 4933:1973 under the nut or bolt head, whichever is rotated during tightening, if the parts to be connected are to be coated with protective coatings before assembly. Washers shall be provided under the nuts and heads of bolts in oversize and slotted holes.

**STW.W350.7 TIGHTENING BOLTS**

Bolts shall be tightened in such a manner that the contact surfaces of permanent bolted joints are drawn into close contact.

**STW.W360.7 TIGHTENING HSFG BOLTS**

1. The degree of preliminary tightening of bolts and nuts complying with BS 4395:Part 1:1969 which are tightened by the part turn method shall be torque controlled. The tightening equipment for preliminary tightening shall be calibrated with a bolt load meter. The value of bedding torque for the preliminary tightening shall be within 10% of the values stated in the following table:
2. Bolts and nuts at each joint with bolts and washers with load indicating devices shall be initially tightened to bring the faying surfaces into close contact over the full area. The range of the average gap after initial tightening shall be as agreed by the CM. The bolts and nuts shall be re-tightened to close the average gap back to the agreed range. After all bolts and nuts at the joint have been initially tightened, the bolts and nuts shall be finally tightened to attain the shank tension stated in BS 4604:Part 1:1970 or BS 4604:Part 2:1970 as appropriate. The range of average gap corresponding to the required shank tension shall be established for each batch as defined in BS 4395:Part 1:1969, BS 4395:Part 2:1969 or BS 4395:Part 3:1973 as appropriate by testing at least three bolt, nut and washer assemblies in a bolt load meter and shall be as agreed by the CM. The average gap after final tightening shall be within the established range;

3. The threads of nuts for HSFG bolts which are to be tightened by the part turn method or the load indicating method shall not be lubricated unless Approved by the CM. If the use of lubricant is Approved in the part turn method, the bedding torque shall be established by a bolt load meter and shall be as agreed by the CM. The lubricant shall be applied at the place of manufacture and shall only be applied to the nut threads. The bearing surfaces of the nuts and the faying surfaces shall not be contaminated with the lubricant;

4. The bolt load meter for measuring bolt shank tension in the part turn, torque control or load indicating methods of tightening shall be calibrated by a laboratory approved by the CM before tightening of bolts and nuts starts and at regular intervals agreed by the CM. During re-calibration, a replacement calibrated bolt load meter shall be provided on the Site. Calibration results shall be submitted to the CM at least one week before the bolt load meter is used.

---

**FABRICATION - APPROVAL AND DEFECTS**

**STW.W410.7  DEFECTIVE STEELWORK**

Defective components for steelwork shall not be used in the permanent work unless repair of the defects is permitted by the CM. If permitted, defective components shall be repaired by methods agreed by the CM.

**STW.W420.7  APPROVAL**

Until the steelwork, including any repaired areas, complies with the specified test and inspection requirements and has been approved by the CM, fabricated steelwork shall not be:

1. Covered with protective coatings, concrete or other materials;
2. Erected; or
3. Despatched from the place of fabrication if fabricated off the Site.
PREPARATION OF STEELWORK TO RECEIVE COATINGS

STW.W510.7  CLEANING STEELWORK AND COATED SURFACES

1. Soil, concrete and other adherent matter shall be removed immediately from steelwork or coated surfaces and the surfaces shall be made good by methods agreed by the CM;

2. Dust, soot, grit, detritus, metallic or other loose particles shall be removed by vacuuming after steelwork surfaces have been blast cleaned or before coated surfaces are washed or steam cleaned;

3. Oil and grease shall be removed by emulsion cleaners, by steam cleaning or by high pressure water jets before removing rust and mill scale or overcoating. Oil and grease shall not be removed by turpentine or other solvents. If steam cleaning is used, steam cleaning shall be carried out after the greasy deposits have been removed by scraping and a detergent shall be added to the feed water of the steam generator;

4. Salts, chemicals, corrosion or paint degradation products, including rust-spotting on blast cleaned surfaces and zinc salts on zinc coatings or zinc-rich paints, shall be removed by washing with detergent solution before coating steelwork surfaces or overcoating;

5. The final shop coats on external surfaces shall be thoroughly washed with a detergent solution at the Site before being overcoated;

6. Unless otherwise permitted by the CM finished coated surfaces shall be cleaned as stated in sub-clauses (2), (3), and (4) not more than 14 days before handover of the steelwork;

7. Cleaning agents to be used shall be as agreed by the CM. Surfaces which have been cleaned using cleaning agents shall be rinsed with fresh water to remove all traces of the cleaning agent;

8. Cleaning tools shall be a type which will not result in damage to the surfaces being cleaned. Wire brushes and brooms shall not be used for cleaning coated surfaces.

STW.W520.7  PREPARATION OF STEEL SURFACES

1. Bare metal surfaces of steelwork which are to be painted or metal coated shall be treated before rust and mill scale are removed in accordance with the following requirements:
   a. Burrs, arrises and serrations shall be smoothed by grinding or filing;
   b. Weld spatter, weld slag and raised metal laminations shall be removed by grinding or chipping and the surface shall be made good.

2. Rust and mill scale shall be removed from steelwork which is to be metal coated in factories by a pickling process which is compatible with the metal coating process;

3. Rust and mill scale shall be removed from steelwork which is to be metal sprayed by blast cleaning carried out in accordance with BS 2569:Part 1:1964, Clause 3;

4. Rust and mill scale shall be removed from steelwork which is to be painted by blast cleaning as stated in STW.W540 unless the use of acid-pickling, mechanical cleaning or flame cleaning as stated in STW.W550 to STW.W570 has been approved by the CM;
5. Excess acid or other chemicals used in the pickling process shall be removed from steelwork which has been prepared by pickling before the application of the metal coating. Pickling shall not be carried out for longer than is necessary to remove the rust and mill scale.

**STW.W530.7 METAL COATINGS**

1. Metal coatings which will be overcoated with paint shall not be passivated;
2. Damaged areas of metal coatings shall be rubbed down to remove excessive roughness, cleaned and made good with a compatible coating of a type approved by the CM;
3. Metal coatings required on part of a component shall be completed before the rest of the component is painted.

**STW.W540.7 BLAST CLEANING**

1. Carry out blast cleaning of steelwork to second quality of surface finish in accordance with Sa 2½ in Swedish Standard SIS 05 59 00:1988 using chilled iron abrasive;
2. Grade chilled iron grit in accordance with BS 2451:1963. The maximum size of grit shall be G17 for use in automatic impeller type equipment and shall be G12 for manual or compressed air equipment. The difference in level between a peak and the adjacent trough of the blasted surface profile shall not exceed 0.1 mm;
3. Do not use non-metallic abrasives with a maximum particle size not exceeding 1 mm other than with portable equipment;
4. Abrasives shall not contain materials which may contaminate the steel surfaces. Do not use sand containing salt or excessive amounts of silts. Remove contaminants from recovered abrasives before re-use;
5. Carry out blast cleaning in a fully enclosed space separated from the place of painting. The enclosed space shall be fitted with dust extractors and filters to prevent the dispersal of dust outside the enclosed space.

**STW.W550.7 ACID PICKLING**

Acid-pickling of steelwork shall be carried out by the Footner process in accordance with BS 5493:1977, Clause 14.3.2. The first priming coat of paint shall be applied as soon as the steel has dried and is still warm.

**STW.W560.7 MECHANICAL CLEANING**

Mechanical cleaning of steelwork shall be carried out using carborundum grinding discs or other power-driven tools followed by steel wire brushing and dusting to remove all loosened material which is not firmly bonded to the metal surface. Excessive burnishing of the metal through prolonged application of rotary wire brushes shall not be carried out. Visible peaks and ridges shall be removed. Pneumatic chipping hammers shall not be used.

**STW.W570.7 FLAME CLEANING**

1. Flame cleaning shall be carried out without distorting the steelwork and without adversely affecting the properties of the steel. The temperature of the steel surface being flame cleaned shall not exceed 200°C;
2. Loose materials shall be removed from the flame-cleaned surface by wire brushing followed by blowing dry air or vacuuming. The priming coat shall be applied when the surface temperature of the steel is between 35°C and 40°C. Surfaces with temperatures of less than 35°C shall be reheated;
3. Flame cleaning of steelwork shall not be carried out at the following locations:
a. Within 2 m of HSFG bolts, cold worked high tensile steel and surfaces already coated with paint or cadmium, lead-based or carbonaceous materials;
b. On sections thinner than 0.5 mm.

STW.W580.7  BOLTS, NUTS AND WASHERS
Bolts, nuts and washers for steelwork shall be kept free from dirt and deleterious material. Oil and grease on bolts, nuts and washers other than Approved lubricants for nuts of HSFG bolts, shall be removed before assembling and coating the exposed parts of assembled bolts, nuts and washers.

STW.W590.7  APPROVAL
Surfaces shall not be coated until the cleaning and preparation of the surfaces have been approved by the CM.

PAINTING SYSTEMS

STW.W610.7  SYSTEM A
Here shown or scheduled on the Drawings, apply the following paint system:
1. Primer: 1 coat of high build zinc phosphate paint;
2. Undercoat: 2 coats of oil based with micaceous iron oxide phenolic paint;
3. Finish: 1 coat of alkyd resin paint;

STW.W620.7  SYSTEM B
Where shown or scheduled on the Drawings, apply the following paint system:
1. Primer: 1 coat of epoxy resin with aluminium mastic paint;
2. Undercoat: 1 coat of epoxy resin paint;
3. Finish: 1 coat of epoxy resin paint;

STW.W630.7  SYSTEM C
Where shown or scheduled on the Drawings, apply the following paint system:
1. Primer: 1 coat of inorganic zinc silicate paint DFT 75 microns;
2. Undercoat: 2 coats of high build micaceous iron oxide epoxy paint;
3. Finish: 1 coat of high build amine adduct cure epoxy paint;

STW.W640.7  SYSTEM D
Where shown or scheduled on the Drawings, apply the following paint system:
1. Primer: 1 coat of two pack wash primer DFT 5 microns;
2. Undercoat: 1 coat of epoxy resin paint;
3. Finish: 1 coat of epoxy resin paint or 2 coats of polyurethane paint;
STW.W650.7 SYSTEM E
Where shown or scheduled on the Drawings, apply the following paint system:
1. Inhibitor: rustoleum or other rust inhibitor paint Approved by the CM;
2. Primer: zinc phosphate, for hot-dip galvanized or GI surface, 'T' wash as specified in BS 5493:1977, Section 2, Clause 11.3.2;
3. Undercoat: 2 coats of micaceous iron oxide paint;
4. Finish: 1 coat of oil based paint or 1 coat of micaceous iron oxide paint;
5. DFT of each coat: as recommended by the manufacturer.

APPLYING PAINT TO STEELWORK

STW.W710.7 GENERAL
1. The different types of paints within each painting system shall be compatible with each other and shall be manufactured by the same manufacturer. Successive coats in a painting system including stripe coats, shall be in contrasting colours to aid identification;
2. Surfaces which are to be painted shall be dry immediately before paint is applied;
3. Paint shall be taken from the paint store ready for application. Thinning, if necessary, shall be carried out in the paint store in the presence of the CM and using the type of thinner in the ratio stated in the manufacturer's data sheets;
4. Paint shall be applied by brush, by air pressure spray or by airless spray. Sealer and primers shall be applied by continuous spraying;
5. Each coat in the paintwork system shall be sufficiently dry or cured before the next coat is applied. The time between the application of successive coats shall be within the limits recommended by the manufacturer and the limits stated in STW.W730;
6. Paints having a pot life specified by the manufacturer, including two pack paints and moisture cured paints, shall be discarded on expiry of the pot life or at the end of each working day, whichever comes first. Other paints in opened containers shall be kept in sealed containers with not more than 10% ullage in store after each day's work and shall not be thinned or mixed with fresh paint when re-issued for another day's work.

STW.W720.7 AMBIENT CONDITIONS
1. Paint shall not be applied to steelwork under the following conditions:
   a. When the ambient temperature falls below 4°C or the relative humidity rises above 90%;
   b. For outdoor work, during periods of inclement weather including fog, frost, mist and rain or when condensation has occurred or is likely to occur on the metal;
   c. When the surface temperature of the metal to be painted is less than 3°C above the dew point of the ambient air;
   d. When the amount of dust in the air or on the surface to be painted is in the opinion of the CM excessive;
2. Two pack paints of the epoxide resin type shall not be applied and cured when the temperature is below that recommended by the paint manufacturer.
STW.W730.7  **TIME LIMITS ON PAINTING**

1. Blast cleaned steel shall be primed or metal coated within 4 hours after blast cleaning;
2. Primed steel surfaces shall be overcoated within 8 weeks after priming;
3. Second undercoats shall be applied within 72 hours after application of the first undercoat;
4. Sealer or etch primer to sprayed metal shall be applied within 4 hours after spraying. The etch primed surfaces shall be overcoated within 72 hours after priming;
5. Etch primer to galvanized steelwork shall be applied within 14 days after delivery of the steelwork to the Site. The etch primed surfaces shall be overcoated within 48 hours after priming;
6. Overcoats to two pack paints of the epoxide of polyurethane type shall be applied within 48 hours after application of the two pack paint. If it is not possible to overcoat within 48 hours, the two pack paint shall be abraded to produce a roughened surface and shall be given a flash coat of primer of a type approved by the CM. The primer shall be allowed to dry for at least 4 hours before application of the next coat of the system.

STW.W740.7  **STRIPE COATS**

Immediately after the first undercoat of the painting system to steelwork has dried, a stripe coat of undercoat paint shall be applied by brush to edges, corners, crevices, exposed parts of bolts, nuts, rivets and welds. Another stripe coat of finishing paint shall be applied in the same manner after the last undercoat has dried.

STW.W750.7  **FINISH THICKNESS**

1. The dry film thickness of the paint coats to steelwork shall be measured using a magnetic dry film thickness gauge or other apparatus Approved by the CM. The total dry film thickness shall be measured at spacings of approximately 1.0 m. If the measured dry film thickness is less than 75% of the specified nominal dry film thicknesses or if more than 10% of the measured dry film thickness are less than 95% of the specified nominal dry film thickness, repair work shall be carried out as stated in STW.W780;
2. Wet film thickness gauges shall not be used as a means of determining whether the dry film thickness of the painting system complies with this Specification.

STW.W760.7  **FINISH QUALITY**

1. Each coat of paint shall be free from embedded foreign matter, mechanical damage and surface defects, including bittiness, blistering, brush marks, bubbling, cissing, cracking, cratering, dry spray, floating, pinholing, rivelling, runs, sagging, spotting and spray mottle as stated in BS 2015:1992. The finished paintwork system shall have an even and uniform appearance;
2. Each coat of paint shall adhere firmly to the substrate without blistering, chipping, flaking or peeling.

STW.W770.7  **ETCH AND BLAST PRIMERS**

Etch primers and blast primers shall not be applied on phosphated steel and shall not be overcoated with zinc-rich primers.

STW.W780.7  **REPAIRS TO DAMAGED PAINT**

1. Areas of paint to steelwork which have been damaged shall be cleaned to bare metal or to the metal coating; the edges of the undamaged paint shall be bevelled;
2. The full specified painting system shall be restored in such a manner that each new paint coat overlaps the existing paint by at least 50 mm all round the affected part.

PROTECTION OF JOINTS AND SURFACES

STW.W810.7 SHOP BOLTED JOINTS
Blast primer for painted steelwork or sprayed metal plus sealer for metal sprayed steelwork shall be applied to the joint and parent material of shop-bolted joints other than HSFG bolted joints. Joints for painted steelwork shall be assembled after the first undercoat of the painting system has been applied to the contact surfaces and while the undercoat is still wet.

STW.W820.7 SITE BOLTED JOINTS
Surfaces of the parent and joint material of site-bolted joints other than HSFG bolted joints shall be coated with the same protective system as the parent material.

STW.W830.7 HSFG BOLTED JOINTS
1. The faying surfaces of HSFG bolted joints in steelwork which is metal sprayed overall and sealed or metal sprayed and painted overall shall be coated with the sprayed metal. The sealer on the parent material shall extend for a distance of between 10 mm and 20 mm inside the perimeter of the faying surfaces. Free surfaces and edges of the joint material shall be coated with the same sealer;

2. The joint material and the faying surfaces on the parent material of steelwork which is metal sprayed only at joints and painted overall shall be metal sprayed. The sprayed metal on the parent material shall extend for a distance of between 10 mm and 20 mm outside the perimeter of the faying surfaces. The primer on the parent material shall extend for a distance of between 10 mm and 20 mm inside the perimeter of the faying surfaces. Sprayed metal on the free surfaces and edges of the joint material shall be coated with a sealer which is compatible with the painting system;

3. The primer on the parent material of steelwork which is painted overall and undercoat at faying surfaces of HSFG bolted joints shall extend for a distance of between 10 mm and 20 mm inside the perimeter of the faying surfaces.

STW.W840.7 WELDED JOINTS
Welds and steelwork surfaces which have been affected by welding shall be coated with the same protective system as the parent material.

STW.W850.7 JOINTS MADE AFTER COMPLETION OF COATING
1. Hot-dip galvanizing and electroplating to steelwork shall not be carried out until all welds for the steelwork which is to be galvanized or electroplated have been completed;

2. Except as stated in sub-clause (4), sprayed metal on the parent material shall be kept at least 15 mm, but not more than 300 mm, clear of areas which are to be welded. The restricted area shall be masked during metal spraying;

3. Except as stated in sub-clause (4), successive coats of paint on the parent material shall be stepped back at 30 mm intervals commencing at 100 mm from welded joints and at 10 mm from the perimeter of HSFG bolted joints;

4. If the parent metal in the Approved welding procedure is coated with the pre-fabrication primer or sprayed metal such coatings are permitted to cover the area to be welded. After welding the pre-fabrication primer or sprayed metal adjacent to the weld shall be made good;
5. The parent material, joint material, exposed part of bolts, nuts and washers, 
welds and weld affected areas shall be cleaned, prepared and brought up to the 
same protective system as the adjoining surfaces not more than 14 days after the 
joints have been made.

STW.W855.7 REINSTATEMENT OF ZINC COATING WITH POST-GALVANIZING 
WELDING
1. Where post-galvanizing welding is necessary and permitted by the CM, the zinc 
coating shall be ground off the mating surfaces directly before welding. 
Immediately after welding, the surface of the weld area shall be prepared by 
removal of slag with the chipping hammer followed by vigorous wire brushing. 
The zinc coating shall then be reinstated within 4 hours of welding by either:

a. Application of the two coats of an organic zinc rich paint (zinc content at 
least 95%) to an overall dry film thickness greater than 100 μm in 
accordance with BS EN ISO 12944 (1998); or

b. Pre-heating the surface of the weld area to 315°C and application of 
proprietary metallic repair stick or powder to a thickness greater than 
100 μm.

2. If reinstatement of the zinc coating takes place after 4 hours of welding, the weld 
areas shall be vacuum-grit blasted in accordance with BS EN ISO 8501 "first 
quality" and hot-zinc spray coated in accordance with BS EN ISO 2063 (2005) 
to a minimum coating thickness of 100 μm;

3. After reinstatement of the zinc coating, the specified paint system shall be 
applied to the repaired area in accordance with STW.W610 to STW.W780 in 
such a manner that each new paint coat overlaps the existing paint by at least 
50 mm all round the affected part.

STW.W860.7 SEALING JOINTS
1. The different parts of joints in steelwork shall be dry immediately before the 
joints are assembled;

2. Gaps around the perimeter of bolted joints and load indicator gaps of HSFG 
bolts in steelwork painted overall shall be sealed by brush application of the 
same painting system as the parent material; gaps shall be plugged if necessary 
with soft solder wire without flux core as a backing before sealing with paint.

STW.W870.7 HOLLOW SECTIONS
The ends of hollow steel section shall be sealed by welding mild steel plates over the 
open ends; the plates shall be at least 5 mm thick. Immediately before hollow steel 
sections are sealed, bags of anhydrous silica gel shall be inserted in each void at the 
rate of 0.25 kg/m³ of void.

STW.W880.7 BRIDGE BEARING SURFACES
Dirt, oil, grease, rust and mill scale shall be removed from the metal bearing surfaces 
for bridge bearings. The surfaces shall be masked with tape or other methods agreed 
by the CM and shall not be primed or painted until the bonding agent has been 
applied.

STW.W890.7 UNCOATED SURFACES
The coated surfaces of steelwork coated over part of the surface shall be protected 
from rust which may form on the uncoated surfaces. Temporary coatings which may 
affect the bond between concrete and uncoated surfaces against which the concrete is 
to be placed shall be removed and the uncoated surfaces shall be cleaned before the 
concrete is placed. The full coating system shall extend 25 mm, or 75 mm for steel 
piles, into areas against which concrete is to be placed.
ERECTION OF STEELWORK

STW.W910.7 FOUNDATION BOLTS
1. Foundation bolts for steelwork shall be held firmly in the set position during fixing. Measures shall be taken to ensure that the full movement tolerances are achieved and the bolts are not displaced during concreting. Bolts and nuts, including the threads, shall be protected against damage, corrosion and contamination;

2. Bolt pockets shall be kept dry and clean. Tubes which are cast in concrete for grouting bolt pockets shall be securely fixed and sealed to prevent ingress of grout during concreting;

3. Bolts in bolt pockets shall be installed in such a manner that the bolt can be moved inside the pocket as designed without hindrance.

STW.W920.7 SUPPORTING DEVICES
The material, size, position and cover of packs, shims and other supporting devices for steelwork which are to be embedded shall be as approved by the CM.

STW.W930.7 TEMPORARY SUPPORTS AND FASTENINGS
1. Steelwork shall be secured in position by temporary supports and fastenings until sufficient permanent connections are complete to withstand the loadings liable to be encountered during erection. The temporary supports and fastenings shall be capable of withstanding loadings which may be encountered during erection and shall not damage the steelwork or the protective coatings;

STW.W940.7 ALIGNMENT
1. Steelwork shall be erected in such a manner that the alignment and levels of the steelwork comply with the tolerances stated in TOL.STW.040. Allowance shall be made for the effects of temperature on the steelwork;

2. Measures shall be taken to ensure that the steelwork will remain stable before temporary supports and fastenings are slackened or removed for lining, levelling, plumbing or other purposes. The temporary supports and fastenings shall be re-tightened or replaced as soon as the adjustments are complete and at the end of each continuous period of working;

3. Permanent connections shall be made as soon as a sufficient portion of the steelwork has been lined, levelled and plumbed. Temporary supports and fastenings shall be replaced by permanent connections progressively and in such a manner that the part connected are securely restrained in the aligned position at all times;

4. Permanent connections for each portion of steelwork shall be completed not more than 14 days after the portion has been erected.

STW.W950.7 COLUMN BASES
1. Column bases for each portion of steelwork shall not be bedded or grouted until the portion has been lined, levelled, plumbed and permanently connected. Spaces below the steel shall be dry, clean and free from rust immediately before beding or grouting;

2. Proprietary types of grout shall be used in accordance with the manufacturer's recommendations;
3. Temporary timber wedges holding steel columns in position shall not project into pockets bases by more than one-third of the embedded length of the steel column. The pocket shall be initially concreted up to the underside of the wedges and the steel column shall be left undisturbed until 48 hours after concreting; the wedges shall then be removed and the remainder of the pocket shall be concreted.

TOLERANCES

STW.W1010.7 GENERAL

Refer to Appendix H 'Schedule of Tolerances' to this Specification.
TESTING

PROCEDURE TRIALS FOR WELDING, FLAME CUTTING AND SHEARING

STW.T010.7 GENERAL

1. If in the opinion of the CM the proposed welding procedure submitted as stated in STW.M760 or the proposed stud welding, flame cutting or shearing procedure for steelwork complying with BS 5400:Part 6:1980 submitted as stated in STW.M770 has not complied with the procedure trial requirements for the procedure stated in the Contract in previous tests, a procedure trial shall be carried out as stated in STW.T020;

2. Procedure trials for welding, flame cutting and shearing shall be carried out in the presence of an inspecting authority approved by the CM.

STW.T020.7 PROCEDURE TRIALS

1. Procedure trials for welding for structural steel shall comply with BS 5400:Part 6:1980, Clauses 4.7.3, 5.4.1.1 and 5.4.1.2;

2. Procedure trials for welding for steel castings shall comply with BS 5400:Part 6:1980, Clauses 4.7.3 and 5.4.2;

3. Procedure trials for welding of studs shall comply with BS 5400:Part 6:1980, Clauses 4.7.4 and 5.4.4;

4. Procedure trials for flame cutting and shearing shall comply with BS 5400:Part 6:1980, Clauses 4.7.3 and 5.4.3;

5. Welds for grade A steels complying with BS 4360:1986 are not required to comply with the requirements for Charpy V-notch impact tests. The temperature of -20°C stated in BS 5400:Part 6:1980, Clause 5.4.1.2(a)(3) shall be amended to 0°C;

6. If in a welding procedure one or more of the parts to be welded is coated with a prefabrication primer or metal coating before welding, the same primer or coating shall be applied to the same before the procedure trial for the welding procedure is carried out;

7. The thickness of the sample of material to be used in procedure trials for flame cutting shall be:
   a. 20 mm for material not exceeding 20 mm thick;
   b. 40 mm for material exceeding 20 mm and not exceeding 40 mm thick;
   c. T mm for material exceeding (T-10) mm and not exceeding T mm thick, where T is any multiple of 10 from 50 up.

STW.T030.7 TRIAL RESULTS

If a procedure trial for welding, flame cutting or shearing does not comply with the specified requirements for the procedure trial, the cause of failure shall be established by the Contractor and particulars of proposed changes shall be submitted to the CM. Further procedure trials shall be carried out to establish the amended procedure unless otherwise permitted by the CM.
STW.T040.7  APPROVED PROCEDURES

1. A welding flame cutting or shearing procedure which complies with the specified requirements for the procedure trial shall become an Approved procedure;

2. If a procedure trial is not required, the procedure for welding, flame cutting or shearing submitted as stated in STW.M760 and STW.M770 shall become an Approved procedure;

3. Welding, flame cutting or shearing shall not commence until the procedure has been approved by the CM.

STW.T050.7  CHANGES TO APPROVED PROCEDURES

Unless permitted by the CM, Approved procedures for welding, flame cutting or shearing shall not be changed. Further procedure trials shall be carried out to demonstrate proposed changes to the procedure unless otherwise permitted by the CM.

STW.T060.7  RECORDS

1. A record of the Approval test for welding procedures shall be submitted to the CM for approval at least 3 weeks before fabrication of the steelwork starts. The record shall be in the form stated in BS 4870:Part 1:1981, Appendix B or BS 4570:1985, Appendix A as appropriate and shall be endorsed by the inspecting authority approved by the CM;

2. Reports of procedure trials for stud welding, flame cutting and shearing shall be submitted to the CM at least 3 weeks before fabrication of the steelwork starts.

PAINTING TRIALS

STW.T110.7  GENERAL

1. A painting trial shall be carried out for each painting system which will be applied to areas exceeding 100 m² to demonstrate that the proposed materials and methods of application will produce a painted surface which complies with the specified requirements;

2. Painting trials shall be carried out at the place where painting to the permanent work will be carried out and using the employees and equipment which will be used to carry out painting to the permanent work;

3. Painting trials shall be carried out on blast cleaned steel.

STW.T120.7  TRIAL RESULTS

If the painted surface produced in a painting trial does not comply with the specified requirements for the paintwork, the cause of failure shall be established by the Contractor and particulars of proposed changes shall be submitted to the CM. Proposed changes to the paint formulation, other than an adjustment in the amount of thinners, shall be carried out at the paint manufacturer’s work before the final painting trial and before the first batch of paint is delivered.

STW.T130.7  COMMENCEMENT OF PAINTING

Painting shall not commence until the painted surface produced in painting trial complies with the specified requirement for paintwork.

STW.T140.7  CHANGES TO MATERIALS AND METHODS OF APPLICATION

Unless permitted by the CM, the materials and methods of application used in a painting trial which complies with the specified requirements shall not be changed.
TESTING GENERALLY

STW.T210.7 TESTING CONSULTANT
Tests which are stated in this Specification to be carried out by an Approved testing consultant shall be carried out by a testing consultant employed by the Contractor and approved by the CM.

OFF-SITE TESTING

STW.T310.7 GENERAL
The test shall be carried out by the manufacturer at the manufacturer's works on samples selected by the manufacturer.

STW.T320.7 STRUCTURAL STEEL
Tests shall be carried out on structural steel in accordance with BS 5400:Part, 6:1980, Clauses 5.2.1, 5.2.2 and 5.3.

STW.T330.7 BOLTS, NUTS AND WASHERS

TESTING STEELWORK GENERALLY

STW.T410.7 STEELWORK BATCHES
1. A batch of steelwork is the amount of steelwork stated in the Contract and which is completed or delivered to the Site at any one time;
2. Submit to the CM a list of the parts included in each batch at least 7 days before testing starts.

STW.T420.7 SAMPLING
1. Samples to be tested shall be selected by the CM if testing is to be carried out in Hong Kong and shall be selected by the Approved testing consultant if testing is not to be carried out in Hong Kong;
2. Samples shall be selected from positions which in the opinion of the CM or Approved testing consultant are representative of the batch as a whole;
3. The CM shall inform the Contractor of the samples selected for testing at least 3 days before testing starts.

STW.T430.7 TEST PROCEDURES
1. The relevant tests stated in STW.T520 to STW.T910 shall be carried out on each batch of steelwork;
2. Inform the CM at least 7 days before tests in Hong Kong are carried out.
STW.T440.7 TEST REPORTS

1. Records of tests on steelwork carried out by the Contractor or the Approved testing consultant shall be kept by the Contractor and a report shall be submitted to the CM at least 7 days before Approval of the batch of steelwork tested is required. The report shall contain the following details:
   a. Procedure tested and exact test location in the steelwork;
   b. Results of tests compared to the required values, with any non-complying results highlighted;
   c. Any tearing, cracking or other defects;
   d. Conclusion as to the overall acceptability of the parts of steelwork examined by the Approved testing consultant.

2. Report shall be certified by the Contractor's authorised representative or by the Approved testing consultant who carried out the test.

STW.T450.7 NON-COMPLIANCE OF STEELWORK

1. If the result of any test on steelwork stated in STW.T520 to STW.T910 does not comply with the specified requirements for the test, the test shall be carried out on additional samples from the batch. The number of additional tests shall be twice the number of original tests;

2. The batch shall be considered as not complying with the specified requirements for the test if the result of any additional test does not comply with the specified requirements for the test;

3. If the result of every additional test complies with the specified requirements for the test, only those parts the samples from which have failed in the original test shall be considered as not complying with the specified requirements of the test.

TESTING STEEL

STW.T510.7 SAMPLING

Provide samples of steel from each batch of steel within 3 days after delivery of the batch to the fabricator's work or to the Site. The rate of sampling and the position and direction of the samples shall be in accordance with BS 4360:1986.

STW.T520.7 TENSILE AND IMPACT TESTING

The tensile test and the impact test shall be carried out by the Approved testing consultant on each sample of steel. The method of testing shall be in accordance with BS 4360:1986.

STW.T530.7 QUALITY GRADING

Quality grading of structural steel shall be carried out by the Approved testing consultant on steel which has not been tested for quality grades by the manufacturer. Quality grading shall be carried out in accordance with BS 5400:Part 6:1980, Clause 3.1.4 or BS 5950:Part 2:1992, Clause 2.1.6 as appropriate.
TESTING WELDS

STW.T610.7 GENERAL
1. Examination and testing of welds shall be carried out after post-weld heat treatment and before the application of corrosion protective coatings. Deburring, dressing, grinding, machining and peening shall be carried out after the visual inspection for cracks, surface pores and joints fit-up and before other inspections and tests are carried out;

2. Testing shall be carried out by the Approved testing consultant except as stated in STW.T640.

STW.T620.7 DESTRUCTIVE TESTING
Destructive testing of welds for steelwork complying with BS 5400:Part 6:1980 shall be carried out in accordance with BS 5400:Part 6:1980, Clauses 5.5.1.1., 5.5.1.2 and 5.5.1.3.

STW.T630.7 NON-DESTRUCTIVE TESTING
Inspect welds for structural steel and steel castings visually in accordance with BS 5289:1976. Carry out non-destructive testing on a proportion of welds after visual inspection. The compliance criteria and the proportion of welds to be tested are denoted by quality categories as stated in BS 5135:1984, Table 18 for butt welds and in BS 5135:1984, Table 19 for fillet welds. The quality categories of welds shall be as stated in the following table:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Butt welds</td>
<td>Fillet welds</td>
</tr>
<tr>
<td>Welds stated in the Contract for 100% non-destructive testing</td>
<td>A</td>
<td>A</td>
</tr>
<tr>
<td>Welds stated in Table 18.2</td>
<td>D</td>
<td>D</td>
</tr>
<tr>
<td>Other welds</td>
<td>B</td>
<td>B</td>
</tr>
</tbody>
</table>

1. Carry out non-destructive testing of butt welds by ultrasonic examination in accordance with BS 3923:Part 1:1986 or BS 3923:Part 2:1972 or by radiographic examination in accordance with BS 2600:Part 1:1983, BS 2600:Part 2:1973 or BS 2910:1986. Carry out non-destructive testing of fillet welds by either the liquid penetrant method in accordance with BS 6443:1984 or the magnetic particle flaw detection method in accordance BS 6072:1981. The particular standard or part of standard to be used shall be appropriate for the joint geometry, material and production requirements and shall be as agreed by the CM. Dress welds to facilitate ultrasonic examinations;

2. If the parent metal adjacent to the length of weld subject to non-destructive testing has been tested for laminations in accordance with BS 5996:1980, the same areas on the parent metal shall be tested by ultrasonic examination in accordance with BS 3923:Part 1:1986 or BS 3923:Part 2:1972 as appropriate when non-destructive testing is carried out on that length of weld;
3. Inspect welds for steelwork which has been fabricated and tested by non-destructive testing at the fabricator's works visually for cracks when the steelwork is delivered to the Site. Examine 5% of the welds, other than welds stated in the Table in STW.M760, for cracks by the magnetic particle flaw detection method in accordance with BS 6072:1981.

**STW.T640.7 INSPECTION OF WELDS**

Inspection of welds will be carried out by the CM for welds stated in the table in STW.M760.

**TESTING STUD SHEAR CONNECTORS AND RIVETS**

**STW.T710.7 GENERAL**

Testing shall be carried out by the Contractor in the presence of the CM.

**STW.T720.7 WELDED STUD SHEAR CONNECTORS**

Tests shall be carried out on 5% of welded stud shear connectors in accordance with BS 5400:Part 6:1980, Clause 5.5.4.

**STW.T730.7 RIVETS**

Tests shall be carried out on 5% of driven rivets in accordance with BS 5400:Part 6:1980, Clause 5.8.

**TESTING FABRICATION TOLERANCES**

**STW.T810.7 GENERAL**

Testing shall be carried out by the Contractor in the presence of the CM.

**STW.T820.7 PROCEDURE**

Rolled and built-up sections of steelwork complying with BS 5400:Part 6:1980 shall be tested to determine compliance with fabrication tolerances in accordance with BS 5400:Part 6:1980, Clauses 5.6.1 to 5.6.6.

**TESTING REPAIRS**

**STW.T910.7 GENERAL**

Defects which have been repaired and adjoining areas which in the opinion of the CM may have been affected by the repair shall be retested as instructed by the CM.

WRS WATER RETAINING STRUCTURES

MATERIALS

GENERAL

WRS.M010.7 APPLICATION OF OTHER WORK SECTIONS
The following works and materials shall comply with the Worksections stated, unless otherwise stated in this Worksection:
1. Earthworks shall comply with Worksection EAR;
2. Formwork and finishes to concrete shall comply with Worksection FOR;
3. Steel reinforcement shall comply with Worksection CON3;
4. Concrete shall comply with Worksection CON1;
5. Joints in concrete shall comply with Worksection CON1;
6. Drainage systems shall comply with Worksection DRA2.

WRS.M020.7 DEFINITION OF WATER RETAINING STRUCTURE
Water retaining structure is a structure, or part of a structure, including walls, floors, roofs, columns and footings, which is stated in the Contract to be constructed for storing, conveying or excluding water, sewage or other aqueous liquids.

SLIDING LAYER

WRS.M110.7 GENERAL
Sliding layers below floor slabs of water retaining structures shall be a proprietary type of polythene sheeting approved by the CM. Polythene sheeting shall be impermeable and shall have a nominal thickness of 1.1 mm.

WRS.M120.7 SUBMISSIONS
Particulars of the source and type of proposed sliding layers for water retaining structures shall be submitted to the CM for approval at least 14 days before the first delivery of the sliding layer to the Site.

WRS.M130.7 SAMPLES
Samples of the proposed sliding layers for water retaining structures shall be submitted to the CM at the same time as the particulars of the sliding layer are submitted.
MATERIALS PROVIDED BY THE WATER SUPPLIES DEPARTMENT

WRS.M210.7 WATER AND STERILIZING CHEMICALS

Water and sterilizing chemicals for cleaning, sterilizing and testing water retaining structures as stated in WRS.W320 and WRS.T240 will be provided by the Water Supplies Department for one set of tests only for those parts of the Works as stated in the Project Specific Specification. The water and sterilizing chemicals, if to be so provided, shall be obtained from the locations stated in the Contract or from other locations agreed by the CM and shall be mixed by the Contractor.
WORKMANSHIP

GENERAL

WRS.W010.7 SUBMISSIONS
The following particulars shall be submitted to the CM at least 28 days before the relevant work starts:
1. Sequence and method of concreting bays in floor slabs, walls and roof slabs and in columns and footings;
2. Details of alternative locations of construction joints if required;
3. Details of type and size of waterstops at construction joints and box-outs;
4. Sequence and method of testing roofs for watertightness;
5. Details of method of testing water retaining structures for watertightness including:
   a. Arrangement of pumps and equipment;
   b. Source of water;
   c. Equipment for measuring fall in water level;
   d. Device for dampening the oscillatory motion of the water surface;
   e. Filling rate;
   f. Method of correction for evaporation and rainfall.

WRS.W020.7 STORING SLIDING LAYERS
Sliding layers for water retaining structures shall be stored in accordance with the manufacturer’s recommendations in a dry weatherproof store.

WRS.W030.7 PROTECTION OF DRAINAGE SYSTEM
Measures shall be taken to prevent concrete and deleterious material from being deposited in drainage systems under floors and on roofs of water retaining structures. After construction and before testing, the drainage system shall be thoroughly cleaned by rodding and flushing to remove any deleterious material which may impede the flow of water into or through the drainage system. The lines and levels of drainage systems shall be within 20 mm of the specified horizontal alignment and within 10 mm of the specified vertical alignment.

CONSTRUCTION

WRS.W110.7 LAYING SLIDING LAYERS
Polyethylene sheeting in sliding layers below floor slabs of water retaining structures shall be laid flat without creases. Laps shall be at least 225 mm and there shall be no gaps at the edges of the bays.

WRS.W120.7 FLOOR SLABS
If reinforcement is continuous across the joint between bays in the floor slab of water retaining structures, the bays shall be concreted contiguously, in sequence, with a minimum period of 48 hours between completion of concreting one bay and commencement of concreting the adjacent bay.
WRS.W130.7 WALLS

1. If reinforcement is continuous across the joint between bays in the wall of water retaining structures, the bays shall be concreted contiguously, in sequence, with a minimum period of 72 hours between the completion of concreting the lift in one bay and commencement of concreting the adjacent lift in the adjacent bay;

2. Unless otherwise permitted by the CM, the first lift in each bay in the walls of water retaining structures shall be concreted within seven days after completion of concreting the adjacent base of the wall. Individual lifts shall be concreted in one continuous operation without cold joints, whether or not the full height of the wall is concreted in one lift. If the full height of the wall is not placed in one lift, succeeding lifts shall be concreted within seven days from concreting of the adjacent lift unless otherwise permitted by the CM.

WRS.W140.7 ROOF SlABS

If reinforcement is continuous across the joint between bays in the roof slab of water retaining structures, the bays shall be concreted contiguously, in sequence, with a minimum period of 48 hours between completion of concreting one bay and commencement of concreting the adjacent bay.

WRS.W150.7 BUILT-IN PIPES

Puddle flanges on built-in pipes in water retaining structures shall be located centrally within the formwork. Waterstops shall be fixed around the perimeter of box-outs to the built-in pipes.

WRS.W160.7 PROTECTION PRIOR TO THE DEPOSITION OF FILL

1. Immediately after the roof slab of water retaining structures has been tested, the slab shall be protected with damp sacks or by other methods agreed by the CM from exposure to conditions which may affect the slab. The protection shall be continued until the roof drainage system has been constructed or the fill material has been deposited and compacted;

2. Materials shall not be stockpiled on roof slabs of water retaining structures. Constructional Plant or other vehicles shall not stand or run on floor slabs or roof slabs of water retaining structures unless permitted by the CM.

DEPOSITION OF FILL MATERIAL

WRS.W210.7 GENERAL

Fill material shall be spread out evenly and shall not be stockpiled on roofs to water retaining structures. Weed killer or other chemicals shall not be applied to fill material on the roofs of water retaining structures for potable or fresh water.

WRS.W220.7 TIMING

1. Fill material shall not be deposited behind sections of walls of water retaining structures until at least seven days after completion of concreting to the section of wall;

2. Deposition of fill material on or adjacent to water retaining structures shall be carried out after the watertightness test on the structure has been completed, unless otherwise permitted by the CM.
CLEANING AND STERILIZATION

WRS.W310.7  CLEANING
Immediately before water retaining structures are tested for watertightness, all dust, debris, unused materials and equipment shall be removed from the structure and the interior of the structure shall be washed and brushed down with water.

WRS.W320.7  STERILIZATION
Water for washing water retaining structures for potable or fresh water shall be fresh, potable water incorporating a mixture of sterilizing chemicals added before the structure is washed at a concentration instructed by the CM. The structure shall be maintained in a clean condition after cleaning.
TESTING

DRAINAGE SYSTEMS

WRS.T010.7 TEST METHODS
Drainage systems under floors and on roofs of water retaining structures shall be tested in accordance with the following requirements:
1. Water shall be poured at different locations agreed by the CM along the drainage system and the flow of water observed at junction pits, outfalls and other discharge points;
2. A mandrel shall be pulled through each completed section of pipeline of 300 mm diameter or less. The mandrel shall be 750 mm long and 12 mm less in diameter than the nominal diameter of the pipe.

WRS.T020.7 COMPLIANCE CRITERIA
The results of tests on drainage systems for water retaining structures shall comply with the following requirements:
1. The water shall in the opinion of the CM be freely discharged by the drainage system;
2. The bore, linearity and jointing of pipes shall comply with the specified requirements.

WRS.T030.7 NON-COMPLIANCE
If the result of any test on the drainage system for water retaining structures does not comply with the specified requirements for the test, the Contractor shall investigate the reason. Remedial or replacement work approved by the CM shall be carried out and the drainage system shall be retested.

WATERTIGHTNESS OF ROOFS

WRS.T110.7 TEST METHODS
1. The roofs of water retaining structures shall be tested for watertightness over the complete area of the roof, including perimeter joints. Roofs shall not be tested in sections unless permitted by the CM;
2. Water shall be ponded on the roof for a period of three days and topped up to maintain a depth of at least 75 mm. The test shall be carried out before fill material is deposited or drainage systems are constructed on the roof.

WRS.T120.7 COMPLIANCE CRITERIA
There shall be no leaks or damp patches visible on the soffits of roofs of water retaining structures during or at the end of the test for watertightness.

WRS.T130.7 NON-COMPLIANCE
If the result of any test for watertightness of the roof of a water retaining structure does not comply with the specified requirements for the test, the Contractor shall investigate the reason. Remedial or replacement work approved by the CM shall be carried out and the roof shall be retested.
WATERTIGHTNESS OF STRUCTURES

WRS.T210.7 GENERAL
Each compartment of structures which incorporate division walls shall be tested separately with adjoining compartments empty. The complete structure shall also be tested.

WRS.T220.7 LOAN OF EQUIPMENT
The equipment for recording water levels in tests on water retaining structures as stated in WRS.T230 will be loaned by the Water Supplies Department only for those parts of the Works as stated in the Project Specific Specification.

WRS.T230.7 TEST METHOD
1. The structure shall be filled with water at an approximately uniform rate not exceeding 2 m depth in 24 hours to the levels stated in the following table:

<table>
<thead>
<tr>
<th>Type of structure</th>
<th>Part of structure tested</th>
<th>Test water level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Water retaining structures other than for sewage</td>
<td>Structure with division wall - each compartment of structure</td>
<td>100 mm below top of division wall</td>
</tr>
<tr>
<td></td>
<td>Structure with division wall - complete structure</td>
<td>Top water level of structure</td>
</tr>
<tr>
<td></td>
<td>Structure without division wall</td>
<td></td>
</tr>
<tr>

<td>Structure with division wall - each compartment of structure</td>
<td>Top water level of structure</td>
</tr>
<tr>
<td></td>
<td>Structure with division wall - complete structure</td>
<td>Top water level of structure</td>
</tr>
<tr>
<td></td>
<td>Structure without division wall</td>
<td></td>
</tr>
</tbody>
</table>

2. The water used for testing water retaining structures for potable or fresh water shall be fresh potable water. The permission of the CM shall be obtained before filling starts. The structure or each compartment of the structure being tested shall be kept full for 7 days before testing to allow for absorption;

3. After the period for absorption, the water shall be topped up to the specified level and the test shall begin. During testing, the oscillatory motion of the water surface shall be dampened. The test period shall be 7 days;

4. The equipment for recording water levels shall be installed in a temporary enclosure of minimum dimensions 2 m x 2 m x 2.5 m high with a lockable door. The enclosure shall be located over stilling wells, manhole openings or other points of recording water levels. The temporary enclosure shall be removed on completion of the test. The equipment shall be calibrated before testing starts and at regular intervals agreed by the CM and shall be readable and accurate to 0.5 mm;

5. The fall in water level of water retaining structures shall be measured at hourly intervals between 8 am and 5 pm each day. The total fall shall be measured at the end of the test period.
WATER RETAINING STRUCTURES

WRS.T240.7 DRAINING AFTER TEST
1. Except as stated in sub-clause (2), structures shall be emptied after completion of testing and maintained in a clean dry condition. The water shall be removed at an approximately uniform rate not exceeding 2 m depth in 24 hours. The permission of the CM shall be obtained before emptying starts;
2. Unless otherwise instructed by the CM, the water used for the final tests on water retaining structures for potable or fresh water shall be retained in the structure and shall not be wasted or contaminated.

WRS.T250.7 COMPLIANCE CRITERIA
The results of tests for watertightness of water retaining structures shall comply with the following requirements:
1. The total fall in water level at the end of the test period, after adjustment for evaporation and rainfall, shall not exceed 1/500 times the maximum specified depth of water in the test or 10 mm, whichever is less;
2. There shall be no leaks or damp patches visible on the surface of the structure, including any division walls, during or at the end of the test.

WRS.T260.7 NON-COMPLIANCE
If the result of any test for watertightness of a water retaining structure does not comply with the specified requirements for the test, the Contractor shall investigate the reason. Remedial or replacement work approved by the CM shall be carried out and the structure shall be retested.

WATER STERILITY

WRS.T310.7 SAMPLING
After the test for watertightness of a water retaining structure for potable or fresh water has been completed, samples of the water in the structure shall be taken by the CM. The number of samples and location of sampling shall be as instructed by the CM.

WRS.T320.7 TEST
Each sample of water shall be tested to determine the bacteriological content.

WRS.T330.7 COMPLIANCE CRITERIA
The results of tests for bacteriological content of the water shall demonstrate that in the opinion of the CM the structure has been adequately sterilized.

WATER SUPPLY PIPEWORK

MATERIALS

GENERAL

WSP.M010.7 APPLICATION OF OTHER WORKSECTIONS
The works and materials specified in this Worksection shall comply with the following Worksections, unless otherwise stated:

1. Drainage works shall comply with Worksection DRA2;
2. Earthworks shall comply with Worksection EAR1;
3. Formwork and finishes to concrete shall comply with Worksection FOR;
4. Concrete shall comply with Worksection CON1.

WSP.M020.7 DEFINITIONS
1. Fitting: a component fitted to a pipe for jointing or connecting or for changing the direction or bore of a pipe;
2. Flexible joint: a connection between pipes and fittings which provides angular deflection or axial movement or a combination of both in service without impairing the efficiency of the connection;
3. Mechanical joint: a flexible joint in which an elastomeric joint ring is located in the socket and the joint sealed by applying pressure to the joint ring by means of a gland bolted to the socket;
4. Nominal size: a numerical designation of size which is common to all components in a pipework system. The nominal size is stated as a convenient round number in millimetres and is related to, but not normally the same as, the actual internal diameter of the pipework; dn designates the nominal size of tees and tapers which are less than DN;
5. Push-in joint: a flexible joint in which an elastomeric ring is located in the socket and the joint is effected by entering the spigot through the joint ring in the socket;
6. Special fitting: a fitting which is made from a manipulated or fabricated pipe;
7. Thin walled pipe: a pipe, including pipes of DN 1200 or greater, which has a ratio of nominal size to wall thickness, excluding linings and coatings, exceeding 125.

WSP.M030.7 MATERIALS GENERALLY
Materials for water supply pipeworks for potable water shall be non-toxic, shall not promote microbial growth and shall not impart a taste, odour, cloudiness or discoulouration to the water after disinfection and washing out of the pipelines as WSP.W1110 and WSP.W1120.

PIPES AND FITTINGS

WSP.M110.7 STEEL PIPES AND FITTINGS
1. Steel pipes and fittings shall comply with the following:
a. Steel pipes, joints and specials for water and sewage: BS 534:1990;
b. Dimensions and masses per unit length of welded and seamless steel pipes and tubes for pressure purposes: BS 3600:1976;

2. Steel pipes and fittings shall be manufactured by the electric-resistance welded and induction-welded process or by the submerged-arc welded process. The tensile strength of the steel used shall be at least 410 N/mm²;

3. Steel pipes, fittings and specials (including all flanges and blank flanges) shall be coated or lined internally and externally as stated in the following table:

<table>
<thead>
<tr>
<th>Protection</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>External</td>
<td>A Fusion Bonded Epoxy system, complying with latest revision of ANSI/AWWA C213, manufactured under a quality system certified to ISO 9001, and factory applied by an applicator approved by the manufacturer, to a minimum dry film thickness of 400 microns. OR A chemically-cured Liquid Epoxy system, complying with the latest revision of ANSI/AWWA C210 manufactured under a quality system certified to ISO 9001, and factory applied by an applicator approved by the manufacturer, to a minimum dry film thickness of 400 microns. AND For pipes to be installed outdoor under direct sunlight, a topcoat of aliphatic polyurethane at 50 microns shall be applied for extra protection.</td>
</tr>
<tr>
<td>Internal</td>
<td>A Fusion Bonded Epoxy system, complying with latest revision of ANSI/AWWA C213, manufactured under a quality system certified to ISO 9001, and factory applied by an applicator approved by the manufacturer, to a minimum dry film thickness of 400 microns. OR A chemically-cured Liquid Epoxy system, complying with the latest revision of ANSI/AWWA C210 manufactured under a quality system certified to ISO 9001, and factory applied by an applicator approved by the manufacturer, to a minimum dry film thickness of 750 microns.</td>
</tr>
</tbody>
</table>

Other requirements of using epoxy system shall be in accordance with Appendix WSP/I.

WSP.M120.7  DUCTILE IRON (DI) PIPES AND FITTINGS

1. DI pipes and fittings shall comply with BS 4772:1988. Pipes and fittings other than collars, caps and blank flanges shall be lined internally with cement mortar in accordance with BS 4772:1988, Clause 3.2. Linings shall be made with sulphate-resisting Portland cement complying with BS 4027:1980;
2. Pipes shall be externally coated with metallic zinc in accordance with BS 4772:1988, Clause 3.1. Fittings shall be externally coated with zinc rich paint in accordance with BS 4772:1988, Clause 3.1.5(b). After zinc coating pipes and fittings shall be externally coated with a finishing coat of one of the following materials as stated in BS 4772:1988, Clause 3.3:
   a. Bitumen based hot applied coating material complying with Clause WSP.M240 and BS 4147:1980: Type I, Grade C; or
   b. Bitumen based cold applied coating material complying with Clause WSP.M240 and BS 3416:1991: Type II.

WSP.M130.7 UPVC PIPES AND FITTINGS
UPVC pipes and fittings shall be class D and shall comply with the following:
1. UPVC pipe for cold water services: BS 3505:1986;
2. Joints and fittings for use with UPVC pressure pipes:
   a. Injection moulded UPVC fittings for solvent welding for use with pressure pipes, including potable water supply: BS 4346:Part 1:1969;

WSP.M140.7 GREY IRON PIPES AND FITTINGS
GI pipes and fittings shall comply with the following:
1. Steel tubes and tubulars suitable for screwing to BS 21:1985 pipe threads: BS 1387:1985, medium grade;
2. Pipe threads for tubes and fittings where pressure tight joints are made on the threads: BS 21:1985;

WSP.M150.7 FLANGES
1. Steel flanges shall comply with BS 4504:Section 3.1:1989, and shall be either steel plate for welding type or steel plate blank flange type. The dimensions and drilling of flanges shall comply with BS 4504:Section 3.1:1989, Table 11, as appropriate regardless of the nominal pressure rating;
2. Steel ring flanges shall be machined in the bore to a diameter of 4 mm ±1 mm larger than the outside diameter of the pipe to which the flange is to be welded;
3. Steel puddle flanges shall be separated into 180° segments;
4. DI flanges shall be cast-on or welded on standard flanges complying with BS 4772:1988.

ANCILLARY MATERIALS

WSP.M210.7 BOLTS AND NUTS
1. Bolts and nuts for flanged joints shall comply with BS 4504:1989: Section 3.1, Section 6;
2. Bolts and nuts shall be compatible with the type of joint and, unless otherwise approved by the CM, shall be obtained from the same manufacturer as the joint;
3. Bolts shall be sufficiently long and shall be suitably threaded for jointing the relevant flanges.
**WSP.M220.7 ELASTOMERIC JOINT RINGS**

Elastomeric joint rings shall comply with BS EN 681-1:1996, Type WA. Elastomeric joint rings for DI pipes and fittings shall comply with BS 4772:1988, Clause 2.3.4. The dimensions of rings for use with flanged joints shall comply with BS 4865:Part 1:1989. The rings shall be compatible with the type of joint and, unless otherwise approved by the CM, shall be obtained from the same manufacturer as the joint.

**WSP.M230.7 ANTICORROSION TAPE**

1. Anticorrosion tape shall be a proprietary type approved by the CM. The tape shall either be a petrolatum tape with fabric reinforcement or a bituminous tape with PVC backing. Petrolatum tape shall be used for valves, flanged joints, slip-on type couplings and flange adapters of all sizes. Bituminous tape shall be used in buried or non-exposed condition for welded joints of steel pipe, repair of steel pipe sheathing and other applications as specified on the Drawings;

2. Anticorrosion tapes shall have a high resistance to cathodic disbondment, acids and alkalis. Colour of bituminous tape shall be black. Anticorrosion tapes shall have the minimum properties stated in the following table:

<table>
<thead>
<tr>
<th>Properties</th>
<th>Petrolatum Tape</th>
<th>Bituminous Tape</th>
</tr>
</thead>
<tbody>
<tr>
<td>Thickness of PVC backing (mm)</td>

</tbody>
</table>

3. Primer and mastic filler for use with anticorrosion tape shall be compatible with the tape and shall be a type recommended by the manufacturer of the tape and approved by the CM. Notwithstanding clause WSP.M410 (6), primer and mastic filler for use with anticorrosion tape shall be supplied by the Contractor;

4. Bituminous tapes shall be stored in a cool dry place away from the sun’s rays. No dirt or grits shall be allowed to stick on the edge of the tape before applying the tape for pipe protection.

**WSP.M240.7 BITUMINOUS COATINGS**

1. Bituminous coatings shall comply with the following:
   a. Bitumen based hot applied coating material for protecting iron and steel including suitable primers where required: BS 4147:1980, Type I, Grade C;
   b. Black bitumen coating solutions for cold application: BS 3416:1991, Type II.
2. Bituminous coatings used for repairing joints and coatings shall be compatible with the adjacent coating;
3. Bituminous coatings shall be made from petroleum or asphaltic bitumen.

WSP.M250.7  **WHITEWASH**
Whitewash shall comply with AWWA C 203:1986.

WSP.M260.7  **ZINC-BASED PAINT**
1. Zinc-based paint shall be a proprietary type approved by the CM;
2. Primers for zinc-based paint shall comply with BS 4652:1971;
3. Rust inhibitor shall be a chemical agent which is capable of converting rust into iron phosphate.

WSP.M270.7  **JOINT FILLER**
Joint filler for joints in concrete bed, haunch and surround shall be a proprietary type approved by the CM and shall be a firm, compressible, single thickness, non-rotting filler. The thickness of the filler shall be as stated in the following table:

<table>
<thead>
<tr>
<th>Joint filler for concrete bed, haunch and surround</th>
<th>Thickness of joint filler (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nominal diameter of pipe</td>
<td></td>
</tr>
<tr>
<td>Less than 450 mm</td>
<td>18</td>
</tr>
<tr>
<td>450 mm – 1200 mm</td>
<td>36</td>
</tr>
<tr>
<td>Exceeding 1200 mm</td>
<td>54</td>
</tr>
</tbody>
</table>

WSP.M280.7  **COMPRESSIBLE PADDING**
Compressible padding between pipes and supports shall be bitumen damp-proof sheeting complying with BS 743:1970.

WSP.M290.7  **POLYETHYLENE SHEETING**
Polyethylene sheeting shall be impermeable and shall have a nominal thickness of 0.125 mm.

WSP.M300.7  **EXTENSION KEYS**

**MATERIALS PROVIDED BY THE AUTHORITY OR WATER SUPPLIES DEPARTMENT**

WSP.M410.7  **PIPES, FITTINGS AND VALVES ETC**
The following materials for water supply pipeworks will be provided by the Water Supplies Department or the Authority only for those parts of the Works stated in the Contract and shall be used in the permanent works:
1. Full, half and quarter length pipes with plain, flanged and spigot and socket ends;
2. Ring flanges, puddle flanges, slip-on type couplings, flange adaptors, collars, expansion joints, detachable joints, elastomeric joint rings, nuts and bolts;
3. Blank flanges and caps other than those required for pressure tests;
4. Bends, tees and tapers;
5. Steel pipes for the fabrication of gusseted steel bends and tees;
6. Primer, bitumen based composition and woven glass cloth for repairs to joints in steel pipes with bitumen coating provided by the Water Supplies Department or the Authority other than materials for protection of steel flanged joints, slip-on type couplings and flange adaptors;
7. Gate valves, air relief valves, butterfly valves and non-return valves, including all winding gear, operating motors and control equipment.

**WSP.M420.7 WATER AND CHEMICALS**

Water and sterilizing chemicals for cleaning, sterilizing and testing pipelines as stated in WSP.W1110, WSP.W1120 and WSP.T220 to WSP.T250 will be provided by the Water Supplies Department for one set of tests only for those parts of the Works stated in the Contract. The water and sterilizing chemicals shall be obtained from the locations agreed by the CM and shall be mixed by the Contractor.

**WSP.M430.7 PROCUREMENT**

The materials shall be obtained from the locations and at the times stated in the Project Specific Specification.

**INSPECTION AND SUBMISSIONS**

**WSP.M510.7 INSPECTION OF MANUFACTURE AND TESTING**

1. The manufacture and testing of pipes, joints, fittings and valves for water supply pipeworks other than materials provided by the Water Supplies Department or the Authority shall be inspected by an independent inspection authority approved by the CM;
2. The inspections shall be carried out at the manufacturer's works or at other locations stated in the Project Specific Specification or Instructed by the CM;
3. Particulars of the proposed independent inspection authority for pipes, joints, fittings and valves for water supply pipeworks, including name and address, previous experience, and names of inspectors, shall be submitted to the CM at least 28 days before manufacture of the materials starts.

**WSP.M520.7 PIPES JOINTS AND FITTINGS**

1. The following particulars of the proposed pipes, joints and fittings for water supply pipeworks shall be submitted to the CM;
   a. Manufacturer's literature, including details of:
      i. Manufacturing process;
      ii. Pressure and temperature ratings;
      iii. Permissible values of straight draws and angular deflection of flexible joints;
      iv. Recommendations for handling, storage, laying, jointing and repair;
      v. Drilling and tapping equipment for connections to pipes.
   b. A certificate for each material showing the manufacturer's name, the date and place of manufacture and showing that the material complies with the requirements stated in the Contract and including results of tests required in accordance with the relevant British Standard;
   c. Three copies of drawings showing details of the pipes, joints and fittings, including the materials used and the mass of each item;
d. A certificate of inspection of the manufacture and testing signed by the Approved independent inspection authority.

2. The particulars, including certificates other than certificates of inspection, shall be submitted to the CM at least 14 days before the first delivery of the material to the Site.
WORKMANSHIP

GENERAL

WSP.W010.7 ACCESS TO PIPELINES
1. Rubber wheeled trolleys shall be provided to obtain access inside pipelines exceeding DN 500 for water supply pipeworks in order to joint pipes, repair joints, coatings and linings and inspect the pipeline. Persons entering pipelines shall wear clean soft-soled footwear;

2. Mechanical fans shall be provided to ensure that an adequate air supply is available to those entering pipelines for inspection. Engine driven fans shall be fitted with a flexible exhaust or other methods of keeping exhaust fumes clear of the fresh air intake.

WSP.W020.7 SETTING OUT OF PIPELINES
1. The alignments of pipelines shown on the Drawings are indicative only and shall be set out in lengths in accordance with the following sub-clauses for determination of the exact alignment on Site by the CM;

2. At least three weeks before commencing trench excavation of a section of pipeline, set out on Site such section of pipeline and proceed to conduct underground utilities survey in accordance with PRE.C9.1630 to PRE.C9.1650. Upon completion of the said survey and at least two weeks before commencing trench excavation, prepare and submit proposal of inspection pits excavation in relation to such pipeline to the CM for agreement. Complete excavation of the inspection pits as agreed by the CM and allow at least one week for CM's inspection before commencing trench excavation;

3. The CM may order excavation of inspection pits after the initial setting out of the alignment of pipeline or after completion of the excavation of inspection pits proposed by the Contractor at locations that may deviate from the proposed indicative alignment for determination of the final alignment. If found necessary, adjust the indicative alignment of the pipeline to suit the topography and obstructions encountered;

4. The method of setting out shall be a centre line peg with suitable offset at every change of horizontal alignment and a sight rail mounted on two posts at 30 m maximum or at every change in vertical alignment or such other appropriate methods as proposed by the Contractor and agreed by the CM;

5. Following the setting out and adjustments, if any, the existing ground levels shall be recorded and agreed with CM;

6. Submit as-built drawings within 14 days after the trench excavated for a section of the pipeline is backfilled.

WSP.W030.7 CONNECTION TO EXISTING WATER MAINS
1. Where connections to existing water mains are specified in the Contract, whether to be done by others or by the Contractor, the Contractor shall excavate inspection pits to determine the locations and levels of the existing water mains as directed by the CM. The CM may adjust the lines and levels of the proposed water mains to suit the lines and levels of the existing water mains;

2. Where connections to the existing water mains are specified in the Contract to be done by others, the Contractor shall lay the proposed water mains up to approximately 2 m from the existing water mains or as directed by the CM on Site.
TRANSPORT HANDLING AND STORAGE

WSP.W110.7 PIPES, JOINTS AND FITTINGS GENERALLY
1. Pipes, joints and fittings for water supply pipeworks shall be transported, handled and stored in accordance with the manufacturer's recommendations and in a manner which will not result in damage or deformation to the pipes, joints and fittings or in contamination of the pipes, joints and fittings;

2. Pipes, joints and fittings shall be protected from damage and damaged pipes, joints and fittings shall not be used in the permanent work unless approved by the CM. Pipes, joints and fittings shall be securely packed and supported to prevent movement when being transported;

3. UPVC pipes, joints and fittings shall be protected from exposure to conditions which may affect the material;

4. Bolts and nuts shall be packed in sealed metal containers;

5. Elastomeric joint rings shall be packed in bags and lubricant for joints shall be stored in sealed containers marked to identify the contents. The rings and lubricants shall be protected from exposure to conditions which may affect the material;

6. Boxed or crated materials or those in sealed containers shall remain in their original boxes, crates or containers.

WSP.W120.7 HANDLING PIPES AND FITTINGS
1. Pipes and fittings other than thin walled pipes shall be handled by manual methods or by using lifting appliances or chains, wire rope or canvas slings of a type recommended by the pipe manufacturer and agreed by the CM. Hooks shall not be used;

2. Slings shall be placed around the pipes and fittings and padding shall be provided at points of contact between pipes and fittings and metal lifting appliances or slings. Pipes and fittings shall not be handled by means of metal slings passed through the pipes;

3. Pipes and fittings shall not be subjected to rough handling, shock loading or dropping and shall not be rolled down ramps unless permitted by the CM; if permitted, the ramps shall be padded.

WSP.W130.7 STORING PIPES
1. Pipes other than thin walled pipes shall be stored horizontally at least 75 mm above the ground on wedged timber bearers. The bottom layers and the outer pipes in each layer shall be securely wedged to prevent sideways movement;

2. Socket and spigot pipes shall be stored with the sockets alternating and in such a manner that loads are not applied to the sockets;

3. The height of stacks of pipes other than thin walled pipes shall not exceed 2 metres unless recommended by the manufacturer and permitted by the CM;

4. Pipes shall not be strung out along the route of the pipeline unless permitted by the CM.

WSP.W140.7 TRANSPORTING THIN WALLED PIPES
When being transported, thin walled pipes shall be supported on three rubber covered saddles shaped such that the pipes are supported over at least one-quarter of the circumference. The pipes shall be securely fixed in position at each saddle by straps tightened by turnbuckles. One saddle shall be placed at the mid-point length of the pipe and the other two saddles shall be placed at distances of one-fifth of the length of the pipe from each end of the pipe.
**WSP.W150.7**  
**HANDLING AND STORING THIN WALLED PIPES**

1. When being handled and stored, thin walled pipes shall be protected from deformation by means of at least two screw jack cruciform struts with rubber padded ends shaped to fit the circumference of the pipes. The struts shall be fitted inside the pipes; any temporary struts fixed by the manufacturer shall be left in position until the cruciform struts have been fixed;

2. Thin walled pipes shall be handled by using two reinforced canvas slings at least 300 mm wide. The slings shall be suspended from a lifting beam and shall be placed at a distance of one-fifth of the length of the pipe from each end of the pipe;

3. Thin walled pipes shall not be rolled;

4. Thin walled pipes shall be stored on timber bearers padded with hessian or straw to provide continuous support over at least one-third of the circumference of the pipe. The pipes shall be securely fixed in position with wedges placed at a distance of one-fifth of the length of the pipe from each end of the pipe;

5. Thin walled pipes shall not be stacked on top of each other.

**WSP.W160.7**  
**STORING VALVES**

Valves, including power operated valves and associated electrical and control equipment, shall be stored in accordance with the manufacturer's recommendations in a weatherproof store.

**LAYING AND BEDDING PIPES**

**WSP.W210.7**  
**LAYING PIPES GENERALLY**

1. The CM shall be allowed to inspect trenches, bedding, pipes, joints, fittings and valves before pipelaying for water supply pipeworks starts. The Contractor shall inform the CM 24 hours, or such shorter period agreed by the CM, before pipelaying starts in any part of the permanent work;

2. The permission of the CM shall be obtained before pipelaying starts in any of the permanent work;

3. The Contractor shall inspect pipes, joints, fittings and valves, including internal and external coatings, immediately before and after pipelaying; valves shall be inspected to ensure that they are in working order and are capable of being fully opened and closed. Deleterious material shall be removed and damage shall be repaired immediately before and after pipelaying; potable water shall be used for washing;

4. The inside of pipelines shall be kept clean and free from water, dirt, stones, debris and deleterious material. Except when pipes are being jointed, the open ends of pipelines shall be sealed with a wooden plug or stopper or by other methods agreed by the CM;

5. Measures shall be taken to prevent flotation of pipes;

6. Pipelaying shall follow closely on excavation of the trench. Lengths of trench which in the opinion of the CM are excessive shall not be left open;

7. Unless otherwise permitted by the CM, pipelines with a gradient steeper than 1 in 20 shall be laid in an uphill direction with sockets facing uphill;

8. Pipes shall be laid in such a manner that water will not pond in locations with zero and shallow gradients and such that the line and level of pipes will comply with the specified tolerances.
WSP.W220.7  LAYING STEEL PIPES

Steel pipes with welded joints for water supply pipeworks shall be spot welded to the adjacent pipe to which they will be jointed immediately after laying. Steel pipes manufactured with longitudinal or spiral welds shall be aligned in such a manner that the welds are staggered from pipe to pipe by at least 15° of arc.

WSP.W230.7  LAYING FLEXIBLY JOINTED PIPES

The degree of the curve of pipes for water supply pipeworks with flexible joints which are to be laid to a curve shall be equally distributed over all joints within the curved section. The deflection at a completed joint shall not exceed 3° or three-quarters of the maximum deflection recommended by the manufacturer whichever is less.

WSP.W240.7  INSTALLING VALVES

1. Operating gear and associated fittings shall be installed and fixed at the same time as valves for water supply pipeworks are installed. After installation, valves shall be cleaned inside and outside and left in a closed position;
2. Extension keys and clamps shall be fixed to valves in valve chambers if the vertical distance between the top of the valve spindle and the finished ground level exceeds 600 mm. The length of extension keys shall be such that the top of the extension key is not more than 300 mm below the finished ground level.

WSP.W250.7  BEDDING PIPES

1. Surfaces on which pipes for water supply pipeworks will be laid shall be cleaned and objects which may damage the pipes shall be removed before pipes are laid;
2. The bottom of trenches on which pipes will be laid directly shall be shaped to support the pipes uniformly along the length of the barrel. Holes shall be dug to prevent pipes resting on the sockets and to allow the pipes to be jointed.

CUTTING AND DRILLING PIPES

WSP.W310.7  CUTTING

1. Pipes for water supply pipeworks shall be cut and the ends shall be prepared in accordance with the manufacturer's recommendations. Purpose made equipment recommended by the manufacturer and agreed by the CM shall be used for cutting the pipes;
2. Cut ends of pipes shall be square and even, without damage to the pipe or coating. Cut ends, including cut ends of the piece not immediately required, shall be trimmed and chamfered to suit the type of joint and in such a manner that elastomeric joint rings will not be damaged by the cut end;
3. Pipes requiring to be cut to form closing lengths shall not be cut until adjacent pipes have been laid and jointed and the length to be cut can be accurately measured;
4. The permission of the CM shall be obtained before pipes provided by the Water Supplies Department or the Authority are cut. Only those pipes which in the opinion of the CM are suitable for cutting on Site shall be cut. All off-cuts shall be used for the permanent work unless in the opinion of the CM this is not practicable.

WSP.W320.7  DRILLING

1. Pipes for water supply pipeworks shall be drilled for small diameter connections using purpose made drilling and tapping equipment;
2. The threads of screw joints shall be painted before assembly with two coats of bituminous paint and shall be wrapped with three turns of spun yarn or other material approved by the CM.

JOINTING PIPES

WSP.W410.7 GENERAL
1. Pipes for water supply pipeworks shall be jointed in accordance with the manufacturer's recommendations and using jointing equipment and jointing materials recommended by the manufacturer and agreed by the CM;

2. The Contractor shall inspect pipes, joints, fittings and valves, including internal and external coatings, immediately before and after jointing. Deleterious material shall be removed and damage shall be repaired immediately before and after jointing. Potable water shall be used for washing. Surfaces which are to be jointed and jointing materials shall be cleaned immediately before jointing;

3. All joints in pipelines shall be watertight;

4. The widths of gaps at joints shall be in accordance with manufacturer's recommendations and shall be achieved by marking the outside of the pipe, by using metal feelers or by other methods agreed by the CM. The position of elastomeric joint rings shall be checked by using metal feelers after jointing;

5. Gaps at joints in pipes shall be protected after jointing by methods agreed by the CM to prevent dirt, stones or other material entering the joint;

6. Bolt holes in flanged joints and joints incorporating bolted components shall be correctly orientated before the bolts are tightened. The correct size of bolts and nuts shall be used. Bolt threads shall be lubricated and bolts shall be tightened using the correct size of spanner. Bolts shall be tightened in diametrically opposite pairs working around the bolt circle until all bolts are tightened to the torque recommended by the manufacturer;

7. Bolt holes in flanged joints shall be orientated symmetrically about the vertical diameter with no bolt holes on the vertical diameter. Elastomeric joint rings shall be the correct size and shall not protrude into the bore of the pipe. The rings may be temporarily fixed to the face of the flange using a minimum amount of adhesive of a type recommended by the manufacturer. Jointing compound or paste shall not be used.

WSP.W420.7 PIPES WITH PUSH-IN JOINTS
Pipes with push-in joints for water supply pipeworks shall be jointed by smearing the spigot end of the pipe with lubricant and placing the elastomeric ring joint in position inside the groove of the socket end of the laid pipe. The spigot end of the pipe shall be placed in the socket end of the laid pipe and pushed home.

WSP.W430.7 DI PIPES WITH MECHANICAL JOINTS
1. The elastomeric joint ring and the ends of the pipe shall be smeared with lubricant over a distance recommended by the manufacturer;

2. The gland and the elastomeric joint ring shall be placed in position on the spigot end of the pipe;

3. The spigot end of the pipe shall be placed in the socket end of the laid pipe before the bolts are tightened.

WSP.W440.7 WELDING JOINTS IN STEEL PIPES
1. Welding of joints in steel pipes for water supply pipeworks shall be carried out by the metal-arc process in accordance with BS 2633:1987 and BS 4515:1984;
2. Butt welding shall not be used for jointing plain ended pipes other than for gusseted bends unless approved by the CM. If Approved, the ends of the pipes shall be prepared in accordance with BS 534:1990 and BS 2633:1987 and welding shall be carried out in accordance with BS 4515:1984;

3. Records of welding operations shall be kept by the Contractor on the Site and shall be available for inspection by the CM at all times. Records should contain the following details:
   a. Date;
   b. Names of welders;
   c. Location of welding operation;
   d. Electrodes used in making each weld.

**WSP.W450.7 SUBMISSIONS FOR WELDING**

The following particulars shall be submitted to the CM at least 14 days before welding starts:

1. Details of welders, including names, copies of Hong Kong Identity Cards and details of previous experience;
2. Details of format of records;
3. Details of welding procedures, including welding plant, method of welding, materials, manufacturer and size of electrodes, number of runs and current strength;
4. Procedures for nitrogen gas tests on joints;
5. Valid certificate of competency in accordance with BS 2633:1987, Clause 11 for each welder, issued by an Authority approved by the CM.

**WSP.W460.7 STEEL PIPES WITH SPIGOT AND SOCKET JOINTS**

1. Pipes not exceeding DN 700 shall be welded externally. Pipes exceeding DN 700 shall be welded internally and shall then be welded externally with a sealing weld;
2. Loose scale, slag, rust, paint and other deleterious material shall be removed from parts of pipes to be welded by wire brushing or by other methods agreed by the CM. The parts shall be kept clean and dry before welding;
3. A double-run convex fillet weld shall be used for pipes not exceeding DN 900 and a triple-run convex fillet weld shall be used for pipes exceeding DN 900. The leg length of the fillet as deposited shall be at least the same as the full thickness of the pipe wall. The actual throat depth shall not be less than seven-tenths, and shall not exceed nine-tenths, of the minimum leg length as deposited;
4. Deposition of the weld metal shall be carried out in such a manner that all welds have adequate root fusion and are of good, clean metal, free from cracks, gas holes, slag intrusion and other impurities. The surface of the weld shall have an even contour with a regular finish and shall indicate proper fusion with the parent metal. Slag shall be removed from each weld by light hammering with a chipping hammer and by wire brushing;
5. Welds which contain cracks or other cavities or defects or in which the weld metal overlaps on to the parent metal without proper fusion shall be cut out and the joints shall be rewelded.
WSP.W470.7 STEEL PIPES WITH WELDED STEEL COLLAR JOINTS
Steel pipes with welded steel collar joints for water supply pipeworks shall be jointed by leaving a gap not exceeding 75 mm between the ends of the pipes to be jointed. A split steel collar shall be placed centrally around the ends of the pipes; the collar shall be at least the same thickness as the pipe wall and shall be approximately 300 mm long. The end of each pipe shall be fillet welded to the collar as stated in WSP.W460.

WSP.W480.7 STEEL PIPES WITH COUPLINGS AND FLANGE ADAPTERS
Steel pipes with slip-on type couplings and flange adapters for water supply pipeworks shall be jointed as follows:
1. Protective wrappings shall be removed from the ends of plain ended pipes to be jointed and shall be replaced by:
   a. Bitumen coating as WSP.M240 and BS 534:1990:Clause 25.1; or
   b. Epoxy or plastics based coating of a proprietary type approved by the CM.
2. The pipe shall be finished to an even, smooth surface free from distortion to allow the components of the coupling or flange adapter to be correctly positioned and jointed;
3. The coupling or flange adapter shall be placed in position on the plain end before the bolts are tightened.

WSP.W490.7 UPVC PIPES WITH SOLVENT WELDED JOINTS UPVC
Pipes with solvent welded joints for water supply pipeworks shall be jointed by applying solvent cement to the pipes to be jointed and pushing the pipes home. Excess solvent shall not be applied and surplus solvent shall be removed after jointing. Solvent welded pipes jointed outside the trench shall not be placed in the trench until the solvent setting period recommended by the manufacturer has elapsed.

WSP.W500.7 GREY IRON PIPE JOINTS
GI pipes for water supply pipeworks shall be screw jointed using a threaded coupler. The surface of the pipe and coupler shall be cleaned and the threads shall be painted with two coats of bituminous paint. The pipe thread shall be wrapped with three turns of spun yarn or other material approved by the CM and the joint tightened using purpose made tools. Coal tar compounds or lead-based paint shall not be used. Locking nuts to branch connections shall be tightened. Branch connections shall not protrude inside the pipe.

WSP.W510.7 MAKING FLANGED JOINTS
1. Further to WSP.W410, pipes and/or fittings to be jointed together shall be independently supported and properly aligned. After placing the gasket in position, the bolts shall be tightened in a sequence in accordance with the manufacturer's recommendations to avoid overstressing of the flange. If it is necessary to dismantle the flanged joint, the bolts shall be loosened in the reverse sequence to that used for tightening. The bolt tightening sequence shall be approved by the CM before making flanged joints;
2. When flanges other than polyethylene flanges are tightened, the bolts shall be tightened with a torque not exceeding the corresponding value specified in Table A or B below as appropriate. If the joint is not sealed after applying the specified torque, then the bolts shall be tightened with the torque increased by 10%. This procedure will be repeated until the joint is sealed. A final tightening shall then be applied with a further 10% increase in torque;
3. When polyethylene flanges are tightened, the bolt torque shall be in accordance with the manufacturer’s recommendations or in the absence of such manufacturer's recommendations to the limits as shown in Table C below.

### JOINT PROTECTION

**WSP.W610.7**

**PROTECTION TO STEEL FLANGED JOINTS, SLIP-ON COUPLINGS AND FLANGE ADAPTERS**

1. Steel flanged joints, slip-on type couplings and flange adapters in steel pipes for water supply pipeworks shall be protected after jointing is complete;
2. The joint, including bolts and nuts, shall be cleaned to remove all moisture, dirt, oil, grease and deleterious material. Bolts and nuts shall be painted with two coats of bituminous paint and the joint shall be coated with primer. Mastic filler shall be applied in such a manner that all depressions, corners and voids between the bolts and nuts are filled and a smooth surface is available on which to apply the anticorrosion tape;
3. At least two layers of anticorrosion tape shall be applied to all parts of the joint and to the adjacent pipe for at least 200 mm beyond each end of the joint. The tape shall be applied in accordance with the manufacturer's recommendations and shall be wrapped spirally around the joint and pipe with at least 55% overlap per spiral;
4. The tape shall be moulded manually after application to take up the contours of the parts being protected.

### REPAIRS TO JOINTS, COATINGS AND LININGS

**WSP.W710.7**

**GENERAL**

1. Unless otherwise approved by the CM, repairs to joints, coatings and linings shall be carried out using materials of the same type and grade as in the pipe, joint or fitting;
2. External repairs shall be completed before internal repairs are carried out;
3. Internal repairs and adjacent areas shall be washed with potable water after the repair is complete.

**WSP.W720.7**

**INTERNAL REPAIRS TO BITUMEN COATED STEELPIPES**

1. Dirt, mill scale, rust and other deleterious material shall be removed from the areas to be repaired by wire brushing to leave dry, clean, bright material. All damaged material shall be removed and the area shall be cleaned and dried;
2. Primer shall be applied to the metal surface by brushing, avoiding bare spots, floods and sags;
3. The area surrounding the area to be repaired shall be gently heated with a blow lamp or hot iron until the adjacent coating is molten;

4. Bitumen shall be heated to 200°C and shall be stirred from time to time to prevent overheating. The bitumen shall be worked into the area to be repaired with a heated trowel to the same thickness as the adjacent coating. The bitumen shall be finished to a smooth uniform surface.

WSP.W730.7 EXTERNAL REPAIRS TO BITUMEN COATED STEEL PIPES
External repairs to joints other than flanged joints, slip-on type couplings and flange adapters of steel pipes with bitumen coatings shall be carried out as stated in WSP.W720, except:

1. External repairs shall not start until any specified electrical continuity has been provided and any individual test to each joint has been carried out;

2. A purpose made moulding box shall be cleaned and coated internally with whitewash. After the whitewash has dried, the box shall be fitted centrally around the joint and bolted together. Gaps between the pipe and the box shall be sealed with yarn or other material agreed by the CM to prevent leakage;

3. The heated bitumen shall be poured into the box in one operation. After the bitumen has solidified, the box shall be removed, cleaned and stored for re-use;

4. The affected area of bitumen coating shall be painted with whitewash after cooling;

5. External repairs of coatings to steel pipes with bitumen coatings shall be carried out as WSP.W720 except that the heated bitumen together with woven glass cloth shall be worked into the area to be repaired. The affected area of bitumen coating shall be painted with whitewash after cooling.

WSP.W740.7 INTERNAL REPAIRS TO STEEL PIPES WITH CONCRETE OR CEMENT MORTAR LINING
1. The area to be repaired shall be cut back to leave clean, bright metal. The area surrounding the area to be repaired shall be wetted;

2. The concrete or cement mortar shall be worked into the area to be repaired and compacted to the same thickness as the adjacent lining; the concrete or cement mortar shall be finished to a smooth uniform surface. The compressive strength and density of the compacted concrete or cement mortar shall be in accordance with BS 534:1990, Clause 29.5. The repaired area shall be cured by using curing compound as Worksection CON1;

3. Samples of the concrete or cement mortar shall be provided and test cubes shall be made and tested as Worksection CON1.

WSP.W750.7 REPAIRS TO DUCTILE IRON PIPES WITH BITUMEN COATINGS
Internal and external repairs to joints and coatings of DI pipes with bitumen coatings shall be carried out using bituminous paint. The area to be repaired shall be cleaned to bare metal and dried. The area to be repaired shall be painted with bituminous paint to the same thickness as the adjacent coating. The paint shall be finished to a smooth uniform surface.

WSP.W760.7 INTERNAL REPAIRS TO DUCTILE IRON PIPES WITH CEMENT MORTAR LINING
1. The area to be repaired shall be cut back to leave clean, bright metal. The area surrounding the area to be repaired shall be wetted;
2. The cement mortar shall be worked into the area to be repaired and compacted to the same thickness as the adjacent lining; the cement mortar shall be finished to a smooth uniform surface. The repaired area shall be cured with curing compound as stated in Worksection CON1;

3. The inside of pipe sockets and the faces of flanges shall be kept free from cement mortar.

**REPAIRS TO GREY IRON PIPES**

WSP.W770.7

Internal and external repairs to joints and coatings of GI pipes shall be carried out using zinc-based paint. The area to be repaired shall be cleaned to bare metal and dried. The area to be repaired shall be painted with a rust inhibitor, primer and two coats of zinc-based paint.

**THRUST AND ANCHOR BLOCKS**

WSP.W810.7

CASTING

The bearing face, and other faces stated in the Contract, of concrete thrust and anchor blocks for water supply pipeworks shall be cast directly against undisturbed ground. The faces of excavations shall be trimmed to remove loose material before concreting. Excess excavation and working space shall be filled with concrete of the same Grade as the block.

WSP.W820.7

APPLICATION OF INTERNAL PRESSURE

Internal pressure shall not be applied to the pipeline until thrust and anchor blocks have developed the specified grade strength.

**BEDDING, HAUNCHING AND SURROUNDING OF PIPELINES**

WSP.W910.7

SUPPORT

Pipes shall be supported at the required level by Grade 20 precast concrete wedges, blocks or cradles or by other methods agreed by the CM. One support shall be placed adjacent to each end of the pipe and the spacing between supports shall not exceed 3 m. Compressible sheeting shall be placed between the pipes and supports.

WSP.W920.7

FLEXIBLE JOINTS

Flexible joints shall be formed in concrete bed, haunch and surround at flexible joints in pipelines. Joint filler shall be placed next to the flexible joint in the pipeline and shall extend for the complete thickness of the bed, haunch and surround.

WSP.W930.7

CONCRETING

1. Polyethylene sheeting shall be placed on the trench bottom before concreting;

2. Concrete shall be placed evenly over the complete width of the bed and over the complete length of the pipe being concreted up to a level of 25 mm below the underside of the pipe. Concrete shall then be placed on one side of the pipe only and worked under the pipe until the concrete spreads under the pipe. Concrete shall then be placed equally on both sides of the pipe to the specified level.
TOLERANCES

WSP.W1010.7 GENERAL
Refer to Appendix H 'Schedule of Tolerance' to this Specification.

CLEANING AND STERILIZATION

WSP.W1110.7 TIMING
1. Unless otherwise permitted by the CM, pipelines shall be cleaned and sterilized not more than 7 days before the pipeline is handed over;
2. Cleaning and flushing shall be carried out after:
   a. The complete pipeline, or parts of the pipeline permitted by the CM, have been tested;
   b. Temporary Works required for testing have been removed;
   c. Parts of the pipeline removed for testing have been reconnected.

WSP.W1120.7 PROCEDURE
1. Fresh water and potable water pipelines for water supply pipeworks shall be cleaned and flushed through with potable water;
2. The pipeline shall be completely filled with water that has been dosed with a homogeneous solution of sterilizing chemicals such that the final concentration of free chlorine in the water is at least 30 ppm. The water shall be left in the pipeline for at least 24 hours;
3. After the 24 hour period, the pipeline shall be drained down and the sterilizing water shall be flushed out using potable water until the concentration of the remaining chlorine is less than 1 ppm.

CONNECTION OF UNDERGROUND WATER SUPPLY MAINS

WSP.W1210.7 PROCEDURE
Connect to supply mains as follows:
1. Submit proposed re-arrangement or tee-off (if any) to CM for approval at least 24 hours prior to execution;
2. Identify existing live fresh, flush, and fire service supply mains by:
   a. Inspect as-built record drawings;
   b. Verify by valve operation. Close all the valves of the pipes and turn on valve of each pipe one by one to identify the type of each water pipes;
   c. Paint underground pipeworks of fresh, flushing and fire service supply mains at both sides of isolating gate valves in colours as stated in WSP.W1240.
3. Test turbidity to confirm salt water mains in accordance with WSP.T530;
4. Provide temporary cover and lockable device for isolating valve pits;
5. Submit findings of the identification for inspection and confirmation by Management Division;
6. Submit to Management Division Form DCMP-F741 together with Form H for making connections to existing in service supply mains within Housing Department estates;

7. Upon receipt of Part B of Form DCMP-F741, proceed with connection works;

8. Upon connection to supply mains, complete Part C of Form DCMP-F741 and submit to Management Division together with a copy of Certificate regarding Water Supply Connection issued by Water Authority for record;

9. Remove temporary cover of the isolating valve pits after completion of the connection of supply mains;

10. Submit record drawings to Management Division within 14 days of connection irrespective of whether or not changes have been made to the Contract Drawings.

WSP.W1220.7 INSPECTION OF CONNECTION
Check all connected pipeworks to supply mains by valve operation. Close all the valves of the pipes and turn on valves of each pipe one by one to identify the type of each water pipe.

WSP.W1230.7 RECORD DRAWINGS
Submit record drawings to CM within 14 days of underground water supply connection irrespective of whether or not changes have been made to the Contract Drawings.

WSP.W1240.7 UNDERGROUND SUPPLY PIPELINE IDENTIFICATION SCHEDULE
Paint underground pipeworks of fresh, flushing, and fire service supply mains at both sides of isolating gate valves in the colours shown in the following table, complete with the identification colour code indication:

<table>
<thead>
<tr>
<th>Underground Supply Pipe Identification - Colour Reference to BS 4800:1989</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service Type</td>
</tr>
<tr>
<td>---------------</td>
</tr>
<tr>

</tr>
<tr>
<td>Flushing Water Main</td>
</tr>
<tr>
<td>Fire Service Water Main</td>
</tr>
</tbody>
</table>

WORKS OUTSIDE SITE BOUNDARY

WSP.W1310.7 APPROVED CONTRACTOR FOR PUBLIC WORKS
Carry out all work in laying and extending the fresh, flushing and fire services water mains from an location at the site boundary to the street mains by a contractor, sub-contractor or licensed plumber approved by Water Supplies Department or other duly constituted authority.

WSP.W1320.7 CONNECTION BY WATER SUPPLIES DEPARTMENT
Cap end of mains to prepare for connection to street mains by Water Supplies Department.

WSP.W1330.7 NOTIFY WATER SUPPLIES DEPARTMENT TO INSPECT
Notify Water Supplies Department to inspect completed pipework and valve pit before backfilling.
TESTING

TRIALS

WSP.T010.7 WELDING TRIALS
1. Unless otherwise permitted by the CM, trials shall be carried out to demonstrate the competency of each proposed welder who will be employed to weld joints in steel pipes for water supply pipeworks;
2. Trials shall be carried out at least 7 days before welding starts;
3. The Contractor shall inform the CM 24 hours, or such shorter period agreed by the CM, before carrying out welding trials;
4. The trials shall be carried out using the welding procedures submitted to the CM;
5. Trials shall be carried out under similar conditions as those which will be encountered on the Site. Each trial shall consist of fillet welding two steel plates using at least two electrodes to complete one run of weld. The thickness of the steel plates shall be the same as the thickness of the steel pipe which will be welded;
6. A 150 mm length of the plate which contains what in the opinion of the CM is the worst welding shall be cut from the steel plates and broken in a vice;
7. The CM shall determine the competency or otherwise of each welder on the basis of the results of the welding trials.

WSP.T020.7 PIPE JOINTING TRIALS
1. Trials shall be carried out to demonstrate that the pipes, joints and fittings for water supply pipeworks fit correctly;
2. The trials shall be carried out at least 6 weeks, or such shorter period agreed by the CM, before the materials are to be incorporated in the permanent work;
3. The Contractor shall inform the CM 24 hours, or such shorter period agreed by the CM, before carrying out the trials;
4. The Contractor shall immediately inform the CM of any pipes, joints or fittings which do not fit correctly. Modifications shall be made to pipes, joints or fittings which do not fit correctly or replacements shall be provided as instructed by the CM.

WSP.T030.7 TRIALS FOR DRILLING AND TAPPING
1. Trials shall be carried out to demonstrate that the proposed equipment and methods of drilling and tapping pipes for water supply pipeworks will produce connections which comply with the specified requirements;
2. The trials shall be carried out at least 14 days before drilling and tapping starts;
3. The Contractor shall inform the CM 24 hours, or such shorter period agreed by the CM, before carrying out trials.

TESTING JOINTS IN STEEL PIPES

WSP.T110.7 METHOD OF TEST
1. Spigot and socket joints in steel pipes exceeding DN 700 for water supply pipeworks shall be tested after welding by the nitrogen gas test;
2. A tapped hole of approximately 6 mm diameter shall be made in the socket end of each pipe to be tested and a non-return valve shall be fixed in the hole. The nitrogen gas test shall be carried out by pumping nitrogen to a pressure of 400 kPa into the annular space between the spigot and socket. The pump shall be disconnected and the pressure shall be recorded for 30 minutes.

WSP.T120.7 COMPLIANCE CRITERIA
There shall be no drop in pressure in the joint during the 30 minute period of the nitrogen gas test.

WSP.T130.7 NON-COMPLIANCE
If the result of any nitrogen gas test does not comply with the specified requirement for the test, the weld at the joint shall be cut out and the joint shall be rewelded and tested.

PRESSURE TESTING PIPELINES

WSP.T210.7 SUBMISSIONS BEFORE TESTING
The following particulars shall be submitted to the CM at least 14 days before the test starts:
1. Test equipment and method of setting up the equipment;
2. Calibration certificates for pressure gauges;
3. Procedure for carrying out the test;
4. Programme for testing.

WSP.T220.7 TESTING IN SECTIONS
1. The pipelines shall be tested in sections as stated in the Contract unless otherwise permitted by the CM;
2. If testing in sections other than those stated is permitted, the section to be tested shall be as long as practicable provided that the specified test pressure will not be exceeded;
3. Final tests on complete pipelines which have been tested in sections shall not be carried out.

WSP.T230.7 TEST PRESSURES
The test pressure shall be:
1. 1.5 times the maximum working pressure if the maximum working pressure does not exceed 1.5 MPa;
2. 1.3 times the maximum working pressure if the maximum working pressure exceeds 1.5 MPa.

WSP.T240.7 TESTING BEFORE BACKFILLING
1. Unless otherwise permitted by the CM, pressure tests shall not be carried out until the fill material has been deposited and compacted over the complete length of the pipeline to be tested;
2. If permitted, sufficient fill material shall be deposited to restrain the pipeline in position during the test.
WSP.T250.7  SIMULTANEOUS TESTING
Tests shall not be carried out simultaneously on pipelines in the same trench.

WSP.T260.7  TEST EQUIPMENT
The following equipment is required:
1. Blank flanges or caps;
2. Struts and wedges;
3. Temporary concrete blocks or other anchors;
4. Force pump and pump feed tank;
5. Pressure gauge, readable and accurate to 0.01 m head;
6. Continuous pressure recorder and purpose made charts, which will be loaned by the Authority or the Water Supplies Department only for those parts of the Works stated in the Contract.

WSP.T270.7  PROCEDURE
The procedure shall be as follows:
1. Pipes and valves shall be checked for cleanliness and the operation of valves shall be checked;
2. Blank flanges or caps shall be fixed to the ends of the pipeline, or section of the pipeline, to be tested. Tests shall not be made against valve gates;
3. The blank flanges and caps shall be secured with struts and wedges against temporary concrete blocks or other anchors. The blocks and anchors shall be completed and shall have hardened sufficiently before testing starts;
4. Thrust and anchor blocks, pipe straps and other devices required to prevent movement of pipes and fittings shall be completed before testing starts;
5. The pipelines shall be filled with water and all air shall be removed;
6. Unless otherwise permitted by the CM, the pipeline shall remain filled for 3 days before testing starts to allow absorption to take place and to achieve conditions which are as stable as practicable;
7. The pressure in the pipeline shall be increased slowly to the specified test pressure by pumping water into the pipeline using a force pump;
8. The pressure in the pipeline shall be maintained within +0% and -5% of the specified test pressure for a test period of at least 2 hours;
9. At the beginning and end of the test period and at 30 minute intervals during the test period, readings shall be taken from the pressure gauge and the pressures (p) shall be recorded. The pressure shall be adjusted to the specified test pressure each time a reading is taken;
10. The pressure shall be adjusted to within the specified tolerances for the test pressure at any time during the test period when the pressure falls outside the specified tolerances;
11. The pressure shall be monitored during the test by means of a continuous pressure recorder with purpose made charts;
12. The leakage of water from the pipeline shall be measured as the amount of water required to maintain the specified test pressure in the pipeline. The amount of water shall be determined from the fall in level of water in the pump feed tank.

WSP.T280.7  CALCULATION
1. The average test pressure (P) shall be calculated as the average of the pressures (p) recorded during the test;
2. The permitted leakage of water from the pipeline during the pressure test shall be calculated from the equation:

\[
\text{permitted leakage} = 0.02 \times d \times l \times \frac{t}{24} \times \frac{P}{10} \text{ litres}
\]

where:
- \(d\) is the nominal diameter of the pipe (mm);
- \(l\) is the length of pipeline tested (km);
- \(t\) is the test period (hr);
- \(P\) is the average test pressure (m).

**WSP.T290.7 REPORTING RESULTS**

The following shall be reported:

1. The internal diameter of pipe to the nearest 1 mm;
2. The length of pipeline tested to the nearest 1 m;
3. The test period to the nearest 0.01 hr;
4. The pressures recorded during the test to the nearest 0.01 m;
5. The average test pressure to the nearest 0.01 m;
6. The leakage and permitted leakage of water to the nearest 0.1 litre;
7. Details of any discernible leakage of water from the pipeline during the test;
8. Charts obtained from the continuous pressure recorder;
9. That the test method used was in accordance with this Specification.

**WSP.T300.7 MAINTENANCE OF HEAD**

Unless otherwise permitted by the CM, the pipeline shall be left charged with water at a head of at least 15 m after testing and until the pipeline has been sterilized or handed over to the Authority.

**WSP.T310.7 COMPLIANCE CRITERIA**

The results of tests on pressure pipelines for water supply pipeworks shall comply with the following requirements:

1. The leakage of water from the pipeline determined by the pressure test shall not exceed the permitted leakage calculated in accordance with WSP.T280;
2. There shall be no discernible leakage of water from the pipeline or from any joint during the pressure test.

**WSP.T320.7 NON-COMPLIANCE**

If the result of any test on pressure pipelines for water supply pipeworks does not comply with the specified requirements for the test, the Contractor shall investigate the reason. Remedial or replacement work approved by the CM shall be carried out and the pipeline shall be retested.
TESTING WATER STERILIZATION

WSP.T410.7 GENERAL

1. After the pressure test on fresh water and potable water pipelines for water supply pipelines has been completed, samples of the water in the pipeline will be taken by the CM. The number of samples and locations of sampling shall be as instructed by the CM. Testing shall be carried out as stated in WRS.T320 and WRS.T330 for water sterilization of water retaining structures;

2. The colour, odour, appearance, turbidity, conductivity and pH value of the water samples shall be of a quality comparable with that drawn from the supply point and acceptable for potable water.

TESTING TURBIDITY

WSP.T510.7 FACILITIES FOR TESTING

Provide clean water and apparatus for testing. Ensure reagents or other chemicals where used, are of current stock.

WSP.T520.7 TESTING PRIOR TO CONNECTION OF SUPPLY MAINS

Test fresh, flush, and fire service supply mains prior to connection works as required by WSP.W1210.

WSP.T530.7 PROCEDURE

Test for development of white turbidity to identify salt water mains to satisfaction of CM, as follows:

1. Collect two 10 ml samples in clean McCartney bottles from the supply mains under investigation;

2. Add two drops of barium chloride solution to one sample;

3. Shake to mix contents and wait for approximately 3 minutes for turbidity to develop;

4. Compare with the other sample for increase in white turbidity (which would indicate the presence of salt water);

5. In doubtful cases, seek record drawings as well as laboratory services for confirmation.
APPENDIX WSP/I PROTECTION TO STEEL PIPES, FITTINGS AND SPECIALS USING EPOXY SYSTEM – OTHER REQUIREMENTS

GENERAL

WSP.A1.010.7 GENERAL REQUIREMENTS

1. Pipes, fittings and specials shall be protected both internally and externally and shall be suitable for use in and transport through the tropics;

2. The Contractor shall provide full documentation from the pipe manufacturer and/or protection supplier detailing the guaranteed service life of the proposed materials;

3. The Contractor shall provide certification pursuant to Clause 4.2.2 of AWWA C210-1997 where epoxy system is applied;

4. For pipes with outside diameter less than 1016 mm, internal protection with sulphate resistant cement mortar lining in accordance with the requirement of BS EN 10298:2005 will also be considered by the CM;

5. Slip-on type couplings and flanges adaptors (including nuts and bolts) shall be protected with Rilsan Nylon 11 or a fusion bonded epoxy coating (as described in the table in WSP.M110) and shall not require bituminous paint;

6. Expansion joints shall be protected in accordance with sub-clauses (1) and (2) above, except stainless steel slides surfaces that require no coating;

7. All bolts and nuts shall be hot dip galvanized or be coated with an epoxy-based or plastic-based corrosion protection coating;

8. For pipes, fittings and specials to be jointed together by welding, internal and external protections shall be stopped at distance from the ends as follows:
   a. Butt welded joints – 75 mm from the ends of pipes to be welded;
   b. Sleeve welded joints – for sleeve and spigot sleeve, length plus 75 mm.
   In all cases, priming shall be up to the ends of the pipes.

9. For pipes, fittings and specials not to be jointed by welding, the external protection shall be stopped at a distance sufficient to permit assembly of the joint and internal protection shall be up to the pipe end;

10. On-site completion or repair of protection lining shall be carried out in strict compliance with the manufacturer's recommendation. Except for epoxy or plastic based protection coatings, materials for completing and repairing the external and internal protections on Site shall be approved by the CM. One set of the maintenance guideline/manual on repair of epoxy coatings shall be submitted to the CM.
GENERAL PROTECTION COATING REQUIREMENTS

WSP.A1.110.7 GENERAL

Selection of coating systems and application procedures shall be made with due consideration to environmental conditions during fabrication, installation and service of the installation. All coating application procedures shall be carried out in accordance with ANSI/AWWA C210-97.

WSP.A1.120.7 PLANNING AND DOCUMENTATION

1. All painting activities shall be fully incorporated into and regarded as an integral part of the fabrication plan;
2. Procedures pertaining to overall management, painting facilities, painting equipment, painting application, quality assurance, quality checks, repair and maintenance etc., shall be established and documented in detail and submitted for the approval of the CM before commencement of the actual painting work.

WSP.A1.130.7 AMBIENT CONDITIONS

1. No final blast cleaning or coating application shall be done if the relative humidity is more than 85%, and if the steel temperature is less than 3°C above dew point in the ambient. No coating shall be applied or cured at ambient temperatures below 10°C;
2. The coating specification and/or product data sheets shall specify the maximum and minimum application and curing temperatures and other relevant requisites regarding application and curing conditions for each product in any coating system.

WSP.A1.140.7 COATING MATERIALS

The coating materials shall be suitable for the intended use and shall meet the following requirements:
1. In compliance with health, safety and environment protection requirements;
2. Suitable for raw water, salt water, fresh water and treated effluent;
3. For fresh water main coating, the material shall be suitable for drinking water uses.

WSP.A1.150.7 STEEL MATERIALS

Before abrasive blast cleaning, the steel used for fabrication shall as a minimum requirement conform to Rust Grade B as described in BS EN ISO 8501-1:2001. Any primer applied by the steel manufacturer shall be regarded as temporary corrosion protection and shall be removed in appropriate manner before application of the coating systems herein.

WSP.A1.160.7 REQUIREMENTS OF COATING, PERSONNEL AND PROCEDURES

Requirements as described in WSP.A1.510 to WSP.A1.540 of this Appendix shall be complied with and documented. Any equivalent product or alternative to the coating system specified in WSP.A1.610 proposed by the Contractor shall be approved by the CM before commencement of any coating work.
HEALTH, SAFETY AND ENVIRONMENTAL CONCERNS

WSP.A1.210.7 REQUIREMENTS
The following information/documentation shall be properly filed and made available for inspection upon demand:
1. Product Data Sheet of the coating material;
2. Material Safety Data Sheet of the coating material;
3. Volatile Organic Compound content (g/l) of the coating material;
4. Special handling precautions, personal protection and disposal instructions.

SURFACE PREPARATION OF THE SUBSTRATE

WSP.A1.310.7 PRE-BLASTING PREPARATION
1. Sharp edges, blurs, welding seams shall be rounded or smoothened by mechanical grinding before blast cleaning;
2. Hard surface layers resulting from flame cutting shall be removed by mechanical grinding before blast cleaning;
3. Welding slag shall be removed by mechanical chipping and/or grinding. Blow-holes and welding imperfections shall be repaired by spot welding or removed by mechanical grinding. All welds shall be inspected and if necessary repaired before final blast cleaning of the area;
4. Any major surface defects, particularly surface laminations or scabs detrimental to the protective coating system shall be removed by suitable dressing. Where such defects have been revealed during blast cleaning, and dressing has been performed, the dressed area shall be re-blasted to the specified standard;
5. The surface of the substrate shall be free from any foreign matter such as weld flux, residue, dirt, oil, grease, salt, etc. before blast cleaning;
6. Any oil and grease contamination shall be cleaned by use of a new rag soaked with a suitable solvent.

WSP.A1.320.7 BLAST CLEANING
1. Blasting abrasives shall be dry, clean and free from contaminants that will be detrimental to the performance of the coating. It shall be in compliance with requirements as specified in BS EN ISO 11124;
2. Size and shape of abrasive particles for blast cleaning shall be such that the prepared surface profile (anchor pattern profile) is in accordance with the requirements for the applicable coating system. The surface profile will be graded in accordance with BS EN ISO 8503;
3. The cleanliness of the blast-cleaned surface shall be as referred to for each coating system i.e. Sa 2.5 or Sa 3 in accordance with BS EN ISO 8501-1:2001.

WSP.A1.330.7 FINAL SURFACE CONDITION
1. The substrate surface, after abrasive blast cleaning and before coating, shall be clean, dry, free from oil/grease and have the specified roughness and cleanliness ready for the first coat to be applied;
2. Dust, residual blast abrasives etc. shall be removed from the surface after blasting such that the surface cleanliness complies with Rating 2 of BS EN ISO 8502-3:2000;
3. The maximum content of soluble impurities on the blasted surface as sampled in accordance with BS EN ISO 8502-6:2000 shall not exceed a conductivity corresponding to a NaCl content of 100 mg/M². Equivalent methods may be used.

**PAINT APPLICATION**

**WSP.A1.410.7** **GENERAL**

1. Product data sheet for each and every product used in a coating system shall be filed and made available for reference;

2. The following information for each product used in the coating system shall be clearly specified:
   a. Surface treatment requirements;
   b. Wet film thickness/dry film thickness (max, min. and specified);
   c. Maximum and minimum recoating intervals at 10°C gradient from 40°C down to -5°C;
   d. Information on type of thinner to be used, thinning ratios;
   e. Mixing, handling and application requirements/recommendations.

**WSP.A1.420.7** **APPLICATION EQUIPMENT**

1. Roller shall not be used for paint application;

2. When paints are applied by brush, the brush used shall be of a style and quality acceptable to the coating manufacturer. Brush application shall be done so that a smooth coat in accordance with the specified thickness is obtained;

3. Airless spray equipment is recommended to achieve uniform coating with good penetration. Coating supplier's recommendation for pressure settings, nozzle sizes and fan angles shall be followed.

**WSP.A1.430.7** **APPLICATION**

1. Before application of each coat, a stripe coat shall be applied by brush to all welds, corners, behind angles, sharp edges of beams and areas not fully reachable by spray, etc. in order to obtain the specified film thickness in these areas;

2. Edges of existing coating shall be feathered before over-coating and overlapping;

3. Each coat shall be applied uniformly over the entire surface. Skips, runs, sags and drips shall be avoided. Each coat shall be free from pinholes, blisters and holidays;

4. Contamination of painted surface between coats shall be avoided. Any contamination shall be removed as per ANSI/AWWA C210 requirements.

**WSP.A1.440.7** **REPAIR**

All repairs of coating shall be conducted in accordance with the original surface preparation requirements for the substrate and coating application requirements. The Contractor shall submit a method statement for repair of any damage caused to the epoxy coating for the approval of the CM.
QUALIFICATION OF PERSONNEL, SUPPLIER AND PRODUCT

WSP.A1.510.7 OPERATORS

1. Operators for blast cleaning, paint application etc. shall be properly trained and approved by the CM with knowledge in areas concerning operational technique, equipment use, product handling, industrial safety, personal health and use of protection equipment, etc.;

2. The personnel involved in carrying out quality inspection or verification such as QC/QA staff shall be qualified in accordance with industrial standard. A relevant qualification in this regard is acceptable if the person has attained the status of Certified Painting Inspector by FROSIO or NACE Painting Inspector - Level 3 or equivalent.

WSP.A1.520.7 SUPPLIER

1. The supplier of coating material shall be evaluated and approved by the CM;

2. The supplier shall demonstrate that it has the resources technically and financially to fulfill its commitments with supply to the Contract. In this regard, Manufacturer's research and development ability to support product advancement, production capacity, quality assurance system, supply logistics, and on-site technical after-sale support shall be evaluated.

WSP.A1.530.7 COATING MATERIAL

1. The coating material used for internal lining shall be tested and pass the requirements of BS 6920. A certification issued by Water Research Centre of the UK approving such coating for contact with potable water suitable for human consumption or its equivalent shall be provided;

2. Coatings used for both internal and external lining shall be demonstrated to have suitable mechanical properties and anti-corrosion properties for the long-term protection of the substrate. In this regard, the following properties may be used as selection criteria:
   a. Minimum adhesion strength in accordance with ASTM D4541 shall be equal to 19 MPa or in accordance with BS EN ISO 4624:2003 shall be equal to 12 MPa;
   b. Minimum impact test in accordance with ASTM D2794 shall be 0.136 kg-m;
   c. Minimum abrasion resistance in accordance with ASTM D4060 (Taber Abraser Wheel CS-17) shall be 200 mg/1000 rotations, load 1000 grams.

WSP.A1.540.7 PAINT WORKING SPECIFICATION

The supplier of coating material shall provide a working specification sheet giving a summary of the work procedures. This working specification shall be properly filed and made available for reference from time to time to ensure that correct procedures are followed.

COATING SYSTEM

WSP.A1.610.7 COATING SYSTEM REQUIREMENTS

Coating system for carbon steel pipe shall be in accordance with the coating system as in Table A, B or C as below appropriate:
### Table A

**System 1 for carbon steel pipe – internal lining**

<table>
<thead>
<tr>
<th>SYSTEM 1</th>
<th>Coating Material and Surface Protection Requirements</th>
<th>Minimum Dry Film Thickness (DFT) (Microns)</th>
</tr>
</thead>
<tbody>
<tr>
<td>For carbon steel pipe – internal lining</td>
<td>Abrasive blast to Min. Sa2.5 (BS EN ISO 8501) Roughness to medium grade (BS EN ISO 8503) or 10Na according to Rugotest No.3</td>
<td>-</td>
</tr>
<tr>
<td>Surface Preparation</td>
<td>Primer Coat: Solvent free two-component, high build polyamine cured epoxy</td>
<td>250</td>
</tr>
<tr>
<td></td>
<td>Intermediate Coat: Solvent free two-component, high build polyamine cured epoxy</td>
<td>250</td>
</tr>
<tr>
<td></td>
<td>Final Coat: Solvent free two-component, high build polyamine cured epoxy</td>
<td>250</td>
</tr>
<tr>
<td></td>
<td>Total Dry Film Thickness</td>
<td>750</td>
</tr>
</tbody>
</table>

### Table B

**System 2 for carbon steel pipe – external lining pipe shielded from direct sunlight (buried underground)**

<table>
<thead>
<tr>
<th>SYSTEM 2</th>
<th>Coating Material and Surface Protection Requirements</th>
<th>Minimum Dry Film Thickness (DFT) (Microns)</th>

INSPECTION AND TESTING

WSP.A1.710.7 TESTING AND INSPECTION

1. Testing and inspection shall be carried out in accordance with the following table throughout the application process to ensure overall specification is met:

<table>
<thead>
<tr>
<th>Test Type</th>
<th>Method</th>
<th>Frequency</th>
<th>Acceptance criteria</th>
<th>Action to take in case of failure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Environmental Conditions</td>

GIN GROUND INVESTIGATION, INSTRUMENTATION AND SOIL TESTING

MATERIALS

GENERAL

GIN.M010.7 SUBMISSION OF DETAILS REGARDING GEOTECHNICAL INSTRUMENTATION
1. The following particulars of the proposed geotechnical instrumentation shall be submitted to the CM:
   a. Details of instruments and any alternative instruments proposed;
   b. Manufacturer's specifications;
   c. Test and calibration certificates;
   d. Method of installation;
   e. Method of acceptance testing;
   f. Details of ancillary measuring equipment;
   g. Schedule for installing instrumentation in relation to other work;
   h. Documents showing that the instruments are capable of measuring within the ranges and accuracies stated in this Worksection and as shown on the Drawings;
   i. Name and experience of persons responsible for installation, testing and monitoring of instruments;
   j. Details of standpipe piezometer tips, including manufacturer's specification; and
   k. Details of the form of records;
2. The particulars shall be submitted for Approval at least 28 days before installation of instrumentation starts.

GIN.M020.7 SUBMISSION OF DETAILS REGARDING GROUND INVESTIGATION
1. Submit the following particulars of the proposed materials and methods for ground investigation to CM:
   a. Details of drilling and in-situ testing equipment;
   b. Details of sampling equipment; and
   c. Details of filter materials and fill materials for drilling and testing.
2. Submit the particulars for Approval at least 7 days before the relevant work starts.

GIN.M050.7 FENCING
Comply with Worksection EXT9.
INSTRUMENTS AND EQUIPMENT

GIN.M110.7 GEOTECHNICAL INSTRUMENTATION - GENERAL REQUIREMENTS
1. Instruments for geotechnical instrumentation and their accessories shall be provided complete with all appropriate tubing, connections, monitoring equipment, read-out units and any other tools necessary for the installation calibration, setting to work and maintenance of the instruments;
2. Instruments shall be manufactured by companies with proven experience and only instruments which are well proven and have been in successful use shall be used, unless otherwise agreed by the CM;
3. Installed instruments shall become the property of the Employer. Detachable tubing, connections, monitoring equipment and read-out units shall become the property of the Contractor upon the expiry of the Maintenance Period.

GIN.M120.7 STANDPIPE PIEZOMETERS
1. Unless otherwise specified, standpipe piezometer is also referred to as piezometer in this Worksection;
2. Piezometer tips for geotechnical instrumentation shall be porous ceramic or plastic material at least 200 mm long and with a bore of at least 25 mm. The permeability shall be at least 10⁻⁴ m/sec;
3. The piezometer tip shall be connected to rigid uPVC standpipes with a bore of at least 25 mm and with a wall thickness of at least 3 mm. The standpipes shall be joined together and to the piezometer tips in such a manner that the joints remain leak-proof under the anticipated head of water.
WORKMANSHIP

GENERAL

GIN.W010.7 METHODOLOGY

1. Except otherwise specified or Instructed, carry out all ground investigation works in accordance with 'Geoguide 2: Guide to Site Investigation', GEO, 'Geotechnical Manual for Slopes', GEO, British Standard BS 1377:1990 - 'Methods of Test for Soils for Civil Engineering Purposes', 'Geospec 3: Model Specification for Soil Testing', GEO, together with any of its Corrigenda. Description of all samples and exposures shall generally be in accordance with 'Geoguide 3: Guide to Rock and Soil Description', GEO;

2. The various methods of sub-surface exploration to be used during the ground investigation are defined in this Worksection;

3. Carry out each exploration method in such a way that even slight changes in the character of the strata can be detected and the soil or rock removed from any hole shall be truly representative of the subsurface;

4. The exploration techniques shall accurately reveal the location of all changes of strata and shall facilitate the taking of disturbed and undisturbed samples at any depth;

5. Choose the exploration techniques, methods and equipment in such a way that all drill casings and other ground investigation tools such as drill rods and drill bits etc. shall be retrieved from all drillholes upon completion of drilling so that they would not become underground obstructions to future developments. If any drill casings and other ground investigation tools cannot be retrieved from drillholes, inform the CM immediately and record in accordance with GIN.W040.

GIN.W020.7 DEFINITIONS

Definitions of words and terms used in this Worksection include the followings:

1. On completion of the investigation, the holes may be required to give further information on site conditions by the installation of perforated standpipes, Casagrande, Cambridge type or pneumatic piezometers. With the exception of pneumatic piezometers, these installations shall be called "observation wells";

2. The word "holes" shall mean all boreholes, auger holes, drillholes, Delft sample holes, probe holes, Penetration Vane Shear Test holes and trial pits, trial trenches, slope surface stripings where the context refers to them collectively. An "uncompleted hole" means any hole in which work is being carried out, and includes any hole which has not yet been backfilled;

3. "Hole Reference Number" shall mean the unit number allocated by the CM to a hole;

4. "Final Report" shall be a report submitted to the CM after satisfactory completion of the Works specified and after the CM's or his Representative's acceptance of the draft reports of fieldworks, field tests and/or laboratory tests;

5. "Boring" shall mean advancing a hole into the sub-surface by the cable tool method using a suitable shell, chisel or clay cutter. Boring will be used principally in conjunction with disturbed and open drive undisturbed sampling. The rig used shall be called a "boring rig" and the hole formed shall be called a "borehole";

6. "Hand augering" shall mean advancing a hole using a portable soil auger rotated by hand and will be used principally for shallow exploration in fine-grained materials. The hole formed shall be called an "auger hole";
7. "Drilling" shall mean the use of a machine-driven rig for advancing a hole in rock or soil and recovering a core with a rotary cutting tool tipped with diamonds or other hard materials. If instructed that a core is not required the Contractor may use a rock roller or similar bit. The hole shall be called a "drilling rig", and the hole formed shall be called a "drillhole";

8. "Probing" shall mean advancing a tool of specified dimensions into the ground without the use of boring, drilling, hand augering or excavation equipment, using either static or dynamic forces and recording the resistance to penetration offered by the ground. The hole formed shall be called a "probe hole";

9. "Sample" is any quantity of material obtained from the ground for the purposes of inspection, logging or testing;

10. A "sample tube" shall mean the container into which undisturbed soil is forced during sampling and in which the soil is extracted from the ground and stored. A "sampler" shall mean the sample tube and all the accessories that are required to obtain the undisturbed sample of soil;

11. Definitions used for laboratory testing staff are given in the testing section to this Worksection;

12. "Datum station" is a mark for which horizontal or vertical values, or both, have been fixed, and which is used as a datum for monitoring or control surveys;

13. "Geotechnical instrumentation" is the installation and monitoring of instruments in the ground or structures to provide information on soil and rock parameters, and to monitor specific variations in the condition of the ground or structures for the purposes of geotechnical design, construction control and performance monitoring;

14. "Monitoring mark" is a mark, fixed or installed, on a structure to be monitored;

15. "Reference point" is a mark placed close to another important survey mark to aid recovery or replacement;

16. "Survey station" is a mark on a stone, concrete, metal or wooden block, pipe, peg or other item defining a surveyed position;

17. "Investigation station" is the area within 1 metre from the specified point or area;

18. "Common ground" is material of clay, silt, sand, gravel, cobbles and all other types of material other than rock or boulders;

19. "Boulders" are rock fragments greater than 200 mm in size;

20. "Cobbles" are rock fragments 60 mm to 200 mm in size;

21. "Gravel" is soil particles 2 mm to 60 mm in size;

22. "Rock" is naturally occurring material of Grades I to III as classified in Table 4 of Geoguide 3 'Guide to Rock and Soil Descriptions';

23. "Structural concrete" shall mean concrete materials of over 200 mm unbroken length measured along the centre line of the hole, either reinforced or unreinforced that are part of structural elements, such as retaining walls, foundation caps, etc.;

24. "Unformed area" shall mean an area where slopes of inclination equal to or greater than 1 vertical to 2 horizontal, over 5 m high imposed between the nearest road access to Site and the first Investigation Station or between adjacent Investigation Stations:

For the purpose of this definition the nearest road access to Site shall be that point which, in the opinion of the CM or his representative, can be reached by a vehicle carrying a drilling rig;

25. "Formed area" shall mean all areas other than those defined as "unformed areas";

26. "Notation":

Length: mm, m, km
Mass: g, kg, Mg
Area: mm², m²
Volume: mm³, m³
Time: s, min, year
Liquid Volume: 1
Force: N, kN, MN
Pressure: kN/m², MPa
Unit Mass: Mg/m³, kg/m³
Permeability: m/s
Consolidation: mm²/s, m²/year

27. "Dimensions of Cores" are given in BS 5930:1981;
28. "Hard strata" are natural or man-made materials, which cannot be penetrated, except by the use of rotary drilling or powered breaking tools;
29. "Block sample" is an undisturbed sample recovered by in-situ hand trimming of a block of material from the surrounding soil;
30. "Bulk sample" is a sample of at least 10 kg mass, which is representative of the grading of the material at the point of sampling;
31. "Inspection pit" is a pit for locating and identifying underground utilities and structures;
32. "Jar sample" is a disturbed sample of at least 0.7 kg mass contained in a transparent airtight jar, which has a screw cap with an airtight sealing ring;
33. "Slope surface stripping" is the removal of surface protection and vegetation from existing slopes to expose underlying soil or rock for inspection;
34. "Trial pit" is a pit for inspecting and logging the ground and in which to carry out in-situ testing and sampling;
35. "Trial trench" is any excavation with dimensions larger than a trial pit on plan;
36. "U76 sample" is an undisturbed sample recovered by advancing a thin-walled tube of approximately 76 mm diameter with a cutting edge into the soil;
37. "U100 sample" is an undisturbed sample recovered by advancing a thin-walled tube of approximately 100 mm diameter with a cutting edge into the soil;
38. "Undisturbed soil sample" is a sample complying with Class 1 or Class 2 of BS 5930:1981;
39. "AGS digital format" is a data format that complies with the Association of Geotechnical and Geoenvironmental Specialists (AGS) publication "Electronic Transfer of Geotechnical and Geoenvironmental Data";
40. "Inclined hole" is any drillhole or corehole Instructed to be drilled at an angel between the horizontal and 89.5° from the horizontal;
41. "CP (Logging)" is a person who shall comply with the minimum requirements on the qualifications and experiences required for the Competent Person (Logging) set out in the CoPSS, to carry out logging of samples and preparation of borehole logs; and
42. "AS" is the Authorized Signatory of RSC(GIFW) who is responsible for the carrying out the ground investigation field works under the Contract.

**GIN.W030.7 PROCEDURE**

1. Information will generally be obtained by boring and drilling with continuous boring in rock, decomposed rock and other materials;
2. Where rock and decomposed rock is overlain by soft natural deposits, then information on these soft deposits shall be obtained by boring through the deposits, taking frequent undisturbed samples and making frequent insitu tests when directed by the CM;

3. When rock or decomposed rock is reached, or as directed by the CM or his Representatives, drilling and coring shall be used to extend any hole started by boring;

4. Fresh or slightly decomposed rock will in general be proved to a depth of 5 m by N size drilling, unless otherwise Instructed.

**GIN.W035.7 FENCING**

1. Erect safety fencing or temporary barriers to comply with the requirements of GCC Clause 5.12. Where Instructed, the fencing shall be erected and left in place after completion of the investigation;

**GIN.W040.7 SUBMISSION OF RECORDS AND REPORTS - GENERAL REQUIREMENTS**

1. Unless otherwise specified, submit the following records and reports as detailed in this Worksection to the CM within the required periods as follows:
   a. 2 copies of daily records of holes, field installations and field tests within 4 working days;
   b. 2 copies of records of the co-ordinates and levels of holes within 2 working days of completion of the last hole excluding backfilling and reinstatement;
   c. 2 copies of preliminary records (logs) of holes, 2 sets of discs containing gINT files capable of generating the preliminary logs and associated data files of AGS within 5 working days of sinking the hole;
   d. 2 copies of draft fieldwork report including 2 sets of all photographs, 2 sets of discs containing gINT files capable of generating the preliminary logs and associated data files of AGS within 10 working days of the actual date of completion of fieldwork;
   e. 2 copies of laboratory test results within 3 working days of completion of each test;
   f. 2 copies of draft laboratory test report within 5 working days of the actual date of completion of test programme. The draft laboratory test report should contain full details of each test together with a summary sheet(s) tabulating the results of the tests undertaken on each sample;
   g. 2 copies of the draft pumping test report within 10 working days of completion of pumping test;
   h. On receipt of the CM's or his Representative's acceptance of the draft fieldwork and laboratory test reports, prepare and submit the following within 10 working days:
      i. 5 fast-bound copies of the Final Report including all photographs required;
ii. 3 copies of digital image of the Final Report. Each digital image shall be stored in files on a CD-ROM and placed in a plastic protective pocket. Each CD-ROM shall be securely and clearly labelled with the date of production of the compact disc, the Contract No. and Works Order No., where applicable, the names of the Site, the name of the Employer, and the name and company chop of the Contractor. The digital image shall contain the complete contents of the report, including a scanned image of the cover page of the Report, all photos, drawings and the certificate signed by the AS as stated in sub-clause (5). The files shall be in Portable Document Format (PDF) that can be viewed and printed by the Adobe Acrobat reader. The size of each file shall be less than 10 MB and the file name shall be agreed with the CM. Separate files should be kept of borehole logs and photographs. The resolution of all colour images shall not be less than 150 dots per inch (dpi) with colour depth of 24-bit true colour. The resolution of black and white images shall not be less than 200 dpi; and

iii. 2 sets of discs containing gINT files capable of generating the Final Report and associated data files of AGS format.

i. Additional copies of the Final Report including photographs ordered by the CM shall be supplied within 10 working days when instructed.

2. The preliminary records shall give the Contractor's preliminary description and depths of all strata encountered and all the relevant information taken from the daily records including the setting out data. Obtain Approval to the form of his daily record sheets and his preliminary records before Works commence on Site;

3. The draft reports shall contain all the information required for the Final Report;

4. The Final Fieldwork Report shall be dated and certified on its cover page as being accurate, correct and complete by the AS;

5. The Final Fieldwork Reports shall contain all the information obtained from the investigation. Each Fieldwork Report shall contain the following:

   a. A factual description, prepared by a CP (Logging), of the nature and methods of the ground investigation works carried out;

   b. If holes have been sunk, a summary table of the depths and thicknesses of all strata (including decomposed rock and rock) encountered at each hole location and the reduced level of each stratum boundary;

   c. A copy of the location plan amended as necessary to show the exact position of each completed hole;

   d. A table of the as-drilled co-ordinates;

   e. Final records of holes together with data in AGS digital format as specified in Appendix I to this Worksection or to the approval of the CM;

   f. Colour photocopies of any photographs taken; and

   g. A certificate signed by the AS confirming the standards of ground investigation works carried out. The contents of the certificate shall be in accordance with the requirements stated in the CoPSS in respect of ground investigation report certification by the AS. The certificate shall be prepared on ICU forms provided by the CM.

6. The Final Laboratory Testing Reports shall contain the following:

   a. All the information gained from the testing programme and such introducing pages and summary sheets as are necessary together with data in AGS digital format as specified in Appendix II to this Worksection or to the approval of the CM. The summary sheets and all test certificates shall be fully typed for inclusion into each Report. Any record photographs of unsuitable samples shall immediately follow the summary sheets;

   b. A complete index of all the tests carried out and those which are HOKLAS accredited shall be clearly shown.
7. All records and reports shall be submitted on International A4 size paper unless otherwise agreed by the CM. All Final Reports shall be typed. The format and binding of the Final Reports shall be to the approval of the CM;

8. The photographs negatives or digital photograph images, together with the digital data disk in AGS digital format, shall be included in a single copy of the Final Report which shall be marked "Master Copy". For Final Laboratory Testing Reports, the original copies of all worksheets and supporting HOKLAS endorse test certificates shall be included in the Master Copy.

GIN.W050.7 GEOTECHNICAL INSTRUMENTATION - GENERAL REQUIREMENTS

1. Instruments shall be handled, stored, installed and used in accordance with the manufacturer's recommendations and in such a manner that the performance of the instruments will not be impaired;

2. Instruments shall be protected from damage and measures shall be taken to ensure that the instruments suffer the minimum practicable amount of disturbance;

3. Instruments shall be calibrated by an Approved laboratory. Instruments shall be calibrated at intervals recommended by the manufacturer and at other intervals as Instructed. Calibration certificates shall be provided to the CM within 24 hours after calibration. See also GIN.W120;

4. Installation, testing and monitoring of the instruments shall be carried out under the supervision of a suitably qualified technician. Particulars of the technician, including qualifications and experience, shall be submitted to the CM at least 7 days before commencement of work relating to geotechnical instrumentation.

GIN.W060.7 LOCATION AND ARRANGEMENT OF GEOTECHNICAL INSTRUMENTATION

Unless specified otherwise:

1. The locations and arrangement of instruments for geotechnical instrumentation shall be as stated on the Drawings or as agreed with the CM before installation;

2. The positions and alignments of instruments shall be recorded after installation and surveys shall be carried out at times and frequencies agreed by the CM to detect any displacement of the instruments;

3. At least two reference points shall be established for each survey station or monitoring mark;

4. The survey station which has the least chance of being disturbed shall be selected as datum station. The datum station shall be stainless steel and shall be protected from damage. At least three reference points shall be established for each datum station;

5. The survey network shall be related to the territorial control points provided by the CM.

GIN.W070.7 INSTALLATION OF INSTRUMENTS

1. Unless specified otherwise, inform the CM 24 hours, or such shorter period agreed by the CM, before the installation of each instrument for geotechnical instrumentation starts;

2. Instruments shall be installed, fixed and protected in a manner which will ensure that the instruments will function satisfactorily. Tests shall be carried out after installation to demonstrate that the instruments have been correctly installed and are functioning correctly. Instruments which are not correctly installed or are not functioning correctly shall be reinstalled or replaced as Instructed;

3. All installed instruments, tubes and wires shall be clearly marked with a unique and conspicuous identification number.
ATTACHMENT OF TUBES AND CABLES TO INSTRUMENTS

Unless specified otherwise:

1. Tubes and cables attached to instruments for geotechnical instrumentation for remote reading shall be impervious to air and water, and shall have sufficient strength and stiffness to withstand the internal and external pressures. Tubes and cables shall be protected from mechanical damage and from the harmful effects of direct sunlight, heat and ultra violet radiation at all times;

2. Tubes and cables shall be free from defects and shall be marked with identification colours and numbers at 5 m intervals. The tubes and cables shall be wound onto reels in such a manner that kinks are not formed and strain is not induced. Open ends of tubes and cables shall be blocked with stop ends at all times;

3. Tubes and cables shall be buried at least 0.5 m below ground level;

4. Tubes and cables shall be laid with sufficient slack, loops and bends to allow for settlement and other ground movements. The routing of tubes and cables shall be as agreed by the CM and shall be in straight lines unless otherwise permitted by the CM. The radius of bends shall be at least 300 mm. Each tube or cable shall be laid from the measuring instrument to the terminal duct in one continuous length without joints.

MAINTENANCE OF GEOTECHNICAL INSTRUMENTATION

1. Instruments for geotechnical instrumentation shall be maintained in good working order until the expiry of Maintenance Period. Instruments, survey marks and stations shall be protected by suitable barricades, notices, signs, marker-buoys or by other methods agreed by the CM. Construction shall be carried out in a manner which will avoid damage to the instruments;

2. Inform the CM immediately of any instruments found damaged or instruments found not to be in working order. Replacements shall be installed for read-out units which are faulty or under repair.

RECORDS OF GEOTECHNICAL INSTRUMENTATION

Unless otherwise specified:

1. Keep on the Site records of activities relating to installation of geotechnical instrumentation and submit a copy to the CM within 24 hours after installation of the instrument is complete;

2. Prepare a drawing showing the locations and identification of installed instruments and submit to the CM within 24 hours after installation of the instrument is complete;

3. Prepare a drawing showing the locations and details of survey stations, monitoring marks and reference points and submit to the CM within 3 days after the survey network has been established.

MONITORING AND RECORDING INSTRUMENT READINGS - GENERAL REQUIREMENTS

Notwithstanding specific requirements detailed in the following clauses to this Worksection:

1. Record the instrument readings and processed data for geotechnical instrumentation on agreed record sheets, and submit to the CM within 24 hours after recording. The form of record sheets shall be as agreed by the CM. Unless otherwise agreed by the CM, readings shall be taken in the presence of the CM;
2. Initial readings shall be taken immediately after the instruments have been installed and after the effects of installation have subsided. The initial readings shall be submitted to the CM and shall form the basis of comparison of subsequent readings. The instruments and the initial readings shall be replaced if the initial readings are not repeatable;

3. The frequencies for reading instruments shall be as agreed with the CM. Inform the CM immediately of sudden or significant changes in the readings;

4. All installed instruments shall be left in correctly functioning condition after final readings have been taken or at the end of the Maintenance Period. Keys for locks shall be tagged to identify the instrument number and shall be handed over to the CM.

GIN.W120.7 CALIBRATION OF MEASURING INSTRUMENTS

1. Where load, displacement, flowmeters, or other measuring instruments are used or where the nature of the instruments is such that calibration is required, then produce evidence of the calibration of all such instruments prior to commencing the works. Calibration of instruments should be carried out at the intervals shown in the table below:

<table>

2. Recalibration shall be conducted immediately if there is any suspicion of damage to measuring instruments or should the CM suspect the quality of the data produced. Copies of certified calibration charts shall be supplied to the CM within three days of a calibration test.

GIN.W130.7 DEPTHS OF EXPLORATION

1. Whilst investigation holes shall be continued to such depths as the CM may direct, provisional termination criteria will be as stated in this Worksection or the Works Order or as shown on the Drawings;

2. Excess drilling/excavation deeper than the depth specified/directed (including the tolerance given in the 'Schedule of Tolerance') will be at the Contractor's expense;

3. When required by the CM or his Representatives, holes shall be started at the bottom of trial pits, which have been excavated by the Contractor.

GIN.W140.7 USE OF CASING

1. Where sub-surface exploration is being carried out in any stratum, which is not sufficiently cohesive to stand firmly without a casing, or when directed by the CM, casing shall be used;

2. Ensure casings are advanced concurrently with the removal of material in such a manner that loss of ground is avoided;

3. Ensure that casings are of a suitable size and are inserted in such a manner as to render them recoverable. The CM reserves the right to direct the minimum diameter of casings where these are required to maintain the hole.
GIN.W150.7 REMOVAL OF CASING
The casing shall not be removed from any hole nor any filling introduced into a hole until permission is given by the CM or his Representatives. The casing shall be gradually withdrawn and, in non-cohesive material, the filling in the hole shall be kept above the bottom of the casing during withdrawal.

GIN.W160.7 SITE LOG BOOK
1. Maintain a Site Log Book in a format approved by the CM. All visitors to an investigation station, including the Contractor's staff, shall sign the Site Log Book on each visit. The Site Log Book shall also be used to record all verbal instructions at that particular investigation station and shall be countersigned by the authorized personnel making the instruction before the work is carried out;
2. Copy the Site Log Book to the CM within 3 working days of the date of completion of the fieldwork for each Works Order.

GIN.W170.7 DISPLAY OF REMOVED MATERIAL
When Instructed, display the removed material as follows:
1. All material removed from boreholes and auger holes, including small and large disturbed samples in their containers and undisturbed samples in their samplers shall be laid out in sequence on a clean corrugated metal sheet protected from the weather for examination by the CM or his Representatives;
2. The material shall be displayed in such a manner that, when required by the CM or his Representatives, further small disturbed samples can be taken unmixed with other material;
3. No material shall be removed from the display unless authorised by the CM or his Representatives.

GIN.W180.7 MARKING HOLES
When ordered by the CM, mark the position of holes permanently by the installation of Grade 20/20 concrete markers (300 mm x 300 mm x 300 mm) flush with ground level and the hole number indicated in red paint on the top face.

GIN.W190.7 ACCESS SCAFFOLDING
1. When Instructed, provide, maintain and subsequently remove on completion of the fieldwork access scaffolding of one of the types specified below:
   a. Scaffolding for the support and transportation of drilling rigs or other plant, equipment and personnel; and
   b. Inspection scaffolding for examination of slope faces by the CM or his Representatives or other authorized person. The scaffolding shall be constructed of sound bamboo or other suitable materials approved by the CM.
2. The scaffolding referred to in sub-clause (1)(a) shall be of adequate size and constructed in a safe and secure manner including the provision of adequate working platforms, guardrails, barriers, toe-boards, fences, coverings on openings, gangways and runs in accordance with the Construction Sites (Safety) Regulations to ensure stability of the plant and equipment and the safety of persons working thereon and of third parties during boring, drilling, sounding and the movement of plant and equipment;
3. The inspection scaffolding referred to in sub-clause (1)(b) shall normally be a double-row scaffold having a maximum horizontal and vertical grid size of 600 mm and shall conform to the relevant safety requirements in the Code of Practice for Bamboo Scaffolding Safety and the Code of Practice for Metal Bamboo Scaffolding Safety or its latest revisions issued by Labour Department. The scaffolding structure at every grid shall be sufficiently strong for safety supporting at least a person and equipment weighting 120 kg. The scaffolding shall be constructed in such a way that makes it possible for person to climb on the outside face of the grid without having to climb across any over-hanging portion or member;

4. Provide a suitable fall-arresting system approved by the CM at every area where the slope inspection process may be involved. The fall-arresting system shall normally be vertical independent lifelines securely tied to stout steel pegs, tree trunks or other suitable anchorage (except the scaffolding members) at a horizontal interval of maximum 4 m;

5. Each lifeline shall be a fibre rope with a minimum diameter of 15.9 mm complying with the American National Standard, ANSI A10.14:1999, or other relevant international safety standards. Make available to the CM four sets of full body safety harness with suitable fall arresters for attaching to the lifelines. All the provided fall-arresting systems and equipment shall meet the relevant requirements in the Labour Department Guidance Notes on Classification and Use of Safety Belts and their Anchorage Systems published in 1998 or its latest revision. In addition, appoint a Competent Person according to the above Guidance Notes to check the provided safety equipment and anchorage system prior to their being used each time. Provide also necessary training to everyone concerned person to ensure the proper use of the safety equipment;

6. Where the inspection scaffolding in sub-clause (1)(b) as instructed is a single-row scaffold, provide suitable working platform(s) for proper execution of slope inspection at area(s) considered to be necessary by the CM. The working platform(s) can be supported by double-row scaffolding, truss-out scaffolding or other suitable structural form(s) meeting the site environment. All working platforms and their supporting structures shall comply with the Code of Practice for Bamboo Scaffolding Safety and the Code of Practice for Metal Bamboo Scaffolding Safety or its latest revisions issued by Labour Department.

GIN.W200.7  WORKING OVER WATER

1. The Contractor may be required to carry out investigations over water. Over deep water a pontoon or jack up platform suited to the conditions may be required. Any pontoon shall have a minimum working area of 100 m² unless otherwise agreed by the CM;

2. The personnel for marine work shall include an experienced Marine Supervisor who will be responsible for the safe moving and movement of marine craft and equipment required for this work;

3. Where drilling over water, all depths shall be measured from the initial submerged ground level which shall be a fixed referenced datum to Principal Datum level;

4. Be responsible for making an application to the Marine Department regarding the Notice to Mariners within 2 working days following the receipt of an instruction for site investigation works over water. The processing of this application by Marine Department normally takes a minimum of 14 working days. Also be responsible for applying for any extension of the Notice to Mariners to complete the Ground Investigation ordered;

5. Be responsible for observing all applicable marine regulations and requirements of the Marine Department, especially those regarding safety;
6. Ensure that, during underwater boring and drilling operations, the craft or structure supporting the plant is adequately secured against movement from tidal, wind, current or other effects. Should the Contractor employ a tower or staging for making underwater boreholes or drillholes he shall ensure that the effects of settlement of the tower or staging are allowed for in any measurement.

GIN.W210.7 WATER LEVELS

1. Take daily readings of water levels in holes on land at the following times in all holes and observation wells and record them in the daily site records and report logs:
   a. Before work commences in the morning;
   b. Before the mid-day break;
   c. After the mid-day break;
   d. After work has finished in the evening but before water (if any) is added to stabilise the hole;
   e. When a hole has been completed;
   f. Immediately prior to backfilling a hole;

   The level of the bottom of the hole and the bottom of the casing, if any, shall be measured and recorded at the same time as each water level reading;

2. If at any time the level of the water in a hole fluctuates, keep a record for the fluctuation. If the hole "gains" or "loses" water, inform the CM or his Representatives immediately and record the details including the level of the bottom of the hole at that time and an estimate of the rate of gain or loss of water. Make provision for measuring artesian water levels when directed by the CM;

3. Record any addition of water to assist the advance of a borehole. In the case of drilling and wash boring, keep a careful record of the behaviour of the drill and wash water including an estimate of the percentage return. Report any extraordinary smell or colour of the water and other unusual circumstances in the daily site records.

GIN.W220.7 WATER LEVEL MEASUREMENT

Provide electrically operated dipmeters to measure all water levels. Each dipmeter shall be fitted with 60 metres of graduated tape at minimum 1 cm interval graduations.

SAMPLING

GIN.W310.7 GENERAL

1. Take both disturbed and undisturbed samples from all holes at the depths and intervals as specified or as otherwise directed by CM, provide all necessary sampling equipment, tubes and containers and carry out all handling and transportation of samples to a laboratory-testing contractor or to a storage area (both temporary and permanent) as directed by the CM;

2. Transport and deliver all samples in core boxes or in any other containers as specified.

GIN.W320.7 EQUIPMENT USED FOR SAMPLING

1. All the sampling equipment and containers shall conform to the requirements of Geoguide 2 and this Worksection;
2. Submit the specifications and examples of the equipment and containers proposed to be used to the CM for approval prior to the commencement of the Works.

GIN.W330.7 SAMPLE NUMBERING

1. Assign a reference number to each common ground sample (both disturbed and undisturbed) and groundwater samples taken, commencing with samples obtained from the inspection pit, if excavated;
2. The number shall be unique for that hole and shall be in order of depth below ground level;
3. The number shall also be shown on the records adjacent to the sample symbol.

GIN.W340.7 LABELLING OF SAMPLES

1. Mark all sample containers and tube samples clearly both on the side and the top of the sample with a permanent marker pen with the following information:
   a. Name of the Contract and Works Order number where applicable;
   b. Name or reference number of the site and area;
   c. Reference number, location and inclination of the hole;
   d. Reference number of the sample;
   e. Date of sampling;
   f. Brief description of the sample;
   g. Depth of the top and bottom of the samples below ground level.
2. Identify each core box by the following information, which shall be clearly marked on the top, both ends and beneath the core box lid using waterproof ink or paint:
   a. Name of the Contract and Works Order number where applicable;
   b. Name or reference number of the site and area;
   c. Reference number, location and inclination of the hole;
   d. Depths of material contained; and
   e. Core box number with indication on the total number of boxes for the hole.
3. Record the depths at which each core run started and finished at the ends of each core run by permanent marker pen on the edge of the box or on wooden blocks which fit between the dividing slats. If a core run is contained in two sequential core boxes, the abbreviation "cont'd" shall be used on the adjacent edges of the core boxes.

GIN.W350.7 SMALL DISTURBED SAMPLES FROM DRILLHOLES

1. For all drillholes,
   a. Take jar samples from the cutting shoes of each undisturbed sample, from any anomalous material, from each Standard Penetration Test and at other locations as Instructed;
   b. Take small disturbed samples of common ground on entering each new stratum (including decomposed rock) and every 1.0 m in between other small disturbed samples from cutting shoes or corebits. They shall be taken with a driven sample tube or other method approved by the CM. The disturbed sample shall be representative of the composition of the common ground.
GIN.W360.7 SMALL DISTURBED SAMPLES FROM TRIAL PITS, TRIAL TRENCHES OR SLOPE STRIPPINGS

1. Take small disturbed samples in all trial pits and trial trenches at the top of each common ground layer encountered and then at intervals of 0.5 m in any layer thicker than 0.5 m. Take small disturbed samples in common ground every 0.5 m along each slope surface stripping, commencing at the base;

2. The disturbed sample shall be representative of the composition of the common ground exposed;

3. Place samples of material predominantly coarser grained than sand, or when instructed, place the samples in large polythene bags. Place other material in airtight plastic containers, of minimum 100 mm diameter, with a screw top. Take sufficient material to fill the bag or container, which shall be sealed immediately after recovery;

4. Label each sample as specified in accordance with GIN.W340 including the face number from which the sample was taken.

GIN.W370.7 BLOCK SAMPLES

1. Take block samples of common ground from the sides or bottom of trial pits or trial trenches or from slope stripplings when directed by the CM. Samples shall be not less than 230 mm cube;

2. The top and four sides of the sample, but not the base, shall be excavated, trimmed, wrapped in aluminium foil and waxed. A wooden box, with two opposite sides removed, shall then be placed over the prepared sample such that a minimum annulus of 25 mm exists between the inside of the box and the sample. The top and side annuli shall then be filled using polyurethane by means of two reagents. After hardening of the polyurethane, the top of the box shall be attached and the sample carefully broken away at its base at a depth of no less than 50 mm below the base of the sample. The sample shall then be carefully inverted and the "base" trimmed, wrapped in aluminium foil and waxed before the basal annulus is filled with polyurethane. After hardening, the base of the wooden box shall be attached. The top and bottom of the sample shall be clearly marked on the box, as shall the direction of magnetic north relative to the in situ sample.

GIN.W380.7 LARGE DISTURBED SAMPLES FROM TRIAL PITS, TRIAL TRENCHES OR SLOPE STRIPPINGS

Take large disturbed samples of at least 25 kg in trial pits, trial trenches or from slope stripping, when instructed. Place all large disturbed samples in heavy duty polythene bags immediately after they are taken, and securely fastened. Before taking sample in slope stripping, remove a minimum of 100 mm of material, or other thickness, as instructed.

GIN.W390.7 UNDISTURBED SAMPLES FROM TRIAL PITS OR TRIAL TRENCHES

Take open drive undisturbed samples from the sides or bottom of trial pits or trial trenches, when directed by the CM as described in this "Sampling" sub-section.

GIN.W400.7 OPEN DRIVE UNDISTURBED SAMPLERS

1. Take open drive undisturbed samples in trial pits, trial trenches, drillholes and as directed by the CM;

2. 
a. Undisturbed samples shall be taken in an Approved 101 mm (±1 mm) (for U100), 77 mm (±1 mm) (for U76) and 41 mm (±1 mm) (for U40) internal diameter open drive sample tubes made from thin walled seamless stainless steel or galvanised mild steel not less than 450 mm (for U100), 350 mm (for U76) and 200 mm (for U40) in length fitted with a cutting shoe tapered at an angle not exceeding 20°;

b. The end area ratio of the sample tube cutting shoes as defined in Figure 13 of Geoguide 2 shall not exceed 30% and inside clearance between the shoe and each tube shall not exceed 2% unless a core retainer is used, in which case the clearance shall not exceed 4%;

c. The adaptor head at the top of the sample tubes shall be fitted with a ball valve to permit the exit of air or water during driving and to assist in retaining the sample during withdrawal and it shall have an allowance for over-driving;

d. Each sample tube shall have the word "TOP" engraved on its exterior at one end;

e. The internal and external diameter of the cutting shoe and of the sample tube shall be recorded.

3.

a. The sample tube cutting shoe shall be free from rust, pitting, burring or any other defect;

b. The use of oil inside the sampler shall not be permitted;

c. The end of the sample tube marked "TOP" shall be driven uppermost;

d. Care shall be taken to ensure that the sample is not compressed by over-driving;

e. The minimum recovery shall be 80% of the sampled length;

f. The method of driving, dimensions, construction and condition of each sample tube, cutting shoe, adaptor head and sample retainer shall be to the approval of the CM prior to sampling;

g. All recovered samples shall be stored and transported vertically, in their correct orientation, in purpose-built racks which shall hold the tubes securely.

GIN.W402.7 GROUNDWATER SAMPLES FROM LAND CONTAMINATION INVESTIGATIONS

1. When Instructed, take one groundwater sample at each drillhole, inspection pit and trial pit where groundwater is encountered during drilling/excavation and only after required soil samples have been collected;

2. For groundwater taken from a drillhole, install a groundwater sampling well in accordance with Appendix XXII to this Worksection. The well shall be constructed using at least 50 mm, flush jointed, threaded class 18 uPVC with standard factory pre-slotted sections of 1 mm or less slot aperture (or a size equivalent to 90% retention for filter pack material) vertically separated by no more than 4 mm, with at least three cuts per perimeter:

a. Submit a method statement to CM for approval for the installation of the groundwater sampling well prior to the commencement of the installation;

b. After installation of the wells, measure the depth to water table at all wells at the same period of time with an interface probe in order to delineate the water table contours at the Site;

c. Upon completion of installation of the wells, pump out approximately five well volumes to remove silt and drilling fluid residue from the wells;

d. Allow the wells to stand for a day to permit groundwater conditions to equilibrate;
e. Measure groundwater level and thickness of free product layer, if present, at each well before groundwater samples are taken;

f. Purge the wells for at least three well volumes to remove fine-grained materials and to collect freshly refilled representative groundwater samples. Record the time for each groundwater purging or recharge as well as the estimated groundwater flow.

3. Where groundwater is encountered in inspection or trial pits, record groundwater level. Collect groundwater samples through pumping out all groundwater, letting groundwater to recharge and allowing the groundwater to stand for a day to permit conditions to equilibrate before sampling;

4. Where free product (discrete layer of contaminant which is not bound to soil or mixed in with groundwater) at or above groundwater is encountered, measure the thickness and depth of the free product layer using an approved interface probe and collect a sample when Instructed;

5. Collect groundwater samples using Teflon bailer and decant it into appropriate sample vials or bottles provided by other contractor in a manner that minimises agitation and volatilisation of the volatile organic compounds from the samples;

6. Comply with the requirement stated in sub-clauses (2) to (8) of GIN.W405 and GIN.W406.

GIN.W405.7 SOIL SAMPLES FROM LAND CONTAMINATION INVESTIGATIONS

1. When Instructed, take specified types of soil samples from inspection pits, trial pits or drillholes for land contamination investigations and comply with the “Guidance Notes for Investigation and Remediation of Contaminated Sites of Petrol Filling Stations, Boatyards, Car Repair/Dismantling Workshops” by Environmental Protection Department;

2. Take special precautions to prevent contamination of samples, which shall include but not be limited to the following:

a. For soil and groundwater samples taken from the inspection pits/trial pits/drillholes, decontaminate all plant and equipment used for excavation/drilling and sampling as follows:
   i. Decontaminated by steam cleaning or high-pressure hot water jet;
   ii. Washed by phosphate-free detergent; and
   iii. Rinsed by distilled or de-ionized water.

b. Between samples, decontaminate all equipment used for sample extraction and handling in accordance with sub-clauses (a)(i), (a)(ii) and (a)(iii).  

3. The sample containers shall be laboratory cleaned, sealable, watertight, made of glass or other suitable materials with aluminium or Teflon-lined lids, in order to prevent reaction between container surface and sample or adsorption of contaminants;

4. Do not allow headspace in the sample containers after collection of sample;

5. Store samples at between 0°C - 4°C but never frozen, and deliver to the laboratory as directed by the CM within 24 hours of the samples being collected. Operate a chain of custody system as part of the QA system;

6. Label the samples in accordance with GIN.W340 unless otherwise specified;

7. Water use for flushing medium shall be of potable quality and no lubricant, hydraulic fluid or other additive shall be introduced during drilling. No re-use of water shall be permitted;

8. Comply with GIN.W406 for safety measures for Land Contamination Investigations;
9. Prior to mobilization, submit for the CM's approval the proposed sampling procedures and safety measures to be taken for the Land Contamination Investigations.

**GIN.W406.7  SAFETY MEASURES FOR LAND CONTAMINATION INVESTIGATIONS**

1. Comply with safety measures as specified in the "Guidance Notes for Investigation and Remediation of Contaminated Sites of Petrol Filling Stations, Boatyards, Car Repair/Dismantling Workshops" by Environmental Protection Department for Land Contamination Investigations;

2. Exercise extreme care when toxic gases or other hazardous materials are encountered. Report any abnormal conditions found immediately to the safety officer on site and the CM or his Representative;

3. Establish and maintain a Health and Safety Plan, before commencement of the Works, which shall include but not be limited to the following:
   a. Instruction of works on work procedures, safe practices, emergency duties, and applicable regulations;
   b. Regularly scheduled and impromptu meetings of the workers in which the possible hazards, problems of the job, and related safe practices are emphasized and discussed;
   c. Good housekeeping practices; and
   d. Availability of and instruction in the location, use and maintenance of personal protective equipment.

4. Maintain equipment and supplies reasonably required in an emergency, including lifesaving, evacuation, rescue and medical equipment in good working order and condition at all times. Use all reasonable means to control and prevent fires and explosions, injury to personnel and damage to equipment of property. Without limiting the foregoing:
   a. Maintain proper safety devices, barriers to minimise hazards during performance of the work;
   b. Prohibit smoking and open flames and the carrying of matches and lighters;
   c. Develop and maintain a written emergency plan applicable to the Works and Site;
   d. Maintain equipment in good operating condition and have emergency and first aid equipment ready for immediate use, where applicable;
   e. Conduct equipment tests to ensure that the equipment is properly placed and in good operating condition, and that workers are able to respond to emergency situations;
   f. Require all workers on Site at all time to wear clothing suitable for the work being carried out, weather and environmental conditions. For example, wear clean PVC/latex gloves whilst handling sampling equipment and carrying out sampling; and
   g. Require the personnel to wear respirator and gloves for vapour exposure protection, if necessary. Safety helmet and protective boots should be worn.

**GIN.W410.7  CLEANING HOLE BEFORE SAMPLING**

Before an attempt to take an undisturbed sample from a drillhole is made, remove all loose material and material disturbed by drilling or field testing from the holes. On recommencement of work at the start of each shift during the progress of a drillhole, remove a minimum of 300 mm of material before the next undisturbed sample is taken, unless otherwise Instructed.
GIN.W420.7 OPEN DRIVE SAMPLING IN BOREHOLES AND DRILLHOLES
1. The CM may order the use of an open drive undisturbed sampler in any drillhole in common ground;
2. Drive the sampler by means of either a jarring link (i.e. drilling rods delivering the impact at the adaptor head of the sampler), a sliding hammer arrangement to the Approval of the CM or a single ram stroke;
3. Do not apply vertical pull-up action to the sampling tube during the lift-up of any hammering operation;
4. Record the total depth driven or pushed and, where relevant, the number of blows used. If driven samples are Instructed in common ground of low cohesion, such as silts and silty fine sands, provide a core retainer of suitable design to improve sample recovery. In cohesive common ground, make an initial attempt to obtain a sample without the use of a core retainer;
5. If an attempt to take a U100 or U76 sample in a drillhole recovers a length of sample less than specified, clear the material disturbed by the sampling process in the hole immediately and make another attempt from the level of the base of the failed attempt, using core retainer. Should the second attempt also prove unsuccessful, perform a Standard Penetration Test with liner sampler, and continue the required sampling sequence. If two consecutive sequences of failed sampling occur in any one drillhole, inform the CM immediately.

GIN.W430.7 OPEN DRIVE UNDISTURBED SAMPLING IN AUGER HOLES
When directed by the CM open drive undisturbed samples shall be taken in auger holes. Open drive undisturbed samplers in auger holes shall be driven by mean of a jarring link and the total number of blows used shall be recorded. The sampler shall be of an Approved design.

GIN.W440.7 OPEN DRIVE SAMPLING IN TRIAL PITS AND TRIAL TRENCHES
1. Prior to sampling in trial pits or trial trenches, clear all disturbed material in order to expose common ground in its natural condition;
2. Take samples using a sliding hammer arrangement with care to ensure that no lateral movement takes place during driving, with the use of guide frame as necessary. The proposed method of driving shall be to the approval of the CM;
3. If a driven sample recovers less than that specified, make a second attempt at a clear distance at least one tube diameter from the first attempt. If the second attempt fails, make a third and final attempt at a clear distance at least one tube diameter from any previous attempts. If the third attempt fails, inform the CM immediately.

GIN.W450.7 WITHDRAWING THE SAMPLER
1. Before withdrawal in boreholes, auger holes and drillholes, rotat the sampler through two complete revolutions to shear the soil horizontally at the bottom of the sampler;
2. If necessary, delay this operation to allow the development of sufficient adhesion inside the tube;
3. Smoothly withdraw the sampler so that disturbance to the sample is kept to a minimum;
4. In trial pits or trial trenches, remove the sampler by excavating around it;
5. Measure and record the total length of the sample. Record any soil that has fallen out of the bottom of the tube.
GIN.W460.7 SEALING OF COMMON GROUND TUBE SAMPLES

1. Once a sample tube has been detached or removed from the sampling equipment, keep the visible ends of the sample clear of any disturbed material and trim the edges at 45°;

2. After cleaning the sides of the tube above the recovered sample, coat the ends with three successive thin films of just molten microcrystalline wax. Add a metal foil disc followed by more molten wax to give a total thickness of not less than 20 mm. Solidly fill any space remaining in the ends of the sample tube with damp sawdust or other material approved by the CM and cover the ends of the sample tube with tight fitting rubber caps;

3. Handle the tubes containing samples with care to avoid any possible disturbance, store them in a cool and dry location and protect them against the sun or inclement weather whilst on Site;

4. Place the material from the cutting shoe/core bit immediately in a plastic container of minimum diameter 100 mm, with a screw top. They shall be arranged securely in the corebox in their proper sequence;

5. If any undisturbed samples are found to have been incorrectly sealed, labelled or stored, they will be regarded as disturbed samples by the CM.

GIN.W470.7 GROUND WATER SAMPLES

1. When directed by the CM, take ground water samples from trial pits, trial trenches, boreholes or drillholes;

2. If water has been used for the purpose of drilling, bale out a volume of water at least equivalent to that of the drillhole volume before sampling;

3. Each sample taken shall not be less than 2 litres and shall be placed in a sterilized airtight bottle of sufficient capacity. Bottles shall be flushed out twice with the water to be sampled before use.

GIN.W480.7 LINER SAMPLES FROM STANDARD PENETRATION TESTS

1. When Instructed, provide a liner sample in conjunction with the Standard Penetration Test;

2. The split barrel sampler shall have an enlarged internal diameter to accommodate a thin stainless steel or aluminium liner of 35 mm internal diameter which shall fit tightly inside. The internal diameter of the liner may be up to 0.2 mm larger but in no case be smaller than that of the drive shoe. The liner shall have a smooth internal surface and may comprise two separate sections of equal length. The enlarged split barrel shall not be used without a liner in place;

3. After the sampler has been withdrawn from the drillhole, treat the liner and the retained soil in the same manner as an undisturbed sample.

GIN.W490.7 PISTON SAMPLING

Take undisturbed piston samples in boreholes or drillholes when Instructed and as follows:

1. Carry out piston sampling with an Approved thin-walled stationary piston sampler;

2. The sampling tube shall be 1000 mm long, formed from stainless steel with an internal cutting edge and shall have an internal diameter of 75 mm or 100 mm (± 1 mm) as specified by the CM;

3. The piston sampler shall be capable of operating to a depth of 20 metres below ground level;
4. The sampling operation shall ensure the sampling tube is pushed into the soil at a steady rate with no lateral deflection;

5. The design and performance of the sampler shall be such that a vacuum is formed over the retained sample in the tube;

6. The area ratio of the tube, as defined in Geoguide 2, shall not exceed 10% and the cutter edge taper angle shall not exceed 15°. No inside clearance is permitted;

7. The minimum recovery shall be 90% of the sampled length. Where the sample length is less than that specified, clear the material disturbed by the sampling process in the hole and make another attempt from the level of the base of the failed attempt at no extra cost. If this second sampling attempt also fails to recover the minimum specified, continue the Instructed sampling sequence and inform the CM immediately, or as soon as possible the next working day;

8. Fabricate purpose-built sample boxes for transporting and storing all piston samples in a vertical position in the correct orientation. Each vertical box shall be used to transport a maximum of two piston samples. These boxes shall be robust, water-tight, and shall be fitted with hinged top and attaching rope stands. The inside of the box shall be provided with styrofoam padding which holds samples tightly in place.

GIN.W500.7 RETRACTABLE TRIPLE TUBE CORE SAMPLER

1. Take undisturbed samples of common ground in drillholes using a triple tube retractable core barrel (Geoguide 2) fitted with either a detachable rigid clear ABS plastic or rigid opaque PVC or Polyethylene (PE) liner;

2. The dimensions of the core barrel and liner shall be as follows:

<table>
<thead>
<tr>

3. Use face-discharged bit formed of steel and set with tungsten carbide inserts in a saw tooth profile. The drill bit shall have groove cuts on the external sidewall to facilitate return of flushing fluid;

4. The cutting shoe shall have an area ratio of 10 to 15%. The ID of the leading edge of the cutting shoe shall be smaller than the ID of the liner tube with an inside clearance within 1.5 to 3.5%. Three lengths of cutting shoes, referred to as "long", "medium" and "short" with decreasing lengths of protrusion beyond the drill bit when mounted, shall be available. The "long" shoe with a protrusion of not more than 50 mm shall be used generally for looser or softer soils, and the "medium" or "short" shoes for denser or stiffer soils;
5. The liner shall fit tightly inside the inner tube, in both radial and longitudinal directions. Obtain the type and make of the liners to be used from a manufacturer approved by the CM. In addition, within 3 weeks of award of the Contract, submit the name(s) of the suppliers, material specification and samples of the liners proposed for use in the Contract to the CM for approval. If approved, maintain the quality of the liners throughout the duration of the Contract;

6. The barrel, drill bit and cutting shoe shall be free from significant defects and in good working condition. A sediment tube may be attached to the top of the barrel to trap the cuttings falling out of suspension from the flushing medium. A core retainer of suitable design may be used only when it is necessary to reduce the risk of sample loss;

7. Prior to lowering the barrel down the drillhole, it shall be checked to ensure that the inner barrel rotates freely, the retractor spring works and that the check valve at the top of the inner barrel is functioning properly;

8. Clean out the bottom of the drillhole properly prior to sampling to the specified sampling commencement depth within a tolerance of ±25 mm, unless otherwise agreed by the CM;

9. In order to alleviate disturbance to the soil being sampled, keep the applied flushing pressure to a minimum. An optimum combination of the applied bit pressure and rotation speed shall be used to achieve a steady penetration which shall not be too slow to avoid unnecessary disturbance induced by the flushing medium;

10. Successful sampling shall mean a minimum recovery of 80% of the sampled length when water flush is being used, and 90% of the sampled length when air-foam flush is being used. If sampling is not successful, clear the material disturbed by the sampling process in the hole immediately and make another attempt from the level of the base of the failed attempt;

11. If continuous retractable triple tube core sampling has been instructed and the second attempt also proves unsuccessful, inform the CM immediately, or as soon as possible the next working day, and submit a proposal to improve sample recovery for the CM’s agreement;

12. If interval sampling has been instructed and the second attempt also proves unsuccessful, perform a Standard Penetration Test with a liner sample and continue with the sampling sequence instructed. If two consecutive sequences of failed undisturbed sampling occur in any one drillhole, inform the CM immediately, or as soon as possible the next working day. Continue the sampling sequence unless otherwise instructed;

13. If the CM or his Representatives accepts a sample less than the successful sampling length as described in sub-clause (10), the sample shall be paid for pro-rata based on the successful length.

GIN.W510.7 VIBROCORING

1. When Instructed, obtain samples by vibrocoring;

2. The vibrocore sample shall be 75 mm (±2 mm) in diameter and shall be 6 m long. The vibrocore shall be fitted with a detachable rigid PVC tube to assist in the recovery of samples;

3. A piston shall be placed inside the PVC liner. During sampling the piston shall be held rigidly so that no vertical movement of the piston shall occur such that a vacuum is formed over the retained sample. A basket core retainer shall be fitted at the bottom of the tube to assist in the recovery of samples;

4. The vibration effort shall be supplied pneumatically or hydraulically, and the vibration energy must be adjustable to suit the ground conditions. The minimum vibration energy necessary to obtain a core should be used, to avoid undue disturbance of the sample;
5. Core recovery shall be at least 80% in any vibrocore run. If the recovery falls below this level, and if in the opinion of the CM higher recoveries should have been achieved, the CM may require another sample to be taken at the same depth at another location to be agreed by the CM;

7. Responsible for labelling, splitting, photographing and logging of the vibrocores. After logging, the vibrocores should be wrapped and sealed in polythene sheeting. When required by the CM, cut the vibrocores into 1 m length, seal and cap both ends, label, and store in core boxes;

8. The equipment shall be so designed that 6 m long core samples can be taken continuously from the existing ground level to the required depth and surface samples can be taken from the 0-2 m run below the existing ground level;

9. Include the logging and photographs in the report in a format to be Approved and submit them in a manner as described in GIN.W040.

GIN.W520.7 FIELD MOISTURE CONTENT SAMPLES
Field moisture content samples shall be taken on the following occasions when directed by the CM:

1. When an undisturbed sample is taken (the material for the moisture content sample shall be taken from the cutting shoe);
2. When a large disturbed sample is taken in cohesive soils (the moisture content sample shall be separated from the large disturbed sample);
3. When a Standard Penetration Test is conducted (the moisture content sample shall be taken from cohesive soil in the split spoon);
4. When a Vane Shear Test is conducted (one moisture content sample shall be taken from the soil adhering to the vane, if any, when it is extracted and another moisture content sample from the sheared soil removed from the borehole, drillhole, auger hole or trial pit when it is advanced to the level of the test);
5. When an in-situ density test is conducted;
6. At the top of any cohesive stratum;
7. At 1500 mm depth below the last moisture content sample.

GIN.W530.7 LARGE DIAMETER PISTON SAMPLING
When Instructed, take large diameter undisturbed piston samples as follows:

1. Large diameter piston sampling shall be carried out with an Approved thin-walled fixed piston sampler;
2. The piston sampler shall be capable of operating to a depth of 20 metres below ground level with no lateral movements being allowed during the actual sampling operation;
3. Where marine site investigations require large diameter piston sampling, the craft supplied must be capable of being supported rigidly from the sea-bed or a fixed platform shall be provided;
4. Prior to sampling, 200 to 300 mm of borehole advance shall be undertaken to remove disturbed ground;
5. The load required to penetrate the sampler shall be applied smoothly and evenly;
6. The minimum sample length shall be 450 mm and have a diameter of 260 mm;
7. The piston sampler shall have an Approved method of cutting the base of the sample; such a method shall include a cutting wire located in the base of the sampler;
8. Samples shall be taken with the exploratory hole filled with water unless otherwise Instructed;

9. The design and maintenance of the sampler shall be such that a vacuum is formed over the retained sample in the tube;

10. Take all necessary steps to ensure full recovery of the specimen;

11. The sampler shall be withdrawn carefully and slowly, particularly for the first metre of its withdrawal, to avoid a vacuum being formed beneath the sampler and sucking the sample from the tube.

GIN.W540.7 STORAGE OF LARGE DIAMETER PISTON SAMPLES

1. Large diameter piston samples shall be stored at all times inside a steel storage container;

2. The ends of the sample tube shall be sealed with at least 3 layers of Approved wax/petroleum jelly mixture;

3. Timber blocks shall be fitted into the sample tube to fill any voids at the top of the tube;

4. The sample tube shall be clamped into the storage container by metal plates at both ends separated from the sample tube by rubber sheeting about 4 mm thick;

5. The space between the sample tube and the inside of the storage container shall be filled with water;

6. Transportation of samples shall conform to GIN.W620.

GIN.W560.7 CORE BOXES

1. Core boxes shall be 1.05 m in length, 0.45 m in width and of sound robust timber construction, able to withstand the weight of the cores and stacking of the boxes, and be sufficiently watertight to protect the cores from rain on Site and in transit. The lid shall be fitted with metal hinges, hasp and staple and a locking device. Rope strands shall be attached to the core box for lifting. Boxes shall be made with rigid separating wooden slats. For core boxes containing rock cores only, core boxes of smaller size to be approved by the CM may be used;

2. Take appropriate preventive and protective measures to minimise the risks of manual handling operations of core boxes, which include but not be limited to the following:
   a. Provide information to the workers on the risks of manual handling operations (ie. The weight and the heaviest side of the load);
   b. Provide mechanical aids and proper personal protective equipment to the works;
   c. Arrange a team of workers to carry out the manual operations.

GIN.W570.7 EXTRUSION AND HANDLING OF CORES

1. Remove all cores from double tube core barrels using a hydraulic extruder, unless otherwise Instructed. Under no circumstances shall air pressure be used for the extrusion of cores. The extruder shall apply a continuous pressure to one end of the core whilst the barrel is in a horizontal position. Only gentle hammering with a wooden mallet on the side of the core barrel to free wedged pieces shall be permitted;

2. Extrude carefully cores from single and double tube core barrels onto split plastic piping of similar diameter to the core such that the core fits tightly into the pipe and is not free to rotate. When Instructed, or the recovered core is heavily jointed or fragmented and is likely to be disturbed during transportation, it shall also be wrapped in self-clinging transparent film, or similar Approved;
3. Wrap cores from split inner tube triple tube core barrels in self-clinging transparent film and then aluminium foil and carefully transferred into split plastic piping of the same internal diameter as the split inner tubes;

4. As the core is extruded, arrange it in core boxes in a proper sequence starting with the shallowest core on the left side nearest the hinge and then working along the slat and subsequently outwards towards the hasp (i.e. from left to right with the box lid on the far side of the box as the core is placed). Position and secure slats to restrain the core from movement;

5. Pack fractured rock securely. At no time should any core be loose in the box. Show core losses in individual core runs by wooden blocks or polystyrene of a square cross section to fill the core box, and of a length equal to the core lost.

**GIN.W610.7**  
**CORE SAMPLES FOR LABORATORY TESTS**

Cores recovered from drillholes will be taken for use as samples for laboratory testing when directed by the CM. The samples shall be cut from the core as it is extruded from the core barrel or when directed by the CM and a spacer bearing the sample number and depth of the top and bottom of the sample placed in the core box.

**GIN.W620.7**  
**DELIVERY AND STORAGE OF SAMPLES**

1. Deliver all samples, including cores, obtained from the Site to the designated HKHA core stores, stores within the Site or any other core stores as directed by the CM within 3 working days after the completion of the field works, unless otherwise Instructed. The locations of the HKHA’s core stores are shown in Appendix XXI to this Worksection;

2. Deliver all samples, including cores in their appropriate containers in such a manner as to prevent disturbance of the samples or cores by sudden movement, continuous or intermittent vibration, sudden temperature changes of any other reason. When necessary, provide purpose-built containers to protect sample tubes and jars when they are being delivered;

3. Whilst in the possession of the Contractor, store the samples in a cool and dry location protected against the sun, inclement weather, theft and vandalism to the satisfaction of the CM. Store block samples in their correct orientation. Store and transport in a vertical or horizontal direction for all samples recovered from vertical/sub-vertical or horizontal/sub-horizontal drillholes respectively in their correct orientation, and in purpose-built racks which shall hold the samples securely. Stack the core boxes by investigation station and box order;

4. Deliver samples to the laboratory specified by the CM within 3 working days of receipt of an instruction. Raise with the CM any discrepancies between the laboratory testing schedule attached to the instruction and the samples, such as incorrect sample depths or reference numbers, prior to delivery. Obtain a signed delivery docket to record the delivery and check off all the samples with a representative from the laboratory.

**INSPECTION PITS, TRIAL PITS, TRIAL TRENCHES AND SLOPE SURFACE STRIPPING**

**GIN.W710.7**  
**INSPECTION PITS**

1. Start all land boreholes and drillholes by means of a hand excavated inspection pit, not less than 0.25 m² on plan and not less than 2 m deep, unless otherwise Instructed;

2. Assist excavation with hand operated power tools where hard strata cannot be broken out without the use of such tools;

3. Do not commence boring or drilling until the presence or otherwise of all services/utilities have been established;
4. Measure the positions, depths and dimensions of all services/utilities encountered and record them as part of the report;

5. Take small disturbed samples every 0.5 m in all common ground layer encountered in the inspection pits for logging purposes, commencing at ground level or below any concrete or road surfacing layers;

6. Where the holes are located near underground electricity cables, comply with the "Code of Practice on Working near Electricity Supply Lines" issued by Electrical and Mechanical Services Department.

GIN.W720.7 EXCAVATION OF TRIAL PITS AND TRIAL TRENCHES

1. Excavate trial pits and trial trenches by manual methods to the termination requirements or depths Instructed. Do not use powered tools unless otherwise agreed by the CM;

2. Remove the excavated material from the site and import the same or similar material for subsequent backfilling. For excavations on sloping ground, protect the material in such a manner that it does not fall or wash downhill or in any way enter surface water drainage system. Protect all excavated material from the weather. Also take all necessary measures to prevent the ingress of surface water into the excavations;

3. Before commencing any excavation, carry out three dynamic probing tests in a triangular pattern not more than 800 mm apart around the centre of each proposed trial pit unless otherwise Instructed. In trial trenches, carry out one dynamic probing test for each 1.0 m² of plan area of the excavation, equally spaced, unless otherwise Instructed. Terminate all probes at the initial Instructed depth of the trial pit or trial trench. On sloping ground, terminate each individual dynamic probing test at the Instructed base of the trial pit or trial trench. Make a second attempt for each test if refusal is met before the Instructed termination depth, at a distance of not less than 150 mm from the original position;

4. Submit to the CM the preliminary results of the dynamic probing tests carried out prior to excavation with the relevant daily site records for each trial pit or trial trench excavated. Include the dynamic probing test results in the Final Fieldwork Report and provide them in AGS digital format; and

5. Inform the CM immediately when each trial pit or trial trench has been completed, or if hard strata are encountered. Carry out logging or photography of each trial pit or trial trench after the termination of each excavation has been Approved.

GIN.W730.7 SIZE AND SUPPORT OF TRIAL PITS AND TRIAL TRENCHES

1. Trial pits shall have nominal plan dimensions of 1.5 m x 1.5 m to their full depth of excavation, unless otherwise Instructed or due to restricted space at the pit location or where prevented by the presence of hard strata. Where trial pits are excavated on sloping ground, the base of each pit shall be horizontal and any Instructed termination depth shall be taken as the depth of excavation at the midpoint of the base to original ground level;

2. Provide or carry out benching, shoring and access ladders such that personnel can safely inspect the sides and base of the pit or trench or carry out in-situ tests and take undisturbed samples;

3. Trial pit or trench sides shall be vertical and shored in such a manner that the natural ground shall be clearly visible throughout the height of each face;

4. Adequately support the sides of all excavation exceeding 1.2 m deep at all times to comply with the Construction Site (Safety) Regulations by using a method approved by the CM to ensure the safeguarding of life and property;

5. This clause shall in no way relieve the Contractor of his obligations or responsibilities under the Conditions of Contract.
GIN.W740.7 ACCESS TO TRIAL PITS AND TRIAL TRENCHES
1. Provide such ladders and platforms as may be necessary such that personnel can safely inspect the sides and base of the pit/trench, take photographs and carry out in-situ tests and take undisturbed samples as necessary in the trial pits or trial trenches;
2. Provide such pumps as may be necessary to maintain the excavation free from water and such ventilation and lighting as may be needed to ensure the safety of people working in the pit/trench. The base of each excavation shall be clearly visible during logging and taking of photographs.

GIN.W750.7 PUBLIC SAFETY
At all times when a trial pit or trial trench is left unattended, provide a strong wooden cover securely battened down and appropriate fencing to prevent persons and animals from falling into the excavation.

GIN.W760.7 PHOTOGRAPHS OF TRIAL PITS AND TRIAL TRENCHES
1. Within 2 working days of the date of Approval of any trial pit or trial trench, take photograph of trial pit or trial trench using a reference board with maximum dimensions of 300 mm (width) by 450 mm (length). Each face and the base shall be photographed;
2. Each photograph shall cover a length of the excavated face of between 1.5 m and 2.0 m in both vertical and horizontal directions. Where more than one photograph is required to cover the full excavated depth or length of a face, the overlap between adjacent photographs shall be between 10% and 20%;
3. Each photograph shall identify the face of the excavation and shall contain a natural scale. In the case of trial trenches, it shall also identify the location of the photograph by the metrage along the face of the excavation;
4. One colour print of minimum size 85 mm x 125 mm of each trial pit or trial trench photograph shall be supplied with the draft fieldwork report. Each copy of the Final Fieldwork Report shall contain colour photocopies of A4 mounted prints of minimum size 125 mm x 175 mm. Within 3 weeks of the award of the Contract, submit the name(s) of the suppliers and samples of the colour photocopies proposed for use in the Contract for the CM's approval. The quality of the approved colour photocopies shall be maintained throughout the duration of the Contract;
5. The method of photography shall be agreed with the CM prior to carrying out the work and shall be in accordance with GIN.W1240; and
6. Submit one copy of photographs of the trial pit or trial trench to the CM for approval before backfilling of the trial pit or trial trench.

GIN.W770.7 BACKFILLING OF INSPECTION PITS, TRIAL PITS AND TRIAL TRENCHES
1. Backfill inspection pits on completion of the drillhole. Plug at the bottom with concrete or similar material;
2. Backfill trial pits and trial trenches within 2 working days of the date of issue of an instruction from the CM. The backfilling material shall contain no material exceeding 200 mm in size, refuse, metal, rubber or synthetic material, peat, vegetation, perishable material, toxic material or material susceptible to combustion or to volume change;
3. Compact the material used to backfill inspection pits, trial pits and trial trenches until original ground level is restored. Compaction for trial pits and trial trenches shall be performed mechanically in successive layers of not more than 150 mm thick. Restore the ground surface to its condition prior to the excavation, i.e. any pitching, paving, chunam, concrete or turf shall be replaced;
4. As backfilling of each trial pit or trial trench proceeds, remove progressively timber, sheeting and other excavation supports, but the removal of such supports will not relieve the Contractor of his responsibilities for the safety and stability of the Works;

5. On completion of backfilling and prior to any reinstatement of the ground surface at the location of any trial pit or trial trench, carry out a further set of dynamic probing tests unless otherwise instructed. Carry out three such tests in a triangular pattern not more than 0.8 m apart around the centre of each trial pit, whilst in trial trenches one such test shall be carried out for each 1 m² of plan area of the excavation, equally spaced. Terminate each test at the level of the excavated base of the respective trial pit or trial trench. Make a second and final attempt for each test if refusal is met before the required depth, at a distance of not less than 150 mm from the first test. Submit to the CM the results of the dynamic probing tests with the relevant daily site records for each trial pit or trial trench excavated, or to volume change. Compact the material used to backfill inspection pits, trial pits and trial trenches until original ground level is restored;

6. Compact the backfill material such that the average dynamic probing test value of the post-backfilled set of probes at any level within the excavation depth of the pit or trench excavation, shall be 80% of the average value of the pre-excavation set of probes at the same level, and no less than 10 blows/100 mm. Notwithstanding this requirement, fill and compact any subsequent depression of the ground surface occurring due to settlement;

7. For backfilling under an Excavation Permit, no broken concrete, bricks, clay, bituminous materials, materials susceptible to spontaneous combustion, perishable materials or debris shall be present in the backfill materials. The backfill materials shall not exceed 75 mm maximum particle size. The work shall comply with the requirements set out in the Conditions of Permit. The more stringent requirement shall prevail in case of any ambiguities or discrepancies between this clause and the Conditions of Permit. Satisfactory compaction of backfill shall be demonstrated by testing for relative compaction in accordance with the Worksection EAR. Relative compaction testing shall be carried out for every meter depth of backfill in each trial pit and trial trench, at locations instructed by the CM.

GIN.W777.7 RECORDS OF INSPECTION PITS

Include details of each inspection pit in the relevant daily site record and drillhole record. Submit a photograph taken vertically downwards into each inspection pit together with the daily site record for the relevant drillhole. A board showing the Contract number, Works Order number where applicable, and drillhole number, and the depth indicator used shall be clearly visible in the photograph.

GIN.W780.7 RECORDS OF TRIAL PITS AND TRIAL TRENCHES

1. Submit daily site records for trial pits or trial trenches in accordance with GIN.W040. The format of daily site records shall be to the approval of the CM. The information required on the daily site records is listed below:
   a. Site name, Contractor's name, Contract number and Works Order number where applicable, trial pit or trial trench number;
   b. Dates of excavation and weather conditions;
   c. Depths and details of all sampling and field testing including total blow count for driven samples and sample recovery; and
   d. Any other relevant information e.g. comments on stability, maximum and average trial pit and trial trench depths and plan dimensions, water inflow, powered tools used.
2. Submit preliminary and final records for trial pits or trial trenches in accordance with GIN.W040. Present the records in the format as shown in Appendix III to this Worksection, unless otherwise agreed by the CM. The record for each trial pit or trial trench shall contain the following information:
   a. Site name, Contractor's name, Contract number and Works Order number where applicable, trial pit or trial trench number;
   b. The reduced level at the centre of the pit for trial pits located on level or sloping ground; the reduced levels of both ends of the longer axis for trial trenches;
   c. Dates during which trial pit or trial trench was excavated;
   d. Dimensions of trial pit or trial trench and its orientation;
   e. The co-ordinates of the centre of the pit for trial pits; the coordinates of both ends of the longer axis for trial trenches;
   f. Water levels with full details of fluctuation and locations of seepages. If no water is encountered, this shall be recorded;
   g. A hand drawn (preliminary) and computer-generated (final) representation of the features and material types encountered in each face and the base of the trial pit or trial trench. Fill shall be shown as its constituent materials in the face sketch and its legend pattern in the legend column;
   h. Details of photographs taken;
   i. Stability conditions during excavation;
   j. Locations and types of samples taken;
   k. In-situ test types and locations;
   l. The size and orientation of any services encountered;
   m. A sketch showing the dimensions of any sub-surface structures, including foundations exposed in the excavations;
   n. If pumping was required during excavation this shall be noted and an estimate of the rate of inflow of water made;
   o. Sign of any settlement caused by excavation; and
   p. A "remarks" section which shall include groundwater and wall stability observations, average and maximum depths, use of shoring and details of any obstruction encountered. If the required number of dynamic probing tests was not carried out, the excavation was terminated earlier than specified, or the plan area of the excavation was reduced, these facts shall be noted with reasons.

GIN.W790.7 SLOPE SURFACE PROTECTION STRIPPING

1. Strip and dispose of surface protection, including that containing reinforcement, from slopes to expose underlying common ground or rock. The width of stripping shall be 500 mm, unless otherwise Instructed, with the axis of the strip parallel to the dip of the slope. The underlying common ground shall be excavated to a minimum depth of 100 mm and up to 300 mm as Instructed;

2. Terminate all excavation if boulders, rock or hard strata are encountered, unless otherwise Instructed. Start the stripping at the top of the slope and proceed downwards unless otherwise Instructed. Horizontal stripping may also be required;

3. When Instructed, limit stripping to specified intervals (windows) along the instructed length and provide a record for the full instructed length of the stripping to the CM;

4. Provide access for inspection by the CM;
5. Protect all exposed surfaces in such a way as to minimise the channelling of rainwater run-off. Cover up stripped areas at the end of each working day and during rainstorms to prevent the ingress of water into the slope;

6. Backfill the excavation in common ground with material approved by the CM. Reinstall stripped areas in form, colour, and conditions similar to the original conditions unless otherwise Instructed. Obtain the permission of the CM before reinstatement starts;

7. Submit preliminary and final slope stripping records in accordance with GIN.W040. Present the records in the format as shown in Appendix III to this Worksection, unless otherwise agreed by the CM. Records of the stripped areas shall contain the following:
   a. Descriptions of strata (including decomposed rock) encountered;
   b. Levels and co-ordinates of the top and bottom of strips, berms, benches and changes in type of slope surfacing. The survey results shall include all points on each strip where there is a change in gradient. Any other salient features shall be noted e.g. dip and dip direction of joints;
   c. The direction and bearing of the slope and the results of any in situ testing carried out;
   d. A dimensioned sketch of the strip cross-section; and
   e. Photographic records as specified in GIN.W1240. The photograph of the exposed slope face shall be of such a size that it occupies the full height of an A4 size page.

DRILLING AND HAND AUGERING FOR GROUND INVESTIGATION

GIN.W810.7 METHOD AND PLANT TYPE

1. Inform the CM or his Representative immediately prior to the commencement of any drilling. Unless otherwise Instructed, sink drillholes for ground investigation by rotary methods;

2. Undertake drillholes by using rigs that meet the following requirements:
   a. Drilling rigs shall be of the hydraulic feed type having the capacity to drill in the sizes and to the termination requirements or depths Instructed;
   b. Drilling rigs shall be capable of providing stable drill-string rotation at speeds in the range 50-1250 rpm and have a minimum ram stroke length of 400 mm if applicable. The rigs shall be fitted with a tachometer, a hydraulic feed pressure gauge of an appropriate scale and a pressure gauge for reading water-flushing pressure. The hydraulic feed pressure readings shall be readily converted to loads transferred to the bit in pounds or kilograms according to the manufacturer’s specification. In order to provide a means of measuring penetration and estimating the rate of advance, a rigid rod, clearly graduated in 10 mm increments, shall be permanently attached to, and parallel with, the hydraulic feed rams;
   c. Drilling rigs shall have the company name and a unique rig number clearly and conspicuously marked; and
   d. Drilling rigs shall be capable of drilling both vertical and inclined holes at any angle.

3. Undertake coreholes by using portable electric powered coring rigs that meet the following requirements. Other types of portable coring rig shall be subject to the approval of the CM:
   a. The rig can be attached securely to the structure being cored to minimise vibration;
b. The rig shall be such that cores of H size or larger can be obtained to a depth of 6 m measured along the axis of the hole, and that either water or air-foam can be used as flushing medium;

c. The rig shall be capable of drilling at any inclination and shall be of such type that samples of common ground can also be obtained from beyond the structure being investigated.

4. The core barrels, drill rods and drill bits of drilling equipment for ground investigation shall be of a type appropriate to the purpose of the drilling and sampling. Triple tube core barrels shall be provided with bits suitable for air-foam flush. The type and make of core barrels shall be approved by the CM;

5. The size of casings shall be appropriate to the drilling, coring, sampling, testing and other installation requirements;

6. Use only standard nominal lengths of casing and drill rods. The mixing of standard nominal imperial and metric lengths is not permitted;

7. Casings and drill rods shall be straight, in good condition, clean at the time of drilling and free from scale, dirt and other loose material;

8. All accessories and spare parts shall be as supplied or recommended by the same manufacturer unless otherwise approved by the CM. They shall be compatible with the equipment in use and with each other. Sufficient spares for core barrels, core bits, core lifters and other accessories shall be available for use on Site without causing any delay to drilling operations. The condition of the core bit in use shall be carefully monitored and if any damage occurs, such as breaking of teeth, it shall be replaced immediately;

9. Always maintain core barrels in proper working order and pay particular attention to the condition of the extrusion piston. Maintain the rubber O-rings in good condition so that no water escapes past the piston during extrusion of the cores;

10. Use sediment catcher tubes attached to the top of the core barrels if Instructed. The tube shall have the same external diameter as the core barrel, and be approximately 0.75 m long;

11. Store core barrels and drill rods on steel frame trestles;

12. Types of core barrel(s) to be used for individual drillholes will be as Instructed;

13. The methods and equipment used shall be such that:

   a. The soils encountered and the levels at which changes in ground conditions occur can be accurately identified;

   b. The specified sampling requirements can be achieved;

   c. All in-situ tests referred to in this Worksection can be undertaken and field installations incorporated at any depth in the hole;

   d. Consistency of measurement and minimal disturbance of the ground is achieved;

   e. Drilling of holes shall be executed in a sequence as indicated on the ground investigation Drawings unless otherwise Instructed.

14. Rotary drilling shall normally be carried out with diamond, tungsten carbide or combination tipped core bits which shall be suitable for the percentage core recovery and diameters required by the Contract. The type and state of the core bit, feed rates and management of the drill string shall be such that the specified minimum acceptable core recovery in any single core run can be obtained where the condition of the ground permits;
15. Common ground around the bottom of a drillhole shall not be unduly disturbed by water entering or leaving the hole, or by stress relief. The water level in a drillhole shall be kept at least 1 m to 2 m above the ambient groundwater level at all times, unless otherwise instructed. Rapid withdrawal of rods and sampling equipment, causing rapid fluctuation in the water level inside the casing, shall be avoided.

16. Advance casings concurrently with the removal of material in such a manner that loss of ground is avoided. Set larger casings concentric with drillholes that are being reamed.

17. When instructed, drill coreholes through retaining walls or other man-made structures by using single tube core barrels. Handle, photograph and report the core obtained as if it were rock with the exception that the submission of data in digital format is not required.

**GIN.W820.7 SIZE OF DRILL HOLES**

1. The size of bits, core barrels and casing shall conform to BS 4019-3:1993 or as otherwise agreed by the CM. Whenever required by the CM, drilling rigs shall be capable of drilling and recovering samples, vertically or inclined, with casing to a depth of 60 metres in S or P size, 160 metres in H size and 200 metres in N size. For purpose of pumping test, provide rigs of adequate capacity for drilling holes of minimum 250 mm diameter;

2. When instructed, increase the size of a drillhole by reaming. The larger casing shall be set concentric with the existing hole and shall be sunk parallel with it.

**GIN.W825.7 CATEGORIES OF CORE DRILLING**

Three categories of core drilling shall be available:

1. Category 'A' – Water/Air-foam flush with triple tube core barrels using split inner tube (4C-MLC, HMLC or NMLC);

2. Category 'B' – Water/Air-foam flush with double tube core barrels (T2-101, TNW or products having equivalent functions or performance approved);

**GIN.W828.7 RECOVERY OF CORES**

1. Total core recovery is defined as the length of core recovered expressed as a percentage of the length of core run carried out;

2. The total core recoveries given below are the minimum which shall normally be accepted for the categories of drilling as defined in **GIN.W825**:

<table>
<thead>
<tr>
<th>Minimum Acceptable Total Core Recovery for Category of Drilling (%)</th>
<th>Category</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>‘A’</td>
</tr>
<tr>
<td>Rock of Decomposition Grade of I to III or concrete or boulder</td>
<td>98</td>
</tr>
<tr>
<td>Common ground</td>
<td>80</td>
</tr>
</tbody>
</table>

**GIN.W830.7 CORING RUN LENGTH**

1. Limit coring runs to a maximum length of 1.5 m;
2. If the percentage core recovery in a core run is less than that specified, reduce the following core run by 50%, to a minimum length of 0.5 m;

3. Notwithstanding the above requirements, withdraw the core barrel and remove the core more frequently as necessary to secure the maximum possible core recovery when approved by the CM.

**GIN.W840.7 BLOCKED DRILLHOLE**

The core shall be removed from the drillhole immediately if blocking of the bit or grinding of the core is apparent regardless of the length of run which has been made.

**GIN.W850.7 USE OF LUBRICANTS AND FLUSHING MEDIUMS**

1. Do not use drilling lubricants other than clean water unless otherwise Instructed;

2. If the flushing medium is water, comply with the followings:
   a. Provide a pump equipped with a gear box and capable of delivering up to 2 litres/sec;
   b. The pump shall incorporate a "surge" bottle to reduce fluctuations in water pressure and the suction hose shall be fitted with a suitable filter. It shall have a by-pass system allowing full control of water flow at all pump delivery rate;
   c. A flowmeter and a pressure gauge shall be directly fitted into the water supply line on the 'downstream' side of the by-pass valve. The flowmeter shall give an immediate visual indication of flow rate (e.g. a large rotating wheel) and be capable of measuring flow rates to the nearest 0.01 litres/sec.

3. If the flushing medium is air with foam additive, comply with the following:
   a. Provide an appropriate air-compressor and all necessary ancillary equipment to carry out drilling with air-foam flush to the CM's satisfaction;
   b. The foam return shall be the consistency of thick shaving cream and the hole shall be kept full of foam at all times. The foam shall either be fully biodegradable or water soluble and arrangements shall be made for the collection and removal or dispersal of the foam returns, if required. The proposed foam additive and mixes shall be to the approval of the CM. A typical arrangement of air-foam mixing and flushing system is shown in Figure 12, Geoguide 2.

4. Flushing media shall be passed through a sedimentation basin and shall be either re-used or be discharged to surface drains or natural stream courses, except stream courses that are used as a supply of drinking water. Take measures to prevent the flushing medium from seeping through the ground. Provide excavated re-circulation pits or re-circulation tanks at the drillhole locations if the flush returns cannot be discharged safely or if Instructed. If necessary, provide temporary settling ponds or tanks to remove drilling cuttings/arisings prior to the disposal of flush returns.

**GIN.W860.7 RAPID DRILLHOLES**

1. The Contractor may be required to form holes up to 250 mm diameter and 60 m deep in soil or rock using rapid rotary-percussive methods with air or water as flushing medium and as follows:
   a. The OD method (Overburden Drilling): this will require the use of top-hammers to advance bit and casing tubes at the same time;
   b. If required by the CM the casing tubes, or Approved equivalent, shall be left in the drillhole to enable drilling to continue with conventional core barrels;
c. Accurately measure and record the rate of penetration with this method of drilling. The method of measurement of penetration will be to Approval. The measurement of the rate of penetration can generally be achieved by timing, with a stop watch, the passage of a fixed point on the drillrods over a unit distance which can vary from 0.15 m to 1.0 m;

d. The Final Report shall include a graphical record of rate of penetration against depth for each rotary percussive drillhole.

2. As far as possible consistent pressures and rotation speeds should be used with rotary percussive drilling. Changes in any drilling parameters such as bit pressure or gearing etc should all be recorded and presented with the penetration record for the drillhole;

3. This drilling technique may be required for proving bedrock, probing for boulders, forming holes rapidly for the installation of instruments or forming inclined holes for the installation of drains.

GIN.W865.7 ROTARY OPEN HOLE DRILLING

Advance a hole up to 170 mm in diameter and to a maximum depth of 40 m in common ground, rock or hard strata without the recovery of core or samples by means of a tricone roller bit, drag bit or other non-coring bit with water as the flushing medium.

GIN.W870.7 INCLINATION AND BEARING MEASUREMENT OF DRILLHOLES

1. When required by the CM, measure and report the inclination and bearing of a drillhole using a single-shot or multi-shot photographic survey tool or similar Approved instrument;

2. Report the results of each test on the daily site records and state the average inclination and bearing over the length of the drillhole on both the preliminary and final record. Submit the original film data with the daily site records.

GIN.W910.7 DRILLING RECORDS

1. The information required on the daily site record and records of a hole are listed below:

   a. Contractor's name, Contract number, Works Order number where applicable, Site name and hole number;
   b. Rig type, number, operator, hours worked and method of drilling;
   c. Dates of operation and weather conditions;
   d. Ground level of hole, the depth of each stratum from the surface and level of samples, in-situ tests and field installations;
   e. Details of all samples including blow counts of driven samples, in-situ tests and field installations and inclination/orientation of hole;
   f. Details of casing and length of casing;
   g. Water levels at start of shift, end of shift, and at times as GIN.W210;
   h. Full and continuous description of the material encountered in the hole, including the classification of each stratum by name and, when required by the CM, the characteristics of the discontinuities all according to Geoguide 3;
   i. Water return;
   j. Details of any delays, standing time;
   k. Rock Quality Designation (RQD), Fracture Index, Core Recovery and Rock Grade as defined in Figure 4 of Geoguide 3;
   l. Co-ordinates of hole position related to the Hong Kong Metric Grid;
m. Legend (Drillhole Records);
n. Any other relevant information.

2. Present the daily record sheets and record sheets of a hole in the format as shown in Appendix III to this Worksection, unless otherwise agreed by the CM.

GIN.W920.7 BACKFILLING OF DRILLHOLES AND ROTARY OPEN HOLES

1. Backfill all drillholes and rotary open holes in which no instrumentation will be installed with cement bentonite grout within one working day of the completion of the hole. The cement bentonite grout shall be a pumpable mix of cement and bentonite in the proportion of 4:1 by dry weight, or an alternative mix agreed by the CM. The water content of the grout shall be limited to that necessary for proper mixing and placement. In no case shall the water:cement ratio exceed 3. The resulting grout shall be free of lumps and foreign material;

2. When Instructed, backfill drillholes with cement grout with water/cement ratio not exceeding 0.45 from the bottom of the drillholes up to a depth specified by the CM. Backfill the remaining portion of the drillhole by cement bentonite grout as described in sub-clause (1) above after the cement grout has achieved initial set;

3. Submit a method statement to the CM for approval together with a trial showing the proposed equipment, material, mixing, handling and placement procedures including appropriate quality controls and checks to be adopted;

4. For each drillhole backfilled with grout, record the viscosity of the grout measured by Marsh Funnel and specific gravity of the grout measured by Mud Balance or any instrument of sufficient accuracy to permit measurement within ±0.01 g/cc. Keep a labelled jar sample of grout from each hole;

5. Unless otherwise Instructed, feed the grout into the bottom of the hole using a suitable pump and a tremie pipe, the end of which shall always be maintained below the grout/water interface. Remove casing in stages during grouting to ensure that the entire hole is backfilled. Check grout level at least 24 hours after initial grouting, and top up any significant drop in grout level with additional grout, or backfill with material agreed by the CM. Level and compact any subsequent depression;

6. Only if Instructed shall granular material, cement mortar or other materials be used to backfill the holes. Under no circumstances shall the Contractor use cement-bentonite balls (i.e. mixed paste) to backfill the hole;

7. Include in the daily site record a complete record of backfilling operations including the quantity of grout placed, the drop in grout level after 24 hours, the viscosity and specific gravity of the grout and any other relevant information and submit the record to the CM within 3 days of completion of backfilling;

8. For backfilling involving an Excavation Permit, the work shall comply with the requirements set out in the Conditions of the Excavation Permit. If there are any discrepancies between this clause and the Conditions of the Excavation Permit, the more stringent requirement shall prevail.

GIN.W930.7 BACKFILLING OF COREHOLES

Backfill each corehole with sand and cement mortar (1:1 ratio by weight) unless otherwise Instructed.

GIN.W940.7 METHOD OF AUGERING

1. Auger holes shall be advanced using hand-operated helical or post-hole type augers;

2. No material other than clean water shall be added to the auger holes and only when Approved;

3. Casing will not be required.
GIN.W950.7 DIAMETER OF AUGER HOLES

Post-hole auger holes shall be at least 100 mm diameter unless otherwise specified or Instructed.

FIELD INSTALLATIONS

GIN.W1110.7 INSTALLATION OF STANDPIPES

1. When Instructed, install standpipes in completed boreholes or drillholes (the holes) as indicated in Appendix V to this Worksection. Install the standpipes within 3 working days after the date of receiving the instruction;

2. The standpipes shall consist of rigid uPVC tubing to the dimensions as described in GIN.M120 for piezometer. The tube shall be capped at its lower end, and perforated/slotted in accordance with the Appendix V;

3. The upper imperforated end of the tube shall be set in concrete and fitted with an air vented uPVC cap and lockable surface box as shown in Appendix IV to this Worksection;

4. Fill the annular space between the perforated uPVC pipe and the wall of the hole with 6 mm to 10 mm size aggregates for its full length;

5. Take readings of water levels in standpipes as described in GIN.T010. Submit preliminary results within 3 working days after the date of completion of water level monitoring and tabulate and incorporate the results in the Final Fieldwork Report.

GIN.W1130.7 INSTALLATION OF PIEZOMETERS

1. When Instructed, install piezometers in completed boreholes or drillholes (the holes) as indicated in Appendix V to this Worksection. Install the piezometers within 3 working days after the date of receiving the instruction;

2. The upper end of the tube shall be set in concrete and fitted with an air vented uPVC cap and a lockable surface box as shown in Appendix IV to this Worksection;

3. Prior to installation, flush the completed hole with clean water to remove loose materials. Where the depth of the completed hole is greater than the depth at which the piezometer tip, sand filter and bottom bentonite seal are to be installed, the hole below the seal shall be grouted;

4. The grout shall consist of cement and bentonite in the proportion of 1:1 by weight or alternative mix as agreed by the CM. Bentonite shall be thoroughly mixed with water for at least 15 minutes before cement is added;

5. Place sufficient grout in the hole using a tremie pipe reaching to the bottom of the hole, such that the top of the grout shall finish 1.0 m below the base of the Instructed response zone. Bentonite pellets of between 10 mm and 15 mm in size, or other material to the approval of the CM, shall be placed in the hole and shall always be tamped with a suitable shaped tamper to form a homogeneous plug 1 m thick;

6. Extend the sand filter surround to the piezometer tip forming the response zone to at least 500 mm above and below the piezometer tip unless otherwise Instructed. The sand filter shall comprise clean sand, falling wholly between the grading limits of 200 and 1210 microns, and the volume of the sand filter placed shall be recorded on the daily site records. Alternative filter material shall be to the approval of the CM;
7. Where there is water in a hole, allow sufficient time for all the sand to settle, and measurements of the upper surface of the filter shall be taken from time to time to ensure this. Bentonite pellets, or other material to the approval of the CM, shall then be placed above the sand filter in the hole and shall always be tamped with a suitable shaped tamper to form a homogeneous impermeable plug 1 m thick. The depth of all boundaries in an installation shall always be recorded on the daily site records;

8. Backfill the hole above the compressed bentonite pellets with the cement/bentonite grout as described above to the details shown in Appendix V to this Worksection;

9. Take preliminary readings of water levels in piezometers as described in GIN.T010. Submit preliminary results within 3 working days after the date of completion of water level monitoring and tabulate and incorporate the results in the Final Fieldwork Report.

GIN.W1135.7 INSTALLATION OF BUCKETS IN STANDPIPES AND PIEZOMETERS

1. When Instructed, fabricate strings of buckets and install them in standpipes/piezometers. Install the buckets within 3 working days after the response test or within 3 working days of receiving an instruction, whichever is the later. The details of fabrication are as shown in Figure 23 of Geoguide 2;

2. Each installed bucket shall have the depth below existing ground level clearly marked at the mid point of the bucket. Include a record of all buckets including their depth and date of installation in the relevant daily site records.

GIN.W1140.7 MONITORING STANDPIPES AND PIEZOMETERS

1. When Instructed, monitor either previously installed existing standpipes/piezometers or those standpipes/piezometers installed by the Contractor in accordance with this Worksection;

2. Where standpipes/piezometers contain buckets, they shall also be monitored. Empty all buckets after monitoring. Lock surface boxes securely after monitoring;

3. Take standpipe/piezometer readings at intervals as Instructed;

4. Reading intervals will vary depending on the time of year and the weather. Dates for readings and report submissions shall be given by the CM;

5. Submit the reading results to the CM within 3 days of the reading date;

6. The wet season shall be taken as being from 1\textdegree{} May to 31\textdegree{} October and intense rainfall shall be rainfall greater than 100 mm/day.

4. Submit reading results with an updated list of water level readings and in graphical plots for each tube as per the typical layout at Appendix VII to this Worksection. Submit two copies of each to the CM within 3 days of taking the readings;

5. The graphical plots shall include rainfall information from Geotechnical Engineering Office, Civil Engineering Development Department (GEO, CEDD) rainfall station nearest to the standpipe/piezometer. Propose for Approval the rainfall station to be used. An information sheet on all GEO rain gauges is published monthly by the Geotechnical Information Unit, GEO, CEDD;

6. Holes may have more than one standpipe/piezometer tubes but readings shall be taken in each tube. The measurement for standpipe/piezometer readings shall be for each tube reading.
GIN.W1145.7 AUTOMATIC GROUNDWATER MONITORING DEVICE IN STANDPIPES AND PIEZOMETERS

1. When Instructed, monitor groundwater levels in standpipes/piezometers by an automatic groundwater monitoring device. Submit details of the automatic groundwater monitoring device and report format to the CM for Approval;

2. Holes may have more than one standpipe/piezometer tubes. When Instructed, carry out automatic groundwater monitoring for the tube(s);

3. The automatic groundwater monitoring device shall comply with the following minimum requirements:
   a. Memory capacity: 24,000 measurements (non-volatile);
   b. Sampling rate: 0.5sec to 99 hours;
   c. Measurement range: 30 m H$_2$O with accuracy of 0.025 m H$_2$O and resolution of 0.01 m H$_2$O.

4. Download monitoring data as Instructed by the CM;

5. Submit monitoring data with an updated list of water level readings taken by dipmeter in graphical plot. Submit two copies of each and a floppy disk or CD-ROM containing the monitoring data in digital format to the CM within 3 working days of downloading the monitoring data;

6. Include graphical plots of rainfall information from Geotechnical Engineering Office, Civil Engineering Development Department (GEO, CEDD) rainfall station nearest to the standpipe/piezometer. Propose for Approval the rainfall station to be used. An information sheet on all GEO rain gauges is published monthly by the Geotechnical Information Unit, GEO, CEDD.

GIN.W1150.7 FLUSHING OUT STANDPIPES AND PIEZOMETERS

When Instructed, provide all necessary labour, plant and material to clean out blocked piezometers and standpipes by water flushing.

GIN.W1160.7 INSTALLING INCLINOMETER ACCESS TUBES

1. When Instructed, install inclinometer access tubes in existing or new drillholes for measuring ground movements in directions perpendicular to the drillhole axis;

2. All components of the inclinometer system shall be from the same manufacturer to the approval of the CM;

3. 
   a. The access tube shall be of rigid PVC tubing with a bore of 50 to 70 mm. It shall be self aligning and contain 4 longitudinal keyways equally spaced around the perimeter precisely manufactured to fit the wheel dimensions of the torpedo as described in GIN.W1170 through the entire length of the tube;
   b. The access tube shall be supplied and installed in not less than 3 m lengths except for one shorter length as required to suit the total required depth;
   c. The tubes shall be joined together with Approved couplings and rivets with sealing mastic applied to each rivet head and also to the points where tubing enters a coupling;
   d. The whole joint assembly shall be wrapped in impregnated water-proofing tape and the end cap shall also be fixed and sealed in a similar manner.

4. 
   a. Before the assembled access tube is lowered into a drillhole, the hole shall be pre-grouted in accordance with GIN.W930. The strength of the grout shall be comparable to that of the surrounding soil or rock;
   b. Clean water shall be added to the inside of the tubing to overcome buoyancy and the ingress of grout;
c. When installation is finished the tubing shall be completely filled with clean water and keyways aligned to the required directions.

5. When Instructed, the upper end of the tube shall be set in concrete and fitted with lockable surface box in accordance with details as shown in Appendix IV to this Worksection.

GIN.W1170.7 TAKING INCLINOMETER READINGS

1. 
   a. When Instructed, take inclinometer readings at the required frequency using an Approved biaxial torpedo. The torpedo shall be fitted with wheels and contain 2 servo-accelerometers located securely within a stainless steel water proof housing;
   b. The accelerometers shall have the sensing axes at 0° and 90°, allowing the angle of inclination of sensor and probe casing to be measured in two orthogonal directions;
   c. The sensitivity of the probe shall not be less than ±0.02 mm per 500 mm casing with a total System Accuracy of ±1.0 mm per 25 m of casing or better;
   d. The torpedo shall be able to negotiate access tube curvature of not less than 3 m radius.

2. The length of the wheel base shall be in the order of two thirds of the overall length of the probe body and the outside diameter of the torpedo (not including the wheels) shall be 25.4 mm or less. The operating range shall be 0° to 53° measured from the vertical. All electrical connections and the torpedo shall be fully waterproofed enabling the probe to operate and provide accurate and repeatable readings under water;

3. The wheels of the inclinometer probe shall be spring loaded enabling it to run precisely in the grooves of the inclinometer casing with a minimum of wobble in the 90° axis;

4. The inclinometer suspension/control cable shall be continuous with no splices or defects steel core with one piece waterproof neoprene jacket to prevent creep and slippage during use and of adequate length for all the holes on the project. It shall be limited to 10 mm diameter;

5. Reading shall be taken successively along the entire length of access tube at 500 mm intervals or shorter, and also at depths as directed by the CM. A set of readings is a down and up set for the first direction and 90° to the first direction. Another set of readings shall also be taken with the torpedo axis rotated through 180° to minimise face errors;

6. 
   a. Results of all inclinometer readings shall be presented to the CM within 3 working days of completion of each monitoring and shall include a profile of all the horizontal deviations from the true vertical at each measuring point in units of mm;
   b. Four copies of monitoring reports shall be submitted to the CM within 14 days of the completion of the required monitoring. The report shall contain all the results obtained in each monitoring and where appropriate the final monitoring report may be included in the Final Report to be submitted in accordance with GIN.W040.

GIN.W1180.7 MONITORING MOVEMENTS OF RETAINING STRUCTURES AND CRACKS

1. When Instructed by the CM or his Representatives, provide and install tell-tales, tilt-plates, nail heads for Demag gauge measurement, or similar approved type for measuring retaining walls or crack movements in all directions;
2. Prior to the installation and monitoring, submit to the CM details of the proposed instruments to be installed, monitoring equipments to be used, installation methods and monitoring methods for Approval. The details of the proposed monitoring instruments and equipments to be used shall be submitted with manufacturer's standard specification;

3. When instructed by the CM or his Representatives, monitor and maintain either existing monitoring instruments or monitoring instruments installed by the Contractor and readings shall be taken at the required frequency;

b. Results of all monitoring readings shall be presented to the CM within 3 working days of each monitoring.

4. a. Provide all equipment of every kind necessary for use in the execution of the monitoring works;

b. All equipment to be used shall be calibrated within the recommended calibration period and conform with the relevant manufacturer's standard specification prior to the start of each monitoring work;

c. Calibration certificates shall be supplied to the CM whenever an instrument is calibrated and the standard calibration procedure from the relevant manufacturer shall be followed and supplied together with required calibration interval and the most recent calibration carried out.

GIN.W1190.7 TILTMETER SYSTEM

1. The Tiltmeter System shall include three major components: tiltmeter sensor, mounting plate and read out unit;

2. a. The portable tiltmeter sensor shall utilise a closed loop, force-balanced servo accelerometer specifically designed for vertical or horizontal tilt measurements;

b. The tiltmeter sensor shall have a measuring range of ±50° from vertical or horizontal, with a sensitivity of 8 arc. seconds reading + 5 arc seconds/° C or better. The sensor unit shall have a stainless steel base and accelerometer housing. To operate, the sensor shall be oriented on the pegs of the mounting plate and an angle read on the four digit indicator display;

c. The mounting plates shall be cast from specially formulated porcelain with four equally spaced pegs on 102 mm diameter circumference. The plates shall be bonded to the rock, concrete, or metal surface by an Approved epoxy resin.

3. The readout unit shall be portable, powered by a rechargeable battery capable of operating for a minimum of 16 hours at 20°C. This readout unit shall have a 20 x 20 backlit LCD screen. The readout unit shall have a temperature rating of -20°C to +50°C and shall be housed in an aluminium case with a plastic jacket. The top of the box shall be splash proof with waterproof connectors.

GIN.W1200.7 TELTTEALES

1. The standard telltale shall be capable of monitoring movement across cracks in both horizontal and vertical directions. The instrument shall be manufactured using durable acrylic plastic with a linear coefficient of thermal expansion of 7.3 x 10⁻⁵ mm/°C;

2. The corner telltale shall be capable of monitoring movement across cracks in the corners in both horizontal and vertical directions. The instrument shall be manufactured using PVC rigid sheet with a linear coefficient of thermal expansion of 6.5 x 10⁻⁵ mm/°C;
3. The floor telltale shall be capable of monitoring settlement of floors relative to a wall or a column. The instrument shall be manufactured using PVC rigid sheet with a linear coefficient of thermal expansion of \(6.5 \times 10^{-5}\) mm/°C;

4. The displacement telltale shall be capable of monitoring movement across cracks when one surface moves out of plane with the other. The instrument shall be manufactured using PVC rigid sheet with a linear coefficient of thermal expansion of \(6.5 \times 10^{-5}\) mm/°C.

GIN.W1210.7 DEMAG GAUGE
1. The Demag Gauge shall consist of an Invar main beam with two conical locating points, one in a fixed position at one end, and the other, pivoting on a special knife edge. The pivoting movement shall be transmitted to a dial gauge graduated in \(2 \times 10^{-3}\) mm mounted on a table. The dial gauge shall be able to measure a maximum movement of 5 mm. The main beam shall be fixed to the pivot block with the dial table;

2. The gauge points shall be made by stainless steel discs and cemented to the structure using the setting out bar. The Demag readings are operator dependent. Ensure that the same technician always performs the gauge readings.

GIN.W1220.7 SETTLEMENT MARKERS
1. When Instructed, provide, install and monitor settlement markers at surface of existing features or at vertical face of building such as wall for settlement monitoring. Survey the settlement markers for level and position and plot on the Instrument Location Plan immediately after installation;

2. Surface Settlement Marker:
   a. The settlement marker shall be securely founded on level ground free from obstructions. Surface settlement marker shall be installed as in Appendix XVIII of this Worksection.

3. Building Settlement Marker:
   a. The settlement marker shall be installed as in Appendix XVIII of this Worksection and securely fixed to building free from obstructions.

GIN.W1230.7 MAGNETIC EXTENSOMETER
1. The magnetic extensometer shall include two major components:
   a. Magnetic target (magnet);
   b. Read switch probe.

2. For each number of magnetic extensometer ordered, it shall be equipped with a maximum 7 nos. of magnetic targets and the installation details including their depths and intervals shall be specified by the CM;

3. The magnetic targets shall be Spider Magnets comprising a PVC body with 3 Spring steel legs. The legs shall be Zinc Plate Type II coated for corrosion resistance and be attached to the body with stainless steel screws 120 degrees from one another. The legs shall be 210 mm long and require a force of at least 40N to pull the leg flush with the access tubing during tying. The magnet body shall have 6 or 12 Alnico V magnets equally spaced around its centre line;

4. The magnet shall be tied to the casing by a single wrap of 20 kg test nylon line around the top and bottom legs. The line shall be held in place by a draw pin which passes through a loop at each end of the lines. The draw pin shall be attached to a nylon cord at least 5 m longer than the installation depth. The magnet shall be held in its correct location on the access tubing by catching the top line in a tight score mark on the access tubing that will be no deeper than 0.5 mm. The magnet shall be released by withdrawing the pin from the magnet by pulling the nylon cord when it is at the required location in the borehole;
5. The Reed Switch Probe shall consist of a reel housing, the electronics and a tape with a probe at the end. The probe shall be 15 mm diameter made of stainless steel and shall house a miniature reed switch. The tape shall consist of a survey tape graduated in millimetres, coated with polyethylene, having two conductors running its length, either side of the survey tape. The reel shall be powder coated and have an epoxy painted stand. The reel shall have a light and buzzer to provide visual and audio response to magnetic fields;

6.  
   a. When instructed by the CM or his Representatives, monitor magnetic extensometer installed and readings shall be taken at the required frequency;
   b. Results of monitoring readings shall be presented to the CM within 3 working days of each test.

7.  
   a. Provide all equipment of every kind necessary for use in execution of the monitoring works;
   b. All equipment to be used shall be calibrated within the recommended calibration period and conform with the relevant manufacturer's standard specification prior to the start of each monitoring work;
   c. Calibration certificates shall be supplied to the CM whenever an instrument is calibrated and the standard calibration procedure from the relevant manufacturer shall be followed and supplied together with the required calibration interval and the most recent calibration carried out.

GIN.W1240.7  

PHOTOGRAPHS OF GROUND INVESTIGATION WORKS

1. Within 3 working days of the date of completion of the hole, take photograph of the samples and/or cores contained within each core box. The photograph shall contain a reference board giving details of:
   a. Contract number and Works Order number where applicable;
   b. Project title;
   c. Hole number;
   d. Core box number (where applicable);
   e. Depth below ground level of start and finish of all material in the core box;
   f. Contractor's name;
   g. Date of taking the photograph;
   h. Standard colour chart or similar;
   i. A reference scale for the entire board length marked in 100 mm units.

2. The following criteria shall also be fulfilled:
   a. The core is evenly lit with no shadows;
   b. The core box and reference board in each photograph fill the frame;
   c. The focal plane of the camera and the plane of the core box are parallel.

3. All cores, except those susceptible to deterioration on contact with water, shall be thoroughly moistened before being photographed. Where core boxes contain disturbed samples, the lids shall be removed from the containers so that the contents are visible in the photograph. The first disturbed sample in any photographed core box shall be identified by its unique sample number and depth so that subsequent disturbed samples in that box can also be identified;
4. All photographs taken during the Contract Period shall be either on good quality colour film or in digital format as instructed by the CM. It is essential to maintain a sharp image and good colour saturation of the photographs. Colour film shall be of the same manufacture, speed and type to maintain consistent colour balance. Soft copy of digital photographs (digital photograph images) shall be the original unaltered digital images taken with a digital camera that shall conform to the JPEG Exchangeable Image File (EXIF) Version 2.2 (or later version) standard;

5. All exposed film shall be processed at a professional laboratory to ensure even results throughout the Contract. Photographs of poor quality due to uneven colour balance, poor focus, missing information or other defects shall not be accepted and the Contractor shall re-photograph the subject at his own expense;

6. One full set of colour prints of minimum size 85 mm x 125 mm shall be supplied with the draft fieldwork report. Colour photocopies of A4 mounted prints of minimum size 200 mm x 250 mm shall be supplied in each copy of the Final Fieldwork Report. Within 3 weeks of award of the Contract, the name(s) of the suppliers and samples of the colour photocopies proposed to be used in the contract shall be submitted for the CM's approval. If approved, the quality of the colour photocopies shall be maintained throughout the duration of the Contract;

7. The photograph negatives, digital photograph images and all prints shall become the property of the Employer and shall not be used by the Contractor for any purpose without written consent from the CM;

8. 
   a. Photographs of soil samples may be required from selected boreholes as decided by the CM or his Representatives. These may include piston, undisturbed samples. The samples should be split longitudinally and photographed using the procedure as for the rock core except they should not be wetted. The top and bottom of each sample should be clearly labelled;
   
   b. Where photographs of soil samples are required, one copy of each soil sample photograph shall be included in each of the laboratory draft report, in each of the Final Reports;

   c. Split and take photograph all triaxial test samples (refer to GIN.T340).

GIN.W1260.7 DATA FOR SETTING OUT THE WORKS

1. It is the Contractor's responsibility to locate Lands Department Bench Marks and survey control points for his use in setting out of any Works. Carry out all survey and levelling work necessary for setting out of any Works in fulfilment of his obligations for setting out of the Works under the Conditions of Contract. In all cases, levelling shall be referred to the Principal Datum of Hong Kong;

2. Setting out and levelling shall be carried out to an accuracy of ±0.1 m and ±0.01 m respectively or as otherwise directed by the CM or his Representatives;

3. 
   a. If it is impractical to locate the Investigation Station within the area defined in GIN.W020 (17), reposition the Station with the prior approval of the CM;
   
   b. No drilling will be allowed to commence unless the setting out of the Investigation Station has been agreed by the CM or his Representatives.

4. Following completion of work at each Investigation Station, determine the coordinates of the Investigation Station to the nearest 0.1 m, and the ground level at the Investigation Station to the nearest 0.01 m. Submit these information to the CM or his Representatives within 3 working days of the completion of work at each Investigation Station;

5. Protect and fence adequately all survey pegs and marks erected to enable the proper execution of the Works;
6. When ordered by the CM, carry out additional setting out and levelling of Investigation Stations;

7. When ordered by the CM, carry out surveying to determine the co-ordinates and levels of Survey Stations set up by others.

GIN.W1270.7 RESULTS AND SAMPLES TO BECOME THE EMPLOYER'S PROPERTY

All the results of the investigation and testings shall be deemed to be the property of the Employer and shall not be divulged without the CM's consent. All cores, samples and other materials recovered from the holes shall also be deemed to be the property of the Employer and the Contractor shall not dispose of any such materials and samples except as directed by the CM or his Representatives.

GIN.W1280.7 TOLERANCES

Refer to Appendix H "Schedule of Tolerances" to this Specification.
TESTING

FIELD TESTS

GIN.T010.7 RESPONSE TEST AND WATER LEVEL READINGS IN STANDBIPES AND PIEZOMETERS

1. Within three working days of the completion of the installation of any standpipe/piezometer, carry out a Response Test in order to prove its successful operation. When Instructed, carry out Response Test on any existing standpipe/piezometer;

2. Carry out the test as for a falling head permeability test except that it shall be terminated after 60 minutes or when the water level has returned to its initial level, which is sooner. Before any Response Test is carried out, give the CM at least 1 working day's prior notice;

3. Submit preliminary results on a record sheet, to the approval of the CM within 1 working day of completion of each test. Include the results of all Response Tests in the fieldwork report;

4. For newly installed standpipes/piezometers:
   a. After completion of the Response Tests, read all standpipe and piezometer water levels daily whilst working on the Site until 7 days after installation of the last standpipe or piezometer;
   b. Subsequent readings on a periodic basis may also be required by the CM;
   c. Submit to the CM records of each readings which shall include hole number, site name, contract number, Works Order number where applicable, date and time of reading, reduced level of ground water surface and method of taking reading. All water levels recorded shall be presented in record charts in a tabular and graphical form as Appendix VII to this Worksection.

GIN.T020.7 IMPRESSION PACKER TEST

1. When Instructed, carry out drillhole impression packer surveys in vertical or inclined drillholes in TNW or T2-101 size, in accordance with Geoguide 2 and using equipment and methods to the approval of the CM. The impression packer equipment shall be capable of surveying a minimum 1.5 m length of drillhole for each test;

2. Carry out the survey by inserting the impression packer device into the drillhole to the depths Instructed, expanding the packers and obtaining an impression of the drillhole wall on the thermoplastic film surrounding the packers. The survey shall be referenced to a known direction by means of a downhole compass and sufficient time shall be allowed for the compass to set following the expansion of the packer. Great care shall be taken when placing the thermoplastic film onto the packers and when transferring the north point from the compass to the film;

3. If an impression packer survey is instructed over a continuous length of drillhole longer than the length of the impression packer itself, successive impression packer test sections shall overlap by a minimum of 250 mm to ensure continuity of information and cross-checking of the north direction between successive test sections;

4. Carry out measurements of the dip and dip direction of the discontinuity traces on the impression packer film. This will involve the measurement of the dip and dip direction of the joints contained in the section of core taken from the drillhole at the level of the impression packer, related to discontinuity traces on the impression packer film;
5. Present the results of the survey on a discontinuity log, in the format to be approved by the CM. Submit each set of preliminary logs to the CM with the preliminary logs of the hole and shall be presented in the Final Fieldwork Report in the same format.

**GIN.T040.7 N-SCHMIDT HAMMER TEST**

1. Schmidt Hammer testing using the N type Schmidt Hammer shall be carried out at the specified intervals on chunam strips. The CM may also instruct testing to be carried out at other locations;

2. The test shall be carried out on a smooth vertical soil face by trimming a patch of at least 100 mm square on the surface exposed after stripping of chunam surfacing. The test shall be conducted, with the hammer held in the horizontal direction, by striking at the vertical face of the patch;

3. Prior to each testing sequence, the hammer shall be calibrated using a calibration test anvil supplied by the manufacturer for that purpose. At each specified location, several initial "seating" blows shall be taken to ensure good contact. Ten consecutive readings shall then be recorded by striking the same spot;

4. Preliminary results shall be submitted to the CM within 2 weeks of the completion of the tests. The results shall be presented in the form specified in Appendix X to this Worksection. The results sheets shall also be included in the Final Report and the rebound values given in the slope surface stripping records to be submitted in accordance with GIN.W040.

**GIN.T050.7 STANDARD PENETRATION TEST**

1. The apparatus and procedure for standard penetration test (SPT) shall comply with BS EN ISO 22476-3:2005, amended by this clause as necessary. The drive hammer shall be a type incorporating an automatic trip mechanism to ensure free fall. The steel anvil of the drive assembly shall have a diameter of 145 ± 5 mm. The guide rod arrangement that permits the hammer to drop with minimal resistance shall have an outer diameter of at least 3 mm smaller than the diameter of the central hole of the hammer;

2. A cone ended adaptor with a 30° half angle shall be available to replace the open-ended driving shoe for use in gravel common ground, or if Instructed;

3. Carry out SPT below the level of the casing. The base of the drillhole shall be fully cleaned before the test starts. Jar samples shall be taken from the split-barrel shoe after each test;

4. The results shall be reported on daily site records and both preliminary and final drillhole records as the number of blows for the first 150 mm penetration (seating drive), in 75 mm increments, and subsequently the number of blows for each 75 mm penetration for 300 mm;

   a. The number of blows of the drive hammer required to achieve each 75 mm of shoe penetration until a total penetration of 450 mm has been achieved shall be recorded. The 'N' value shall be recorded as the sum of the number of blows of the driving hammer required to achieve the last 300 mm of shoe penetration:

   \[
   \begin{align*}
   \text{e.g.} & \quad 14, 16 \\
   & \quad 27, 29, 32, 36 \\
   \text{N} & = 124
   \end{align*}
   \]
i. If the full penetration of the seating drive is not achieved after 50 blows of the drive hammer, the number of blows and the penetration achieved (in mm) shall be recorded and the test continued with the test drive from that point:

<table>
<thead>
<tr>
<th>Seating Drive</th>
<th>Test drive</th>
<th>Summary</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>27, 23/35 mm</td>
<td>35,27,32,31</td>
<td>N = 125</td>
<td>Test drive commenced after completion of 50 blows in the seating drive.</td>
</tr>
<tr>
<td>50/20 mm</td>
<td>38, 100/50 mm</td>
<td>138/125 mm</td>
<td>Test drive commenced after completion of 50 blows in the seating drive; test terminated in increment 3.</td>
</tr>
<tr>
<td>50/20 mm</td>
<td>100/40 mm</td>
<td>100/40 mm</td>
<td>Test drive commenced after completion of 50 blows in the seating drive; test terminated in increment 2.</td>
</tr>
</tbody>
</table>

ii. During the test drive, if any of the first three increments of 75 mm penetration is not achieved after 100 blows of the drive hammer, or where total number of blows excluding the seating drive, reaching 200, the number of blows and the penetration achieved (in mm) shall be recorded and the test shall be terminated:

<table>
<thead>
<tr>
<th>Seating Drive</th>
<th>Test drive</th>
<th>Summary</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>17, 25</td>
<td>38, 100/50 mm</td>

<tr>
<td>17, 25</td>
<td>25, 30, 35, 110/70 mm</td>
<td>200/295 mm</td>
<td>Test terminated in increment 6.</td>
</tr>
</tbody>
</table>

5. The water level in the hole at the time of test shall be recorded and reported. When testing below the groundwater table particular care shall be taken to maintain water level in the drillhole at or above the ambient groundwater level;

6. When Instructed, provide liner samples in conjunction with the Standard Penetration Test as described in GIN.W480;

7. If liner samples have not been instructed, place the sample recovered from the split spoon immediately in a plastic container of minimum diameter of 100 mm, with a screw top. It shall then be arranged securely in the core box with the core, in proper sequence.
GIN.T060.7 PACKER (WATER ABSORPTION) TEST

1. When Instructed, carry out single or double Packer Tests in vertical or inclined drillholes in TNW and T2-101 size. Testing shall follow the method described in Geoguide 2. The general arrangement of the tests shall be as shown in Figure 31 of Geoguide 2;

2. At the commencement of the Contract, and at other times if Instructed, carry out calibration of the equipment for friction head loss by connecting the pressure gauges, flow meter and supply pipe headworks, three or four different lengths of drill rod and the packer with its tailpipe to the water supply. Pump water through the system and record flow rates for several values of back pressure. Establish and submit to the CM a graphical relationship of flow against pressure loss for the number of drill rods used and include it in the Final Fieldwork Report if packer tests are carried out;

3. Carry out a single packer test by expanding a hydraulic or pneumatic packer in the drillhole (not in the casing) to create a seal at the top of the test section. All rods and couplings must be watertight and the threads of drilling rods supplying the water to the test section shall be wrapped with thread sealing tape. The length of test section required shall be Instructed. Fill the drillhole below the packer with water and keep it full at the specified water pressure for 15 minutes immediately before the test commences. The flow meter used shall be capable of measuring flow quantities to the nearest 0.1 litre. Monitor the water levels in the drillhole above the packer at regular intervals during the test, by means of a suitable dipmeter, to check whether leakage is occurring around the packer;

4. The acceptance of water by the test section shall then be measured and recorded at successive pressures as Instructed, the maximum of which will not exceed 75% of the effective overburden pressure at the mid-depth of the test section. A calibrated pressure gauge capable of measuring the required pressure to the following accuracies shall be used:
   a. 0 - 100 kPa Maximum Value (accurate to ± 5 kPa);
   b. 0 - 200 kPa Maximum Value (accurate to ± 10 kPa);
   c. 0 - 500 kPa Maximum Value (accurate to ± 20 kPa); and
   d. 0 - 1000 kPa Maximum Value (accurate to ± 20 kPa).

5. At each pressure, the flow of water into the drillhole shall be measured over three periods, each of 5 minutes duration. If the first two readings do not differ by more than 10%, the third reading is not required. A complete test shall comprise measurement of the flow through the full cycle of pressures and any calibration tests required by the CM;

6. Packer tests using single or double packers may also be required after the drillhole has been completed. The double packer test shall be performed as for a single packer test, except that the water pressure shall be applied to a specified length of drillhole isolated between two packers;

7. Submit preliminary results on the record sheets to the approval of the CM with the corresponding preliminary logs of the hole.

GIN.T070.7 VANE SHEAR TEST

1. When Instructed, carry out the vane shear tests as specified in BS 1377-9:1990 (Test 4.4) unless amended by this clause as necessary;

2. Vanes capable of measuring shear strengths up to approximately 75 kPa shall be available. The area ratio of each vane blade shall be less than 12%. The torque measuring instrument shall be calibrated by a method approved by the CM and a copy of the most recent certified calibration chart shall be submitted with each set of vane test results and be included in the Final Fieldwork Report;
3. The vane shall be advanced to the test depth and the torque applicator assembly shall be carefully connected. After a pause of 5 minutes, the vane shall be rotated at a constant rate of between 0.1 and 0.2 degrees/sec. Readings shall be taken at intervals of each 5° rotation. The maximum torque required to rotate the vane shall be recorded. The vane shall then be rotated rapidly through 12 revolutions without taking any readings. After a further pause of 5 minutes, the test procedure shall then be repeated in order to obtain the remoulded (disturbed) undrained shear strength;

4. Submit preliminary results in a format agreed by the CM with the corresponding preliminary logs of the hole;

5. Submit final results of undrained shear strength, corrected using the torque head calibration curve with the Final Fieldwork Report in a format agreed by the CM. For tests on common ground, report the residual value of undrained shear strength.

GIN.T080.7 FALLING OR RISING HEAD PERMEABILITY TEST

1. When Instructed, carry out falling or rising head permeability tests in a hole. Flush the hole prior to carrying out the test. The installation shown in Figure 27 of Geoguide 2 shall be used unless otherwise Instructed. The graded filter material and sand shall be to the approval of the CM and shall be placed in the hole by tremie pipe. The groundwater level shall be allowed to equalise in the completed installation for at least one hour before test commences;

2. The method of flushing of the bottom of the hole for field permeability tests shall be as follows:
   a. Clean water shall be introduced to the cased hole through a 38 mm diameter pipe fed from a storage tank. The feed pipe shall contain a perforated section 480 mm in length consisting of 20 rings of holes at 25 mm centres, each containing 4 holes of 6 mm diameter. The end of the perforated section of pipe shall be capped. The complete perforated section shall be positioned such that it is just below the existing groundwater level in the hole;
   b. The flushing water shall be withdrawn from the casing through a 38 mm diameter pipe positioned with its open end between 150 mm and 200 mm above the base of the borehole. The discharge shall be by means of a pump of sufficient capacity to extract the flushing water from the base of the borehole. Control of the flow of clean water and discharge water shall be by means of valves positioned on the inflow pipe and the discharge pipe.

3. For a falling head permeability test, raise the water level in the piezometer by adding clean water by a minimum of 3 m, or the maximum practical. Then allow the water level to equalize with the groundwater level. Measure water levels in the piezometer by means of a suitable dipmeter at the following elapsed times in minutes from the start of the test:
   0, 0.25, 0.5, 0.75, 1, 1.5, 2, 3, 4, 5, 6, 7, 8, 9, 10, 15, 20, 25, 30, 45, 60, 90, 120, 150, 180
   Terminate the test at 180 minutes, or earlier if:
   a. The water level has returned to its initial level; or
   b. A head ratio (the ratio of water head at any time during the test to the initial head at the commencement of test) of 0.3 is achieved; or
   c. Instructed by the CM.

4. For a rising head permeability, lower the water level in the piezometer by pumping by a minimum of 3 m, or the maximum practical. Then allow the water level to equalize with the groundwater level. Measure water levels in the piezometer following the same procedure as for a falling head permeability test;
5. Repeat both types of permeability test once to demonstrate that consistent results have been obtained. If the results differ by more than 20% then repeat the test again;

6. Submit preliminary results of a falling or rising head permeability test on a record sheet to the approval of the CM, together with the corresponding preliminary logs of the hole.

GIN.T090.7 CONSTANT HEAD PERMEABILITY TEST

1. The procedure used for the constant head permeability test for flushing the hole, setting up the installation and allowing the ambient groundwater level to equalise shall be the same as for a falling or rising head permeability test;

2. Feed clean water into the piezometer at a constant rate until a constant water level is established or until the water level is 0.3 m below the top of the piezometer tube. Record the constant rate of inflow to maintain a constant head.

3. Use a flow meter capable of measuring flows down to 0.1 litre;

4. Record cumulative inflow readings, once the constant head has been achieved, in the following sequence:
   a. 4 readings at 15 second intervals;
   b. 9 readings at 1 minute intervals;
   c. 4 readings at 5 minute intervals;
   d. Readings at 10-minute intervals until the inflow values do not differ by more than 10% in any 10 minute interval.

4. Submit preliminary results on the record sheet, to the approval of the CM, with the corresponding preliminary logs of the hole.

GIN.T110.7 IN-SITU DENSITY TEST

1. Carry out in-situ density tests in trial pits and trial trenches in accordance with Test Method 11.1 or 11.2 of Geospec 3;

2. Submit preliminary results using a HOKLAS approval worksheet along with the preliminary logs of the trial pit or trial trench in which the test was performed;

3. The Final Field Work Report shall contain the results presented on a HOKLAS endorsed report.

GIN.T120.7 DYNAMIC PROBE TEST

1. The equipment of dynamic probe test shall be generally as shown in Figure 36 of Geoguide 2 and amplified below:
   a. The mass of the hammer shall be 10.0 kg (±0.1 kg). The ratio of the length to the diameter of the hammer shall be between 1 and 2. The hammer shall be provided with an axial hole with a diameter which is 2-3 mm larger than the diameter of the guide rod;
   b. The anvil shall be rigidly fixed to the extension rods. The mass of the anvil shall be between 1.5 kg and 1.8 kg and the diameter between 60 mm and 70 mm. The combined mass of the anvil, guide rod and upper anvil shall not exceed 5.0 kg;
   c. The hammer shall fall freely and not be connected to any object which may influence the acceleration or deceleration of the hammer. The hammer shall be stationary in its upper position prior to release. The fall shall be 300 mm (±5 mm);
   d. The diameter of the rods shall be between 11 mm and 13 mm and the length 1000 mm (±10 mm). The rods shall be straight and shall be connected so as to bear against each other over their full area by means of external couplers of maximum diameter 20 mm;
e. The diameter of the point shall be 25 mm (±0.2 mm). The cylindrical portion of the point shall have a length of 25 mm (±1 mm). The point shall have a conical tip with an apex angle of 45º (±2º).

2. Carry out the dynamic probe test as follows:
   a. The lower end of the probe shall be rested against the ground at the test location, with the first extension rod and guide rod in a vertical position;
   b. The hammer shall be raised to bear against the upper anvil, and shall be allowed to fall freely. It shall not be connected to objects which may influence its acceleration and deceleration, and shall be stationary when released in the upper position. The fall shall be 300 mm ± 5 mm;
   c. The hammer shall be used to drive the probe into the ground, with a rate of driving between 20 and 60 blows per minute;
   d. Additional extension rods shall be added as necessary. The rods shall be rotated clockwise one full turn each time a rod is added to ensure that screw joints are tight. The blow count for every 100 mm of penetration shall be recorded, or at refusal the penetration distance for 50 blows of the hammer. Interruptions exceeding 5 minutes shall be recorded;
   e. If any obstruction to the probe is encountered which cannot be penetrated over 100 mm by 100 blows of the driving hammer, then that probe shall be considered to have reached refusal and the test shall be terminated.

3. Submit test results on a record sheet to the approval of the CM, which shall contain the following details:
   a. Blow count for every 100 mm penetration or at refusal the penetration distance for 50 blows of the hammer;
   b. Interruptions exceeding 5 minutes;
   c. Dynamic probe record (Figure 37 of Geoguide 2);
   d. Confirmation that the test was carried out in accordance with this Specification.

4. If refusal is met at a depth of less than 3 m, then carry out a second test at a distance of between 0.3 m and 0.6 m from the first test;

5. Seal all probe holes on completion with cement grout consisting of cement and water in the proportions 0.4:1 by mass, for at least the top 600 mm;

6. For dynamic probing tests that are not related to trial pit or trial trench excavations, submit preliminary results within 3 working days of the date of completion of all dynamic probing testing instructed.

GIN.T130.7 PUMPING TEST

1. When instructed, carry out pumping tests in new or existing holes;

2. The tests consist of pumping water from a hole and observing the effect on the water table by measuring water levels in the hole being pumped and in adjacent piezometers and/or observation wells;

3. These tests shall be performed in accordance with the principles and methods outlined in BS 5930:1981: Section 5, or in accordance with BS 6316:1992 if instructed to determine the hydraulic properties of the aquifer(s) and/or effect of pumping on neighbouring area;

4. All equipment necessary to undertake the tests shall be provided including temporary electricity supply, pumps, instruments, materials, labour and haulage;

5. Unless otherwise specified, commence the pumping tests in the morning about 8 am on an agreed day;
b. When Instructed, take water samples in accordance with GIN.W470 or otherwise as directed by the CM for laboratory tests. Complete all preparation works one day before the test;

c. The pump used for the test shall be capable of pumping 1.5 times the maximum anticipated flow rate or flow-rate directed by the CM and shall have a discharge line connected to an efficient existing drainage system so that ponding and recharge into the ground does not occur;

d. Measure the pumping rate and pumped water quantities using an Approved flowmeter and check them using an orifice, or similar weir.

6.  
   a. Prior to pump testing, clean and flush the hole, and measure the depth of the hole accurately;

   b. When directed by the CM and unless otherwise specified, place a temporary perforated PVC lining and filter pack in the hole and withdraw the driving casing carefully. Develop the hole by using Approved methods such as jetting, surging and over pumping;

   c. Install the pump and pump the hole in accordance with the following test procedures unless otherwise Instructed:

      i. A Step Drawdown Test shall be performed at the following pumping rates:

         Stage 1: 0.25 x flow rate specified;
         Stage 2: 0.50 x flow rate specified;
         Stage 3: 0.75 x flow rate specified;
         Stage 4: 1.00 x flow rate specified;
         Stage 5: 1.25 x flow rate specified;
         Stage 6: Recovery.

         Each stage shall have a minimum of 2 hours duration. Pumping shall be carried out at a constant rate for each stage. The test shall be continuous, commencing with the lowest pumping rate. Under no circumstances shall the pumping rate be increased above the rate for the next stage. Water level readings shall be taken in the hole and in the adjacent piezometers and/or observation wells every 15 seconds up to 2 minutes; every 30 seconds between 2 and 5 minutes; every 1 minute between 5 and 15 minutes; every 5 minutes between 15 and 120 minutes. After Stage 5 the pump shall be turned off and water levels monitored for a minimum of 2 hours, but in any event until the water level measured is substantially the same as the standing water level measured at test commencement;

      ii. A Constant Rate Pumping Test shall be performed at the flow rate specified for a continuous period of 48 hours. Water level readings shall be taken in the hole and in the adjacent piezometers and/or observation wells every 15 seconds up to 2 minutes; every 30 seconds between 2 and 5 minutes; every 1 minute between 5 and 15 minutes; every 5 minutes between 5 and 120 minutes and subsequently at 30 minutes intervals. Pumping rate shall remain constant and be adjusted as necessary by reference to the flowmeter or orifice weir manometer. The test shall be continuous. In the event of any breakdown the test shall be repeated, with that portion of the test already performed at the Contractor's expense. After 48 hours or such period as the CM determines the pump shall be turned off and the water level monitored until the water level measured is substantially the same as the standing water level at test commencement.
7. Record, plot and calculate the pump test results on the standard sheets shown in Appendix XI to this Worksection or to follow the proforma/graphs shown in BS 6316:1992 if instructed;

8. Submit a report on the testing to the CM in accordance with GIN.W040. The report shall include a plan showing the general arrangement of the pumping test (the locations of the holes where pumping tests have been performed and piezometers and/or observation wells where water levels have been recorded, a geological log for the hole; records of the pumping tests performed; a drawing (A4 size) showing details of the hole lining; filter pack and pump level; the pump details (which shall include the pump dimensions, construction and characteristics), water level monitoring records of all relevant piezometers and/or observation wells and the results of any water laboratory tests which may have been undertaken.

GIN.T140.7 PRESSUREMETER TEST

1. 
   a. When Instructed, carry out Pressuremeter Test using a Menard pressuremeter type GB or GC of NX size at locations shown on the Drawings, as detailed in this Worksection or as directed by the CM;
   b. The equipment shall have a pressure range and membrane strengths suitable for testing the materials at the test location. For this purpose a pressure range of up to 10,000 kPa shall be available for tests in Grades III to V decomposed rock and up to 4,000 kPa for tests in Grade VI decomposed rock or in other soils. Grades of decomposition shall be as defined in the Geoguide 3.

2. 
   a. The probe shall comprise essentially a 74 mm diameter measuring cell between two guard cells. The measuring cell shall be pressurised by water and the guard cells by gas;
   b. The control unit shall comprise essentially a cylindrical reservoir with a graduated transparent tube called the volumeter which is connected to the measuring cell of the probe;
   c. The volumeter shall be capable of being pressurised, the pressures being read on Bourdon type gauges of suitable sensitivity;
   d. Coaxial tubing shall connect the probe to the control unit. The length of tubing shall be the minimum necessary to allow the deepest test to be carried out;
   e. The equipment shall at all times be protected from direct sunlight. If type GC equipment is used then a separate gauge shall be used to read guard cell pressures.

3. The equipment shall be checked and calibrated when a new probe is used, a probe has been refurbished, any water circuit has been subjected to a vacuum or sudden pressure release or when 10 tests have been completed since the previous calibrations and checks. The checks and calibrations shall include the following:
   a. Integrity and de-aired state of the water circuits and water;
   b. Volume calibration of the measuring cell;
   c. Pressure calibration of the line and volumeter;
   d. Initial volume of the probe;
   e. Pressure calibration of the probe, line and volumeter.

4. Install the probe in a NX size investigation hole. Lower the probe into the hole and apply the first pressure increment within 15 minutes of removal of the core barrel from the test level;
5. Select pressure increments so that the limit pressure is achieved in 7 to 14 increments. Keep the pressure constant for the duration of each increment and take volumeter readings at 15 sec., 30 sec., 1 min., 1.5 min. and 2 min. after the application of the pressure. Take further readings if significant volume change takes place after 2 minutes;

6. Carry out cycles of unloading and reloading as directed by the CM. Consult the CM before any termination of the test;

7. Subject to Approval, the test shall be considered complete when the total volume of water in the volumeter has been injected into the measuring cell or when the pressure capacity of the apparatus is reached or when the limit pressure is reached whichever is the least;

8. Present the results of Pressuremeter Tests in the form of a net volume versus net pressure diagram with pressure indicated on the abscissa and volume on the ordinate. Plot creep volume (volume at 120 sec. minus volume at 30 sec.) for each increment;

9. Report all details of the test including the following:
   a. Site;
   b. Contract number and Works Order number where applicable;
   c. Hole number;
   d. Date of test;
   e. Number of test;
   f. Pressuremeter type and dimensions;
   g. Probe number;
   h. Name of technician;
   i. Reduced level and co-ordinates of hole;
   j. Depth below ground level and reduced level of centre of measuring cell;
   k. Depth below ground level and reduced level of water/bentonite in the hole;
   l. Height of centre of volumeter above ground level at the hole and reduced level;
   m. Depth below ground level and reduced level of bottom of the hole;
   n. Details of all relevant calibrations;
   o. Reason for terminating test;
   p. Weather.

10. Report the results including the Limit Pressure, Pressuremeter Modulus, Secant Shear Modulus (initial and for each cycle) and Secant Deformation Modulus (initial and for each cycle) within 7 days of the test being carried out;

11. Carry out Pressuremeter testing using an Approved pressuremeter probe of AX size having a pressure range up to 10,000 kPa at locations shown on the Drawings or as directed by the CM. The procedure for carrying out the tests will be as for the NX size or as directed by the CM and the control unit shall be located at ground level with the probe installed in a hole formed with a hand-held percussive drill of suitable diameter.

GIN.T150.7  POINT LOAD TEST ON ROCK CORE

1. Carry out Point Load Test in accordance with the 'Suggested Method for Determining the Point Load Strength' International Journal of Rock Mechanics, Mining Science and Geomechanics, 1985, Volume 22, No. 2, Pages 51-60;

2. a. The point load testing machine shall be an Approved type;
b. Make available at least two spare sets of conical testing platens. Platens that are dented or chipped shall be immediately replaced;

c. Tests shall be carried out under air-dry or saturated conditions and to axial or diametrical orientation as directed by the CM.

3. If tests are ordered at regular intervals along the whole length of core obtained from a hole, transport the testing equipment to the Site if required by the CM or his Representatives so that the testing may be undertaken as cores are extracted from the drillhole(s). Reporting shall be in a form to be agreed using a correlation coefficient as agreed by the CM.

GIN.T180.7  GOODMAN JACK TEST

Goodman Jack Tests shall be carried out as directed by the CM to determine the rock mass modulus. The tests shall be carried out according to ASTM D4971-02:2006. The tests shall be carried out by an operator fully conversant with the equipment and the method of test. Submit the results in a format to be approved by the CM within 7 days of the test being carried out.

GIN.T190.7  PLATE LOAD TEST

1. Carry out Plate Load Test at shallow pits or trenches or at other locations when Instructed. The plate load test shall be carried out in accordance with BS 1377-9:1990 (Test 4.1), except where noted hereunder;

2. The dimensions of the loading plate shall not be less than 300 mm, square or circular as Instructed. The loading plate shall be sufficiently rigid to prevent any distortion or bending at all stage of the loading test. The alignment and direction of the applied load including the load cells and jack shall remain vertical and concentric with the loading plate;

3. Apply the loading by a reaction system provided by means of kentledge system to the approval of the CM. The kentledge shall be capable of providing a reaction force equivalent to 3 times of the working pressure as Instructed by the CM;

4. Measure displacement of the loading plate by four dial gauges located at orthogonal positions. Use a reference beam to aid the measurement of the displacement. The reference beam shall be supported by two rigid foundations positioned outside the influence zones of the loaded area or kentledge reaction area. The dial gauges shall be of sufficient travel to measure the displacement of the plate and to an accuracy of 0.01 mm;

5. The maximum test load is 3W, where W is equal to allowable working pressure times the area of loading plate;

6. Apply the test load in increments of 0.5W up to W, release and reapply the test load in increments of 0.5W up to 2W, then release and reapply in increments of 0.5W up to 3W;

7. Maintain the test load at each increment until all movement of the plate has ceased or when the movement is less than 0.05 mm in 10 minutes;

8. Maintain the maximum test load for at least 72 hours before removal;

9. Report all details of the test including:
   a. Reduced level at the test location and co-ordinates;
   b. Description of soil stratum where plate load test is conducted;
   c. Details of all calibration and correlation charts;
   d. Description of the method of reaction system used for the application of required loads, including any drawings to assist the presentation of the set-up;
   e. Results and interpretation of the tests in determining the soil modules of the underlying soil;
f. Temperature and weather at the time of plate loading test;
g. Date of test.

GIN.T200.7 ACOUSTIC BOREHOLE TELEVIEWER SURVEY

1. The output from the Acoustic Borehole Televiewer shall be such that the following information is provided:
   a. The location of discontinuities in the rock mass relative to ground level;
   b. The width, dip, and dip direction of detected discontinuities.

2. For the calculation of discontinuity dips, use the measured drillhole diameter. Provide the obtained information in graphical, tabulated, text, and digital format, as appropriate;

3. Graphical output shall include:
   a. A legible and orientated travel time log;
   b. A legible and orientated amplitude log;
   c. An orientated, digitised interpretation in the form of a diagrammatic internal view of the drillhole wall, showing the locations and shapes of discontinuities;
   d. A dip/dip direction “tadpole” graphic; and
   e. An indicator of the drillhole's deviation from vertical showing both amount and direction of deviation.

4. Adjust the depth scale of the logs to ensure the depth of the discontinuities represented on the log correlate to their corresponding depth in the rock cores or as agreed by the CM;

5. State clearly in the logs that all directions are relative to magnetic north. The declination of magnetic north from Hong Kong Metric Grid System north shall be recorded within the header information for each log. Final copies of these logs shall show the travel time and amplitude plots in colour. Logs shall have a vertical scale of not less than 1/10 unless otherwise instructed. Provide the discontinuity data for each drillhole surveyed in tabular format and as a contoured stereographic plot, in the form of a lower hemisphere projection on an equal area stereonet;

6. Provide the following data in tabular format:
   a. Depth relative to ground level to the first appearance of each discontinuity;
   b. Depth relative to ground level to the last appearance of each discontinuity;
   c. The drillhole diameter at the mid-depth of each discontinuity;
   d. The calculated dip of each discontinuity feature to within one degree. (Horizontal is 00 degrees, vertical is 90 degrees). Dip is to be reported as a two-digit figure. The value of dip shall be corrected for the angle of the drillhole;
   e. The measured direction of dip relative to magnetic north. Direction is to be reported as a three-digit figure. Any deviation of the direction from vertical shall be taken into account when measuring dip direction;
   f. The deviation of the drillhole from vertical at the mean depth of the discontinuity reported to the nearest 0.1 degrees; and
   g. The direction of deviation of the drillhole at the mean depth of the discontinuity reported to at least the nearest 0.5 degrees relative to magnetic north.

7. The declination of magnetic north from Hong Kong Metric Grid System north shall be clearly stated in a footnote to the tabulated data;
8. Make an assessment of the distribution of material decomposition grades, according to Geoguide 3, based on the Acoustic Borehole Televiewer data as far as possible and include it in the Final Report. The assessment shall be carried out by a qualified geologist/geophysicist with experience in the interpretation of Acoustic Borehole Televiewer data;

9. A graphical differentiation shall be made between tight and open discontinuities and shading shall be used between discontinuity walls to illustrate aperture distances;

10. The tabulated data specified above shall also be supplied in digital form as a comma separated value text file. The file name shall be agreed with the CM. The file shall also contain a header line giving the Contract No., the Works Order number where applicable, the project title, the drillhole identification number, and the date of surveying. Each item in the header line is to be separated by a comma and shall not include commas;

11. Submit the results obtained under this clause in a format to be Approved within 7 days of the survey being carried out.

GIN.T210.7 CONE PENETRATION TEST

1. When Instructed, use an electrical cone capable of measuring the resistance, sleeve friction and pore pressure simultaneously. The cone shall be advanced hydraulically at a steady penetration rate of 20 mm/sec. Records at 20 mm interval of slide friction, tip resistance, and pore water pressure shall be obtained. Carry out the cone penetration test using equipment and methods in accordance with the recommendations of CIRIA Ground Engineering Report: In-situ Testing, Cone Penetration Testing, methods and interpretation by A.C. Meigh (1987);

2. For each test, provide the following information to the approval of the CM:
   a. Plot of cone point resistance, $q_c$ versus depth;
   b. Plot of local sleeve friction $f_s$ versus depth;
   c. Plot of pore pressure ($u$) versus depth;
   d. Plot of friction ratio, $R_f$ versus depth;
   e. Plot of pore pressure ratio, $(u/q_c)$;
   f. Plot of effective cone point resistance $(q_c - u)$;
   g. Plot of corrected total cone resistance $q_t = q_c + (1 - \beta) \times u$ versus depth where $\beta$ is the cone correction factor;
   h. Plot net cone resistance $q_{net} = q_t - \text{total overburden pressure}$ versus depth;
   i. Plot normalised dissipated record versus time;
   j. Soil profile adjacent to CPT plots;
   k. Copies of all detailed test data including tapes/diskettes on which the data may be stored. All results shall be presented in SI units.

3. All tests and calibration data shall be made available to the CM within 3 days of the completion of the test;

4. The test could be terminated in cases when:
   a. 80% of the cone tip capacity, i.e. tip resistance or local friction are exceeded; or
   b. The pore pressure reaches or exceeds the nominal capacity, i.e. 20 bars or 2000 kPa; or
   c. The total thrust applied is less than the full reaction weight of the seabed frame, i.e. reaching the limitation of the penetrometer/rod string capacity.
LABORATORY TESTS

GIN.T310.7 GENERAL

1. All laboratory testings shall be carried out by an Approved commercial testing laboratory on the Development Bureau's List of Approved Suppliers of Material and Specialist Contractors for Public Works in Soil and Rock Testing. The testing work to be carried out comprises generally of testing of soil, rock and groundwater samples. The testing may be of any of the following types:
   a. Determination of Moisture Content;
   b. Determination of Atterberg Limits;
   c. Determination of Particle Density;
   d. Determination of Particle Size Distribution;
   e. Determination of Amount of Chemical Substances and Electro-chemical Properties;
   f. Determination of Dry Density/Moisture Content Relationship;
   g. Determination of In-situ Bulk Density, In-situ Dry Density and Relative Compaction;
   h. Determination of the California Bearing Ratio;
   i. Determination of Compressibility Characteristics of Soils;
   j. Determination of Shear Strength of Soils using Triaxial Apparatus;
   k. Determination of Shear Strength of Soils using Shear Box Apparatus;
   l. Direct shear strength tests including tests carried out on rock joints;
   m. Any other soil and rock tests as directed by the CM.

2. Carry out all laboratory tests for soils in accordance with the recommended testing methods and procedures stated in 'Geospec 3: Model Specification for Soil Testing', GEO, unless otherwise specified;

3. Provide HOKLAS endorsed test reports for those soil tests that carried out in accordance with the recommended testing methods and procedures stated in 'Geospec 3: Model Specification for Soil Testing', GEO;

4. For those soil and rock tests where HOKLAS endorsed test reports are not available, submit the following to the CM for approval at least two months prior to testing:
   a. Copies of the full test procedures manuals (with equipment details, sample preparation and testing procedures, and recording and reporting specific to the laboratory) to be adopted for each test;
   b. Copies of calibration certificates for major equipment and measuring instruments to be used;
   c. A sample of the work sheets and of the test report;
   d. The name, qualifications and experience in testing of the person who will be supervising the tests full time at the laboratory and certifying the reliability and completeness of the test reports;
e. Such tests shall be carried out to the test methods and test conditions specified by the CM, under a quality system up to HOKLAS standards. In particular, approved Signatories of Test Certificates and Reports and Senior Laboratory Technicians shall have qualifications and experience as specified in Appendix XIII to this Worksection. Evidence of training provided to personnel shall be available. Calibration shall have traceability to national standards of measurement. The CM may require an audit to be carried out on the testing laboratory at any time by Public Works Laboratories or by a third party. No claims for extension of time or additional payment will be considered by the CM for any action required by the laboratory to correct non-compliance identified in the audit.

5. The CM or his Representatives shall have the right of access to the Contractor's laboratory at all times when testing is being carried out in connection with this Contract;

6. While laboratory testing is in progress, inform the CM or his Representatives without delay of any unusual occurrences during any of the tests ordered, and of any test that is running to excessive time.

GIN.T320.7 LABORATORY TESTING DEFINITIONS
For laboratory testing the following definitions will apply:

1. Laboratory Engineer - a graduate engineer with a minimum of 5 years experience with at least 2 of which have been gained in soil testing in a laboratory, or a Chartered Engineer with a minimum of 2 years experience in soil testing and fully familiar with the soil testing procedures to be used in the Contract;

2. Senior Technician - a person with at least 10 years experience gained in a soil testing laboratory and fully familiar with all soil testing procedures to be used in the Contract;

3. Technician - any of the Contractor's personnel capable and qualified to set up and conduct tests in the laboratory;

4. Laboratory Assistant - any of the Contractor's personnel requiring direct supervision from an engineer, senior technician or technician.

GIN.T340.7 PHOTOGRAPHIC RECORD OF SAMPLES
1. A colour photographic record shall be taken for each triaxial test specimen, splitting of undisturbed sample, uniaxial rock compression test specimen and rock joint shear test specimen as described in GIN.W1240;

2. Immediately after testing, split soil cylindrical specimen longitudinally or otherwise as directed by the CM or his Representatives;

3. Place a reference label, scale and a suitable colour comparator along with the split specimen in the camera's field of view and a photograph taken at a scale agreed with the CM.

GIN.T350.7 RETENTION OF SAMPLES
1. When laboratory tests are carried out on only part of a soil sample, the remainder of the soil in the sampler or container shall be resealed with wax as soon as possible and retained;

2. All soil on which laboratory tests have been carried out, including that wasted during the preparation of test specimens, shall be retained in airtight containers until the presentation of the Final Report;

3. On submission of the Final Report and with the CM's acceptance, samples and specimens may be dumped. In no circumstances are samples and specimens allowed to be dumped without the Approval.
GIN.T360.7 CLASSIFICATION AND CHEMICAL TESTS

1. For all classification and chemical tests, adopt the following tests:

   a. Test procedures as specified in 'Geospec 3: Model Specification for Soil Testing', GEO:

<table>
<thead>
<tr>
<th>Classification and Chemical Tests</th>
<th>Test Method as specified in 'Geospec 3: Model Specification for Soil Testing', GEO</th>
</tr>
</thead>
<tbody>
<tr>
<td>i. Determination of moisture content</td>
<td>5.1, 5.2 or 5.3</td>
</tr>
<tr>
<td>ii. Determination of Atterberg Limits</td>
<td>6.1 or 6.2</td>
</tr>
<tr>
<td>iii. Determination of particle density</td>
<td>7.1 or 7.2</td>
</tr>
<tr>
<td>iv. Determination of particle size distribution</td>
<td>8.1, 8.2, 8.3, 8.4, 8.5, 8.6 or 8.7</td>
</tr>
<tr>
<td>v. Determination of organic matter content</td>
<td>9.1</td>
</tr>
<tr>
<td>vi. Determination of total sulphate content of soils and sulphate content of groundwater</td>
<td>9.3</td>
</tr>
<tr>
<td>vii. Determination of water-soluble chloride content</td>
<td>9.4</td>
</tr>
<tr>
<td>viii. Determination of the pH value</td>
<td>9.5</td>
</tr>
</tbody>
</table>

   b. Test procedures as specified in BS:

<table>
<thead>
<tr>
<th>Classification and Chemical Tests</th>
<th>BS</th>
</tr>
</thead>
<tbody>
<tr>
<td>i. Determination of carbonate content of soils</td>
<td>The method as stated in BS 1377-3:1990, Test 6</td>
</tr>
<tr>
<td>ii. Determination of resistivity of soils</td>
<td>The method as stated in BS 1377-3:1990, Test 10.4</td>
</tr>
</tbody>
</table>

2. The particular test method to be employed will be given by the CM.

GIN.T365.7 TRIAXIAL TESTS ON SOIL SAMPLES

1. Carry out the test for determination of shear strength of soils using Triaxial Apparatus (also known as Triaxial Tests) in accordance with Test Method 15.1 or 15.2 or 15.3 of 'Geospec 3: Model Specification for Soil Testing', GEO. The particular test method to be employed will be given by the CM;

2. Triaxial testing shall be either single stage or multistage as Instructed. The size of the specimens to be tested shall generally be either 76 mm or 100 mm nominal diameter;

3. Remoulded triaxial specimens not greater than 100 mm diameter may be required. The specimen shall be prepared in accordance with Clause 13.2 of 'Geospec 3: Model Specification for Soil Testing', GEO;

4. Triaxial specimens not greater than 100 mm diameter may be required from a block sample. These shall be prepared by trimming using a soil lathe, in accordance with the method described in Clause 13.3 of 'Geospec 3: Model Specification for Soil Testing', GEO.

GIN.T367.7 TRIAXIAL TESTS ON LOOSELY COMPACTED FILL MATERIALS

Follow Test Method 15.2 of 'Geospec 3: Model Specification for Soil Testing', GEO (Geospec 3) with modifications on the following stages:

1. Sample preparation
a. Follow Clause 13.2 of Geospec 3 if the initial target density is dense enough to enable a uniform triaxial specimen to be prepared. (Note 1 of Clause 13.2.2.9 of Geospec 3 recommends the use of static compaction);

b. Where static compaction is not applicable in preparing a very loose and uniform specimen, slight tamping using a purposely-made apparatus shall be used;

c. The initial target dry density and moisture content shall be specified by the CM. When the initial moisture content (m.c.) is not specified, the use of a m.c. value close to its optimum m.c. shall be acceptable;

d. The CM may specify a series of initial relative compaction for the triaxial specimens instead of the initial target dry densities as mentioned in sub-clause (c).

2. Saturation

a. Before applying back pressure, follow the following steps:
   i. Disconnect the tubes at pore pressure and back pressure lines;
   ii. Set the pressure of the CO₂ coming out from the cylinder at about 20 kPa;
   iii. With the pore pressure and back pressure valves closed, plug in the tube with CO₂ to the pore pressure line;
   iv. Immediately open the pore pressure and back pressure valves at the same time;
   v. Check the CO₂ pressure via the pore pressure transducer. Adjust the CO₂ cylinder pressure at around 20 kPa;
   vi. Allow the CO₂ to percolate through the soil specimen for about 5-10 minutes;
   vii. Plug out the CO₂ tube and plug in back the tubes for pore pressure and back pressure. Take care to avoid trapping air bubbles in the tubes; and
   viii. Continue with the procedures as set out in clause 15.2.6.2 of Geospec 3.

b. Use more stringent criterion for saturation. To enable correction for volume change during saturation be estimated, a full saturation or nearly full saturation of the specimen is required. The pore pressure coefficient B shall be $\geq 0.97$ and the back pressure $\geq 200$ kPa before proceeding to the consolidation;

c. Follow the recommendation of Geospec 3 if the change in volume during saturation is significant. An estimate of the volume change is required.

3. Shearing

a. Terminate the test only at an axial strain of at least 20%.

4. Unload the specimen and dismantle the test

a. During unloading and dismantling, care must be exercised to minimize the loss of moisture and soil grains from the specimen.

GIN.T380.7 ONE-DIMENSIONAL CONSOLIDATION TEST

Carry out one-dimensional consolidation tests in accordance with Test Method 14.1 of 'Geospec 3: Model Specification for Soil Testing', GEO.
GIN.T390.7 SPLITTING OF UNDISTURBED SAMPLES OBTAINED FROM TRIPLE TUBE RETRACTABLE CORE BARRELS

1. For inspection purposes, tubes containing undisturbed samples obtained from triple tube retractable core barrel may be required to be split longitudinally on Site or in the laboratory for their full length by use of a rotary saw or other suitable means. Saw runs will in general be two in number and diametrically opposite. The tube material will be plastic;

2. Log the split undisturbed samples graphically with detailed description in accordance with Geoguide 3. Include the logs and photographs of the split undisturbed samples in both the Final Fieldworks Report and Laboratory Tests Report.

GIN.T400.7 DIRECT SHEAR BOX TEST

Carry out the test for determination of shear strength of soils using Shear Box Apparatus (also known as Direct Shear Box Tests) in accordance with Test Method 16.1 of 'Geospec 3: Model Specification for Soil Testing', GEO. The particular test method (Method A or Method B) to be employed will be given by the CM.

GIN.T410.7 SOIL COMPACTION TEST

Carry out the test for determination of dry density/moisture content relationship (also known as Soil Compaction Tests) in accordance with Test Method 10.1, 10.2, 10.3, 10.4, 10.5, 10.6, 10.7 or 10.8 of 'Geospec 3: Model Specification for Soil Testing', GEO. The particular method to be employed will be given by the CM. Separate specimens shall be required for each moisture content/dry density determination.

GIN.T420.7 DETERMINATION OF THE CALIFORNIA BEARING RATIO

Carry out the test for determination of California Bearing Ratio in accordance with Test Method 12.1 of 'Geospec 3: Model Specification for Soil Testing', GEO.

GIN.T430.7 ROWE CELL TESTING OF LARGE DIAMETER PISTON SAMPLES

1. Rowe Cell (also known as hydraulic cell) consolidation tests may be required on soil samples with diameters ranging from 75 to 254 mm. Testing may be of "free strain" or "equal strain" type and be carried out under one of the following drainage conditions:
   a. Vertical drainage to the top surface only, with measurement of pore pressure at the centre of the base;
   b. Vertical drainage to both top and bottom surfaces;
   c. Radial drainage outwards to the periphery only, with measurement of pore pressure at the center of the base;
   d. Radial drainage inwards to a central drain with measurement of pore pressure at one or more points off center.

2. Carry out Rowe cell consolidation tests in accordance with BS 1377-6:1990 (incorporating Amendment No. 1) with the following modification:
   a. Carry out all tests in an area free from significant vibrations and other mechanical disturbance. The temperature variation during any test shall not exceed 8°C, and the temperature at any time during a test shall be between 15°C and 28°C. The apparatus shall be sited away from the effects of local sources of heat, direct sunlight and draught;
   b. Carry out a pre-test assessment of the soil sample before the test. If necessary, inform and request the CM to examine and assess the sample condition and its suitability for test;
c. The permeability of the porous discs shall be at least one order of magnitude greater than the estimated permeability of the soil specimen. Check the permeability of the porous discs before they are first used and subsequently at a frequency of at least once every year to ensure that they meet the above criterion;

d. In addition to the calibration of the apparatus as described in Clauses 3.2.5 and 3.2.6 of BS 1377-6:1990, calibration of rim drain shall also be carried out for tests under outward radial drainage condition;

e. At each stage of loading, plot the compression gauge readings against both logarithm of time and square-root of time and maintain the pressure until such time that the end of primary consolidation is reached. The end of primary consolidation shall be determined using both the log time and the square-root time plots, whichever gives a longer primary consolidation period. When the end of primary consolidation can be identified on only the log time or the square-root time plots, that shall be taken as the end of primary consolidation;

f. Determination of the initial moisture content of the soil sample in clause 3.5.8.1.2 of BS 1377-6:1990 shall be in accordance with Test Method 5.1 or 5.3 of 'Geospec 3: Model Specification for Soil Testing', GEO as Instructed. Drying of the specimen as required in Clause 3.5.6.4 of BS 1377-6:1990 shall be at a temperature which is the same as that adopted in the test method specified for the determination of initial moisture content of the soil specimen;

g. Temperature correction described in Clause 3.5.8.5.5 of BS 1377-6:1990 shall not be carried out;

h. The coefficient of consolidation (cv) shall be calculated using both the log of time plot and the square-root time plot, where possible;

i. Upon completion of the test, break up the specimen for inspection (if necessary, soak the dried soil specimen in water until it is sufficiently soft for breaking up into individual particles). If there are particles of size larger than one-fifth of the height of the consolidation ring, determine and record the percentage by weight and the size distribution of these particles within the specimen. Determine the percentage by weight and size distribution of large particles using BS sieves or other equivalent standard sieves;

j. The reporting to test results shall include all information as required in Clause 3.5.9 of BS 1377-6:1990 except that:

i. A basic description of the specimen shall be carried out;

ii. The initial void ratio and degree of saturation of the sample shall be reported;

iii. Plot of percentage vertical compression and void ratio (which correspond to the end of primary consolidation as defined in sub-clause (2)(e) against the logarithm of applied pressure for the complete load-unload cycle shall be provided;

iv. Plots of compression against time (both log time and square-root time), for each load increment, shall be included;

v. The daily maximum and minimum temperatures recorded in the vicinity of the test apparatus over the whole period of test shall be reported; and

vi. The percentage by mass and size distribution of particles larger than that acceptable, if found within the test specimen, shall be reported.

k. For "free strain" tests under outward radial drainage condition, 0.465 plots instead of square root time plots shall be used as referred in sub-clauses (2)(e) and (2)(j)(iv).

3. Report the results on the forms shown in Appendix A of BS 1377-6:1990. Alternative record sheets shall be to the approval of the CM.
GIN.T440.7  UNIAXIAL COMpressive STRENGTH TEST

1. When Instructed, determine the uniaxial compressive strength (UCS) in accordance with ASTM D7012-07 on intact rock core specimens;

2. At the discretion of the CM, determine also the elastic moduli of the intact rock in accordance with ASTM D7012-07;

3. Report the test results on forms to the approval of the CM.

GIN.T450.7  ROCK JOINT SHEAR TEST

Carry out rock joint shear test in accordance with ASTM D5607-02:2006 and with the following modifications:

1. Unless otherwise Instructed, carry out multi-stage testing;

2. Carry out the following in rock joint shear tests and report on the forms to the approval of the CM:

   a. Determine and record the dimensions of the top and bottom shear surfaces;

   b. Estimate the actual area of contact between the top and bottom surfaces. Calculate the areas of regular shapes. Determine the areas of irregular shapes by tracing the shape onto a tracing paper and measuring the area with a planimeter;

   c. Record the roughness profile, before and after shear, with the aid of the profilometer. Also make a description of the rock joint surfaces with regard to colour, tightness and nature of infilling materials;

   d. Take photographs of top and bottom joint surfaces, before and after shear, in accordance with the requirements of GIN.T340;

   e. Soak the specimen in water for 48 hours before testing unless otherwise Instructed;

   f. Record the horizontal displacements, vertical displacements, shear loads and normal loads during the tests;

   g. Make the following corrections in calculating the stresses:

      i. Hydraulic ram springs - where hydraulic rams have been used, apply a correction to gauge readings to take into account the resistance provided by the ram return springs;

      ii. Cross-sectional areas - take into account the reduction in cross-sectional area during the shearing process;

      iii. Take into account contributions to normal load such as self-weight of loading system, weight of upper box and sample and cementing material.

3. The variations to the above procedures for testing tight joints shall be Approved.

GRO

GROUTING FOR GEOTECHNICAL WORKS

MATERIALS

GENERAL

GRO.M010.7 DEFINITIONS

In this Specification:

1. "Ground", for the purpose of grouting for geotechnical works, is fill material, soil and rock and the interfaces between fill material, soil and rock and any structures;

2. "Grout", for the purpose of grouting for geotechnical works, is cement grout, cement-sand grout, cement-bentonite grout and Approved proprietary grout;

3. "Grouting", for the purpose of grouting for geotechnical works, is the mixing and injection of grout through predrilled or preformed holes;

4. "Grouting stage", for the purpose of grouting for geotechnical works, is the discrete length of drillhole into which grout is to be injected in a continuous operation;

5. "Lugeon" is a water loss of 1 litre per minute per metre length of hole tested at an effective pressure of 1 MPa.

GROUT FOR GEOTECHNICAL WORKS

GRO.M110.7 GROUT

1. Materials for grout shall comply with Worksection CON1 except as stated in this Worksection;

2. Cement grout for geotechnical works shall consist of PC, PFA, sand and water. Admixtures shall not be used unless permitted by the CM. The use of PFA in cement grout shall follow the same requirements of PFA in concrete as specified in Worksection CON1;

3. Sand for grout shall be clean dry sand complying with BS 1200:1976 and shall have a particle size distribution such that 100% passes a 2 mm BS test sieve and not more than 30% passes a 0.2 mm BS test sieve;

4. Water for grout shall be clean fresh water having a temperature not exceeding 30°C or less than 5°C;

5. Cement grout shall have a minimum crushing strength of 30 MPa at 28 days;

6. The amount of bleeding of grout shall not exceed 0.5% by volume 3 hours after mixing or 1.0% maximum when measured at 23 ± 1.7°C in a covered glass or metal cylinder of 100 mm internal diameter and with a grout depth of approximately 100 mm. In addition, the water shall be reabsorbed by the grout within 24 hours;

7. The flow cone efflux time of grout shall not be less than 15 seconds.
GRO.M120.7 STANDPIPES

Unless otherwise Approved, standpipes for grouting shall be standard black metal pipe complying with BS 1387:1985 (1990). Unless otherwise permitted by the CM, non-metallic grout pipe may be used for grouting rock dowels, rock bolts and soil nails. Where metallic standpipes are used for grouting rock dowels, rock bolts and soil nails, they shall be extracted from drillholes as grouting proceeds.
WORKMANSHIP

SUBMISSIONS, RECORDS AND MONITORING

GRO.W010.7 PARTICULARS OF GROUTING FOR GEOTECHNICAL WORKS
The following particulars of the proposed materials and methods of construction for grouting for geotechnical works shall be submitted for Approval at least 28 days before grouting starts:
1. Details of drilling, grouting and testing equipment;
2. Details of grout mix, including admixtures;
3. Methods of storing, mixing and injecting grout;
4. Methods of drilling, cleaning, capping and sealing grout holes;
5. Methods of grouting, including grouting stages, order of working and regrouting methods;
6. Methods of controlling surface water, groundwater, grout leakage and ground movement, including methods of containing overflow grout, grout spill, monitoring and instrumentation; and
7. Safety and hazard risk control measures, including bursting of high pressure grout pipes.

GRO.W020.7 RECORDS OF GROUTING FOR GEOTECHNICAL WORKS
1. Keep records of grouting for geotechnical works on the Site. The records shall be available for inspection by the CM at all times. Records shall include the following details:
   a. Hole location and reference number;
   b. Depth of hole;
   c. Type of grout and grout mix proportions;
   d. Volume of grout injected;
   e. Grouting pressures; and
   f. Times and details of any interruptions, leakages and equipment malfunctions.
2. Submit a record of grouting for each hole to the CM within 24 hours after completion of grouting of the hole. The record shall contain the following details:
   a. Hole location and reference number;
   b. Grouting stage numbers and lengths;
   c. Collar level and hole inclination;
   d. Details of grout injections including the information stated in sub-clause (1); and
   e. Details of the grouting procedure, including any stoppages, leaks to other holes, surface leaks and ground movement.
3. Submit a record of the testing for each hole, including test results, to the CM within 24 hours after completion of testing of a hole. Records of Packer tests shall contain the following details:
   a. Hole location and reference number;
   b. Depth of packer in the hole;
c. Date and time of test;

d. Type of gauge or meter and identifying reference number;

e. Test readings for each 5 minutes period;

f. Calculated test results in Lugeons; and

g. Details of any equipment malfunctions, sudden water losses or blockages, surface leakage or other variations in test procedure.

4. Submit a report of grouting for each part of the Works as shown on the Drawings, including record drawings and logs of holes, to the CM within 7 days after completion and testing of grouting for that part of the Works. The form of records, logs and record drawings shall be as agreed by the CM.

GRO.W030.7  
MONITORING OF GROUTING OPERATIONS

1. Where as shown on the Drawings or directed by the CM, install instrumentation to monitor heave, bulging, settlement, lateral movement, deformation or fracturing of the ground or structures due to grouting operations. Keep records of monitoring on the Site and submit a copy of the records to the CM at frequencies as shown on the Drawings or as agreed by the CM;

2. Check the accuracy of the instruments before grouting starts and at regular intervals agreed by the CM.

GRO.W110.7  
DRILLING FOR GROUTING FOR GEOTECHNICAL WORKS

1. Drill holes in rock for grouting for geotechnical works using rotary or percussion type drills. The tolerances for the holes shall be as stated in Worksection GIN except that for drillholes of soil nails which shall be as stated in Worksection SLO. Do not use grease and other lubricants in the flushing medium or on the rods, except around the threads at the ends of the rods. Do not use drilling methods which result in drill cuttings causing blockages such that grouting cannot be performed satisfactorily;

2. The set-up for drilling plant and ancillary equipment shall be in such a manner that water, dust, fumes and noise generated in the course of drilling and grouting operation shall be sufficiently diverted, controlled, suppressed and muffled. The flushing medium for drilling shall be clean water or air accompanied by the operation of an effective dust extraction and filtering device as agreed by the CM;

3. The minimum size of hole for grouting in rock shall be 40 mm;

4. Drill holes in soil for grouting for geotechnical works by a method which is suitable to the ground conditions and which is Approved;

5. The location of all underground obstructions and utilities shall be determined by the Contractor before drilling starts and the drilling pattern shall take account of the location of obstructions and utilities;

6. Casings required to prevent the collapse of grout holes shall be as stated in Worksection GIN. Remove casings immediately before or simultaneously with the grouting or sleeve grouting operation in such a manner that the grout hole will not collapse and the injection of grout will not be hindered;

7. Flush clean grout holes with water or compressed air introduced at the bottom of the hole after drilling is complete. Protect the holes with capping pipes or standpipes to prevent subsequent collapse or clogging after flushing;
8. Re-flush grout holes, which have been drilled more than one day before grouting of the hole starts, with water or compressed air immediately before grouting is commenced and remove excess flushing water by air jet. Holes drilled in soft ground or in ground other than rock and in which sleeve grouts are proposed as part of the grouting operation shall be sleeve grouted as soon as practicable after drilling.

GRO.W120.7 INSTALLATION OF STANDBIPES AND CAPPING PIPES
1. Unless otherwise permitted by the CM, cap grout holes after drilling and before grouting. Capping shall be by a suitably sealed grout connection, standpipe, packer or other methods agreed by the CM. The cap shall seal the hole to prevent contamination or clogging of the hole until grouting operations start;
2. Install standpipes, if required, in holes after drilling. The pipe shall be sealed into the hole using cement grout consisting of PC and water in the proportions 1:1 by volume.

GROUTING FOR GEOTECHNICAL WORKS

GRO.W130.7 GROUTING EQUIPMENT
1. Grouting equipment for geotechnical works shall be a type, quantity and size suitable for the grouting required. The equipment shall be kept clean and in good working order;
2. Standby grouting equipment shall be available at all times and shall be capable of being brought into operation immediately in the event of breakdowns during grouting operations;
3. Grouts mixers shall be high-speed colloidal mixers having a rotor speed of the least 1000 r/min and capable of producing a colloidal grout mix. Mixers shall be fitted with a water-volume measuring device for batching purposes;
4. Holding tanks shall be fitted with an agitator to provide continuous agitation of the grout at 100 r/min. The tank shall be fitted with a dipstick to allow continuous measurement of the volume of grout in the tank. A 2.36 mm removable screen shall be provided between the tank and the pump or grout lines;
5. Grout pumps shall be a positive displacement type. Pumps shall be fitted with bypass valves to allow a standby pump to be brought into operation;
6. Working pressure gauges shall be accurate to within 3% and shall be calibrated against a test gauge before grouting starts and at weekly intervals. A test gauge with accompanying calibration certificates shall be kept on the Site for the purpose of calibrating working gauges. Working gauges shall be numbered and a record shall be kept of gauge number, shift worked, calibration dates and repairs undertaken. Keep records on the Site and make the records available for inspection by the CM at all times;
7. Packers shall be such that they seal holes in rock at the specified level and shall be capable of withstanding the maximum grout or water pressure to be used at the level without leakage. Packers may be of the mechanical or inflatable rubber type. A sufficient number of packers of a size to suit the holes shall be available on the Site.

GRO.W140.7 MIXING GROUT
1. Grout for geotechnical works shall be mixed by volume or batched by weight as agreed by the CM. The mix proportions may be adjusted if Approved depending on the results of the trial grouting, water tests in the hole or the results of previously grouted holes;
2. Mix grout by adding approximately two-thirds of the cement to the water, adding any admixture and adding the remaining one-third of cement. Other mixing procedures shall not be used unless permitted by the CM;

3. The time for which grout shall be mixed in high-speed mixers shall be suitable for the type of mixer used. Grout shall be continuously agitated in a holding tank after mixing and shall be screened before being circulated in the grout lines. Mixed grout shall be continuously circulated in such a manner that grout which is not taken in a hole can be returned to the holding tank;

4. Grout to which a retarding agent has not been added, and which is not used within 30 minutes after mixing, shall not be used for grouting.

**GRO.W150.7 PRESSURE GROUTING**

1. Grout holes in rock in grouting stages not exceeding 3 m. Grouting may be carried out in either an upstage or a downstage sequence;

2. Grout ground other than rock in such a manner that grout can be injected at various points along the grout hole in a multi-stage operation. The grouting method shall employ perforated pipes with rubber sleeve valves unless otherwise permitted by the CM;

3. Grouting pressures shall initially be 100 kPa per 4-metre depth of hole and shall not exceed the overburden pressure unless permitted by the CM;

4. Grout holes in a continuous operation at the grouting stages and pressures as stated in the Drawings. Unless otherwise permitted by the CM, carry out grouting by injecting the grout under pressure into each grouting stage of the hole until the grouting stage refuses to take further grout;

5. If in the opinion of the CM grouting of any hole or grouting stages has not been completed due to excessive grout-takes, low pressures, excessive leakage or other causes, the hole shall be redrilled or flushed out with water and re-injected with grout.

**GRO.W160.7 LOSS OR LEAKAGE OF GROUT**

1. If during the grouting of any hole, grout is found to flow from adjacent grout holes in quantities, which in the opinion of the CM are sufficient to interfere seriously with the grouting operation or to cause appreciable loss of grout, the holes shall be temporarily capped. If in the opinion of the CM capping is not essential, ungrouted holes shall be left open to allow air and water to escape;

2. If during the grouting of any hole grout is found to flow from joints in the geological formation at the Site or any other location, the leaks shall be plugged or caulked in a manner agreed by the CM;

3. If during the grouting of any hole the grout-take increases suddenly by a significant amount, inform the CM immediately.

**GRO.W170.7 MAKING GOOD HOLES**

1. Make good grout holes through concrete using concrete agreed by the CM. The concrete shall be firmly compacted and shall be finished to match the adjacent surface;

2. Top up uncapped holes in rock after grouting using cement grout consisting of PC and water in the proportion 1:1 by volume, or 1:3 cement sand mortar.
TESTING

GENERAL

GRO.T010.7 TRIALS FOR GROUTING
Unless otherwise permitted by the CM, carry out a grouting trial. The extent and depth of holes for grouting trials and the tests to be carried out shall be as stated in the Drawings.

GRO.T020.7 BATCH OF GROUT
1. For GRO.T110 and GRO.T210, a batch of grout for geotechnical works is any quantity of grout used for grouting geotechnical works in one continuous operation in one day;
2. For GRO.T310, a batch of grout for geotechnical works is the quantity of grout as stipulated in Clause 1.2 of CS1:1990.

GRO.T030.7 LABORATORY
Unless otherwise Approved, carry out tests by employing a laboratory that complies with the requirements stated in the Preliminaries Worksection.

TESTING FOR BLEEDING OF GROUT

GRO.T110.7 TEST FOR BLEEDING OF GROUT
1. Testing arrangements:
   a. Carry out tests by employing a laboratory that complies with the requirements stated in the Preliminaries Worksection.
2. Testing samples:
   a. Provide one sample of grout from each batch of grout for geotechnical works to determine the amount of bleeding of the grout;
   b. Provide samples not more than 30 minutes after the grout has been mixed and protect samples from moisture content changes before the tests for determining the amount of bleeding are carried out.
3. Testing methods:
   a. Divide each sample of grout into three specimens. Test each specimen to determine the amount of bleeding;
   b. Test each specimen for bleeding in accordance with ASTM C940-98a;
   c. Complete the bleeding tests immediately prior to each application in a day or as directed by the CM.
4. Non-compliance:
   a. If the result of any test does not comply with the specified requirements for amount of bleeding of grout for geotechnical works:
      i. Submit particulars of proposed changes to the materials, grout mix or methods of production to the CM for approval;
      ii. Carry out further grouting trials unless otherwise permitted by the CM.
TESTING FLOW CONE EFFLUX TIME OF GROUT

GRO.T210.7 TEST FOR FLOW CONE EFFLUX TIME OF GROUT
1. Testing arrangements:
   a. Carry out tests by employing a laboratory that complies with the requirements stated in the Preliminaries Worksection.

2. Testing samples:
   a. Provide one sample of grout from each batch of grout for geotechnical works to determine the flow cone efflux time of the grout.

3. Testing methods:
   a. Test each sample to determine the flow cone efflux time in accordance with ASTM C939-87.

4. Non-compliance:
   a. If the result of any test does not comply with the specified requirements for flow cone efflux time:
      i. Submit particulars of proposed changes to the materials, grout mix or methods of production to the CM for approval;
      ii. Carry out further grouting trials unless otherwise permitted by the CM.

TESTING CRUSHING STRENGTH OF GROUT

GRO.T310.7 TEST FOR CRUSHING STRENGTH OF GROUT
1. Testing arrangements:
   a. Carry out tests by employing a laboratory that complies with the requirements stated in the Preliminaries Worksection.

2. Testing samples:
   a. Provide one sample of grout for geotechnical works from every 25 m³ or 25 batches, whichever is the smaller volume, for geotechnical works to determine the crushing strength of the grout. Provide at least one sample from the grout produced on any one day;
   b. Provide samples not more than one hour after the grout has been mixed and protect samples from moisture content changes before test cubes are made.

3. Testing methods:
   a. Make two 100 mm test cubes from each sample of grout taken;
   b. Make, cure and test the cubes for crushing strength at 28 days in accordance with CS1:1990;
   c. Take the average of the two crushing strengths as the test result. Adopt the criteria C1 and C2 as appropriate for assessing the compliance with the requirements as stipulated in CON1.T640 and CON1.T660 of Worksection CON1.

4. Non-compliance:
   a. The test result shall comply with the following requirements:
      i. Individual test results: comply with the strength determined from limits given in Column A of the Table specified in CON1.T650 of Worksection CON1;
ii. Average strength determined from any group of four consecutive test results: comply with the strength determined from limits given in Column B of the Table specified in CON1.T650 of Worksection CON1. Where there are less than four available test results, treat the average of the first two or first three consecutive test results in the same manner as groups of four consecutive test results.

b. If the result does not comply with the specified requirements for crushing strength of grout:
   i. Submit particulars of proposed changes to the materials, grout mix or methods of production to the CM for approval;
   ii. Make further trial mixes and carry out further grouting trials unless otherwise permitted by the CM.

PACKER TESTS ON DRILLHOLES FOR GROUTING AND GROUTED DRILLHOLES

GRO.T410.7 TESTING

1. The water loss from drillholes for grouting and from grouted and re-grouted drillholes shall be determined by the Packer test;
2. The number of drillholes for grouting to be tested to determine the water loss shall be as Instructed;
3. Unless otherwise Instructed, test every grouted drillhole and every re-grouted drillhole to determine the water loss;
4. Carry out Packer tests in accordance with BS 5930:1981, Chapter 21.5 and the following sub-clauses (5) to (8);
5. Tests shall be carried out using clean water, in grouting stages not exceeding 3 m in length. Determine the rate of flow of water in the test to an accuracy of 10% for flows exceeding 1 L/min;
6. The test pressure shall be equal to the overburden pressure and shall not exceed the specified maximum grouting pressure for the grouting stage being tested;
7. Carry out the test between a packer and the base of the hole for grouting stages at the base of a hole and between two packers in other cases;
8. Carry out the test by pumping water at the specified pressure into the grouting stage being tested and measuring with a volume meter the water loss over three consecutive 10 minutes periods. The results shall be calculated in Lugeons for each 10 minutes period.

GRO.T420.7 COMPLIANCE CRITERIA

The water loss determined by the Packer test in the grouted hole shall not exceed 5 Lugeons when measured over a 10 minute period.

GRO.T430.7 NON-COMPLIANCE OF DRILLHOLES

If the result of any Packer test on drillholes for grouting does not comply with the specified requirements for the test, the drillhole shall be grouted, re-drilled and retested. Grouting, re-drilling and retesting shall continue until the result of the Packer test complies with the specified requirements for the test.
GRO.T440.7  NON-COMPLIANCE OF GROUTED AND REGROUTED DRILLHOLES

If the result of any Packer test on grouted drillholes or regrounded drillholes does not comply with the specified requirements for the test, the grout shall be removed and the drillhole shall be regrounded and retested. Removal of grout, regrouting and retesting shall continue until the result of the Packer test complies with the specified requirements for the test.

GROUND WATER DRAINAGE AND CONTROL

MATERIALS

GENERAL

DEFINITIONS

In this Specification:

1. "Caisson drain" is an excavated vertical shaft, with or without raking drains, to provide drainage by intercepting and lowering the groundwater level in the vicinity;

2. "Geotextile filter" is a permeable sheet of synthetic material used like a granular filter for filtration and in-plane drainage;

3. "Filter pipe" is a perforated or non-perforated pipe used for draining groundwater;

4. "Granular filter" is a graded sand or gravel placed against a soil to prevent the migration of fine particles out of the soil caused by water flow, and graded such that free discharge of water flowing into the filter is allowed;

5. "Prefabricated band drain" is a synthetic drain which, when installed in a soil strata, acts as a drainage medium for dissipation of pore water pressure;

6. "Raking drain" is a drillhole, with or without perforated filter pipes and geotextile filter sheath, installed generally at an upward inclination for groundwater lowering by gravity flow;

7. "Relief drain" is a synthetic drain installed on slope surfaces or in excavations to divert water seepage before applying sprayed concrete, masonry dentition or other construction;

8. "Trench drain" is a trench wholly or partly filled with granular material or clean crushed rock, with or without filter pipes and geotextile filter.

SUBMISSIONS

PARTICULARS OF GRANULAR FILTERS

Submit to the CM for approval the following particulars of the proposed materials and methods of construction for granular filters at least 14 days before deposition of granular filter material starts:

1. Whether granular filter material is to be supplied ready mixed or is to be mixed on the Site;

2. Source of supply, including name of supplier of ready mixed material;

3. Quantity of each constituent if the material is to be mixed on the Site;

4. Construction plant and methods of mixing for material mixed on the Site;

5. Method of storage and location of storage areas on the Site;

6. Methods of deposition and compaction of material;

7. Results of three tests for particle size distribution of the fill material against which the granular filter is to be placed; and
8. Details of filter design including calculations and grading envelopes.

GWD.M120.7 PARTICULARS OF GEOTEXTILE FILTER

1. Submit to the CM for approval the following particulars, including certificates, of the proposed materials and methods of construction of geotextile filter at least 28 days before the first delivery of the geotextile filter to the Site:
   a. Manufacturer's name and source of supply;
   b. Details of geotextile filter including manufacturer's literature;
   c. A certificate for the geotextile filter showing the manufacturer's name, the date and place of manufacture and showing that the geotextile filter complies with the requirements, including results of tests, stated in this Specification or shown on the Drawings;
   d. Calculations showing that the geotextile filter complies with the filtration characteristics stated in this Specification or shown on the Drawings;
   e. Details of previous uses of the geotextile filter;
   f. Details of quantities to be supplied in each delivery;
   g. Method of storage;
   h. Methods of cutting and jointing geotextile filter;
   i. Method of repairing small batches; and
   j. Methods of laying and holding in position.

2. Submit certificates for each batch of geotextile filter delivered to the Site.

GWD.M130.7 PARTICULARS OF TRENCH DRAINS

Submit to the CM for approval the following particulars of the proposed materials and methods of construction for trench drains at least 14 days before installation of trench drains starts:

1. Method of excavation of trench and installation of geotextile filter;
2. Details of granular fill material as stated in GWD.M360; and
3. Details of geotextile filter as stated in GWD.M120.

GWD.M140.7 PARTICULARS OF RAKING DRAINS

Submit to the CM for approval the following particulars of the proposed materials and methods of construction for raking drains at least 14 days before installation of raking drains starts:

1. Method of connecting adjacent sections of pipes;
2. Proportions of sealant mix; and
3. Details of geotextile filter sheath.

GWD.M150.7 PARTICULARS OF RELIEF DRAINS

Submit to the CM for approval the following particulars of the proposed materials and methods of construction for relief drains at least 14 days before fixing of relief drains starts:

1. Details of relief drains and outlets; and
2. Method of fixing relief drains to the slope face.
PARTICULARS OF CAISSON DRAINS
Submit to the CM for approval the following particulars of the proposed materials and methods of construction for caisson drains at least 14 days before construction of caisson drains starts:

1. Methods of excavation and installation and removal of caisson liners;
2. Method of compaction of fill material;
3. Details of granular filter material as stated in GWD.M110; and
4. Details of geotextile filter as stated in GWD.M120.

PARTICULARS OF PREFABRICATED BAND DRAINS
Submit to the CM for approval the following particulars of the proposed materials and methods of construction for prefabricated band drains at least 28 days before installation of prefabricated band drains starts:

1. Details of type of drain, including manufacturer's literature;
2. A certificate showing the manufacturer's name, the date and place of manufacture and showing that the drains comply with the requirements stated in this Specification or shown on the Drawings;
3. Details of previous installations by the Contractor using similar drains;
4. Method of installation; and
5. Details of installation mandrel, drain anchor, method of penetration and method of recording depth of installation.

PARTICULARS OF FILTER PIPES
Submit to the CM for approval the following particulars of the proposed materials and methods of construction for filter pipes at least 28 days before installation of the filter pipes starts:

1. Details of type of pipes, including manufacturer's literature;
2. A certificate showing the manufacturer's name, the date and place of manufacture and showing that the pipes comply with the requirements stated in this Specification or shown on the Drawings;
3. Details of previous installations by the Contractor using similar pipes; and

PARTICULARS OF GROUNDWATER CONTROL, DRAWDOWN AND MONITORING
Submit to the CM for information the following particulars of the proposed materials and methods of construction for groundwater control, drawdown and monitoring at least 14 days before the relevant work starts:

1. Constructional plant and materials for dewatering;
2. Timing and sequence of dewatering operations;
3. Details of silt traps;
4. Methods of monitoring flow rates and volumes of silt, including monitoring intervals; and
5. Methods and locations for discharging groundwater.
SAMPLES OF MATERIALS
Submit samples of the following proposed materials to the CM for approval of the source and type of each material at the same time as particulars of the material are submitted:
1. Granular filter material;
2. Geotextile filter and two pieces of geotextile filter joined in accordance with the manufacturer's recommendations for each type of joint; and
3. Relief drains.

FILTER AND DRAINAGE MATERIALS

GRANULAR FILTER MATERIAL
Granular filter material for granular filter, trench drains and caisson drains shall consist of durable, inert, natural material free from clay, organic material and other impurities. Granular filter material shall have the particle size distribution stated in this Specification or shown on the Drawings.

GEOTEXTILE FILTER
Geotextile filter shall be an Approved proprietary type and shall have the properties stated in this Specification or as shown on the Drawings.

FILTER PIPES
1. Filter pipes shall comply with the following:
   a. Precast concrete pipes to BS 5911-100:1988;
   b. Vitrified clay pipes to BS 65: 1991 (2003);
   c. DI pipes to BS 4772:1988;
   d. Steel pipes to BS 534:1990;
   e. Porous concrete pipes to BS 5911-114:1992;
   f. Perforated concrete pipes to BS 5911-110:1992;
   g. Pitch fibre pipes to BS 2760:1973;
   h. uPVC pipes to BS 4660:2000 or BS 3506:1969;
   i. Corrugated polyethylene tubing to AASHTO Designation M252-81.
2. Class O uPVC pipes shall not be used;
3. The perforations in perforated pipes shall be cleanly cut and shall be uniformly spaced along the length and circumference of the pipe;
4. uPVC plastic pipes shall be jointed by couplers.

RAKING DRAINS
1. Type 0 raking drains shall be unlined raking drains. Drain holes shall be at least 40 mm diameter;
2. Type 1 raking drains shall be single pipe raking drains consisting of a single perforated pipe with a non-perforated invert;
3. Type 2 raking drains shall be single pipe raking drains consisting of a single perforated pipe with a non-perforated invert and enclosed within a geotextile filter sheath;
4. Type 3 raking drains shall be double pipe raking drains consisting of an outer permanent pipe and an inner removable pipe enclosed within a geotextile filter sheath. The outer and inner pipes shall be perforated pipes with a non-perforated invert;

5. Pipes for raking drains shall be perforated pipes with non-perforated invert as Approved. The portion of openings in the perforated pipe shall cover between approximately 50% and 70% of the circumference of the pipe. The percentage of opening areas to overall surface area of the pipe shall neither be less than 14% for 40 mm diameter pipe nor less than 8% for 65 mm or above diameter pipe. The pipe material shall have the following physical properties or having equivalent functions:
   a. Material: non-metallic;
   b. Minimum tensile strength: 21,300 kN/m²;
   c. Minimum compressive strength: 22,000 kN/m²;
   d. Minimum flexural strength: 6,800 kN/m².

6. Couplers for filter pipes shall also have non-perforated invert and shall be of similar strength and durability of the pipe materials. The lapped length of coupler and each end of the filter pipes shall be at least 100 mm. The elongation at the pipe connection shall be less than 5 mm under a 45 kg pulling force;

7. Geotextile filter sheaths for raking drains shall be formed of non-woven geotextile filter robust enough to prevent tearing and shall have the following physical properties or materials having equivalent functions or performance as Approved:
   a. Material: non-metallic;
   b. Minimum tensile strength: 17 kN/m;
   c. Apparent opening size: 140 µm;
   d. Coefficient of permeability under 2 kN/m²: 5 x 10⁻³ m/s;
   e. Flow rate at 100 mm head under 2 kN/m²: 195 L/m²s.

8. Tying wires for jointing pipes and stitching filter sheath shall be non-metallic wires of minimum breaking load 400 N or equivalent as Approved.

**GWD.M345.7 RELIEF DRAINS**

Relief drains shall be drain mats with multi-layer porous fabric wrapped in filter fabric and covered with an impermeable fabric or products having equivalent function or performance as Approved. PVC flanges for connecting relief drains to outlet pipes shall be directed by the CM.

**GWD.M350.7 PREFABRICATED BAND DRAINS**

1. Prefabricated band drains shall consist of a core and a filter. The drains may be manufactured as a single unit or the filter may be wrapped around the core, and overlapped and sealed to contain the core. The drains shall be made from chemically treated paper, polyethylene, polyester, polyolefine or other synthetic material or combination of such materials;

2. Prefabricated band drains shall be provided with an outer casing or mandrel of rhomboidal or rectangular cross section for use during installation. The drains shall also be provided with an anchor to ensure embedment of the drain during extraction of the mandrel;

3. The strength of the materials in prefabricated band drains shall be such that the drains will withstand all forces resulting from handling and installation;

4. The filter jacket for prefabricated band drains shall be a type which:
a. Has been previously proved effective under similar soil and pressure conditions;
b. Is in all cases able to prevent excessive migration of soil particles into the core; and
c. Has a permeability not less than that of the surrounding soil.

5. Prefabricated band drains shall be able to conform to soil deformation without buckling or crimping of the core.

**GWD.M360.7 FILL MATERIAL FOR TRENCH DRAINS**

1. Fill material to be used with geotextile filter in trench drains shall be clean crushed rock. Type A and Type B fill material shall have the particle size distributions stated in the following table:

<table>
<thead>
<tr>
<th>Type of fill material</th>
<th>Percentage by mass passing BS test sieve</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>63 mm</td>
</tr>
<tr>
<td>Type A</td>
<td>-</td>
</tr>
<tr>
<td>Type B</td>
<td>100</td>
</tr>
</tbody>
</table>

2. Fill material passing a 425 μm BS test sieve shall be non-plastic;

3. The D15 particle size of Type A fill material for use with perforated pipes shall be at least 15% larger than twice the maximum dimension of the perforations, where D15 is the equivalent sieve size in millimetres, interpolated from the particle size distribution curve, through which 15% of the fill material would pass.

**GWD.M370.7 CAISSON LINERS**

Caisson liners shall be concrete tapered rings at least 100 mm thick and not exceeding 1 m deep. The liners shall be constructed with well-compacted concrete of Grade 20/20 or greater.
WORKMANSHIP

DELIVERY, HANDLING AND STORAGE

GWD.W010.7 GRANULAR FILTER MATERIAL
1. Granular filter material shall not be handled or stored in a manner which will result in mixing of the different types and sizes or in segregation, contamination, deterioration or erosion of the material;

2. Place stockpiles of granular filter material on well-drained, prepared areas and shall be separated by dividing walls of sufficient height to keep the different materials separate.

GWD.W020.7 GEOTEXTILE FILTER
1. Deliver geotextile filter in secure wrappings to ensure that the geotextile filter is dry and protected from damage, contamination and exposure to conditions that may adversely affect it;

2. Store geotextile filter on a level surface and shall be kept in a secure and dry condition, which will not result in damage to the fabric or in contamination of the fabric.

GWD.W030.7 FILTER PIPES
Store coils of plastic tubing for filter pipes flat.

GWD.W040.7 PREFABRICATED BAND DRAINS
1. Prefabricated band drains shall be supplied in rolls, securely packed in lightproof wrappings;

2. Store prefabricated band drains in a clean, dry environment.

GRANULAR FILTERS

GWD.W110.7 MIXING
Mix granular filter material thoroughly by the method approved by the CM. Material that has been stockpiled shall be remixed before deposition.

GWD.W120.7 DEPOSITION AND COMPACTION
1. Deposit and compact granular filter material as stated in Worksection EAR1;

2. Deposit granular filter material in a manner which will not result in segregation or contamination of the material;

3. Deposit granular filter material in such a manner that a continuous free draining zone is formed. Clean and scarify the surface of each layer before the next layer is deposited unless otherwise permitted by the CM.
GEOTEXTILE FILTER

GWD.W210.7 EXPOSURE AND DAMAGE REPAIR
1. The total period for which geotextile filter is exposed to daylight or other sources of ultra-violet radiation during handling, delivery, storage and installation shall not exceed 7 days;
2. Do not use geotextile filter that has been damaged or exposed to daylight or other sources of ultra-violet radiation for longer than the period stated in sub-clause (1) above in the permanent work unless permitted by the CM;
3. Repair geotextile filter that has been torn or damaged during installation by using a patch of the same material extending at least 300 mm beyond the edge of the damaged area. Do not carry out repairs on geotextile filter that has been damaged during storage prior to installation.

GWD.W220.7 LAYING
1. Install geotextile filter in such a manner that the individual yarns, webs or layers of the fabric retain their intended orientation and relative positions with respect to each another;
2. Install, cut and joint geotextile in accordance with the manufacturer’s recommendations;
3. Laps in sheets of fabric reinforcement, which are not stated in the Drawings to be jointed, shall be at least 300 mm.

GWD.W230.7 PROTECTION
Do not operate construction plant and other vehicles on installed geotextile filter unless in the opinion of the CM that the installed geotextile filter is adequately protected by a cover of fill material or other means agreed by the CM.

GWD.W240.7 RECORDS
Keep records of installation of geotextile filter on the Site and submit a copy of the records to the CM each day. Records shall contain the following details:
1. Identification of structures and sections of work where geotextile filter is installed;
2. Type of geotextile filter, including identification of batch;
3. Date of first exposure of geotextile filter to ultra-violet radiation before installation;
4. Type of joint, amount of overlap, method of holding in place and any repairs to geotextile filter carried out during installation;
5. Date of installation of geotextile filter; and
6. Date of final covering of geotextile filter.

RAKING DRAINS

GWD.W310.7 INSTALLATION
1. The length of raking drains assembled before installation shall not exceed 12.5 m. Connections between adjacent pipes shall be secured in such a manner that the cumulative longitudinal extension of a 12.5 m assembled length of pipe does not exceed 5 mm when pulled by hand;
2. Pipes for Type 2 and Type 3 raking drains are to be wrapped in geotextile filter sheath in the following manner prior to installation in order to ensure that the overlap and stitching shall be at the non-perforated invert of the pipe:
   a. The pipe shall be placed onto and along the centre of a strip of geotextile filter with the non-perforated invert at top;
   b. The strip of geotextile filter shall be of sufficient width to allow an overlap of at least 50 mm, and shall be drawn around the pipe and stitched together tightly with non-metallic wires;
   c. The stitching shall be tied off onto the pipe and the fabric at every 300 mm to prevent dislocation during installation;
   d. The filter sheath shall be marked to ensure that the non-perforated invert is correctly positioned during installation.
3. During delivery and installation of raking drains, take care to ensure that the pipe and geotextile filter sheath are not damaged. Submit the method of installation of raking drains to the CM for approval prior to installation;
4. Before installation of drain pipes, check the drillholes for cleanliness. Whenever any obstruction is encountered inside a drillhole during pipe insertion, withdraw the pipe and clear the obstruction before re-insertion. No jacking or hammering of pipes shall be carried out during the whole process of pipe insertion.

**GWD.W320.7 DRILLING**
1. Do not use drilling lubricants other than clean air or fresh water for drilling holes for raking drains. Use casings to prevent collapse of the hole and to permit unobstructed insertion of the pipes and geotextile filter sheath;
2. Position the drillhole entry point within the tolerance specified. Deviation in alignment and from straight shall not exceed the tolerance specified. Maintain a positive gradient throughout the complete length of the hole. Measure the inclination of holes by a method agreed by the CM;
3. Drilling and sampling for undisturbed soil samples and rock cores instructed by the CM to be recovered from drillholes shall be as stated in Worksection GIN;
4. Drillholes shall be temporarily plugged or otherwise protected to prevent entry of deleterious material after drilling.

**GWD.W330.7 RECORDS**
Keep records of drillholes for raking drains on the Site and submit a drillhole log for each drillhole to the CM before installation of the raking drain starts. The borehole log shall contain the following details:
1. Drain reference number;
2. Location, inclination, bearings, diameter and length of hole;
3. Details of drilling progress;
4. Details of water seepage related to drilling progress; and
5. Details of samples taken.

**TRENCH DRAINS**

**GWD.W410.7 EXCAVATION**
The width of trench drains:
1. Shall be at least 450 mm;
2. With filter pipes not exceeding 150 mm diameter shall be at least four times the nominal diameter of the pipe;
3. For pipes exceeding 150 mm diameter shall be at least the same as the external diameter of the pipe plus 450 mm.

GWD.W420.7 GEOTEXTILE FILTER SURROUND
Install geotextile filter surround for trench drains as stated in GWD.W220.

GWD.W430.7 BED FOR TRENCH DRAINS
1. Concrete bed for filter pipes in trench drains shall be at least 75 mm thick and shall be Grade 20/20 concrete;
2. Granular bed for filter pipes for trench drains shall have a thickness at least the same as the diameter of the pipe or 150 mm, whichever is greater.

GWD.W440.7 DEPOSITION AND COMPACTION OF FILL MATERIAL
1. Deposit the material for granular bed for trench drains in the trench in layers not exceeding 150 mm thick and for the complete width of the trench. Compact each layer with six passes of a plate vibrator or by other methods agreed by the CM;
2. Deposit and compact fill materials around filter pipes in trench drains as stated in Worksection EAR1. Obtain the permission of the CM before depositing fill material around filter pipes.

RELIEF DRAINS

GWD.W510.7 TRIALS
Construct a trial length of relief drains of at least 2 m.

GWD.W520.7 FIXING
Fix relief drains in position before surface protection or remedial measures are applied. Carry out the fixing in a manner that will not affect the serviceability of the relief drains or outlets. Discharge water collected in relief drains to outlets agreed by the CM.

CAISSON DRAINS

GWD.W610.7 CONSTRUCTION
1. Carry out excavation for caisson drains by manual methods in stages not exceeding 1.0 m depth unless otherwise permitted by the CM. Dewater excavation below the groundwater level so that work may be carried out, as near as may be practicable in the circumstances, in dry conditions. Carry out the dewatering as stated in GWD.W810 and GWD.W820;
2. Unless otherwise permitted by the CM, support the caisson drain shaft at all times during construction using concrete liners. Fill voids between liners and excavated faces with no fines concrete. Install caisson liners for each 1.0 m stage on the same day as that stage is excavated;
3. Remove softened and loose material from the base of the caisson drain immediately before depositing granular filter material in the caisson drain;
4. Remove part or all of the concrete liner adjacent to the granular filter layer before depositing the granular filter material or fill material. Remove debris arising from the concrete liner from the caisson drain;
5. Deposit granular filter material in layers not exceeding 500 mm and compact the granular filter material by methods approved by the CM.
GWD.W620.7 DISCHARGE OF WATER
Discharge water collected in caisson drains to the outlets stated in this Specification or shown on the Drawings.

GWD.W630.7 RECORDS
1. Keep records of caisson drains on the Site and submit a copy of the records to the CM within 14 days after completion of construction of caisson drains. The records shall contain the following details:
   a. Record of work carried out each day; and
   b. Drawings showing the exact locations of caisson drains and the final depths relative to Principal Datum.
2. Keep detailed face logs of caisson drains on the Site and make available for inspection by the CM at all times. The logs shall contain the following information and the format shall be as shown in Figure 10 of 'GEOGUIDE 2: Guide to Site Investigation', GEO:
   a. Details of depths and rate of groundwater seepage;
   b. Details of water levels, including dates and details of fluctuation; and
   c. Four colour prints and one negative for each of the photographs or composite photographs taken during excavation. Each excavation stage shall be photographed using a reference board with maximum dimensions of 300 mm (width) by 450 mm (length). The photographs shall cover all the excavated faces before the placing of caisson liners. Where more than one photograph is required to cover the full excavated depth or length of a face, the overlap between adjacent photographs shall be between 10% and 20%. Each photograph shall identify the face of the excavation and shall contain a natural scale and a colour comparison chart placed alongside the excavated face. The minimum size of colour prints shall be 125 mm x 175 mm.

PREFABRICATED BAND DRAINS

GWD.W710.7 INSTALLATION
1. The installed location of prefabricated band drains shall be within 300 mm of the specified location in plan on the ground surface and the drain shall be within 2% of the installed length to the vertical;
2. Install each prefabricated band drain in one continuous length without joints;
3. The depth of penetration of prefabricated band drains shall be as stated in this Specification or shown on the Drawings. Modify the depth as instructed by the CM during installation based on the resistance of the soil to penetration. Notify the CM immediately of any sudden change in the penetration resistance to the mandrel.

GROUNDWATER CONTROL AND DRAWDOWN

GWD.W810.7 DRAWDOWN OF GROUNDWATER TABLE
Do not draw down the groundwater table to more than 2 m below the earthwork final surface as defined in Worksection EAR1 for excavation.

GWD.W820.7 DEWATERING
1. Carry out dewatering in such a manner that no loss of fines from the ground occurs;
2. Silt traps shall be provided and shall be regularly maintained. All dewatering pumps shall discharge into silt traps;

3. Do not discharge pumped groundwater onto roads, footpaths, kerb channels or adjacent land. Make all arrangements with and obtain the necessary approvals from the relevant authorities for discharging water to drainage systems, watercourses or the sea. Do not start dewatering until the arrangements for disposal of the water have been approved by relevant authorities and implemented. Water entering the Site shall not be discharged into the same silt traps as are used for dewatering;

4. The total capacity of pumps available on the Site for dewatering shall be at least equal to twice the rate of flow measured through the silt traps at any time when the groundwater table is maintained at maximum drawdown;

5. Half of the total pump capacity shall be equipped with a secondary motive power source in addition to the primary motive power. The secondary motive power source shall commence operation automatically in the event of failure of the primary motive power source or an effective alarm system shall be set up which will warn of failure of the primary motive power source. The maximum allowable delay between failure of the primary motive power source and full operation of the secondary motive power source shall not exceed 15 minutes;

6. A full-time attendant shall be available on the Site at all times to execute the changeover if manual operation of equipment is required to bring the secondary motive power into operation;

7. The operation of the changeover of motive power equipment shall be demonstrated to the satisfaction of the CM before the relevant work starts unless otherwise permitted by the CM.

GWD.W830.7 GROUNDWATER RECHARGE

1. If groundwater recharge is to be carried out to maintain the specified groundwater levels at any location, the groundwater recharge system shall have the means to regulate and measure the rate of recharge and to provide an adequate continuous supply of water for recharge. Only clean water shall be used;

2. The capacity of pumps and the power sources which are to be used for groundwater recharge shall be as stated in GWD.W820 (4) except that the rate of flow shall refer to the maximum rate of groundwater recharge required;

3. The groundwater table at any location shall not be raised above the background groundwater table measured before the relevant work starts.

GWD.W840.7 MONITORING

1. Monitor groundwater levels at locations stated in this Specification or shown on the Drawings or as instructed by the CM at all times when groundwater control and drawdown is carried out. Make arrangements for installing instruments and taking measurements both inside and outside the Site;

2. The survey marks for monitoring shall be located in position and level to the Hong Kong standard survey grid and to Principal Datum to within 10 mm in every direction;

3. Monitoring stations and monitoring shall be as stated in Worksection GIN;

4. Groundwater levels shall be measured to an accuracy of 20 mm. Settlements shall be measured to an accuracy of 3 mm;

5. Notify the CM immediately if any incremental settlement reading exceeds 5 mm or if the accumulated settlement exceeds the maximum allowable settlement stated in this Specification or shown on the Drawings.
GWD.W850.7  RECORDS
Keep records of monitoring of settlement, groundwater control and drawdown on the Site and submit a copy of the records to the CM within 24 hours of taking readings.

GWD.W860.7  TOLERANCES
Refer to Appendix H "Schedule of Tolerances" to this Specification.
TESTING

GRANULAR FILTER MATERIAL

GWD.T010.7 GRANULAR FILTER MATERIAL

1. Testing arrangements:
   a. Carry out tests by employing a laboratory that complies with the requirements stated in the Preliminaries Worksection.

2. Testing samples:
   a. A batch of granular filter material is any quantity of granular filter material of the same type and grading delivered to the Site at any one time;
   b. Provide one sample of granular filter material from each 500 m³ or part thereof of the material delivered to the Site;
   c. Unless otherwise permitted by the CM, provide one sample of granular filter material from each 500 m³ or part thereof of granular filter material that has been deposited and compacted;
   d. The size of each sample taken as stated in sub-clause (2)(b) above shall be 10 kg. The method of sampling shall be in accordance with BS 812-102:1989;
   e. Samples taken as stated in sub-clause (2)(c) above, shall consist of material excavated from the compacted layer to form a flat bottomed, steep sided hole of approximately 0.13 m² to the complete depth of the compacted layer. A template shall be used to fix the edges of the hole if necessary. The sides and bottom of the hole shall be at least 50 mm from other types of fill material.

3. Testing methods:
   a. Test each sample of granular filter material to determine the particle size distribution in accordance with Test Method 8.2 of Geospec 3: Model Specification for Soil Testing, GEO.

4. Non-compliance:
   a. If the result of any test for particle size distribution on a sample of granular filter material taken as stated in sub-clause (2)(b) does not comply with the specified requirements for particle size distribution, provide additional samples from the same batch and carry out additional tests for particle size distribution;
   b. If the result of any test for particle size distribution on a sample of granular filter material taken as stated in sub-clause (2)(c) does not comply with the specified requirements for particle size distribution, provide additional samples from the same batch and carry out additional tests for particle size distribution;
   c. The batch shall be considered as not complying with the specified requirements for particle size distribution if the result of any additional test as stated in sub-clauses (4)(a) or (4)(b) above for particle size distribution does not comply with the specified requirements for particle size distribution.
FILL MATERIAL FOR TRENCH DRAINS

GWD.T110.7 FILL MATERIAL FOR TRENCH DRAINS

1. Testing arrangements:
   a. Carry out tests by employing a laboratory that complies with the requirements stated in the Preliminaries Worksection.

2. Testing samples:
   a. A batch of fill material for trench drains is any quantity of fill material for trench drains of the same type delivered to the Site at any one time;
   b. Unless otherwise permitted by the CM, provide one sample of fill material for trench drains from each batch of fill material for trench drains delivered to the Site;
   c. The size of each sample taken as stated in sub-clause (2)(b) above shall be 10 kg. The method of sampling shall be in accordance with BS 812-102:1989.

3. Testing methods:
   a. Test each sample of fill material for trench drains to determine the particle size distribution in accordance with Test Method 8.2 of Geospec 3: Model Specification for Soil Testing, GEO;
   b. Test fill material passing a 425 μm BS test sieve to determine the plasticity index in accordance with Test Method 6.1 of Geospec 3: Model Specification for Soil Testing, GEO.

SLO SLOPE TREATMENT WORKS

MATERIALS

GENERAL INFILLING, BEDDING AND SURFACING MATERIALS ETC

SLO.M010.7 CEMENT MORTAR
1. Cement mortar for in-filling joints in rock faces, for bedding rock for masonry infilling and for surfacing slopes shall consist of Portland cement (PC) and sand in the proportions 1:3 by volume;
2. PC shall comply with BS 12:1996;

SLO.M020.7 ROCK FOR MASONRY INFILLING
Rock for masonry infilling shall not exceed 300 mm in size and shall be obtained from an Approved source.

SLO.M030.7 SOIL-CEMENT
1. Soil-cement shall consist of PC, sand and inorganic soil in the proportions 1:3:12 by mass unless otherwise stated. The mix proportion of soil-cement is 1:3:40 by mass when it is applied to the top layer (maximum 300 mm thick) or other areas as directed or agreed by the CM;
2. PC shall comply with BS 12:1996;
3. Sand shall comply with BS 1200:1976;
4. Inorganic soil shall be free from organic matter and shall contain not more than 30% of soil particles passing a 63 μm BS test sieve.

SLO.M040.7 GROUT FOR GEOTECHNICAL WORKS
As Worksection GRO.

SLO.M070.7 WEEPHOLES
Unless otherwise as shown on the Drawings, weepholes shall be 50 mm nominal diameter uPVC pipes.

SPRAYED CONCRETE MATERIALS

SLO.M110.7 CONCRETE
As Worksection CON1.

SLO.M120.7 AGGREGATE
The nominal maximum aggregate size of aggregates for sprayed concrete shall not exceed 10 mm.
SLO.M130.7 REINFORCEMENT

Unless otherwise Approved, fabric reinforcement including A393 and A252 for sprayed concrete shall comply with BS 4483:1998 except that the 50 mm x 50 mm x 2.7 mm (wire diameter) hot dip galvanized steel welded mesh shall have tensile strength not less than 275 N/mm².

SLO.M140.7 COLOURING

The pigment shall comply with BS 1014:1975 and shall have the characterization of light fast, lime proof, weather resistance and durable like concrete.

PROTECTIVE SCREEN FOR SLOPE WORKS

SLO.M210.7 PROTECTIVE MESH AND FIXINGS

1. Protective mesh for slopes shall be PVC coated galvanized steel wire woven into a double twisted hexagonal mesh. Each hexagon shall be 80 mm x 60 mm. The steel wire shall be at least 2.2 mm diameter and the PVC coating shall be at least 0.4 mm thick. PVC coating on steel wire shall comply with BS 4102:1998 or equivalent. The colour of PVC coating is to be approved by the CM. Wire for protective mesh shall comply with BS 1052:1980 (1999). Galvanized coating on wires shall comply with BS EN 10244-2:2001. The tolerance on the opening of mesh shall comply with BS EN 10223-3:1998;

2. Tying wire for protective mesh shall be 2.2 mm diameter PVC coated galvanized soft annealed steel wire;

3. Bolts for fastening protective mesh to rock or structure shall be galvanized mild steel hooks as shown on the Drawings;

4. Stainless steel anchor bolts and accessories for fastening protective mesh to soil nail heads shall be as shown on the Drawings;

5. Hooks, fixing pins, steel plates and washers for fixing the protective mesh to slope face shall be as shown on the Drawings and shall be galvanized to BS EN ISO 1461:2009;

ROCK BOLTS AND GROUT

SLO.M310.7 ROCK BOLTS

1. Rock bolts shall be an Approved proprietary type. Rock bolt shall comply with CS2:1995 and shall be mild steel or high yield deformed steel as shown on the Drawings;

2. The rated working load of rock bolts shall not exceed 50 % of the ultimate tensile strength. A reduction of 4 mm in the diameter of the bolt shall be taken into account for corrosion when calculating the ultimate tensile strength;

3. Nuts for rock bolts shall be of grade 4 steel and comply with BS 4190:2001. Connectors shall comply with Worksection STW. Bearing plates shall be of grade S275JR steel plate and comply with BS EN 10025-2:2004. Holes in steel plates for rock bolt heads shall be drilled perpendicular to the face of the steel plate and the centre of the hole shall be at a position of within 2 mm from the centroid of the plate. The clearance between the steel bar and the hole of the steel plate shall not be more than 2 mm. All nuts, connectors and bearing plates shall be galvanized to BS EN ISO 1461:1999. Rock bolts shall have non-corrodible centralizers capable of ensuring an even annulus of grout as Approved. Grease shall comply with Table 1 of Geospec 1: Model Specification for Prestressed Ground Anchors, GEO;
4. Rock bolts shall be galvanized in accordance with BS EN ISO 1461:2009.

SLO.M320.7  GROUT FOR ROCK BOLTS
Grout for rock bolts shall be as stated in GRO.M010 to GRO.M110 except that the water cement ratio shall not exceed 0.45. The use of admixtures (e.g. PFA) shall be subject to Approval.

ROCK DOWELS

SLO.M410.7  ROCK DOWELS
1. Rock dowels shall consist of untensioned straight or L-shaped deformed high yield steel or mild steel bars complying with CS2:1995 and shall be galvanized to BS EN ISO 1461:2009;
2. Rock dowels shall have non-corrodible centralizers capable of ensuring an even annulus of grout around the steel bar as Approved.

SLO.M420.7  GROUT FOR ROCK DOWELS
Grout for rock dowels shall be as stated in GRO.M010 to GRO.M110 except that the water cement ratio shall not exceed 0.45. The use of admixtures (e.g. PFA) shall be subject to Approval.

SOIL NAILS

SLO.M510.7  GENERAL
A soil nail shall consist of a steel bar, cement grout, centralizers, head assembly and all other associated components as shown on the Drawings.

SLO.M520.7  SOIL NAILS
1. Soil nail bars shall be of high yield deformed bars and comply with CS2:1995;
2. Nuts shall be of grade 4 steel and comply with BS 4190:2001;
3. Connectors shall comply with Worksection STW and shall be:
   a. A proprietary type approved by the CM;
   b. For tension joints, a cold swaged or threaded type. The connectors shall be capable of developing the full tensile strength of the parent bar and shall comprise high tensile steel studs and seamless steel tubes fitted with protective plastic caps;
   c. For compression joints, a wedge locking or bolted sleeve type.
4. Bearing plates shall be of grade S275JR steel plate and comply with BS EN 10025-2:2004;
5. Permanent casings shall comply with BS 4019-3:1993;
6. All steel components for soil nails shall be galvanized to BS EN ISO 1461:2009;
7. Soil nails shall have non-corrodible centralizers capable of ensuring an even annulus of grout around the steel bar. The nominal diameter of the centralizers shall not differ from the specified diameter of the drillhole by more than 10 mm;
8. Conducting wires for length checking shall be solid wires of specified diameter with insulation;
9. Wires and ties for fixing and anchoring packers, centralizers, grout pipes and conducting wires etc. shall be made of non-corrodible materials;
10. For soil nails using threaded type reinforcement connectors but without galvanized coating on either the threads inside the connectors or the threads at the ends of reinforcement bars, heat-shrinkable sleeve of a proprietary type as approved by the CM shall be used as an alternative to galvanization as a corrosion protection measure to the connections. Any rust on the threads of reinforcement bars and connectors shall be thoroughly cleaned before being connected together;

11. Unless otherwise specified by the manufacturer and approved by the CM, the heat-shrinkable sleeve for reinforcement connectors shall be made of a layer of radiation cross-linked polyethylene and a layer of anti-corrosion mastic sealant material. The properties of polyethylene and mastic sealant materials shall comply with the following requirements:

SLO.M525.7  **SOIL NAILS WITH DOUBLE-CORROSION PROTECTION**

Materials for soil nails with double-corrosion protection shall comply with SLO.M520 unless otherwise specified in the following sub-clauses:

1. Corrugated sheathing for the double corrosion protection shall be a proprietary type approved by the CM and shall be made of high density thermoplastic materials which shall be homogeneous, thermally stable, chemically inert and resistant to chemical, bacterial and fungal attack. The wall thickness of the sheathing shall be at least 1.0 mm. Plastic sheathing and all associated components shall comply with the requirements as stipulated in Table 2 of Geospec 1: the Model Specification for Prestressed Ground Anchors, GEO;

2. Finished internal and external surfaces of the sheathing shall be smooth, clean and free from flaws, pin-holes, bubbles, cracks and other defects. Sheathing and all associated components shall be used in accordance with the manufacturer's instructions;
3. Sheathing and other plastic protective components shall:
   a. Not contain any substances that will promote corrosion;
   b. Be covered to prevent exposure to ultra-violet light from direct or indirect sunlight;
   c. Be resistant to slip; and
   d. Be capable of withstanding the applied handling stresses, the hydrostatic and grouting pressures.

SLO.M526.7 GROUT FOR SOIL NAILS
Grout for soil nails shall be as stated in GRO.M010 to GRO.M110 except that the water cement ratio shall not exceed 0.45. The use of admixtures (e.g. PFA) shall be subject to Approval.

SLO.M527.7 SOIL-NAIL HEAD
1. Steel reinforcement for soil-nail heads shall be of grade 460 steel and comply with CS2:1995;
2. Concrete for soil-nail heads shall be Grade 30/20 concrete or 30 MPa sprayed concrete and comply with Worksection CON1.

SLO.M540.7 NON-BIODEGRADABLE MATS FOR EROSION CONTROL
1. Non-biodegradable mats for erosion control shall be woven and ultraviolet stabilized mats. The mats shall have the material properties as shown on the Drawings;
2. The mats must be produced by proprietary manufacturers and specifically designed for the erosion control of sloping ground;
3. The colour of the mats shall be black or dark green or other colour as directed or Approved.

SLO.M550.7 BIODEGRADABLE MATS FOR EROSION CONTROL
1. Biodegradable mats for erosion control shall be woven coir mesh mats or woven jute mats. The mats shall have the material properties as shown on the Drawings;
2. The mats must be produced by proprietary manufacturers and specifically designed for the erosion control of sloping ground.

SLO.M560.7 WIRE MESH FOR EROSION CONTROL
1. Wire mesh for erosion control shall comply with SLO.M210 (1);
2. Unless otherwise specified in the Drawings, fix the wire mesh onto the slope surface by means of anchor bolts and/or fixing pins. The fixing pins, steel plates and washers for fixing the wire mesh to slope face shall comply with SLO.M210;
3. Galvanized costing on wires shall comply with BS EN 10244-2:2001. The anchor bolts nuts and washers for fixing the wire mesh to soil nail heads shall be stainless steel complying with Worksection DRA. Submit details of anchor bolts and fixing pins to CM for approval;
4. Anchor bolts and accessories shall have the following properties:
   a. The minimum size of the anchor bolts shall be M8;
   b. The components of the anchor bolts shall include the following:
      i. Hexagonal bolt or threaded rod with hexagonal nut;
      ii. Washer with minimum diameter of 20 mm.
c. The length and diameter of the drillholes and the minimum size and embedment depth of the anchor bolts shall be as shown on the Drawings or otherwise Approved;

d. The mean ultimate tensile resistance and mean ultimate shear resistance of the anchor bolts shall be 31 kN and 47 kN respectively in non-crack concrete with concrete strength at 30 N/mm².

**BUTTRESSES**

**SLO.M610.7**  
**CONCRETE**  
Buttresses may be either mass concrete or reinforced concrete as directed by the CM. Concrete for buttresses shall be of Grade 20/20 concrete and shall comply with Worksection CON1 unless otherwise as shown on the Drawings.

**SLO.M620.7**  
**REINFORCEMENT**  
As shown on the Drawings.

**SLO.M630.7**  
**DRAINS**  
Drainage which is required behind buttresses shall consist of relief drains connected to 50 mm diameter uPVC outlet pipes.

**ROCK JOINT RELIEF DRAINS**

**SLO.M710.7**  
**DRAINS**  
The drain must be produced by proprietary manufacturers and specifically designed for use as rock joint relief drain.

**BOULDER BARRIER MATERIAL**

**SLO.M810.7**  
**GABION**  
The barrier shall consist of mesh gabions or equivalent. The gabion shall be a box-shaped container made of triple-twist hexagonal steel wire mesh strengthened by selvedges of heavier wire and by mesh diaphragms which divide it into 1 m compartments. The steel wire mesh for the gabion shall be 2.7 mm diameter with a plastic coating giving an outer diameter of 3.8 mm. The mesh shall conform to BS EN 10223-3:1998.

**SLO.M815.7**  
**FABRICATED SOIL**  
Fabricated soil shall consist of a mixture of 3 parts by volume Decomposed Granite and 1 part by volume Soil Conditioner as follows:

1. Decomposed Granite shall consist of evenly textured, granular soil taken from the top 300 mm of land previously supporting vegetation growth. It shall be free from weeds, deleterious matter and stones larger than 50 mm in any dimension;

2. Soil Conditioner shall consist of moist peat; or fully matured animal manure as supplied by Agriculture and Fisheries Department; or equal and approved by the CM. No material shall give off toxic nor obnoxious fumes.
SUBMISSIONS

SLO.M910.7 PARTICULARS OF ACCESS
Particulars of the proposed means of access for slope treatment works, including access structures and reinstatement, shall be submitted to the CM for approval at least 14 days before the slope treatment works start.

SLO.M920.7 PARTICULARS OF SPRAYED CONCRETE
1. Submit to the CM for approval the following particulars of the proposed materials and methods of construction of sprayed concrete at least 14 days before sprayed concrete is used:
   a. Type and performance of mixing and spraying plant;
   b. Details of water sprays and associated pumps for surface spraying;
   c. Method of curing;
   d. Details of trial panels and test panels;
   e. Methods of measuring surface temperature and moisture content of the soil;
   f. Methods of achieving the specified thickness of sprayed concrete and the specified cover to reinforcement and methods of measuring the thickness and cover after spraying;
   g. Method of fixing reinforcement;
   h. Details of materials and mix design;
   i. Details of dry mix process and/or wet mix process for applying sprayed concrete;
   j. Name and details of the experience of the shotcretors;
   k. Details of working platform;
   l. Method of forming expansion joints; and
   m. Sequence of spraying on slope surfaces.
2. Keep records of sprayed concrete operations on the Site and submit to the CM daily. The records shall contain details of the quantities of all materials used at each location.

SLO.M930.7 PARTICULARS OF ROCK BOLTS
1. Submit to CM for approval on the source and type of rock bolts and a sample of a complete rock bolt at the same time when particulars of rock bolts are submitted;
2. Submit to the CM for approval the following particulars of materials and methods of construction for rock bolts at least 28 days before pull-out trials start and before any rock bolts are installed in the permanent works:
   a. Details of rock bolts, nuts, washers, bearing plates, connectors, sleeves, grease and centralizers;
   b. Methods of tensioning and grouting;
   c. Proposed working loads;
   d. Previous performance records;
   e. Details of equipment for testing rock bolts, including test and calibration certificates;
   f. Details of working platform and drilling equipment, including method of drilling and size of drillholes;
g. Details of equipment for Packer tests in drillholes including test and calibration certificates;

h. Grout mix details and grouting equipment.

3. All equipment for testing rock bolts shall be tested and calibrated by laboratories approved by the CM not more than 6 months prior to the date of carrying out the tests.

SLO.M950.7  PARTICULARS OF SOIL NAILS

Submit to the CM for approval the following particulars of materials and methods of construction for soil nails at least 28 days before pull out tests commence and before any soil nails are installed in the permanent works:

1. Details of and assembled component samples comprising of soil nails bars, coupling sleeves, nuts, washers, plates, connectors, centralizers, grout pipes, conducting wires, corrugated sheathing, packers for isolating the bond length and plugs capable of sealing the drillholes and withstanding the pressure head maintained on the grout during grouting;

2. Details of galvanizer to be employed for galvanizing the steel components and method of making good any damaged galvanized coating;

3. Details of heat-shrinkable sleeve for protecting the connections between reinforcement bars if galvanized coating to either the threads inside connectors or at the ends of reinforcement bars is not applied, together with details of the heat application equipment for shrinking the sleeves; risk assessment for using the heat application equipment and safety measures in connection with the use of the heat application equipment;

4. Method of repairing damaged heat shrinkable sleeves during heat application or other installation process of soil nails;

5. Details of corrosion protection for the threaded portion of the steel bar at soil nail head;

6. Details of working platform;

7. Details of temporary support to drillholes;

8. Details of permanent casing;

9. Method of storing materials;

10. Method of drilling and details of drilling equipment;

11. Method of assembling soil nail bars;

12. Method of installing soil nail bars into drillholes;

13. Method of grouting and details of grouting equipment;

14. Details of equipment for measuring the volume of grout injected into each drillhole together with the accuracy and method of calibrating the equipment;

15. Details of equipment for testing soil nails, including test and calibration certificates;

16. Details of testing assembly including details of datum for deformation measurement and bearing pad; and

SLO.M955.7  PARTICULARS OF MATS FOR EROSION CONTROL

Submit to the CM for approval the following particulars of materials and methods of construction for the mats for erosion control at least 14 days prior to installation:

1. Details and samples of materials;
2. Manufacturer’s literature including recommended sequence of mat installation and hydroseeding;
3. Methods of drilling holes, lapping, fixing and anchoring;
4. Method of placing and tamping soil into the mats, if required;
5. Details of equipment; and
6. Certificates from the manufacturer on the compliance of the materials with the requirements as shown on the Drawings.

SLO.M957.7 PARTICULARS OF WIRE MESH FOR EROSION CONTROL
Submit to the CM for approval the following particulars of materials of wire mesh, anchor bolts and methods of construction at least 14 days prior to installation:
1. Details and samples of wire mesh and anchor bolts;
2. Method of drilling holes for the bolts and details of drilling equipment; and
3. Certificates from the manufacturer on the compliance of the materials with the requirements as shown on the Drawings.

SLO.M960.7 DETAILS OF ROCK ANCHORS
1. When required by the CM submit, prior to the commencement of fabrication and installation, details of rock anchors which the Contractor proposes to use in the Works. The details shall include, inter alia, working drawings showing all relevant anchor dimensions, corrosion protection, head details, stages of installation, etc, together with a method statement including all relevant data on installation, grouting, stressing and monitoring procedures. All relevant test certificates and manufacturer's literature shall also be submitted. Do not commence the installation of anchors until the CM has indicated that he has no further comment on these drawings and procedures. The CM’s acceptance of the proposals for anchors will be contingent upon their acceptance by the Geotechnical Engineering Office, Civil Engineering Development Department;
2. Maintain detailed comprehensive records of all activities relating to the installation of rock anchors on the Site. Such records shall be compiled on Approved record sheets. Records shall be submitted to the CM for his verification not more than 24 hours after completion of each anchor.

SLO.M970.7 PARTICULARS OF GABIONS
Submit to the CM for approval the following particulars of materials of gabions and the methods of construction at least 14 days prior to installation:
1. Details and samples of materials;
2. Manufacturer's literature including recommended sequence of gabion installation; and
3. Certificates from the manufacturer on the compliance of the materials with the requirements as shown on the Drawings.

SLO.M980.7 METHOD STATEMENT FOR REMOVAL OF UNSTABLE BOULDERS
Submit to the CM for approval a method statement for the removal of unstable boulders, including the safety precautions to be taken, before the commencement of works.
WORKMANSHIP

GENERAL REQUIREMENTS AND PRELIMINARY WORK

SLO.W010.7 SCOPE OF WORK
1. Rock stabilization works on final excavated rock slopes shall include, but shall not be limited to breaking up and removing loose or overhanging rocks, supporting loose rocks with dowels or bolts, providing masonry infill, buttresses or reinforced concrete supports, securing loose areas with sprayed concrete (reinforced with mesh or plain), infilling joints with mortar, removing soft material and backfilling with concrete and providing adequate drainage measures. Typical details of these items are shown on the Drawings;

2. The quantities of various stabilization measures given in the Bill of Quantities are all provisional. A detailed examination of the final rock slope may result in significant variation in the actual quantity of work required. The Contractor shall be deemed to have made allowance in his rates for this variation in quantities;

3. Blasting is not permitted for the works unless Approved;

4. If, in the CM's opinion, the rock stabilization works are required principally as a result of the Contractor's standard of workmanship (for example poorly aligned presplit drillholes) the Contractor shall bear the cost of such stabilization measures as are required by the CM;

5. The CM will inform the Contractor of the extent and nature of rock stabilization work required for any slope, or portion of slope, within two weeks of access being provided to that slope or portion of slope. The CM will also inform the Contractor which of these items, if any, he considers to be necessary as a result of the Contractor's standard of workmanship;

6. For rock slopes with multiple benches, rock stabilization works shall be installed progressively as the benches are excavated. Blasting of each lower bench shall not be carried out unless the upper bench has been inspected by the CM and the Instructed stabilization measures installed to the CM's satisfaction.

SLO.W020.7 ACCESS TO SLOPES
1. Means of access consisting of scaffolding constructed of sound bamboo, metal or other materials agreed by the CM shall be installed to enable the CM to examine slope treatment works. The scaffolding shall allow access to within 0.8 m of the slope face. Hand and foot holds for climbing shall be provided by bamboo or metal members at centres not exceeding 0.5 m vertically and 0.8 m horizontally;

2. Where the slope stabilization details include the removal of rock from the slope or other materials the CM may wish to carry out an additional inspection of that area of the slope from which rock or other materials have been removed. If required by the CM, re-erect or repair the access to enable such additional inspection to take place;

3. Install a system of safety ropes on the scaffolding. Safety ropes shall be 12 mm diameter and shall have a breaking force of at least 18 kN. The system of safety ropes shall consist of:
   a. Vertical ropes at not more than 3 m centres horizontally securely anchored to the crest of the slope; and
   b. Horizontal ropes at not more than 3 m centres vertically.
The system of safety ropes shall be constructed in such a manner that the ropes are tied at not more than 3 m spacings in both directions to form a net.

4. Provide scaffolding for CM to carry out inspection to the slope. Do not use the scaffolding for carrying out site operations without the permission of the CM;

5. Where rock slope works are included in the Contract, allow sufficient time in the programme for the CM to inspect the rock slope, check the stability, design slope treatment works and determine the extent of works required, taking into account of any specified time stated in the Contract that the CM may require for inspection and design of slope treatment works;

6. Additional payment for repairing or re-erecting access for the purpose of inspection in accordance with sub-clause (2) shall not be made. The rate to provide and maintain access shall be deemed to include the cost of complying with this sub-clause.

SLO.W030.7 PROTECTION FENCES AND BARRIERS
1. Construct protection fences and barriers for slope treatment works as shown on the Drawings before slope treatment works start;

2. Repair damaged protection fences and barriers immediately. Obtain CM's permission before protection fences and barriers are dismantled.

SLO.W040.7 PREPARATION FOR SLOPE TREATMENT WORKS
1. Clear vegetation and remove existing impermeable surfaces and topsoil from existing soil slopes before slope treatment works start;

2. Trim and scarify surface of slopes before slope treatment works start. On completion of trimming and scarifying, remove any loose materials from the surface of slopes by means of water jet coupled with compressed air for rock slopes or other hard surfaces and by means of air jet for soil slopes, unless otherwise directed by the CM;

3. Clean rock faces and joints, and the surface and joints of retaining walls of moss, vegetation and loose material, immediately before slope treatment works start. Remove surplus water by an air jet. Divert water flowing from or across the rock face by relief drains or by other methods agreed by the CM before the application of impermeable surfaces;

4. Reinstall any slope surface that has been stripped for inspection by the CM without any further slope work to its original condition.

BOULDER STABILISATION, REMOVAL AND CONSTRUCTION OF BOULDER BARRIERS

SLO.W110.7 GENERAL
1. Where shown on the Drawings or as directed by the CM, carry out boulder stabilization/removal works. Carry out the boulder stabilization/removal works in such a manner as to prevent damage to other parts of the ground surface, slope drainage channels or pipes, road surfaces, fencing and any other temporary or permanent features;

2. Take all necessary precautions to ensure public safety within the area of boulder stabilization/removal works to prevent fires, and to avoid erosion or the slippage or wash of loose materials within, or into areas beyond, the limits of the Site;

3. On the completion of the works the area shall be left clean and tidy. Reinstall all works areas, including backfilling of any excavations, re-establishing vegetation by hydrosowing or planting, making good of any erosion and damage to roads, tracks or paths to the satisfaction of the CM.
SLO.W120.7  REMOVAL OF BOULDERS

1. Where directed by the CM, remove boulders from slopes by means of line drilling, expansive grouts, rock breakers or other methods agreed by the CM. For the purpose of this clause, a boulder to be removed from rock slopes shall qualify as “boulder” only if it exceeds 0.2 m³ in volume before excavation and it cannot be removed without the use of powered mechanical equipment;

2. Under no circumstances will blasting be permitted. Take all materials removed off the slope and clean the slope surface. Devoid of any loose fragments;

3. Carry out such removal so as to prevent boulders, rock fragments or other materials from falling down the slope. The broken up boulders, rock fragments or other materials from boulder removal shall not be allowed to remain or be scattered on the slope. Removal shall also be carried out in such a manner as to prevent damage to other parts of the ground surface, slope drainage channels or pipes, road surfaces, fencing and any other temporary or permanent features.

SLO.W130.7  CONSTRUCTION OF BOULDER BARRIERS

1. Where shown on the Drawings or as directed by the CM, construct boulder barriers as protection against potentially hazardous boulders or rock falls. Conduct a joint initial record survey to determine the actual barrier location for agreement before construction. Details of boulder barriers shall be issued within 2 weeks after the survey. Vegetation clearance at the tentative barrier location is to be completed to the satisfaction of the CM prior to the survey;

2. Excavate the foundation for the barrier in accordance with Worksection EAR1 and to depths as directed by the CM;

3. Construct drainage pipes, headwalls, baffle blocks and watercourse paving associated with the boulder barrier in accordance with the Drawings to intercept water and to carry the water flow through the pipes under boulder barriers;

4. The barrier shall consist of mesh gabions or equivalent in accordance with SLO.M810. Join the gabions securely by looping binding wire through the mesh and twisting it together. The binding wire shall be coated with PVC. The strength of connections shall be not less than the strength of the steel wire mesh. Sprayed concrete shall be applied on the gabions surface for fire protection if required by the CM;

5. Where shown on the Drawings or as directed by the CM, place additional steel wire mesh on the face of the gabions. The wire mesh sheeting shall be fastened to the gabions by binding wire;

6. Fill the gabions to one-third height with hard durable stones of sizes between 125 mm to 200 mm. The stones shall be adequately hand-packed to ensure that it is tightly packed and has minimum voids. Horizontal bracing wires with plastic coating shall be fixed in the gabions directly above the level of the stone to keep the face of the gabion even and free from bulging. Continue filling and repeat the process until the stones reach to the top level of the gabion;

7. Where shown on the Drawings or as directed by the CM, place a layer of galvanized steel wire mesh with openings less than 1.5 mm at one-third height of the gabions. Fill and compact stones until they reach the top level of the gabion. Fill all voids within the rockfill above the mesh with fabricated soil as specified in SLO.M815. The top surface of the barrier shall be hydroseeded or planted as directed by the CM.
ROCK SLOPE TREATMENT WORKS

SLO.W210.7 SCALING AND TRIMMING OF ROCK SLOPES
1. Carry out rock scaling on areas as directed by the CM. Rock scaling shall include the removal of all loose blocks of any size using hand tools, or boulders not exceeding 0.2 m³ in volume using powered mechanical equipment;
2. Carry out scaling and trimming of rock slopes in such a manner that soil and rock is removed from the slope face without affecting the stability and integrity of the slope;
3. Take measures to prevent uncontrolled falls of debris arising from scaling and trimming works. Carry out scaling and trimming of rock slopes using hand-held tools;
4. Remove all material excavated by scaling and trimming and loose fragments of soil and rock off the slope;
5. Clean rock faces using a water jet coupled to compressed air after scaling and trimming is complete.

SLO.W220.7 ROCK SPLITTING
Carry out rock splitting using percussive hammers, drills, hydraulic splitters, chemical expanding agents, hand-tools or other methods agreed by the CM.

SLO.W230.7 SEALING AND INFILLING OF ROCK JOINTS
Seal joints in rock faces with Grade 20/20 concrete, cement mortar or masonry as shown on the Drawings or directed by the CM. Rock for masonry infilling shall be bedded in cement mortar. Where shown on the Drawings or as Instructed, install relief drains before rock joints are sealed or infilled.

SLO.W240.7 CONCRETE BUTTRESSES
1. General requirements:
   a. Where directed by the CM, construct buttresses to support rock or rock faces at the locations and to the dimensions as directed by the CM and in accordance with the details shown on the Drawings;
   b. Construction of buttresses may incorporate some or all of the following activities and features: scaling of loose rock, trimming, installation of rock dowels, rock bolts, no-fines concrete, sandbag filters, raking drains, drainage holes and channels;
   c. At each buttress location, scale off loose blocks and trim the slope to lines and levels as directed by the CM. For buttresses located at the base of the slope, trim and excavate the bottom area to an Approved alignment;
   d. Unless otherwise specified, form all exposed concrete faces in accordance with Worksection CON1;
   e. Construct drainage behind buttresses as SLO.W260 with a gradient of at least 1 in 50. Fix the uPVC pipes securely to the formwork before concreting starts.
2. Special requirements for concrete buttressing to unstable rock:
   a. Where shown on the Drawings or directed by the CM, construct buttresses to support a boulder, groups of boulders or other rock masses;
   b. Excavate the foundation for the buttress in accordance with Worksection EAR1 to depths directed by the CM. Do not place any formwork until the CM is satisfied that a suitable founding level has been achieved;
c. The buttress shall be anchored by 32 mm diameter rock dowels embedded 500 mm into the ground and projected at least 300 mm into the buttress, or as shown on the Drawings or as directed by the CM;

d. Prior to concreting, scarify the rock surface thoroughly;

e. Where shown on the Drawings or as directed by the CM, construct drains to intercept water and to carry it past the boulder, groups of boulders, rock masses or the strata influencing their stability.

SLO.W250.7 CONSTRUCTION OF REINFORCED CONCRETE PADS
Reinforced concrete pads may be used in conjunction with one or more rock bolts. Dimensions of the pads and details of the reinforcement required shall be given to the Contractor within two weeks of access being provided for the CM's examination of the rock slope. Where possible the shape of the concrete pads will be chosen so that support during construction can be provided by natural irregularities in the rock slope. Where such irregularities do not exist, the Contractor may, where Approved, install dowel bars to provide temporary support.

SLO.W260.7 DRAINAGE HOLES IN BUTTRESSES AND PADS
1. Where ordered by the CM, 50 mm diameter uPVC pipes shall be built into buttresses or reinforced concrete pads to act as drainage holes. The buried end of the pipe shall be mortared in place on a joint or fissure and the exposed end fixed firmly to the formwork before concreting commences;
2. Where directed by the CM, a pocket of coarse filter material or no-fines concrete shall be placed at the buried end of the pipe.

SOIL-CEMENT FILL

SLO.W310.7 MIXING SOIL-CEMENT
Mix soil-cement thoroughly in a concrete mixer. Small quantities of soil-cement shall not be hand mixed unless permitted by the CM. The method of mixing soil-cement shall be agreed by the CM.

SLO.W320.7 DEPOSITION AND COMPACTION OF SOIL-CEMENT FILL
1. Deposit soil-cement fill in its final position and compact within 30 minutes after the cement has been added to the mix;
2. Compact soil-cement fill in accordance with Worksection EAR1 to obtain a relative compaction of at least 95% throughout. Soil-cement fill shall be at optimum moisture content during compaction. The tolerance on the optimum moisture content percentage shall be ± 3.

SPRAYED CONCRETE

SLO.W410.7 RECORD
Before sprayed concrete is applied to any slope, keep records of the slope in terms of photographs/mapping, format of which shall be as agreed with the CM.

SLO.W420.7 MIX DESIGN AND PROCESS
Before sprayed concrete is used, submit the mix design to the CM for approval. Where required by the CM, construct trial panels for different types of spraying equipments or different shotcretors. Make test panels to establish the suitability of sprayed concrete mix, spraying equipment and shotcretors and test in accordance with SLO.T110.
SLO.W430.7  TRIAL PANEL
1. Construct a trial panel at least 50 mm thick and at least 3 m x 3 m in area for sprayed concrete on the surface to be treated. The average percentage rebound shall be estimated for each trial panel and shall be used in the calculations of the cement content of the applied concrete. Cores shall be taken and tested in accordance with the requirements of the testing section in this Worksection;

2. Trial panel for coloured sprayed concrete:
   a. Carry out a trial panel for coloured sprayed concrete of an area not less than 2 m x 2 m at least 2 months before any permanent coloured sprayed concrete is to be constructed;
   b. The trial panel shall be used to demonstrate the methods and the finishes of the proposed coloured sprayed concrete construction;
   c. Should the panel not present the required finishes, carry out further trial panels until acceptable finishes are produced. No permanent coloured sprayed concrete construction shall be allowed until the trial panel is Approved.

SLO.W440.7  PREPARATION OF SLOPE SURFACES
1. Remove weak material along joints or seams in slope surfaces to which sprayed concrete will be applied to a depth equal to the width of the weak zone;

2. If the soil surface temperature exceeds 25°C or the moisture content is less than 10 %, water the surface to be sprayed using sprays unless otherwise Instructed. Hoses without sprays shall not be used. Spraying of water onto the slope surface shall be carried out not more than 1 hour before spraying of concrete starts;

3. Before sprayed concrete is applied, protect all tree trunks, railings, channels, utilities, pipes, structures, street furniture or other facilities adjacent to or within the sprayed concrete area from being contaminated by sprayed concrete or rebound particles with an Approved means. Clean and make good all contaminated surfaces to the satisfaction of the CM.

SLO.W450.7  FIXING REINFORCEMENT
Fix and lay fabric reinforcement for sprayed concrete securely to the slope by steel nails or rawl bolts, or as shown on the Drawings, without sharp bends or creases. The cover to the reinforcement shall be at least 20 mm and laps between adjacent sheets shall be at least 150 mm, or as shown on the Drawings. Place the fabric reinforcement centrally in the sprayed concrete. The fabric reinforcement shall be supported clear of the ground and away from any surface irregularities with adequate numbers of cover blocks.

SLO.W455.7  WEEPHOLES, STUD DRAINS AND JOINTS IN SPRAYED CONCRETE
1. Construct 50 mm diameter weepholes as follows:
   a. On slope surfaces at 1.5 m staggered centres in each direction; and
   b. On rock faces, on rock joints and at locations/spacings as directed by the CM.

2. Extend all weepholes through the full thickness of the sprayed concrete and lay with an outward inclination of 1 in 10;

3. When directed by the CM, form stub drains and rock joint relief drains as shown on the Drawings. Stub drains shall be formed with perforated uPVC pipes installed in 75 mm diameter drillholes of 500 mm minimum length. The spacing of the drains shall be as directed by the CM;

4. On soil slopes, construct expansion joints in sprayed concrete in line with the expansion joint s of adjacent channels, berm slabs and concrete structures etc, or at 15 m intervals maximum in case there is no channels, berm slabs or concrete structures;
5. Construction joints in sprayed concrete shall comply with Worksection CON1.

**SLO.W460.7**  
**EQUIPMENT FOR SPRAYING CONCRETE**  
1. Sprayed concrete shall be applied using the dry process in which water and admixtures shall be added at the nozzle. Alternatively, sprayed concrete shall be applied using wet process in which wet ready-mixed concrete shall be supplied at the nozzle;

2. Equipment for dry-mix process shall be capable of projecting a mixture of cement, fine and coarse aggregate and water at high velocity on to the surface of the slope to produce a dense homogeneous cover. The equipment shall be fitted with weight-batching facilities;

3. Equipment for wet-mix process shall be capable of projecting a mixture of wet ready-mixed concrete at high velocity on to the surface of the slope to produce a dense homogeneous cover;

4. Only skilled operators experienced in the use of sprayed concrete shall be employed as shotcretors. Submit the names and details of the experience of the shotcretors who will be employed on the Works for Approval at least 14 days before sprayed concrete works start.

**SLO.W470.7**  
**SPRAYING CONCRETE**  
1. Measure the surface temperature and moisture content of the soil and submit the results to the CM immediately before sprayed concrete is applied;

2. For dry-mix process, the aggregates and sand for sprayed concrete shall be kept dry before mixing. The water shall be added at the nozzle at the instant of application. The air and water supply, the rate of application and all other factors affecting the quality of the work shall be adjusted to produce dense concrete with no sloughing. For wet-mix process, the ready-mixed concrete shall comply with Worksection CON1 unless otherwise Approved. For both the dry-mix process and wet-mix process, rebound material shall not be reused and shall be removed within 8 hours after spraying;

3. Apply sprayed concrete in layers not exceeding 50 mm thick to the total thickness as shown on the Drawings or as directed by the CM. Sprayed concrete shall be applied perpendicular to the surface to be sprayed and the nozzle shall not be positioned farther than 1.5 m from the surface during spraying. Submit details of the methodology to be used to achieve the required thickness. The maximum panel dimension shall not exceed 15 m²;

4. Colour pigment approved by the CM shall be mixed thoroughly with the sprayed concrete mix. A layer of 25 mm thick of coloured sprayed concrete shall be applied to form the total thickness of sprayed concrete as shown on the Drawings;

5. Submit details of colour pigments including specification and colour samples and the method statement to the CM for approval prior to application. Colour to be employed shall be directed by the CM.

**SLO.W490.7**  
**CURING SPRAYED CONCRETE**  
Cure sprayed concrete for at least 4 days after application by one of the following:

1. Applying a liquid curing compound to the sprayed concrete surface by a low-pressure spray until a continuous visible covering is achieved. The application rate shall be applied as recommended by the manufacturer. For textured surfaces and fluted surfaces, the application rate shall be adjusted to ensure that full covering is achieved. Covering the adjoining reinforcement or formwork shall be avoided; or

2. Covering the sprayed concrete surface with hessian, sacking, canvas or other absorbent material as agreed by the CM or with a layer of fine aggregate at least 25 mm thick. The hessian, sacking, canvas, absorbent material or fine aggregates shall be kept constantly wet; or
3. Covering the sprayed concrete surface with polyethylene sheeting. Sprayed concrete surfaces which have become dry shall be thoroughly wetted before the sheeting is placed.

SLO.W500.7 INSPECTION OF SPRAYED CONCRETE
1. Completed areas of sprayed concrete shall be sounded using a wooden mallet;
2. Take cores of 75 mm diameter from the completed sprayed concrete area at the rate of 1 no. per every 150 m² of sprayed surface or part thereof at locations determined by the CM for checking the quality and thickness of the sprayed concrete as well as cover to reinforcement;
3. Whenever any defect is found or the test result of any of the concrete cores from test panels as detailed in SLO.T110 does not comply with specified requirements, carry out further investigation to locate the extent of the defect;
4. Remove and re-spray areas which in the opinion of the CM are substandard or hollow;
5. Reinstate the surface with core holes with cement mortar of colour matching the adjacent surface.

SLO.W510.7 RECORDS OF SPRAYED CONCRETE
Keep records of sprayed concrete operations on Site and submit them to CM daily. The records shall contain details of the quantities of all materials used at each location. The records could be either a hard copy or soft copy as agreed by the CM.

PROTECTIVE MESH FOR SLOPES

SLO.W750.7 FIXING PROTECTIVE MESH
1. Unless otherwise shown on the Drawings, orientate, lace, suspend down and fix protective mesh onto the slope face with dowels or steel hooks at intervals not exceeding 3 m;
2. The diameter of the drillholes for dowels or steel hooks shall be at least 20 mm larger than the diameter of the dowels or steel hooks;
3. The method of drilling and cleaning of drillholes shall be as stated in sub-clauses (1) and (2) of SLO.W830;
4. Position the last column and row of dowels or steel hooks fixing the edge and base of the protective mesh at not more than 300 mm from the respective edges/base of the mesh;
5. Laps in mesh sheets in vertical direction shall be avoided as far as possible. Where necessary, the laps shall be at least 300 mm minimum wide and lapping sheets shall be laced with 2.2 mm nominal diameter galvanized and PVC-coated binding wire at the centre of the lap in the same way as adjacent vertical sheets.

INSTALLATION OF ROCK BOLTS

SLO.W810.7 GENERAL
1. Where directed by the CM, install rock bolts to support large blocks or boulders, to reinforce masses of unstable jointed rock, or, in conjunction with reinforced concrete pads and beams, or steel support, to support zones of loose fragmented rock or rock masses resting on weak seams, as shown on the Drawings;
2. Provide and install all flat washers, tapered washers, steel bearing plates, and cement mortar patching, to ensure uniform bearing of the rock bolt on the surface of the rock, concrete pad, beam, or support, as shown on the Drawings and as directed by the CM;

3. The permission of the CM shall be obtained before installation of rock bolts starts.

SLO.W820.7 STORAGE AND PROTECTION OF ROCK BOLTS
The rock bolts shall be stored in clean dry conditions, and at the time of installation shall be undamaged, straight and free from rust, pitting, grease or other deleterious matter.

SLO.W830.7 DRILLING AND PREPARING ROCK BOLT HOLES
1. Drill holes for rock bolts at the locations as Instructed. The diameter of the hole shall be at least 20 mm larger than the diameter of the rock bolt or the outer diameter of the connectors, if used, whichever is larger. The method of drilling shall be rotary or rotary percussive with water flush or air flush accompanied by the operation of an effective dust extraction and filtering device. Holes shall be drilled to provide 50 mm cover to the end of bolts for which cement grout is used to form the bond length;

2. Flush holes for rock bolts with clean fresh water before rock bolt installation starts and until the return water runs clear. Blow out standing water from the hole using compressed air after flushing. Seal hole to prevent ingress of foreign matter;

3. Test holes for rock bolts by the Packer test as stated in SLO.T220 and submit the test results to the CM for approval before commencing the installation of the rock bolts.

SLO.W840.7 FIXING ROCK BOLTS
1. The location, direction, inclination, length and diameter of each rock bolt drillhole shall be in accordance with the Drawings or as directed by the CM;

2. Obtain CM's permission before commencing the installation of the rock bolts;

3. All rock bolts shall first be fixed centrally in the drillhole by permanent centralizers or other Approved means to prevent displacement of the bolt during injection and setting of grout. When Instructed, provide double corrosion protection of approved type to rock bolts. All bolts (other than trial bolts for load testing) shall be finally grouted within 8 hours of being tensioned to their installed working load;

4. Install rock bolts in accordance with the manufacturer's recommendations;

5. Rock bolts shall be fully grouted after stressing. Heat-shrinkage plastic sleeves approved by the CM shall be provided to the free length of rock bolts;

6. Installation of rock bolts, including grouting of the free length and installation of head protection, shall be completed as soon as practicable and not more than 14 days after completion of the drillhole;

7. Rock bolt with a grouted anchorage shall not be stressed until the grout crushing strength has attained a value of 21 MPa when tested in accordance with Worksection GRO;

8. Where as shown on the Drawings or as Instructed, cover all rock bolts determined as permanent by the CM by concrete of Grade 20/20 which shall be 250 mm square in size and of 150 mm minimum thickness. A unique identification number shall be marked on the concrete surface. Temporary rock bolts shall have their unique identification numbers marked on a concrete pad of 150 mm square in size and of 30 mm minimum thickness. Depth of marking of all rock bolts shall not be less than 5 mm.
SLO.W850.7  GROUTING ROCK BOLTS
1. Grouting for rock bolts shall be in accordance with Worksection GRO except as stated in sub-clauses (2) and (3) below;
2. Grout shall be introduced at the lower end of drillholes with downward inclinations and shall displace all air and water through the top of the drillhole;
3. Packers and return ducts which maintain a head on the grout until the grout has set shall be used for drillholes with upward inclinations or with inadequate downward inclinations. The packers and ducts shall be such that separate grouting of the anchorage zone and free-length zone of the drillhole can be carried out. The head to be maintained on the grout shall be as Approved.

SLO.W860.7  PROVING ROCK BOLTS
Each installed rock bolt shall be proved as stated in SLO.T230. Rock bolts shall be locked off at 1.1 times the working load after proving. The complete bolt head assembly shall be encased by a concrete block after locking off.

SLO.W870.7  RECORDS OF ROCK BOLTS
1. Keep records of installation of each rock bolt on the Site and submit a copy to the CM not more than 7 days after each installation operation. The records could be either a hard copy or soft copy as agreed by the CM. The hard-copy report shall use re-cycled papers and double side printed. The soft copy shall be in read-only format. Format and content of the records shall be as Approved;
2. The records shall contain the following information:
   a. Rock bolt location and identification number;
   b. Drilling details, including:
      i. Date and time drilling started and finished;
      ii. Machine and operator identification;
      iii. Location, level, inclination, bearing, length and diameter of drillhole;
      iv. Rate of penetration at 0.5 m intervals.
   c. Water tightness of drillhole, including:
      i. Date and time water test started and finished;
      ii. Details of any pre-grouting and redrilling;
      iii. Length of test zone;
      iv. Water pressure applied;
      v. Duration of test;
      vi. Measured water absorption rate.
   d. Details of steel bolts, including:
      i. Type and diameter;
      ii. Bond length;
      iii. Overall length;
      iv. Number and type of centralizers;
      v. Stressing record and lock-off load; and
      vi. Details of Manufacturer and supplier.
   e. Corrosion protection details;
   f. Test details and results;
   g. Details of grouting, including:
i. Date and time grouting started and finished;
ii. Details of any packers used and length of grouted zones;
iii. Head maintained on grout during setting;
iv. Volume of grout accepted;
v. Identification marks of grout cubes.

INSTALLATION OF ROCK DOWELS

SLO.W910.7 GENERAL
Obtain CM's permission before commencing the installation of the rock dowels.

SLO.W920.7 STORAGE AND PROTECTION OF DOWELS
The bars shall be stored in clean dry conditions and at the time of installation shall be undamaged and free from rust, pitting, grease, or any other deleterious matter.

SLO.W930.7 DRILLING AND PREPARATION OF ROCK DOWEL HOLES
The drilling and preparation of holes for rock dowels shall be as stated in sub-clauses (1) and (2) of SLO.W830.

SLO.W940.7 FIXING ROCK DOWELS
1. The location, length, direction, inclination and diameter of each dowel shall be as directed by the CM;
2. The bar shall be fixed centrally in the drillhole by permanent centralizers or other Approved means which will prevent displacement of the bar during injection and setting of the grout.

SLO.W950.7 GROUTING ROCK DOWELS
1. Grouting for rock dowels shall be in accordance with Worksection GRO except as stated in sub-clause (2) below;
2. Rock dowels shall be grouted over the complete length of the drillhole in which the dowel is installed. Centralizers shall be fitted to rock dowels before grouting to ensure an even annulus of grout. No jacking or hammering of the dowels shall be carried out during the whole process of insertion of dowels into drillholes. Grout shall be introduced at the lower end of drillholes with downward inclinations and shall displace all air and water through the top of the drillhole.

SLO.W960.7 RECORDS OF ROCK DOWELS
Keep records of installation of each rock dowels on the Site and submit a copy to the CM not more than 7 days after each installation operation. The records could be either a hard copy or soft copy as agreed by the CM. The hard-copy report shall use re-cycled papers and double side printed. The soft copy shall be in read-only format. Format and content of the records shall be as Approved. The records shall contain details of the reference number, date of installation, location, length, inclination and level of each rock dowel installed.
INSTALLATION OF ROCK ANCHORS

SLO.W1010.7 DESIGN, INSTALLATION AND TESTING
Design, install, test and subsequently monitor rock anchors to comply with all the requirements in Geospec 1: Model Specification for Prestressed Ground Anchors, GEO.

INSTALLATION OF SOIL NAILS

SLO.W1110.7 GENERAL
1. The dimensions of soil nail heads and the orientation of soil nails shall be as shown on the Drawings or as directed by the CM;
2. The diameter of drillholes shall be the minimum diameter as specified. The grout cover to the lower end of steel bar shall be at least 50 mm;
3. Holes in steel plates for soil nail heads shall be drilled perpendicularly to the face of the steel plate and the centre of the hole shall be at a position of within 2 mm from the centroid of the plate. The clearance between the steel bar and the hole of the steel plate shall not be more than 2 mm;
4. The spacing of the centralizers and the suitability of the method of fixing the centralizers, grout pipes, conducting wires and corrugated sheathing where required shall be determined by carrying out trials on Site until no damage, deformation and displacement of the centralizers, grout pipes, conducting wires and corrugated sheathing are observed on completion of assembling all components, during inserting and withdrawing the soil nails. Once Approval is given, no change to the type, method and arrangement of fixing of the centralizers, grout pipe, conducting wires and corrugated sheathing shall be made without the prior approval of the CM;
5. For soil nails with double corrosion protection, centralizers shall be provided on the steel bar and the sheathing at suitable intervals to meet the following requirements:
   a. The steel bar shall be positioned in the sheathing so that a minimum grout cover to the bar of 10 mm is maintained;
   b. There shall be minimum clearance of 15 mm between the sheathing and the sides of the drillholes or casing.
6. For soil nails with double corrosion protection, corrugated sheathing shall be embedded at least 50 mm into soil nail head.

SLO.W1120.7 DRILLING FOR SOIL NAILS
1. Comply with sub-clauses (4) and (5) of GRO.W110, and the following sub-clauses of this clause;
2. The set up of drilling plant and ancillary equipment shall be in such a manner that water, dust, fumes and noise generated during the drilling operation shall be sufficiently diverted, controlled, suppressed and muffled;
3. Carry out drilling for soil nails using rotary or percussive type drills with air as the flushing medium unless otherwise agreed by the CM. Provide temporary support, including but not limited to the use of temporary casing, to drillholes to prevent the collapse of drillholes until the completion of grouting. Clear drillholes of all debris and standing water immediately before installation of soil nails. Before soil nails are installed, provide the CM all necessary equipment and assistance to check the inclination, diameter, bearing, cleanliness and length of all drillholes;
4. Where as shown on the Drawings or required by the CM, submit drilling records
including reference numbers of soil nails, date and time of drilling, penetration
rate, description of strata of materials penetrated and any special observations
during drilling such as underground voids encountered, collapse of hole, 
groundwater encountered, appropriate depth to groundwater and depth of zone of
no air return etc. to the CM not more than 2 working days after completion of 
drilling in a format agreed by the CM;

5. Where as shown on the Drawings or ordered by the CM, install and leave in
place with soil nails permanent steel casing of appropriate internal diameter and
of 6.3 mm minimum thick. Unless otherwise specified by the CM, the bottom
2 m length of drillhole should be left unsupported by permanent casing;

6. Do not carry out drilling at a place within 10 meters radius of any freshly
grouted soil nails, including soil nails for pull-out tests, grouted less than
12 hours previously.

**SLO.W1130.7 INSTALLATION AND GROUTING FOR SOIL NAILS**

1. Install and grout soil nails as soon as possible after drilling. In any case, each 
drillhole shall not be left unsupported for more than 3 days. Check all drillholes
for cleanliness prior to installation of soil nails. For soil nail bars with threaded
type connectors, each length of the steel bars shall be tightened by means of an
appropriately sized wrench. During the whole process of installation, do not
carry out any jacking or hammering of the soil nails. Grouting for soil nails shall 
comply with Worksection GRO and the following sub-clauses of this clause;

2. Calculate and record the gross volume of the drillholes, discounting the volume
of all cast-in components of each of the soil nails to be grouted on the request
forms for inspection of soil nail installation;

3. Terminate the grout pipe at a point within 150 mm above the lower end of the
steel bar and no side cut hole shall be made on the grout pipe except that the cut
is made within 150 mm above the lower end. Fix grout pipe onto the steel bar or
corrugated sheathing (in case of double corrosion protection soil nails) by non-
corrodible ties at spacing of not more than 2 m. Grout pipes shall not be
removed from drillholes after insertion and the part protruding from drillholes
after grouting shall be trimmed down to the base of soil nail head;

4. Where heat-shrinkable sleeve is used, the heat-shrinkable sleeve shall be heat-
shrunk by means of an apparatus approved by the CM, and it shall be used in
accordance with the manufacturer’s instructions. The sleeve shall have sufficient
length and shall be positioned such that a minimum 100 mm length of
reinforcement bar beyond the connector is protected by the sleeve after
completion of heat-shrinking. No lapping of the sleeve shall be allowed. The
sleeve thickness shall not be less than 1.0 mm after heat-shrinking. Finished
surface of the sleeve shall be smooth, free of trapped air pockets, flaws, holes,
cracks, burn marks and other defects. Any defects or damages found on the
sleeve shall be made good to the satisfaction of the CM;

5. Install a pair of conducting wires in each permanent soil nail in accordance with
the Drawings. For the shorter wire, the insulation of the wire at the lower end
(25 mm length) shall be removed and the exposed end of the wire shall be in
contact with the steel bar and securely tied to the steel bar by adhesive tape. The
lower end of the longer wire shall be sealed in such a manner to achieve
electrical insulation;

6. After insertion of steel bar into the drillhole, seal the top end of the drillhole with
an appropriate plug capable of withstanding a grout pressure head, which is
maintained during the first hour after completion of grouting as described in sub-
clause (8) of this Clause. Install an outlet pipe extending above the slope surface
through the plug to allow discharge of air, water and grout from the upper end of
the drillhole during grouting. Submit details of the arrangement of outlet pipe
and sealing plug for the CM’s agreement and carry out a site trial to demonstrate
that the set up performs satisfactorily;
7. Grout soil nails on the same day when the steel bars are inserted into drillholes. Soil nails which are not grouted after insertion and are left in drillhole overnight shall be withdrawn from the drillhole and the drillhole shall be checked for cleanliness and obstructions prior to re-insertion;

8. Grout soil nails over their entire length of steel bar in one single operation. Inject grout into drillhole through the grout pipe to the lower end of drillhole such that air and water are displaced from the drillhole as grouting proceeds. When the consistency of the grout flowing out of the outlet pipe is the same as the injecting grout, the grouting operation shall be stopped and the inlet grout pipe sealed. A pressure head of at least 300 mm of grout measured from the top of drillhole shall be maintained in the outlet pipe during the first hour after completion of grouting. Any settlement of the grout level inside the outlet pipe observed shall be replenished with fresh grout immediately;

9. The set up of grouting plant and ancillary equipment shall be in such a manner that water, spillage of grout, dust, fumes and noise generated in the course of grouting operation shall be sufficiently diverted, controlled, suppressed and muffled;

10. Record the volume of grout used for grouting each drillhole and the volume used for refilling each drillhole after grout settlement. Submit the records to the CM not more than 3 days after each grouting operation. The records shall include all details as required in GRO.W020 (1) and the followings:
   a. Volume of grout spilled from the drillhole;
   b. Volume of grout added to outlet pipe after grout settlement.

11. Report to the CM any excessive grout loss immediately. If a drillhole cannot be fully filled with grout after injecting a volume of grout equal to 10 times the calculated gross volume of the drillhole, discounting the volume of all cast-in components, cease immediately the grouting operation for that drillhole unless otherwise agreed by the CM. Report the grouted length of the drillhole to the CM and submit proposals for completing the grouting for that drillhole to the CM for approval as soon as possible;

12. Unless otherwise agreed by the CM, for soil nails with double corrosion protection, grout firstly over the annular space between the wall of drillhole and corrugated sheathing in a continuous operation. Grout the annular space between corrugated sheathing and steel bars immediate afterwards in a continuous operation.

SLO.W1140.7  SOIL-NAIL HEAD

1. Construct soil-nail heads in accordance with the details as shown on the Drawings. Submit for the CM's agreement a method statement for the construction of soil-nail heads;

2. The threads at the top end of soil nail bars shall be thoroughly cleaned, properly treated with galvanized coating or protected with approved zinc-rich paint prior to construction of soil-nail heads;

3. Carry out concreting of soil-nail heads in a manner which ensures that the placed concrete is adequately compacted. Unless agreed otherwise by the CM, concreting of soil-nail heads using sprayed concrete shall be applied in two stages, allowing the bearing plate to be positioned firmly against the first stage concrete. The method statement as referred to in sub-clause (1) of this clause shall include proposal for the construction sequence of 2-stage sprayed concrete soil-nail heads. Conduct trial runs to demonstrate to the CM that the proposed method statement will produce satisfactory results and the rebound of sprayed concrete material is minimal;

4. Backfill any temporary excavation for constructing soil-nail heads, including overbreaks, with Grade 30/20 concrete, 30 MPa sprayed concrete or other material as agreed by the CM;
5. Where instructed, uncover a maximum of 3 concreted soil-nail heads from the batch of soil-nail heads cast on any one day for examination of the quality of soil-nail heads. If defective workmanship is identified in any one of the uncovered soil-nail heads, the whole batch of soil-nail heads cast on the same day shall be deemed to be defective. Break up all the remaining soil-nail heads cast on the same day for the CM's examination. Recast and re-examine the soil-nail heads to the satisfaction of the CM.

MATS FOR SLOPE EROSION CONTROL

SLO.W1150.7 PREPARATION OF SURFACES
Clear areas to be applied with mats of all rubbish, debris and loose soils. All local irregular spots and areas shall be trimmed or filled with compacted fill material or compacted soil-cement to provide smooth surface unless otherwise instructed. The finished slope surfaces shall be inspected by the CM prior to installation of mats.

SLO.W1160.7 LAYING AND FIXING OF MATS FOR EROSION CONTROL
Lay and fix mats for erosion control onto sloping ground in accordance with the manufacturers' recommended procedures and in compliance with the following requirements:

1. The mats shall be anchored along the slope crest and each berm level with at least 200 mm length embedded into the ground or underneath the concrete berm slabs. The mats shall also be embedded at least 200 mm into any adjacent structures to be constructed. The mat shall be rolled out from top down the slope surfaces. Sufficient galvanized anchorage pins at a maximum spacing of 1 m centre to centre shall be provided to ensure the mats are in complete and total contact with the ground at every place. In areas of irregularities due to exposed rocks or existing structures, additional anchorage pins shall be provided to prevent any gap or void forming underneath the mats. Lapping between mats shall be at least 150 mm and shall be formed with the upslope mat over the downslope mat. No lapping shall be formed within 1 m of any intersection of two slope surfaces which have a sharp difference in slope gradient or strike direction;

2. Where recommended by the manufacturer of the mats for erosion control, on completion of laying and anchoring of the mats, place and tamp soil into the mats in accordance with the Drawings or as directed by the CM. All voids shall be completely filled to form an integral composite structure;

3. The sequence of hydroseeding and laying of mats shall be in accordance with the manufacturer's recommended sequence, or as directed by the CM. The protective material for hydroseeding shall be laid on top of the erosion mat, if specified.

INSTALLATION OF ROCK JOINT RELIEF DRAINS

SLO.W1210.7 GENERAL
Where as shown on the Drawings or directed by the CM, install rock joint relief drains on the slope surface before applying sprayed concrete, buttresses or other constructions. Install the drains along weathered seams or at joints where water seepage is evident.

SLO.W1220.7 WEEPHOLES FOR ROCK JOINT RELIEF DRAINS
Weepholes shall be provided from the relief drain through the sprayed concrete or buttresses at intervals not greater than 1200 mm in each direction, or as directed by the CM.
SLO.W1230.7  FIXING ROCK JOINT RELIEF DRAINS
1. Fix the relief drain in place immediately prior to applying sprayed concrete, buttresses or other constructions;
2. Before the first length of permanent drain is installed, fix a trial length in place to demonstrate the method of fixing for Approval;
3. No permanent relief drains shall be installed until the CM has given his Approval to the method of fixing.

APPLICATION OF NO-FINES CONCRETE

SLO.W1310.7  USE AND APPLICATION
1. Where as shown on the Drawings or directed by the CM, apply no-fines concrete as Worksection CON1 to form drainage layers between the rock slopes and the sprayed concrete, buttresses, or other structures, or on its own;
2. Where as shown on the Drawings or directed by the CM, fill rock slopes that have voids behind the trim line or undercut points, resulting from face treatment and stabilization work or scaling and trimming, with no-fines concrete as Worksection CON1.

GROUT STRENGTHENING OF JOINTED ROCK

SLO.W1410.7  TECHNIQUE AND APPLICATION
1. Cement grouting shall be carried out in holes not less than 50 mm diameter drilled at locations, spacings, depth, inclinations, and directions, all as directed by the CM and as shown on the Drawings;
2. At the collar of each grout hole, reamed out if necessary, a stand-pipe shall be cemented not less than 1000 mm into the rock, and extend not more than 500 mm out of the rock, and shall be attached to a Tee manifold to facilitate injection of grout. The bore of the standpipe shall be not less than 50 mm;
3. The manifold shall consist of inlet and outlet connections for the delivery hose from the grout pump and the return hose to the grout holding tank, respectively; a valve in the stem of Tee to control bleed off of grout from the pumping circuit into the grout hole; a valve in the branch to the delivery hose; a valve in the branch to the return hose; and a pressure gauge (0 to 250 kPa), located not more than 200 mm above the connection to the standpipe, to measure the injection pressure of the grout, all as shown on the Drawings;
4. The grout pump and delivery and return hoses shall be of sufficient capacity to allow a pressure of not less than 250 kPa to be maintained at the standpipe of the grout hole being injected;
5. The grout pump shall be of the positive displacement type and, together with its motive power, shall permit small variations (not more than 25 kPa) in output pressure to be effected over the whole range from zero pressure to maximum delivery pressure. A suitable pressure gauge shall be fitted to the delivery line;
6. Grout shall be mixed in accordance with Worksection GRO;
7. During grout injection, a manifold operator shall be in continuous attendance at the grout injection manifold and a pump operator shall be in continuous attendance at the grout pump, for the whole duration of the work. The manifold operator shall be in continuous radio or telephone communication with the pump operator during this time;
8. The injection pressure to be maintained at the manifold gauge; the water:cement ratio of the grout mix; the duration of the injection, the number of injection periods, and the sequence in which holes are to be injected or re-injected, shall be as directed by the CM one day in advance of the work for every grout hole. No grouting shall be commenced or resumed unless Instructed;

9. The manifold operator, with the aid of the pump operator, shall ensure that the specified injection pressure is maintained at all times within a tolerance of 10 kPa at the manifold gauge. He shall record the gauge pressure and the times of commencement and cessation of grout injection, against each hole number. He shall also keep a record of any grout leakage at the ground surface or other holes by means of a dimensioned sketch plan. Fair copies of these records shall be forwarded to the CM at the end of each working day;

10. If grout leakage through natural rock joints at the surface occurs during grouting of a hole, then grouting shall immediately cease and shall not be resumed until the leaking joints are caulked using oakum, lead wool, or other caulking materials, all to the satisfaction of CM, who may direct grouting to continue at other holes until caulking is completed. If grout leaks into another hole near that being grouted, the former hole shall be flushed clean of grout after grouting is completed and before the grout has set;

11. If grout leakage occurs from the collar of the hole, grouting of the hole shall cease until the leak is stopped by caulking or cementing or other methods;

12. If the manifold operator observes lift or heave of surface rock during grouting, he shall immediately close the manifold valve, and advise the CM. No further grouting shall be attempted at the general locality until Instructed;

13. The pump operator shall, for each hole grouted, dip the grout tank and record the total volume of grout injected to an accuracy of 0.02 m³ (Note: this will not include the grout in the delivery and return pipes), the strength of the grout mix, the pressure in the delivery line, and the times of commencement and termination of pumping. Fair copies of these records shall be conveyed to the CM at the end of each working day;

14. At the commencement of grouting operations each day, and before the grout hoses are connected to the standpipe manifold at the hole, a grout tank and delivery and return hoses shall be flushed with clean water for not less than 5 minutes at a velocity sufficient to remove all dirt, cement flakes, sand and foreign matter;

15. Before grouting commences at a hole, the hole shall be cleaned out by means of a probe or lance consisting of a 25 mm bore pipe of suitable length, fitted with a cap at one end and connectors for compressed air and water at the other, and perforated by 5 mm diameter holes at 25 mm centres in staggered rows every 90° for a distance of not less than 300 mm from the cap. The lance shall be passed up and down the hole for not less than five minutes and all drill cuttings and rock particles and foreign matter shall be removed from the hole by the compressed air and water jets before grouting is attempted;

16. On connection of the grout injection manifold to the standpipe and commencement of grouting, injection pressures shall be continuously maintained within tolerance of the pressure specified by the CM for the full period of injection, except in the event of grout leakage or rock movement as noted in sub-clauses (10), (11), and (12) above;

17. On completion of grouting at a hole, and after a suitable period of time has elapsed (as specified by the CM) for the grout to achieve an initial set, all grout in the hole itself shall be flushed out using the air-water lance. The standpipe shall then be temporarily capped. If the hole is not required for further grouting, the standpipe shall, on the CM’s Instructions, be cut off flush with the rock surface and the hole filled with grout;

18. No oils, water soluble oils, greases, or other lubricants, shall be used on drill rods or drill bits or in drilling water during the drilling of grout holes;
19. The CM may require tell-tales, uplift gauges, or other means of detecting rock movement, to be installed before grouting commences;

20. The CM may require additives to be used in the grout to hasten or delay setting times or to achieve other characteristics in the grout;

21. The CM may require holes that have already been grouted to be deepened by further drilling through the standpipe and additional grouting carried out;

22. The CM may require type of grout other than cement grout to be used in the grouting operations;

23. On completion of grouting of a hole, the grout injection manifold shall not be removed from the standpipe until the grout pressure on the gauge has fallen to zero. Care shall be exercised by the manifold operator when disconnecting the manifold from the standpipe and moving it to another hole not to spill grout on the ground.

TREATMENT OF DECOMPOSED ZONES

SLO.W1510.7

TECHNIQUE AND APPLICATION

1. Where directed by the CM, decomposed zones shall be stabilized and protected in accordance with the measures shown on the Drawings;

2. For steeply dipping or sub-vertical decomposed zones, the work shall consist of:
   a. Removing weak or loose material from the seam to a depth equal to 100 mm plus the width of the zone if the latter is less than or equal to 300 mm or to a depth of 400 mm otherwise;
   b. Installing a drainage layer and longitudinal continuous drain if so instructed;
   c. Placing a Grade 20/20 mass concrete plug flush to the rock surface;

3. The CM may direct raking drains to be installed to intersect and drain the weathered zone below its outcrop;

4. For gently dipping or sub-horizontal decomposed zones, the work shall consist of:
   a. Removing weak and loose material from the zone as described above;
   b. Placing a drainage layer of sandbags not less than 100 mm thick and a continuous longitudinal drain next to the decomposed material;
   c. Installing a reinforced concrete plug, inclined outward to its foot, and keyed and dowelled into the rock on the lower side of the seam; and
   d. Installing outlet drain pipes through the concrete plug from the longitudinal drain, as directed by the CM.

REINSTATEMENT OF ROCK BERMS

SLO.W1610.7

MAKING GOOD

Where directed by the CM, make good the shoulder of rock berms by means of mass concrete (Grade 20/20) placed flush with the berm surface and rock face and securely held to the rock by means of rock dowels as shown on the Drawings.
EXTENSOMETERS

SLO.W1710.7 PROVISION, INSTALLATION, TESTING AND RECORDING
1. Where directed by the CM provide, install and test rod extensometers of an Approved proprietary type;
2. The extensometers shall have either five (5) rods and a maximum length of 25 metres, or three (3) rods and a maximum length of 15 metres;
3. The extensometers shall be installed and tested in drillholes of a suitable size according to the manufacturer's instructions and shall be completed with all necessary components such as reference heads and protective caps;
4. A dial gauge of suitable accuracy and its accessories (including calibration accessories) shall be provided by the Contractor and shall be available on the Site in a serviceable condition at all times;
5. Take readings from all installed extensometers at a frequency to be directed by the CM from time to time, and convey the recorded data to the CM within 2 days of the readings being taken.

TELL-TALES AND REFERENCE POINTS

SLO.W1810.7 PROVISION AND INSTALLATION
1. Where directed by the CM, provide and install tell-tales and reference points for the purpose of measuring rock or soil movement. The tell-tales shall consist of mortar patches or glass strips affixed to the rock, or of such other similar means as the CM may direct;
2. The reference points shall be of an Approved proprietary type consisting of demountable stainless steel eyebolts affixed to corrosion protected steel bolts grouted not less than 200 mm into rock. Provide the necessary accessories and protective caps for the reference points. Install the reference points strictly in accordance with the manufacturer's installation instructions.

TOLERANCES

SLO.W1910.7 SOIL NAILING
Refer to Appendix H "Schedule of Tolerance" to this Specification.
TESTING

TESTING FOR THE OPTIMUM MOISTURE CONTENT AND MAXIMUM DRY DENSITY OF SOIL-CEMENT FILL

SLO.T010.7 OPTIMUM MOISTURE CONTENT AND MAXIMUM DRY DENSITY OF SOIL-CEMENT FILL

The maximum dry density and optimum moisture content of soil-cement fill shall be as Worksection EAR1 except that the method of testing shall be the Vibrating Hammer Test Method in accordance with BS 1924:1990.

TESTING CONCRETE CORES FROM SPRAYED CONCRETE

SLO.T110.7 TESTING CONCRETE CORES FROM SPRAYED CONCRETE

1. Testing arrangements:
   a. Carry out tests by employing a laboratory that complies with the requirements stated in the Preliminaries Worksection.

2. Testing samples
   a. The strength of sprayed concrete shall be determined from the concrete cores cut from a test panel constructed at the same time as sprayed concrete is applied;
   b. Construct one test panel for each application in a day or as directed by the CM;
   c. The test panel shall be 250 mm thick and shall be at least 1000 mm x 1000 mm in size. Fix securely the mould in position at the same height and inclination as the surface being sprayed. Construct the panel by spraying concrete into the mould at the same time as the concrete to be tested is applied. Cure the test panel by the same method as the sprayed concrete;
   d. Provide three concrete cores from each test panel. Cores shall not be taken within 125 mm from the edges of the panel;
   e. Concrete cores shall be 100 mm diameter and shall be the full depth of the test panel;
   f. The method of taking concrete cores shall be in accordance with CS1:1990.

3. Testing methods
   a. Test each concrete core to determine the compressive strength and density;
   b. Prepare and test the concrete cores to determine the compressive strength in accordance with CS1:1990;
   c. Test the concrete cores to determine the density in accordance with CS1:1990;
   d. Three concrete cores shall be tested at 28 days;
   e. Interpret the results of tests for compressive strength of concrete cores in accordance with BS 6089:1981;
   f. Do not make adjustments to the measured strength in respect of the age of the core when tested unless permitted by the CM;
g. The minimum compressive strength of concrete cores, converted to estimate in-situ cube strength in accordance with BS 6089:1981 shall be the specified grade strength at 28 days.

4. Non-compliance
   a. If the result of any test does not comply with the specified requirements for compressive strength or density of concrete cores from sprayed concrete:
      i. Submit particulars of proposed changes to the materials, mix design, methods of production or methods of construction to the CM for approval;
      ii. Make further trial mixes and construct further trial panels unless otherwise permitted by the CM.

**TESTING ROCK BOLTS**

**SLO.T210.7**

**TRIALS FOR ROCK BOLTS**

1. The design bond length of rock bolts with bonded anchorages shall be determined for each rock type by a pull-out trial;
2. The proof load of the pull-out trial shall be twice the working load;
3. Pull-out trials shall be carried out on two bolts for each combination of rock bolt and rock type;
4. Unless otherwise permitted by the CM the bolts used in trials shall be discarded and shall not form part of the permanent works, and the hole shall be sealed by grouting.

**SLO.T220.7**

**PACKER TESTS ON DRILLHOLES FOR ROCK BOLTS**

Holes for rock bolts shall be tested by the Packer test as follows and the results of the tests shall be submitted for Approval, before installation of rock bolts starts:

1. The water loss from drillholes for rock bolts shall be determined by the Packer test. The number of drillholes to be tested shall be as Instructed;
2. The Packer test shall be carried out on the bond length of the drillhole at a test pressure of 100 kPa. The method of testing shall be as stated in Worksection GRO;
3. The water loss determined by the Packer test in the grouted hole shall not exceed 5 Lugeons when measured over a 10 minute period;
4. If the result of any Packer test on drillholes for rock bolts does not comply with the specified requirements for the test, the drillhole shall be grouted, re-drilled and retested. Grouting, re-drilling and retesting shall be continued until the result of the Packer test complies with the specified requirement for the test.

**SLO.T230.7**

**TESTS ON INSTALLED ROCK BOLTS**

1. Test each installed rock bolt to determine the loss in stress by applying a test load of 1.5 times the working load for 5 minutes;
2. The loss in stress in installed rock bolts shall not exceed 5% of the test load in 5 minutes;
3. If the result of any test for loss in stress of installed rock bolts does not comply with the specified requirements for the test, an additional test for loss of stress shall be carried out on the rock bolt;
4. If the result of any additional test for loss of stress of installed rock bolts does not comply with the specified requirements for the test, the rock bolt shall be replaced.
TESTING SOIL NAILS

SLO.T310.7  GENERAL

1. Soil nails for pull-out tests shall be installed and tested prior to the installation of permanent soil nails as directed by the CM. The number of pull-out tests shall be as shown on the Drawings or as Instructed. Soil nails subjected to pull-out tests shall not form part of the permanent works. Submit the details of the testing arrangement including the set-up and support for the testing apparatus to the CM for approval. Drilling records of holes selected for pull-out tests shall be provided to the CM within 24 hours after drilling;

2. Where Instructed, carry out non-destructive testing of soil nails by either Time Domain Reflectometry (TDR) test or magnetometer test to verify the length of the installed soil nails. The frequency of non-destructive testing shall be at least 1% of soil nails with a minimum of 2 nails per slope (including wall).

SLO.T315.7  MEASURING APPARATUS FOR PULL-OUT TEST

1. The apparatus for measuring loads and deformations shall have an accuracy of 5 kN and 0.05 mm respectively. The apparatus for measuring deformation shall be capable of measuring a displacement of up to 50 mm;

2. The apparatus shall be tested and calibrated by laboratories approved by the CM not more than 6 months prior to the date of carrying out the tests;

3. Submit the test and calibration certificates to the CM at least one week before the test.

SLO.T320.7  PULL-OUT TEST FOR SOIL NAILS

Unless otherwise directed by the CM, adopt the following procedures of the pull-out tests for soil nails:

1. The loading apparatus shall be set up in such a way that no loading, other than the pull-out load, acts on the steel bar at the nail head. The reaction of the pull-out load from the loading apparatus shall act on a sufficiently sized rigid bearing plate placed against a temporary cut face at normal to the alignment of the steel bar to ensure adequate load spreading and to avoid eccentric loading. Monitoring instruments shall be carefully positioned and independently supported to record the extension of the soil nail steel bar and any movement of the steel baring plate;

2. Grout the soil nail over the length as specified in the Drawings or as directed by the CM. The length to be grouted shall be isolated by means of a packer that can prevent grout from leaking through to the free-length section during grouting and that can ensure that the proposed bonded section is effectively grouted to the required length as shown on the Drawings. Subject to the CM's approval, alternative means to form the required bond length may be adopted by the Contractor. The entire free length of the steel bar shall be properly debonded or capped to ensure that the test load can be directly transferred to the bonded zone in case of grout leak through the packer. The pull-out test shall not be carried out until the grout has reached a cube strength of 21 MPa;

3. The maximum test load shall be either 90 % of the yield load of the steel bar of the test nail (T_p) or the ultimate soil/grout bond load (T_{ult});

4. The test nail shall be loaded in stages: from the initial load (T_a) via two intermediate test loads (T_{DL1} and T_{DL2}) to the maximum test load. T_{DL1} and T_{DL2} are the loads that result in the bonded zone tested to the design working bond strength and 2 times the working bond strength respectively. T_a shall not be greater than T_{DL1} or 5 % of T_p. All loadings including T_a, T_{DL1}, T_{DL2} and T_p shall be specified in the Drawings or as directed by the CM;
5. During the first two loading cycles, the intermediate loads, $T_{DL1}$ and $T_{DL2}$, shall be maintained for 60 minutes for deformation measurement. After the measurement has been completed, the load shall be reduced to $T_a$ and the residual deformation shall be recorded. In the last cycle, the test load shall be increased gradually from $T_a$ straight to maximum test load and then maintained for deformation measurement. The measurement at each of the cycles shall be taken at time intervals of 1, 3, 6, 10, 20, 30, 40, 50 and 60 minutes. The test nail is considered to be able to sustain the test load if the difference of nail movements at 6 and 60 minutes does not exceed 2 mm or 0.1% of the grouted length of the test nail. In this case, the test shall proceed to the next loading cycle or be terminated if the test nail is subject to $T_p$.

6. If the nail fails to sustain the test load $T_{DL1}$, $T_{DL2}$ or $T_p$, the test shall be terminated and the nail movement against residual load with time shall be recorded. The measurements shall be taken at time intervals of 1, 3, 6, 10 and every 10 minutes thereafter over a period for at least two hours. Where required, the measurements shall be continued and at intervals as directed by the CM;

7. Throughout the test, the soil nail movement versus the applied load shall be measured, plotted on a graph and recorded along with all other relevant information, on forms agreed by the CM or as shown on the Drawings. All the results shall be submitted to the CM within 3 days of completion of the test;

8. Where required, the whole soil nail shall be pulled out from the drillhole for the CM’s inspection. Where the steel bar remains in-situ after the pull-out test, the bar shall be cut-off flush with the finished ground and remaining part of the drillhole grouted.

**SLO.T325.7 CREEP TEST**

Where Instructed, carry out a creep test as part of a pull-out test as stated in SLO.T320. During a creep test, monitor movement of the test nail at a prescribed load as detailed below:

1. The test nail shall be loaded in stages in accordance with the loading cycles specified for a pull-out test;

2. The test load in one of the loading cycles shall correspond to two times the allowable design bond strength;

3. The creep period shall start as soon as the test load of two times the allowable design bond strength is applied. The load shall be maintained for 60 minutes. During this period, readings of the nail head movement shall be taken at time intervals of 1, 2, 3, 5, 6, 10, 20, 30, 50 and 60 minutes;

4. A test nail shall be considered acceptable when:
   a. A total creep movement between the 6-minute and 60-minute readings during creep testing is less than 2 mm; and
   b. The overall trend of creep rate (i.e. creep movement/log time) is linear or decreasing throughout the creep test load hold period.

**SLO.T360.7 TIME DOMAIN REFLECTOMETRY (TDR) TEST**

Adopt the following procedures for the TDR test:

1. Select some nails of known length for calibration of pulse propagation velocity;

2. Remove concrete nail head to provide access to steel nail head;

3. The head of the steel soil nail shall electrically be accessible. All loose materials shall be removed from the bar head;

4. Connect the TDR instrument to the steel soil nail head and the electric wire;

5. Send a short pulse into the steel soil nail and record the time of reflection (if the wire is electrically in contact with the steel soil nail end, the return signal from the nail end should go down and vice versa);
6. Send a long pulse into the steel soil nail and record the time of reflection (if the wire is electrically in contact with the steel soil nail end, the return signal from the nail end should go down and vice versa);

7. Determine the average propagation velocity of the pulse from the results obtained in sub-clauses (5) and (6);

8. Repeat steps described in sub-clauses (4) to (7) for steel soil nail to be tested and estimate its length by using the calibrated propagation velocity;

9. Submit a test report with the test results and their interpretations to the CM within 3 days of completion of the test;

10. Re-cast the concrete nail head after the test as directed by the CM.

SLO.T370.7 MAGNETOMETRY TEST

Adopt the following procedures for the magnetometry test:

1. Drill a hole parallel and in the vicinity of the test nail. The separation between the drillhole and the test nail should be about 300 mm to 500 mm, and the length of drillhole should be longer than the anticipated length of the soil nail by at least 1 m. The size of the drillhole should be large enough to accommodate a PVC pipe of minimum 55 mm internal diameter;

2. Insert the magnetometer into the PVC pipe. Measure and record the Earth's magnetic field as the magnetometer moves along the pipe until it reaches the end of the pipe;

3. Repeat the measurement and recording process as the magnetometer moves away from the pipe end until it reaches the top of the pipe;

4. Analysing the fluctuation of the measured Earth's magnetic field to determine the locations of couplers and the end of steel soil nails;

5. Submit a test report with the test results and their interpretations to the CM within 3 days of completion of the test;

6. Grout the drillhole after the test as directed by the CM.
