- n is the number of interlocking blocks in each sample
 - $\sum C^2$ is the sum of the square of the compressive strengths of the n interlocking blocks (MPa)
 - Cm is the average of the compressive strengths of the n interlocking blocks
3. Calculate the characteristic strength (Cc) of the batch from the following equation:

$$C_c = C_m - 1.65s \text{ MPa}$$

Where:

- Cm is the average of the compressive strengths of the n interlocking blocks and stated in (2) above
- s is the unbiased standard deviation as stated in (2) above.

EXT3.T150.8**REPORTING**

Report on the following:

1. Source, name of manufacturer and type of blocks;
2. Identification marks of blocks;
3. Date of manufacture of blocks;
4. Nominal gross plan area of each block to the nearest 100 mm²;
5. Nominal height of each block to the nearest mm;
6. Breaking load of each block to the nearest kN;

-
7. Compressive strength of each block to the nearest MPa;
 8. Average of the eight compressive strengths to the nearest MPa;
 9. Unbiased standard deviation to the nearest MPa;
 10. Characteristic compressive strength to the nearest MPa;
 11. That the test method used was in accordance with this Specification.

EXT3.T160.8 COMPLIANCE CRITERIA

The characteristic compressive strength of the interlocking blocks sample must be:

1. 30 MPa for blocks in footways and cycle tracks; and
2. 45 MPa for blocks in carriageways and paved areas to which vehicles will have access.

TRANSVERSE BREAKING LOAD OF CLAY BRICK PAVERS**EXT3.T210.8 DEFINITION OF "BATCH"**

A batch of clay brick pavers is any quantity of pavers of the same type and size, of the same strength, manufactured in the same place, covered by the same certificates and delivered to the Site at any one time.

EXT3.T220.8 SAMPLES FOR TESTING

1. No bulk sample shall represent more than 10,000 pavers from the same batch;
2. The sample size of each bulk sample of each type of clay brick pavers for each test shall be as stated in BS EN 1344:2002. The number of specimens in each sample shall be 10.

EXT3.T230.8 TEST PROCEDURE

Test clay brick pavers in accordance with the procedures laid down in BS EN 1344:2002.

EXT3.T240.8 CALCULATIONS

Divide the load by the measured width of each paver, and round the result to the nearest N/mm. Calculate the arithmetic mean of the results from the specimens comprising the test sample to the nearest N/mm.

EXT3.T250.8 REPORTING

Report on the following:

1. Source, name of manufacturer and type of pavers;
2. Identification marks of pavers;
3. Date of manufacture of pavers;
4. Nominal length, width and height of each paver to the nearest mm;
5. Transverse breaking load of each paver to the nearest N/mm;
6. Mean transverse breaking load of the pavers to the nearest N/mm;
7. That the test method used was in accordance with this Specification.

EXT3.T260.8 COMPLIANCE CRITERIA

The mean transverse breaking load of a sample of clay pavers shall not be less than:

1. 30 N/mm with no individual result less than 24 N/mm for Class T2 clay pavers in footways and cycle tracks;

-
2. 80 N/mm with no individual result less than 50 N/mm for Class T3 clay pavers in carriageways, run-ins and other paved areas to which vehicles will have access, footways and cycle tracks where vehicular loads due to frequent illegal parking or other reasons are anticipated.

BENDING STRENGTH OF PRECAST CONCRETE PAVING SLABS

EXT3.T310.8

DEFINITION OF "BATCH"

- a. A batch of precast concrete paving slabs is any quantity of paving slabs of the same type, size and finish, of the same concrete grade, manufactured in the same place covered by the same certificates stipulated under **EXT3.M030** (2) delivered to the Site;
- b. Paving slabs of different colours can be grouped together to form a batch provided that they are manufactured with the same type of materials and production methods.

EXT3.T320.8

SAMPLES FOR TESTING

1. Provide one sample of paving slabs from every 1000 m² of paving slabs, or part thereof, in a batch;
2. Number of paving slabs in each sample: 8;
3. Carry out sampling at random so that the sample comprises paving slabs that are distributed throughout the batch.

EXT3.T330.8

TEST PROCEDURE

Test precast concrete paving slabs in accordance with the procedures laid down in BS 7263-1:2001:Annex E.

EXT3.T340.8

CALCULATIONS

Calculate the mean strength of the sample to the nearest 0.1 MPa.

EXT3.T350.8

REPORTING

Report on the following:

1. Source, name of manufacturer and type of paving slabs;
2. Identification marks of paving slabs;
3. Date of manufacture of paving slabs;
4. Nominal length, width and height of each paving slab to the nearest mm;
5. Failure load of each paving slab to the nearest 0.1 kN;
6. Strength of each paving slab to the nearest 0.1 MPa;
7. Mean strength of the three paving slabs tested to the nearest 0.1 MPa;
8. That the test method used was in accordance with this Specification.

EXT3.T360.8

COMPLIANCE CRITERIA

1. The mean bending strength of a sample of paving slabs shall not be less than 3.7 MPa; and
2. Bending strengths of individual slabs shall not be less than 3.0 MPa.

ADDITIONAL TESTS FOR GRADE A PAVING UNITS

EXT3.T410.8

DEFINITION OF "BATCH"

- a. A batch of paving units is any quantity of paving units of the same type, size and finish, of the same concrete grade, manufactured in the same place covered by the same certificates and delivered to the Site at any one time;
- b. Paving units of different colours can be grouped together to form their respective batches provided that they are manufactured with the same type of materials and production methods.

EXT3.T420.8

SAMPLES FOR TESTING

1. Provide one sample of Grade A paving units from every 1000 m² of the paving units, or part thereof, in a batch, each for the following tests:

Test	Number of paving units in each sample
a. Dimensional deviation	8
b. Slip/Skid resistance	5
c. Water absorption value	10

2. Carry out sampling at random so that the sample comprises paving units that are distributed throughout the batch;
3. The sample can be used for other tests.

EXT3.T430.8

DIMENSIONAL DEVIATION

1. Carry out the test as follows:
 - a. Measure the overall dimensions and thickness of each sample of paving blocks to BS 6717:2001;
 - b. Measure the overall dimensions and thickness of each sample of paving slabs to BS 7263-1:2001.
2. Compliance criteria:
Tolerances for the dimensions of each individual paving unit shall be within ± 2 mm for length and width, and ± 3 mm for thickness.

EXT3.T440.8

SLIP/SKID RESISTANCE

1. Test the slip/skid resistance of each sample of paving units to BS EN 1344:2002;
2. Compliance criteria:
The mean slip/skid resistance of a sample is specified in **Project Specific Specification**.

EXT3.T450.8

WATER ABSORPTION VALUE

1. Carry out the test as follows:
 - a. Test the 24-hour cold water absorption value of each sample of paving units to AS/NZS 4456.14:1997;
 - b. Calculate the characteristic water absorption value (W_c) from the following equation:

$$W_c = W_m + 1.65 X_s \%$$
 Where:
 W_m is the average water absorption rate of the sample;
 X_s is the unbiased standard deviation as stated in AS/NZS 4456.2:1997.
2. Compliance criteria:

The sample shall have a characteristic water absorption value not more than 6% by 24-hour cold immersion method to AS/NZS 4456.14:1997.

SURVEILLANCE TESTS FOR TACTILE BLOCKS AND PAVING SLABS

EXT3.T510.A

SURVEILLANCE TEST FOR TACTILE INTERLOCKING CONCRETE BLOCKS

1. Test Arrangements:
 - a. When Instructed, surveillance tests shall be carried out by the CM, a Direct Contractor or the Housing Department Material Testing Laboratory;
 - b. Comply with the following pertaining to surveillance tests:
 - i. Provide attendance on the Site;
 - ii. Provide, deliver and collect samples etc. as specified or as directed by the CM.
2. Testing Samples:
 - a. Provide one set of test sample for each type of tactile blocks from the batch of material delivered to Site under one delivery note or as instructed by the CM;
 - b. One set of test sample shall consist of three tactile interlocking concrete blocks.
3. Testing methods:

As per **EXT3.M130** (12);
4. Non-compliance:
 - a. In the event that the testing samples fail to meet the testing requirements, follow either one of the following actions:
 - i. Remove the representative batch off Site; or
 - ii. Carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in **PRE.B9.570** on three separate sets of samples selected by the CM from the representative batch. In case of any one sample fails the re-test, remove the representative batch off Site.
 - b. When the representative batch of tactile interlocking concrete blocks is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in **PRE.B9.570** for one sample selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clause (4)(a);
 - c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.

EXT3.T520.8

SURVEILLANCE TEST FOR TACTILE PRECAST CONCRETE PAVING SLABS

1. Test Arrangements:
 - a. When Instructed, surveillance tests shall be carried out by the CM, a Direct Contractor or the Housing Department Material Testing Laboratory;
 - b. Comply with the following pertaining to surveillance tests:
 - i. Provide attendance on the Site;
 - ii. Provide, deliver and collect samples etc. as specified or as directed by CM.
2. Testing Samples:

-
- a. Provide one set of test sample for each type of tactile paving slabs from the batch of material delivered to Site under one delivery note or as instructed by CM;
 - b. One set of test sample shall consist of three tactile precast concrete paving slabs.
 3. Testing methods:
As per **EXT3.M140** (10);
 4. Non-compliance:
 - a. In the event that the testing samples fail to meet the testing requirements, follow either one of the following actions:
 - i. Remove the representative batch off Site; or
 - ii. Carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in **PRE.B9.570** on three separate sets of samples selected by the CM from the representative batch. In case of any one sample fails the re-test, remove the representative batch off Site.
 - b. When the representative batch of tactile precast concrete paving slabs is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in **PRE.B9.570** for one sample selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clause (4)(a);
 - c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.

EXT4 ROUTE INDICATORS

MATERIALS

GENERAL

EXT4.M010.8 STATUTORY REQUIREMENTS

Comply with the following:

1. Road Traffic Ordinance, Cap 374;
2. Road Tunnels (Government) Ordinance, Cap 368; and
3. All their subsidiary legislation.

EXT4.M020.8 DESIGN

Design traffic signs, including letters, characters, numbers, symbols and borders in accordance with the conditions and restrictions imposed by the Commissioner for Transport.

EXT4.M030.8 COMPATIBILITY OF MATERIALS

Ensure all materials used in traffic sign construction are mutually compatible with each other.

SUBMISSIONS

EXT4.M110.8 TRAFFIC SIGNS

Submit to the CM the following details at least 14 days prior to fabrication:

1. Manufacturer's name;
2. Details of materials and finishes to be used in the manufacture of the signs.

EXT4.M120.8 ILLUMINATION OF SIGNS

As scheduled or shown on Drawings.

MATERIALS FOR TRAFFIC SIGNS

EXT4.M210.8 STANDARDS

Comply with BS EN 12899:Part 1:2001 except that the requirements for marking signs shall not be applied.

EXT4.M220.8 GENERAL

1. Use only galvanized bolts, nuts, screws and rivets with traffic signs secured to galvanized pedestrian guard railing;
2. Insulate aluminium fixings from ferrous materials with an Approved type non-conductive insulator at least 2 mm thick.

EXT4.M230.8 HOT FINISHED SEAMLESS TUBES

To BS 6323:Part 3:1982.

EXT4.M240.8 HOT ROLLED SECTIONS

To BS 4:Part 1:1980.

EXT4.M250.8	HOT ROLLED STRUCTURAL STEEL SECTIONS To BS 4848:Part 4:1972.
EXT4.M260.8	WELDABLE STRUCTURAL STEELS To BS 4360:1986.
EXT4.M270.8	STAINLESS STEEL To BS EN 10088-2:2005, Grade 1.4401.
EXT4.M280.8	STAINLESS STEEL TUBES To BS 6362:1990, suitable for threading in accordance with BS 21:1985; grade: 304 S 11.
EXT4.M290.8	ALUMINIUM ALLOY Free from defects and surface blemishes and in accordance with the following: <ol style="list-style-type: none">1. Grade: EN AW-6082 in the T6, T651 or T62 tempers;2. Anodized to grade AA25 to BS EN 12373:Part 1:2001.
EXT4.M300.8	WROUGHT ALUMINIUM AND ALUMINIUM ALLOYS SUITABLE FOR GENERAL ENGINEERING PURPOSES <ol style="list-style-type: none">1. Plate, sheet and strip: to BS EN 485:Part 1:1994, BS EN 485:Part 2:2004, BS EN 485:Part 3:2003 and BS EN 485:Part 4:1994;2. Drawn tube: to BS EN 754:Part 1:1997, BS EN 754:Part 2:1997, BS EN 754:Part 3:1996, BS EN 754:Part 4:1996, BS EN 754:Part 5:1996, BS EN 754:Part 6:1996, BS EN 754:Part 7:1998 and BS EN 754:Part 8:1998;3. Bars, extruded round tubes and sections: to BS EN 755:Part 1:1997, BS EN 755:Part 2:1997, BS EN 755:Part 3:1996, BS EN 755:Part 4:1996, BS EN 755:Part 5:1996, BS EN 755:Part 6:1996, BS EN 755:Part 7:1998, BS EN 755:Part 8:1998 and BS EN 755:Part 9:2001.
EXT4.M310.8	FACES FOR TRAFFIC SIGNS Background letters, characters, numerals, symbols and borders to: <ol style="list-style-type: none">1. Be clear cut, sharp edged and free from cracks;2. Be matched for colour;3. Provide a uniform appearance by day and by night.
EXT4.M320.8	BACKING PLATES AND SPILL SCREENS <ol style="list-style-type: none">1. Material: aluminium;2. Thickness: 3 mm.
EXT4.M330.8	RETROREFLECTIVE SHEETING Class Ref 1 or Class Ref 2 material to BS EN 12899:Part 1:2001, Tables 8 and 9 or Type IX material complying with ASTM D 4956-05.
EXT4.M340.8	NON-RETROREFLECTIVE SHEETING To BS EN 12899:Part 1:2001.
EXT4.M350.8	PLASTIC SHEETING An Approved proprietary type.

FIXINGS FOR TRAFFIC SIGNS

EXT4.M410.8

GENERAL

Ensure fixing materials are compatible to the materials that they are to be fixed.

EXT4.M420.8

ISO METRIC BLACK HEXAGON BOLTS, SCREWS AND NUTS

To BS 4190:2001.

EXT4.M430.8

ISO METRIC BLACK CUP AND COUNTERSUNK HEAD BOLTS AND SCREWS WITH HEXAGON NUTS

To BS 4933:1973.

EXT4.M440.8

METAL WASHERS

To BS 4320:1968.

EXT4.M450.8

RIVETS

To BS 4620:1970.

EXT4.M460.8

BANDING

Stainless steel.

EXT4.M470.8

WROUGHT ALUMINIUM AND ALUMINIUM ALLOYS

Rivet, bolt and screw stock to BS 1473:1972.

EXT4.M480.8

CARBON, CARBON MANGANESE AND STAINLESS STEELS

Specific requirements, general inspection and testing procedures to BS EN ISO 3560-1:2009 for bolts, screws and studs, and to BS EN ISO 3506-2:2009 for nuts.

EXT4.M490.8

BOLT LENGTH

The thread position of bolt to project through the nut by a minimum of one thread and a maximum of four threads.

EXT4.M500.8

RAG AND INDENTED BOLTS

To BS 1494:Part 2:1967.

EXT4.M510.8

EXPANSION AND RESIN BONDED BOLTS

An Approved proprietary type capable of withstanding the design loading.

PAINT TO TRAFFIC SIGN FACES

EXT4.M610.8

GENERAL

To BS EN 12899:Part 1:2001, Tables 3 and 5.

EXT4.M620.8

PAINTED FINISH

For the following areas on the sign face:

1. Colour: homogeneous and uniform, to BS 381C:1996 and referenced as follows:

Colour	Reference Number	Colour Reference
Red	537	Signal Red
Orange	557	Light Orange
Yellow	355	Lemon Yellow

Colour	Reference Number	Colour Reference
Blue	109	Middle Blue
Green	225	Light Brunswick Green

2. Black:
 - a. Type: non-reflective;
 - b. Luminance factor: maximum 0.03, measured in accordance with BS EN 12899:Part 1:2001.

MATERIALS FOR ROAD STUDS

EXT4.M710.8

ROAD STUDS

1. To Road Traffic Ordinance, Cap 374 and its subsidiary legislation;
2. An Approved proprietary type;
3. Permanent reflecting road studs to be used as lane line markers on dual carriageway trunk roads and primary distributor roads must be a type to which traffic cylinders of an Approved type can be attached. The method of attachment must be such that the traffic cylinder can be easily detached from the road stud;
4. Temporary reflecting road studs to be used as markers for temporary traffic routes must be yellow.

EXT4.M720.8

BITUMEN GROUT FOR ROAD STUDS

1. Comprising:
 - a. Bitumen:
 - i. Bitumen content: 25 to 30% of the total mass;
 - ii. Bitumen grade: tropical grade filled bitumen, oxidised grade R 85/25.
 - b. Hydrated lime filler:
 - i. Percentage by mass of hydrated lime passing a 75 micron BS test sieve: minimum of 85%.
2. Properties:
 - a. Penetration at 25°C: 12±4;
 - b. Softening point: 105°C ± 5°C;
 - c. Specific gravity: not to exceed 1.8.

WORKMANSHIP

DELIVERY AND STORAGE OF MATERIALS

EXT4.W010.8**TRAFFIC SIGNS**

Store sheets in a dry, weatherproof store in a manner which will not result in damage or deformation. Separate traffic signs which are stored together by the use of slip sheets.

FABRICATION OF TRAFFIC SIGNS

EXT4.W110.8**POSTS**

1. Colour:
 - a. Beacons at zebra crossings: paint with alternate black and white stripes;
 - b. Other posts:
 - i. Paint grey in accordance with BS 5252F:1976, Code 18B19; or
 - ii. Galvanize to BS EN ISO 1461:2009 and comply with **EXT7.W020**. Treat galvanized areas affected by cutting and drilling using an Approved method;
2. Length:
 - a. Posts supporting external luminaries: length protruding above top of signs to be as short as practicable;
 - b. Other posts: must not protrude above the top of signs.

EXT4.W120.8**BACKING PLATES**

1. For signs not exceeding 1200 mm high x 2400 mm wide fabricate from a single sheet;
2. For signs exceeding 1200 mm high x 2400 mm long use a minimum number of sheets, rectangular in shape and approximately the same size;
3. Drill holes in the backing plate prior to painting or the application of retroreflective or non-reflective sheeting.

EXT4.W130.8**SPILL SCREENS**

1. Extend spill screens to the entire width of the backing plate;
2. Cut corners to the same radius as the corners of the backing plate;
3. Consider spill screens to be part of the backing plate and design stiffeners and mountings to accommodate the combined size.

EXT4.W140.8**FACES FOR TRAFFIC SIGNS**

1. Fabricate from a single sheet of retroreflective or non-retroreflective plastic sheeting unless otherwise Instructed;
2. If more than one sheet is required, keep the number of sheets used to a minimum;
3. Fix sheeting material, including letters, characters, numerals, symbols and borders using adhesive. Ensure there are no bubbles, creases, cracks or other blemishes;
4. Fix in accordance with the manufacturer's instructions.

EXT4.W150.8**LACQUER COATINGS**

1. Apply to the face of traffic signs at the time of manufacture.
2. Ensure coatings are uniform and continuous.

EXT4.W160.8 PAINT TO TRAFFIC SIGN FACES

1. Thoroughly clean and pre-treat, by anodising, using and etching primer or another Approved process, the traffic sign face prior to painting or stoveing;
2. Apply a minimum of one undercoat and one finishing coat of paint and stove to a thickness of 0.0315 mm - 0.0375 mm of enamel over a minimum thickness of 0.025 mm of primer. Where light colours are applied over dark colours, apply a minimum of two coats. Ensure the final surface has a uniform thickness, an egg-shell flat finish and is smooth and free from defects.

ASSEMBLY OF TRAFFIC SIGNS**EXT4.W210.8 JOINTS**

Weld or join using brackets, nuts, bolts and washers where joints for framework and stiffeners are not an integral part of the backing plate.

EXT4.W220.8 FIXINGS

1. Spacing of rivets and other fixings to be uniform and not to exceed 150 mm around the outside edge of the sheet and 300 mm on cross braces;
2. Use an additional neoprene, nylon or other Approved material washer to protect face of sign from metal nuts, bolts, washers and screws.

EXT4.W230.8 COVER PLATES FOR FIXINGS

Use a material of the same colour as the part of the face in which it is in contact.

EXT4.W240.8 CONNECTIONS TO ROAD LIGHTING COLUMNS

When fixing traffic signs to columns do not drill columns.

EXT4.W250.8 BACKING PLATES

1. Connect to posts by an Approved method;
2. Drill holes in ferrous components before finishes are applied.

EXT4.W260.8 LACQUER COATINGS

Apply to the edges of holes drilled in plates with plastic sheeting immediately before fixings are inserted.

COVERING OF TRAFFIC SIGNS**EXT4.W310.8 GENERAL**

1. Ensure coverings are sufficiently opaque to prevent reflection from the covered sign. Do not remove coverings until Instructed;
2. Unless otherwise Instructed, blank out the faces of traffic signs which have been erected but do not relate either wholly or in part to the traffic situation in operation.

EXT4.W320.8 METHOD OF COVERING

Where required blank out traffic signs using the following methods:

1. A 1.5 mm thick sheet compatible with the sign material;
2. A self-adhesive plastic film if the sign is to be covered for a period of more than 12 months;
3. An Approved loose cover sheet.

EXT4.W330.8**FIXING COVER SHEETS**

1. Fix using 5 mm diameter stainless steel bolts, washers and nuts or non-ferrous rivets at maximum 600 mm spacing;
2. Pass bolts through 5 x 12 mm diameter plastic distance piece between the face of the sign and the cover plate;
3. Fill holes remaining on the finished face of the sign using blocked rivets;
4. Colour rivet face by an Approved method.

EXT4.W340.8**PLASTIC FILM**

Fix and remove in accordance with the manufacturer's recommendations. Ensure that the self-adhesive plastic film is compatible with the material it is to be adhered to.

EXT4.W350.8**LOOSE COVERS**

Fasten securely to the back of the sign. Do not apply tape or adhesive material to the face of the sign.

INSTALLATION OF ROAD STUDS**EXT4.W410.8****ROAD STUDS**

1. Install in accordance with the manufacturer's recommendations;
2. Do not install road studs until concrete work has reached the specified grade strength;
3. Ensure surfaces to which bonded road studs are to be fixed are clean, and free from dust, grease and other deleterious matter prior to installation of the road studs.

EXT4.W420.8**DEPRESSIBLE ROAD STUDS**

Fix in place with bitumen grout.

TESTING

TESTING TRAFFIC SIGNS

EXT4.T010.8

TESTING

In accordance with BS 873: Part 1:1983 and:

1. The number of signs tested to be as Instructed or indicated on the Drawings;
2. The number and type of tests to be carried out on the traffic signs to be as Instructed;
3. Carry out testing in such a manner that will not cause damage to the traffic signs;
4. Carry out testing at an Approved laboratory.

EXT4.T020.8

COMPLIANCE CRITERIA

The results of tests of traffic signs must comply with BS 873:Part 1:1983.

EXT5 KERBS, EDGINGS AND QUADRANTS

MATERIALS

KERBS, EDGINGS AND QUADRANTS

EXT5.M010.8 INSITU CONCRETE

1. Kerbs, edgings and quadrants: concrete grade 30/20;
2. Foundations and backings to kerbs, edgings and quadrants: concrete grade 20/20.

EXT5.M020.8 PRECAST CONCRETE

Hydraulically pressed and complying with BS 7263:Part 1:1990, excluding the testing of water absorption and:

1. Nominal length of kerbs: 1000 mm;
2. Nominal length of edgings: 750 mm.

EXT5.M030.8 GRANITE

Kerbs, edgings and quadrants:

1. Worked straight or circular;
2. Corners: square;
3. Top front and back edges: parallel;
4. Ends: chisel-dress square to form a close butt-joint with adjacent kerbs and:
 - a. Depth on the front face: 140 mm minimum;
 - b. Depth on the back face and full width of the top face: 75 mm minimum.
5. Length: 600 mm minimum.

WORKMANSHIP

PRECAST CONCRETE AND GRANITE KERBS, EDGINGS AND QUADRANTS

EXT5.W010.8**LAYING**

1. Lay on a regulating layer of cement mortar;
2. Thickness: 10 mm minimum and not exceeding 40 mm.

EXT5.W020.8**JOINTS**

1. Generally:
 - a. Not exceeding 10 mm in width;
 - b. Filled and flush pointed with cement mortar.
2. Expansion joints on bridge decks: as shown on the Drawings;
3. Transverse expansion and contraction joints laid on or adjacent to concrete carriageways: in accordance with Worksection EXT2.

EXT5.W030.8**RADIUS KERBS**

Use for kerbs less than 10 m external radius.

INSITU KERBS, EDGINGS AND QUADRANTS

EXT5.W110.8**LAYING**

Construct in accordance with BS 5931:1980 and lay using an Approved type of automatic extrusion machine or by other Approved alternative method.

EXT5.W120.8**FINISHING**

1. Kerbs, quadrants and edgings must have regular sides, edges, arrises and chamfers;
2. Finish concrete surfaces as follows:
 - a. Method of producing finish: levelling the surface of the compacted concrete with a screed board and steel trowelling the surface under firm pressure or power floating the surface;
 - b. Abrupt irregularities permitted: Nil;
 - c. Gradual irregularities permitted: <5 mm in 2 m;
 - d. Specific requirement: Uniform, dense and smooth surface, free from trowel marks. No staining or discolouration.
3. Do not finish or dress kerbs, edges and quadrants with cement mortar.

EXT5.W130.8**JOINTS**

1. Generally: flush pointed with cement mortar;
2. Contraction joints: form at intervals not greater than 4 m;
3. Transverse expansion and contraction joints laid on or adjacent to concrete carriageways: in accordance with Worksection EXT2.

ACCURACY AND TOLERANCES

EXT5.W210.8 GENERAL

Refer to Appendix H "Schedule of Tolerances" to this Specification.

WORKS OUTSIDE SITE BOUNDARY

EXT5.W310.8 APPROVED CONTRACTOR FOR PUBLIC WORKS

Kerbs, edging and quadrant works required to be carried out by a contractor or sub-contractor who is on the current List of Approved Contractors for Public Works for Roads and Drains are specified in [Project Specific Specification](#).

EXT5.W320.8 SPECIFICATION

Carry out the works specified under [EXT5.W310](#) in accordance with Sections 6, 9, 10, 11, 14, 15, 16 and 18 of the Hong Kong Government General Specification for Civil Engineering Works (2006 Edition) and its amendments published 42 days prior to the date for the return of tenders unless otherwise specified.

EXT5.W330.8 HANDING OVER INSPECTION

Notify the CM to arrange with Highways Department for a joint handing over inspection. Allow the CM to give at least 2 working days advance notice for this inspection.

EXT5.W340.8 RECORD DRAWINGS AND TEST REPORTS

Provide as-built record drawings and all test reports to the CM for submitting to Highways Department.

EXT6 CONCRETE PROFILE BARRIERS

MATERIALS

EXT6.M010.8 CONCRETE MIX

Grade 30/20 as Worksection CON1.

EXT6.M020.8 FORMWORK

Use steel formwork unless otherwise permitted by the CM. Do not loosen or remove formwork until at least 7 hours after completion of concreting.

EXT6.M030.8 CONCRETE FINISH

Finish concrete surfaces as follows:

1. Unformed concrete surfaces, Class U5, as follows:
 - a. Method of producing finish: Level the surface of the compacted concrete with a screed board, wood float or power float the surface and steel trowel the surface under firm pressure or power float the surface;
 - b. Abrupt irregularities permitted: nil;
 - c. Gradual irregularities permitted: < 5 mm in 2 m;
 - d. Specific requirements: uniform, dense and smooth surface, free from trowel marks, no staining or discolouration.
2. Concrete surfaces for transverse joints, use Class F3 as follows:
 - a. Type of formwork normally used: plywood;
Note: formwork of this type will normally produce a concrete surface which complies with the characteristics of finish stated but other types of formwork may be used to produce the specified finish.
 - b. Formwork pattern: pattern of formwork joints and tie holes as stated in sub-clauses (4) and (5) below;
 - c. Abrupt irregularities permitted: < 3 mm;
 - d. Gradual irregularities permitted: < 5 mm in 2 m;
 - e. Specific requirements: even surface, no grout runs.
3. Exposed concrete surfaces, use Class F5 as follows:
 - a. Type of formwork normally used: sealed plywood Note: formwork of this type will normally produce a concrete surface which complies with the characteristics of finish stated but other types of formwork may be used to produce the specified finish;
 - b. Formwork pattern: pattern of formwork joints and tie holes as stated in sub-clauses (4) and (5) below;
 - c. Abrupt irregularities permitted: < 2 mm;
 - d. Gradual irregularities permitted: < 3 mm in 2 m;
 - e. Specific requirements: even surface, uniform, dense and smooth surface, no grout runs, no grain pattern, no crazing, no blemishes, no staining or discolouration.

-
4. Panel joints: formwork panels for the finishes in sub-clauses (2) and (3) above shall be the same size and shall form a regular pattern approved by the CM. The lines of joints between panels shall be straight and continuous, horizontal and vertical, or inclined to suit the pattern of profiled formwork, and shall be coincident with construction joints and other joints and with recesses in the concrete surface. The number of make-up pieces shall be kept to a minimum;
 5. Tie holes: holes left by formwork ties and components in concrete surfaces with the finishes in sub-clauses (2) and (3) above shall be in line horizontally and vertically and shall form a regular pattern approved by the CM. Unless otherwise permitted by the CM, holes in profiled formwork shall be located in such a manner that the holes are completely within recesses in the concrete surface.

EXT6.M040.8 JOINTS IN CONCRETE PROFILE BARRIERS

Form joints:

1. At locations which coincide with expansion or construction joints in the adjoining structure or carriageway; or
2. At intervals not exceeding 12 m, whichever is less; and
3. In accordance with the appropriate provisions of Worksection CON6.

EXT6.M050.8 PROTECTIVE POLYTHENE SHEETING

Impermeable polythene sheeting with a nominal thickness of 0.125 mm.

EXT6.M060.8 CEMENT MORTAR

Cement mortar consisting of one part of cement to three parts of fine aggregate by volume together with the minimum amount of water necessary to achieve a consistency suitable for the required work. Fine aggregates to be sand or crushed rock to BS 1200:1976 passing a 5 mm BS Test Sieve.

WORKMANSHIP

CONSTRUCTION OF PROFILE BARRIERS

EXT6.W010.8 SLIP-FORMED CONCRETE PROFILE BARRIERS

Construct by slip-form machine between sliding forms to BS 5931:1980. Slip-form machines to comply with BS 5931:1980, Appendix A.

EXT6.W020.8 PRECAST CONCRETE PROFILE BARRIERS

Lay on a cement mortar regulating layer, 10 – 40 mm thick.

SUBMISSIONS

EXT6.W110.8 PARTICULARS OF CONCRETE PROFILE BARRIERS

Submit the following particulars to the CM of the proposed methods of construction of the concrete profile barriers at least 14 days before construction of the concrete profile barriers starts:

1. Particulars of formwork for insitu construction using fixed forms as stated in:
 - a. Worksection FOR for works carried out under site formation / road and drainage works contracts; or
 - b. Worksection CON2 for all other works not mentioned in sub-clause (1)(a) above.
2. Details of slip-form machine for insitu construction between sliding forms; and
3. Methods of manufacture, handling, transport, storing and fixing in position of precast units.

PROTECTION OF WORKS

EXT6.W210.8 PROTECTION

1. Immediately after the formwork has been removed or the curing compound applied, protect concrete profile barriers with polythene sheeting for at least 24 hours from exposure to conditions which may adversely affect the concrete;
2. Ensure the sheeting is lapped and held securely in position in a manner that will not damage the concrete surface.

TOLERANCES

EXT6.W310.8 GENERAL

1. Refer to Appendix H 'Schedule of Tolerances' to this Specification;
2. Form a smooth alignment of the barriers.

TESTING

TRIALS

EXT6.T010.8

TRIAL LENGTHS

1. Construct trial lengths to demonstrate that the proposed materials, mixes, methods of production and methods of construction will produce concrete profile barriers complying with this Specification;
2. Construct trial length:
 - a. In a location separate from the permanent concrete profile barrier; or
 - b. Over the first 25 m of the permanent concrete profile barrier; as Instructed;
3. Allow the CM sufficient time, at least 7 days, to determine whether the specified requirements have been produced in the trial area before further material of the same type is used to construct the concrete profile barrier;
4. Construct trial lengths using the same materials, mixes, method of production and methods of construction as the details submitted to the CM;
5. Inform the CM at least 24 hours before constructing trial lengths, or at another interval agreed by the CM;
6. Unless otherwise Instructed to remove, protect trial lengths from damage and leave in position. Do not remove trial lengths which form part of the permanent barrier and which comply with this Specification.

EXT6.T020.8

SAMPLING AND TEST METHODS FOR TRIAL LENGTHS

1. Test the trial length to determine the accuracy of the alignment, the level and the finish of the concrete surface;
2. Cut cores from the trial length to determine the amount of segregation of the constituents and the presence of voids. Take cores as **EXT6.T070**.

EXT6.T030.8

COMPLIANCE CRITERIA

1. Alignment and levels of barrier: as **EXT6.W310**;
2. Finish of concrete surface: as the appropriate provisions of **EXT6.M030**;
3. Amount of segregation of constituent materials and the presence of voids: as the appropriate provisions of Worksection EXT2.

EXT6.T040.8

NON-COMPLIANCE

1. In the event of non-compliance of any trial length with the specified requirements, submit details of proposed changes to the materials, mixes, methods of production or construction, required to meet the compliance criteria. Construct further trial areas as necessary until the result of every test on trial lengths complies with the specified requirements;
2. Unless otherwise Instructed remove trial lengths, or parts of the trial lengths, which do not comply with the specified requirements for the trial length.

EXT6.T050.8

USE IN THE PERMANENT WORKS

1. Notwithstanding the requirements of sub-clause (2) do not place concrete in the permanent barriers until the result of all the tests on the trial length confirm the specified requirements for the trial length;

-
2. Concrete may be placed in the permanent barriers before the results of tests for compressive strength of the trial mix are available, provided that the result of every other test or the trial mix and trial length complies with the specified requirements for trial mix concrete and for the trial length.

EXT6.T060.8**SPECIFICATION CHANGES**

Unless otherwise permitted by the CM do not change the materials, mixes, methods of production and construction required to meet the compliance criteria. Construct further trial lengths to demonstrate compliance of any proposed changes, unless otherwise Instructed.

EXT6.T070.8**CONCRETE CORES FROM TRIAL LENGTHS**

1. Provide two concrete cores from each trial length of concrete profile barriers, taken from positions as Instructed;
2. Samples, testing and compliance criteria for concrete cores from trial lengths: as Worksection EXT2.

EXT7 UNTENSIONED BEAM BARRIERS

MATERIALS

SUBMISSIONS

EXT7.M010.8 DETAILS

Submit details of the following, for Approval, at least 14 days prior to installation of beams:

1. A certificate for each batch of beams delivered to Site from the manufacturer in the format of BS 4360:1986 stating the manufacturer's name, the date and place of manufacture and showing that the beams comply with the requirements of this Specification, including the carbon equivalent values;
2. Proposed method of installation.

EXT7.M020.8 SAMPLES

Submit samples of the following beam barrier materials for Approval of the source and type.

1. Beams;
2. Posts, cleats and struts;
3. Bolts, nuts and washers.

MATERIALS

EXT7.M110.8 UNTENSIONED BEAM BARRIERS

1. Where applicable, steelworks to Worksection STW for works to be handed over to other government departments upon completion as stated in the Contract unless otherwise stated;
2. Steel plates to BS 1449-1.1:1991, Type BHR, and BS EN 10149-3:1996, Grade S315NC capable of withstanding a tensile force of at least 300 kN which will not deflect by more than 40 mm when loaded centrally with a point load of 1 t over a simply supported span of 3 m;
3. Hot dip galvanized with a minimum coating thickness of 85 µm.

EXT7.M120.8 BOLT SLOTS IN BEAMS FOR CONNECTION POSTS

1. Prepare in the workshop by cold saw-cutting;
2. Spacing: 2 m or 4 m as shown on the Drawings;
3. Hot dip galvanized with a minimum coating thickness of 70 µm.

EXT7.M140.8 WELDS FOR END BEAM SECTIONS

Full-penetration butt welds.

EXT7.M150.8 CONCRETE FOR FOOTINGS

As Worksection CON1 and:

1. Concrete mix: Grade 20/20;
2. Finish: Class U5 as [EXT7.M170](#).

EXT7.M160.8 CONCRETE FOR ANCHOR BLOCKS

Grade 20/20 as Worksection CON1.

EXT7.M170.8 FINISH TO CONCRETE SURFACES OF ANCHOR BLOCKS

Finish concrete surfaces as follows:

1. Formed finishes:
Class F5: as specified in **EXT6.M030**.
2. Unformed concrete surfaces, class U5, as specified in **EXT6.M030**.

POSTS

EXT7.M210.8 POSTS FOR UNTENSIONED BEAM BARRIERS

1. Grade 43A steel to BS 4360:1986;
2. Hot dip galvanized with a minimum coating thickness of 85 µm.

EXT7.M230.8 POSTS FABRICATED FROM HOLLOW SECTIONS

1. Seal by welding mild steel sealing plates over the open ends;
2. Plate thickness: 3 mm.

FIXINGS

EXT7.M310.8 CLEATS AND STRUTS

1. Fabricated from angle sections to BS 4:1980;
2. Material: weldable structural steel to BS 4360:1986:Grade 43A;
3. Hot dip galvanized with a minimum coating thickness of 85 µm.

EXT7.M320.8 BOLTS

To BS 4190:2001, and:

1. Size: M 16;
2. Strength: Grade 4.6;
3. Bolts for beam splicing, connecting beams to posts and for connecting beams to cleats: round or button-headed with oval shoulders;
4. Other bolt types: ISO metric black hexagon type;
5. Hot dip galvanized with a minimum coating thickness of 55 µm;
6. Bolt length: such that the threaded portion of each bolt projects through the nut by not more than four threads;
7. Rag, indented and expansion bolts and resin bonded bolts: Approved proprietary type and capable of withstanding the design loading.

EXT7.M330.8 NUTS

To BS 4190:2001, and:

1. Strength: Grade 4 or 5;
2. Hot dip galvanized with a minimum coating thickness of 55 µm;
3. Tapped 0.4 mm oversized to accommodate galvanized coating.

EXT7.M340.8 WASHERS

Black, mild steel to BS 4320:1968, Form E, F or G and manufactured from steel to BS 1449-1.1:1991 and BS EN 10149-3:1996, Grade S315NC.

EXT7.M350.8 PLAIN WASHERS

1. Of dimensions suitable for use with M 16 bolts and nuts;
2. Thickness: 2 mm;
3. Hot-dip galvanized with a minimum coating thickness of 55 µm.

EXT7.M360.8 SHAPED WASHERS

To BS 3468:1986 and shaped to fit the curvature of circular hollow sections used as posts:

1. Material: cast iron;
2. Thickness: 5 mm minimum.

WORKMANSHIP

GENERAL

EXT7.W010.8 STORAGE AND PROTECTION

1. Store beams and posts off the ground on level supports in a manner which will not damage, deform or contaminate the materials;
2. Protect beams and posts from damage and ensure that damaged materials are not used in permanent work unless permitted by the CM.

EXT7.W020.8 HOT DIP GALVANIZING

1. Unless otherwise specified, galvanized coatings to be applied by hot-dip galvanizing to be in accordance with BS EN ISO 1461:2009 with minimum mean coating thickness of 45 microns to 85 microns depending on thickness of article as stipulated in Table 3 of BS EN ISO 1461:2009, unless otherwise specified. The coating thickness to comply with the following Table:

Article Thickness	Minimum Mean Coating Thickness
> 6 mm	85 µm
> 3 mm to ≤ 6 mm	70 µm
≥ 1.5 mm to ≤ 3 mm	55 µm
< 1.5 mm	45 µm

2. Unless Approved, all components are to be galvanized after welding, drilling and cutting operations are complete;
3. All hot dip galvanizing is to be carried out by galvanizers with ISO 9001 certification. Submit the name of galvanizer for Approval;
4. Submit original invoice/delivery note and galvanizing certification for each delivery. These documents shall include the following information:
 - a. Project title/number;
 - b. Name of galvanizer;
 - c. Types and dimensions of articles;
 - d. Quantities.
5. Attach a durable identification tape to each batch of galvanized articles indicating the project title, galvanizing certification number and name of galvanizer.

FORMING FOOTINGS

EXT7.W110.8 COMPACTED EARTH FOOTINGS

1. Deposit and compact the following to obtain a relative compaction of at least 95% throughout:
 - a. Sub-base material: to the bottom 250 mm of the foundation pit;
 - b. Fine fill material: to the remainder of the pit;
2. Posts: securely fix in position during deposition and compaction of the fill material.

EXT7.W120.8 CONCRETE FOOTINGS

1. Ensure the top surface of the footings is finished level with the adjoining ground;
2. Posts:

-
- a. Surround posts with polyethylene sheeting prior to placing of concrete;
 - b. Ensure posts are securely fixed in position during concreting.

CONSTRUCTION OF BEAM BARRIERS

EXT7.W210.8

GENERAL

Untensioned beam barriers when delivered to site must be ready for assembly. Beams and posts shall be free from blisters, flux, uncoated spots and other defects.

EXT7.W220.8

INSTALLATION AND FIXING

1. Install beam barriers to a smooth alignment and within 10 mm of the position and height as shown on the Drawings. Ensure transition sections provide a smooth and uniform transition;
2. Curve in the workshop those beams to be installed to a radius less than 45 m;
3. Use rag, indented, expansion or resin bonded bolts for fixing to concrete. Fit bolts into pockets and fill with cement mortar or resin grout;
4. Bolt beam barriers to metalwork.

TOLERANCES

EXT7.W310.8

GENERAL

Refer to Appendix H 'Schedule of Tolerances' to this Specification.

EXT8 ROAD MARKING

MATERIALS

GENERAL

EXT8.M010.8 ROAD MARKING

Road markings are white or yellow continuous or intermittent lines, letters, characters, figures, arrows or symbols marked on the carriageway to guide road users and pedestrian.

EXT8.M020.8 SKID RESISTANCE

The minimum skid resistance of road marking materials when measured in accordance with the method contained in Annex D of BS EN 1436:1998 shall be Class S1.

EXT8.M030.8 FUNCTIONAL LIFE

The functional life of the road-marking material shall be at least 1 year after laying is carried out as defined in BS EN 1436:1998.

THERMOPLASTIC MATERIALS

EXT8.M110.8 HOT APPLIED THERMOPLASTIC MATERIAL

1. Unless otherwise specified in Drawings, use either one of the following materials:
 - a. Type 'A' - Standard hot applied thermoplastic material;
 - b. Type 'B' - Alkyd resin hot applied thermoplastic material.
2. Complying with BS EN 1871:2000, with particular attention to the following material properties:
 - a. Softening point: Class SP2 when tested in accordance with Annex F of BS EN 1871:2000;
 - b. Luminance factor: Class LF4 for white material and Class LF2 for yellow material when tested in accordance with Annex E of BS EN 1871:2000.
3. Solvent-free marking substance supplied in block, granular or powder forms, which can be heated to a molten state and then applied with an appropriate hand or mechanical applicator, and form a cohesive film by cooling;
4. With solid glass beads to BS EN 1423:1998 of reflective index conforming to Class A when determined in accordance with Annex A of BS EN 1423:1998 so that not less than 25% of the volume of material comprises glass beads;
5. Colour: as shown on Drawings.

EXT8.M120.8 CERTIFICATION

When required by the CM, submit, 14 days before the commencement of the Works, a test certificate prepared and signed by an independent laboratory, showing the manufacturer's name, the place and date of manufacture and certifying that samples taken from the road marking materials to be used in the Contract have been tested and are in compliance with the specified standards.

PREFORMED MATERIALS

EXT8.M210.8**COLD APPLIED ROAD MARKINGS**

1. An Approved proprietary type with glass beads to BS EN 1423:1998 of reflective index conforming to Class A when determined in accordance with Annex A of BS EN 1423:1998, applied during manufacture;
2. Colour: as shown on Drawings.

EXT8.M250.8**COLD PLASTIC ROAD MARKINGS**

To BS EN 1871:2000. The luminance factor shall be Class LF4 for white material and Class LF2 for yellow material when applied at the manufacturer's state thickness and tested in accordance with Annex A of BS EN 1871:2000.

PAINT

EXT8.M310.8**ROAD MARKING PAINT**

1. To BS EN 1871:2000, in particular the following:
 - a. Luminance factor: Class LF6 for white material and Class LF2 for yellow material when tested in accordance with Annex A of BS EN 1871:2000;
 - b. Difference in luminance factor after UV ageing: Class UV1;
 - c. Difference in luminance factor after bleed resistance test: Class BR1.
2. Colour: as shown on Drawings.

ANCILLARY MATERIALS

EXT8.M410.8**TACK COAT**

Compatible with the road marking material.

EXT8.M420.8**REFLECTIVE GLASS BEADS FOR SURFACE APPLICATION**

Complying with BS EN 1423:1998 of reflective index conforming to Class A when determined in accordance with Annex A of BS EN 1423:1998.

WORKMANSHIP

PREPARATION FOR ROAD MARKING

EXT8.W010.8**ROAD CONDITION**

Ensure that the road surface is clean, dry and free from any loose detritus, mud, old and/or flaking road marking materials or similar extraneous matters.

EXT8.W020.8**CLEANING**

When directed, remove oil and grease by high pressure water jetting, shot blasting, grinding or other Approved methods.

EXT8.W030.8**BITUMINOUS SURFACES**

No surface preparation is required to bituminous road surfaces which have not been opened to traffic.

EXT8.W040.8**CONCRETE SURFACES**

1. If the road has not previously been opened to traffic, remove all curing compound and laitance from the road surface by wire brushing or other Approved method;
2. Apply a tack coat to the road surface in accordance with the manufacturer's recommendations.

EXT8.W050.8**EXISTING ROAD MARKINGS**

1. Where road markings are to be replaced by material of a different type, remove the existing material by high pressure water jetting, shot blasting, grinding or other Approved methods; do not mask the existing markings using black paint or similar method;
2. Where road markings are to be replaced by material of a similar type, roughen the existing marking by an Approved method until the thickness of the existing material is reduced by approximately 50%;
3. Carry out the removal or roughening of existing road markings adjacent to any longitudinal or transverse joint by an Approved method which will not damage the joint.

LAYING THERMOPLASTIC MATERIALS

EXT8.W110.8**SUPPLY, DELIVERY AND STORAGE**

Ensure that road marking materials are supplied, delivered and stored in accordance with the following:

1. Thermoplastic materials: each container shall be clearly and indelibly marked with the following information:
 - a. The name, trade mark or other means of identification of the manufacturer;
 - b. Batch number;
 - c. Date of manufacturer;
 - d. The number and date of the Standard, i.e. BS EN 1871:2000;
 - e. Whether reflectorized;
 - f. Colour (white, yellow or black);
 - g. Chemical description and type of resin;
 - h. Maximum application temperature and maximum safe heating temperature;

-
- i. Relative density;
 - j. The class of its content if applicable;
 - k. A warning about the use of lead pigment if applicable.
 2. Road marking paint material: shall be discarded after expiry of the shelf life;
 3. Preformed material: in accordance with the manufacturer's recommendations.

EXT8.W120.8**CODE OF PRACTICE**

Prepare thermoplastic road marking materials on site and lay in accordance with clauses 4 and 5 of BS 3262: Part 3:1989.

EXT8.W130.8**AMBIENT CONDITIONS**

Do not lay road markings when:

1. The road surface is wet; or
2. When the ambient air temperature in the shade is below 10°C.

EXT8.W140.8**LAYING PLANT**

Ensure that the apparatus employed for the laying of road markings is capable of producing markings to a uniform thickness and width. The marking must have clean edges and be free from streaks, lumps and blisters.

EXT8.W150.8**THICKNESS**

Thickness of road markings laid and measured in accordance with Appendices B of BS 3262:Part 3:1989:

1. Screed markings: 4 mm;
2. Sprayed markings
(other than yellow edge lines): ≥ 1.5 mm;
3. Sprayed yellow edge lines: ≥ 0.8 mm.

LAYING PREFORMED MATERIAL**EXT8.W210.8****LAYING COLD APPLIED ROAD MARKINGS**

Lay:

1. In accordance with the manufacturer's recommendations;
2. When the surface of the carriageway is dry;
3. To a thickness of at least 1.5 mm.

APPLYING ROAD-MARKING PAINT**EXT8.W240.8****APPLICATION OF ROAD-MARKING PAINT**

1. Use road-marking plant only where the use of other road marking material, such as thermoplastic, will affect the functional performance of the road markings and with the written approval of the CM;
2. Apply in accordance with the manufacturer's recommendation;
3. Do not apply road-marking paint for temporary road markings and covering up existing road markings.

PERFORMANCE REQUIREMENTS

EXT8.W270.8**ROAD MARKING PERFORMANCE FOR ROAD USERS**

Comply with BS EN 1436:1998, in particular the following:

1. Minimum luminance coefficient under diffuse illumination: Class Q2 and Q3 on asphaltic surface and concrete surface respectively for white markings, and Class Q1 for yellow markings when measured in accordance with Annex A of BS EN 1436:1998;
2. Minimum coefficient of retroreflected luminance for dry road markings: Class R2 and R1 for permanent white and yellow markings respectively, and Class R3 for temporary markings when measured in accordance with Annex B of BS EN 1436:1998;
3. Minimum luminance factor for dry road markings: Class B3 for white markings and B2 for yellow markings when measured in accordance with Annex C of BS EN 1436:1998.

TEMPORARY ROAD MARKINGS

EXT8.W310.8**GENERAL**

1. Use cold-applied performed material for temporary road markings;
2. Use proprietary black tape approved by the CM for covering up existing road markings temporarily during the course of road works;
3. Remove temporary road markings.

EXT8.W320.8**DISPOSAL**

Dispose of temporary markings after removal and:

1. Remove all traces of tape from the surface of the carriageway;
2. Make good any existing, permanent road markings to Approval and so that it is safe for traffic to use the road.

REMOVAL OF EXISTING ROAD MARKINGS

EXT8.W360.8**REMOVAL OF EXISTING ROAD MARKINGS BY SHOT-BLASTING**

Where directed by the CM to remove the existing road marking by steel shot-blasting, use Approved self-propelled shot-blasting machine with a minimum cleaning path of 350 mm.

TOLERANCES

EXT8.W410.8**GENERAL**

Refer to Appendix H "Schedule of Tolerances" to this Specification.

EXT9 FENCING, GATES AND GUARDRAILS

MATERIALS

GENERAL

EXT9.M010.8 ALTERNATIVE DESIGN

The Contractor may offer an alternative design for the pedestrian guard railing or that which is to be erected as temporary works and shown on the Drawings or detailed in this Specification. Such design must be in accordance with BS 7818, Table 1, Class C.

EXT9.M020.8 SUBMISSIONS

Submit the following details to the CM at least 28 days prior to fabrication:

1. A certificate from the manufacturer stating their name, date and place of manufacture and a statement confirming that the materials comply with the requirements of this Specification; and
2. Details of alternative design proposals as **EXT9.M010** where applicable.

EXT9.M030.8 SAMPLES

Submit with the other details required by **EXT9.M020** samples of the following for Approval of source and type:

1. Each type of pedestrian guard railing to be used;
2. Mesh infill;
3. Each type of bolt, nut and washer to be used in the fabrication.

FENCING

EXT9.M120.8 GALVANIZED STEEL WIRE FOR FENCING

To BS 4102:1990.

EXT9.M130.8 GALVANIZED WIRE NETTING FENCING

To BS 1485:1983 or of Approved local manufacture.

CONCRETE POSTS

EXT9.M210.8 PRECAST CONCRETE FENCING POSTS

Reinforced concrete to dimensions shown on the Drawings and the following:

1. Concrete: Grade 25/10 as Worksection CON1;
2. Reinforcement: as Worksection CON3;
3. Finish: fair faced as Worksection CON2.

STEEL AND ALUMINIUM FOR GATES, POSTS AND GUARD RAILS

EXT9.M310.8	HOT FINISHED SEAMLESS STEEL TUBES To BS 6323:Part 3:1982.
EXT9.M320.8	STEEL TUBES AND TUBULARS SUITABLE FOR SCREWING TO BS 21 PIPE THREADS To BS 1387:1985.
EXT9.M330.8	HOT ROLLED STEEL SECTIONS To BS 4:Part 1:1980.
EXT9.M340.8	HOT ROLLED STRUCTURAL STEEL SECTIONS (EQUAL AND UNEQUAL ANGLES) To BS 4848:Part 4:1972 (1986).
EXT9.M350.8	WELDABLE STRUCTURAL STEELS To BS 4360:1986.
EXT9.M360.8	STAINLESS STEEL To BS EN 10088-2:2005, Grade 1.4401.
EXT9.M370.8	STAINLESS STEEL TUBES To BS 6362:1990 Grade 316 S 31, and a type suitable for threading in accordance with BS 21:1985.
EXT9.M380.8	ALUMINIUM 1. Grade: H30TF; 2. Anodized to grade AA25 in accordance with BS 1615:1987.
EXT9.M390.8	WROUGHT ALUMINIUM AND ALUMINIUM ALLOYS SUITABLE FOR GENERAL ENGINEERING PURPOSES 1. Plate, sheet and strip: to BS 1470:1987; 2. Drawn tube: to BS 1471:1972; 3. Bars, extruded round tubes and sections: to BS 1474:1987.

FIXINGS

EXT9.M410.8	TYPE 1. Use only galvanized bolts, nuts, screws and rivets with galvanized pedestrian guard railing; 2. Insulate aluminium fixings from ferrous materials with an Approved type non-conductive insulator at least 2 mm thick.
EXT9.M420.8	ISO METRIC BLACK HEXAGON BOLTS, SCREWS AND NUTS To BS 4190:1967.
EXT9.M430.8	ISO METRIC BLACK CUP AND COUNTERSUNK HEAD BOLTS AND SCREWS WITH HEXAGONAL NUTS To BS 4933:1973.

EXT9.M440.8 METAL WASHERS

To BS 4320:1968.

EXT9.M450.8 RIVETS

To BS 4620:1970 (1988).

EXT9.M460.8 RIVET, BOLT AND SCREW STOCK

Wrought aluminium and aluminium alloys to BS 1473:1972.

EXT9.M470.8 BOLT LENGTH

The thread position of bolt to project through the nut by a minimum of one thread and a maximum of four threads.

EXT9.M480.8 RAG, INDENTED, EXPANSION AND RESIN BONDED BOLTS

An Approved proprietary type capable of withstanding the design loading.

INFILL PANELS FOR GUARD RAILINGS**EXT9.M510.8 MESH INFILL PANELS**

To BS 4483:1985 and free from surface defects, surface irregularities and mesh misalignment.

WORKMANSHIP

ERECTING FENCING

EXT9.W010.8**LOCATION**

Erect fencing to lines and levels as shown on the Drawings.

EXT9.W020.8**ERECTION**

Comply with BS 1722:Part 1:1986:Section 3 in respect of:

1. Level of top of fence (sub-section 3.1);
2. Fixing posts and struts (sub-section 3.2);
3. Fixing fencing infill (sub-section 3.3);
4. Fixing gates within fencing (sub-section 3.4);
5. Renovation of damaged coatings (sub-section 3.5).

EXT9.W030.8**FIXING**

1. Fix selvage wires at top, bottom and mid points of fencing and strain tight to each straining post by means of eye bolts or other suitable straining device;
2. Strain fence between straining posts and secure to straining and intermediate posts using galvanized mild steel flats fixed with galvanized mild steel bolts, nuts and washers.

FABRICATION, PROTECTION AND INSTALLATION OF PEDESTRIAN GUARD RAILING

EXT9.W110.8**STORAGE AND PROTECTION**

1. Store and protect guard railing off the ground on level supports in a manner that will not result in damage, deformation or contamination;
2. Do not use any damaged guard railing in the permanent works unless permitted by CM.

EXT9.W120.8**WELDING**

1. Unless otherwise permitted by the CM, do not make welded joints after galvanizing. Where permitted, ensure welded areas are free from scale and slag and treated with an alternative zinc-coating system;
2. Type of weld: fillet;
3. Ensure welded surfaces are clean and flush, prior to application of the protective coating.

EXT9.W130.8**HOT DIP GALVANIZING**

Hot dip galvanize all steel components forming pedestrian guard railing to BS EN ISO 1461:2009 with minimum mean coating thickness of 45 microns to 85 microns depending on thickness of article as stipulated in Table 3 of BS EN ISO 1461:2009, unless otherwise specified. Galvanize components after welding, drilling and cutting operations are complete. The coating thickness to comply with the following Table:

Article Thickness	Minimum Mean Coating Thickness
> 6 mm	85 µm
> 3 mm to ≤ 6 mm	70 µm
≥ 1.5 mm to ≤ 3 mm	55 µm
< 1.5 mm	45 µm

EXT9.W140.8**INSTALLATION**

1. Use guard railing curved in the workshop for radii of less than 45 m. Do not use straight lengths in this application;
2. Fix guard railing to concrete using rag, indented, expansion or resin bonded bolts. Fix bolts into pockets and fill with cement mortar or resin grout;
3. Bolt fix guard railing to metalwork.

ACCURACY AND TOLERANCES**EXT9.W210.8****GENERAL**

Refer to Appendix H "Schedule of Tolerances" to this Specification.

EXT10 PLAY/FITNESS EQUIPMENT AND PLAY SURFACES

MATERIALS

PLAY/FITNESS EQUIPMENT

EXT10.M010.8

PLAY / FITNESS EQUIPMENT

1. Play / fitness equipment in the Specification refers to a proprietary play and / or fitness equipment item, which shall be supplied and installed by an Approved sub-contractor selected by the Contractor from the Housing Authority Play / fitness Equipment Agents Reference List as approved by the HA Play Equipment Review Board (abbreviated as “the List” hereunder), this Approved sub-contractor is hereinafter referred to as the “agent”. The List, listing requirements and guiding principles for reviewing the listing of agents are given in Appendix
2. Play equipment item as mentioned in sub-clause (1) of this clause also refers to a fixed integral physical structure installed in a designated play area that is accessible to users for participation in various play activities such as balancing, climbing, crawling, creeping, spinning, rocking, rotating, tilting, sliding, springing, swinging, etc. thereof. Individual component of a play equipment item refers to any portion of the play equipment that provides a specific play activity;
3.
 - a. A multi-play equipment item is a play equipment item that shall be able to perform the specified ‘core play activities’ and shall comply with the requirements on the number(s) of ‘non-core play activities’ which is / are to be proposed by the Contractor as specified in **EXT10.M015** (8)(a)(i);
 - b. An individual play equipment item is a play equipment item that shall be able to perform the play activity as specified in **EXT10.M015** (8)(a)(ii).
4. Fitness equipment item as mentioned in sub-clause (1) of this clause also refers to a fixed integral physical structure installed in a designated fitness area that is accessible to users for participation in various exercise activities complying with the requirements of ‘core exercise activities and ‘non-core exercise activities’ as specified in **EXT10.M015** (8)(b). Individual component of a fitness equipment item refers to any portion of the fitness equipment that provides a specific exercise activity;
5. Type and play activity of a play equipment item for respective target user age groups (aged 2-5 and / or 5-12, or adults or elderly), safety margin / use zone and critical fall height (or the free height of fall) in the designed play / fitness area shall be designed in accordance with international standards of safety, namely BS EN 1176:2008 and / or ASTM F1487-11, the latest edition of the standards referred to shall apply;
6. A Play Consultant (PCon) is a company which:
 - a. Has more than three years of relevant experience in playground safety inspection;
 - b. Has at least one certified inspector who possesses the qualification of Certified Playground Safety Inspector (CPSI) – National Recreation and Park Association (NRPA), US;
 - c. Has at least one certified inspector who possesses the qualification of Certified Annual Outdoor Inspector – Register of Play Inspector International Ltd (RPII), UK.
7. Nomination and engagement of PCon:
 - a. Nominate a candidate for the CM’s approval to be the PCon and submit the candidate’s declaration of no conflict of interest in carrying out compliance check, safety audit or other duties specified in the Contract;

-
- b. Upon the CM's approval, the Contractor shall enter into a written contract for service with the PCon and the contract for service shall be made available for the CM's inspection upon request by the CM;
 - c. In the event that the Contractor fails to comply with any of the requirements in sub-clauses 7(a) and 7(b) above, the Employer shall be entitled to engage a PCon forthwith and deduct all costs, charges and expenses arising from or in connection with the engagement of a PCon in accordance with the Contract and / or recover such costs, charges and expenses as a debt from the Contractor.
8. Nomination and engagement of replacement PCon:
- a. In the event that the PCon employed by the Contractor is unable or refuses to carry out such duties as specified in the Contract or is not performing satisfactorily in the opinion of the CM, the CM may withdraw his approval for engagement of the PCon at any time;
 - b. Within seven (7) days of the CM's notice of withdrawal, nominate a candidate for the CM's approval to be the replacement PCon and submit the candidate's declaration of no conflict of interest in carrying out compliance check, safety audit or other duties specified in the Contract;
 - c. Upon the CM's approval, the Contractor shall enter into a written contract for service with the replacement PCon and the contract for service shall be made available for the CM's inspection upon request by the CM;
 - d. In the event that a replacement PCon engaged as per sub-clauses 8(b) and 8(c) above is unable or refuses to carry out such duties as specified in the Contract or is not performing satisfactorily in the opinion of the CM, the CM may withdraw his approval for the replacement PCon at any time;
 - e. Within seven (7) days of the CM's notice of withdrawal of approval for the replacement PCon, nominate a candidate to be engaged as the further replacement PCon as per sub-clauses 8(b) and 8(c) above;
 - f. In the event that the Contractor fails to comply with any of the requirements in sub-clauses 8(a) to 8(e) above, the Employer shall be entitled to engage a replacement PCon forthwith and deduct all costs, charges and expenses arising from or in connection with the engagement of a replacement PCon in accordance with the Contract and / or recover such costs, charges and expenses as a debt from the Contractor.

EXT10.M015.8**DESIGN SUBMISSION**

1. Before expiry of the months from the notified date for commencement of the Works, submit to the CM design proposal provided by the proposed agent(s) selected from the List stated in sub-clause (1) of **EXT10.M010** for the designated play / fitness area(s) for the CM's Approval. The Contractor shall obtain the current List from the CM for preparation of design proposal. The design proposal shall:
 - a. Include suitable equipment items, fixing details and other builder's works requirements in compliance with the Drawings, the requirements stated in **EXT10.M010** and this clause;
 - b. Provide information on the international safety standard complied with, the place of origin, place of manufacture, name of manufacturer, brand name, model number and manufacturer's installation manual;
 - c. Include play equipment item that complies with international standards of safety. The international standards of safety are namely BS EN 1176:2008 and / or ASTM F1487-11 for all aspects including safety margin / use zone, critical fall height (or the free height of fall), separation of age group etc., the latest edition of the standards referred to shall apply. Document and certifications issued by the testing laboratory with international accreditation to prove the compliance of the equipment item, not individual component of the equipment item, with recognised international standards of safety shall be submitted;

-
- d. Include at least one or one third of the total required numbers of equipment items for the respective play / fitness area, whichever is more, which shall be accessible to the disabled or in compliance with the latest Americans with Disabilities Act Accessibility Guidelines for Building and Facilities (ADAAG) or equivalent. Physical barriers shall be provided as far as practicable to separate equipment for different age groups in those areas;
 - e. Include the audit report of compliance check / safety audit of the design proposal to demonstrate compliance with the international standards of safety in sub-clause (1)(c) above by the appointment of either:
 - i. a Play Consultant (PCon) as specified in **EXT10.M010** (6); or
 - ii. a laboratory accredited under the Hong Kong Laboratory Accreditation Scheme (HOKLAS) or by an accreditation body with mutual recognition arrangements with HOKLAS who is qualified to carry out safety compliance check.

who shall carry out the compliance check / safety audit on the design proposal in accordance with BS EN 1176:2008 and / or ASTM F1487-11, the latest edition of the standards referred to shall apply, and compile the audit report.

The compliance check / safety audit shall take into account all elements within the designated play / fitness area including signage, furniture, lamp pole, bollard, boundary fence and planter wall etc. as shown on the Drawings;
 - f. Include drawings showing bilingual signage in Chinese and English for each designated play / fitness area to indicate the designated user groups and the users' guides on the proper use of the equipment items.
2. The Contractor shall be responsible for the identification of proposed agent(s).
*There shall be at least two proposed agents included in the proposal and each shall be involved in play equipment items amounting to at least one third of the total sum of play equipment items for the whole Site;
 3. There shall be no more than 3 proposed agents supplying and installing the equipment items for the whole Site;
 4. Submit revised design proposal, drawings and relevant information upon comment or where considered necessary by the CM;
 5. In the situation if the proposed agent(s) providing the equipment items of the design proposal is suspended or removed from the List before the design proposal is approved, the Contractor shall re-submit a new design proposal;
 6. Upon notification in writing by the CM of the Approved design proposal, the Contractor shall engage with the agent(s) in providing the equipment items of the Approved design proposal as the Approved sub-contractor(s) for the supply and installation of the Approved equipment items;
 7. Within 28 days from the date of the CM's notification of the Approval of the design proposal, submit detailed information comprising shop drawings and fixing details of the equipment items for the CM's approval;
 8. The equipment items included in the design proposal in sub-clauses (1), (4) and (5) of this clause shall be suitable equipment items with detailed functional component type and play / exercise activity meeting, but not be limited to, the following requirements:
 - a. CPA [] as shown on Drawing no., in accordance with the international standards of safety * BS EN 1176:2008 / *ASTM F1487-11, the latest edition of the standards referred to shall apply,, consisting of number(s) of multi-play equipment item(s), and number(s) of individual play equipment item(s) with critical fall height of mm, detailed as follows:

- i. *Multi-play equipment item [] for children with an age range of *2-5 / *5-12 years capable of performing a minimum of number(s) of core play activities which are(Insert project specific requirements)..... , and a minimum of number(s) of non-core play activities which play activities are to be proposed by the Contractor in the design proposal submission;
- ii. *Individual play equipment item [] for children with an age range of *2-5 / *5-12 years capable of performing at least one play activity per play equipment item;

CPA []	Play Equipment Item []	
Core Play Activity	Component Type	Descriptions
Sliding (type) Slide	Made of (material); (Description of component(s): shape, features and relations with other components)
Climbing (type) Climber	Made of (material); (Description of component(s): shape, features and relations with other components)
Climbing (type) Staircase / ladder	Made of (material); (Description of component(s): shape, features and relations with other components)
Standing (type) Deck	Made of (material); (Description of component(s): shape, features and relations with other components)
Cover (type) Roof	Made of (material); (Description of component(s): shape, features and relations with other components)
Walking (type) Bridge	Made of (material); (Description of component(s): shape, features and relations with other components)
Separation / Sensory (touch, hear, sight) (type) Panel	Panel made of (material); (Description of component(s): shape, features and relations with other

		components)
Rocking (type) Spring Rider	(Description of component(s): shape, features and relations with other components)
Spinning (type) Spinner	Made of (material); (Description of component(s): shape, features and relations with other components)
Swaying (type) Swaying component	Made of (material); (Description of component(s): shape, features and relations with other components)

- b. Fitness Area [] as shown on Drawing no(s). consisting of:-
- *Elderly fitness equipment item(s) capable of performing a minimum of number(s) of core exercise activities which are(Insert project specific requirements)..... , and a minimum of number(s) of non-core exercise activities which exercise activities are to be proposed by the Contractor in the design proposal submission *with critical fall height of mm;
 - *Fitness equipment item(s) capable of performing a minimum of number(s) of core exercise activities which are(Insert project specific requirements)..... , and a minimum of number(s) of non-core exercise activities which exercise activities are to be proposed by the Contractor in the design proposal submission *with critical fall height of mm;

The Contractor may in respect of any fitness area propose a quantity of elderly fitness equipment items that does not correspond to the number of core exercise activities as long as the required number of core exercise activities and non-core exercise activities are fulfilled. For fitness equipment item(s), arrangement similar to that for elderly fitness equipment item(s) is also acceptable.

Fitness Area [] – Fitness Equipment		
Core Exercise Activity	Component Type	Descriptions
Lower Body exercises (Type) e.g. bike, stepper, pedalling etc.	Made of (material); (Description of component(s): shape, features and relations with other components)
Upper Body exercises	...(Type) e.g. Stretcher (push / pull), grab bar, etc.	Made of (material); (Description of component(s): shape, features and relations with

		other components)
--	--	----------------------------------

9. Each play / fitness component is counted for one core play / exercise activity only. Play / fitness component once counted as core play / exercise activity shall not be recounted as non-core play / exercise activity.

EXT10.M020.8**WARRANTY**

The Contractor and the agent for the design, supply and installation of the play / fitness equipment shall separately warrant the Employer in respect of the play / fitness equipment as detailed in Clause SCC7.6 of the Special Conditions of Contract. In particular, the structural integrity of the play / fitness equipment, and the timber parts and polyethylene components thereof shall be subject to the specified periods of warranty.

PLAY SURFACES - BALL COURT SURFACES**EXT10.M110.8****BALL COURT SURFACES**

As scheduled on Drawings.

EXT10.M120.8**INTERNAL BALL COURT SURFACING**

An Approved proprietary product.

EXT10.M130.8**EXTERNAL BALL COURT SURFACING**

An Approved proprietary product.

EXT10.M140.8**MARKING PAINT FOR BALL COURT SURFACES**

An Approved proprietary product.

ADHESIVE AND FIXINGS FOR BALL COURT SURFACING**EXT10.M210.8****ADHESIVES**

1. As recommended by the ball court surfacing manufacturer;
2. Adhesives and adhesive primer shall be in compliance with the prescribed limits of VOC content as set out in the Air Pollution Control (Volatile Organic Compound) Regulation.

EXT10.M220.8**FIXINGS**

As recommended by the ball court surfacing manufacturer.

PLAY SURFACES - IMPACT ABSORBING SURFACING MATERIALS (IASM)**EXT10.M310.8****GENERAL REQUIREMENTS**

1. The extent of IASM is shown on the Drawing(s) and shall include safety margin / use zone, underneath and surrounding of the play / fitness equipment as specified in sub-clause (8) of **EXT10.M015**;

2. In addition to compliance with other requirements stipulated in the Specification for IASM, IASM shall comply with the manufacturers' recommendations for safety, design and installation requirements of the play / fitness equipment under which the surfacing material is to be installed;
3. The IASM shall be in the form of pre-fabricated modular units. Wet-pour IASM applied in-situ shall not be accepted.

EXT10.M320.8**QUALITY REQUIREMENTS**

1. The quality requirements of IASM are as follows:
 - a. A proprietary pre-fabricated synthetic rubber or Ethylene-Propylene-Diene-Monomer (EPDM) product, details as specified by the manufacturer, to comply in all aspects with BS 7188:1998+A2:2009 and / or BS EN 1177:2008, the latest edition of the standards referred to shall apply, and be tested by a recognized laboratory. The laboratory shall be accredited under the Hong Kong Laboratory Accreditation Scheme (HOKLAS) or by an accreditation body with mutual recognition arrangements with HOKLAS for performing the tests on IASM. The laboratory shall issue the test results on all test items in one submission of HOKLAS endorsed test certificates or equivalent. The full scope of accreditation shall be submitted for the CM's Approval and acceptance;
 - b. The "critical fall height" (as defined in BS EN 1177:2008) of the IASM on which the play / fitness equipment is placed shall be greater than the "free height of fall" (as defined in BS EN 1177:2008) or the "fall height" (as defined in ASTM F1292-13 & ASTM F 1487-11) of the play / fitness equipment. The latest edition of the standards referred to shall apply;
 - c. The IASM material used shall comply with the toxicity requirement of BS EN 71-3, or DIN18035 Part 6 & 7. Before installation, the Contractor shall submit to the CM the certificate from the manufacturer and the associated test report(s) certifying compliance of the IASM materials with the aforesaid international standards;
 - d. The IASM material used shall comply with weathering test requirement of ASTM D4214, D1729, D2616, or UV resistance of DIN EN1297 and DIN EN ISO3386-2.
2. When instructed by the CM, collect samples from the Site prior to the installation of IASM for laboratory tests in accordance as per **EXT10.T005**.

EXT10.M330.8**DESIGN SUBMISSION**

1. Before expiry of the months from the notified date for commencement of the Works, submit to the CM design proposal(s) from supplier(s) for the IASM to be laid in the designated play / fitness area(s) for each of the area(s) as shown on Drawing no(s). for the CM's Approval. The supplier(s) to be proposed by the Contractor for such purpose shall supply and install IASM. The design proposal shall:
 - a. Include the IASM catering for the critical fall height requirements in individual designated play / fitness area stated in **EXT10.M015** (8) (according to Drawing no(s) or the recommended critical fall height of play equipment submitted in the design proposal whichever the higher), fixing details and other builder's works requirements in compliance with the Drawings, the requirements stated in **EXT10.M310**, **EXT10.M320** and this clause;
 - b. Provide information including but not limited to the country of origin, place of manufacture, and date of manufacture, manufacturer's instruction on installation, maintenance and inspection procedures of the IASM;
 - c. Indicate design patterns and maximum critical fall height of IASM in each designated play / fitness areas as shown on Drawing nos.

The Contractor shall be responsible for the identification of supplier(s), and there shall be no more than 3 suppliers supplying and installing the IASM for the whole Site;

2. Submit revised proposal, drawings and relevant information upon comment or where considered necessary by the CM;
3. Upon notification in writing by the CM of the Approved design proposal, engage the supplier providing the IASM of the Approved design proposal as the Approved sub-contractor for the supply and installation of the Approved IASM;
4. The supply and installation of the IASM shall comply with international standards of safety. Those international standards of safety are namely BS 7188:1998+A2:2009, BS EN 1177:2008 and / or ASTM F1292-13, ASTM F1487-11 for all aspects including critical fall height etc., the latest edition of the standards referred to shall apply. Document and certifications issued by the accredited international testing laboratory to prove that the IASM is in compliance with recognised international standards shall be submitted. Submit samples of IASM with test certificates to the CM for approval prior to ordering / purchasing.

EXT10.M340.8**DELIVERY**

1. The IASM delivered to the Site shall be labelled in batch with country of origin, place of manufacture, date of manufacture etc. by the manufacturer and in good condition with intact packaging by the manufacturer. Any batch / lot / piece of the IASM that was manufactured earlier than a period of 9 months before delivery to the Site shall not be accepted or installed;
2. Submit written confirmation from the manufacturer of the place of origin and relevant documentary evidence such as Delivery Note with batch numbers and Laboratory Test Certificate.

EXT10.M350.8**WARRANTY**

The Contractor and Approved sub-contractor for the design, supply and installation of the IASM shall separately warrant the Employer in respect of the IASM as detailed in Clause SCC7.6 of the Special Conditions of Contract.

EXT10.M360.8**APPLICATION OF REQUIREMENTS OF OTHER WORKSECTIONS**

Where applicable, comply with the relevant provisions of the following Worksections unless otherwise specified in this Worksection:

1. Earthworks: Worksection EAR1;
2. Sub-bases and bituminous materials: Worksection EXT1;
3. Concrete pavings (including formwork, reinforcement, concreting, jointing and finishing): Worksection EXT2.

WORKMANSHIP

GENERAL

EXT10.W010.8

HANDLING AND STORAGE

Handle and store equipment and surfacing materials carefully as per the manufacturer's recommendations and in a manner that:

1. Prevents damage to pre-finished surfaces;
2. Retains protective coverings in position;
3. Prevents contact with harmful elements.

EXT10.W020.8

BUILDER'S WORK IN CONNECTION

.....

EXT10.W030.8

FIXING, ASSEMBLING AND LAYING

Carry out any fixing, assembling or laying in accordance with the manufacturer's instructions.

INSTALLATION OF PLAY/FITNESS EQUIPMENT

EXT10.W110.8

GENERAL

1. Install play / fitness equipment in accordance with manufacturer's instructions, which should comply with BS EN 1176: 2008 and / or ASTM F1487-11, the latest edition of the standards referred to shall apply;
2. All materials and workmanship shall be of the respective character, quality or kind required by this Contract and shall be subject to such examinations, measurements or tests as required by this Contract or as ordered by CM. The measurements and tests are to be carried out by the Contractor;
3. The Contractor shall submit to the CM upon the arrival of the play / fitness equipment and signage on Site, the original or certified true copy of manufacturers' certificates and invoices for verification of the origin of the play / fitness equipment and signage delivered to the Site against the Approved design proposal as stated in **EXT10.M015**.

EXT10.W120.8

INSTALLATION

1. Ensure play / fitness equipment is placed and fixed in the position and in accordance with safety margin / use zone requirement as shown on the Drawings or to manufacturer's recommendation;
2. Before installing any play / fitness equipment, check and ensure that all permanent draw pits, catch pits, manhole covers and surface channels shall be located outside the safety margin / use zone of the designated play / fitness area as shown on the Drawings and / or Approved design proposal as stated in **EXT10.M015**. If any permanent draw pits, catch pits, manhole covers or surface channels are found within the safety margin / use zone of the play area, revise the Approved design proposal as necessary to avoid them and re-submit to the CM for approval. Allow sufficient time for any associated checking, re-submission and CM's approval;
3. Upon completion of the installation of play / fitness equipment, the agent(s) shall self-certify that all installed play / fitness equipment on the Site are in compliance with the manufacturer's instruction of installation as stated in **EXT10.M010** and the Approved design proposal as stated in **EXT10.M015**;

-
4. Upon completion of the installation of play / fitness equipment, the Contractor shall also include the audit report of compliance check / safety audit for all installed play / fitness equipment within each play area which has to be in compliance with the international standards of safety in **EXT10.M015**(1)(c) by the appointment of either:
 - a. A Play Consultant (PCon) as specified in **EXT10.M010** (6);
 - b. A laboratory accredited under the Hong Kong Laboratory Accreditation Scheme (HOKLAS) or by an accreditation body with mutual recognition arrangements with HOKLAS who is qualified to carry out safety compliance check.

who shall carry out the compliance check / safety audit on the completed installation in accordance with BS 7188:1998+A2:2009, BS EN 1177:2008 and / or ASTM F1292-13, ASTM F1487-11, the latest edition of the standards referred to shall apply.

EXT10.W130.8 EXISTING PLAY / FITNESS EQUIPMENT

Dismantle and set aside existing play / fitness equipment(s) that is / are to be retained in a secure enclosure. Re-assemble once the playground surface has been completed.

LAYING OF BALL COURT SURFACES

EXT10.W210.8 GENERAL

Lay the ball court surfaces in accordance with manufacturer's instructions.

EXT10.W220.8 INSPECTION PRIOR TO LAYING SURFACING MATERIALS

1. Inspect existing surface to ascertain suitability to receive the surfacing materials. Ensure the existing surface is clean, free from defects, projections and deleterious material that would affect the laying of the surfacing materials;
2. Carry out all works necessary to ensure correct installation of the surfacing materials;
3. Where applicable, obtain manufacturer's/specialist sub-contractor's agreement to suitability of the bed prior to laying the surfacing materials.

EXT10.W230.8 SURFACES PREPARATION

1. Sweep, clean and prepare base removing all dirt, grease and loose or other extraneous matter;
2. Cut out and fill, using material compatible with the base, all cracks, hollows or other imperfections;
3. Ensure that the base is dry prior to surfacing materials being laid.

EXT10.W240.8 DRAINAGE

Lay base to falls and levels as shown on the Drawings.

EXT10.W250.8 LAYING

1. Recess all fixing bolts and eyelets below the surfacing materials;
2. Ensure no gaps are left between the surfacing materials and the adjoining hard surface;
3. Cut and fit the surfacing materials to form a close and neat joint around edge and all upstands;
4. Ensure the finished surfacing is even and free from irregularities or projections.

EXT10.W260.8 GROUND CLEARANCE

Maintain sufficient ground clearance under all equipment. Adjust height of equipment or level of base if necessary.

EXT10.W270.8 ADHESIVES

Ensure all adhesive and jointing materials used are compatible with the ball court surface and the base material.

EXT10.W280.8 LINE MARKING FOR BALL COURT SURFACES

Employ a specialist recommended by the marking paint supplier to apply line marking in accordance with the paint manufacturer's instructions.

INSTALLATION OF IMPACT ABSORBING SURFACING MATERIALS (IASM)

EXT10.W310.8 GENERAL INSTALLATION REQUIREMENTS

Install the IASM in strict compliance with manufacturer's instructions and specification.

EXT10.W320.8 SAMPLES AND DATA

1. Submit samples of the IASM as stated in **EXT10.M330**, adhesives and fixings for CM's approval before installation;
2. Before the installation works, submit material testing results as stated in **EXT10.T005** and safety data for the adhesive in connection with the installation / laying of the IASM accompanied with the manufacturer's requirements and recommendation on safety precautionary measures.

EXT10.W330.8 SURFACING MATERIAL AND ITS FOUNDATION

1. Lay the IASM in accordance with manufacturer's instructions and ensure all adhesive and jointing materials used are compatible with the IASM and the base material;
2. Prepare the base and foundation properly to receive the IASM in accordance with the manufacturer's requirements;
3. The surfacing material shall fit the designated play / fitness area as shown on the Drawings with no gap and level difference between adjoining IASM units and between the peripheral IASM units and its surrounding surface, and shall also fit closely around all play / fitness equipment (and its posts / fittings).

EXT10.W340.8 DRAINAGE

*Install surface drainage under the IASM as specified in Project Specification and in accordance with the Drawings.

*Lay base to falls and levels as shown on the Drawings.

TESTING

ON-SITE VERIFICATION TEST - IMPACT ABSORBING SURFACING MATERIALS (IASM)

EXT10.T005.A

VERIFICATION TESTING

1. Test Arrangements:
 - a. Carry out verification test in an Approved Laboratory when:
 - i. Upon delivery of IASM material to site under a Delivery Note;
 - ii. During the course of construction when directed by the CM.
 - b. Comply with the followings pertaining to tests:
 - i. Provide attendance on the Site;
 - ii. Provide, deliver and collect samples etc. as directed by the CM or as specified.
2. Testing Samples:
 - a. Samples shall be selected by the CM and witnessed by representative of the Contractor;
 - b. Collect one set of samples (minimum four whole piece samples for each thickness);
 - c. Bear all cost for any replacement samples.
3. Testing Methods:
 - a. By a laboratory complying with **PRE.B9.570** carried out in accordance with BS 7188:1998+A2:2009, BS EN 1177:2008 and / or ASTM F1292-13, ASTM F1487-11, and BS EN 71-3, or DIN18035 Part 6 & 7 in relation to the toxicity requirement, the latest edition of the standards referred to shall apply, but not limited to, the following quality and performance requirements of the IASM:
 - i. Critical fall height;
 - ii. Resistance to indentation;
 - iii. Ease of ignition;
 - iv. Slip resistance;
 - v. Toxicity requirement.
 - b. The laboratory shall issue to the CM with copy to Contractor the test results on HOKLAS or by an accreditation body with mutual recognition arrangements with 'HOKLAS Approved Signatory' test reports, stating the final testing result on all test items with supporting data for each tested item, directly to the CM.
4. Non-compliance:
 - a. In the event that any one of the tests fails to meet the test requirements as stated in sub-clause 3(a):
 - i. Remove the representative batch off Site, a representative batch means the materials delivered to Site under the same Delivery Note; or
 - ii. Apply to the CM for re-test for the representative batch in accordance with sub-clause (1) on three separate samples, each sample with a minimum of four whole pieces and make up of a total of 12 pieces selected by the CM in a laboratory that complies with the requirements as stated in sub-clause (1). In case of any one sample fails the re-test, remove the representative batch off Site.

-
- b. When the representative batch of IASM material is removed off Site, re-deliver and re-test as stated in sub-clause (1);
 - c. Bear all additional time and costs arising from or in connection with any re-tests.
 - 5. When instructed, further verification tests shall be carried out by the CM, a Direct Contractor or the Housing Department Material Testing Laboratory during the course of construction as directed by the CM.
 - a. Comply with the following pertaining to the verification tests:
 - i. Provide attendance on the Site;
 - ii. Provide, deliver and collect samples etc. as directed by the CM or as specified.
 - b. Test Samples as per sub-clause (2);
 - c. Test Methods as per sub-clause (3);
 - d. Non-compliance as per sub-clause (4).

EXT10.T010.8**IN-SITU DROP TEST**

- 1. Upon completion of installation of the IASM, carry out the in-situ drop test on critical fall height in accordance with BS EN 1177:2008 and / or ASTM F1292-13, ASTM 1487-11, the latest edition of the standards referred to shall apply, at random sampling of not more than 5% by area or four pieces of mats / tiles, whichever is larger by area, in each designated play / fitness area, to be agreed with the CM, for each thickness category of IASM installed, inclusive of all ingress / egress, landing zone of the play / fitness equipment and submit to CM the in-situ drop test / re-test results on HOKLAS endorsed test certificates with written certification;
- 2. Exact locations for carrying out the in-situ test shall be verified by the CM;
- 3. Non-compliance:
 - a. In the event that any in-situ drop test fails to meet the critical fall height requirements, remove and re-install the IASM that failed the test, and take three separate in-situ drop tests of the same designated play area of IASM supplied and installed by the same Approved sub-contractor in sub-clause (1) at three separate locations within the same designated play / fitness area for re-test;
 - b. Where any of the re-tests fails to meet the testing requirements as specified in sub-clause (1), all IASM of the same batch supplied and installed by the same Approved sub-contractor represented by the failed mats / tiles shall be removed;
 - c. When the representative batch of IASM material is removed off Site, re-install the IASM and re-test the rectified areas in accordance to sub-clauses (1) and (2);
 - d. Bear all additional time and costs arising from or in connection with any re-tests.
- 4. At a date to be agreed with the CM but not prior to the expiry of 18 months from the date of completion of the respective Section of Works as certified by CM, carry out the in-situ drop test on the critical fall height in accordance with the test version in sub-clauses (1) and (2) above. Re-conduct the in-situ drop test(s) on the IASM in accordance with sub-clause (3) should the in-situ drop test fail. Bear all associated costs and time incurred for the retesting required and replacement of sub-standard IASM;
- 5. Testing of critical fall height should refer to critical fall height of IASM specified and as shown on Drawings.

EXT11 EXISTING VEGETATION TREATMENT

MATERIALS

GENERAL

- | | |
|---------------------|--|
| EXT11.M010.8 | ANTI-DESICCANT SPRAY
Anti-desiccant spray to be approved proprietary water dispersed plastic spray type. |
| EXT11.M020.8 | HESSIAN BINDING
Hessian binding to be natural woven jute, natural brown colour, 150 to 200 mm wide in a continuous roll. |
| EXT11.M030.8 | JUTE STRING
Jute string to be braided jute fibres, total 3 mm diameter, natural brown colour. |

WORKMANSHIP

GENERAL

EXT11.W010.8**SCOPE OF EXISTING VEGETATION TREATMENT**

The extent of works required, conditions of site, tree felling, vegetation treatment, weed and creeper removal etc. and any individual plants requiring treatment and/or transplanting are detailed and shown on Drawings, or as Instructed by CM.

EXT11.W020.8**PRE-TENDER INSPECTION**

Prior to tendering inspect the site to confirm the extent of the works and that maintenance works specified can properly be carried out.

EXT11.W030.8**TOOLS AND EQUIPMENT**

Ensure tools and equipment used are sharp and appropriate for the works specified.

EXT11.W040.8**EROSION**

Carry out all operations taking precautions to prevent erosion and slippage of slopes.

PRESERVATION OF EXISTING TREES AND SHRUBS

EXT11.W052.8**PROTECTION OF EXISTING VEGETATIONS**

1. Protect all existing trees, palms, bamboos and other vegetations as shown on Drawings, unless specified or instructed to be pruned or felled by CM;
2. Protect the branch structure, crown and root zone of all existing trees, palms and bamboos to be retained and any overhanging vegetation, unless specified or Instructed to be pruned;
3. Erect necessary structural support constructed with GMS hollow sections or I-beams as directed by CM when working around existing trees to ensure their structural stability and proper growth throughout the construction period.

EXT11.W055.8**PROTECTION FOR PRESERVED TREES**

Exercise the greatest care to avoid any damage to the preserved trees by complying with the following:

1. Take all necessary precautions to ensure that:
 - a. No nails or other fixings shall be driven into the trees, including the exposed tree roots;
 - b. No fencing, services, or signs other than the identification labels or markings required under sub-clause (5) of **PRE.B8.1116** shall be attached to any part of the trees;
 - c. No trees shall be used as anchorages for ropes or chains used in guying or pulling or for equipment used for removing stumps, roots or other trees, or for any other purposes;
 - d. No soil, materials, equipment or machinery shall be stockpiled or stored within the tree protection zones;
 - e. No site offices, workshops, canteens, containers or similar structures shall be installed within the tree protection zones;
 - f. Petrol, oil, bitumen, creosote, cement and other materials likely to be injurious to the trees shall be kept away from the tree protection zones, and any accidental spills of these materials shall be cleaned up immediately;

-
- g. Excessive water shall be drained away from the tree protection zones to prevent damage to tree roots by asphyxiation;
 - h. The surface on slopes shall be shaped so that water will not drain to the tree trunks but bypass them;
 - i. No passage or parking of vehicles and no operation of equipment or machinery shall take place within the tree protection zones unless otherwise agreed by the CM;
 - j. No stripping of surface vegetation or top layer of soil, and no paving or earth filling shall be carried out within the tree protection zones unless otherwise agreed by the CM;
 - k. No fires shall be lit within the tree protection zones or in a position where the flames will likely extend to within 5 m of foliage, branches or trunks of the trees, taking into consideration the size of the fire and the wind direction;
 - l. No concrete mixing, gas tank filling, paintbrush and tool cleaning, or equipment maintenance shall be carried out within the tree protection zones;
 - m. Any necessary scarification or cultivation within the tree protection zones shall be carried out carefully by hand so as not to cause damage to the trees, in particular the bark and the roots;
 - n. Any equipment, in particular delivery vehicles, overhead cranes, excavation machines, drilling rigs and piling rigs, shall be carefully operated so as not to cause striking of the trunks, branches, foliage or root collars of the trees;
 - o. The trees to be felled that are adjacent to, or that lie within a continuous canopy of, the preserved trees, shall be carefully removed, and if necessary in sections but not using bulldozers in any circumstances, so as not to cause damage to the preserved trees such as scraping bark off trunks or breaking branches of trees;
 - p. Do not use herbicides that can leach through the soil, such as the products containing sodium chlorate, and any other herbicides that are injurious to the trees when it is necessary to use herbicides to kill any vegetation;
 - q. Make allowance for the slope of the ground so that damaging materials such as concrete washings, mortar or diesel oil cannot run towards the trees;
 - r. Do not use alkaline clays or limestones for filling or paving. Mix concrete on a thick plastic tarpaulin or outside the Site and rinse the mixing trucks out on the Site, so as not to cause changes, in particular increases, in soil pH;
 - s. Haul away all building debris and chemical wastes for proper disposal. In any circumstances, do not burn or bury them on the Site and do not dispose them by pouring them on the soil within the Site.
 2. Repair any damage to the trees in accordance with the requirements stipulated in **EXT11.W712**;
 3. Where the passage or parking of vehicles or the operation of equipment or machinery within the tree protection zones as referred to in sub-clause (1)(i) above is considered necessary and is agreed by the CM, carry out the following measures to reduce soil compaction:
 - a. Minimise the traffic of the vehicles, equipment or machinery;
 - b. Confine the passage or parking of vehicles or operation of equipment or machinery to the areas laid with temporary protective mulching and also with double, overlapping, thick metal sheet coverings, or other materials of equivalent strength as agreed by the CM, placed on top.
 4. Where it is necessary to clear the existing undergrowth within the tree protection zones to allow access and visibility for, and operation of any construction work, comply with the following:

- a. Prune shrubs and grass or cut other herbaceous plants to a height of not less than 50 mm above the ground level that they shall not be pulled out by equipment in any circumstances;
 - b. Obtain CM's agreement prior to commencing the vegetation clearance.
5. Protect the preserved trees, where necessary, from increased exposure to sun and wind due to removal of adjacent trees;
6. Align all routes of the overhead services within the Site and all access routes to the Site or within the Site away from the preserved trees as far as possible and seek the CM's approval to the alignment;
7. Report to the CM of any preserved tree having structural defects or unhealthy or decaying symptoms which may pose danger to the public if the tree falls.

EXT11.W060.A**PHOTOGRAPHIC RECORD OF EXISTING TREES**

1. Provide a full set of photographs of each individually numbered tree as shown on Drawings or as Instructed at the commencement of the Works for the CM's agreement on the existing conditions of the trees. Comply with the following requirements for the photographs:
 - a. All photographs shall be date-stamped to indicate the dates that the photographs are taken and shall be well-annotated; and
 - b. The photograph of each tree shall show clearly the whole tree as far as possible, the identification number of the tree, and the status of the tree as identified by the labelling or marking system on the Site.
2. Update the photographic record of the non-OVT taken in accordance with sub-clause (5)(e) of **PRE.B8.1116** and submit a report on the updated photographic record to the CM at every three months intervals. Comply with the following requirements for the photographic record:
 - a. Each of the reports shall comprise all preserved non-OVT;
 - b. Each of the reports shall be in the form of an A4-sized, bound document which shall bear a report cover indicating the Contract number, Contract title, and date of the report;
 - c. The format of the reports shall be agreed by the CM prior to the submission of the first report;
 - d. All photographs shall be date-stamped to indicate the dates that the photographs are taken and shall be well-annotated;
 - e. The photograph of each tree shall show clearly the whole tree as far as possible, the identification number of the tree, and the status of the tree as identified by the labelling or marking system on the Site as required in sub-clause (5) of **PRE.B8.1116**;
 - f. Each of the reports shall include details of any damage caused to the trees and any signs of health deterioration of the trees in the reporting period, accompanied with photographic record of the damage and the tree deterioration.

EXT11.W062.8**RECORD OF OLD AND VALUABLE TREE**

1. Engage a Qualified Arborist (QAr) to prepare and submit the monitoring reports on the OVT in accordance with the following requirements:
 - a. The timetable for submission of reports shall be as follows:

Period	Frequency of submission of monitoring reports	Time frames for submission of monitoring reports
From the date of commencement of the employment of the QAr to	At monthly intervals	Within the first week of each

the day immediately before the day of commencement of the Aftercare to the Old and Valuable Tree.		month
The period for the Aftercare to the Old and Valuable Tree stated in the Contract	At bimonthly (every two months) intervals	Within the first week of every two months

- b. The reports shall be in the form of an A4-sized, bound document which shall bear a report cover indicating the Contract number, Contract title, and date of the report and shall be signed by the QAr;
- c. The format of the reports shall be agreed by the CM prior to the submission of the first report.
2. Submit method statements for the work, the site activities, and the precautionary or mitigation measures in respect of the OVT, as described in the following items:
 - a. Work planned to be carried out to each of the OVT in the next reporting period, including but not limited to the recommended arboricultural work as part of tree maintenance, repair to damage or health deterioration, or precautionary or mitigation measures against damage by site activities;
 - b. Other site activities planned to be carried out within the tree protection zone of each of the OVT in the next reporting period, including but not limited to the tree preservation and protection work stipulated in PRE.B8 and EXT11;
 - c. Potential damage to the OVT by the site activities planned to be carried in the next reporting period and proposed precautionary or mitigation measures;
 - d. Any other details relevant and specific to the purpose of the reports.
3. Obtain the CM's approval prior to the commencement of such works / activities, and ensure that the QAr shall carry out the following:
 - a. Provide arboricultural advice in the preparation of the method statements as per sub-clause (2) above and the preparation of any reports on repair of damage of the OVT;
 - b. Supervise arboricultural work to the OVT;
 - c. Provide on-site advice in relation to site control within the tree protection zones of the OVT and at their adjacent areas.

EXT11.W075.8 WATERING EXISTING VEGETATION

Water existing vegetation with non-toxic water to keep it in a healthy condition; during the dry season, water at least three time per week at the rate of 10 litres per sq. m.

EXT11.W085.8 PRUNING OF EXISTING TREES

1. Do not carry out pruning to the preserved trees without the prior approval of the CM unless the pruning work is required under the Contract or is directed by the CM. Notify the CM of any preserved trees whose branches interfere with the Works and thus require pruning. Carry out the approved pruning work during the site clearance stage unless otherwise instructed or agreed by the CM;
2. Comply with the following when carrying out the pruning work:
 - a. Provide all necessary tools and equipment, and physical support, and take all necessary safety precautions to protect the people engaged in the pruning work as well as the people and property in the vicinity;
 - b. For all pruning work to the OVT, the extent of pruning shall be agreed between the QAr and the CM on the Site prior to the commencement of the pruning work and the pruning work shall only be carried out under the supervision of the QAr;

-
- c. Carry out all pruning work in accordance with good horticultural practice and the recommendations of BS 3998;
 - d. Do the pruning and removal of branches by using sharp, clean implements to give a single flat, sloping face;
 - e. Trim ragged, rough edges of bark or wood cleanly from around wounds with a sharp knife to the minimum extent that is necessary so as to hasten wound closure, and cut twigs less than 15 mm diameter with sharp secateurs;
 - f. Carry out pruning with the cut just above and sloping away from an outward-facing healthy bud, and carry out the removal of branch by having the final cut of the last branch segment made just outside the branch collar when it is present or at an angle being the mirror image of the branch bark ridge when there is no branch collar, so that no part of the stem is damaged or torn, and no snags or stumps are left;
 - g. Remove large branches in stages beginning with the removal of the main weight of the branch from perimeter of crown in towards the trunk and with the final cut of the last branch segment made in a way as described in sub-clause (2)(f) above, without leaving a stub and damaging the bark;
 - h. Make all cuts to avoid splintering or tearing of bark that would catch water and encourage rot, and cut back cracks, cavities or rotten wood with a clean, sharp implement to remove the dead, damaged and decayed tissue without damaging the living tissue;
 - i. Do not carry out topping, which is cutting off all of the top branches to the same height, in any circumstances;
 - j. Unless otherwise instructed by the CM, leave any cuts or wounds uncovered instead of painting them with wound dressing or coating so as to avoid water retention and disease development;
 - k. Remove any material pruned from the trees away from the Site as soon as possible;
 - l. Reinstall any adjacent areas affected by the pruning work.

EXT11.W090.8**CONTROL OF PEST AND DISEASE FOR EXISTING TREES**

1. Take all necessary precautionary measures to protect the preserved trees from pest and disease attack, and all necessary control measures to eradicate pest and disease from the infected trees in the execution of the Works;
2. Before commencing the application of the pest and disease control measures, submit the method statements for the control measures to the CM for approval:
 - a. The method statements for the pest and disease control measures shall cover, amongst other aspects as required by the CM, the pesticide or fungicide to be used and any other necessary associated arboricultural work to the infected areas.
3. Commence the application of the control measures only after obtaining the CM's approval to the method statements;
4. Comply with the following requirements in applying the pest and disease control measures:
 - a. Adopt environmental friendly measures; and
 - b. Follow strictly the safety precautions as the manufacturer's instruction in using pesticide or fungicide so as to avoid causing danger or harm to the public and the environment.

SITE CLEARANCE

EXT11.W110.8**GENERAL**

1. Clear all existing vegetated areas of all rubbish, waste materials and felled timber, including any generated from the works specified herein;
2. Clear all debris, rubbish, silt etc. from drainage channels, catchpits and grilles thereon;
3. Clear each part of the site at times and to the extent required by this Specification and as Instructed;
4. Remove cleared materials from site to a properly designated tip.

EXT11.W120.8**UNDERGROWTH CUTTING**

Carry out a complete undergrowth cut and clear scrub and bushes by hand or by Approved mechanical means.

EXT11.W130.8**CREEPER CLEARANCE**

Clear all wild creepers entwining existing trees and shrubs and grub up their entire root systems.

REMOVAL OF EXISTING TREES

EXT11.W210.8**GENERAL**

Fell diseased and dead trees as shown on the Drawings or as Instructed.

EXT11.W220.8**TREE REMOVAL**

Completely remove the tree including the stump to the extent of the depth of the root system below ground, by hand, machine hacking or grubbing out.

EXT11.W230.8**LARGE TREES IN CONFINED SPACES**

Carefully take down in sections any large trees in confined spaces or near other trees which are to be retained.

EXT11.W240.8**PROTECTION MEASURES FOR TREES TO BE FELLED/TRANSPLANTED**

The limits of site clearance shall be agreed by the CM on the Site before site clearance commences. Comply with the following requirements in respect of tree removal, either by felling or by transplanting:

1. In respect of tree felling, comply with the following:
 - a. Fell only those trees earmarked for such under the Contract and labelled for such on the Site pursuant to sub-clause (5) of **PRE.B8.1116** or those as directed or approved by the CM;
 - b. Take all necessary precautions to protect the people engaged in the tree felling work as well as the people and property in the vicinity;
 - c. Fell the trees by cutting them near the ground, with their stumps ground rather than pulled so that the roots of the nearby plants to be retained are not injured;
 - d. Remove the stumps and rootballs of the felled trees carefully to avoid causing damage to the roots of the nearby plants to be retained, where it is necessary to have such removal as directed by the CM;
 - e. Remove all debris, wood, and roots where necessary pursuant to sub-clause (1)(d) above, from the trees felled from the Site as soon as possible.
2. In respect of tree transplanting either within or off the Site, comply with the following:

- a. Transplant only those trees earmarked for such under the Contract and labelled for such on the Site pursuant to sub-clause (5) of **PRE.B8.1116** or those as directed or approved by the CM;
- b. Commence any work related to tree transplanting on the Site only after having complied with the requirements stipulated to be completed prior to commencing the tree transplanting work.
3. Where it is found necessary for the completion of the Works to remove, either by felling or by transplanting, any trees other than those earmarked for such under the Contract or those directed or approved for such during the progress of the Works by the CM, carry out the following:
 - a. Report to the CM the necessity of such tree removal;
 - b. Provide all reasonable assistance as required by the CM in the tree survey and the justification for the proposed tree removal with substantiation and the necessary details such as method statement, site formation plan and architectural or engineering drawings, for the CM's preparation of the tree felling or transplanting application for the tree removal.

TRANSPLANTING EXISTING TREES AND PALMS

EXT11.W310.8

GENERAL

1. Make reference to Development Bureau's 'Guidelines on Tree Transplanting' and submit a 'Method Statement' for CM's approval;
2. Carry out tree transplantation in accordance with true horticultural practice and use specialist equipment as required;
3. Wrap trunk and large lower branches with hessian binding, as **EXT11.M020**, and tie with jute string, as **EXT11.M030**, at least one day prior to rootball preparation;
4. Sever lateral roots in stages over a period of at least 8 weeks prior to transplantation when instructed;
5. Treat all trees transplanted as new planting with respect to planting methods and defects liability except that any replacements as **SLW9.W130** will be limited to the normal maximum size commercially available for that plant species;
6. Protect trees during transportation as **SLW1.W210** (1).

EXT11.W320.8

IMMEDIATE TRANSPLANTATION

Transplant existing semi-mature trees, within two hours of uplifting, either:

1. To their final positions; or
2. To Contractor's temporary store as Instructed.

EXT11.W330.8

ROOTBALLS

1. Make reference to Development Bureau's 'Guidelines on Tree Transplanting' for rootball preparation; and
2. Keep rootballs intact with the soil to the appropriate sizes as shown on the Drawings and wrapped in hessian.

EXT11.W340.8

WATERING

1. Fill tree pit with water and allow to drain before planting;
2. Keep the whole tree, including rootball and heissan binding, moist at all times;
3. Water the transplanted trees (thoroughly soaked into the rootball soil) everyday during the first three months after transplant to keep them in healthy condition, irrespective of temperature, except in periods of heavy rainfall as determined by the CM.;

-
4. Afterwards, water to field capacity the area covered by the spread of transplanted trees three times per week or as Instructed by the CM.

EXT11.W350.8 CROWN THINNING

Carry out limited crown thinning prior to rootball preparation, to those trees scheduled and/or shown on the Drawings, as Worksection SLW8. Retain form and shape of tree.

EXT11.W360.8 ANTI-DESICCANT SPRAY APPLICATION

Prior to rootball preparation spray trees thoroughly when required, covering whole of leaves, branches and trunks:

Apply spray in accordance with manufacturer's instructions.

TRANSPLANTING EXISTING SHRUBS AND BAMBOOS

EXT11.W410.8 GENERAL

Treat all shrubs transplanted as new planting with respect to planting methods and defects liability except that any replacements, as **SLW9.W130**, will be limited to the normal maximum size commercially available for that plant species.

EXT11.W420.8 TRANSPLANTATION

Transplant existing shrubs and bamboos within two hours of uplifting either:

1. To their final positions as shown on Drawing or as Instructed; or
2. To Contractor's temporary store as Instructed.

EXT11.W430.8 ROOTBALLS

Keep rootballs intact with the soil to a minimum size of 750 mm diameter and 450 mm depth and wrapped with hessian. Transplant in a suitable size basket and keep moist at all times.

EXISTING SHRUBS

EXT11.W510.8 PRUNING

Prune existing shrubs as **SLW9.W430** unless otherwise Instructed.

EXISTING GRASSED AREAS

EXT11.W610.8 REINSTATEMENT

Reinstate existing grassed areas including levelling, grass seeding and post planting operations as Worksection SLW7.

EXT11.W620.8 CUTTING

Cut grass, on existing grassed areas, to 25 mm sward and make subsequent cuts as **SLW9.W410**.

TREATMENT/REPLACEMENT OF DAMAGED TREES AND SHRUBS

EXT11.W710.8 RESPONSIBILITY

Accept responsibility and costs of treatment or replacement of existing trees/shrubs arising from the execution of the works whether on or surrounding the site.

EXT11.W712.8 REPAIR OF DAMAGE TO EXISTING TREES AND OTHER AFFECTED PLANTS

1. Carry out all necessary work of repair of any damage to the preserved trees and any other damaged plants within the Site together with the necessary mitigation landscape works to reinstate the affected land. Bear all costs for all necessary work of repair of damage and reinstatement works if the necessity for such work is, in the opinion of the CM, due to neglect or failure on the part of the Contractor to comply with any obligation expressed or implied on the Contractor's part under the Contract;
2. The work of repair of damage as per sub-clause (1) above shall include the following:
 - a. All necessary arboricultural work to the preserved trees and any other damaged plants, which may include:
 - i. Tree surgery work to remove dead, damaged, diseased or hazardous parts, to repair wounds, or to provide cables or braces for additional support;
 - ii. Watering and / or mulching in case of water deficiency;
 - iii. Applying appropriate fertilizers in case of nutrient deficiency;
 - iv. Applying appropriate pest and disease control measures in case of pest and disease attack.
 - b. The replacement planting pursuant to sub-clause (7) below for the trees and any other plants damaged to an extent as described in sub-clause (6) below and the subsequent Establishment Works for the new plants for 2 years, when instructed by the CM;
 - c. Any other reinstatement work necessary to bring the damaged plants to their original condition prior to the occurrence of the damage, as directed by the CM.
3. Notify the CM of any damage to the preserved trees and other affected plants within the same day of the occurrence of damage and submit to the CM within 24 hours of the occurrence of damage, a report comprising the following information in a format agreed by the CM:
 - a. The timing of the damage;
 - b. The nature and extent of the damage;
 - c. Photographic records of the damage;
 - d. The proposed work of repair of the damage;
 - e. The proposed protection measures to avoid recurrence of similar incident.
4. When directed by the CM, firm up and secure all dislodged trees and any other dislodged plants and treat all wounds of the damaged plants within 3 days of the occurrence of the damage;
5. Save as stated in sub-clause (4) above, do not carry out any work of repair of the damage prior to the CM's acceptance of the report as required in sub-clause (3) above;
6. Provide replacement planting of the damaged trees and any other affected plants under the following circumstances:
 - a. In the opinion of the QAr in the case of an OVT, or the CM in the case of a non-OVT, the damaged plants are dead;

- b. In the opinion of the QAr in the case of an OVT, or the CM in the case of a non-OVT, the trees or other affected plants have been substantially damaged and have become moribund, resulting in one or more of the following conditions:
 - i. Imminent plant death within the coming growing season is predicted;
 - ii. The structural integrity of the damaged trees or other affected plants is permanently compromised and consequently the trees or other affected plants become an irreparable public hazard;
 - iii. Any major parts of the damaged trees or other affected plants have been lost and consequently their form, habit and balance have been grossly altered so that their function cannot be reasonably recovered or the trees or other affected plants are causing harm to other preserved trees.
 7. When instructed by the CM, carry out the following:
 - a. Carry out the removal of the damaged plants for which replacement planting as sub-clause (6) above is required, in accordance with the following requirements:
 - i. For the removal of the damaged trees including any damaged OVT, prepare a tree felling application document to the CM's satisfaction and provide any other assistance or information as required by the CM for applying approval from the appropriate Government approving authority to the felling of the damaged trees;
 - ii. Fell the damaged trees including any damaged OVT only after obtaining the CM's approval to the tree felling, which shall normally be given only after the tree felling application has been approved by the appropriate Government approving authority;
 - iii. Remove the damaged plants including any damaged OVT from the Site as soon as possible.
 - b. Carry out the replacement planting of new plants to compensate for the damaged plants including any damaged OVT in accordance with the following requirements:
 - i. Complete the replacement planting within 28 days from the CM's instruction or other time duration as agreed by the CM;
 - ii. For the replacement planting for the damaged plants including any damaged OVT, plant new plants of the same species and of similar size and form as the damaged plants prior to the damage, or provide other alternative replacement planting together with the necessary mitigation landscape works to reinstate the affected land as agreed by the CM.

EXT11.W714.8**AFTERCARE TO OLD AND VALUABLE TREE**

1. Provide the Aftercare to the Old and Valuable Tree for the period as stated in the Contract;
2. Perform the following during the period for the Aftercare to the Old and Valuable Tree as per sub-clause (1) above:
 - a. Ensure that the QAr shall prepare and submit monitoring reports on the OVT comprising the details and within the time frames as stipulated in **EXT11.W062**; the requirements of the report format shall be in accordance with sub-clause (6) of **PRE.B8.1116**;
 - b. Ensure that the QAr shall conduct a final survey of the OVT and a final site survey and final soil tests of its tree protection zone, and submit a report on the same comprising the details and within the time frames as stipulated in **EXT11.W062**; the requirements of the report format shall be in accordance with sub-clause (6) of **PRE.B8.1116**;

- c. Carry out any tree maintenance work, work of repair to damage or health deterioration, or precautionary or mitigation measures against damage, to the OVT as recommended by the QAr in the monitoring reports as per sub-clause (2)(a) above, or in the report on final tree survey / final site survey / final soil tests as per sub-clause (2)(b) above, or in any other written advice given by the QAr during the period for the Aftercare to the Old and Valuable Tree.

EXT11.W716.8 ESTABLISHMENT OPERATIONS DURING AFTERCARE PERIOD

During the Aftercare Period, carry out the operations as scheduled below applicable to the Old and Valuable Tree, and in accordance with this Specification:

Operation	Anticipated No.	Timing
Watering	180	Min. twice per week during dry seasons, or as Instructed.
Fertilizing	2	Once per year as Instructed.
Soil aeration	2	Immediately after fertilizer application.
Checking and adjusting tree ties	12	Check every two months; adjust/replace as necessary.
Pruning	Min 2	As Instructed.
Pesticide	As required	Check monthly; treat immediately.
Fungicide	As required	Check monthly; treat immediately.
Typhoon damage; assessment and repair	As required	As specified.

EXT11.W720.8 CIRCUMSTANCES FOR TREE/SHRUB REPLACEMENT

Provide replacement trees for those existing trees/shrubs which were to be retained in the following circumstances:

1. Death of the existing tree/shrub;
2. Substantial damage resulting in a condition that tree/shrub-death is confidently predicted within one year or that the tree/shrub's structural integrity is permanently compromised and consequently is a public hazard;
3. Substantial damage resulting in a condition that the form, habit and balance of the tree/shrub has been grossly spoiled.

EXT11.W730.8 REPLACEMENT TREES/SHRUBS

Replacement trees/shrubs as near as is technically possible to the stature and species as that existing at Contract commencement will be specified.

EXT12 EARTHWORKS

MATERIALS

EXISTING SOILS

EXT12.M010.8 GENERAL

1. Prior to tender, inspect the existing subsoil and topsoil to ensure that it is acceptable for the work specified herein;
2. No claims shall subsequently be considered in respect of existing soils which would relieve the Contractor of his responsibilities under Worksection SLW9 of this Specification.

EXT12.M020.8 EXISTING SUBSOIL

Existing subsoil consists mainly of granular DG, generally derived from original deposits.

EXT12.M030.8 DG AS PLANTING MEDIUM

Soil as **EXT12.M020** for planting and grassing has in certain areas been roughly spread by others, and forms the basic constituent of fabricated soil, when mixed with other materials, for planting areas at existing ground levels, and areas already made up.

IMPORTED SOILS

EXT12.M110.8 SUBSOIL

Subsoil to be evenly textured, good clean granular DG containing no stones larger than 50 mm in any dimension, nor any deleterious matter. Do not use any subsoil from land which have been used by industries identified as having potential for causing land contamination as stipulated in “Guidance Note for Contaminated Land Assessment and Remediation” issued by Environmental Protection Department.

EXT12.M120.8 DG AS PLANTING MEDIUM

DG as planting medium to be evenly textured, granular soil free from weeds, deleterious matter, and stones larger than 50 mm in any dimension. Do not use any DG from land which have been used by industries identified as having potential for causing land contamination as stipulated in “Guidance Note for Contaminated Land Assessment and Remediation” issued by Environmental Protection Department.

SOIL CONDITIONERS

EXT12.M210.8 MANUFACTURED SOIL CONDITIONER

Manufactured soil conditioner to be properly composted organic material with the following characteristics:

1. Fine, free flowing consistency;
2. Stable composition;
3. Not capable of raising the temperature of the treated soil more than 5°C above the temperature of the untreated soil;
4. Not made with materials that are known to contain pathogens or other toxic materials injurious to plants, humans, or animals;

-
5. Giving off neither toxic nor obnoxious fumes;
 6. With a pH value between 6.5 and 7.75;
 7. With a moisture content of less than 80% (moisture weight as a proportion of overall weight);
 8. With an organic matter content of not less than 85% (dry matter);
 9. With a carbon to nitrogen ratio between 20 and 55;
 10. Heavy Metal:
 - a. Arsenic ≤ 41 mg/kg dw;
 - b. Cadmium ≤ 39 mg/kg dw;
 - c. Chromium ≤ 1200 mg/kg dw;
 - d. Copper ≤ 1500 mg/kg dw;
 - e. Mercury ≤ 17 mg/kg dw;
 - f. Nickel ≤ 420 mg/kg dw;
 - g. Lead ≤ 300 mg/kg dw;
 - h. Selenium ≤ 36 mg/kg dw;
 - i. Zinc ≤ 2800 mg/kg dw.
 11. Pathogen:
 - a. Salmonella sp. ≤ 3 MPN/4g;
 - b. E. coli ≤ 1000 MPN/g.

EXT12.M220.8**CERTIFICATION**

For every batch of soil conditioner as **EXT12.M210** of 300m³ or part thereof delivered to Site, take one sample for testing as directed by the CM. Every batch of soil conditioner set aside for sampling and testing should be properly segregated and labelled, and not to be used until the CM's approval is given. Within 14 calendar days of taking the samples, submit to the CM certificates of analysis from an Approved laboratory stating:

1. pH (H₂O) value;
2. Moisture content (calculated as the loss in weight between the dry weight and the overall weight as a percentage of the overall weight);
3. Organic matter content (dry weight);
4. Organic carbon content (using loss of ignition 'Ashing' method of testing);
5. Nitrogen content ('Kjeldahl' Method);
6. Carbon: nitrogen ratio;
7. Heavy metal content; and
8. Pathogen content.

This sampling and certification requirement may be exempted if the supply of soil conditioner is from an Approved source, such as the composting facilities operated by the Environmental Protection Department. In such case, Contractor is required to submit relevant product literature and quality documents to demonstrate conformation of specified properties for the CM's review and consideration to grant exemption. The operator of the Approved source shall deliver the soil conditioner direct to Site.

EXT12.M230.8**SAND**

Sand to be clean, graded non-marine sand of size 4 mm or below.

EXT12.M235.8 GRADED SAND FOR SAND BASED LAWN

Sand to be clean, sharp graded quartz or non-marine sand with particle size distribution as stated in the following table. Certificate of analysis shall be submitted to the CM together with a sample of the sand for every 100 m³ of graded sand to be used in the Works and prior to execution of any works using the sand.

Particle size distribution of sand for grassed area	
BS test sieve size	Percentage by mass passing (%)
1.18 mm	98 – 100
0.6 mm	85 +/- 5
0.212 mm	20 +/- 5
0.15 mm	0 – 5
0.063 mm	0 – 1

EXT12.M236.8 AGGREGATE FOR SAND BASED LAWN

For area specified as “Sand Based Lawn”, aggregate to be washed clean stone, 10 to 15mm in size.

EXT12.M240.8 COMPOST

Compost as shown on Drawings, to be:

1. Manufactured soil conditioner: as **EXT12.M210**, with a Certificate of Analysis as **EXT12.M220**; and/or
2. Compost: animal manure as **EXT12.M245**.

EXT12.M245.8 ANIMAL MANURE

Animal manure as shown on Drawings, to be:

1. Well rotted, fully mature and without smell;
2. Accompanied by a Certificate of Analysis as **EXT12.M220**.

EXT12.M250.A SYNTHETIC SOIL CONDITIONER

Synthetic soil conditioner to be free flowing synthetic acrylamide polymer crystals, 0.15-5mm in diameter when dry:

1. Capable of absorbing water and nutrients in gel form swelling to 100-550 times of original dry weight;
2. Having a minimum effective life of 2 years when used in the soil.

EXT12.M260.8 COCO PEAT

Coco peat to be finely textured fibrous material derived from the husk of the coconut.

EXT12.M270.8 SOIL BINDER

Soil binder to be an Approved proprietary type and consisted of a binding medium applied in aqueous suspension by spraying onto the surface of the soil to stabilise the soil. The binding agent shall not be injurious to plant growth.

FABRICATED SOILS**EXT12.M310.8 GENERAL MIX**

Fabricated soils as shown on Drawings, to be:

1. Comprise a mixture of:

- a. 3 parts DG, as per [EXT12.M030](#); or [EXT12.M120](#);
 - b. 1 part manufactured soil conditioner, as per [EXT12.M210](#); or
 - c. 1 part animal manure, as per [EXT12.M245](#).
2. Comprise a soil which sustains healthy plant growth in a variety of landscape situations free from pernicious weeds, roots, clay lumps, non-soil material and chemical contamination;
3. Certification:
Take one sample for testing prior to planting, and one sample for every 2,000 m² of planting area or part thereof prepared on Site. Submit to the CM certificates of analysis from an Approved laboratory within 14 calendar days of taking the samples. Apply mitigation measures as per [EXT12.W260](#), [EXT12.W270](#), [EXT12.W280](#), and [EXT12.W290](#) if the tested samples do not comply with the following characteristics:
 - a. pH value between 5.5 and 6.5;
 - b. Organic matter more than 4%;
 - c. Nitrogen content more than 0.2%.

EXT12.M320.8 LIGHTWEIGHT MIX

Lightweight soil to comprise a mixture of:

1. 2 parts DG, as [EXT12.M120](#);
2. 1 part manufactured soil conditioner, as [EXT12.M210](#);
3. 1 part vermiculite or volcanic pellets, with a particle size of 5-10 mm.

EXT12.M330.8 SOIL FILLING MIX FOR USE IN GRASS PAVING SYSTEM

Soil filling mix as shown on Drawings, for use in reinforced grass surfaces which are to receive either grass seed as [SLW7.M270](#) or turves as [SLW7.M110](#), to comprise of:

1. 4 parts DG, as [EXT12.M030](#) or [EXT12.M120](#);
2. 1 part manufactured soil conditioner, as [EXT12.M210](#);
3. 2 parts sand as [EXT12.M230](#);
4. Quick release fertilizer as [SLW1.M130](#) at a rate of 300 g/m³.

EXT12.M340.8 ROOT ZONE MEDIUM MIX FOR USE IN SAND BASED LAWN

At top 30mm of root zone medium mix as shown on Drawings, for use in area specified as “Sand Based Lawn”, to comprise a mixture of:

1. 9 parts of graded sand, as per [EXT12.M235](#);
2. 1 part manufactured soil conditioner, as per [EXT12.M210](#).

BOULDERS AND ROCKS**EXT12.M410.8 GRANITE**

Granite boulders and rocks to have a natural, weathered appearance, free from blasting and drill marks, obtained from a local source and:

1. Shape: rounded;
2. Size: various, ranging from a minimum of 750 x 600 x 500 mm to a maximum size of 1800 x 1200 x 900 mm;
3. Colour: grey.

EXT12.M420.8 SERPENTINE

Serpentine boulders and rocks to comprise hard, metamorphic rock (normally obtained from Taiwan):

-
1. Size: various, ranging from a minimum of 500 x 500 x 500 mm to a maximum of 1800 x 1200 x 900 mm;
 2. Colour: strongly veined blue and white.

EXT12.M430.8**GREAT LAKE ROCK**

Great lake rocks to be from the Great Lake (Tai Hu), near Suzhou, or from other Approved regions of China, and:

1. Each rock being of one piece;
2. Appearance: slender, with folds and a large number of holes on the surface and containing such shapes as "deep hollows", "eye holes", "twists" and "strange grooves" without visual defects;
3. Colour: blackish grey;
4. Size: various, ranging from a minimum 800 x 500 x 300 mm to a maximum of 3000 x 1200 x 900 mm.

EXT12.M440.8**REJECTS**

Remove, at own expense, any boulders and rocks rejected by the CM.

WORKMANSHIP

GENERAL

EXT12.W010.8

STOCKPILES

1. Obtain Approval of stockpile areas prior to the commencement of any stockpiling of materials;
2. Stabilise firmly all materials stockpiled against wind blow and erosion by water, at all times.

SUBSOIL PREPARATION

EXT12.W110.8

GRADING

Grade existing subsoil or DG as planting medium to form free flowing contours without water collecting hollows.

For area specified as “Sand Based Lawn”, prepare the sub-base as follows:

1. Grade existing subsoil to minimum 400mm below finished levels;
2. Compact formations to obtain a relative compaction of at least 95% to a depth of 200 mm below the formation;
3. Fill aggregate as per [EXT12.M236](#) to 200mm below finished levels;
4. Protect the finished sub-base with impermeable protective sheeting before laying of graded sand as per [EXT12.M235](#).

EXT12.W120.8

CLEANING

1. Remove rubbish, weeds, metal, deleterious material, and all stones exceeding 50mm in any dimension from existing subsoil or DG as planting medium, to a depth of 400mm;
2. Backfill any voids left by this operation with imported DG as planting medium, as per [EXT12.M120](#).

EXT12.W130.8

RIPPING

Rip subsoil or DG as planting medium prior to spreading topsoil:

1. At 500 mm centres to a depth of 400mm or as shown on Drawings, to improve water and air movement;
2. Removing from site all obstructions to cultivation, or deleterious material brought to the surface;
3. Backfilling any voids left by this operation with imported DG as planting medium, as per [EXT12.M120](#);
4. Do not rip ground at a slope exceeding 15° to the horizontal.

PREPARATION OF PLANTING MEDIA

EXT12.W210.8

CONTAMINATED GROUND

Obtain Approval to confirm the location and volume of all areas contaminated by petrol, or other toxic substances, and:

1. Excavate all such contaminated ground to be planted or sown to 500 mm below the depths specified in [EXT12.W410](#);
2. Remove the contaminated material to a properly designated tip;

-
3. Backfill all such excavated areas with fabricated soil, as **EXT12.M310**.

EXT12.W225.8 PREPARATION OF PLANTING MEDIUM

1. Remove contaminated soil as per **EXT12.W210**;
2. Grade, rip and clean existing subsoil or DG as planting medium as per **EXT12.W110**, **EXT12.W120** and **EXT12.W130**.

EXT12.W230.8 FABRICATED SOIL MIX

Where the finished levels comprise existing DG as **EXT12.M030**, mix with manufactured soil conditioner as **EXT12.M210**, and/or animal manure, as **EXT12.M245** to form Fabricated Soil, as **EXT12.M310**, to the depths given in **EXT12.W410**. Take samples and test the same for every 1,000 m² of planting area or part thereof.

EXT12.W240.8 POLYMER MIX

Mix thoroughly, fully hydrated synthetic soil conditioner, as **EXT12.M250**, at a rate of 1.5 kg dry polymer to 1 m³ fabricated soil, as **EXT12.M310**, and incorporate 600 gms of slow release fertilizer, as **SLW1.M110**.

EXT12.W250.8 COMPOST MIX

Mix thoroughly 50 mm thick layer of compost, as **EXT12.M240**, into the top 150 mm of topsoil or fabricated soil.

EXT12.W255.8 ROOTZONE MEDIUM MIX

Mix thoroughly 10 mm thick layer of manufactured soil conditioner as per **EXT12.M210**, into the top 30 mm of graded sand for area specified as "Sand Based lawn".

EXT12.W260.8 RAISING NITROGEN CONTENT

Mix slow or controlled release nitrogen fertilizer at the rate calculated using the formula:

$$F = \frac{11,400 \times B}{Z}$$

where F = Fertilizer required in gm/sq.m.
 B = Nitrogen deficiency in percent.
 Z = Nitrogen content of fertilizer in percent.

EXT12.W270.8 RAISING PH LEVEL

Add limestone, as **SLW1.M150**, at the rate of 100 g/m² per application as required to raise pH of fabricated soil to within the range 5.5 to 6.5.

EXT12.W280.8 LOWERING PH LEVEL

Thoroughly mix in appropriate quantities of either:

1. Sulphate of ammonia (during periods of wet weather only);
2. Natural sphagnum peat moss with pH of 4 to 4.5.

EXT12.W290.8 INCREASING ORGANIC MATTER CONTENT

Add, as a separate operation, either manufactured soil conditioner, as **EXT12.M210**, or Coco Peat, as **EXT12.M260**, to the fabricated soil at the rate of 5 mm thickness for each 1% shortfall in organic matter content, spread over the deficient area and thoroughly mix through the full depth of the fabricated soil.

MAKING UP LEVELS

EXT12.W310.8**FABRICATED SOIL**

Where the levels are required to be made up to the finished level, import fabricated soil, as **EXT12.M310**, and spread and grade to the depths given in **EXT12.W410**.

EXT12.W320.8**POLYMER MIX**

Import polymer mix, as **EXT12.W240**, to make up levels to the depths given in **EXT12.W410**, in the locations as shown on Drawings.

EXT12.W325.8**ROOTZONE MEDIUM MIX**

Where the levels are required to be made up to the finished level, import graded sand, as per **EXT12.M235**, and spread and grade to the depths given in **EXT12.W410** before cultivate with manufactured soil conditioner to form the rootzone medium mix.

EXT12.W330.8**GENERAL SOIL FILLING IN GRASS PAVING SYSTEM**

Fill openings of the grass paving system, in the location as shown on Drawings, with:

1. Soil filling mix, as **EXT12.M330** to receive turves as **SLW7.M110** for turf finish; or
2. Grass seed and soil filling mix as **SLW7.M270** for grass seed finish.

DEPTHS OF PLANTING MEDIA

EXT12.W410.8**FABRICATED SOIL**

Provide to the depth(s) for the following planting situations:

1. Shrub and ground-cover areas: 300 mm;
2. Grassed Area: 200mm;
3. Sand Based Lawn: 200 mm with root zone medium mix as per **EXT12.M340**;
4. Tree pits: as per **SLW2.W250**;
5. Grass paving system: to depths to suit the system in use and / or as shown in the Drawings or indicated in the schedules issued for individual Works Order.

FINAL GRADING

EXT12.W510.8**GENERAL**

Grade all areas to free flowing contours and without humps or water collecting hollows.

EXT12.W520.8**PLANT BEDS**

Slightly mound plant beds to levels shown on the Drawings ± 150 mm at the top of the mound.

EXT12.W530.8**BEHIND RETAINING WALLS**

Finish soil levels, immediately behind retaining walls, 75 mm ± 25 mm below the top of the wall after settlement.

EXT12.W540.8**ADJACENT PAVED AREAS**

1. Finish soil 25 mm ± 25 mm below adjacent paving to plant beds at ground level;
2. Finish soil flush +25 mm -0 mm with adjacent paving to grassed areas at ground level.

EXT12.W550.8 GRASS PAVING SYSTEM

The turf finish or grass seed finish of the grass paving system to flush with the surrounding finished levels, or to depths to suit the system in use and/or as shown on Drawings, with allowance of settlement.

EXT12.W555.8 SAND BASED LAWN

The finished grading of rootzone medium mix after compaction by rollers shall be flushed with the surrounding finished levels, kerb or to depths as shown on Drawings, with allowance of settlement.

BACKFILLING RAISED PLANTERS WITH IMPERMEABLE BASES**EXT12.W610.8 PROCEDURE**

1. Spread drainage layer in accordance with Worksection EXT13 in the bottom of the container;
2. Place filter layer, as **EXT13.M110**, over aggregate;
3. Place planting medium in 250 mm \pm 25 mm thick layers, lightly consolidating each layer before spreading the next;
4. Fill ground level containers to 50 mm \pm 10 mm below the top with fabricated soil, as **EXT12.M310**;
5. Fill podium level containers with lightweight soil, as **EXT12.M320**;
6. Leave the surface smooth and level to receive plants.

BOULDERS AND ROCKS**EXT12.W710.8 PLACING**

Place boulders in the required positions during backfilling but prior to planting.

EXT12.W720.8 FIXING GRANITE AND SERPENTINE BOULDERS

Ensure complete stability, with 25% by volume of the boulder below finished ground level to the satisfaction of the CM.

EXT12.W730.8 FIXING GREAT LAKE ROCKS

Place rocks in their required positions, prior to planting, in locations as directed by the CM on site, and:

1. For rocks at least 3000 mm high x 1200 mm long x 900 mm wide, place in a concrete base 1200 mm long x 900 mm wide x 300 mm deep;
2. For rocks at least 3000 mm high x 1200 mm long x 900 mm wide, place and wedge with small rocks to prevent movement, with 25% by volume of the boulder below finished ground level to the satisfaction of the CM.

SURPLUS MATERIAL**EXT12.W810.8 REMOVAL**

Remove all surplus soils, arising from the Works to a properly designated tip.

EXT13 DRAINAGE TO PLANTERS

MATERIALS

DRAINAGE LAYER

EXT13.M010.8 AGGREGATE

Aggregate to be clean stone, 25 – 50 mm diameter.

EXT13.M020.8 LIGHTWEIGHT AGGREGATE

Lightweight aggregate to be clean clinker, or other Approved equivalent material.

1. Size: 20 – 50 mm diameter;
2. Density: 500 kg per m³ maximum weight when compacted.

FILTER LAYER

EXT13.M110.8 FILTER LAYER FOR PLANTERS

Permeable, non-woven, thermally bonded geotextile, type not affected by acids, alkalis, bacteria, humidity, or rotting and shall meet performance requirements set out in the table:

Properties	Test Method	Acceptance Standards
Mechanical Properties		
(i) Wide width strip tensile - Mean peak strength	BS EN ISO 10319	Not less than 3.0 kN/m
(ii) CBR puncture resistance - Mean peak strength	BS EN ISO 12236	Not less than 525 N
Hydraulic Properties		
(i) Pore size - Mean AOS O ₉₀	BS EN ISO 12956	Not more than 300 µm
(ii) Permeability - 5cm head	BS EN ISO 11058	Not less than 100 l/m ² /s

WORKMANSHIP

DRAINAGE LAYER

EXT13.W010.8 CLEANING OUT WEEPHOLES

Prior to placing the drainage layer clean out all weepholes. When drainage layer has been placed by others, prior to any soiling operations, clean out all weepholes taking care not to damage any rodent grilles. Advise CM of any weepholes which cannot be cleared or are missing.

EXT13.W020.8 LEVELS

Place the base of the drainage layer level (+0 mm -25 mm) with the bottom of weepholes.

EXT13.W030.8 PRECAST CONCRETE / PORTABLE PLANT BOXES

Lay drainage layers evenly over the base of precast concrete / portable plant boxes to compacted depths indicated below:

Plant Box		Aggregate	
Height (mm)	Position	Depth (mm)	Type Clause Ref.
750 or less	Ground level	75	EXT13.M010
Above 750	Ground level	100	EXT13.M010
750 or less	Podium level	75	EXT13.M020
Above 750	Podium level	100	EXT13.M020

EXT13.W040.8 IN-SITU CONCRETE PLANTERS WITH IMPERMEABLE BASES

Lay drainage layers evenly over base of in-situ concrete plant boxes with impermeable bases to compacted depths indicated below:

Plant Box		Aggregate	
Height not exceeding (mm)	Position	Depth (mm)	Type Clause Ref.
750 or less	Ground level	75	EXT13.M010
Above 750	Ground level	100	EXT13.M010
750 or less	Podium level	75	EXT13.M020
Above 750	Podium level	100	EXT13.M020

EXT13.W050.8 IN-SITU CONCRETE PLANTERS WITH PERMEABLE BASES

Form drainage strips of aggregate along back of perimeter walls of in-situ concrete planters with permeable bases to dimensions and in positions indicated below:

Plant Box Type	Aggregate (EXT13.M010)	
	Strip Dimensions (mm) (Width x height)	Position
Level	200 x 200 high	Along all walls
Sloping	200 x 200 high	Along lower wall
Level & sloping	200 x 200 high x 500 long	Over each weep hole

FILTER LAYER

EXT13.W110.8**APPLICATION**

Cover all drainage aggregate, where exposed to soil, with filter layer, as **EXT13.M110**.
Lap joints between sheets and overlap other materials by 200 mm.

EXT14 HYDROSEEDING

MATERIALS

GENERAL

EXT14.M010.8

SCOPE

The application, by high pressure spraying, of a specified mixture of grass seed, fertilizer, mulch and other additives in aqueous suspension.

EXT14.M020.8

METHOD STATEMENT

Submit to the CM, at least 14 days before starting hydroseeding operations, details of materials to be used and method of application to be employed. Include the following:

1. Species and rate of application of seed;
2. Type and rate of application of fertilizer, mulch, soil binder and soil conditioner;
3. Type and colour of dye;
4. Type of protective fabric material;
5. Details of the company employed to carry out the hydroseeding;
6. Equipment to be used.

SEED MIXES

EXT14.M110.8

BASIC MINIMUM SEED MIX FOR USE BETWEEN APRIL AND AUGUST

30 g/m² (spreading rate) mix comprising:

Species	Rate
Cynodon dactylon (Bermuda grass)	13 – 15 g/m ²
Paspalum notatum (Bahia grass)	8 – 10 g/m ²
Others selected from "other recommended species" listed in EXT14.M120	0 – 4 g/m ²
Shrub species selected from EXT14.M145 , when instructed by the CM	5 g/m ²
Fern species leaf fragments full of mature sporangia selected from EXT14.M145 , when instructed by the CM	2 g/m ²

EXT14.M120.8

OTHER RECOMMENDED SPECIES

1. Chloris gayana (Rhodes grass);
2. Eragrostis curvula (Weeping love grass) (not more than 2%);
3. Eremochloa ophiuroides (Centipede grass);
4. Zoysia japonica (Korean Grass).

EXT14.M130.8

BASIC MINIMUM SEED MIX FOR USE BETWEEN SEPTEMBER AND MARCH

35 g/m² (spreading rate) mix comprising:

Species	Rate
Cynodon dactylon (Bermuda grass)	15 g/m ²
Paspalum notatum (Bahia grass)	10 g/m ²
Lolium perenne (Manhattan Rye grass)	5 g/m ²
Shrub species selected from EXT14.M145 , when instructed by the CM	5 g/m ²
Ground fern fond laden with mature sporangia selected from EXT14.M146 , when instructed by the CM	1 g/m ²

EXT14.M145.8**SHRUB SPECIES**

Any of the three listed below:

1. Raphiolepis indica;
2. Melastoma sanguineum;
3. Lespedeza spp.;
4. Desmodium spp.;
5. Crotalaria pallida;
6. Crotalaria retusa;
7. Others accepted by the CM.

EXT14.M146.8**FERN SPECIES**

1. Any one of the following:
2. Cibotium barometz;
3. Dicranopteris pedata;
4. Nephrolepis auriculata;
5. Woodwardia japonica;
6. Others accepted by the CM.

EXT14.M150.8**GERMINATION**

Germination capacity of each variety to be at least 80%.

EXT14.M160.8**PURITY**

1. Purity of each variety to be greater than 90%;
2. Total weed seed content not more than 0.5%;
3. Other crop seed not more than 1%.

EXT14.M170.8**CERTIFICATION**

Provide a certificate of testing, no less than 14 days before hydroseeding starts, stating:

1. Date of tests (within 6 months of hydroseeding);
2. Species variety;
3. Percentage germination (with date of assessment);
4. Percentage composition by weight (with statement of impurities).

ANCILLARY MATERIALS

EXT14.M210.8 FERTILIZER INCLUDED IN THE HYDROSEEDING MIX

A soluble compound fertilizer in the ratio 15:15:15 NPK, or similar Approved compound applied at a rate of at least 100 g/m² in the hydroseeding mix.

EXT14.M220.8 DYE AND SOIL BINDER

The application rate of dye and soil binders shall strictly refer to manufacturer recommendation.

1. Dye, to be: an Approved type, suitable for hydroseeding purposes and non-injurious to plant growth;
2. Soil binder, as [EXT12.M270](#).

EXT14.M230.8 MULCH FOR HYDROSEEDING

A proprietary type manufactured from cellulose or paper based materials for application at a minimum rate of 170 g/m².

EXT14.M240.8 PROTECTIVE FABRIC MATERIAL FOR HYDROSEEDING

An Approved proprietary type of degradable fabric that does not degrade within 100 days after application or until the specified grass cover has been established.

EXT14.M250.8 HYDROSEEDING POST-PLANTING FERTILIZER

Consisting of 15:15:15 (nitrogen/phosphorus/potassium) mix or an Approved equivalent.

WORKMANSHIP

GENERAL

EXT14.W010.8 PROGRAMME

1. Carry out hydroseeding between 1st March and 31st August. Hydroseeding outside this period may be Approved on condition that any additional maintenance requirements specified by the CM are carried out at the Contractor's expense;
2. Carry out hydroseeding during damp overcast conditions, but not during rain or periods of strong winds.

EXT14.W020.8 STORING GRASS SEED

Store grass seed in bags off the ground in a clean, dry, well ventilated location free from vermin. Carry out prolonged storage under controlled conditions of temperature and humidity.

EXT14.W030.8 STORING FERTILIZER

Store fertilizer off the ground in sealed waterproof bags and protect from exposure to conditions which may adversely affect the fertilizer.

EXT14.W040.8 HYDROSEEDING EQUIPMENT

Use hydroseeding plant for application of mix.

PREPARATION

EXT14.W110.8 SURFACE FINISH

1. Clear away rubbish and vegetation from areas to be hydroseeded and form site to the levels indicated;
2. Lightly scarify to leave a coarse, open textured surface, level with (+25 mm -0 mm) adjoining hard surfaces;
3. Carry out finishing work by machines across the direction of slope;
4. Do not leave vehicle track marks or bucket teeth marks parallel to the line of maximum gradient of the slope.

EXT14.W120.8 CULTIVATION

1. Cultivate areas less steep than 1:2 to a depth of 125 mm and bring to a 25 mm deep fine tilth by Approved mechanical means or by hand raking;
2. Remove all stones larger than 30 mm in any dimension;
3. If necessary, carry out regrading of the surface to conform to the prescribed finished levels and create free flowing contours free from humps and water collecting hollows;
4. Finish final level (+25 mm -0 mm) with any adjacent hard surfaces.

EXT14.W130.8 CULTIVATION ON EMBANKMENTS

Do not cultivate the existing soil on embankments with slopes of 1:2 or steeper, to ensure that the slope remains stable and to prevent erosion.

EXT14.W140.8 WATERING

When Instructed thoroughly moisten the previously prepared soil prior to hydroseeding, and use a fine spray hose attachment to avoid soil erosion and run off.

EXT14.W150.8 PREPARING TREE SEEDS

1. Soak all tree seeds to be included in the hydroseeding mix (except Acacia Species) in water at room temperature, for 4 to 8 hours immediately before mixing with other ingredients of the hydroseeding mix;
2. Immerse seeds of Acacia confusa in water, bring water to boil, remove seeds immediately and mix seeds with other ingredients of the hydroseeding mix.

APPLICATION**EXT14.W210.8 MIXING**

1. Thoroughly mix materials for hydroseeding on site in the hydroseeding equipment immediately before spraying, ensuring that seed is not damaged;
2. Blend in water at the rate of 5 litres/m² to form an aqueous gel solution, unless otherwise instructed.

EXT14.W220.8 APPLYING SOIL BINDERS

1. Apply soil binders as **EXT12.M270** at the rate recommended by the manufacturer, modified as necessary to suit conditions in Hong Kong;
2. Use dye to demonstrate that adequate cover has been achieved unless otherwise instructed due to the fact that run off or water courses are coloured to an unacceptable level.

EXT14.W230.8 SPRAYING HYDROSEEDING SOLUTION

Spray the solution by high pressure pump to evenly cover the area and:

1. Constantly agitate the hydroseeding mixture during spraying to keep it homogeneous and avoid blockage to pipes;
2. Ensure that material is not lost during application due to run off.

POST APPLICATION OPERATIONS**EXT14.W310.8 PATCHING UP**

1. Where hydroseeded areas do not show 90% cover over any 10 m² area, 28 days after hydroseeding:
 - a. Respray areas where, in the opinion of the CM germination has been unsuccessful;
 - b. Respray areas affected by repairs to washout and gullies and other erosion on slopes.
2. Patch up areas which, in the opinion of the CM, are not accessible or are too small for the use of a hydroseeder, by broadcasting seeding as follows:
 - a. Lightly scarify the area with a rake or similar implement;
 - b. Broadcast the seed and fertilizer over the area at a rate of not less than 75 g/m²(±5%);
 - c. Cover the seed by lightly working into the surface or by spreading sufficient soil to just cover the seed;
 - d. Carry out broadcast seeding using Bermuda grass (Cynodon dactylon), perennial ryegrass (Lolium perenne) or carpet grass (Axonopus compressus).

EXT14.W320.8 PROTECTION OF HYDROSEEDING

1. Following hydroseeding, including patching up, cover the area with bio-degradable erosion resistant fabric, as **EXT14.M240** and fix securely with 100 mm long staples at 1000 mm staggered centres, with a minimum of 150 mm overlap between adjacent sheets of fabric sufficient to avoid local erosion;
2. On sloping ground lay fabric along the greatest slope and fully adhere to the hydroseeded surface by sprinkling with water with an Approved spray;
3. Do not permit walking on areas that have been hydroseeded unless for fixing protective material and for patching up.

EXT14.W330.8 WATERING DURING DRY WEATHER

During dry weather water hydroseeded slopes to encourage germination and growth of the grass as follows:

1. During periods of dry weather determine watering requirements with the CM twice weekly;
2. Thoroughly water areas as necessary or as Instructed and complete watering within 24 hours of receiving such instruction;
3. Use fresh water only for the works;
4. When required obtain an analysis of the water to be used for Approval;
5. Apply water using an Approved hose or sprinkler so as not to erode the slope;
6. Make good any erosion of hydroseeding that may occur.

EXT14.W340.8 APPLYING POST-PLANTING FERTILIZER

Apply post-planting fertilizer at a rate of 50 g/m²(±5%) between two months and nine months after application of hydroseeding and, unless otherwise permitted by the CM, during the period 1st March and 31st August.

EXT14.W350.8 CUTTING

1. Reduce by cutting to a height of 100 mm when the grass sward is 300 mm high;
2. Rake off and dispose of all cuttings within 24 hours of cut.

TESTING GRASS COVER**EXT14.W410.8 TESTING**

1. Attend with CM when carrying out tests to determine grass cover 100 days after grassing and at the end of the Establishment Period;
2. The number of tests will be determined by the CM in locations which, in his opinion, are representative of the grassed area as a whole;
3. Mark out an approximately square area of 10 m² at each test location and cut grass to a height of 300 mm if necessary;
4. Measure the percentage of bare ground, other than rock and other hard material, in each 10 m² test area.

EXT14.W420.8 ACCEPTANCE CRITERIA

1. Hydroseeding to achieve a cover by grass species of at least 90% of the surface area of each 10 m² of the area to be hydroseeded within 100 days after the area has been hydroseeded;
2. Grass cover to be healthy, vigorous and free from perennial and other weeds.

EXT14.W430.8 NON-COMPLIANCE

If the result of any test for grass cover does not comply with the specified requirements for grass cover, re-hydroseed or reseed the area as **EXT14.W310** (1) or (2), as Instructed depending upon the size of the defective area.

EXT15 MISCELLANEOUS EXTERNAL WORKS

DESIGN

GENERAL

EXT15.D010.8 EXTERNAL FURNITURE

External furniture in this Specification refers to a series of proprietary external furniture comprising, but not be limited to, seating bench, litter bin, chess table set, table tennis table, bollard and bicycle rack, in accordance with the performance requirements and design intent as specified.

EXT15.D020.A DESIGN SUBMISSION

1. Unless the CM instructs otherwise, submit to the CM at the time as specified in the **Project Specific Specification** at least 3 design proposals from different agents/suppliers for the external furniture specified in **EXT15.M010** to **EXT15.M060** meeting with the requirements as specified in the Specification and shown on the design intent Drawing(s) for CM's selection and approval. Each design proposal shall include plans, elevations, sections and details, and the following information:
 - a. The place of origin of the external furniture, name of manufacturer, brand name, model number, manufacturer's instruction on installation procedures;
 - b. Product details and descriptions etc. with detailed layout drawing indicating the relationship of the furniture to the surrounding external works;
 - c. Materials, colours, sizes, dimensions, assemblage and fixing of various components of the external furniture and other items as instructed by the CM and/or as shown on the design intent Drawing(s);
 - d. Minimum design loading for seating bench, chess chair, chess table and table tennis table;
 - e. Copy of structural calculation by RSE verifying the proposed minimum design loading for the external furniture. The copy of the structural calculation shall be certified true by the QCM;
 - f. Builder's works requirements and method statement on fixing the external furniture to the substrate, wall or pavement surface;
 - g. Test certificates for the specified tests in clauses **EXT15.M110** and **EXT15.M120**, where appropriate.

Each design proposal shall also be accompanied with a quotation from the respective agents/suppliers. The Contractor shall be responsible for the identification of agents/suppliers, preparation of invitation documents and invitation of quotations. Sufficient time shall be allowed for agents/suppliers to prepare and return their quotations. The quotation closing date and time, and location of the quotation box of the Contractor for deposition of quotations shall be specified in the invitation of quotations. Make invitation to the CM at least 14 days before the quotation closing date for his arrangement of representation to witness the opening of quotations at the Contractor's office. Quotations received shall be opened promptly after the specified closing date and time. Opening of the quotations shall be witnessed by at least two representatives of the Contractor and two representatives of the CM;

-
2. Re-submit revised design proposals, quotations, drawings and relevant information where commented or considered necessary by the CM;
 3. Upon notification in writing by the CM of his selected and approved design proposal among the submitted design proposals (a copy of the Contractor's submitted quotation in respect of the Approved design proposal may be attached with CM's notification for the sake of reference), engage the respective agents/suppliers for the supply and installation of the external furniture of the Approved design proposal provided that the actual cost of procuring each of the Approved external furniture shall not exceed the amount shown on the quotation submitted to the CM for the Approved design proposal;
 4. If, prior to entering into sub-contract with the agents/suppliers providing the Approved external furniture, it becomes apparent to the Contractor that the actual cost of any of the Approved external furniture exceeds the amount shown on the quotation submitted to the CM for the Approved design proposal for whatever reasons, give immediate notice to the CM for further instruction. Any claim for additional costs due to higher actual costs than the quotation submitted to the CM for the Approved design proposal arising from or after entering into sub-contract with the agent/supplier providing the Approved external furniture shall not be considered. Submit certified true copy of the sub-contract(s) to substantiate the actual costs of the procurement of the Approved external furniture;
 5. In addition to sub-clause (1) above, the CM may at his own discretion before or after the Contractor's submissions in sub-clause (1), obtain design proposals and quotations directly from agents/suppliers of external furniture and instruct the Contractor as appropriate;
 6. Within 28 days from the date of CM's notification of selection and approval of the design proposal, submit detailed information comprising shop drawings and fixing details of the external furniture for CM's approval;
 7. Allow at least 6 months for the process of ordering, material delivery and installation.

EXT15.D030.8**SAMPLE SUBMISSION**

After being notified in writing by the CM of his selected and approved design proposal and before ordering of the products, submit samples of the components of the external furniture showing their physical properties such as material, colour, texture and fixing details etc. for the CM's approval.

EXT15.D040.8**DELIVERY**

Submit original or certified true copies of Certificate of Origin for the external furniture delivered to the Site.

MATERIAL

EXTERNAL FURNITURE

EXT15.M010.8

SEATING BENCH

1. Seating bench: as specified in **Project Specific Specification**;
2. The design of the seating bench shall fit for purpose. The product shall be rigid, well supported and not prone to deformation. The components shall have no sharp edge, corner and projections etc.;
3. Material used shall be able to withstand cigarette burns and discolouring from exposure to ultraviolet radiation from the sun. There shall be no toxic emission upon combustion of any components and parts;
4. Allow a range of colours on materials used for CM's selection.

EXT15.M020.8

LITTER BIN

1. Litter bin: as specified in **Project Specific Specification**;
2. Provide litter bin with ash tray at designated smoking areas only as specified by CM and/or shown on the landscape layout plan;
3. The design of the litter bin shall fit for purpose. The product shall be rigid, well supported and not prone to deformation. The components shall have no sharp edge, corner and projections etc.;
4. Materials used must be able to withstand cigarette burns and discolouring from exposure to ultraviolet radiation from the sun. There shall be no toxic emission upon combustion of any components and parts;
5. Allow a range of colours on materials used for CM's selection.

EXT15.M030.8

CHESS TABLE SET

1. Chess table set: as specified in **Project Specific Specification**;
2. Allow at least one seating place for wheelchair user to access the chess table;
3. The design of the chess table set shall fit for purpose. The product shall be rigid, well supported and not prone to deformation. The components shall have no sharp edge, corner and projections etc.;
4. Materials used shall be able to withstand cigarette burns and discolouring from exposure to ultraviolet radiation from the sun. There shall be no toxic emission upon combustion of any components and parts;
5. Allow a range of colours on materials used for CM's selection.

EXT15.M040.8

BOLLARD

1. Bollard: as specified in **Project Specific Specification**;
2. The design of the bollard shall fit for purpose. The product shall be rigid, well supported and not prone to deformation. The components shall have no sharp edge, corner and projections etc.;
3. Materials used shall be able to withstand cigarette burns and discolouring from exposure to ultraviolet radiation from the sun. There shall be no toxic emission upon combustion of any components and parts;
4. Allow a range of colours on materials used for CM's selection;
5. Avoid protruding projections and loose-fixed component parts that are easy to be stolen.

EXT15.M050.8 TABLE TENNIS TABLE

1. Table tennis table: as specified in **Project Specific Specification**;
2. The design of the table tennis table shall fit for purpose. The product shall be rigid, well supported and not prone to deformation. The components shall have no sharp edge, corner and projections etc.;
3. Materials used must be able to withstand cigarette burns and discolouring from exposure to ultraviolet radiation from the sun. There shall be no toxic emission upon combustion of any components and parts;
4. Allow a range of colours on materials used for CM's selection.

EXT15.M060.8 BICYCLE RACK

1. Bicycle rack: as specified in **Project Specific Specification**;
2. The design of the bicycle rack shall fit for purpose. The product shall be rigid, well supported and not prone to deformation. The components shall have no sharp edge, corner and projections etc.;
3. Materials used shall be able to withstand cigarette burns and discolouring from exposure to ultraviolet radiation from the sun. There shall be no toxic emission upon combustion of any components and parts;
4. Allow a range of colours on materials used for CM's selection.

COMPONENTS OF EXTERNAL FURNITURE**EXT15.M115.8 WOOD PLASTIC COMPOSITE (WPC)**

1. Submission Requirements:
 - a. At sample submission and approval stage, submit a sample of the proposed WPC and accessories for the CM's approval together with all the following substantiation for the CM's information:
 - i. Job reference of the proposed WPC;
 - ii. Name, address and contact person of the local supplier;
 - iii. Name, address and contact person of the manufacturer;
 - iv. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agent or distributor in Hong Kong or document from the supplier showing the appointment of the manufacturer and manufacturer's agreement for the production of the proposed WPC;
 - v. Original or a certified true copy (issued or certified by the laboratory that complies with **PRE.B9.570**) of test reports showing full compliance with the requirements of sub-clause 2(b), 2(c) and 2(d) below for the CM's information of the proposed WPC:
 - The test reports shall be submitted at sample submission and approval stage, or at a time not later than the delivery of the materials;
 - In the event that no test report has been submitted for the CM's information when the materials are delivered to Site, remove all the delivered materials off Site. Bear all associated costs so incurred and no extension of time will be allowed.
 - b. For landscape furniture, after the approval of submitted sample of the proposed WPC, submit shop drawings for the CM's Approval showing the materials, fixing, joints, hatch opening details, loading requirements, supporting frames and drainage for the application of the proposed WPC in the outdoor landscape furniture;

-
- c. For decking and cladding components using the proposed WPC, submit detailed structural calculations of the supporting frames endorsed by RSE and the shop drawings and associated information as specified in sub-clause (1)(b) above. Any junctions between WPC decking components specified in the shop drawings shall not produce any gaps jeopardizing pedestrians.
 - 2. Quality Requirements:
 - a. A proprietary product made of plastic and wood fibre;
 - b. Surface spread of flame shall comply with Class 2 of BS 476 Part 7:1997, or Class C of BS EN 13501-1:2007 when used in indoor site furniture, cladding or decking;
 - c. Composition of the submitted WPC shall contain a minimum of 35% wood fibre;
 - d. Coefficient of friction shall comply with Grade “Good” of Appendix C of the Design Manual: Barrier Free Access 2008.

EXT15.M116.8**MAINTENANCE MANUAL FOR WPC**

Submit to the CM five sets of maintenance manuals for the completed works within three months after the certified date of completion of the Works. This should be developed in parallel with the design and should include, but not be limited to, the following information:

- 1. Name, address and telephone number of each supplier and / or sub-contractor involved in the supply of materials, components, assemblies and finishes;
- 2. Recommendations in English and Chinese for maintenance procedures and routine maintenance activities;
- 3. A full set of as-built drawings including the structural calculations;
- 4. Submit one set electronic copy of the as-built drawings in AutoCAD file format or other editable format as approved by the CM.

EXT15.M120.8**FINSIHES TO GALVANIZED MILD STEEL**

Show no sign of rusting when tested to ASTM B117-97:2009 for 1000 hours.

WORKMANSHIP

GENERAL

EXT15.W010.8 HANDLING AND STORAGE

Handle and store all external furniture carefully and in a manner that:

1. Prevent damage to pre-finished surfaces;
2. Retain protective coverings in position for as long as possible;
3. Prevent contact with harmful elements.

EXT15.W020.8 FIXING, ASSEMBLING AND LAYING

1. Carry out any fixing, assembling or installation in accordance with the manufacturer's instructions;
2. Ensure all external furniture is/are placed and fixed in the position as set out in the Drawings, and in accordance with manufacturer's recommendation;
3. Avoid exposing the base plate which may cause potential hazard in hurting the feet of pedestrians.

INSTALLATION OF EXTERNAL FURNITURE

EXT15.W110.8 SEATING BENCH

Install seating bench in accordance with manufacturer's specifications and instructions.

EXT15.W120.8 LITTER BIN

Install litter bin in accordance with manufacturer's specifications and instructions.

EXT15.W130.8 CHESS TABLE SET

Install chess table set in accordance with manufacturer's specifications and instructions.

EXT15.W140.8 TABLE TENNIS TABLE

1. Assemble table tennis table in accordance with manufacturer's specifications and instructions;
2. Location of the table tennis table to be advised by CM;
3. The table tennis table shall be firmly fixed to the ground or be secured against displacement either by its own weight or by anchoring. The table tennis table installed in accordance with the manufacturer's instructions shall withstand without any displacement or toppling over a horizontal force of 1.5 kN per meter length of the table structure, applied in the middle of the highest part of the structure (excluding the net), in both the length and the width of the table.

EXT15.W150.8 BOLLARD

1. Install bollard onto the pavement surface in accordance with manufacturer's specifications and instructions;
2. Should the installed bollard become off-plumbed due to ground settlement and/or soil displacement etc., the Contractor shall rectify the situation where applies to ensure the bollard is firmly upright.

EXT15.W160.8**BICYCLE RACK**

1. Assemble bicycle rack in accordance with manufacturer's specifications and instructions;
2. Install bicycle rack with the adjacent pavement surface in accordance with manufacturer's specifications and instructions.

EXT16 ZERO IRRIGATION SYSTEM (ZIS) - INSITU TYPE

MATERIALS

GENERAL

EXT16.M010.8

DEFNITION

Zero Irrigation System (ZIS) - Insitu Type is an at-grade sub-irrigation system which utilises capillary action to deliver storm water stored in water retention boxes to top soil.

EXT16.M020.8

COMPOSITION

The ZIS shall comprise the following major components:

1. In-situ reinforced concrete planter wall;
2. Waterproofing membrane - Sodium bentonite layer, as **EXT16.M110**;
3. Filter layer, as **EXT16.M140**;
4. Water retention box as **EXT16.M130**;
5. Drainage cell as **EXT16.M130**;
6. River sand as **FIN1.M410**;
7. Decomposed Granite (DG) as **EXT12.M120**;
8. Ground water recharge device as **EXT16.M145** and overflow pipe as **DRA2.M190**;
9. Mechanical water level indicator & lockable inspection chamber as **EXT16.M160**;
10. Fixing device for tree anchorage.

EXT16.M030.8

APPLICATION OF OTHER WORKSECTIONS

Where applicable, comply with the relevant provisions of the following Worksections unless otherwise specified in this Worksection:

1. Concrete Works: Worksection CON;
2. Earthworks: Worksection EXT12;
3. Drainage to Planter: Worksection EXT13;
4. Pipes and fitting: Worksection DRA;
5. Soft Landscape Works (Planting): Worksection SLW.

EXT16.M040.8

ACCESSORIES

The ZIS shall comprise the following accessories in the installation:

1. Sodium bentonite powder;
2. Sodium bentonite strip.

EXT16.M050.8

MATERIAL SUBMISSIONS AND SHOP DRAWINGS

1. Submit material submission and shop drawings to CM for Approval at least 6 months before construction;
2. Re-submit material submission and shop drawings to CM for Approval within 14 days upon receipt of CM's comments which require amendments to be made;
3. The shop drawings above shall include but not be limited to the following:
 - i. The layout and configuration of ZIS;
 - ii. The water proofing;

-
- iii. The configuration of ground water recharge devices and overflow pipes;
 - iv. The mounting of water pipes;
 - v. The location, access and details of inspection chambers within mechanical water level indicator;
 - vi. The dimensions and setting out;
 - vii. Other builder's work requirements;
 - viii. The interfacing details with structure in the vicinity.
4. The material submission above shall include but not be limited to the following:
- i. Particulars of all materials for the construction of ZIS;
 - ii. Manufacturer's literature and certificates of material compliance with the requirements of this Specification.

EXT16.M060.8**METHOD STATEMENT**

Submit to the CM, at least 6 months before construction, and resubmit if amendments are necessary, the method statement comprising but not limited to the following:

- 1. Details and particulars of materials to be used;
- 2. Method of application of the materials to be deployed in relation to ZIS;
- 3. Description of the complete procedures for construction of all components of ZIS;
- 4. Programme of the construction works including verification testing.

EXT16.M070.8**SAMPLES**

Submit samples of components of the ZIS including but not limited to the following for CM's approval at least six months prior to construction of ZIS:

- 1. Sodium bentonite waterproofing layer;
- 2. Filter layer;
- 3. Water retention box;
- 4. Drainage cell;
- 5. River sand;
- 6. Lockable inspection chamber with cover;
- 7. Pipes & fittings for ground water recharge and overflow pipe;
- 8. Mechanical water level indicator.

EXT16.M080.8**AS-BUILT RECORD FOR PLANTERS WITH ZIS**

Submit full particulars of the as-built ZIS for CM's review and record. The record shall include all relevant information such as estimated water retention capacity, depth and as-built dimensions.

MAJOR COMPONENTS**EXT16.M110.8****SODIUM BENTONITE WATERPROOFING LAYER**

The sodium bentonite waterproofing layer shall be a geo-synthetic clay liner coated with polyethylene layer to the entire surface of the woven side, with the following characteristics:

- 1. An even and continuous bentonite layer made mainly of sodium bentonite powder;
- 2. Mass per unit area: minimum 4,300 g/m²;
- 3. Thickness: minimum 6mm;
- 4. Maximum tensile strength in accordance with EN ISO 10319: machine direction not less than 12.0 kN/m; or ASTM D6768: machine direction not less than 12.0 kN/m;
- 5. Peel strength in accordance with ASTM D6496: not less than 60N/10cm;

-
6. Static puncture strength in accordance with EN ISO 12236 or ASTM D6241 not less than 2,000N;
 7. Hydraulic Conductivity in accordance with EN 14150 or ASTM D5084-90: not more than 10-14 m/s;
 8. Index Flux (q₁₀) in accordance ASTM D 5887: minimum 2.7 x 10⁻⁹ (m³/m²)/s;
 9. Geotextile layer: polypropylene non-woven material.

EXT16.M120.8 FILTER LAYER

Refer to **EXT13.M110**.

EXT16.M130.8 WATER RETENTION BOX

The water retention box shall be a modular polyethylene or polypropylene tank resistant to bacteria, moulds and algae, soil-borne chemicals. The water retention box shall possess the following characteristics:

1. Type: prefabricated modular tank intended for underground application;
2. Compressive strength in accordance with ASTM D1621: not less than 210 kPa or equivalent;
3. Approximate size: (Length) 600-800mm, (Width) 375- 475mm, (Height) 375-475mm.

Refer to drawing no. LA/STD/L/AS-01.

EXT16.M135.8 DRAINAGE CELL

A minimum 40mm thick polyethylene moulded drainage layer shall have the following functions and properties. Delivery and installation shall be in accordance with the manufacturer's instructions.

1. To allow water to be distributed evenly across water-retention boxes;
2. High crush strength to support the loading of vegetation and soil to be provided;
3. Biological and chemical resistance: unaffected by moulds and algae, soil-borne chemicals, bacteria and bitumen;
4. Flow rate in accordance with ASTM D4716: not less than 16 litres/ m²/ second at 1% gradient;
5. Compressive strength in accordance with ASTM D1621: not less than 980 kPa or equivalent.

EXT16.M140.8 SAND

Refer to **EXT12.M230**.

EXT16.M145.8 GROUND WATER RECHARGE DEVICE

Once the designated water discharge level is reached, the ground water recharge device shall allow discharge of excess water from in-situ reinforced concrete planter wall to adjoining packets of aggregates.

Materials: UPVC pipes and fittings refer to **DRA2.M190**.

EXT16.M150.8 OVERFLOW PIPE

Once the designated water discharge level is reached, the overflow pipe shall allow direct discharge of excess water from in-situ reinforced concrete planter wall directly to nearby drainage provision.

Materials: UPVC pipes and fittings refer to **DRA2.M190**.

EXT16.M160.8 MECHANICAL WATER LEVEL INDICATOR

1. The mechanical water level indicator shall be installed inside the lockable inspection chamber at the appropriate locations of the system to reflect the level of retained water. The dial should be conveniently readable from outside the lockable inspection chamber upon removal of cap;
2. The water level indicator should possess the following properties:
 - a. Mechanically operable without the need of batteries or electric wiring;
 - b. Dial face with empty and full indicator.

ACCESSORIES**EXT16.M200.8 SODIUM BENTONITE POWDER**

Sodium bentonite in powder form.

EXT16.M210.8 SODIUM BENTONITE STRIP

Flexible hydrophilic strip made of but not limited to natural sodium bentonite clay and synthetic rubber as per manufacturer's recommendations.

WORKMANSHIP

GENERAL

EXT16.W010.8 HANDLING AND STORAGE

Handle and store the materials carefully as per the manufacturer's recommendations and in a manner that:

1. Prevents damage to surface coating;
2. Prevents contact with harmful elements.

EXT16.W020.8 BUILDER'S WORK IN CONNECTION

1. In-situ reinforced concrete planter wall for ZIS as CON1;
2. Sub-soil drainage pipe as DRA2.

EXT16.W030.8 FIXING, ASSEMBLING AND LAYING

Carry out any fixing, assembling or laying in accordance with the manufacturer's instructions.

INSTALLATION OF MAJOR COMPONENTS

EXT16.W110.8 INSTALLATION

1. Compact the soil within the confines of planters to prepare for the base of ZIS as **EXT3.W120**;
2. Laying sodium bentonite layer up to 200mm lap down of the reinforced concrete planter wall with minimum 150mm overlapping or as per manufacturers' recommendations between each sodium bentonite layer. Fix and apply the sodium bentonite layer in accordance with the manufacturer's instructions;
3. Lay drainage cell flat at the base of reinforced concrete planter in accordance with manufacturer's instructions;
4. Lay filter fabric on top of the drainage cell;
5. Connect the ground water recharge device from ZIS to adjacent subsoil area;
6. Verify level of pipe opening against nearby silt trap or sub-soil drainage system before connecting to the overflow pipe from the ZIS;
7. Seal pipe opening of the reinforced concrete planter wall by the sodium bentonite grout (bentonite powder or bentonite strip) in accordance with the manufacturer's instructions;
8. Laying the water retention boxes wrapped with filter layer in accordance with the manufacturer's instructions;
9. Filling the spaces between water retention boxes with river sand up to 50mm above the boxes;
10. Install lockable inspection chamber and mechanical water level indicator;
11. Lay the filter layer on top of river sand;
12. Carry out water flood test as **EXT16.T110**;
13. Backfill DG as **EXT12.M120** for planter.

TESTING

ON-SITE VERIFICATION TEST

EXT16.T110.A WATER FLOOD TEST TO ZIS

1. Test Arrangements:
 - a. Carry out water flood test to verify the water-tightness of the ZIS planters prior to backfilling of DG; test to be carried out in the presence of the CM or his representatives;
 - b. The difference of water level recorded from the beginning of water flood test and after 48 hours shall not be more than 10mm;
 - c. The test report and water level records shall be submitted to the CM within 7 days after the test.
2. Test Samples:
 - a. All and entire ZIS planters unless instructed otherwise.
3. Test Method:
 - a. Carefully flood the ZIS planter to a level agreed with the CM and maintain for 48 hours;
 - b. Mark the top water level at clearly visible locations and regularly inspect for any drop of water level.
4. Non-compliance:
 - a. In the event of test failing to meet the requirement stated in sub-clause 1(b) above:
 - i. Submit to the CM detailed proposals for remedial measures;
 - ii. Carry out subsequent repairs and flood tests until the ZIS is watertight;
 - iii. Bear all associated time and costs of any subsequent flood testing.

EXT17 AUTOMATIC DRIP IRRIGATION SYSTEM

DESIGN

GENERAL

EXT17.D010.N

DEFINITION

1. Automatic Drip Irrigation System (ADIS) is a surface drip irrigation system which delivers water to the planting areas at low water pressure through a network of driplines fitted with emitters. A typical ADIS shall comprise a Control Zone and Watering Zone(s);
2. The demarcation of the Control Zone is measured from a water supply point teed-off from the main water supply pipes, up to the boundary of the Watering Zone(s) where water is distributed through a network of driplines. This zone comprises all the regulating devices such as controller unit, valves, filter and pressure regulator for controlling the proper operation of the system, and to ensure that a specified amount of water is delivered to all the planting areas within the specified period;
3. A Watering Zone is demarcated by a set of driplines arranged in continuous loop served by one single solenoid valve. Isolation valves shall be provided to enable proper isolation of different zones for maintenance. The operation of one or more Watering Zones in an ADIS is controlled by the regulating devices in the Control Zone.

EXT17.D020.N

GENERAL REQUIREMENTS

1. The ADIS shall be designed, supplied and installed by a sub-contractor Approved by the CM;
2. Subject to the CM's Approval, the sub-contractor shall be a company which has:
 - a. More than three years of relevant experience in ADIS design, installation and maintenance; and
 - b. At least one Technical Manager who has more than three years of design experience and he / she shall be responsible for all technical issues including design submission, certification and checking after installation.
3. ADIS shall be installed for the areas indicated in Drawing Nos. and, and comply with the following requirements:
 - a. The ADIS shall be designed to effectively water all planting areas and to allow operational flexibility to cater for different watering requirements in different planting areas (Watering Zones) separately due to variation in plant type / species and soil condition;
 - b. All plantings shall receive specific amount of water within the day for proper and healthy growth and sufficient soaking into the soil for encouragement of vigorous root growth;
 - c. All above ground services, e.g. intermediate junction boxes, shall be arranged in concealed but accessible locations, and demarcated for easy identification;
 - d. Coordinate the design and installation works to avoid abortive works. Coordination at early design stage is required when installation of underground connection pipe across planters is necessary.

EXT17.D030.N GENERAL SCOPE OF WORKS

1. Technical design of the ADIS shall meet the design criteria and parameters specified in **EXT17.D040**. The design and installation of the plumbing works of the ADIS shall comply in all aspects with the requirements of the Water Authority;
2. The ADIS shall be installed in accordance with the Approved design proposal including installation of teed-off fittings to the main water supply point;
3. Check and test of every system component. The completed installation shall be subject to satisfactory testing as **EXT17.T020**;
4. Provide training to the management and maintenance staff during the Maintenance Period;
5. Inspection of the ADIS on a monthly basis during the Maintenance Period as **EXT17.T040** to ensure proper performance of the system.

EXT17.D040.N DESIGN PARAMETERS

1. Dripline design shall meet the following requirements:
 - a. Dripline emitter spacing to be 300mm +/- 10%;
 - b. Dripline to dripline placing to be 300mm +/- 10% apart;
 - c. Driplines to be installed in “Ring” or “Grid” connection;
 - d. The lateral run length of dripline at a given water pressure shall not exceed the maximum lateral run length as recommended by the manufacturer.
2. Watering Zone
 - a. The aggregate flow rate for each Watering Zone shall not exceed 0.7 litre/second;
 - b. The number of Watering Zones should be minimised as far as practicable;
 - c. The area of each Watering Zone shall not exceed the effective area in relation to the maximum lateral length of the dripline in design calculation or 100 m², whichever is less;
 - d. One Watering Zone may serve more than one individual planter. The driplines in each planter may be linked up using distribution tubing as **EXT17.M130** for connecting the driplines system between planters within each Watering Zone. Distribution tubing shall pass through the pipe sleeve pre-installed in planter walls; or underground PVC conduit for kerb planters;
 - e. The water velocity in headers shall be designed to no more than 1.5 metre/second and no more than 3.5 bar to reduce friction loss, long-term wear and hydraulic water hammer.
3. Component Security
 - a. All system components requiring subsurface protection during installation or for maintenance shall be accommodated in irrigation valve boxes as **EXT17.M100**. The irrigation valve boxes shall be arranged in concealed but accessible locations and clearly demarcated with irrigation valve box labels as **EXT17.M110** for easy identification for future maintenance;
 - b. Alternatively, the controller unit in the Control Zone may be mounted on wall or a post in upright position. In this situation, the controller unit shall be stored inside a proprietary IP66 stainless steel enclosure fitted with a stainless steel lock.
4. Rain sensor

Mount the rain sensor on the top of a stainless steel post at min. 1500 mm above ground level. For best performance, the sensor shall be positioned in an open area where the rain sensor head receive direct rainfall without physical obstruction and within lightning protection zone which provide protection against lightning strike.

EXT17.D050.N WATER CONSUMPTION RATE*Option 1*

The irrigation patterns and programmes shall be optimized to suit the plant growth with minimum water consumption. The average annual water consumption shall be litre/day/m².

Option 2

The irrigation patterns and programmes shall be optimized to suit the plant growth with minimum water consumption. The average annual water consumption shall be not more than 3.5 litre/day/m² of net planting area.

EXT17.D060.N TECHNICAL DESIGN PROPOSAL SUBMISSION

1. At least six months before the programmed commencement of the installation work on Site, submit for CM's approval the technical design proposal, including shop drawings, installation details, calculations, manuals, method statement, installation programme, testing proposal and training proposal as **EXT17.T020**. The submission shall detail the installation procedures and other relevant technical information to substantiate the system design;
2. Shop drawings shall include but not be limited to the following:
 - a. Schematic design layout and configuration of ADIS showing the location of controller / timer and other components;
 - b. Number, setting out and the covering area of each Watering Zone. Each zone shall be controlled by means of a solenoid valve to fulfill the system performance;
 - c. Design calculation to demonstrate compliance with the design criteria and parameters, adequacy of the supply pressure, flow rate and pipe sizes for effective operation of the system;
 - d. Other builder's work requirements; and
 - e. Interfacing details with structure services and works in the vicinity.
3. Resubmit for Approval within 14 days upon receipt of CM's comments. Allow the times for submission / resubmission for obtaining the CM's Approval. Bear all associated costs and no extension of time will be granted.

EXT17.D070.N MATERIAL SUBMISSION

1. Within 14 days upon acceptance of the technical design proposal by the CM, submit samples of material to the CM for approval;
2. The list of samples of the proposed materials shall include but not be limited to the following:
 - a. Battery powered controller unit with external rain sensor input port;
 - b. *Rain sensor;
 - c. Solenoid valve;
 - d. Stainless Steel Screen Filter;
 - e. Ball Valve;
 - f. Non-return Valve;
 - g. Pressure Regulator;
 - h. Irrigation Valve Box;
 - i. Dripline;
 - j. Air Relief Valve;
 - k. Flush Valve;
 - l. Dripline Operation Indicator; and
 - m. Others accessories - uPVC pipes and fittings.

-
3. All pipes and fittings for plumbing works under sub-clause (2) shall comply with the requirement of the Water Authority for the intended application;
 4. Submission Requirements:
Full particular of all materials including:
 - a. Catalogue, brand name / model name and job reference;
 - b. Name, address and contact person of the local supplier;
 - c. Name, address and contact person of the manufacturer;
 - d. Approval by the Water Authority with a valid approval document if applicable;
 - e. Manufacturer's literature and certificates of components showing compliance with the requirements of this Specification;
 - f. Other specified submission requirements for the materials.
 5. Sample Board:
 - a. Provide sample board(s) to display samples of components, pipes, fittings and jointing materials and accessories to be used in the ADIS installation and listed in sub-clause (2) above;
 - b. The sample board is to be kept by the CM on Site together with associated relevant certificates / test reports / catalogues / supporting documents upon submission;
 - c. Each sample, with clear numbering and labelling, shall be firmly fixed onto a rigid wooden or metal board. A list shall also be affixed on the sample board to show the item description, make and brand, country of origin and locations of installation.

MATERIAL

GENERAL

EXT17.M010.N GENERAL REQUIREMENTS

All materials of the ADIS shall comply with the relevant clauses in other Worksections of the Specification unless otherwise stated in this Worksection EXT17. Alternative materials may be used only with prior Approval before ordering / installation.

EXT17.M020.N COMPOSITION

The ADIS shall comprise a Control Zone and Watering Zone(s):

1. Control Zone
 - a. Battery powered controller unit with external rain sensor input port, as **EXT17.M030**;
 - b. *Rain sensor as **EXT17.M040**;
 - c. Solenoid valve as **EXT17.M050**;
 - d. Screen Filter as **EXT17.M060**;
 - e. Other accessories including but not limited to
 - i. Ball Valve as **EXT17.M070**;
 - ii. Non-return Valve as **EXT17.M080**;
 - iii. Pressure Regulator as **EXT17.M090**;
 - iv. Irrigation Valve Box as **EXT17.M100**.
2. Watering Zone
 - a. Dripline with built-in check valve, as **EXT17.M120**;
 - b. Other accessories including but not limited to
 - i. Air Relief Valve as **EXT17.M140**;
 - ii. Flush Valve as **EXT17.M150**;
 - iii. Dripline Operation Indicator as **EXT17.M160**;
 - iv. uPVC pipes and fittings as **EXT17.M170**.

MAJOR COMPONENTS

EXT17.M030.N BATTERY POWERED CONTROLLER UNIT

The controller unit shall possess the following characteristics:

1. Power Source: non-built-in battery powered using AA or 9V alkaline battery;
2. With external rain sensor input port;
3. With output terminals to independent solenoid valves using DC pulse (controller unit with built-in solenoid valve as one single unit not acceptable);
4. Water adjustment ranging from at least 0 to 150% to accommodate changing weather condition;
5. Non-volatile memory holding all programmes without batteries;
6. Low battery indicator;
7. Water resistance rating:

IP24 rating or above for above ground installation and IP68 rating for below ground installation;
8. Underwriters Laboratories (UL) or Conformité Européenne (CE) Approved;

-
9. For Control Zone serving more than one Watering Zone, the controller unit provided shall be a multi-stations model with multiple programming options;
 10. Manual irrigation mode available.

EXT17.M040.N RAIN SENSOR (OPTIONAL)

The rain sensor shall have the following characteristics:

1. Compatible with controller unit as **EXT17.M030**;
2. Multiple rainfall setting;
3. Adjustable device to control drying time;
4. With latching hinge and bracket to maintain alignment;
5. Switch electrical rating: 24 V, 3A or above;
6. UL or CE Approved.

EXT17.M050.N SOLENOID VALVE

The solenoid valve shall possess the following characteristics:

1. One-piece solenoid design with captured plunger and springs;
2. Operate with DC latching solenoid;
3. Compatible with system controller unit as **EXT17.M030**;
4. With flow control device for precise zone adjustment and manual shutoff;
5. Internal bleed with manual override;
6. Minimum Operating pressure range: 1.5 to 10 bars;
7. Water Temperature rating: up to 40 °C;
8. Operating range: 9VDC.

EXT17.M060.N SCREEN FILTER

The filter shall possess the following characteristics:

1. The filter case is made up of UV-resistant, durable corrosive-resistant plastic material;
2. With replaceable 150-200 mm mesh stainless steel screen;
3. With flush cap or flush valve for easy flushing of particles;
4. Operating pressure up to 8 bars;
5. Operating ceiling flow rate not less than 60 litre/minute.

EXT17.M070.N BALL VALVE

Refer to **PLU1.M610** and **PLU1.M660**.

EXT17.M080.N NON-RETURN VALVE

Refer to **PLU1.M640**.

EXT17.M090.N PRESSURE REGULATOR

Refer to **PLU1.M910** and **PLU1.M920**.

EXT17.M100.N IRRIGATION VALVE BOX

The irrigation valve box shall possess the following characteristics:

1. Made up of UV-resistant materials;
2. Reinforced cover with bevelled edges;
3. Lid shall be securely fastened to body with stainless steel bolts, washers and clips;
4. Skid-resistant lid texture;
5. Pre-moulded pipe slots;

-
6. Sidewall with reinforced ribs with wide flange bases.

EXT17.M110.N IRRIGATION VALVE BOX LABEL

Irrigation Valve box labels to be 250 mm x 140 mm x 2 mm thick, white acrylic or aluminium with:

1. Typical wording includes “Control Zone / Watering Zone” as heading and “Automatic Controller / Gate valve / non-returning valve / filter / pressure regulator / solenoid valve etc.” as contents;
2. If there is more than one Watering Zone, the heading shall be subdivided into zone 1, zone 2, zone 3, etc.;
3. The wording shall be heat - indented in black characters;
4. The size of the capital letter to be not less than 16 mm and the lower case to be not less than 9 mm;
5. The size of Chinese character to be not less than 20 mm;
6. Fix the label to the top cover of the irrigation valve box with silicon adhesive sealant.

EXT17.M120.N DRIPLINE WITH BUILT-IN CHECK VALVE

The dripline shall possess the following characteristics:

1. 17mm diameter;
2. Constructed with pressure compensation, integral emitters with an internal check valve;
3. Protection to minimize dirt intrusion;
4. UV resistant tubing;
5. Flow rates: 2.2-2.3 litre/hour;
6. Minimum Operating Pressure: ≤ 1.4 bars;
7. Emitter spacing 300mm +/- 10%.

EXT17.M130.N DISTRIBUTION TUBING

The distribution tubing shall possess the following characteristics:

1. 17mm diameter;
2. UV resistant tubing;
3. Maximum Operating Pressure: ≥ 4.1 bars.

EXT17.M140.N AIR RELIEF VALVE

1. Operating pressure range: up to 4.13 bars;
2. Material: UV-resistant plastic.

EXT17.M150.N FLUSH VALVE

1. Operating pressure range: up to 3.0 bars;
2. Parts removable for maintenance;
3. Material: UV-resistant plastic.

EXT17.M160.N DRIPLINE OPERATION INDICATOR

The indicator provides visual confirmation that the ADIS is in operation and shall possess the following characteristics:

1. Minimum operating pressure should be compatible with the minimum operating pressure of the dripline system;

-
2. Indicator stem shall extend to a height of at least 12 cm for vertical pop-up stem type, or the color flag shall be at upright position (90°) for flag type operation indicator;
 3. Material: UV-resistant plastic.

EXT17.M170.N UNPLASTICIZED PVC (UPVC) PIPES AND FITTINGS

Refer to **PLU1.M200**.

EXT17.M180.N PIPE SLEEVES

1. Refer to **PLU1.M430**;
2. Diameter of pipe sleeves shall be at least one size larger than the PVC conduit that passes through the wall partition.

EXT17.M190.N SILICON SEALANT

Refer to **WAT5.M170**.

WORKMANSHIP

GENERAL

EXT17.W010.N

SITE ASSEMBLY AND INSTALLATION

1. Prior to installing the ADIS, ensure the main water supply system is functioning properly, and is suitable for the proposed ADIS;
2. Install ADIS strictly in accordance with the manufacturer's recommendations and the Approved installation details;
3. Coordinate the planter wall / kerb construction and makes necessary allowance for connection fittings to link up with driplines in adjacent planters to form one Watering Zone. The provision and installation of PVC conduits and pipe sleeve fittings on planter walls / kerb should comply with the Specification and Drawings.

EXT17.W020.N

HANDLING AND STORAGE

Handle and store the materials carefully as per the manufacturer's recommendations.

EXT17.W030.N

BUILDER'S WORK IN CONNECTION

- *1. In-situ reinforced concrete planter wall as CON1;
- *2. Masonry walls as MAS1;
3.

EXT17.W040.N

FIXING, ASSEMBLING AND LAYING

1. Ensure adequate protection to the existing waterproofing layer during the installation process;
2. Provide adequate temporary protection to the installed irrigation system in the field during construction and liaise closely with the Approved sub-contractor on the protection required during construction;
3. Carry out any fixing, assembling or laying in accordance with the manufacturer's recommendations.

INSTALLATION OF MAJOR COMPONENTS

EXT17.W050.N

SEQUENCE AND GENERAL PROCEDURES

1. Preparatory Works
 - a. Check and confirm the water pressure and flow rate of the water supply point, to which the ADIS is to be connected, are in order;
 - b. Do not remove the non-return and air vacuum valves from the water supply point;
 - c. Check and confirm the installation locations of the controller unit of the Control Zone;
 - d. Remove any stones or sharp-edged objects or construction debris from the soil to avoid damage to the drip tubing;
 - e. Keep all pipes and fittings clear of dirt and debris, protect exposed ends by plugging while the installation of other components is in progress.
2. Control Zone Installation

-
- a. Place irrigation valve box at appropriate location and connect pipe fitting to the water supply point through pre-molded pipe slots of the irrigation valve box. Accommodate all controller unit, gate valves and non-return valves into irrigation valve box(es);
 - b. For upright installation of the controller unit, mount the stainless steel controller box to wall or a stainless steel post with conduit clamp at 1,100-1,500 mm above ground level;
 - c. Mount the rain sensor (if provided) on the top of a stainless steel post at 1,500-2,000 mm above ground level;
 - d. Fix a copy of laminated schematic design layout plan of the ADIS referred to at **EXT17.D060** (2)(a) inside the enclosure where the controller unit is located;
 - e. Connect and accommodate solenoid valve, screen filter and pressure regulator into irrigation valve box(es);
 - f. Fix the irrigation valve box labels as **EXT17.M110** on the top of the irrigation valve boxes;
 - g. Determine the number of Watering Zones.
3. Watering Zone Installation
- a. Identify the zone boundaries of each Watering Zone;
 - b. Determine the maximum lateral run length for a given water pressure;
 - c. Determine the dripline layout based on the configuration of the planter and identify the locations of supply header and flush header. The location of all headers shall be 150mm from the planter wall;
 - d. Establish the overall grid pattern by connecting the supply header and the flush header with driplines using manufacturer's fittings as appropriate. The spacing between driplines is 300mm +/- 10 % apart and 150mm from planter edge;
 - e. For Watering Zone serving more than one planter, connect the driplines system in each planter by distribution tubing which may pass through the pipe sleeves pre-installed in planters wall or underground PVC conduits for kerb planters;
 - f. Perform a pressure loss calculation from the water supply point to the farthest end of the header to confirm that the water pressure at all driplines is adequate;
 - g. The lateral run length of a Watering Zone is measured from the supply header to the flush header, which should not exceed the maximum lateral run length as recommended by the manufacturer;
 - h. Use Approved dripline stakes to hold driplines in place;
 - i. Install the air relief valve at the highest point of the Watering Zone;
 - j. Install the flush valve at the lowest point of the flush header or at the end of the dripline;
 - k. Install the operation indicator at the appropriate location;
 - l. Flush the dripline systems thoroughly prior to installing the last connections on each header;
 - m. Repeat the process as described in sub-clauses (3)(a) to (3)(l) above for each Watering Zone.
4. Final Check
- a. Check all valves, tubing and connections for leaks;
 - b. Verify the location of each air relief valve in field, ensuring one is installed at each localized high point;
 - c. Check and record water pressure at the supply header and flush header to ensure the system runs below the maximum operating pressure.

TESTING

GENERAL

EXT17.T010.N

GENERAL REQUIREMENTS

1. Carry out complete performance tests for all components and systems installed, make all necessary adjustments and commission the installations in accordance with the Specification, manufacturers' recommendations and the completed installation satisfies the functional requirements specified;
2. Prior to any tests, submit detailed procedures and a programme for testing for CM's approval;
3. Submit the followings for CM's approval:
 - a. Test reports;
 - b. Operation and Maintenance manuals;
 - c. As-built record drawings.
4. Provide training on management and maintenance of the ADIS to estate management and maintenance staff.

EXT17.T020.N

TESTING AND TRAINING

1. At least two (2) weeks before scheduled testing, submit testing schedule to the CM for approval. The testing shall demonstrate the ADIS is designed and installed in accordance with the Specification and manufacturers' recommendation;
2. The tests shall include but not limited to the following items:
 - a. Test the proper functioning of the controller units, including manual activation of each control valve in sequence, and automatically by using the program setting function of controller unit;
 - b. Test the proper functioning of the rain sensor (if provided);
 - c. Test the proper functioning of all valves, screen filters and pressure regulators;
 - d. Carry out water tightness test in accordance with **PLU1.T050**;
 - e. Carry out water pressure test in each Watering Zone to ensure that the pressure variation within the Watering Zone falls within 10 percent range;
 - f. Carry out water consumption rate test to ensure that the water consumption rate falls within +/- 5 percent of the range specified in **EXT17.D050**;
 - g. Test the uniformity of the wetting pattern formed around emitters of the driplines by visual observation during operation to demonstrate uniform water delivery;
 - h. Test the proper functioning of the locking devices in the irrigation valve boxes, operation indicator and other provisions.
3. In the event of any test failures, investigate the cause(s) of the failure, modify the installation works and replace all defective components as required. Carry out re-test for compliance as required under sub-clauses (1) and (2). Should any preceding test result may have been impacted by a particular fault, repeat such test after the fault has been rectified. Bear all associated costs for investigation / modification / replacement works etc. and the test / re-test required. No extension of time will be granted;
4. Upon completion of all tests, submit test records to the CM for final review;
5. Provide appropriate training to the estate management and maintenance staff on the proper operation and maintenance of the system including but not limited to briefing session, on-site familiarization visit and technical demonstration.

EXT17.T030.N OPERATION AND MAINTENANCE MANUALS

1. Within one month after completion of the whole ADIS system, submit an Operation and Maintenance Manuals in both English and Chinese, to the CM for approval. Provide to the CM one (1) digital copy and three (3) sets of binded hard copy of the Operation & Maintenance Manuals;
2. The manuals shall include but not limited to the following information:
 - a. A full set of as-built drawings, updated to include any changes made up to the time of completion of the ADIS system;
 - b. A simplified user manual and troubleshooting guide covering the major components of the ADIS for frontline estate management and maintenance staff, in both English and Chinese, highlighting the key operation and maintenance procedures;
 - c. Recommendations for routine maintenance works including:
 - i. Irrigation schedule (daily watering quantity and intervals);
 - ii. Operating schedule (adjustment of timer under different seasons);
 - iii. Timing and method for cleaning, checking and replacement of any components;
 - iv. A method statement covering the procedures for replacement of damaged or otherwise defective materials or components.
 - d. Training video with audio clips on the following topics:
 - i. Setting up of controller units, rain sensor, solenoid valve and pressure regulator;
 - ii. Maintenance issues such as cleansing of filter and flushing of driplines;
 - iii. Trouble-shooting and checking procedures in case the system breakdowns;
 - iv. Replacement of defective components such as controller units and driplines.
 - e. Technical specification, schedules, catalogues and user manuals of major components including contacts (i.e. designated contact persons, e-mail addresses, postal addresses and telephone numbers) of each agent and / or manufacturers involved in the supply of materials, components and accessories;
 - f. Provide two sets of laminated schematic design layout plans showing the location of controller units, irrigation valve boxes and other components of the ADIS;
 - g. The terms and conditions of any guarantees / warranties relating to the installed system.

EXT17.T040.N REGULAR INSPECTION REPORT DURING MAINTENANCE PERIOD

During the Maintenance Period, the Contractor shall deploy competent technicians or such other suitable personnel to carry out any necessary inspection, testing and repair work on a monthly basis. The Contractor shall submit to the CM contact information of the personnel including their mobile telephone numbers.

EXT17.T050.N FINAL INSPECTION

1. At one month before the end of the Maintenance Period, the Contractor shall carry out final inspection of the whole ADIS;
2. The Contractor shall carry out any adjustment, rectification, replacement, or alteration, as may be required to correct any faulty works prior to the expiry of the Maintenance Period;
3. Update the Operation and Maintenance Manuals as stipulated in **EXT17.T030** and submit the final version of the Operation and Maintenance Manuals to the CM for approval within one month upon completion of the Maintenance Period if any alterations or adjustments are conducted during the Maintenance Period;

-
4. Provide final on-site familiarization visit and technical demonstration to the estate management and maintenance staff.

CON1 INSITU CONCRETE

MATERIALS

GENERAL

CON1.M010.8

STANDARD

Unless otherwise specified, comply with 'Code of Practice for Structural Use of Concrete 2013' issued by the Buildings Department, BS8007:1987 and BS5400:Part 4:1990 as appropriate.

CON1.M020.8

STATUS OF THE SPECIFICATION

Where any clauses in this Specification vary from the Regulations of the HKQAA "Quality Scheme for the Production and Supply of Concrete", the clauses in this Specification shall take precedence.

CON1.M025.8

STATUS OF THE WORKSECTION

Worksection EXT2 takes precedence over this Worksection for the construction of the concrete carriageways and bus terminus as indicated on the Drawings.

CON1.M030.8

GRADES OF CONCRETE

In this Specification:

1. The grade of Designed mix concrete is denoted by the characteristic strength in MPa and the nominal maximum size of aggregate in mm with suffix "D";
2. The grade of Standardised designed mix concrete is denoted by the characteristic strength in MPa and the nominal maximum size of aggregate in mm with suffix "S";
3. The characteristic strength of Designed mix concrete with any type of cement is the 28 day cube strength below which not more than 5% of the test results are expected to fall;
4. For any clause of this Section where no suffix "D" or "S" is indicated in the concrete grade, the requirements of that particular clause shall deem to apply to both Designed mix and Standardised designed mix concrete;
5. Obtain CM's approval prior to the use of concrete of grade above 60 in the Works;
6. Where any grade of concrete is designated in other Worksections of this Specification, in Drawings, in design guidelines, in Bills of Quantities or in any other documents relating to this Contract, as one of the grades listed in column (1) of the Table below, such grade is deemed to be the grade of concrete set out in the corresponding column (2) below:

(1) Designated Grade	(2) Grade of Concrete	(1) Designated Grade	(2) Grade of Concrete	(1) Designated Grade	(2) Grade of Concrete
A	20/20	A1	20/40	C2 D2	30/10 35/10
B	25/20	B1	25/40		
C	30/20	C1	30/40		
D	35/20	-	-		
H	15/20	H1	15/40		
K	10/20	K1	10/40		

CON1.M040.8 CEMENTITIOUS CONTENT

Cementitious content of concrete, for the purpose of this Specification, is defined as:

1. The mass of cement per cubic metre of compacted concrete if sub-clause (2) is not applicable; or
2. The combined mass of the mass of cement and the mass of either pulverised fuel ash (PFA) or ground granulated blastfurnace slag (GGBS) per cubic metre of compacted concrete, if either PFA or GGBS is used as a partial cement replacement.

CON1.M050.8 FREE WATER/CEMENT RATIO

Free water/cement ratio, for the purpose of this Specification, is defined as the ratio between the mass of the free water in the concrete mix and the cementitious content.

CEMENTS**CON1.M110.8 SUBMISSIONS**

Submit to the CM for provisional approval, a sample for each type of cement, PFA and GGBS together with a certificate issued by an Approved laboratory not more than six months before the submission, showing the following:

1. For each type of cement:
 - a. The manufacturer's name;
 - b. The date and place of manufacture;
 - c. With test results that the cement complies with the requirements of this Specification.
2. For PFA:
 - a. The manufacturer's name (it must be stated explicitly if high lime PFA, as defined in **CON1.M150** (1)(b), is submitted);
 - b. The date and place of manufacture;
 - c. With test results that the PFA complies with the requirements of this Specification and the tests required in Clause 14.1 of BS 3892:Part 1:1997.
3. For GGBS:
 - a. The manufacturer's name;
 - b. The date and place of manufacture;
 - c. With test results that the GGBS complies with the requirements of this Specification and the tests required for factory production control as stipulated in **CON1.M180**.

CON1.M120.8 PORTLAND CEMENT (PC)

1. To BS EN 197-1:2000: type CEM I with strength class of cement for structural concrete to be 52.5N, unless otherwise approved by the CM;
2. Comply with the limiting values given in Table NC.1 of National annex NC of BS EN 197-1:2000 for acceptance inspection of cement at delivery.

CON1.M130.8 SULPHATE RESISTING PORTLAND CEMENT (SRPC)

To BS 4027:1980.

CON1.M140.8 HIGH ALUMINA CEMENT (HAC)

Do not use high alumina cement in structural concrete.

CON1.M150.8 PULVERISED FUEL ASH (PFA)

To BS3892:Part 1:1997 with the following modifications:

1. Lime content in PFA:

- a. PFA shall contain up to 10% total lime content; or
 - b. High lime PFA shall contain up to 20% total lime content and with soundness value not more than 10 mm.
2. Water requirement and strength factor at 28 days: not requirements of this Specification, but the values as determined shall be stated in the certificates for submission;
3. Cement to be used to determine water requirement, strength factor at 28 days, soundness and initial setting time: Portland cement CEM I (strength class 52.5N) to BS EN 197-1.

CON1.M160.8**PORTLAND FLY ASH CEMENT (PFAC)**

1. To BS EN 197-1:2000: types CEM II/A-V and CEM II/B-V with strength class of cement for structural concrete to be 42.5N or higher, unless otherwise approved by the CM;
2. Comply with the limiting values given in Table NC.1 of National annex NC of BS EN 197-1:2000 for acceptance inspection of cement at delivery.

CON1.M170.8**USE OF PULVERISED FUEL ASH**

1. Incorporate PFA to Portland cement (PC) only, as a partial cement replacement:
 - a. In all structural concrete for foundation works including caissons, bored piles, caisson caps, pile caps (including pile caps to driven piles), tie beams and footings of all structures. PFA content to be 35% by mass of the cementitious content of the concrete;
 - b. In all structural concrete shown as PFA concrete up to grade 60D on the Drawings. PFA content to be 25% by mass of the cementitious content of the concrete;
 - c. In all concrete, with the exception of sprayed concrete, for external works including concrete carriageway, other paving and hard landscaping unless otherwise specified. PFA content to be 25% by mass of the cementitious content of the concrete;
 - d. Notwithstanding the minimum striking period stipulated in **CON2.W630**, submit for the CM's agreement on the striking period of vertical formwork for PFA concrete in sub-clauses (1)(b) and (1)(c) above but in no case less than 1 day.
2. At the discretion of the Contractor and where approved by the CM, incorporate PFA to PC as a partial cement replacement in structural concrete not shown as PFA concrete on the Drawings. PFA content to be 25% by mass of the cementitious content of the concrete;
3. Prior to the use of PFA concrete in sub-clause (2) above:
 - a. Carry out necessary tests and trials to provide evidence to the satisfaction of the CM that the use of PFA concrete shall not adversely affect the construction cycle, curing of the concrete and the application of finishes; and
 - b. Submit details for sub-clause (3)(a) before carrying out the tests and trials for the Approval of the CM.
4. PFAC may be used where PFA concrete with PFA content of 25% by mass of the cementitious content of concrete is specified or permitted;
5. Use of PC in the works specified in sub-clauses (1)(a) to (1)(c) above may be accepted provided that:
 - a. Satisfactory evidence can be furnished to the CM showing that supply of PFA or PFAC from all available sources cannot be obtained;

- b. The highest grade of PC concrete for caissons and bored piles shall not exceed 35/20D. For pile caps or footings and transfer structures submit a detailed method statement of the proposed temperature control and monitoring strategy as stipulated in **CON1.W470** to the CM for approval at least 7 days before concreting;
- c. Where necessary, submit re-design of the foundation works resulting from such a change to the CM for approval at least 21 days before commencement of affected works. Submit re-design according to **PIL1.D030** and any other requirement as detailed elsewhere in this Specification;
- d. Be liable for any additional cost or time as a result of any such change. The Surveyor shall, if he considers that there is a saving in cost arising from any such change determine the sum which in his opinion shall be deducted from the contract sum as result of such saving and certify in accordance with the General Conditions of Contract.

CON1.M180.8 GROUND GRANULATED BLASTFURNACE SLAG (GGBS)

To BS EN 15167-1:2006 with the following modifications:

1. Cement to be used to determine initial setting time and activity indices at 7 days and 28 days: Portland cement CEM I (strength class 52.5N) to BS EN 197-1:2000;
2. Factory production control: In the absence of autocontrol testing, proof of the GGBS manufacturer's testing on the quality control for Class S95 in accordance with Chinese National Standard GB/T 18046:2008 is acceptable.

CON1.M190.8 USE OF GGBS IN PRECAST FACADE AND PRECAST STAIRCASE

1. Incorporate GGBS as a partial replacement of Portland cement (PC) in the production of precast facade and precast staircase;
2. GGBS content to be 35% by mass of the cementitious content of the concrete;
3. The use of PC concrete without GGBS to produce precast facade and precast staircase for the period from December to March will be allowed. Inform the CM in advance if PC concrete will be used for the production of precast facade and precast staircase in such period.

AGGREGATES

CON1.M210.8 SUBMISSIONS

Submit to the CM, for provisional approval, a sample of each type of aggregate together with a certificate showing that the aggregate producer has a quality assurance system certified to the ISO 9001, and a certificate for each nominal maximum aggregate size showing:

1. The name of the quarry / locality of the aggregate and documentary evidence from the supplier for subsequent verification;
2. Where available, evidence that the aggregates from the same source have been used in other HA Contracts in the past 12 months;
3. That the aggregate complies with the requirements of this Specification;
4. Results of tests carried out by HOKLAS laboratories and presented in HOKLAS endorsed test reports of all the typical properties listed in CS3:2013 Clause 6.2.2 with the following validity period on the test data:
 - a. Not older than three months:
 - i. Grading.
 - b. Not older than six months:
 - i. All other properties.

CON1.M215.8 RECYCLED COARSE AGGREGATES

1. Use recycled coarse aggregates produced by crushing old concrete and complying with the requirements in **CON1.T410** for external works as specified in the Contract or as permitted by the CM. The concrete shall be with 100% recycled coarse aggregates for grade strength 20 MPa and 20% for grade strengths 25-35 MPa. Recycled coarse aggregates shall not be used in concrete above grade strength 35 MPa for Portland cement concrete and 30 MPa for PFA concrete;
2. Thoroughly wet recycled coarse aggregates before use;
3. Store recycled coarse aggregates in separate stockpiles or silos to prevent inadvertent mixing with natural aggregates. Provide a separate compartment for recycled coarse aggregates in the batching plant;
4. Obtain recycled coarse aggregates for incorporation into the Works from Approved source as specified or permitted by the CM.

CON1.M220.8 SOURCES OF AGGREGATES

1. Obtain crushed rock aggregates for each Approved Designed concrete mix from a single Approved source which may be either an Approved quarry or an Approved source of rock;
2. Where the aggregates are obtained through a crushing plant, the rock from which the aggregates for the Approved Designed concrete mix are obtained must be from the same single Approved source;
3. Obtain natural sand fine aggregates for each Approved Designed concrete mix from a single Approved locality within a defined boundary agreed with the CM;
4. Clear overburden as far as practicable from the working area prior to rock excavation. Overburden is defined as all unwanted material including vegetation, top soil and material of varying degrees of decomposition from the parent rock. The latter category may appear as intrusive bands between volumes of massive rock;
5. Remove rock from igneous intrusions as far as practicable from the working area;
6. Incorporate sufficient scalping and screening facilities in the aggregate production plant to remove all overburden from the aggregates;
7. Keep separate in clearly defined areas the materials both before and after processing where the aggregate production plant is rock from more than one quarry or rock source.

CON1.M230.8 COARSE AGGREGATE

Clean, hard, durable crushed rock complying with CS3:2013 except for the requirement of Aggregate Impact Value and Los Angeles Value.

CON1.M240.8 FINE AGGREGATE

1. Clean, hard durable crushed rock, complying with CS3:2013;
2. Do not use natural sand unless with prior agreement of the CM.

CON1.M250.8 ALL-IN AGGREGATE

Do not use all-in aggregate.

CON1.M260.8 LIGHTWEIGHT AGGREGATE

To BS 3797:1990 except not to use clinker and furnace bottom ash.

CON1.M270.8 AGGREGATES FOR AQUEOUS LIQUID RETAINING STRUCTURES

Having a water absorption, as measured in accordance with CS3:2013 Section 17 of not greater than 3%.

CON1.M280.8 GRADING OF COMBINED AGGREGATES

The grading of the combined fine and coarse aggregates must ensure a dense concrete of suitable workability, using the specified proportions of cement and water.

WATER**CON1.M310.8 WATER**

1. In accordance with PRE.B10.1210 to PRE.B10.1260 or PRE.C11.090 as appropriate, and;
2. Use only clean fresh water from Water Supplies Department mains supply for making concrete. Unless otherwise specified, do not use recycled water;
3. If the water from Water Supplies Department mains supply is not available, submit to the CM for provisional approval:
 - a. The source of water;
 - b. A certificate showing that the water complies with the requirement of this Specification.
4. Where specified in the Contract, use recycled water to make concrete for minor structures.

CON1.M320.8 RECYCLED WATER

1. Where specified on the Drawings, use recycled water in the mixing of concrete of grade strength not exceeding 30 MPa for minor structures, including ground pavings not subjected to vehicular traffic, footpaths, benches and stools, planter walls and non-structural concrete fill;
2. Produce recycled water by combining clean fresh water from Water Supplies Department mains supply with wash water from mixer washout operations in compliance with the properties specified in CON1.T330;
3. Submit method of batching of the recycled water for Approval.

ADMIXTURES**CON1.M410.8 ADMIXTURES GENERALLY**

Ensure that the chloride ion content of admixtures for concrete containing embedded metal or for concrete made with SRPC does not exceed 2% by mass of the admixture or 0.03% by mass of the cement, whichever is the less.

CON1.M420.8 SUBMISSIONS

Submit to the CM for provisional approval:

1. Manufacturer's information on admixtures;
2. Confirmation from the manufacturer that the admixtures comply with the requirements of this Specification;
3. Details of toxicity, proposed dosage, detrimental effects, if any, of under-dosage or over-dosage;
4. Details of chloride content and method of adding to the concrete mix;
5. One sample of each type of admixtures.

CON1.M430.8 PIGMENTS FOR PORTLAND CEMENT AND PORTLAND CEMENT PRODUCTS

To BS 1014:1975.

CON1.M440.8 ADMIXTURES AND SUPERPLASTICISERS
To BS EN 934-2:2009+A1:2012.

CURING COMPOUNDS

CON1.M510.8 GENERAL

1. Of an Approved type and:
 - a. Having an efficiency index of at least 85% when tested to BS 7542:1992;
 - b. Either wax or aluminised resin based and containing a fugitive dye.
2. Do not use curing compound containing organic solvents for public roads and bus terminuses which are to be handed over to the Highways Department of the HKSAR on completion.

CON1.M520.8 SUBMISSIONS

Submit to the CM for provisional approval:

1. Manufacturer's information on curing compounds showing that the curing compounds comply with the requirements of this Specification;
2. Test certificates prepared by an Approved testing laboratory, to show that the curing compounds will provide the required efficiency index;
3. A sample of each type of curing compound.

CON1.M530.8 PROPERTIES

The compound when applied according to the manufacturer's recommendations must:

1. Be stable and impervious to evaporation of water from the concrete surface within 60 minutes after application;
2. Not react chemically with the concrete to be cured and not crack, peel or disintegrate within 1 week after application;
3. Degrade completely within 3 weeks after application.

CON1.M540.8 CONCRETE CARRIAGEWAY CONSTRUCTION

Non-pigmented liquid resin or wax-resin based membrane curing compound of a proprietary brand, and available both with and without a fugitive dye.

CON1.M550.8 STRUCTURES TO CONTAIN POTABLE WATER

Concrete curing compound for use on concrete surfaces against which potable or fresh water will be stored or conveyed must be non-toxic and incapable of imparting a taste to the water.

ANCILLARY MATERIALS

CON1.M610.8 UNDERLAYS TO CONCRETE PAVINGS AND SLABS ON HARDCORE

Either:

1. Subsoil grade reinforced waterproof building paper to BS 1521:1972, grade B1F; or
2. 0.125 mm nominal thick impermeable polythene sheet.

CON1.M620.8 POLYETHYLENE SHEETING FOR CURING

Impermeable and of a minimum thickness of 0.125 mm.

CON1.M630.8 WATERPROOF ADHESIVE TAPE

Of proprietary manufacture.

CON1.M640.8 BITUMASTIC PAINT

Tar based complying with BS 1070:1993, type B.

CON1.M650.8 REPAIR MORTAR

1. Of proprietary manufacture and certified to the "Product Conformity Certification Scheme for Repair Mortars" (PCCS-RM) published by the Hong Kong Concrete Institute. The product conformity certificate shall be issued by a certification body accredited by Hong Kong Accreditation Service (HKAS) or its Multilateral Recognition Arrangement (MRA) partners;
2. Cement based product comprising Portland cement, fines /sand, admixture and/or non-shrink additives packed in bags and complying with the performance characteristics given in the Table below:

Properties	Testing method	Performance characteristics
Compressive strength at 28 days (MPa)	CS1: Section 12, using 100 mm cube test specimens	\geq grade strength of parent concrete + 7
Elastic modulus (GPa)	CS1: Section 17	≥ 23
Chloride ion content	CS1: Section 21	$\leq 0.05\%$
Expansion (H) within 24 hours	ASTM C827-01a(05)	$0\% \leq H \leq 4\%$
Expansion (V) between 3 days to 28 days	ASTM C1090-01(05)	$0\% \leq V \leq 0.4\%$

3. The repair mortar shall not release substances hazardous to health, hygiene and environment.
4. Submit the following for CM's information:
 - a. The original or a certified true copy of the product conformity certificate to PCCS-RM stipulated in sub-clause (1). Certified true copy shall be certified true by the issuer of the original copy or by the QCM;
 - b. A summary of the results on tests stipulated in the 'initial type test' and 'audit testing' of the PCCS-RM. The summary shall be prepared by the accredited laboratory who carried out the testing or by the certified manufacturer. If so directed by CM, submit a full set of the audit test reports to CM for information.

CON1.M660.8 LOW VISCOSITY POLYMER RESIN

Of proprietary manufacture.

CON1.M670.8 EPOXY RESIN FOR INJECTION

Of proprietary manufacture.

CON1.M680.8 CAST IN STEEL INSERT CHANNELS

As **MET1.M080**.

SOURCES OF SUPPLY OF CONCRETE

CON1.M710.8 READY MIXED CONCRETE

Ready-mixed concrete and any concrete batched off site, may be used only with Approval and must comply with all requirements of this Specification in respect of materials, quality and strength of such concrete.

CON1.M720.8 SUBMISSION FOR APPROVAL

1. Submit the following information to CM for approval, upon commencement of the Contract or during the course of Contract when concrete supply from a new source is to be used, at a minimum time specified in sub-clause (2):
 - a. A statement advising whether the concrete is to be site-batched or ready-mixed. In case on-site concrete batching is proposed, submit further details to the CM on suitability of the plant in relation with statutory requirements and possible effects on adjoining localities;
 - b. The name(s) of the proposed concrete supplier(s) as specified in **CON1.M730** (who may be the Contractor) and details of the concrete supply;
 - c. The name of each supplier's Quality Representative taking specific responsibility and authority for ensuring compliance with the requirements of the following:
 - i. "Quality Scheme for the Production and Supply of Concrete" (QSPSC) issued by the Hong Kong Quality Assurance Agency (HKQAA);
 - ii. ISO 14001 on environmental management.
 - d. For high strength concrete works (concrete of grade strength higher than 60 MPa), a quality assurance proposal with sufficient preliminary test results is required to confirm that reliable and consistent concrete can be produced. The proposal should include a detailed assessment of the concreting materials, the mix design and the quality control procedures of the batching plant. In this respect the designed mean resistance to crushing, it shall initially exceed the specified resistance to crushing by a margin of not less than 12 MPa. Details of any subsequent revision of the mix design are to be submitted.
2. The time of submission for Approval for the respective concrete shall be at least:
 - a. Concrete to be ready-mixed: 7 days before placing concrete or 7 days before the trial mixes if trial mixes are made;
 - b. Concrete to be site-batched: 52 days for the first submission and a further 45 days for each re-submission before the commencement of batching plant erection.
3. Where provisional approval has been given by the CM on site-batched concrete supply, submit to CM for approval the following documents certified by Registered Structural Engineer for the on-site concrete batching plant:
 - a. Location plan of the on-site concrete batching plant;
 - b. General arrangement plans with adequate details for construction;
 - c. Structural and foundation plans and calculations;
 - d. Approval from relevant Government Departments, where applicable.
4. Do not commence plant erection without written approval from CM;
5. Submit Form ICU 13 to CM for approval on commencement of operation of the plant at least 22 days before completion of plant erection;
6. Programme the Works by taking into account of the submission and re-submissions that may be required under sub-clauses (3) to (5);
7. Comply with sub-clauses (3) to (6) for any subsequent relocation of the on-site concrete batching plant.

CON1.M730.8 SUPPLIER'S CERTIFICATE

1. Obtain concrete only from suppliers who have achieved the following certification in respect of each batching plant supplying concrete under the Contract:
 - a. QSPSC as stipulated in **CON1.M720** for concrete production;
 - b. ISO 14001 for environmental management.
2. Submit a copy of the certificates as stated in sub-clause (1) above in respect of each batching plant to the CM. All certification bodies shall be accredited by:
 - a. The Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS to QSPSC in the category of product certification system;
 - b. The HKAS or the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS to ISO 14001 in the category of environmental management system.
3. Newly erected batching plant shall be deemed to have achieved the certification valid for the following period if evidence is provided to CM that the concrete supplier has given written notice to the concerned certification body:
 - a. QSPSC: in accordance with the Administrative Regulations of QSPSC;
 - b. ISO 14001: not more than 2 months or such lesser time that is required for assessment and certification.

CON1.M740.8 WITHDRAWAL OF CERTIFICATION

In the event that certification in **CON1.M730** is not obtained, suspended or withdrawn in respect of any supplier or batching plant supplying concrete under the Contract:

1. Inform the CM immediately and cease using concrete from that supplier or batching plant;
2. Do not resume the supply of concrete from that supplier or batching plant without Approval, notwithstanding any suspended or withdrawn certification being subsequently reinstated.

CON1.M750.8 SITE BATCHING

Where site batching plant is used, concrete supply from plants as defined in **CON1.M760** below may be acceptable under the following conditions provided that evidence can be furnished to the CM showing that supply from other sources, including the contingency measure proposal as required under **CON1.M1110** complying with **CON1.M730** cannot be obtained:

1. At the first two months from commencement before operation of the site batching plant;
2. After dismantling of the site batching plant with only minor concrete work including small concrete structures still outstanding.

CON1.M760.8 SITE BATCHING PLANT

Concrete supplied by the following plants may be acceptable if **CON1.M750** as given above is satisfied:

1. Plants operated in another Housing Authority contract by the same Contractor, and having achieved certification under the QSPSC for concrete production and ISO 14001 for environmental management as approved by CM. Evidence must also be furnished to the CM to show that the proposal shall not affect the progress and works on the projects with the proposed plants;
2. Plants operated within the Contract, without a QSPSC and/or ISO 14001 certificate may only supply concrete under the condition as stated in sub-clause (2) of **CON1.M750**, provided that the following requirements are satisfied:

- a. The operation of the plants is to comply with the Technical Regulations of QSPSC and ISO 14001 for environmental management;
- b. Minor specific deviations from the Technical Regulations to cater for smaller plants may be acceptable. These may include tolerance on weighing equipments and use of single hopper for all constituent materials. All deviations must be submitted to the CM for approval;
- c. An Independent Qualified Person (IQP) holding the qualification of MHKIE, MISTructE or MICE shall be engaged and is responsible for monitoring the quality standards of the said plant. IQP is required to submit monthly statement to CM to confirm that the required quality standards and environmental management system are maintained. Submit details of IQP to CM for approval.

CONCRETE MIXES GENERALLY

CON1.M810.8

CHLORIDE CONTENT

The total chloride content of the concrete must not exceed the limits shown in the Table below, expressed as a percentage relationship between chloride ion and cementitious content of mix:

Chloride content	
Type of concrete	Maximum total chloride content %
Prestressed concrete. Steam cured structural concrete	0.1
Reinforced concrete. Concrete with embedded metal	0.35
Concrete made with SRPC	0.2

CON1.M820.8

DESIGNED CONCRETE MIXES

Use Designed concrete mixes for all concrete.

CON1.M830.8

USE OF SULPHATE RESISTING PORTLAND CEMENT

Do not use pulverised fuel ash with sulphate resisting Portland cement.

CON1.M840.8

USE OF PFA AND PFAC

Do not use pulverised fuel ash in addition to Portland fly ash cement.

CON1.M850.8

CONTROL OF ALKALI-AGGREGATE REACTIONS

1. Submit measures to control the occurrence of alkali-aggregate reaction in concrete for Approval;
2. In the absence of alternative proposals, the reactive alkali of concrete expressed as the equivalent sodium oxide (Na_2O) per cubic metre of concrete shall not exceed 3.0 kg:
 - a. The equivalent Na_2O shall be calculated by the expression:

$$\text{Equivalent Na}_2\text{O} = A + B + C$$

- where
- | | |
|---|--|
| A | is the sum of the acid-soluble alkalis (expressed as equivalent Na_2O) of cement, admixtures and water; |
| B | is equal to either 1/6 the total alkalis of PFA or 1/2 the total alkalis of GGBS (expressed as equivalent Na_2O); and |
| C | is equal to 0.76 times the chloride ion (Cl^-) of |

the aggregate.

- b. The acid-soluble alkali content of the cement shall be determined in accordance with BS EN 196-21:1992 and shall be taken as the average of the latest 25 daily determinations of equivalent sodium oxide plus twice the standard deviation of the results;
 - c. The acid-soluble alkali content of admixtures shall be determined in accordance with BS 1881:Part 124:1988;
 - d. The acid-soluble alkali content of water shall be determined in accordance with BS EN 1008:2002;
 - e. The total alkali content of the PFA or the GGBS shall be determined in accordance with BS EN 196-21:1992 and shall be taken as the average of 25 weekly determinations plus twice the standard deviation of the results. For a casting yard where there are less than twenty-five weekly determinations available, use the average and the standard deviation of all the available weekly determinations for calculation;
 - f. The equivalent Na_2O content of the coarse and fine aggregates shall be calculated from the quantity of Cl^- present which shall be measured in accordance with CS3:2013 Clause 21.3.
3. Submit the following particulars for each concrete mix:
 - a. At Contract commencement:
 - i. HOKLAS-endorsed test certificates, issued in less than six months' time from the date of commencement of the Works, giving the results of tests required in sub-clauses (2)(b) to (2)(f) above;
 - ii. Calculation of the reactive alkali of the proposed mix.
 - b. At quarterly intervals after Approval:
 - i. HOKLAS-endorsed test certificates giving the results of tests required in sub-clauses (2)(b) to (2)(f) above;
 - ii. Any further calculations necessary to demonstrate that the mix continues to comply with the limit on reactive alkali.
 4. When Instructed, arrange for the parallel sampling of constituent materials in sub-clauses (2)(b) to (2)(f) by the HDMTL or the DTC for testing.

NO FINES CONCRETE

CON1.M910.8

COMPOSITION

1. Cement: Portland cement;
2. Aggregate: nominal maximum size 20 mm of which not more than 15% by mass is retained on a 20 mm BS test sieve, and not more than 10% by mass passes a 10 mm BS test sieve.

CON1.M920.8

AGGREGATE/CEMENT CONTENT RATIO

Lying within the range 10 to 15 by weight.

CON1.M930.8

CEMENT CONTENT

The cement content is such that each particle of aggregate is coated with cement paste but the compacted concrete has an open texture which permits the flow of water through the hardened concrete.

STANDARDISED DESIGNED CONCRETE MIX PROPORTIONS

CON1.M1010.8

CEMENT

To be Portland cement type CEM I in BS EN 197-1:2000.

CON1.M1020.8

MIX PROPORTIONS

- Except for concrete with recycled coarse aggregates, select the mix proportions for standardised designed mix concrete from Tables A and B below. Select the appropriate content of water and water-reducing admixtures in accordance with **CON1.M1170** and **CON1.M1040** respectively. If mix proportions are so selected, no trial mixes as stipulated in **CON1.T010** to **CON1.T120** are required:

Table A. Weights of any aggregate to be used with 100 kg cement				
Specified grade strength (MPa)	Nominal maximum size of aggregate (mm)	40	20	10
	Slump (mm)	85-170	75-150	65-130
10	Total Aggregate (kg)	800	690	-
15		550	500	400
20, 25		490	440	360
30		440	380	300

Table B. Percentage by weight of fine aggregate to total aggregate				
Specified Grade strength (MPa)	Grading of fine aggregate	Nominal maximum size of aggregate (mm)		
		40	20	10
10, 15	C, M or F	30-45	35-50	-
20, 25 or 30	C	30-40	35-45	45-55
	M	25-35	30-40	40-50
	F	25-30	25-35	35-45

- For concrete of grade strength 20 MPa with recycled coarse aggregates, mix to give a slump value of 75 mm and in the following proportions:

Portland Cement	100 kg
Recycled Coarse aggregate	
20 mm	180 kg
10 mm	90 kg
Fine aggregate	180 kg

- Fine aggregates to be within the limits of grading M in Table 3.2 of CS3:2013;
- Do not derive fine aggregates from concrete rubble;
- Conduct laboratory trial mix for concrete with recycled coarse aggregates in accordance with **CON1.T050** prior to Approval.

CON1.M1030.8 CONTRACTOR'S RESPONSIBILITY

Notwithstanding full compliance with the other provisions of this Worksection, the Contractor's attention is drawn to his full responsibility in ensuring compliance with the strength, workability and all other requirements for Designed concrete mixes, taking due consideration of the characteristics of the materials used in the mix, and the Specification provisions allowed for Contractor's design within specified ranges.

CON1.M1040.8 USE OF ADMIXTURES

Do not use admixtures, other than water-reducing admixtures, without Approval.

DESIGNED CONCRETE MIXES**CON1.M1110.8 SUBMISSIONS**

Submit details of mix design to the CM for provisional Approval at least 7 days before trial mixes are made or, if trial mixes are not required, at least 7 days before the mix is placed in the permanent work. Include the following:

1. Quantities of each constituent per m³ of compacted concrete;
2. Details of aggregates, including specific gravities and absorbencies, in support of sub-clause (1)(a) above;
3. Nominal grading details of fine and coarse aggregates in tabular and graphic form;
4. Nominal grading details, in tabular and graphic form, of the combined aggregate;
5. Free water / cement ratio by weight;
6. Designed workability, in terms of designed slump value or designed flow value;
7. Type of plant to be used, location of offsite ready-mixed plant, and a contingency proposal to demonstrate that continuous and adequate supply of concrete can be secured in the event of disruption to the planned supply. Include in such proposal measures to mitigate sudden break down of concrete supply during concreting;
8. System of mixing, i.e. what proportion of the minimum required mixing time will be carried out at the batching plant;
9. Total chloride ion content of mix;
10. Method of controlling the temperature of fresh concrete as stipulated in **CON1.W465**.

CON1.M1120.A MAXIMUM CEMENTITIOUS CONTENT

1. The cementitious content of any mix up to Grade 60 must not exceed:
 - a. 400 kg/m³ for concrete containing PC only, used for aqueous liquid retaining structures;
 - b. 450 kg/m³ for concrete containing either (a) PFA and PC, or (b) GGBS and PC or (c) PFAC, used for aqueous liquid retaining structures;
 - c. 550 kg/m³ for concrete used for any other structures.
2. Mass of cement of the cementitious content of any mix higher than Grade 60 should be limited to not more than 450 kg/m³.

CON1.M1130.8 MINIMUM CEMENTITIOUS CONTENT

Design mix of Grade 20 or greater in reinforced concrete or prestressed concrete to have the required minimum cementitious content, in kg/m³, given in the Table below:

PC/PFA /GGBS Reinforced Concrete	Grade Strength (MPa)		20	25	30	35	40	45	≥50
	Nominal maximum	10 mm	330	330	350	370	390	415	440
		20 mm	290	290	310	330	350	375	400

	aggregate size	40 mm	260	260	280	300	320	345	370
Prestressed Concrete	Grade Strength (MPa)		35		40		45		
	Nominal maximum aggregate size	10 mm	400		420		445		
		20 mm	340		360		385		
		40 mm	340		360		385		

CON1.M1150.8 AQUEOUS LIQUID RETAINING STRUCTURES

Subject to the limits set out in the Table to **CON1.M1130** above the minimum cementitious content for aqueous liquid retaining structures is 325 kg/m³. The maximum cementitious content for aqueous liquid retaining structures shall be in accordance with **CON1.M1120**.

CON1.M1160.8 INCREASING CEMENTITIOUS CONTENT

After Approval of the designed concrete mixes, the Approved cementitious content may be increased by up to 20 kg/m³ without the CM's consent, provided that the specified maximum and minimum limits for cementitious content are maintained.

CON1.M1170.8 MAXIMUM FREE WATER / CEMENT RATIO

Do not exceed the following maximum free water/cement ratio figures for concrete grades 20D and above:

1. Unreinforced concrete: 0.60 or the ratio stipulated in Table 4.4 of 'Code of Practice for Structural Use of Concrete 2013' issued by the Buildings Department, whichever is the less;
2. Reinforced concrete: 0.55 or the ratio stipulated in Table 4.2 of 'Code of Practice for Structural Use of Concrete 2013' issued by the Buildings Department, whichever is the less;
3. Aqueous liquid retaining concrete: 0.50.

CON1.M1180.8 MINIMUM SLUMP VALUE

The designed slump value must not be less than 75 mm except:

1. Blinding, unreinforced mass concrete and road pavement concrete;
2. Where otherwise agreed by the CM.

CON1.M1190.8 CEMENT CONTENT IN CONCRETE WITH PFA OR GGBS

1. When PFA is used as a partial cement replacement and incorporated into the concrete as a separate material, ensure that:
 - a. For foundation works, 65% by mass of the cementitious content of the mix is Portland cement to BS EN 197-1:2000: type CEM I;
 - b. For all other works, 75% by mass of the cementitious content of the mix is Portland cement to BS EN 197-1:2000: type CEM I.
2. When GGBS is used as a partial cement replacement and incorporated into the concrete as a separate material for the production of precast facade and precast staircase, ensure that 65% by mass of the cementitious content of the mix is Portland cement to BS EN 197-1:2000: type CEM I.

CON1.M1200.8 ADJUSTMENT OF FINE AND COARSE AGGREGATES IN DESIGNED CONCRETE MIXES

After Approval of the designed concrete mixes, the Approved fine and coarse aggregate content may be adjusted without the CM's consent up to a maximum of ± 20 kg per 100 kg of cementitious content provided that the adjusted mixes comply with all requirements of this Specification in respect of materials, quality and strength of such mixes, and the aggregate / cementitious content ratio is kept unchanged. In the event that the Approved fine aggregate content is adjusted, the Approved coarse aggregate content shall be adjusted accordingly to keep the Approved aggregate / cementitious content ratio unchanged. The same is for the adjustment of the Approved coarse aggregate content.

MATERIALS FOR REMEDIAL WORK**CON1.M1210.8 GENERAL**

Obtain Approval for all materials for remedial work.

WORKMANSHIP

HANDLING AND STORAGE OF MATERIALS

CON1.W010.8 BAGGED CEMENT

Store cement in bags:

1. In a dry, weatherproof store with a raised floor;
2. Cover every stock of more than 20 bags of cement or dry pulverized fuel ash (PFA) or dry ground granulated blastfurnace slag (GGBS) entirely with impervious sheeting or place them in an area sheltered on the top and the three sides;
3. With each delivery identified and kept separate;
4. For use in the order of delivery.

CON1.W020.8 BULK CEMENT, PFA AND GGBS

Store bulk cement, PFA and GGBS:

1. In dry, weatherproof and closed silos fitted with overflow detection device so that when the silo is approaching overflowing, a high level audible alarm is triggered and the material filling stops automatically within one minute. Do not overfill silos;
2. Carry out the loading, unloading, transfer, handling or storage of bulk cement or dry PFA or dry GGBS; or any cement or dry PFA during or after the debagging process in a totally enclosed system or facility and fit any vent or exhaust with fabric filter or equivalent air pollution control system or equipment;
3. Of different types and from different sources in separate silos clearly marked to identify the different contents of each.

CON1.W030.8 AGGREGATES

1. Do not handle or store aggregates in a manner which will result in the mixing of different types and sizes or in the segregation or contamination of the aggregates;
2. Store different types and sizes of aggregates in separate hoppers or in separate stockpiles. Provide the stockpiles with well drained concrete floors and dividing walls of sufficient height to keep the different aggregates separate.

CON1.W040.8 ADMIXTURES AND CURING COMPOUNDS

1. Store admixtures and curing compounds:
 - a. In sealed containers, marked to identify the contents;
 - b. Protected from exposure to conditions which may affect the material;
 - c. In accordance with the manufacturers' recommendations.
2. Do not use the materials after the recommended shelf life has been exceeded.

BATCHING AND MIXING CONCRETE

CON1.W110.8

BATCHING PLANT

1. Maintain the weighing mechanisms for all batching plant in good working order and ensure their accuracy is maintained within the tolerances given in the "Quality Scheme for the Production and Supply of Concrete" (QSPSC) issued by the Hong Kong Quality Assurance Agency (HKQAA). Check them against accurate weights and volumes at least once per month when required by the CM. Use separate weighing equipment for cement and aggregates. Arrange for calibration of all weighing mechanisms, water meters and admixture dispensers at three monthly intervals by an Approved independent consultant;
2. Obtain Approval for all dispensing equipment for admixtures which shall be accurate to within $\pm 5\%$ of the quantity of any admixture being used. The weights of cement, PFA, water and each size of aggregate as indicated by the mechanisms employed shall be accurate to within $\pm 2\%$ of the respective weights per batch agreed by the CM.

CON1.W120.8

ALLOWANCE FOR WATER CONTENT OF AGGREGATES

Adjust the weights fine and coarse aggregates to allow for the free water contained in them.

CON1.W130.8

QUANTITY OF WATER

Add that quantity of water to the mix required to produce concrete of the Approved workability.

CON1.W140.8

CONCRETE MIXING PLANT

Mixing plant must comply with BS 1305:1974 and BS 4251:1980 for batch and truck type concrete mixers respectively, and the requirement in BS 4251:1980 for revolution counters on truck mixer drum is not mandatory.

CON1.W150.8

MIXING CONCRETE

1. Comply with the mixer manufacturer's recommended batch capacity, method of loading, mixing time and speed of operation and do not change mixing time without Approval;
2. For production of concrete using bagged cement, dry PFA or dry GGBS in a standard bag (not exceeding 50 kg), carry out de-bagging, batching and mixing processes in an area sheltered on the top and the three sides.

CON1.W160.8

CEMENT FROM DIFFERING SOURCES

The use of cement from differing sources in same concrete pour and same structure shall be subject to the standards stipulated in **CON1.W165** and **CON1.T075** and approved by the CM, unless:

1. At different locations without any physical contact;
2. In the same structure with a construction joint already formed in accordance with **CON1.W510** to **CON1.W570** prior to the placing of fresh concrete with different cement source against the hardened concrete.

CON1.W165.8

PRE-REQUISITES ON MIXING TWO CONCRETE MIXES WITH CEMENT FROM TWO DIFFERING SOURCES

1. Each of the two concrete mixes, when used individually, shall comply with all requirements in the Specification, including the strength, workability and durability requirements;
2. The grade of strength, workability, durability and maximum size of aggregate of the two concrete mixes must be the same;

3. The types and proportions of the cementitious materials used in the two concrete mixes must be the same;
4. The types and brand of admixtures used in the two concrete mixes must be the same. The difference in the dosages of the admixtures between the two concrete mixes shall not be more than 5%, unless otherwise approved by the CM;
5. The difference in the water / cementitious materials ratio between the two concrete mixes shall not be more than 0.02;
6. The two concrete mixes may be produced from different sources of aggregates provided that the sources of the two difference aggregates have each been approved before for concrete production and the aggregates are of the same type. The difference in the fines content of the fine aggregate between the two concrete mixes shall not be more than 5%.

CON1.W170.8**REMIXING**

Do not remix partially hardened concrete with or without additional cement, aggregate or water.

CON1.W180.8**TRUCK MIXED CONCRETE**

When using truck mixed concrete:

1. Add water at the batching plant as agreed by the CM;
2. Do not add water in transit;
3. Do not add water at the Site without Approval.

CON1.W190.8**CLEANLINESS OF MIXER**

1. Do not load mixer in excess of its rated capacity and empty the mixer before recharging;
2. Clean mixers which have been out of use for more than 30 minutes before fresh concrete is mixed; and whenever there is a change in the type of cement being used.

CON1.W200.8**LIGHT-WEIGHT CONCRETE**

Mix and place light-weight concrete as indicated on the Drawings in accordance with the aggregate manufacturer's instructions and as required by the CM.

CON1.W210.8**WATERPROOF CONCRETE**

For concrete specified as "waterproof," incorporate water-proofing material strictly in accordance with the manufacturer's instructions, and complying with aqueous liquid retaining concrete.

PROGRAMME AND SITE RECORDS FOR CONCRETING

CON1.W305.8**PROGRAMME FOR CONCRETING**

1. Provide monthly programme for concreting showing concreting works for the coming month for information and discussion at each Monthly Site Meeting;
2. Provide the monthly programme for concreting in sub-clause (1) above to the concrete supplier for advanced planning within one week after each Monthly Site Meeting;

3. Submit a summary report on concrete supply status monthly or at an agreed interval with the CM for record for any concrete pour larger than 100 m³. The report shall include, but not be limited to, the name of the supplier, the quantities and the dates of each concrete grade ordered and delivered on Site, and the dates that the orders are placed within the reporting period. In case if any order is cancelled, the date that the cancellation order is placed and an explanation for the cancellation shall be provided in the report.

CON1.W310.8**REQUIREMENTS ON SITE RECORDS FOR CONCRETING**

1. Provide delivery notes on Site, relating to each delivery of concrete available for inspection by the CM at all times and containing the following information:
 - a. Serial number of delivery note;
 - b. Date;
 - c. Name of supplier and location of batching and mixing plant;
 - d. Registration number of delivery vehicle;
 - e. Name of purchaser;
 - f. Name and location of the Site;
 - g. Sources and actual quantities of each constituent, including admixtures, if any;
 - h. Designation of concrete mix and approved workability value;
 - i. Quantity of concrete;
 - j. Time of introduction of cement to the mix.
2. Keep records of concreting operations on the Site available for inspection by the CM at all times, and containing the following details:
 - a. Date;
 - b. Designation of concrete mix and approved workability value;
 - c. Serial number of delivery note;
 - d. Arrival time of delivery vehicle;
 - e. Time of completion of discharge;
 - f. Position where concrete is placed;
 - g. Results of workability tests in terms of measured slump or flow table values as appropriate;
 - h. Details of test cubes markings, and whether test cubes were taken from the delivery;
 - i. Total quantity of each concrete mix placed that day;
 - j. Temperature of fresh concrete when it is placed in position where temperature control is required in accordance with **CON1.W470**. (For practical reasons the CM may accept that the temperature of concrete measured immediately before it is placed in position is taken as the temperature of concrete when it is placed in position.)
3. For public roads and bus termini which will become the properties of the Highways Department of the HKSAR after the handing over of the works, submit all the related Delivery Notes and record book to the Employer on completion of the Works.

TRANSPORTING AND PLACING CONCRETE**CON1.W410.8****GENERAL**

1. Transport and place concrete by Approved methods which ensure that there is no contamination, segregation or loss of the constituent materials;

-
2. Place and compact concrete in such a way as to avoid disturbance to the formwork and reinforcement. Where sections of the work are carried out in lifts, support the reinforcement projecting above the lift being cast to prevent movement of the bars during the casting and setting of the concrete.

CON1.W420.8 CONCRETE BATCHED OFF-SITE

For concrete batched off-site:

1. Carry the concrete in purpose made agitators operating continuously, or in truck mixers;
2. Submit to the CM for verification details of the methods for agitating the concrete during transport and immediately prior to placing.

CON1.W430.8 CLEANLINESS

1. Clean all areas where concrete is to be placed and, except for concrete placed under water, remove all standing water immediately before placing the concrete;
2. Protect slab formwork surfaces from concrete droppings and spillage during concreting.

CON1.W440.8 APPROVAL BEFORE PLACING CONCRETE

1. Do not place concrete in any part of the structure until Approval has been given;
2. Obtain Approval again if concreting is not started within 24 hours of Approval being given.

CON1.W450.8 PROCEDURE

1. Place concrete continuously between construction joints as close as practicable to its final position;
2. Do not allow concrete to free fall in excess of 2.7 m unless otherwise Approved;
3. Deposit concrete in horizontal layers to a compacted depth not exceeding 450 mm where internal vibrators are used or 150 mm in all other cases unless otherwise Approved. Do not force concrete into place by vibrator;
4. Do not place fresh concrete against insitu concrete which has been in position for more than 30 minutes unless the insitu concrete has been kept damp with a layer of wet hessian and protected from the weather to the satisfaction of the CM;
5. When insitu concrete has been in place for 4 hours or in the opinion of the CM the concrete has stiffened to such an extent that it no longer responds to the action of an internal vibrator, do not place further concrete against it for a further 20 hours unless otherwise Approved and form a construction joint in accordance with **CON1.W510** to **CON1.W570** as appropriate;
6. Compact concrete in its final position within 2½ hours of the introduction of cement to the mix. Concrete, which in the opinion of the CM is no longer sufficiently workable, will be rejected;
7. Place concrete by skip or such other Approved methods as specified by the requirements of the Specifications;
8. Do not place concrete in flowing water.

CON1.W460.8 USE OF TRUNKING AND CHUTES

Keep trunking or chutes clean and use them in such a way as to avoid segregation.

CON1.W465.8 TEMPERATURE CONTROL IN FRESH CONCRETE

1. Submit to the CM for approval details of measures on control of fresh concrete to a temperature not higher than 30°C:
 - a. For the structural elements with concrete grade strength greater than 60 MPa;

- b. For the massive structural elements as specified in **CON1.W470**;
 - c. For mass concrete retaining walls with concrete grade strength greater than 60MPa.
2. The CM may reject any concrete for which the temperature, as measured on Site by the DTC, exceeds 30°C.

CON1.W470.A TEMPERATURE CONTROL IN MASSIVE STRUCTURAL ELEMENTS

1. Comply with **CON1.W465** and submit the following to the CM for approval on the temperature control for massive structural elements as specified in the **Project Specific Specification** at least two months before concreting:
 - a. A method statement of the proposed temperature control;
 - b. Calculations of the forecast concrete temperature, temperature gradients and resulting stresses. The calculation of temperature in concrete shall be in accordance with the CIRIA Report No. C660 "Early Age Thermal Crack Control in Concrete" or other Approved recognised method.

TRANSPORTING AND PLACING CONCRETE

CON1.W480.N CONCRETING PLAN

Submit a concreting plan for each concreting pour to the CM at least one week prior to commencement of concreting works of the respective pour for agreement. The concreting plan shall demonstrate that the concreting works is able to be completed within the statutorily permitted working hours, with content including but not limited to the following:

1. Volume of the pour and planned timeline of the concreting works; and
2. Contingency measures to be taken once there is a slippage in concreting affecting the timely completion of the scheduled concreting works within the permitted working hours. The contingency measures shall include planning and details of construction joint(s) to be formed if necessary.

FORMING CONSTRUCTION JOINTS

CON1.W510.8 LOCATION OF JOINTS

1. Obtain Approval for the position and details of any construction joints not specified in the Contract;
2. Arrange such joints so as to minimise the possibility of the occurrence of shrinkage cracks;
3. Arrange construction joints horizontally or vertically unless otherwise Approved.

CON1.W520.8 AQUEOUS LIQUID RETAINING STRUCTURES

1. Cast the bottom slab and walls of aqueous liquid retaining structures in one operation where no pre-determined construction joints are specified, unless otherwise Approved;
2. Where construction joints are shown on Drawings, provide Approved proprietary type waterstops at construction joints and:
 - a. Securely fix waterstops in position to formwork in such a manner that compaction of the concrete will not be affected;
 - b. Make in-situ joints in waterstops using methods and equipment recommended by the manufacturer;
 - c. Protect exposed waterstops from exposure to conditions that may affect the waterstops; and

-
- d. Keep the waterstops free from rust, hydrocarbons and other deleterious material.

CON1.W530.8 WALLS AND COLUMNS

Finish the upper surface of lifts of concrete walls and columns horizontally and clean the formwork of adhering concrete before the next lift is placed.

CON1.W540.8 EXPOSING AGGREGATE

Remove laitance and all loose material and expose the aggregate by an Approved method as soon as is practical after casting, but:

1. Where an air jet is used-allow a minimum period of 4 hours after casting to elapse;
2. Where a water jet is used-allow a minimum period of 12 hours after casting to elapse.

CON1.W550.8 FOOTINGS AND PILE CAPS PREPARED BY OTHERS

Where the footings or pile caps have been constructed by others:

1. Hack off and expose aggregate by an Approved method of all construction joints of columns and walls on footings and pile caps prepared by a previous contractor;
2. Remove the cement slurry coating on column and wall starter bars.

CON1.W560.8 PLACING ADJACENT CONCRETE

Ensure the surface of the construction joint is clean and moist when fresh concrete is placed against it.

CON1.W570.A INTERRUPTED POURS

Form construction joint(s) in accordance with the provisions of the preceding clauses of this subsection under the following circumstances:

1. Placing of concrete has to be unexpectedly stopped; or
2. There is a slippage in concreting which may affect the timely completion of the scheduled concreting works within the statutorily permitted working hours.

CON1.W580.8 CONSTRUCTION JOINTS FOR CONCRETE CARRIAGEWAY AND PAVED AREA

Arrange construction joints normal to the axis or plane of the element being constructed unless otherwise permitted by the CM.

COMPACTION

CON1.W610.8 GENERAL

Compact concrete to produce a dense homogeneous mass with vibrators unless otherwise Approved and:

1. Provide types of vibrating equipment which will effectively compact the concrete;
2. Provide a sufficient number of vibrators in serviceable condition on Site to ensure that reserves are always immediately available in the event of breakdowns.

CON1.W620.8 VIBRATING EQUIPMENT

To BS 2769:Part 2:1984 and:

1. Internal vibrators: operating at a minimum of 10,000 cycles per minute;
2. External vibrators: operating at a minimum of 3,000 cycles per minute;
3. Vibrating tables: operating at a minimum of 5,000 oscillations per minute may be used for pre-cast elements subject to Approval;
4. Do not use external clamp-on type vibrators without Approval.

CON1.W630.8 USING VIBRATORS

Use vibrators in such a manner that vibration is applied continuously and systematically during placing of the concrete until the expulsion of air has practically ceased and:

1. Do not use vibrators in a manner which will result in segregation;
2. Do not apply vibration by way of the reinforcement;
3. Where vibrators of the immersion type are used, avoid all contact with reinforcement, formwork and inserts as far as is practicable;
4. Do not use vibration as a means of distributing concrete into position.

CON1.W640.8 NEW CONCRETE

Do not vibrate concrete between 4 and 24 hours after compaction.

CON1.W650.8 COMPACTING NO-FINES CONCRETE

Compact using a minimum amount of punning.

PUMPING CONCRETE**CON1.W710.8 CM'S APPROVAL**

Do not use concrete pumps without prior Approval.

CON1.W720.8 PUMPING EQUIPMENT

Operate and maintain concrete pumps in accordance with the manufacturer's recommendations and:

1. Keep pumps and pipelines maintained in a clean condition;
2. Do not use pipelines with internal surfaces of aluminium;
3. Ensure joints in pipelines are tightly fixed and do not permit grout loss.

CON1.W730.8 PIPELINES

Position concrete pumps such that pipelines are as short and straight as practicable and require as little repositioning as practicable and arrange bends in such a manner that the concrete, formwork, reinforcement or built-in components are not disturbed.

CON1.W740.8 LUBRICATING PIPELINES

Lubricate pipelines by passing cement grout or concrete through the pipeline before the concrete is pumped. Do not place the initial discharge of pumped concrete in the permanent work.

PLACING CONCRETE UNDER WATER**CON1.W810.8 GENERAL**

Do not place concrete underwater without prior Approval.

CON1.W820.8 STANDARD

Place underwater concrete in accordance with the recommendations given in BS 8004:1986.

CON1.W830.8 TREMIES

Securely support tremies used to place concrete in position and ensure the joints are watertight. Use a temporary seal of an Approved type to keep the water and the concrete separate at the start of concreting.

CON1.W840.8**PROCEDURE**

After the concrete is flowing, raise the tremie in a manner agreed by the CM and:

1. Keep the lower end of the tremie immersed in the concrete to a depth of at least 1 m;
2. Prevent water, mud and other deleterious material from entering the tremie after concreting has started.

CON1.W850.8**DEALING WITH BLOCKAGES**

Unless otherwise permitted by the CM, stop concreting immediately if the tremie becomes blocked or is removed from the concrete and:

1. Do not recommence concreting for at least 24 hours without Approval;
2. Remove contaminated concrete before concreting recommences.

CON1.W860.8**SURCHARGE AND CONTAMINATED CONCRETE**

1. Surcharge concrete placed by tremie above the specified level by an amount which is sufficient to allow for the removal of any contaminated concrete;
2. Remove contaminated concrete.

LAYING HOLLOW BLOCK FOR SLABS**CON1.W910.8****GENERAL**

See **CON2.W300**.

WATERTIGHT BASEMENT CONSTRUCTION**CON1.W1010.8****GENERAL**

Ensure that the completed work is free from leaks and damp patches.

CON1.W1020.8**BLINDING LAYER**

Lay blinding layer to the grade and thickness shown on the Drawings, to form a clean and dry base for the main structural slab, ensuring that there is no loss of cement to, nor gain of water from the base.

CON1.W1030.8**WATER/VAPOUR PROOF MEMBRANE**

Exercise special care to prepare the surface for application of asphalt waterproofing in accordance with Worksection WAT1 and to avoid damage to the membrane after application.

CON1.W1040.8**FORMWORK TIES**

Use only formwork-ties which leave no open holes through the concrete.

CON1.W1050.8**CONCRETE SUPPLY**

If ready-mixed concrete is used, supply to the site at regular intervals.

CON1.W1060.8**CONSTRUCTION JOINTS**

1. Provide waterstops as specified in **CON6.M210** and **CON6.W210** to **CON6.W230** for all construction joints, plan the positions of the construction joints according to planned daily production of concrete and keep their number to a minimum;
2. Position the joint between the base slab and the walls a minimum of 250 mm above the top of the base slab.

CON1.W1070.8 GROUND WATER

Keep ground water levels below the blinding level so that the cast concrete will not be subjected to water pressure until it has attained sufficient strength.

CON1.W1080.8 REMEDIAL WORK TO LEAKS ETC.

Carry out remedial work required to eliminate any leaks and damp patches that occur, and obtain Approval of method to be used.

MASS CONCRETE RETAINING WALLS**CON1.W1110.8 CONCRETE GRADE**

Grade 20/20, unless otherwise specified.

CON1.W1120.8 ADDED STONES AND BOULDERS

The addition of granite stones or boulders will be Approved provided that their weight does not exceed 20% of that of the finished concrete and that any two stones or boulders are spaced at a clear distance of at least 225 mm.

CON1.W1130.8 WEEP HOLES

Build in 75 mm diameter plastic weep pipes through the full thickness of walls, falling to the outside and spaced at staggered centres of 1.5 m.

CON1.W1140.8 TEMPERATURE CONTROL

Comply with the provisions of **CON1.W470** when specified grade strength greater than 20 MPa and up to 60 MPa.

GROUND SLABS**CON1.W1210.8 LAYING UNDERLAYS TO SLABS LAID ON HARDCORE**

Lap and tape underlays at least 300 mm at joints.

CON1.W1220.8 BLINDING LAYER

Unless otherwise specified, provide a blinding layer of Grade 15/20 concrete to underside of all reinforced concrete works in contact with earth to the following thicknesses:

1. Pilecaps and footings: 75 mm;
2. All other cases: 50 mm.

KICKERS**CON1.W1310.8 WALLS AND COLUMNS**

See **CON2.W410** to **CON2.W440**.

CURING**CON1.W1410.8 METHODS OF CURING - GENERAL**

1. Immediately after compaction, protect finished concrete against the harmful effects of weather, running water and drying out;
2. Close any cracks developed on the concrete surface immediately while the concrete is still plastic with suitable methods such as trowelling and brushing before curing;

3. Ensure proper protection by using one of the following methods which are minimum requirements and apply them for the minimum periods stated in **CON1.W1490**:
 - a. Method A (as **CON1.W1420**): For all concrete slabs in domestic floors and transfer structures except for areas which in the opinion of the CM are of such irregular shape which renders the method impractical;
 - b. Method F (as **CON1.W1470**): For caps or footings where the least dimension exceeds 500 mm;
 - c. Methods B, C, D or E (as **CON1.W1430** to **CON1.W1460**): At the Contractor's option for all other concrete elements including domestic floor slabs and transfer structures with irregular shapes.
4. Where concrete is to be kept moist by spraying water for curing methods stipulated in sub-clause (3), or during temporary removal of the protection to facilitate construction stipulated in **CON1.W1500**, take due consideration and necessary measures to avoid thermal shock to the concrete.

CON1.W1420.8**CURING - METHOD A**

Cover the concrete with waterproof Approved tarpaulin sheets of good quality and condition suitable for the intended purpose, and:

1. Make tarpaulin sheets to size to suit the shape, size and number of slab panels such that the number of tarpaulin sheets to cover the area is as few as is practical;
2. Lap tarpaulin sheets 600 mm (minimum) at joints;
3. Effectively hold down the tarpaulin sheets during the curing period in such a manner as not to damage the concrete surface;
4. Ensure the concrete is constantly moist;
5. For strips not more than 300 mm wide around walls or columns, use hessian or similar absorbent material in lieu of tarpaulin sheets and keep constantly wet.

CON1.W1430.8**CURING - METHOD B**

Except for surfaces against which concrete or applied finishes have subsequently to be placed, cure the concrete by the application of an Approved liquid curing compound and apply:

1. By means of a low-pressure spray at the rate recommended by the manufacturer;
2. On horizontal surfaces immediately after finishing the concrete;
3. On vertical surfaces immediately after removing the formwork.

CON1.W1440.8**CURING - METHOD C**

After thoroughly wetting, cover the concrete with polyethylene sheeting, lapped and securely held in position in such a manner as not to damage the concrete surface, and ensure the concrete is kept constantly moist.

CON1.W1450.8**CURING - METHOD D**

Cover the concrete with a layer of fine aggregate minimum 25 mm thick, then hessian, sacking, canvas or similar absorbent material, lapped and securely held in position in such a manner as not to damage the concrete surface. Keep this covering layer constantly wet.

CON1.W1460.8**CURING - METHOD E**

1. Cover the concrete with polythene sheeting, lapped and securely held in position in such a manner as not to damage the concrete surface, until the concrete has hardened sufficiently for water curing to be carried out;

2. Water cure by spraying the concrete surface continuously with water or by ponding immediately after the sheeting is removed.

CON1.W1470.8 CURING - METHOD F

1. Formwork is to be stripped at least 3 days after concreting;
2. After thoroughly wetting the concrete, cover the concrete with polyethylene sheeting, lapped and securely held in position in such a manner as not to damage the concrete surface, then cover the polyethylene sheeting with hessian bags, and ensure the hessian bags are kept wet throughout the curing period. This also applies to the locations of columns and walls with starter bars.

CON1.W1480.8 PROTECTION OF NEW CONCRETE FROM THE WEATHER

Provide adequate amount of polyethylene sheets to protect freshly placed concrete against heavy rain as required or directed by the CM.

CON1.W1490.8 MINIMUM PERIODS OF PROTECTION FOR CONCRETE

1. Maintain the following minimum curing periods after the concrete has been placed:

Minimum Periods of Protection of Concrete			
Type of Structure	Method of Protection	Minimum Period of Protection (Days)	
		Concrete not Containing PFA, PFAC or GGBS	Concrete Containing PFA, PFAC or GGBS
Aqueous liquid retaining and watertight structures	B	7	7
Aqueous liquid retaining and watertight structures	C, D, E	7	9
Cap or footing where the least dimension exceed 500 mm	B	7	7
	F	10	10
Others	B	7	7
Others	A, C, D, E	4	5
Transfer structure	A	10	10

2. The figures given in the above table may be reduced by the number of days during which formwork has been left in place.

CON1.W1500.8 TEMPORARY REMOVAL OF PROTECTION

Where protection to concrete slabs must temporarily be removed to facilitate setting out or other follow-up operations, ensure that the exposed concrete is adequately sprayed with water and kept moist for the duration of these operations and that the protective covering is restored as soon as practicable.

CON1.W1510.8 ENHANCED CURING CONTROL IN ROOF SLAB

1. In addition to the curing measures in **CON1.W1410**, provide the following enhanced curing control to the roof slab of domestic blocks:
 - a. Artificial fogging from nozzles to the concrete slab surface immediately after concrete is cast until the slab is proper protected;
 - b. Ensure that the protection is implemented at the shortest possible time but shall not be more than two hours under all circumstances.

-
2. Where specified in **Project Specific Specification**, cast the wing slabs and central core slab in separate pours and allow for late cast strips between the slabs.

LOADING NEW CONCRETE STRUCTURES

CON1.W1610.8 LIMITATIONS

Unless otherwise specified, do not subject concrete at any time to a loading which will induce a compressive stress exceeding 33% of the compressive strength of the concrete at the time of loading, or of the grade strength whichever is the least and:

1. When determining the loading, make due allowance for the self-weight of the concrete;
2. For the purpose of this clause, the assessment of the strength of concrete and the stresses produced by the loads is subject to Approval.

WORKED FINISHES TO CONCRETE

CON1.W1710.8 TYPES OF FINISH

Apply to the following finishes where shown or scheduled on the Drawings and execute in an Approved manner:

1. Wood float: to give an even textured surface;
2. Steel trowel or power float: to give a smooth untextured surface;
3. Scratch with a stiff brush: to give a slightly roughened even texture;
4. Tamp with the edge of a board: to give an even texture of parallel ribs.

CON1.W1720.8 ADDED CEMENT OR WATER

Do not, without Approval:

1. Wet the surface to assist working;
2. Add cement to produce the specified finish.

CON1.W1730.8 PROTECTION OF LIVING ROOM FLOORS

Protect from damage the power float finish of all living room floor slabs of domestic flats. Obtain Approval for method of protection.

APPLIED SURFACE FINISHES

CON1.W1810.8 HARDENING

Where shown or scheduled on the Drawings mix the concrete with an Approved hardening admixture in accordance with the manufacturer's recommendations.

CON1.W1820.8 SURFACE HARDENING

Where shown or scheduled on the Drawings, apply an Approved liquid surface hardener in accordance with the manufacturer's recommendations.

CON1.W1830.8 METALLIC OR MINERAL TREATMENTS

Where shown or scheduled on the Drawings, apply an Approved metallic or mineral surface treatment in accordance with the manufacturer's recommendations.

CRACK REPAIR

CON1.W1910.8

GENERAL

All visual cracks to hardened structural and non-structural concrete in domestic and non-domestic buildings discovered during the construction period and/or Maintenance Period, whether they are less than, equal to or greater than the calculated maximum crack width as stated in Code of Practice for Structural Use of Concrete 2013, shall be regarded as defects, imperfections or faults for which the Contractor is liable under GCC Clause 10.3(2), unless such cracks are proved by the Contractor to be due to a design fault of the Authority. If any cracks prove to be due to a design fault of the Authority, then the expense incurred in any investigation and remedial work carried out by the Contractor, as hereunder specified, will be valued in accordance with GCC Clause 10.3(3).

CON1.W1920.8

INVESTIGATION

Investigate all visual cracks as directed by the CM and repair in accordance with the classification methods described in the Table contained in [CON1.W1990](#).

CON1.W1930.8

METHOD STATEMENT

Before commencement of repairs to cracks, submit, for Approval, a method statement detailing the materials and methods to be used.

CON1.W1940.8

CONTRACTOR'S RESPONSIBILITY

1. Take responsibility for initiating the inspection of cracks and the programming of subsequent remedial repairs to ensure all such cracks are repaired before hand-over of the structures to the Authority;
2. Likewise define and repair all visible cracks discovered during the Maintenance Period in accordance with the remaining clauses in this Section.

CON1.W1950.8

PROCEDURE FOR CLASSIFICATION - TYPE OF MEMBER

Types of elements are classified in this specification as follows:

1. (U) All concrete placed below ground level which is not part of a water-retaining structure or water barrier;
2. (S) Slabs (including ribbed slabs): horizontal or inclined elements of concrete in which two dimensions in the horizontal or inclined plane exceed the dimension in the vertical plane;
3. (B) Beams: horizontal elements of concrete in which one dimension in the horizontal plane exceeds the other dimension in the horizontal plane and also exceeds the dimension in the vertical plane;
4. (W) Walls: vertical elements of concrete in which one dimension in the vertical plane and one dimension in the horizontal plane both exceed the other dimension in the horizontal plane;
5. (C) Columns: vertical elements in which one dimension in the vertical plane exceeds the other two dimensions in the horizontal plane.

CON1.W1960.8

PROCEDURE FOR CLASSIFICATION - WIDTH OF CRACK

Determine the width of the crack at the surface of the concrete with the aid of a transparent sheet on which lines of different width are printed or by examining the crack with a low power microscope incorporating a measuring graticule. The classifications of crack width in this specification are:

1. F: maximum width at any point 0.3 mm or less.
2. C: maximum width at any point greater than 0.3 mm.

CON1.W1970.8 PROCEDURE FOR CLASSIFICATION - DEPTH OF CRACK

Determine the depth of a crack in one of the following ways:

1. Slabs: observe whether water on the top surface of the slab passes through the crack and can be seen as a moistened patch on the underside of the slab:
 - a. If water is seen to pass through the slab, the crack is deemed to be a through crack of type T;
 - b. In all other cases it is deemed to be a non-through crack of type NT.
2. In all other elements, if the line of the crack on one surface can be traced on another surface parallel to the first surface or in the case of a beam, if the crack can be seen to traverse two adjacent surfaces in different planes, it is deemed to be a through crack of type T;
3. If a crack follows an irregular pattern on one surface of an element only and is branched at least two points it is deemed to be a non-through crack of type NT.

CON1.W1980.8 METHODS OF REMEDIAL REPAIR

Use the following permissible methods for rectifying cracks according to the overall classification of the crack as given in the table in **CON1.W1990**:

1. Simply surface seal the crack by brushing into it, wherever it is visible, a coat of heavy grade bitumastic paint or other approved durable inert waterproof material;
2. Fill the crack by brushing in dry cement and moistening after the treatment;
3. Brush cement grout or cement paint into the crack until it appears to be filled;
4. Cut a V-groove and fill with repair mortar, applied in accordance with the manufacturer's recommendations, or other equivalent Approved material;
5. Seal by arranging for a low viscosity polymer resin to flow, under the influence of gravity or injection, into the crack to fill it and harden;
6. Inject epoxy resin under pressure into the crack until it exudes at weep holes located so as to ensure that when this occurs the crack may reasonably be expected to have been completely filled and all air to have been displaced by resin; and
7. Apply the method in sub-clause (6), and a coat of heavy grade bitumastic paint over the surface of the crack or other method as approved by CM.

CON1.W1990.8 REPAIR ACCORDING TO CLASSIFICATION

Carry out crack repair according to the treatment method in the following table unless otherwise instructed by CM:

Element	Width	Depth	Treatment Method
U: Underground S: Slabs B: Beams W-C: Wall/Columns	F: 0.3 mm or less C: >0.3 mm	NT: Non-through T: Through	Sub-clauses of CON1.W1980 : (1), (2), (3), (4), (5), (6) or (7)
U	F C	NT, T NT, T	(1) (7)
S	F	NT	(2)
S (Soffit only)	F	NT	(3)
S	F	T	(5)
S	C	NT	(3)
S	C	T	(5)

B	F	NT	(3)
B	F	T	(5)
B	C	NT	(4)
B	C	T	(6)
W-C	F	NT	(3)
W-C	F	T	(5)
W-C	C	NT	(4)
W-C	C	T	(5)

TOLERANCES

CON1.W2010.8

GENERAL

1. For tolerances other than civil engineering works and slopeworks, refer to:
 - a. Code of Practice for Structural Use of Concrete 2013 published by the BD;
 - b. Appendix H "Schedule of Tolerances" to this Specification;
 - c. Where any ambiguity, discrepancy or conflict arises between sub-clauses 1(a) and 1(b) above, the provisions given in Appendix H shall prevail.
2. For any abrupt projections in excess of 5 mm at inner surfaces of liftwell walls:
 - a. Use Approved non-shrink cementitious material to form a hard smooth surface to splay the abrupt projections, to an angle of not less than 75° from the horizontal plane, and extend for a distance of not less than 20 mm;
 - b. Submit remedial details for the CM's approval.
3. For civil engineering works and slopeworks, tolerances given in this Worksection should be read in conjunction with additional tolerances given in Worksection FOR. Tolerances on joints:
 - a. The best fit straight line of straight joints shall be within 25 mm of a specified line. The line of straight joints shall be within 10 mm of the best fit straight line;
 - b. The best fit curved line of curved joints shall be as agreed by the CM and shall be within 25 mm of the specified line. The line of curved joints shall be within 10 mm of the best fit curved line;
 - c. Joints shall be continuous across intersections of joints to within 5 mm of the best fit straight lines or best fit curved lines of each joint.

TESTING

TRIALS OF DESIGNED CONCRETE MIXES

CON1.T010.8

REQUIREMENT FOR TRIAL MIXES

1. Trial mixes are not required for Designed concrete mix of grade strength 20 MPa and below;
2. Where a Designed concrete mix of grade strength above 20 MPa is to be used, carry out trial mixes to determine the suitability of the proposed mix proportions for production of concrete of the required quality, at the intended workability for compaction of the concrete in the position, shape and location as described on the Drawings.

CON1.T020.8

TIMING OF TRIALS

Prepare trial mixes on receipt of the provisional Approval of the mix design and complete at least 35 days before commencement of concreting.

CON1.T030.8

PLANT AND LABORATORY TRIALS

Testing arrangements:

1. Make trial mixes for mix designs details under **CON1.M1110** using the plant proposed for the Works for Plant Trials and in an Approved Laboratory for Laboratory Mix Trials. Sample the concrete, make and test concrete cubes in accordance with CS1:2010;
2. Plant Trials may be required, if test or trial mix data for designed concrete mix of the proposed grade with similar materials to that of the proposed mix and produced in plant other than that proposed for the Works are submitted and are acceptable to the CM;
3. Laboratory Mix Trials may be required, if test or trial mix data for designed concrete mix of similar grade or with different materials to that of the proposed mix and produced in plant proposed for the Works are submitted and are acceptable to the CM;
4. Laboratory Mix Trials may be required in addition to Plant Trials, if no satisfactory test or trial mix data for designed mix concrete or if test or trial mix data submitted do not demonstrate the suitability of the proposed plant and mix design.

CON1.T040.8

PROCEDURE OF PLANT TRIALS FOR CONCRETE FROM SINGLE BATCHING PLANT

Testing samples:

1. Make one trial mix on each of three different days for each mix design using materials typical of the proposed supply, the volume of each to be at least 60% of the nominal volume of the mixer's discharge;
2. Take three samples on each day from each mix in accordance with the sampling method stipulated in CS1:2010;
3. Allow sufficient size of each sample for the following:
 - a. Carry out one slump test or one flow table test as instructed by the CM to determine the workability;
 - b. Make two test cubes for compressive strength test at 28 days.
4. For the GGBS concrete in the production of precast facade and precast staircase, make two additional test cubes on each day for compressive strength test at the time of demoulding.

CON1.T045.A**PROCEDURE OF PLANT TRIALS FOR MIXING CONCRETES FROM TWO BATCHING PLANTS WITH DIFFERENT CEMENT SOURCES**

The two concrete mixes from two different batching plants (plant A and plant B) shall be added with water and mixed at their batching plants within 10 minutes from each other. Upon delivery to testing area, the two concrete mixes shall be mixed together following the mix proportions shown below:

1. 100% from plant A + 0% from plant B (unmixed concrete A);
2. 80% from plant A + 20% from plant B;
3. 50% from plant A + 50% from plant B;
4. 20% from plant A + 80% from plant B;
5. 0% from plant A + 100% from plant B (unmixed concrete B).

Testing samples:

1. Make one trial mix on each of three different days for each mixed concrete of the three different mix proportions and each of the two unmixed concretes mentioned above, using materials typical of the proposed supply, the volume of each to be at least 60% of the nominal volume of the mixer's discharge;
2. Take three samples on each day from each mixed concrete of the three different mix proportions and each of the two unmixed concrete in accordance with the sampling method stipulated in CS1:2010;
3. Allow sufficient size of each sample for the following:
 - a. Carry out one slump test or one flow table test as instructed by the CM to determine the workability;
 - b. Make two test cubes for compressive strength test at 28 days.

CON1.T050.8**PROCEDURE OF LABORATORY MIX TRIALS**

Testing samples:

1. Make 3 separate batches of concrete for each mix design using materials typical of the proposed supply;
2. Take one sample from each batch in accordance with the sampling method stipulated in CS1:2010;
3. Allow sufficient size of each sample for the following:
 - a. Carry out two slump tests or two flow table tests as instructed by the CM to determine the workability;
 - b. Make six test cubes for compressive strength test at 28 days.

CON1.T070.A**STANDARD FOR APPROVAL OF PLANT TRIALS FOR CONCRETE FROM SINGLE BATCHING PLANT**

1. The results of tests for compressive strength at 28 days of the test cubes must comply with the following requirements:
 - a. The average strength of the eighteen test cubes exceeds the specified characteristic strength by at least 12 MPa;
 - b. The compressive strength of each individual test cube exceeds the specified characteristic strength by at least 5 MPa.
2. The results of tests for workability must comply with the following requirements:
 - a. Slump test:
 - i. The range of the three measured slump values for each of the three days must not exceed the average of the three measured slump values by $\pm 20\%$;
 - ii. The average of the nine measured slump values for the three days must fall within ± 20 mm or $\pm 25\%$ of the designed slump value, whichever is the greater.

-
- b. Flow table test:
 - i. The range of the three measured flow values for each of the three days must not exceed the designed flow value by ± 70 mm;
 - ii. The average of the nine measured flow values for the three days must fall within ± 50 mm of the designed flow value.
 - 3. The results of tests on compressive strength of concrete in precast concrete components at demoulding of the test cubes must comply with the following requirement:
 - a. The compressive strength of each individual test cube attains a compressive strength of at least 15 MPa.

CON1.T075.8
**STANDARD FOR APPROVAL OF PLANT TRIALS FOR MIXING
CONCRETE FROM TWO BATCHING PLANTS WITH DIFFERENT
CEMENT SOURCES**

- 1. The results of tests for compressive strength at 28 days of the five mixed concretes, consisted of the three different mix proportions and the two unmixed concretes, stipulated in **CON1.T045** must comply with the following requirements:
 - a. The average strength of the 90 test cubes, consisted of the 18 test cubes from each of the five mixed concretes prepared on the three days, exceeds the specified characteristic strength by at least 12MPa;
 - b. The compressive strength of each individual test cube exceeds the specified characteristic strength by at least 5 MPa.
- 2. The results of tests for workability of the five mixed concretes, consisted of the three different mix proportions and the two unmixed concretes, stipulated in **CON1.T045** must comply with the following requirements:
 - a. Slump test:
 - i. The range of the 15 measured slump values, consisted of the three measured slump values from each of the five mixed concretes taken on each of the three days, must not exceed the average of the 15 measured slump values by $\pm 20\%$;
 - ii. The average of the 45 measured slump values, consisted of the nine measured slump values from each of the five mixed concretes taken on the three days, must fall within ± 20 mm or $\pm 25\%$ of the designed slump value, whichever is the greater.
 - b. Flow table test:
 - i. The range of the 15 measured flow values, consisted of the three measured slump values from each of the five mixed concretes taken on each of the three days, must not exceed the designed flow value by ± 70 mm;
 - ii. The average of the 45 measured flow values, consisted of the nine measured slump values from each of the five mixed concretes taken on the three days, must fall within ± 50 mm of the designed flow value.

CON1.T080.8
STANDARD FOR APPROVAL OF LABORATORY MIX TRIALS

- 1. Except for concrete of grade strength 20 MPa with recycled coarse aggregates, the results of tests for compressive strength at 28 days of the test cubes must comply with the following requirements:
 - a. The average strength of the eighteen test cubes exceeds the specified grade strength by at least 14 MPa, or 10 MPa if test data submitted show that the operating standard deviation of the proposed plant does not exceed 5.5 MPa and the data are acceptable to the CM;

- b. The compressive strength of each individual test cube exceeds the specified grade strength by at least 7 MPa, or 3 MPa if test data submitted show that the operating standard deviation of the proposed plant does not exceed 5.5 MPa and the data are acceptable to the CM.
2. For concrete of grade strength 20 MPa with recycled coarse aggregates, the compressive strength of each individual test cube at 28 days shall exceed the specified grade strength by at least 6 MPa;
3. The results of tests for workability must comply with the following requirements:
 - a. Slump test: the average of the six measured slump values for the three batches must fall within ± 20 mm or $\pm 25\%$ of the designed slump value, whichever is the greater;
 - b. Flow table test: the average of the six measured flow values for the three batches must fall within ± 50 mm of the designed flow value.

CON1.T085.8**PROVISIONAL APPROVAL OF PLANT AND LABORATORY MIX TRIALS**

Provisional approval of the proposed mixes based on 7-days cube results may be given provided that the following are satisfied:

1. Prepare test cubes (from the corresponding batch of concrete taken for 28-days strength test) for compressive strength test at 7 days in accordance with **CON1.T040** and **CON1.T050**;
2. The results of tests for compressive strength at 7 days of the test cubes must comply with **CON1.T070** and **CON1.T080** except that the specified grade strength (and the difference between average strength/individual compressive strength and specified grade strength) given in **CON1.T070** and **CON1.T080** can be reduced by 25%;
3. The results of tests for workability comply with the specified requirements;
4. If the results of tests for compressive strength at 28 days of the test cubes are subsequently found not to comply with **CON1.T070** and **CON1.T080**, the provisional approval of concrete shall be nullified. The concrete cast for the works based on the provisional approval shall be deemed to be unacceptable and where necessary, carry out Approved remedial works and bear all the cost and time of such works.

CON1.T090.8**NON-COMPLIANCE**

If the result of any test for workability or strength of trial mix concrete, whether the trial mix concrete is as stated in **CON1.T040** or as stated in **CON1.T045**, does not comply with the specified requirements, further trial mixes are to be made until the results of every test complies with the specified requirements of trial mix concrete.

CON1.T100.8**VARIATIONS TO APPROVED MIXES**

When the mix has been Approved do not make variations in the proportions and sources of materials or in the type, size and grading of aggregates without the consent of the CM, who may require further trial mixes to be made.

CON1.T110.8**PRACTICAL TESTS FOR SUITABILITY OF THE MIX**

The CM may also require practical tests to be made on Site by filling trial moulds or by pumping to confirm the suitability of the mix for the Works. Ensure that, in such tests, the type of plant used for mixing, transporting and placing, the method of compaction used, the formwork face to the mould and the size and disposition of reinforcement are similar in all respects to those intended for use in the Works.

CON1.T120.8**CERTIFIED EVIDENCE OF MIX SUITABILITY**

Trial mixes need not be made, if test or trial mix data for designed concrete mix of the proposed grade with similar materials to that of the proposed mix and produced in the plant proposed for the Works are submitted and are acceptable to the CM.

SAMPLING AND TESTING GENERALLY

CON1.T205.8

GENERAL

When Instructed:

1. Arrange and provide attendance necessary for the sampling of cement, PFA, GGBS, aggregates (excluding recycled aggregates) and other concrete constituent materials by the DTC; and
2. Submit the samples to the CM in accordance with **CON1.T220** to **CON1.T240**.

CON1.T210.8

DEFINITION OF "BATCH"

In this Specification:

1. A batch of cement, PFA, GGBS, aggregate, admixture or curing compound is defined as any quantity of the material of the same type, manufactured or produced at the same time in the same place, covered by the same certificates and delivered to the site, or stored at the ready-mixed concrete plant, at any one time;
2. A batch of fresh concrete for testing purposes is as defined in clause 1.2 of CS1:2010.

CON1.T220.8

SAMPLES FOR TESTING BY DIRECT TESTING CONTRACTOR (DTC)

When Instructed, arrange and submit to the CM, one sample of each type of material, from each specified concreting day that the concrete is placed in the permanent work, for testing by Direct Testing Contractors (DTC) employed by the Housing Authority.

CON1.T230.8

TESTING PROGRAMME

For recycled aggregates to be tested by DTC, ascertain and allow sufficient time for carrying out the tests and issue of test results by DTC.

CON1.T240.8

SAMPLE SIZES

When Instructed, take samples of the sizes and using the methods of sampling stated in the Table below:

Sample Sizes and Methods of Sampling		
Material	Size of Sample	Method of Sampling
Cement	20 kg	BS EN 196-7:1992
PFA	20 kg	BS EN 196-7:1992
GGBS	20 kg	BS EN 196-7:1992
PFAC	20 kg	BS EN 196-7:1992
Coarse Aggregate	50 kg	CS3:2013 Section 8
Fine Aggregate	10 kg	CS3:2013 Section 8
Water	10 litre	BS3148:1980
Admixture (powdered)	1 kg	BS5075:Part 1:1982
(liquid)	1 litre	BS5075:Part 1:1982
Curing compound	5 litre	BS5075:1982 / BS7542:1992

SAMPLING

CON1.T320.8

COARSE AND FINE AGGREGATES

1. Except for recycled coarse aggregates, the DTC shall sample coarse and fine aggregates at each stockpile and carry out sieve analyses only when instructed by the CM;
2. For recycled coarse aggregates from a particular source, the DTC shall carry out tests stipulated in **CON1.T410** once at the start of the Contract and at weekly intervals thereafter.

CON1.T330.8

WATER FOR MAKING CONCRETE

1. If clean fresh water from Water Supplies Department mains supply is not available, provide:
 - a. One sample of water at the same time as particulars of the water are submitted to the CM in accordance with **PRE.B10.1230** or **PRE.C11.090** as appropriate; and
 - b. One sample of water, for testing by the DTC, during each month that the concrete is being placed in the permanent work unless otherwise Approved.
2. For recycled water specified in **CON1.M320**:
 - a. Arrange to use laboratories which have obtained HOKLAS accreditation to carry out the required tests, unless otherwise permitted by the CM;
 - b. Obtain samples of recycled water at each batching plant for testing by the Approved laboratory according to the test frequency in the following table:

Property		Limit	Test method	Test frequency
(i)	Density	$\leq 1,030 \text{ kg/m}^3$	BS 718:1991 Appendix E (Alternative test method may be used subject to the CM's approval)	At least once per day
(ii)	Initial setting time of cement with recycled water	Deviation not earlier than 1 hour and not later than 1.5 hour as from that of control cubes (Test in parallel with those using recycled water is required on control cubes using clean fresh water only to determine the initial setting time and the deviation)	BS EN 196-3:1995	Once every 3 months for the first year; once every 6 months for subsequent years
(iii)	Chloride content (as Cl)			Once every week for the first two months; once every month for subsequent months
	- Prestressed concrete or steam cured structural concrete	$\leq 500 \text{ ppm}$	American Public Health Association (APHA) Standard, APHA 4500-Cl-B, 18 th edition (1992)	
	- Concrete with reinforcement or other embedded metal	$\leq 1,000 \text{ ppm}$	APHA 4500-Cl-B, 18 th edition (1992)	
	Sulphate content (as SO_4)	$\leq 3,000 \text{ ppm}$	APHA 4500-SO42-C, 18 th edition (1992)	
(v)	Acid-soluble alkali content	$\leq 600 \text{ ppm}$	APHA 3500-K-C & 3500-Na-C, 18 th edition (1992)	

- c. Submit test reports to the CM to show that the recycled water is in compliance with this Specification;
- d. If the test results do not comply with the limits:
 - i. Suspend the use of recycled water immediately and carry out investigation to propose remedial works;
 - ii. Submit two sets of consecutive satisfactory test results taken from the same source for the CM's consideration to resume the use of recycled water for subsequent concrete mixing.

CON1.T340.8**FRESH CONCRETE**

Testing arrangements:

1. Sampling of concrete for testing will be carried out by the DTC in accordance with the requirements given in CS1:2010 and as follows:
 - a. Location of batches to be sampled: as required by the CM;
 - b. The times of day at which samples are taken will be at random;
 - c. Frequency of sampling for compressive strength testing:
 - i. Except for concrete of grade strength 20 MPa with recycled coarse aggregates or concrete of grade strength higher than 60MPa, the sampling rates are as set out in the table below, provided that a minimum of one sample is taken from each mix of concrete produced on any one day. Where the type of structure is not specified all concrete is deemed to be for 'other types' of structure;

Sampling Rates of Fresh Concrete for Compressive Strength Testing	
Types of Structure	Approximate quantity of concrete to be represented by each sample
Masts, Cantilevers with span ≥ 3 m, Prestressed elements, Columns and shear walls, Transfer beams and transfer plates, other critical elements	10 m ³ or 10 batches whichever is the smaller volume
Other types	25 m ³ or 25 batches whichever is the smaller volume
Solid rafts, Pile caps, Mass concrete	100 m ³ or 100 batches whichever is the smaller volume

- ii. For concrete of grade strength 20 MPa with recycled coarse aggregates, make four test cubes for compressive strength testing on each concreting day, two to be tested at 7 days and two at 28 days;
- iii. For concrete of grade 15/20 or below, take a minimum of one sample per 100 m³, irrespective of concreting day, for compressive strength test;
- iv. For high strength concrete of grade strength higher than 60 MPa, take at least one sample of concrete from every ready mixed vehicle arriving on Site. If the concrete is site batched, take a minimum of one sample per every 10 m³, irrespective of concreting day, for compressive strength test.
- d. To determine the workability of the concrete: one sample of concrete from each batch of concrete;
- e. The CM may agree to a reduced frequency of sampling for exceptionally large pours;

- f. For concrete used for construction of hoardings and associated covered walkways and gantries, the frequency of sampling stated in the sub-clauses (1)(c) and 1(d) above may be reduced at the discretion of the CM;
 - g. For blinding layer concrete to underside of pile caps and suspended ground slabs / beams in contact with earth, the tests stated in sub-clauses (1)(c) and 1(d) above are not required.
2. Tests on workability, making and curing of concrete cubes for precast concrete components shall be carried out by the Contractor / manufacturer of the precast concrete components. Tests on compressive strength of concrete cubes shall be carried out by the DTC and / or HDMTL.

CON1.T350.8**FACILITIES FOR SAMPLING FRESH CONCRETE**

Provide, at the normal point or points of discharge of the mixer, a mobile shelter/shelters to accommodate workability test and cube making processes.

TESTS ON AGGREGATES**CON1.T410.8****STANDARD**

1. The DTC shall test recycled coarse aggregates for the following properties:

Requirements	Limits	Testing Method
Minimum dry particle density	2000 kg/m ³	CS3:2013 Section 17
Maximum water absorption	10%	CS3:2013 Section 17
Maximum content of wood and other material less dense than water (by mass)	0.5%	Manual sorting in accordance with BRE Digest 433
Maximum content of other foreign material (e.g. metals, plastics, clay lumps, asphalt and tar, glass etc.) (by mass)	1.0%	Manual sorting in accordance with BRE Digest 433
Maximum fines (by mass)	4%	CS3:2013 Section 10
Maximum content of sand (<4 mm) (by mass)	5% m/m	CS3:2013 Section 10
Maximum content of sulphate (by mass)	1% m/m	CS3:2013 Section 21
Flakiness index	40%	CS3:2013 Section 11
10% fines test	100 kN	CS3:2013 Section 16
Grading	Table 3.1 of CS3:2013 for single-sized 20 mm and 10 mm aggregates	CS3:2013 Section 10
Maximum chloride content	Table 5.1 of CS3:2013 - 0.05% by mass of chloride ion of combined aggregate	CS3:2013 Section 21

2. Limits of acceptance in accordance with the values in the Table above.

CON1.T420.8**FURTHER ANALYSIS**

The CM may require further analysis, including submission stated in **CON1.M210**, to be made if there is any alteration to the type of aggregate.

TESTS FOR WORKABILITY**CON1.T510.8****STANDARD**

Testing arrangements:

1. Sample for workability testing shall:
 - a. Be in accordance with CS1:2010;
 - b. Not be taken from the first 0.3 m³ and the last 0.3 m³ of concrete discharged from the truck;
 - c. Be remixed and divided into two specimens. Each specimen shall be tested by DTC to determine the workability of the concrete either by the slump test or by the flow table test all in accordance with CS1:2010.
2. Unless otherwise specified by the CM, adopt the testing method for workability as below:

Normal Workability (designed slump value from 20 mm to 200 mm)	High Workability (designed flow value from 340 mm to 600 mm)
Slump Test (For designed slump value exceeding 175mm and ≤ 200mm, see the Note to Clause 2.1.1 of CS1)	Flow Table Test

3. Notwithstanding the sampling requirement specified in sub-clause (1)(b) above, the first 0.3 m³ discharged concrete may be used in the Works provided that:
 - a. The discharged concrete is properly protected from contamination to CM's satisfaction; and
 - b. The measured workability of the concrete is in compliance with this Specification.
4. For pre-batched concrete or concrete with volume less than 1 m³ as defined in Clause 1.2 of CS1:2010, the requirement to disregard the first 0.3 m³ and the last 0.3 m³ of concrete before sampling from a mixer for making concrete cube is waived.

CON1.T520.8**ACCEPTANCE VALUES FOR APPROVED MIXES**

1. The Approved workability value is that used to produce the mix Approved under **CON1.T010** to **CON1.T120**;
2. For standardised designed mixes: the average of two measured slumps shall be within the corresponding range specified in Table A of **CON1.M1020**;
3. For designed concrete mixes:
 - a. Where slump test is used to determine the workability, the average of the two measured slumps must fall within ±25 mm or ±33% of the Approved designed slump value, whichever is greater, up to the limit of ±50 mm. No correction to the nearest 5 mm shall be made in determining the average of the measured slumps and the acceptance limits;
 - b. Where flow table test is used, the average of the two measured flow values must fall within ±60 mm of the Approved designed flow value, and no correction to the nearest 10 mm shall be made in determining the average of the measured flow values.

-
4. The CM may reject any concrete for which the measured workability falls outside the limits specified in sub-clauses (2) and (3) as appropriate.

TESTS ON COMPRESSIVE STRENGTH OF CONCRETE CUBES

CON1.T610.8

STANDARD FOR CUBE TESTS

Testing arrangements:

1. For compressive strength testing on concrete cast on Site, the DTC will take samples, make, cure and test concrete cubes of 100 mm size in accordance with CS1:2010;
2. For compressive strength testing on concrete cast at manufacturer's factory, the Contractor / manufacturer of precast concrete components shall take samples, make and cure the concrete cubes of 100 mm size and the DTC and / or HDMTL shall test the concrete cubes in accordance with CS1:2010.

CON1.T620.A

SAMPLES FOR DESIGNED CONCRETE MIXES

Testing samples:

1. Prepare two cubes from a single sample taken at random from a batch of concrete selected at random as follows:
 - a. At the point of discharge from the mixer; or,
 - b. In the case of ready-mixed concrete, at the point of discharge from the delivery vehicle; or
 - c. Elsewhere as directed by the CM;
 - d. In no case to be from the first 0.3 m³ of concrete discharged from the truck.
2. For concrete cast on Site, Radio Frequency Identification (RFID) tag to be provided and installed on the surface of each cube by the Direct Testing Contractor, to authenticate the identity of the cube throughout the whole testing process. A typical RFID tag is shown on Sketch no. RFID/TAG/SK-01;
3. For concrete cast at manufacturer's factory where precast concrete components are constructed, Radio Frequency Identification (RFID) tag is to be provided by DTC or the CM or his representatives resident at manufacturer's factory, and is to be installed by the manufacturer's factory, to authenticate the identity of the cube throughout the whole testing process. A typical RFID tag is shown on Sketch no. RFID/TAG/SK-01;
4. On completion of curing for 28 days, the two tagged cubes will be tested and the average of the two results taken as the test result;
5. If requested, or if the CM instructs that the concrete be tested for compressive strength at ages other than 28 days, provide additional samples;
6. Take cubes with installed RFID tags for 7 days work cube compressive strength tests at a frequency of 2 cubes per concrete mix used per day for all concreting days, or at any other frequency as considered appropriate by the CM.

CON1.T630.8

RESULTS FOR DESIGNED CONCRETE MIXES

1. The results of tests on compressive strength at 28 days of designed mix concrete must comply with the following requirements:
 - a. Individual test results: to comply with the strength determined from limits given in Column A in the Table to **CON1.T650** below;

- b. Average strength determined from any group of four consecutive test results: to comply with the strength determined from limits given in Column B in the Table in **CON1.T650** below. Where there are less than four available test results, treat the average of the first two or first three consecutive test results in the same manner as groups of four consecutive test results.
2. If the difference between the compressive strengths of 2 test cubes made from one sample of designed mix concrete exceeds 15% but does not exceed 20% of the test result:
 - a. Use the higher of the compressive strengths of the 2 test cubes to assess compliance as stated in sub-clause (1)(a) above; and
 - b. Do not use the test results for that sample to assess compliance as set out in sub-clause (1)(b) above nor to calculate the standard deviation.
3. If the difference between the compressive strengths of 2 test cubes made from one sample of designed mix concrete exceeds 20% of the test result:
 - a. Discard the test result for that sample; and
 - b. Propose investigation for Approval to establish if the concrete represented by the sample is acceptable or not.

CON1.T640.8**COMPLIANCE CRITERIA FOR DESIGNED CONCRETE MIXES**

1. Except for concrete of grade strength 20 MPa with recycled coarse aggregates,
 - a. Apply compliance criteria C3 given in the table to **CON1.T650** for concrete of grade below 20;
 - b. Adopt compliance criteria C2 under the following conditions for concrete of grade 20 and above:
 - i. Where there is sufficient previous production data using similar materials from the same plant under similar supervision to establish that the standard deviation for at least 40 test results will not exceed 5.5 MPa; or
 - ii. Where the calculated standard deviation of 40 previous consecutive test results does not exceed 5.5 MPa.
 - c. Adopt compliance criteria C1 if compliance criteria C2 in sub-clause (1)(b) is not applicable;
 - d. For concrete grade 20 and above, the standard deviation is the standard deviation for each mix of concrete to be calculated after every test result using the last 40 test results judged by the same compliance criteria. Apply compliance criteria C2 to subsequent test results if the standard deviation does not exceed 5.5 MPa. Apply compliance criteria C1 to subsequent test results if the standard deviation exceeds 5.5 MPa.
2. For concrete of grade strength 20 MPa with recycled coarse aggregates, the result of any test on compressive strength shall not be less than:
 - a. 70% of the grade strength when tested at 7 days; or
 - b. The grade strength when tested at 28 days.
3. If the compliance criteria is changed from C1 to C2 or from C2 to C1, in the table to **CON1.T650**, apply the new compliance criteria from the 35th day after making the last pair of test cubes in the set of 40 on which the decision to change was based. For the purpose of sub-clause **CON1.T630** (1)(b), treat test results immediately before and after the change separately.

CON1.T650.8**TABLE OF COMPLIANCE CRITERIA FOR DESIGNED CONCRETE MIXES**

The specified grade strength for concrete shall deem to have been attained if the test results comply with both of the requirements specified in Column A and Column B of the table below:

Strength compliance requirements for designed concrete mixes			
		Column A	Column B
Specified Grade Strength	Compliance Criteria	Individual test result must not be less than the specified grade strength by	Average of any 4 consecutive test results must exceed the specified grade strength by
20 and above	C1	2 MPa	7 MPa
	C2	2 MPa	5 MPa
Below 20	C3	2 MPa	3 MPa

CON1.T660.8**NON-COMPLIANCE OF DESIGNED CONCRETE MIXES**

1. When the calculated standard deviation exceeds 8.5 MPa, place no further concrete in the permanent work until an investigation of the materials, mix design and methods of production has been carried out and measures have been taken which, in the opinion of the CM, will result in restoring a satisfactory standard of quality control;
2. If the average strength determined from any group of four consecutive test results, or the first two or first three consecutive test results if applicable, fails to meet the requirement of Column B in table to **CON1.T650**, then all the concrete in all the batches represented by the samples to be deemed defective. For the purposes of this clause, the batches of concrete represented by a group of two, three or four consecutive test results include the batches from which the first and last samples in the group were taken together with all the intervening batches.
When there is a period exceeding two weeks between any two consecutive test results in a group, the CM may direct that the test results immediately before and immediately after the intervening period be treated separately;
3. If any individual test result fails to meet the requirement in Column A of the Table to **CON1.T650**, then that result may be considered to represent only the particular batch of concrete from which the sample was taken, provided that the average of any 4 consecutive results, which contained the failed individual test result, satisfies the requirement of Column B of the Table.

CON1.T670.8**FURTHER TESTS ON DESIGNED CONCRETE MIXES**

If the strength requirements of this Specification are not satisfied, comply with any Instruction of the CM for further testing, including chemical analysis of samples of hardened concrete in the structure, that he considers necessary.

TESTS ON COMPRESSIVE STRENGTH OF CONCRETE CORES

CON1.T710.8**GENERAL**

Provide all necessary facilities and attendance for coring and testing of concrete cores carried out by DTC.

CON1.T720.8**STANDARD**

1. Comply with CS1:2010 in respect of the method of preparing, inspecting and testing concrete cores to determine compressive strength;
2. Witness the sampling of cores by the DTC who shall avoid the following concrete as far as practicable:

- a. The top 50 mm or 20% layer of concrete in a lift, whichever is the greater, where the depth of lift is less than 1.5 m;
- b. The top 300 mm layer of concrete in a lift, where the depth of lift is 1.5 m or more.
3. Agree with the CM on the section of the core samples to be selected as test specimens, including those cores sampled from concrete in thin lift where such layer stated in sub-clause (2) cannot be avoided.

CON1.T730.B**SIZE AND NUMBER OF ROUTINE CORE TEST SAMPLES**

Testing samples:

1. Provide necessary facilities and attendance for taking 3 Nos. or 12 Nos. of the following core samples for testing by DTC from finished concrete works for the same concreting day, at locations selected by the CM:
 - a. 150 mm diameter core samples: for 40 mm aggregate concrete;
 - b. 75 mm diameter core samples: early core test for volumetric precast bathroom (VPB), volumetric precast kitchen (VPK) and volumetric precast lift shafts as described under Worksection CON8, precast façades, precast structural walls, precast balconies and precast staircases as described under Worksections CON5 and CON7;
 - c. 100 mm diameter core samples: for 20 mm aggregate concrete and all cases other than sub-clauses (1)(a) and (1)(b) above.
2. Provide necessary facilities and attendance for taking core samples by DTC from the finished high strength concrete works of which the concrete grade strength is higher than 60 MPa for each concreting day. The number of cores and locations are to be decided by the CM and in accordance with the coring proposal acknowledged by ICU;
3. The length of core samples shall be at least 95% of the core diameter after end preparation;
4. The ratio of core diameter to the maximum aggregate size shall be not less than 3;
5. The diameter of cores should preferably be 150 mm for 40 mm aggregate and 100 mm for 20 mm aggregate or less, and must not be less than 75 mm.

CON1.T740.B**AGE OF CORE SAMPLES**

1. Do not take cores for strength test at ages less than 28 days except the cores for early core tests on volumetric precast bathroom (VPB), volumetric precast kitchen (VPK) and volumetric precast lift shafts as described under Worksection CON8 and precast façades, precast structural walls, precast balconies and precast staircases as described under Worksections CON5 and CON7;
2. Do not make any adjustment to the measured strength in respect of the age of the core when tested.

CON1.T750.8**REQUIREMENT FOR FURTHER CONCRETE CORE SAMPLES**

Carry out further concrete core tests if any of the following apply:

1. Failure of recycled aggregate:
Should a test result on recycled aggregate used in the concrete fail to meet any of the properties as stipulated in **CON1.T410**, comply with any instruction of the CM for the taking of three core samples (these cores are exclusive from the routine core tests in **CON1.T730**), in each concreting day for further tests and bear all the cost and time of such extra work;
2. Low concrete core strength:

Where 3 core samples have been taken in accordance with **CON1.T730** or **CON1.T750** (1), and the estimated insitu cube strength of any individual core is less than 85% of the specified grade strength, comply with any instruction of the CM for the taking of additional core samples to make up a total of 12 numbers of core samples in the same concreting day for further tests. Allow the time without any claim for extension of time and bear all the costs for such extra work;

3. Failure of concrete cube test:

If concrete represented by test cubes in any concreting day fails to meet the standard of acceptance specified in **CON1.T640** and **CON1.T650**, comply with any instruction of the CM for the taking of additional core samples (in addition to the routine cores required under **CON1.T730**) to make up a total of 12 numbers of cores in the same concreting day for further tests. Allow the time without any claim for extension of time and bear all costs for such extra work.

CON1.T760.8

ASSESSING COMPRESSIVE STRENGTH OF CONCRETE CORES

1. In assessing the results of compressive strength on concrete cores for cases other than that stated in sub-clause (2) below, all relevant concrete represented by the cores in the same concreting day is deemed not to comply with this Specification if the strength of the core, when adjusted for length / diameter ratio and converted to estimated insitu cube strength in accordance with CS1:2010, is either:
 - a. Less than 85% of the specified grade strength, for an average result of twelve cores; or
 - b. Less than 75% of the specified grade strength for any individual result.
2. In assessing the results of compressive strength of concrete cores for the case where a reduction factor of 0.8 is applied to the design stresses of concrete placed under water (Type 1(c) and Type 3 piles), all concrete represented by the cores in the same concreting day is deemed not to comply with this Specification if the compressive strength of the core, when adjusted for length / diameter ratio and converted to estimated in-situ cube strength in accordance with CS1:2010, is either:
 - a. Less than 70% of the specified grade strength, for an average result of three cores; or
 - b. Less than 60% of the specified grade strength for any individual result.

CON1.T770.8

MAKING GOOD CORE HOLES

Make good core holes to Approval with cement mortar or concrete of same concrete strength to that originally specified for the parent concrete.

ADDITIONAL TESTS

CON1.T810.8

GENERAL

1. During the progress of the Works, the CM has the power to order tests other than cube tests and core tests. Comply with CS1:2010 or with the relevant British Standard and Code of Practice where CS1:2010 does not apply;
2. The method of sampling, preparing and testing of hardened concrete to determine cement content is to be in accordance with CS1:2010.

CON1.T820.8

CEMENT CONTENT TEST

For Portland cement (PC) concrete, test all core samples taken in the same concreting day to determine their cement content should the estimated in-situ cube strength of any individual core taken in accordance with **CON1.T710** to **CON1.T760** be less than 85% of the specified strength. The test is to be carried out after the completion of the core compression test and by the Direct Testing Contractors employed by the Housing Authority.

CON1.T830.8 NON-COMPLIANCE OF CEMENT CONTENT TEST

Should the average of the test results of all core samples taken in the same concreting day be less than 83% of the minimum cement content stated in **CON1.M1130** to **CON1.M1160**, all relevant concrete represented by these samples in the same concreting day to be deemed not to comply with Specification.

CON1.T840.8 AQUEOUS LIQUID RETAINING STRUCTURES

Test aqueous liquid retaining structures such as water tanks in accordance with clause 9.2 of BS 8007:1987.

FAILURE TO MEET REQUIRED CRITERIA**CON1.T910.8 AQUEOUS LIQUID RETAINING STRUCTURES**

Non-compliance:

1. If any aqueous liquid retaining structure fails to meet the requirements of **CON1.T630**, **CON1.T640** or **CON1.T650** or evidence of seepage is observed during testing according to **CON1.T840**, then the structure is deemed defective.

TESTS FOR REPAIR MORTAR**CON1.T1010.8 SAMPLES FROM REPAIR MORTAR**

When Instructed, take testing samples in accordance with the following sub-clauses:

1. A set of two 100 mm or a set of three 70.7 mm cubes from a single sample taken from a batch of repair mortar selected at random for compressive strength test for each testing age as directed by the CM;
2. RFID tag to be provided and installed on the surface of each cube by the Direct Testing Contractor, to authenticate the identity of the cube throughout the whole testing process. A typical RFID tag is shown on Sketch no. RFID/TAG/SK-01;
3. Take the average of the cube results in the set as the test result.

TESTS ON GGBS**CON1.T1110.8 PURCHASER TESTS**

1. Employ an Approved testing laboratory as stipulated in **CON7.W010** for carrying out the tests to verify the physical and chemical properties of GGBS in accordance with BS EN 15167-1:2006 before production of the precast facade and precast staircase units;
2. Submit the test reports to the CM in accordance with **CON7.T010**.

INVESTIGATION BY EXTENSIVE CORE TESTING**CON1.T1210.8 GENERAL**

1. When concrete is deemed not complying with this Specification as assessed in accordance with **CON1.T750** or **CON1.T830**, the CM shall issue a condemnation letter;
2. Apply the procedure in **CON1.T1220** to **CON1.T1260** to investigate the extent of non-compliance and re-execute the works;
3. The provisions stated hereinafter shall be without prejudice to the Employer's right, the CM's power and the Contractor's obligations in connection with the removal of unsatisfactory material and work, and subsequent re-execution of work under the Contract.

CON1.T1220.8 INVESTIGATION AND REPORTS

1. Within 14 days from the date of condemnation letter issued by the CM, submit the following for Approval:
 - a. A statement of request to identify the extent of non-complying concrete in the affected structural elements on the concreting day(s) as stated in the condemnation letter;
 - b. An investigation plan as stipulated in **CON1.T1230**;
 - c. A statement of undertaking to complete the investigation and re-execution of works within a duration agreed by the CM; and
 - d. A statement of confirmation to bear all costs and time so incurred in connection with or arising from the investigation.
2. Confirm in writing to accept the conditions, if any, as stipulated by the CM related to the Approval in sub-clause (1) before the investigation proceeds;
3. Within 7 days upon completion of the investigation, report to the CM with details as stipulated in **CON1.T1250** for Approval;
4. Confirm in writing to accept the conditions, if any, as stipulated by the CM related to the Approval in sub-clause (3) before re-execution of works proceeds; and
5. Within 7 days upon completion of the re-execution of works, report to the CM with details as stipulated in **CON1.T1260**.

CON1.T1230.8 INVESTIGATION PLAN SUBMISSION

The investigation plan shall be endorsed by an Approved RSE and shall include the following details:

1. Delineation of concrete to be investigated;
2. Method statement of the extensive core testing and the details of a HOKLAS accredited laboratory, to be approved by the CM, responsible for sampling and carrying out the compressive strength test;
3. Volume of concrete represented by each core; and
4. Programme of the investigation works.

CON1.T1240.8 ASSESSMENT CRITERIA

1. Include the cores taken in accordance with **CON1.T750** in addition to the cores obtained from the investigation plan in identifying the extent of non-complying concrete; and
2. The volume of concrete represented by an individual core is deemed not to comply with this Specification if the following test result of the individual core is found:
 - a. Criterion applicable to all types of concrete: The estimated in-situ cube strength is less than 85% of the specified grade strength; or
 - b. Criterion applicable to Portland Cement (PC) concrete only: The cement content is less than 83% of the minimum cement content stated in **CON1.M1130** to **CON1.M1160**, for Portland cement (PC) concrete.

CON1.T1250.8 INVESTIGATION REPORT SUBMISSION

Submit an investigation report, endorsed by the Approved RSE in **CON1.T1230**, with the following details:

1. Delineation of non-complying concrete;
2. Method statement for the re-execution of works; and
3. Programme of the re-execution of works including verification testings.

CON1.T1260.8**RE-EXECUTION OF WORKS REPORT SUBMISSION**

Submit a report, substantiated by results of verification testings and endorsed by the Approved RSE in **CON1.T1230**, to confirm that the Works subsequent to the re-execution of works comply with this Specification.

CON2 FORMWORK

DESIGN

FORMWORK DESIGN GENERALLY

CON2.D010.8

LOADINGS

Design and construct falsework and formwork to withstand any combination of the following loadings and to maintain the position and shape of the formwork to achieve the required shape and finish of the hardened concrete:

1. Total weight of formwork, falsework and wet concrete;
2. Construction loads including dynamic effects of placing, compacting and construction traffic;
3. Wind loads in accordance with the Code of Practice on Wind Effects in Hong Kong 2004 issued by the Buildings Department;
4. Any other relevant loading described in BS 5975:1982.

CON2.D020.8

STANDARD

Comply with the requirements of BS 5975:1982 regarding design, construction and dismantling of falsework and formwork.

CON2.D030.8

INCLINED SURFACES

Provide formwork to the top surface of concrete where inclined at a slope exceeding 15° to the horizontal.

CON2.D040.8

DISMANTLING AND REMOVAL

Design falsework and formwork so that they can be dismantled and removed without disturbing or overloading the finished concrete work or the structure.

CON2.D050.8

BRIDGE AND TRANSFER STRUCTURE CONSTRUCTION

1. Appoint a Registered Structural Engineer to design and control the temporary works for the construction of the bridge and the transfer structure;
2. The submission shall include drawings and supporting calculations and shall be submitted to the CM not less than 4 weeks before the Contractor proposes to put such work in hand. Do not commence the proposed work without the prior consent of the CM. Such consent shall, however, in no way relieve the Contractor of any of his responsibilities for the design of the falsework;
3. Monitor falsework levels and make any necessary adjustments for settlement or other deflection or movements;
4. Unless otherwise approved by the CM, the falsework supporting system for the transfer structure shall be carried down directly to the pile cap levels and shall not impose any additional loadings on the floors, columns and walls.

CON2.D060.8

FORMWORK FOR STRUCTURAL WALLS IN DOMESTIC BLOCKS

1. Design and use large panel formwork, in accordance with **CON2.D310**, for all structural walls in domestic floors between first domestic floor level and main roof level;

-
2. For domestic blocks without rotational symmetry and where the use of large panel formwork at critical areas of a domestic floor would lead to an unacceptable prolonged construction cycle, the Contractor may propose the use of small panel metal formwork, together with justification in the submission stipulated in **CON2.D240**, for CM's approval.

FALSEWORK SPANNING PUBLIC HIGHWAYS

CON2.D110.8

DESIGN RESPONSIBILITY

Employ a Registered Structural Engineer to take responsibility for the design and construction of all temporary works and falsework spanning public highways. No consent or dissent of the CM will relieve the Contractor of his sole responsibility for the falsework design, construction and obtaining Approval.

CON2.D120.8

FALSEWORK SPANNING A PUBLIC HIGHWAY

Ensure the falsework system does not interfere with normal traffic flow and does not reduce the width of the traffic lanes. Design clearances to falsework spanning a public highway in accordance with Section 35 of the Transport Planning and Design Manual Volume 2 - Highway Design Characteristics.

CON2.D130.8

APPROVALS

1. Take responsibility for obtaining all necessary approvals of any proposed falsework design and construction, through the Authority, from the Highways Department, the Commissioner of Police and the Commissioner for Transport;
2. Do not commence any temporary works, including falsework spanning a public highway, unless the falsework design and construction method has been approved by the Highways Department and Commissioner of Police and Commissioner for Transport.

SUBMISSIONS

CON2.D210.8

TIMING

Submit details of formwork and falsework to the CM for information before commencement of construction.

CON2.D220.8

FALSEWORK SPANNING A PUBLIC HIGHWAY

Submit proposals for falsework spanning a public highway to the CM in the form of proper, numbered, fully dimensioned drawings accompanied by full structural calculations endorsed by the Contractor's Registered Structural Engineer. Make any amendments required by the CM and submit copies to the CM in order to obtain all necessary approvals from the Highways Department and Commissioners. See also **CON2.D130** (2) above.

CON2.D230.8

PLYWOOD SHEATHING

Before commencement of the superstructure and where the sheathing is timber plywood, submit for Approval, details of the method of identifying and recording the number of uses to which the sheathing will be subjected to. Upon Approval, provide all labour and equipment and carry out marking and recording to the satisfaction of the CM.

CON2.D240.8

LARGE PANEL FORMWORK AND SMALL PANEL METAL FORMWORK FOR DOMESTIC BLOCK

Submit the following information for CM's approval:

1. Details of the system, including drawings and calculations;

2. Details of safety requirements regarding the designated storage yard for large panel formwork as stipulated in **PRE.B8.262**;
3. Details for holding down and stabilising the panels of the wallforms including horizontal ties at the top of wallforms;
4. Details of kicker construction, both for precast kicker blocks and cast-in-situ kickers, including proposed bedding and grouting material for precast kicker blocks;
5. Details of metal formwork, and its fixings, for slab edges which form an integral part of wall elevations;
6. Proposals for curing and protecting the concrete;
7. Method statement for placing and compacting the concrete;
8. Details of any relaxation to the minimum periods for retaining formwork and falsework in position before striking as stated in **CON2.W630** which may be required to suit the proposed formwork systems;
9. Details of assembling and striking of any small panel metal formwork, including the maintenance of the panels for repeated uses;
10. Documentary evidence, such as previous project references, indicating that the finished concrete surface produced by the small panel metal formwork is not to be of a lesser standard than that produced by the large panel formwork, together with a method statement for applying skim coat to the wall joints in accordance with **CON2.W315**.

CON2.D250.8**BRIDGE AND TRANSFER STRUCTURE CONSTRUCTION**

Submit the following details of formwork and falsework to the CM at least 4 weeks before commencement of construction:

1. Details of the system, including drawings and calculations;
2. Details of holding down and stabilising the system including horizontal ties;
3. Method statement for construction of the structure;
4. Proposal for curing and protecting the concrete; and
5. Method statement for placing and compacting the concrete.

CON2.D260.8**INSPECTION RECORDS**

Submit records of inspection on the completed formwork and falsework to the CM for information before carrying out any further works that may affect the stability of the formwork and falsework. Such records are to be certified by a contractor's superintendent holding qualification equivalent to TCP Grade T4 in civil or structural engineering discipline.

DESIGN OF LARGE PANEL FORMWORK FOR DOMESTIC BLOCK

CON2.D310.8**GENERAL DEFINITION**

Large panel formwork refers to metal formwork complying clauses **CON2.D320** to **CON2.D450**.

CON2.D320.8**WALLS NOT EXCEEDING 7.5 M LONG**

For walls not exceeding 7.5 m long, design the whole of the formwork assembly for one face of the wall per storey as one complete reusable panel.

CON2.D330.8 WALLS EXCEEDING 7.5 M LONG WITHOUT OPENINGS

For walls exceeding 7.5 m long, without door or window openings, design the whole of the formwork assembly, for one face of the wall per storey, as one or two complete reusable panels.

CON2.D340.8 WALLS EXCEEDING 7.5 M LONG WITH OPENINGS

For walls exceeding 7.5 m long with door/window openings, the whole of the formwork assembly for one face of the wall per storey may comprise a no. of panels provided that any joints between panels must fall within the width of the door/window openings.

CON2.D350.8 JUNCTIONS

At any wall junction, where it is not practicable to position the edge of the formwork assembly at the junction, position the edge at a clear distance of not more than 300 mm from the junction line.

CON2.D360.8 USE OF OTHER TYPES OF FORMWORK

Where it is not practicable to use large panel formwork, e.g. at staircases, columns at wall ends etc, adopt other types of formwork, including small panel metal formwork or traditional formwork, and submit details for Approval.

CON2.D370.8 JOINTS IN SHEATHING

1. Design the sheathing of the formwork free of horizontal joints;
2. Position any vertical joints at minimum 1 m centres maintaining a continuous smooth surface across the joints.

CON2.D380.8 BACKING STRUCTURE

Support the sheathing with a backing structure of metal or other Approved material.

CON2.D390.8 SEALING BASE OF WALLFORMS

With the exception of where in-situ monolithic kickers are used, seal the toes of all wallforms with a compressible rubber hose placed between the floor slab and the base of the wallform, backed with a cement mortar seal to prevent grout loss.

CON2.D400.8 TOP BRACING

Securely brace every panel of wallform at the top by at least two horizontal ties to ensure vertical alignment.

CON2.D410.8 SLAB EDGES

Fabricate slab edge formwork in metal to match the wallform system where any part of a wall is formed as a slab edge.

CON2.D420.8 ACCESS WALKWAY

In addition to GCC Clauses 7.1(2):

1. Provide continuous walkway around the edges of the building under construction. Working platforms and table forms may be used;
2. Comply with details of safety requirements regarding working platforms as stipulated in **PRE.B8.262**;
3. Provide a minimum walkway width of at least 1000 mm with a minimum width of 650 mm at joints with any adjacent walkway. The walkway must be close boarded or planked in timber of 25 mm minimum thickness, plated or of metalwork;
4. Provide toe boards to a minimum height of 200 mm on the platform side where a person or object could fall for more than two metres;

-
5. Read this Specification in conjunction with drawing No. SES/LP/S/EG001 in Appendix B which details the access walkway.

CON2.D430.8 OTHER TYPES OF FORMWORK - ACCESS WALKWAY

Propose and provide alternative platforms and access walkway and maintain continuity where large panel formwork is not used in accordance with **CON2.D360** and obtain Approval before use, provided that the alternative is not of a lesser standard in conforming to the requirements in **CON2.D420**.

CON2.D440.8 PATENT WALLFORM SYSTEMS

Obtain prior Approval for use of patent wallform systems not complying with this Specification, provided that the finished products produced by such system proposed are not to be of a lesser standard than that produced by formwork conforming to the above formwork design requirements.

CON2.D450.8 ALTERNATIVE GROUT SEALING SYSTEMS

Obtain Approval before using any alternative grout sealing system:

1. The CM may Approve any other proposed system, provided that the Contractor can demonstrate that the finished product provided can match the requirements of the Specification before commencement of construction;
2. At any time the CM may withdraw such Approval of the proposed system if he considers that it will fail to produce the required finished product;
3. In such a case, revert to the system described in this Specification. No monetary claims whatsoever will be entertained or extensions of time granted in the event of such a withdrawal of Approval.

DESIGN OF SMALL PANEL METAL FORMWORK FOR DOMESTIC BLOCK

CON2.D510.8 GENERAL DEFINITION

Small panel metal formwork, e.g. aluminium formwork, refers to small metal formwork complying clauses **CON2.D520** to **CON2.D600**.

CON2.D520.8 JUNCTIONS

As **CON2.D350**.

CON2.D530.8 JOINTS IN SHEATHING

Maintain a continuous smooth surface across all horizontal and vertical joints.

CON2.D540.8 BACKING STRUCTURE

As **CON2.D380**.

CON2.D550.8 SEALING BASE OF WALLFORMS

As **CON2.D390**.

CON2.D560.8 TOP BRACING

1. For walls not exceeding 7.5 m long, securely brace each wallform at the top by at least two horizontal ties to ensure vertical alignment;
2. For walls exceeding 7.5 m long, securely brace each wallform at the top by at least four horizontal ties to ensure vertical alignment.

CON2.D570.8 SLAB EDGES

As **CON2.D410**.

CON2.D580.8	ACCESS WALKWAY As CON2.D420.
CON2.D590.8	PATENT WALLFORM SYSTEMS As CON2.D440.
CON2.D600.8	ALTERNATIVE GROUT SEALING SYSTEMS As CON2.D450.

MATERIALS

DEFINITIONS

CON2.M010.8 FORMWORK OR FORM

That section of the temporary works used to give the required shape and support to poured concrete, consisting of sheathing material in direct contact with the concrete and joists or stringers that directly support the sheathing.

CON2.M020.8 FALSEWORK

Any temporary structure used to support a permanent structure while it is not self-supporting.

CON2.M030.8 TRADITIONAL FORMWORK

Formwork assembled from individual elements comprising sheathing material as described in BS 5975:1982 and separate backing structure supporting the sheathing.

CON2.M040.8 PERMANENT OR LEFT IN FORMWORK

Formwork designed to remain in position as part of the permanent work.

CON2.M050.8 LARGE PANEL FORMWORK

Formwork as [CON2.D310](#).

CON2.M060.8 SMALL PANEL METAL FORMWORK

Formwork as [CON2.D510](#).

CON2.M080.8 TIMBER FOR FORMWORK

Use sustainable timber as specified in [PRE.B8.2450](#) and reuse timber whenever possible as specified in [PRE.B8.2460](#).

SHEATHING

CON2.M110.8 SUITABLE MATERIALS

Material against which the concrete will be cast must be suitable for providing the specified concrete finish, formed for example, in metal, timber, plywood, film faced plywood or plastic.

ANCILLARY MATERIALS

CON2.M210.8 RELEASE AGENT

An Approved type which will not:

1. Stain or colour the concrete;
2. Affect the adhesion between the concrete and any subsequent finishings.

CON2.M220.8 SURFACE RETARDERS

An Approved type which will not stain or colour the concrete.

CON2.M230.8 HOLLOW CONCRETE BLOCKS FOR SLABS

Manufactured as follows:

-
1. Concrete:
 - a. Mix comprising cement, granite fines and granite aggregate passing a 10 mm sieve but retained on a 5 mm sieve;
 - b. Grade: 20/10.
 2. Dimensions:
 - a. Outer casing and web: 25 mm thick;
 - b. With a 25 mm x 5 mm groove formed along both sides for key.

CON2.M240.8**PRECAST KICKER BLOCKS**

Of solid construction and:

1. Cast in the same grade of concrete as the wall into which they are to be cast. Provide evidence of the grade of concrete to CM for approval;
2. Having a length of 100 mm parallel to the wall face, the same thickness as the wall and a minimum height of 75 mm above the highest slab abutting the wall at the level at which the kicker is formed.

MATERIAL FOR SEALING FORMWORK TIE HOLES**CON2.M250.8****MORTAR**

Shall be:

1. One-part prebagged non-shrink cementitious mortar made by mixing on Site with water to form a trowellable consistency in application;
2. In accordance with mortar manufacturer's specified application procedures (including bond cost if required by the mortar manufacturer);
3. All mortar shall be subject to tests specified in **CON2.T110**, **CON2.T120**, **CON2.T130**, **CON2.T140** (2), **CON2.T150** and **CON2.T160** before approval by the CM.

CON2.M260.8**POLYURETHANE FOAM**

1. The polyurethane foam shall be formed from a system of components which expands and sets to become a rigid foam;
2. The polyurethane foam shall be subjected to watertightness test specified in **CON2.T140** (1) & (2)(b), before approval by the CM.

WORKMANSHIP

HANDLING AND STORAGE

CON2.W010.8

FORMWORK

1. For superstructure works:
 - a. Store formwork, including large panel formwork and small panel metal formwork, off a levelled, well-drained and maintained hard-standing ground on level supports and in a manner which will not result in damage, deformation or contamination;
 - b. Store large panel formwork and small panel metal formwork safely and securely with struts or supports according to the method statement approved;
 - c. Comply with details of safety requirements regarding prevention of falling objects as stipulated in **PRE.B8.262**.
2. For works other than that in sub-clause (1):
 - a. Store formwork off the ground on level supports and in a manner which will not result in damage or deformation to the formwork or in contamination of the formwork.

CON2.W020.8

ANCILLARY MATERIALS

Store:

1. Release agents and surface retarders in sealed containers marked to identify the contents and protected from exposure to conditions which may affect the material;
2. All materials in accordance with the manufacturer's recommendations and do not use the materials after the recommended shelf life has been exceeded.

SAFETY AND PROTECTION

CON2.W110.8

PERIMETER WALKWAY

Do not stack any materials or debris on the perimeter formwork walkway at any time.

ERECTING FORMWORK

CON2.W210.8

CHECKING AND INSPECTION

Check the alignment of all kickers and wallforms prior to concreting and:

1. Allow the CM to inspect the completed formwork before any work, including fixing reinforcement adjacent to formwork, makes access for inspection difficult;
2. Inform the CM 24 hours, or sooner if agreed with the CM, before carrying out such work.

CON2.W220.8

KICKERS

Fix wall and column forms tightly against kickers by an Approved method.

CON2.W230.8

JOINTS

Construct joints between formwork panels, stop ends and adjoining concrete to prevent loss of grout. Cut formwork in such a manner that reinforcement and built-in components passing through the formwork are maintained in position and grout loss is prevented.

CON2.W240.8 TEMPORARY ACCESS

Provide temporary openings in the formwork for cleaning or inspection if required.

CON2.W250.8 PIPE SLEEVES ETC

1. Provide galvanised mild steel or PVC pipe sleeves through floors and walls etc as required for all trades as specified elsewhere;
2. Fix pipe sleeves, inserts, void formers and box outs to specified sizes and in correct positions before placing concrete. Do not cut hardened concrete to provide holes or chases unless otherwise Approved;
3. Do not use polystyrene for void formers or box outs larger than 150 mm x 150 mm x 150 mm unless otherwise Approved.

CON2.W260.8 FORMWORK FIXINGS GENERALLY

Do not allow any devices for securing formwork and falsework to remain within the specified concrete cover.

CON2.W270.8 FORMWORK TIES

Fix formwork ties and components in such a manner that they do not touch reinforcement or any other built-in component. Any part left in the concrete must be at least 40 mm or the specified nominal cover to the reinforcement, whichever is greater, from the concrete surface.

CON2.W280.8 TIES IN STRUCTURAL ELEMENTS WITH WATERTIGHT FUNCTION

1. Use only ties which leave no open holes through the concrete having a watertight function, including:
 - a. Aqueous liquid retaining structures;
 - b. All structural elements constructed below finished ground level; and
 - c. Roof parapets below the upturn level of waterproofing membrane as shown on Drawings.
2. Provide precautionary measures, which may be nylon, epoxy, plastics or other dielectric material coating, to ties left in aqueous liquid retaining structures to avoid damaging the epoxy coating of reinforcement bar.

CON2.W290.8 FORMING CONSTRUCTION JOINTS

Ensure formwork to construction joints is rigid and accommodates projecting reinforcement without bending or displacement.

CON2.W300.8 LAYING HOLLOW BLOCKS FOR SLABS

1. Do not use blocks within 28 days of their being cast;
2. Lay on formwork in straight rows with butt joints;
3. Seal exposed, open ends with similar concrete to a depth of 25 mm.

CON2.W310.8 JOINTS IN LARGE PANEL FORMWORK

Ensure close contact between the edges of panels used on the same wall side, with maximum tolerance measured perpendicular to the wall not to exceed 3 mm after concreting.

CON2.W315.8 JOINTS IN SMALL PANEL METAL FORMWORK

1. Ensure close contact between the edges of panels used on the same wall side, with maximum tolerance on abrupt changes/irregularities of a continuous fair-face finished concrete surface measured perpendicular to the wall tightened to not to exceed 2 mm after concreting;

2. Unless otherwise instructed by the CM, apply skim coat as specified in **FIN7.M790** to the wall joints to cover up and smoothen any abrupt changes/irregularities notwithstanding that the tolerance on abrupt changes/irregularities is met. Bear all associated costs and no extension of time shall be allowed.

CON2.W320.8 ARRISES

Erect formwork to provide smooth arrises free from damage and cracks.

KICKERS FOR LARGE PANEL FORMWORK AND SMALL PANEL METAL FORMWORK

CON2.W410.8 DEFINITIONS

For the purposes of this Worksection the following apply:

1. An external wall is defined as a complete length or section of a wall which is abutted by a floor slab on one side only, at the level where the kicker is formed;
2. An internal wall is defined as a complete length or section of a wall which is abutted by floor slabs on both sides, at the level where the kicker is formed.

CON2.W420.8 PROVISION OF KICKERS

Provide kickers at the toes of all walls constructed by large panel formwork and/or small panel metal formwork for the purpose of maintaining correct alignment and preventing grout loss.

CON2.W430.8 KICKERS FOR EXTERNAL WALLS

1. Form in-situ kicker, using metal formwork, monolithically with the floor slab abutting the wall in one continuous casting operation;
2. The concrete grade of the kicker shall be the same as that of the abutting floor slab and the dimensional details are as follows:
 - a. Length: over the whole length of the wall;
 - b. Thickness: same as that of the wall;
 - c. Top level: 100 mm above the highest level of the abutting floor slab.

CON2.W440.8 KICKERS FOR INTERNAL WALLS

Use evenly spaced precast blocks as specified in **CON2.M240** to form the kickers of internal walls, with a minimum of two blocks provided per wall as follows:

1. Place the kicker blocks in position after the slabs abutting walls have been cast and bed to the correct level using an approved bedding material;
2. Fix the blocks firmly to the top of the slabs either by cast in or drilled anchor bolts. Fill any voids around bolts with an Approved grouting material. Ensure fixings prevent blocks being displaced during the wall construction;
3. Adjust reinforcement locally, and only with prior Approval, to enable precast kicker blocks to be fixed.

WORK BELOW GROUND

CON2.W510.8 FORMING AGAINST EXCAVATION FACES

Do not cast concrete below ground against sides of excavation unless with the CM's prior Approval.

STRIKING FORMWORK

CON2.W610.8 GENERAL

Strike formwork and falsework without disturbing, damaging or overloading the finished concrete work or the structure and without affecting other formwork and falsework.

CON2.W620.8 CONTRACTOR'S RESPONSIBILITY

Notwithstanding any other clauses in this Specification accept sole responsibility for the safe removal of formwork and falsework.

CON2.W630.8 MINIMUM PERIODS BEFORE STRIKING

Minimum periods for retaining formwork and falsework in position are as follows:

Striking Time	
Type of Formwork and Falsework	Period
Inclined formwork to top Surfaces	12 hours
Vertical formwork to columns, beams and walls (unloaded)	16 hours
Soffit formwork to Slabs (Props left under)	3 days
Props to slabs (unloaded)	7 days
Soffit formwork to beams (Prop left under)	7 days
Props to beams (unloaded)	16 days
Prop to cantilevers (unloaded)	28 days

CON2.W640.8 STRIKING AT LOW TEMPERATURE

Obtain instructions from the CM for increased striking times of formwork at lower temperatures. The periods stated in **CON2.W630** are for Portland cement at 15°C ambient temperature and the conditions stated in the table.

CON2.W650.8 STRIKING LARGE PANEL FORMWORK AND SMALL PANEL METAL FORMWORK

Alternative minimum periods before striking large panel formwork and small panel metal formwork may be Approved, if the design allows, provided that:

1. Props for soffits of insitu slabs or combined precast and insitu slab construction, must remain in place for a minimum of five days and until the concrete has achieved two thirds of the required 28 day crushing strength;
2. The props supporting the floor immediately below the cast slab or soffit must remain in place for a minimum period of 2½ days after the upper floor is concreted and until the concrete has achieved a crushing strength of 10 MPa, or twice the stress to which the concrete will be subjected, whichever is the greater. No re-propping is permitted within the minimum periods;
3. In the event that a request for relaxation of the minimum periods before striking, if any, is not accepted by the CM, the design of the formwork system is deemed to have been prepared on the basis of the minimum periods detailed in **CON2.W630** or this sub-clause, provided the conditions referred to are complied with;
4. As evidence that concrete placed insitu or in combined precast and insitu slabs has attained the minimum strengths specified, from test results obtained from the laboratory established on site in accordance with the requirements for testing contained in the Preliminaries PRE.B9 of this Specification.

CON2.W660.8 BACK PROPPING SOFFITS

Where the props are to be left in place whilst the soffit formwork to slabs and beams are removed, design such props either to remain in position throughout the striking process without having to be temporarily removed or alternatively, if agreed by the CM, so that a few can be removed at a time and replaced immediately.

CON2.W670.8 LOADING THE STRUCTURE

Do not place construction loads on any unshored portion of the structure under construction. Agree the number of floors requiring propping with the CM, according to the design loads of such floors.

TRIAL PANELS**CON2.W710.8 SAMPLES**

Provide samples of any exposed formed or worked finishes as detailed in the [Project Specific Specification](#), and obtain Approval.

CON2.W720.8 CONSTRUCTION OF TRIAL PANEL

Subject to CM's instruction, construct on Site a trial panel before the commencement of typical floor construction as detailed in the [Project Specific Specification](#) to demonstrate that the proposed formwork and falsework system is adequate in providing the required quality standard of finishes to concrete.

CON2.W730.8 SUB-STANDARD TRIALS

Should the finish to the trial panels not be to the standard specified and not to the satisfaction of the CM, modify the formwork system and construct further trial panels until, in the opinion of the CM, the finish to the concrete produced is satisfactory. Adopt the formwork system producing the required finish as the standard for all subsequent formwork used.

STANDARD PANEL**CON2.W810.8 INSITU STANDARD PANEL**

As soon as is practical after commencement of superstructure work, select a sample area from the insitu works as being representative of the minimum standard of the specified finish for inspection by the CM. Upon agreement in writing by the CM the finish to the sample area will become the minimum standard for that specified finish for all subsequent concrete.

FORMED FINISHES FOR CONCRETE**CON2.W910.8 TYPE A : ROUGH BOARD FINISH**

1. Formwork or formwork linings to consist of Approved rough textured seasoned wood boards with moisture content of between 10% and 20%;
2. Arrange boards of varying textures to give uniform overall effect;
3. Assemble boards to prevent leakage of grout between them;
4. Soak formwork with water before erecting, and keep damp until concrete is placed;
5. Position cover spacers and bolts to the satisfaction of the CM;
6. The number of uses of formwork lining will be limited to its ability to provide the required finish;
7. The finish to be left as struck. Do not make good until inspected by the CM;

-
8. Discoloration will not be permitted;
 9. Fill minor voids and irregularities on surfaces with a matching mortar to Approval, using a sponge rubber face float.

CON2.W920.8**TYPE B : FAIR-FACED FINISH**

1. Produce an even finish with a sheet material (e.g. plywood);
2. Arrange panels in pattern as specified;
3. The finish to be left as struck. Submit method statement for rectification works for approval prior to carrying out any remedial works. Do not make good until inspected by the CM;
4. Blowholes not exceeding 10 mm diameter will be permitted, but otherwise surface to be free from voids, honey-combing or other large defects;
5. Variations in colour will be permitted when the finished concrete is to receive an applied decoration;
6. Make good small defects, and fill blowholes and formwork tie holes with Approved materials.

MAINTENANCE OF FORMWORK**CON2.W1010.8****PREPARATION FOR RE-USE**

Clean and repair formwork which has been previously used before it is re-erected.

CON2.W1020.8**DAMAGED AND DETERIORATED FORMWORK**

Do not re-use formwork where strength and composition has so far deteriorated due to repeated use that, in the opinion of the CM, it will no longer adequately perform its function in accordance with the Specification but remove it from Site.

CON2.W1030.8**RUBBER SEALS**

Properly maintain the rubber hose seals and replace when required or as Instructed but in no case subject seals to more than nine uses.

CON2.W1040.8**RE-USE OF TIMBER FORMWORK**

Do not subject plywood sheathing to formwork to more than nine uses, irrespective of the use of one or both faces of such sheathing.

SEALING FORMWORK TIE HOLES**CON2.W1110.8****GENERAL**

Seal all tie holes left in walls by formwork ties and components in accordance with Sketch no. SES/TB/S/SK-001/A.

CON2.W1120.8**SEALING THE TIE HOLES**

1. Procedures for external walls with tile finishes:
 - a. Knock out the PVC tubing;
 - b. Drive in and secure a piece of minimum 30 mm thick cork at 40 mm from each end of a formwork tie hole;
 - c. Wet thoroughly to achieve saturation and clean concrete surfaces inside the hole to remove dust and loose materials prior to applying mortar (and bond coat if required by the mortar manufacturer);

-
- d. Using the cork as a backing, apply and completely fill the hole ends by prebagged non-shrink cementitious mortar as described and Approved in accordance with **CON2.M250**;
 - e. Cure the mortar to **CON1.W1410** or in accordance with the mortar manufacturer's recommendations as Approved by the CM.
 2. Procedures for external walls without tile finishes:
 - a. Knock out the PVC tubing;
 - b. Clean thoroughly concrete surfaces inside the hole to remove dust and loose materials prior to applying polyurethane foam;
 - c. Drive in and secure a piece of minimum 30 mm thick cork at 40 mm from the external side of the wall;
 - d. Using the cork as a backing, apply the polyurethane foam Approved by the CM in accordance with **CON2.M260** from the internal side of the wall in such quantity that it expands, fills the hole entirely and moves it way out away from the backing cork. Allow adequate time for full development and setting of the foam rigidity as recommended by the manufacturer;
 - e. Cut back all excess polyurethane foam by 40 mm from the internal side of the wall. Remove all traces of foam remaining on the hole concrete surfaces;
 - f. Repeat procedures as described in **CON2.W1120** (1)(c) to (1)(e) for application of mortar (and bond coat if required by the mortar manufacturer) at either end of the hole.
 3. Procedures for internal walls:
 - a. Knock out the PVC tubing;
 - b. Wet thoroughly to achieve saturation and clean concrete surfaces inside the hole to remove dust and loose materials prior to applying mortar (and bond coat if required by the mortar manufacturer);
 - c. Apply and completely fill the hole by prebagged non-shrink cementitious mortar as described and Approved in accordance with **CON2.M250**;
 - d. Cure the mortar to **CON1.W1410** or in accordance with the mortar manufacturer's recommendations as Approved by the CM.

TOLERANCES

CON2.W1210.8

GENERAL

Refer to Appendix H "Schedule of Tolerances" to this Specification.

TESTING

TESTING OF MORTAR FOR SEALING FORMWORK TIE HOLES

CON2.T110.8

LABORATORY TESTING

1. Submission requirements:
 - a. Submit technical details and test reports done by Approved local independent testing laboratory at Contractor's own costs to demonstrate the following mortar characteristics:
 - i. 1-4% of change in height of specimen tested to ASTM C827 - 95a(97);
 - ii. Minimum value of 200 seconds for Figg air permeability.
2. Testing samples:
 - a. Submit samples of mortar for carrying out one set of the tests as stated in **CON2.T110** (1) by the Direct Testing Contractor to demonstrate the mortar characteristics for Approval and thereafter every 750 kg of mortar to be used on site for routine monitoring test as instructed by the CM;
 - b. Unless otherwise Approved or specified elsewhere, testing of mortar shall be carried out by the Direct Testing Contractor;
 - c. Allow sufficient time for testing of the materials by the Direct Testing Contractor.

CON2.T120.8

TESTING FOR CHARACTERISTICS OF MORTAR

Testing methods:

1. Early change in height test: test shall be carried out to C827 - 95a(97) as specified by American Society for Testing and Materials;
2. Permeability test: the permeability of the mortar shall be determined by the modified Figg air permeability test described in "Improvements to the Figg method for determining the air permeability of concrete" Cather, Figg, Marsden and O'Brien. Mag. Conc. Res 36 No. 129 Dec 1984. The specimen shall be a 100 mm cast cube conditioned at a temperature of $27 \pm 2^{\circ}\text{C}$ and $55 \pm 5\%$ relative humidity, demoulded 72 hours after casting and kept in the same environment for a further 18 days. The permeability test shall be carried out after conditioning at 50°C for 14 days.

CON2.T130.8

REQUIREMENT FOR FURTHER TEST

Non-compliance:

1. Two additional tests shall be carried out by the Direct Testing Contractor for each failure of the laboratory test result obtained for any one mortar characteristic;
2. The mortar is considered as not complying with the specified property if the result of any additional test fails to comply with the specified requirements for the property;
3. Submit another mortar for Approval.

CON2.T140.8

WATERTIGHTNESS TEST ON SITE

1. All watertightness tests made on Site are at Contractor's own costs, time and to be witnessed and certified both by the CM and the Contractor's representative. Testing procedures to carry out watertightness test as follows:
 - a. Construct working platforms where necessary for carrying out water test safely;

- b. A continuous jet of water is to be sprayed from a nozzle at water pressure of 210 to 240 KPa at the nozzle inlet to the joint and along the longitudinal axis of the formwork tie hole for a minimum of 5 minutes. The nozzle shall be stationary while an observer inspects carefully on the indoor side of the formwork tie hole with the assistance of adequate lighting where necessary. The nozzle used for the tests shall be to the requirements of Architectural Aluminium Manufacturers' Association (AAMA) 501.2-83, unless otherwise Approved.
2. Before sealing any formwork tie holes, carry out watertightness test on Site for the following:
 - a. Watertightness test for mortar only: the CM to select 10 nos. of formwork tie holes sealed with mortar at one end of hole only and without polyurethane, prepared in accordance with **CON2.W1120**. Watertightness test to be applied on the mortar side for a minimum of 5 minutes;
 - b. Watertightness test for polyurethane foam only: the CM to select 10 nos. of formwork tie holes sealed with polyurethane foam only and without mortar, prepared in accordance with **CON2.W1120** (2)(a) to (2)(f). Watertightness test to be applied on the cork side for a minimum of 5 minutes.
3. Carry out watertightness test for completely sealed formwork tie holes on Site for 10% of formwork tie holes at each floor of every block sealed complete in accordance with **CON2.W1120** (1) or **CON2.W1120** (2) and selected by the CM. Watertightness test to be applied on one side of a wall only (external side if applicable) for a minimum of 5 minutes.

CON2.T150.8**FAILURE OF WATERTIGHTNESS TEST**

If sign of water seeping through the hole, including sign of damp patches, is observed on the opposite side of the wall face subject to test during the test and within the subsequent 2 hours after the test, the watertightness test is deemed to have failed.

CON2.T160.8**ADDITIONAL TESTS UPON FAILURE OF WATERTIGHTNESS TEST**

Is carried out in accordance with the following procedures:

1. For any one hole failed for the watertightness test made in accordance with **CON2.T140** (2)(a) or (2)(b), two additional holes are selected by the CM for watertightness test in accordance with **CON2.T140** (1);
2. The mortar or polyurethane foam is considered not complying with the specified field watertightness requirements when result of any additional test made upon mortar or polyurethane foam respectively according to **CON2.T140** (2)(a) or (2)(b) fails in accordance with **CON2.T150**;
3. For any tests carried out according to **CON2.T140** (3) and fails in accordance with **CON2.T150** the Contractor shall carry out further tests progressively as described in **CON2.T160** (1) above until all tests are successful.

CON2.T170.8**MAKE GOOD FORMWORK TIE HOLES**

The work is carried out in accordance to the following:

1. Make good all formwork tie holes which have failed the watertightness test carried out in accordance with **CON2.T140** (3) and **CON2.T160** (3) to CM's satisfaction at Contractor's own costs and time;
2. All repaired holes shall be subject to watertightness test as specified in **CON2.T140** (1).

CON2.T180.8**BLOWHOLES**

All blowholes shall be filled with one-part prebagged non-shrink cementitious mortar Approved in **CON2.M250**.

CON3 REINFORCEMENT MATERIALS

REINFORCEMENT GENERALLY

CON3.M010.8 STOCKIST'S OR SUPPLIER'S CERTIFICATION

Submission requirements:

1. For bar reinforcement, submit certificates from quality assured stockist and/or supplier to demonstrate that the bar reinforcement supplied complies with the requirements of CS2: 2012 Section 4.
2. For fabric reinforcement, submit a certificate from the manufacturer to the CM, stating:
 - a. That the fabric reinforcement supplied has been tested and complies with the requirements of BS 4449:2005, BS 4483:2005 and this Specification;
 - b. Evidence that the cold reduced steel wire in fabric reinforcement has complied with the bond classification as specified in BS 4449:2005.

CON3.M020.8 VERIFICATION OF SOURCE

When Instructed provide evidence that each load of steel reinforcement which includes the bars for fabric reinforcement delivered to site forms part of the same consignment and originates from the same source as that in respect of which the specimen and the manufacturer's certificate relate.

CON3.M030.8 QUALITY ASSURANCE SCHEME FOR FABRIC REINFORCEMENT

1. Obtain a quality assurance scheme from the manufacturer and submit for Approval. Details of the scheme must include a routine inspection complying with BS 8666:2005 Annex A;
2. Unless the quality assurance scheme has been certified under ISO 9001, it shall be assessed by an Approved third party certification authority who shall audit the manufacturer's inspection records in accordance with BS 8666:2005 Annex B. If Instructed, submit the audit report to the CM.

CON3.M035.8 PRODUCT CONFORMITY CERTIFICATION SCHEME FOR FABRIC REINFORCEMENT

1. Submit original or a certified true copy of the product conformity certificate to the "Product Conformity Certification Scheme For Mesh Reinforcements" (PCCS-MR) published by the Hong Kong Concrete Institute. The product conformity certificate shall be issued by a certification body accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a multilateral recognition arrangement with HKAS. If a photocopy of the product conformity certificate is submitted, it shall be certified true by the certification body or by the QCM;
2. The product conformity certificate shall either be submitted before the first delivery to Site or precast concrete casting yard whichever the earlier, or at a time not later than 12 months from the date of commencement of the Works;
3. When directed by CM, submit full set of original or certified true copy of the test reports under the audit testing of the PCCS-MR:

- a. The test reports shall be issued by a laboratory accredited by Hong Kong Laboratory Accreditation Scheme (HOKLAS) or an accredited laboratory which has entered into a mutual recognition arrangement with HOKLAS, showing full compliance with the requirements of PCCS-MR. If a photocopy of the test report is submitted, it shall be certified true by the accredited laboratory carried out the testing or by the QCM;
- b. The date of the test report shall be within three years prior to the date of commencement of the Works.

CON3.M040.8**COLOUR CODE SYSTEM OF REINFORCEMENT**

Submit for Approval a colour code system in the Quality Control System as stipulated in **PRE.B8.1425** for identification of reinforcement unloaded to designated areas by the Contractor on Site:

1. For different batches, as defined in **CON3.T010**, before any testing:
 - a. Use white, yellow, blue, grey or other specific colours at the ends of reinforcement bar as directed by the CM;
 - b. Avoid to use any colours similar to rust and do not use green and/or red colours.
2. For each batch available with all test results, including the re-test results as permitted in the Specification, add:
 - a. Green colour: for reinforcement conforming to the Specification;
 - b. Red colour: for reinforcement not conforming to the Specification.

REINFORCEMENT**CON3.M110.8****BAR REINFORCEMENT**

Quality requirements:

1. Hot rolled steel bars: to CS2:2012;
2. Cold reduced steel wire used for fabric reinforcement: to BS 4449:2005.

CON3.M130.8**FABRIC REINFORCEMENT**

Quality Requirements: to BS4483:2005.

CON3.M140.8**REPLACING FABRIC REINFORCEMENT TO BAR REINFORCEMENT**

Do not replace the fabric reinforcement by bar reinforcement. Where bar reinforcement proposed for replacement in the event of non-availability of fabric reinforcement, the bar reinforcement proposed for replacement conforming with the equivalent standards set for fabric reinforcement as shown on drawings will be acceptable subject to Approval.

ANCILLARY MATERIALS**CON3.M210.8****COVER SPACERS**

Quality requirements:

1. Unless specified elsewhere, type as shown on Standard Drawing STD/FD/S/EG001 or STD/FD/S/EG001/A as appropriate, and as small as practicable, consistent with their purposes, capable of supporting the weight of reinforcement and construction loads without breaking, deforming or overturning;
2. Be one of the following types:
 - a. Plastic: Approved type(s);

- b. Concrete (for foundations only): precast or proprietary concrete of strength and durability not less than that of the surrounding concrete. Provide evidence of the grade of concrete to CM for approval.

CON3.M220.8 CHAIRS AND SUPPORTS

Quality requirements:

1. To BS7973:Part 1:2001;
2. Unless otherwise shown on the Drawings, to be steel with plastic-coated feet or Approved anti-rust treatment if not properly protected by concrete. Steel is cut and bent to BS8666:2005.

CON3.M230.8 REINFORCEMENT TYING WIRE

Quality requirements:

1. Diameter of annealed iron wire:
 - a. For bars up to and including 16 mm diameter: 0.9 mm;
 - b. For bars of 20 mm diameter and over: 1.2 mm.

EPOXY COATED REINFORCEMENT

CON3.M250.8 MANUFACTURER'S DOCUMENT AND TEST RESULTS

Submission requirements:

1. Submit the following particulars, including certificates and test results, for each batch of epoxy coated reinforcement bars at least 60 days before the first delivery of the epoxy coated reinforcement bars to Site:
 - a. Name and location of the coating factory;
 - b. Mill sheets of the steel reinforcement bars complying with CS2:2012;
 - c. Date and place of the coating application;
 - d. Certificate of the coating materials in compliance with BS 7295:Part1:1990, including:
 - i. Corrosion resistance;
 - ii. Chemical resistance;
 - iii. Cathodic disbonding of coating;
 - iv. Adhesion;
 - v. Abrasion resistance;
 - vi. Impact strength;
 - vii. Hardness.
 - e. A contingency plan for dealing with epoxy coated reinforcement bars which are found to be non-conforming to the requirements of Worksection CON3.
2. Re-submit the particulars in sub-clause (1)(d) when the relevant tests have been carried out over 5 years or when there are changes in the composition of the coating materials, whichever the earlier.

CON3.M260.8 EPOXY COATING TO REINFORCEMENT

Quality requirements:

1. Epoxy coatings and patching materials for epoxy coating to BS 7295:Part 1 & 2:1990 except as stated in **CON3.M260 (3)**, **CON3.W250**, **CON3.T450**, **CON3.T460** and **CON3.T470**;
2. Epoxy coating applied by electrostatic spray method to BS 7295:Part 1:1990 at a factory approved by CM;

-
3. The bond classification of coated bars determined in bond performance tests not less than that of uncoated bars.

CON3.M270.8 CHAIRS, SUPPORTS AND SPACERS

Quality requirements:

1. Steel coated with nylon, epoxy, plastics or other dielectric material for epoxy coated reinforcement.

CON3.M280.8 TYING WIRE

Quality requirements:

1. 1.6 mm diameter soft annealed steel wire coated with nylon, epoxy, plastic or other dielectric material.

MECHANICAL COUPLER

CON3.M310.8 TYPE OF MECHANICAL COUPLER

Quality Requirements of mechanical coupler: Type 1 and Type 2 mechanical couplers as stipulated in the Code of Practice for Structural Use of Concrete 2013 published by the Buildings Department.

CON3.M320.8 SUBMISSION

1. Commencement of the mechanical coupler works is subject to CM's written permission;
2. Submit the following details to the CM for approval at least 30 days prior to the commencement of the mechanical coupler works:
 - a. The name and model number of the mechanical coupler;
 - b. The name of the manufacturer and the address of manufacturing factory;
 - c. The information / documents of the quality assurance scheme as set out in **CON3.M330**;
 - d. A description of the sampling procedures including the arrangement from collecting samples to delivery of samples to laboratory for testing the quality of the mechanical splice assemblies;
 - e. For Type 2 mechanical coupler, the quality supervision plan as set out in **CON3.W310**.
3. Upon completion of the mechanical splice works, submit the following documents to the CM for record: -
 - a. The inspection log book as detailed in **CON3.W320**;
 - b. A copy of mill certificates of the constituent materials used to produce the couplers.

CON3.M330.8 QUALITY ASSURANCE SCHEME FOR MECHANICAL COUPLER

The quality assurance scheme of the manufacturer shall include the information as specified in the **Project Specific Specification**.

WORKMANSHIP

GENERAL

CON3.W010.8 STORAGE OF REINFORCEMENT

Store:

1. All reinforcement clear of a levelled, well-drained and maintained hard-standing ground in a manner that will avoid damage, deformation and contamination of the reinforcement;
2. Fabric reinforcement horizontally;
3. Different types and sizes of reinforcement separately.

CON3.W015.8 STORAGE OF FABRIC REINFORCEMENT IN FACTORY/STOCKYARD

Provide a fenced-off area in the manufacturer's factory or stockyard for the exclusive storage of fabric reinforcement.

CON3.W020.8 SURFACE CONDITION OF REINFORCING STEEL

Clean and free from loose mill scale, loose rust, oil, grease or any substance, which in the opinion of the CM, is likely to reduce the bond or affect the reinforcement or concrete chemically.

CON3.W030.8 CONTAMINATED OR HEAVILY RUSTED REINFORCEMENT

Remove contaminated or heavily rusted reinforcement from Site unless it has been cleaned or satisfactorily treated by an Approved method.

CON3.W040.8 PROTECTION OF EXPOSED REINFORCEMENT

Where specified or instructed by the CM, protect reinforcement left exposed after completion of the Works by the specified method or by other Approved methods.

CON3.W050.8 COLOUR MARKINGS OF REINFORCEMENT BY STOCKISTS OR SUPPLIERS PRIOR TO DELIVERY

1. Obtain reinforcement preferably without red and green colour markings from stockists /suppliers;
2. If reinforcement with red colour marking, or with a colour marking covering a previous red colour, or with green colour marking is to be supplied:
 - a. Provide in advance an explanation to the CM before delivery to Site. In addition, for reinforcement with red colour marking or a colour marking covering a previous red colour, provide to the CM before delivery to Site confirmation each from the Contractor and the stockist /supplier that as far as it is aware, the reinforcement is not non compliant with CS2 and/or rejected by other project;
 - b. The CM may refuse entry of reinforcement to Site if:
 - i. No explanation is provided in advance; or
 - ii. The provided explanation is not satisfactory.

FIXING REINFORCEMENT

CON3.W110.8 CUTTING AND BENDING REINFORCEMENT

Reinforcement bars are to be cut and bent in accordance with the dimensional requirements of BS 8666:2005 unless otherwise shown on Drawing.

CON3.W120.8 COLD BENDING

Bend bars cold, using a proprietary bending machine, and do not rebend unless permitted by the CM.

CON3.W130.8 SECURING REINFORCEMENT

1. Secure with tying wire of the correct gauge for the sizes of bars, steel clips of an Approved type, or where Approved, by tack welding;
2. Ensure that the tying wire, including the wire ends, tying devices and clips do not encroach into the nominal cover to the reinforcement;
3. Demonstrate the adequacy of the system employed when Instructed;
4. Submit method statement on the fabrication of reinforcement cages of Barrette or Large Diameter Bored Piles to the CM for approval. The method statement shall include:
 - a. Set-up of the fabrication yard;
 - b. Step-by-step procedures of reinforcement cage fabrication;
 - c. Stability support system;
 - d. Working platform arrangement;
 - e. Safety plan.
5. The Contractor shall refer to the conceptual method for fixing single layer of reinforcement bars for Large Diameter Bored Piles as shown in Drawings No.CPT/LDBP/S/SK-001 to SK-004 and the conceptual method for fixing double layers of reinforcement bars for Large Diameter Bored Piles as shown in Drawings No. CPT/LDBP/S/SK-101 to SK-106 in Appendix C to this Specification. The Drawings are for reference only and are given in good faith without prejudice to the Contractor's responsibilities and liability under the Contract;
6. Riggers with Silver Card will also be accepted as skilled trade tested workers for fixing of U-bolts for the reinforcement cages.

CON3.W140.8 LOCATING REINFORCEMENT

Provide sufficient cover spacers, chairs and supports, having regard to Table 3 of BS 8000:Part 2:Section 2.2:1990, to maintain the reinforcement in its correct location and to maintain the specified cover at all positions.

CON3.W150.8 WELDING

1. Do not weld bars without Approval;
2. Where Approved, weld in accordance with BS EN ISO 17660-1:2006, and the relevant parts of Code of Practice for Structural Use of Concrete 2013.

CON3.W160.8 CONCRETE COVER

Provide minimum 25mm concrete cover to all reinforcement unless otherwise specified in Drawing.

CON3.W170.8 COMPLIANCE WITH DRAWINGS

Check that completed reinforcement complies with the drawings, in particular with respect to:

1. Bar conditions;

-
2. Size of bars;
 3. Provision of trimming bars;
 4. Number of bars;
 5. Spacing;
 6. Cover.

CON3.W180.8**CM'S INSPECTION**

1. Ensure all completed reinforcement is inspected by the CM before carrying out any work, including erecting any formwork adjacent to the reinforcement, which makes access for inspection difficult;
2. Notify the CM 24 hours, or a shorter period agreed by the CM, prior to carrying out such work.

TOLERANCES**CON3.W210.8****GENERAL**

Refer to Appendix H "Schedule of Tolerances" to this Specification.

EPOXY COATED REINFORCEMENT**CON3.W220.8****HANDLING OF REINFORCEMENT**

1. Do not subject the reinforcement to rough handling, shock loading or dropping from a height;
2. Lift epoxy coated reinforcement with nylon, rope or padded slings and lift bundles with strongback or with multiple supports to prevent abrasion.

CON3.W230.8**STORAGE OF REINFORCEMENT**

Store on wooden or padded cribbing.

CON3.W240.8**CUTTING AND BENDING REINFORCEMENT**

1. Bend epoxy coated reinforcement cold;
2. Provide padded supports for bar cutting and bar bending equipment for epoxy coated reinforcement and fit all contact areas of the equipment with nylon or plastic mandrels.

CON3.W250.8**REPAIRS TO EPOXY COATING ON SITE**

1. Do not use the epoxy reinforcement in the permanent work if the coating is delaminated, split or damaged:
 - a. At any point by an amount exceeding 25 mm² in area or 50 mm in length;
 - b. At more than three points in a 1 m length by amounts each even not exceeding 25 mm² in area and 50 mm in length;
 - c. At more than six points in the cut and bent length of a bar by amounts each even not exceeding 25 mm² in area or 50 mm in length.
2. Repair all cut ends and damaged areas not exceeding 25 mm² in area or 50 mm in length with patching material applied in accordance with manufacturer's recommendations;
3. Carry out repairs to epoxy coatings within 8 hours of cutting or damage and remove traces of rust from the surface of the reinforcement before carrying out the repair.

MECHANICAL COUPLER

CON3.W310.8

QUALIFIED SUPERVISION

1. Assign a Mechanical Coupler Quality Control Coordinator (MCQCC), with a minimum qualification and experience of a Grade T1 TCP for Type 1 mechanical coupler and a Grade T3 TCP for Type 2 mechanical coupler under the Registered Contractor's stream in the CoPSS, to:
 - a. Supervise mechanical splice works and ensure that these are all carried out in accordance with approved plans and comply with the requirements on quality and workmanship;
 - b. Devise inspection check list of the mechanical couplers works;
 - c. Provide full time continuous supervision of the manufacturing process of the connecting ends of the steel reinforcing bars and the installation of steel reinforcing bars to the mechanical couplers.
2. For Type 1 mechanical coupler, submit the details as specified in the **Project Specific Specification** to the CM for approval;
3. For Type 2 mechanical coupler, submit a quality supervision plan as specified in the **Project Specific Specification** to the CM for approval;
4. The duties of MCQCC can be taken up by SQCC as stipulated in **PRE.B6.130**.

CON3.W320.8

INSPECTION LOG BOOK

1. Record the following details in an inspection log book:
 - a. The names and qualifications of the supervisory personnel assigned by the CM and by the Contractor as stipulated in **CON3.W310**;
 - b. The date, time, items inspected and inspection results.
2. Keep the inspection log book on Site for CM's inspection when required and submit the inspection log book to CM upon completion of the mechanical splice works.

TESTING

DEFINITIONS

CON3.T010.8 BATCH OF BAR REINFORCEMENT

1. Subject to the maximum tonnage in sub-clause (2) below, a batch of bar reinforcement is the quantity of bar reinforcement delivered to Site within a week under one delivery order, of one nominal diameter, and one steel grade and produced by the same manufacturer;
2. The maximum tonnage of a batch shall not exceed:
 - a. For bars of diameter 20 mm and above : 200 tonnes;
 - b. For bars of diameter less than 20 mm : 100 tonnes..

CON3.T020.A BATCH AND LOT OF FABRIC REINFORCEMENT

1. A batch of fabric reinforcement is any quantity of fabric reinforcement of the same combination of steel grades and diameters, produced by the same welding machine with defined bar pattern, covered by the same mill and testing certificates and produced and properly identified by the CM in an Approved fenced off area in factory or in the stockholder's yard under one consignment;
2. A lot of fabric reinforcement is any quantity of fabric reinforcement of the same combination of steel grades and diameters, produced by the same welding machine with defined bar pattern, covered by the same mill and testing certificates and delivered to Site at any one time.

CON3.T025.8 BATCH OF MECHANICAL COUPLER

In this Specification, a batch of mechanical coupler is any quantity of coupler of the same type and size delivered to the Site as one consignment and covered by the same mill and testing certificates.

CON3.T030.8 TESTING BY DIRECT TESTING CONTRACTOR (DTC) AND HOUSING DEPARTMENT'S MATERIALS TESTING LABORATORY (HDMTL)

Unless otherwise Approved or specified elsewhere, provide reinforcement samples to the CM for testing by the DTC or HDMTL.

CON3.T040.8 TESTING PROGRAMME

1. Allow sufficient time for the testing of specimens;
2. Do not cut, bend, fix or incorporate steel reinforcement into permanent works until all relevant test specimens have successfully passed all tests carried out by the DTC and HDMTL.

PURCHASERS TESTING

CON3.T110.8 RATE OF SAMPLING

1. For bar reinforcement, provide adequate test specimens from each batch delivered to the Site in accordance with CS2:2012. The number of test specimens taken from each batch and the rate of sampling shall be in accordance with Table 10 of CS2:2012;
2. For fabric reinforcement in factory/stockholder's yard, provide samples from each batch as follows:

Sampling Rate of Fabric Reinforcement	
Size of Batch	No. of Samples per Batch
0 - 50 tonnes	1
Each additional 50 tonnes or part of 50 tonnes	1

3. For reinforcement used for construction of hoardings and associated covered walkways and gantries, the rate of sampling stated in the sub-clauses (1) and (2) above may be reduced at the discretion of the CM.

CON3.T120.A**PROCEDURE**

Testing arrangement:

1. Under the supervision of the CM,
 - a. Cut and take test specimens selected at random from bar reinforcement on Site or samples selected at random from fabric reinforcement in factory/stockholder's yard;
 - b. Ensure size of specimens/samples to be:
 - i. Bar reinforcement: each specimen to be minimum 1 m long;
 - ii. Fabric reinforcement: each sample to be 1.2 m long x 1.2 m wide containing at least four wires in each direction.
 - c. Appropriately mark and deliver the test specimens or samples to the DTC for testing.

CON3.T130.8**TESTING BY HDMTL**

Testing samples:

1. Provide additional bar reinforcement specimens to HDMTL for test as follows:
 - a. Take specimens from bars adjacent to those from which specimens have been cut for testing by the DTC;
 - b. Rate of sampling: approximately one-fifth of the rate specified in **CON3.T110** with same number of test specimens or samples;
 - c. Size of specimens/samples: in accordance with **CON3.T120**;
 - d. Scope, number of tests and method of testing as specified in **CON3.T210** and **CON3.T220**.
2. Provide additional samples from fabric reinforcement in factory/stockholder's yard under the same testing regime in sub-clause (1).

CON3.T140.8**ADDITIONAL SAMPLES OF FABRIC REINFORCEMENT DELIVERED TO SITE**

When Instructed, provide additional samples of fabric reinforcement for testing by DTC. The rate of sampling shall be minimum one sample for every total 100 tonnes of fabric reinforcement delivered to Site, irrespective of batches/consignments numbers assigned in the factory/stockholder's yard. Each sample so selected by the CM represents the particular lot delivered to Site.

TESTING BY DTC**CON3.T210.A****SCOPE AND NUMBER OF TESTS**

Testing samples:

1. Tests will be carried out on each specimen of bar reinforcement in accordance with CS2:2012;

2. Number of tests on each specimen of bar reinforcement in accordance with Table 10 of CS2:2012;
3. Tests will be carried out on each sample of fabric reinforcement to determine:
 - a. Yield stress;
 - b. Elongation;
 - c. Tensile strength;
 - d. Rebending and/or bending properties;
 - e. Unit mass;
 - f. Pitch dimension;
 - g. Surface geometry (determination for relative rib area (f_R) only).
4. Number of tests on each sample of fabric reinforcement as follow:

Description	Type and Number of Tests					
	Tensile	Bend	Rebend	Unit Mass	Pitch Dimension	Surface Geometry
Steel fabric						
- fabric sheet	-	-	-	1	-	-
- longitudinal wire	1	-	1	-	1	1
- transverse wire	1	-	1	-	1	1

CON3.T220.8**METHODS OF TESTING**

Tests will be carried out at a temperature between 5°C to 35°C and in accordance with the following standards:

1. CS2:2012: for hot rolled steel bars;
2. BS4449:2005: for cold reduced steel bars;
3. BS4483:2005: for steel fabric.

COMPLIANCE**CON3.T310.8****COMPLIANCE CRITERIA - BAR REINFORCEMENT**

A batch of bar reinforcement is deemed to comply with the specification if the test results meet the requirements of CS2:2012. Any non-complying batch of bar reinforcement is to be removed from Site.

CON3.T320.8**COMPLIANCE CRITERIA - FABRIC REINFORCEMENT**

1. For fabric reinforcement in factory/stockholder's yard, a batch is considered as not complying with the specified requirements for grade strength if the yield stress in any tensile test carried out on any sample taken from the batch is less than 93% of the specified grade strength. The non-complying batch is not to be delivered to Site;
2. For fabric reinforcement delivered to Site, a lot is considered as not complying with the specified requirements for grade strength if the yield stress in any tensile test carried out on any sample taken from the lot is less than 93% of the specified grade strength. The non-complying lot is to be removed from Site;

3. If the yield stress in any tensile test for fabric reinforcement in sub-clauses (1) and (2) is less than the specified grade strength but equal to or greater than 93% of the specified grade strength, provide additional samples from the same batch or lot for additional test on yield stress. The number of additional samples is to be in accordance with **CON3.T110**.

RE-TESTS

CON3.T410.8

REQUIREMENTS FOR BAR REINFORCEMENT

Non-compliance:

1. If the result of any test for bar reinforcement does not comply with the specified requirements for the property, provide additional test specimens from the same batch for additional tests for the property in accordance with CS2:2012. The number of additional specimens must be as stated in CS2:2012.

CON3.T420.A

REQUIREMENTS FOR FABRIC REINFORCEMENT

Non-compliance:

1. If the result of any test for fabric reinforcement for elongation, tensile strength, bending, rebending, unit mass, pitch dimension and surface geometry does not comply with the specified requirements for the property, provide additional samples from the same batch for additional tests for the property. The number of additional samples is the total number of samples taken in accordance with **CON3.T110** and each additional sample shall comprise 2 pieces of 1200 mm x 1200 mm fabric reinforcement;
2. Test in accordance with the following:
 - a. Number of tests on each additional sample of fabric reinforcement in accordance with the following table:

Description	Type and Number of Tests					
	Tensile	Bend	Rebend	Unit Mass	Pitch Dimension	Surface Geometry
Steel fabric						
- fabric sheet	-	-	-	2	-	-
- longitudinal wire	2	-	2	-	2	2
- transverse wire	2	-	2	-	2	2

CON3.T430.8

STANDARD FOR REJECTION

The batch or lot of reinforcement is considered as not complying with the specified requirements for any particular property if the result of any additional test does not comply with the specified requirements for that property, then:

1. The non-complying batch of bar reinforcement or lot of fabric reinforcement shall be removed from Site;
2. The non-complying batch of fabric reinforcement in the factory/stockholder's yard shall not be delivered to Site.

EPOXY COATED REINFORCEMENT

CON3.T440.8 ADDITIONAL TEST SPECIMENS FOR EPOXY COATING TEST FOR EACH BATCH

1. Provide and cut 2 test specimens each two metre length from each batch of reinforcement, as directed by CM for epoxy coating tests;
2. Cut each specimen at least 1 m from the ends of a 12 m length bar and select test specimens from different bundles of the reinforcement batch.

CON3.T450.8 TESTING OF THE EPOXY COATING

The DTC shall carry out thickness, adhesion and continuity tests on each additional test specimen as selected in accordance with **CON3.T440**:

1. Perform the tests in accordance with the following Standards:
 - a. Adhesion and continuity tests: to BS 7295:Part 1:1990 with 180° bend test replaced by 90°;
 - b. Thickness test for bars of 12 mm diameter or below: to Method No. 6Aa of BS 3900:Part C5:1992;
 - c. Thickness test for bars of 16 mm diameter or above to: Method No. 6Aa or No. 6Ab of BS 3900:Part C5:1992.
2. Carry out tests on specimens within a temperature range of between 5 degree Celsius and 30 degree Celsius;
3. Take 5 pairs of readings along two opposite sides of each specimen for thickness test (a total of ten recorded measurements per bar). A single recorded thickness measurement is the average of three individual reading obtained in between the ribs of three consecutive deformations;
4. Perform two bend tests for adhesion at a uniform rate within 15 seconds.

CON3.T460.8 COMPLIANCE CRITERIA FOR EPOXY COATINGS TO REINFORCEMENT

Results of tests for thickness, adhesion and continuity for epoxy coatings to reinforcement to comply with the following requirements:

1. All coating thickness measured from the 2 specimens not less than 0.13 mm. The average of the recorded thickness measurements of coating not less than 0.18 mm and not exceed 0.30 mm;
2. Cracking or debonding of the coating not visible to the unaided eye on any part of the bent bar;
3. The continuity of the coating to BS 7295:Part 1:clause 4.2:1990.

CON3.T470.8 NON-COMPLIANCE FOR THICKNESS, ADHESION AND CONTINUITY TESTS

1. Retests of specimens of the same batch are permitted if one test specimen fails to meet the coating thickness, coating adhesion or coating continuity requirements;
2. Take two further specimens from the same batch for the test or tests in which the original specimens failed;
3. The batch is deemed to comply with the specification if both additional specimens pass the retests;
4. The batch is deemed not to comply with the specification if either or both specimens fails in the retests;
5. Reject and remove the non-complying batch from Site.

CON3.T480.8 TIME REQUIRED FOR TESTING OF THE EPOXY COATED REINFORCEMENT

1. Allow minimum 20 working days for the availability of test results after delivery of the test specimens to the DTC;
2. Do not use the epoxy coated reinforcement until the relevant test specimens have passed all tests.

MECHANICAL COUPLER**CON3.T510.8 RATE OF SAMPLING**

Provide test specimens, each with two reinforcing bars of the relevant diameter either threaded or grouted in sleeve in accordance with the manufacturer's recommended assembly method, from each batch for testing by DTC as follows;

1. For Type 1 mechanical coupler:

Sampling Rate of Mechanical Coupler	
Size of batch (No.)	Minimum number of test specimens per batch
Less than 100	3
100 – 500	6
Exceeding 500	9

2. For Type 2 mechanical coupler:

Size of batch (No.)	Minimum number of test specimens per batch	
	Tests as per clause 3.2.8.4 (b), (c) & (d) of the CoP for Structural Use of Concrete 2013 (per test)	Test as per clause 3.2.8.4(a) of the CoP for Structural Use of Concrete 2013
Less than 100	5	3
100-500	6	6
Exceeding 500	9	9

CON3.T520.8 METHOD OF TESTING

The testing for splicing assemblies of Type 1 and Type 2 mechanical couplers shall be in accordance with the Code of Practice for Structural Use of Concrete 2013 published by the Buildings Department.

CON3.T530.8 COMPLIANCE CRITERIA

1. A batch of Type 1 mechanical coupler is deemed to comply with the specification if the test results of all the splicing assemblies meet the requirements of clause 3.2.8.3 of the Code of Practice for Structural Use of Concrete 2013;
2. A batch of Type 2 mechanical coupler is deemed to comply with the specification if the test results of all the splicing assemblies meet the requirements of clause 3.2.8.4 of the Code of Practice for Structural Use of Concrete 2013;
3. For Type 2 mechanical coupler, if any one of the tests as specified in sub-clause (2) above cannot be completed due to the reinforcement breakage with the testing load below 125% of the characteristic yield strength of the reinforcement, disregard the test result and provide another test specimen for repetition of that particular test;

-
4. For Type 2 mechanical coupler, further repetition of tests may be carried out if there is subsequent failure with reinforcement breakage at below 125% of the characteristic yield strength of the reinforcement;
 5. Any non-complying batch is to be removed from Site.

CON3.T540.8**TIME REQUIRED FOR TESTING**

1. Allow minimum 15 days for the availability of test results after delivery of the test specimens to the DTC;
2. Allow extra time for carrying out repetition of tests as mentioned in sub-clauses (3) and (4) of **CON3.T530**;
3. Do not use the batch of mechanical couplers until the relevant test specimens have passed all tests.

CON4 PRECAST CONCRETE

DESIGN

DESIGN PARAMETERS

CON4.D010.8 PRECAST CONCRETE

1. Design in accordance with this Worksection and Worksection CON1;
2. Where any ambiguity, discrepancy or conflict arises between this Worksection and any clauses in any other Worksections of this Specification, ensure that the provisions of this Worksection prevail.

CON4.D020.8 STRUCTURAL JOINT DESIGN

Design structural joints between precast concrete units and insitu concrete to transmit the worst anticipated combination of moment, shear, axial force, temperature stresses, shrinkage, creep and torsion in accordance with Worksection CON1 unless specified otherwise.

CON4.D030.8 STEEL LIFTING FRAMES

Design and construct steel lifting frames in accordance with the Code of Practice for the Structural Use of Steel 2011 issued by the Buildings Department.

CON4.D040.8 LIFTING POINTS

Submit for Approval the proposed positions of lifting holes and/or points of attachment of lifting slings to precast concrete units if not shown on the Drawings.

DRAWINGS AND CALCULATIONS

CON4.D110.8 GENERAL

All drawings and calculations relating to the structural design must be prepared and signed by a Registered Structural Engineer who is registered under the Buildings Department.

DESIGN SUBMISSIONS

CON4.D210.8 GENERAL

Where appropriate, submit all necessary design, calculation and drawings pertinent to **CON4.D010** to **CON4.D110**, **CON4.D310** to **CON4.D530** for Approval.

CON4.D220.8 PROGRAMME FOR SUBMISSIONS

Agree a programme for all submissions during the Contract with the CM prior to the notified date for commencement of Works.

CON4.D230.8 SHOP DRAWINGS

Unless otherwise agreed, submit five sets of fully dimensioned shop drawings for Approval in accordance with **CON4.D220**.

JOINTS

CON4.D310.8

JOINTS

For application of back-up materials, bond breakers and sealants, see Worksection WAT5.

CON4.D320.8

GASKETS

Gasket may be used in weatherproofing joint provided that:

1. The joint is horizontal; and
2. The gasket is always under compression.

CON4.D330.8

MORTAR STOPS

Use backing rods or other Approved method as mortar stops in grouting panel joints when necessary.

WEATHERPROOF JOINTS

CON4.D410.8

JOINT DESIGN

Design weatherproof external joints to ensure airtightness and watertightness and in accordance with BS 6093:1993.

CON4.D420.8

TYPES OF JOINT

Use weatherproof joints of one of the following types and in accordance with BS 6093:1993:

1. Sealed joint (one-stage joint);
2. Drained joint (two-stage joint).

CON4.D430.8

DESIGN WIDTH OF JOINTS

Design the joint width in accordance with BS 6093:1993 and BS 6213:1982.

CON4.D440.8

CONTRACTOR'S RESPONSIBILITY

Approval of the proposed jointing system including the weatherproofing materials does not relieve the Contractor from any liability on the performance of the joints.

MODIFICATIONS TO THE BUILDING STRUCTURE

CON4.D510.8

CONTRACTOR'S RESPONSIBILITY

The Contractor's responsibility for the design of his proposed modification is covered under GCC Clauses 5.15 and 11.8 and the Appendix E to the Specification.

CON4.D520.8

COMPLIANCE WITH GUIDELINES AND REGULATIONS

Any proposed structural modifications must comply with the following:

1. The relevant structural design guidelines published by the Housing Department and included as Appendix E to this Specification; and
2. The Regulations currently in use.

CON4.D530.8

REINFORCEMENT CHANGES

Obtain CM's approval for any proposed changes to reinforcement details, as shown on the Drawings, required to suit the proposed method of casting and installation.

MATERIALS

GENERAL

CON4.M010.8 SUBSTITUTION OF NON-STRUCTURAL CONCRETE

Submission requirements:

1. Submit for Approval any proposal to substitute non-structural insitu concrete or non-structural partitions, excluding panel wall partitions, with precast concrete.

CON4.M020.8 PRECAST CONCRETE

Where precast work is proposed and Approved, comply with the relevant provisions of:

1. Worksection CON1;
2. Worksection CON2 or FOR; and
3. Worksection CON3.

CON4.M030.8 PRECAST CONCRETE COMPONENTS

See Worksection CON7.

CON4.M040.8 OFF-SITE MANUFACTURE

Obtain Approval for off-site manufacture. For precast concrete components, see [CON7.D010](#).

SUBMISSIONS

CON4.M110.8 GENERAL

Submit the following details for Approval:

1. Drawings, calculations and any other information indicating the location and/or element of precast concrete and any changes resulting from the use of precast concrete;
2. Calculations which show all loading imposed on the precast concrete due to lifting, handling, stacking, shock or any other reason, complies with the relevant British Standards, unless specified otherwise;
3. A method for identifying and recording the daily production of precast concrete units and their final position after installation;
4. The joints required between the proposed precast concrete and insitu concrete;
5. Drawings and calculations of lifting frames for precast units where specified.

CON4.M120.8 REINFORCEMENT CHANGES

Obtain prior Approval for any proposed changes to reinforcement details, as shown on the Drawings and/or to the bar bending schedules, required to suit the proposed method of casting and installation.

CONCRETE GRADE

CON4.M210.8 CONCRETE FOR LINTELS

Cast precast lintels in concrete Grade 35/20, unless otherwise specified.

CON4.M220.8 CONCRETE FOR STAIRS

Cast precast stairs in concrete Grade 35/20, unless otherwise specified.

CON4.M222.8 CONCRETE FOR REFUSE CHUTE

Cast precast refuse chute in concrete Grade 35/20, unless otherwise specified.

NON-SHRINK GROUT FOR PRECAST STAIRS

CON4.M230.8 APPROVED MIX

For non-shrink grout, the submitted grout mix shall have the specified characteristic as stated in **CON4.M260**. Submit samples of non-shrink grout for carrying out the tests as stated in **CON4.M260** by the Direct Testing Contractor for Approval.

CON4.M240.8 CONSTITUENT MATERIALS OF NON-SHRINK GROUT

To be a pre-packaged cement base product which contains Portland cement, selected sand and non-shrink additives.

CON4.M250.8 WATER/POWDER RATIO OR WATER CONTENT

For pre-packaged non-shrink grout product, comply with the manufacturer's recommendations.

CON4.M260.8 NON-SHRINK GROUT

Quality requirements:

1. To be pre-packaged cement based product which contains Portland cement, selected sand and non-shrink additives with the following required properties:
 - a. A 28 days strength equal to or higher than the grade of the adjoining structures. The compressive strength shall be determined by compressive strength test as **CON4.T080**;
 - b. Chloride content of grout shall not exceed 0.1% by mass of the cement. Submit documentary evidence that the summation of chloride contents of constituent materials complies with the aforesaid requirement;
 - c. Setting time of the non-shrink grout when tested in accordance with ASTM C953 - 87(97) shall be greater than 1 hour for initial set and be less than 24 hours for final set;
 - d. Free expansion within 24 hours shall be of maximum 4% when measured in accordance with ASTM C827 - 95a(97). Expansion between 3 to 28 days when measured in accordance with ASTM C1090 - 96 shall be between 0% to 0.4%.

CON4.M270.8 CONCRETE WITH NON-SHRINK ADDITIVES

Submit for Approval and:

1. Maximum aggregate size: 10 mm;
2. Grade strength: a 28 days strength equal to or higher than the grade strength of the adjoining structure;
3. To comply with the manufacturer's recommendations on non-shrink additives;
4. Do not contain chlorides.

WEATHER PROOF JOINTS

CON4.M310.8 GENERAL

Weatherproofing materials to comply with BS 6093:1993 and subject to Approval.

CON4.M320.8 SEALANTS

As **WAT5.M180**.

CON4.M330.8 MORTAR STOP BACKING RODS

Polyethylene foam or other Approved.

CON4.M340.8 DETAILS OF WEATHERPROOFING

Submission requirements:

1. Submit details of weatherproofing materials in accordance with **CON4.M310** and **CON4.M330** for Approval, including technical information, samples, test reports and proven performance records of proposed materials.

WORKMANSHIP

CASTING PRECAST UNITS

CON4.W005.8

QUALITY SYSTEMS AND QUALIFIED SUPERVISION

Comply with **CON7.W010** to **CON7.W120** and relevant provisions of Worksection CON7 on quality systems and qualified supervision for precast works.

CON4.W010.8

PLACING CONCRETE

Cast precast concrete in a single pour unless otherwise Approved.

CASTING LINTELS

CON4.W110.8

GENERAL

Except where unusual or exceptional loading conditions apply or specified elsewhere, construct lintels as shown below:

Lintels		
Clear Span (metres)	Depth of Lintel (mm)	No. and diameter of mild steel bars per 105 mm (or part) in width
0 - 1	150	one 12 mm
1 - 2	225	one 16 mm
2 - 3	300	one 20 mm

CON4.W120.8

COVER TO REINFORCEMENT

Unless otherwise specified, provide 25 mm minimum concrete cover to steel bar reinforcement.

CON4.W130.8

BEARING ALLOWANCE

Unless otherwise specified, allow for a minimum bearing of 150 mm over its full width at each end.

CASTING STAIRS

CON4.W210.8

CONSTRUCTION

Construct stairs in accordance with details given on the Drawing.

CON4.W220.8

FORMWORK

As **CON2.W920**, unless otherwise specified.

CURING

CON4.W310.8

GENERAL

Cure concrete in accordance with **CON1.W1410** to **CON1.W1490**, unless otherwise Approved.

CON4.W320.8 OTHER CURING METHODS

Carry out a full scale trial, where curing methods other than those specified in **CON4.W310** are proposed, to demonstrate satisfactory performance. Obtain Approval before precast concrete work commences.

STORAGE, TRANSPORTATION AND LIFTING OF UNITS

CON4.W410.8 STRENGTH OF UNITS

Unless otherwise specified, do not lift precast units for at least 24 hours after casting or until the concrete has attained a strength adequate to resist the resultant stresses without inducing cracking or other damage to the concrete.

CON4.W420.8 STORING UNITS

1. For superstructure works:
 - a. Store units on a levelled, well-drained and maintained hard-standing ground which will not result in damage, contamination or injury to others, and separate using Approved methods. Store different types of precast units separately. Protect as necessary from the weather and from staining;
2. For works other than that in sub-clause (1):
 - a. Store units on a clean, firm base and separate using Approved methods. Store different types of precast units separately. Protect as necessary from the weather and from staining.

CON4.W430.8 DAMAGED UNITS

Replace or repair all units damaged by handling, hoisting into position or during transporting.

ERECTING PRECAST UNITS

CON4.W510.8 STANDARD AND SEQUENCE

Erect precast units in accordance with BS 5531:1988 and in an Approved sequence.

CON4.W520.8 TEMPORARY BRACING

Provide temporary bracing to units where appropriate.

CON4.W530.8 DOWEL FIXINGS FOR PRECAST STAIRS

Locate box cutouts of precast stairs over cast-in dowel bars and fill with non-shrink grout.

CON4.W540.8 BEDDING AND JOINTING PRECAST STAIRS

Bed and joint precast stairs in non-shrink grout or cement mortar where shown on Drawings.

ACCURACY AND TOLERANCES

CON4.W610.A GENERAL

1. Refer to:
 - a. Code of Practice for Precast Concrete Construction 2016 published by the BD;
 - b. Appendix H "Schedule of Tolerances" to this Specification.

-
2. Where any ambiguity, discrepancy or conflict arises between sub-clauses (1)(a) and (1)(b) above, the provisions given in Appendix H shall prevail.

IDENTIFICATION FOR PRECAST UNITS

CON4.W710.8 IDENTIFICATIONS AND RECORDS

Submit a method for identifying and recording the daily production of precast concrete units and their final position after installation.

DEFECTS

CON4.W810.8 MINOR CHIPPING

Subject to Approval, carry out repairs to minor chipping only by patching up after installation.

CON4.W820.8 OTHER REPAIRS

For repairs to other damaged units, carry out any repair work to the satisfaction of the CM.

TESTING

SAMPLING AND TESTING

CON4.T010.8 FULL SCALE MOCK UP

Where required by the CM, provide full scale mock up to demonstrate the precast units and the system of joints proposed as detailed in the [Project Specific Specification](#), all to the satisfaction of the CM.

CON4.T020.8 WATERTIGHTNESS TEST

Before Approval to use precast concrete as [CON4.M110](#), carry out watertightness test on the mock up on the precast unit of a particular type, with the jointing system in place.

CON4.T030.8 SAMPLING FOR WATERTIGHTNESS TEST

Testing samples:

1. Carry out full scale watertightness test on the precast unit of a particular type, with the jointing system in place, at the rate of 0.5% or each type proposed or one precast unit, whichever is the greater.

CON4.T040.8 AGREED TEST PROCEDURES

Test with a water pressure, duration, frequency and procedure as agreed by the CM.

CON4.T050.8 CRITERIA FOR FAILURE

The precast units and joints will be deemed failures if any sign of water seeping through the joints or the body of the cast unit, including signs of damp patches, is observed during the test.

CON4.T060.8 REMEDIAL ACTION

Non-compliance:

1. Upon failure of the watertightness test as [CON4.T050](#):
 - a. Remove the precast unit and scrape out all jointing materials;
 - b. Redesign the precast unit or the jointing system, if the CM considers appropriate; and
 - c. Reconstruct and retest as directed by the CM.

CON4.T070.8 TESTING OF NON-SHRINK GROUT

Testing method and testing samples:

1. Test grout in accordance with CS1:2010 as follows:
 - a. Provide one sample for each grout mix from every 10 batches of grout or every 10 m³ of grout produced in a day, whichever is the lesser. At least one sample shall be provided for each grout mix produced on any one day or less than 10m³ of grout produced. For the purpose of this clause, a batch of grout is any quantity of grout produced in one cycle of operations of a mixer;
 - b. Each sample provided in sub-clause (1)(a) above shall not be taken at a time more than one hour after the grout is mixed and shall be protected from weather before test cubes are made.

CON4.T080.8 COMPRESSIVE STRENGTH TEST FOR NON-SHRINK GROUT

1. The DTC shall prepare two grout cubes of 100 mm size from each sample, cure and test the grout cubes for crushing strength at 28 days in accordance with CS1:2010;

-
2. The average of the crushing strengths of the two grout cubes shall be taken as the test result. The compliance criteria C1 and C2 shall be adopted as appropriate for assessing compliance requirements stipulated in **CON1.T640** and **CON1.T660**;
 3. The test result shall comply with the following requirements:
 - a. Individual test results: comply with the requirement given in Column A of the Table specified in **CON1.T650**;
 - b. Average strength determined from any group of four consecutive test results: comply with the requirement given in Column B of the Table specified in **CON1.T650**. Where there are less than four available test results, treat the average of the first two or first three consecutive test results in the same manner as groups of four consecutive test results.
 4. If the difference between the compressive strengths of two grout cubes made from one sample of grout mix exceeds 15% but does not exceed 20% of the test result:
 - a. Use the higher of the compressive strengths of the two grout cubes to assess compliance as stated in sub-clause (3)(a) above; and
 - b. Do not use the test results for that sample to assess compliance as set out in sub-clause (3)(b) above nor to calculate the standard deviation.
 5. If the difference between the compressive strengths of two grout cubes made from one sample of grout mix exceeds 20% of the test result:
 - a. Discard the test result for that sample; and
 - b. Propose investigation for Approval to establish if the grout represented by the sample is acceptable or not.

TESTING FIXINGS

CON4.T110.8

TENSILE TESTING

Testing method:

1. When directed, test fixings and anchors to BS 5080:Part 1:1993.

CON4.T120.8

SHEAR TESTING

Testing method:

1. When directed, test fixings and anchors to BS 5080:Part 2:1986.

CON5 PRECAST FACADE UNITS (CONTRACTOR'S DESIGN)

DESIGN

GENERAL

CON5.D010.8 RELEVANCE OF OTHER SPECIFICATION WORKSECTIONS

1. Design and construct precast facades in accordance with this Worksection and with the relevant provisions of the following Worksections:
 - a. CON1, Insitu Concrete;
 - b. CON2, Formwork;
 - c. CON3, Reinforcement;
 - d. CON4, Precast Concrete;
 - e. COM11, Radio Frequency Identification and Web-Based Database System for Building Components.
2. Where any ambiguity, discrepancy or conflict arises between this Worksection, and any clauses in any other Worksections of this Specification, ensure that the provisions of this Worksection prevail.

CON5.D020.8 STANDARD

Comply particularly with **CON1.M010**.

SCOPE OF THE WORK

CON5.D110.8 GENERAL

1. Refer to the Drawings for the definition of the extent of the precast facades including window installation;
2. For off-Site casting, coordinate with the precast facade supplier for the installation of windows, pre-formed holes, surface finishes, earthing lugs as shown on the Drawings;
3. Include the following with the precast facades delivered to or fabricated on Site:
 - a. Precast concrete panel as shown on the Drawings;
 - b. Aluminium or uPVC window obtained from a supplier approved by the CM;
 - c. Pre-formed holes for the installation of drainage pipes;
 - d. Earthing lugs as shown on the Drawings;
 - e. Concealed electrical PVC conduit system installations as shown on Drawings and as specified;
 - f. A certificate indicating the date of casting;
 - g. Work completion certificate for pre-installed electrical conduit system installation;
 - h. Embed Radio Frequency Identification tag as specified.

CON5.D120.8 INSITU CONCRETE ELEMENTS INCLUDED

In addition to the precast elements shown on the Drawings, any insitu facades at F1 and roof-minus-one floors and any other floor indicated as such on the Drawings, designed and cast as insitu concrete, also form part of the whole precast facade system. For such insitu facade elements, comply with Worksections CON1, CON2, CON3 and CON6 of this Specification and those provisions of this Worksection as may apply to insitu facades.

CON5.D130.8 SCOPE OF THE DESIGN

Include the following in the scope of the design of the precast facade system:

1. The structural design of the facade units to the dimensions shown on the Drawings;
2. The design of the structural connections by which the facade units are joined monolithically with the building structure;
3. The design of one-stage weatherproof joints between the facade units and the building structure;
4. The design of the connection to the supporting system for the air conditioning unit as shown on the Drawings, (maximum net weight 100 kg);
5. The design of the fixing of the windows to the openings;
6. The design of electrical conduit system installation.

DESIGN PARAMETERS

CON5.D210.8 GENERAL

Design the facade units generally as a one-piece design.

CON5.D220.8 MINIMUM THICKNESSES

Design each facade unit with the line of the inner side of the unit fixed as shown on the Drawings and:

1. With a general minimum thickness of not less than 150 mm;
2. With the thickness of the ledge for the air conditioning hood not less than 125 mm.

CON5.D230.8 OVERHANG AT BASE OF UNITS

Incorporate a 575 mm overhang at the base of each facade unit designed monolithically with the wall of that facade unit.

CON5.D240.8 WINDOW OPENINGS

Design openings for windows in the facade unit:

1. To the dimensions shown on the Drawings;
2. Restrained at the top with a beam and at either side with a wall or a post.

CON5.D250.8 LOADINGS

Design facade units to sustain all possible loadings acting upon the units. In particular, take the following loading conditions into account:

1. Dead loads and superimposed loads;
2. Wind loads in accordance with the Code of Practice on Wind Effects in Hong Kong 2004 issued by the Buildings Department except that the total pressure coefficient (Cp) is 1.4;
3. Eccentric loads which arise either as a result of the centre of gravity of the facade units being offset from the support or from random inaccuracies occurring during construction. Allow a minimum of 25 mm eccentricity in the design for such random inaccuracies;

4. Tensile loads if the facade units are designed to be hung from the top or from the sides;
5. Buckling loads if the facade units are subject to vertical compression;
6. Temperature stresses;
7. Temporary loads which arise during demoulding, storage, lifting, transporting and erection of the facade units. In particular, design for the complex stresses arising out of lifting from stacked position into lifting position.

CON5.D260.8 MINIMUM CONCRETE GRADE

For facade units: Grade 35/20.

CON5.D270.8 CONCRETE COVER TO REINFORCEMENT

Minimum cover to reinforcing bars in facade units:

1. External face: 30 mm;
2. Internal face: 25 mm.

CON5.D280.A LIFTING AND LOCATING DEVICES

1. Design lifting and location devices for embedding or fixing to the facade units in accordance with the Code of Practice for Precast Concrete Construction 2016 issued by the BD;
2. Allow a minimum safety factor of 4 for lifting inserts under normal circumstances;
3. Check and make necessary provisions in the facade units to prevent local rupture or cracking as a result of using lifting and locating devices.

CON5.D290.8 LOCATION POINTS

1. Make provision on each facade unit for locating, plumbing and levelling to the designed location within acceptable tolerance limits;
2. Include details of location points as part of the submission under sub-clause (7) of **CON5.D860**.

CON5.D300.8 PERMANENT CONNECTIONS

Design permanent structural connections using one, or a combination of both, of the following methods:

1. Insitu connection by which the facade units are joined monolithically with the building structure;
2. Mechanical connections by which the facade units are secured to the building structure at attachment points using brackets, cleats and fixings.

CON5.D310.8 ERECTION RESTRAINTS

1. Design vertical and horizontal restraints for temporary connections of the facade units to the main structure such that displacement of the facade unit cannot occur before making the permanent structural connection;
2. Design horizontal restraint to resist a minimum horizontal live load of ± 0.5 kN/m run acting at 1.5 m from the base of the facade unit.

CON5.D320.8 ADJUSTMENT DEVICES

1. Provide the facade units with separate vertical and horizontal adjustment devices;
2. Do not use adjustment devices in the vertical plane for horizontal location devices or horizontal restraint and do not design such devices to take any permanent shear (horizontal) loads;
3. Do not design any adjustment devices in the horizontal plane to take permanent vertical loads.

CON5.D330.8 STRUCTURAL SUPPORT

1. Design the facade units at each floor to derive their support from the building structure at the same floor via the specified permanent structural connections;
2. Do not allow any permanent loading from the facade units to be transferred to the facade units above or below.

INSITU CONNECTION DESIGN

CON5.D410.8 GENERAL

Design the insitu connection as **CON5.D130**:

1. To withstand the stresses induced by the facade units described in **CON5.D250**, sub-clauses (1) to (6);
2. To be watertight;
3. In concrete of the same grade as that for the precast units.

CON5.D420.8 REINFORCEMENT, SHEAR CONNECTORS ETC

Ensure reinforcement, shear connectors, etc used for the insitu connection design are adequately embedded or anchored into the building structure.

CON5.D430.8 VERTICAL CONNECTIONS

For vertical insitu connections:

1. If the minimum dimension of the void to be in filled is more than 150 mm, use non-shrink grout or concrete with non-shrinking additives;
2. If the minimum dimension of the void is less than 150 mm, use only non-shrink grout.

CON5.D440.8 HORIZONTAL CONNECTIONS

Concrete with non-shrinking additives may be permitted for horizontal insitu connections, in lieu of non-shrink grout, subject to the provisions of **CON5.M050**.

MECHANICAL CONNECTIONS

CON5.D510.8 GENERAL

Design the mechanical connections referred to in sub-clause (2) of **CON5.D130** to withstand the stresses transmitted by the facade units to the building structure, described in **CON5.D250** sub-clauses (1) to (6), in one of the following two groups:

1. Tying back fixing;
2. Location fixing.

CON5.D520.8 LOAD BEARING FIXINGS

Adopt load bearing fixing where the facade unit is designed to bear upon the building structure. Design the fixing so that the supporting area is adequate to carry the weight of the facade unit.

CON5.D530.8 TYING BACK FIXINGS

Adopt tying back fixing for securing the facade units into position. Design the fixing and the facade units to sustain the forces due to the restraint of the relative movement between the facade units and the building structure including movements cause by the effect of temperature, moisture movement, shrinkage and creep based on Hong Kong conditions.

CON5.D540.8 LOCATION FIXINGS

Adopt location fixing for positioning and levelling the facade unit before it is connected. Allow for all handling and positioning loads.

CON5.D550.8 TYPES OF ATTACHMENT TO STRUCTURE

1. Fix the facade units to the building structure by one of the following methods:
 - a. Cast in anchorages (Type A);
 - b. Grouted in dowel bars (Type B);
 - c. Expanding anchorages (Type C).
2. Comply with **CON5.D530** to **CON5.D540** for Type A and B anchorages;
3. For Type C anchorages, submit manufacturer's certificates and conduct pull out tests to check compliance with manufacturer's recommendations;
4. Submit for Approval any proposed alternative anchorage methods.

CON5.D560.8 LINKS BETWEEN ANCHORAGES

Angle cleats may be used to form the link between anchorages. Assembly adjustments may be made in three dimensions using horizontal and vertical slotted holes. Submit for Approval any proposed alternative devices to link between anchorages.

CON5.D570.8 CONCEALMENT OF FIXINGS

Conceal all permanent fixing connections by Approved methods.

CON5.D580.8 RESISTANCE TO CORROSION

All metal parts of connections must either be:

1. Corrosion resistant, being constructed of non-ferrous metal or stainless steel but avoiding any contact of such materials with the reinforcement; or
2. Protected against corrosion by an Approved method.

WEATHERPROOF JOINTS

CON5.D610.8 GENERAL

Design weatherproof joints between the facade units and the structure or between two adjacent facade units to ensure air and water tightness and in accordance with BS 6093:1993 and include joint seals in accordance with **CON5.M110** and **CON5.M120**.

CON5.D620.8 TYPES OF JOINT

Use weatherproof joints of one of the following types:

1. Sealed joint (one-stage joint);
2. Drained joint (two-stage joint).

CON5.D630.8 DESIGN WIDTH OF JOINTS

Design the joint width in accordance with BS 6093:1993 and BS 6213:1982.

CON5.D640.8 COMBINATIONS OF JOINT TYPE AND STRUCTURAL CONNECTIONS

Use only the following combinations of weatherproof joint and permanent structural connection in the design of the precast facades:

1. Either one-stage or two-stage weatherproof joint with insitu connections specified in **CON5.D300** (1);
2. Two-stage weatherproof joint with mechanical connections specified in **CON5.D300** (2).

CON5.D650.8 CONTRACTOR'S RESPONSIBILITY

Approval of the proposed jointing system including the weatherproofing materials does not relieve the Contractor from any liability on the performance of the joints.

MODIFICATIONS TO THE BUILDING STRUCTURE

CON5.D710.8 CONTRACTOR'S RESPONSIBILITY

The Contractor's responsibility for the design of his proposed modification is covered under GCC Clauses 5.15 and 11.8 and the Appendix E to the Specification.

CON5.D720.8 TYPES OF MODIFICATION

Modification to the design of the building structure to accommodate the precast facade design is permitted under the following circumstances subject to detailed submissions and Approval:

1. Modification for constructing the permanent structural connections. Reinforcement may be required to be relocated and/or added to the building structure provided that the resulting reinforcement arrangements produce an equivalent or higher overall design strength to that of the original structure;
2. Modification to incorporate the weatherproof joints. Grooves may be required to be formed provided that the resulting section produces an equivalent or higher overall design strength to that of the original structure.

CON5.D730.8 COMPLIANCE WITH GUIDELINES AND REGULATIONS

Any proposed structural modifications to accommodate the precast facade design must comply with the Regulations currently in use.

CON5.D740.8 WIND LOADINGS

For the purposes of designing for wind, the values and requirements must be not less than those specified in relevant structural design guidelines published by the Housing Department and included as Appendix E to this Specification.

SUBMISSIONS

CON5.D810.8 TENDER DESIGN PROPOSAL

Submit for Approval, full details of tender design proposals including drawings, layouts, details, calculations and any other information required by the CM.

CON5.D820.8 REGISTERED STRUCTURAL ENGINEER

All structural drawings, layouts, details and calculations submitted to the CM, including those submitted with tender, must be prepared and signed by a Registered Structural Engineer registered under Buildings Department of Hong Kong Government.

CON5.D830.8 PROGRAMME FOR SUBMISSIONS

Agree a programme for all submissions during the Contract to the CM prior to the notified date for commencement of Works. Include in the programme, the CM's undertaking to reply to design submissions within the following periods:

1. Initial submission - Within 28 days;
2. Resubmission - Within 14 days.

CON5.D850.8 SHOP DRAWINGS

Within two months of the notified date for commencement of the Works, submit five sets of fully dimensioned shop drawings for each type of facade unit, including shop drawings for windows to **COM2.D210** and electrical conduit system complete with its accessories, for approval.

CON5.D860.8 DRAWINGS AND METHOD STATEMENT

Within two months of the notified date for commencement of the works, submit, for agreement, the following items:

1. Design of moulds, layout arrangements, casting methods (horizontal or vertical), tilting mechanism (if any), demoulding methods and the provision for attachments of openings for window fixing;
2. The complete procedures for fabrication, curing, demoulding, application of finishes, lifting, transporting, storage, erection and installation of weatherproof joints;
3. Method of protecting the facade units from damage at all times;
4. Minimum concrete strength required for the facade units for demoulding, handling, storage, transportation and erection;
5. Position and design of lifting points;
6. Calculated weights of the facade units;
7. The proposed Radio Frequency Identification tag and the fixing method as specified in the Worksection COM11.

CON5.D870.8 METHOD OF FIXING WINDOWS

Within two months of the notified date for the commencement of the Works, submit for agreement, the method of fixing window frames or windows before casting of the facade units commences. Obtain either aluminium or uPVC windows from a supplier approved by CM.

CON5.D880.8 DETAILS OF WEATHERPROOFING

Within two months of the notified date for the commencement of the Works, submit details of weatherproofing materials in accordance with **CON5.M110** and **CON5.M120** for Approval, including technical information, samples, test reports and proven performance records of proposed materials.

CON5.D890.8 QUALITY ASSURANCE SCHEME

Within two months of the notified date for the commencement of the Works, submit details of the Quality Assurance Scheme for manufacturing the facade units, in accordance with **CON5.W030** to **CON5.W050** as applicable, for Approval.

CON5.D900.8 QUALITY CONTROL PROCEDURES

Within three months from the notified date for commencement of Works, submit for Approval, details of quality control procedures for erection of the facade units in accordance with **CON5.W640**.

CON5.D910.8 PROGRAMMES

Within one month of the notified date for the commencement of the Works, submit, for agreement:

1. When instructed by the CM, the programme for the design and the testing of the trial samples of the facade units;
2. The programme for manufacture of the facade units showing the rate of production for each month and the dates for clearing the area of casting yard and associated plant upon completion of the manufacture of the facade units;
3. The programme for the erection of facade units in accordance with **CON5.W610**.

CON5.D920.8 LOADING OF INSITU STRUCTURAL MEMBERS

Submit calculations to demonstrate that the insitu structural members are not subject to excessive stresses arising from the erection method of the facade units and to demonstrate the adequacy of any temporary supports which may be required.

SUBMISSIONS FOR PRECASTING

CON5.D1010.8 PRELIMINARY DESIGN

Submit preliminary design of moulds indicating the material to be used, layout arrangements, casting methods (horizontal or vertical), tilting mechanism (if any), demoulding methods of the main and side panels of the moulds and the provision for attachments of openings for window fixing.

CON5.D1020.8 METHOD STATEMENTS

Submit a method statement:

1. Describing the complete procedures for fabrication, curing, demoulding, application of finishes, lifting, transporting, storage, erection including fixing, grouting and installation of weatherproof joints;
2. Designed to ensure the dimensional accuracy both of the facade units and the structural elements adjoining them.

CON5.D1030.8 CASTING FACILITIES

Submit for Approval in accordance with **CON5.W010**.

CON5.D1040.8 PRELIMINARY PROGRAMME

Submit a preliminary programme for the design, manufacture, erection, testing and full size trial samples of the facade units including dates for clearing the area of any on-Site casting yard and associated plant upon completion of manufacture of the facade units.

MATERIALS

NON-SHRINK GROUT AND CONCRETE

CON5.M010.8 APPROVED MIX

For non-shrink grout, the submitted grout mix shall have the specified characteristic as stated in **CON5.M040**. Submit samples of non-shrink grout for carrying out the tests as stated in **CON5.M040** by the Approved testing laboratory.

CON5.M020.8 CONSTITUENT MATERIALS OF NON-SHRINK GROUT

To be a pre-packaged cement base product which contains Portland cement, selected sand and non-shrink additives.

CON5.M030.8 WATER/POWDER RATIO OR WATER CONTENT

For pre-packaged non-shrink grout product, comply with the manufacturer's recommendations.

CON5.M040.8 NON-SHRINK GROUT

Quality requirements:

1. To be pre-packaged cement base product with the following required properties:
 - a. A 28 days strength equal to or higher than the grade of the adjoining structures. The compressive strength shall be determined by compressive strength test as **CON5.T260**;
 - b. Chloride content of grout shall not exceed 0.1% by mass of the cement. Submit documentary evidence that the summation of chloride contents of constituent materials complies with the aforesaid requirement;
 - c. Setting time of the non-shrink grout when tested in accordance with ASTM C953 - 87(97) shall be greater than 1 hour for initial set and be less than 24 hours for final set;
 - d. Free expansion within 24 hours shall be of maximum 4% when measured in accordance with ASTM C827 - 95a(97). Expansion between 3 to 28 days when measured in accordance with ASTM C1090 - 96 shall be between 0% to 0.4%.

CON5.M050.8 CONCRETE WITH NON-SHRINK ADDITIVES

Submit for Approval and:

1. Maximum aggregate size: 10 mm;
2. Grade strength: a 28 days strength equal to or higher than the grade strength of the adjoining structure;
3. To comply with the manufacturer's recommendations on non-shrink additives;
4. Do not contain chlorides.

WEATHERPROOFING

CON5.M110.8 GENERAL

Quality requirements:

1. Weatherproofing materials to comply with BS 6093:1993 and subject to Approval.

CON5.M120.8 SEALANTS

As shown or scheduled on the Drawings as **WAT5.M180**.

- CON5.M130.8 MORTAR STOP BACKING RODS**
Polyethylene foam or other Approved.

CONDUIT SYSTEM

- CON5.M210.8 STANDARDS**

- For rigid plain polyvinyl chloride (PVC) conduits, conduit fittings and PVC boxes, comply with the following British Standards:

Conduits and Fittings	British Standards
PVC conduits:	BS 6099:Section 2.2:1982(1988)
PVC conduits fittings:	BS 4607:Part 1:1984(1993)& BS 4607:Part 5:1982(1988)
PVC circular conduit boxes:	BS 4607:Part 5:1982(1988)
PVC boxes for electrical accessories:	BS 4662:1970(1989)

- Ensure that all PVC conduits, fittings and boxes are of the same make.

- CON5.M220.8 COLOUR**

PVC conduits, fittings and boxes: white in colour.

- CON5.M230.8 FLAME RESISTANCE**

PVC conduits, fittings and boxes: non-flame-propagating and self-extinguishing.

- CON5.M240.8 TEMPERATURE CLASSIFICATION**

- For all PVC conduits, fittings and boxes, comply with the temperature classification of -5 in accordance with BS 6099:Section 2.2:1982(1988);
- For PVC conduits, where the ambient temperature at the country of manufacture is likely to be below -5°C, the temperature classification is -25.

RIGID PLAIN PVC CONDUITS

- CON5.M310.8 CONSTRUCTION AND SIZE**

- PVC conduits: rigid, plain and of a non-threadable type;
- Nominal diameter of PVC conduits: within the range of 20 mm to 32 mm unless otherwise specified.

- CON5.M320.8 MECHANICAL PROPERTIES**

PVC conduits are:

- Of heavy mechanical strength;
- Capable of withstanding the heavy compression and impact tests specified in BS 6099:Section 2.2:1982 (1988).

- CON5.M330.8 TYPE-TESTING FOR ELECTRICAL PVC CONDUITS**

- Rigid plain PVC conduits shall be type-tested for complete compliance with BS 6099:Section 2.2:1982(1988) by an Independent Accredited Laboratory or an Independent Short-Circuit Testing Organisation;
- Upon request from CM, provide documentary evidence that the batch/consignment of PVC conduits delivered to Site have satisfied the requirement as stipulated in the relevant British Standards mentioned in sub-clause (1) above.

PVC CONDUIT FITTINGS

CON5.M410.8

CONSTRUCTION

1. Use plain, moulded slip-type couplers and expansion type couplers to BS 4607:Part 5:1982 (1988) in the jointing of conduits;
2. Use saddles and spacers in compliance with BS 4607:Part 1:1984 (1993) for fixing of conduits unless otherwise specified.

CON5.M420.8

TYPE-TESTING FOR ELECTRICAL PVC CONDUIT FITTINGS

1. PVC conduit fittings shall be type-tested for complete compliance with the following British Standards by an Independent Accredited Laboratory or an Independent Short-Circuit Testing Organisation:

PVC Conduit Fittings	British Standards
Plain moulded slip type coupler	BS 4607:Part 5:1982(1988)
Male bush and female adaptor	BS 4607:Part 1:1984(1993)

2. Upon request from CM, provide documentary evidence that the batch/consignment of PVC conduit fittings delivered to Site have satisfied the requirement as stipulated in the relevant British Standards mentioned in sub-clause (1) above.

PVC CIRCULAR CONDUIT BOXES, PVC BOXES FOR ELECTRICAL ACCESSORIES AND PVC ADAPTABLE BOXES

CON5.M510.8

CONSTRUCTION AND DIMENSIONS

1. For PVC boxes and their covers, comply with the relevant British Standard specification listed in **CON5.M210**;
2. Fit all screw holes with metal inserts. Except for PVC adaptable boxes, provide each box with a brass earthing terminal complete with screw for the connection of circuit protective conductor (CPC);
3. Ceiling-mounted circular conduit boxes: deep pattern type having an internal depth of not less than 60 mm;
4. For extension rings, comply with BS 4607:Part 5:1982 (1988);
5. Mould each PVC box in one piece;
6. For dimensions of PVC adaptable boxes, comply with BS 4568:Part 2:1970 (1988).

CON5.M520.8

MECHANICAL PROPERTIES

1. For PVC boxes, comply with the requirements for mechanical properties stated in the relevant British Standard specification listed in **CON5.M210**;
2. PVC adaptable boxes are:
 - a. Moulded;
 - b. Of sufficient mechanical strength to withstand forces encountered in concealed conduit wiring system application;
 - c. Complete with provision for prevention of deformation of the boxes where necessary.
3. Plastic boxes are of:
 - a. Dimensions: can be interchangeable with steel boxes;
 - b. Wall thickness: 2 mm minimum;
 - c. Cover sizes: larger than the adaptable box on each edge by at least 5 mm.

4. Where considerable heat is produced, fit boxes for the suspension of luminaires or other equipment with steel insert clips;
5. Do not use plastic boxes where:
 - a. Temperature of the box is likely to exceed 60°C;
 - b. The mass suspended from the box exceeds 3 kg.

CON5.M530.8

TYPE-TESTING FOR ELECTRICAL PVC CONDUIT BOXES

1. PVC circular conduit boxes, PVC boxes for electrical accessories and PVC adaptable boxes shall be type-tested for complete compliance with the following British Standards by an Independent Accredited Laboratory or an Independent Short-Circuit Testing Organisation:

PVC Conduit Boxes	British Standards
PVC circular conduit boxes	BS 4607:Part 5:1982(1988) with the following conditions: a. The marking of the PVC circular conduit boxes shall be 60/10 kg. b. The PVC circular conduit boxes shall be type-tested to 10 kg suspended load.
PVC boxes for electrical accessories	BS 4662:1970(1989)
PVC adaptable boxes	a. BS 4568:Part 2:1970(1988) Clause 6 Dimensions b. BS 4607:Part 5:1982(1988) Clause 7.3 Safety on impact test Clause 8 Resistance to heat Clause 9 Resistance to burning Clause 10 Insulating characteristics

2. Upon request from CM, provide documentary evidence that the batch/consignment of PVC conduit boxes delivered to Site have satisfied the requirement as stipulated in the relevant British Standards mentioned in sub-clause (1) above.

WORKMANSHIP

GENERAL

CON5.W010.8

CASTING YARD

Within one month from the notified date for commencement of the Works, submit for Approval on the following:

1. For on-Site casting:
 - a. The location of casting yard for manufacture of precast concrete components;
 - b. Details of plant and equipment including the location, boom radii and lifting capacities of cranes, gantry capacities, curing facilities, number of moulds and means of transporting the concrete components within the Site.
2. For off-Site casting:
 - a. The name, casting yard address with street maps and job reference of the manufacturer and the following:
 - i. Details of organisation structure and top management;
 - ii. Self-certified true copy of the business licence of the manufacturer;
 - iii. Annual production capacity of the casting yard in terms of concrete volume, numbers of products and the current workload;
 - iv. Details of the Quality Assurance Scheme required in **CON5.W030**;
 - v. Details of the audit plan and previous audit report, if any, carried out by the Precast Concrete Construction Auditing Consultant required in **CON5.W050**;
 - vi. Details of compliance with requirements of this specification on batching plant and concrete mixes in accordance with Worksection CON1;
 - vii. Test results for quality tests being carried out for the precast concrete components to demonstrate the compliance with requirements of this specification;
 - viii. Other details of construction quality as required in **CON5.W090** (1).
 - b. Scaled and dimensioned layout plan of the casting yard with fenced boundaries showing the office, the production lines for the products including hardstanding and covered casting yards, disposition of steel moulds, vibration plant, handling and lifting plants, steam or hot air curing room / facilities, storage areas for finished products, steel reinforcement storage and bending yards, storage sheds for incoming materials, samples room, batching plant if any, testing laboratory, concrete cubes curing facilities, means of transporting the concrete components to the Site;
 - c. The laboratory for carrying out the tests and issuing test certificates shall be approved by the Housing Department, or accredited either by Hong Kong Accreditation Scheme (HKAS) under the Hong Kong Laboratory Accreditation Scheme (HOKLAS), or an equivalent organization which has signed a mutual recognition agreement with HOKLAS. All expenses / costs related to the tests carried out by the laboratory shall be borne by the Contractor.

CON5.W015.8

MANAGEMENT SCHEMES FOR OFF-SITE CASTING

1. Ensure that the casting yards for the off-Site casting of precast concrete components are operating on the following management schemes:
 - a. An Environmental Management Scheme certified under ISO 14001;

- b. An Occupational Health and Safety Management Scheme certified under OHSAS 18001.
2. Submit the original or certified true copy of the respective certificates for the manufacturing plant within the following time frame:
 - a. ISO 14001: At not later than 15 days before the commencement of the production of precast concrete components;
 - b. OHSAS 18001: At not later than 12 months from the date of commencement of the Works.
3. When the photocopy of certificate is submitted, it shall be certified by the certification body or by the QCM. The certification body shall be accredited by the Hong Kong Accreditation Service (HKAS), or the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS for the respective certification.

CON5.W020.8 QUALITY ASSURANCE SCHEME FOR OFF-SITE CASTING

Ensure that casting yards for the off-Site casting of units are operating on an Approved Quality Assurance Scheme in accordance with **CON5.W030** to **CON5.W050**.

CON5.W025.8 QUALITY ASSURANCE FOR ON-SITE CASTING

Within two months from the notified date for the commencement of the Works, submit for Approval details of the Quality Assurance Scheme for manufacturing the precast concrete components, in accordance with **CON5.W030** to **CON5.W040** as applicable.

CON5.W030.8 QUALITY ASSURANCE SCHEME

1. Ensure that the facade units are manufactured under a Quality Assurance Scheme which covers the following items and is certified under ISO 9001:
 - a. Quality control tests of materials, including proprietary products such as lifting anchors for handling precast concrete components;
 - b. Calibration of laboratory equipment for quality control tests;
 - c. Efficiency and proper operation of equipment at the casting yard;
 - d. Production process;
 - e. Sampling / testing procedures and requirements by an independent Approved laboratory;
 - f. Quality control procedures including the frequency and extent of inspection by manufacturer's staff and independent parties;
 - g. Regular audits at a minimum frequency of once per month by manufacturer's staff and independent parties.
2. Endorse the Quality Assurance Scheme and submit to the CM for approval at least 15 days before the commencement of the production of precast facade.

CON5.W035.A PRECAST CONCRETE CONSTRUCTION AUDITING CONSULTANT

1. Select a consultant on the Architectural and Associated Consultants Selection Board's (AACSB) List of Structural Engineering Consultants (the "List") for CM's approval as the Precast Concrete Construction Auditing Consultant to carry out technical audits at the manufacturer's factory in accordance with the Code of Practice for Precast Concrete Construction 2016 issued by the BD;
2. A Precast Concrete Construction Auditing Consultant on the "List" in sub-clause (1) appointed by the manufacturer may be proposed for Approval;
3. Notify the CM immediately if there is any subsequent change of the Precast Concrete Construction Auditing Consultant during the course of services.

CON5.W040.8

QUALIFIED SUPERVISION

1. Assign a Precast Quality Control Manager (PQCM), with a minimum qualification and experience of a Grade T4 TCP in the civil or structural engineering discipline under the Registered Contractor's stream in the CoPSS, to certify all control documentation or test certificates required for the QA Scheme;
2. Assign a Precast Quality Control Coordinator (PQCC), with a minimum qualification and experience of a Grade T3 TCP under the Registered Contractor's stream in the CoPSS, to provide continuous supervision of the precast concrete production works at the casting yard;
3. Submit the details of the PQCM and the PQCC for Approval. For on-Site casting, it is permissible for the PQCM to be the same person as the QCM and the PQCC to be the same person as the SQCC;
4. Provide attendance to an RSE who is nominated by the CM, to carry out audit checks to the casting yard at least once every month;
5. The Authorized Signatory as stipulated in **PRE.B6.060** is to carry out inspection and audit checks to the casting yard at least once every month and submit a monthly audit report to the RSE as stipulated in sub-clause (4) above and then to the CM for endorsement and onward submission to ICU.

CON5.W050.A

RECTIFICATION TO QUALITY NON-COMPLIANCE

1. For off-Site casting in **CON5.W010** (2), the manufacturer shall be under regular technical audits in a manner as stipulated in **CON5.W030** (5) and supervision of the CM or his representatives resident at the manufacturer's factory;
2. The Contractor shall:
 - a. Ensure that the manufacturer shall rectify any non-conformance to the Specification revealed by the audit or the supervision of the CM or his representatives resident at manufacturer's factory and if necessary, modify the QA Scheme and temporarily suspend the manufacture of the precast facade panels until the non-conformance is rectified;
 - b. Report to the CM of the non-conformance and rectification carried out.
3. Notwithstanding sub-clause (2) above, bear full responsibility to assure that all the precast concrete components delivered to Site comply with the requirements of the Specification at all times.

CON5.W055.8

INSPECTION LOG BOOK

1. Record the following in an inspection log book:
 - a. The names and qualifications of the supervisory personnel assigned by the CM and by the Contractor as stipulated in **CON5.W040**;
 - b. The details of concrete production, inspection, auditing and testing.
2. Keep the inspection log book in the casting yard and provide a duplicate of the inspection log book on Site for CM's inspection when required.

CON5.W060.8

EQUIPMENT

Ensure casting yards, erected on-Site or off-Site are equipped with all the necessary facilities, including efficient vibration plant, necessary curing facilities, storage, handling and lifting facilities to secure compliance with all the provisions of this Specification.

CON5.W070.8

USE OF CASTING YARD

Do not use any on-Site casting yard for manufacture of any components for other sites. See **PRE.B8.010**.

CON5.W080.8 SUBMISSION AND PILOT PRODUCTION RUN BEFORE APPROVAL

1. Submission:
 - a. Submit the shop drawings, for the production of the precast components for Approval, including any proposed changes to the products so as to suit individual production process / plant;
 - b. Use concrete mix for the manufacture of precast components all in accordance with the requirements in Worksection CON1;
 - c. Provide relevant information / samples associated with the proposed precast components for Approval including:
 - i. Engraved manufacturer's logo and casting date;
 - ii. Printed precast concrete components identity numbers on surface of products;
 - iii. Schmidt hammer test certificate and covermeter tests record endorsed by the manufacturer's Quality Control Personnel;
 - iv. Delivery Order / Invoice;
 - v. Import and Export Manifests or Bill of Lading.
2. Before obtaining Approval for mass production, carry out a pilot production run with the CM on the proposed manufacturer to demonstrate the technical capability and effectiveness of the Quality Management System;
3. In the pilot production run:
 - a. Provide, for each category of products:
 - i. One sample with the reinforcement fixed in steel mould for the inspection of workmanship including reinforcement fixing and provision of bar spacers;
 - ii. One sample with concrete cast in steel mould for the inspection of conditions of the steel mould, checking of the finished sample.
 - b. Carry out trial run to demonstrate the manufacturing process including installation of windows, lifting operation, curing, storage, fixing of mosaic tiles, quality tests at factory laboratory, applied finishes and quality controls in accordance with the required drawings and specification;
 - c. Carry out verification check for engraved logo, casting date, identity number, Schmidt hammer test certificate and covermeter tests record, dimensions, size, spacing, position of starter bars and finishes.
4. The pilot production run may not be required, if the following documents are submitted and are acceptable to the CM:
 - a. Track records on similar types of precast concrete components supplied by the proposed manufacturer to other HA construction projects, within five years prior to the notified date for commencement of the Works; or
 - b. In the absence of the track records, detailed records of the pilot production run for similar types of precast concrete components carried out in other HA construction projects, within five years prior to the notified date for commencement of the Works.

CON5.W090.8 FIRST JOINT INSPECTION AT MANUFACTURER'S FACTORY

1. Prior to mass production, carry out the first joint inspection between the Contractor and the CM at factory for Approval on the minimum standard of the product for all subsequent concrete and the specified finish. Arrange for the transportation and provide all facilities for the first joint inspection;

2. Provide samples, including those samples in **CON5.W080** (3)(a) and those accepted samples in previous pilot production run carried out in accordance with **CON5.W080**, for Approval as being representative of the minimum standard of the product for all subsequent concrete and the specified finish;
3. Maintain accepted facade sample at a minimum of one number, or as directed by the CM, in an area in the factory and do not remove the accepted samples from the area unless otherwise instructed by the CM. Incorporate a further set of samples to the trial panel on Site;
4. Carry out further joint inspections as in **CON5.T710**.

PRODUCING PRECAST UNITS

CON5.W110.8

MOULDS

1. Construct moulds from steel or other materials to produce a standard suitable for the 'Surface finishes' specified in **CON5.W310** to **CON5.W350**;
2. Construct and maintain moulds so that:
 - a. Dismantling and re-assembly of moulds after each casting allows the production of subsequent facade units within permitted tolerance limits;
 - b. The positioning of securing components and fixings etc. are within the permitted tolerances;
 - c. Adequate stiffness for the control of dimensional tolerances is maintained.

CON5.W120.8

DEFECTIVE MOULDS

Replace any mould which fails to produce facade units within the permitted tolerance limits as specified in Appendix H, the "Schedule of Tolerances", or to the standards of surface finishes as **CON5.W310** to **CON5.W350**.

CON5.W130.8

HORIZONTAL CASTING

Provide moulds designed to facilitate horizontal casting with devices to enable rotation from horizontal to vertical through 90° so that the facade units can be lifted vertically on demoulding.

CON5.W140.8

USE OF RELEASE AGENTS

Apply mould release agent of an Approved type, to the surfaces of moulds either by brush or by spraying before the fixing of steel reinforcement at a rate in accordance with the manufacturer's recommendations.

CON5.W150.8

CONCRETING, COMPACTION AND CURING GENERALLY

See CON1.

CON5.W160.8

EXTERNAL VIBRATORS

Obtain Approval for the use of external vibrators.

CON5.W170.8

CURING BY APPLICATION OF HEAT

Obtain Approval for heat curing by means of steam, hot air, etc. and:

1. Ensure that the total chloride content of the concrete mix for facade units subject to heat curing, is less than 0.1% by weight of that of the cement;
2. Carry out a site trial to demonstrate the adequacy of the proposed method to the satisfaction of the CM.

CON5.W180.8 DEMOULDING GENERALLY

1. Unless otherwise Approved, do not disturb the facade units within 24 hours of casting;
2. Demould by means of an Approved method and:
 - a. Do not use crowbars;
 - b. Do not subject the mould to any form of impact.

CON5.W190.8 CONCRETE STRENGTH BEFORE DEMOULDING

1. Demould the facade units only after concrete has achieved the Approved strength;
2. To determine the concrete strength required for demoulding or handling:
 - a. Make the necessary concrete cubes in pairs from the same batch of concrete used for casting the facade units and cure the concrete cubes under the same conditions as the concrete in the facade units;
 - b. Specially identify the cubes and do not use them for normal quality control or for compliance testing;
 - c. Determine the concrete cube strength by compression test as **CON5.T210** and satisfy the CM that the concrete cubes have acquired the required strength before the demoulding or handling the facade units.
3. If Instructed, prepare beam specimens for determination of flexural strength for those facade units that are subject to bending during demoulding and lifting.

CON5.W200.8 IDENTIFICATION AND RECORDS

1. Mark all facade units with date of manufacture and a unique reference number;
2. Record in a master register the dates of casting, the concrete grades and the final locations of all facade units;
3. Update records specified in above sub-clause (2) for all facade units to the RFID Web-Based Database System.

CON5.W210.8 HANDLING INSTRUCTIONS

If the facade units are designed for handling in a particular direction only, make this clear by means of instructions on shop drawings and appropriate markings on the facade units.

CON5.W220.8 REQUIREMENTS OF OTHER TRADES AND COMPONENTS

Incorporate the requirements of all trades such as blockouts, recesses, notches, embedded metal works or any other items before casting the facade units.

CON5.W230.8 WINDOWS FIXING TO FACADE UNITS

Fix window frames / windows complete with or without opening sashes before casting the facade units as specified in COM2 Worksection and:

1. Obtain Approval for the method of fixing window frames / windows;
2. Do not fix window frames / windows into preformed openings after casting;
3. For off-Site casting, coordinate with the PCF and window suppliers approved by the CM.

SURFACE FINISHES

CON5.W310.8 EXTERNAL FACE

Finish outside faces except edges and overhang soffits to give an even textured surface suitable for fixing glazed ceramic tiles by adhesive, or cast the tiles into the mould as required by the Contract.

CON5.W320.8 EDGES AND OVERHANG SOFFIT

Finish top, edge and soffit of overhang to give a smooth untextured surface suitable for applying acrylic paint.

CON5.W330.8 INTERNAL FACE - LIVING / DINING / BEDROOMS

Finish to give:

1. A smooth untextured surface suitable for applying plastic emulsion paint for rental blocks;
2. An even textured surface suitable for receiving internal cement lime plaster for SSF blocks as required by the Contract.

CON5.W340.8 INTERNAL FACE - BATHROOM

Finish to give an even textured surface suitable for fixing glazed ceramic tiles in accordance with **FIN5.W210** and **FIN5.W220** as appropriate.

CON5.W345.8 INTERNAL FACE - KITCHEN

Finish to give an even textured surface suitable for fixing glazed ceramic tiles in accordance with **FIN5.W210** and **FIN5.W220** as appropriate.

CON5.W350.8 INTERNAL FACE - UTILITY AREA

Finish to give an even textured surface suitable for fixing glass mosaic tiles by adhesive.

ACCURACY AND TOLERANCES

CON5.W410.A MANUFACTURING AND ERECTION TOLERANCES

1. Refer to:
 - a. Code of Practice for Precast Concrete Construction 2016 published by the BD;
 - b. Appendix H "Schedule of Tolerances" to this Specification.
2. Where any ambiguity, discrepancy or conflict arises between sub-clauses (1)(a) and (1)(b) above, the provisions given in Appendix H shall prevail.

CON5.W420.8 CHECKING TOLERANCES

Check the manufacturing dimensional tolerances of the facade units by an Approved method at a rate of 1 in every 10 facade units produced and report the result to CM within two days of checking.

CON5.W430.8 DEFECTIVE UNITS

1. Any facade unit that falls outside the tolerance limits is considered defective and must be replaced as Instructed. Indelibly mark rejected facade units for identification purposes;
2. In the event of the CM agreeing to accept any defective facade unit, execute all necessary remedial and modification work to the CM's satisfaction.

HANDLING, TRANSPORTATION AND STORAGE

CON5.W510.8 LIFTING FRAME

Lift facade units within the casting yard by means of a purpose-made steel lifting frame designed to the Code of Practice for the Structural Use of Steel 2011 issued by the Buildings Department.

CON5.W520.8	<p>LIFTING INSERTS AND SUPPORTS</p> <p>Determine exact number, size and location of lifting inserts and proper supports with locations for transportation and storage.</p>
CON5.W522.8	<p>TEMPORARY SUPPORTS FOR TRANSPORTATION AND STORAGE</p> <p>Determine proper supports with locations for transportation and storage.</p>
CON5.W530.8	<p>INSPECTION</p> <p>Inspect each facade unit before lifting to ensure that neither damage nor hazard occurs during lifting.</p>
CON5.W540.8	<p>LIFTING</p> <p>During lifting, keep the facade units vertical and:</p> <ol style="list-style-type: none"> 1. Ensure that all connections between the lifting frame and lifting points remain vertical as far as possible; 2. Lift the facade units only at appropriate lifting points as shown on the Approved shop drawings; 3. Locate lifting points that the line of the resistant force passes through the centre of gravity of the facade unit.
CON5.W550.8	<p>LIFTING PLANT AND EQUIPMENT</p> <ol style="list-style-type: none"> 1. Ensure plant used for lifting including cranes, hoists, lifting frames, hooks, etc possess adequate safety margins, are maintained in good working order and are regularly tested. Provide details of plant and maintenance records and current test certificates when required by the CM; 2. Maintain crane rope in a sound condition. Discard all frayed bridle ropes or slings; 3. Notwithstanding sub-clause (1) above, provide test certificates of lifting anchors to the CM in accordance with CON5.T810 to CON5.T850.
CON5.W560.8	<p>STORING UNITS</p> <ol style="list-style-type: none"> 1. Store the facade units in the vertical plane on a level, well drained and maintained concrete surface and protect against staining or physical damage; 2. Support the facade units by an Approved method to prevent their warping, bowing, chipping or cracking; 3. Store different types of facade units separately; 4. The facade units shall be supported by a device in storage area to prevent toppling. For off-site casting yards, racks shall be used and detailed in the submitted QA scheme.
CON5.W570.8	<p>TRANSPORTING FROM CASTING YARD</p> <p>Stack facade units vertically on vehicles during transportation from the casting yard and:</p> <ol style="list-style-type: none"> 1. Support the units on special cradles so that the units are completely protected against damage and adverse stresses; 2. Provide the details of the support and the support locations to the CM for comment.
CON5.W580.8	<p>LOADING AND OFF-LOADING</p> <p>Carry out lifting for loading or off-loading the facade units in one movement. Lift off and re-position any facade unit which is not properly positioned after lifting, rather than levering it into place.</p>

CON5.W590.8 TRANSPORT VEHICLES

Maintain lorries or trolleys used for the transportation of the facade units in a good condition. Ensure trolleys are equipped with suspension systems to minimise shock loading.

ERECTING UNITS

CON5.W610.8 PROGRAMME

Provide a programme for the erection of the facade units, showing the rate of erection for each month. Make due allowance for all restrictions on the age of concrete in the facade units for handling, storage, transportation and erection.

CON5.W620.8 SITE RECORDS

Provide, at the end of each week during erection of the facade units, records in a form to be agreed with the CM, showing:

1. Dates and the locations of structural connections completed;
2. Dates of removal and locations of props and temporary supports to the facade units.

CON5.W630.8 CM'S INSPECTION

Allow and facilitate inspection of the facade units at any time before erection and after installation.

CON5.W640.8 QUALITY CONTROL PROCEDURES

Carry out erection of the facade units under Approved quality control procedures covering the following:

1. Protective measures to avoid cracking and chipping of the facade units and damage to the applied finishes and to the built-in items such as window frames;
2. Checking the accuracy of the insitu structural members receiving the facade units, including location and level of all bearing surfaces, joints, bolts, horizontal and vertical restraining devices and adjustment devices. Carry out checking by means of a template or measurement frame or a similar Approved method;
3. Checking of erection tolerances;
4. Testing of the compressive strength of the grouting materials in accordance with **CON5.T250**.

CON5.W650.8 LIFTING UNITS INTO POSITION

1. Lift the facade units by steel lifting frame complying with **CON5.W510** except otherwise stipulated in sub-clause (4) below;
2. Maintain all cables connecting the lifting frame and the lifting points of the facade units in a vertical direction. Provide the cables with devices for the adjustment of their length;
3. Do not allow devices such as sockets or bolts for lifting purposes to be used for fixing the facade units to the main structure;
4. Submit detailed method statement including the design, drawing and installation procedures with endorsement of the Contractor's RSE demonstrating to the satisfaction of the CM that the precast concrete component will not subject to excessive stresses arising from their proposed erection method without the steel lifting frame, exemption from using the steel lifting frame as stated in sub-clause (1) above can be allowed only for the lifting of precast façade with the maximum horizontal dimension less than or equal to 1.8m;

5. In connection with sub-clause (4) above, address the safety use of the proposed lifting anchor system, including but not limited to the proprietary anchor bolt with clutch. The proposed lifting anchor system shall be flexible enough to allow for both vertical and slant lifting sling.

CON5.W660.8 TEMPORARY SUPPORT

1. During fixing of the facade units, prop adjacent insitu structural members adequately to avoid excessive deflection or adverse stresses;
2. Maintain all temporary supports, props and restraints in position during casting of concrete / grout in the structural joint. Remove temporary supports, props and restraints upon satisfactory testing and calculation to Approval;
3. Unless specifically designed for, do not allow temporary support to be derived from the facade units fixed at lower floors;
4. For off-Site casting, coordinate with the supplier regarding the details of all temporary supports, props and inserts to suit the proposed lifting and installation method;
5. For the temporary support of the facade on the floor, refer to the drawings detailed in **Project Specific Specification**, which are provided for reference only;
6. Submit design calculations and detail drawings of installation and fixing for the CM's approval at least 4 weeks before commencement of constructing the temporary support.

CON5.W670.8 UNITS DAMAGED ON TRANSPORTATION, LIFTING OR ERECTION

Replace any facade unit which has been damaged on transportation, lifting or erection.

CON5.W680.8 APPROVAL FOR PERMANENT FIXING

Do not carry out permanent jointing or connection between any facade unit and another, or to any part of the insitu structure, without prior Approval.

CON5.W690.8 PREPARING AND PLACING GROUTING MATERIALS

Obtain Approval for the method of preparing and placing grouting materials in structural joints between the facade units and insitu structural members.

DEFECTS

CON5.W710.8 MINOR CHIPPING

Carry out repairs only to minor chipping by patching up after installation subject to Approval.

CON5.W720.8 OTHER REPAIRS

The CM may at his discretion approve other proposals for repairs to damaged facade units. Carry out any repair work to the satisfaction of the CM.

CON5.W730.8 REJECTED PANELS

Replace any defective or damaged facade panels rejected by the CM.

JOINTS

CON5.W810.8

GENERAL

1. Prepare and construct joints strictly in accordance with the Drawings and in accordance with the relevant manufacturer's recommendations so as to provide continuous weathertightness of buildings and give a neat, uniform and smooth appearance;
2. For application of back-up materials, bond breakers and sealants, see Worksection WAT5.

CON5.W820.8

GASKETS

Gasket may be used in weatherproofing joint provided that:

1. The joint is horizontal; and
2. The gasket is always under compression.

CON5.W830.8

MORTAR STOPS

Use backing rods or other Approved method as mortar stops in grouting panel joints when necessary.

CON5.W840.8

JOINT WIDTH

Unless otherwise Approved, the installed joint width must not be less than 6 mm nor greater than 30 mm.

CONDUIT SYSTEM

CON5.W910.8

APPLICATION

Supply and install conceal rigid plain PVC conduit system complete with steel draw wires for precast facade as indicated on the Drawings.

CON5.W920.8

SHOP DRAWINGS PREPARATION

Prepare shop drawings, coordinate and agree with the Nominated Sub-contractor for electrical installation and Supplier for precast facade before submitting shop drawings for Approval.

CON5.W930.8

SUBMISSION AND APPROVAL

Submit for Approval technical details, samples and type-tested certificates for the conduit system as specified in clauses [CON5.M330](#), [CON5.M420](#) and [CON5.M530](#).

CON5.W940.8

COMPLETION CERTIFICATION FOR ELECTRICAL CONDUIT SYSTEM INSTALLATION

1. All conduits, fittings and accessories installed have to be certified by at least Grade A2 of Registered Electrical Workers (REW);
2. When delivered to Site, the precast facade units must be accomplished with a Work Completion Certificate Form WR1(A) specified by Electrical and Mechanical Services Department which shall be duly signed by a Registered Electrical Contractor and a REW certifying that the conduit system installation is in full compliance with the Specification and the Code of Practice for the Electricity (Wiring) Regulations;
3. A single certificate can be issued for delivered lots of precast concrete components which are produced in each production lot. The certificate shall also carry information e.g. reference number etc. for traceability purpose;

-
4. Provide CM and the Nominated Sub-contractor for Electrical Installation each a copy of the Work Completion Certificate for record.

CONDUIT AND WIRING INSTALLATION

CON5.W1010.8 CONDUIT BENDS

Internal radius: At least 4 times the outside diameter of the conduit.

CON5.W1020.8 BENDING, JOINTING AND TERMINATING OF CONDUITS

Follow conduit manufacturers' recommendation for:

1. Method of carrying out the conduit bends and conduit joints;
2. Method of fixing conduits to boxes without spouts;
3. Use of tools and materials.

TESTING

SAMPLING AND TESTING GENERALLY

CON5.T010.8

RECORDS

1. Keep a complete record of all sampling and testing, in a form agreed with the CM;
2. Submit test reports and certificates to the CM within 14 days from the date of test.

CON5.T020.A

WITNESSING SAMPLING AND TESTING BY THE CM

The CM will witness any sampling and testing carried out under the Quality Assurance Scheme:

1. Make the records of sampling and testing available for inspection by the CM or his representatives resident at manufacturer's factory;
2. The CM or his representatives resident at manufacturer's factory is entitled to reject individual facade unit represented by any failed test result on the facade unit.

CON5.T030.A

TESTS AT MANUFACTURER'S FACTORY

Provide samples, all necessary facilities and attendance to the DTC or the CM or his representatives resident at manufacturer's factory to carry out the following tests:

1. Schmidt hammer tests and covermeter tests on the construction quality of precast concrete components;
2. Tests on concrete constituent materials, tests on compressive strength of concrete cubes and concrete cores, tests on reinforcement bars and tests on fabric reinforcement by the DTC and / or HDMTL.

CON5.T040.A

INSTALLATION OF RFID TAG IN CONCRETE CUBE FOR CUBE COMPRESSION TEST TO BE CARRIED OUT BY DTC OR HDMTL

1. Install a Radio Frequency Identification (RFID) tag as detailed on Sketch no. RFID/TAG/SK-01 onto the trowelled surface of each of the concrete cubes immediately after preparation of cubes at the manufacturer's factory under the witness of the CM or his representatives resident at manufacturer's factory unless otherwise instructed by the CM;
2. The RFID tags are to be provided by DTC or the CM or his representatives resident at manufacturer's factory in batches;
3. Validate and scan the RFID tag with the Bluetooth RFID reader provided by DTC or the CM or his representatives resident at manufacturer's factory before use, and ensure that information such as tag unique identification (UID), electronic product code (EPC) number and timestamp have been uploaded to the PC provided by the DTC or the CM or his representatives resident at manufacturer's factory and incorporated into the DTC's database system (through 3G or above internet service);
4. Input the mould number and / or sampling certificate number against the concerned tag EPC number through the DTC's database system;
5. Before the tagged cubes are sent from the manufacturer's factory to HDMTL or are collected by the DTC, scan the tag again using the Bluetooth RFID reader and ensure that information such as tag UID, EPC number and timestamp have been uploaded to the PC and incorporated into the DTC's database system (through 3G or above internet service);
6. Deliver the tagged cubes to HDMTL or arrange the tagged cubes to be collected by the DTC with due care at a time such that a minimum of 4 days is allowed for curing the cubes in DTC or HDMTL before testing on compressive strength at 28 days by DTC or HDMTL;

7. In case any damaged RFID tags are discovered, report to the CM or his representatives resident at manufacturer's factory immediately without any delay;
8. Maintain an inventory record of all RFID tags including those damaged and submit the inventory record to the CM or his representatives resident at manufacturer's factory.

TRIAL UNITS

CON5.T110.8

GENERAL

Prior to mass production of the facade units:

1. Produce a full size trial sample for the Type T1 facade unit complete with joints, windows, glazing and the electrical conduit system installation etc. and all finishing at ground level for Approval;
2. Maintain the Approved sample facade unit as the yardstick for the standard and quality necessary for all facade units unless otherwise required under the terms of **CON5.T120**;
3. When construction of a trial panel is required in **CON2.W720**, structurally connect the trial sample to surrounding structural frames and with interfacing services as detailed on the Drawings.

CON5.T120.8

ADDITIONAL TRIAL UNITS

Non-compliance:

1. In the event that the trial sample, in the opinion of the CM, cannot represent any one of the other facade types due to different designs proposed or methods of manufacture and erection, the CM is entitled to order additional trial samples for those different facade types including the surrounding structural frames all at the Contractor's own expense and without detriment to the programme.

CON5.T130.8

PROTECTION AND DISPOSAL

Ensure that the Approved sample facade units remain undamaged and remove both the samples and surrounding structural frames upon the completion of erection of all facade units.

TESTS ON WORKABILITY

CON5.T131.8

STANDARD

As **CON1.T510**.

CON5.T132.8

ACCEPTANCE VALUES FOR APPROVED CONCRETE MIXES

As **CON1.T520**.

TESTS ON COMPRESSIVE STRENGTH OF CONCRETE CUBES

CON5.T210.8

STANDARD

TESTS ON COMPRESSIVE STRENGTH OF EARLY CORES FOR PRECAST FACADES

CON5.T221.A	GENERAL <ol style="list-style-type: none"> 1. Provide all necessary facilities and attendance for carrying out coring and testing of concrete cores by DTC, including the provision of a secure and lockable storage for DTC to store the coring machine and other associated equipment; 2. Tests are to be witnessed and endorsed by the Contractor's representative and the CM or his representatives resident at manufacturer's factory; 3. Allow 2-day advance notice for preparation by DTC before the taking of core samples at the manufacturer's factory; 4. Upon completion of the taking of core samples by DTC at the manufacturer's factory, allow a minimum of 6 more days and a maximum of 15 more days for DTC to provide the core test results; 5. Make due allowance in the programme for the aforesaid arrangement and no claim for extension of time shall be allowed; 6. Subject to CM's approval, omission of early core test may be permitted for a particular batch of precast facades in order not to affect the construction work on Site. In such case, core test shall be carried out in accordance with the procedures set out in CON1.T710 to CON1.T760 to prove the compliance of that particular batch of precast facades to compressive test on cores as stipulated in this Specification.
CON5.T222.8	STANDARD Comply with CS1:2010 in respect of the method of preparing, inspecting and testing concrete cores to determine the compressive strength except the measurement of saturated density.
CON5.T223.8	SIZE AND NUMBER OF EARLY CORE SAMPLES Testing samples: <ol style="list-style-type: none"> 1. Provide necessary facilities and attendance to the taking of 3 Nos. of core samples by the DTC from the precast facades of the same concreting day, at locations decided by the CM, for test as follows: <ol style="list-style-type: none"> a. 75 mm diameter core samples; b. For vertically casted precast facades, the length of core samples shall be at least 90 mm;

- c. For horizontally casted precast facade, the length of core samples shall be at least 90 mm plus top 50 mm or 20% of depth of concrete being cored whichever is greater.

CON5.T224.8 AGE OF EARLY CORE SAMPLES

1. Do not take cores for compressive test at ages less than 3 days;
2. Do not carry out compressive test on the core samples at ages less than 9 days.

CON5.T225.8 ASSESSING COMPRESSIVE STRENGTH OF EARLY CORES

In assessing the compressive strength of early cores, the precast facades of the same concreting day represented by the early cores are deemed to comply with this Specification if the compressive strength of the early core, when adjusted for length / diameter ratio and converted to estimated insitu cube strength in accordance with CS1:2010, is:

1. Not less than 85% of the specified grade strength for any individual results.

CON5.T226.8 NON-COMPLIANCE AND FURTHER TESTS ON COMPRESSIVE STRENGTH OF CONCRETE CORES FOR PRECAST FACADES

1. For precast facades of the same concreting day represented by the early cores that the compressive strength of the early cores comply with **CON5.T225**, their core test results are deemed to be acceptable under this Specification, and further coring test at 28 days is not necessary unless compressive strength test of concrete cube of the same batch of concrete not comply with **CON5.T212** or instructed otherwise by the CM;
2. For precast facades of the same concreting day represented by the early cores that the compressive strength of the early cores do not comply with **CON5.T225**:
 - a. if the concreting ages of the precast facades are less than 28 days, carry out further early core tests by DTC. If the result of the further early core test does not comply with **CON5.T225**, the precast facades are not allowed to be lifted into place or installed on Site, and further early core test may be carried out in accordance with this sub-clause;
 - b. if the concreting ages of the precast facades are 28 days or over, carry out further core test by DTC in accordance with **CON1.T710** to **CON1.T760**. If the result of this further core test does not comply with **CON1.T760**, the precast facades are not allowed to be lifted into place or installed on Site. All relevant concrete of precast facades represented by this further core test in the same concreting day is deemed not complying with this Specification. Investigate the extent of non-compliance and re-execute the works in accordance with **CON1.T1210** to **CON1.T1260**.
3. Make due allowance in the programme for the aforesaid arrangement and bear all time and cost for compliance with this clause.

CON5.T227.8 MAKING GOOD CORE HOLES

As **CON1.T770**.

TESTS ON COMPRESSIVE STRENGTH OF CONCRETE CORES

CON5.T230.8 GENERAL

As **CON1.T710**.

CON5.T231.8 STANDARD

As **CON1.T720**.

CON5.T232.8 SIZE AND NUMBER OF CORE SAMPLES

Testing samples:

1. Provide necessary facilities and attendance for taking 3 Nos. of 100 mm diameter core samples from the facade units for the same concreting day, at the location selected by CM;
2. Take concrete cores at the rate of three per precast facade unit so selected.

CON5.T233.8 AGE OF CORE SAMPLES

As **CON1.T740**.

CON5.T234.8 REQUIREMENT FOR FURTHER CONCRETE CORE SAMPLES

As **CON1.T750**.

CON5.T235.8 ASSESSING COMPRESSIVE STRENGTH OF CONCRETE CORES

As **CON1.T760**.

CON5.T240.8 NON-COMPLIANCE AND FURTHER TESTING

Should any core fail to meet the requirements of compressive strength of concrete cores as specified in **CON1.T760**:

1. All relevant concrete represented by the cores in the same concreting day is deemed not to comply with this Specification;
2. The CM may order further tests on cores taken from the failed precast facade units or other precast facade units cast from the same batch of concrete used for casting the failed units all at the Contractor's own expense.

CON5.T245.8 MAKE GOOD CORE HOLES

As **CON1.T770**.

CON5.T250.8 TESTING ON NON-SHRINK GROUT

As **CON4.T070**.

CON5.T260.8 TESTS ON COMPRESSIVE STRENGTH OF GROUT CUBES

As **CON4.T080**.

CON5.T280.8 COUTINHO RING TEST

Testing method:

1. The mould for this test shall be formed from steel to provide an annular specimen with an inner diameter of 115 ± 0.1 mm, an outer diameter of 175 ± 0.1 mm and a depth of 50 ± 0.1 mm;
2. The grout shall be mixed in accordance with the manufacturer's specification and placed within the mould. Materials, moulds and specimens shall be kept at a temperature of $27^{\circ}\text{C} \pm 2^{\circ}\text{C}$ and a relative humidity of $55\% \pm 5\%$;
3. After 72 hours the outer mould ring shall be removed from the hardened grout specimen and the specimen with the inner ring still in place shall be returned to the conditioning environment.
4. The grout specimen shall be examined at 7, 14, 21 and 28 days and any cracking shall be reported.

SCHMIDT HAMMER TESTS

CON5.T290.A

TESTING FREQUENCY

1. Provide all necessary facilities and attendance for carrying out of Schmidt hammer test on all precast facades by the CM or his representatives resident at manufacturer's factory when the concreting age of the precast facades is at least 3 days;
2. Subject to CM's approval, the testing frequency may be reduced when satisfactory and consistent standard is established.

LABORATORY WATERTIGHTNESS TEST

CON5.T310.8

NATURE AND PURPOSE OF TEST

Testing arrangements:

1. Prior to the Approval of the proposed jointing system, carry out the watertightness test at an Approved independent laboratory to demonstrate that the proposed jointing system within the facade unit resists water penetration as **CON5.T450**;
2. Where an insitu connection, specified in **CON5.D410** to **CON5.D440**, is designed in combination with joint sealing compound specified in **CON5.M120**, carry out the watertightness test without the joint sealing compound in place to test the watertightness of the insitu connection.

CON5.T320.8

EXEMPTION FROM TEST

Laboratory testing of the proposed jointing system is not required if satisfactory test evidence relating to a similar joint system can be furnished to the CM. Test data for such a similar jointing system made from the Works or used on other Authority contracts may be accepted for this purpose.

CON5.T330.8

TEST PROCEDURE

Arrange for testing to be carried out generally in accordance with the procedure stipulated in BS 5368:Part 2:1980 with the following modifications:

1. Test specimen prepared according to the Drawings and submitted to the Approved independent laboratory for testing;
2. The water-spraying system employed according to method No. 2 of BS 5368:Part 2:1980 but installed with additional nozzles to provide uniformity of water spray at the jointing system of the test specimen;
3. The spray set to apply water at a minimum rate of 5.0 litres/m²/min;
4. A maximum pressure difference P_{max} maintained, as stated in BS 5368:Part 2:1980 Clause 8, of 1 kPa, together with the water spray for 15 minutes.

CON5.T340.8

JOINT PERFORMANCE

Do not cast or manufacture facade units prior to the proposed jointing system performing satisfactorily in the laboratory tests.

SITE WATERTIGHTNESS TESTS

CON5.T410.8

TESTING TRIAL UNIT

Testing arrangements:

1. Carry out watertightness tests to the jointing system of the full size trial samples specified in **CON5.T110** in accordance with the procedures set out in **CON5.T430**;

2. Extend the watertightness tests to cover testing on joints of windows fixed to the full size trial sample all to the requirements specified in **COM2.T210**.

CON5.T420.A TESTING INSTALLED JOINTS

Testing samples:

1. Carry out watertightness tests in accordance with the procedures set out in **CON5.T430** to all joints of the properly installed facade units not connected monolithically to in-situ concrete at the rate of 50% of each particular type in locations as instructed by the CM or his representatives;
2. Where a jointing system is constructed in combination with joint sealing compound specified in **CON5.M120**, carry out the watertightness test prior to the application of the sealing compound to test the watertightness of the joint.

CON5.T430.8 TEST PROCEDURE

Test joints of each selected facade unit according to the procedures as follows:

1. Construct working platforms where necessary for carrying out water test safely;
2. Working from the exterior, wet the facade unit selectively, starting from the lowest horizontal joint, followed by the vertical joints and then the horizontal joint above;
3. Spray a continuous jet of water from a nozzle at a water pressure of 210 to 240 kPa at the nozzle inlet to the joint and perpendicular to the face of the facade unit. Move the nozzle slowly along the joint, at a distance of 300 mm from it, for a period of 5 minutes in every 1.5 metre of joint length while an observer carefully inspects on the interior side of the facade unit with the assistance of adequate lighting where necessary;
4. Unless otherwise Approved, use a nozzle to the requirements of the Architectural Aluminium Manufacturer's Association (AAMA) 501.2-83;
5. Repeat the process specified in sub-clause (3) above on all joints and joint intersections using increments of exposed joint length not exceeding 1.5 metres upward until all the joints are covered.

CON5.T440.8 WITNESSES TO TEST

All watertightness tests carried out on Site must be witnessed and certified both by the CM and the Contractor's representative.

CON5.T450.8 FAILURE OF UNITS

The facade units and joints are deemed to have failed if signs of water seeping through the joints or through the facade unit, including signs of damp patches, are observed during the test and within the subsequent 2 hours after the test.

CON5.T460.A REMEDIAL WORK TO UNITS FOR RE-TEST AND ADDITIONAL TESTING

Non-compliance:

1. Carry out remedial work to facade units and joints which have failed the watertightness test. Methods of carrying out the remedial work are subject to Approval;
2. After the remedial work is completed, re-test the facade units and joints in accordance with the procedures set out in **CON5.T430**;
3. Repeat sub-clauses (1) & (2) above until the facade unit and joint comply with the specified criteria of watertightness;
4. For any one facade unit fails the watertightness test, carry out additional tests as follows:

- a. Select three additional samples as instructed by the CM or his representatives for testing. Each sample shall comprise three facade units of the same type as the failed facade unit;
- b. Carry out watertightness test to the additional samples in accordance with the procedures set out in **CON5.T430**;
- c. When any facade unit fails the test, repeat sub-clauses (1) & (2) above until the facade unit and joint comply with the specified criteria of watertightness.
5. Repeat sub-clause (4) above until all testing facade units and joints have complied with specified criteria of watertightness;
6. Bear all associated costs for the re-tests and additional tests as specified in the above sub-clauses. No extension of time will be allowed.

TESTING FIXINGS

CON5.T510.8

TENSILE TESTING

Testing method:

1. When directed test fixings and anchors to BS 5080:Part 1:1993.

CON5.T520.8

SHEAR TESTING

Testing method:

1. When directed test fixings and anchors to BS 5080:Part 2:1986.

SURVEILLANCE INSPECTION

CON5.T710.A

JOINT INSPECTION AT MANUFACTURER'S FACTORY AND BREAKING UP TEST

For off-site casting:

1. Arrange transportation for and carry out joint inspections between the Contractor and the CM or his representatives at the manufacturer's factory at the notice of the CM;
2. When instructed by the CM, carry out up to 4 breaking-up tests:
 - a. Provide a sample of precast standard facade unit randomly selected by the CM or his representatives, break up the unit for inspection and remove the broken unit after inspection;
 - b. Carry out the following inspection in the presence of the CM or his representatives:
 - i. Reinforcement details including total number of bars and bar size in accordance with standard design drawings;
 - ii. Bar pattern of the reinforcement used against the Mill Certificate and the requirements of purchaser test in CS2:2012;
 - iii. The installation, markings and brand name of concealed electrical conduit, fittings and conduit accessories etc. when pre-installed electrical conduit system is installed.
3. In the event of sample failing to meet any one of the requirements in the breaking-up inspection above, take further samples according to the following formula until all samples satisfy the requirements as above:
 Nos. of further samples = $(n^2 - 2n + 3)$
 where n is equal to the total number of unsuccessful components;
4. Bear costs of all tests and no extension of time will be allowed.

LIFTING ANCHOR

CON5.T810.8

DEFINITION OF BATCH

In this Specification, a batch is defined as any quantity of lifting anchor of the same type and same working load capacity, delivered to the casting yard as one consignment and covered by the same test certificate issued by the lifting anchor manufacturer.

CON5.T820.8

TYPE AND LOAD CAPACITY

Unless otherwise specified on Drawings, lifting anchors shall be either eye anchor type or foot anchor type, and with a working load of 0.25 times the ultimate load capacity.

CON5.T830.8

RATE OF SAMPLING

1. The rate of sampling for ultimate load capacity for each batch of lifting anchor shall be a minimum of one sample, which comprises three test specimens, for every 3,000 anchors or part thereof;
2. When Instructed, provide an additional sample comprising three test specimens for testing by DTC.

CON5.T840.8

COMPLIANCE CRITERION

No test result of ultimate load capacity of individual test specimen shall be less than 4 times the working load as stipulated in **CON5.T820**.

CON5.T850.8

SUBMISSION

Prior to the production of precast concrete components, provide test certificates issued by:

1. The lifting anchor manufacturer/agent supplier; and
2. An Approved testing laboratory employed by the manufacturer of precast concrete component on the ultimate load capacity of lifting anchors for each batch under the Quality Assurance System as stipulated in **CON5.W030**.

CON6 MOVEMENT JOINTS

MATERIALS

JOINT FILLERS

CON6.M010.8 COMPRESSIBLE JOINT FILLER

Quality requirements:

1. Firm, compressible, single thickness, non-rotting proprietary type approved by the CM.

CON6.M020.8 INORGANIC COMPRESSIBLE JOINT FILLERS, BOND BREAKERS AND BACKUP MATERIALS

Quality requirements:

1. Sheet form or strip and cord sections of an Approved type.

SEALANTS

CON6.M110.8 GENERAL

Refer to Worksection WAT5 for all sealants, primers, back-up materials and bond breakers.

WATER STOPS

CON6.M210.8 WATER STOPS

Quality requirements:

1. Of an Approved type made with prefabricated angle and intersection pieces with details on the type of materials required, its intended location and purpose of use as specified in the **Project Specific Specification** and on the Drawings.

PROPRIETARY EXPANSION JOINTS

CON6.M310.8 MECHANICAL EXPANSION JOINTS

Quality requirements:

1. From an Approved manufacturer with details on the type of materials required, its intended location and purpose of use as specified in the **Project Specific Specification** and on the Drawings.

ANCILLARY MATERIALS

CON6.M410.8 ADHESIVE FOR JOINT FILLER

Quality requirements:

1. Bituminous type recommended by the joint filler manufacturer.

WORKMANSHIP

GENERAL

CON6.W010.8 JOINT CONSTRUCTION

1. Construct joints strictly in accordance with the drawings and in accordance with the relevant manufacturer's recommendations;
2. Keep edges true, free from cracks, spalling or other imperfections. Ensure that edges or joints are clean and free from dust or grease immediately before fixing fillers or applying sealants.

CON6.W020.8 APPLYING SEALANTS

Refer to the Workmanship section of Worksection WAT5 for the application of primers, back-up materials bond breakers and sealants.

MOVEMENT JOINTS

CON6.W110.8 FIXING JOINT FILLER

Fix joint filler to the concrete with bituminous adhesive before casting the adjoining bay. Form a sealing slot by casting in a removable former.

CON6.W120.8 PLACING CONCRETE

Do not place concrete on both sides of a movement joint simultaneously.

WATER STOPS

CON6.W210.8 INSTALLATION

Adequately install waterstops to ensure their correct position is maintained during concrete placement.

CON6.W220.8 JOINTING

Make all joints using hot or cold vulcanizing.

CON6.W230.8 CONCRETING

Compact concrete fully around waterstops to ensure that no voids or porous areas remain.

CON7 PRECAST CONCRETE COMPONENTS (ENGINEER'S DESIGN)

DESIGN

GENERAL

CON7.D010.A SCOPE OF THE WORK

Precast concrete components specified in this Worksection include:

1. Precast facades (including precast roof parapet);
2. Semi-precast slabs (including semi-precast roof slabs and semi-precast corridor slabs);
3. Precast balconies;
4. Precast staircases (including precast roof staircases);
5. Precast structural walls; and
6. Precast partition walls.

Refer to the Drawings for the extent of fixtures, finishing, fittings and building services installations associated with precast concrete components.

Refer to the Drawings and relevant Specification clauses for the scope of builders, structural and building services works to be prefabricated in off-site yards.

SUBMISSIONS

CON7.D110.8 LOADING OF INSITU STRUCTURAL MEMBERS

Submit calculations to demonstrate that the insitu structural members are not subject to excessive stresses arising from the erection method of the precast concrete components and to demonstrate the adequacy of any temporary supports which may be required.

PRECAST FAÇ ADE / PRECAST BALCONY - DESIGN PARAMETERS

CON7.D210.8 ERECTION RESTRAINTS

1. Design vertical and horizontal restraints for temporary connections of the precast façade / precast balcony to the main structure such that displacement of the precast façade / precast balcony unit cannot occur before making the permanent structural connection;
2. Design horizontal restraint to resist a minimum horizontal live load of ± 0.5 kN/m run acting at 1.5 m from the base of the precast façade / precast balcony unit.

CON7.D220.8 ADJUSTMENT DEVICES

1. Provide the precast façade / precast balcony units with separate vertical and horizontal adjustment devices;
2. Do not use adjustment devices in the vertical plane for horizontal location devices or horizontal restraint and do not design such devices to take any permanent shear (horizontal) loads;

-
3. Do not design any adjustment devices in the horizontal plane to take permanent vertical loads.

MATERIALS

GENERAL

CON7.M010.8

RELEVANCE OF OTHER SPECIFICATION WORKSECTIONS

1. Construct precast concrete components for Standards Domestic in accordance with this Worksection and with the relevant provisions of the following Worksections:
 - a. CON1, Insitu Concrete;
 - b. CON2, Formwork;
 - c. CON3, Reinforcement;
 - d. CON4, Precast Concrete;
 - e. COM11, Radio Frequency Identification and Web-Based Database System for Building Components.
2. Construct aluminium window or uPVC window frames in accordance with Worksections COM2 or COM3 respectively;
3. Where any ambiguity, discrepancy or conflict arises between this Worksection and any clauses in any other Worksections of this Specification, ensure that the provisions of this Worksection prevail.

PRECAST FACADE, PRECAST BALCONY, SEMI-PRECAST SLAB, PRECAST STRUCTURAL WALL AND PRECAST PARTITION WALL - CONDUIT SYSTEM

CON7.M110.8

STANDARDS

1. For rigid plain polyvinyl chloride (PVC) conduits, conduit fittings and PVC boxes, comply with the following British Standards:

Conduits and Fittings	British Standards
PVC conduits:	BS 6099:Section 2.2:1982(1988)
PVC conduits fittings:	BS 4607:Part 1:1984(1993)& BS 4607:Part 5:1982(1988)
PVC circular conduit boxes:	BS 4607:Part 5:1982(1988)
PVC boxes for electrical accessories:	BS 4662:1970(1989)

2. Ensure that all PVC conduits, fittings and boxes are of the same make.

CON7.M120.8

COLOUR

PVC conduits, fittings and boxes: white in colour.

CON7.M130.8

FLAME RESISTANCE

PVC conduits, fittings and boxes: non-flame-propagating and self-extinguishing.

CON7.M140.8

TEMPERATURE CLASSIFICATION

1. For all PVC conduits, fittings and boxes, comply with the temperature classification of -5 in accordance with BS 6099:Section 2.2:1982(1988);

2. For PVC conduits, where the ambient temperature at the country of manufacture is likely to be below -5°C, the temperature classification is -25.

PRECAST FACADE, PRECAST BALCONY, SEMI- PRECAST SLAB, PRECAST STRUCTURAL WALL AND PRECAST PARTITION WALL - RIGID PLAIN PVC CONDUITS

CON7.M210.8

CONSTRUCTION AND SIZE

1. PVC conduits: rigid, plain and of a non-threadable type;
2. Nominal diameter of PVC conduits: within the range of 20 mm to 32 mm unless otherwise specified.

CON7.M220.8

MECHANICAL PROPERTIES

PVC conduits are:

1. Of heavy mechanical strength;
2. Capable of withstanding the heavy compression and impact tests specified in BS 6099:Section 2.2:1982(1988).

CON7.M230.8

TYPE-TESTING FOR ELECTRICAL PVC CONDUITS

1. Rigid plain PVC conduits shall be type-tested for complete compliance with BS 6099:Section 2.2:1982(1988) by an Independent Accredited Laboratory or an Independent Short-Circuit Testing Organisation;
2. Upon request from CM, provide documentary evidence that the batch/consignment of PVC conduits delivered to Site have satisfied the requirement as stipulated in the relevant British Standards mentioned in sub-clause (1) above.

PRECAST FACADE, PRECAST BALCONY, SEMI- PRECAST SLAB, PRECAST STRUCTURAL WALL AND PRECAST PARTITION WALL - PVC CONDUIT FITTINGS

CON7.M310.8

CONSTRUCTION

1. Use plain, moulded slip-type couplers and expansion type couplers to BS 4607:Part 5:1982 (1988) in the jointing of conduits;
2. Use saddles and spacers in compliance with BS 4607:Part 1:1984 (1993) for fixing of conduits unless otherwise specified.

CON7.M320.8

TYPE-TESTING FOR ELECTRICAL PVC CONDUIT FITTINGS

1. PVC conduit fittings shall be type-tested for complete compliance with the following British Standards by an Independent Accredited Laboratory or an Independent Short-Circuit Testing Organisation:

PVC Conduit Fittings	British Standards
Plain moulded slip type coupler	BS 4607:Part 5:1982(1988)
Male bush and female adaptor	BS 4607:Part 1:1984(1993)

2. Upon request from CM, provide documentary evidence that the batch/consignment of PVC conduit fittings delivered to Site have satisfied the requirement as stipulated in the relevant British Standards mentioned in sub-clause (1) above.

PRECAST FACADE, PRECAST BALCONY, SEMI- PRECAST SLAB, PRECAST STRUCTURAL WALL AND PRECAST PARTITION WALL - PVC CIRCULAR CONDUIT BOXES, PVC BOXES FOR ELECTRICAL ACCESSORIES AND PVC ADAPTABLE BOXES

CON7.M410.8

CONSTRUCTION AND DIMENSIONS

1. For PVC boxes and their covers, comply with the relevant British Standard specification listed in **CON7.M110**;
2. Fit all screw holes with metal inserts. Other than for PVC adaptable boxes, provide each box with a brass earthing terminal complete with screw for the connection of circuit protective conductor (CPC);
3. Ceiling-mounted circular conduit boxes: Deep pattern type having an internal depth of not less than 60 mm. Extension rings shall comply with BS 4607:Part 5:1982 (1988);
4. Mould each PVC box in one piece;
5. For dimensions of PVC adaptable boxes, comply with BS 4568:Part 2:1970 (1988).

CON7.M420.8

MECHANICAL PROPERTIES

1. For PVC boxes, comply with the requirements for mechanical properties stated in the relevant British Standard specification listed in **CON7.M110**;
2. PVC adaptable boxes are:
 - a. Moulded;
 - b. Of sufficient mechanical strength to withstand forces encountered in concealed conduit wiring system application;
 - c. Complete with provision for prevention of deformation of the boxes where necessary.
3. Plastic boxes are of:
 - a. Dimensions: can be interchangeable with steel boxes;
 - b. Wall thickness: 2 mm minimum;
 - c. Cover sizes: larger than the adaptable box on each edge by at least 5 mm.
4. Fit boxes for the suspension of luminaires or other equipment, where considerable heat will be produced with steel insert clips;
5. Do not use plastic boxes where:
 - a. Temperature of the box is likely to exceed 60°C; or
 - b. The mass suspended from the box exceeds 3 kg.

CON7.M430.8

TYPE-TESTING FOR ELECTRICAL PVC CONDUIT BOXES

1. PVC circular conduit boxes, PVC boxes for electrical accessories and PVC adaptable boxes shall be type-tested for complete compliance with the following British Standards by an Independent Accredited Laboratory or an Independent Short-Circuit Testing Organisation:

PVC Conduit Boxes	British Standards
PVC circular conduit boxes	BS 4607:Part 5:1982(1988) with the following conditions: <ol style="list-style-type: none"> a. The marking of the PVC circular conduit boxes shall be 60/10 kg; b. The PVC circular conduit boxes shall be type-tested to 10 kg suspended load.

PVC boxes for electrical accessories	BS 4662:1970(1989)
PVC adaptable boxes	<ul style="list-style-type: none"> a. BS 4568:Part 2:1970(1988) Clause 6 Dimensions b. BS 4607:Part 5:1982(1988) Clause 7.3 Safety on impact test Clause 8 Resistance to heat Clause 9 Resistance to burning Clause 10 Insulating characteristics

2. Upon request from CM, provide documentary evidence that the batch/consignment of PVC conduit boxes delivered to Site have satisfied the requirement as stipulated in the relevant British Standards mentioned in sub-clause (1) above.

WORKMANSHIP

GENERAL

CON7.W010.8

CASTING YARD

Within one month from the notified date for commencement of the Works, submit for Approval on the following:

1. For on-Site casting:
 - a. The location of casting yard for manufacture of precast concrete components;
 - b. Details of plant and equipment including the location, boom radii and lifting capacities of cranes, gantry capacities, curing facilities, number of moulds and means of transporting the concrete components within the Site;
2. For off-Site casting:
 - a. The name, casting yard address with street maps and job reference of the manufacturer and the following:
 - i. Details of organisation structure and top management;
 - ii. Self-certified true copy of the business licence of the manufacturer;
 - iii. Annual production capacity of the casting yard in terms of concrete volume, numbers of products and the current workload;
 - iv. Details of the Quality Assurance Scheme required in **CON7.W030**;
 - v. Details of the audit plan and previous audit report, if any, carried out by the Precast Concrete Construction Audit Consultant required in **CON7.W060**;
 - vi. Details of compliance with requirements of this specification on batching plant and concrete mixes in accordance with Worksection CON1;
 - vii. Test results for quality tests being carried out for the precast concrete components to demonstrate the compliance with requirements of this specification;
 - viii. Other details of construction quality as required in **CON7.W120** (1).
 - b. Scaled and dimensioned layout plan of the casting yard with fenced boundaries showing the office, the production lines for the products including hardstanding and covered casting yards, disposition of steel moulds, vibration plant, handling and lifting plants, steam or hot air curing room / facilities, storage areas for finished products, steel reinforcement storage and bending yards, storage sheds for incoming materials, samples room, batching plant if any, testing laboratory, concrete cubes curing facilities, means of transporting the concrete components to the Site;
 - c. The laboratory for carrying out the tests and issuing test certificates shall be approved by the Housing Department, or accredited either by Hong Kong Accreditation Scheme (HKAS) under the Hong Kong Laboratory Accreditation Scheme (HOKLAS), or an equivalent organization which has signed a mutual recognition agreement with HOKLAS. All expenses / costs related to the tests carried out by the laboratory shall be borne by the Contractor.

CON7.W015.8

MANAGEMENT SCHEMES FOR OFF-SITE CASTING

1. Ensure that the casting yards for the off-Site casting of precast concrete components are operating on the following management schemes:
 - a. An Environmental Management Scheme certified under ISO 14001;

- b. An Occupational Health and Safety Management Scheme certified under OHSAS 18001.
2. Submit the original or certified true copy of the respective certificates for the manufacturing plant within the following time frame:
 - a. ISO 14001: At not later than 15 days before the commencement of the production of precast concrete components;
 - b. OHSAS 18001: At not later than 12 months from the date of commencement of the Works.
3. When the photocopy of certificate is submitted, it shall be certified by the certification body or by the QCM. The certification body shall be accredited by the Hong Kong Accreditation Service (HKAS), or the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS for the respective certification.

CON7.W020.8 QUALITY ASSURANCE FOR ON-SITE CASTING

Within two months from the notified date for the commencement of the Works, submit for Approval details of the Quality Assurance Scheme for manufacturing the precast concrete components, in accordance with **CON7.W040** to **CON7.W050** as applicable.

CON7.W030.8 QUALITY ASSURANCE FOR OFF-SITE CASTING

Ensure that casting yards for the off-Site casting of precast concrete components are operating on a Quality Assurance Scheme certified under ISO 9001 in accordance with **CON7.W040** to **CON7.W060**.

CON7.W040.8 QUALITY ASSURANCE SCHEME

1. Ensure that the precast concrete components are manufactured under a Quality Assurance Scheme which covers the following items and is certified under ISO 9001:
 - a. Quality control tests of materials, including proprietary products such as lifting anchors for handling precast concrete components;
 - b. Calibration of laboratory equipment for quality control tests;
 - c. Efficiency and proper operation of equipment at the casting yard;
 - d. Production process;
 - e. Sampling/testing procedures and requirements by an independent Approved laboratory;
 - f. Quality control procedures including the frequency and extent of inspection by manufacturer's staff and independent parties;
 - g. Regular audits at a minimum frequency of once per month by manufacturer's staff and independent parties.
2. Endorse the Quality Assurance Scheme and submit to CM for approval at least 15 days before the commencement of the production of precast concrete components.

CON7.W045.A PRECAST CONCRETE CONSTRUCTION AUDITING CONSULTANT

1. Select a consultant on the Architectural and Associated Consultants Selection Board's (AACSB) List of Structural Engineering Consultants (the "List") for CM's approval as the Precast Concrete Construction Auditing Consultant to carry out technical audits at the manufacturer's factory in accordance with the Code of Practice for Precast Concrete Construction 2016 issued by the BD;
2. A Precast Concrete Construction Auditing Consultant on the "List" in sub-clause (1) appointed by the manufacturer may be proposed for Approval;

3. Notify the CM immediately if there is any subsequent change of the Precast Concrete Construction Auditing Consultant during the course of services.

CON7.W050.8 QUALIFIED SUPERVISION

1. Assign a Precast Quality Control Manager (PQCM), with a minimum qualification and experience of a Grade T4 TCP in the civil or structural engineering discipline under the Registered Contractor's stream in the CoPSS, to certify all control documentation or test certificates required for the QA Scheme;
2. Assign a Precast Quality Control Coordinator (PQCC), with a minimum qualification and experience of a Grade T3 TCP under the Registered Contractor's stream in the CoPSS, to provide continuous supervision of the precast concrete production works at the casting yard;
3. Submit the details of the PQCM and the PQCC for Approval. For on-Site casting, it is permissible for the PQCM to be the same person as the QCM and the PQCC to be the same person as the SQCC;
4. Provide attendance to an RSE who is nominated by the CM, to carry out audit checks to the casting yard at least once every month;
5. The Authorized Signatory as stipulated in **PRE.B6.060** is to carry out inspection and audit checks to the casting yard at least once every month and submit a monthly audit report to the RSE as stipulated in sub-clause (4) above and then to the CM for endorsement and onward submission to ICU.

CON7.W055.8 INSPECTION LOG BOOK

1. Record the following in an inspection log book:
 - a. The names and qualifications of the supervisory personnel assigned by the CM and by the Contractor as stipulated in **CON7.W050**;
 - b. The details of concrete production, inspection, auditing and testing.
2. Keep the inspection log book in the casting yard and provide a duplicate of the inspection log book on Site for CM's inspection when required.

CON7.W060.A RECTIFICATION TO QUALITY NON-COMPLIANCE

1. For off-Site casting in **CON7.W010** (2), the manufacturer shall be under regular technical audits in a manner as stipulated in **CON7.W040** (1)(g) and supervision of the CM or his representatives resident at the manufacturer's factory;
2. The Contractor shall:
 - a. Ensure that the manufacturer shall rectify any non-conformance to the Specification revealed by the audit or the supervision of CM's resident representatives and if necessary, modify the QA Scheme and temporarily suspend the manufacture of the precast concrete components until the non-conformance is rectified;
 - b. Report to the CM of the non-conformance and rectification carried out.
3. Notwithstanding sub-clause (2) above, bear full responsibility to assure that all the precast concrete components delivered to Site comply with the requirements of the Specification at all times.

CON7.W070.8 DRAWINGS AND METHOD STATEMENT FOR ON-SITE CASTING

Within two months of the notified date for commencement of the Works, submit, for agreement, the following items:

1. Details of moulds, layout arrangements, casting methods (horizontal or vertical), tilting mechanism (if any), demoulding methods and the provision for attachments of openings for window fixing (if any);
2. The complete procedures for fabrication, curing, demoulding, application of finishes, lifting, transporting, storage, erection, grouting (if any);

3. Method of protecting the precast concrete components from damage at all times;
4. The proposed Radio Frequency Identification tag and the fixing method as specified in the Worksection COM11.

CON7.W080.8

PROGRAMME

Provide a programme for manufacture of the precast concrete components showing the rate of production for each month. For on site precasting, the dates for clearing the area of casting yard and associated plant upon completion of the manufacture of the precast concrete components must also be shown.

CON7.W090.8

EQUIPMENT

Ensure casting yards, erected on-Site or off-Site are equipped with all the necessary facilities, including efficient vibration plant, necessary curing facilities, storage, handling and lifting facilities to secure compliance with all the provisions of this Specification.

CON7.W100.8

USE OF CASTING YARD

Do not use any on-Site casting yard for manufacture of any components for other sites. See **PRE.B8.010**.

CON7.W110.A

SUBMISSION AND PILOT PRODUCTION RUN BEFORE APPROVAL

1. Submission:
 - a. Submit the shop drawings, for the production of the precast components for Approval, including any proposed changes to the products so as to suit individual production process / plant;
 - b. Use concrete mix for the manufacture of precast components all in accordance with the requirements in Worksection CON1;
 - c. Provide relevant information / samples associated with the proposed precast components for Approval including:
 - i. Engraved manufacturer's logo and casting date;
 - ii. Printed precast concrete components identity numbers on surface of products;
 - iii. Schmidt hammer test certificate and covermeter tests record endorsed by the manufacturer's Quality Control Personnel;
 - iv. Delivery Order / Invoice;
 - v. Import and Export Manifests or Bill of Lading.
 - d. The proposed Radio Frequency Identification tag and the fixing method as specified in the Worksection COM11.
2. Before obtaining Approval for mass production, carry out a pilot production run with the CM or his representatives on the proposed manufacturer to demonstrate the technical capability and effectiveness of the Quality Management System;
3. In the pilot production run:
 - a. Provide, for each category of products:
 - i. One sample with the reinforcement fixed in steel mould for the inspection of workmanship including reinforcement fixing and provision of bar spacers;
 - ii. One sample with concrete cast in steel mould for the inspection of conditions of the steel mould, checking of the finished sample.

- b. Carry out trial run to demonstrate the manufacturing process including installation of windows, lifting operation, curing, storage, fixing of mosaic tiles, quality tests at factory laboratory, applied finishes and quality controls in accordance with the required drawings and specification;
 - c. Carry out verification check for engraved logo, casting date, identity number, Schmidt hammer test certificate and covermeter tests record, dimensions, size, spacing, position of starter bars and finishes.
4. The pilot production run may not be required, if the following documents are submitted and are acceptable to the CM:
 - a. Track records on similar types of precast concrete components supplied by the proposed manufacturer to other HA construction projects, within five years prior to the notified date for commencement of the Works; or
 - b. In the absence of the track records, detailed records of the pilot production run for similar types of precast concrete components carried out in other HA construction projects, within five years prior to the notified date for commencement of the Works.

CON7.W120.8

FIRST JOINT INSPECTION AT MANUFACTURER'S FACTORY

1. Prior to mass production, carry out the first joint inspection between the Contractor and the CM at factory for Approval on the minimum standard of the product for all subsequent concrete and the specified finish. Arrange for the transportation and provide all facilities for the first joint inspection;
2. Provide samples, including those samples in **CON7.W110** (3)(a) and those accepted samples in previous pilot production run carried out in accordance with **CON7.W110**, for Approval as being representative of the minimum standard of the product for all subsequent concrete and the specified finish;
3. Maintain accepted sample of precast façade / precast balcony and semi-precast slab at a minimum of one number, or as directed by the CM, in an area in the factory and do not remove the accepted samples from the area unless otherwise instructed by the CM. Incorporate a further set of samples to the trial panel on Site;
4. Carry out further joint inspections as in **CON7.T510**.

PRODUCING PRECAST UNITS

CON7.W210.A

MOULDS

Construct and maintain moulds so that:

1. Dismantling and re-assembly of moulds after each casting allows the production of subsequent precast concrete components within permitted tolerance limits;
2. The positioning of securing components and fixings etc. are within the permitted tolerances;
3. Adequate stiffness for the control of dimensional tolerances is maintained.

CON7.W220.8

DEFECTIVE MOULDS

Replace any mould which fails to produce precast concrete components within the permitted tolerance limits as specified in Appendix H, the "Schedule of Tolerances".

CON7.W230.8

USE OF RELEASE AGENTS

Apply mould release agent of an Approved type, to the surfaces of moulds either by brush or by spraying before the fixing of steel reinforcement at a rate in accordance with the manufacturer's recommendations.

CON7.W240.8 CONCRETING, COMPACTION AND CURING GENERALLY

See CON1.

CON7.W250.8 EXTERNAL VIBRATORS

Obtain Approval for the use of external vibrators.

CON7.W260.8 CURING BY APPLICATION OF HEAT

Obtain Approval for heat curing by means of steam, hot air, etc. and:

1. Ensure that the total chloride content of the concrete mix for precast concrete components subject to heat curing, is less than 0.1% by weight of that of the cement;
2. Carry out a site trial to demonstrate the adequacy of the proposed method to the satisfaction of the CM.

CON7.W270.8 DEMOULDING GENERALLY

Demould by means of an Approved method and:

1. Do not use crowbars;
2. Do not subject the mould to any form of impact.

CON7.W280.8 CONCRETE STRENGTH BEFORE DEMOULDING

1. Demould the precast concrete components only after concrete has achieved the required strength;
2. To determine the concrete strength required for demoulding or handling:
 - a. Make the necessary concrete cubes in pairs from the same batch of concrete used for casting the concrete components and cure the concrete cubes under the same conditions as the concrete in the precast concrete components;
 - b. Specially identify the cubes and do not use them for normal quality control or for compliance testing;
 - c. Determine the concrete cube strength by compression test as **CON7.T110** and satisfy the CM that the concrete cubes have acquired the required strength before the demoulding or handling the precast concrete components.

CON7.W290.8 IDENTIFICATION AND RECORDS

1. Mark all precast concrete components with date of manufacture and a unique reference number;
2. Record in a master register the dates of casting, the concrete grades and the final locations of all precast concrete components;
3. Update records specified in above sub-clause (2) for all precast façade / precast balcony units to the RFID Web-Based Database System.

CON7.W300.8 REQUIREMENTS OF OTHER TRADES AND COMPONENTS

Incorporate the requirements of all trades such as blockouts, recesses, notches, embedded metal works or any other items before casting the precast concrete components units.

ACCURACY AND TOLERANCES

CON7.W410.A MANUFACTURING AND ERECTION TOLERANCES

1. Refer to:
 - a. Code of Practice for Precast Concrete Construction 2016 published by the BD;
 - b. Appendix H "Schedule of Tolerances" to this Specification.

2. Where any ambiguity, discrepancy or conflict arises between sub-clauses (1)(a) and (1)(b) above, the provisions given in Appendix H shall prevail.

CON7.W420.8 CHECKING TOLERANCES

Check the manufacturing dimensional tolerances of the precast concrete components by an Approved method for each type of components at a rate of 1 in every 10 units produced and report the result to CM within two days of checking.

CON7.W430.8 DEFECTIVE UNITS

1. Any precast concrete components that falls outside the tolerance limits is considered defective and must be replaced as Instructed. Indelible mark on rejected units for identification purposes;
2. In the event of the CM agreeing to accept any defective precast concrete components, execute all necessary remedial and modification work to the CM's satisfaction.

HANDLING, TRANSPORTATION AND STORAGE

CON7.W510.8 LIFTING FRAME

Lift precast concrete components within the casting yard by means of a purpose-made steel lifting frame designed to the Code of Practice for the Structural Use of Steel 2011 issued by the Buildings Department.

CON7.W520.8 INSPECTION

Inspect each precast concrete components before lifting to ensure that neither damage nor hazard occurs during lifting.

CON7.W530.8 LIFTING

Lift the precast concrete components only at appropriate lifting points as shown on the Drawings.

CON7.W540.8 LIFTING PLANT AND EQUIPMENT

1. Ensure plant used for lifting including cranes, hoists, lifting frames, hooks, etc possess adequate safety margins, are maintained in good working order and are regularly tested. Provide details of plant and maintenance records and current test certificates when required by the CM;
2. Maintain crane rope in a sound condition. Discard all frayed bridle ropes or slings;
3. Notwithstanding sub-clause (1) above, provide test certificates of lifting anchor to the CM in accordance with **CON7.T610** to **CON7.T650**.

CON7.W550.8 LOADING AND OFF-LOADING

Carry out lifting for loading or off-loading the precast concrete components in one movement. Lift off and re-position any precast concrete components which is not properly positioned after lifting, rather than levering it into place.

CON7.W560.8 TRANSPORT VEHICLES

Maintain lorries or trolleys used for the transportation of the precast concrete components in a good condition. Ensure trolleys are equipped with suspension systems to minimize shock loading.

ERECTING UNITS

CON7.W610.8

PROGRAMME

Provide a programme for the erection of the precast concrete components showing the rate of erection for each month. Make due allowance for all restrictions on the age of concrete in the precast concrete components for handling, storage, transportation and erection.

CON7.W620.8

SITE RECORDS

Provide, at the end of each week during erection of the precast concrete components, records in a form to be agreed with the CM, showing:

1. Dates and the locations of structural connections completed;
2. Dates of removal and locations of props and temporary supports to the precast concrete components.

CON7.W630.8

CM'S INSPECTION

Allow and facilitate inspection of the precast concrete components at any time before erection and after installation.

CON7.W640.8

QUALITY CONTROL PROCEDURES

Within three months from the notified date of commencement of Works, submit for Approval, details of erection of the precast concrete components under Approved quality control procedures covering the following:

1. Protective measures to avoid cracking and chipping;
2. Checking the accuracy of the insitu structural members receiving the precast concrete components, including location and level of all bearing surfaces, joints, bolts, horizontal and vertical restraining devices and adjustment devices. Carry out checking by means of a template or measurement frame or a similar Approved method;
3. Checking of erection tolerances.

CON7.W650.A

LIFTING UNITS INTO POSITION

1. Lift the precast concrete components by steel lifting frame complying with **CON7.W510** except otherwise stipulated in sub-clause (4) and (5) below;
2. Maintain all cables connecting the lifting frame and the lifting points of the precast concrete components in a vertical direction. Provide the cables with devices for the adjustment of their length;
3. Do not allow devices such as sockets or bolts for lifting purposes to be used for fixing the precast concrete components to the main structure;
4. Submit detailed method statement including the design, drawing and installation procedures with endorsement of the Contractor's RSE demonstrating to the satisfaction of the CM that the precast concrete component will not subject to excessive stresses arising from their proposed erection method without the steel lifting frame, exemption from using the steel lifting frame as stated in sub-clause (1) above can be allowed only for the lifting of the following precast concrete components.
 - a. Vertically lifting precast elements:
Precast façade, precast balcony, precast structural wall, precast partition wall, precast refuse chute, lost form (semi-precast wall), precast roof parapet and precast A/C hood with the maximum horizontal dimension less than or equal to 1.8m;
 - b. Horizontally lifting precast elements:

Full precast slab, semi-precast slab, precast staircase and precast tie beam with the maximum horizontal dimension less than or equal to 6m.

5. In connection with sub-clause (4) above, address the safety use of the proposed lifting anchor system, including but not limited to the proprietary anchor bolt with clutch. The proposed lifting anchor system shall be flexible enough to allow for both vertical and slant lifting sling.

CON7.W660.8 UNITS DAMAGED ON TRANSPORTATION, LIFTING OR ERECTION

Replace any precast concrete components which has been damaged on transportation, lifting or erection.

TRIAL UNIT

CON7.W710.8 GENERAL

Prior to mass production of the precast concrete component units:

1. Produce a full size trial sample for the precast façade / precast balcony unit and semi-precast slabs (if any) complete with joints, windows and glazing and the electrical conduit system installation and all finishing;
2. Maintain the Approved sample units as the yardstick for the standard and quality necessary for all precast concrete components;
3. When construction of a trial panel is required in **CON2.W720**, structurally connect the trial sample to surrounding structural frames and with interfacing services as detailed on the Drawings.

TRIAL ASSEMBLY

CON7.W750.X DELETE

PRODUCING PRECAST FAÇ ADE / PRECAST BALCONY UNITS

CON7.W810.8 SCOPE OF WORK

For off-Site casting, coordinate with the precast concrete components supplier and include the following provisions with the precast facades and / or precast balconies delivered to Site.

1. Aluminium windows or uPVC windows obtained from a supplier approved by the CM in accordance with **COM2.M005** or **COM3.M010** respectively;
2. Pre-formed holes for the installation of drainage pipes;
3. Earthing lugs as shown on the Drawings;
4. Concealed electrical PVC conduit system installations as shown on the Drawings and as specified;
5. A certificate indicating the date of casting;
6. Work completion certificate for pre-installed electrical conduit system installation;
7. Embed Radio Frequency Identification tag as specified.

CON7.W820.8 MOULDS

Construct moulds from steel or other materials to produce a standard in accordance with the 'Surface finishes' specified in **CON7.W850** to **CON7.W900**. Replace any mould which fails to comply with the standard.

CON7.W830.8	<p>HORIZONTAL CASTING</p> <p>Provide moulds designed to facilitate horizontal casting with devices to enable rotation from horizontal to vertical through 90° so that the precast façade / precast balcony units can be lifted vertically on demoulding.</p>
CON7.W840.8	<p>WINDOWS FIXING TO PRECAST FAÇADE / PRECAST BALCONY UNITS</p> <p>Fix window frames / windows complete with or without opening sashes before casting the precast facade / precast balcony units as specified in COM2 Worksection and:</p> <ol style="list-style-type: none"> 1. Obtain Approval for the method of fixing window frames / windows; 2. Do not fix window frames / windows into preformed openings after casting.
CON7.W850.8	<p>SURFACE FINISHES TO EXTERNAL FACE</p> <p>Finish outside faces except edges and overhang soffits to give an even textured surface suitable for fixing glazed ceramic tiles by adhesive, or cast the tiles into the mould.</p>
CON7.W860.8	<p>SURFACE FINISHES TO EDGES AND OVERHANG SOFFIT</p> <p>Finish top, edge and soffit of overhang to give a smooth untextured surface suitable for applying acrylic paint.</p>
CON7.W870.8	<p>SURFACE FINISHES TO LIVING / DINING / BEDROOMS</p> <p>Finish to give:</p> <ol style="list-style-type: none"> 1. A smooth untextured surface suitable for applying plastic emulsion paint for rental blocks; 2. An even textured surface suitable for receiving internal cement lime plaster for SSF blocks as required by the Contract.
CON7.W880.8	<p>SURFACE FINISHES TO BATHROOM</p> <p>Finish to give an even textured surface suitable for fixing tiles by method as shown or specified on the Drawings.</p>
CON7.W890.8	<p>SURFACE FINISHES TO KITCHEN</p> <p>Finish to give an even textured surface suitable for fixing tiles by method as shown or specified on the Drawings.</p>
CON7.W900.8	<p>SURFACE FINISHES TO UTILITY AREA</p> <p>Finish to give an even textured surface suitable for fixing glass mosaic tiles by adhesive.</p>
CON7.W910.8	<p>STORING UNITS</p> <ol style="list-style-type: none"> 1. Store the precast facade / precast balcony units in the vertical plane on a level, well drained and maintained concrete surface and protect against staining or physical damage; 2. Support the precast facade / precast balcony units by an Approved method to prevent their warping, bowing, chipping or cracking; 3. Store different types of precast facade / precast balcony units components separately; 4. The precast facade / precast balcony units shall be supported by a device in storage area to prevent toppling. For off-site casting yards, racks shall be used and detailed in the submitted QA scheme.
CON7.W920.8	<p>TRANSPORTING FROM CASTING YARD</p> <p>Stack precast facade / precast balcony units vertically, on vehicles during transportation from the casting yard and:</p> <ol style="list-style-type: none"> 1. Support the precast facade / precast balcony units on special cradles so that the units are completely protected against damage and adverse stresses;

2. Provide the details of the support and the support locations to the CM for comment.

CON7.W930.8 PROTECTIVE MEASURE FOR ERECTING UNITS

Provide protective measures to avoid cracking and chipping of the precast facade / precast balcony units and damage to the applied finishes and to the built-in items such as window frames.

CON7.W940.8 TEMPORARY SUPPORT

1. During fixing of the precast facade / precast balcony units, prop adjacent insitu structural members adequately to avoid excessive deflection or adverse stresses;
2. Maintain all temporary supports, props and restraints in position during casting of concrete in the structural joint. Remove temporary supports, props and restraints upon satisfactory testing and calculation to Approval;
3. Unless specifically designed for, do not allow temporary support to be derived from the precast facade / precast balcony units fixed at lower floors;
4. For off-Site casting, coordinate with the supplier regarding the details of all temporary supports, props and inserts to suit the proposed lifting and installation method.

CON7.W950.8 APPROVAL FOR PERMANENT FIXING

Do not carry out permanent jointing or connection between any precast facade / precast balcony unit and another, or to any part of the insitu structure, without prior Approval.

CON7.W960.8 CONDUIT INSTALLATION

Supply and install conceal rigid plain PVC conduit system complete with steel draw wires for precast facade and / or precast balcony as indicated on the Drawings.

CON7.W970.8 SHOP DRAWINGS OF CONDUITS

Prepare shop drawings, coordinate and agree with the Nominated Sub-contractor for electrical installation and Supplier for precast facade and / or precast balcony before submitting shop drawings for Approval.

CON7.W980.8 SUBMISSION AND APPROVAL OF CONDUITS

Submit for Approval technical details, samples and type-tested certificates for the conduit system as specified in clauses [CON7.M230](#), [CON7.M320](#) and [CON7.M430](#).

CON7.W990.8 CONDUIT BENDS

Internal radius: at least 4 times the outside diameter of the conduit.

CON7.W1000.8 BENDING, JOINTING AND TERMINATING OF CONDUITS

Follow conduit manufacturers' recommendation for:

1. Method of carrying out the conduit bends and conduit joints;
2. Method of fixing conduits to boxes without spouts;
3. Use of tools and materials.

CON7.W1010.8 COMPLETION CERTIFICATION FOR ELECTRICAL CONDUIT SYSTEM INSTALLATION

1. All conduits and accessories installed have to be certified by at least Grade A2 of Registered Electrical Workers (REW);

2. When delivered to Site, the precast concrete components must be accompanied with a Work Completion Certificate Form WR1(A) specified by Electrical and Mechanical Services Department which shall be duly signed by a Registered Electrical Contractor and a REW certifying that the pre-installed conduit system installation is in full compliance with the Specification and the Code of Practice for the Electricity (Wiring) Regulations;
3. A single certificate can be issued for delivered lots of precast concrete components which are produced in each production lot. The certificate shall also carry information e.g. reference number etc. for traceability purpose;
4. Provide CM and the Nominated Sub-contractor for Electrical Installation each a copy of the Work Completion Certificate for record.

PRODUCING AND ERECTING SEMI-PRECAST SLAB

CON7.W1105.8

ERECTION OF SEMI-PRECAST SLAB

1. For erection of semi-precast slab, refer to the drawings detailed in **Project Specific Specification**, which are provided for reference only;
2. Submit design calculations and detail drawings of the shoring layouts and details for CM's approval at least 4 weeks before commencement of constructing the erection support.

PRODUCING AND ERECTING SEMI-PRECAST SLAB

CON7.W1110.A

STORING AND TRANSPORTING

1. Unless otherwise Approved, the semi-precast slabs must be stacked and separated by 75 mm x 75 mm timber joints to the full length of the elements symmetrically placed next to the lifting hook and vertically aligned;
2. Provide details of the support and the support locations to the CM for comment;
3. Ensure that stacking of semi-precast slab does not generate unintended bearing, compressive, tensile or flexural stresses on the prefabricated reinforcement and conduit system.

CON7.W1120.A

CLEANSING AND CRACK INSPECTION BEFORE INSITU CONCRETE TOPPING

1. Remove all laitance, loose materials, dirt and grease from the top surface of the semi-precast slab to the satisfaction of the CM before applying insitu concrete topping:
 - a. Use water jet with a minimum pressure of 10,000 kPa (100 bar) for cleansing;
 - b. Maintain the cleansing as specified in sub-clause (a) above for a minimum period of 4 minutes per flat of about 30 m² and adjust the operation duration for different flat size.
2. After water-jet cleansing in sub-clause (1) above, check for cracks at the underside of semi-precast slab:
 - a. Through cracks are deemed to exist if signs of water seepage or damp patches are observed at the bottom of semi-precast slab;
 - b. Carry out crack remedial work under **CON1.W1980** before applying insitu concrete topping to the semi-precast slabs.

CON7.W1130.N

CONDUIT INSTALLATION

Supply and install concealed rigid plain PVC conduit system completed with draw wires for semi-precast slab as shown on Drawings.

CON7.W1140.N SHOP DRAWINGS OF CONDUITS

Submit to the CM for approval within two months prior to production, 5 sets shop drawings of conduits mounted on semi-precast slab, which have been coordinated and agreed with all relevant building services Nominated Sub-contractors and suppliers.

CON7.W1150.N SUBMISSION AND APPROVAL OF CONDUITS

Submit for approval technical details, samples and type-tested certificates for the conduit system as specified in clauses **CON7.M230**, **CON7.M320** and **CON7.M430**.

CON7.W1160.N CONDUIT BENDS

Internal radius: at least 4 times the outside diameter of the conduit.

CON7.W1170.N BENDING, JOINTING AND TERMINATING OF CONDUITS

Follow conduit manufacturers' recommendation for:

1. Method of carrying out the conduit bends and conduit joints;
2. Method of fixing conduits to boxes without spouts;
3. Use of tools and materials.

CON7.W1180.N COMPLETION CERTIFICATION FOR ELECTRICAL CONDUIT SYSTEM INSTALLATION

1. All conduits and accessories installed have to be certified by Registered Electrical Workers (REW) of Grade A2 or above;
2. When delivered to Site, the precast concrete components shall be accompanied with a Work Completion Certificate Form WR1(A) specified by Electrical and Mechanical Services Department which shall be duly signed by a Registered Electrical Contractor and a REW certifying that the conduit system installation is in full compliance with the Specification and the Code of Practice for the Electricity (Wiring) Regulations;
3. A single or multiple certificates shall be issued for delivered lots of precast concrete components which are produced in each production lot. The certificate shall also carry information, e.g. reference number, etc., for traceability purpose;
4. Provide the CM and the Nominated Sub-contractor for Electrical Installation each a copy of the Work Completion Certificate for record.

ERECTING PRECAST STAIRS

CON7.W1210.8 DOWEL FIXING

Locate box cutouts of precast stairs over cast-in dowel bars and fill with non-shrink grout.

CON7.W1220.8 BEDDING AND JOINTING

Bed and joint precast stairs in non-shrink grout or cement mortar where shown on Drawings.

PRODUCING AND ERECTING PRECAST STRUCTURAL WALL / PRECAST PARTITION WALL

CON7.W1310.A STORING AND TRANSPORTING

Unless otherwise Approved, the precast structural walls / precast partition walls must be stacked and separated by 75 mm x 75 mm timber joints to the full length of the elements symmetrically placed next to the lifting hook and vertically aligned.

CON7.W1320.A	<p>CLEANSING AND INSPECTION OF JOINTS BEFORE POURING SLAB CONCRETE</p> <ol style="list-style-type: none"> 1. Before fixing the concealed conduits and void formers, remove all laitance, loose materials, dirt and grease from the top of the precast structural walls / precast partition walls by using high pressure waterjet with minimum pressure of 10,000 Kpa (100 bar) to the satisfaction of the CM; 2. Allow and facilitate inspection of joints by the CM before applying insitu concrete topping to the semi-precast slabs.
CON7.W1330.A	<p>TEMPORARY SUPPORT</p> <ol style="list-style-type: none"> 1. During fixing the precast structural walls / precast partition walls, prop adjacent insitu structural members adequately to avoid excessive deflection or adverse stresses; 2. Maintain all temporary supports, props and restraints in position during applying insitu concrete topping to the semi-precast slabs. Remove temporary supports, props and restraints upon satisfactory testing and calculation to Approval; 3. Do not use precast partition walls as temporary or permanent supports for other structural and non-structural members; 4. For off site casting, coordinate with the supplier regarding the details of all temporary supports, props and inserts to suit the proposed lifting and installation method.
CON7.W1340.A	<p>PROTECTIVE MEASURE FOR ERECTING UNITS</p> <p>Provide protective measures to avoid cracking and chipping of the precast structural walls / precast partition walls and damage to the applied finishes and to the built-in items such as fabricated U-channels and embedded steel plates.</p>
CON7.W1350.A	<p>BEDDING AND JOINTING</p> <p>Locate embedded steel plates of precast structural walls / precast partition walls over cast-in locking steel plates. Bed and joint precast structural walls / precast partition walls in non-shrink cement mortar where shown on Drawings.</p>
CON7.W1360.A	<p>APPROVAL FOR PERMANENT FIXING</p> <p>Do not carry out permanent jointing or connection between any precast structural walls / precast partition walls and another, or to any part of the insitu structure, without prior Approval.</p>
CON7.W1370.A	<p>CONDUIT INSTALLATION</p> <p>Supply and install concealed rigid plain PVC conduit system completed with draw wires for precast structural walls / precast partition walls / precast lift shafts / volumetric precast concrete components etc. as shown on Drawings.</p>
CON7.W1380.A	<p>SHOP DRAWINGS OF CONDUITS</p> <p>Submit to the CM for approval within two months prior to production, 5 sets shop drawings of conduits mounted on precast structural walls / precast partition walls, which have been coordinated and agreed with all relevant building services Nominated Sub-contractors and suppliers.</p>
CON7.W1390.8	<p>SUBMISSION AND APPROVAL OF CONDUITS</p> <p>Submit for approval technical details, samples and type-tested certificates for the conduit system as specified in clauses CON7.M230, CON7.M320 and CON7.M430.</p>
CON7.W1400.8	<p>CONDUIT BENDS</p> <p>Internal radius: at least 4 times the outside diameter of the conduit.</p>

CON7.W1410.8 BENDING, JOINTING AND TERMINATING OF CONDUITS

Follow conduit manufacturers' recommendation for:

1. Method of carrying out the conduit bends and conduit joints;
2. Method of fixing conduits to boxes without spouts;
3. Use of tools and materials.

CON7.W1420.8 COMPLETION CERTIFICATION FOR ELECTRICAL CONDUIT SYSTEM INSTALLATION

1. All conduits and accessories installed have to be certified by at least Grade A2 of Registered Electrical Workers (REW);
2. Where delivered to Site, the precast concrete components must be accompanied with a Work Completion Certificate Form WR1(A) specified by Electrical and Mechanical Services Department which shall be duly signed by a Registered Electrical Contractor and a REW certifying that the conduit system installation is in full compliance with the Specification and the Code of Practice for the Electricity (Wiring) Regulations;
3. A single certificate can be issued for delivered lots of precast concrete components which are produced in each production lot. The certificate shall also carry information e.g. reference number etc. for traceability purpose;
4. Provide CM and the Nominated Sub-contractor for Electrical Installation each a copy of the Work Completion Certificate for record.

TESTING

SAMPLING AND TESTING GENERALLY

CON7.T010.8

RECORDS

1. Keep a complete record of all sampling and testing, in a form agreed with the CM;
2. Submit test reports and certificates to the CM within 14 days from the date of test.

CON7.T020.A

WITNESSING SAMPLING AND TESTING BY THE CM

The CM will witness any sampling and testing carried out under the Quality Assurance Scheme:

1. Make the records of sampling and testing available for inspection by the CM or his representatives resident at manufacturer's factory;
2. The CM or his representatives resident at manufacturer's factory is entitled to reject individual precast concrete components represented by any failed test result on the precast concrete component.

CON7.T030.A

TESTS AT MANUFACTURER'S FACTORY

Provide samples, all necessary facilities and attendance to the DTC or the CM or his representatives resident at manufacturer's factory to carry out the following tests:

1. Schmidt hammer tests and covermeter tests on the construction quality of precast concrete components;
2. Tests on concrete constituent materials, tests on compressive strength of concrete cubes and concrete cores, tests on reinforcement bars and tests on fabric reinforcement by the DTC and / or HDMTL.

CON7.T040.A

INSTALLATION OF RFID TAG IN CONCRETE CUBE FOR CUBE COMPRESSION TEST TO BE CARRIED OUT BY DTC OR HDMTL

1. Install a Radio Frequency Identification (RFID) tag as detailed on Sketch no. RFID/TAG/SK-01 onto the trowelled surface of each of the concrete cubes immediately after preparation of cubes at the manufacturer's factory under the witness of the CM or his representatives resident at manufacturer's factory unless otherwise instructed by the CM;
2. The RFID tags are to be provided by DTC or the CM or his representatives resident at manufacturer's factory in batches;
3. Validate and scan the RFID tag with the Bluetooth RFID reader provided by DTC or the CM or his representatives resident at manufacturer's factory before use, and ensure that information such as tag unique identification (UID), electronic product code (EPC) number and timestamp have been uploaded to the PC provided by the DTC or the CM or his representatives resident at manufacturer's factory and incorporated into the DTC's database system (through 3G or above internet service);
4. Input the mould number and / or sampling certificate number against the concerned tag EPC number through the DTC's database system;
5. Before the tagged cubes are sent from the manufacturer's factory to HDMTL or are collected by the DTC, scan the tag again using the Bluetooth RFID reader and ensure that information such as tag UID, EPC number and timestamp have been uploaded to the PC and incorporated into the DTC's database system (through 3G or above internet service);

6. Deliver the tagged cubes to HDMTL or arrange the tagged cubes to be collected by the DTC with due care at a time such that a minimum of 4 days is allowed for curing the cubes in DTC or HDMTL before testing on compressive strength at 28 days by DTC or HDMTL;
7. In case any damaged RFID tags are discovered, report to the CM or his representatives resident at manufacturer's factory immediately without any delay;
8. Maintain an inventory record of all RFID tags including those damaged and submit the inventory record to the CM or his representatives resident at manufacturer's factory for endorsement.

COMPRESSIVE TEST ON CONCRETE CUBES

CON7.T110.8

GENERAL

Testing arrangements:

1. Carry out tests on workability, make and cure concrete cubes made from the concrete used for casting the precast concrete components, by the Contractor / manufacturer for precast concrete components;

2. All details, including sampling frequency, of the concrete cubes tests must be in accordance with Worksection CON1;
3. The tests on compressive strength of concrete cubes shall be carried out by the DTC and / or HDMTL.

TESTS ON COMPRESSIVE STRENGTH OF EARLY CORES FOR PRECAST CONCRETE COMPONENTS EXCEPT SEMI-PRECAST SLAB AND PRECAST PARTITION WALL

CON7.T121.A

GENERAL

1. Provide all necessary facilities and attendance for carrying out coring and testing of concrete cores by DTC, including the provision of a secure and lockable storage for DTC to store the coring machine and other associated equipment;
2. Tests are to be witnessed and endorsed by the Contractor's representative and the CM or his representatives resident at manufacturer's factory;
3. Allow 2-day advance notice for preparation by DTC before the taking of core samples at the manufacturer's factory;
4. Upon completion of the taking of core samples by DTC at the manufacturer's factory, allow a minimum of 6 more days and a maximum of 15 more days for DTC to provide the core test results;
5. Make due allowance in the programme for the aforesaid arrangement and no claim for extension of time shall be allowed;
6. Subject to CM's approval, omission of early core test may be permitted for a particular batch of precast concrete components in order not to affect the construction work on Site. In such case, core test shall be carried out in accordance with the procedures set out in **CON1.T710** to **CON1.T760** to prove the compliance of that particular batch of precast concrete components to compressive test on cores as stipulated in this Specification.

CON7.T122.8

STANDARD

Comply with CS1:2010 in respect of the method of preparing, inspecting and testing concrete cores to determine the compressive strength except the measurement of saturated density.

CON7.T123.A

SIZE AND NUMBER OF EARLY CORE SAMPLES

Testing samples:

1. Provide necessary facilities and attendance to the taking of 3 Nos. of core samples by the DTC from each of the following precast concrete components for the same concreting day, at locations selected by the CM:
 - a. Precast facades (including precast roof parapet);
 - b. Precast balconies;
 - c. Precast staircases (including precast roof staircases);
 - d. Precast structural walls;
 - e. Other precast elements as directed by the CM.
2. Size of core samples:
 - a. 75 mm diameter core samples for precast concrete components;
 - b. For vertically casted precast concrete components, the length of core samples shall be at least 90 mm;

- c. For horizontally casted precast concrete components, the length of core samples shall be at least 90 mm plus top 50 mm or 20% of depth of concrete being cored whichever is greater.

CON7.T124.8 AGE OF EARLY CORE SAMPLES

1. Do not take cores for compressive test at ages less than 3 days;
2. Do not carry out compressive test on the core samples at ages less than 9 days.

CON7.T125.8 ASSESSING COMPRESSIVE STRENGTH OF EARLY CORES

In assessing the compressive strength of early cores, the precast concrete components of the same concreting day represented by the early cores are deemed to comply with this Specification if the compressive strength of the early core, when adjusted for length / diameter ratio and converted to estimated insitu cube strength in accordance with CS1:2010, is :

1. Not less than 85% of the specified grade strength for any individual results.

CON7.T126.8 NON-COMPLIANCE AND FURTHER TESTS ON COMPRESSIVE STRENGTH OF CONCRETE CORES FOR PRECAST CONCRETE COMPONENTS

1. For precast concrete components of the same concreting day represented by the early cores that the compressive strength of the early cores comply with **CON7.T125**, their core test results are deemed to be acceptable under this Specification, and further coring test at 28 days is not necessary unless compressive strength test of concrete cube of the same batch of concrete not comply with **CON7.T054** or instructed otherwise by the CM;
2. For precast concrete components of the same concreting day represented by the early cores that the compressive strength of the early cores do not comply with **CON7.T125**:
 - a. if the concreting ages of the precast concrete components are less than 28 days, carry out further early core tests by DTC. If the result of the further early core test does not comply with **CON7.T125**, the precast concrete components are not allowed to be lifted into place or installed on Site, and further early core test may be carried out in accordance with this sub-clause;
 - b. if the concreting ages of the precast concrete components are 28 days or over, carry out further core test by DTC in accordance with **CON1.T710** to **CON1.T760**. If the result of this further core test does not comply with **CON1.T760**, the precast concrete components are not allowed to be lifted into place or installed on Site. All relevant concrete of precast concrete components represented by this further core test in the same concreting day is deemed not complying with this Specification. Investigate the extent of non-compliance and re-execute the works in accordance with **CON1.T1210** to **CON1.T1260**.
3. Make due allowance in the programme for the aforesaid arrangement and bear all time and cost for compliance with this clause.

CON7.T127.8 MAKING GOOD CORE HOLES

As **CON1.T770**.

TESTS ON COMPRESSIVE STRENGTH OF CONCRETE CORES EXCEPT PRECAST PARTITION WALL

CON7.T128.8 GENERAL

As **CON1.T710**.

CON7.T129.8 STANDARD

As **CON1.T720.**

CON7.T130.B SIZE AND NUMBER OF CORE SAMPLES

1. Testing samples:
 - a. Provide necessary facilities and attendance for taking 3 Nos. 100 mm diameter cores by DTC from each of the following precast concrete components for the same concreting day, at the location selected by the CM:
 - i. Precast facades (including precast roof parapets);
 - ii. Semi-precast slabs with insitu concrete topping;
 - iii. Precast balconies;
 - iv. Precast staircases (including precast roof staircases);
 - v. Volumetric precast bathroom (VPB) and / or Combined VPB components;
 - vi. Volumetric precast kitchen (VPK) and / or Combined VPK and / or Combined VPB and VPK components;
 - vii. Volumetric precast lift shafts;
 - viii. Other precast elements as directed by the CM.
 - b. Provide necessary facilities and attendance for taking 3 Nos. 75 mm diameter cores by DTC from the precast structural walls for the same concreting day, at the location selected by the CM.

CON7.T135.8 AGE OF CORE SAMPLES

As **CON1.T740.**

CON7.T136.8 NON-COMPLIANCE AND FURTHER TESTS ON COMPRESSIVE STRENGTH OF CONCRETE CORES FOR SEMI-PRECAST SLAB

1. In the event that any of the core samples taken from the semi-precast slab with the insitu concrete topping debonds at the location between the semi-precast slab and insitu concrete topping, the core is deemed to be unacceptable for compression test. Take core from another slab that its insitu topping was cast on the same concreting day as the semi-precast slab with debonded core sample for compression test;
2. For the semi-precast slab panel with debonded core sample, the slab panel is deemed to be unacceptable. In addition, to confirm that debonding will not occur in other semi-precast slab panel of the same concreting day when insitu topping was cast, take further cores according to the following formula:
 Nos. of further cores = $(n^2 - 2n + 3)$.
 Where n is equal to the total number of unsuccessful cores, progressively until all cores are satisfactory (i.e. no debonding occurs). All semi-precast slab panels at which the cores had deboned shall be demolished and recast to the satisfaction of the CM all at contractor's own expense.

CON7.T140.8 CORE TESTING FOR SEMI-PRECAST SLAB

In respect of semi-precast slab, the concrete represented by the cores is to include:

1. The insitu concrete for the same concreting day;
2. The precast concrete slabs manufactured in the casting yard within the same casting day.

CON7.T150.8 REQUIREMENT FOR FURTHER CORE SAMPLES

As **CON1.T750.**

CON7.T160.8 ASSESSING COMPRESSIVE STRENGTH OF CONCRETE CORES
As **CON1.T760.**

CON7.T180.8 MAKE GOOD OF CORE HOLES

SCHMIDT HAMMER TESTS

CON7.T205.A TESTING FREQUENCY

1. Provide all necessary facilities and attendance for carrying out of Schmidt hammer test on all structural element(s) of precast concrete components by the CM or his representatives resident at manufacturer's factory when the concreting age of the precast concrete components is at least 3 days;
2. Subject to CM's approval, the testing frequency may be reduced when satisfactory and consistent standard is established.

SITE WATERTIGHTNESS TESTS TO PRECAST FAÇ ADE / PRECAST BALCONY

CON7.T210.8 TESTING TRIAL UNIT

Testing arrangements:

1. Carry out watertightness tests to the jointing system of the full size trial samples specified in **CON7.W710** in accordance with the procedures set out in **CON7.T230**;
2. Extend the watertightness tests to cover testing on joints of windows fixed to the full size trial sample all to the requirements specified in **COM2.T210**.

CON7.T220.A TESTING INSTALLED JOINTS

Testing samples:

1. Carry out watertightness tests in accordance with the procedures set out in **CON7.T230** to all joints of the properly installed precast facade / precast balcony units not connected monolithically to in-situ concrete at the rate of 50% of each particular type in locations as instructed by the CM or his representatives.

CON7.T230.8 TEST PROCEDURE

Test joints of each selected precast facade / precast balcony unit according to the procedures as follows:

1. Construct working platforms where necessary for carrying out water test safely;
2. Working from the exterior, wet the precast facade / precast balcony unit selectively, starting from the lowest horizontal joint, followed by the vertical joints and then the horizontal joint above;

3. Spray a continuous jet of water from a nozzle at a water pressure of 210 to 240 kPa at the nozzle inlet to the joint and perpendicular to the face of the precast facade / precast balcony unit. Move the nozzle slowly along the joint, at a distance of 300 mm from it, for a period of 5 minutes in every 1.5 metre of joint length while an observer carefully inspects on the interior side of the precast facade / precast balcony unit with the assistance of adequate lighting where necessary;
4. Unless otherwise Approved, use a nozzle to the requirements of the Architectural Aluminium Manufacturer's Association (AAMA) 501.2-83;
5. Repeat the process specified in sub-clause (3) above on all joints and joint intersections using increments of exposed joint length not exceeding 1.5 metres upward until all the joints are covered.

CON7.T240.8 WITNESSES TO TEST

All watertightness tests carried out on Site must be witnessed and certified both by the CM and the Contractor's representative.

CON7.T250.8 FAILURE OF UNITS

The precast facade / precast balcony units and joints are deemed to have failed if signs of water seeping through the joints or through the precast facade / precast balcony unit, including signs of damp patches, are observed during the test and within the subsequent 2 hours after the test.

CON7.T260.A REMEDIAL WORK TO UNITS FOR RE-TEST AND ADDITIONAL TESTING

Non-compliance:

1. Carry out remedial work to precast facade / precast balcony units and joints which have failed the watertightness test. Methods of carrying out the remedial work are subject to Approval;
2. After the remedial work is completed, re-test the precast facade / precast balcony units and joints in accordance with the procedures set out in **CON7.T230**;
3. Repeat sub-clauses (1) & (2) above until the precast facade / precast balcony unit and joint comply with the specified criteria of watertightness;
4. For any one precast facade / precast balcony unit fails the watertightness test, carry out additional tests as follows:
 - a. Select three additional samples as instructed by the CM or his representatives for testing. Each sample shall comprise three precast facade / precast balcony units of the same type as the failed precast facade / precast balcony unit;
 - b. Carry out watertightness test to the additional samples in accordance with the procedures set out in **CON7.T230**;
 - c. When any precast facade / precast balcony unit fails the test, repeat sub-clauses (1) & (2) above until the precast facade / precast balcony unit and joint comply with the specified criteria of watertightness.
5. Repeat sub-clause (4) above until all testing precast facade / precast balcony units and joints have complied with specified criteria of watertightness;
6. Bear all associated costs for the re-tests and additional tests as specified in the above sub-clauses. No extension of time will be allowed.

CORE TEST AND CRACK INSPECTION FOR SEMI-PRECAST SLAB

CON7.T410.8 CORE TEST IN SAMPLE FLAT UNIT

1. Testing samples:

The CM may select 3 Nos. of samples of standard cores through the roof slab at Trial Panels in **CON7.W710** to determine the cleansing standard of semi-precast slab.

2. Non-compliance:

If debonding is observed at the interface between the semi-precast slab and topping concrete, the cleansing standard under **CON7.W1120** should be reviewed and the roof slab at Trial Panels recast for further core testing to the satisfaction of the CM.

SURVEILLANCE INSPECTION

CON7.T510.A

JOINT INSPECTION AT MANUFACTURER'S FACTORY AND BREAKING UP TEST

For off-site casting:

1. Arrange transportation for and carry out joint inspections between the Contractor and the CM or his representatives at the manufacturer's factory at the notice of the CM;
2. When instructed by the CM, carry out up to 4 breaking-up tests:
 - a. Provide samples of precast concrete component randomly selected by the CM or his representatives, break up the component for inspection and remove the broken component after inspection;
 - b. Carry out the following inspection in the presence of the CM or his representatives:
 - i. Reinforcement details including total number of bars and bar size in accordance with standard design drawings;
 - ii. Bar pattern of the reinforcement used against the Mill Certificate and the requirements of purchaser test in CS2:1995;
 - iii. The installation, markings and brand name of concealed electrical conduits, fittings and conduit accessories etc. when pre-installed electrical conduit system is installed.
3. In the event of samples of a type of components failing to meet any one of the requirements in the breaking-up inspection above, take further precast concrete components of that particular type according to the following formula until all precast concrete components satisfy the requirements as above:
 Nos. of further samples = $(n^2 - 2n + 3)$
 where n is equal to the total number of unsuccessful components;
4. Bear all costs of any further breaking-up inspections that are instructed by the CM and no extension of time will be allowed.

LIFTING ANCHOR

CON7.T610.8

DEFINITION OF BATCH

In this Specification, a batch is defined as any quantity of lifting anchor of the same type and same working load capacity, delivered to the casting yard as one consignment and covered by the same test certificate issued by the lifting anchor manufacturer.

CON7.T620.8

TYPE AND LOAD CAPACITY

Unless otherwise specified on Drawings, lifting anchors shall be either eye anchor type or foot anchor type, and with a working load of 0.25 times the ultimate load capacity.

CON7.T630.8 RATE OF SAMPLING

1. The rate of sampling for ultimate load capacity for each batch of lifting anchor shall be a minimum of one sample, which comprises three test specimens, for every 3,000 anchors or part thereof;
2. When Instructed, provide an additional sample comprising three test specimens for testing by DTC.

CON7.T640.8 COMPLIANCE CRITERION

No test result of ultimate load capacity of individual test specimen shall be less than 4 times the working load as stipulated in **CON7.T620**.

CON7.T650.8 SUBMISSION

Prior to the production of precast concrete components, provide test certificates issued by:

1. The lifting anchor manufacturer/agent supplier; and
2. An Approved testing laboratory employed by the manufacturer of precast concrete component on the ultimate load capacity of lifting anchors for each batch under the Quality Assurance System as stipulated in **CON7.W040**.

CON8 VOLUMETRIC PRECAST CONCRETE COMPONENTS FOR DOMESTIC BLOCKS

DESIGN

GENERAL

- CON8.D010.A DEFINITION OF VOLUMETRIC PRECAST CONCRETE CONSTRUCTION**
- Construction of three-dimensional precast concrete building components or units, with fixtures, fittings and finishes, but excluding the following precast concrete components:
1. Precast facades (including precast roof parapet) (refer to CON7);
 2. Semi-precast slabs (including semi-precast roof slabs and semi-precast corridor slabs) (refer to CON7);
 3. Precast balconies (refer to CON7);
 4. Precast staircases (including precast roof staircases) (refer to CON7);
 5. Precast structural walls (refer to CON7);
 6. Precast partition walls (refer to CON7);
 7. Precast refuse chutes (refer to CON4).
- CON8.D020.A USE OF VOLUMETRIC PRECAST CONCRETE COMPONENTS**
- Volumetric precast concrete components, including but not limited to the following, are covered by the specification in this Worksection:
1. Volumetric precast lift lobbies;
 2. Volumetric precast kitchens;
 3. Volumetric precast lift shafts;
 4. Volumetric precast bathrooms;
 5. Volumetric precast roof water tanks;
 6. Volumetric precast ground floor water tanks.
- CON8.D030.A RELEVANCE OF OTHER SPECIFICATION WORKSECTIONS**
1. Comply with the requirements of this Worksection and relevant provisions of the Specification, in particular, the following Worksections:
 - a. CON1, In-situ Concrete;
 - b. CON2, Formwork;
 - c. CON3, Reinforcement;
 - d. CON4, Precast Concrete;
 - e. CON6, Movement Joints;
 - f. CON7, Precast Concrete Components;
 - g. COM2, Aluminium Windows and Louvres;
 - h. COM3, uPVC Windows;
 - i. COM5, Timber Doorsets;
 - j. COM11, Radio Frequency Identification and Web-based Database System for Building Components;

-
- k. DRA1, Drainage Above Ground;
 - l. FIN1, Plastered and Rendered Finishes;
 - m. FIN3, Screeds;
 - n. FIN5, Floor and Wall Tiles and Slabs;
 - o. FIN6, Flexible Sheet and Tile Finishes;
 - p. FIN7, Painting;
 - q. MAS1, Brickwork, Blockwork and Panel Partitions;
 - r. MAS3, Mortar;
 - s. MET1, General Metalwork;
 - t. STR1, Structural Steel;
 - u. PLU1, Water Supply;
 - v. PLU2, Sanitary Appliances;
 - w. WAT5, Sealants;
 - x. WAT6, Proprietary Tanking and Waterproofing Systems.
2. Where building services installations are associated with volumetric precast concrete components, comply with the requirements and relevant provisions of the following Worksections:
 - a. ELE1 - ELE31, Electrical Installation;
 - b. FWP1 - FWP14, Fire Services & Water Pump Installation;
 - c. LTE1 - LTE2, Lift Installation.
 3. Where any ambiguity, discrepancy or conflict arises between this Worksection and any clauses in any other Worksections, the provisions of this Worksection prevail.

CON8.D040.A**DESIGN STANDARDS**

1. For reinforced concrete structures, comply with **CON1.M010**;
2. For precast concrete, comply with **CON4.D010** and Code of Practice for Precast Concrete Construction 2016 published by Buildings Department;
3. For structural joint design, comply with **CON4.D020**;
4. Where any ambiguity, discrepancy or conflict arises between this Worksection and any clauses in any other Worksections or standards, the most onerous conditions shall apply. Agree with the CM on the interpretation in advance of design.

SCOPE OF WORK**CON8.D110.A****GENERAL (ENGINEER'S DESIGN)**

1. Refer to the Drawings for the extent of volumetric precast concrete components including the identification of parts of the component that will function as facades;
2. Refer to the Drawings for the extent of fixtures, finishing, fittings and building services installations associated with volumetric precast concrete components;
3. Refer to the Drawings and relevant Specification clauses for the scope of builders, structural and building services works to be prefabricated in off-site yards.

CON8.D120.A**SCOPE OF THE DESIGN (CONTRACTOR'S DESIGN)**

Design the volumetric precast concrete components in accordance with the requirements specified in this Worksection, Worksections CON4 and CON7 as appropriate. Include the following in the scope of the design of those components:

1. The structural design of the volumetric precast concrete components;
2. The design of permanent structural connections between volumetric precast concrete components and/or building structure;

3. The design of the waterproof joints between volumetric precast concrete components functioning as a facade and/or the building structure;
4. The design of the installation of fixtures and finishes, including the finishing textures, associated with volumetric precast concrete components;
5. Building services installations as required and included in the fabrication of volumetric precast concrete components as a whole module;
6. Inspection method.

DESIGN PARAMETERS (CONTRACTOR'S DESIGN)

CON8.D210.A

STABILITY

Design the volumetric precast concrete components to be stable at all times. Provide designs for both the component and for any necessary temporary props, ties and supports.

CON8.D220.A

RESISTANCE TO PROGRESSIVE COLLAPSE

Design the volumetric precast concrete components in two ways, both as an assembly of individual walls and floors, and also as a complete unit in a progressive collapse design situation, providing additional ties to the rest of the structure for each case.

CON8.D230.A

DEFORMATIONS

Design the volumetric precast concrete components to be located in the structure without deforming excessively before all of the joints and permanent structural connections are made. Include consideration of any temporary stiffening, support jigs or frames in the design.

CON8.D240.A

INTERFACE WITH OTHER STRUCTURAL COMPONENTS

Design the volumetric precast concrete components so that all interfaces between other volumetric precast concrete components or the rest of the structure can be made neatly to the required standards of finish and tolerance.

CON8.D250.A

EXTERNAL FACES

Design the volumetric precast concrete components so that any external faces can be inspected before erection and the main jointing can be made safely from within the structural envelope.

CON8.D260.A

LOADING

1. Design the volumetric precast concrete components to be either load bearing or non load bearing to sustain all possible loading acting upon them;
2. If load bearing, then design the component to carry the loads placed on it in both the temporary and permanent situations taking into consideration of any creep on vertical shortening of walls which may be more highly stressed than outer adjacent precast or in-situ vertical load bearing elements;
3. Submit calculations to demonstrate that in-situ structural members are not subject to excessive stresses arising from the erection method of the volumetric precast concrete components and to demonstrate the adequacy of any temporary supports which may be required;
4. Where volumetric precast concrete components include a facade element, the loading conditions should be determined in accordance with **CON5.D250**.

CON8.D270.A

MINIMUM CONCRETE GRADE

Where volumetric precast concrete components include a facade element, the minimum concrete grade shall be Grade 35/20.

CON8.D280.A CONCRETE COVER TO REINFORCEMENT

Minimum cover to reinforcing bars in the facade elements of the volumetric precast concrete components:

1. External face: 30 mm;
2. Internal face: 25 mm.

CON8.D290.A CONCRETE COVER TO PVC CONDUIT

Minimum cover to PVC conduits concealed within volumetric precast concrete components: 30 mm.

CON8.D300.8 CONCEALMENT OF FIXINGS

Conceal all permanent fixing connections by Approved methods.

JOINTS**CON8.D410.8 JOINTS**

Apply back-up materials, bond breakers and sealants in accordance with Worksection WAT5.

CON8.D420.8 GASKETS

Gaskets may be used in weatherproofing joints provided that:

1. The joint is horizontal; and
2. The gasket is always under compression.

CON8.D430.8 MORTAR STOPS

Use backing rods or other Approved methods as mortar stops in grouting panel joints when necessary.

WEATHERPROOF JOINTS (CONTRACTOR'S DESIGN)**CON8.D510.8 JOINT DESIGN**

Design weatherproof external joints to be maintenance free, and ensure airtightness and watertightness in accordance with BS 6093:1993.

CON8.D520.8 TYPES OF JOINT

Use one of the following types of weatherproof joints in accordance with BS 6093:1993:

1. Sealed joint (one-stage joint);
2. Drained joint (two-stage joint).

CON8.D530.8 DESIGN WIDTH OF JOINTS

Design the joint width in accordance with BS 6093:1993 and BS 6213:1982.

PERMANENT STRUCTURAL CONNECTIONS**CON8.D610.A GENERAL (CONTRACTOR'S DESIGN)**

Design the permanent structural connections:

1. To withstand the stresses induced by the volumetric precast concrete components described in **CON8.D260**;
2. To be watertight;

-
3. To be of the same grade of concrete as that for the volumetric precast concrete components.

CON8.D620.8 REINFORCEMENT, SHEAR CONNECTORS ETC

Ensure reinforcement, shear connectors, etc used for the permanent structural connections are adequately embedded or anchored into the building structure.

CON8.D630.A VERTICAL PERMANENT STRUCTURAL CONNECTIONS

At the vertical permanent structural connections between volumetric precast concrete components that are to be infilled,

1. Use non-shrink grout or concrete with non-shrinking additives if the minimum dimension is more than 150 mm;
2. Use only non-shrink grout if the minimum dimension is less than 150 mm.

CON8.D640.8 HORIZONTAL PERMANENT STRUCTURAL CONNECTIONS

For horizontal permanent structural connections, concrete with non-shrinking additives in lieu of non-shrink grout may be permitted subject to the provisions of **CON4.M270**.

DESIGN TOLERANCES

CON8.D710.A OVERALL TOLERANCES (CONTRACTOR'S DESIGN)

1. Design the volumetric precast concrete components and the associated joints/connections to the in-situ structure, other volumetric precast concrete components, precast concrete components, architectural and building services installations, including all cast in elements, to conform with the relevant tolerances given in Appendix H and the Code of Practice for Precast Concrete Construction 2016;
2. Where any ambiguity, discrepancy or conflict arises between the tolerances given in Appendix H and the CoP for Precast Concrete Construction, the provisions given in Appendix H shall prevail.

CON8.D720.A VOLUMETRIC PRECAST CONCRETE COMPONENTS MANUFACTURE TOLERANCE (CONTRACTOR'S DESIGN)

Design the volumetric precast concrete components and propose the manufacture tolerances in order to satisfy the overall tolerances given in Appendix H and Code of Practice for Precast Concrete Construction 2016, taking into account the erection tolerances.

CON8.D730.A VOLUMETRIC PRECAST CONCRETE COMPONENTS ERECTION TOLERANCE

Propose a set of erection tolerances that is in compliance with the overall tolerance allowed when taken together with the set of manufacture tolerances proposed taking into consideration all possible interfaces with adjacent precast units or in situ elements.

LIFTING OF VOLUMETRIC PRECAST CONCRETE COMPONENTS

CON8.D810.A LIFTING DESIGN

1. Ensure that the design of the lifting mechanism for volumetric precast concrete components provides a safe and robust means of lifting and holds the component in a truly vertical position and is adjustable to ensure verticality if necessary;

-
2. Submit for Approval the proposed lifting positions and any points of attachments on the components for lifting slings if not shown on the drawings.

CON8.D820.8 STEEL LIFTING FRAMES

Design and construct steel lifting frames in accordance with the Code of Practice for the Structural Use of Steel 2011 issued by the Buildings Department.

CON8.D830.8 LIFTING METHOD

Ensure that:

1. The design for lifting takes into account all loads on the component, friction against mould faces, snatch, impact and self weight of all fittings, lifting frame and equipment with an appropriate factor of safety;
2. Any lifting system that has a number of bolts, chains or ropes that work in parallel, is either designed such that all internal loads are calculable and statically determinate or, if not, that each bolt, chain, or rope possesses sufficient reserve of strength for any likely load distribution;
3. The equipment is capable of supporting the component if any single individual fastening, chain or bolt fails, taking into account any realignment of the component as it moves to place the centre of gravity under the new lifting arrangement.

SUBMISSIONS

CON8.D910.8 TENDER DESIGN PROPOSAL

Submit for Approval, full details of tender design proposals including drawings, specifications, layouts, details, calculations and any other information required.

CON8.D920.8 REGISTERED STRUCTURAL ENGINEER

All structural drawings, layouts, details and calculations submitted, including those submitted with tender, must be prepared and signed by a Registered Structural Engineer registered under Buildings Department of the Government of Hong Kong Special Administrative Region.

CON8.D930.A PROGRAMME FOR SUBMISSIONS

1. Agree with the CM a programme for all submissions during the Contract prior to the notified date for commencement of Works;
2. Agree with the CM a programme for all ICU submissions for building works prior to the notified date for commencement of Works;
3. Within one month after the notified date for commencement of the Works, submit to the CM for approval, a programme for the design, planning and coordination with NSCs, ICU approval, manufacturing, erection and testing of a study mock up of the volumetric precast concrete components;
4. No extension of time will be allowed for any delay related to ICU's approval.

CON8.D940.A DRAWINGS AND METHOD STATEMENT (CONTRACTOR'S DESIGN)

Within two months after the notified date for commencement of the Works, submit the following to the CM for review and comment:

1. 5 sets of design drawings;
2. 5 sets of shop drawings including, but not limited to, coordinated services drawings, combined builder's works drawings, building services drawings, fixtures and fittings drawings. All shop drawings shall be fully dimensioned with tolerances and properly coordinated;

3. Calculations and any other information indicating the location of the volumetric precast concrete components and any changes resulting from the use of volumetric precast concrete components;
4. Calculations which show all loading imposed on the volumetric precast concrete components due to lifting, handling, stacking, shock or any other reason, complies with the relevant standards, unless specified otherwise;
5. Jointing details and/or permanent structural connections, which can accommodate building movements, between the proposed volumetric precast concrete components and insitu concrete;
6. Design of moulds with tolerance, layout arrangements, casting methods (horizontal or vertical), tilting mechanism, demoulding methods and the provision for attachments of openings for door and / or window fixing;
7. The complete procedures for fabrication, curing, demoulding, application of finishes, lifting, transporting, storage, erection of volumetric precast concrete components, installation of weatherproof joints, and its associated temporary works;
8. Method for identifying and recording the daily production of volumetric precast concrete components and their final position after installation;
9. Method of protecting the volumetric precast concrete components, including all building services installations and associated equipment fabricated within the units, from damage at all times;
10. Minimum concrete strength required for the volumetric precast concrete components for demoulding, handling, storage, transportation and erection;
11. Position and design of lifting points with tolerances;
12. Calculated weight and size, including projections beyond transportation vehicles, of each type of volumetric precast concrete components;
13. The proposed Radio Frequency Identification tag and the associated fixing method as stipulated in Worksection COM11.

CON8.D950.A**DRAWINGS AND METHOD STATEMENT (ENGINEER'S DESIGN)**

Within two months after the notified date for commencement of the Works, submit the following to the CM for review and comment:

1. Design of moulds with tolerance, layout arrangements, casting methods (horizontal or vertical), tilting mechanism, demoulding methods and the provision for attachments of openings for door and/or window fixing;
2. The complete procedures for fabrication, curing, demoulding, application of finishes, lifting, transporting, storage, erection of volumetric precast concrete components, installation of weatherproof joints and its associated temporary works;
3. Method for identifying and recording the daily production of volumetric precast concrete components and their final position after installation;
4. Method of protecting the volumetric precast concrete components, including all building services installations and associated equipment fabricated within the units, from damage at all times;
5. The proposed Radio Frequency Identification tag and the associated fixing method as stipulated in Worksection COM11;
6. 5 sets shop drawings of volumetric precast concrete components, which have been coordinated and agreed with all relevant building services Nominated Sub-contractors and suppliers.

STRUCTURAL MODIFICATIONS TO THE BUILDING STRUCTURE (ENGINEER'S DESIGN)

CON8.D1010.8

CONTRACTOR'S RESPONSIBILITY (ENGINEER'S DESIGN)

The Contractor's responsibility for the design of his proposed modification is covered under GCC Clauses 5.15 and 11.8 and the Appendix E to the Specification.

CON8.D1020.8

COMPLIANCE WITH GUIDELINES AND REGULATIONS (ENGINEER'S DESIGN)

Any proposed structural modifications to the building structure must comply with the following:

1. The structural design guidelines as appropriate to the building structure published by the Housing Department and included as Appendix E to this Specification;
2. The relevant Regulations, PNAP, CoP, etc. currently in use.

CON8.D1030.8

REINFORCEMENT CHANGES (ENGINEER'S DESIGN)

Obtain CM's Approval for any proposed changes to reinforcement details, as shown on the Drawings, required to suit the proposed method of casting and installation.

STUDY MOCK-UP

CON8.D1110.A

GENERAL

1. Set up a study mock-up in order to demonstrate, prior to mass production, that the use of the proposed volumetric precast concrete components is feasible and that the volumetric precast concrete components are constructable, structurally safe, architecturally and functionally satisfactory when gauging against the following aspects:
 - a. Buildability - speed, safety, structural & building services connections & interfaces, safe system of working;
 - b. Tolerances, accuracy;
 - c. Quality;
 - d. Manufacturing process;
 - e. Joint integrity;
 - f. Testing on watertightness, strength and, structural integrity.
2. Implement any improvements shown to be necessary to the proposed volumetric precast concrete components in a timely manner to ensure that mass production of such components will meet the required standards and to minimise risk associated with new construction processes and methods.

CON8.D1120.8

LOCATION OF CASTING YARD

Within one month of the notified date for the awarded tender, state the location of the casting yard for the manufacture of the study mock-up for CM's approval.

CON8.D1130.A

SIZE OF STUDY MOCK-UP

1. Unless otherwise agreed by the CM, the study mock-up should be at least 2 storeys high, comprising all the different types of volumetric precast concrete components (except volumetric precast lift shafts) that will be adopted for construction in a typical floor with modular layout, for demonstrating all interfaces and joints with adjacent units, either in-situ or precast elements;

-
2. The study mock-up shall be in accordance with the overall size, shape, layout and external envelope of the typical floor. For Engineer's design, the actual extent of the study mock up is as shown on Drawings.

CON8.D1140.A EXTENT OF COVERAGE OF STUDY MOCK-UP

Unless otherwise agreed by the CM, the study mock-up should include all internal and external finishes, doors and windows, electrical lighting, fittings, sockets, concealed conduits, sanitary fittings, internal and external services, plumbing and drainage, and any other accessories required for the proper functioning of the volumetric precast concrete components.

CON8.D1150.A RESPONSIBILITIES OF THE CONTRACTOR

1. Be responsible for the design, submission, manufacture, transportation and installation of the proposed volumetric precast concrete components for the study mock-up;
2. All structural submissions, such as design principles, calculation and construction details, etc. shall be prepared and endorsed by a Registered Structural Engineer (RSE), registered with the Buildings Department as mentioned in **CON8.D920**;
3. Demonstrate that the design of the study mock-up can sustain the required dead, imposed, wind load and any other loads;
4. Design and execute any temporary works for the safe erection of the study mock-up;
5. Coordinate the interfacing works of the building services installation contained within the proposed volumetric precast concrete components of the study mock-up;
6. Allow adequate time for the application of design approval from the ICU prior to mass production of the volumetric precast concrete components;
7. Acquire the necessary approval from the relevant Authorities related to the following aspects:
 - a. Architectural;
 - b. Structural;
 - c. Building services;
 - d. Safety;
 - e. Environmental.
8. Submit a method statement, together with all necessary shop drawings, for the study mock-up for review and comment by the CM prior to its execution. The method statement shall contain details on the manufacturing and transportation of the volumetric precast concrete components as well as their construction methodology, construction cycle, labour force required, major machineries and plants to be employed, and detailed work program;
9. Construct the study mock-up in strict accordance with the commented shop drawings and all methods of the study mock-up joint assembly are to faithfully represent actual job conditions. Do not use special measures or techniques that are not representative of those to be used on the building;
10. After the completion of the erection of the study mock-up, submit a report detailing the following:
 - a. Assessment of the performance of the study mock-up and identification of any deficiencies or defects, conflicts or interface with building services;
 - b. Proposed improvement measures, covering the design, manufacture, transportation and erection aspects of the study mock-up;
 - c. Dimensional checking results;
 - d. Test results;
 - e. RSE's appraisal of the jointing system;

- f. Digital photographs and video records of the erection procedures, in particular the fixing of the jointing system, and any in-situ testing.
11. Bear all costs for any required laboratory and field tests, including any additional fees, penalties or retest costs, and no extension of time will be allowed for any delay related to ICU's approval.

CON8.D1160.8 SHOP DRAWINGS

1. Coordinate the study mock-up drawings in order to construct the mock-up including adjacent interfacing elements, either in-situ or other precast components;
2. Submit 2 sets of shop drawings of the study mock-up, which include plans, elevations, sections and jointing details for review and comment by the CM prior to its manufacturing;
3. Submit 2 sets of Coordinated Services Drawings (CSD) and/or Combined Builders Work (CBW) Drawings of the study mock-up, demonstrating the proper coordination of interfacing works of the building services installation, for review and comment by the CM prior to its manufacturing.

CON8.D1170.8 CM'S COMMENT AND INSPECTION OF STUDY MOCK-UP

1. Do not commence the manufacturing and erection of the study mock-up until the comments from CM on the submitted shop drawings and proposed method statement had been received;
2. Alter or revise the study mock-up as directed upon CM's inspection.

CON8.D1180.8 AS-BUILT DRAWINGS FOR APPROVAL

1. Submit one set of as-built drawings, including as-built CSD and/or CBW, immediately upon completion of the study mock-up for Approval;
2. Incorporate and clearly shown on the as-built drawings any changes made to the study mock-up or deviations from the previously commented shop drawings.

CON8.D1190.A MAINTENANCE MANUAL

Submit a maintenance manual for the replaceable structural items of the volumetric precast concrete components. This should be developed in parallel with the study mock-up and should include, but not be limited to, the following information:

1. Name, address and telephone number of each firm and/or Sub-contractor involved in the supply of materials, components and/or assemblies of the replaceable structural items;
2. A clear and concise description of the method used to construct the concerned replaceable structural items;
3. Copies of certification and test reports of the material and/or component of the replaceable structural items;
4. A method statement covering the procedures for replacement of damaged or otherwise defective materials or components of the structural items, and materials and components that have a design life less than the design life of the volumetric precast concrete components and will therefore require replacement during the life of the volumetric precast concrete components;
5. Recommendations for routine maintenance, cleaning, suitable cleaning agents and any special inspection method of the materials and/or components of the replaceable structural items;
6. A full set of Approved as-built drawings, described in **CON8.D1180**, with particular emphasis on the details of the replaceable structural items;
7. The terms and conditions of any guarantees or warranties associated with the installed materials or components of the replaceable structural items.

CON8.D1200.A CM'S APPROVAL TO PROCEED

Obtain CM's Approval to proceed with the mass production of volumetric precast concrete components.

CON8.D1210.A VALIDATION OF DESIGN ON STUDY MOCK-UP

1. Conduct testing to the study mock-up in accordance with the relevant clauses of Worksections CON4, CON7 and CON8, subject to CM's agreement;
2. All joints and permanent structural connections, as demonstrated on the study mock-up which are designed to withstand any loadings, shall be tested in a HOKLAS laboratory to demonstrate their effectiveness in the transfer of loadings;
3. Carry out watertightness test to all external vertical and horizontal joints and permanent structural connections, as demonstrated on the study mock-up, in accordance with the procedures set out in **CON8.T320**;
4. Where a joint or permanent structural connection, as demonstrated on the study mock-up, is designed in combination with joint sealing compound specified in **WAT5.M180**, carry out the watertightness test prior to the application of the sealing compound to test the watertightness of the joint or permanent structural connection;
5. Conduct all necessary tests to the study mock-up in the presence of the CM or his representatives.

CON8.D1310.8 CORE TEST TO STUDY MOCK-UP

1. Upon completion of grouting of joints and permanent structural connections, with large box out, of the study mock-up, provide all necessary facilities and attendance for concrete cores to be taken out from the grouted joints and permanent structural connections;
2. Take 3 nos. 100 mm diameter cores from selected grouted joints or permanent structural connections, as demonstrated on the study mock-up, to validate the effectiveness of the proposed grouting procedure for the joints or permanent structural connections;
3. In the event that any of the cores taken show any signs of irregularity or voids, such core and grouting procedure are deemed to be unacceptable. Review and revise the grouting procedures accordingly;
4. Replace and re-grout all such joints or permanent structural connections on the study mock-up, at which the cores show signs of irregularity or voids, and repeat the core test as described in sub-clause (2) above to the satisfaction of the CM;
5. Bear all costs of any further cores and no extension of time will be allowed.

MATERIALS

GENERAL

CON8.M010.A

RELEVANCE OF OTHER SPECIFICATION WORKSECTIONS

1. Construct volumetric precast concrete components in accordance with this Worksection and the relevant provisions of the following Worksections:
 - a. CON1, In-situ Concrete;
 - b. CON2, Formwork;
 - c. CON3, Reinforcement;
 - d. CON4, Precast Concrete;
 - e. CON6, Movement Joints;
 - f. CON7, Precast Concrete Components;
 - g. COM11, Radio Frequency Identification and Web-based Database System for Building Components.
2. Construct architectural, plumbing & drainage and structural works in accordance with the Worksections listed in **CON8.D030**;
3. Construct building services installations in accordance with the Worksections listed in **CON8.D030**;
4. Where any ambiguity, discrepancy or conflict arises between this Worksection and any clauses in any other Worksections of this specification, the provisions of this Worksection shall prevail.

SUBMISSIONS

CON8.M110.8

CONCRETE MIX

As CON1.

CON8.M120.8

DETAILS OF WEATHERPROOFING

Within two months of the notified date for the commencement of Works, submit details of weatherproofing materials in accordance with **CON4.M310** and **CON4.M320** for Approval, including technical information, samples, test reports and proven performance records of proposed materials.

CON8.M130.8

CONDUIT SYSTEM

Submit technical details and samples of the conduit system for Approval before commencement of works.

CONCRETE

CON8.M210.A

CONCRETE MIX

The concrete mix shall satisfy the requirements of **CON1.M810** - **CON1.M850**, **CON1.M1010** - **CON1.M1040**, **CON1.M1110** - **CON1.M1200**, the functional and durability requirements of the volumetric precast concrete components, and comply with the relevant provisions of **CON1.M730**.

CON8.M220.8 CONCRETE STRENGTH

Design the mix to have a sufficient compressive and tensile strength. The compressive strength of the mix in load bearing components shall be compatible with the strength of other adjacent load bearing components.

CON8.M230.A DURABILITY

Use the appropriate concrete mix for volumetric precast concrete components which is compatible with the defined exposure conditions of the internal and external faces of the components.

CON8.M240.8 NON-SHRINK GROUT AND CONCRETE WITH NON-SHRINK ADDITIVES
As **CON4.M230** to **CON4.M270**.**JOINTS****CON8.M310.8 WEATHERPROOF JOINTS**

As **CON4.M310** to **CON4.M340**.

PERMANENT STRUCTURAL CONNECTIONS**CON8.M410.8 RESISTANCE TO CORROSION**

All metal parts of permanent structural connections must either be:

1. Corrosion resistant, being constructed of non-ferrous metal or stainless steel but avoiding any contact of such materials with the reinforcement; or
2. Protected against corrosion by an Approved method.

CONDUIT SYSTEMS**CON8.M510.A GENERAL**

Conduit systems incorporated into volumetric precast concrete components shall comply in general with the requirements of clauses **CON7.M110** to **CON7.M430** inclusive.

DIMENSIONS AND TOLERANCES**CON8.M610.8 DIMENSIONAL CHECK**

1. Ensure that manufacture tolerances are met by checking the VPC components using suitably designed jigs and gauges;
2. Provide a means of checking the jigs and gauges which cannot be damaged.

ON SITE DELIVERY VERIFICATION**CON8.M710.A INSPECTION**

1. Carry out the following verifications for volumetric precast concrete components upon delivery on Site in the presence of the CM or his representatives:
 - a. Method:

Verification Items	Method	Acceptance Standards
Date of manufacture and unique reference number	Visual inspection, document check against master register	No anomalies, evidence of QA checks
Required finishes (both internal and external), provisions and fixtures	Visual inspection	Full compliance with Approved as-built drawings for the study mock-up, no damage, no substandard repair
Sharp corners	Visual inspection	No damage, no substandard repair
Embedded conduits	Visual inspection	Open ends properly plugged; availability of draw wire inside conduits, correct brand name, size, alignment and setting out as per Approved as-built drawings of the study mock-up
Conduit boxes	Visual inspection	Properly sealed, no signs of inflow of concrete
Socket / switch boxes	Visual inspection	No damage, correct brand name and size as per Approved as-built drawings of the study mock-up
Starter bars	Visual inspection	Correct size and numbers as per Approved as-built drawings of the study mock-up

b. Frequency:

Verification Items	Sampling Frequency	Representative Consignment
Date of manufacture and unique reference number	100%	All volumetric precast concrete components delivered to Site
Required finishes (both internal and external), provisions and fixtures	100%	All volumetric precast concrete components delivered to Site
Sharp corners	100%	All volumetric precast concrete components delivered to Site
Embedded conduits	100%	All volumetric precast concrete components delivered to Site
Conduit boxes	100%	All volumetric precast concrete components delivered to Site
Socket / switch boxes	100%	All volumetric precast concrete components delivered to Site

Starter bars	100%	All volumetric precast concrete components delivered to Site
--------------	------	--

- c. Keep proper record of inspections, together with photographs, for CM's inspection at any time.
2. Non-compliance:
 - a. In case of non-compliance, identify clearly such volumetric precast concrete components;
 - b. Repair such identified volumetric precast concrete components in accordance with the Approved repair methods / procedures as per **CON8.W420**.

CON8.M720.A**BREAKING-UP INSPECTION**

1. When instructed, provide a sample of volumetric precast concrete components randomly selected by the CM or his representatives upon delivery on Site, break up the component, carry out the following verifications in the presence of the CM or his representatives and remove the broken component after verification:
 - a. Method:

Verification Items	Method	Acceptance Standards
Reinforcement details including total no. of bars and bar size	Visual inspection	Full compliance with Approved as-built drawings for the study mock-up
Bar pattern of reinforcement	Visual inspection	Compliance with Mill Certificate and the requirements of purchaser test in CS2:2012
Cover to reinforcement	By measurement	Full compliance with Approved as-built drawings of the study mock-up
Concrete strength	Coring and compressive test	Compressive strength in compliance with required concrete strength
Embedded conduit cover and bends	By measurement	Full compliance with Approved as-built drawings of the study mock-up
Sizes and routing of embedded conduit	By measurement	Full compliance with Approved as-built drawings of the study mock-up
Embedded conduits, accessories and adaptable boxes	Visual inspection	Bearing the same marking, brand name or standard as per Approved sample
Embedded conduits and / or connections with accessories	Visual inspection	Connections are properly jointed in compliance with Approved sample
Conduits and accessories	Visual inspection	Properly fixed to reinforcement in compliance with Approved sample

- b. Frequency:

Verification Items	Sampling Frequency	Representative Consignment
--------------------	--------------------	----------------------------

Reinforcement details including total no. of bars and bar size	1 no. per type of volumetric precast concrete components per domestic block	All volumetric precast concrete components delivered to Site
Bar pattern of reinforcement	1 no. per type of volumetric precast concrete components per domestic block	All volumetric precast concrete components delivered to Site
Cover to reinforcement	1 no. per type of volumetric precast concrete components per domestic block	All volumetric precast concrete components delivered to Site
Concrete strength	1 no. per type of volumetric precast concrete components per domestic block	All volumetric precast concrete components delivered to Site
Embedded conduit cover and bends	1 no. per type of volumetric precast concrete components per domestic block	All volumetric precast concrete components delivered to Site
Sizes and routing of embedded conduit	1 no. per type of volumetric precast concrete components per domestic block	All volumetric precast concrete components delivered to Site
Embedded conduits, accessories and adaptable boxes	1 no. per type of volumetric precast concrete components per domestic block	All volumetric precast concrete components delivered to Site
Embedded conduits and / or connections with accessories	1 no. per type of volumetric precast concrete components per domestic block	All volumetric precast concrete components delivered to Site
Conduits and accessories	1 no. per type of volumetric precast concrete components per domestic block	All volumetric precast concrete components delivered to Site

2. Non-compliance:

- a. In the event of samples failing to meet any of the requirements given above:
 - i. Remove the broken volumetric precast concrete components off site;
 - ii. Take further volumetric precast concrete components as sample for re-test progressively according to the formula $n^2 - 2n + 3$ where n = total number of unsuccessful volumetric precast concrete components and the maximum value of n is limited to 3; until all samples satisfy the requirements as above;

-
- iii. In the event that $n = 3$ and not all samples satisfy the above requirements, all volumetric precast concrete components of the same type cast on the same date as per those samples that failed the breaking-up inspection shall be condemned and removed off site.
 - b. Bear all associated costs of any further breaking-up inspections that are instructed by the CM and no extension of time will be allowed.

WORKMANSHIP

GENERAL

- CON8.W010.8 OFF SITE CASTING YARD**
Unless otherwise specified in this Worksection, comply with the requirements of **CON7.W010** to **CON7.W090** pertaining to off-site casting.
- CON8.W020.8 ARCHITECTURAL WORKS**
Comply with the relevant requirements of architectural works as given in the Worksections in **CON8.D030** unless specified otherwise in this Worksection.
- CON8.W030.8 BUILDING SERVICES INSTALLATION**
Comply with the relevant requirements of building services installation as given in the Worksections listed in **CON8.D030**.
- CON8.W040.B QUALIFIED SUPERVISION FOR VOLUMETRIC PRECAST CONCRETE COMPONENTS**
1. For production of volumetric precast concrete components, assign a Precast Quality Control Co-ordinator (PQCC), with a minimum qualification and experience of a Grade T3 TCP under the Registered Contractor's stream in the CoPSS, to provide full time supervision at the casting yard;
 2. Submit the details of the PQCC for Approval;
 3. It is permissible for the PQCC assigned under sub-clause (1) above to be the same person assigned as the PQCC under **CON5.W040** or **CON7.W050** provided that the qualification and experience of the PQCC assigned under **CON5.W040** or **CON7.W050** can satisfy the qualification and experience stipulated in the sub-clause (1) above;
 4. For off site casting, subject to CM's approval, the PQCC assigned under sub-clause (1) above may supervise the production of volumetric precast concrete components for more than one HA Contract of the same Contractor at the same casting yard.

SUBMISSIONS

- CON8.W110.A MOULDS**
1. Submit for CM's approval details of the mould for volumetric precast concrete construction showing its support and design to fulfil the functional requirements. Comply with the provisions given in **CON7.W210**;
 2. Obtain CM's approval before casting any components.
- CON8.W120.A METHOD STATEMENT**
Submit a method statement, covering the following, for CM's approval:
1. Mould set up, inspection, approved mix, demoulding, curing, finishing and lifting;
 2. Method of fixing window frames or windows, in accordance with **CON7.W840**, before casting of the volumetric precast concrete components commences;
 3. Repair methods / procedures to typical defective components likely to be encountered;
 4. Method to rectify starter bars which are out of position but within tolerances;
 5. Details of the proposed means of support and storage of volumetric precast concrete components in the casting yard;

6. A layout of the storage yard which allows any components to be removed without disturbing other components on demand and minimises the need to sequence stacking and removal;
7. Erection of volumetric precast concrete components at their final locations in the structure;
8. The proposed Radio Frequency Identification tag and the associated fixing method as stipulated in Worksection COM11.

CON8.W130.8 CONDUIT SYSTEM SHOP DRAWINGS

Prepare shop drawings, coordinate and agree on the interfacing and connection method with the Nominated Sub-contractor for electrical installation before submitting shop drawings for Approval.

CON8.W140.A PROGRAMMES

Within one month after the notified date for commencement of the Works, submit, for Approval, the following:

1. Programme for manufacturing volumetric precast concrete components showing the rate of manufacture for each month and the dates for clearing the area of casting yard and associated plant upon completion of the manufacture of the components;
2. Programme for the erection of the volumetric precast concrete components showing the rate of erection for each month. Make due allowance for all restrictions on the age of concrete in the volumetric precast concrete components for handling, storage, transportation and erection.

CON8.W150.A QUALITY ASSURANCE SCHEME FOR MANUFACTURE OF VOLUMETRIC PRECAST CONCRETE COMPONENTS

Within two months after the notified date for commencement of the Works, submit details of the Quality Assurance Scheme for manufacturing the volumetric precast concrete components, in accordance with **CON7.W040** to **CON7.W060** as applicable, for Approval.

CON8.W160.A QUALITY CONTROL PROCEDURES FOR ERECTING VOLUMETRIC PRECAST CONCRETE COMPONENTS

Within three months after the notified date for commencement of the Works, submit for Approval, details of erection of the volumetric precast concrete components under Approved quality control procedures covering the following:

1. Protective measures to avoid cracking and chipping;
2. Checking the accuracy of the insitu structural members receiving the volumetric precast concrete components, including location and level of all bearing surfaces, joints, bolts, horizontal and vertical restraining devices and adjustment devices. Carry out checking by means of a template or measurement frame or a similar Approved method;
3. Checking of erection tolerances;
4. Provision and removal of temporary works;
5. Procedure for grouting of permanent structural connections with details to prevent air lock.

MOULD ASSEMBLY

CON8.W210.A TOLERANCE

Ensure that the mould is capable of manufacturing a component that, after erection, will be within the overall tolerances and manufacture tolerances for volumetric precast concrete components.

CON8.W220.8	GROUT SEALS Ensure that: <ol style="list-style-type: none">1. The mould has grout seals appropriate to avoid leakage, or2. If the concrete is to be vibrated, the seal design is appropriate to the means of filling and vibration.
CON8.W230.8	GAUGES Provide details of gauges and fittings to check the correct set up of the mould before casting.
CON8.W240.8	FITTINGS Ensure that the means of securing fittings to the mould is robust, suitable for repeated use, and will result in achieving the required tolerances without damage to the component.
CON8.W250.8	EXTERNAL FACES Ensure that any concrete surfaces that will be external to the structure have, after casting, no metal fixings exposed and any holes have been filled.
CON8.W260.A	DEFECTIVE MOULDS Replace any part of the mould system that fails to manufacture volumetric precast concrete components within the permitted tolerance limits.
CON8.W270.8	USE OF RELEASE AGENTS Apply mould release agent, in accordance with CON2.M210 , to the surfaces of moulds either by brush or by spraying before the fixing of steel reinforcement at a rate in accordance with the manufacturer's recommendations.

MANUFACTURING OF VOLUMETRIC PRECAST CONCRETE COMPONENTS

CON8.W310.A	GENERAL Unless otherwise specified in this Worksection, comply with the provisions for manufacturing volumetric precast concrete components as given in Worksection CON7.
CON8.W320.A	CONCRETE MIX <ol style="list-style-type: none">1. Provide concrete in quantities such that casting is continuous using the Approved mix and method statement;2. Arrange back up supplies for large volumetric precast concrete components if breaks in main supply are possible.
CON8.W330.8	CONCRETING, COMPACTION AND CURING GENERALLY As CON1.
CON8.W340.A	CONSTRUCTION JOINTS Demonstrate, for CM's approval, that if the volumetric precast concrete components have construction joints within it, the detail and form of those joints will satisfy the requirements for the finishes requirement.
CON8.W350.8	EXTERNAL VIBRATORS Obtain Approval for the use of external vibrators.

CON8.W360.A CURING BY APPLICATION OF HEAT

Obtain Approval for heat curing by means of steam, hot air, etc. and:

1. Ensure that the total chloride content of the concrete mix for volumetric precast concrete components, subject to heat curing, is less than 0.1% by weight of that of the cement;
2. Carry out a trial to demonstrate the adequacy of the proposed method to the satisfaction of the CM.

CON8.W370.8 DEMOULDING AND STRIPPING MOULDS

Demould by means of an Approved method:

1. Do not use crowbars;
2. Do not subject the mould to any form of impact;
3. Fully, or partially, strip moulds when the concrete has gained sufficient strength, measured on specimens kept with the mould after casting;
4. Prove the stripping strength by test as given in **CON8.W380** and check against the method statement.

CON8.W380.A CONCRETE STRENGTH BEFORE DEMOULDING

1. Demould the volumetric precast concrete components only after concrete has achieved the required strength;
2. To determine if the concrete has achieved the strength required for demoulding or handling:
 - a. Make the necessary concrete cubes in pairs from the same batch of concrete used for casting the volumetric precast concrete components and cure the concrete cubes under the same conditions as the concrete in the volumetric precast concrete components;
 - b. Specially identify the cubes and do not use them for normal quality control or for compliance testing;
 - c. Determine the concrete cube strength by compression test as **CON7.T110** and satisfy the CM that the concrete cubes have acquired the required strength before the demoulding or handling the volumetric precast concrete components.

CON8.W390.A IDENTIFICATION AND RECORDS

1. Mark all volumetric precast concrete components with date of manufacture and a unique reference number;
2. Record in a master register the dates of casting, the concrete grades and the final locations of all volumetric precast concrete components;
3. Where required by the CM, each of the volumetric precast concrete components is to be delivered to Site with an appropriate QA certificate endorsed by the Quality Control Engineer;
4. Update the records stipulated in above sub-clause (2) above for all volumetric precast concrete units to the RFID Web-Based Database System.

CON8.W400.A REQUIREMENTS OF OTHER TRADES AND COMPONENTS

Incorporate the requirements of all trades such as blockouts, recesses, notches, embedded metal works, building services installations or any other items etc. before casting the volumetric precast concrete components.

CON8.W410.8 SCOPE OF MINOR REPAIR

1. Use suitable filler to fill blow holes, small voids and repair non structural damage in accordance with the Approved procedures as given in the method statement required under **CON8.W120**;

2. Test those procedures and, if required by the CM, demonstrate the procedures on the study mock-up.

CON8.W420.A DEFECTIVE COMPONENTS

1. Any volumetric precast concrete components that falls outside the manufacture tolerance is considered defective and must be rejected. Apply indelible mark on rejected units for identification purposes;
2. For other defects, including but not limited to minor chipping, damage to finishes or exposed conduits, etc., quarantine for inspection in accordance with the Approved QA scheme within the casting yard. Agree with the CM special repair methods or rejection of any defective volumetric precast concrete components that cannot be repaired and finished by the Approved repair methods / procedures as required under **CON8.W120**;
3. In the event of the CM agreeing to accept any quarantined volumetric precast concrete components, execute all necessary remedial and modification work to CM's satisfaction.

CON8.W430.A CLEANING

1. Ensure that all fittings that will be used to make connections in-situ are cleaned and checked prior to delivery of the volumetric precast concrete components to Site;
2. Ensure that all internal surfaces of the volumetric precast concrete components are cleaned to the standard agreed with the CM before the components are delivered to Site.

CON8.W440.A PROTECTION

Protect volumetric precast concrete components to ensure that no damage is done during and after storage, lifting, transportation or erection.

CON8.W450.A LIFTING

1. Lift volumetric precast concrete components only when the concrete has achieved the required lifting strength, measured on specimens kept with the volumetric precast concrete components in accordance with the Approved method statement required under **CON8.D940** and **CON8.W380**;
2. Lift volumetric precast concrete components within the yard by means of a lifting system designed in accordance with **CON8.D810** to **CON8.D830**;
3. Ensure that lifting plant and equipment complies with the requirements of **CON7.W540**.

CON8.W460.A SIZE AND WEIGHT OF VOLUMETRIC PRECAST CONCRETE COMPONENTS FOR TRANSPORTATION AND CRANEAGE

1. Indicate, in the method statement required under **CON8.D940**, the maximum projected horizontal and vertical dimensions of the component, including any protection, packing or protruding steel, beyond transportation vehicles, to ensure compliance with the limitations stipulated by local legislation;
2. Indicate, in the method statement required under **CON8.D940**, the maximum weight of the component including the weight of any props, supporting frame, protection or packing. Make clear any lifting or other components that are not included in this value. This weight shall not be exceeded;
3. Weigh each type of volumetric precast concrete components prototype component and any subsequent components as required by the CM.

CON8.W470.A TEMPORARY STORAGE SUPPORT

1. Provide temporary support for storage of volumetric precast concrete components that does not place excessive bearing, compressive, tensile or flexural stresses on the component or cause spalling, cracking or unintended deformations;
2. Provide calculations to demonstrate that the likely deformation of volumetric precast concrete components, temporarily supported in the storage yard, is not detrimental to the manufacture tolerances, and, after erection, to the overall tolerance;
3. Ensure that stacking of volumetric precast concrete components does not generate unintended bearing, compressive, tensile or flexural stresses on the component or cause spalling, cracking or unintended deformations;
4. Store volumetric precast concrete components in the vertical plane on a levelled, well-drained and maintained concrete surface and protect against staining or physical damage.

CON8.W480.A TRANSPORTATION

1. Provide a transportation system, complying with **CON7.W510** to **CON7.W560**, such that damage to the component is prevented preferably without reliance on any protection cover;
2. Maintain lorries or wagons used for the transportation of the volumetric precast concrete components in a good condition. Ensure wagons are equipped with suspension systems to minimize shock loading;
3. Ensure all lifting of volumetric precast concrete components during transportation, including loading and unloading from lorries or wagons, comply with the lifting method as per **CON8.W450**.

ERECTING VOLUMETRIC PRECAST CONCRETE COMPONENTS

CON8.W510.A SITE RECORDS

Provide, at the end of each week during erection of the volumetric precast concrete components, records in a form to be agreed with the CM, showing:

1. Delivery and installation dates, and the locations of joints and permanent structural connections completed on a location plan for each floor;
2. Dates of removal and locations of any props and temporary supports to the volumetric precast concrete components.

CON8.W520.A CM'S INSPECTION

Allow and facilitate inspection of the volumetric precast concrete components at any time before and after erection.

CON8.W530.A LIFTING UNITS INTO POSITION

1. Prove, by demonstration, that the lifting method is capable of meeting the design requirements given in **CON8.D810** to **CON8.D830**;
2. Lift the volumetric precast concrete components using the lifting system complying with **CON8.W450**;
3. Maintain all cables connecting the lifting frame and the lifting points of the volumetric precast concrete components in a vertical direction. Provide the cables with devices for the adjustment of their length;
4. Do not allow devices such as sockets or bolts for lifting purposes to be used for fixing the volumetric precast concrete components to the main structure.

CON8.W540.A UNITS DAMAGED ON TRANSPORTATION, LIFTING OR ERECTION

Repair or replace as agreed with the CM any volumetric precast concrete components which have been damaged on transportation, lifting or erection in accordance with the Approved repair methods / procedures as required under **CON8.W120**.

JOINTS AND PERMANENT STRUCTURAL CONNECTIONS**CON8.W610.8 GENERAL**

Prepare and construct joints strictly in accordance with the Approved drawing details and in accordance with the relevant manufacturer's recommendations so as to provide continuous weathertightness of buildings and give a neat, uniform and smooth appearance.

CON8.W620.8 GROUTING OF PERMANENT STRUCTURAL CONNECTION

Clean the connection by methods approved by the CM before the grout is placed. Take measures to prevent the accumulation of dirt and other material at the connection and the presence of air lock.

CON8.W630.8 JOINT WIDTH

Unless otherwise Approved, the installed joint width must not be less than 6 mm nor greater than 30 mm.

CONDUIT SYSTEM**CON8.W710.A APPLICATION**

Supply and install concealed rigid plain PVC conduit system complete with steel draw wires for volumetric precast concrete components as shown on Drawings.

CON8.W720.8 COMPLETION CERTIFICATION

Comply with **CON7.W1010**.

CONDUIT AND WIRING INSTALLATION**CON8.W810.8 CONDUIT BENDS**

As **CON7.W990**.

CON8.W820.8 BENDING, JOINTING AND TERMINATING OF CONDUITS

As **CON7.W1000**.

PROTOTYPE MOCK-UP**CON8.W910.A PROTOTYPE MOCK-UP**

1. Erect a prototype mock-up on Site, in full accordance with the Approved as-built drawings of the study mock-up;
2. If proposed by the Contractor and approved by the CM, the prototype mock-up can be part of the permanent works;
3. Obtain Approval from the CM upon inspection of the completed prototype mock-up to set the standard and quality of workmanship necessary for all volumetric precast concrete components;

-
4. Do not alter, move, or destroy the Approved prototype mock-up unless permitted by the CM.

CON8.W920.A REMOVAL OF PROTOTYPE MOCK-UP

Subject to CM's approval, remove the prototype mock-up as well as the surrounding structural frames upon completion of erection of all the volumetric precast concrete components.

CON8.W930.8 VERIFICATION OF PROTOTYPE MOCK-UP

1. Carry out watertightness tests on the jointing system of the full size prototype mock-up specified in **CON8.W910** in accordance with the procedures set out in **CON8.T320**;
2. Extend the watertightness tests to cover testing on joints of windows fixed to the full size prototype mock-up all to the requirements specified in **COM2.T210**;
3. Conduct tests to finishes in accordance with the relevant clauses in Worksections FIN1 to FIN7 as referred to in **CON8.D030**.

TESTING

SAMPLING AND TESTING

CON8.T010.8**RECORDS**

1. Keep a complete record of all sampling and testing, in a form agreed with the CM;
2. Submit test reports and certificates to the CM within 14 days from the date of test.

CON8.T020.A**WITNESSING SAMPLING AND TESTING BY THE CM**

The CM will witness any sampling and testing carried out under the Quality Assurance Scheme:

1. Make monthly records of sampling and testing available for inspection by the CM or his representatives resident at manufacturer's factory.

CON8.T030.A**TESTS AT MANUFACTURER'S FACTORY**

Provide samples, all necessary facilities and attendance to the DTC or the CM or his representatives resident at manufacturer's factory to carry out the following tests:

1. Schmidt hammer tests and cover meter tests on the construction quality of precast concrete components;
2. Tests on concrete constituent materials, tests on compressive strength of concrete cubes and concrete cores, tests on reinforcement bars and tests on fabric reinforcement by the DTC and / or HDMTL.

CON8.T035.A**INSTALLATION OF RFID TAG IN CONCRETE CUBE FOR CUBE COMPRESSION TEST TO BE CARRIED OUT BY DTC OR HDMTL**

1. Install a Radio Frequency Identification (RFID) tag as detailed on Sketch no. RFID/TAG/SK-01 onto the trowelled surface of each of the concrete cubes immediately after preparation of cubes at the manufacturer's factory under the witness of the CM or his representatives resident at manufacturer's factory unless otherwise instructed by the CM;
2. The RFID tags are to be provided by DTC or the CM or his representatives resident at manufacturer's factory in batches;
3. Validate and scan the RFID tag with the Bluetooth RFID reader provided by DTC or the CM or his representatives resident at manufacturer's factory before use, and ensure that information such as tag unique identification (UID), electronic product code (EPC) number and timestamp have been uploaded to the PC provided by the DTC or the CM or his representatives resident at manufacturer's factory and incorporated into the DTC's database system (through 3G or above internet service);
4. Input the mould number and / or sampling certificate number against the concerned tag EPC number through the DTC's database system;
5. Before the tagged cubes are sent from the manufacturer's factory to HDMTL or are collected by the DTC, scan the tag again using the Bluetooth RFID reader and ensure that information such as tag UID, EPC number and timestamp have been uploaded to the PC and incorporated into the DTC's database system (through 3G or above internet service);
6. Deliver the tagged cubes to HDMTL or arrange the tagged cubes to be collected by the DTC with due care at a time such that a minimum of 4 days is allowed for curing the cubes in DTC or HDMTL before testing on compressive strength at 28 days by DTC or HDMTL;
7. In case any damaged RFID tags are discovered, report to the CM or his representatives resident at manufacturer's factory immediately without any delay;

-
8. Maintain an inventory record of all RFID tags including those damaged and submit the inventory record to the CM or his representatives resident at manufacturer's factory for endorsement.

CON8.T040.A FULL SCALE MOCK UP FOR VPB AND VPK

1. Where required by the CM, design and provide full scale mock up as detailed in the **Project Specific Specification** to demonstrate that the volumetric precast bathroom (VPB) and volumetric precast bathroom (VPK) components, the installation of the VPB and VPK, and the workmanship of jointing are adequate, all to the satisfaction of the CM;
2. If agreed by the CM, the requirements of this full scale mock up shall be provided and demonstrated by the study mock-up as stipulated under **CON8.D1110** to **CON8.D1310**.

TESTS ON WORKABILITY**CON8.T045.8 STANDARD**

As **CON1.T510**.

CON8.T050.8 ACCEPTANCE VALUES FOR APPROVED CONCRETE MIXES

As **CON1.T520**.

TESTS ON COMPRESSIVE STRENGTH OF CONCRETE CUBES**CON8.T060.8 STANDARD**

As **CON1.T610**.

CON8.T061.8 SAMPLES FOR DESIGNED CONCRETE MIXES

As **CON1.T620**.

CON8.T062.8 RESULTS FOR DESIGNED CONCRETE MIXES

As **CON1.T630**.

CON8.T063.8 COMPLIANCE CRITERIA FOR DESIGNED CONCRETE MIXES

As **CON1.T640**.

CON8.T064.8 TABLES OF COMPLIANCE REQUIREMENT FOR DESIGNED CONCRETE MIXES

As **CON1.T650**.

CON8.T065.8 NON-COMPLIANCE OF DESIGNED CONCRETE MIXES

As **CON1.T660**.

CON8.T066.8 FURTHER TESTS ON DESIGNED CONCRETE MIXES

As **CON1.T670**.

MIX TESTS

CON8.T110.8

GENERAL

Unless otherwise specified in this Worksection, comply with the requirements for trial concrete mixes and associated tests of both concrete and grout as given in Worksections CON1, CON4 and CON7.

SCHMIDT HAMMER TESTS

CON8.T120.B

TESTING FREQUENCY

1. Provide all necessary facilities and attendance for carrying out of Schmidt hammer test on the volumetric precast concrete components by the CM or his representatives resident at manufacturer's factory when the concreting age of the volumetric precast concrete components is at least 3 days;
2. Subject to CM's approval, the testing frequency may be reduced when satisfactory and consistent standard is established.

TESTS ON COMPRESSIVE STRENGTH ON EARLY CORES FOR VPB, VPK AND VOLUMETRIC PRECAST LIFT SHAFT COMPONENTS

CON8.T130.B

GENERAL

1. Provide all necessary facilities and attendance for carrying out coring and testing of concrete cores by DTC, including the provision of a secure and lockable storage for DTC to store the coring machine and other associated equipment;
2. Tests are to be witnessed and endorsed by the Contractor's representative and the CM or his representatives resident at manufacturer's factory;
3. Allow 2-day advance notice for preparation by DTC before the taking of core samples at the manufacturer's factory;
4. Upon completion of the taking of core samples by DTC at the manufacturer's factory, allow a minimum of 6 more days and a maximum of 15 more days for DTC to provide the core test results;
5. Make due allowance in the programme for the aforesaid arrangement and no claim for extension of time shall be allowed;
6. Subject to CM's approval, omission of early core test may be permitted for a particular batch of volumetric precast bathroom (VPB), volumetric precast kitchen (VPK) and volumetric precast lift shaft components in order not to affect the construction work on Site. In such case, carry out core test in accordance with the procedures set out in **CON1.T710** to **CON1.T760** to prove the compliance of that particular batch of VPB, VPK and volumetric precast lift shaft components to compressive test on cores as stipulated in this Specification.

CON8.T140.8

STANDARD

Comply with CS1:2010 in respect of the method of preparing, inspecting and testing concrete cores to determine the compressive strength except the measurement of saturated density.

CON8.T150.B

SIZE AND NUMBER OF EARLY CORE SAMPLES

Testing samples:

1. Provide necessary facilities and attendance to the taking of 3 Nos. of core samples by the DTC from each of the following volumetric precast components of the same concreting day, at locations decided by the CM:
 - a. Volumetric precast bathroom (VPB) including Combined VPB components;
 - b. Volumetric precast kitchen (VPK) including Combined VPK and Combined VPB and VPK components;
 - c. Volumetric precast lift shaft components.
2. Size of core sample:
 - a. 75 mm diameter core samples;
 - b. For vertically casted VPB, VPK and volumetric precast lift shaft components, the length of core samples shall be at least 90 mm;
 - c. For horizontally casted VPB, VPK and volumetric precast lift shaft components, the length of core samples shall be at least 90 mm, plus top 50 mm or 20% of depth of concrete being cored whichever is greater.

CON8.T160.8 AGE OF EARLY CORE SAMPLES

1. Do not take cores for compressive test at ages less than 3 days;
2. Do not carry out compressive test on the core samples at ages less than 9 days.

CON8.T170.B ASSESSING COMPRESSIVE STRENGTH ON EARLY CORES

In assessing the results of compressive strength on early cores, the volumetric precast bathroom (VPB), volumetric precast kitchen (VPK) and volumetric precast lift shaft components of the same concreting day represented by the early cores are deemed to comply with this Specification if the strength of the early core, when adjusted for length / diameter ratio and converted to estimated insitu cube strength in accordance with CS1:2010, is:

1. Not less than 85% of the specified grade strength for any individual results.

CON8.T180.B NON-COMPLIANCE AND FURTHER TESTS ON COMPRESSIVE STRENGTH OF CONCRETE CORES FOR VPB, VPK AND VOLUMETRIC PRECAST LIFT SHAFT COMPONENTS

1. For volumetric precast bathroom (VPB), volumetric precast kitchen (VPK) and volumetric precast lift shaft components of the same concreting day represented by the early cores that the compressive strength of the early cores comply with **CON8.T170**, their core test results are deemed to be acceptable under this Specification, and further coring test at 28 days is not necessary unless compressive strength test of concrete cube of the same batch of concrete not comply with **CON8.T062** or instructed otherwise by the CM;
2. For VPB, VPK and volumetric precast lift shaft components of the same concreting day represented by the early cores that the compressive strength of the early cores do not comply with **CON8.T170**:
 - a. if the concreting ages of the VPB, VPK and volumetric precast lift shaft components are less than 28 days, carry out further early core tests by DTC. If the result of the further early core test does not comply with **CON8.T170**, the VPB, VPK and volumetric precast lift shaft components are not allowed to be lifted into place or installed on Site, and further early core test may be carried out in accordance with this sub-clause;

- b. if the concreting ages of the VPB, VPK and volumetric precast lift shaft components are 28 days or over, carry out further core test by DTC in accordance with **CON1.T710** to **CON1.T760**. If the result of this further core test does not comply with **CON1.T760**, the VPB, VPK and volumetric precast lift shaft components are not allowed to be lifted into place or installed on Site. All relevant concrete of the VPB, VPK and volumetric precast lift shaft components represented by this further core test in the same concreting day is deemed not complying with this Specification. Investigate the extent of non-compliance and re-execute the works in accordance with **CON1.T1210** to **CON1.T1260**.
3. Make due allowance in the programme for the aforesaid arrangement and bear all time and cost for compliance with this clause.

CON8.T190.8 MAKING GOOD CORE HOLES

As **CON1.T770**.

CON8.T195.8 TESTING ON NON-SHRINK GROUT

As **CON4.T070**.

CON8.T200.8 TESTS ON COMPRESSIVE STRENGTH OF GROUT CUBES

As **CON4.T080**.

TESTING FIXINGS

CON8.T210.8 TENSILE AND SHEAR TESTING

As **CON4.T110** and **CON4.T120**.

SITE WATERTIGHTNESS TESTS TO EXTERNAL FACES ELEMENT OF VOLUMETRIC PRECAST CONCRETE COMPONENTS

CON8.T310.A TESTING INSTALLED JOINTS

Carry out watertightness tests to the jointing system of the external faces of the properly installed volumetric precast concrete components at the rate of 100% of each particular type in accordance with the procedures set out in **CON8.T320**.

CON8.T320.A TEST PROCEDURE

Test joints on each selected external face of volumetric precast concrete components according to the procedures as follows:

1. Construct working platforms where necessary for carrying out water test safely;
2. Working from the exterior, wet the external face of the volumetric precast concrete components selectively, starting from the lowest horizontal joint, followed by the vertical joints and then the horizontal joint above;
3. Spray a continuous jet of water from a nozzle at a water pressure of 210 to 240 kPa at the nozzle inlet to the joint and perpendicular to the external face of the volumetric precast concrete components. Move the nozzle slowly along the joint, at a distance of 300 mm from it, for a period of 5 minutes in every 1.5 metre of joint length while an observer carefully inspects on the interior side of the external face of the volumetric precast concrete components with the assistance of adequate lighting where necessary;
4. Unless otherwise Approved, use a nozzle to the requirements of the Architectural Aluminium Manufacturer's Association (AAMA) 501.2-83;

5. Repeat the process specified in sub-clause (3) above on all joints and joint intersections using increments of exposed joint length not exceeding 1.5 metres upward until all the joints are covered.

CON8.T330.8 WITNESSES TO TEST

All watertightness tests carried out on Site must be witnessed and certified both by the CM and the Contractor's representative.

CON8.T340.A FAILURE OF UNITS

The volumetric precast concrete components and joints are deemed to have failed if signs of water seeping through the joints or through the external face of the volumetric precast concrete components, including signs of damp patches, are observed during the test and within the subsequent 2 hours after the test.

CON8.T350.A REMEDIAL WORK TO VOLUMETRIC PRECAST CONCRETE COMPONENTS FOR RE-TEST

Carry out remedial work to volumetric precast concrete components and joints which fail in the watertightness test. Methods of carrying out the remedial work are subject to Approval. After the remedial work is completed, re-test the external face of the volumetric precast concrete components and joints as **CON8.T320** until all specified criteria have been satisfied.

SITE TESTING OF JOINTS AND PERMANENT STRUCTURAL CONNECTIONS

CON8.T410.A SITE TESTING OF JOINTS AND PERMANENT STRUCTURAL CONNECTIONS

1. When instructed, carry out the following tests on Site in the presence of the CM or his representatives:
 - a. Prior to grouting the joints or permanent structural connections:
 - i. Check integrity of welds of any structural steelworks, for connection purpose, present at the permanent structural connections in accordance with **STR1.T120**, as appropriate, against the acceptance criteria as stipulated in **STR1.T130**.
 - b. Upon completion of grouting:
 - i. Check location and cover of rebars, with the use of Approved steel reinforcement detector or cover meter, against Approved drawings.
2. Non-compliance:
 - a. In the event that any test result on a weld does not comply with the acceptance criteria, conduct further weld test in accordance with **STR1.T120** (5);
 - b. Cut out and repair all defective welds in accordance with **STR1.T140** and re-test the welds in accordance with **STR1.T120**;
 - c. Bear all costs of any further tests and no extension of time will be allowed.

LIFTING ANCHOR

CON8.T510.8 DEFINITION OF BATCH

In this Specification, a batch is defined as any quantity of lifting anchor of the same type and same working load capacity, delivered to the casting yard as one consignment and covered by the same test certificate issued by the lifting anchor manufacturer.

CON8.T520.8 TYPE AND LOAD CAPACITY

Unless otherwise specified on Drawings, lifting anchors shall be either eye anchor type or foot anchor type, and with a working load of 0.25 times the ultimate load capacity.

CON8.T530.8 RATE OF SAMPLING

1. The rate of sampling for ultimate load capacity for each batch of lifting anchor shall be a minimum of one sample, which comprises three test specimens, for every 3,000 anchors or part thereof;
2. When Instructed, provide an additional sample comprising three test specimens for testing by DTC.

CON8.T540.8 COMPLIANCE CRITERION

No test result of ultimate load capacity of individual test specimen shall be less than 4 times the working load as stipulated in **CON8.T520**.

CON8.T550.8 SUBMISSION

Prior to the production of precast concrete components, provide test certificates issued by:

1. The lifting anchor manufacturer/agent supplier; and
2. An Approved testing laboratory employed by the manufacturer of precast concrete component on the ultimate load capacity of lifting anchors for each batch under the Quality Assurance System as stipulated in **CON7.W040**.

FACTORY VERIFICATION TESTS

CON8.T610.A WATER FLOOD TEST TO INTERNAL INSTALLATIONS

1. Testing Arrangements:
 - a. Carry out water flood test on the completed internal waterproofed volumetric precast bathroom (VPB) components at a rate of 1 to 25 numbers at the manufacturer's factory;
 - b. Place the VPB component on an elevated temporary support platform and connect the floor drains where necessary for carrying out water flood test;
 - c. Submit three copies of the test reports, or other number of copies as required by the CM for the water flood tests for record.
2. Testing Methods:
 - a. Seal all outlets and do not permit any debris to enter into the drainage pipeworks;
 - b. Carefully flood the internal floor of the VPB component to levels agreed with the CM or his representatives resident at manufacturer's factory, generally no less than 50 mm, but in no case higher than the curb levels and maintain for 24 hours;
 - c. Mark the top water level at clearly visible locations and regularly inspect for leaks;
 - d. Carry out joint inspections with the CM or his representatives resident at manufacturer's factory at the external side of the walls and at the underside of the floor slab to check that there is no water leakage, water seepage or visible damp patch within half an hour after the flooding has maintained for 24 hours;
 - e. If required by the CM, provide records in the form of photos or video clips to prove that the inspected surfaces are free from water leakage, water seepage or visible damp patch;

-
- f. Subject to CM's approval, in case the test results cannot be verified due to wet weather, record such condition in the test report and the whole batch of VPB components can be exempted from this test.
3. Non-compliance:
- a. In the event that any VPB component fails to meet the requirement stipulated in sub-clause (2)(d) above:
 - i. Carry out re-test to the non-complying VPB component, after repaired according to the Approved remedial works, and until the criteria stipulated in sub-clause (2)(d) above are complied with;
 - ii. Carry out further water flood tests to the batch of VPB components represented by the non-complying VPB component according to the following formula:
Nos. of further water flood tests = $(n^2 - 2n + 3)$
Where n is equal to the total number of the failed water flood tests progressively until all the water flood tests complied with the criteria specified;
 - iii. Bear all associated costs and expenses incurred for the re-tests and further tests. No extension of time will be allowed.

CON9 OFF-SITE STEEL REINFORCING BAR PREFABRICATION YARD

GENERAL

SCOPE AND TYPES

CON9.G010.A SCOPE OF OFF-SITE STEEL REINFORCING BAR PREFABRICATION YARD

1. Worksection CON9 applies where off-site steel reinforcing bar prefabrication yard (OSRPY) is adopted;
2. The scope of OSRPY in this Worksection covers the following:
 - a. Storage of steel reinforcing bar, where steel reinforcing bar is defined in Clause 1.2.18 of CS2:2012;
 - b. Cutting and bending of steel reinforcing bar;
 - c. Fabrication of reinforcement cage; and
 - d. Threading of steel reinforcing bar for coupling with reinforcement connectors.
3. This Worksection is not applicable to the prefabrication of the following:
 - a. Precast concrete component produced outside the Hong Kong Special Administrative Region; and
 - b. All fabric reinforcement.

CON9.G020.A TYPES OF OFF-SITE STEEL REINFORCING BAR PREFABRICATION YARD

The OSRPY shall be one of the following:

1. An OSRPY on the “List of Approved Steel Reinforcing Bar Prefabrication Yards” (the “List”), referred to as “Type 1 Yard”. The List has been set up and maintained by the Civil Engineering and Development Department (CEDD) in accordance with the Development Bureau Technical Circular (Works) No. 10/2018;
2. An OSRPY not on the List which includes:
 - a. An OSRPY at the Contractor’s workshop and run by the Contractor, referred to as “Type 2 Yard”;
 - b. An OSRPY other than the types in sub-clauses (1) and 2(a) above referred to as “Type 3 Yard”.

CON9.G030.X DELETED.

SUBMISSION

CON9.G110.A GENERAL

1. For Type 1 Yard, submit the following within one month from the notified date for commencement of the Works for CM’s information:
 - a. The name, address with street map of the OSRPY;
 - b. Details of the organisation structure of the OSRPY, including the management and supervision teams;
 - c. Self-certified true copy of the valid registration document under the List as stated in **CON9.G020** (1);

-
- d. Monthly production capacity of the OSRPY in terms of tonnage and the current workload;
 - e. Where carrying out of the fabrication of reinforcement cage or threading for steel reinforcing bar using reinforcement connector is involved, records showing separate approval from the Government has been obtained for such fabrication process to be carried out at this prefabrication yard; and
 - f. The storage and traceability system of steel reinforcing bar products within the Site for identifying the steel reinforcing bar and the prefabricated steel reinforcing bar products produced by this prefabrication yard and other steel reinforcing bar for on-site cutting and bending or for fabrication of reinforcement cage or threading for steel reinforcing bar using reinforcement connector for on-site installation. Approval from the CM shall be obtained for such storage and traceability system prior to the delivery of prefabricated products to the Site.
2. For Type 2 Yard, submit the following within one month from the notified date for commencement of the Works for CM's approval:
 - a. The address with street map of the OSRPY and details of the quality management system as stipulated in **CON9.G120**;
 - b. A scaled and dimensioned layout plan of the OSRPY with fenced boundaries showing locations of entrances, exits, designated storage areas for incoming steel reinforcing bar, and prefabricated steel reinforcing bar products, and areas for prefabrication;
 - c. Details of the security and traceability requirements as stated in **CON9.G310** and **CON9.G320** respectively.
 3. For Type 3 Yard, submit the following within one month from the notified date for commencement of the Works for CM's approval:
 - a. The name, address with street maps, organisation structure, and job reference of the OSRPY and details of the quality management system as stipulated in **CON9.G120**;
 - b. A scaled and dimensioned layout plan of the OSRPY with fenced boundaries showing locations of entrances, exits, designated storage areas for incoming steel reinforcing bar and prefabricated steel reinforcing bar products, and areas for prefabrication;
 - c. Details of the security and traceability requirement as stated in **CON9.G310** and **CON9.G320** respectively.

CON9.G120.A**QUALITY MANAGEMENT SYSTEM**

1. The Type 3 Yard shall be certified to the requirements of ISO 9001 and ISO 14001 by a relevant certification body accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into mutual recognition agreement with HKAS for key operations of the yard with a scope relating but not limited to storage, handling, fabrication, sampling, testing and supply of prefabricated steel reinforcing bar products in accordance with the requirements stipulated in the CS2:2012, BS4449:2005+A2:2009, BS4482:2005, BS 8666:2005, etc. where appropriate;
2. Both the Type 2 and Type 3 Yards, shall establish, document and maintain a quality management system complying with the relevant provisions of Worksection CON3.

TYPE 1 YARD

CON9.G210.A SURVEILLANCE AUDIT / INSPECTION

The CM or his representatives shall be allowed to enter the OSRPY to carry out surveillance audit / inspection at any time without advance notice. They shall be allowed to:

1. Check and make copy, if necessary, of all quality control records, test reports and certificates associated with the prefabricated steel reinforcing bar products of the Contract, which have been or will be delivered to the Site;
2. Inspect and take photo of, if necessary, all the steel reinforcing bars and prefabrication steel reinforcing bar products of the Contract at the designated storage area and the prefabrication lines.

CON9.G220.A TRACEABILITY

When the prefabricated steel reinforcing bar products are delivered to Site, they shall be affixed firmly with traceability tags which shall include, but not be limited to, the information such as contract title, contract number, delivery note number / stockist certificate number, test report number, bending schedule number, bar marks, shape, bar size quantity and fabrication date.

CON9.G230.A PREFABRICATED STEEL REINFORCING BAR PRODUCTS SUMMARY REPORT

Submit a summary report on the prefabricated steel reinforcing bar products monthly or at an interval agreed by the CM. The report shall include, but not be limited to, the following:

1. Quantities of each size of each type of prefabricated steel reinforcing bar products delivered to the Site but not yet installed at the beginning of the reporting period;
2. Quantities of each size of each type of prefabricated steel reinforcing bar products delivered to the Site within the reporting period;
3. Tentative quantities of each size of each type of prefabricated steel reinforcing bar products planned to be delivered to the Site in the next reporting period;
4. Accumulated quantities of each size of each type of prefabricated steel reinforcing bar products delivered to the Site since the notified date for commencement of the Works;
5. Bending schedule of each size of each type of prefabricated steel reinforcing bar products delivered to the Site within the reporting period with details of bar marks, bar types, bar size, quantities, dimensions, bending shape codes and weights;
6. Copy of mill certificates issued by the stockist suppliers and the test report issued by the Direct Testing Contractor (DTC) and / or Housing Department's Materials Testing Laboratory (HDMTL) and / or CEDD's Public Works Laboratories showing that the test results of the prefabricated steel reinforcing bar products delivered to the Site within the reporting period meet the requirements of CS2:2012 or BS4449:2005+A2:2009 as appropriate.

**CON9.G240.A OFF-SITE STEEL REINFORCING BAR PREFABRICATION YARD
REMOVED FROM THE LIST**

All prefabricated steel reinforcing bar products produced by the Type 1 Yard and delivered to the Site shall be attached with a certificate issued by the OSRPY confirming that all the products are fabricated under a valid registration of the List. In the event that the OSRPY is removed from the List, all of the OSRPY's products, fabricated on and after the removal date, whether or not delivered to the Site shall not be used. Bear all time and cost for, including but not be limited to, the removal of non-conforming prefabricated steel reinforcing bar products delivered on Site, dismantling the non-conforming prefabricated steel reinforcing bar products that were installed, reinstating and making good all damages to the Works arising out of or in connection with the removal of the OSRPY from the List and no extension of time or monetary claims will be entertained under the Contract.

TYPE 2 AND TYPE 3 YARDS**CON9.G310.A REQUIREMENTS ON SECURITY PROCEDURE**

1. The CM and his representatives shall be allowed to enter the OSRPY to carry out inspection at any time without advance notice. They shall be allowed to:
 - (a) Check and make copy, if necessary, of all quality control records, test reports and certificates associated with the prefabricated steel reinforcing bar products of the Contract, which have been or will be delivered to the Site;
 - (b) Inspect and take photo of, if necessary, all the steel reinforcing bars and prefabrication steel reinforcing bar products of the Contract at the designated storage area and the prefabrication lines.
2. At least two closed circuit television (CCTV) cameras shall be provided at opposite corner of the designated storage area to monitor and video record all of the steel reinforcing bar stored at the designed storage area at all times subject to CM's satisfaction that the Contractor's proposed number and / or position of the cameras(s) can have clear and full view of the designed storage area. The CCTV cameras shall also be positioned in such a way that they can record the arrival and departure of the steel reinforcing bar to and from the designated storage area. Sign(s) shall be put up indicating the steel reinforcing bar is to be used for HA's contracts with the contract information, i.e. contract title, contract number, contractor's name, etc., of each contract clearly shown to the CCTV for ease of identification and monitoring;
3. The internal transportation of the steel reinforcing bar between designated storage area and prefabrication lines shall be monitored by CCTV camera(s) at all times. If this cannot be achieved throughout the whole route, then the movement of the steel reinforcing bar shall be monitored and recorded by a car video recorder or an equivalent equipment at all times during the transportation. Sign(s) shall be put up on top of the steel reinforcing bar or attached at suitable location of the steel reinforcing bar with the contract information, i.e. contract title, contract number, contractor's name, etc., and clearly shown to the CCTV or equivalent equipment for ease of identification and monitoring during the transportation process;

4. The steel reinforcing bar at the prefabrication lines shall be monitored by CCTV camera(s) or equivalent equipment at all times. The video recording at the prefabrication lines shall include the recording of the arrival of the steel reinforcing bar from the designated storage area, the prefabrication process at the prefabrication lines, and the departure of the steel reinforcing bar and prefabricated steel reinforcing bar products from the prefabrication lines. Sign(s) shall be put up on top or attached at suitable location of the steel reinforcing bar and / or the prefabricated steel reinforcing bar products with the contract information, i.e. contract title, contract number, contractor's name, etc., and clearly shown to the CCTV or equivalent equipment for ease of identification and monitoring during the transportation and prefabrication process;
5. The prefabrication of the steel reinforcing bar shall be executed in a designated time slot. No prefabrication of reinforcement of other non-HA contract(s) shall be carried out in this designated time slot and in this prefabrication lines to avoid the mixing up of the steel reinforcing bar. A schedule showing the designated time slot for the prefabrication of the steel reinforcing bar shall be submitted to the CM one month prior to the commencement of prefabrication of the steel reinforcing bar or at a time interval agreed by the CM. Any revised schedule(s) shall be submitted to the CM at least one week or at a time interval agreed by the CM prior to the prefabrication of the steel reinforcing bar;
6. The external transportation of the prefabricated steel reinforcing bar products from the OSRPY to the Site shall be monitored and recorded by a car video recorder or an equivalent equipment at all times during the transportation. Sign(s) shall be put up on top or attached at suitable location of the prefabricated steel reinforcing bar products with the contract information, i.e. contract title, contract number, contractor's name, etc., and clearly shown to the car video recorder or equivalent equipment for ease of identification and monitoring during the transportation process;
7. Video records of all CCTV cameras, car video recorders and equivalent equipment, if any, shall have the date and time shown in the video, and shall be retained for 60 days. Moreover, a copy of all video records shall be submitted to the CM within 24 hours of the recording or at a time interval agreed by the CM for monitoring / inspection; and
8. Photo records as means of recording the storage and internal and external transportation of steel reinforcing bar or prefabricated steel reinforcing bar products are not acceptable unless under unforeseen incident, i.e. sudden breakdown of CCTV or video recorder. Any such incident shall be reported with the photo records to the CM within 3 days and a written report shall be submitted to the CM within 7 days of the incident. Any breakdown of CCTV or video recorder shall have their functions restored within 24 hours or a period agreed by the CM.

CON9.G320.A**REQUIREMENTS ON TRACEABILITY PROCEDURE**

1. All steel reinforcing bars shall be stored in designated storage areas. Sign(s) shall be put up at the designated storage area indicating the steel reinforcing bar is to be used for HA's contracts with the contract information, i.e. contract title, contract number, contractor's name, etc., of each contract clearly shown for ease of identification and monitoring;
2. All steel reinforcing bar shall be traceable with unique tags or equivalent means (Unique Tags) affixed firmly when the steel reinforcing bar is delivered to OSRPY. The Unique Tags shall include information such as, but not limited to, the identification that the reinforcement is to be used for HA's contract, the contract title, the contract number, the contractor's name, the delivery note number / stockist certificate number, the steel reinforcing bar's type and size and length, the bundle weight and / or number of bars, and the heat / lot number;

-
3. All Unique Tags shall always be available and kept in good condition for inspection throughout the period from delivery, storage, internal transportation and up to prefabrication processes;
 4. After prefabrication, the Unique Tags shall be updated, or a second set of traceability tags (Traceability Tags) for the prefabricated steel reinforcing bar products shall be provided, to include information such as the contract title, the contract number; the contractor's name, the delivery note number / stockist certificate number, the testing report number, the bar bending schedule number, the bar mark, the shape, the bar size, and the quantity.

CON9.G330.A**PREFABRICATED STEEL REINFORCING BAR PRODUCTS SUMMARY REPORT**

Submit a summary report on the prefabricated steel reinforcing bar products monthly or at an interval agreed by the CM. The report shall include, but not be limited to, the following:

1. Quantities of each size of each type of prefabricated steel reinforcing bar products delivered to the Site but not yet installed at the beginning of the reporting period;
2. Quantities of each size of each type of prefabricated steel reinforcing bar products delivered to the Site within the reporting period;
3. Tentative quantities of each size of each type of prefabricated steel reinforcing bar products planned to be delivered to the Site in the next reporting period;
4. Accumulated quantities of each size of each type of prefabricated steel reinforcing bar products delivered to the Site since the notified date for commencement of the Works;
5. Bending schedule of each size of each type of prefabricated steel reinforcing bar products delivered to the Site within the reporting period with details of bar marks, bar types, bar size, quantities, dimensions, bending shape codes and weights;
6. Copy of mill certificates issued by the stockist suppliers and the test report issued by the Direct Testing Contractor (DTC) and / or Housing Department's Materials Testing Laboratory (HDMTL) and / or CEDD's Public Works Laboratories showing that the test results of the prefabricated steel reinforcing bar products delivered to the Site within the reporting period meet the requirements of CS2:2012 or BS4449:2005+A2:2009 as appropriate.

MATERIALS

REINFORCEMENT GENERALLY

CON9.M010.A STOCKIST'S OR SUPPLIER'S CERTIFICATION

Submission requirements:

1. For bar reinforcement delivered to the OSRPY, submit certificates from quality assured stockist and / or supplier to demonstrate that the bar reinforcement supplied complies with the requirements of Section 4 of CS2: 2012;
2. For reinforcement delivered in the form of coil (coil reinforcement) to the OSRPY, submit certificate from quality assured stockist and / or supplier to demonstrate the coil reinforcement supplied complies with the requirements of Section 4 of CS2: 2012 or alternatively compliance of the following requirements:
 - a. The coil reinforcement has been manufactured and tested to comply with the requirements of BS 4449:2005+A2:2009 Sections 7 and 8;
 - b. The coil reinforcement is produced by a manufacturer certified by a third party certification body. The certification body shall be accredited by the Hong Kong Accreditation Service or its 'Multilateral Recognition Agreements / Arrangements' (MLA) partner(s) to the requirements of ISO 9001 for its quality management system with a scope related to good practices of reinforcing steel production to meet requirements of BS 4449:2005+A2:2009.

CON9.M020.A VERIFICATION OF SOURCE

When Instructed, provide evidence that each load of steel reinforcing bar delivered to the OSRPY forms part of the same consignment and originates from the same source as that in respect of which the specimen and the manufacturer's certificate are related.

CON9.M030.A COLOUR CODE SYSTEM OF REINFORCEMENT

Submit for Approval a colour code system in the Quality Control System as stipulated in **PRE.B8.1425** for identification of steel reinforcing bar unloaded to designated areas in the OSRPY:

1. For different batches, as defined in **CON9.T110**, before any testing:
 - a. Use white, yellow, blue, grey or other specific colours for marking at the ends of reinforcement bar or at an agreed location with the CM for the coil reinforcement;
 - b. Avoid to use any colours similar to rust and do not use green and / or red colours.
2. For each batch available with all test results, including the re-test results as permitted in the Specification, add markings in:
 - a. Green colour: for reinforcement conforming to the Specification;
 - b. Red colour: for reinforcement not conforming to the Specification.

REINFORCEMENT

CON9.M110.A BAR / COIL REINFORCEMENT

Quality requirement:

1. Bar reinforcement of hot rolled steel reinforcement shall be in accordance with CS2:2012;

-
2. Coil reinforcement of hot rolled steel reinforcement shall be in accordance with CS2:2012 or BS 4449:2005+A2:2009;
 3. The bar / coil reinforcement shall be classified as follows:
 - a. Class 1 steel reinforcing bar that is fully traceable to their manufacturer and production data;
 - b. Class 2 steel reinforcing bar that is traceable to their manufacturers and production data except their heat / cast number.

ANCILLARY MATERIALS

CON9.M210.8

COVER SPACERS

Cover spacers shall be in accordance with **CON3.M210**.

CON9.M220.8

CHAIRS AND SUPPORTS

Chair and supports shall be in accordance with **CON3.M220**.

CON9.M230.8

REINFORCEMENT TYING WIRE

Reinforcement tying wire shall be in accordance with **CON3.M230**.

WORKMANSHIP

GENERAL

CON9.W010.A STORAGE OF STEEL REINFORCING BAR DELIVERED TO OSRPY BEFORE PREFABRICATION

Store:

1. All steel reinforcing bar in designated storage area(s);
2. All steel reinforcing bar on a levelled, well-drained and maintained hard-standing ground in a manner that will avoid damage, deformation and contamination of the steel reinforcing bar;
3. Different types and sizes of steel reinforcing bar separately.

CON9.W020.A SURFACE CONDITION OF STEEL REINFORCING BAR

Surface condition of steel reinforcing bar shall be in accordance with **CON3.W020**.

CON9.W030.8 CONTAMINATED OR HEAVILY RUSTED REINFORCEMENT

Remove contaminated or heavily rusted reinforcement from the designated area of the OSRPY unless it has been cleaned or satisfactorily treated by an Approved method.

CON9.W040.A COLOUR MARKINGS OF STEEL REINFORCING BAR BY STOCKISTS OR SUPPLIERS PRIOR TO DELIVERY TO THE OSRPY

1. Obtain steel reinforcing bar preferably without red and green colour markings from stockists / suppliers;
2. If steel reinforcing bar with red colour marking, or with a colour marking covering a previous marking in red, or with green colour marking is to be supplied, then:
 - a. Provide in advance an explanation to the CM before delivery to the OSRPY. In addition, for steel reinforcing bar with red colour marking or a colour marking covering a previous marking in red, provide to the CM before delivery to the OSRPY confirmation from each of the Contractor, the stockist / supplier and owner of the OSRPY as far as it is aware, the reinforcement is not non-compliant with CS2:2012 or BS4449:2005+A2:2009 whichever is appropriate and / or is rejected by other project;
 - b. The CM may reject the use of the steel reinforcing bar if:
 - i. No explanation is provided in advance; or
 - ii. The provided explanation is not satisfactory.

FIXING REINFORCEMENT

CON9.W110.A CUTTING AND BENDING STEEL REINFORCING BAR

1. Steel reinforcing bar shall be cut and bent in accordance with the dimensional requirements of BS 8666:2005 unless otherwise shown on the Drawing;
2. For coil reinforcement, it shall be straightened before cutting and bending in accordance with sub-clause (1) above. The straightening process shall be done by Quality Assured (QA) Coil Processor with an automated machine made for this purpose.

CON9.W120.A COLD BENDING

Bend steel reinforcing bar in accordance with **CON3.W120**.

CON9.W130.8 SECURING REINFORCEMENT

Secure reinforcement in accordance with **CON3.W130**.

CON9.W140.8 LOCATING REINFORCEMENT

Provide sufficient cover spacers, chairs and supports in accordance with **CON3.W140** where appropriate.

CON9.W150.8 WELDING

Welding of reinforcement shall be in accordance with **CON3.W150**.

CON9.W160.8 CONCRETE COVER

The provision of concrete cover shall be in accordance with **CON3.W160**.

CON9.W170.8 COMPLIANCE WITH DRAWINGS

Checking of completed reinforcement shall be in accordance with **CON3.W170**.

CON9.W180.A CM'S INSPECTION

1. Ensure all prefabricated steel reinforcing bar products delivered to the Site are inspected by the CM before carrying out any work, including erecting any formwork adjacent to the reinforcement, which makes access for inspection difficult;
2. Notify the CM within 24 hours, or a shorter period agreed by the CM, prior to carrying out the inspection work.

FIXING REINFORCEMENT**CON9.W190.N QUALIFIED SUPERVISION**

Assign an OSRPY Quality Control Coordinator (OSRPY-QCC), with a minimum qualification and experience of a Grade T1 TCP under the Registered Contractor's stream in the CoPSS, to:

1. Supervise steel reinforcing bar prefabrication works and ensure that these are all carried out in accordance with approved plans and comply with the requirements on quality and workmanship;
2. Devise inspection check list of the off-site steel reinforcing bar prefabrication works;
3. Provide full time continuous supervision of the off-site steel reinforcing bar prefabrication works, including sampling of steel reinforcing bars.

CON9.W200.N INSPECTION LOG BOOK

1. Record the following details in an inspection log book:
 - a. The names and qualifications of the supervisory personnel assigned by the CM and by the Contractor as stipulated in **CON9.W190**;
 - b. The date, time, items inspected and inspection results.
2. Keep the inspection log book in the prefabrication yard and a copy of it on Site for CM's inspection when required and submit the inspection log book to the CM upon completion of the works.

TOLERANCES**CON9.W210.8 GENERAL**

The tolerances shall comply with **CON3.W210**.

TESTING

GENERAL

CON9.T010.A TESTING ARRANGEMENT

Unless otherwise stated, testing arrangement of steel reinforcing bar in the OSRPY as defined in **CON9.G020** shall be in accordance with this Worksection.

DEFINITIONS

CON9.T110.A BATCH OF STEEL REINFORCING BAR

1. Subject to the maximum tonnage in sub-clause (2) below, a batch of steel reinforcing bar is the quantity of steel reinforcing bar delivered to the OSRPY within a week under one delivery order, of one nominal diameter, and one steel grade and produced by the same manufacturer;
2. The maximum tonnage of a batch shall not exceed:
 - a. For steel reinforcing bars of diameter 20 mm and above : 200 tonnes;
 - b. For steel reinforcing bars of diameter less than 20 mm : 100 tonnes.

CON9.T120.A TESTING BY DIRECT TESTING CONTRACTOR (DTC) AND HOUSING DEPARTMENT'S MATERIALS TESTING LABORATORY (HDMTL)

Unless otherwise Approved or specified elsewhere, provide steel reinforcing bar samples to the CM for testing by the DTC and / or HDMTL.

CON9.T130.A TESTING PROGRAMME

1. Allow sufficient time for the testing of specimens;
2. For Type 1 Yard, do not commence any steel reinforcing bar prefabrication work until all relevant test specimens have successfully passed all tests carried out by the DTC and / or HDMTL and / or CEDD's Public Works Laboratories;
3. For Type 2 Yard and Type 3 Yard, do not commence any steel reinforcing bar prefabrication work until all relevant test specimens have successfully passed all tests carried out by the DTC and HDMTL.

PURCHASERS TESTING

CON9.T210.A RATE OF SAMPLING

1. For bar reinforcement and coil reinforcement complying CS2:2012, provide adequate test specimens from each batch delivered to the OSRPY in accordance with CS2:2012. The number of test specimens taken from each batch and the rate of sampling shall be in accordance with Table 10 of CS2:2012;
2. For coil reinforcement complying BS 4449:2005+A2:2009, provide samples from each batch as follows:
 - a. Class 1 coil reinforcement:

Description	No. of test specimens per batch					
	Size of batch	Tensile properties	Bend performance	Mass per metre	Chemical composition (product analysis)	Bond property

Coil Reinforcement nominal size 10 mm - 16 mm	0 - 60 tonnes	3	1	3	1	1
	each additional 60 tonnes or part of 60 tonnes	1	Nil	1	Nil	Nil
Coil Reinforcement nominal size 20 mm - 25 mm	0 - 80 tonnes	3	1	3	1	1
	each additional 80 tonnes or part of 80 tonnes	1	Nil	1	Nil	Nil

b. Class 2 coil reinforcement:

Description	No. of test specimens per batch					
	Size of batch	Tensile properties	Bend performance	Mass per metre	Chemical composition (product analysis)	Bond property
Coil Reinforcement nominal size 10 mm - 16 mm	0 - 35 tonnes	3	1	3	1	1
	each additional 35 tonnes or part of 35 tonnes	3	Nil	3	Nil	Nil
Coil Reinforcement nominal size 20 mm - 25 mm	0 - 45 tonnes	3	1	3	1	1
	each additional 45 tonnes or part of 45 tonnes	3	Nil	3	Nil	Nil

3. For steel reinforcing bar used for construction of hoardings and associated covered walkways and gantries, the rate of sampling stated in the sub-clause (1) above may be reduced at the discretion of the CM.

CON9.T220.A**PROCEDURE**

Testing arrangement:

1. Under the supervision of the CM or his representatives,
 - a. Cut and take test specimens selected at random from steel reinforcing bar in the OSRPY as defined in **CON9.G020**;
 - b. Each steel reinforcing bar specimen shall be minimum 1 m long;
 - c. Test specimens taken from coil reinforcement shall have been straightened according to BS EN ISO 15630-1:2010 Clause 4 or CS2:2012. The means of straightening the test specimen (manual, machine) shall be indicated in the test request form;
 - d. Appropriately mark and keep the test specimens or samples on yard for collection and testing by the DTC and / or HDMTL;
 - e. The test specimens or samples shall be stored in a lockable steel box before collection.

CON9.T230.A TESTING BY HDMTL

Testing samples:

1. Provide additional steel reinforcing bar specimens to HDMTL for test as follows:
 - a. Take specimens from steel reinforcing bars adjacent to those from which specimens have been cut for testing by the DTC;
 - b. Rate of sampling: approximately one for every five batches selected randomly with the same number of test specimens to be tested by the DTC for each test type as specified in **CON9.T210**, and the cumulative total number of specimens tested by HDMTL shall be approximately one-fifth of that tested by DTC;
 - c. Size of specimens / samples: in accordance with **CON9.T220**;
 - d. Scope, number of tests and method of testing as specified in **CON9.T310** and **CON9.T320**.

TESTING BY DTC**CON9.T310.A SCOPE AND NUMBER OF TESTS**

Testing samples:

1. Tests shall be carried out on each specimen in accordance with
 - a. CS2:2012 for bar reinforcement; and
 - b. CS2:2012 or BS 4449:2005+A2:2009 for coil reinforcement.
2. Number of tests on each specimen shall be in accordance with
 - a. Table 10 of CS2:2012 for bar reinforcement; and
 - b. **CON9.T210** (2) for coil reinforcement.

CON9.T320.A METHODS OF TESTING

Tests will be carried out at room temperature between 5°C and 35°C and in accordance with the following standards:

1. CS2:2012 for bar reinforcement;
2. CS2:2012 or BS4449:2005+A2:2009 for coil reinforcement.

COMPLIANCE**CON9.T410.A COMPLIANCE CRITERIA – STEEL REINFORCING BAR**

1. Bar reinforcement

A batch of bar reinforcement is deemed to comply with the Specification if the test results meet the requirements of CS2:2012. Any non-complying batch of bar reinforcement shall not be used and shall be removed from the designated area in the OSRPY;

2. Coil reinforcement

A batch of coil reinforcement is deemed to comply with the Specification if the test results meet the requirements of CS2:2012 or BS 4449:2005+A2:2009. Any non-complying batch of coil reinforcement shall not be used and shall be removed from the designated area in the OSRPY.

RE-TESTS**CON9.T510.A REQUIREMENTS FOR STEEL REINFORCING BAR**

Non-compliance:

1. Bar reinforcement

If the result of any test for bar reinforcement does not comply with the specified requirements for the property, provide additional test specimens from the same batch for additional tests for the property in accordance with CS2:2012. The number of additional specimens must be as stated in CS2:2012;

2. Coil reinforcement

For each test specimen taken in accordance with **CON9.T210** and failing to meet the requirement for the mass per meter, chemical composition, tensile properties and bend performance or bond property, two additional test specimens shall be taken from the remainder of the same batch and be subjected to the test or tests which the original specimen failed.

CON9.T520.8**STANDARD FOR REJECTION**

1. Bar reinforcement

A batch of bar reinforcement shall be deemed not complying with the specified requirements for any particular property if the result of any additional test in accordance with **CON9.T510** (1) does not comply with the specified requirements for that property. The non-complying batch of bar reinforcement shall not be used and shall be removed from the designated area in the OSRPY;

2. Coil reinforcement

For properties other than chemical composition, a batch of coil reinforcement shall be deemed not complying with the Specification if any of the additional tests in accordance with **CON9.T510** (2) fails. For chemical composition, a batch of coil reinforcement shall be deemed not complying with the Specification if any of them fails unless it is demonstrated to the CM's satisfaction by alternative method acceptable under the International Standards listed in the bibliography of BS EN ISO 15630-1:2010. The non-complying batch of coil reinforcement shall not be used and shall be removed from the designated area in the OSRPY.

EAR1 EXCAVATION AND FILLING

DESIGN

GENERAL

EAR1.D010.8

DESIGN RESPONSIBILITY

1. Submit for Approval, within 7 days of the notified date for commencement of the Works, the name and particulars of the Registered Structural Engineer (RSE) and Registered Geotechnical Engineer (RGE) who will be employed on the Project in accordance with the Preliminaries Worksection. The RSE and RGE must have relevant experience to design, supervise and control all temporary works, excavation, dewatering and any specified design and built items. Comply with PNAP APP-141 for the division of responsibilities between RSE and RGE in connection with the excavation and lateral support works;
2. Prior to the notified date for commencement of the Works, the CM has provided reference design for the Excavation and Lateral Support Works (ELSW) for permanent works construction as specified in sub-clause (2) of **EAR1.D030**. The Contractor shall review and decide whether to dispense with, adopt in full or modify the reference design provided by the CM;
3. Should the Contractor choose to adopt in full the reference design provided by the CM, the procedures for submitting the Excavation and Lateral Support Plan (ELSP) to the CM as stipulated in sub-clause (3) of **EAR1.D030** shall be followed;
4. Should the Contractor choose to dispense with or modify the reference design provided by the CM, the procedures for obtaining the CM's approval of the Contractor's design or the modified design as stipulated in sub-clause (4) of **EAR1.D030** shall be followed;
5. If the reference design provided by the CM is adopted in full by the Contractor, the Contractor shall assume full design responsibility for the said ELSW in sub-clause (2);
6. If the Contractor decides to dispense with or modify the reference design provided by the CM, the Contractor shall be solely responsible for the design of ELSW or the modified design (including submission of ELSP).

EAR1.D020.8

METHOD STATEMENT FOR TEMPORARY WORKS

1. Prior to commencement of the temporary work submit a method statement which takes account of geotechnical considerations and gives full details of all materials, plant and timing and sequence of operations involved in the construction of the temporary work, for the structures as specified in the **Project Specific Specification**;
2. As part of the information provided with the method statement submit for Approval full details of the temporary earth support systems it is proposed to use associated with the construction of the structures listed above;
3. Give due considerations to any drainage pipe works and existing retaining walls nearby along any Estate Roads;
4. Ensure particulars include, but are not limited to, the following:
 - a. A detailed programme for the works showing phases of construction with associated traffic arrangements and provision for the existing utility services necessitated by the method of construction;
 - b. Details of construction method including:
 - i. Plant, equipment and labour to be deployed;

-
- ii. Sequence for temporary works installation and excavation;
 - iii. Sequence for temporary works removal and backfilling;
 - iv. Temporary drainage measures to prevent flooding during rainstorms.
 - c. The workmanship submission requirements specified at **EAR1.W050**.
 - 5. Allow adequate time in the construction programme for the CM's processing of the specified submissions. The time allowed must be in no circumstances less than 42 days. Do not commence the temporary work without the CM's consent.

EAR1.D030.8**EXCAVATION AND LATERAL SUPPORT PLAN (ELSP)**

1. Submit ELSP and allow at least the number of days as specified in the **Project Specific Specification** for obtaining CM's approval. Allow a further number of days as specified in the **Project Specific Specification** for granting of approval by CM for each ELSP re-submission. The structural calculations and drawings submitted are prepared and signed by the RSE referred to in sub-clause (1) of **EAR1.D010**. The geotechnical report / supporting documentation for the ELSP shall be prepared and signed by the RGE appointed in accordance with the Preliminaries Worksection in case of having excavation depth deeper than 4.5 m and / or involving significant geotechnical elements. ELSP submission is required where the excavation is one of the following types:
 - a. Deeper than 2.5 m and greater than 5 m in length;
 - b. Liable to affect any road, building, structure, slope steeper than 30 degrees or water main 75 mm in diameter or greater, the affected area being defined as within the 45 degree line up from the base of the excavation to the ground surface;
 - c. Of substantial depth, the collapse of which would cause serious consequences to public safety as per PNAP APP-57;
 - d. Any other ELSW requiring ELSP submission as specified by CM.

Notwithstanding the approval of the ELSP, the commencement of the ELSW shall be subject to the CM's written permission referred to in **PRE.B4.050**.
2. The reference design for the ELSW is provided for the location(s) as specified in the **Project Specific Specification** with details in reference drawings listed in Appendix U to this Specification. The reference drawings are given in good faith for the Contractor's information and reference only, and are by no means exhaustive nor represent the design provided therein or any part thereof being in compliance with the Specification. Notwithstanding these reference drawings which the Contractor is free to adopt or not, or to modify in whole or in part, the Contractor shall be solely responsible for the design (including submission of ELSP) and construction of the ELSW. The provision of these reference drawings shall not prejudice the Contractor's obligations and liabilities under the Contract;
3. Where the Contractor chooses to adopt in full the said reference design of the ELSW referred to in sub-clause (3) of **EAR1.D010**, submit ELSP based on the said reference design of the ELSW duly signed by the RSE and / or RGE as appropriate appointed in accordance with the Preliminaries Worksection and allow at least the number of days as specified in the **Project Specific Specification** to obtain CM's approval for such submission before commencement of the ELSW. Notwithstanding the approval of the ELSP, the commencement of the ELSW shall be subject to the CM's written permission referred to in **PRE.B4.050**;

4. Where the Contractor chooses to dispense with or modify the said reference design of the ELSW referred to in sub-clause (4) of **EAR1.D010**, the Contractor shall submit ELSP to CM and allow at least the number of days as specified in the **Project Specific Specification** to obtain CM's approval for the new or modified design before commencement of the ELSW. The structural calculations and drawings submitted are prepared and signed by the RSE referred to in sub-clause (1) of **EAR1.D010**. The geotechnical report / supporting documentation for the ELSP shall be prepared and signed by the RGE appointed in accordance with the Preliminaries Worksection in case of having excavation depth deeper than 4.5 m and / or involving significant geotechnical elements. Allow for a further number of days as specified in the **Project Specific Specification** for granting of approval by the CM for each ELSP re-submission. ELSP submission is required where the excavation is one of the following types:
 - a. Deeper than 2.5 m and greater than 5 m in length;
 - b. Liable to affect any road, building, structure, slope steeper than 30 degrees or water main 75 mm in diameter or greater, the affected area being defined as within the 45 degree line up from the base of the excavation to the ground surface;
 - c. Of substantial depth, the collapse of which would cause serious consequences to public safety as per PNAP APP-57;
 - d. Any other ELSW requiring ELSP submission as specified by CM.

Notwithstanding the approval of the ELSP, the commencement of the ELSW shall be subject to the CM's written permission referred to in **PRE.B4.050**.
5. The ELSP submission shall include information as specified in the **Project Specific Specification**;
6. For ELSW with pile walls and bulk excavation, comply with the following:
 - a. Refer to the **Project Specific Specification** on restrictions on commencement for pile walls driving work;
 - b. Comply with the requirements of the Approved ELSP;
 - c. At the completion of pile walls driving works, submit record plans showing the actual penetration depth of the pile walls to CM for approval. Allow at least of 22 days for granting of approval by CM on:
 - i. Certification of completion of the works using Form ICU 14;
 - ii. Commencement of bulk excavation works.
 - d. Allow sufficient time in the programme of Works for obtaining the said Approvals. Do not commence driving of pile walls and bulk excavations without written Approval for commencement from the CM.
7. For ELSW with bulk excavation only, comply with the following:
 - a. Refer to the **Project Specific Specification** on restrictions on commencement on bulk excavation works;
 - b. Allow sufficient time in the programme of Works for obtaining the said Approvals. Do not commence ELSW without written Approval for commencement from the CM;
 - c. Comply with the requirements under the Approved ELSP.

EAR1.D040.8**SHORING AND EXCAVATION PROCEDURE DETAILS**

1. Unless ELSP has been submitted in accordance with **EAR1.D030**, submit 'Shoring and Excavation Procedure Details' to CM and allow the number of days as specified in **Project Specific Specification** after obtaining CM's written approval of such procedure details for obtaining CM's written permission to commence such work;
2. Comply with the requirements under the submitted 'Shoring and Excavation Procedure Details'.

EAR1.D050.8**DESIGN PARAMETERS**

1. Design temporary works, excavation and dewatering methods and submit proposals for review and Approval. Include in the submission of the details of the temporary earth support systems the following:
 - a. Design philosophy; bearing in mind that design is such that the risk of failure is not more than that which would be adopted if the temporary works were to be permanent. Allowance may be made in the design for the shorter design life and for the risk to persons and property and the surface water and ground water conditions which are likely to occur during construction;
 - b. Detailed design calculations and drawings;
 - c. Specification for the works including procedures for installation and removal;
 - d. Prediction of deformation of the temporary works and ground settlement and horizontal movement;
 - e. Assessment of ground vibrations resulting from the temporary works that must not exceed the limits set down in **EAR2.W200**. In case where the temporary works involve installation of pile walls by percussive or vibratory methods, assessment of ground vibrations resulting from such works that must not exceed the limits set down in Appendix A of PNAP APP-137;
 - f. Precautionary measures to safeguard the integrity of the existing drainage pipe work and retaining wall in vicinity of the temporary works.
2. Refer to **EAR1.D030** on the design requirement and method of construction of the ELSW;
3. Include in the design contingency measures to be adopted should site conditions deviate from the design assumptions;
4. Ensure all calculations and drawings submitted are certified and signed by the Registered Structural Engineer referred to at **EAR1.D010** and ensure all geotechnical reports and supporting documents are certified and signed by the Registered Geotechnical Engineer referred to in **EAR1.D010**;
5. Allow in the design for the subsequent removal of the temporary works while maintaining the stability of the excavation upon completion of the Works;
6. Make a detailed submission to the CM to provide design parameters and design ground water levels with supporting document/calculation/justification for the design and:
 - a. Verify the proposed design parameters and design ground water levels by carrying out necessary Approved laboratory tests and monitoring. The CM reserves the right to reject any proposed design parameters and design ground water levels that are not to the CM's satisfaction;
 - b. Submit details of all required tests to the CM's satisfaction. Arrange for sufficient number of laboratory tests and investigation to establish the design parameters for each major stratum with sufficient independent results for that stratum. Carry out all laboratory tests and investigation for this purpose at the expense of the Contractor and bear all the time involved.
7. Where the Contractor chooses to adopt in full the reference design of ELSW for permanent works construction referred to in sub-clause (2) of **EAR1.D030**:
 - a. Refer to **EAR1.D030** on the design requirement and method of construction of the ELSW;
 - b. Include in the design contingency measures to be adopted should site conditions deviate from the design assumptions;

-
- c. Submit details of all required tests to the CM's satisfaction. Arrange for sufficient number of laboratory tests and investigation to establish the design parameters for each major stratum with sufficient independent results for that stratum. Carry out all laboratory tests and investigation for this purpose at the expense of the Contractor and bear all the time involved.
 8. Where the Contractor chooses to dispense with or modify the reference design of ELSW for permanent works construction referred to in sub-clause (2) of **EAR1.D030**:
 - a. Design temporary works, excavation and dewatering methods and submit proposals for review and Approval. Include in the submission of the details of the temporary earth support systems the following:
 - i. Design philosophy; bearing in mind that design is such that the risk of failure is not more than that which would be adopted if the temporary works were to be permanent. Allowance may be made in the design for the shorter design life and for the risk to persons and property and the surface water and ground water conditions which are likely to occur during construction;
 - ii. Detailed design calculations and drawings;
 - iii. Specification for the works including procedures for installation and removal;
 - iv. Prediction of deformation of the temporary works and ground settlement and horizontal movement;
 - v. Assessment of ground vibrations resulting from the temporary works that must not exceed the limits set down in **EAR2.W200**. In case where the temporary works involve installation of pile walls by percussive or vibratory methods, assessment of ground vibrations resulting from such works that must not exceed the limits set down in Appendix A of PNAP APP-137;
 - vi. Precautionary measures to safeguard the integrity of the existing drainage pipe work and retaining wall in vicinity of the temporary works.
 - b. Refer to **EAR1.D030** on the design requirement and method of construction of the ELSW;
 - c. Include in the design contingency measures to be adopted should site conditions deviate from the design assumptions;
 - d. Ensure all calculations and drawings submitted are certified and signed by the Registered Structural Engineer referred to at **EAR1.D010** and ensure all geotechnical reports and supporting documents are certified and signed by the Registered Geotechnical Engineer referred to in **EAR1.D010**;
 - e. Allow in the design for the subsequent removal of the temporary works while maintaining the stability of the excavation upon completion of the Works;
 - f. Make a detailed submission to the CM to provide design parameters and design ground water levels with supporting document/calculation/justification for the design and:
 - i. Verify the proposed design parameters and design ground water levels by carrying out necessary Approved laboratory tests and monitoring. The CM reserves the right to reject any proposed design parameters and design ground water levels that are not to the CM's satisfaction;

- ii. Submit details of all required tests to the CM's satisfaction. Arrange for sufficient number of laboratory tests and investigation to establish the design parameters for each major stratum with sufficient independent results for that stratum. Carry out all laboratory tests and investigation for this purpose at the expense of the Contractor and bear all the time involved.

EAR1.D060.8**EFFECT OF WORKS ON OTHERS**

1. Where temporary work, ELSW and dewatering proposals could have an effect on the properties of others, the CM may require submission of the design proposals to be presented to the Geotechnical Engineering Office (GEO), Technical Services Division of Civil Engineering Development Department, Highways Department, Mass Transit Railway Corporation, Kowloon Canton Railway Corporation, Water Supplies Department and Drainage Services Department, etc. for comments and / or acceptance;
2. When Instructed abide by such requirements;
3. Where this is the case allow sufficient time in the programme for comment by various Government Departments. Incorporate all comments and requirements from various Government Departments into the ELSP prior to submission to CM in accordance with **EAR1.D030**;
4. Address all queries raised by the various Government Departments;
5. Do not commence construction works until formal Approval has been given.

EAR1.D070.8**INFORMATION PROVIDED BY THE AUTHORITY**

1. Drillhole data, laboratory testing data, structural design criteria and any other information relevant to the Works may be viewed at the Authority's office by appointment at any time during normal office hours;
2. The following soil parameters may be taken as reference values for design of ELSW:

Soil material	Soil Parameters				
	c' (kPa)	ϕ' (deg.)	γ (kN/m ³)	E' (MPa)	ν'

Notes to table:

- a. c' = effective cohesion of soil;
 - b. ϕ' = effective friction angle of soil;
 - c. γ = bulk unit weight of soil;
 - d. E' = Young's modulus (for drained loading); and
 - e. ν' = Poisson's ratio (for drained loading)
3. The above information is given in good faith for reference only and is not meant to be exhaustive or to be representative of the whole or any part of the Site or in any way limiting the obligations and liabilities of the Contractor under the Contract. No guarantee can be given nor responsibility be taken by the Employer or the CM for their accuracy, consistency or sufficiency, and no claim whatsoever will be entertained on account of any errors, discrepancies and insufficiency in relation to the information given.

EAR1.D080.8 GEOTECHNICAL STUDY AND GROUND INVESTIGATION

1. In addition to the general responsibilities provided under the Contract, carry out a geotechnical study and any necessary ground investigation so as to become fully aware of the geotechnical characteristics of the design of temporary works or the execution of the works;
2. Comply with the requirements as specified in **Project Specific Specification**.

EAR1.D090.8 BUILDING REGULATIONS

Carry out calculations for temporary works in accordance with the relevant Building Regulations made under the Building Ordinance, slope manual, geoguide and model specification of Geotechnical Engineering Office and the relevant British Standards. Wherever there is conflict between British Standards and Building Regulations, the latter shall take precedence.

EAR1.D100.8 DESIGN OF LOAD CARRYING ELEMENTS

Ensure all materials used as load carrying elements conform to the relevant British Standards in respect of quality, and that the design conforms with the safe working stresses laid down in those Standards.

EAR1.D110.8 TRENCH EXCAVATION

Without prejudice to other provisions in the Contract, comply with the provisions in the "Guide to Trench Excavations (Shoring Support and Drainage Measures)" published jointly by the Highways Department and the Civil Engineering and Development Department, Hong Kong Government or its updates as may be promulgated from time to time in the design of temporary support to trench excavations.

MATERIALS

DEFINITIONS

EAR1.M005.8 INERT CONSTRUCTION AND DEMOLITION MATERIAL

Rock, rubble, earth, soil, concrete, asphalt, brick, tile and masonry generated from construction and demolition works.

EAR1.M010.8 EARTHWORKS MATERIAL

Soil, rock, or inert construction and demolition material on or below the Site at the commencement of the Works, or which is imported to the Site to carry out the Works.

EAR1.M020.8 OWNERSHIP OF EARTHWORKS MATERIAL

1. Ownership of the Employer - earthworks material within the Site at the commencement of the Works, except as in sub-clause (2) below;
2. Ownership of the Contractor - earthworks material which is required to be disposed of by the Contractor is the property of the Contractor when it is removed from the Site. Dispose of in tips provided by the Contractor, unless otherwise stated in the Contract.

EAR1.M030.8 SUITABLE MATERIAL

1. Naturally occurring or processed material, or inert construction and demolition material, which at the time of deposition is capable of being compacted in accordance with the specified requirements to form stable areas of fill;
2. Grade 200 Recycled Rock Fill as **EAR1.M045** where specified in the Drawings or approved by CM;
3. Do not use unsuitable materials as listed in **EAR1.M050**.

EAR1.M040.8 PUBLIC FILL

1. Public fill shall mean the inert material arising from construction and demolition activities such as site clearance, excavation, construction, refurbishment, renovation, demolition and roadworks. Public fill comprises material including stone, rock, masonry, brick, concrete, soil and other inert material. There is no size limitation on the public fill, and a small amount of timber mixed with otherwise suitable material is permissible. The public fill may also consist of wet soil;
2. The use of public fill as fill material for earthwork may be permitted and the size limitation, transportation, stockpiling, deposit, spreading, compaction and any particular requirements of such material shall be as stated in the Contract.

EAR1.M045.8 GRADE 200 RECYCLED ROCK FILL

1. Grade 200 Recycled Rock Fill (RR 200) shall mean a type of recycled rock or inert construction and demolition material which is hard and durable, and free from cracks, veins, and other evidence of decomposition;
2. RR 200 shall be collected from the recycling facilities managed by the Fill Management Division of Civil Engineering and Development Department as specified in the **Project Specific Specification**;
3. In the event that RR200 is used in the Works, comply with the following:
 - a. Comply with the relevant ordering and collection procedures of RR 200 as specified by the CEDD;

- b. Complete and submit the order form to the CM at least 10 days before the collection of RR 200 from the recycling facilities. The ordering and collection procedures together with the order form can be obtained from the CEDD website;
- c. Make due allowance in the works programme for the time associated with ordering and collection of RR200 and bear all associated costs, and no extension of time will be allowed.

EAR1.M050.8**UNSUITABLE MATERIAL**

Other than Suitable Material and Grade 200 Recycled Rock Fill, and including the following:

1. Peat, vegetation, timber, organic, soluble or perishable material, or rubbish;
2. Swelling clays or collapsible soils;
3. Dangerous or toxic material or material susceptible to combustion;
4. Material susceptible to volume change, including marine mud, materials from swamps, nullahs, stream courses and culverts, or soil with a liquid limit exceeding 65% or a plasticity index exceeding 35%; and
5. Metal, rubber, plastic or synthetic material.

EAR1.M055.8**MARINE MUD**

The term "mud" shall be as defined in Table 11 of 'Geoguide 3: Guide to Rock and Soil Descriptions' GEO, which is broadly classified as marine deposits with fine soils of over 35% by mass of silts and clays of particle sizes up to 0.06 mm.

EAR1.M060.8**ROCK**

1. Naturally occurring hard material which in the opinion of the CM can only be removed by:
 - a. Blasting;
 - b. Pneumatic tools other than clay spades;
 - c. Wedges and sledge hammers;
 - d. Drilling and the use of mechanical bursting;
 - e. Drilling and the use of expanding agents.
2. Any isolated, solid boulder or detached piece of rock exceeding 0.2 m³.

EAR1.M070.8**TOPSOIL**

Soil capable of supporting vegetable growth.

EAR1.M080.8**EMBANKMENT**

An area on the Site, other than a foreshore or sea-bed, where the ground level is to be raised by filling in layers as part of the Works.

EAR1.M090.8**TRENCH EXCAVATION**

Excavation starting at ground level and not exceeding 5 m in width at the surface.

EAR1.M100.8**BULK EXCAVATION**

Excavation in the open, other than trench excavation.

FILL MATERIALS**EAR1.M210.8****GENERAL**

1. Use only suitable material as previously defined;

2. Unless otherwise specified, form areas of fill by general fill material;
3. Obtain fill material from excavation within the Site. If there is insufficient fill material of the required types within the Site, provide imported fill material from sources outside the Site subject to approval by the CM.

EAR1.M220.8**PARTICLE SIZE DISTRIBUTION AND TYPES OF FILL MATERIAL**

For different types of fill material, keep particle size distribution within the following table:

Type of fill material	Percentage by mass passing					
	Size		BS Test Sieve			
	400 mm	200 mm	75 mm	20 mm	600 µm	63 µm
Fine fill	-	-	100	-	-	-
General fill	-	100	75 - 100	-	-	-
Special fill	-	-	100	-	-	0 - 45
Granular fill	-	-	100	-	0 - 5	-
Rock fill (Grade 200)	-	100	20 - 75	0 - 50	-	-
Recycled rock fill (Grade 200)	-	100	20 - 75	0 - 50	-	-
Rock fill (Grade 400)	100	20 - 75	10 - 30	0 - 25	-	-

Notes to table:

1. Special fill material is to consist of material which has a liquid limit not exceeding 45%, a plasticity index not exceeding 20% and a coefficient of uniformity exceeding 50. For those special fill material which contains less than 30% by weight of particles less than 63 µm, testing on the liquid limit and plasticity index of the material is not required;
2. Granular fill material is to consist of clean, hard, durable material including recycled aggregates, rock and concrete;
3. Rock fill material is to consist of pieces of hard and durable rock of which the maximum size shall not be greater than three times the minimum dimension of individual pieces and in the opinion of the CM not more than 30% by mass is discoloured or shows other evidence of decomposition. Crushed rock or crushed concrete may be permitted subject to approval by the CM;
4. The soluble sulphate content of fill material placed within 500 mm of concrete, cement bound material or cementitious material must not exceed 1.9 grams of sulphate, expressed as SO₃, per litre;
5. The total sulphate content, expressed as SO₃, of fill material placed within 500 mm of metalwork must not exceed 0.5% by mass;
6. Well-graded material to consist of material which has a coefficient of uniformity exceeding 10;
7. Uniform-graded material to consist of material which has a coefficient of uniformity of 10 or less.

EAR1.M230.8**FILTER MATERIAL**

1. Hard, durable, inert material. When placed and compacted this material, either:
 - a. Conforms with the grading limits specified; or

-
- b. Other limits separately designed by the Contractor to suit the type of adjacent material in accordance with filter rules acceptable to the GEO, as agreed by the CM; and
 - c. Submitted to the CM at least 4 weeks prior to actual incorporation into the Works; and
 - d. Graded - in accordance with Test Method 8.2 of Geospec 3: Model Specification for Soil Testing, GEO, and free from organic or other impurities.
 2. Sampling - size of sample and method of sampling in accordance with BS 812-102:1989.

EAR1.M240.8 HARDCORE

To comprise either:

1. Rock fill, or;
2. Broken stone, hard brick, concrete or other comparable hard, inert material, free from dust, rubbish or deleterious foreign matter and capable of passing through a 150 mm diameter ring in every direction.

EAR1.M250.8 HYDROSEEDING

Refer to [Project Specific Specification](#).

EAR1.M260.8 SOFT LANDSCAPING

Refer to [Project Specific Specification](#).

WORKMANSHIP

DEFINITIONS AND SUBMISSIONS

EAR1.W010.8 AREAS OF FILL

Areas within the Site, including areas in embankments, platforms and slopes and in excavations for structures, pits and trenches, in which fill material is deposited and compacted as part of the permanent work.

EAR1.W020.8 EARTHWORKS FINAL SURFACE

The surface to which the work included in this Worksection is finished.

EAR1.W030.8 FORMATION

That part of the earthworks final surface on which a pavement, structure or utility, is constructed, or on which the blinding or bedding for a pavement, structure or utility is placed.

EAR1.W040.8 INTERMEDIATE AREAS OF FILL

Areas of fill in which fill material is deposited and compacted directly into shallow water or onto naturally occurring soft ground.

EAR1.W050.8 SUBMISSION OF PARTICULARS

Submit the following particulars of proposed methods of construction for earthworks to the CM at least 14 days before relevant work starts:

1. Details of constructional plant and haulage vehicles;
2. Methods of excavation and of deposition and compaction of fill material;
3. Use of different type of excavated material and sources of imported fill material;
4. Arrangements for stockpiling, sorting and separating excavated material, earthworks material and fill material and for reusing and disposing of such materials;
5. Methods of controlling the moisture content of fill material;
6. Methods of controlling surface water and groundwater and of protecting earthworks and earthworks material from damage due to water and from weather conditions which may affect the earthworks or earthworks material;
7. Methods of monitoring groundwater levels;
8. Methods of monitoring the ground and structures for movements;
9. Methods, with detailed design of supporting excavations adjacent to slopes, retaining walls, structures, roads, private developments or other properties;
10. Stability calculations of unsupported excavations adjacent to slopes, retaining walls, structures, roads, private developments or other properties.

USE OF BLASTING

EAR1.W110.8 USE OF BLASTING METHOD

Refer to [Project Specific Specification](#).

SURVEYS

EAR1.W210.8**DATUM**

Spot levels and contours shown on the Drawings are, unless otherwise specified, reduced to Hong Kong Principal Datum for levels and the latest edition of Hong Kong Geodetic Datum for coordinate locations.

EAR1.W220.8**COMMENCEMENT SURVEY**

1. Upon possession of the Site, and before any work is carried out, carry out and record a topographical survey of the whole of the Site in the presence of the representatives of the CM;
2. Obtain Approval to the method of survey and the instrument to be used from the CM before the commencement of the survey;
3. Submit the survey drawings to the CM within 14 days after commencement of the survey for endorsement and adopt the endorsed survey drawings as the true record of the Site at commencement;
4. Use the endorsed survey drawings for measurement of earthwork quantities as applicable;
5. Do not start earthworks on any location prior to the endorsement of the survey drawings;
6. When instructed by the CM, carry out a joint survey of the Site with the previous piling contractor immediately upon award of the Contract in the presence of the CM or his representatives as specified in **PRE.B3.080**.

EAR1.W230.8**INTERIM AND FINAL SURVEYS**

1. Carry out interim surveys at intervals requested by the CM;
2. Carry out final topographical survey upon completion of the works;
3. Follow instructions of the CM for any extra surveys required to resolve any doubts on the correctness of survey records;
4. Adopt the same process for interim, final, and extra surveys as specified in **EAR1.W220**;
5. When instructed by the CM, carry out a joint survey with the subsequent building contractor after completion of the Works and upon award of the subsequent building contract to record the site topography and the works to be handed over to the subsequent building contractor in the presence of the CM or his representatives as specified in **PRE.B9.130**.

EAR1.W240.8**SURVEY INFORMATION**

All topographical surveys:

1. Must be reduced to Hong Kong Principal Datum and coordinate locations to be to the latest edition of the Hong Kong Geodetic Datum;
2. Must include plans and sections;
3. Must be reproduced on transparent film of dimensionally stable material to scale of 1:200 (or as Instructed);
4. Must be signed by the Contractor and the responsible party involved in case of a joint survey and the CM as being a true record of the Site.

TEMPORARY WORKS, SLOPES AND GROUND DRAINAGE

EAR1.W310.8 TEMPORARY DRAINAGE SYSTEM

Rapidly disperse water, whether shed on to the excavation or earthwork or arising from any other source, including flowing into the Site from elsewhere and:

1. Obtain Approval to the discharge points of the temporary drainage and pumping systems;
2. Make all arrangements with and obtain necessary approvals and inspections from the relevant authorities for discharging water to drains, watercourses or the sea;
3. Do not start the work until the Approved arrangements for disposal of the water have been implemented;
4. Take measures to prevent floatation of new and existing structures;
5. Provide temporary watercourses, ditches, catchpits, drains, pumping or other means of maintaining the excavations and earthworks free from water;
6. Discharge the water into the permanent outfall of the piped drainage system whenever possible;
7. Provide Approved means of trapping silt on temporary systems discharging into the permanent drainage systems;
8. Ensure that temporary and permanent drainage systems are adequately maintained and clear of rubbish and debris.

EAR1.W320.8 TEMPORARY SUPPORTS TO EARTHWORKS

1. Use temporary supports or other methods to maintain excavations in a stable condition and to prevent settlement of structures or utilities due to excavation or dewatering;
2. Do not operate or park construction plant or other vehicles adjacent to excavations unless this has been allowed for in the design of the temporary works for the support of the excavation. Erect barriers at a distance from excavations not less than the depth of excavations, or where space is not permitted, at a shorter distance from excavations as agreed with the CM;
3. Do not place earthworks material or other materials adjacent to excavations unless this has been allowed for in the design of the temporary works for the support of the excavation;
4. Securely support all sides of trenches, pits, excavations, slopes or stockpiles exceeding 1.2 m vertical height/depth unless formed to a safe batter substantiated by design calculation agreed with the CM.

EAR1.W330.8 GENERAL SAFETY PRECAUTIONS

1. Carry out excavations and earthworks in such a manner to prevent erosion or slips;
2. Do not stockpile material where it might cause a landslide;
3. Do not store excavated materials adjacent to the top edge of mass excavations, slopes or stockpiles exceeding 1.2 m high unless otherwise agreed;
4. When Instructed trim and seal final faces of excavations to remove all loose rocks to prevent falling which might cause injury to workmen;
5. Limit working surfaces to safe slopes and height.

EAR1.W340.8 SAFETY PRECAUTIONS FOR OPEN EXCAVATION EARTHWORKS

1. Provide open board fencing, or equivalent, and warning signs to:
 - a. Excavations, slopes or stockpiles exceeding the following heights:
 - i. Vertical slope face: 2 m

-
- ii. Battered slope face: 3 m
 - b. Trenches or pits exceeding 2 m deep.
2. Provide temporary fencing or warning ribbons to excavations, slopes, stockpiles, trenches or pits less than the heights/depth given in sub-clause (1) above but exceeding 1.2 m.

GENERAL

EAR1.W410.8

EXCAVATION AND EARTHWORKS

1. Carry out excavations and earthworks in dry conditions unless otherwise permitted by the CM, except where the excavations and earthworks are required to be carried out in or with water or other fluids;
2. Suppress dust generation during excavation and earthworks operations by spraying the work area of any excavation or earth moving equipment operation with water or a dust suppression chemical immediately before, during and immediately after the operation so as to maintain the entire surface wet. Dispose cement, pulverized fuel ash or any other dusty materials collected by fabric filters or other air pollution control system or equipment in totally enclosed containers;
3. Control height from which excavated materials are dropped to a practical minimum;
4. Carry out the formation of cuttings and filling in such a manner that the surfaces have at all times a sufficient minimum crossfall and, where practicable a sufficient longitudinal gradient to enable them to shed water and prevent ponding;
5. Adopt a method of working which minimises the area of exposed soil across the Site;
6. Carry out excavation to the lines, levels, dimensions and slopes specified;
7. Carefully level the bottom of excavation and step or bench horizontally as specified.

EAR1.W420.8

PROTECTION FROM WATER AND WEATHER

1. Keep earthworks after site clearance, excavation or filling and earthworks material after excavation free of water and:
 - a. Protect from damage due to water;
 - b. Protect from exposure to weather conditions which may affect the earthworks or earthworks material.
2. Take measures including but not limited to the following:
 - a. Use temporary drainage, pumping systems or other effective measures approved by the CM. Intercept silt and debris with traps before water is discharged from the Site;
 - b. Obtain Approval from the CM for the discharge points of temporary drainage and pumping systems. Make all arrangement with and obtain the necessary approvals and inspections from the relevant authorities for discharging water to drains, watercourses or the sea. Do not start the relevant works until the approved arrangements for disposal of the water have been implemented;
 - c. Do not carry out works in weather conditions that may adversely affect the works unless protection by methods agreed by the CM is provided;
 - d. Maintain surfaces in a stable condition;
 - e. Form surfaces to falls to shed water and to prevent ponding;
 - f. Keep the area of exposed surfaces to a minimum;
 - g. Seal or cover with impermeable sheeting or protect by other Approved methods surfaces which are temporarily exposed.

EAR1.W430.8 WORK NEAR SLOPES

Do not carry out excavations on or adjacent to slopes unless measures are taken to drain the excavation and to prevent water from the excavation entering the slopes.

EAR1.W440.8 UNSUITABLE EARTHWORKS MATERIAL

1. Replace the following materials or deal with by the methods agreed by the CM:
 - a. Earthworks material which has been used, or is required for use, in the permanent work and which is allowed to become unsuitable such that in the opinion of the CM it no longer complies with the specified requirements for that type of material;
 - b. Earthworks material which is not specified to be excavated and which the Contractor causes or allows to deteriorate such that in the opinion of the CM the permanent work will be affected.
2. Dispose of all unsuitable material;
3. Material provided to replace earthworks material, which has been allowed to become unsuitable, or which the Contractor causes or allows to deteriorate, shall be an equivalent material approved by the CM. The replacement material shall have the same volume after compaction as the material replaced.

EAR1.W450.8 ADDITIONAL EXCAVATION AND STABILIZATION

When Instructed, carry out additional excavation to remove earthworks material which in the opinion of the CM has inadequate strength, durability or stability and treat the voids as follows:

1. Deposit and compact general fill, fine fill, or special fill material below areas of fill and below formations other than in rock;
2. Place and compact Grade 10 concrete as specified in Worksection CON1 below formations in rock;
3. Deposit granular fill material below standing water;
4. In other circumstances where the CM requires stabilisation of existing material, use rock fill material (Grade 400) deposited directly into the original material and compacted to form a stable foundation on which to construct the subsequent work.

EAR1.W460.8 HANDLING AND STORAGE OF EARTHWORKS MATERIAL

1. Do not handle or store in a manner which will result in segregation, deterioration, erosion or instability of the material;
2. Keep different types of earthworks material separate from each other. Maintain earthworks material which is suitable for use as fill material in a suitable condition and free from contamination by other materials;
3. Stockpile excavated materials away from nullahs, stream courses and covered culverts at a point convenient for direct loading onto transport in such a manner as to cause the minimum nuisance to the public;
4. Remove topsoil when required before starting excavation or filling and, unless otherwise specified, deposit on Site in temporary heaps not greater than 2 m in height for re-use. Ensure the soil is kept free from contamination and undue compaction;
5. Temporary spoil heaps will not be allowed in certain areas. Obtain CM's permission for location;
6. Level and drain properly the material handling and storage areas. Spray stockpiles of material with water or a dust suppression chemical to minimize dust generation.

EAR1.W470.8 EXISTING DRAINS AND SERVICES

During excavation and earthworks:

-
1. Take all precautions to prevent damage and excessive settlement to existing drains and services;
 2. Notify the CM and the Authority of any damage and any settlement in excess of the limits allowed by relevant authority immediately and make good;
 3. Temporarily divert ditches, land drains and other waterways found in excavation and subsequently reinstate to Approval;
 4. Excavate by hand adjacent to utilities that are known, proven or suspected to exist.

EAR1.W480.8 EXCAVATION ADJACENT EXISTING STRUCTURES

Excavate by hand unless otherwise permitted by the CM.

EAR1.W490.8 TRIMMING

Neatly trim the face of excavations. Do not trim the side faces of excavation for at least 24 hours after placing any blinding concrete.

EAR1.W500.8 EXCAVATION OF TRENCHES FOR UTILITIES

1. The length of trench excavation left open at any one time shall not exceed that agreed by the CM;
2. Unless otherwise permitted by the CM, do not excavate trenches for utilities in areas of fill until the fill material has been deposited and compacted up to the earthworks final surface or formation or up to 1 m above the top of the utility, whichever is lower.

OBSTRUCTIONS**EAR1.W610.8 BURIED OBSTRUCTIONS**

Notify the CM without delay of the location and nature of any unforeseen obstruction encountered during excavation.

EAR1.W620.8 DISUSED DRAINS AND MANHOLES

If required by the CM, take up disused drains encountered during the excavation, clear away and:

1. Remove any contaminated earth;
2. Disinfect as necessary and seal off ends with concrete;
3. Break up and remove disused manholes and backfill where required, properly compacted;
4. Submit details of filling materials to be used for Approval.

EAR1.W630.8 OLD UNDERGROUND STRUCTURES

1. If required by the CM, break out and remove old walls, foundations, piles and other underground structures encountered during the excavation and backfill where required, properly compacted;
2. Submit details of filling materials to be used for Approval.

EAR1.W640.8 BOULDERS

Treat boulders that intersect the earthworks final surface or formation as excavation proceeds by methods agreed by the CM. Do not leave boulders protruding unless permitted by the CM.

EAR1.W650.8 PILED FOUNDATIONS

Take necessary precautions to prevent damage to tops of piles during excavation.

CUTTINGS

EAR1.W710.8 SURFACES OF CUTTINGS

Remove the following from surfaces as required by the CM:

1. Inferior stone or soft material occurring between layers of compact rock;
2. Rock which the CM considers will not withstand weather sufficiently;
3. Rock fragments which move when prised with a crow-bar.

EAR1.W720.8 DEPTH OF REMOVAL

Comply with the CM's instructions on the depth from the face of cuttings to which material is to be removed.

EAR1.W730.8 MAKING GOOD

Build up to required profile with Grade 15/20 concrete as specified in Worksection CON1 or masonry laid with cement mortar finishing in "rock texture" similar to adjoining natural rock faces.

DISPOSAL OF EXCAVATED MATERIAL

EAR1.W810.8 UNSUITABLE AND SURPLUS MATERIAL

1. Unless otherwise stated in the Contract:
 - a. Take measures to sort and separate excavated material on Site for use in the permanent works according to the Environmental Management Plan;
 - b. Dispose of the excavated material, which in the opinion of the CM cannot be selected, processed or mixed in a practical manner to make it suitable for use in the permanent work;
 - c. Dispose of excavated material that is surplus to the requirements of the permanent works. Take measures to sort and separate the surplus material according to the Environmental Management Plan before disposal.
2. Take possession of unsuitable material and surplus material, unless otherwise provided for in the Contract.

EAR1.W820.8 SUITABLE MATERIAL

Do not remove suitable material from Site without the permission of the CM, unless surplus to the requirements of the Contract.

EAR1.W830.8 DUMPING OF UNSUITABLE AND SURPLUS MATERIALS

Inform the CM of the proposed dumping areas and take responsibility for making arrangements for disposal of these materials. Notwithstanding the foregoing, the CM retains the right to direct the manner in which the dumping is carried out.

EAR1.W835.8 DISPOSAL OR REUSE OF MARINE MUD

Refer to [Project Specific Specification](#).

EAR1.W840.8 ON SITE SORTING OF CONSTRUCTION AND DEMOLITION MATERIALS

1. All construction and demolition (C&D) materials arising from or in connection with the works shall be sorted on-site and be separated into different groups for disposal at landfills, public filling areas, in filling areas within the Site, in filling areas outside the Site provided by the Contractor, or recycling as appropriate. The inert portion of the C&D material is the public fill. All public fills to be disposed of at public filling areas shall be sorted and broken down according to the Dumping Licence conditions. The non-inert portion of the C&D material is the C&D waste which shall be disposed of at the landfill;
2. Unless otherwise stated in the Contract, all C&D material arising from or in connection with the works shall become the property of the Contractor when it is removed from the Site. Promptly remove all sorted and processed materials arising from or in connection with the works from the Site on a regular basis as the works proceed;
3. A method statement for the sorting, processing and disposal of C&D materials arising from or in connection with the works shall be submitted to the CM's Representative for approval 14 days before the commencement of any sections of the Works.

EAR1.W845.8 TRIP-TICKET SYSTEM

Comply with the Trip-ticket System as specified in Preliminaries Specification for the disposal of construction and demolition (C&D) materials generated from the Works.

RETAINING WALLS, SHALLOW FOUNDATIONS AND OTHER STRUCTURES**EAR1.W910.8 SIZE OF EXCAVATIONS**

1. When excavating for structures, pits, and trenches keep to the minimum size necessary to construct the permanent work. Keep the sides of excavations vertical unless otherwise permitted by the CM;
2. Obtain Approval for the length of trench excavation left open at any one time and do not exceed that amount.

EAR1.W920.8 APPROVAL OF EXCAVATION BOTTOMS

Bottoms of excavations are to be Approved before any new work is laid on them. Inform the CM when the excavation is ready for inspection.

EAR1.W930.8 FOUNDING OF SHALLOW FOUNDATIONS

1. All shallow foundations (rafts or pads) of the structures specified in **Project Specific Specification** shall be founded on material of the type and / or bearing capacity specified and at the founding levels shown on the drawings unless otherwise instructed by the CM;
2. The founding bases of shallow foundations shall be free of unsuitable materials. If the base lies below the groundwater table and where necessary, proper means shall be provided to divert and / or lower the groundwater such that the integrity of the exposed founding material(s) and the subsequent concrete casting will be ensured;

3. Sink drillholes for carrying out Standard Penetration tests (SPT) in accordance with BS EN ISO 22476-3:2005, modified by Geoguide 2 as necessary, to the founding materials (except for foundations on rock). The SPT shall be carried out by a contractor on the Housing Authority List of Ground Investigation Contractors. The minimum number and depth of the drillholes shall be as specified in **Project Specific Specification**. Unless otherwise Instructed, commence the drillhole at existing ground level before excavation for the foundations and carry out the SPT at intervals as specified in **Project Specific Specification**. Submit to the CM the preliminary test reports within 2 days and the final test reports within 2 weeks upon completion of the SPT;
4. If Instructed, carry out Plate Load Test for shallow foundations (except for foundations on rock) in accordance with **GIN.T190** and the Code of Practice for Foundations issued by the Buildings Department;
5. If Instructed, take down the excavations for founding of shallow foundations (except for foundations on rock) first to not less than 300 mm above the designed founding level and carry out dynamic probe tests or other tests. The dynamic probe tests shall be in accordance with Appendix 7.1 of the 'General Specification for Civil Engineering Works', The Government of the Hong Kong Special Administrative Region, 2006 Edition. Submit the test results within 2 days and a record plan showing all the locations and levels of the dynamic probe tests within 1 week upon completion of the tests;
6. If considered necessary after examining the actual ground exposures and / or test results, the CM may order further excavation to deepen the founding level of the foundations and / or other measures to ensure a satisfactory foundation. The bases shall be inspected and approved by the CM before concreting;
7. If considered necessary the CM may order compaction of the whole or parts of the founding bases of shallow foundations by at least 12 passes of a vibratory roller, or other accepted construction plant, with a minimum static load per 100 mm width of roll of 2kN or 4kN. In areas adjacent to structures and utilities, which are existing or constructed as part of the permanent works, compaction shall be carried out by hand-rammers or manually operated power equipment in a manner that these structures and utilities are not disturbed or damaged.

EAR1.W940.8**PROVING BEDROCK FOR FOOTINGS (RAFTS AND PADS)**

1. Where footings (rafts/pads) are specified to be founded on bedrock, carry out proving of bedrock in accordance with the following sub-clauses as directed by the CM. Clear completed excavations for footings of all soils and loose materials;
2. Footings shall be founded on bedrock of minimum bearing capacity as specified in **Project Specific Specification**;
3. When Instructed, upon excavation reaching bedrock, take NX size cores for a depth of 5000 mm into the bedrock and provide rock core samples and records of bores for the CM's inspection; cores to be taken at the frequency as specified in **Project Specific Specification**;
4. When Instructed, carry out laboratory compression tests or field point load tests on recovered cores to determine rock strength;
5. Fill core holes for the full depth with 1:3 cement and sand grout with water/cement ratio of 0.6;

6. When Instructed, upon excavation reaching bedrock, proving test at the frequency as specified in the **Project Specific Specification** shall be conducted with a percussive air rock drill to be supplied by the Contractor, of not less than 35 kg in weight and fitted with newly sharpened 40 mm diameter steel drilling bit. The proving test shall be performed with 25 mm diameter steel drilling rods. At the completion of each 1.5 m of drilling, the drilling bit shall be replaced with a newly sharpened 40 mm diameter bit. Additional lengths of drilling rock shall be fitted at that time as appropriate. The rock drill shall be at all times free to penetrate under its own weight and in a vertical direction. Perform the proving test by drilling minimum 5.0 m below the founding level. The results of each proving test shall be recorded by the Contractor, and he shall plot the time in minutes taken to drill each 300 mm on a graph. A 20 mm diameter steel rod 5.5 m long shall be placed in each completed drillhole for the CM's inspection. Fill drill holes for the full depth with 1:3 cement and sand grout with water/cement ratio of 0.6.

REMEDIAL WORKS

EAR1.W1010.8

EXCAVATION BOTTOMS DAMAGED AFTER APPROVAL

If, due to water or other causes, the bottom of the excavation becomes unsuitable after Approval, excavate further to a new Approved level, and backfill with Grade 15/20 concrete as specified in Worksection CON1.

EAR1.W1020.8

OVER EXCAVATION

Backfill and compact in accordance with this Specification or other Approved means those areas where the Contractor's method involves excavation in excess of that specified.

EAR1.W1030.8

DAMAGED SURFACES

1. Make good surfaces after excavation which, due to exposure to weather conditions, flooding or other cause, have been allowed to deteriorate to a condition unacceptable to the CM;
2. Where this is the case carry out additional excavation and filling in accordance with this Specification, or by waiting until the condition of the exposed material is, in the opinion of the CM, fit to receive the backfill.

FILLING GENERALLY

EAR1.W1110.8

USE OF ROCK CRUSHING PLANT

Do not use rock crushing plant on the Site unless permitted by the CM to do so.

EAR1.W1115.8

USE OF GRADE 200 RECYCLED ROCK FILL

Where the use of Grade 200 Recycled Rock Fill (RR 200) is specified in the Contract, comply with the requirements stated in **EAR1.W1720** to **EAR1.W1750** and **EAR1.W1910** to **EAR1.W1930** in respect of the deposition and compaction of this material.

EAR1.W1120.8

HAULAGE OF FILL MATERIAL

Do not haul fill material to the area of fill until compaction plant operating at the area of fill is sufficient to achieve the specified requirements for relative compaction of the fill material.

EAR1.W1130.8 REMOVAL OF EARTHWORKS MATERIAL

Do not remove from the Site any earthworks material that is required for use in the permanent work as fill material without prior Approval. Notify the CM before any earthworks material is removed from the Site.

PREPARATION FOR FILLING**EAR1.W1210.8 EXISTING GROUND**

Prepare the surfaces on which fill material is to be deposited after site clearance in accordance with the following requirements:

1. Remove topsoil, grass, and other organic matter;
2. Remove soft spots, boulders, and other materials, which in the opinion of the CM are unsuitable or unstable;
3. Deal with voids as stated in the Contract or Instructed.

EAR1.W1220.8 WATER-COURSES

Do not place fill material until watercourses have been diverted or under-drained.

EAR1.W1230.8 SLOPING GROUND

1. Cut benches and install sub-soil drainage system as stated in the Contract;
2. Do not place fill material on sloping ground until benches have been completed at the area receiving the fill material.

EAR1.W1240.8 AVAILABILITY OF PLANT

Commence filling works only when sufficient compaction plant is in operation at the place of deposition to ensure compliance with the requirements of this Specification and when the CM's permission has been obtained.

EAR1.W1250.8 SCARIFYING

Scarify surfaces other than rock to a depth of 200 mm and compact to the same standard as the fill material which is to be deposited.

FILLING OPERATIONS**EAR1.W1310.8 DISPOSAL OF WATER**

1. Keep the fill area free of water;
2. Leave surfaces with no area that can retain water at the end of each day's work and, if necessary, cut ditches to achieve this.

EAR1.W1320.8 APPROVAL

Obtain Approval before deposition of fill material starts and before any fill layer is covered.

EAR1.W1330.8 ADVERSE WEATHER CONDITIONS

Stop work when the state of the weather is such that, in the opinion of the CM, it will adversely affect the placing and compacting of fill.

EAR1.W1340.8 APPROVAL OF REMEDIAL MEASURES

Obtain Approval for and prior to carrying out remedial measures.

EAR1.W1350.8 REMEDIAL MEASURES FOR DAMAGED FILL AREAS

Adopt one of the following procedures when material placed and compacted or awaiting compaction reaches a condition which, in the opinion of the CM does not comply with this Specification or has been damaged either by weather or in any other way:

1. Remove the material from Site, replacing it with equivalent suitable material;
2. Remove the material to stockpile until it is in a condition suitable for re-use;
3. Make good the material by mechanical or chemical means;
4. Cease work on the material until it is in a suitable physical condition for re-use.

EAR1.W1360.8 REMEDIAL MEASURES WHERE FILL OVERLAID

Remove, and adopt sub-clause (1) or (2) in **EAR1.W1350** for any material not complying with this Specification that has been overlaid by more recently laid material.

EAR1.W1370.8 RESTRICTIONS ON USE OF FILL MATERIAL

1. Do not use excavated material required for use in the permanent works which is capable of being selected, processed and mixed to make it suitable for use as fill material for any other purposes unless permitted by the CM;
2. Replace any such excavated material which the CM permits to be removed from the Site or used for other purposes by an equivalent Approved material of the same volume after compaction as the material replaced.

EAR1.W1380.8 MIX PROPORTIONS, MIXING AND PLACING RECONSTITUTED SOIL

1. For reconstituted soil use 1:3:12 cement, sand, special filling material by weight;
2. Mix in a concrete mixer with sufficient water to ensure the mix is just damp enough to enable it to be properly mixed and compacted;
3. Place each batch in its final position and compact within 30 minutes of the water being added. Mixed material not placed and compacted within this time limit will be rejected;
4. Hand mixing of small quantities may be permitted by the CM.

EAR1.W1390.8 SETTLEMENT

Make good, to the satisfaction of the CM, settlement in filling and backfilling and any consequential damage that may occur up to the end of the Maintenance Period.

FILLING FOUNDATION PITS AND TRENCHES ETC**EAR1.W1410.8 ADJACENT UTILITIES OR STRUCTURES**

1. Within 500 mm of a structure or utility except as stated in **EAR1.W1420**, deposit fill material of:
 - a. Fine fill material, unless otherwise stated in the Contract;
 - b. The fine fill material may contain no more than 5% by weight of fresh, slightly decomposed or moderately decomposed rock fragments of up to 200 mm maximum size provided that these rock fragments do not cause any damage to the structures or utilities and do not interfere with compaction requirements.
2. Do not deposit fill material adjacent to or above structures or utilities until the construction of the structure or utility is sufficiently advanced to accept the imposed forces without disturbance or damage;
3. Deposit evenly on all sides of structures or utilities and in such a manner that the structure or utility is not disturbed or damaged;
4. Compact the fill material in such a manner that the structure or utility is not disturbed or damaged;

5. Where sheet piling, timbering or other temporary supports to the excavations are not to be left in place, remove the sheet piling, timbering or other temporary supports as deposition of fill material proceeds, in such a manner that the stability of the adjacent ground is maintained and the compacted fill material is not disturbed.

EAR1.W1420.8 FILLING AROUND WATER, SEWERAGE AND DRAINAGE PIPES

Where these have been laid as part of the permanent works:

1. Use special filling material unless otherwise stated in the Contract;
2. Deposit the fill material in layers not exceeding 100 mm thick to a level of 300 mm above the top of the pipe;
3. Deposit the fill material in such a manner that the layer on one side of the pipe is not more than 100 mm higher than the layer on the other side;
4. Compact the fill material by hand rammers or manually operated power equipment;
5. Compact the fill material within 300 mm above the top of sewage and drainage pipes to obtain a relative compaction of at least 85% throughout.

EAR1.W1430.8 BACKFILLING TO FOUNDATIONS

Backfill to top of foundations with general filling materials.

EAR1.W1440.8 BACKFILLING TO TRENCHES FOR AUTOMATED REFUSE COLLECTION SYSTEM (ARCS)

Backfill to top of trenches with excavated or Approved general filling materials. Cover to ARCS conveyance pipe to be minimum 600 mm generally and 800 mm in vehicle circulation areas.

FILLING EXISTING WATERCOURSES**EAR1.W1510.8 PREPARATION**

Divert existing watercourses and channels as required and clear the same of all vegetation growth and unsuitable material.

EAR1.W1520.8 FILLING

Filling materials and method of construction to be used are specified in [Project Specific Specification](#).

BACKFILLING BEHIND RETAINING WALLS**EAR1.W1610.8 PLACING FILTER MATERIAL**

1. Carefully place filter material to avoid contamination and damage;
2. Bed in layers simultaneously with the filling material and compact.

EAR1.W1620.8 FILLING

Unless otherwise specified place special filling material as backfilling and compact by the Performance Specification method of compaction: [EAR1.W1810](#) - [EAR1.W1860](#). Compaction plant is to be of such a size as to ensure that no undue stress is placed on the wall during compaction.

FORMING EMBANKMENTS AND PLATFORMS**EAR1.W1710.8 MATERIAL SELECTION**

Form embankments with special fill material unless otherwise specified.

EAR1.W1720.8 DEPOSITION OF FILL MATERIAL

1. Deposit fill material obtained from excavation within the Site in its final location as soon as practicable after it has been excavated;
2. Build up embankments evenly over the full width;
3. Control the construction method to ensure that any compaction of the fill material resulting from the passage of construction plant or haulage vehicles is uniform;
4. In areas of fill formed of fill material other than rock fill material, form earthworks final surfaces sloping at a gradient exceeding 1 to 3 (vertical to horizontal) by over-filling and cutting back after compaction. Extend the over-filling beyond the earthworks final surface by a horizontal distance of 500 mm or three times the thickness of the compacted layer, whichever is greater;
5. Deposit fill material in layers of a thickness appropriate to the compaction method to be used. In deposition of fill material, ensure that a good bonding is achieved between layers of fill, and unless otherwise directed by the CM, do not place fill material on previously compacted layers unless the surface has been scarified or otherwise broken up and, if necessary, watered.;
6. Unless otherwise permitted by the CM, construct layers of fill material horizontally, except for any gradient required for drainage, and keep the thickness of each layer uniform over the area to be filled. Bring up the fill material from the bottom in uniform horizontal layers, with the top of each layer graded to enable surface water to drain readily;
7. If the difference in level between adjacent areas to be filled exceeds 1 m, bench the edge of the higher area before fill material is placed against it;
8. Except for intermediate fill area, do not deposit fill material by end-tipping, by pushing loose material down slope faces or by other methods which may result in segregation or inadequate compaction of the fill material;
9. Make good damage to compacted layers caused by construction traffic.

EAR1.W1730.8 COMPACTION

1. Compact filling material, other than rock fill and material as stated in **EAR1.W1940** in accordance with the Compaction by Performance Specification: **EAR1.W1810 - EAR1.W1860** unless otherwise specified;
2. Compact rock fill material in accordance with the Compaction by Method Specification: **EAR1.W1910 - EAR1.W1930**;
3. Compact general fill material with a large portion of coarse material in accordance with **EAR1.W1940**.

EAR1.W1740.8 ROCK FILL EMBANKMENTS AND PLATFORMS

1. Place rock fill material so that the final compacted thickness of each layer exceeds 1.5 times and does not exceed twice the nominal Grade size of the rock fill material;
2. Spread and level the fill material by a crawler tractor weighing not less than 15 tonnes and compact the fill material in accordance with the Compaction by Method Specification: **EAR1.W1910 - EAR1.W1930**;
3. Ensure each layer consists of reasonably graded rock and fill the surface voids with fragments of rock before the next layer is deposited.

EAR1.W1750.8 BLINDING ROCK FILL EMBANKMENTS AND PLATFORM

1. Blind the top surface and side slopes with fine fill material to seal the surface;
2. Top soil may be used to blind side slopes and verges.

EAR1.W1760.8 ISOLATED BOULDERS

At the discretion of the CM isolated boulders, each within the range 0.015 m³ to 0.1 m³ in volume, may be incorporated into embankments not of rock fill, provided that the specified compaction requirements are met. Any boulders exceeding 0.015 m³ must be placed at a minimum of 2 m below formation level of carriageways or hard shoulders.

EAR1.W1770.8 CULVERTS AND DRAINS ETC

Form embankments equally on both sides of culverts or drain pipes and the like.

EAR1.W1780.8 SURFACES USED BY CONSTRUCTION TRAFFIC

1. Where surfaces of embankments are required for use by construction traffic, build up and maintain at a minimum of 300 mm above formation level, the area between extremities of carriageways, including any central reserve and hard shoulders before subsequently trimming to formation level;
2. Make good surface damage;
3. Ensure that no construction traffic uses the area once trimming to final formation level has commenced, with the exception of constructional plant necessary for such trimming and ensure that no damage is caused to the surface by such constructional plant.

REUSE OF MARINE MUD FOR BACKFILLING**EAR1.W1785.8 REUSE OF MARINE MUD FOR BACKFILLING**

Where specified to reuse marine mud for backfilling, at least 28 days before commencement of excavation works, obtain CM's approval for backfilling with cement-stabilized marine mud, which shall have undergone an approved cement-stabilization process to avoid undue ground settlement in future, and comply with the following requirements:

1. Submit a detailed method statement of the proposed cement-stabilization and backfilling processes, which shall include but not be limited to the method and procedure of the proposed cement-stabilization process, the sorting and temporary storage of the materials to prevent cross-contamination with other materials, the mix proportion with cement, granular soil, water and other approved additives, the methods of mixing, backfilling, compacting, curing, sampling and testing of the cement-stabilized materials to achieve 7-day cube test of 100 kN/m² minimum in accordance with CS1;
2. Prepare sufficient test samples on Site and test the cement-stabilized materials at 7-day in accordance with CS1 for determination of the 7-day cube strength to demonstrate the suitability of the proposed mix proportion and method of construction. Appoint a HOKLAS accredited testing laboratory approved by the CM to carry out the test;
3. Carry out trials on Site and all necessary testing to demonstrate the suitability of the proposed cement-stabilization and backfilling processes for the Works to the satisfaction of the CM;
4. Backfill with and compact the cement-stabilized materials in accordance with the approved method statement and in layers of not greater than 300 mm thick to achieve a standard of compaction as stipulated in [EAR1.W1850](#) and [EAR1.W1860](#), unless otherwise approved by the CM;
5. All areas backfilled with cement-stabilized marine mud should be covered on top by suitable materials all in accordance with Worksection EAR1 and/or other specified materials for a minimum thickness of 500 mm;

6. For piling works, do not backfill the fill areas between future ground level and 1.5 m below the future ground level with cement-stabilized marine mud unless otherwise approved by the CM;
7. Do not backfill the fill areas between top of pile caps and underside of ground slabs of domestic blocks with cement-stabilized marine mud without CM's prior approval. Restrictions on backfilling of cement-stabilized marine mud for external areas are as follow:

Pipes/ducts	Range in level at carriageway where ducts/pipes are located with which no backfilling of Cement-Stabilized Marine Mud is allowed	Range in level at locations other than carriageway where ducts/pipes are located with which no backfilling of Cement-Stabilized Marine Mud is allowed	Drainage for Cable /valve pit required
Water Pipes	From FGL to - 1400 mm below FGL	From FGL to - 1000 mm below FGL	Yes
Gas Pipe	From FGL to - 1300 mm below FGL	From FGL to - 1000 mm below FGL	Yes
Power Cable Duct	NA	NA	Yes
Telecom Cable Duct	NA	NA	No.

(FGL = Finished Ground Level)

Backfilling by cement-stabilized marine mud directly underneath the cable pits or valve pits is not allowed for proper drainage of water from the pits. Water pipes and gas pipes are not allowed to be directly surrounded by backfilled cement-stabilized marine mud for ease of maintenance. Cable ducts are allowed to be surrounded by cement-stabilized marine mud subject to proper coordination of works sequence with utility undertakings and sub-contractors;

8. Sink drillholes for carrying out Standard Penetration Tests (SPT) in accordance with BS1377:Part 9:1990 (Test 3.3), modified by Geoguide 2 at 1.5 m intervals to below the backfilled material to demonstrate that the relative strength of the stabilized material is achieved. Appoint a contractor on the Housing Authority List of Ground Investigation Contractors to carry out the SPT 7 days after backfilling. The minimum number of the drillholes shall be one drillhole for 100 m³ of the backfilling or part thereof in each foundation base on each operation day, and to a depth and location as directed by the CM;
9. Submit to the CM preliminary test reports within 1 day and final test reports within 1 week upon completion of the SPT;
10. In any situation, a SPT N-value of less than 10 shall render the backfilling unsuccessful. In this situation, submit a remedial proposal, which shall include but not be limited to excavation of the backfilled material, adjustment of the mix proportion and method of construction, and re-execution of the Works, to the CM for approval. Bear all costs and no extension of time is allowed for the remedial works and all associated consequences;
11. Obtain EPD's permit for disposal of all surplus cement-stabilized materials to a suitable dumping facility and dispose the materials accordingly after the backfilling. Make reference to ETWB Technical Circular (Works) No. 34/2002 and 19/2005 and other relevant regulations and guidelines for obtaining the permit;

12. Refer to the drawing in Appendix APC to this Specification for the profile of backfilling around foundations.
13. Provide adequate personal protective equipments to the workers to protect them against direct contact with contaminated marine mud.

COMPACTION BY PERFORMANCE SPECIFICATION

EAR1.W1810.8

PROCEDURE

1. Compact fill material in areas of fill in uniform layers to a stable condition as soon as practicable after deposition and in a manner appropriate to the location and to the material to be compacted;
2. Obtain the permission of the CM before the next layer is deposited on each layer of compact fill material;
3. Agree with the CM the thickness of each layer which is to be compatible with the compaction plant used. Carry out carefully controlled tests to determine the optimum placing thickness for the particular fill and the number of passes to achieve the required density with the compaction plant provided;
4. Do not place any permanent fill until such tests have been agreed with the CM. Earthmoving plant will not be accepted as compaction equipment.

EAR1.W1820.8

TESTING

Test each class of material to be compacted in accordance with the compaction tests specified in the Testing section of this Worksection.

EAR1.W1830.8

MOISTURE CONTENT

Other than rock fill material and the material as stated in **EAR1.W1940**, the moisture content of the fill material during compaction shall be within $\pm 3\%$ of the optimum moisture content determined in accordance with the test methods specified in the Testing section of this Worksection, provided that the fill material is still capable of being compacted in accordance with the specified requirements to form stable areas of fill. Take all necessary measures to achieve and maintain the specified moisture content.

EAR1.W1840.8

FIELD DENSITY

After compaction carry out insitu field density tests in accordance with the compaction tests specified in the Testing section of this Worksection. Test each layer and obtain Approval before placing of the next layer.

EAR1.W1850.8

STANDARD OF COMPACTION

Unless specified otherwise, compact fill material to obtain a relative compaction of at least 95% of the maximum dry density in general and at least 98% for fill within 200 mm of any formation level or slope profile.

EAR1.W1860.8

STANDARD OF COMPACTION BETWEEN PILE CAPS AND SUSPENDED SLABS AND AROUND PILE CAPS

The relative compaction of compacted material in the fill areas between top of pile cap and underside of suspended slab to be minimum 90% of the maximum dry density. Compact fill material around pile caps to achieve a relative compaction of at least 95%.

COMPACTION BY METHOD SPECIFICATION

EAR1.W1910.8

ADOPTION

Use for rock fill material and in exceptional circumstances for other suitable material when Approved.

EAR1.W1920.8 ROLLERS

Use vibratory rollers having a static load of at least 2 kN per 100 mm width of roll for layers with a compacted thickness not exceeding 500 mm, and at least 4 kN for layers with a compacted thickness exceeding 500 mm.

EAR1.W1930.8 COMPACTION METHOD

1. Compact each layer of rock fill material by at least eight passes of a vibrating roller, or by other Approved equivalent compaction method;
2. Compact the final surface of rock fill material by at least two additional passes of a vibrating roller or by other Approved equivalent method;
3. Fill voids as compaction proceeds.

EAR1.W1940.8 COMPACTION OF GENERAL FILL MATERIAL WITH A LARGE PORTION OF COARSE MATERIAL

1. For general fill material of which less than 90% passes a 20 mm BS test sieve, it will be difficult to permit determination of the moisture content and maximum dry density according to **EAR1.T350**, **EAR1.T420** and **EAR1.T540**. This type of material shall be compacted to the requirements of sub-clauses (2), (3) and (4);
2. Spread and level each horizontal layer of general fill material with a thickness not less than 1.5 times of the maximum size of the general fill material and not exceeding the maximum depth of compacted layer in accordance with the following Table. If this criterion is not met due to the presence of over-sized coarse material in the general fill, remove and break down the over-sized coarse material to sizes acceptable to the CM. Compact each layer systematically by a vibratory roller with the stipulated minimum number of passes corresponding to the minimum static load per 100 mm width of the roller;

Compaction requirement for general fill material with a large portion of coarse material				
Force per 100 mm width	Well-graded material		Uniform-graded material	
(kN)	Maximum depth of compacted layer (mm)	Minimum no. of passes	Maximum depth of compacted layer (mm)	Minimum no. of passes
0.25-0.45			150	16
0.46-0.70			150	12
0.71-1.25	125	12	150	10
1.26-1.75	150	8	200	10
1.76-2.30	150	4	225	10
2.31-2.80	175	4	250	10
2.81-3.50	200	4	275	8
3.51-4.20	225	4	300	8
4.21-4.90	250	4	300	8

3. Count only the number of passes of the roller when the roller is travelled on the material to be compacted at a speed of not more than 2 km per hour with full vibration. Disregard plant other than vibratory roller carrying out material spreading or providing some preliminary compaction, to assist the use of heavier plant in counting the number of passes;
4. Variation from the method or the use of plant different from that specified in sub-clause (2) will be permitted only if the Contractor demonstrates at site trials that equivalent compaction is achieved by the alternative method or plant. Agree with CM and obtain CM's approval on the procedure to be adopted for these site trials;

5. Without prejudice to the provision of the Conditions of Contract and in order that the CM may take proper provision for the supervision of compaction in the permanent work, apply in writing to the CM for permission to carry out compaction not less than 24 hours before the compaction process;
6. When materials of widely divergent grading are used in embankments and fill areas, spread and compact the materials in separate clearly defined areas;
7. If more than one class of material is being used in such a way that in the opinion of the CM, it is not practicable to define the areas in which each class occurs, operate the compaction plant as if only the material which requires the greatest compaction effort is being compacted.

INTERMEDIATE AREAS OF FILL

EAR1.W2010.8

DEPOSITING

Fill material may be deposited in intermediate areas of fill by end-tipping or by pushing into position until, in the opinion of the CM, it is sufficient to form a stable foundation on which to construct the subsequent work.

EAR1.W2020.8

COMPACTION

Except in areas of fill formed of rock fill material or fill material as stated in **EAR1.W1940**, compact fill material in intermediate areas of fill to a degree which in the opinion of the CM is practicable. Compact fill material above the level stated in clause **EAR1.W2010** to obtain a relative compaction of at least:

1. 90% throughout;
2. 95% within 1500 mm of earthworks final surfaces and formations; and
3. 98% within 200 mm of formations.

COMPLETION OF GENERAL EARTHWORKS SURFACES

EAR1.W2110.8

GENERAL

1. Complete earthworks final surfaces to a stable condition as soon as practicable after excavation or after deposition and compaction of fill material has been completed;
2. Carry out the subsequent permanent work or surface protection as soon as practicable after the earthworks final surface has been completed;
3. Properly treat exposed earth by compaction, turfing, hydroseeding, vegetable planting or sealing with latex, vinyl, bitumen, shotcrete or other suitable surface stabilizer within six months after the last construction activity on the exposed earth;
4. Complete earthworks final surfaces to smooth alignments without abrupt irregularities unless otherwise stated in the Contract;
5. Complete formations above structures or utilities after construction of the structure or utility.

EAR1.W2120.8

COMPACTION

Compact formations to obtain a relative compaction of at least 98% to a depth of 200 mm below the formation.

EAR1.W2130.8

PROOF ROLLING

1. Unless otherwise agreed by the CM, carry out proof rolling on formations;
2. Roll the formation in the presence of the CM by at least two passes of a non-vibrating rubber tyred roller;

-
3. The roller must have a static load per 100 mm width of roll of at least 4 kN and travel at a speed not exceeding 2 km/h.

EAR1.W2140.8 MAKING GOOD DEFECTS

Make good to Approval any defect in the formation which is revealed during proof rolling by deformation of the formation which in the opinion of the CM is excessive.

EAR1.W2150.8 PAVEMENT FORMATIONS

After all other formation work and testing have been completed and damage caused by testing reinstated, roll any pavement formation with one pass of a smooth steel-wheeled non-vibrating roller. The roller must have a load per 100 mm width of roll of at least 2 kN.

EAR1.W2160.8 PROTECTION OF FORMATIONS

Carry out the following procedures:

1. Unless otherwise permitted by the CM, protect formation surfaces which will not be immediately covered by the subsequent permanent work by methods agreed by the CM;
2. Maintain earthworks final surfaces and formations in a stable condition and protect from damage due to water or other causes and from exposure to conditions which may adversely affect the surface;
3. Do not allow formations to be used by construction plant or vehicles other than those which, in the opinion of the CM, are essential to construct the subsequent work.

EAR1.W2170.8 HYDROSEEDING

Refer to [Project Specific Specification](#).

ADDITIONAL REQUIREMENTS FOR SOFT LANDSCAPING**EAR1.W2210.8 GENERAL**

Refer to [Project Specific Specification](#).

ADDITIONAL REQUIREMENTS FOR SURFACE PREPARATION OF ROAD FORMATIONS**EAR1.W2310.8 SEQUENCE**

Carry out preparation and surface treatment of the road formation after completion of any specified sub-grade drainage and, unless otherwise agreed by the CM, immediately prior to laying the sub-base or the road-base where no sub-base is required.

EAR1.W2320.8 FORMATIONS OTHER THAN ROCK FILL

Carry out the following sequence of operations:

1. Remove all mud and slurry from surfaces below carriageways, lay-bys, cycle tracks, footpaths and hard shoulders after general reinstatement of any soft areas;
2. Unless otherwise permitted by the CM to carry out proof rolling on the road formation. Roll in the presence of the CM by at least 2 passes of a non-vibrating roller with rubber tyres. Roller to have a static load per 100 mm width of at least 4 kN and travel at speeds not exceeding 2 km/h;

3. Make good any defect in the formation during proof rolling where required by the CM;
4. Trim the formation after testing and when any damaged reinstatement has been carried out;
5. Roll the trimmed formation by one pass of a smooth steel-wheeled non-vibrating roller having a minimum load per 100 mm of 2 kN.

EAR1.W2330.8**ROCK FILL FORMATIONS**

Carry out the following sequence of operations:

1. Trim and blind the formation as **EAR1.W1740** and **EAR1.W1750**;
2. Roll the trimmed formation as **EAR1.W2320** (5);
3. Make good with Grade 15/20 concrete as specified in Worksection CON1 any surface irregularities under the formation which remain after trimming the rock excavation.

ADDITIONAL REQUIREMENTS FOR FILL SLOPES**EAR1.W2410.8****GENERAL**

1. Comply with the following sub-clauses for the fill slopes as specified in the Drawings and submit to the CM the date of commencement of the filling works for these slopes;
2. Notwithstanding the requirements on filling works as specified in other clauses of this Worksection, comply with the "Standards for Filling Works" specified in Appendix A of PNAP APP-15;
3. During construction, submit monthly reports to the CM giving records of tests on compaction of fill slopes together with a covering assessment on the adequacy of compaction. Submit the format of the report to the CM for prior approval. The reports shall be prepared and signed by the TCP Grade T4 and the AS of RSC(SF) (provided in accordance with the Preliminaries Worksection);
4. Incorporate in the report all the test results determined in accordance with this clause and the Testing section of this Worksection, including those tests carried out by the Direct Testing Contractor(s). Keep records on drawings the soil type, plan location and elevation reference to Principal Datum of each test. Graphs of dry density vs. moisture content, laboratory test record sheets, field sheets, calculation sheets and a complete soil description are to be kept in a companion folder;
5. Carry out all tests under the supervision of the TCP Grade T4 as mentioned in sub-clause (3);
6. Include in the contents of the covering assessment:
 - a. A summary of the results of insitu density tests and laboratory compaction tests of the fill, highlighting areas of non-compliance with the specified compaction standards;
 - b. Details of any corrective measures taken to rectify areas of inadequate compaction; and
 - c. An overall assessment to all the filling works completed at the time of assessment.
7. Keep records of compaction tests also on site for inspection by the CM, ICU and the officers of Geotechnical Engineering Office (GEO). The costs of providing the monthly reports are deemed to be included in the Contract rates of the filling works;

8. Where there is reason to believe that the placed fill may be loose, or if the CM from time to time directs, carry out field checks under the CM's direction, initially by dynamic probe tests (supplemented by observations of fill materials in trial pits if an appreciable cobble and boulder content in the fill is suspected). Provide the necessary equipment, apparatus and labourers for the dynamic probe tests and trial pit excavation. Carry out dynamic probe tests in accordance with Appendix 7.1 of the 'General Specification for Civil Engineering Works', The Government of the Hong Kong Special Administrative Region, 2006;
9. If loose fill is detected, arrange for the Approved Laboratory to carry out insitu density tests of the loose layer in accordance with the Testing section of this Worksection in the presence of the CM or his representatives. Carry out the tests within seven days after the detection of the loose fill. If the test results fail to comply with the Contract requirements, rectify the filling works to the satisfaction of the CM as a matter of urgency. Where extensive loose fill is found which could pose a significant threat if not rectified, the CM may issue an order to suspend the progress of the Works in accordance with GCC Clause 9.2;
10. If the filling work has been done after compliance with the requirements of GCC Clause 7.3, and is found to be executed in accordance with the Contract, the expense of investigation, testing, reinstating and making good the same shall be valued at the relevant Contract rates but in any other case the expense shall be borne by the Contractor;
11. Upon completion of the filling work, submit to the CM:
 - a. "As-built" plans and sections of the work showing its relationship to existing and proposed structures; and
 - b. Records of insitu density tests and laboratory compaction tests of the fill.The costs of providing as-built records are deemed to be included in the Contract rates of the filling works;
12. Bear all associated costs and make due allowance in the programme of the Works for the provisions as stated in the above sub-clauses. No claim for extension of time will be entertained in connection therewith.

REMOVAL OF TEMPORARY WORKS

EAR1.W2510.8

DISMANTLING AND REMOVAL

Dismantle and remove temporary works after completion of the permanent works unless otherwise agreed by the CM.

TOLERANCES

EAR1.W2610.8

GENERAL

Refer to Appendix H 'Schedule of Tolerances' to this Specification.

TESTING

FILL MATERIAL - GENERAL REQUIREMENTS

EAR1.T020.8 BATCH

A batch of fill material is any quantity of fill material of the same type and which, in the opinion of the CM, has similar properties throughout. For the purpose of testing for moisture content and relative compaction, a batch is also any fill material which is deposited in a single layer in any area of fill presented by the Contractor for testing on one occasion.

EAR1.T030.8 SAMPLES

Each sample of fill material must consist of at least four increments taken from different parts of the batch. Combine the increments and thoroughly mix and divide by quartering or by using a riffle box to obtain specimens of an appropriate size to carry out the individual tests.

EAR1.T040.8 SAMPLE SIZE

Take the size of samples of fill material, other than rock fill, in accordance with Clauses 2.5.1, 4.2 and Table 2.1 of 'Geospec 3: Model Specification for Soil Testing', GEO, 2001. Each sample of rock fill material of grade size not exceeding 200 is to have a mass of at least 250 kg and each sample of rock fill material of grade size exceeding 200 must have a mass of at least 1000 kg.

SITE TESTS FOR SOIL AND GROUNDWATER

EAR1.T110.8 GENERAL

1. Arrange for an independent laboratory to carry out the tests described in 'Geospec 3: Model Specification for Soil Testing', GEO, 2001;
2. Select the laboratory from one of those listed on the Development Bureau's List of Approved Suppliers of Materials and Specialist Contractors for Public Works: Soil and Rock Testing and Approved. In addition, the laboratory must be accredited by HOKLAS for the said tests.

EAR1.T115.8 COMPACTION TEST FOR FILL SLOPES

1. Arrange for independent laboratories as stated in **EAR1.T110** on a roster system to carry out compaction tests stated in **EAR1.T510** to **EAR1.T550** for all fill slopes specified in the Drawings. No independent laboratories shall carry out compaction tests for a cumulative period longer than 3 months within any twelve-month period;
2. Instruct the independent laboratories to deliver directly to the CM in a sealed envelope or by other means agreed by the CM, without routing through the Contractor, a copy of all test reports including preliminary testing results compiled by the independent laboratories, not later than the copy sent to the Contractor;
3. In addition, where considered necessary, the CM will order Direct Testing Contractor(s) (DTC) to carry out the same tests as mentioned in sub-clause (1) above;
4. Provide attendance on the DTC and render all necessary assistance to the DTC including:
 - a. Provision of all facilities for the DTC in the taking of samples;

- b. Provision of information for the preparation of the report, all as required by the DTC; and
 - c. Reinstatement and making good of the sampled areas to its original condition where Instructed.
5. Carry out additional tests for relative compaction in accordance with **EAR1.T550** if the result of any test for relative compaction of fill material does not comply with the specified requirements;
6. Investigate and report findings on any non-compliance or irregularities identified by the compaction tests and carry out rectification as necessary to the satisfaction of the CM before proceeding to the next stage of the filling works;
7. Bear all associated costs and allow sufficient time in the programming of the filling works for the compliance with this clause. No claim whatsoever will be entertained for the interruption, if any, due to the DTC's works.

FILL MATERIAL - PARTICLE SIZE DISTRIBUTION, LIQUID LIMIT, PLASTICITY INDEX, COEFFICIENT OF UNIFORMITY AND SULPHATE CONTENT

EAR1.T210.8

GENERAL

The size of sample and method of sampling to be in accordance with "Geospec 3: Model Specification for Soil Testing published by GEO". Where required test samples of fill material for particle size distribution, liquid limit, plasticity index coefficient of uniformity and sulphate content and deliver results at least 14 days, or such shorter period agreed by the CM, before deposition of the fill material starts. Provide samples from each batch as stated in the following table:

Description	Size of Batch	No. of samples per Batch
Special fill material	0 - 3,000 m ³	3
	Exceeding 3,000 m ³	1 for each 1,000 m ³ or part thereof
Fill material other than special fill material	0 - 15,000 m ³	3
	Exceeding 15,000 m ³	1 for each 5,000 m ³ or part thereof

EAR1.T220.8

TESTING CRITERIA

For samples of fill material in the table to **EAR1.T210**:

1. Particle size distribution: test as **EAR1.T230** (1);
2. Special fill material: test for the coefficient of uniformity as **EAR1.T230** (2);
3. Liquid limit: test all samples other than rock fill material (unless otherwise agreed by the CM) as **EAR1.T230** (3);
4. Plasticity index: as sub-clause (3) above and **EAR1.T230** (4);
5. Soluble sulphate: test each sample of fill that will be deposited within 500 mm of concrete, cement bound, or cementitious material, or metalwork as **EAR1.T230** (5).

EAR1.T230.8

TEST METHODS

Test in accordance with 'Geospec 3: Model Specification for Soil Testing', GEO, 2001 as follows:

1. Particle size: test as Test Method 8.1 or 8.2 whichever is Instructed for particles passing a 75 mm BS Test Sieve. Take the size of particles of fill material which do not pass a 75 mm BS test Sieve as the largest dimension measured in any plane;

2. Coefficient of uniformity: calculate the coefficient of uniformity (Cu) from the equation:

$$Cu = D_{60}/D_{10}$$

where:

D_{60} and D_{10} are the equivalent sieve sizes in millimetres, interpolated from the particle size distribution curve, through which 60% and 10% of the fill material would pass respectively;

3. Liquid limit: test in accordance with Test Method 6.1 for that proportion of fill passing a 425 micron BS Test Sieve;
4. Plasticity index: test in accordance with Test Method 6.1 for that proportion of fill passing a 425 micron BS Test Sieve;
5. Soluble sulphate: test as Test Method 9.3;
6. Total sulphate: test as Test Method 9.3.

EAR1.T240.8**NON-COMPLIANCE WITH TESTS**

Where the tests show non-compliance, adopt the following procedures:

1. Soluble sulphate content: test each sample to determine the total sulphate content as in Test Method 9.3 of 'Geospec 3: Model Specification for Soil Testing', GEO, 2001;
2. Particle size distribution, liquid limit, plasticity index, coefficient of uniformity or total sulphate content: provide additional samples, in numbers as stated in the table to **EAR1.T210**, from same batch and retest as before.

FILL MATERIAL - OPTIMUM MOISTURE CONTENT AND MAXIMUM DRY DENSITY

EAR1.T310.8**GENERAL**

Where required, test samples of fill material for optimum moisture content and maximum dry density and deliver results at least 72 hours, or such shorter period agreed by the CM, before deposition of the fill material starts. Provide samples from each batch as specified in the table to **EAR1.T210**.

EAR1.T320.8**LOCATION**

Inform the CM of the exact location in which the fill material from which each sample is taken is to be deposited.

EAR1.T330.8**ADDITIONAL SAMPLES**

Take additional samples to test for optimum moisture content and maximum dry density after the fill material has been deposited in its final position, at intervals of not more than 28 days.

EAR1.T340.8**MATERIALS NOT FOR SAMPLING**

Do not take samples from the following material:

1. Fill material including rock fill material which contains an insufficient proportion of particles passing a 20 mm BS Test Sieve to permit determination of the moisture content and maximum dry density; and
2. Fill material which is to be deposited as intermediate areas of fill, as specified under **EAR1.W2010**.

EAR1.T350.8**TESTING METHODS**

1. Test each sample for:

- a. Optimum moisture content, as Test Method 10.1, 10.2, 10.3, 10.4, 10.5, 10.6, 10.7 or 10.8 of 'Geospec 3: Model Specification for Soil Testing', GEO, whichever is Instructed;
 - b. Maximum dry density, as for sub-clause (1)(a) above and whichever is Instructed.
2. If agreed by the CM, use the Hilf method as specified in [EAR1.T860](#) to [EAR1.T900](#) instead of the methods stipulated in sub-clause (1) above to determine the optimum moisture content and maximum dry density;
3. If in the opinion of the CM that there is any undue discrepancy between the results of tests for optimum moisture content of fill material using methods as stipulated in sub-clause (1)(a) above and the results of tests using the Hilf method, adopt only the results of tests using methods stipulated in sub-clause (1)(a) above.

EAR1.T370.8**INCONSISTENT MATERIALS**

Where tests for optimum moisture content or maximum dry density indicate inconsistencies in the fill material and are likely, in the opinion of the CM, to affect subsequent relative compaction tests:

1. Divide the batch into smaller batches of material with similar properties throughout;
2. Provide additional samples from each of the smaller batches, the number of samples being as in accordance with the table to [EAR1.T210](#);
3. Carry out additional tests for optimum moisture content and maximum dry density, of each sample.

FILL MATERIAL - MOISTURE CONTENT**EAR1.T410.8****SAMPLES**

1. Test samples of fill material for moisture content during deposition and compaction and not more than 1 hour after the fill material has been deposited in its final position;
2. Provide the number of samples from each batch in accordance with the table to [EAR1.T440](#). Do not provide samples if, in accordance with [EAR1.T340](#) (1) or [EAR1.T340](#) (2), the optimum moisture content has not been determined.

EAR1.T420.8**TESTING METHODS**

Test each sample to determine moisture content by Method 1, or by Method 2 if agreed by the CM, as follows:

1. Method 1: Test Method 5.1 or 5.2 of 'Geospec 3: Model Specification for Soil Testing', GEO, whichever is Instructed;
2. Method 2: Microwave oven drying method as specified in [EAR1.T810](#) to [EAR1.T850](#).

EAR1.T430.8**MOISTURE CONTENT COMPLIANCE CRITERIA**

If, in the opinion of the CM, there is any undue discrepancy between the results of tests for moisture content of fill material using Method 1 and the results of tests using Method 2, adopt only the results using Method 1.

EAR1.T440.8**DIFFERENCES BETWEEN MOISTURE CONTENT AND OPTIMUM MOISTURE CONTENT RESULTS**

1. If the result of any test for moisture content of fill material differs from the optimum moisture content by more than the specified amount and, if Instructed, adjust the moisture content of the whole of the batch of fill material;

2. Provide additional samples from the same batch and undertake additional tests for moisture content;
3. Take the number of additional samples as stated in the following table:

Number of samples to be tested for moisture content and number of tests for relative compaction		
Description	Size of area of fill in batch	No. of samples/ tests per batch
Areas of fill in excavations for structures pits and trenches and on formation	0 - 100 m ²	3
	100 - 500 m ²	2 for each 100 m ² or part thereof
	Exceeding 500 m ²	1 for each 100 m ² or part thereof
Other areas of fill	0 - 1 ha	4 for each 1000 m ² or part thereof
	1 - 10 ha	3 for each 1000 m ² or part thereof
	Exceeding 10 ha	2 for each 1000 m ² or part thereof

FILL MATERIAL - RELATIVE COMPACTION

EAR1.T510.8

REQUIREMENT FOR TESTING

1. Unless otherwise agreed by the CM, test each batch of fill material to determine relative compaction;
2. Carry out each test after the fill material has been deposited and compacted in its final position;
3. The number of tests will be in accordance with the requirements of the table to **EAR1.T440**;
4. Do not test the following:
 - a. Fill material including rock fill materials which contain an insufficient proportion of particles passing a 20 mm BS test sieve to permit determination of the relative compaction; and
 - b. Fill material which has been deposited as intermediate areas of fill as **EAR1.W2010**.

EAR1.T520.8

LOCATION OF TESTS

Carry out tests at positions which, in the opinion of the CM, are representative of the batch of compacted fill material as a whole.

EAR1.T530.8

METHODS

1. Adopt Method 1, or adopt Method 2 if agreed by the CM, to determine the relative compaction of fill material as follows:
 - a. Method 1: Test Method 11.4, Geospec 3, GEO
Determine the relative compaction (RC) of fill material from the equation:

$$RC = IDD/MDD \times 100\%$$
 where:
 IDD is the in-situ dry density determined as **EAR1.T540**;
 MDD is the maximum dry density determined as **EAR1.T350** (1)(b);
 - b. Method 2: The relative compaction (RC) shall be calculated from the equation:

$$RC = IBulkD/MCBulkD \times 100\%$$

where:

IBulkD is the in-situ bulk density determined as [EAR1.T540](#);

MCBulkD is the maximum converted bulk density determined by Hilf method as [EAR1.T350](#) (2). If the amount of material retained on a 20 mm BS test sieve is more than 5% of the mass of the sample, adjust the maximum converted bulk density (MCBulkD) of fill material in accordance with [EAR1.T910](#) to [EAR1.T950](#).

2. If in the opinion of the CM that there is any undue discrepancy between the results of tests for relative compaction of fill using Method 1 stipulated in sub-clause (1)(a) above and the results of tests using Method 2 stipulated in sub-clause (1)(b), adopt only the results of tests using the Method 1.

EAR1.T540.8**IN-SITU BULK DENSITY AND IN-SITU DRY DENSITY**

Adopt Method 1, or adopt Method 2 if agreed by the CM, to determine in-situ bulk density and in-situ dry density as follows:

1. Method 1: Test Method 11.1 or 11.2 of 'Geospec 3: Model Specification for Soil Testing', GEO, as appropriate to the grain size of the fill material;
2. Method 2: Nuclear densometer method in accordance with Test Method 11.3 of 'Geospec 3: Model Specification for Soil Testing', GEO.

EAR1.T550.8**NON-COMPLIANCE OF RELATIVE COMPACTION TEST**

If the result of any test for relative compaction of fill material does not comply with the specified requirements for relative compaction, carry out additional tests for relative compaction on the same batch. The number of additional tests are stated in the table to [EAR1.T440](#).

TEST METHODS FOR FILL MATERIALS**EAR1.T710.8****GENERAL**

The definitions, terms, abbreviations symbols, and grouping of materials stated in the relevant parts of 'Geospec 3: Model Specification for Soil Testing', GEO, apply except as stated in [EAR1.T720](#) and [EAR1.T730](#).

EAR1.T720.8**ABBREVIATIONS AND SYMBOLS**

Terms used in this Worksection and in the relevant parts of 'Geospec 3: Model Specification for Soil Testing', GEO, are identified by the following abbreviations and symbols:

Abbreviation/Symbol	Term
BulkD	Bulk density
CBulkD	Converted bulk density
DD	Dry density
IBulkD	In-situ bulk density
IDD	In-situ dry density
MDD	Maximum dry density
MCBulkD	Maximum converted bulk density
RC	Relative compaction
w	Moisture content

w_i	In-situ moisture content
w_o	Optimum moisture content

EAR1.T730.8**GROUPING OF MATERIALS**

1. Fine grained material is material of which at least 90% passes a 2 mm BS Test Sieve;
2. Medium grained material is material of which at least 90% passes a 20 mm BS Test Sieve and more than 10% is retained on a 2 mm BS Test Sieve.

DETERMINATION OF THE MOISTURE CONTENT OF FINE GRAINED AND MEDIUM GRAINED MATERIAL BY THE MICROWAVE OVEN DRYING METHOD

EAR1.T810.8**SCOPE**

This method covers the determination of the moisture content of fine grained and medium grained material as a percentage of the mass of the dry material.

EAR1.T820.8**APPARATUS**

Use the following apparatus:

1. A microwave oven with a timer and an adjustable power setting;
2. An airtight container of microwave safe and non-reflective material;
3. A balance readable and accurate to 0.01 g;
4. A desiccator containing anhydrous silica gel.

EAR1.T830.8**PROCEDURE**

Adopt the following procedure:

1. The container must be clean, dry and weighed to the nearest 0.01 g (m_1);
2. Crumble a specimen and place loosely in the container and replace the lid. Ensure each specimen of fine grained material is at least 30 g and each specimen of medium grained material at least 300 g. Specimens of medium grained material may be tested in several parts each less than 300 g and the results aggregated;
3. Weigh the container and contents to the nearest 0.01 g (m_2);
4. Remove the lid of the specimen container and place the container with its lid and content in the microwave oven and dry. Consider the specimen to be dry when, after an initial drying period, successive weighing at intervals of 1 minute produce results which are the same to the nearest 0.01 g. Alternatively, the oven may be set to an appropriate time and power setting to dry the specimen as determined by calibration of the oven on soil of a similar type;
5. After drying, remove the container and contents from the microwave oven and place in the desiccator to cool;
6. Replace the lid and weigh the container and contents to the nearest 0.01 g (m_3).

EAR1.T840.8**CALCULATION**

Calculate the moisture content of the material (w) as a percentage of the dry mass of the material from the equation:

$$w = (m_2 - m_3) / (m_3 - m_1) \times 100\%$$

where:

- m_1 is the mass of the container (g)
- m_2 is the mass of the container and contents before drying (g)

-
- m_3 is the mass of the container and contents after drying (g).

EAR1.T850.8 REPORTING

Report on the following:

1. Source and identification of the soil;
2. The moisture content of the material to the nearest 0.1%;
3. That the test method used was in accordance with this Specification.

DETERMINATION OF THE MAXIMUM CONVERTED BULK DENSITY BY THE HILF METHOD**EAR1.T860.8 SCOPE**

This method covers the determination of the maximum converted bulk density and the difference between the optimum moisture content and the in-situ moisture content of a material by relating the converted bulk density and the moisture content added.

EAR1.T870.8 APPARATUS

Use the following apparatus:

1. Apparatus in accordance with Geospec 3, Test Method 10.1 or 10.2, whichever as Instructed by the CM;
2. Apparatus for determination of the moisture content in accordance with either Geospec 3, Test Method 5.1 or 5.2 or **EAR1.T820**, whichever as Instructed by the CM;
3. Apparatus to extract specimen from the mould;
4. Apparatus, such as a warm air blower, for rapid drying of the material.

EAR1.T880.8 PROCEDURE

Adopt the following procedures:

1. Take a sample of material immediately after completing the in-situ bulk density test at the same location as the test. The sample shall be obtained by digging to the same depth as that of the in-situ bulk density test, keeping the sides of the excavation vertical and bottom flat and level. The size of the sample shall be sufficient to yield a maximum of 10 kg after screening over a 20 mm BS test sieve;
2. Weigh the sample to the nearest 0.01 g;
3. Screen the sample over a 20 mm BS test sieve, ensuring that moisture loss is kept to a minimum and that any free moisture appearing in the container is worked back into the sample;
4. Weigh the amount retained on the sieve to the nearest 0.01 g and express as a percentage of the mass of the sample. If the percentage exceeds 5%, adjust for coarse material in accordance with **EAR1.T910** to **EAR1.T950**. If the percentage does not exceed 5%, no adjustment is required;
5. Mix the material to be tested thoroughly and divide by quartering or by using a riffle box to obtain a maximum of four specimens of at least 2,500 g each, ensuring that the moisture loss is kept to a minimum. Alternatively, if it has previously been ascertained that the material is not susceptible to crushing, use a single specimen of at least 2,500 g for repeating the testing;
6. Weigh each specimen to the nearest 0.01 g and take the result as the mass of the specimen at the in-situ moisture content;
7. Place and seal each specimen and any remaining material in separate moisture-tight containers;

-
8. Plot the converted bulk density of at least three specimens against the amount of water added or removed as a percentage of the mass of the specimen at the in-situ moisture content (z) on a graph as shown in Civil Engineering and Development Department Standard Drawing No. C2006, in accordance with the procedure stated in sub-clauses (9) to (15) below;
 9. Obtain the first point on the graph as follows:
 - a. Compact a specimen at its in-situ moisture content in accordance with Geospec 3, Test Method 10.1, Clause 10.1.5 or Test Method 10.2, Clause 10.2.5, whichever is Instructed by the CM;
 - b. Cut a diametrical slice of approximately 400 g to 500 g from the specimen along its entire length. Determine the in-situ moisture content of the slice (w_i) in accordance with either Geospec 3, Test Method 5.1 or 5.2 or **EAR1.T810** to **EAR1.T850**, whichever as Instructed by the CM;
 - c. Calculate the bulk density ($BulkD_1$) as stated in **EAR1.T890** (1) and plot on the 0% ordinate of the graph as the converted bulk density ($CBulkD_1$).
 10. Obtain the second point on the graph as follows:
 - a. Examine a second specimen and, if the in-situ moisture content obviously exceeds the optimum moisture content, follow the procedure stated in sub-clause (11) below;
 - b. Increase the moisture content of the specimen by adding an amount of water equal to 2% of the mass of the specimen. Mix the specimen thoroughly and compact in accordance with the method stipulated in sub-clause (9) above;
 - c. Calculate the bulk density ($BulkD_2$) as stated in **EAR1.T890** (1), adjust to converted bulk density ($CBulkD_2$) as stated in **EAR1.T890** (2) and plot on the +2% ordinate of the graph.
 11. If the in-situ moisture content of the second specimen obviously exceeds the optimum moisture content, dry and cool the specimen until the amount of water removed is approximately 2% of the mass of the specimen. Mix the specimen thoroughly and compact in accordance with the method stipulated in sub-clause (9) above. Determine the amount of water removed. Calculate the bulk density ($BulkD_2$) as stated in **EAR1.T890** (1), adjust to converted bulk density ($CBulkD_2$) as stated in **EAR1.T890** (2) and plot on the negative ordinate of the graph at a point which corresponds to the amount of water removed;
 12. Obtain the third point on the graph as follows:
 - a. If the plotted value of $CBulkD_2$ is equal to or greater than the plotted value of $CBulkD_1$, increase the moisture content of the third specimen by adding an amount of water equal to 4% of the mass of the specimen. Alternatively, if the procedure of sub-clause (11) above has been followed, dry and cool the specimen until the amount of water removed is approximately 4% of the specimen after cooling;
 - b. If the plotted value of the $CBulkD_2$ is less than the plotted value of $CBulkD_1$, dry and cool the third specimen until the amount of water removed is approximately 2% of the specimen after cooling. Alternatively, if the procedure of sub-clause (11) above has been followed, increase the moisture content by adding an amount of water equal to 2% of the mass of the specimen;
 - c. Mix the specimen thoroughly and compact in accordance with the method stipulated in sub-clause (9) above. Determine the amount of water removed if applicable;
 - d. Calculate the bulk density ($BulkD_3$) as stated in **EAR1.T890** (1), adjust to converted bulk density ($CBulkD_3$) as stated in **EAR1.T890** (2) and plot on the graph at a point corresponds to the amount of water added or removed.

13. If the centre point of the three points plotted is lower than one of the other two points, or is higher than one point and equal to the other, obtain an additional point or points by proceeding in 2% increments or decrements as appropriate;
14. If it is apparent that the moisture condition of the material is such that a total five points will not result in the determination of the optimum moisture content, adopt increments or decrements of 3% moisture content for the entire procedure;
15. Draw a smooth parabolic curve to the plotted points. Determine the peak of the curve as the maximum converted bulk density (MCBulkD);
16. Determine the amount of water added or removed as a percentage of the mass of the specimen at the in-situ moisture content corresponding to the maximum converted bulk density (z_m);
17. Determine the value of moisture correction curve passing through the peak value of the plotted parabolic curve (z_c). If there is no moisture correction curve passing through the peak value of the curve, draw a moisture correction curve through the peak by interpolating to the nearest 0.1%.

EAR1.T890.8**CALCULATION**

1. Calculate the bulk density (BulkD) from the equation:

$$\text{BulkD} = (m_2 - m_1)/V \quad \text{Mg/m}^3$$
 where:
 m_1 is the mass of the mould and base (g)
 m_2 is the mass of the mould and base and wet material (g)
 V is the mass of the volume of the mould (mL).
2. Calculate the converted bulk density (CBulkD) from the equation:

$$\text{CBulkD} = \text{BulkD}/(1 + z/100) \quad \text{Mg/m}^3$$
 where:
 z is the amount of water added or removed as a percentage of mass of the specimen at the in-situ moisture content (%)
 z is negative for values below the in-situ moisture content.
3. Calculate the difference between the optimum moisture content (w_o) and the in-situ moisture content (w_i) of the material from the equation:

$$w_o - w_i = z_m + z_c \quad \%$$
 where:
 z_m is the amount of water added or removed as a percentage of mass of the specimen at the in-situ moisture content corresponding to the maximum converted bulk density (%)
 z_c is the value of the moisture correction curve passing through the peak value of the plotted parabolic curve (%).
4. Calculate the optimum moisture content (w_o) from the equation:

$$w_o = w_i + (1 + w_i/100)z_m \quad \%$$
 where:
 w_i is the in-situ moisture content of the material (%).
5. Calculate the maximum dry density (MDD) from the equation:

$$\text{MDD} = \text{MCBulkD}/(1 + w_i/100) \quad \text{Mg/m}^3$$
 where:
 MCBulkD is the maximum converted bulk density of the material (Mg/m³).
6. Calculate the relative compaction (RC), if required, from the equation:

$$\text{RC} = \text{IBulkD}/\text{MCBulkD} \times 100 \%$$
 where:

IBulkD is the in-situ bulk density of the material determined in accordance with Geospec 3, Test Method 11.1 or 11.2 as appropriate to the grain size of the material.

EAR1.T900.8**REPORTING**

Report on the following:

1. Source and identification of the soil;
2. The graph showing the plotted points and the parabolic curve passing through them;
3. The maximum converted bulk density to the nearest 0.01 Mg/m³;
4. The optimum moisture content to the nearest 0.1%;
5. The maximum dry density to the nearest 0.01 Mg/m³;
6. The relative compaction to the nearest 0.1 %, if determined;
7. The percentage retained on the 20 mm BS test sieve and the percentage retained on the 37.5 mm BS test sieve to the nearest 1%;
8. Whether the test was carried out using individual specimens or repeat testing of a single specimen;
9. Whether a manual or an automatic compaction rammer was used;
10. That the test method used was in accordance with this Specification.

ADJUSTMENT OF THE MAXIMUM CONVERTED BULK DENSITY FOR DETERMINATION OF RELATIVE COMPACTION**EAR1.T910.8****SCOPE**

This method covers the adjustment of the maximum converted bulk density determined in accordance with **EAR1.T860** to **EAR1.T900** for the determination of relative compaction of a material containing more than 5% of the mass of the material at the in-situ moisture content retained on a 20 mm BS test sieve.

EAR1.T920.8**APPARATUS**

Use the following apparatus:

1. Apparatus in accordance with **EAR1.T870**;
2. A 20 mm and a 37.5 mm BS test sieve;
3. A mould with collar as used for determination of the California Bearing Ratio (CBR mould);
4. An extrusion device as used for determination of the California Bearing Ratio.

EAR1.T930.8**PROCEDURE**

Adopt the following procedures:

1. If the amount of material retained on the 20 mm BS test sieve exceeds 5% and does not exceeds 20%, compact the material passing the sieve in accordance with **EAR1.T860** to **EAR1.T900**. Determine and adjust the maximum converted bulk density (MCBulkD) as stated in **EAR1.T940**;
2. If the amount of material retained on the 20 mm BS test sieve exceeds 20%, screen the retained material over the 37.5 mm BS test sieve. Follow the procedure stated in either sub-clause (3) or (4) below as appropriate;
3. If the amount of material retained on the 37.5 mm BS test sieve does not exceed 5%, follow the procedure stated in sub-clause (5);

4. If the amount of material retained on the 37.5 mm BS test sieve exceeds 5% and does not exceed 20%, replace the retained material with an equal mass of material which is of similar nature and which is retained on a 20 mm BS test sieve but passes a 37.5 mm BS test sieve. Follow the procedure stated in sub-clause (5) below;
5. Follow the procedure in [EAR1.T860](#) to [EAR1.T900](#) except that the material shall be compacted into the CBR mould and each layer shall be subject to 62 blows of the rammer.

EAR1.T940.8**CALCULATION**

Calculate the maximum converted bulk density (MCBulkD) from the equation:

$$\text{MCBulkD} = \text{MCBulkD}_{20} [1 + m(1 - \text{MCBulkD}_{20}/G_s)/(1 + z/100)] \quad \text{Mg/m}^3$$

where:

MCBulkD_{20} is the maximum converted bulk density of the material passing 20 mm BS test sieve (Mg/m^3)

m is the mass of material not passing the 20 mm BS test sieve expressed as a fraction of the mass of the material at the in-situ moisture content

G_s is the specific gravity of the material not passing 20 mm BS test sieve

z is the amount of water added as a percentage of the mass of the specimen at the in-situ moisture content corresponding to the maximum converted bulk density (%)

EAR1.T950.8**REPORTING**

Report on the following:

1. Source and identification of the soil;
2. The results in accordance with [EAR1.T900](#);
3. The mass of the original material not passing the 20 mm BS test sieve and 37.5 mm BS test sieve as a percentage of the mass of the material at the in-situ moisture content to the nearest 0.1%;
4. The type of mould used;
5. The number of blows per layer;
6. Whether the specific gravity was measured or assumed and, if measured, the method used;
7. That the test method used and the results adjusted were in accordance with this Specification.

EAR2 BLASTING

MATERIALS

EXPLOSIVES

EAR2.M010.8 NITRO-GLYCERINE BASED EXPLOSIVES

Do not use.

EAR2.M020.8 PRE-SPLIT BLASTING EXPLOSIVES

Only use explosives for pre-split blasting that are specifically recommended by the explosives manufacturer for pre-splitting.

WORKMANSHIP

GENERALLY

EAR2.W010.8**STATUTORY REQUIREMENTS**

1. Comply with conditions and restrictions imposed by the Commissioner of Mines for:
 - a. Blasting operations;
 - b. Supply, transportation, storage, use and disposal of explosives.
2. Make all arrangements with and obtain all licences and permits from the Commissioner of Mines in connection with blasting operations;
3. Ensure that the Mines and Quarries Division, Civil Engineering Development Department is given adequate notice to arrange visits to the site to consider blasting conditions, and thereafter comply promptly and fully with any instruction issued by the Commissioner of Mines, or his representative, in connection with blasting;
4. Allow access to the Site by the staff of the Mines and Quarries Division at all times;
5. Employ at least one registered shotfirer who holds a valid Hong Kong Mine Blasting Certificate and is approved by the Mines and Quarries Division and the CM.

EAR2.W020.8**TRAFFIC CONTROL**

Liaise with the Hong Kong Police Force in respect of traffic control on adjacent roads during blasting operations.

EAR2.W030.8**RESTRICTIONS ON TIMING**

Do not carry out blasting at the following times:

1. General holidays;
2. Before 8:30 am or after 5:30 pm on any day;
3. When a Hong Kong Observatory thunderstorm warning is in force (unless permitted by the Commissioner of Mines);
4. When strong wind signal or tropical cyclone warning No. 3 or higher is hoisted (unless permitted by the Commissioner of Mines).

EAR2.W040.8**PARTICULARS OF BLASTING**

Submit the following particulars to the CM at least 48 hours before blasting starts:

1. Any conditions or restrictions imposed by the Commissioner of Mines, including copies of applications, licences, permits and correspondence;
2. Names, qualifications and experience of the persons responsible for the design and supervision of blasting operations;
3. Location, diameter, inclination and depth of holes to be charged with explosive;
4. Type and total mass of explosive to be used and its mass and distribution in each hole;
5. Dimensions of stemming and decking;
6. Initiation sequence, delay periods and mass of explosive per delay;
7. Burden and bench height;
8. Ratio of diameter of explosive to diameter of hole;
9. Arrangements for and methods of instrumentation and monitoring the effects of blasting;
10. Details of velocity seismographs, including manufacturer's literature;

-
11. Method of controlled blasting;
 12. Details of blasting trials; and
 13. Protective measures.

EAR2.W050.8 PARTICULARS OF PRE-SPLIT BLASTING

In addition to the data required by clause **EAR2.W040** submit to the CM the following information at least 48 hours before pre-split blasting starts:

1. Plan showing proposed method of working;
2. Pre-split burden;
3. No of pre-split holes to be fired at each delay;
4. Distance from the pre-split face to the nearest primary blast drillholes;
5. Decoupling ratio;
6. Delay arrangements between pre-split and primary blasts.

EAR2.W060.8 BLASTING ASSESSMENT

Prior to carrying out blasting works, submit to the Geotechnical Engineering Office a Blasting Assessment containing the following information:

1. Assessment of site geology and the condition of existing structures, slopes, retaining walls and services;
2. Assessment of the stability of existing structures, slopes and retaining walls under the effects of blasting;
3. Proposals for preventive and precautionary measures to be implemented to ensure stability and integrity of the affected structures, slopes, retaining walls and services both during blasting and in the long term;
4. Outline blast design to demonstrate the practicability of satisfying any constraints imposed under sub-clause (3) above;
5. Proposals for instrumentation and monitoring of the effects of blasting;
6. Details of site supervision to ensure professional input during the blasting work by the Blasting Control Engineer; and
7. Curriculum vitae of the Blasting Control Engineer who prepared the Blasting Assessment.

EAR2.W070.8 GEOTECHNICAL ENGINEERING OFFICE (GEO) REQUIREMENTS

Comply with all requirements, comments and conditions imposed on the blasting works by the GEO in respect of the submitted Blasting Assessment.

SAFETY PRECAUTIONS, RESTRICTIONS AND BLASTING PROCEDURES**EAR2.W110.8 SAFETY PRECAUTIONS AND RESTRICTIONS**

1. The CM may regulate, restrict or prohibit blasting if, in his opinion, it is necessary to do so for the safety of persons or property, to limit noise or to safeguard the Works. Notify the CM, by not later than noon of the previous day, any intention to bring any Explosives to the Site or to carry out any blasting;
2. Store, transport and use explosives at all times in accordance with the Dangerous Goods Ordinance (Cap 295) and such other Statutory Regulations concerned with the possession and use of explosives which may be in force. Do not store explosives and detonators on the Site overnight unless permitted by the Commissioner of Mines;
3. Safeguard, and relocate if necessary, any structures or services within the Site;

4. Consult Power Companies when blasting near high voltage underground or overhead cables and observe restrictions imposed by these Companies; make good any damage caused by, or consequential to, blasting operations;
5. Provide a system approved by the CM for warning and preparing the general public and all site personnel of an impending blast, both by audible and visual means, and ensure that the blasting area is cleared of all personnel immediately prior to blasting. This warning system is to comply with all statutory requirements;
6. Take all necessary precautions to prevent accident, injury or loss to persons and damage to works or property, within and outside the Site, resulting from the use or handling of explosives. Obtain agreement from the CM of such precautions and the method of handling and using explosives;
7. Blasting will be allowed only within the area outlined on the site plan attached to the Commissioner of Mines permit;
8. Do not use ANFO or emulsion, that is not in cartridged form, for blasting within 5 m from an excavation free face;
9. Dispose of unused explosives and detonators at the end of each day as stipulated by the Commissioner of Mines.

EAR2.W120.8**GENERAL PROCEDURES**

1. Wet areas within 30 m from the blasting area with water prior to blasting;
2. Clear all loose materials to expose the final rock face as soon as practicable after the blast and scale all final rock faces to remove loose rock fragments;
3. Do not blast to form drainage channel, cascade, catchpit and the like, on the final rock face;
4. Utilise uncharged guide holes to form any corner in the final slope profile. When the final profile design includes the provision of berms between slopes, exercise extreme care to ensure no drilling below berm level and in the selection of toe charging details to produce the required profile.

EAR2.W130.8**SURFACE PREPARATION**

Before assessments of blasting safety precautions are made, remove all vegetation, overburden, and soft or loose materials, and expose the rock that is to be blasted.

EAR2.W140.8**PROTECTIVE SCREENS**

Unless otherwise permitted by the Commissioner of Mines, erect screens and other protective covers to prevent the projection of flying fragments of material resulting from blasting. Construct screens using wire mesh securely supported on steel frames; use wire of nominal diameter at least 3.5 mm and wire mesh size not exceeding 25 mm.

EAR2.W150.8**PLASTER BLASTING**

Do not use plaster blasting unless permitted by the Commissioner of Mines.

EAR2.W160.8**BLAST HOLES**

Unless otherwise permitted by the Commissioner of Mines provide blast holes stemmed and decked using free-flowing granular materials. Cover charges with thick gunny sacking and 2 m by 2 m square of steel fabric reinforcement weighted down with filled sandbags. Except on slopes cover surface detonating cords, knots, detonating relay conductors and initiating detonators with a 300 mm thickness of sand or soil.

EAR2.W170.8**DETONATORS**

Do not use electrical detonators within 60 m of overhead power lines unless permitted by the Commissioner of Mines. When using electrical detonators in the vicinity of static or mobile radios transmitters comply with BS 6657:1991.

EAR2.W180.8 DELAY BLASTING

Use delay-blasting at all times with millisecond delays unless otherwise permitted by the Commissioner of Mines, or as specified under pre-splitting.

EAR2.W190.8 PROXIMITY TO CERTAIN STRUCTURES

Unless permitted by the CM, do not carry out blasting within a distance of:

1. 60 m from water retaining structure or water tunnels; and
2. 6 m from water mains or other water supply structures or installations.

EAR2.W200.8 VIBRATIONS TO INSTALLATIONS OR STRUCTURES

Unless permitted by the CM the vibrations at structures and installations due to blasting, measured in terms of peak particle velocity and vibrational amplitude, must not exceed the values stated in the following table:

Type of structure or installation	Peak particle velocity (mm/s)	Vibrational amplitude (mm)
Water retaining structures. Water tunnels. Under any reinforced concrete structure that has been cast less than 24 hours previously.	13	0.1
Water mains. Other structures and pipes.	25	0.2

EAR2.W210.8 VIBRATIONS TO ADJOINING LAND

Unless otherwise permitted by the CM, the vibration at adjoining slopes and land due to blasting measured in terms of peak particle acceleration and peak particle velocity must not exceed the values stated in the Contract.

EAR2.W220.8 RECORDING VIBRATIONS

1. Take measurements of vibrations due to blasting at locations stated in the Contract, or instructed by the CM, at all times when blasting is carried out. Keep records of vibrations on the Site and provide a copy for the CM. Make any arrangements for installing instruments and taking measurements both inside and outside the Site;
2. Measure vibrations due to blasting in terms of peak particle velocity, peak particle acceleration and vibration amplitude. Take peak values as the maximum resultant calculated by vector summation of the three components of velocity and amplitude respectively, measured as instantaneously as the resolution of the recording instrument permits;
3. Take measurements with velocity seismographs, which have operating instructions in English of a type agreed by the CM. Seismographs must be capable of:
 - a. Recording vibrations in terms of peak particle velocity and vibration amplitude over a frequency of 0 - 200 Hz in three mutually perpendicular directions; and
 - b. Producing a permanent record of vibrations by tracing an ultra-violet light beam on sensitised paper, or by other methods agreed by the CM;
4. Check the accuracy of seismographs at regular intervals agreed with the CM.

PRE-SPLIT BLASTING

EAR2.W310.8**FORMING FINAL SURFACES**

1. Form earthworks final surfaces and formations, which are to be formed by blasting, and which slope at a gradient exceeding 2 vertical to 1 horizontal and exceed 3 m in height by pre-splitting. Do not use other methods of controlled blasting unless permitted by the CM;
2. Ensure that:
 - a. Other blast holes are located at a sufficient distance from the earthwork final surface to avoid damaging the surface; and
 - b. The row of blast holes nearest to that surface is inclined parallel to the slope face.

EAR2.W320.8**METHODOLOGY**

1. Carry out pre-splitting and other methods of controlled blasting in such a manner that the rock mass is cleanly split on the required plane and that rock outside the earthworks final surface is not shattered or loosened;
2. Faces formed by pre-splitting or other methods of controlled blasting must not exceed 15 m in height in any one blasting operation unless permitted by the CM.

EAR2.W330.8**HOLES FOR PRE-SPLITTING**

1. Drill a single row of holes at the appropriate inclination along the line of the earthworks final surface. Load holes with explosives not exceeding half the diameter of the hole. Detonate the explosives simultaneously or with the minimum amount of delay necessary to reduce ground vibrations;
2. Drill holes for pre-splitting at least 50 mm in diameter with the ratio of the distance between the centre of the holes and the diameter of the hole not exceeding 10;
3. Form the holes so that they are within a distance of 0.015 times the length of the hole from their designed position;
4. Do not drill holes for pre-splitting into the sub-grade below berm levels. Remove rock which remains in position on berms after blasting by method other than blasting.

TRIAL BLASTS

EAR2.W410.8**REASON FOR TRIAL BLASTS**

Carry out trial blasts to demonstrate that:

1. The procedure is safe;
2. The resulting ground vibrations at locations stated in the Contract or instructed by the CM can be satisfactorily predicted, recorded and are within acceptable limits, do not adversely affect the safety and stability of adjoining structures, installations, slopes and land.

EAR2.W420.8**PARTICULARS OF TRIAL BLASTING**

Submit to the CM details of blasting trials in accordance with **EAR2.W040** at least 14 days in advance of blasting.

EAR2.W430.8**PRE-SPLIT BLASTING TRIALS**

Carry out the blasting trials for pre-splitting and other methods of controlled blasting to form a face at least 6 m wide by 6 m high, on rock which has similar properties to that of the earthwork final surface and which is at least 6 m away from the earthwork final surface.

EAR2.W440.8 RESULTS OF BLAST TRIALS

If in the opinion of the CM any aspect of the proposed blasting procedures as demonstrated by blasting trials is unsatisfactory, submit details of proposed changes in the procedure to the CM. Carry out further blasting trials until the procedure is satisfactory.

EAR2.W450.8 CHANGES IN PROCEDURE

Do not vary the satisfactorily Approved blasting procedure. Demonstrate any proposed changes in procedure by further blast trials, unless otherwise permitted by the CM.

EAR2.W460.8 COMPLETION OF TRIAL BLASTS

1. Complete all trials at least 7 days before the related blasting is due to start;
2. Carry out blasting trials in accordance with the trial procedure submitted to and agreed by the CM. The location and size of blasting trials shall be as agreed by the CM.

EAR2.W470.8 COMMENCEMENT OF BLASTING

Do not proceed with blasting until in the opinion of the CM the procedure as demonstrated by the relevant blasting trials is satisfactory.

TOLERANCES**EAR2.W510.8 GENERAL**

Refer to Appendix H 'Schedule of Tolerances' to this Specification.

STR1 STRUCTURAL STEEL

GENERAL

STANDARDS

STR1.G010.8 CODE OF PRACTICE AND STANDARDS

1. Comply with the Code of Practice for the Structural Use of Steel 2011 issued by the Buildings Department;
2. Unless otherwise approved, comply with the British Standards stated in this Specification. Where the Contractor proposes to substitute any other standard or code of practice either in its entirety or in part, for any of those specified, submit details of such together with two complete copies for Approval. Generally, Approval will only be given where the CM considers the proposals to give at least an equivalent standard of the finished work;
3. In the case of any conflict, ambiguity or contradiction between the Code of Practice for the Structural Use of Steel 2011 and the British Standards or other Approved Standards, unless expressly stated otherwise in this Specification, the conditions of the Code of Practice for the Structural Use of Steel 2011 shall prevail.

STR1.G020.8 STATUS OF THE SPECIFICATION

Where this Specification includes provisions additional to, or more stringent than those of the aforementioned Code of Practice for the Structural Use of Steel 2011 and the British Standards, the provisions of this Specification shall prevail overall.

STR1.G030.8 RESPONSIBLE ENGINEER

Employ a Registered Structural Engineer as specified in **PRE.B6.060** to take up the role of Responsible Engineer stated in the Code of Practice for the Structural Use of Steel 2011. The Responsible Engineer shall take responsibility for the design, erection and construction of all permanent and/or temporary works and falsework for the construction of major structural steelwork. No consent or dissent of the CM will relieve the Contractor of his sole responsibility for the design, construction and obtaining Approval.

STR1.G040.8 MINOR STEEL STRUCTURES

1. The list of minor steel structures is given in the **Project Specific Specification**;
2. Specification clauses not applicable to the minor steel structures are listed in the **Project Specific Specification**.

DESIGN

GENERAL

STR1.D010.8 STRUCTURAL STEEL DESIGN

Comply with the information given on the Drawings and the following information. In general member sizes on the Drawings will be given as serial sizes and loads will be indicated under dead and superimposed live loads only. Wind loading, seismic loading and thermal loading will not generally be shown.

STR1.D020.8 DESIGN STANDARDS

Ensure compliance of the design with the requirements of Code of Practice for the Structural Use of Steel 2011 for all building works. For steel bridges the design must also comply with BS 5400 and the Structure Design Manual for Highways and Railways issued by the Highways Department.

STR1.D030.8 WIND LOADING

Calculate the wind loads in accordance with the Code of Practice on Wind Effects in Hong Kong 2004 issued by the Buildings Department.

STR1.D040.8 SEISMIC LOADING

Ensure that seismic loading, (where this needs to be considered) is in compliance with the appropriate national standard for the design of structures in relation to earthquakes.

STR1.D050.8 ALTERNATIVE DESIGN

Loading tests in accordance with Chapter 16 of the Code of Practice for the Structural Use of Steel 2011 may be used to verify alternative design or construction that is not entirely in accordance with the design requirements of the same Code.

STR1.D060.8 DESIGN SUBMISSION FOR MINOR STEEL STRUCTURE

1. Notwithstanding the submission requirements stated in **PRE.B6.085**, submit for CM's approval calculation and drawings, which have been certified by a Registered Structural Engineer, to demonstrate that the design of minor steel structure, including the details of the materials of the structure, shown on the manufacturer's drawings, manuals or catalogues complied with the Specification and the Code of Practice for Structural Use of Steel 2011;
2. Agree with CM the programme for submission.

FABRICATION AND ERECTION DOCUMENTS

STR1.D110.8 FABRICATION DOCUMENTS

1. Prepare and submit to the CM at least six weeks before starting fabrication, complete details of fabrication to include the following:
 - a. All connections including relevant calculations;
 - b. Methods of fabrication;
 - c. Welding process and procedure, see **STR1.T090** and **STR1.T100**;

-
- d. Temporary guys and bracing for use during the erection;
 - e. Details of holding down bolts and fittings to be built into the concrete or masonry.
 2. Do not commence fabrication or deviate from the Drawings prior to receiving Approval.

STR1.D120.8**ERECTION DOCUMENTS**

1. Prepare and submit to the CM at least six weeks before starting to erect steelwork, details of the following:
 - a. Method of erection;
 - b. Type of craneage;
 - c. Calculations of erection stresses;
 - d. Temporary guys and bracing for use during the erection.
2. Do not commence erection or deviate from the Drawings prior to receiving Approval.

STR1.D150.8**WELDING SYMBOLS**

Show welding on the drawings using welding symbols to the Code of Practice for the Structural Use of Steel 2011.

STR1.D160.8**DRAWINGS RESPONSIBILITY**

Accept responsibility for any errors in fabrication drawings subsequently found whether or not Approval to the drawings has been obtained.

STR1.D170.8**RECORD DRAWINGS**

On completion of the erection, revise or redraw fabrication drawings to show any agreed modifications made during the course of the Contract. Submit one copy negative or velograph of each drawing to the CM for record purposes.

DESIGN OF SPACE FRAMES**STR1.D210.8****GENERAL**

This Specification and the Drawings show the works for the purpose of defining the design intent and performance requirements. Details show the preferred arrangements to other building elements and do not provide solutions to structural and thermal movements, fixings and anchorages etc.

STR1.D220.8**DESIGN RESPONSIBILITY**

Accept responsibility for the complete suitability of the design. Approval to the design does not relieve the Contractor from this responsibility.

STR1.D230.8**SCOPE OF WORKS**

The space frame works comprise the design, supply and erection of the whole of the space frame structure in accordance with this Specification including delivery to the site, all testing as required by this Specification, assembling, erecting in position and painting.

STR1.D240.8**DESCRIPTION OF WORKS**

Design the space structure with dimensions as indicated in the **Project Specific Specification**. General Layout, structural supports and all other relevant information pertaining to the space frame are depicted in **Project Specific Specification**.

STR1.D250.8**SPACE FRAME SYSTEM**

1. Propose a specialist supplier/contractor on the Hong Kong Special Administrative Region Development Bureau's 'List of Approved Suppliers of Materials and Specialist Contractors for Public Works' in the category of Space Frame System for the CM's approval and obtain the space frame from the Approved specialist supplier/contractor;
2. Design the space frame which shall be a proprietary system complying with the details as specified in the **Project Specific Specification**.

STR1.D260.8**TENDER INFORMATION**

Provide the following information with return of Tender:

1. The manufacturer's certificate of origin, certificates of chemical composition and physical tests;
2. A complete design calculation of the space frame structure certified by a Registered Structural Engineer;
3. The approximate total weight, loads on each supports, anchorages/anchor bolts required for the fixing of the space frame structure;
4. Method of erection.

STR1.D270.8**DESIGN**

Design proprietary space frame system:

1. To comply with the Code of Practice for the Structural Use of Steel 2011 for steel or BS 8118 for aluminium, as appropriate;
2. To be capable of withstanding thermal movement and induced stresses under a temperature variation ranging from 0°C to 40°C and other loads as shown on Drawings.

STR1.D280.8**ERECTION INFORMATION**

1. Submit for the CM's consent at least one month before the proposed erection of the space frame:
 - a. Organization chart and details of the erection supervisory staff;
 - b. Detail programme for erection;
 - c. Method and procedure of erection with the system employed complete with sketches, drawings, or photographs;
 - d. Details including capacities of all lifting equipment to be used;
 - e. A quality control & assurance system for the verification of the compliance of specification in all materials and workmanship;
 - f. A copy of full set of design calculations including those for the erection stage, certified by the Responsible Engineer;
 - g. Four copies of a full set of shop drawings of the space frame structure and the supporting parts complete with bearings, required for the proper execution of works, certified by the same Responsible Engineer; and

- h. Manufacturer's certificates of origin and chemical composition of, and certificates of results of physical tests for, structural elements showing compliance with the specification.
2. The CM undertakes to reply to the Contractor's submissions and re-submissions within 42 days.

MATERIALS FOR AND FABRICATION OF SPACE FRAMES

STR1.D310.8

MATERIALS STANDARDS

Design with materials of standard hollow section complying with Code of Practice for the Structural Use of Steel 2011 for steel, and BS 1471:1972 or BS EN 755 part 1-2:1997, Part 3-6:1996, part 7-8:1998, Part 9:2001 as appropriate for aluminium. Use members of circular section connected by spherical nodes of the same material. Make the configuration of the nodes such that all resultant forces from members coincide with the centroid of nodes. Where a proprietary space frame is proposed based on other recognized international standards, submit the relevant material specification for Approval.

STR1.D320.8

ROOF FALLS

Design the finished roof with a minimum fall as specified in the [Project Specific Specification](#). Fall to be effected by the space frame structure and/or the purlin systems, after being loaded with all roofing materials.

STR1.D330.8

SIZE OF MEMBERS

Give consideration to providing an aesthetic proportion and balance between members when selecting member sizes.

STR1.D340.8

FABRICATION

Ensure all members are free from twist, true to profile and dead straight or truly curved as shown on the Drawings. Materials damaged whilst being straightened or curved to be rectified or rejected as the CM directs.

STR1.D350.8

CUTTING AND FITTING

Cut to exact lengths the ends of members and other parts abutting against or upon other parts, true and square, so as to provide a good bed or joints as the case may be. Proper cover plates must be provided where necessary.

STR1.D360.8

FASTENERS

1. Provide and fit all bolts with washers, splayed if necessary, to give a level and even bearing on the nuts;
2. Washers to be minimum of 2.4 mm thick;
3. When required by the CM, provide tapered washers for connections with a difference in slope of 3 degrees or greater. Tapered washers are to be used with bolts through flanges. As far as possible, fix the bolt heads to the upper side of the connections.

STR1.D370.8 LIGHT FITTINGS

Provide supports for all light fittings and as shown on drawings and as specified in the [Project Specific Specification](#). Derive support from nodal joints and not from chords, unless otherwise Approved.

STR1.D380.8 ACCESS CATWALKS

Provide internal catwalks together with catladders to the layout shown on the Drawings. Number of catladders required are as specified in the [Project Specific Specification](#). Design catwalks to fit within the depth of the space frame structure and be minimum 600 mm wide unless otherwise stated. Catwalks to be maximum 400 mm from each light fitting. The position of each light fitting may be adjusted from the position shown on the Drawings by up to maximum of 200 mm in any direction to accommodate the design and construction method of the space frame structure and the catwalks.

STR1.D390.8 SECURITY GATE

Allow for provision of a 600 mm wide hinged, opening inward, lockable gate at location as shown on Drawings and specified in the [Project Specific Specification](#).

STR1.D400.8 ELECTRICAL CONNECTIONS

Allow for provision of screw holes or other suitable connection points for the purpose of connection, by the Nominated Sub-contractor for electrical installation and of equipotential bonding conductors as required by the IEE Wiring Regulations.

TREATMENTS AND FINISHES TO SPACE FRAMES**STR1.D510.8 ELECTROPLATING**

Electroplate spherical nodes with zinc layer 25 microns minimum.

STR1.D520.8 HOT DIP GALVANIZING

Hot dip galvanize all other components (both inside and outside of tube members) to BS EN ISO 1461:2009 with minimum mean coating thickness of 45 microns to 85 microns depending on thickness of tube walls as stipulated in Table 3 of BS EN ISO 1461:2009, unless otherwise specified.

STR1.D530.8 POWDER COATINGS

Apply finishing coat to space frame members of factory applied polyester powder. Coat of minimum dry film thickness of 80 microns. Colour to be selected from Standard colour chart.

ERECTION OF SPACE FRAMES**STR1.D610.8 ERECTION SUBMISSION**

Submit for the CM's consent the proposed method and procedure of erection of the space frame prior to installation. Ensure compatibility with the requirements of the proposed construction programme and the site conditions. Demonstrate to the satisfaction of the CM that the effects of the forces and stresses imposed in the structure during erection of the space frame shall not exceed the originally allowed for in the design of the structure.

STR1.D620.8 TEMPORARY SUPPORTS

Allow for the provision and the CM's consent of all necessary temporary bracing and supports prior to final fixing.

STR1.D630.8 FIXINGS

Provide installation details of all anchorages/anchor bolts, that must avoid conflicting with the reinforcement of supporting elements.

STR1.D640.8 PROTECTION

Allow for taking necessary precautions to prevent damage to the existing structure and finishes thereof if applicable, during erection. Protect floors when cranes or other plant are to be used internally for erection.

STR1.D650.8 CONTRACTOR'S SUPERVISION

Provide a suitable experienced engineer full time on Site to supervise the erection of the space frame structure until physical completion of the works. The engineer must have previous experience in space frame construction. Submit for Approval the name and qualifications of the engineer who may be the employee of the Specialist Sub-contractor.

DESIGN OF PEDESTRIAN FOOTBRIDGES

STR1.D710.8 GENERAL

Design steel footbridges using structural steelwork to Code of Practice for the Structural Use of Steel 2011, BS 5400 and the Structure Design Manual for Highways and Railways issued by the Highways Department unless otherwise particularly specified.

STR1.D720.8 DRAWINGS AND DETAILS

Submit to the CM, at least 42 days before fabrication, two copies of all detailed working drawings and calculations for the erection and for temporary works and, where applicable, the following information:

1. Specification of materials used in the temporary works;
2. Locations, sizes, lengths and form of joint, angle between fusion faces, gap between parts of all welds. Symbols conforming to Code of Practice for the Structural Use of Steel 2011 should be used for standard weld forms, but full details must be given of any non-standard welds;
3. Where welds are to be made in the shop or elsewhere;
4. Details of stress relieving;
5. Details of testing and inspection methods.

STR1.D730.8 FABRICATION APPROVALS

Do not commence fabrication until Approval to the proposals has been received. Such Approval does not relieve the Contractor of any obligation under the Contract.

STR1.D740.8 APPROVED FIRMS

1. Select a specialist contractor from the Development Bureau's "List of Approved Suppliers of Materials and Specialist Contractors for Public Works" in the category of Structural Steelwork for CM's approval;

-
2. Employ the Approved specialist contractor and accept all normal obligations under the Contract including responsibility for works carried out by the specialist contractor.

STR1.D750.8**ERECTION APPROVALS**

Before commencing erection of footbridges:

1. Obtain approvals from Highways Department, Commissioner of Police, and Commissioner for Transport for proposed method of erection of footbridges;
2. Comply with all requirements of the Highways Department and the Commissioners at Contractor's own expense and without any claim for extension of time.

STR1.D760.8**ERECTION PROPOSALS**

1. Prepare and submit the erection proposal at an appropriate time having regard to the programme of work and the time taken for checking by the CM, obtaining replies and Approvals from the Highways Department and the Commissioners, and making any necessary amendments as required by the Highways Department, the Commissioners and the CM. Details of the erection proposal submitted must include:
 - a. A method statement including the type of plant and equipment to be used;
 - b. Drawings and calculations of any proposed temporary falsework system;
 - c. All drawings properly numbered, fully detailed and dimensioned. All calculations and drawings submitted certified and signed by a Registered Structural Engineer, stating that the design is adequately safe.
2. Amend details as necessary to meet the CM's requirements and then submit through the Authority, to the aforesaid authorities for obtaining their approvals;
3. The giving of consent by the CM to the proposal does not relieve the Contractor of any of his duties or responsibilities under the Contract including his responsibility to obtain the necessary approvals from the aforesaid authorities. Allow a minimum of four weeks for comments from various Government Departments on the erection proposal.

STR1.D770.8**ERECTION PROCEDURE**

1. Ensure that all falsework used does not interfere with normal traffic flow, and not reduce the width of the traffic lanes. Comply with the minimum clearance restriction imposed by relevant authorities for falsework spanning across carriageways and footways;
2. Assemble, fit and temporarily bolt or tack weld members to Approval prior to final riveting or welding;
3. Submit records of inspection of the completed formwork and falsework to the CM for information before carrying out any further works that may affect the stability of the formwork and falsework. Such records are to be certified by a contractor's superintendent holding qualification equivalent to TCP Grade T4 in civil or structural engineering discipline;
4. Monitor falsework levels and make any necessary adjustments for settlement, or other deflection or movements.

STR1.D780.8**BRIDGE BEARINGS**

1. Prepare bearing surfaces for bridge bearings by removing all oil and grease by use of a suitable solvent all mill scale, rust and dirt removed by shot blasting;

-
2. Protect the proposed surface by covering with tape or similar material. The surfaces must not be primed or painted at any time prior to application of the bonding agent.

MATERIALS

GENERAL

STR1.M020.8 MATERIALS AND WORKMANSHIP

Ensure that all structural steelwork is in accordance with the Code of Practice for the Structural Use of Steel 2011 for building and general work and in accordance with BS 5400 and the Structure Design Manual for Highways and Railways issued by the Highways Department for bridge works except where specified otherwise.

STR1.M030.8 APPROVALS

Prior to commencing construction, submit for Approval any details required of the welding plant, techniques and procedures, jigs, workshop facilities and construction devices e.g. cranes, scaffolding etc, which the Contractor proposes using for the fabrication and erection of the steelwork. The information must be in sufficient detail to enable the CM to approve or otherwise.

STR1.M040.8 SAFETY

Comply with safety recommendation contained in BS EN 1011-1:2009 and with the Factories and Industrial Undertakings Ordinance throughout the fabrication, transport, handling and erection of structural steelwork.

STR1.M050.8 METHOD OF MANUFACTURE

Do not use the following method of steel manufacture:

1. Steel made by the Bessemer process;
2. Rimming steel.

STR1.M060.8 STEEL GRADES

Structural steelwork to comprise weldable structural steel in accordance with the following standards as appropriate:

1. Hot rolled sections (excluding hollow sections) and plates:
BS EN 10025 Part 1-6:2004 Grade S275, S275JR, S355JR, S355J0, S450J0;
2. Hot finished hollow sections:
BS EN 10210-1:2006, Grade S275J0H, S355J0H, S450J0;
3. Cold formed hollow sections:
BS EN 10219-1:2006: Grade S275J0H, S355J0H;
4. Cold rolled galvanized sections:
either BS 2989:1992 Grade Z35, coating type G600, surface finish N, or Hot dipped coated steel sheets to BS EN 10147:1992 Grade FE E3509, coating type G600, surface finish N.

STR1.M070.8 HOT ROLLED SECTIONS

Dimensions, mass, tolerances and rolling margins for:

1. Universal beams, columns, joists, tees and channels to BS 4:Part 1:2005;

-
2. Hollow sections to BS EN 10210-2:2006;
 3. Angles to BS EN 10056-1:1999 and BS EN 10056-2:1993.

STR1.M080.8 COLD ROLLED SECTIONS

1. Dimension, mass and tolerances of cold rolled sections to BS 2994:1976 (1987);
2. Do not use cold rolled sections without Approval.

STR1.M090.8 COLD ROLLED HOLLOW SECTIONS

1. Dimension, mass and tolerances of cold rolled hollow sections to BS EN 10219-2:2006;
2. Do not use as substitute for hot finished hollow sections.

STR1.M100.8 PLATES, FLATS AND BARS

1. Comply with the standards as follows:
 - a. For plates dimensions and mass tolerances to BS EN 10029:2010;
 - b. For wide flats dimensions and mass tolerances to Euronorm 91 Class II thicknesses tolerances;
 - c. For bars dimensions and mass tolerances to Euronorm 59 - Square bars, Euronorm 60 - Round bars, Euronorm 61 - Hexagonal bars.
2. Ensure tolerances on thickness are wholly over that shown on the drawings unless otherwise specified.

STR1.M110.8 SURFACE QUALITY

Surface quality of steel to be in accordance with the following:

1. Sections: BS EN 10163 Part 3:2004 Class C;
2. Plates and wide flats: BS EN 10163 Part 2:2004 Class A.

STR1.M120.8 SURFACE DEFECTS AND REPAIR

1. Steel with surface defects within the limits of the following may be repaired and used:
 - a. Sections: BS EN 10163 Part 3:2004 Class C;
 - b. Plates and wide flats: BS EN 10163 Part 2:2004 Class A.
2. Obtain Approval to carry out surface defect repairs by welding.

STR1.M130.8 SURFACE RUSTING

Use only steel with Grade A, B or C surface rusting in accordance with BS 7079: Part A1:1989 (1994).

STR1.M140.8 MAXIMUM CARBON EQUIVALENT

Steel used in built-up welded assemblies or at welded connections must have a carbon equivalent value not exceeding that appropriate to the grade of steel given in Annex D1.1 of the Code of Practice for the Structural Use of Steel 2011 where this may be required for the avoidance of hydrogen cracking in welds unless the Contractor's proposed welding procedures are such to make this requirement unnecessary.

STR1.M150.8 MARKING STEELWORK

Clearly mark all steelwork for identification and erection purposes as follows:

1. Identification: ensure that all steel elements are identified in accordance with BS EN 10025:2004, indicating grade, cast number and manufacturer's identification mark. Where indicated on the Drawings as being unmarked, tag steelwork and leave free of all other marking or hard stamping;
2. Grade S355 and S450 steel: in addition to marking in accordance with BS EN 10025:2004 mark steel with a continuous pale blue water paint line. Mark immediately, with light blue water painting any part cut from S355 and S450 steel which does not have a light blue marking;
3. Cold work steel: mark cold worked areas of member with orange water paint;
4. Marking for erection purposes: tag, hard stamp or pencil weld each member with an individual identification mark, which can not be obliterated by surface coatings. Prepare a marking drawing identifying markings and indicating position of member in structure;
5. Permanent identification: supply and fix to structure after erection, a brass identification plate. Plate to indicate with lettering not less than 15 mm high, etched or punched to a depth not less than 1.5 mm, the following:
 - a. Steelwork Contractor's name;
 - b. Grade of steel in structure;
 - c. Date of fabrication.

STR1.M160.8 NON-AVAILABLE MATERIALS

Obtain Approval for any equivalent alternative required when the specified material is not available.

STR1.M170.8 MANUFACTURERS CERTIFICATES

Provide the manufacturer's certificates for all steel sections, rivets, bolts, screws, nuts and washers delivered to Site.

STR1.M180.8 CLASS OF STEEL

Use only the Class of steel as stated in the **Project Specific Specification**, unless otherwise shown on the Drawings and/or Approved.

BOLTS, ACCESSORIES, CONNECTIONS AND FITTINGS

STR1.M210.8 STEEL GRADE FOR CONNECTIONS AND FITTINGS

Use Grade S275 steel as a minimum, subject to design suitability, unless otherwise specified.

STR1.M220.8 HIGH STRENGTH BOLTS AND NUTS

1. To BS 3692:2001:Grade 8.8;
2. To the strength of BS 3692:2001:Grade 8.8 and the tolerances of BS 4190:2001;
3. To BS EN 14399:2005 used as ordinary high strength bolts in accordance with BS 4604:Part 1:1970, without the hardened steel washers.

STR1.M230.8	BS 4190 HOLDING DOWN BOLTS AND NUTS Holding down bolts and nuts to BS 4190:2001:Grade 4.6. Unless otherwise agreed by the CM, holding down bolts shall be encased in concrete or grout and with either one of the following: <ol style="list-style-type: none">1. Normal bolt head at the exposed end;2. Screwed ends with two nuts at the exposed end.
STR1.M240.8	BS 3692 HOLDING DOWN BOLTS AND NUTS Holding down bolts and nuts to BS 3692:2001:Grade 8.8. Unless otherwise agreed by the CM, holding down bolts shall be encased in concrete or grout and with either one of the following: <ol style="list-style-type: none">1. Normal bolt head at the exposed end;2. Screwed ends with two nuts at the exposed end.
STR1.M250.8	BLACK BOLTS AND NUTS To BS 4190:2001:Grade 4.6.
STR1.M260.8	DRIVE SCREWS Use self-tapping metallic drive screws to BS 4174:1972.
STR1.M270.8	PLAIN WASHERS FOR BLACK BOLTS Round washers to be to BS 4320:1968, Form A made from cold rolled strip in the hardened condition to BS 1449:Part 1:1991:Section 1.15, Grade CS4 chamfered on one outside edge.
STR1.M280.8	SPRING WASHERS FOR BLACK BOLTS Washers to be single coil square or rectangular steel spring washers to BS 4464:1969 (1990).
STR1.M290.8	TAPERED WASHERS Made from cold formed strip in the hard condition to BS 1449:Part 1:1991:Section 1.15, Grade CS4 to similar dimensions and tolerances as shown in BS EN 14399:2005.
STR1.M300.8	BOLT LENGTHS Ensure threaded portion of each bolt projects through the nut by at least one thread.
STR1.M310.8	HIGH STRENGTH FRICTION GRIP BOLTS Use bolts and associated nuts and washers to BS EN 14399:2005 unless otherwise specified.
STR1.M320.8	RIVETS Use mild steel rivets for general engineering purposes to BS 4620:1970 (1988).
STR1.M330.8	TURNBUCKLES OR SIMILAR Obtain Approval for specially made elements and components such as turnbuckles.

STR1.M340.8 MARKING BOLTS AND ACCESSORIES

Clearly mark all bolts, screws, nuts and washers by either embossed or indented markings identifying the relevant British Standard. (See also **STR1.W040**).

WELDING CONSUMABLES**STR1.M410.8 QUALITY OF ELECTRODES, RODS AND WIRES**

Select to give weld metal properties not less than the minimum specified for the grade of steel being welded.

STR1.M420.8 CONSUMABLES FOR WELDING STEELS TO BS EN 10025

To BS EN 1011-1:2009.

STR1.M430.8 ELECTRODES FOR WELDING GRADE S355 AND S450 STEELS

To be capable of depositing no more than 15 ml of diffusible hydrogen per 100 g of deposited weld metal, as defined in BS EN ISO 2560:2009.

STR1.M440.8 COVERED ELECTRODES FOR MANUAL METAL ARC WELDING

To BS EN ISO 2560:2009.

STR1.M450.8 FILLER WIRES FOR GAS-SHIELDED WELDING

To BS EN ISO 14341:2011.

STR1.M460.8 CORED ELECTRODES

To BS EN ISO 17632:2015.

STR1.M470.8 FILLER WIRES AND FLUXES FOR SUBMERGED ARC WELDING

To BS EN ISO 14171:2010.

STR1.M480.8 CONTINUOUS COVERED ELECTRODES

Of an Approved manufacture.

STR1.M490.8 MANUFACTURER'S TEST CERTIFICATES

Provide CM with relevant manufacturer's certificates for each batch of electrodes/rods/coils of wire.

STR1.M500.8 STORAGE OF ELECTRODES

Keep electrodes in unbroken packets in accordance with BS EN 1011-1:2009. Any drying or baking of consumables before issue shall be carried out in accordance with the manufacturers recommendations.

WORKMANSHIP

TRANSPORTATION AND STORAGE

STR1.W010.8 GENERAL

Make all necessary arrangements for transport of steel from the fabrication yard to the site.

STR1.W020.8 HANDLING

Carefully load, stack, and unload to avoid damage of any description. Replace damaged items at Contractor's own expense unless the CM permits rectification of damage.

STR1.W030.8 SPECIAL HANDLING

1. Where necessary; use, special slings or lifting points or both for handling, loading and unloading in fabrication shops, during transit and on Site;
2. Provide special supports, packings and lashings on vehicles, trucks and on ship (if appropriate) to prevent chafing;
3. Ensure small components receive special handling and stacking;
4. Ensure unpainted components, e.g. high strength friction grip bolts and associated nuts and washers are adequately protected against corrosion.

STR1.W040.8 BOLTS, NUTS, WASHERS, AND SCREWS

1. Transport and store in sealed or wire clipped bags labelled to identify:
 - a. Contents;
 - b. Number;
 - c. Grade;
 - d. Standard;
 - e. Manufacturer;
 - f. Batch or cast number.
2. Store in a dry area dedicated to the purpose;
3. Do not mix contents of opened bags.

STR1.W050.8 EXPOSURE TO POLLUTANTS

1. Take precautions to minimise exposure of steelwork to atmospheric or chemical pollution before and after fabrication;
2. Store and stack steel members in such a manner that markings are clearly visible;
3. Either one of the following:
 - a. For superstructure works:
 - i. Store steelwork awaiting erection clear of a levelled, well-drained and maintained hard-standing ground and keep different members separate. Lay or stack to avoid accumulation of water or dirt on or against any of the surfaces. Provide suitable packings between layers of stacked steelwork. Ventilate covered steelwork sufficiently to preclude condensation.

-
- b. For works other than that in sub-clause (3)(a):
 - i. Store steelwork awaiting erection clear of the ground and keep different members separate. Lay or stack to avoid accumulation of water or dirt on or against any of the surfaces. Provide suitable packings between layers of stacked steelwork. Ventilate covered steelwork sufficiently to preclude condensation.

STR1.W060.8 ROAD TRANSPORT

1. Use vehicles long enough to carry components with permitted overhang at either end;
2. Provide intermediate supports to which a component can be tied with strops to prevent oscillation;
3. Sit components on softwood supports covered with soft clean pads;
4. Ensure buckles to strops do not touch components.

STR1.W070.8 SEA TRANSPORT

1. Containerise steelwork destined to be shipped overseas;
2. Do not ship steelwork as deck cargo unless in containers;
3. Ensure containers can be handled at ports of exit and entry if vehicle cannot be ferried;
4. Pack containers so that no components touch. Use softwood with soft padding and man-made fibre ropes and strops to prevent movement and contract;
5. Bag fasteners and accessories;
6. Bundle small components and prevent contact;
7. Chromate dip galvanized steel, which is not to be overcoated, when it is to be containerised for longer than three weeks or when going to go through the tropics.

STR1.W080.8 REPAIR OF DAMAGE INCURRED IN TRANSPORT

1. Inspect steelwork after transportation;
2. Set aside components with damage to steel or coatings;
3. Report damaged steel to the CM;
4. If damaged component is not rejected by the CM repair by agreed method;
5. Repair coatings as specified immediately.

FABRICATION**STR1.W110.8 ACCESS**

Provide access for the CM at all reasonable times to all places where work is being carried out, with all necessary facilities for inspection during fabrication and off-site assembly.

STR1.W120.8 GEOMETRIC FORM

Keep all material, before and after fabrication, straight unless required to be of curvilinear form. Keep free from twists. Avoid excessive stack-up of sections to prevent damage and distortion.

STR1.W130.8 IDENTIFICATION

Identify at all stages of fabrication, structural steel as described in **STR1.M150**.

STR1.W140.8 SURFACE PREPARATION

Before fabrication remove all oil and grease by use of a suitable solvent from all bare surfaces and remove all mill scale, rust and dirt by either:

1. Shot blasting to surface finish designation Sa 2 to BS 7079:Part A1:1989 (1994);
2. Mechanical wire brushing to surface finish designation St 2 to BS 7079:Part A1:1989 (1994).

STR1.W150.8 POST CLEANING

After cleaning adopt one of the following methods:

1. Apply a coat of blast primer, not greater than 20 microns DFT. Where subsequent welding is to be carried out ensure that a weld through blast primer is used which will not give off noxious fumes during welding. Ensure compatibility with final protective system; or
2. Fabricate steelwork within four hours of cleaning and apply protective system primer (See **STR1.W1220**); or
3. Reclean steel after fabrication by shot blasting or mechanical wire brushing to standard required for protective coating and apply protective system primer (See **STR1.W1220**).

STR1.W160.8 EXECUTION

1. Carry out all fabrication to:
 - a. The Code of Practice for the Structural Use of Steel 2011 for hot rolled sections and cold formed sections in building;
 - b. BS 5400:Part 6:1980 for plates and sections in bridgework.
2. Conform with the requirements for accuracy of construction with respect to levels, dimensions, alignment and fabrication tolerances of members and joints given in the above Code of Practice and British Standard.

STR1.W170.8 SETTING OUT

Set out all holes and cuts along the length of a member from one datum line perpendicular to its longitudinal axis. Mark centres of all holes at standard back marks/cross centre unless otherwise shown on the Drawings.

STR1.W180.8 TEMPORARY ATTACHMENTS

Design and fabricate all temporary attachments for use as assembly/erection aids to ensure their use will not damage the structure of its surface protection.

STR1.W190.8 END PLATES

1. For flexible end plate connections:
 - a. To be not less than 12 mm thick;
 - b. To extend across, but not be connected to the top flange;
2. For sealing hollow sections;
 - a. Suspend suitable desiccant (Silica-gel) in bags in each void prior to sealing up;

-
- b. Weld sealing plate over end.

STR1.W200.8**JIGS**

Use jigs for repetitive, interchangeable or complicated work.

STR1.W210.8**MEASUREMENT AND SETTING OUT MARKS**

Make all measurements by steel tape or bands calibrated at 20°C and used at the correct tension.

STR1.W220.8**CONTINUOUS STRUCTURES**

Make allowance in setting out continuous structures for dimensional variations due to temperature variations.

STR1.W230.8**STRAIGHTENING BENDING AND CAMBERING OF STEEL SECTIONS**

Submit proposals to the CM where steel sections are required to be straightened, bent to a specified radius or precambered and methods to be adopted to perform these operations, for his approval in each case. Ensure that the adopted method does not weaken or deface the member.

STR1.W240.8**POST FABRICATION MAKING GOOD**

Clean and prepare all mechanical damage, weld burns and welded surfaces as follows:

1. By shot blasting; or
2. Mechanical or hand wire brushing;
3. All bare and welded surfaces must also be made good and primed in accordance with **STR1.W150**;
4. Plates over 25 mm that are to be connected by high strength friction grip bolts and found to be bowed or rippled must be machined flat before the steel leaves the fabrication works.

STR1.W250.8**CUTTING STEEL**

1. Cut by sawing, shearing, cropping, nibbling, laser or machine flame cutting, unless otherwise Instructed. Do not use manual gas cutting without Approval;
2. Shearing must not distort steelwork;
3. Saw cut slightly oversize to allow for machining and/or grinding;
4. Flame cut oversize where necessary to allow for removal of notches by machining.

STR1.W260.8**CUT EDGES**

1. Remove burrs, sharp arrises and slag from edges of all cut members;
2. Dress machine sheared or cropped edges to a neat finish, free from distortion.

STR1.W270.8**MACHINING GENERALLY**

1. Grind stiffeners, plates and the like to fit the profile of the parent member with diagonal cuts to clear the root radius;
2. Machine stanchion splices and butt joints of compression members true and square;

3. Splay cut projecting corners of cleats, plates, etc and machine the edges and ends of all flanges and end plates of girders or other members except where Universal beams or flats with reasonably square edges are used;
4. Machine the edges of all web and flange plates of welded girders square unless specified otherwise. Where plates are specified to be planed, cut to sufficient size to permit 3 mm to be planed off all edges. The edges of floor plates, gutter plates, and trough flooring may be sheared;
5. Machine square all butt ends of compression members and those in close contact throughout so that applied loads are evenly transmitted over the entire area of the section.

STR1.W280.8 FLAME CUTTING

Grind off heat affected metal or notches where gas cutting is used. Where gas cutting is applied to Grade S275 steel over 25 mm thick or to Grade S355 & S450 steel of all thicknesses, machine any gas cut edge which is to be subject to fluctuating stresses along its length but not subsequently incorporated in a weld so as to remove not less than 3 mm of the flame cut profile.

STR1.W290.8 FORMING HOLES FOR BOLTS AND RIVETS

1. Form holes by any of the following methods:
 - a. Drilling full size;
 - b. For plate less than 15 mm thick: punching 2 mm less in diameter than the required size and subsequently reaming out to the required diameter;
 - c. Punching full size and meeting the following conditions:
 - i. The punching operations must not in the opinion of the CM unduly distort the material;
 - ii. The holes must be free from burrs which would prevent solid seating of the parts when tightened;
 - iii. The thickness of the material through which the hole is punched must not exceed the diameter of the hole;
 - iv. The thickness of the material must not be greater than 12 mm unless Approved;
 - v. In spliced connections the holes in the mating surfaces must be punched from the same direction.
 - d. Holes must not be punched full size in any of the following conditions:
 - i. In tension flanges at locations where plastic hinges have been assumed in the design analysis;
 - ii. In elements of rigid connections in which local yield lines have been assumed;
 - iii. Where repetition of loading makes fatigue critical in the member design.
2. Comply with clause 14.2.5 of the Code of Practice for the Structural Use of Steel 2011.

STR1.W300.8 BUILT-UP SECTIONS

1. Drill after the members have been assembled and tightly clamped together;

-
2. Where not practicable, drill the holes to a diameter at least 2 mm less than the required size and ream after assembly to the full diameter.

STR1.W310.8 REMOVING BURRS

Remove all burrs from holes from assembly. Parts which have been drilled to receive black bolts need not be separated to remove burrs. Parts drilled to receive HSFG bolts to be separated and the surfaces cleaned of all burrs and drilling fluid to ensure the coefficient of friction is not compromised.

STR1.W320.8 HOLES FOR BLACK BOLTS

Finished holes for black bolts must not be more than 2 mm in diameter larger than the diameter of the bolt passing through them for bolt diameters up to 24 mm, and not more than 3 mm larger than the diameter of the bolts for bolt diameters over 24 mm, unless otherwise specified or required by the design.

STR1.W330.8 HOLES FOR HIGH STRENGTH FRICTION GRIP BOLTS

Use hole sizes specified in **STR1.W320** where the number of plies in the grip does not exceed three, if the number of plies exceed three, form the holes in the two outer plies as before and the diameter of the hole in the inner plies not more than 3 mm larger than that of the bolt.

STR1.W340.8 FITTED BOLTS, PINS OR RIVETS

1. Holes for rivets:
 - a. All matching holes for rivets to register with each other so that a gauge 2 mm less in diameter than the diameter of hole will pass freely through the assembled members in a direction at right angles to such members;
 - b. Finished holes to be more than 2 mm in diameter larger than the diameter of the rivet passing through them, for rivet diameters up to 24 mm, and not more than 3 mm greater than the diameter of the rivet for rivet diameters over 24 mm, unless otherwise specified;
 - c. Holes for rivets must not be formed by a gas cutting process.
2. Holes for fitted bolts:
 - a. Drill holes for fitted bolts to a diameter equal to the nominal diameter of the shank subject to a tolerance of +0.15 mm and -0 mm;
 - b. Use tacking bolts or cramps on parts connected together with fitted bolts. Drill through all the thicknesses at one operation and ream to size;
 - c. All holes not drilled through a thicknesses at one operation are to be drilled to a smaller size and reamed out after assembly. Where this is not practicable, drill and ream the parts separately through hard bushed steel jigs.

STR1.W350.8 SLOTTED HOLES

Drill first then ream out smooth to required size.

STR1.W360.8 PREVENT MOISTURE INGRESS

Make provision to prevent moisture ingress to sealed hollow members where these are holed for bolts.

MECHANICAL JOINTING

STR1.W410.8 SURFACE PREPARATION

Prepare and prime the contact surfaces at riveted, bolted and screwed joints. If the contact surfaces are specified to be coated or otherwise treated, e.g. machined surface finish, obtain Approval to the joint before assembly.

STR1.W420.8 USE OF HIGH STRENGTH FRICTION GRIP BOLTS

1. Clean the interface of members jointed with high strength friction grip bolts to the specified surface preparation and leave unpainted;
2. Use high strength friction grip bolts in accordance with BS 4604:Part 1:1970. Tighten the bolts and nuts by the torque-control method using a calibrated power-operated or a hand-operated torque wrench to achieve the proof loads set out below:

Nominal size	Proof Load, kN (minimum shank tension)
M12	49.4
M16	92.1
M20	144
M22	177
M24	207
M27	234
M30	286

3. Use tapered washers on surfaces with a slope $>3^\circ$.

STR1.W430.8 WRENCH CALIBRATION

1. Maintain the wrench in a proper working condition in accordance with the manufacturer's recommendations. Calibrate the wrench regularly using a calibrated bolt load meter and using a bolt from the batch of bolts to be used in the works as follows:
 - a. At the commencement of each new working day or shift;
 - b. With each change of bolt diameter;
 - c. With each change of bolt grip length in excess of 1/5th of the length used in the calibration of the wrench in accordance with BS 4604:Part 1:1970.
2. Re-apply the wrench to bolts previously tightened in a multi-bolt connection to ensure all bolts have the correct torque;
3. Ensure that the bolt used in the calibration is, as far as is practicable, representative of bolts to be used in the works. No additional lubrication should be applied unless it is to be applied to bolts incorporated in the permanent works.

STR1.W440.8 CALIBRATION OF BOLT LOAD METER

The bolt load meter for measuring bolt shank tension must be calibrated by an Approved laboratory before tightening of bolts and nuts commences and at regular intervals agreed by the CM. During re-calibration, a replacement calibrated bolt load meter must be provided on the Site. Submit calibration results to the CM at least one week before the bolt load meter is used.

STR1.W450.8 BLACK OR PRECISION BOLTED CONNECTIONS

1. Keep all bolts, nuts and washers free from rust and dip in linseed oil immediately before connections;
2. Provide each bolt with at least one steel washer placed under the nut or bolt head, whichever element is to be rotated during the tightening operation;
3. Tighten all bolt heads and nuts against surfaces normal to the bolt axes. Use tapered washers as necessary to meet this requirement. Where bolted connections are subject to vibration provide the nuts with lock nuts or castle nuts and split pins.

STR1.W460.8 ALIGNMENT, TEMPORARY CONNECTIONS AND PERMANENT FIXINGS

1. Do not distort holes or members during alignment;
2. Do not enlarge holes without prior Approval;
3. Drifts used during the fabrication or erection of the steelwork must be of such shape and dimensions as to locate the work accurately. Drifts must not cause any damage to or deformation of the component parts, nor alter in any way the sizes of the holes provided for the permanent bolts;
4. Temporary bolts used for the initial or trial assembly of any part of the steelwork must have the same hole clearances as the permanent bolts;
5. Tighten all bolts securely in the finished work so that the length of each bolt after tightening projects at least one thread beyond the other face of the secured nut.

STR1.W470.8 BOLTED CONNECTIONS WITH PROVISION FOR SLIDING

Provide slotted hole through one member and a round hole in the other. Connect with shouldered bolts, spring washers, flat washers, castle nuts and split pins. Form round holes with a diameter less than the width of the slot and place the shoulder of the bolt against the faying surface of the unslotted member enabling the bolt to be tightened on this member. Locate the spring washer under the head of the bolt and the flat washer under the castle nut.

WELDING**STR1.W510.8 GENERAL**

1. Prior to fabrication of bridgework carry out welding and flame cutting trials using representative samples of materials to be used in the work in accordance with BS 5400:Part 6:1980;
2. Provide an experienced and competent operative to supervise welding. Submit evidence that all welders are capable in accordance with **STR1.T080**;
3. When directed by the CM, keep a site record that identifies the welders responsible for major welds.

STR1.W520.8 USE OF WELDING EQUIPMENT AND ACCESSORIES

1. Use welding plant, equipment and accessories that comply with the requirements of BS 638;
2. Use individual transformers or motor generator that are fitted with a current density control and situated close to the welder so that he may adjust the current;
3. Store and use welding consumables in accordance with BS EN 1011-1:2009, BS EN ISO 2560:2009 and the manufacturers recommendations;

-
4. Store electrodes in dry conditions and where necessary keep in heated quivers while in use;
 5. Use covered electrodes to BS EN ISO 2560:2009;
 6. Regularly calibrate, using an ammeter, the transformers or motor generators to ensure that current is kept within the range specified by the manufacturers for electrodes;
 7. Do not open packets except for sampling or when electrodes are to be used;
 8. Reject electrodes with broken, damp or damaged coatings.

STR1.W530.8**PREPARATION FOR WELDING**

1. Submit in writing, for Approval, details of proposed welding procedure for each type of welded connection in accordance with **STR1.T100**;
2. Keep the surfaces to be welded free from all scale, grease, paint, rust and other matter. Prepare all parts to be welded in a manner that ensures a close fit;
3. Prepare fusion surfaces to BS EN 1011-1:2009. Dry surfaces and warm as necessary, to remove any condensation.

STR1.W540.8**ADDITIONAL REQUIREMENTS FOR SITE WELDING**

1. Surfaces to be welded must be clean, free from paint, grease, contaminants dry and free from condensation. Where the steel is damp or the temperature is low then warming with a low temperature flame may be used. Thermal indicating crayons may be used to determine the plate temperature and the area pre-heated;
2. Protection from the weather: provide adequate protection to shield the welding from the weather. Tent type structures made from fireproof and waterproof material may be used to shield the weldment from the wind and rain. Such temporary structures to be mounted on stable scaffolding supports, and a stable platform to be provided for the welder. Where welding to hollow sections is required ensure draughts are prevented from blowing through the section;
3. Electrodes: bake on site at a temperature between 100°C and 150°C and where necessary store in heated quivers for use at the welders convenience;
4. Power supply: may be from a transformer or generator to provide a three phase power supply of the required voltage. Locate the generator or transformer as close as possible to the welder to prevent a drop in voltage along the cables length. Ensure all the cables are as short as possible, routed away from the path of construction vehicles, and adequately protected;
5. Earth run: adequately earth all electrical plant. Ensure the welding return from the weldment is adequate in cross section and correctly connected and earthed;
6. Weld detail: ensure the welded joint is of the correct profile and fit up. As a general guide do not carry out welding where the gap is less than 1 mm or more than 3 mm unless a backing strip is provided. Where a backing strip is provided the weld gap is not to exceed the greater of 5 mm or the thickness of the material being welded. Adequately support all welded joints with props or restraints that ensure relative movement of the fusion faces is prevented;
7. Work in confined spaces: provide adequate ventilation and formulate plans of evacuation and escape before the work commences.

STR1.W550.8**METHOD OF WELDING**

1. Carry out welding in accordance with the requirements of BS EN 1011-1:2009. Manual metal-arc weld unless otherwise specified;

-
2. Execute welding in a flat or horizontal position wherever possible. Do not weld overhead without Approval;
 3. Ensure electrodes used in conjunction with fluxes give a weld deposit having mechanical properties at least equal to the minimum specified for the parent metal. Use electrodes and fluxes strictly in accordance with the manufacturer's recommendations.

STR1.W560.8 REMOVAL OF SLAG

Remove welding slag by chipping before depositing subsequent runs, and thoroughly wire brush the surfaces.

STR1.W570.8 TACK WELDS

Do not use tack welding unless Approved. Tack welds to be minimum 50 mm long. Form location welds, where Approved, of the same quality and size as the first run of the main weld which when completed, fuse completely with the ends of the location welds and form a reasonably regular finished profile. Do not weld temporary attachments to principle joints. Obtain Approval of the position of welds for temporary attachments.

STR1.W580.8 WELD DEFECTS

1. Welds will be rejected if they do not meet the acceptance criteria of welds stipulated in clause 14.3.6.7 of the Code of Practice for the Structural Use of Steel 2011;
2. Take particular care when welding hollow sections, plates and angles to avoid distortion by using correct sequences and speeds.

STR1.W590.8 FILLET WELDS

Deposit fillet welds to the required length, throat thicknesses and with partial or full penetration as specified.

STR1.W600.8 BUTT WELDS

1. Form butt welds as full penetration welds between prepared fusion faces, unless otherwise directed;
2. Carry out back chipping, grinding or gouging of the deposited weld as required to obviate imperfections in the root run such that the root edges or root faces are not out of alignment by more than 1/8 of the thickness of the thinner material for material up to 12 mm thick or by more than 1.5 mm for thicker material;
3. Grind butt welds flush without loss of parent metal;
4. In the fabrication of built-up assemblies ensure, all butt welds in each component are completed, wherever possible, before the final assembly.

STR1.W610.8 STUD SHEAR CONNECTORS

Weld stud shear connectors by automatic stud welding gun strictly in accordance with the manufacturer's recommendations unless specified otherwise.

ERECTION OF STEELWORK**STR1.W710.8 ERECTION**

1. Carry out all erection to:

-
- a. The Code of Practice for the Structural Use of Steel 2011 for hot rolled sections and cold formed sections in building;
 - b. BS 5400:Part 6:1980 for plates and sections in bridgework.
2. Conform with the requirements for accuracy of construction in respect of levels, dimensions and alignment given in the above Code of Practice and British Standard and those contained in the "Schedule of Tolerances" in Appendix H to this Specification.

STR1.W720.8**ERECTORS**

Carry out all work employing trained and experienced erectors. Provide evidence of the erector's competence when directed by the CM.

STR1.W730.8**SAFETY**

Comply with the relevant regulations on safety including the 'Factories and Industrial Undertakings Ordinance', the recommendations of BS 5531:1988 as applicable and:

1. Use only recently tested equipment for lifting and remove from site any damaged equipment;
2. Do not carry out complex operations at a height except from safe platforms large enough to take operators and equipment. Maintain platforms and safe access until work has been accepted and any added protection completed.

STR1.W740.8**STABILITY**

Ensure stability of structure at all stages of construction.

STR1.W750.8**SEQUENCE OF OPERATIONS**

Prepare and submit details of the proposed method of erection for the CM's consent. Details submitted must include type of plant and equipment to be used and if necessary drawings and calculations of any temporary work. The giving of consent by the CM will not in any way relieve the Contractor of his responsibility for safe erection of permanent work or the safe erection and subsequent dismantling of temporary work.

STR1.W760.8**PLANT AND EQUIPMENT**

Do not employ any plant or equipment which is, or in the CM's opinion likely to be, unsuitable, unsafe, or likely to cause damage to the structure during erection or damage to existing buildings etc.

STR1.W770.8**PREVENTION OF DISTORTION**

Do not distort steelwork or exceed the stresses specified in the Code of Practice for the Structural Use of Steel 2011 or BS 5400:Part 3:1982 for bridgework during erection.

STR1.W780.8**APPROVED SEQUENCE**

Erect structural steel according to the sequence agreed with the CM.

STR1.W790.8**FALSEWORK**

When specified, design, construct and dismantle falsework to BS 5975:1982. Supply all staging and all labour, tools, erection plant, lifts, services, nuts and washers and other necessary materials. Provide temporary bracings and guys to ensure adequate resistance to wind and stability against collapse during construction.

1. Submit records of inspection of the completed formwork and falsework to the CM for information before carrying out any further works that may affect the stability of the formwork and falsework. Such records are to be certified by a contractor's superintendent holding qualification equivalent to TCP Grade T4 in civil or structural engineering discipline;
2. Monitor falsework levels and make any necessary adjustments for settlement, or other deflection or movements.

STR1.W800.8 SETTING OUT, LEVELLING AND LOCATION

Set out, level and position:

1. Using steel tapes or bands for setting out that are calibrated at 20°C and used at the correct tension;
2. To a level that is levelled to a datum point and aligned to a base line during erection. Agree both datum point and setting out lines before commencement;
3. That ensures all steelwork is accurately and securely located to the correct profile and camber, if any, before assembly;
4. That ensures the structural steelwork is not subjected to stresses in excess of those for which it was designed.

STR1.W810.8 ERECTION OF STEELWORK

1. Do not erect fabricated steelwork until all welded joints and specified protective coatings have been inspected, tested where required, and Approved;
2. Align structural members accurately to the specified tolerances and obtain Approval before any permanent welding or tightening of bolts is carried out;
3. Do not bed stanchion bases or grout anchor bolts until the steelwork has been plumbed, levelled, aligned and Approved.

STR1.W820.8 STEELWORK BY SUB-CONTRACTOR

1. Take responsibility for checking all the work prepared by others that may be incorporated into the work or the dimensions of any structure affecting steel erection. As a result of the check report any discrepancies or shortfalls to the CM immediately;
2. Ensure that the Sub-contractor supplies any items required to be cast into concrete. Cast in such items using templates provided by the Sub-contractor where these are necessary.

CLEANING, SURFACE PREPARATION AND PROTECTION (POST FABRICATION)

STR1.W910.8 CLEANING AND COATING IN THE SUPPLIERS WORKSHOP

Ensure that the supplier provides sufficient covered and enclosed workshop space to enable blast cleaning, priming coat and undercoat painting to be carried out in close sequence. The blast cleaning section of the workshop must be fitted with extractors and filters to prevent and deposition of dust on metal surfaces to be painted.

STR1.W920.8 CLEANING SURFACES OF BARE METAL

Thoroughly clean down to remove all dirt, grease and the like, using a suitable solvent and thoroughly chip, scrape, wire-brush flame clean or grit blast to remove all loose scale back to clean metal.

STR1.W930.8 CONTAMINATED SURFACES

1. Weld spatter: clean of all surfaces, keep paint films free of embedded foreign metallic particles;
2. Concrete deposits etc: wash or clean off immediately they occur and if necessary make the surfaces good to the satisfaction of the CM;
3. Oil or grease: clean with white spirit.

STR1.W940.8 PAINTED AND OTHER COATED SURFACES

Unless otherwise directed by the CM clean the final workshop applied coating to the external surfaces on site by:

1. Washing with a solution of an Approved liquid detergent followed by rinsing with clean fresh water and allowed to dry thoroughly before overcoating;
2. Thoroughly cleaning rivet heads, bolts heads and the surfaces surrounding them;
3. Removing all loose particles, dust and debris immediately prior to application of paint.

STR1.W950.8 ATMOSPHERIC CORROSION

Do not apply protective coating to surfaces bearing atmospheric corrosion products or other chemicals which may be harmful to the coating or succeeding coating. Clean off these contaminants, which may include any remaining after surface preparation as specified in this Worksection and any produced by welding, to an Approved extent that is compatible with the specified protective system.

STR1.W960.8 BLAST CLEANING

1. Carry out blast cleaning in accordance with BS 7079:Part A1:1989 (1994) and that produces surface qualities as follows:
 - a. For surfaces to be galvanized to 140 microns: Sa 2 (prior to pickling).
Note: Surfaces to be galvanized to 85 microns do not require blast cleaning;
 - b. For surfaces to be metal sprayed: as specified in BS EN ISO 2063:2005;
 - c. For surfaces to be painted: Sa 2½.
2. Non-metallic abrasive should be free from contamination and recovered material is to be cleaned to the satisfaction of the CM before re-use;
3. Do not exceed a maximum amplitude (peak to trough) of the blast-cleaned surface of 0.1 mm;
4. Clean blasted surfaces by brush or vacuum. Do not touch by hand. Do not contaminate in any other way;
5. Apply protective coating within 4 hours of blast cleaning;
6. Before commencing any follow on operations submit, for Approval, a sample blast cleaned steel panel measuring not less than 150 mm x 150 mm x 6 mm thick adequately protected by sealed clean polythene wrapping. The Approved sample will be retained by the CM for comparison with the prepared steelwork.

STR1.W970.8 MECHANICAL CLEANING

Carry out mechanical cleaning to surface quality designation St 2 of BS 7079:Part A1:1989 (1994) by power driven tools, such as carborundum grinding discs, chipping hammers and needle guns, followed by steel-wire brushing and dusting to remove all loosened material. Avoid excessive brushing of the metal through prolonged application to rotary wire brushes. Protect surfaces within 48 hours of mechanical cleaning.

STR1.W980.8 PICKLING

Carry out pickling of steel by the "Footner" process as specified in BS 5493:1977. Apply the first priming coat of paint as soon as the steel has dried and is still warm.

STR1.W990.8 FLAME CLEANING

Plan and control the sequence of operations for flame cleaning steelwork to avoid the risk of distortion and buckling. Clean the flame cleaned surfaces of all loosened material. Apply priming coat while the steel is still warm. Control the heat input so that no harmful distortion of the steelwork occurs.

STR1.W1000.8 NEW GALVANIZED SURFACES

Thoroughly clean to remove all dirt, oil and grease and pre-treat with either an etching primer or Approved etching compound.

STR1.W1010.8 PREVIOUSLY PAINTED GALVANIZED SURFACES

Thoroughly degrease previously painted galvanized surfaces. Where corrosion has spread under the paint film, remove old paint with an organic solvent type paint remover.

STR1.W1020.A CLEANED OR COATED MEMBERS

1. Ensure that, unless specified otherwise, exposure times for blast cleaned, wire brushed or coated surfaces (other than at joints) are not longer than those given in the following table:

Surface	Enclosed Workshop	Outside
a. Blast cleaned	4 hours	Nil
b. Metal Sprayed	4 hours	Nil
c. Mechanically Cleaned	48 hours	Nil
d. Blast Primer on 'a'	Maximum exposure of 8 weeks with up to 2 weeks of this time outside	
e. Etch primer on 'b'	24 hours	Nil
f. Primer on 'c'	48 hours	Nil
g. 1st Undercoat on 'd', 'e' or 'f'	48 hours	Nil
h. Subsequent Undercoats	As agreed by the CM	

Note: 'Outside' refers to any area outside a fully enclosed workshop.

2. The tabulated exposure times refer to any part of the surface being blast or mechanically cleaned, metal sprayed or painted;
3. For surface condition 'd' where blast primed steelwork is exposed outside, the minimum dry paint film thickness over the peaks of the blast cleaned steel must not be less than 13 microns;

4. Zinc rich coated steelwork may only be exposed outside for the minimum period to allow movement at the fabricator's works. Such movement to be under the supervision of the CM or his representatives and unless the weather conditions are favourable the sections are to be covered;
5. Where it is necessary to overcoat two pack paints of the epoxide or polyurethane type, re-coat within 48 hours of application. Where it is not possible to overcoat within this time the paint film to be abraded to produce a roughened surface, given a flash coat of suitable primer, and allowed to dry for at least 4 hours before application of the next coat of the system;
6. No steelwork to be loaded for transport until the paint system has been Approved as being sufficiently dry for handling;
7. Keep steelwork to be site painted clean and dry. Where necessary provide temporary shelters to simulate, as far as is practicable, workshops conditions.

APPLICATION OF METAL COATINGS

STR1.W1110.8

HOT DIP GALVANIZING

1. To BS EN ISO 1461:2009: minimum mean coating thickness of 45 microns to 85 microns depending on thickness of steel sections as stipulated in Table 3 of BS EN ISO 1461:2009, unless otherwise specified;
2. Apply metal coatings to BS EN ISO 1461:2009 only to components of a tensile strength up to and including that of general grade high strength friction grip bolts unless otherwise specified;
3. Make good small areas of galvanized coating damaged by welding, cutting or by rough treatment during transit or erection either by the use of low melting point zinc alloy repair rods, powders made specifically for this purpose, or by the use of at least two coats of zinc rich paint to BS 4652:1995. Apply sufficient material to provide a zinc coating at least equal in thickness to the galvanized coating.

STR1.W1120.8

SPRAYED METAL COATING

To BS EN ISO 2063:2005. The nominal thickness of coating to be 100 microns. Apply one flood coat of polyurethane (or similar approved) sealer immediately after spraying.

STR1.W1130.8

ELECTROPLATING

1. To BS 3382:Parts 1 and 2:1961;
2. Coating thickness: 5 microns minimum.

STR1.W1140.8

CHROMIUM PLATING

To BS 4641:1986 (1996). Ensure that the protection offered is at least the same as that provided for the adjacent main structural steel element.

STR1.W1150.8

METAL COATING ON PART ONLY OF ASSEMBLED SECTION

Apply the metal coating before the remainder receives its priming coat.

STR1.W1160.8 PROTECTION OF HSFG BOLTED JOINTS

1. Zinc or aluminium sprayed steelwork: where the metal spray is carried over the interfaces of the HSFG bolted joints, take the etch primer on the parent metal between 10 mm and 20 mm inside the perimeter of the joint area. The outer surfaces and edges of the joint material may also be given a coat of the same primer in order to reduce surface preparation required after the joint has been made;
2. Painted steelwork: where metal spray is specified only at the interfaces of HSFG bolted joints, carry the metal spray between 10 mm and 20 mm outside the perimeter of the joint area and the blast primer taken between 10 mm and 20 mm inside the perimeter. If the outer surfaces and edges of the joint materials are metal sprayed, these may be given a coat of etch primer in order to reduce subsequent surface preparation;
3. Painted steelwork: where the interfaces of HSFG bolted joints are bare steel, take the blast primer between 10 mm and 20 mm inside the perimeter of the joint area. The outer edges and surfaces of the joint material may also be given a coat of blast primer in order to reduce subsequent surfaces preparation.

STR1.W1170.8 PROTECTION OF OTHER BOLTED JOINTS

1. Shop joints: apply metal spray plus etch primer or blast primer alone to parent and joint material. Assemble the joint immediately after the first undercoat of the parent system has been applied to the contact surfaces;
2. Site joints: apply to all surfaces, excepting those of fasteners, the same painting system in the shop as is to be applied to the parent metal surfaces, unless otherwise specified.

STR1.W1180.8 PROTECTION OF NON-BOLTED JOINTS

1. Riveted joints: shop and site joints: apply metal spray plus etch primer or blast primer alone, to parent and joint material. Assemble the joint immediately after the first undercoat of the parent system has been applied to the contact surfaces;
2. Welded joints: unless otherwise specified, treat welds and surfaces which have been affected by welding with the protective system which is applied to the parent surfaces.

STR1.W1190.8 SURFACES ADJACENT TO TREATED JOINTS

1. Keep metal spray at least 15 mm clear of areas to be welded and mask off these areas during spraying;
2. Where paints other than blast primers are to be applied to the parent surfaces before the making of a joint they must be stepped back at 30 mm intervals commencing at 80 mm from welded joints and at 10 mm from the perimeter of all other joints.

STR1.W1200.8 PAINTING AND SEALING OF JOINTS

1. As soon as possible after joints have been Approved, paint the parent and joint material, exposed parts of bolts, nuts and washers, weld and affected areas to bring them up to the same state of preparation and painting as the adjoining surfaces;
2. Seal all bolted joints against the ingress of water. Before painting commences and, subject to Approval, plug gaps at joints with an Approved filler. Seal the perimeter of all joints with subsequent coats of paint.

STR1.W1210.8 APPLICATION OF PAINT

1. Types of paint and painting generally to be as specified at **STR1.W1220** and **STR1.W1230** as appropriate for application to steelwork;
2. Only apply to surfaces which have been prepared and cleaned in accordance with this Worksection;
3. Do not apply in the following conditions:
 - a. When the ambient temperature falls below 4°C or the relative humidity rises above 90%;
 - b. For external works: during period of inclement weather, e.g. rain, fog or mist or when condensation has occurred or is likely to occur on steel;
 - c. When the surface temperature of the metal to be painted is less than 3°C above the dew point of the ambient air;
 - d. When, in the opinion of the CM, the amount of dust in the atmosphere and/or on the surface of the material is such that the application of the paint would be unsatisfactory;
 - e. For two pack paints of the epoxide resin type: when the temperature is below 5°C or as recommended by the paint manufacturer, nor when the temperature is likely to fall below the specified minimum during the curing period.

STR1.W1220.8 PAINTING STEELWORK

Apply the appropriate paint system as detailed in the following table at the locations as specified in the **Project Specific Specification**.

System A:	<ul style="list-style-type: none"> - primer : - undercoat : - finish : - minimum total DFT : 	1 coat of high build zinc phosphate paint; 2 coats of oil based with micaceous iron oxide phenolic paint; 1 coat of alkyd resin paint; 250 microns
System B:	<ul style="list-style-type: none"> - primer : - undercoat : - finish : - minimum total DFT : 	1 coat of epoxy resin with aluminium mastic paint; 1 coat of epoxy resin paint; 1 coat of epoxy resin paint; 280 microns
System C:	<ul style="list-style-type: none"> - primer : - undercoat : - finish : - minimum total DFT : 	1 coat of inorganic zinc silicate paint, DFT 75 microns; 2 coats of high build micaceous iron oxide epoxy paint; 1 coat of high build amine adduct cure epoxy paint; 320 microns
System D:	<ul style="list-style-type: none"> - primer : - undercoat : - finish : 	1 coat of two pack wash primer, DFT 5 microns; 1 coat of epoxy resin paint; 1 coat of epoxy resin paint or 2 coats of polyurethane paint;

	- minimum total DFT :	180 microns
System E:	- Inhibitor :	'Rustoleum' or other rust inhibitor paint approved by the CM;
	- primer :	Zinc phosphate or, for hot-dip galvanized or GI surface, 'T' wash as specified in BS 5493:1977, Section 2, Clause 11.3.2;
	- undercoat :	2 coats of micaceous iron oxide paint;
	- finish :	1 coat of oil based paint or 1 coat of micaceous iron oxide paint;
	- DFT of each coat :	as recommended by the manufacturer.

Notes:

1. The different types of paints within each painting system to be compatible with each other and manufactured by the same manufacturer. Successive coats in a painting system, including stripe coats, to be in contrasting colours to aid identification;
2. DFT is the dry film thickness.

STR1.W1230.8**PAINT FOR STEELWORK PROTECTION SYSTEMS**

1. In accordance with BS 5493:1977, Section 2, Table 4 unless specified otherwise. Organic zinc-rich paint to comply with BS 4652:1995. Do not use lead-based paint for finishing coats;
2. To be supplied in sealed containers of not more than 5 litres capacity. Each container shall show the following information:
 - a. The name of the manufacturer;
 - b. The paint manufacturer's reference number;
 - c. Intended purposes, type of pigment and binder;
 - d. Batch number, date of manufacture, expiry date and pot life; and
 - e. Colour, gloss, drying times and flash point.
3. To be in compliance with the prescribed limits of VOC content as set out in the Air Pollution Control (Volatile Organic Compounds) Regulation;
4. Submit written confirmation from paints suppliers and manufacturers for the following:
 - a. The VOC contents of the proposed paints are complied with the Air Pollution Control (Volatile Organic Compounds) Regulation;
 - b. The types of regulated paints that the proposed paints belong; and
 - c. The VOC contents of the proposed paints.

ACCURACY AND TOLERANCES**STR1.W1310.8****GENERAL**

Refer to Chapter 15 of the Code of Practice for the Structural Use of Steel 2011 and Appendix H, "Schedule of Tolerances" to this Specification.

OFF-SITE FABRICATION

STR1.W1410.8 SUBMISSIONS

Where structural steelwork is to be fabricated off-site, submit the following items for Approval within a period from the notified date for commencement of Works as specified in the **Project Specific Specification**:

1. The name, fabrication yard address with street maps and job reference of the fabricator and the following:
 - a. A quality assurance (QA) scheme and testing regime on fabrication of the structural steelwork with the items as stipulated in **STR1.W1420**; and
 - b. A fabrication and delivery schedule.
2. An RSE appointed by the Contractor/fabrication yard who shall carry out the duties as stipulated in **STR1.W1430**;
3. A laboratory for carrying out the tests and issuing test certificates in the QA scheme (except for those tests specified in **STR1.T520** (2)), which shall be accredited either by Hong Kong Accreditation Scheme (HKAS) under the Hong Kong Laboratory Accreditation Scheme (HOKLAS), or an equivalent organization which has signed a mutual recognition agreement with HOKLAS.

STR1.W1415.8 SUBMISSIONS FOR MINOR STEEL STRUCTURES FABRICATED OFF-SITE

1. Prior to fabrication, submit for Approval proposal of a laboratory for carrying out tests and issuing test certificates for minor steel structures excepting the following tests:
 - a. Tests specified in **STR1.T520** (2);
 - b. Tests concerned are not applicable to minor steel structure as stated in **STR1.G040** (2).
2. The laboratory proposed in sub-clause (1) above shall be accredited either by Hong Kong Accreditation Service (HKAS) under the Hong Kong Laboratory Accreditation Scheme (HOKLAS), or an equivalent organization which has signed a mutual recognition agreement with HKAS.

STR1.W1420.8 QUALITY ASSURANCE (QA) SCHEME

Ensure that the steelwork is fabricated under a quality assurance scheme which covers the following items and is certified under ISO 9001:

1. Organisation chart of the fabrication yard with the qualification and experience of key technical personnel clearly stated;
2. Responsibility of the management in respect of the fabrication process;
3. Material purchasing and delivery procedures;
4. Material / product identification, traceability process and control;
5. Fabrication and inspection process;
6. Designated welders who shall be tested to and comply with the requirements of this Specification;
7. Quality control testing regime including welding procedural test and chemical analysis for welding consumables used for temporary or permanent structural steelworks on Site of steel grade as stated in **STR1.M060** and shown in the structural working drawings;

-
8. Control on non-compliant materials and works;
 9. Transportation and storage process.

STR1.W1430.8**REGISTERED STRUCTURAL ENGINEER**

1. Appoint an Registered Structural Engineer (RSE) registered under Buildings Department for ensuring and certifying the fabrication works are in compliance with the drawings and Specification;
2. The duties and roles of the RSE include but not limited to:
 - a. Pay regular site visits for proper control of the works and submit reports after each visit;
 - b. Carry out inspection on all activities which, in his professional judgement, are critical and require close supervision;
3. The frequency of RSE's visits shall be a minimum of two visits per month.

TESTING

GENERAL REQUIREMENTS

STR1.T010.8

GENERAL

Allow sufficient time in the Works programme for the testing specified below. Do not incorporate materials until relevant tests have been carried out and Approval obtained.

STR1.T020.8

TESTING BY MANUFACTURER

Carry out inspection and testing on BS EN 10025:2004 products by cast and documentation supplied in accordance with Euronorm 21. Specific testing and documentation to include chemical analysis; tensile tests and impact tests.

STR1.T030.8

TESTING OF BOLTS, NUTS AND WASHERS

1. Testing arrangement:

Provide test specimens and carry out testing of bolts and associated nuts and washers in accordance with the relevant BS in an Approved Laboratory employed and paid for directly by the Contractor, when so directed by the CM;

2. Testing samples:

Rate of sampling to be one bolt per identifiable batch or 1% whichever is the lesser unless otherwise specified.

STR1.T040.8

TEST CERTIFICATES

Submission requirements:

1. Submit a manufacturer's certificate of tests in accordance with the appropriate standard for each steel batch relating to steel to be used in the works. Documentation to include chemical analysis impact test and tensile test.

STR1.T050.8

TESTING OF SECTIONS

Testing samples:

1. Provide specimens for testing which shall be in accordance with the requirements stipulated in the Code of Practice for the Structural Use of Steel 2011. In addition, provide further specimens for testing when otherwise stated in the **Project Specific Specification** or as Instructed. For minor steel structures, further test specimens for Class 1 Steel are not required. Test specimens to be taken from sections selected at random on Site by the CM;
2. Prepare the test specimens to BS EN 10025:2004 or BS EN 10210:2006 as directed and appropriately mark and deliver them to a Direct Testing Contractor employed and paid direct by the Authority for testing. Testing and documentation to include tensile tests and impact tests;
3. For steel sections used for construction of hoardings and associated covered walkways and gantries, the frequency of sampling stated in the sub-clauses (1) above may be reduced at the discretion of the CM.

STR1.T060.8

FAILURE OF TESTS

Non-compliance:

1. If any test specimens do not comply with the relevant BS, the CM may require further tests at the Contractor's expense or reject the whole or part of the particular consignment, which must be removed from Site forthwith.

STR1.T070.8**ULTRASONIC TESTING**

When plates are subjected to through thickness tension by virtue of the type of connection, test quality grade steel plates and flats which may, as a result of welding be subject to lamellar tearing, using ultrasonic testing using equipment as described in Section 2 of BS 5996:1993 and, unless otherwise specified or agreed, be of quality LC3 as defined in Section 3 of that document.

STR1.T080.8**ABILITY OF WELDERS**

1. All welders must be capable of passing the training tests to BS 1295:1987;
2. Where specified, carry out approval testing of welders by either one of the following:
 - a. For welds where welding procedure approval is required to BS EN ISO 15614-1:2004: carry out approval testing of welders to BS EN 287: Part 1:2004 for steel and stainless steel and to BS EN 287:Part 2:1992 for aluminium as appropriate;
 - b. For welds where welding procedure approval is not required: carry out approval testing of welders to BS 4872:Part 1:1982 for steel and stainless steel and to BS 4872:Part 2:1976 (1995) for aluminium as appropriate.
3. Submit evidence to show that all welders satisfy the requirements as stated in sub-clause (1) above.

STR1.T090.8**PARTICULARS OF INSPECTING AUTHORITY**

Submit to the CM the name of the proposed inspecting authority endorsing welder certificates and records of approval tests for welding procedures. The proposed inspecting authority must be accredited by the Hong Kong Accreditation Service (HKAS) under the Hong Kong Inspection Body Accreditation Scheme (HKIAS) for welding inspection or by other accreditation bodies which have reached mutual recognition agreement for inspection body accreditation with HKAS. The name to be submitted at least 3 weeks before approval tests start or, if approval tests are not required, at the same time as the welder certificates are submitted.

STR1.T093.8**BATCH OF WELDING CONSUMABLE**

In this Specification, a batch of welding consumables is the quantity of welding consumables of the same type and size, which may include one or multiple standard lot(s) as defined in the manufacturer's quality assurance programme, delivered to the Site, or the off-site fabrication yard as one consignment that is covered by the manufacturer's certificate(s) and under one delivery order, and shall not exceed five tonnes and twenty tonnes respectively.

STR1.T094.8 TESTING OF WELDING CONSUMABLES

For each batch of welding consumables used for temporary or permanent structural steelworks on Site of steel grade as stated in **STR1.M060** and shown in the structural working drawings for foundation works, prepare 2 test specimens for each standard lot and carry out the chemical analysis in accordance with BS EN ISO 2560:2009 or BS EN ISO 14341:2011 or BS EN ISO 14171:2010 or BS EN ISO 17632:2015 as appropriate, except for the standard lot(s) where complying chemical analysis results have been attained from the first chemical analysis under which circumstance no further chemical analysis is required for the same standard lot(s) in subsequent batches of welding consumables. The chemical analysis shall be carried out by an Approved laboratory, accredited either by the Hong Kong Accreditation Service (HKAS) under the Hong Kong Laboratory Accreditation Scheme (HOKLAS) or an equivalent organization which has signed a mutual recognition agreement with HKAS and is employed and paid for directly by the Contractor. Allow sufficient time for testing of welding consumables in the programme.

STR1.T095.8 ACCEPTANCE CRITERIA - WELDING CONSUMABLES

A standard lot in a batch of welding consumables is deemed to comply with the requirements of the Specification if the test results meet the requirements of BS EN ISO 2560:2009 or BS EN ISO 14341:2011 or BS EN ISO 14171:2010 or BS EN ISO 17632:2015 as appropriate. If the test results of the first chemical analysis of a standard lot complied with the requirements of the Specification, further chemical analysis on the same standard lot in all subsequent batches of welding consumables delivered to the same Site or the same off-site fabrication yard is not required.

STR1.T096.8 FAILURE OF TESTS

Non-compliance:

If any test specimen of the welding consumables does not comply with BS EN ISO 2560:2009 or BS EN ISO 14341:2011 or BS EN ISO 14171:2010 or BS EN ISO 17632:2015, the Contractor may choose to carry out further test(s) and take further test samples from the same lot of welding consumables at the Contractor's expense or remove the whole lot of the particular batch from Site and / or the fabrication yard for off-site fabrication if appropriate. If further test(s) is chosen, the number of further test(s) is to be calculated by the application of the formula given below and no extension of time will be allowed for the said further test(s). Bear the cost of such further test(s).

$$\text{number of further test(s)} = (n^2 - 2n + 3)$$

where n = total number of unsuccessful inspection(s) / test(s) progressively until all inspection(s) / test(s) is / are successful.

Typical example of calculating the number of further inspections / tests is given in Appendix I to this Worksection, for illustration purposes only.

Acceptance criteria and further actions arising from the further test(s) shall be in accordance with **STR1.T095**.

For a standard lot with any non-compliant chemical analysis results, chemical analysis shall be carried out for the standard lot of welding consumables, as defined in the manufacturer's quality assurance programme, subsequently delivered to the same Site or the same off-site fabrication yard regardless of the results of the further test(s).

STR1.T097.8 STANDARD FOR REJECTION

If the result of any test or any further test does not comply with the specified requirements in the Specification for any particular property, the standard lot in a batch of welding consumables is deemed failing to comply with the specified requirements for that property. Then:

1. The non-compliant standard lot in a batch of welding consumables shall be removed from Site;
2. The non-compliant standard lot in a batch of welding consumables shall be removed from the off-site fabrication yard if appropriate.

STR1.T100.8 STANDARD OF WELD PROCEDURE TESTING

Testing arrangement:

1. Unless acceptable documentation relating to the welding of similar connections is available, carry out approval testing of each welding procedure in accordance with BS EN ISO 15614-1:2004 for steel and BS EN ISO 15614-2:2005 for aluminium.

STR1.T110.8 ADDITIONAL DESTRUCTIVE WELD TESTS AS SELECTED BY THE CM

Testing arrangement:

1. Prepare specimen welds and subject to one or more of the following tests as required:
 - a. Butt welds:
 - i. Transverse tensile test to BS EN 895:1995;
 - ii. Transverse bend tests to BS EN 910:1996 or BS 709:1983 as appropriate with the root of the weld in tension and compression respectively;
 - iii. Side bend tests to BS EN 910:1996 or BS 709:1983 as appropriate;
 - iv. Macro-examinations to BS 709:1983 or BS EN 1321:1997 as appropriate.
 - b. Fillet welds:
 - i. Fracture tests to BS 709:1983;
 - ii. Macro-examinations to BS 709:1983 or BS EN 1321:1997 as appropriate.
 - c. For destructive weld test, comply with the same hold time as stipulated in clause 14.3.6.4 of the Code of Practice for the Structural Use of Steel 2011;
 - d. If any test specimens do not comply with the relevant BS, the CM may require further tests at the Contractor's expense or reject the whole or part of the particular consignment, which must be removed from Site forthwith.
2. Strictly follow the procedures of welding established in the successful Approval test for the Works. Carry out further Approval tests if either the material or procedure changes.

STR1.T120.8 ADDITIONAL NON-DESTRUCTIVE TESTING OF STEEL, STAINLESS STEEL AND ALUMINIUM

1. Testing arrangement:
 - a. Arrange for a percentage of each welder work to be selected by the CM and subjected to non-destructive testing as follows:
 - i. Visual inspection in accordance with BS EN 970:1997;

-
- ii. Ultrasonic in accordance with BS EN 1714:1998; or magnetic particle inspection in accordance with BS EN 1290:1998. (Not for stainless steel and aluminium);
 - iii. The scope and frequency of test shall be in accordance with clause 14.3.6.1 of the Code of Practice for the Structural Use of Steel 2011;
 - iv. For welds on steelworks of hoardings and associated covered walkways and gantries, the percentages of tests stated in the sub-clause (1)(a)(iii) above may be reduced at the discretion of the CM.
- b. Comply with clause 14.3.6.4 of the Code of Practice for the Structural Use of Steel 2011 for hold time before final non-destructive testing.
2. Non-compliance:
- Where any weld is judged to be unsatisfactory by the CM, a further 10% of that welder's work is to be tested. If further defects are found, then all weld in the group should be tested by the same method.

STR1.T130.8 ACCEPTANCE CRITERIA

Non-compliance:

1. Welds on steel will be rejected if they do not meet the acceptance criteria for welds stipulated in clause 14.3.6.7 of the Code of Practice for the Structural Use of Steel 2011;
2. Welds on aluminium will be rejected if they do not meet the acceptance level for welds stated in BS 8118:Part 2:1991.

STR1.T140.8 WELD REPAIR

Cut out and repair all defective welds in accordance with the Code of Practice for the Structural Use of Steel 2011 for steel or BS 8118 :Part 2:1991 for aluminium.

STR1.T150.8 ENGAGEMENT OF SPECIALIST TESTING CONTRACTOR (FOR FABRICATION ON SITE)

1. Carry out tests required to satisfy the requirements of BS 4872, BS EN 287-1:2004 and BS EN ISO 15614-1:2004 by an Approved Laboratory employed and paid for directly by the Contractor;
2. Provide samples required by the CM (**STR1.T050**, **STR1.T110**, **STR1.T120** and **STR1.T140**) for tests by a Direct Testing Contractor employed and paid for directly by the Authority.

TESTING OF PAINTS

STR1.T210.8 SAMPLING AND TESTING

Permit authorized sampling of materials on site. Set aside unopened sealed containers of materials for testing when directed by the CM.

STR1.T220.8 PAINT SAMPLES

Testing samples:

1. Sample each batch of paints in accordance with BS 3900:Part A1:1992.

STR1.T230.8 TESTING PAINTS

Testing method:

1. Carry out the following tests on each sample as directed by the CM in **STR1.T240**:

BS 3900: Part C2:1994:	Surface drying test;
BS 3900: Part C3:1990:	Through dry test;
BS 3900: Part E1:1970:	Bend test;
BS 3900: Part E2:1992:	Scratch test;
BS 3900: Part E7:1974 (1992):	Resistance;
BS 3900: Part F3:1971 (1986):	Resistance to artificial weathering;
BS 3900: Part F4:1968 (1991):	Resistance to continuous salt spray;
BS 3900: Part F8:1993:	Resistance to humid atmospheres containing sulphur dioxides.

STR1.T240.8 TESTING LABORATORY

Submission requirements and testing arrangement:

1. Test certificates to be submitted to the CM before painting starts;
2. Where manufacturer's test certificates are available these may be accepted in lieu of a retest at the CM's discretion;
3. Tests for paints in **STR1.T230** to be carried out by an Approved Laboratory employed and paid for directly by the Contractor.

STR1.T250.8 GLOSS FINISH

Prepare a sample panel to indicate the standard of gloss finish and obtain Approval. Ensure application matches agreed sample.

SPACE FRAMES - WARRANTIES AND TESTING**STR1.T310.8 SUITABILITY WARRANTY**

If required, submit a warranty as specified in the **Project Specific Specification**.

STR1.T340.8 TESTING OF SECTIONS

Testing arrangement:

1. Undertake testing of steel and aluminium sections as clauses **STR1.T010**, **STR1.T030**, **STR1.T050** and **STR1.T060** except as specified at sub-clause (2) below;
2. Provide at least two full length samples for every aluminium section of same thickness to be used in the Works for testing to BS EN 10002-1:2001, as appropriate.

STR1.T350.8 WELDING TESTS

1. Testing of welds for steel and aluminium will be required;
2. Clauses **STR1.T080** to **STR1.T140** apply equally to welding of aluminium.

STR1.T360.8 PROOF LOAD TESTING

1. If in the opinion of the CM the relevant British Standards are not appropriate for the welding configuration proposed, the CM may order not more than 10% of the welded components for proof load tests at the Contractor's expense;
2. Provide suitable equipment to carry out proof load tests on welded components. Apply a tensile load uniaxially in opposite directions of a magnitude equal to the resultant of the worst combination of factored design loads multiplied by a factor of 1.3. and on removal of the test load, the deflection shall be reduced by at least 20%;
3. The weld shall be deemed to comply the requirements of this Specification when under the proof load test the weld shall exhibit no sign of crack. If any one test of a group of welded components fails to meet this Specification, then 2 additional welded components for the same group are to be subject to load proof tests. If any of these two further welded components continue to fail the test, then each welded component of the group is to be subject to proof load tests. Any cracks identified in any stage of the test are to be repaired and retested until they all satisfy the requirements;
4. A group of welded components is defined as the welds done by the particular welder within a specified period of time as decided by the CM.

STR1.T370.8 NODAL JOINTS OF SPACE FRAMES

Testing samples:

1. Provide one test specimen for every 100 or part thereof of each type of nodal joint for tensile test. The test load shall be a tensile load applied uniaxially in opposite directions of a magnitude equal to the resultant of the worst combination of factored design loads of the possible heaviest connecting member multiplied by a factor of safety of 1.3 acting on the nodal joints.

STR1.T380.8 ACCEPTANCE CRITERIA FOR NODAL JOINT TESTS

The test specimen in **STR1.T370** is deemed to comply with the requirement of this Specification under the test loading if there is no sign of crack, no deformation at thread, buckling or rupture of any part of the nodal joint. On removal of the test load the deflection should reduce by at least 20%.

STR1.T390.8 FAILURE AND RE-TESTING OF NODAL JOINTS

Non-compliance:

1. The CM will reject any test specimens which do not comply with the requirements. In addition, the CM may require further tests at the Contractor's expense or reject the whole or part of the particular consignment, which must be removed from Site forthwith;
2. Carry out further tests if directed, provided the results of these further tests fulfil the test requirements, all the nodal joints represented by these tests are deemed to comply with this Specification;
3. If the result of any of these additional tests fail to fulfil the test requirements, the part of the particular consignment represented by these nodal joints must be removed from Site forthwith.

STR1.T400.8 LOADING TESTS

If in the opinion of the CM that loading tests on parts of the space frame are necessary, the CM may order proof tests in accordance with the Code of Practice for the Structural Use of Steel 2011, by an Approved Laboratory employed and paid for directly by the Contractor.

OFF-SITE FABRICATION**STR1.T510.A TESTING AND SURVEILLANCE VISITS AT FABRICATION YARD**

For off-site fabrication in Guangdong province of China, comply with the following:

1. Provide all necessary facilities and attendance required by the CM and Consultant employed for inspection and surveillance visits and the Direct Testing Contractors for carrying out the tests as stated in **STR1.T520** (2) at the fabrication yard;
2. Make all necessary arrangement including providing transportation to the CM and Consultant employed for inspection and surveillance visits to the fabrication yards. Take the staff of each of the Direct Testing Contractors to the locations of the testing and / or parallel testing works for the first visit to the fabrication yards, and the Direct Testing Contractors shall arrange their own transportation for subsequent visits to the same locations of the fabrication yard.

STR1.T520.A ENGAGEMENT OF SPECIALIST TESTING CONTRACTOR (FOR OFF-SITE FABRICATION)

For off-site fabrication, testing arrangement shall comply with the Approved quality assurance scheme and testing regime submitted in accordance with **STR1.W1410**. The engagement of specialist testing contractor shall comply with the following requirements:

1. Except for the testing arrangement as stated in sub-clause (2) below, all testing shall be carried out by the Approved laboratory proposed in **STR1.W1410** (3), employed and paid for directly by the Contractor;
2. For off-site fabrication carried out in Guangdong province of China, comply with the following:
 - a. The following tests shall be carried out by the Direct Testing Contractor employed and paid for directly by the Authority:
 - i. Tensile tests and impact tests of steel sections;
 - ii. Visual inspection of welds;
 - iii. Ultrasonic inspection of welds;
 - iv. Magnetic particle inspection of welds.
 - b. Provide specimens for testing as specified in 2(a)(i) above, which shall be selected from sections at random either in the fabrication yard by the Direct Testing Contractor or on the Site by the CM or his representatives. The preparation and delivery of the test specimens from the fabrication yard or the Site to the laboratory for testing shall be carried out by the Direct Testing Contractor;
 - c. Welds for testing shall be selected and tested by the Direct Testing Contractors in the fabrication yard.

APPENDIX STR1/I

STR1.APPEND1.8 CALCULATION OF NUMBER OF FURTHER INSPECTIONS / TESTS

Typical Examples for Illustrative Purposes Only

1. Chemical analysis shows 2 samples failing to meet the requirements in the Specification.

2. The Contractor can either remove the standard lot of the particular batch of welding consumables from the Site and / or the fabrication yard for off-site fabrication or at his own expense, carry out further test(s) in accordance with the formula of:

$$(n^2 - 2n + 3) = 2^2 - 2 \times 2 + 3$$

$$= 3 \text{ further tests}$$

3. If one of the above 3 further tests fails, the Contractor may order further tests to be carried out at the Contractor's own expense by re-applying the formula and taking into account the total number of failed samples. Altogether and based on the formula, the number of total retesting required:

$$= 3^2 - 2 \times 3 + 3$$

$$= 6$$

As 3 tests have already been carried out by the Contractor, the Contractor shall carry out:

$$6 - 3 = 3 \text{ further tests}$$

4. If the next 3 further tests show further failed samples, the formula will be re-applied as before until all the tests results are satisfactory.

APE1 SCOPE OF APPENDIX

APE1.A010.8 APPLICATION

1. All terms and requirements set out in this Appendix shall only be applicable to contracts with the construction of superstructure of domestic blocks.
2. All terms and requirements set out in this Appendix shall be applicable to permitted modifications or proposals for modifications to design and/or Specification for the domestic blocks.
3. Where any terms and requirements in Worksection APE4 of this Appendix are at variance with those in Worksections APE2 and APE3 of this Appendix, the terms and requirements of Worksection APE4 shall prevail.

APE1.A020.8 TERMS AND REQUIREMENTS ON PERMITTED MODIFICATIONS PROPOSED IN TENDER STAGE

Terms and requirements applicable to permitted modifications to design and/or Specification for the domestic blocks proposed by the Contractor in tender stage are specified in Worksection APE2 of this Appendix.

APE1.A030.8 TERMS AND REQUIREMENTS ON PROPOSALS FOR MODIFICATIONS IN POST-CONTRACT STAGE

Terms and requirements applicable to modifications to design and/or Specification for the domestic blocks proposed by the Contractor in post-contract stage after the notified date for commencement of the Works are specified in Worksection APE3 of this Appendix.

APE1.A040.8 ACCEPTANCE CRITERIA FOR PROPOSED MODIFICATIONS

The acceptance criteria for permitted modifications to design and/or Specification proposed by the Contractor in tender stage and for modifications to design and/or Specification for domestic blocks proposed by the Contractor in post-contract stage after the notified date for commencement of the Works are specified in Worksection APE4 of this Appendix.

APE2 TERMS AND REQUIREMENTS ON PERMITTED MODIFICATIONS PROPOSED IN TENDER STAGE

GENERALLY

APE2.A010.8

APPLICATION

All terms and requirements included in Worksection APE2 hereunder apply to permitted modifications to design and/or Specification for domestic blocks proposed by the Contractor in tender stage.

SCOPE OF MODIFICATIONS

APE2.A020.8

LIMITATIONS

1. Only modifications to design and/or Specification for domestic blocks arising as a result of complying with Items **APE2.A030** to **APE2.A070** inclusive are permitted in tender stage.
2. Permitted modifications proposed and submitted by the Contractor with the tender shall be in accordance with the Special Conditions of Tender and shall comply with all the requirements as specified in Worksections APE2 and APE4 of this Appendix.

APE2.A030.8

LARGE PANEL FORMWORK SYSTEM

The further use of large panel formwork system for constructing the structural walls (see **CON2.D310** to **CON2.D450**).

APE2.A040.8

NON-MANDATORY PRECAST EXTERNAL FACADES

The use of precasting method for constructing the external facades of the domestic flat units (see Worksection CON5).

APE2.A050.8

NON-MANDATORY SEMI-PRECAST SLABS

The use of semi-precasting method for constructing the slabs to areas other than domestic flat units (see Worksection CON7).

APE2.A060.8

NON-MANDATORY PRECAST STAIRS

The use of precasting method for constructing the stairs of the domestic blocks (see Worksection CON7).

APE2.A070.8

MECHANISED CONSTRUCTION METHODS

The use of any Approved mechanised method of construction.

SUBMISSIONS

APE2.A110.8 SUBMISSIONS - GENERALLY

Submit a schedule listing any permitted modifications to the design and/or Specification for domestic blocks proposed by the Contractor in a letter attached to the Form of Tender.

APE2.A120.8 CONFLICT WITH SPECIFICATION

Submit with the tender a list of all items contained in the Specification which may conflict with the tenderer's design, and full details of proposals for any amendments or additions to the Specification.

APE2.A130.8 MECHANISED CONSTRUCTION METHODS

Submit with the tender details of any mechanised method of construction that it is intended to use.

APE2.A140.8 PROPOSED STRUCTURAL MODIFICATIONS

Submit details with the tender showing:

1. The principles of any incidental structural design modifications proposed which shall be prepared by a Registered Structural Engineer registered with the Buildings Department; and
2. Proposals for supervision of all aspects of the concrete work by Contractor's own staff and the CM.

APE2.A150.8 PROGRAMME FOR FURTHER SUBMISSIONS IN POST CONTRACT STAGE

Agree programme for submission of design calculations, framing plans, reinforcement details, etc. with the CM prior to the notified date for commencement of the Works. No change to the design principles submitted with the tender documents will be permitted.

DESIGN RESPONSIBILITY

APE2.A210.8 DESIGN RESPONSIBILITY

Notwithstanding Clause 5.15 of the General Conditions of Contract, the Contractor shall, with respect to the Contractor's proposed modification to the design and / or Specification, be responsible for the satisfactory performance of the Works as modified by the Contractor's proposed modifications to the design and / or Specification and shall guarantee the same to the Employer. The Contractor shall indemnify and keep indemnified the Employer, his agents and employees against any liability, claims, demands, proceedings, damage, costs, charges and expenses whatsoever in respect thereof or in relation thereto, and shall compensate the Employer for any loss or expense arising therefrom.

BILLS OF QUANTITIES

APE2.A310.8

AMENDMENTS

1. Subject to compliance with sub-clause (2) of this clause, the Contractor may, at time of tender, insert, delete or revise the description and / or quantity of the measured items within the Bills of Quantities to suit any modifications to design and / or Specification for domestic blocks proposed by him. Such insertion, deletion or revision shall be made in accordance with the Method of Measurement stated in the Preliminaries to the Bills of Quantities. The Contractor shall include a schedule in his tender showing all such revisions to the Bills of Quantities;
2.
 - a. No insertion, deletion or revision shall be made to the Preliminaries to the Bills of Quantities;
 - b. No insertion, deletion or revision to any provisional quantities contained in the Bills of Quantities shall be allowed to be made, although the work or works to which the provisional quantities refer may be modified by the Contractor in accordance with Worksection APE2 of this Appendix.

APE2.A320.8

PREPARATORY WORKS FOR FINISHES

Where items, such as plastering, rendering and screeding, have been deleted from the Bills of Quantities as a result of the operation of sub-clause (1) of Item **APE2.A310**, the cost of all preparatory work, including keying, or the use of special bonding agent, etc., as required by the CM, to receive any subsequent finish is deemed to have been included in the tender.

PRELIMINARIES ITEMS

APE2.A410.8

ON-SITE PLANT AND EQUIPMENT

1. For domestic blocks, where the precast concrete facade system involves early capital cost of major and necessary items of on-Site plant and equipment which are used intimately in association with the precast facade construction, the Contractor may make a request for special terms of payment in respect of these items and is advised to make known to the Employer at time of tender, by submitting proposals in a separate letter with his tender.
2. In this connection, the Contractor is to note that any special terms of payment proposal must be restricted to only the on-Site items of plant and equipment as described in Clause SCT10 of the Special Conditions of Tender and the amounts of these items must have been tendered in Bill No 1 - Preliminaries. The acceptance of any special terms of payment proposals shall be at the discretion of the Employer.
3. All other Preliminaries items not related to the special terms of payment proposal shall be paid in accordance with the provisions set out in Bill No 1 Preliminaries.

INFORMATION TO TENDERERS FOR NOMINATED SUB-CONTACT AND SPECIALIST WORKS

APE2.A510.8**INFORMATION TO TENDERERS FOR NOMINATED SUB-CONTRACT
AND SPECIALIST WORKS**

1. The Contractor shall give full information and assistance to tenderers tendering for any Nominated Sub-contract or Specialist Works on any permitted modifications to design and/or Specification for domestic blocks which may affect the submission of a tender for any such Nominated Sub-contract or Specialist Works.
2. The Contractor shall be responsible for any additional costs, claims or expenses whatsoever and howsoever arising on Nominated Sub-contracts or Specialist Works as a result of any permitted modification to design and/or Specification for domestic blocks and the Final Contract Sum shall not be adjusted in respect of any such claims.

APE3 TERMS AND REQUIREMENTS ON PROPOSALS FOR MODIFICATIONS IN POST-CONTRACT STAGE

GENERALLY

APE3.A010.8 APPLICATION

All terms and requirements included in Worksection APE3 hereunder apply to modifications to design and/or Specification for domestic blocks proposed by the Contractor in post-contract stage after the notified date for commencement of the Works.

APE3.A020.8 TERMS AND CONDITIONS

1. Any modifications proposed by the Contractor in post-contract stage after the notified date for commencement of the Works shall be submitted to the CM in accordance with Clause 11.8 of the General Conditions of Contract. Such proposals shall be treated as Requested Variation Proposals and subject to the CM's agreement under Clause 11.8 of the General Conditions of Contract.
2. The proposed modifications shall comply with all the requirements as specified in Worksections APE3 and APE4 of this Appendix.

SUBMISSIONS

APE3.A110.8 SUBMISSIONS - GENERALLY

Any modifications proposed by the Contractor shall be submitted in accordance with Clause 11.8(2) of the General Conditions of Contract. Submit with the proposal a report identifying the principles of any proposed structural modifications which shall be prepared by a Registered Structural Engineer registered with the Buildings Department.

APE4 ACCEPTANCE CRITERIA FOR PROPOSED MODIFICATIONS TO DESIGN AND/OR SPECIFICATION FOR DOMESTIC BLOCKS

DESIGN AND/OR SPECIFICATION

APE4.A010.8 COMPLIANCE WITH REGULATIONS

1. Any permitted modifications to design and/or Specification for domestic blocks including any incidental structural design modifications proposed by the Contractor in tender stage, and any modifications to design and/or Specification for domestic blocks proposed by the Contractor in post-contract stage after the notified date for commencement of the Works shall comply with the Hong Kong Buildings Ordinance and its subsidiary Regulations.
2. The structural design of any modifications to domestic blocks shall comply with the Building (Construction) Regulations, Codes of Practices, Practice Notes for Authorized Persons, Registered Structural Engineers and Registered Geotechnical Engineers (PNAPs), and the Hong Kong Housing Authority Specification Library, currently in use.
3. In the event that any element of the design of modifications is not covered by the requirements in the Ordinance, Regulations and documents specified in sub-clauses (1) and (2) above or any British Standards, when instructed by the CM, the Contractor shall demonstrate by design calculation or experiment at his own expense the suitability of any such element to comply with any other proposed standard.

CONSTRUCTION

APE4.A110.8 INSPECTION OF WORK

Any proposal that may require the CM or his representative to carry out inspection of any work outside normal office hours will not be considered.

APE4.A120.8 OPENINGS THROUGH STRUCTURAL MEMBERS

Ensure that all proposed modifications allow for all openings, sleeves, etc., through structural members as shown in the Contract drawings or where necessary.

APE4.A130.8 INSTALLATION OF CONCEALED SERVICES

Ensure that all proposed modifications allow for installation of all concealed building services provisions in concrete, brickwork and blockwork where required under the Contract.

ACCEPTABILITY OF STRUCTURAL MODIFICATIONS

APE4.A210.8 CONDITIONS OF ACCEPTABILITY

The following clauses in this sub-section are subject to all the conditions stated elsewhere in the Appendix.

APE4.A220.8 REDESIGN OF FOUNDATIONS

Redesign of the foundation is not permitted.

APE4.A230.8 STRUCTURAL MEMBER SIZES

Reduction to structural member sizes is not permitted. Increase to structural member sizes shall be subject to Approval.

APE4.A240.8 CONCRETE DESIGN

Change to lower concrete grades and/or smaller concrete covers to reinforcing bars are not permitted.

APE4.A250.8 REINFORCEMENT DESIGN

Modification to reinforcement design, except to suit any permitted modification to structural concrete design, is not permitted.

APE4.A260.8 USE OF FABRIC REINFORCEMENT

Fabric reinforcement may be substituted for bar reinforcement providing that the fabric reinforcement complies with all requirements of the Specification. In the event that a change to design is required to suit a proprietary mesh, the cross sectional area of the reinforcement in the fabric shall not, in any location, be less than the designed area of steel/m² for bar reinforcement for that location.

APE4.A270.8 PRECAST CONCRETE STAIRS

Where a staircase flight is required to be constructed as precast concrete, a redesign of the staircase flight to insitu concrete is not permitted. However, modifications to the joints between the precast concrete flight and the insitu concrete landing may be made but such modifications will be subject to Approval.

APE4.A280.8 NON-STRUCTURAL CONCRETE ELEMENTS

In accordance with **CON4.M010** to **CON4.M030**, non-structural concrete elements which are not shown on the Structural Framing Plans may be substituted with precast concrete providing that such precast concrete complies with all requirements of the Specification.

ACCEPTABILITY OF ARCHITECTURAL MODIFICATIONS

APE4.A310.8 CONDITIONS OF ACCEPTABILITY

The following clauses in this sub-section are subject to all the conditions stated elsewhere in this Appendix.

APE4.A320.8	FLOOR LAYOUTS AND ELEVATIONS <p>Unless otherwise specified in the Contract, modification to floor layouts and elevations is not permitted.</p>
APE4.A330.8	MODIFICATIONS TO BUILDING STRUCTURE <p>Internal non-structural walls may be constructed as a later separate operation, and may be constructed of precast concrete, or solid concrete blocks plastered both sides. For any proposed design changes to internal non-structural walls provide at least the same performance standards as the walls shown on the tender drawings.</p>
APE4.A340.8	UTILITY SERVICE ROOMS <p>Notwithstanding the provisions of Item APE4.A330 above, no modification or change to utility service rooms will be permitted.</p>
APE4.A350.8	RENDER COAT TO WALLS <p>For domestic blocks, all walls receiving a tile or paint finish include a 10 mm render coat unless otherwise specified. Under no circumstances is this render coat to be omitted. Pay special attention to spatterdash in accordance with the Specification to ensure adequate key for this render coat.</p>
APE4.A360.8	CONCEALMENT OF ELECTRICAL WIRING <p>For domestic blocks, electrical wiring is all by concealed conduit in walls and slabs and shall comply with the requirements of the Code of Practice for the Electricity (Wiring) Regulations published by the Electrical and Mechanical Services Department. No modifications to the layout will be permitted without prior Approval.</p>
APE4.A370.8	EXTERNAL BUILDING FEATURES <p>Do not omit any external building features. Any non-structural external elements may be constructed later as a separate operation.</p>
APE4.A380.8	DIMENSIONS OF OPENINGS <p>Do not vary the dimensions shown on the tender drawings for all doors, windows and other openings.</p>
APE4.A390.8	MONOLITHIC SLAB AND SCREED FINISH <p>Monolithic slab and screed finish is acceptable subject to the following conditions:</p> <ol style="list-style-type: none">1. Floor level and falls being maintained as shown on the tender drawings;2. The removal of any stains, marks, scratches or foreign matter left on the cast floors and making good to the satisfaction of the CM. Should there be any floors which, in the opinion of the CM, were not properly prepared or which were left with a bowed floor surface with a surface which is excessively marked, cut back the entire floor surface by 25 mm and lay a 25 mm cement sand screeding at no extra cost; and3. Permission to use a monolithic floor finish will be withdrawn should the CM consider, at any time, that the general standard of floor finish is unacceptable. No monetary claims whatsoever will be entertained or extensions of time granted in the event of such a withdrawal of permission.

**APH APPENDIX H –
SCHEDULE OF TOLERANCES**

APH APPENDIX H - SCHEDULE OF TOLERANCES

INTRODUCTION

TOL.INTRO1.8 INTRODUCTION

1. **FORMAT:** This Schedule is prepared as an Appendix so that it is in a convenient form to use as a reference document by those concerned with site quality control during the construction stage of HKHA projects. However the Schedule is divided into the same Worksections as those used in the main body of the Specification; this facilitates easy division and attachment to Specification Worksections by main contractors for sub-contract tendering purposes;
2. **PRECEDENCE:** This Schedule shall not take precedence over any conflicting or variation tolerances given in other parts of this Specification or shown on the Drawings;
3. **DEFINITIONS:** The following are definitions of terms used in this Schedule of Tolerances:
 - a. **MASTER BENCH MARK (MBM):** The level datum from which all levels on site are derived;
 - b. **TRANSFERRED BENCH MARK (TBM):** Subsidiary level datum derived from the master bench mark;
 - c. **BOW:** Curvature of the length or width of the component expressed as a deviation from a straight line connecting the extremities;
 - d. **DEVIATION:** Difference between a size or position (actual, limit etc) and a specified size or position;
 - e. **PERMISSIBLE DEVIATION (PD):** Specified limit(s) of deviation;
 - f. **TOLERANCE:** Difference between the limits within which a size or position must lie. The tolerance is an absolute value without sign but the dimension or axis is to which it applies must be stated.

TOL.BRI - BRIDGE WORKS

TOL.BRI.010.8 BRIDGE BEARINGS

1. The centreline of bridge bearings shall be within 3 mm of the specified position;
2. The level of bridge bearings shall be within 0.0001 times the adjacent span or the lesser of the adjacent spans or with 5 mm of the specified level, whichever is less;
3. The inclination of bridge bearings shall be within 1 in 200 of the specified inclination;
4. The horizontal axis of bridge bearings shall be within 0.005 radian of the specified alignment;
5. Departure from the common plane between twin or multiple bridge bearings shall be within the tolerances stated on the Drawings.

TOL.BRI.020.8 VEHICULAR PARAPETS

Vehicular parapets shall be within 10 mm of the specified position and height.

TOL.BRI.030.8 FABRICATED MOVEMENT JOINTS

The surface of fabricated movement joints shall be at least 1 mm, and not more than 3 mm, below the surrounding road surface.

TOL.BSW - WORK FOR ELECTRICAL AND MECHANICAL INSTALLATIONS

TOL.BSW.010.8 FLOORS OF SWITCHGEAR ROOMS

The tolerance in floor levels for switchgear rooms shall be as follows:

1. ± 2 mm in 1000 mm for high voltage switchgear rooms;
2. ± 4 mm in 1000 mm for medium voltage switchgear rooms.

TOL.BSW.020.8 LAMP STANDARDS

Lamp standards shall be within 0.1 degrees of the vertical.

TOL.COM1 - STAINLESS STEEL WINDOWS, DOORS AND LOUVRES

TOLERANCE

TOL.COM1.010.8 DESIGN CLEARANCE

PD of the clearance between the frame and the structure opening at the:

1. Jamb	+5 mm : -10 mm
2. Head	+8 mm : -10 mm
3. Sill	+2 mm : -3 mm

TOL.COM1.020.8 VERTICALITY

PD of frame from plumb in any 1.2 m length	±3 mm
--	-------

TOL.COM2 - ALUMINIUM WINDOWS AND LOUVRES

TOLERANCE

TOL.COM2.010.8 DIMENSION

- | | |
|----------------------------------|-----------------|
| 1. PD for peripheral dimensions: | |
| a. Length <2 m: | ±1.0 mm |
| b. Ditto ≥2 m <3.5 m: | ±1.5 mm |
| c. Ditto ≥3.5 m <5 m: | ±2.0 mm |
| d. Ditto ≥5 m: | ±3.0 mm |
| 2. PD for step joint: | +0.5 mm : 0 mm |
| 3. PD for diagonal dimensions: | |
| a. Length <2 m: | ±1.5 mm |
| b. Ditto ≥2 m <3.5 m: | ±2.5 mm |
| c. Ditto ≥3.5 m: | ±3.5 mm |
| 4. Aluminum wall thickness: | |
| a. Structural members: | +0.16 mm : 0 mm |
| b. Non-structural members: | +0.16 mm : 0 mm |
| c. Glazing bead | ±0.1 mm |

TOL.COM2.020.8 VERTICALITY

- | | |
|---|-------|
| PD from plumb in any 1.2 m length | ±3 mm |
|---|-------|

TOL.COM5 - TIMBER DOORSETS

- NOTE: 1. Read the tolerances given in this section in conjunction with the dimensional requirements specified in BS 4787:Part 1:1980 unless otherwise specified on the Drawings. Dimension references given in brackets relate to these used in this BS;
2. Where smoke seals are to be used, other clearance sizes and related permissible deviations between door leaf and jamb, head, transom and sill may be specified.

DOORSETS

TOLERANCE

TOL.COM5.010.8 WORKSIZES

PD from doorset worksizes specified in
BS 4787:Part 1:1980:

- | | |
|-----------------------------|-------------------|
| 1. Height (A2 and G2) | +2.5 mm : -2.5 mm |
| 2. Width (B2) | +2.5 mm : -2.5 mm |

DOOR LEAVES

TOLERANCE

TOL.COM5.110.8 HEIGHT

PD for leaves in all doorsets (d3)	+2.5 mm : -2.5 mm
--	-------------------

TOL.COM5.120.8 WIDTH

PD for leaves in single or double equal leaf doorsets (e3)	+2.5 mm : -2.5 mm
---	-------------------

TOL.COM5.130.8 THICKNESS

PD for all leaf thicknesses (f3):

- | | |
|----------------------------|-------------------|
| 1. Internal doorsets | +1.0 mm : -2.0 mm |
| 2. External doorsets | +1.5 mm : -1.5 mm |

TOL.COM5.140.8 DOORSTOP WIDTH

- | | |
|----------------------------|-------------------|
| 1. Internal doorsets | +2.0 mm : -2.0 mm |
| 2. External doorsets | +2.0 mm : -0 mm |

TOL.COM5.150.8 REBATE DEPTH

PD (f2)	+1.0 mm : -1.0 mm
---------------	-------------------

TOL.COM5.160.8 CLEARANCES

PD from clearances specified in
BS 4787:Part 1:1980 or shown on drawings for:

- | | |
|---|-------------------|
| 1. Non fire resisting doors | +2.0 mm : -1.0 mm |
| 2. Fire resisting doors without smoke seals | +1.0 mm : -0.5 mm |
| 3. Fire resisting door with smoke seals | See Note 2 Above |

TOL.COM5.170.8 SQUARENESS

PD when measured in accordance with BS 5278:1976 at a point 500 mm from any corner	2.0 mm
--	--------

TOL.COM5.180.8 FLATNESS

PD when measured in accordance with BS 5278:1976, due to:	
1. Bending:	
a. Measured horizontally	2.0 mm
b. Measured vertically	4.0 mm
2. Twisting of any corner in relation to the other three:	
a. Doors of type '2' construction	6.0 mm
b. Doors of types '1' and '3' construction	3.0 mm

TOL.COM5.190.8 SMOOTHNESS

For any door type:	
1. PD in any position:	
a. When measured with a 50 mm bridge	0.2 mm
b. When measured with a 200 mm bridge	1.0 mm
2. PD for doors of type '2' construction, when measured with a 200 mm bridge, at not more than 3 points along the 4 horizontal lines and 3 points along the 2 vertical lines of each face	0.5 mm
3. PD for doors of type '1' and '3' construction, when measured with a 200 mm bridge, at not more than 4 points along the 2 vertical lines and 4 points along the 4 horizontal lines of each face	0.5 mm

DOOR FRAMES**TOLERANCE****TOL.COM5.210.8 BOW**

PD in the thickness of hardwood framing members in any 2 m length:	
1. Member thickness ≤50 mm	2.0 mm
2. Member thickness >50 mm	6.0 mm

TOL.COM5.220.8 SPRING

PD in the width of hardwood framing members in any 2 m length:	
1. Member thickness ≤100 mm	4.0 mm
2. Member thickness >100 mm	6.0 mm

INSTALLATION OF FRAMES AND SUB-FRAMES**TOLERANCE****TOL.COM5.230.8 PD FROM LEVEL OR VERTICALITY**

In any 1.2 m length 3.0 mm

TOL.COM6 - METAL DOORS**TOLERANCE****TOL.COM6.010.8 DESIGN CLEARANCE**

PD of clearance between the frame and the structural openings at head, sill and jambs.....

+5 mm : -10 mm

TOL.COM6.020.8 VERTICALITY

PD of frame from plumb in any 1.2 m length

±3 mm

TOL.COM7 - GATESETS**GATE AND FRAME****TOLERANCE****TOL.COM7.010.8 VERTICALITY AND SQUARENESS**

PD from plumb or level in any 1.2 m length

 ± 3 mm

TOL.COM9 - COOKING BENCH / SINK UNITS

PRODUCT ACCURACY

		<u>TOLERANCE</u>
TOL.COM9.010.8	CROSS SECTION AND LINEAR DIMENSIONS	
	PD	± 3 mm
TOL.COM9.020.8	STRAIGHTNESS OR BOW DIMENSIONS	
	PD	± 3 mm
TOL.COM9.030.8	TWIST	
	PD in the distance of any one corner from the plane containing the other three corners	± 3 mm
TOL.COM9.040.8	SQUARENESS OF CORNER	
	Taking the larger of two adjacent sides as the base line, the shorter side must not vary in its distance from a perpendicular to the base line by more than	± 3 mm
TOL.COM9.050.8	FLATNESS	
	PD of a nominally plane surface when measured with a 1.5 m straight edge	± 3 mm

ERECTION ACCURACY

		<u>TOLERANCE</u>
TOL.COM9.110.8	LINES AND LEVEL	
	PD from horizontal plane of unit in any 1.2 m length	± 3 mm

TOL.CON1 - INSITU CONCRETE

Note: Tolerances given in this section should be read in conjunction with additional tolerances given in TOL.CON2.

UNREINFORCED/REINFORCED CONCRETE FOUNDATION (INCLUDING RAFTS, GROUND BEAMS, COLUMN BASES, PILE CAPS AND STRIP FOUNDATIONS)

TOLERANCE

TOL.CON1.010.8 POSITION ON PLAN

PD in plan of any point measured from the nearest building grid line, for elements of dimensions

- | | |
|-------------|--------|
| 1. ≤1500 mm | ±35 mm |
| 2. >1500 mm | ±50 mm |

TOL.CON1.020.8 DIMENSION ON PLAN

- | | |
|-------------------------|-----------------|
| 1. PD per 300 mm: | ± 10 mm |
| 2. Maximum PD: | +50 mm : -35 mm |

TOL.CON1.030.8 UPPER SURFACE LEVEL

PD in level of upper surface with reference to the nearest TBM	±20 mm
--	--------

TOL.CON1.040.8 CAST-IN FOUNDATION BOLTS

PD from specified position	±25 mm
----------------------------------	--------

ELEMENTS OR COMPONENTS ABOVE FOUNDATIONS (EXCEPT LIFTWELLS AND STAIRS)

TOLERANCE

TOL.CON1.110.8 POSITION ON PLAN

PD in plan of any point measured from the nearest building grid line:	±15 mm
---	--------

TOL.CON1.120.8 SIZE AND SHAPE OF ELEMENT

PD for elements of dimensions:

- | | |
|-------------------------|--------|
| 1. ≤500 mm: | ±10 mm |
| 2. >500 ≤3000 mm: | ±20 mm |
| 3. >3000 mm: | ±30 mm |

TOL.CON1.130.8 VERTICALITY OF WALL AND COLUMNS

- | | |
|--|-------------|
| 1. Plumbness in height ≤ 500 mm: | ± 10 mm |
| 2. Ditto > 500 mm ≤ 3000 mm: | ± 15 mm |
| 3. Ditto > 3000 mm ≤ 30 m: | ± 20 mm |
| 4. > 30 m: Pro-rata on ± 20 mm per 30 m to the nearest 5 mm. | |

Note: When separated by another plane or member use the thickness of the plane or member for checking verticality.

TOL.CON1.140.8 SURFACE PROFILE OF WALLS AND SLAB SOFFITS

PD from mean of surface profile across the whole element (from extremities):

- | | |
|--|-------------|
| 1. Surface profile ≤ 3000 mm: | ± 10 mm |
| 2. Ditto > 3000 mm ≤ 15 m: | ± 15 mm |
| 3. Ditto > 15 m: | ± 20 mm |

Notes: Measure deviations in two directions.

TOL.CON1.150.8 GRADUAL IRREGULARITIES

PD from 3000 mm straight edge:

- | | |
|---------------------------------------|-------------|
| 1. Formwork type A: Rough board | ± 10 mm |
| 2. Formwork type B: Fairfaced | ± 10 mm |

TOL.CON1.160.8 ABRUPT IRREGULARITIES

Abrupt changes of a continuous finished concrete surface:

- | | |
|---------------------------|------------|
| 1. Formwork type A: | ± 4 mm |
| 2. Formwork type B: | ± 3 mm |

Note: This also applies to displacement of successive lifts for columns and walls within one storey height.

TOL.CON1.170.8 TWIST

The distance of any one corner from the plane containing the other three corners, i.e. a variation from the target plane:

- | | |
|--|-------|
| 1. For diagonal ≤ 3000 mm: | |
| a. Formwork type A: | 10 mm |
| b. Formwork type B: | 5 mm |
| 2. For diagonal > 3000 mm ≤ 15 m: | |
| a. Formwork type A: | 20 mm |
| b. Formwork type B: | 10 mm |
| 3. For each further 10 m of diagonal: | |
| a. Formwork type A: | 10 mm |
| b. Formwork type B: | 5 mm |

TOL.CON1.180.8 SQUARENESS OF CORNERS

Where the longer of two adjacent sides is taken as the base line and the PD of the shorter side, from a perpendicular to the base line, is related to the length of the shorter side:

- | | |
|--|-------------------|
| 1. Short side ≤ 250 mm: | ± 10 mm |
| 2. Ditto > 250 mm ≤ 500 mm: | ± 10 mm |
| 3. Ditto > 500 mm ≤ 3000 mm: | ± 20 mm |
| 4. Ditto for every additional 2500 mm (to nearest 5 mm): | ± 20 mm x L/3 |

TOL.CON1.200.8 LEVEL

PD from designed level with reference to the nearest TBM of the upper or lower surface, as may be specified of any slab or other element or component:

- | | |
|---------------------------------------|-------------|
| 1. Length ≤ 8 m: | ± 10 mm |
| 2. Length > 8 m ≤ 15 m: | ± 15 mm |
| 3. Length > 15 m ≤ 30 m: | ± 20 mm |

TOL.CON1.210.8 ITEMS CAST IN

The position of, or provision for, components fixings and holes cast in: PD from its designed position of centre line of component, fixing or hole:

± 15 mm

LIFTWELLS**TOLERANCE****TOL.CON1.310.8 POSITION ON PLAN**

Position on plan at bottom of well of any point of each wall. PD of internal face from the designed position in relation to the nearest parallel reference line at the same level (distance between the two points being not more than 15 m):

± 10 mm

TOL.CON1.320.8 STRUCTURAL LIMITS OF WELL ACCURACY AT ANY LEVEL

Comply with Section 3 of BS 5655:Part 6:1990 including Table 1 which is extended as follows:

TABLE 1 Limits of accuracy of well plumb dimensions			
Well height (m)		Limits of accuracy (mm)	
		+	-
1.	≤ 30	25	0
2.	$> 30 \leq 60$	35	0
3.	$> 60 \leq 90$	50	0

4.	>90	65	0
----	-----	----	---

Read Table 1 in conjunction with figure 1 of Section 3 of BS 5655.

TOL.CON1.330.8 LANDING DOOR OPENINGS

1. Position of landing door openings in relation to design position: ± 15 mm

Note: It is important that landing doors come one above another PD of actual centre line of structural opening (to receive lift doors) from the design position.

2. Plumbness of jamb: PD from the vertical:
- a. For every 1000 mm of height: ± 5 mm
- b. Up to a maximum of: ± 15 mm

TOL.CON1.340.8 ABRUPT IRREGULARITIES OF WALLS

Abrupt changes of inner surfaces of walls: Not to exceed 5 mm

INSITU STAIRS (FLIGHT FROM LANDING TO LANDING)

TOLERANCE

TOL.CON1.410.8 POSITION ON PLAN

PD on plan of any point in relation to the nearest reference point at the same level, the distance between the points being no more than 15 m: ± 15 mm

TOL.CON1.420.8 LENGTH

Length on plan of clear span (excluding landings): ± 15 mm

TOL.CON1.430.8 WIDTH OF FLIGHT

..... ± 10 mm

TOL.CON1.440.8 HEIGHT

Vertical height measured between either top surfaces or soffit surfaces of any flight of stairs: ± 15 mm

TOL.CON1.450.8 WAIST THICKNESS

Thickness of waist measured at right angles to the slope of the flight: ± 10 mm

TOL.CON1.460.8 RISE

Difference in the rise of two consecutive steps: ± 5 mm

TOL.CON1.470.8 GOING

Difference in width of tread of two consecutive steps: ± 10 mm

TOL.CON1.480.8 TREAD LEVEL

Difference in level of tread:

1. Across the going: ± 4 mm

2. Across width of stairs per 1000 mm width (measured between extremities of tread): ± 5 mm

3. Other widths: Pro-rata with a maximum of: ± 10 mm

OPENINGS (EXCLUDING LIFT OPENINGS) - ALL BLOCK TYPES

TOLERANCE

TOL.CON1.510.8 POSITION ON ELEVATION

PD on elevation from its designed position of centre line with reference to the nearest building grid line: ± 15 m

TOL.CON1.520.8 POSITION ON PLAN

PD on plan of any point measured from the nearest building grid line: ± 15 mm

OPENINGS (EXCLUDING LIFT OPENINGS) - HARMONY BLOCKS ONLY

TOLERANCE

TOL.CON1.610.8 FAIRFACED CONCRETE WALL OPENING IN FLAT A AND D

1. Height: ± 6 mm

2. Width: ± 6 mm

3. Plumb: ± 3 mm/1.2 m

4. Level: ± 3 mm/1.2 m

TOL.CON1.620.8 DOOR, WINDOW AND OTHER OPENINGS

Width and height:

1. ≤ 500 mm: ± 15 mm

2. > 500 mm ≤ 3000 mm: ± 20 mm

OPENINGS (EXCLUDING LIFT OPENINGS) - BLOCK TYPES EXCEPT HARMONY

TOLERANCE

TOL.CON1.710.8 DOOR, WINDOW AND OTHER OPENINGS

Width and height:

- | | |
|-------------------------------------|--------|
| 1. ≤ 500 mm: | ±15 mm |
| 2. > 500 mm ≤ 3000 mm: | ±20 mm |

TOL.CON1.720.8 PLUMBNESS OF JAMBS

PD from the vertical:

- | | |
|---------------------------------------|--------|
| 1. For every 1000 mm of height: | ±5 mm |
| 2. With a maximum of: | ±15 mm |

TOL.CON1.730.8 LEVEL OF SILL OR SOFFIT

PD:

- | | |
|---------------------------------------|--------|
| 1. For every 1000 mm of length: | ±5 mm |
| 2. With a maximum of: | ±15 mm |

OVERALL DIMENSIONS OF A CONCRETE FRAMED BUILDING

TOLERANCE

TOL.CON1.810.8 LENGTH AND WIDTH

- | | |
|--------------------------------|--------|
| 1. ≤ 15 m: | ±25 mm |
| 2. > 15 m ≤ 30 m: | ±50 mm |
| 3. Each subsequent 30 m: | ±20 mm |

Note: Measure dimensions at lowest floor level
or, if not practicable, as otherwise
specified or agreed.

TOL.CON1.820.8 HEIGHT

To structural roof level with reference to the
TBM:

- | | |
|--------------------------------|--------|
| 1. ≤ 30 m: | ±40 mm |
| 2. Each subsequent 30 m: | ±15 mm |

TOL.CON2 - FORMWORK

Note: Tolerances given in this section should be read in conjunction with those given in TOL.CON1.

FORMWORK TO FOUNDATIONS (INCLUDING RAFTS, GROUND BEAMS, COLUMN BASES, PILE CAPS AND STRIP FOUNDATIONS)

TOLERANCE

TOL.CON2.010.8 DIMENSION ON PLAN

- | | | |
|----|----------------------|-----------------|
| 1. | PD per 300 mm: | ±10 mm |
| 2. | Maximum PD: | +50 mm : -35 mm |

FORMWORK TO ELEMENTS OR COMPONENTS ABOVE FOUNDATIONS

TOLERANCE

TOL.CON2.110.8 SIZE AND SHAPE OF ELEMENTS

PD for elements of dimensions:

- | | | |
|----|-------------------------|--------|
| 1. | ≤500 mm: | ±10 mm |
| 2. | >500 mm ≤3000 mm: | ±20 mm |
| 3. | > 3000 mm: | ±30 mm |

TOL.CON2.120.8 ABRUPT IRREGULARITIES

Misalignment of joints:

- | | | |
|----|--------------------------------------|-------|
| 1. | Formwork Type A: | ±4 mm |
| 2. | Formwork Type B: | |
| | a. Small panel metal formwork: | ±2 mm |
| | b. Others: | ±3 mm |

TOL.CON2.130.8 TWIST

The distance of any one corner from the plane containing the other three corners, i.e. a variation from the target plane:

1. For diagonal ≤ 3000 mm:
 - a. Formwork type A: 10 mm
 - b. Formwork type B: 5 mm
2. For diagonal > 3000 m ≤ 15 m:
 - a. Formwork type A: 20 mm
 - b. Formwork type B: 10 mm
3. For each further 10 m of diagonal:
 - a. Formwork type A: 10 mm
 - b. Formwork type B: 5 mm

TOL.CON2.140.8 SQUARENESS OF CORNER

Where the longer of two adjacent sides is taken as the base line and the PD of the shorter side, from a perpendicular to the base line, is related to the length of the shorter side:

1. Short side ≤ 250 mm: ± 10 mm
2. Ditto > 250 mm ≤ 500 mm: ± 10 mm
3. Ditto > 500 mm ≤ 3000 mm: ± 20 mm
4. Ditto for every additional 2500 mm: (to nearest 5 mm) ± 20 mm x L/3

TOL.CON3 - REINFORCEMENT

TOLERANCE

TOL.CON3.020.8	TOLERANCES TO CONCRETE COVER - GENERALLY	
	PD from nominal cover:	±5 mm
TOL.CON3.030.8	TOLERANCES TO CONCRETE COVER - STARTER BARS	
	Starters in walls and column spots of horizontal lift:	+5 mm + Φ , -5 mm
	Φ = diameter of starter bar	
TOL.CON3.040.8	SPACING	
	The lesser of:	+50 mm or 20% of specified spacing
TOL.CON3.050.8	ANCHORAGE, LAP LENGTH AND CURTAILMENT	
	PD from specified length:	-25 mm
TOL.CON3.060.8	CUTTING AND BENDING	
	Comply with the cutting and/or bending tolerances defined in Table 4 of BS 8666 : 2000 as follows:	
	1. Cutting of straight lengths (including reinforcement for subsequent bending):	±25 mm
	2. Bent bars:	
	a. Dimension of bent bars ≤1000 mm:	±5 mm
	b. Ditto >1000 mm to ≤2000 mm:	+5 mm : -10 mm
	c. Ditto >2000 mm:	+5 mm : -25 mm
	3. Length of wires in fabric:	±25 mm or 0.5 % of the length (whichever is greater)

TOL.CON4 - PRECAST CONCRETE

TOLERANCE

TOL.CON4.010.8 ALL ELEMENTS (UNLESS OTHERWISE SPECIFIED)

- | | |
|---|-------|
| 1. Length up to 2000 mm: | ±6 mm |
| 2. Width or height up to 250 mm: | ±4 mm |
| 3. Thickness or depth up to 500 mm: | ±6 mm |

STAIRS TO STANDARD DOMESTIC (FLIGHT FROM LANDING TO LANDING)

TOLERANCE

TOL.CON4.110.8 POSITION ON PLAN

- | | |
|---|--------|
| PD on plan of any point in relation to the nearest reference point at the same level, the distance between the points being not more than 15 m: ... | |
| | ±10 mm |

TOL.CON4.120.8 LENGTH

- | | |
|--|--------|
| Length on plan of clear span (excluding landings): | |
| | ±12 mm |

TOL.CON4.130.8 WIDTH OF FLIGHT

- | | |
|-------|-------|
| | ±6 mm |
|-------|-------|

TOL.CON4.140.8 HEIGHT

- | | |
|--|--------|
| Vertical height measured between either top surfaces or soffit surfaces of any flight of stairs: | |
| | ±10 mm |

TOL.CON4.150.8 WAIST THICKNESS

- | | |
|---|---------------|
| Thickness of waist measured at right angles to the slope of the flight: | +6 mm : -3 mm |
|---|---------------|

TOL.CON4.160.8 RISE

- | | |
|--|-------|
| Difference in the rise of two consecutive steps: | |
| | ±5 mm |

TOL.CON4.170.8 GOING

- | | |
|--|-------|
| Difference in width of tread of two consecutive steps: | |
| | ±8 mm |

TOL.CON4.180.8 TREAD LEVEL

- | | |
|---------------------------------|-------|
| Difference in level of tread: | |
| 1. Across the going: | ±4 mm |
| 2. Across width of stair: | ±5 mm |

TOL.CON5 - PRECAST FACADE UNITS

CASTING FACADE UNITS

TOLERANCE

TOL.CON5.010.8 DEVIATIONS FROM DESIGN DIMENSIONS

Manufacture the facade units within the dimensional tolerances set out below:

1. Length and height:

a. Up to 2 m:	+0 : -3 mm
b. 2 m to 3 m:	+0 : -6 mm
c. 3 m to 4.5 m:	+0 : -9 mm
d. 4.5 m to 6 m or more:	+0 : -12 mm

2. Thickness:

a. Up to 500 mm:	+6 mm : -3 mm
b. 500 mm to 750 mm:	+8 mm : -5 mm

3. Straightness or bow (deviation from intended line):

a. Up to 3 m:	6 mm
b. 3 m to 6 m:	9 mm
c. 6 m to 12 m:	12 mm

TOL.CON5.020.8 SQUARENESS

When assessing the squareness of a corner:

1. Take the longer of the two adjacent sides being checked as the base-line;
2. Ensure that the shorter side does not vary in its distance from a perpendicular so that the difference between the greatest and shortest dimensions exceeds:

Length of shorter sides:

a. Up to and including 1000 mm:	3 mm
b. Over 1000 mm to 2000 mm:	5 mm
c. Over 2000 mm:	6 mm

TOL.CON5.030.8 TWIST

Ensure that no corner is more than the dimension stated from the plane containing the other three corners:

1. Up to and including 3 m:	6 mm
2. Over 3 m to 6 m:	9 mm
3. Over 6 m to 12 m:	12 mm

TOL.CON5.040.8 POSITION OF CAST-IN WINDOW FRAMES

PD from design dimensions on plan: ± 6 mm

INSTALLING FACADE UNITS**TOLERANCE****TOL.CON5.110.8 ERECTION TOLERANCES**

1. Install the facade units within the erection tolerances set out below:
 - a. Horizontal position: In x and y directions:
..... ± 5 mm
 - b. Plumb: per element: ± 6 mm
 - c. Width of joint: On a nominal joint of
20 m: ± 5 mm
2. In addition, respect the prescribed dimensions for height, width and length, of the completed building to within 0.1%;
3. Respect the theoretical line, both horizontal and vertical, with the same tolerance of 0.1%, for each storey when seen from the front. Deviations in profile must not exceed ± 10 mm.

TOL.CON7 - PRECAST CONCRETE COMPONENTS

CASTING FACADE AND PRECAST CONCRETE WALL UNITS

TOLERANCE

TOL.CON7.010.8 DEVIATIONS FROM DESIGN DIMENSIONS

Manufacture the facade and precast concrete wall units within the dimensional tolerances set out below:

1. Length and height:
 - a. Up to 2 m: +3 mm : -3 mm
 - b. 2 m to 3 m: +6 mm : -6 mm
 - c. 3 m to 4.5 m: +9 mm : -9 mm
 - d. 4.5 m to 6 m or ore: +10 mm : -12 mm
2. Thickness:
 - a. Up to 500 mm: +6 mm : -3 mm
 - b. 500 mm to 750 mm: +8 mm : -5 mm
3. Straightness or bow (deviation from intended line):
 - a. Up to 3 m: 6 mm
 - b. 3 m to 6 m: 9 mm
 - c. 6 m to 12 m: 12 mm

TOL.CON7.020.8 SQUARENESS

When assessing the squareness of a corner:

1. Take the longer of the two adjacent sides being checked as the base-line;
2. Ensure that the shorter side does not vary in its distance from a perpendicular so that the difference between the greatest and shortest dimensions exceeds:

Length of shorter sides:

- a. Up to and including 1000 mm: 3 mm
- b. Over 1000 mm to 2000 mm: 5 mm
- c. Over 200 mm: 6 mm

TOL.CON7.030.8 TWIST

Ensure that no corner is more than the dimension stated from the plane containing the other three corners:

- | | |
|---------------------------------|-------|
| 1. Up to and including 3: | 6 mm |
| 2. Over 3 to 6: | 9 mm |
| 3. Over 6 to 12: | 12 mm |

TOL.CON7.040.8 POSITION OF CAST-IN WINDOW FRAMES

PD from design dimensions on plan: ± 6 mm

INSTALLING FACADE AND PRECAST CONCRETE WALL UNITS

TOLERANCE

TOL.CON7.110.8 ERECTION TOLERANCES

1. Install the facade and precast concrete wall units within the erection tolerances set out below:

- | | |
|---|------------|
| a. Horizontal position: In x and y directions: | ± 5 mm |
| b. Plumb: per element: | ± 6 mm |
| c. Width of joint: On a nominal joint of 20 mm: | ± 5 mm |

2. In addition, respect the prescribed dimensions for height, width and length, of the completed building to within 0.1%;

3. Respect the theoretical line, both horizontal and vertical, with the same tolerance of 0.1%, for each storey when seen from the front. Deviations in profile must not exceed ± 10 mm.

STAIRS TO STANDARD DOMESTIC (FLIGHT FROM LANDING TO LANDING)

TOLERANCE

TOL.CON7.210.8 POSITION ON PLAN

PD on plan of any point in relation to the nearest reference point at the same level, the distance between the points being not more than 15:

± 10 mm

TOL.CON7.220.8 LENGTH

Length on plan of clear span (excluding landings):

± 12 mm

TOL.CON7.230.8	WIDTH OF FLIGHT	
	±6 mm
TOL.CON7.240.8	HEIGHT	
	Vertical height measured between either top surfaces or soffit surfaces of any flight of stairs:	±10 mm
TOL.CON7.250.8	WAIST THICKNESS	
	Thickness of waist measured at right angles to the slope of the light:	+6 mm : -3 mm
TOL.CON7.260.8	RISE	
	Difference in the rise of two consecutive steps:	±5 mm
TOL.CON7.270.8	GOING	
	Difference in width of tread of two consecutive steps:	±8 mm
TOL.CON7.280.8	TREAD LEVEL	
	Difference in level of tread:	
	1. Across the going:	±4 mm
	2. Across width of stair:	±5 mm

TOL.CON8 - VOLUMETRIC PRECAST CONCRETE COMPONENTS FOR DOMESTIC BLOCKS

OVERALL TOLERANCES - GENERAL

	<u>TOLERANCE</u>
TOL.CON8.010.8 POSITION ON PLAN	
Permissible Deviation (PD) in plan of any point measured from the nearest building grid line:	±15 mm
TOL.CON8.020.8 LENGTH AND WIDTH	
1. ≤15 m:	±25 mm
2. >15 m	
≤30 m:	±50 mm
3. Each subsequent 30 m:	±20 mm
Note: Measure dimensions at lowest floor level or, if not practicable, as otherwise specified or agreed.	
TOL.CON8.030.8 HEIGHT	
To structural roof level with reference to the Transferred Bench Mark (TBM):	
1. ≤30 m:	±40 mm
2. Each subsequent 30 m:	±15 mm
TOL.CON8.040.8 VERTICALITY OF WALL AND COLUMNS	
1. Plumbness in height ≤500 mm:	±10 mm
2. Ditto >500 mm ≤3000 mm:	±15 mm
3. Ditto >3000 mm ≤30 m:	±20 mm
4. >30 m:	Pro-rata on ±20 mm per 30 m to the nearest 5 mm
Note: When separated by another plane or member use the thickness of the plane or member for checking verticality.	
TOL.CON8.050.8 SURFACE PROFILE OF WALLS AND SLAB SOFFITS	
Permissible Deviation (PD) from mean of surface profile across the whole element (from extremities):	
1. Surface profile ≤3000 mm:	±10 mm
2. Ditto >3000 mm ≤15 m:	±15 mm
3. Ditto >15 m:	±20 mm
Note: Measure deviations in two directions.	

TOL.CON8.060.8 TWIST

The distance of any one corner from the plane containing the other three corners, i.e., a variation from the target plane:

1. For diagonal ≤ 15 m: 20 mm
2. For each further 10 m of diagonal: 10 mm

TOL.CON8.070.8 SQUARENESS OF CORNERS

Where the longer of two adjacent sides is taken as the base line and the Permissible Deviation (PD) of the shorter side, from a perpendicular to the base line, is related to the length of the shorter side:

1. Short side ≤ 3000 mm: ± 20 mm
2. Short side for every additional 2500 mm (to nearest 5 mm): ± 20 mm x L/3

TOL.CON8.080.8 LEVEL

Permissible Deviation (PD) from designed level with reference to the nearest Transferred Bench Mark (TBM) of the upper or lower surface, as may be specified of any slab or other element or component:

- Length ≤ 8 m: ± 10 mm
- Length > 8 m ≤ 15 m: ± 15 mm
- Length > 15 m ≤ 30 m: ± 20 mm

OVERALL TOLERANCES - LIFTWELLS**TOLERANCE****TOL.CON8.110.8 POSITION ON PLAN**

Position on plan at bottom of well of any point of each wall. Permissible Deviation (PD) of internal face from the designed position in relation to the nearest parallel reference line at the same level (distance between the two points being not more than 15 m):

 ± 10 mm**TOL.CON8.120.8 STRUCTURAL LIMITS OF WELL ACCURACY AT ANY LEVEL**

Comply with Section 3 of BS 5655:Part 6:1990 including Table 1 which is extended as follows:

TABLE 1 Limits of accuracy of well plumb dimensions			
Well height (m)		Limits of accuracy (mm)	
		+	-
1.	≤ 30	25	0
2.	$> 30 \leq 60$	35	0

3.	>60 ≤90	50	0
4.	>90	65	0

Read Table 1 in conjunction with figure 1 of Section 3 of BS 5655.

TOL.CON8.130.8 LANDING DOOR OPENINGS

1. Position of landing door openings in relation to design position: ±15 mm

Note: It is important that landing doors come one above another Permissible Deviation (PD) of actual centre line of structural opening (to receive lift doors) from the design position.

2. Plumbness of jamb: Permissible Deviation (PD) from the vertical:
- a. For every 1000 mm of height: ±5 mm
 - b. Up to a maximum of: ±15 mm

TOL.DRA1 - DRAINAGE ABOVE GROUND

TOLERANCE

TOL.DRA1.010.8	VERTICALITY	
	PD of pipes from plumb when measured with a 1.2 m straight edge	± 3 mm

TOL.DRA2 - DRAINAGE BELOW GROUND

PIPELINES (EXCLUDING TERMINATION PIPES)

TOLERANCE

TOL.DRA2.010.8 GRAVITY PIPELINES

PD from lines and levels shown on the Drawings:

- | | |
|---|---------------|
| 1. Line | ±20 mm |
| 2. Invert level (providing there is no backfall at any point) | +6 mm : -6 mm |

TOL.DRA2.020.8 PRESSURE PIPELINES

PD from lines and levels shown on the Drawings:

- | | |
|-----------------------|--------|
| 1. Line | ±50 mm |
| 2. Invert level | ±20 mm |

TERMINATION PIPES

TOLERANCE

TOL.DRA2.110.8 TERMINATION PIPES

PD for termination pipes which are designed to connect to pipes and fittings laid by others from the positions, gradients and levels shown on the Drawings:

- | | |
|---|--------|
| 1. Position of the centre of the termination face in the longitudinal direction | ±10 mm |
| 2. Position of the centre of the termination face in the lateral direction | ±3 mm |
| 3. Gradient | ±0.5° |
| 4. Invert level of the termination face | ±3 mm |

MANHOLES

TOLERANCE

TOL.DRA2.210.8 MANHOLE COVERS

PD from specified level unless a more accurate level is defined for adjacent surfaces in this schedule:

- | | |
|--|----------------|
| 1. Concrete road | +10 mm : -0 mm |
| 2. Bituminous paving | +5 mm : -0 mm |
| 3. Paving blocks, tiles or granolithic finish on soft base | +10 mm : -0 mm |
| 4. Paving blocks, tiles or granolithic finish on hard base | +5 mm : -0 mm |

TOL.EAR1 - EXCAVATION AND FILLING

EARTHWORKS FINAL SURFACE TOLERANCES

TOL.EAR1.010.8 GENERAL

1. Keep earthworks final surfaces and formations within the tolerances of the specified lines and levels tabulated in **TOL.EAR1.020**, **TOL.EAR1.030** and **TOL.EAR1.040** below;
2. The tolerances for formations do not apply to pipes or preformed structures which require to be supported over their complete length or area;
3. Excavation: A positive (+) tolerance refers to insufficient excavation and a negative (-) tolerance refers to excess excavation;
4. Filling: A positive (+) tolerance refers to excess fill material and a negative (-) tolerance refers to insufficient fill material.

TOL.EAR1.020.8 SETTING OUT

Requirement	Tolerance (mm)	
	+	-
PD in plan of any point measured from the nearest building grid line	35	35

TOL.EAR1.030.8 BULK EXCAVATION/FILLING

Types of surface		Method of forming surface		Tolerance (mm)	
				+	-
1.	Formations for structures and utilities	a.	Excavation except in rock	0	25
		b.	Excavation in rock	0	150
		c.	Deposition and compaction of fill material	0	25
2.	Formations for pavements, including carriageways, footways, cycletracks, paved areas, aircraft pavements and railway trackbeds	a.	Excavation except in rock	0	50
		b.	Excavation in rock	0	150
		c.	Deposition and compaction of fill material	0	50
3.	Earthworks final surfaces, other than	a.	Excavation except in rock	0	100
		b.	Excavation in rock	0	200

4.	formations, with a gradient not exceeding 1 vertical to 10 horizontal	c.	Deposition and compaction of fill material	0	100
	Other earthworks final surfaces	a.	Excavation except in rock	100	100
		b.	Excavation in rock	100	200
		c.	Deposition and compaction of fill material	100	100

TOL.EAR1.040.8 FOUNDATION PITS AND TRENCHES

Types of surface		Method of forming surface		Tolerance (mm)	
				+	-
1.	Formations to receive blinding or structural concrete	a.	Excavation except in rock	0	25
		b.	Excavation in rock	0	150
2.	Width of excavation	a.	Excavation except in rock	0	100
		b.	Excavation in rock	0	200

TOL.EAR2 - BLASTING

PRE-SPLIT BLASTING

TOL.EAR2.010.8 FINAL SURFACE TOLERANCES

A tolerance of + 100 - 200 mm from the design profile.

Notes:

1. Redrill any pre-split hole which, before firing, is found to be outside this tolerance;
2. A positive (+) tolerance refers to insufficient blasted material and a negative (-) tolerance refers to excess blasted material.

TOL.EXT1 - SUB-BASES, BITUMINOUS ROADWAYS AND RELATED FOOTPATHS

TOLERANCE

TOL.EXT1.010.8	ALIGNMENT	
	PD of edgelines from the dimensions indicated on the Drawings:	
	1. Generally	+25 mm : -25 mm
	2. Adjacent edges of structure	+6 mm : -6 mm
TOL.EXT1.020.8	MEASUREMENT OF LEVELS	
	Determine the levels of the surface of each layer of sub-base, roadbase, base course, wearing and friction courses on a grid at 10 m centres in the longitudinal direction and at 2 m centres in the transverse direction.	
TOL.EXT1.030.8	TOLERANCES IN LEVELS FOR EACH TYPE OF LAYER	
	PD from the level of the surface of each layer of sub-base, roadbase base course, wearing and friction courses:	
	1. Sub-base	+10 mm : -20 mm
	2. Road-base course	+8 mm : -15 mm
	3. Base course	+6 mm : -6 mm
	4. Wearing course	+6 mm : -6 mm
	5. Friction course	+6 mm : -6 mm
TOL.EXT1.040.8	SURFACE LEVELS AT JOINTS	
	PD in level of the surface of wearing course and friction course across joints	3 mm
TOL.EXT1.050.8	COMBINATION OF TOLERANCES	
	Maximum reduction in thickness from specified thickness:	
	1. Pavement (excluding sub-base)	15 mm
	2. Bituminous wearing course	5 mm
TOL.EXT1.060.8	LEVELS OF GULLY GRATINGS	
	PD of gully frame from level of adjacent finished surface	+0 mm : -5 mm
TOL.EXT1.070.8	LEVELS OF COVERS, FRAMES AND OTHER HARDWARE	
	PD of hardware from level of adjacent finished surface	+5 mm : -0 mm

Limits of irregularity as specified in EXT1.T610
and EXT1.T620

$$- \dot{} -$$

TOL.EXT2 - CONCRETE CARRIAGEWAYS

TOLERANCE

TOL.EXT2.010.8 STRAIGHT ALIGNMENT

- | | |
|--|-----------------|
| 1. PD of best fit straight line of straight joints and of straight edges from that shown on the Drawings | +25 mm : -25 mm |
| 2. PD of line of straight joints and straight edges from the best fit straight line | +10 mm : -10 mm |

TOL.EXT2.020.8 CURVED ALIGNMENT

- | | |
|---|-----------------|
| 1. PD of the best fit curved line of curved joints and of curved edges from that Approved and shown on the Drawings | +25 mm : -25 mm |
| 2. PD of line of curved joints and curved edges from the best fit curved line | +10 mm : -10 mm |

TOL.EXT2.030.8 ALIGNMENT OF JOINTS

- | | |
|--|---------------|
| PD of joint continuity across intersections of joints from the best fit straight lines or best fit curved line of each joint | +5 mm : -5 mm |
|--|---------------|

TOL.EXT2.040.8 LEVEL OF SUB-BASE

- | | |
|---------------------------------------|-----------------|
| PD from level shown on Drawings | +10 mm : -20 mm |
|---------------------------------------|-----------------|

TOL.EXT2.050.8 FORMWORK

- | | |
|--|-----------------|
| 1. PD of line of formwork from that shown on Drawings | +10 mm : -10 mm |
| 2. PD of level of formwork from that shown on Drawings | +3 mm : -3 mm |
| 3. PD of abrupt irregularities in line and level of formwork | 3 mm |

TOL.EXT2.060.8 COVER TO REINFORCEMENT

- | | |
|--|-----------------|
| PD from cover specified or shown on Drawings | +10 mm : -10 mm |
|--|-----------------|

TOL.EXT2.070.8 DOWEL BARS

- | | |
|---|-----------------|
| 1. PD of dowel bars at joints from mid-depth of slab | +20 mm : -20 mm |
| 2. PD of half the length of dowel bars from parallel to: | |
| a. The longitudinal joint or axis of the carriageway where there is no longitudinal joint | 3 mm |
| b. The top surface of the slab | 3 mm |
| c. Adjacent dowel bars | 3 mm |

TOL.EXT2.080.8 GROOVE DEPTH

PD of groove depth from that shown on the Drawings unless otherwise recommended by the sealant manufacturer +3 mm : -3 mm

TOL.EXT2.090.8 LEVELS

When the levels of the concrete carriageway are determined 200 mm from the edges of each bay, at 10 m centres in the longitudinal direction and 2 m centres in the transverse direction:

1. PD of surface fall from that shown on Drawings (Providing that falls shall always be in the specified direction without backfall). +6 mm : -6 mm
3 mm
2. Maximum difference in level across joint

TOL.EXT2.100.8 SLAB THICKNESS

PD from specified thickness - : -10 mm

TOL.EXT2.110.8 LEVEL OF COVERS, FRAMES AND OTHER HARDWARE

PD from surface of adjacent carriageway +0 mm : -3 mm

Surface regularity: The tolerances specified in this section should be read in conjunction with the compliance criteria for surface regularity specified in EXT2 TESTING.

TOL.EXT3 - PATHS AND PAVED AREAS

MATERIALS

		<u>TOLERANCE</u>
TOL.EXT3.010.8	INTERLOCKING CONCRETE BLOCKS	
	PD on size	+3 mm : -3 mm
TOL.EXT3.020.8	PRECAST CONCRETE PAVING SLABS	
	PD as defined at 11.2.1 of BS 7263:Part 1:1994 measured in accordance with Annex A to this BS:	
	1. Thickness	+3 mm : -3 mm
	2. Length and width	+2 mm : -2 mm
	3. Squareness on plan (difference between diagonals) according to flag type defined in BS:	
	a. Flag types A, B, C and D;	6 mm
	b. Flag types E, F and G.	3 mm
	4. Flatness, winding and bowing:	
	a. Measured over 550 mm to 850 mm;	+2 mm : -2 mm
	b. Measured over 250 mm to 400 mm.	+1 mm : -1 mm
TOL.EXT3.030.8	CLAY PAVERS	
	Limits of overall measurement defined in Table 2 of BS 6677:Part 1:1986.	- : -

WORKMANSHIP

		<u>TOLERANCE</u>
TOL.EXT3.110.8	INTERLOCKING CONCRETE BLOCKS, PRECAST CONCRETE PAVING SLABS AND CLAY PAVERS	
	1. PD from surface level specified	+3 mm : -3 mm
	2. PD between adjacent slabs	2 mm
	3. PD of drainage channels and gratings from level of adjacent finished surface	+0 mm : -5 mm
	4. PD of covers, frames and other hardware from level of adjacent finished surface	+5 mm : -0 mm

TOL.EXT3.120.8 INSITU CONCRETE SURFACE FINISH

- | | |
|--|---------------|
| 1. Abrupt irregularities: Maximum | 3 mm |
| 2. Gradual irregularities: Maximum in any 2 m length | 10 mm |
| 3. PD of drainage channels and gratings from level of adjacent finished surface | +0 mm : -5 mm |
| 4. PD of covers, frames and other hardware from level of adjacent finished surface | +5 mm : -0 mm |

TOL.EXT5 - KERBS, EDGINGS AND QUADRANTS

		<u>TOLERANCE</u>
TOL.EXT5.010.8	LINE	
	PD from line specified	+3 mm : -3 mm
TOL.EXT5.020.8	TOP LEVEL	
	PD from level specified	+3 mm : -3 mm
TOL.EXT5.030.8	IN SITU SURFACE FINISH	
	1. Abrupt irregularities: Maximum	3 mm
	2. Gradual irregularities: Maximum in any 2 m length	10 mm
TOL.EXT5.040.8	ACCURACY OF PRECAST UNITS	
	PD's when measured in accordance with Annex A of BS 7263:Part 1:1994:	
	1. Length, width or height	+3 mm : -3 mm
	2. Straightness and winding:	
	a. Measured over 550 to 850 mm	+2 mm : -2 mm
	b. Measured over 250 to 400 mm	+1 mm : -1 mm
	3. Squareness	2 mm clearance

TOL.EXT6 - CONCRETE PROFILE BARRIERS

		<u>TOLERANCE</u>
TOL.EXT6.010.8	HORIZONTAL DIMENSIONS OF CROSS SECTIONS	
	PD from specified dimensions	+5 mm : -5 mm
TOL.EXT6.020.8	VERTICAL DIMENSIONS OF CROSS SECTIONS	
	PD from specified dimensions	+10 mm : -10 mm
TOL.EXT6.030.8	HORIZONTAL ALIGNMENT	
	PD from specified centre line	+10 mm : -10 mm
TOL.EXT6.040.8	FORMATION LEVEL	
	PD from specified level	+10 mm : -10 mm
TOL.EXT6.050.8	BARRIER TOP LEVEL	
	PD from specified level	+10 mm : -10 mm
TOL.EXT6.060.8	ABRUPT IRREGULARITIES	
	Abrupt changes of a continuous finished concrete surface	+3 mm : -3 mm

TOL.EXT7 - UNTENSIONED BEAM BARRIERS

MATERIALS

		<u>TOLERANCE</u>
TOL.EXT7.010.8	BASE METAL THICKNESS	
	PD from thickness shown on the Drawings	+0.2 mm : -0.2 mm
TOL.EXT7.020.8	STRIP WIDTH

TOL.EXT8 - ROAD MARKING

THICKNESSES AND TOLERANCES

TOLERANCES

TOL.EXT8.010.8	SCREED MARKINGS	
	PD from specified thickness	+1.0 mm : -1.0 mm
TOL.EXT8.020.8	WIDTH AND LENGTH	
	PD from specified dimension	+10% : -5%

TOL.EXT9 - FENCING, GATES AND GUARD RAILS

FENCING

TOLERANCE

TOL.EXT9.010.8 MATERIALS

PDs for components as defined in Section 2 of
BS 1722 : Part 1 : 1986

- : -

TOL.EXT9.020.8 WORKMANSHIP

1. Position of posts: PD from specified position

75 mm

2. Level of top of posts: PD from specified level

+25 mm : -25 mm

3. Verticality of posts: PD in the height of the post
from plumb

5 mm

PEDESTRIAN GUARD RAILS

TOLERANCE

TOL.EXT9.110.8 ALIGNMENT

PD of line, position and height from that indicated
on Drawings

+10 mm : -10 mm

TOL.FEN - FENCING

TOL.FEN.010.8 GENERAL

Fencing shall comply with the following requirements:

1. The position of posts shall be within 75 mm of the position shown on the Drawings;
2. The level of the top of the posts shall be within 25 mm of the level shown on the Drawings;
3. Posts shall be vertical to within 5 mm in the height of the post.

TOL.FIN1 - PLASTERED AND RENDERED FINISHES

INTERNAL AND EXTERNAL WALL FINISHES

TOLERANCE

TOL.FIN1.010.8

EVENNESS AND PLUMB

PD when measured in any direction with a 1.2 m straight edge for:

- | | |
|---|------|
| 1. Plaster or render to receive mosaic or paint | 3 mm |
| 2. Render to receive glazed wall tiles | 6 mm |

CEILING FINISHES

TOLERANCE

TOL.FIN1.110.8

LINE AND LEVEL

PD from true plane when measured in any direction with a 1.2 m straight edge

3 mm

TOL.FIN2 - PLASTERBOARD**TOLERANCE****TOL.FIN2.010.8****BRITISH STANDARD**PD to fall within the tolerances defined in
BS 8000:Part 8:1989.

As stated

TOL.FIN3 - SCREEDS

TOLERANCE

TOL.FIN3.010.8

LEVEL

PD when measured with a 1.2 m straight edge:

1. From specified level measured in any direction ...

.....

3 mm

2. From specified fall measured in the direction of fall provided that, in any situation, there is no backfall

3 mm

TOL.FIN4 - INSITU WALL AND FLOOR FINISHES

		<u>TOLERANCE</u>
TOL.FIN4.010.8	LEVEL	
	PD when measured with an 1.2 m straight edge:	
	1. From specified level measured in any direction	3 mm
	2. From specified fall measured along the fall provided that in any situation there is no backfall	3 mm

TOL.FIN5 - FLOOR AND WALL TILES AND SLABS

FLOOR TILES AND SLABS

		<u>TOLERANCE</u>
TOL.FIN5.010.8	LEVEL PD from specified fall when measured with a 1.2 m straight edge in the direction of fall provided that, in any situation, there is no backfall	3 mm
TOL.FIN5.020.8	LEVEL OF ADJACENT TILES PD in level of adjacent tiles	1.25 mm
TOL.FIN5.030.8	ALIGNMENT OF JOINTS 1. PD of any tile from general line of joints 2. With a maximum non-alignment of adjacent tiles of	1.25 mm 20% of joint width

WALL TILES

		<u>TOLERANCE</u>
TOL.FIN5.110.8	PLANE PD when measured with a 1.2 m straight edge in any direction	3 mm
TOL.FIN5.120.8	PLANE OF ADJACENT TILES PD in plane of adjacent tiles	1.25 mm
TOL.FIN5.130.8	ALIGNMENT OF JOINTS 1. PD of any tile from general line of joints 2. With a maximum non-alignment of adjacent tiles of	1.25 mm 20% of joint width

MOSAIC TILES

		<u>TOLERANCE</u>
TOL.FIN5.210.8	PLANE PD when measured with a 1.2 m straight edge in any direction	3 mm
TOL.FIN5.220.8	PLANE OF ADJACENT TILES PD in plane of adjacent tiles	1.25 mm

TOL.FIN5.230.8	ALIGNMENT OF JOINTS	
	1. PD of any tile from general line of joints	1.00 mm
	2. With a maximum non-alignment of adjacent tiles of	1.00 mm

TOL.FIN6 - FLEXIBLE SHEET AND TILE FINISHES

		<u>TOLERANCE</u>
TOL.FIN6.010.8	LEVEL	
	PD when measured with a 1.2 m straight edge	
	3 mm

TOL.FIN8 - PROPRIETARY SUSPENDED CEILINGS

INSTALLED CEILING SYSTEM

TOLERANCE

TOL.FIN8.010.8	LINE AND LEVEL	
	PD from true plane when measured with a 1.2 m straight edge in any direction	±3 mm
TOL.FIN8.020.8	ALIGNMENT OF JOINTS	
	PD in width of joints between panels or strips	±3 mm
TOL.FIN8.030.8	DEFLECTION OF MAIN MEMBERS	
	Maximum deflection between points of suspension:	
	1. Spans up to 1200 mm	Span x 1/400
	2. Spans from 1200 mm to 1800 mm	Span x 1/500
	3. Spans over 1800 mm	Span x 1/600

CEILING COMPONENTS

TOLERANCE

TOL.FIN8.110.8	STRUCTURAL MEMBERS AND GRIDS	
	Tolerances not to exceed these specified in Section 2.5 of BS 8290:Part 2:1991 with particular reference to Table 1 for Steel Sections	As stated
TOL.FIN8.120.8	INFILL UNITS	
	PD from manufacturers stated dimensions as specified in BS 8290:Part 2:1991:	
	1. Generally: As Table 3	As stated
	2. Mineral fibre: As Table 4	As stated
	3. Steel tiles and panels formed by means other than pressing: As Table 5	As stated
	4. Steel and aluminium linear strip: As Table 6	As stated

TOL.GIN - GROUND INVESTIGATION, INSTRUMENTATION AND SOIL TESTING

TOL.GIN.010.8 DEPTHS OF EXPLORATION

1. A tolerance of ± 100 mm in length will be permitted on the drilled length of a drill hole;

TOL.GIN.020.8 VERTICAL TOLERANCE

1. No nominally vertical hole shall deviate from the vertical direction by more than 1% of the vertical depth below ground level except that in underwater boreholes or underwater drillholes the tolerance shall be 5%;
2. For inclined drillhole, the inclination shall not deviate from the instructed inclination by more than 2° throughout the length of the hole;
3. Where required by the CM, the verticality and inclination of any hole shall be measured by an approved method.

TOL.GWD - GROUND WATER DRAINAGE AND CONTROL

TOL.GWD.010.8 DRILLING

1. The drillhole entry point shall be positioned within a tolerance of ± 75 mm. Deviation in alignment shall not exceed 1 in 20. Deviation from straight shall not exceed 20 mm in any 3 m length of drillhole.

TOL.MAR - MARINE WORKS

TOL.MAR.010.8 DREDGING

The final surface of dredging shall be within 300 mm of the specified surface.

TOL.MAR.020.8 DEPOSITION OF FILL MATERIAL

1. The final surface of deposition and compaction of fill material, measured perpendicular to the specified surface, shall comply with the following requirements:
 - a. Top surfaces to receive levelling stones shall not be more than 75 mm above, and not more than 250 mm below, the level shown on the Drawings;
 - b. Top surfaces of levelling stones shall be within 25 mm of the specified surface for foundations of structures and shall be within 50 mm of the level shown on the Drawings for submarine outfalls;
 - c. Other top surfaces shall be within 250 mm of the level shown on the Drawings;
2. There shall be no abrupt change in level of the finished surface of reclamation and levelling stones.

TOL.MAR.030.8 PRECAST CONCRETE SEAWALL BLOCKS AND COPINGS

Precast concrete seawall blocks and copings shall be within 25 mm of the position shown on the Drawings. The gaps between adjacent blocks and between successive layers of blocks shall not exceed 20 mm.

TOL.MAR.040.8 TIMBER FENDERING SYSTEMS

1. The dimensions of members of timber fendering systems shall be within 5 mm of the dimensions shown on the Drawings;
2. The levels and positions of timber fendering systems shall comply with the following requirements:
 - a. The top level of blocks for landings and steps shall be within 5 mm of the level shown on the Drawings;
 - b. The top level of other members shall be within 10 mm of the level shown on the Drawings;
 - c. The horizontal position perpendicular to the berthing face of the fendering system shall be within 10 mm of the position shown on the Drawings;
 - d. The horizontal position parallel to the berthing face of the fendering system shall be within 25 mm of the position shown on the Drawings.

TOL.MAR.050.8 RUBBER FENDERS

1. The dimensions of rubber fenders and bolt holes shall comply with the following requirements:
 - a. The bolt hole diameter shall be within 2 mm of the diameter shown on the Drawings;
 - b. The bolt pitch shall be within 4 mm of the pitch shown on the Drawings;
 - c. The height, length and width of rubber fenders shall be within +4% and -2% of the dimensions shown on the Drawings;

-
- d. The thickness of fender sections shall be within +8% and -5% of the thickness shown on the Drawings;
 2. The positions of rubber fenders shall comply with the following requirements:
 - a. The centrelines shall be within 25 mm of the positions on the face of the supporting structures shown on the Drawings;
 - b. The inclination shall not deviate by more than 1 in 50 from the inclination shown on the Drawings.

TOL.MAR.060.8 SUBMARINE OUTFALLS

1. The horizontal alignment of submarine pipelines shall be within 250 mm of the alignment shown on the Drawings;
2. The invert level of submarine outfalls shall be within 50 mm of the level shown on the Drawings;
3. There shall be no abrupt change in alignment or level of the submarine outfall.

TOL.MAS1 - BRICKWORK, BLOCKWORK AND PANEL PARTITIONS

BRICKWORK

TOL.MAS1.010.8 **GENERALLY**

Comply with Table 2 Section 3 of BS 8000:Part 3:1989.

BRICKWORK AND PANEL PARTITIONS

		<u>TOLERANCE</u>
TOL.MAS1.110.8	POSITION ON PLAN	
	PD	±15 mm
TOL.MAS1.120.8	LENGTH	
	PD for:	
	1. Up to 5 m	±15 mm
	2. 5 m to 10 m	±20 mm
	3. 10 m to 20 m	±25 mm
	4. Over 20 m	±30 mm
TOL.MAS1.130.8	HEIGHT	
	PD for:	
	1. Up to 3 m	±15 mm
	2. 3 m to 6 m	±20 mm
	3. Over 6 m.....	±25 mm
TOL.MAS1.140.8	LEVEL OF BED JOINTS	
	PD in any 5 m for:	
	1. Up to 5 m	±10 mm
	2. 5 m to 10 m	±15 mm
	3. Over 10 m	±25 mm
TOL.MAS1.150.8	THICKNESS OF BED JOINTS	
	PD	±6 mm
TOL.MAS1.160.8	STRAIGHTNESS	
	1. PD in any 1.2 m	±6 mm
TOL.MAS1.170.8	VERTICALITY	
	1. PD in any 1.2 m	±6 mm

TOL.MAS1.180.8 SETTING-OUT OF PRE-INSTALLED JUNCTION/BS 4662 BOXES ON WALLS

The deviation of the installed position of pre-installed junction/BS 4662 boxes from the specified position as shown on the Drawings with the following considerations:

1. In general, the sockets outlets and lighting switches etc. shall be at the same level in the same room. PD for vertical levels of boxes designed at the same level on the same panel wall:
2. The installed position of boxes after taking the above tolerance into consideration shall not contravene the requirements of the position of switches/sockets as stipulated in the Design Manual - Barrier Free Access 1997; nor have conflict with other installations such as skirting, door frame, etc.;
3. Deviations exceeding the tolerance under special site condition shall be subject to the approval of the CM.

±3 mm

OPENINGS IN BRICKWORK, BLOCKWORK AND PANEL PARTITIONS**TOLERANCE****TOL.MAS1.210.8 OPENINGS FOR DOORS, WINDOWS ETC.**

PD in height and width

±10 mm

MANUFACTURING OF PANEL WALL PARTITIONS**TOLERANCE****TOL.MAS1.310.8 MANUFACTURING OF PANEL WALL PARTITIONS**

PD in:

- | | |
|--------------------|---------|
| 1. Length | ±5 mm |
| 2. Thickness | ±1.5 mm |
| 3. Flatness | ±3 mm |
| 4. Width | ±2 mm |

TOL.MAS2.350.8 STRAIGHTNESS

PD in any horizontal 2 m	±3 mm
--------------------------------	-------

TOL.MAS2.360.8 VERTICALITY

PD in any 1.2 m	±3 mm
-----------------------	-------

Note: The tolerance on the verticality is measured in relation to the true vertical from the base of the wall and is not cumulative.

TOL.MAS2.370.8	WINDOW AND DOOR OPENINGS	
	1. Width along wall: PD up to 3 m	±6 mm
	2. Height: PD up to 3 m	±6 mm

TOL.MEW - METALWORK

TOL.MEW.010.8 GENERAL

Handrailing, ladders, stairs and flooring shall comply with the following requirements:

1. The position and height of handrailing shall be within 10 mm of the specified position and height;
2. The level of the top rung of ladders and the top tread of stairs shall be within 75 mm of the specified level;
3. The level of flooring and curbs shall be within 3 mm of the specified level.

TOL.MRY - MASONRY WALLING

TOL.MRY.010.8 GENERAL

1. Rubble stone walling shall comply with the following requirements:
 - a. The position on plan shall be within 25 mm of the specified position;
 - b. The length shall be within 25 mm of the specified length;
 - c. The height shall be within 25 mm of the specified height;
 - d. The level of bed joints shall be within 25 mm of the specified level in any 5 m length;
 - e. The walling shall be straight to within 25 mm in any 5 m length;
 - f. The walling shall be vertical to within 20 mm in any 3 m height.
2. Ashlar stone walling shall comply with the following requirements:
 - a. The position on plan shall be within 15 mm of the specified position;
 - b. The length shall be within 15 mm of the specified length;
 - c. The height shall be within 10 mm of the specified height;
 - d. The level of bed joints shall be within 10 mm of the specified level in any 5 m length;
 - e. The walling shall be straight to within 15 mm in any 5 m length;
 - f. The walling shall be vertical to within 15 mm in any 3 m height.

TOL.PIL1 - PILING AND FOOTINGS

ALL PILE TYPES

TOLERANCE

TOL.PIL1.010.8	POSITION ON PLAN Except Type 5 Piles, PD in plan of piles from their designed positions measured at the working level of the piling rig:	75 mm
TOL.PIL1.020.8	VERTICALITY Except Type 5 Piles, PD from the vertical axis of the pile through the centroid of the cross-sections at the cut-off level to any level of the finished pile:	1 in 75
TOL.PIL1.030.8	OUT OF EXACT INCLINATION PD from exact inclination, where specified, measured from the centre of pile:	2°
TOL.PIL1.040.8	CUT-OFF LEVELS PD from specified top level of pile heads:	+20 mm : -20 mm
TOL.PIL1.050.8	DIAMETER OF CAST INSITU PILES Minimum proportion of specified diameter:	97%

PILE TYPES 1A AND 1B

TOLERANCE

TOL.PIL1.110.8	DIMENSIONAL ACCURACY FOR SOLID NON-CIRCULAR SECTION PD:	+6 mm : -6 mm
TOL.PIL1.120.8	DIMENSIONAL ACCURACY FOR HOLLOW CYLINDRICAL SECTION 1. External diameter: 2. Internal diameter: 3. Thickness:	+10 mm : -6 mm - : -6 mm +25 mm : -6 mm
TOL.PIL1.130.8	STRAIGHTNESS PD:	1 in 500

TOL.PIL1.140.8 SUPERFICIAL CRACKS

Limits which may be tolerated at the discretion of the CM provided that the Contractor can prove that the cracks will not develop further:

- | | |
|--|--------|
| 1. Crack depth: Not deeper than: | 1 mm |
| 2. Crack width: Not wider than: | 0.2 mm |

PILE TYPE 3**TOLERANCE****TOL.PIL1.160.8 DIAMETER OF PERMANENT LINERS**

Minimum proportion of specified diameter:	99%
.....	

PILE TYPE 4**TOLERANCE****TOL.PIL1.210.8 STRAIGHTNESS OF COMPLETE PILE**

PD from straightness of the complete pile:

- | | |
|-------------------------------------|-----------|
| 1. Along a 3 m straight edge: | 3 mm |
| 2. Overall limit: | 1 in 1000 |

PILE TYPE 5**TOLERANCE****TOL.PIL1.310.8 BORING**

Do not drill holes oversize by more than:	20 mm
---	-------

TOL.PIL1.305.N POSITION ON PLAN

PD in plan of piles from their designed positions measured at the working level of the piling rig:

.....	15 mm
-------	-------

Subject to justification and Approval, the value may be increased to a value not exceeding 75 mm.

TOL.PIL1.330.8 VERTICALITY

PD from the vertical axis of the pile through the centroid of the cross-section at the cut-off level to any level of the finished pile:

1 in 100

TOL.PLU2 - SANITARY APPLIANCES

TOLERANCE

TOL.PLU2.010.8 HORIZONTALITY OF INSTALLATION

PD from horizontal plane measured across width of
appliance

± 3 mm

TOL.PSC - PRESTRESSING CONCRETE**TOL.PSC.010.8 TOLERANCES**

The lines of prestressing sheaths shall be within 5 mm of the specified line.

TOL.SLO - SLOPE TREATMENT WORKS

SOIL-CEMENT FILLING

TOL.SLO.010.8 COMPACTION

1. The tolerance on the optimum moisture content percentage shall be ± 3 .

SOIL NAILING

TOL.SLO.110.8 GENERAL

The installation of soil nails shall comply with the following dimensional tolerances:

1. The permitted deviation of drillholes shall be within $\pm 2^\circ$ to the specified vertical and horizontal alignments;
2. The nominal diameter of the centralizers shall not differ from the specified diameter of the drillhole by more than 10mm.

TOL.STR1 - STRUCTURAL STEEL

FABRICATION OF STEELWORK

TOL.STR1.010.8 CRITICAL DIMENSIONS AFFECTING REPETITION OR INTERCHANGEABILITY OF UNITS

Carry out fabrication so that the critical dimensions, when measured by a tape calibrated at 20°C, comply with the tolerances given in the Table below:

Dimension Measured	Tolerance for Single Element	Tolerance on overall dimension of assembled system of more than one
Not exceeding 5 m	±3 mm	±3 mm
Exceeding 5 m but not exceeding 10 m	±5 mm	±6 mm
Exceeding 10 m but not exceeding 15 m	±5 mm	±10 mm
Exceeding 15 m	±10 mm	±10 mm

TOL.STR1.020.8 DETAILED DIMENSIONS

Comply with the fabrication tolerances in the following British Standard and Code of Practice:

1. BS 5400:Part 6:1980 for plates and sections in bridgework;
2. The Code of Practice for the Structural Use of Steel 2011 for hot rolled sections and cold rolled sections in building.

ERECTION OF STEELWORK

TOLERANCE

TOL.STR1.110.8 CAST-IN FOUNDATION BOLTS

Tilt of bolts to be not more than 1 in 40 from specified line.

TOL.STR1.120.8 ERECTION TOLERANCES

After lining, levelling, plumbing and making the permanent connections:

1. Level of the top of base plates and level of the lower end of vertical or raking components in a pocket: PD from specified levels: ±10 mm
2. PD from line of vertical or raking components other than portal frames:
 - a. 1 in 600
 - or
 - b. From specified line in every direction: 10 mm

3. PD from line of vertical or raking components . in portal frames:	
a.	1 in 600
or	
b. From specified line normal to the plane of the frame:	±10 mm
4. The position and level of components connected with other components: PD from the specified position and level at point of connect:	5 mm
5. The difference in level between adjacent sloping or horizontal components connected by a deck slab: PD from specified difference in level:	±10 mm
.....	

TOL.STW - STEELWORK

TOL.STW.010.8 FABRICATION TOLERANCES GENERALLY

Fabrication tolerances for steelwork shall comply with BS 5950:Part 2:1992, Sub-section 7.2 as appropriate.

TOL.STW.020.8 FABRICATION TOLERANCES FOR BRIDGEWORKS

Fabrication tolerances shall comply with BS 5400:Part 6:1980, Clause 4.2.

TOL.STW.030.8 FOUNDATION BOLTS

The position of cast-in foundation bolts at the top of base plates shall be within 3 mm of the specified position. The position of foundation bolts in bolt pockets at the top of base plates shall be within 5 mm of the specified position. The line of bolts shall not be tilted from the specified line by more than 1 in 40.

TOL.STW.040.8 ERECTION TOLERANCES

After lining, levelling, plumbing and making the permanent connections, steelwork shall be erected to within the following tolerances:

1. The position in plan of vertical components at the base shall be within 10 mm of the specified position;
2. The level of the top of base plates and the level of the lower end of vertical or raking components in a pocket based shall be within 10 mm of the specified level;
3. The thickness of bedding shall be within one-third of the nominal thickness or 10 mm, whichever is less, of the specified nominal thickness;
4. The line of vertical or raking components other than in portal frames shall be within 1 in 600 and within 10 mm of the specified line in every direction;
5. The line of vertical or raking components in portal frames shall be with 1 in 600 and within 10 mm of the specified line normal to the plane of the frame;
6. The position and level of components connected with other components shall be within 5 mm of the specified position and level relative to the other components at the point of connection;
7. The position of components supported on a bearing shall be within 5 mm of the specified position relative to the bearing along both principal axes of the bearing;
8. The difference in level between adjacent slopping or horizontal components connected by a deck slab shall be within 10 mm of the specified difference in level.

TOL.WSP - WATER SUPPLY PIPEWORK

TOL.WSP.010.8 LINE AND LEVEL

The line and level of pipelines for water supply pipeworks shall be within 25 mm of the specified line and level.

DEM1 DEMOLISHING STRUCTURES

GENERAL

DEMOLITION SUB-CONTRACTOR

DEM1.G010.8 INFORMATION ON DEMOLITION SUB-CONTRACT

In the event that parts of the demolition works are to be sub-contracted in accordance with **PRE.B6.035**, submit with the tender the following information:

1. Letter of intent from the proposed sub-contractor whom the tenderer intends to employ for the Contract should the tenderer be awarded the Contract, indicating his willingness to carry out the proposed parts of the demolition works;
2. The names of the directors or sole proprietor and site representatives of the proposed sub-contractor;
3. The activity and the scope of the proposed sub-contract.

DEM1.G020.8 CONDITIONS ON DEMOLITION SUB-CONTRACT

1. In the event that parts of demolition works are to be sub-contracted in accordance with **PRE.B6.035**, incorporate the following conditions into the sub-contract:
 - a. The activity and the scope of the sub-contract;
 - b. The sub-contractor is not allowed to sub-contract the demolition works;
 - c. The sub-contractor is not allowed to sub-contract more than one tier the following works:
 - i. Scaffolding;
 - ii. Mechanical handling and lifting (for tower crane only);
 - iii. Mechanical plant and equipment for demolition works.
 - d. A probity clause shall be included in the sub-contract such that:

"If the sub-contractor or any of his agents or employees are found to have offered or given advantage, gratuity, bonus, discount, bribe or loan of any sort to any agent or employee of the Contractor, Hong Kong Housing Authority or Housing Department, the Contractor shall at liberty forthwith terminate the employment of the sub-contractor under the sub-contract. The Contractor, Hong Kong Housing Authority or Housing Department shall hold the sub-contractor liable for any loss or damage which the Contractor, Hong Kong Housing Authority or Housing Department may thereby sustain."
2. Before execution of the sub-contract works, submit to the CM a signed copy of the sub-contract or written confirmation signed by the Contractor and the sub-contractor confirming that the conditions stated in sub-clause (1) above have been included into the sub-contract.

DESIGN

GENERAL

DEM1.D010.8 EXISTING INFORMATION

1. The information on the structure to be demolished as contained in the Contract is given in good faith and without prejudice to the Contractor's liability under the Contract;
2. The demolition plan for the preparation of the method statements, which is issued as a reference for adoption or proposed deviation as per DEM1.D220, is specified in **Project Specific Specification**.

DEM1.D020.8 CONTRACTOR'S RESPONSIBILITY

Accept sole responsibility for the execution of the demolition works including but not limited to the preparation of the method statements as specified in DEM1.D220 notwithstanding that such method statements may have followed the demolition plan which is for reference only.

DEM1.D030.8 STANDARDS AND STATUTORY REQUIREMENTS

1. Comply with all requirements relevant to demolition works issued by the Government of HKSAR and/or statutory authorities;
2. Where this Specification includes provisions additional to, or more stringent than those of the Building Regulations, the provisions of this Specification will prevail overall.

DEM1.D040.8 NON-COMPLIANCE

1. In the event of non-compliance with the restrictions specified regarding the method of demolition to be employed and the sequence of operations to be followed, an Instruction to cease work may be issued by the CM;
2. Bear any extra time or cost compensation in respect of or resulting from such Instruction to cease work.

DEM1.D050.8 REGISTERED STRUCTURAL ENGINEER & REGISTERED GEOTECHNICAL ENGINEER

1. Appoint a Registered Structural Engineer (RSE) registered under Buildings Department for the preparation and endorsement of the method statements, with drawings and design calculation, and any other submissions as required by this Specification;
2. The duties and roles of the RSE include but not limited to:
 - a. Take up the full design responsibility for method statements and all related drawings and calculation as required under this Specification;
 - b. Take up the role of Contractor's Representative and the highest grade TCP in the Contractor's Stream under SP;
 - c. Check that assumptions made in the design of temporary works and method statements are validated on Site;

-
- d. Prepare a risk assessment report with the Safety Officer including an inspection schedule for all staff such as RSE, site engineer, Safety Officer, site agent, site supervisor / foreman on all critical activities in demolition work;
 - e. Pay regular site visits for proper control of the works and submit reports after each visit to certify the work is safe;
 - f. Carry out inspection on other activities which, in his professional judgement, are critical and require close supervision.
3. The frequency of RSE's visits shall be a minimum of two visits per each month;
 4. In case of change of RSE, the new RSE has to endorse and re-submit the method statements prepared by the former RSE and take up the role of Contractor's Representative and the highest grade TCP in the Contractor's Stream under SP;
 5. Appoint a Registered Geotechnical Engineer (RGE) registered under Buildings Department for the preparation and endorsement of the geotechnical report / supporting documentation for the submissions as per above sub-clause (1).

SURVEY AND PREPARATORY WORK

DEM1.D110.8 SURVEY

Prior to commencement of Work,

1. Visit the Site and inspect the appropriate drawings and demolition plan as issued by the CM to ascertain the extent and scope of the demolition works required;
2. Identify demolition procedures for any unconventional structural elements.

DEM1.D120.8 EXISTING SERVICES

Before commencement of demolition works,

1. Locate and identify position of existing services affected by the works;
2. Ensure all statutory authority's installations have been safely disconnected and associated fittings and equipment have been removed;
3. Be responsible for liaison with the relevant Government Departments and utilities companies for disconnecting existing utilities and services within the Site. Allow sufficient time in the programme for the utilities and services disconnections.

DEM1.D130.8 SURVEY ON MATERIALS WITH POTENTIAL DANGER

1. Within 14 days following the notified date for the commencement of the Works, carry out survey on the presence of wastewater, hazardous materials, matters arising from toxic chemicals, etc. and possible presence of materials which can contribute to contaminations on the environment;
2. Submit method of removal for CM's approval within 14 days in case of any of these materials being identified.

DEM1.D140.8 SURVEY ON MATERIALS TO BE COLLECTED/RECYCLED

1. Carry out a survey before the demolition process to ascertain the types and quantities of materials to be collected/recycled as specified in **DEM1.M025**;
2. Identify also the recovery/recycling companies or organizations for recovery and recycling of the materials other than those specified in **DEM1.M025**;
3. Submit the survey record for CM's approval within 21 days from the notified date for the commencement of the Works.

SUBMISSIONS

DEM1.D210.8

SUBMISSIONS PRIOR TO CONSENT APPLICATION

1. Submit three sets of the following documents to CM for approval at such date which shall be a date within 14 days after the notified date for commencement of the Works and minimum 42 days before application for consent of demolition works under **DEM1.D230**:
 - a. SP for the Contractor's Stream as specified in **DEM1.W110**;
 - b. Method statements as specified in **DEM1.D220**.
2. Allow a minimum of 42 days for the first submission and a minimum of 37 days for any subsequent re-submission required for obtaining the Approval;
3. Allow sufficient time in the programme of Works for obtaining the said Approval and subsequent re-submissions.

DEM1.D220.8

METHOD STATEMENTS

1. Submit the method statements prepared and endorsed by the RSE and RGE according to **DEM1.D050** for CM's approval. Details of the method statements shall be as specified in **Project Specific Specification**;
2. The method statements shall comply with this Specification and all statutory requirements relevant to demolition works;
3. The method statements shall also comply with the following codes:
 - a. Code of Practice for Demolition of Buildings 2004 (CoPDem) issued by Buildings Department;
 - b. Code of Practice for Bamboo Scaffolding Safety (CoPScaffold) issued by Labour Department;
 - c. Code of Practice for Site Supervision 2009 (CoPSS) issued by Buildings Department.

DEM1.D230.8

CONSENT TO COMMENCE DEMOLITION WORKS

1. Submit the supporting documents specified in **Project Specific Specification** and allow a minimum of 21 days for granting the consent to commence demolition works;
2. Do not commence demolition works without a written consent from the CM and until all precautionary measures as stated in **DEM1.W210** are complete.

DEM1.D240.8

COMMENCEMENT OF DEMOLITION WORKS

Notify the CM and submit Form ICU 10 after obtaining the consent and before commencing the demolition works.

DEM1.D250.8

COMPLETION OF DEMOLITION WORKS

1. For Contract without phased completion, submit Form ICU 14A to notify the CM of the completion of the demolition works as detailed in the demolition plan at least 18 days prior to the completion of the demolition works;
2. For Contract with phased completion and for each Section as per **PRE.B4.080**, submit Form ICU 14A to notify the CM of the completion of the demolition works as detailed in the demolition plan at least 18 days prior to the completion of the demolition works in that Section.

MATERIALS

MATERIALS ARISING FROM THE DEMOLITION WORKS

DEM1.M010.8 MATERIALS NOT REQUIRED FOR RE-USE

Unless otherwise specified at **DEM1.M020**, all materials arising from demolition including electric light fittings, fans, water heaters etc. and all playground equipment, which are to be removed from Site as work proceeds, are property of the Contractor.

DEM1.M020.8 MATERIALS REQUIRED BY THE AUTHORITY

Materials which are remained the property of the Authority are specified in the **Project Specific Specification**.

DEM1.M025.8 MATERIAL TO BE COLLECTED/RECYCLED

Materials to be collected/recycled are specified in the **Project Specific Specification**.

DEM1.M030.8 HARDCORE

Brick rubble or other hard materials as sub-clause (2) of **EAR1.M240** arising from the demolition may be re-used as hardcore.

DEM1.M040.8 EXCAVATED MATERIALS SUITABLE FOR FILLING

1. Unless certified otherwise by the CM, all materials excavated are deemed suitable for filling purposes;
2. The CM's decision regarding the suitability of excavated materials for filling purposes applies only to this Contract and only to the extent that such opinion is not subsequently changed.

WORKMANSHIP

GENERAL

DEM1.W010.8

SEQUENCE

1. Do not proceed with the demolition of the building and associated structures before all reusable and recyclable materials as specified in **DEM1.M025** are removed from the building or the structure;
2. Unless otherwise approved by the CM, carry out demolition work on a floor to floor basis commencing at roof/top floor level as applicable;
3. Do not dismantle any existing steel props forming part of the structural strengthening works in a floor prior to the demolition of that floor;
4. Ensure all operators and workers involved understand clearly the method and sequence of demolition. Draw sketches with explanation in Chinese illustrating the work sequences and post them in a conspicuous position on Site.

DEM1.W020.8

METHODS OF DEMOLITION

1. Use only hand held equipment for the salvage of reusable and recyclable materials from structures;
2. Use of the following demolition methods will not be permitted:
 - a. 'Swinging ball';
 - b. 'Drop ball';
 - c. 'Blasting'.

SUPERVISION

DEM1.W110.8

SUPERVISION PLAN

1. The SP shall comply in all respects with the requirements stated in the TMSP and CoPSS;
2. Complete and submit Form ICU206 for the SP for demolition works under the Contractor's Stream in accordance with TMSP, and the CoPSS;
3. The submitted SP shall include the following additional safety supervision requirements at critical stages of the works unless otherwise approved by the CM:

Critical Stages of the Works	Contractor's Stream					
	AS	CR/T5 ^{Note}	T4	T3	T2	T1
Cantilevered Structures	Bi-weekly	Bi-weekly	Full Time	Full Time	-	Full Time
Factory Block	Bi-weekly	Bi-weekly	Full Time	Full Time	-	Full Time

Note: As specified in **DEM1.D050**, the RSE shall take up the role of Contractor's Representative (CR) and the highest grade TCP in Contractor's Stream under SP.

DEM1.W120.8 TECHNICALLY COMPETENT PERSONS

1. Appoint TCPs under the Contractor's Stream for demolition works as per the submitted Supervision Plan required in **DEM1.W110** for the duration of the Contract;
2. The appointed TCP shall oversee the entire process of demolition works and whose duties include but not limited to:
 - a. Inspect precautionary measures;
 - b. Ensure effectiveness of propping system;
 - c. Prevent overloading of floors.
3. Post details of appointed TCPs in the specified Form ICU20 in a prominent position adjacent the Works.

DEM1.W130.8 FLAGMAN

During removal of demolition material arrange for a flagman to be in attendance at each site entrance and exit used for this purpose.

DEM1.W140.8 SITE VIDEO RECORDING SYSTEM

1. Provide, operate and maintain, including all necessary cables, wirings, lightings and other accessories, a video recording system to record the entire demolition process with the following essential features:
 - a. The video cameras used in the system should be of high resolution, lowlight and colour type;
 - b. Power backup should be provided to cater for accidental breakdown of the power supply to the system;
 - c. Videos captured by the system shall be recorded continuously without break unless agreed by the CM; and
 - d. Videos shall be captured in a format acceptable to CM.
2. Install a minimum number of video cameras per block at strategic locations as specified in **Project Specific Specification**. Re-locate the video cameras from time to time to suit the progress of the demolition works as instructed by the CM;
3. Securely protect the video cameras from being damaged or blocked so that the entire demolition process including movement of debris and the overall sequences of demolition can be recorded;
4. Design and construct all necessary temporary works, including any supporting frames and protections, for the video cameras and their accessories, even at high level;
5. Provide the software and hardware for CM's viewing the recorded videos and keep the videos for at least 14 days;
6. Post sufficient notices at conspicuous positions to notify the workers and staff about the purpose of video recording system in accordance with Data Protection Principles set out in the Personal Data (Privacy) Ordinance.

SAFETY AND PROTECTION

DEM1.W210.8

PRECAUTIONARY MEASURES

1. Carry out necessary surveys as the demolition proceeds to detect hazards resulting from the activities and inform the CM forthwith;
2. In the salvage of reusable and recyclable materials, do not use cutting torches until the work area is cleared of flammable materials. Maintain portable fire-suppression devices during flame-cutting operations, and maintain adequate ventilation when using cutting torches;
3. Do not commence demolition works until the following procedures and works are complete:
 - a. Removal of the reusable and recyclable materials as specified in **DEM1.M025** from structures;
 - b. Granting of written consent by the CM as specified in **DEM1.D230**;
 - c. Erection of hoardings, covered walkways, etc as specified in **PRE.B10.710** to **PRE.B10.730**;
 - d. Erection of shoring, strutting, protective screening etc as specified in **PRE.B8.875**, **DEM1.W220** and **DEM1.W230**;
 - e. Removal of all asbestos containing materials and provision of associated protective works as specified in Worksection DEM2 in individual building blocks or structures prior to the demolition of those individual building blocks or structures;
 - f. Provision of water supply at points of demolition works action as specified in **PRE.B8** and to CM's satisfaction;
 - g. Installation of debris chutes outlet enclosures as specified in **PRE.B8** and to CM's satisfaction;
 - h. Disconnection and termination of all utility services as specified in **DEM1.D120**;
 - i. Sealing all sewers and drainage connection to prevent building debris, soil and etc. from entering public sewers and drains.

DEM1.W220.8

SHORING AND STRUTTING

1. Provide, maintain, alter and adapt all temporary supports and strutting of adequate strength to support walls, floors, roofs etc and ensure safety of the public, operatives and adjoining property;
2. Submit details of the proposed methods of support designed by Registered Structural Engineer for CM's approval unless specified otherwise by the CM;
3. Remove all temporary supports on completion and make good to works disturbed.

DEM1.W230.8

PROTECTION OF ADJOINING AREAS

1. Protect adjoining areas from the risk of falling debris with a protective screen enclosure encasing the whole building to be demolished;
2. Protect adjoining areas from the risk of fire by the following:
 - a. Provide and properly maintain a sufficient number of portable fire fighting appliances during the course of demolition works: minimum 1 fire extinguisher and 2 buckets of sand in each staircase on each floor;

-
- b. Provide and maintain the water supply including the installation of water tank, pump or apparatus as necessary for sprinkling the working floor continually to suppress risk of fire when flame cutting is carried out within 5 m from the scaffolding; and
 - c. Provide full time supervision by a competent supervisor when flame cutting is carried out within 5 m from the scaffolding.
 3. Employ a Registered Structural Engineer to prepare design and method statement for scaffolding, catch platform, covered walkway with steel catch platform, protective canopy, etc. for submission to CM's approval. Their design and construction shall include but not limited to:
 - a.
 - i. Unless otherwise specified in **Project Specific Specification**, construct screen with ordinary tarpaulin sheets supported by adequately sized bamboo scaffolding or other framework and erected according to the Construction Sites (Safety) Regulations and the Code of Practice for Bamboo Scaffolding Safety (CoPScaffold);
 - ii. Provide fire-retardant tarpaulin sheets instead of ordinary tarpaulin sheets to the faces of the blocks as specified in **Project Specific Specification**;
 - iii. The fire-retardant tarpaulin sheets shall be light weight and constructed of fire retardant materials meeting one of the following requirements:
 - Class B material as specified in BS 5867; or
 - Flame retardant test for certain items, light weight cloths methods, provided by the Fire Retardant Regulations for Protective Canvas for Construction, Japan Ministerial Ordinance of the Ministry of Home Affair; or
 - Any equivalent standard criteria or testing approved by the CM.
 - b.
 - i. Unless otherwise specified in the **Project Specific Specification**, construct bamboo scaffolding in single row;
 - ii. Construct bamboo scaffolding in double row for the faces of the blocks as specified in **Project Specific Specification**.
 - c. Maintain height of screen at a minimum level of 1000 mm above the structure being demolished;
 - d. Construct screen in 3 layers, with minimum overlapping width of 300 mm, and fix screen to the frame at regular intervals - the innermost net of minimum 3.5 mm diameter heavy duty nylon (maximum mesh grid opening 50 mm), tarpaulin sheet and the outermost nylon net of minimum 1.0 mm diameter (maximum mesh grid opening 20 mm), all materials use shall resist ultra-violet light deterioration;
 - e. For scaffoldings higher than 15 m above the ground floor level, provide steel brackets anchored to the existing structure or other support system at interval of not more than 15 m to support the scaffolding;
 - f. Tie scaffolding to the buildings at intervals of not more than 4 m in both horizontal and vertical directions to firm supports to guard against storms / typhoon. Check ties effectively restraining scaffolding at all times, particularly before and after storms / typhoons;

- g. Dismantling of the scaffolds shall coincide with the demolition progress. When the wall ties are disconnected due to the demolition of the building structure, the unsecured section of the scaffoldings shall be removed accordingly. In all times, the unbraced sections shall not be higher than 2 m from the nearest anchor;
- h. Inspect and reinstate the ties for scaffolding if any of the ties are fixed onto materials or fixtures specified in **DEM1.M025**.
4. Provide additional protective canopy for blocks close to the streets as specified in **Project Specific Specification**;
5. Carry out vibration monitoring at locations specified by the CM during demolition and the peak particle velocities at these locations specified shall not exceed 15 mm/sec for prolonged vibration caused by mechanical demolition;
6. Maintain safe ingress and egress for adjoining properties at all the times.

DEM1.W240.8**CATCHFAN**

1. Construct catchfan as specified in **Project Specific Specification** to prevent fall of demolition debris around perimeter of building under demolition;
2. Construct catchfan at a vertical distance of not more than 10 m below the working floor;
3. Erect sloping catchfan with a horizontal extension of at least 1500 mm from the exterior face of the scaffold;
4. The typical angle of inclination shall be 20° to 45° from the horizontal plane.

DEM1.W250.8**SUPPORTING EXISTING STRUCTURES**

1. Support existing structures as necessary during cutting of new openings or replacement of structural members;
2. Prior to commencement of works, submit details of all intended arrangements for structural support designed by Registered Structural Engineer for CM's approval;
3. Do not remove supports until new work is capable of carrying all loads.

DEM1.W260.8**PARTLY DEMOLISHED STRUCTURES**

Leave the Site and partly demolished structures in a safe condition at the end of each day's work. No accumulation of debris, particularly at working floors and at ground floor, which causes excessive pressure on the floors, slopes, retaining structures, hoardings/covered walkways and walls of adjoining buildings.

DEM1.W270.8**WEATHERPROOFING RETAINED AREAS OF PARTIALLY DEMOLISHED BUILDINGS**

1. Protect retained building structure and interiors exposed during course of demolition works with a temporary weather-tight screen erected 1000 mm back from perimeter edge of floor;
2. Construct screens with close boarding fixed to framing and faced outside with roofing felt of an Approved type;
3. Cover the exposed floor beyond the screening with roofing felt of similar type to that used to face screens;
4. Form a waterproof seal between floor and screen;
5. Construct doors in the screens and fix with secure fastenings and hanging devices as necessary to provide authorised access.

DEM1.W280.8 PREVENTION OF OVERLOADING

1. Do not overload the structure under demolition with the reusable and recyclable materials, demolition plant and/or resulting debris;
2. Provide temporary shoring and strutting in accordance with the demolition plan or Approved method statement;
3. Bear all costs of temporary shoring or strutting required;
4. Maximum weight of mobile equipment on suspended floors is not to exceed 11,600 kg. The use of plants heavier than 11,600 kg are subject to the requirements of sub-clause (2) above and CM's approval;
5. Unless approved by the CM, the minimum number of consecutive floors required to distribute mobile equipment loading through popping is 5;
6. Unless approved by the CM, the minimum number of consecutive floors required to distribute localized loading from temporary ramp through propping is 5;
7. Maximum spacing of steel props in each direction is 1.2 m;
8. Use steel props of minimum bearing capacity 25 kN (45 kN for local area under temporary ramp);
9. Secure and wedge tight top and bottom supports of props. Fix bracings/ties to the props to provide lateral restraints in at least two directions;
10. Do not allow mobile equipment to move to within 2 m of the building edge, 1 m of any floor opening or on to any cantilevered structures;
11. Provide adequate spreader for props bearing on ground, where necessary, to avoid any undue settlement.

DEM1.W290.8 OVERHEAD WIRES

Prevent damage to overhead wires during demolition operations.

DEM1.W300.8 RISK OF FIRE OR EXPLOSION

Take precautions to prevent fire or explosion from gas or vapour release, electricity or any other source, especially when removing tanks or pipes which may have contained flammable liquids or gases.

DEM1.W310.8 DAILY SITE INSPECTION IN THE MORNING

1. Do not commence any demolition works on each day unless the daily morning site inspection has been carried out by the Safety Officer and the TCP(s) specified in the SP;
2. Submit to CM a plan, including the inspection route(s), check list(s) and the name of Safety Officer and TCP(s), for carrying out the daily morning site inspection;
3. Revise the plan from time to time to suit the actual site progress and resource.

DEM1.W320.8 INDUCTION TRAINING

1. Implement a site specific induction training system to ensure that all workers and machine operators fully understand the demolition sequences and precautionary measures before allowing them to work on Site;
2. Keep a proper record of the trained workers/operators and submit to CM monthly.

DEM1.W330.8 CLEAR EMERGENCY ACCESS

Maintain at all times at least one clear emergency access at the working floor during demolition for the safe passage of all personnel.

DEM1.W340.8 ROUTINE DAILY SITE INSPECTION BY CM

During demolition works, CM may carry out routine site inspection at any time during each working day. For safety reason, the demolition works, in particular those on working floors, may be required to be temporarily suspended if instructed by CM. Allow time and cost for the routine site inspection of CM. No claim whatsoever will be entertained for the interruption, if any, of the demolition works.

DEMOLITION WORKS**DEM1.W410.8 SORTING PROCESSING AND REMOVAL OF DEMOLITION MATERIAL**

1. Submit a method statement to the CM indicating proposed sorting and processing method;
2. Unless specified otherwise, sort and process the materials to be collected or recycled arising from the demolition works;
3. Separate out all timber, steel, rubbish, materials to be collected/recycled as specified in **DEM1.M025** and other decomposable material;
4. Arrange for collection and removal of the materials to be collected/recycled off site in accordance with their types as specified in **DEM1.M025**;
5. Break down large sized demolition fragments of building debris to 250 mm maximum size all round;
6. Remove materials arising from demolition from site as work proceeds; and
7. Submit the name of recycle collection companies and their collection receipt for record.

DEM1.W420.8 DISMANTLING AND STORAGE OF MATERIALS REQUIRED BY THE AUTHORITY

Carefully dismantle and remove to store materials specified at **DEM1.M020**.

DEM1.W430.8 UNDERGROUND FEATURES

Report to CM details of any underground tanks, wells etc discovered during demolition works and await his Instructions.

DEM1.W440.8 DISUSED DRAIN AND MANHOLES

Allow disused drains to vent built-up gases before proceeding with works below ground level as follows:

1. Pipework: plug ends of disused drains by filling bore with 15/20 grade concrete 150 mm or diameter of pipe if greater;
2. Manholes: plug ends of pipes as sub-clause (1) above. Break up top 300 mm of chamber and fill void with hardcore.

DEM1.W450.8 SORTING AND REMOVAL OF EXCAVATED MATERIAL

1. Sort suitable and unsuitable materials into separate temporary spoil heaps in locations agreed with the CM;

-
2. Remove unsuitable materials from site as work proceeds.

DEM1.W460.8 FILLING VOIDS

1. After excavation, backfill and compact voids with suitable material such as Approved excavated material and/or general filling material as specified in EAR1;
2. Level to adjacent paving level with compacted hardcore 100 mm thick;
3. Do not use unsuitable materials such as salvaged materials or debris arising from demolition for backfilling;
4. The opinion of the CM as to the suitability of filling materials applies to the Contract only and only to the extent that such opinion is not subsequently changed.

DEM1.W470.8 LEVELLING

Unless otherwise Instructed, level off the site to the satisfaction of CM on completion of the work.

DEM1.W480.8 REQUIREMENT FOR STUDIES DURING CONTRACT PERIOD

1. Carry out as instructed structural monitoring, non-destructive testing, concrete cores extraction, concrete sampling and exposures, and partial or full cutting of reinforcement bars;
2. Provide adequate water, electricity supply and temporary falsework;
3. Construct temporary falsework capable of sustaining the self-weight of the canopy for designated area underneath first floor canopy, as instructed by CM.

DEM1.W490.8 STRUCTURE SUPPORTING GROUND

1. Where adjacent land or building may be affected, submit temporary support details prepared by Registered Structural Engineer for CM's approval;
2. Submit detailed temporary support system prepared by Registered Structural Engineer for CM's approval where the retaining structure is:
 - a. Higher than 3 m in height; and
 - b. Liable to affect any road, building, structure, slope steeper than 30° or water mains 75 mm in diameter or greater, the affected area being defined as within the 45° line up from the retaining wall base to the ground surface at wall crest.

DEM1.W500.8 OPERATION OF POWERED MECHANICAL PLANT OR EQUIPMENT

1. Operate mechanical plant or equipment for demolition work by competent operators under the immediate supervision of a TCP as specified in **DEM1.W120**;
2. Submit full details including names, addresses, qualifications and experience of these operators for applying the consent to commence demolition works under **DEM1.D220**;
3. The operators of powered mechanical plant or equipment used in demolition works shall meet the requirements as specified in Building (Demolition Works) Regulations, Clause 9 (3);
4. The operators shall have completed a training course in "Demolition of Building Course for Plant Operators" organized by the Construction Industry Training Authority (CITA) and obtained the relevant certificate and shall have at least three years experience in operating the particular plant or equipment. Equivalent training and certificates issued by a recognised examining body may also be favourably considered by the CM for meeting the requirement;

-
5. Notify the CM within 7 days of the change in the appointment of the operator and provide the personal particulars, qualifications and experience of the new operator.

DEM1.W510.8 REMOVAL OF PART OF A BUILDING

Where the removal of a part of a building or structure may result in another part of the building, adjoining slope, retaining wall or land becoming unsafe, submit a temporary support proposal prepared by Registered Structural Engineer. Support external features, enclosure walls, parapets and cantilevered construction such as canopies, cornices and balconies before the anchorage or holding down load is removed.

DEM1.W520.8 DISPOSAL OF MATERIALS TO BE COLLECTED/RECYCLED OFF SITE

1. Provide sufficient space within the Site for the storage of the materials to be collected/recycled specified in **DEM1.M025** before removing them from the Site;
2. Produce a Material for Salvage Form (MSF) for each and every vehicular trip transporting reusable and recyclable materials as follows:
 - a. Propose the format of the MSF for CM's agreement;
 - b. The MSF shall contain the following information:
 - i. Contract title, Name of Contractor, Contract No.;
 - ii. Location of Site;
 - iii. The name of the recovery/recycling company;
 - iv. The vehicle registration number;
 - v. Approximate load;
 - vi. Type of salvaged materials;
 - vii. Time of departure.
 - c. Complete the MSF in duplicate except for the entry of the "time of departure" before leaving the Site.
3. Prior to the vehicle leaving the Site, present to the site supervisory staff of the CM the completed Form for inserting the time of departure and signing. Forward a copy of the MSF to the site supervisory staff for record;
4. Employ a contractor, who shall be a recovery/recycling company listed in the "Directory of Recovery/Recycling Companies in Hong Kong" maintained by the Environmental Protection Department of the Government of the Hong Kong Special Administrative Region, to salvage the reusable and recyclable materials; and
5. All materials to be collected/recycled shall become the property of the Contractor when they are removed from the site.

DEM2 ASBESTOS REMOVAL

MATERIALS

DEFINITIONS

DEM2.M010.8 GENERAL

Where used in this Worksection the following definitions apply. Words in upper case italics within the definitions indicate that a separated definition is provided.

DEM2.M020.8 DEFINITIONS AND EXPLANATORY NOTES

1. ABATEMENT: all procedures taken to control fibre release during removal, encapsulation, enclosure and repair of *ASBESTOS CONTAINING MATERIALS*;
2. AGGRESSIVE SAMPLING: method of sampling in which the individual collecting the air sample uses mechanical equipment to stir settled dust and simulate normal activity in the sample area;
3. AIRLOCK: a system permitting entrance and exit whilst restricting air movement between contaminated and uncontaminated areas. Consisting of two curtained doorways at least 1 m apart to allow the doorway sheeting to overlap and close off the opening before proceeding through the second doorway, thereby preventing flow-through contamination. (See also *HYGIENE UNIT*);
4. AIR MONITORING: the measurement or determination of airborne *ASBESTOS* fibre concentrations in the air at specific locations;
5. AIR MOVER: a portable exhaust system equipped with HEPA filter capable of creating a negative pressure differential of at least 15 Pa and 6 air changes per hour between the outside and inside of the *CONTAINMENT*;
6. AIR SAMPLING: the process of measuring the fibre content of a known volume of air during a specific period of time, complying with the NIOSH Standard Analytical Method, the UK EH10 coupled with MDHS 39/3 or an updated method specified by the Authority; or methods accredited under HOKLAS which are laid down in the laboratory manual;
7. AMBIENT AIR MONITORING: the measurement or determination of airborne *ASBESTOS* fibre concentrations within the vicinity of the Site;
8. AMENDED WATER: water to which a saturated solution of a *WETTING AGENT* has been added;
9. AREA AIR SAMPLING: the method of *AIR SAMPLING* where the sampling equipment is situated at a stationary location within the contaminated *WORK AREA*;
10. ASBESTOS CONTAINING MATERIAL (ACM): *ASBESTOS* or any material/product containing greater than 1% asbestos by weight;
11. ASBESTOS CONTAINING WASTE MATERIAL: ACM or materials contaminated with asbestos which requires disposal;
12. ASBESTOS: the minerals chrysotile, amosite, crocidolite, fibrous tremolite, fibrous anthophyllite and fibrous actinolite or substances containing such minerals;

-
13. **BACKGROUND MONITORING:** the measurement or determination of airborne *ASBESTOS* fibre concentrations within the Site and outside the building prior to commencement of the work as follows:
- a. Sampler: an air sampling pump fitted with an Approved type cowl;
 - b. Filter: 25 mm cellulose ester filter of pore size 0.8 - 1.2 μm ;
 - c. Sampling pump: a battery-run or mains-run pump capable of maintaining a low rate of at least 2 litres per minute for at least 4 hours;
 - d. Sampling point:
 - i. A minimum of 2 samples, or as specified in the individual air monitoring strategy (depending on the size of the site), taken on different sides of the contained/segregated work area;
 - ii. Samples taken as close to the work site as possible, of the area where those not involved in the abatement works are likely to pass or occupy;
 - iii. Sampling locations shall be as far as possible the same as the *ENVIRONMENT SAMPLES*.
 - e. Sampling rate: a minimum of 2 litres per minute taken with a calibrated pump and checked with a calibrated rotameter equivalent flow measurement device regularly during the sampling period;
 - f. Sampling time: not less than 4 hours.
14. **BACKGROUND SAMPLE:** a sample taken prior to commencement of the asbestos removal works;
15. **CLEAN ROOM/END:** an uncontaminated area or room within the *HYGIENE UNIT* with the provision for storage of personal clothing and protective equipment;
16. **CLEARANCE AIR MONITORING:** the employment of *AGGRESSIVE SAMPLING* techniques with a volume of air, collected to determine the airborne concentration of residual fibres, performed as the final abatement activity, using the following:
- a. Sampler: an air sampling pump with an Approved type of cowl;
 - b. Filter: 25 mm cellulose ester filter of pore size 0.8- 1.2 μm ;
 - c. Sampling pump: battery-run or mains-run pump capable of maintaining a flow of at least 4 litres per minute for 4 hours;
 - d. Sampling point:
 - i. Static;
 - ii. A minimum of 1 sample for an area up to 8 m² and 2 samples for an area between 8-25 m²;
 - iii. One further sample for each additional 25 m²;
 - iv. If the enclosure is higher than 2 m, the above should be converted to a volume criteria e.g.:
2 samples for the first 75 m³ and one further sample for each additional 75 m³;
 - v. If the contained space is further subdivided by larger pieces of equipment or walls take more samples than specified above;
 - vi. Position sampler 1-2 m above the floor with the cowl pointing downwards;
 - vii. Sampling is to be aggressive, see item (2) above;

viii. Do not proceed with air sampling if debris is visible within the work area.

(The sampling point and number of samples required are dependent upon the site layout and the Air Monitoring Strategy agreed by the CM. The Guidelines on Air Monitoring included in each removal method of the ACM's are for reference only.)

- e. Sampling rate: minimum of 4 litres per minute taken with a calibrated pump and checked, with a calibrated rotameter equivalent flow measurement device, regularly during the sampling period;
 - f. Sampling time: to be set to give a total sampling volume of a minimum of 480 litres;
 - g. Reporting: if more than 1 sample is taken, obtain results by pooling a minimum of 2 samples of at least 240 litres each, taken within 4 m of each other. Results may be taken simultaneously or one after another. At the evaluation state the same number of graticule areas are inspected on each filter and the counts combined to give one measurement based on at least 480 litres. If the total volume is 480 litres for two or more samples, 200 graticule areas must be examined on each filter. For larger volumes reduce the number of graticule areas to be counted proportionally.
17. CLEARANCE TEST SAMPLE: a sample taken after *ASBESTOS* has been removed to ascertain whether *WORKING ZONE* has been thoroughly decontaminated. A visual inspection to detect gross contamination must be carried out before one or more static samples are taken to establish the fibre level in the *WORKING ZONE*. Disturbance of surface dust is essential during the sampling period. When the clearance indicator shows a fibre level of 0.01 fibre/ml or below, the Working Zone can be declared fit for re-occupation. Where results exceed the clearance indicator, thoroughly re-clean the Working Zone and re-sample;
18. CONTAINMENT: a temporary timber or metal framed structure lined with 3 layers of 0.15 mm thick polythene sheeting to floors and walls, completely sealing off the work area. All sheet joints to be overlapping and properly sealed, with the innermost floor sheeting extending at least 500 mm up each wall surface;
19. CURTAINED DOORWAY: a device consisting of a minimum of 3 overlapping plastic sheets over an existing or temporarily framed doorway. The first sheet is fixed at the top and left side, the second at the top and right side and the third at the top and left side. Weights are to be attached to the bottom of all sheets to ensure that the sheets hang straight and maintain a seal over the doorway when not in use;
20. DECONTAMINATION FACILITIES: a series of connected rooms, separated from the *WORK AREA* and from each other by *AIRLOCKS*, used for the decontamination of operatives, materials, waste containers and equipment;
21. DEMOLITION: the dismantling or razing of a building, including all incidental operations (except asbestos removal);
22. DIRECT TESTING CONTRACTOR: a laboratory appointed by the CM and paid by the Authority to carry out asbestos associated tests;
23. DIRTY END: a contaminated area or room, which is part of the *HYGIENE UNIT*, with the provision to store contaminated clothing and equipment;
24. DISTURB: any action taken which may alter, change or stir, such as, but not limited to, the removal, encapsulation, enclosure or repair of any *ASBESTOS CONTAINING MATERIAL*;

-
25. **ENCAPSULANT (SEALANT) OR ENCAPSULATING AGENT:** a material applied to the ACM which temporarily controls the possible release of asbestos fibres from the material either by creating a membrane over the surface (bridging encapsulant) or by penetrating into the material and binding its components together (penetrating encapsulant). This may also be used to seal surfaces from which the ACM has been removed;
26. **ENCAPSULATION:** concealing the ACM either with a sealant, by cementitious rendering or by cladding, to prevent the release of asbestos fibres;
27. **ENCLOSURE:** the construction of airtight walls and ceilings between the ACM and the facility environment, around surfaces coated with ACM or any other appropriate procedure which prevents the release of asbestos fibres;
28. **ENVIRONMENTAL SAMPLE:** a sample taken in the vicinity of the asbestos work area, especially within occupied areas where the fibre levels may be higher than the general ambient level as a consequence of a failure of precautionary measures taken in the asbestos work area. Without any established ambient level standard, environmental samples are often compared to the clearance indicator in deciding whether significant environmental pollution has occurred around the work site. A flow rate of up to 8 litre/min may be used to achieve the desired fibre density on the filter:
- a. **Sampler:** an air sampling pump with an Approved type of cowl;
 - b. **Filter:** 25 mm cellulose ester filter of pore size 0.8-1.2 µm;
 - c. **Sampling pump:** battery-run or mains-run pump capable of maintaining a flow rate of 2 litres per minute for a minimum of 4 hours;
 - d. **Sampling point:**
 - i. A minimum of 2 samples, or as specified in the individual air monitoring strategy, taken on different sides of the contained/segregated work area;
 - ii. Samples taken, as close to the work site as possible, of the area where those not involved in the abatement works are likely to pass or occupy.
 - e. **Sampling rate:** minimum of 2 litres per minute taken with a calibrated pump and checked, with a calibrated rotameter equivalent flow measurement device, regularly during the sampling period;
 - f. **Sampling time:** not less than 4 hours.
29. **EQUIPMENT ROOM:** see *DIRTY END*;
30. **FIBRE:** an acicular single crystal or a similarly elongated polycrystalline aggregate which displays resemblance to organic fibres, with properties such as flexibility, high aspect ratio, silky lustre, axial lineation and which has attained its shape primarily through growth rather than cleavage;
31. **FIXED OBJECT:** equipment or furniture within the *WORK AREA* which may not be removed;
32. **FOAM METHOD:** a method, used by the Housing Department, to remove asbestos-containing balcony grilles where the grilles are sandwiched between two plywood boards, the space between the two boards is injected with quick setting polyurethane foam allowing the grille to remain intact whilst being removed by chiselling the surrounding concrete;
33. **FRIABLE ASBESTOS MATERIAL:** any *ASBESTOS* or *ACM* which can be crumbled, pulverized or reduced when dry, by hand or a similar mechanical pressure;

-
34. **GLOVE BAG METHOD:** a method for removing friable asbestos-containing material from heating, ventilation and air conditioning ducts, short piping runs, valves, joints, elbows and other non-planar surfaces in a non-contained work area. The glove bag assembly is a manufactured device consisting of a glove bag (constructed of at least 0.15 mm thick transparent plastic), two inward-projecting long-sleeve gloves, one inward-projecting waterwand sleeve, an internal tool punch and an attached labelled receptacle for asbestos waste. The glove bag is constructed and installed in such a manner that it surrounds the object or area to be decontaminated and contains all asbestos fibres released during the removal process;
35. **GLOVE METHOD:** any method whereby a transparent, soft PVC structure equipped with integral gloves is used as mini-containment for small-scale asbestos removal. The glove method can be applied in the removal of balcony grille panels;
36. **HEPA FILTER:** a High Efficiency Particulate Air filter capable of trapping and retaining particles (asbestos fibres) with an efficiency complying with BS 3928:1969 or US Military Standard No. 282 in association with Army Instruction Manual 136-300-175 or Approved equivalent;
37. **HEPA VACUUM EQUIPMENT:** vacuuming equipment with HEPA;
38. **HYGIENE UNIT:**
- A 3 compartment, air-locked chamber comprising a *DIRTY END*, a shower area and a *CLEAN END*, constructed with timber frames, 0.15 mm thick opaque polythene sheeting and sealed with 75 mm adhesive tape;
 - The Dirty End is separated from the shower area by a door. A further door separates the entry point. The Dirty End may be used as a temporary store for soiled equipment and footwear;
 - The Clean End is separated from the shower area by a door. A further door separates the exit. The Clean End may be used as a temporary store for personal clothing. A mirror should be provided to ensure workers obtain a good facefit with the Respiratory Protective Equipment;
 - All waste water must pass through an approved aquarium type or similar filter for removal of particles down to 5 microns in suspension before being discharged into the soil and waste drainage system;
 - An induced draft should be introduced inside the Hygiene Unit to achieve an air flow from the Clean End to the Dirty End;
 - A pre-fabricated Hygiene Unit may also be used to perform the same function;
 - The Hygiene Unit and *AIRLOCK* are similar, although their names are derived from their different specific functions.
39. **ISOLATION BARRIER:** the construction of partitions, the placement of solid materials and the sealing of apertures to isolate the *WORK AREA* from the surrounding area, containing asbestos fibre release;
40. **LEAK SAMPLE:** static samples taken immediately outside the contained *WORK AREA* to ensure that dust generated within the contained area is not released into the surrounding environment.

Criterion for leakage detection is generally the same as for the *CLEARANCE INDICATOR* and immediate remedial action must be taken should a leakage occur:

- Sampler: air sampling pump with an Approved type of cowl;
- Filter: 25 mm cellulose ester filter of pore size 0.8-1.2 µm;
- Sampling pump: battery-run or mains-run, capable of maintaining a minimum flow of 4 litres per minute for up to 4 hours;

-
- d. Sampling point: to be located in at least one of the following:
 - i. 2 area samples outside *CONTAINMENT* in uncontaminated area of the premises but remote from the decontamination unit;
 - ii. 1 area sample inside the clean room of the decontamination unit;
 - iii. 1 area sample within 1500 mm from the unobstructed exhausted of the HEPA air mover.
 - e. Sampling rate: 1 to 4 litres per minute taken, with a calibrated rotameter or equivalent flow measurement device, regularly during the sampling period;
 - f. Sampling time: set to give a total sample volume of at least 480 litres.
41. LOG: a record of all activities that have occurred during the project also identifying the building owner, agent, Contractor, operatives and other information such as equipment malfunctions, contamination beyond the work area etc;
42. MATERIAL LOCK: a compartment attached to the *CONTAINMENT* provided for temporary storage and transit of asbestos abatement equipment and asbestos waste;
43. NEGATIVE AIR PRESSURE EQUIPMENT: see *AIR MOVER*;
44. NEGATIVE PRESSURE MONITOR: a monitoring device with an alarm setting and continuous print-outs and permanent record facility for monitoring of the negative pressure inside the *CONTAINMENT*;
45. OCCUPIED AREA: an area of the work site where no abatement work is taking place and where the use of *PERSONAL PROTECTIVE EQUIPMENT* is not required;
46. PENULTIMATE TEST SAMPLE: take air sample after final cleaning, when the innermost plastic layer, upon drying from the spraying of PVA, is removed and the second plastic sheeting HEPA vacuumed and wet-wiped. Employ an aggressive sampling technique and the acceptance limit is 0.01 fibre/ml;
47. PERSONAL AIR MONITORING: a method used to determine employees' exposure to airborne fibres. Samples are collected outside the respirator in the operative's breathing zone:
- a. Sampler: air sampling pump fitted with an approved cowl;
 - b. Filter: 25 mm cellulose ester filter of pore size 0.8-1.2 μm ;
 - c. Sampling pump: battery-run, sampling pump to be carried on the operatives belt;
 - d. Sampling point: sampler, fixed to operative's clothing and within the breathing zone (200 mm from nose and mouth). The cowl of the sample must point downwards;
 - e. Sampling rate: 1 - 4 litres per minute checked, with a calibrated rotameter or equivalent flow measurement device, regularly during the sampling period;
 - f. Sampling time: to be set according to the following criteria:
 - i. To be a period of 4 hours. Where the level is higher, a shorter period must be used to avoid filter over-loading. This period must be long enough to be representative of the 4 hour period. Samples taken over several separate periods may also be used to calculate the 4 hour TWA value;
 - ii. Minimum sampling time: 10 minutes; adjust the sampling time such that fibre density on the filter lies within 100 - 400 fibre/ m^2 ;

-
- iii. In order to test the respiratory protective equipment is adequate for the asbestos dust exposure, liaise with the Direct Testing Contractor to conduct the personal samples to measure the representative asbestos dust exposure, including the periods when the asbestos dust exposure are expected to be maximum.
48. **PERSONAL PROTECTIVE EQUIPMENT:** appropriate protective clothing e.g. gloves, eye protection, footwear, headgear and Approved respiratory equipment acceptable to the CM;
49. **PERSONAL SAMPLES:** an air sample taken as close to the breathing zone of an operative as possible, to indicate the ambient level of exposure. An appropriate amount of the work period should be covered either by continuous sampling or by short term samples. For known procedures which have been thoroughly evaluated before, such extensive sampling is not required but minimal batch samples can be taken to ensure that the levels of fibre release are indeed comparable:
- Sampling rate: 1 litre per minute;
50. **RE-ASSURANCE SAMPLE:** a sample taken in areas where Containment is not required or where it has been removed. See also *CLEARANCE TEST*;
51. **REMOVAL:** the stripping of any *ACM* from surfaces or components of a facility or taking out structural components;
52. **REPLACEMENT MATERIAL:** any material used to replace an *ACM* that does not contain *ASBESTOS*;
53. **SECURE STORE:** a buffer store for asbestos waste used prior to transportation to a dumping site. The store must be located close to the asbestos removal works, be weather-proof and structurally strong enough to withstand strong winds and accidental disturbances, with a lockable door/cover and posted with appropriate warning labels. It is preferable that a permanent space inside a building be converted into the Secure Store e.g. a refuse room, empty flat, empty bay with a temporary lockable door free of debris, dirt, objects and water accumulations. If located externally it may be a lockable metal skip adjacent to the building block and covered with tarpaulin sheets to keep water out or an area hoarded with plywood of at least 18 mm thick with no floor clearance and a water-proof slanting canopy where practicable; or use tarpaulin sheets as the cover for large hoarded area;
54. **SHIFT:** an operative's daily term of work;
55. **SHOWER ROOM:** a room between the *CLEAN END* and the *DIRTY END* in the *HYGIENE UNIT*, equipped with controllable hot and cold water for showering purposes, a shower tray and of a minimum size of 2000 mm (height) x 1000 mm (width) x 1000 mm (length). Provide at a ratio of 1 Shower Room for every 6 operatives engaged in asbestos removal works;
56. **SMOKE TEST:** a test carried out using non-toxic smoke to ensure airtightness of the *CONTAINMENT before commencement of work*. Following a successful test, switch on the *AIR MOVER* to exhaust smoke from the *CONTAINMENT* and check the absolute filter to ascertain whether the smoke has been screened effectively. The CM must be notified of test and be present whilst the test is carried out;
57. **SPECIALIST ASBESTOS REMOVAL CONTRACTOR:** any Sub-contractor employed by the Contractor to execute the asbestos removal works chosen from the Approved list;
58. **SURFACTANT:** a chemical wetting agent added to water to improve penetration;

-
59. **VIEWING PANEL:** a 2 mm thick, clear acrylic sheet, size 600 mm x 600 mm per layer of polythene sheeting built into the *CONTAINMENT* at a designated area to enable work inside the Containment to be viewed. A hinged wooden door may be installed for the Viewing Panel should the Containment be housed within a hoarding;
 60. **VISIBLE EMISSIONS:** any emissions containing particulate material which can be visually detected without the aid of instruments;
 61. **WASHROOM:** a room between the *WORK AREA* and the holding area in the equipment decontamination enclosure where equipment and waste containers are *WET CLEANED* and/or *HEPA* vacuumed prior to disposal;
 62. **WASTE DECONTAMINATION ENCLOSURE SYSTEM:** an area designated for the controlled transfer of materials and equipment, consisting of a buffer zone and a holding area;
 63. **WET CLEANING:** the removal of *ASBESTOS* fibres from building surfaces using cloths or cleaning tools dampened with water;
 64. **WET METHODS:** *AMENDED WATER* or removal encapsulants used to minimize the generation of fibres during disturbance of *ACM*;
 65. **WETTING AGENT:** a chemical to be added to water to improve penetration;
 66. **WORK AREA:** designated rooms, spaces or areas of the building or structure where asbestos abatement activities are taking place;
 67. **WORKING ZONE:** the zone where asbestos removal is being, or has been, undertaken which includes the *WORK AREA* and all access routes (before passing the *CLEARANCE TEST*). All operatives, equipment and bagged waste withdrawing from the Working Zone must undergo thorough decontamination through a *MATERIAL LOCK*. Only in the event of it being impracticable to install a Material Lock may a *HYGIENE UNIT* be used.

ASBESTOS REMOVAL PLANT AND EQUIPMENT

DEM2.M110.8

GENERAL

1. Ensure all plant, including scaffolding and mechanical hoisting equipment, tools and vehicles to be used during the asbestos removal works is uncontaminated, well maintained and in good working order;
2. Provide for the inspection of the CM certified records that all plant and equipment including HEPA filters and respirators have been regularly maintained;
3. Decontaminate all plant, scaffolding and equipment prior to removal from site.

DEM2.M120.8

PROVISION

Provide all plant, equipment and materials, including the following, for the execution of the asbestos removal works. Ensure their suitability for the particular application and of sufficient quantity for the scope and extent of the asbestos removal works:

1. Hygiene unit (as defined in [DEM2.M020](#));
2. Heavy duty vacuum cleaner: an Approved type suitable for use on asbestos removal and fitted, on site, with a HEPA filter (as defined in [DEM2.M020](#));
3. Small vacuum unit for personal cleaning:
 - a. Fitted on site just prior to use, with a HEPA filter;

-
- b. Located at exit to asbestos removal work area or dirty end (as defined in **DEM2.M020**) where the hygiene unit is attached to exit of the asbestos removal work area;
 4. Negative pressure monitor (as defined at **DEM2.M020**): for use when full containment approach is adopted to give a continuous, permanent record of the negative pressure measured. An audible alarm must be fitted to give warning of insufficient pressure differential;
 5. Asbestos waste containers: complying with the Code of Practice on the Handling, Transportation and Disposal of Asbestos Wastes issued by the Environmental Protection Department. Nylon woven sacks may be used as the innermost bag (i.e. triple bagging) when the debris contains sharp edges and/or proves to be too heavy for the plastic waste bags;
 6. Air movers: (as defined in **DEM2.M020**):
 - a. An Approved type;
 - b. Fitted with a pre-filter and HEPA filter;
 - c. With a negative pressure of at least 15 kPa;
 - d. Capable of performing at least 6 air changes per hour;
 7. Polyvinyl acetate emulsion adhesive (PVA): aqueous solution and expanded foam in aerosol cans;
 8. Cleaning and personal hygiene consumables;
 9. Water spray equipment for damping the asbestos element to minimize the release of air borne particles;
 10. Wetting agent: 50% polyoxyethylene ester and 50% polyoxyethylene ether at a ratio of 1:1 or equivalent;
 11. Amended water (as defined in **DEM2.M020**).

DEM2.M130.8**VIEWING PANEL**

1. Location: within the screening to the work area and in a position where all or most of the asbestos removal works can be viewed;
2. Size: 600 mm x 600 mm;
3. Construction: 2 mm thick clear acrylic sheet per layer of polythene sheeting with 50 mm minimum lap affixed and sealed with 50 mm wide vinyl tape to sheeting.

PERSONAL PROTECTIVE EQUIPMENT AND CLOTHING

DEM2.M210.8**CLOTHING**

1. Provide the following protective clothing for use by operatives:
 - a. Disposable, impervious protective overalls with zipper fastening, integral hoods, elasticated cuffs and ankles;
 - b. Rubber knee length boots with non-slip soles, or shoe covers;
 - c. Eye protection and hard hats, where their use is appropriate;
 - d. Disposable gloves.
2. Provide the above protective clothing for use by the Authority's staff;

-
3. Use of other items of disposable clothing e.g. woven fabric overalls, or shorts and hair covers may be permitted where heat stress or discomfort are factors. Prior approval must be obtained from the Labour Department.

DEM2.M220.8 RESPIRATORS

1. Provide for all persons on site the appropriate respiratory protective equipment:
 - a. Type approved under the Factories and Industrial Undertakings (Asbestos) Special Regulations for the specific use;
 - b. Ori-nasal half face mask type fitted with HEPA filter: for use under all circumstances;
 - c. Full face positive pressure respirator: for use when required by this Specification.
2. Provide each operative with own face piece. Ensure face piece is cleaned before each re-use as a minimum requirement.

DEM2.M230.8 RESPIRATOR FILTERS

Ensure that:

1. Filters are removed from respirators under wet conditions and are treated as contaminated waste;
2. New filters are placed in the respirator prior to re-use;
3. Sufficient spare filters are held on site at all time.

WORKMANSHIP

GENERAL

DEM2.W010.8 ASBESTOS REMOVAL WORK

1. Carry out the asbestos removal work as specified in [Project Specific Specification](#);
2. The information provided on the extents of asbestos removal work are known to be in existence to the best knowledge of the Housing Authority but may not be exhaustive.

DEM2.W020.8 SPECIALIST ASBESTOS REMOVAL CONTRACTOR

1. Employ a firm whose name is included in the Register of Asbestos Contractors kept by Environment Protection Department to carry out the asbestos removal works;
2. Such firm shall be a Sub-contractor to the Main Contractor and employed at his own expense;
3. Submit with tender a letter of intent from the Specialist Asbestos Removal Contractor indicating their willingness to carry out the asbestos removal works, which includes a Method Statement as specified.

DEM2.W030.8 SITE VISIT AND INSPECTION

Before tendering, visit the site and inspect the appropriate drawings to ascertain the full extent of the asbestos removal work and the conditions affecting its execution.

DEM2.W040.8 SURVEY AND REPORT

Within 14 days of notification of the start of the contract, a confirmatory survey for the whole site is carried out by a Registered Asbestos Consultant employed by the Contractor under Air Pollution Control Ordinance to Submit the Asbestos Investigation Report to CM and Environmental Protection Department. The survey covers the whole site and materials, rubbish lying on the ground to establish the presence of asbestos containing materials other than those already identified in this Specification or shown on the drawings.

DEM2.W050.8 SUPERVISION BY REGISTERED ASBESTOS CONSULTANT

If asbestos containing materials which are to be removed are not materials under the exemption list published by Environmental Protection Department (EPD), employ a Registered Asbestos Consultant:

1. To submit Asbestos Abatement Plan to EPD for the planned removal of ACM and / or an Operation and Maintenance Plan for deferred treatment, e.g. encapsulation, enclosure, of the same; and
2. To control and supervise the abatement of all asbestos containing materials, all in accordance with Air Pollution Control Ordinance.

DEM2.W060.8 METHOD STATEMENT

Submit for Approval, 2 weeks prior to commencement of the asbestos removal works, a Method Statement containing:

1. Details of the ACM to be removed and the proposed zoning and sequence of the asbestos removal works;

-
2. Method of removal of ACM and control of air-borne dust to be employed;
 3. Method of disposal of contaminated materials from the point of action to the secure store;
 4. Description of the hygiene unit and decontamination facilities, including waste water treatment to be used, prior to discharge off site.

DEM2.W070.8 SITE SUPERVISOR

Submit to the Authority within 7 days of notification of commencement of the asbestos removal works, details of the Site Supervisor to be employed, including name, qualifications and experience:

1. Site Supervisor to:
 - a. Register with Environmental Protection Department;
 - b. Posses at least 2 years relevant supervisory experience, capable to make decisions in case of emergency;
 - c. Be conversant with the Authority's requirement for the removal of ACM. Hold a relevant certificate issued by the Occupational Safety and Health Council, or equivalent, indicating competence in the safe handling of asbestos and be trained in asbestos removal work;
 - d. Be present full time on site every day during the course of asbestos removal work;
 - e. Ensure that the asbestos removal work complies with the requirements of this Specification and oversee all safety procedures;
 - f. Liaise with the Direct Testing Contractor and ensure the works continue with the DTC in attendance at a suitable time.

DEM2.W080.8 PREVENTION OF NUISANCE

1. Occupied premises: proceed with the minimum of inconvenience and nuisance to occupants of premises in the vicinity of the asbestos removal works;
2. Prevent dust arising by frequent water spraying, or other Approved methods;
3. Erect dust barriers where directed by the CM to prevent air borne dust affecting adjacent, occupied blocks.

DEM2.W090.8 SITE ORGANISATION CHART

Post a site organisation chart identifying the Specialist Asbestos Removal Contractor in a prominent location adjacent to the asbestos removal works.

DEM2.W100.8 NOTIFICATIONS

At least 28 days prior to asbestos removal, give notice to the Environmental Protection Department (EPD) and the Labour Department (LD).

DEM2.W110.8 INSPECTION OF PREPARATORY WORKS

24 Hours prior to commencement of the asbestos removal works, notify the CM that air monitoring arrangements and preparatory works are made and precautionary measures are ready for inspection and request consent from the CM before proceeding with removal.

STATUTORY OBLIGATIONS, CODES OF PRACTICE AND OTHER REQUIREMENTS

DEM2.W310.8 SAFETY, HEALTH AND WELFARE

Comply with the provisions of the following:

1. Factories and Industrial Undertakings (Asbestos) Regulation made under the Factories and Industrial Undertaking Ordinance (CAP 59);
2. Construction Sites (Safety) Regulations made under the Factories and Industrial Undertaking Ordinance (CAP 59);
3. Factories and Industrial Undertakings (Notification of Occupational Diseases) Regulations made under the Factories and Industrial Undertaking Ordinance (CAP 59);
4. Code of Practice on Safety and Health at Work with Asbestos, issued by the Labour Department;
5. Code of Practice on Handling, Transportation and Disposal of Asbestos Waste, issued by the Environmental Protection Department;
6. Guidance Notes on Health Hazards in Construction, issued by the Labour Department;
7. Health Hazards of Asbestos, issued by the Labour Department;
8. Guide to Occupational Diseases Prescribed for Compensation Purposes, issued by the Labour Department;
9. Air Pollution Control Ordinance (CAP 311);
10. Pneumoconiosis and Mesothelioma (Compensation) Ordinance (CAP 360);
11. Waste Disposal Ordinance (CAP 354);
12. Code of Practice on Asbestos Control: Safe Handling of Low Risk Asbestos Containing Material, issued under Section 37 of the Air Pollution Control Ordinance (CAP 311);
13. Code of Practice on Asbestos Control: Asbestos Work Using Full Containment or Mini Containment Method, issued under Section 37 of the Air Pollution Control Ordinance (CAP 311);
14. Code of Practice on Asbestos Control: Asbestos Work Using Glove Bag Method, issued under Section 37 of the Air Pollution Control Ordinance (CAP 311);
15. Code of Practice on Asbestos Control: Preparation of Asbestos Investigation Report, Asbestos Management Plan and Asbestos Abatement Plan, issued under Section 37 of the Air Pollution Control Ordinance (CAP 311);
16. 3 Leaflets published by EPD:
 - a. Environmental Asbestos Control;
 - b. Asbestos Removal of Unauthorised Building Works;
 - c. Banning Asbestos.
17. Practice Note 2/97 Handling of Asbestos Containing Materials in Buildings issued by the Professional Persons Environmental Consultative Committee;
18. Code of Practice for Demolition of Buildings published by the Buildings Department.

PROTECTIVE ENCLOSURES

DEM2.W410.8 ERECTION OF TARPAULIN ENCLOSURE

1. Erect tarpaulin enclosure in accordance with the following requirements:
 - a. Prior to commencement of asbestos removal work;
 - b. Constructed from tarpaulin sheeting supported by substantial bamboo scaffolding or similar;
 - c. Enclosure to encase entire block, extending from ground level to 1000 mm above roof parapet of block being demolished;
 - d. Overlap tarpaulin sheets on all four sides by 200 mm minimum. Ensure airborne dust is retained within enclosure during asbestos removal;
 - e. Do not disturb or damage asbestos containing material during erection of enclosure.
2. Submit details of protective enclosure to CM prior to erection. Do not disturb asbestos containing materials. If disturbed, stop work and propose remedial actions.

DEM2.W420.8 DAMAGE TO ENCLOSURE

1. Upon discovery of any damage to enclosure, immediately make good to the satisfaction of the CM;
2. Allow for time and additional costs incurred for repairing any damage to enclosure.

ASBESTOS REMOVAL

DEM2.W510.8 METHODOLOGY

The removal and disposal of asbestos containing materials are from top down on a zone by zone basis unless otherwise approved by the CM. Consider the following methods and procedures for asbestos removal as minimum requirements. Adoption does not release the Contractor from any responsibilities or liabilities under the terms of the Contract. Alternative methods of working may be employed, subject to Approval and submission of details provided that all regulations and restrictions imposed by the Environmental Protection Department and the Labour Department are complied with.

DEM2.W520.8 GENERAL PREPARATION PROCEDURES

1. Ensure all access points between the working zone and non-working zone are sealed with 2 sheets of polythene sheet or similar;
2. Post warning notices on the non-working zone side prohibiting access to the works of non-authorized personnel;
3. Construct viewing panels as [DEM2.M130](#).

DEM2.W530.8 GENERAL PRECAUTIONARY PROCEDURES

Where the presence of amosite or crocidolite asbestos fibres is known or discovered in the asbestos containing materials being removed, ensure operatives wear full-face positive pressure respirators as at [DEM2.M220](#) and [DEM2.M230](#).

DEM2.W540.8 REMOVAL OF BALCONY GRILLE PANELS (INCLUDING PANELS ENCAPSULATED ON ONE SIDE)

1. Preparation procedures: in addition to the general preparation procedures as **DEM2.W520**:
 - a. Access balconies from the living room area of each domestic unit through a designated route and a hygiene unit;
 - b. Removal operators in the working zone are to wear ori-nasal half face masks fitted with Approved air filters, Approved disposable coveralls and knee length rubber boots with non-slip soles. Wear gloves if it is considered necessary;
 - c. Ensure operatives working on the external face of the balcony panel use a safety harness attached to a secure anchorage or life line;
 - d. Ensure operatives on the external face secure all tools and equipment to a safety line;
 - e. Remove all existing metal guard grilles, glazing, toilet walls and bases, cooking benches and other fittings or furniture which may obstruct access to the balcony grille panels. Transport all debris from the removal works by an Approved route.
2. Removal:
 - a. Clear up as work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed;
 - b. During the removal operation, continuously spray panels and surrounding concrete surfaces with water containing a wetting agent;
 - c. Place a primary, 5 mm thick, pre-cut and drilled plywood panel against the external face of each grille panel. Fit in position by four set screws retained by locknuts protruding through the grille panel. If panels are encapsulated on one side, the plywood board on the encapsulated side may be waived if approved by CM;
 - d. Position a secondary, 5 mm thick, plywood panel against the internal face of the grille panel, fixed in position by the wing nuts on the bolts from the primary panel;
 - e. Fix a third 5 mm thick, plywood panel against the external face of the balcony. Fit with non-intercellular nitrile, neoprene rubber seals, contoured to ensure no leakage of debris or dust occurs during removal of the grille panel. Cover the internal face and seals of the panel with a double layer of 0.15 mm polythene, secured by waterproof self-adhesive vinyl tape;
 - f. Where panels are encapsulated on one side, the use of plywood board on the encapsulated side may be waived if Approved;
 - g. Fill the cavity space between the primary and secondary boards with high density polyurethane foam to encapsulate the grille panels. If isocyanate foam is used provide an appropriate respirator for use by operatives;
 - h. Cover the balcony floor with a double layer of 0.15 mm thick polythene sheeting, secured by waterproof self adhesive vinyl tape;
 - i. Install a screen in the space above the spandrel beam and the underside of the upper balcony beam. Construct frame using a timber framework supporting a woven, nylon tarpaulin sheet;

- j. Using a powered, low voltage chisel or hand chisel, chip away concrete spandrel beams and posts to the top and sides of the grille panel to expose the full extent of grille panel reinforcement bar fixings, leaving the grille panel unrestrained. Cut all exposed grille panel reinforcing bars with bolt cutters. Ensure eye protectors are worn by operatives during this operation;
- k. Remove the base ledge of the balcony wall adjoining the panel with a hand chisel;
- l. Free the grille panel from the surrounding concrete and reinforcing bars and lift clear of the balcony wall cavity. Secure a tie wire fitted with a turnbuckle to the exposed spigot and the nearer floor-mounted eye bolt;
- m. Vacuum and wet clean the encapsulated grille panel after removal from the wall cavity;
- n. Secure the exposed edges of the grille panel with 2 layers of 0.15 mm thick polythene, secured in place by waterproof, self-adhesive tape.

DEM2.W550.8**REMOVAL OF BALCONY GRILLE PANELS (ENCAPSULATED ON BOTH SIDES)**

1. Preparation procedures: in addition to the general preparation procedures as **DEM2.W520**:
 - a. Access balconies from the living room area of each domestic unit through a designated route and a hygiene unit;
 - b. Removal operatives in the working zone are to wear Approved ori-nasal half face masks fitted with air filters, Approved disposable coveralls and knee length rubber boots with non-slip soles. Wear gloves if it is considered necessary;
 - c. Ensure operatives working on the external face of the balcony panel use a safety harness attached to a secure anchorage or life line;
 - d. Ensure operatives on the external face secure all tools and equipment to a safety line;
 - e. Remove all existing metal guard grilles, glazing, toilet walls and bases, cooking benches and other fittings or furniture which may obstruct access to the balcony grille panels. Transport all debris from the removal works by an Approved route.
2. Removal:
 - a. Clear up as work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed;
 - b. During the removal operation, continuously spray panels and surrounding concrete surfaces with water containing a wetting agent;
 - c. Fix a 5 mm thick, plywood panel against the external face of the balcony wall. Fit with non-intercellular nitrile neoprene rubber seals, contoured to ensure no leakage of dust. Cover the internal face and seals of the panel and the floor of the balcony with a double layer of 0.15 mm thick, polythene sheeting, secured by waterproof, self adhesive vinyl tape;
 - d. Install a screen in the space above the spandrel beam and the underside of the upper balcony beam. Construct screen using a timber framework, supporting a woven, nylon tarpaulin sheet;

- e. Using a powered, low-voltage chisel or hand chisel, chip away the concrete on the spandrel beams and posts to the top and sides of the grille panel to expose the full extent of grille panel reinforcement bar fixings, leaving the grille panel unrestrained. Cut all exposed grille panel reinforcing bars with bolt cutters. Ensure eye protectors are worn by operatives during this operation;
- f. Remove the base ledge of the balcony wall adjoining the panel with a hand chisel;
- g. Free the grille panel from the surrounding concrete and reinforcing bars and lift clear of the balcony wall cavity. Secure a tie wire fitted with a turnbuckle to the exposed spigot and the nearer floor-mounted eye bolt;
- h. Vacuum and wet clean the encapsulated grille panel after removal from the wall cavity;
- i. Secure the exposed edges of the grille panel with 2 layer of 0.15 mm thick polythene, secured in place by waterproof, self-adhesive tape.

DEM2.W560.8**REMOVAL OF STAIRCASE GRILLE PANELS**

1. Preparation procedures: in addition to the general preparation procedures as **DEM2.W520**:
 - a. Access staircases from the inside of the building through the designated route and a hygiene unit as **DEM2.W540**;
 - b. Removal operators in the working zone are to wear ori-nasal half face masks fitted with Approved air filters, Approved disposable coveralls and knee length rubber boots and non-slip soles. Wear gloves if it is considered necessary;
 - c. Position a full height screen across the staircase landing and linking lobby to prevent the escape of debris. Construct screen using a timber framework supporting 0.15 mm thick polythene sheeting. The timber frame if well-covered and cleaned up can be re-used. Erect partial screening where necessary to avoid cross contamination of other work areas;
 - d. Remove any demolition debris from stairwells or lobbies prior to commencement of asbestos removal work;
 - e. Cover the floor areas between the grille block panels and the screen with a double layer of 0.15 mm thick polythene sheeting secured by waterproof, self adhesive vinyl tape;
 - f. Secure, using direct fastening anchor bolts, a purpose made plywood screen, maintained in good condition for re-use, to cover the external face of the grille block panel. Fix a double layer of 0.15 mm thick polythene sheeting to the internal face of the screen.
2. Removal:
 - a. Clear up as work proceeds. Prevent debris accumulating on the floor where it may be further broken or crushed;
 - b. Prior to removal, spray working area and panels with water containing a wetting agent;
 - c. Use hand tools to remove panels. Spray water containing a wetting agent to working area and exposed edges of the panel;
 - d. Chase out grooves in the panel openings to remove all visible traces of the panels;

-
- e. Position a vacuum cleaner (as **DEM2.M120**) near the panel, enabling the suction hose to be as near as is practical to the work area. Ensure that during the asbestos removal works the vacuum unit is in continuous operation;
 - f. Remove panels block by block, avoiding fragmentation;
 - g. Place blocks inside 0.15 mm thick polythene disposal sacks and seal with waterproof, self adhesive tape. Additional sacks may be required if deemed necessary by the CM;
 - h. Remove all remaining debris at the end of each work shift.

DEM2.W570.8**REMOVAL OF ROOF INSULATION TILES**

1. Preparation procedures: in addition to the general preparation procedures as **DEM2.W520**:
 - a. Access asbestos removal work area through a designated route and the hygiene unit;
 - b. Isolate asbestos removal work area from internal spaces with 0.15 mm thick polythene sheeting;
 - c. Exclude all personnel not directly involved with the work. Post warning notices prohibiting access and alert others not involved in the work of the presence of asbestos;
 - d. All removal operatives are to wear Approved ori-nasal half masks fitted with Approved air filters, Approved disposable coveralls and knee length rubber boots with non-slip soles. Wear full face positive pressure respirator if asbestos other than chrysotile is present. Wear gloves if it is considered necessary;
 - e. Take full account of prevailing weather conditions, and the following, to avoid dispersion of asbestos fibres to adjoining buildings:
 - i. Under normal conditions: schedule asbestos removal works on a daily basis to allow for preparation, removal, bagging and cleaning up of debris;
 - ii. During windy conditions: seek Approval to continue prior to commencement of the asbestos removal works. Erect a suitable 1000 mm high wind break of tarpaulin sheeting supported on a substantial bamboo framework;
 - iii. Special circumstances (e.g. working immediately adjacent adjoining residential accommodation): prevent entry of asbestos dust by erecting a 2000 mm high screen, fabricated from tarpaulin sheets supported on a bamboo frame. Extend the screen on both sides by 2000 mm minimum beyond the edge of the block to be demolished. Ensure all screens are secured against the wind.
2. Removal:
 - a. Clear up as asbestos removal works proceed bagging all resulting debris on removal of tiles. Prevent debris accumulating on the floor and becoming further broken or crushed. Remove all remaining debris at the end of each workshift;
 - b. Spray amended water using a low pressure water spray onto the roof tiles during the course of the removal works;
 - c. Use hand tools for the removal operation. Take care whilst lifting the tiles to ensure breakage is kept to a minimum;

-
- d. Use hand chisels to remove all the remaining portions of tiles from the cement screed.

DEM2.W580.8 REMOVAL OF REFUSE CHUTES

1. Preparation procedures: in addition to the general preparation procedures as **DEM2.W520**:
 - a. Be aware of the potential high risk to nearby residents of this type of removal work and pay particular attention to minimizing the release of dust from the asbestos removal works;
 - b. Removal operators in the working zone are to wear ori-nasal half faced masks fitted with Approved HEPA filters, Approved disposable coveralls and shoe covers. Full face positive pressure respirators fitted with HEPA filters are worn if amosite or crocidolite are present;
 - c. Carry out removal under total containment and negative pressure of 15 Pa and 6 nos. of air changes per hour minimum. Reliance on air monitoring outside the containment will not be considered sufficient;
 - d. Ensure the construction of the containment conforms to the following:
 - i. Unless a two floor containment zone is Approved, each floor constitutes a separate containment zone;
 - ii. Each zone, including the chute aperture at each zone boundary, is completely sealed from the next. No debris is allowed to fall to the zone below the rough chute opening;
 - iii. The vent pipe at roof level and the portion at ground level are included within the containment;
 - iv. Removal work commences from the top working downwards;
 - v. Each containment is treated as a separate entity, with a hygiene unit, an air mover and a viewing panel for external inspection of the asbestos removal works. Leave a sufficient clear space from the flue to enable the whole section of flue to be removed and manoeuvred inside the containment zone;
 - vi. Construct using a timber framework faced with 2 layers of 0.15 mm thick polythene sheeting. Make airtight by sealing all joints with Approved foam sealant, spray glue and tape.
 - e. Prior to commencement of asbestos removal work:
 - i. Carry out a visual inspection and a smoke test with non-toxic smoke to ensure air-tightness of the containment;
 - ii. On completion of successful test: switch the air-mover to exhaust smoke from the containment and carry out a visual test to ensure that the absolute filter screens out the smoke effectively and the pressure gauge indicates normal.
 - f. If the test is unsuccessful: seal the air-mover and remove from site for servicing.
2. Removal:
 - a. Run air movers continuously throughout the removal works and until satisfactory clearance test results are obtained;

-
- b. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed. Minimize fibre release by wetting with amended water and HEPA vacuuming to remove debris as it is created;
 - c. Take down chute sections within the work zone using non-power hand tools. Do not disturb the seal between the zone below;
 - d. Cover and seal both sides of the short chute section passing through floor. Construct seal from timber framing faced both sides with polythene sheeting;
 - e. Carry out visual inspection and clearance test in the containment zone of that part of the chute removed; then
 - f. Repeat removal operations in next zone down, removing small section left in the upper zone from the zone below without disturbing the enclosure. The inside of the enclosing structure left on the upper zone must be decontaminated from below.

DEM2.W590.8**REMOVAL OF INTERNAL CHIMNEY FLUES**

1. Preparation procedures: in addition to the general preparation procedures as **DEM2.W520**:
 - a. Carry out removal of asbestos lagging under total containment and a negative pressure of 15 Pa minimum. Make efforts to minimize fibre release within the containment, reliance on air monitoring outside the containment will not be considered sufficient;
 - b. Ensure the construction of the containment conforms to the following:
 - i. Each floor constitutes a separate containment zone. Provide separate containments for the portions at the roof and kitchen level (ground floor level);
 - ii. Removal work commences from the top working downwards;
 - iii. Each containment is treated as a separate entity, with a hygiene unit, an air mover and a viewing panel for external inspection of the asbestos removal works. Leave a clear space of 1500 mm minimum from the flue to enable the whole section of flue to be removed and manoeuvred inside the containment zone;
 - iv. Construct using a timber framework faced with 3 layers of 0.15 mm thick polythene sheeting. Make airtight by sealing all joints with an approved foam sealant, spray glue and tape.
 - c. Prior to commencement of asbestos removal work:
 - i. Carry out a smoke test with non-toxic smoke to ensure air-tightness of the containment;
 - ii. On completion of successful test: switch the air-mover to exhaust smoke from the containment and carry out a visual test to ensure that the absolute filter screens out the smoke effectively and the pressure gauge indicates normal;
 - iii. If the test is unsuccessful: seal the air-mover and remove from site for servicing.
 - d. Removal operators are to wear Approved full face positive pressure respirators fitted with HEPA filters, Approved disposable coverall and shoe cover.

2. Removal:

-
- a. Run air movers continuously to provide at least 6 air changes per hour throughout the removal works and until satisfactory clearance tests are obtained;
 - b. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed. Minimize fibre release by wetting with amended water and HEPA vacuuming to remove debris as it is created;
 - c. Carry out asbestos removal to a maximum of two adjoining vertical zones at any one time. Treat each horizontal as a separate zone;
 - d. Where only surface lagging is to be removed from the chimney flue, apply wetting agent in accordance with the manufacturer's recommendations to all surfaces of the internal chimney flue lagging as the works proceed. Ensure complete penetration of the lagging material before removing. Completely de-lag the section of the flue within a zone using non-power hand tools, decontaminate and carry out a clearance test prior to commencing asbestos removal work on any further zone;
 - e. Where the flues are of asbestos cement or in a poor condition carry out the following:
 - i. Within each containment zone: double wrap flue section in polythene sheeting and remove with the lagging using non-power hand tools. Double wrap flue sections in polythene sheeting before removal from containment;
 - ii. Remove the portion of the flue that passes through the floor slab once the containment zone on the floor below has been constructed and its air mover has been switched on. The holes left are completely sealed;
 - iii. Removal work in 2 adjoining zones may be carried out at one time if containment zone has been built below and its air mover switched on.

DEM2.W600.8**REMOVAL OF EXTERNAL CHIMNEY FLUES WITH SURFACE LAGGING**

1. Preparation procedures: in addition to the general preparation procedures as **DEM2.W520**:
 - a. Carry out the removal of asbestos lagging under total containment and a negative pressure of 15 Pa minimum. Make efforts to minimize fibre release within the containment, reliance on air monitoring outside the containment will not be considered sufficient;
 - b. Design and construct containment in a manner which minimizes risk of exposure;
 - c. When designing and constructing the external containment structure, consider the following:
 - i. Asbestos removal work method to be employed;
 - ii. Safety aspects of working at height;
 - iii. Maintaining the weatherproof integrity of the structure.
 - d. Erect a suitable double scaffolding, comprising the following:
 - i. An access staircase outside the containment. Where the staircase is constructed of bamboo or similar, ensure gaps between steps do not exceed 300 mm and landings have supports at 300 mm maximum centres, sturdy enough to support a fully laden man plus equipment;
 - ii. A work platform every two floors inside the containment;

-
- iii. A safe internal access within the containment;
 - iv. A hoist system for transportation of waste;
 - v. A tarpaulin cover to encase the structure externally, securely fixed to withstand wind conditions.
 - e. Dismantle existing installations including ventilation ducts that obstruct access to the flue. Do not disturb the flue during this operation and the erection of the scaffolding;
 - f. Ensure the construction of the containment conforms to the following:
 - i. Line the platform inside the containment with 18 mm thick plywood covered with 2 layers of 0.15 mm thick polythene sheeting. Support all joints in the plywood lining;
 - ii. Construct using a timber framework faced with 3 layers of 0.15 mm thick polythene sheeting securely fixed to battens tied to the scaffolding structure. Make airtight by sealing all joints with an Approved foam sealant, spray glue and tape;
 - iii. Install florescent tubing or similar non-heat producing lighting inside the containment to provide adequate illumination;
 - iv. Treat each containment zone as a separate entity, with a hygiene unit, an air mover and a viewing panel for external inspection of the asbestos removal works.
 - g. Prior to commencement of asbestos removal work:
 - i. Carry out a smoke test with non-toxic smoke to ensure air-tightness of the containment;
 - ii. On completion of a successful test: switch the air-mover to exhaust smoke from the containment and carry out a visual test to ensure that the absolute filter screens out the smoke effectively and the pressure gauge indicates normal;
 - iii. If the test is unsuccessful: seal the air-mover and remove from site for servicing.
 - h. Removal operators are to wear Approved full face positive pressure respirators fitted with HEPA filters, Approved disposable coverall and shoe cover.
2. Removal:
- a. Run air movers continuously throughout the asbestos removal works and until satisfactory clearance tests are obtained;
 - b. Clear up asbestos proceeding from top to bottom zone by zone as the removal work proceeds. Each zone is approximately 2 floors in height. Prevent debris accumulating on the floor and becoming further broken or crushed. Minimize fibre release by wetting with amended water and HEPA vacuuming to remove debris as it is created;
 - c. Carry out asbestos removal to a maximum of two adjoining vertical zones at any one time. Treat each horizontal section as a separate zone;
 - d. Keep fibre release to a minimum by wetting with amended water and a HEPA vacuum to remove debris as it is created. Completely de-lagg the section of the flue within a zone using non-power hand tools, decontaminate and carry out a clearance test prior to commencing asbestos removal work on any further zone;

-
- e. Where the external flue is in a poor condition, remove flue section with lagging to a maximum of 2000 mm in length, using non-powered hand tools. Double wrap flue sections in polythene sheeting prior to removal from containment.

DEM2.W610.8 REMOVAL OF SANDWICHED FLUES

1. Preparation procedures: in addition to the general preparation procedures as **DEM2.W520**:
 - a. Carry out the asbestos removal work under total containment and a negative pressure of 15Pa minimum. Make efforts to minimize fibre release within the containment. Ensure containment is large enough to allow manoeuvring of the floor sections but not greater than eight floors in height;
 - b. Remove the whole flue to get rid of asbestos lagging. Ensure fibre release within the containment is minimized. Reliance on air monitoring outside the containment will not be considered sufficient;
 - c. Design and construct the containment to minimize the risk of exposure to asbestos containing materials;
 - d. When designing and constructing the external containment structure, consider the following:
 - i. Asbestos removal work method to be employed;
 - ii. Safety aspects of working at height;
 - iii. Maintaining the weatherproof integrity of the structure.
 - e. Erect a suitable double scaffolding, comprising the following:
 - i. An access staircase outside the containment.
 - ii. A work platform every two floors inside the containment;
 - iii. A safe internal access within the containment;
 - iv. A hoist system for transportation of waste;
 - v. A tarpaulin cover to encase the structure externally, securely fixed to withstand wind conditions.
 - f. Dismantle existing installations including ventilation ducts that obstruct access to the flue. Do not disturb the flue during this operation and the erection of the scaffolding;
 - g. Ensure the construction of the containment conforms to the following:
 - i. Construct using a scaffolding framework, faced with 2 layers of 0.15 mm thick polythene sheeting fixed to battens. Make airtight by sealing all joints with an Approved foam sealant, spray glue and tape.
 - h. Treat each containment zone as a full height separate entity, with a hygiene unit, an air mover and a viewing panel for external inspection of the asbestos removal works;
 - i. Prior to commencement of asbestos removal work:
 - i. Carry out a smoke test with non-toxic smoke to ensure air-tightness of the containment;
 - ii. On completion of successful test: switch the air-mover to exhaust smoke from the containment and carry out a visual test to ensure that the absolute filter screens out the smoke effectively and the pressure gauge indicates normal;

-
- iii. If the test is unsuccessful: seal the air-mover and remove from site for servicing.
 - 2. Removal:
 - a. Run air movers continuously throughout the asbestos removal works to provide at least 6 air changes per hour and maintain a negative pressure of at least 15 Pa and until satisfactory clearance tests are obtained;
 - b. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed. Minimize fibre release by wetting with amended water and HEPA vacuuming to remove debris as it is created;
 - c. Remove whole flue complete to ensure removal of all asbestos lagging;
 - d. Treat each horizontal section as a separate zone. Commence removal work from the top working downwards. Wet exposed lagging and insulation with Amended Water and keep them damp all the time;
 - e. Dismantle the flue in sections by unbolting the flanged joints, preventing where possible damage to the flue walls. Seal both ends of the flue with PVC tape before transferring by hoist to ground level.

DEM2.W620.8**REMOVAL OF ASBESTOS-CONTAINING CORRUGATED SHEET ROOFING**

- 1. Preparation procedures: in addition to the general preparation procedures as **DEM2.W520**:
 - a. Access the asbestos removal work area through a designated route and the hygiene unit;
 - b. Clean area beneath the roofing and lay 2 layers of plastic sheeting over the floor area to collect debris;
 - c. Treat asbestos cement sheets being removed as asbestos waste;
 - d. Fix suitable signs;
 - e. All workers must wear Approved half-face ori-nasal respirators and disposable coveralls with a hood during the removal work.
- 2. Removal:
 - a. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor or ground and becoming further broken or crushed;
 - b. During the asbestos removal operation continuously spray roofing sheets and surrounding roof surface with amended water to keep them wet all the time;
 - c. Remove and dispose of asbestos cement roofing sheets with care, avoiding free fall of asbestos containing debris from a height above 500 mm;
 - d. Remove sheets intact as far as is practicable using non-power hand tools. Keep unavoidable breakage to a minimum;
 - e. Wrap all removed sheets in 2 layers of 0.15 mm thick polythene and label as asbestos waste. Collect the debris into the labelled asbestos waste bags and seal securely with PVC tape.

DEM2.W630.8**REMOVAL OF CEMENT COVERED CORRUGATED ASBESTOS SHEET ROOFING**

- 1. Preparation procedures: in addition to the general preparation procedures as **DEM2.W520**;

-
- a. Access the asbestos removal work area through a designated route and the hygiene unit;
 - b. All workers must wear Approved half face ori-nasal respirators and disposable coveralls during the removal work.
2. Removal:
- a. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed;
 - b. During the removal operation continuously spray roofing sheets and surrounding roof sheets with amended water;
 - c. Remove and dispose of asbestos cement roofing sheets with care, avoiding free fall of asbestos containing debris from a height above 500 mm. Where a hazard of falling debris above this height exists, carry out the following, or similar Approved operation ensuring no free falling of asbestos debris:
 - i. Securely connect a steel lifting frame of sufficient strength onto and across the underside for subsequent lifting of the roof;
 - ii. Fix four wire slings of sufficient strength to the four upturns of the steel beams with the free ends fixed to a crane. Avoid staying directly below;
 - iii. Once the complete roof is suspended from above by the crane, cut and remove all supports lower down onto the floor and disconnect the wire slings.
 - d. Remove sheets intact as far as is practicable using non-power hand tools. Keep unavoidable breakage to a minimum;
 - e. Wrap all removed sheets in 2 layers of 0.15 mm thick polythene and label as asbestos waste.

DEM2.W640.8**REMOVAL OF CHALKBOARDS CONTAINING ASBESTOS**

1. Preparation procedures: in addition to the general preparation procedures as **DEM2.W520**;
 - a. Access the asbestos removal work area through a designated route and the hygiene unit. Fix a suitable sign;
 - b. Removal operators in the working zone are to wear ori-nasal half face masks fitted with Approved air filters, Approved disposable coveralls and knee length rubber boots with non-slip soles. Wear gloves if it is considered necessary;
 - c. Dispose contaminated clothing and used respirator filters after each shift;
 - d. Line the floor of the classroom within 2000 mm of the chalkboard with 2 layers of polythene sheeting.
2. Removal:
 - a. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed;
 - b. Remove the chalkboard in one piece using hand tools, wrap in 2 layers of 0.15 mm thick polythene sheeting and seal with PVC tape and label;
 - c. Use a mist spray during the removal process to suppress dust release. Remove any dust or debris generated immediately by vacuuming and wet-wiping;
 - d. Wet wipe and clean walls and floors within 2 metres with HEPA vacuum cleaner.

DEM2.W650.8 REMOVAL OF BUILDING SERVICES INSTALLATION

1. Preparation procedures: comply with the general preparation procedures as **DEM2.W520**:
 - a. Removal operators in the working zone are to wear ori-nasal half face masks fitted with Approved air filters, Approved disposable gloves.
2. Removal:
 - a. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed;
 - b. Do not disturb the ACM whilst dismantling or dismounting any building services installation;
 - c. Where part of an installation containing asbestos is required to be detached, carefully remove in tact;
 - d. Continually spray amended water onto the installations during the whole period of the removal;
 - e. Wrap the removed installation in 2 layers of 0.15 mm thick polythene sheeting, seal with PVC tape and label.

DEM2.W660.8 REMOVAL OF BUSBAR RISER TRUNKING

1. Preparation procedures: in addition to the general preparation procedures as **DEM2.W520**:
 - a. All Workers must wear Approved half face ori-nasal respirators fitted with Approved air filters, Approved disposable coveralls and gloves;
 - b. Use polythene sheeting to line the floor around the busbar riser trunking to collect any scattered debris;
 - c. Line caulking on the ceiling of the floor below with a polythene bag or sheet, fitted with a HEPA vacuum cleaner to draw any fibre generated in the removal of caulking from above. Dispose of as asbestos waste.
2. Removal:
 - a. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further crushed or broken;
 - b. Carefully chisel off all caulking with minimum generation of dust. Remove all asbestos fibres by thoroughly vacuuming and wiping with a clean, dry cloth the outside of the busbar riser trunking, the concrete kerb and the ceiling of the floor below;
 - c. Remove the whole section of busbar riser trunking without disturbing the fire barrier or breaking the concrete kerb and wrap in 0.15 mm thick polythene sheeting, seal with tape and dispose of as asbestos waste. Wrap both ends of the trunking to prevent dropping any accessory of the fire barrier;
 - d. Handle caulking for underground cable, conduit or trunking through floor slab in a similar manner.

DEM2.W670.8 REMOVAL OF FLEXIBLE JOINT OR CAULKING TO CONDUIT OR TRUNKING THROUGH FLOOR SLABS

1. Preparation procedures: in addition to the general preparation procedures as **DEM2.W520**:
 - a. Use polythene sheeting to line the area of floor adjacent to caulking removal works to collect any scattered debris;

-
- b. Wet the flexible joint/gasket or caulking with wetting agent.
 2. Removal:
 - a. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further crushed or broken;
 - b. Vacuum clean the flexible joint/gasket or caulking and the adjacent ducting with HEPA vacuum cleaner;
 - c. Wet the flexible joint/gasket or caulking with wetting agent and wrap it with 2 layers of plastics;
 - d. Carefully chisel off all caulking. Spray the flexible joint with amended water to keep it wet. Remove all asbestos fibres by thoroughly vacuuming and wiping with a clean, dry cloth the outside of the trunking;
 - e. Wrap the flexible joint/gasket or caulking in double layers of 0.15 mm polythene sheets for disposal.

WORK ON COMPLETION

DEM2.W710.8

GENERAL

Carry out the following operations on completion of the asbestos removal work:

1. Designate a secure area located at ground level to use as a secure area to receive bagged asbestos waste;
2. Install a closed hoist to transport the bagged asbestos waste to ground level;
3. Collect debris into labelled asbestos waste bags and seal securely with PVC tape;
4. Double bag all labelled asbestos waste in an airlock before transferring to the hoist area. Take care at all times when handling the bags to avoid damage;
5. Remove all plastic, protective sheeting and timber framing and dispose of as contaminated waste. Where permitted by the CM, well covered and cleaned timber frame and external cover panels may be re-used;
6. Wrap all items too large to fit normal waste disposal sacks using 0.15 mm thick polythene sheeting, secured by vinyl tape and label clearly as asbestos waste;
7. Take all sacks and wrapped debris to a designated collection point through an Approved route, vacuum and wet clean and place in a further 0.15 mm thick polythene bag or wrap in a second layer of 0.15 mm thick polythene, sealed using waterproof, self adhesive vinyl tape;
8. Metal drums may be used as an alternative to polythene bags, provided the following is complied with:
 - a. Conform with EPD disposal requirements;
 - b. Do not place or roll drums directly onto asbestos roof tiles, or cause crushing of tiles;
 - c. Make available a cleared area for the storage of drums containing asbestos debris;
 - d. Seal and remove all drums, whether or not filled, from the work area to the storage area at the end of each day's work and ensure that the drums undergo decontamination prior to removal;
 - e. Sack barrows may be used in the Work Area for transportation of drums;
 - f. Take steps to prevent dust releasing from drums.

9. Vacuum and wet clean nylon tarpaulin screen, and all tools and equipment for re-use after a satisfactory re-assurance test has been carried out. Tools and equipment are secured inside polythene bags before taken off the site;
10. Ensure each asbestos removal working zone/containment is clean and dust free before the workmen leave site at the end of each day's work;
11. Remove all dust and debris from operators' clothing and footwear after a work shift or on leaving the site;
12. Arrange for a clearance/reassurance test and an inspection by the CM to be carried out for the whole working zone after the area is vacuumed and wet cleaned. If the test result indicates fibre levels in excess of 0.01 fibres per ml, reclean the working zone and carry out a further test, at the Contractor's own expense and with no claim for any extension of time;
13. Number all bags containing asbestos waste using a waterproof pen. The Authority's site staff will keep a record of the waste;
14. Pass all waste water through an Approved filter to remove all particles to a level of 5 microns in suspension before discharging into the drainage system.

DEM2.W720.8**BALCONY AND STAIRCASE GRILLE PANELS**

In addition to the relevant general requirements as **DEM2.W710** carry out the following:

1. Vacuum and wet clean walls and floor of the balcony and any areas within the asbestos removal working zone. The polythene sheeting on the floor of the balcony is placed in asbestos disposal bags and disposed of as contaminated waste;
2. Vacuum and wet clean the area surrounding the grille panel cavity;
3. Seal filled sacks with waterproof, self adhesive vinyl tape. Large or unwieldy items may be wrapped in 0.15 mm thick polythene sheet, secured by vinyl tape and labelled as asbestos waste;
4. On satisfactory completion of the clearance test, spray PVA on polythene covering to the panels at the external face of the balcony wall and the polythene sheeting before dismantling the containment and dispose as contaminated waste;
5. At the end of each day's work, allow for the complete removal of the grille panel and the clearing up of the debris in a flat.

DEM2.W730.8**ROOF INSULATION TILES**

In addition to the relevant general requirements as **DEM2.W710** carry out the following:

1. Thoroughly clean the roof screed, all contained surfaces and equipment with a vacuum cleaner and wet cloths as soon as debris is produced;
2. Transfer labelled asbestos waste bags to a clean area outside the Work Area where they are wiped clean and double-bagged.

DEM2.W740.8**REFUSE CHUTES**

In addition to the relevant general requirements as **DEM2.W710** carry out the following:

1. Double wrap chute sections in polythene sheets before passing out of the containment;
2. On satisfactory completion of the clearance test, spray PVA on the polythene sheeting before dismantling the containment;

3. Remove timber frame and dispose of as asbestos waste. Re-use timber shuttering if it has been well covered during the asbestos removal works and has been thoroughly cleaned;
4. Number bags and wrapped chute sections and provide record to HD site staff. Provide a certificate from the dump site to HD site staff.

DEM2.W750.8 INTERNAL CHIMNEY FLUES

In addition to the relevant general requirements as **DEM2.W710** carry out the following:

1. Double bag all asbestos waste bags in the middle chamber of the airlock before transferring to the ground level secure store;
2. On completion of removal of the lagging, wire brush the surfaces of the flue to remove any remaining debris;
3. Arrange for a Penultimate Tests after inspection by CM that the area is free of debris and dust. If test results exceed 0.01 fibres/ml, reclean the area and carry out further Penultimate Test. If test results satisfactory, wet wipe and vacuum the area and arrange for a final clearance test;
4. Number bags and wrapped flue sections and provide record to HD site staff. Provide a certificate from the dump site to HD site staff;
5. On satisfactory completion of the final clearance test, spray PVA on the polythene sheeting before dismantling the containment.

DEM2.W760.8 EXTERNAL CHIMNEY FLUES WITH SURFACE LAGGING

In addition to the relevant general requirements as **DEM2.W710** carry out the following:

1. On completion of removal of the lagging, wire brush the surfaces of the flue to remove any remaining debris;
2. Install a hoist system within the tarpaulin enclosure for transportation of the bagged asbestos waste to ground level. The hoist is closed cage type;
3. Arrange for a Penultimate Tests after inspection by CM that the area is free of debris and dust. If test results exceed 0.01 fibres/ml, reclean the area and carry out further Penultimate Test. If test results satisfactory, wet wipe and vacuum the area and arrange for a final clearance test;
4. Number bags and wrapped flue sections and provide record to HD site staff. Provide a certificate from the dump site to HD site staff;
5. On satisfactory completion of the clearance test, spray PVA on the polythene sheeting before dismantling the containment.

DEM2.W770.8 SANDWICHED FLUES

In addition to the relevant general requirements as **DEM2.W710** carry out the following:

1. Wipe clean flue sections and wrap in polythene before removing from the containment;
2. Install a hoist system within the tarpaulin enclosure for transportation of the bagged asbestos waste to ground level. The hoist is closed cage type;
3. Arrange for a Penultimate Tests after inspection by CM that the area is free of debris and dust. If test results exceed 0.01 fibres/ml, reclean the area and carry out further Penultimate Test. If test results satisfactory, wet wipe and vacuum the area and arrange for a final clearance test;

4. Number bags and wrapped flue sections and provide record to HD site staff. Provide a certificate from the dump site to HD site staff;
5. On satisfactory completion of the clearance test, spray PVA on the polythene sheeting before dismantling the containment.

DEM2.W780.8 CORRUGATED SHEETS AND CEMENT COVERED CORRUGATED SHEETS

In addition to the relevant general requirements as **DEM2.W710** carry out the following:

1. Thoroughly clean by wet wiping, HEPA vacuuming and manual scraping any debris adhering to the floor, the steel structure and the steel runners etc.;
2. Clean Work Area before the end of the day;
3. Number bags and wrapped flue sections and provide record to HD site staff. Provide a certificate from the dump site to HD site staff.

DEM2.W790.8 BUSBAR RISER TRUNKING AND BUILDING SERVICES INSTALLATION

In addition to the relevant general requirements as **DEM2.W710** carry out the following:

1. Vacuum and wipe with clean, dry cloth all surfaces within the rooms to both floors to remove any asbestos fibres. Only contaminated tools may be cleaned with a damp cloth;
2. Wet wipe outer surface of the bagged waste and wrapped ACM. Wrap in another polythene sheet or bag and label outside the working area.

DEM2.W800.8 CHALKBOARDS

In addition to the relevant general requirements as **DEM2.W710** carry out the following:

1. Vacuum and wipe clean the area adjacent to the asbestos removal works to a distance of 2000 mm;
2. Wet wipe outer surface of the bagged waste and wrapped ACM. Wrap in another polythene sheet or bag and label outside the working area.

DEM2.W810.8 DISPOSAL OF WASTE

1. Dispose of all asbestos waste in a designated site and in strict accordance with the 'Code of Practice on the Handling, Transport and Disposal of Asbestos Waste', issued by the Environmental Protection Department (EPD);
2. Temporarily store all asbestos waste in sealed bags in a secure Approved store. Remove waste from store commencing from the top working downwards unless otherwise Instructed;
3. On completion of asbestos removal to an entire floor invite the CM to inspect the works and check the number of waste bags for that zone prior to removing the bags to the secure store;
4. To avoid over accumulation of waste at the appointed site, provide information to EPD stating the proposed schedule for disposal of asbestos waste;
5. Provide transport and all necessary equipment required for disposal of asbestos waste;
6. Collect all water used within the asbestos removal works, including that used in washing facilities, by means of sumps and pumps and pass through an aquarium type filter or similar Approved to remove particles down to 5 microns in suspension before discharging into the drainage system;

7. Inform the CM at least 7 days prior to disposal of waste from site. Inform the CM the type of waste and the number and location of packages to be disposed prior to removing from site. Submit a signed copy of each delivery note to the CM;
8. Asbestos removal work will not be permitted to proceed to more than two floors below a level if provisional acceptance of the asbestos removal work has not been obtained from the CM;
9. Upon satisfactory visual inspection of the works by the CM on completion of one entire floor, arrange for Clearance/Reassurance Tests to be carried out by the Direct Testing Contractor.

EMERGENCY PROCEDURES

DEM2.W910.8 GENERAL

If during the course of the asbestos removal works any of the following situations occur, inform the CM and carry out the following specified procedures immediately. Any stoppage or reduction in output resulting in compliance with this clause will not result in any extension of time for completion or to any additional costs claimed.

DEM2.W920.8 SPILLAGE OF ASBESTOS DEBRIS

1. Stop all processes which may result in the production of asbestos dust;
2. Spray all surfaces and debris within the asbestos removal work area with amended water in a fine mist spray, using airless spray equipment;
3. Bag all loose asbestos debris present in the asbestos removal work area and remove to a secure store. Wipe clean and vacuum all surfaces when the surface is dry;
4. Prepare the site of the remedial work for inspection by the CM and air testing prior to recommencing removal work.

DEM2.W940.8 FIRE

1. Spray all surfaces and debris within the asbestos removal work area with amended water in a fine mist spray, using airless spray equipment once the fire has been extinguished and the Site is safe for re-entry;
2. Bag all loose asbestos debris present in the asbestos removal work area and remove to a secure store. Wipe clean and vacuum all surfaces when the surface is dry;
3. Prepare the Site for inspection by the CM and air testing prior to recommencing removal work.

DEM2.W950.8 ACCIDENT

1. Stop all work and if necessary remove worker(s) to a safe area;
2. If a worker has collapsed remove face mask (in all other cases the face mask should be left in place), carry out normal emergency first aid procedures and arrange to transfer the worker to hospital. Personal decontamination should be carried out if possible;
3. Where it is impossible to carry out decontamination procedures on the worker, inform the medical team to enable them to take the appropriate safety measures;
4. Bag all loose asbestos debris present in the asbestos removal work area and remove to a secure store. Wipe clean and vacuum all surfaces and any adjoining area contaminated during the emergency;

-
5. Prepare the Site for inspection by the CM and air testing prior to recommencing removal work.

DEM2.W960.8 TYPHOON SIGNAL NUMBER 3 AND ABOVE

1. Stop all processes which may result in the production of asbestos dust;
2. Spray all surfaces and debris within the asbestos removal work area with amended water in a fine mist spray, using airless spray equipment;
3. Bag all loose asbestos debris present in the asbestos removal work area and remove to a secure store. Wipe clean and vacuum all surfaces;
4. Cut off all power and water supplies and secure all loose equipment against typhoon damage;
5. Arrange a revised inspection by the CM before the workers leave Site;
6. Recommence the removal works once the No 3 typhoon signal has been lowered, the necessary cleaning up work and repairs to containment have been completed and permission has been given by the CM.

DEM2.W970.8 PERSONAL PROTECTION DECONTAMINATION

Prior to leaving the site ensure all operatives:

1. Are provided with showering facilities and all items including sponge and brush necessary to clean respiratory equipment and protective clothing;
2. Wet and remove all dust and debris from working clothing and footwear using an Approved vacuum cleaner before going out of the working area;
3. Follow the designated route to the hygiene unit. On entering the dirty end wet their respirators and protective clothing, contaminated equipments are stored in labelled waste disposal receptacle in the dirty area;
4. Remove clothing after wetting thoroughly in the dirty area of the hygiene unit, and place into a labelled disposal bin. Remove footwear and leave for cleaning and decontamination;
5. Pass into the shower area, wash thoroughly particularly hair and finger nails, discarding the respirator filter in a designated bin;
6. Do not remove respiratory protective equipment until in the shower and the respirator has been washed;
7. Place respirators in a drying compartment of the clean area of the unit after washing, change cloths in the clean area;
8. Vacuum, wet clean and secure inside polythene bags all tools and equipment prior to removal from the asbestos removal work site.

DEM2.W980.8 ACCEPTANCE OF ASBESTOS REMOVAL WORK

1. Provisional acceptance is based on visual inspection by the CM together with air test results of Penultimate Tests within the acceptance limit;
2. Upon completion of asbestos removal and clearance of asbestos waste and equipment, the CM conducts a final inspection;
3. Final acceptance is based on visual inspection by the CM together with Final Clearance Test results within the acceptance limit;
4. After final acceptance, the site is safe to continue with demolition work.

TESTING

AIR MONITORING TEST

DEM2.T010.8

AIR MONITORING TESTS BORNE BY EMPLOYER

The Authority will employ at its own expense a Direct Testing Contractor to carry out air monitoring test as follows to measure the asbestos fibre content in the air outside and within the site during the asbestos removal works. The Authority will keep a record of all air monitoring test results for tests carried out by the Direct Testing Contractor on Site for inspection by the Contractor:

1. Prior to commencement of the asbestos removal work: air sampling tests (environmental test) shall be carried out to ascertain the background level of air quality in the vicinity of the block at locations outside the hoarding in a convenient open area, within the adjacent blocks and on the edge of the estate, and at other locations as agreed;
2. During asbestos removal work: air sampling tests (environmental test) shall be carried out daily at regular sampling points to establish the fibre level of airborne dust at the closest sensitive receptor and around the demolition site; and
3. On completion of the asbestos removal works: air sampling tests shall be carried out to ascertain the air quality for clearance and reassurance (clearance test and reassurance test) in accordance with the following table:

Items	Clearance/Reassurance
Balcony grille	1 in 10 flats (min. 2 per zone)
Stair grille	1 in 5 grille (min. 1 per zone)
Roof tile	min. 3 per roof
Refuse chute	1 per zone (3 for the first 10 m ³ of containment size)
Chimney	1 per zone (3 for the first 10 m ³ of containment size)
Corrugated sheet	1 per zone
Chalk board	1 per 10 nos. (min. 1 per zone)

DEM2.T020.8

AIR MONITORING TESTS BORNE BY CONTRACTOR

Appoint an Approved independent asbestos laboratory registered under Air Pollution Control Ordinance to carry out air monitoring tests, except those tests stated in **DEM2.T010** which are to be carried out by the Direct Testing Contractor, to ensure conformity with the requirements of this Specification.

DEM2.T030.8

SURVEILLANCE TESTS BY DIRECT TESTING CONTRACTOR

For air monitoring tests that are carried out by the Approved independent laboratory, CM may employ Direct Testing Contractor to carry out parallel tests.

DEM2.T040.8 AIR MONITORING TESTS

1. Testing arrangements:
 - a. Comply with the air monitoring requirements in the Asbestos Abatement Plan as approved by EPD;
 - b. Arrange and allow for coordination of the air monitoring operations within the programme for the asbestos removal works;
 - c. Arrange a representative to present at all stages of the air monitoring tests if possible. Non-attendance at test will not invalidate test results.
2. Testing methods:
 - a. As **DEM2.M020**;
 - b. Do not exceed the following levels during and on completion of the asbestos removal works and provide the appropriate respiratory protective equipment for personnel involved:
 - i. During asbestos removal works:
 - Amosite or crocidolite: 0.2 fibre per millilitre;
 - Other types of asbestos: 0.5 fibre per millilitre.
 - ii. On completion of asbestos removal works (final clearance test / reassurance test) when no visible debris is apparent: 0.01 fibre per millilitre. If the limit is exceeded, reclean the working zone and repeat final clearance / reassurance test after 24 hours, all extra time and costs are to be borne by the contractor;
 - iii. Environmental air level outside tarpaulin / hoarding must not differ significantly from background level and in any case must not exceed Environmental Control Level of 0.01 fibre per millilitre.
3. Non-compliance:
 - a. Where the fibre count exceeds the acceptable limit:
 - i. Stop all processes which may result in the production of asbestos dust;
 - ii. Spray all surfaces and debris within the asbestos removal work area with amended water in a fine mist spray, using airless spray equipment;
 - iii. Bag all loose asbestos debris present in the asbestos removal work area and remove to a secure store. Wipe clean and vacuum all surfaces;
 - iv. Together with the CM, investigate the integrity of the containment, identify the cause of the limit exceedance and take immediate measures, as directed by the CM, to rectify the situation.
 - b. In the event of air monitoring test result failures resulting from the Contractor's non-compliance with the workmanship requirements of this Worksection, bear all costs in relation to tests carried out and those tests required subsequent to rectification of the works to confirm compliance.

PIL1 PILING AND FOOTING

GENERAL

DEFINITIONS

PIL1.G010.8

DEFINITIONS

In this Worksection, the following definitions are used:

1. "Piling Contract" shall mean a foundation contract for which the scope of works includes construction of foundation and does not include the construction of superstructure;
2. "Combined Piling and Building Contract" shall mean a contract for which the scope of works includes the construction of both the foundation and the superstructure;
3. "Contractor's Design Piling Contract / Combined Piling and Building Contract" shall mean a Piling Contract / Combined Piling and Building Contract for which the scope of works includes design of piles and/or pile caps and/or footings;
4. "Engineer's Design Piling Contract / Combined Piling and Building Contract" shall mean a Piling Contract / Combined Piling and Building Contract for which the scope of works does not include design of piles and/or pile caps and/or footings and the design of such works is provided by the CM.

PIL1.G020.8

CODE OF PRACTICE FOR FOUNDATIONS 2017

In this Specification, the Code of Practice for Foundations shall mean the Code of Practice for Foundations 2017 issued in April 2017 by the Buildings Department of the Hong Kong Special Administrative Region, and its subsequent amendment(s).

DESIGN RESPONSIBILITY

PIL1.G110.8

DESIGN RESPONSIBILITY

The design responsibility for piles, pile caps and footings is to be specified in the [Project Specific Specification](#).

STANDARDS

PIL1.G210.8

PILING

Comply with the Code of Practice for Foundations and the relevant Building Regulations of Hong Kong.

PIL1.G220.8

PILE CAPS AND FOOTINGS

Comply with the 'Concrete Works' Worksection of this Specification in respect of all materials and workmanship for footings, reinforced concrete pile caps and for structural concrete above piles, unless otherwise specified.

PIL1.G230.8

STATUS OF THE SPECIFICATION

Where this Specification includes provisions additional to, or more stringent than those of the aforementioned British Standards, Code of Practice for Foundations or Building Regulations, the provisions of this Specification shall prevail overall.

PIL1.G240.8 OTHER WORKSECTIONS

Comply with the relevant provisions of other Worksections of this Specification and in particular with the following:

1. EAR1 Excavation and Filling;
2. CON1 Insitu Concrete;
3. CON2 or FOR Formwork;
4. CON3 Reinforcement;
5. STR1 Structural Steel.
6. CON9 Off-site Reinforcement Prefabrication Yard

PIL1.G250.8 CONTRACTOR'S DESIGN FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

In the event of any conflict, contradiction or ambiguity between the Contractor's design and this Specification, the provisions of this Specification shall prevail.

PILE TYPES**PIL1.G310.8 GENERAL**

1. This Specification applies to pile types 1 to 7 as defined in clauses **PIL1.G320** to **PIL1.G375** below;
2. Where relevant, this Specification applies equally to any other type of pile.

PIL1.G320.8 TYPE 1 PILES

1. Type 1a piles shall mean precast reinforced concrete piles complying with the requirements stated in clause 5.4.3 of the Code of Practice for Foundations;
2. Type 1b piles shall mean precast prestressed spun concrete piles complying with the requirements stated in clause 5.4.4 of the Code of Practice for Foundations;
3. Type 1c piles shall mean driven cast-in-place concrete piles complying with the requirements stated in clause 5.4.5 of the Code of Practice for Foundations.

PIL1.G330.8 TYPE 2 PILES

Driven steel tube with detachable toe and precast concrete pile insert (steel tube to be withdrawn).

PIL1.G340.8 TYPE 3 PILES

Large diameter bored cast insitu concrete piles:

1. Cast with inserted precast concrete annuli; or
2. Cast with left-in-place lining; or
3. Cast with temporary steel casing.

PIL1.G350.8 TYPE 4 PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Driven steel H-piles of sizes, masses, grades and material properties to the standards as specified in the Drawings.

PIL1.G355.8 TYPE 4 PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Driven steel piles of types and brands recognized by BD. Submit the recognition documentation of the proposed piles issued by BD with the tender.

-
- PIL1.G360.8 TYPE 5 PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**
- Minipiles, being defined as piles consist of a number of steel reinforcing bars encased by grout inside drill hole and comply with the requirements stated in clause 5.4.8 of the Code of Practice for Foundations, derive the structural capacity solely from the steel reinforcing bars.
- PIL1.G365.8 TYPE 5 PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**
- Minipiles, being defined as piles consist of a number of steel reinforcing bars encased by grout inside drill hole and comply with the requirements stated in clause 5.4.8 of the Code of Practice for Foundations, derive the structural capacity solely from the steel reinforcing bars.
- PIL1.G370.8 TYPE 6 PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**
- Socketed steel H-piles, being defined as piles installed by inserting steel H-piles, which their sizes, masses, grades and material properties are to the standards as specified in the Drawings, in pre-bored holes sunk into bedrock as defined in **PIL1.G450** and subsequently grouting the pre-bored hole.
- PIL1.G372.8 TYPE 6 PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**
- Socketed steel H-piles, being defined as piles installed by inserting steel H-piles of types and brands recognized by BD in pre-bored holes sunk into bedrock as defined in **PIL1.G450** and subsequently grouting the pre-bored hole. Submit the recognition documentation of the proposed piles issued by BD with the tender.
- PIL1.G375.8 TYPE 7 PILES**
- Pakt-In-Place (PIP), Continuous Flight Auger Pile (CFA) as stated in clause 5.4.6(2) of the Code of Practice for Foundations or piles formed by similar techniques, being defined as non-percussive cast in-situ concrete piles with diameters not exceeding 610 mm and formed by boring with a continuous flight auger without temporary steel casing. The bored hole is filled with grout placed by pumping through the hollow orifice of the auger pipe at the pile base while withdrawing the auger from the hole.
- PIL1.G380.8 ALTERNATIVE TYPES OF PILE - FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**
- Where the Contractor proposes a type of pile other than the types specified in clauses **PIL1.G320** to **PIL1.G375**, he must submit, with his tender, the testing regime and the acceptance standard of the quality of the piles for Approval.

SITE INVESTIGATION

- PIL1.G410.8 PRELIMINARY INVESTIGATIONS**
1. Tenderers may make preliminary investigations or sink test piles as they require and at their own cost. Arrangements for access to the Site can be made, on application to the CM, at least seven days in advance;
 2. The period for carrying out site investigation by tenderers is scheduled to be between and

PIL1.G420.8 EXISTING BOREHOLE INFORMATION

Certain logs of exploratory boreholes made on Site and reports of laboratory soil test results are available for inspection by appointment at the CM's office during normal working hours. Copies of the drillhole logs and reports may also be made available to tenderers who have previously applied to the CM in writing and subject to payment of a charge for photocopying. Such information as is contained in the drillhole logs and reports is given in good faith and without prejudice to the Contractor's liabilities under the Contract.

PIL1.G430.8 CONTRACTOR'S RESPONSIBILITY

The onus is on the Contractor to satisfy himself as to the nature of the Site sub-soil conditions and to make any site investigation to obtain all information which may affect the Works.

PIL1.G440.8 ADDITIONAL INVESTIGATIONS

1. The Contractor may make such other site investigations during the Contract as he deems necessary and at his own expense;
2. The CM may order such other site investigation during the Contract as he deems necessary.

PIL1.G450.8 DEFINITION OF "BEDROCK"

1. In this Specification, "bedrock" is defined as:
 - a. Rock mass of at least 5 m thick measured downwards from the pile base for Types 1, 2, 3 and 4 piles;
 - b. Rock mass of at least 5 m thick or of thickness not less than the designed length of the rock socket, whichever is the greater, measured downwards from the rockhead of the specified category of rock for Type 5 and 6 piles.
2. The 'rock mass' used in sub-clause (1) shall refer to the following category of rock:
 - a. For Types 1, 2, 3 and 4 piles: Rock not inferior to category 1(d) or 2 rock as described in Table 2.1 of the Code of Practice for Foundations;
 - b. For Types 5 and 6 piles: Category 1(a), 1(b) or 1(c) rock as described in Table 2.1 of the Code of Practice for Foundations.
3. The Uniaxial Compressive Strength (UCS) and point load index strength stated in Table 2.1 of the Code of Practice for Foundations shall be determined by the following tests:
 - a. Uniaxial Compressive Strength (UCS): ASTM Designation: D2938 - 95 Standard Test Method for Unconfined Compression Strength of Intact Rock Core Specimens;
 - b. Point Load Tests: ISRM "Suggested Method for Determining Point Load Strength" 1985 Edition.
4. Refer to **EAR1.W940** sub-clause (2) for definition of "bedrock" for footings;
5. In this Specification, the definition of "total core recovery of the designated grade" shall follow Notes (4) and (5) of Table 2.1 of the Code of Practice for Foundations.

PIL1.G460.8 WORKS REQUIRED TO BE CARRIED OUT BY A RSC(GIFW) UNDER THE CONTRACT

1. All works required to be carried out by a RSC (GIFW) under the CoPSS, including the sampling and testing founding levels to pile Types 3 to 7 inclusive as described in **PIL1.T210** to **PIL1.T240** inclusive and **PIL1.T260** and confirmatory core testing of founding strata of Type 3 piles as described in **PIL1.T1710** to **PIL1.T1750** inclusive, shall be considered as ground investigation works under the contract;
2. Comply with the requirements of clause **PRE.B9.250** for all works stated in sub-clause (1) of this clause.

PIL1.G470.8 BACKFILLING OF DRILLHOLES

1. Unless otherwise instructed by the CM or unless the method or materials of backfilling of drillholes is specifically stated in other parts of the Specification, fill all drillholes with granular material (or with 4:1 cement bentonite grout where Instructed) and compact to the original density of the ground or a higher density;
2. Fill in and compact any subsequent depression of the ground;
3. Do not fill drillholes without the CM's permission.

APPROVED CONTRACTORS AND SUBCONTRACTORS**PIL1.G510.8 APPROVED CONTRACTORS FOR PILING WORKS - FOR ENGINEER'S DESIGN PILING CONTRACT**

1.
 - a. Contractor must be on the following Category of Housing Authority List of Piling Contractors:
 - i. Type 1, 2, & 4 Piles - Percussive Piles Category;
 - ii. Type 3 Pile - Large Diameter Bored Piles Category;
 - iii. Any acceptable pile types other than Type 1, 2, 3 & 4 Piles - Large Diameter Bored Piles Category or Percussive Piles Category.
 - b. In the event that more than one type of piles are used in the Contract, the Contractor must be on the appropriate Categories of Housing Authority List of Piling Contractors for all the pile types used.
2. In the event that the Contractor employ a Piling Sub-contractor to carry out the following piling activities, select the Piling Sub-contractor from the list given in sub-clause (3) below:
 - a. Pile driving of Type 1, 2, & 4 Piles;
 - b. Excavation and concreting of Type 3 Pile;
 - c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles.
3. The Piling Sub-contractor must be on the following list:
 - a. Appropriate Category of Housing Authority List of Piling Contractors; or
 - b. Buildings Department List of Registered Specialist Contractors (Foundation) who has undertaken in the past five years at least three contracts in relevant piling works under ICU's procedures or BD's control and of contract value not less than \$20M in one of the contracts and in aggregates total of not less than \$40M.
4. Piling Sub-contractor for pile types other than Type 3 not on the lists in sub-clause (3) above may be considered and subject to CM's approval.

PIL1.G512.8 APPROVED CONTRACTORS FOR PILING WORKS - FOR CONTRACTOR'S DESIGN PILING CONTRACT

1.
 - a. Contractor must be on the following Category of Housing Authority List of Piling Contractors:
 - i. Type 1, 2, & 4 Piles - Percussive Piles Category;
 - ii. Type 3 Pile - Large Diameter Bored Piles Category;
 - iii. Any acceptable pile types other than Type 1, 2, 3 & 4 Piles - Large Diameter Bored Piles Category or Percussive Piles Category.

- b. In the event that more than one type of piles are used in the Contract, the Contractor must be on the appropriate Categories of Housing Authority List of Piling Contractors for all the pile types used.
2. In the event that the Contractor employ a Piling Sub-contractor to carry out the following piling activities, select the Piling Sub-contractor from the list given in sub-clause (3) below:
 - a. Pile driving of Type 1, 2, & 4 Piles;
 - b. Excavation and concreting of Type 3 Pile;
 - c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles;
 - d. Foundation design.
3. The Piling Sub-contractor must be on the following list:
 - a. Appropriate Category of Housing Authority List of Piling Contractors; or
 - b. Buildings Department List of Registered Specialist Contractors (Foundation) who has undertaken in the past five years at least three contracts in relevant piling works under ICU's procedures or BD's control and of contract value not less than \$20M in one of the contracts and in aggregates total of not less than \$40M.
4. Piling Sub-contractor for pile types other than Type 3 not on the lists in sub-clause (3) above may be considered and subject to CM's approval.

PIL1.G515.8**APPROVED CONTRACTORS FOR PILING WORKS - FOR ENGINEER'S DESIGN COMBINED PILING AND BUILDING CONTRACT**

1. The Contractor must employ a Piling Sub-contractor to carry out the following piling activities unless the Contractor is on the relevant Category of the Housing Authority List of Piling Contractors and takes up the role of Piling Sub-contractor in carrying out the respective piling activities:
 - a. Pile driving of Type 1, 2, & 4 Piles;
 - b. Excavation and concreting of Type 3 Pile;
 - c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles.
2. Requirements on Piling Sub-contractor:
 - a. The Piling Sub-contractor must be on the following Category of the Housing Authority List of Piling Contractors:
 - i. Type 1, 2, & 4 Piles - Percussive Piles Category;
 - ii. Type 3 Pile - Large Diameter Bored Piles Category;
 - iii. Any acceptable pile types other than Type 1, 2, 3 & 4 Piles - Large Diameter Bored Piles Category or Percussive Piles Category.
 - b. In the event that more than one type of piles are used in the Contract, the Piling Sub-contractor must be on the appropriate Categories of Housing Authority List of Piling Contractors for all the pile types used.
3. In the event that the Piling Sub-contractor employ a Piling Sub-sub-contractor to carry out the piling activities stated in sub-clauses (1)(a) to (1)(c) above, the Piling Sub-sub-contractor must be on the following list:
 - a. Appropriate Category of Housing Authority List of Piling Contractors; or
 - b. Buildings Department List of Registered Specialist Contractors (Foundation) who has undertaken in the past five years at least three contracts in relevant piling works under ICU's procedures or BD's control and of contract value not less than \$20M in one of the contracts and in aggregates total of not less than \$40M.
4. Piling Sub-sub-contractor for pile types other than Type 3 not on the lists in sub-clause (3) above may be considered and subject to CM's approval.

**PIL1.G517.8 APPROVED CONTRACTORS FOR PILING WORKS - FOR
CONTRACTOR'S DESIGN COMBINED PILING AND BUILDING
CONTRACT**

1. The Contractor must employ a Piling Sub-contractor to carry out the following piling activities unless the Contractor is on the relevant Category of the Housing Authority List of Piling Contractors and takes up the role of Piling Sub-contractor in carrying out the respective piling activities:
 - a. Pile driving of Type 1, 2, & 4 Piles;
 - b. Excavation and concreting of Type 3 Pile;
 - c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles;
 - d. Foundation design.
2. Requirements on Piling Sub-contractor:
 - a. The Piling Sub-contractor must be on the following Category of the Housing Authority List of Piling Contractors:
 - i. Type 1, 2, & 4 Piles - Percussive Piles Category;
 - ii. Type 3 Pile - Large Diameter Bored Piles Category;
 - iii. Any acceptable pile types other than Type 1, 2, 3 & 4 Piles - Large Diameter Bored Piles Category or Percussive Piles Category.
 - b. In the event that more than one type of piles are used in the Contract, the Piling Sub-contractor must be on the appropriate Categories of Housing Authority List of Piling Contractors for all the pile types used.
3. In the event that the Piling Sub-contractor employ a Piling Sub-sub-contractor to carry out the piling activities stated in sub-clauses (1)(a) to (1)(d) above, the Piling Sub-sub-contractor must be on the following list:
 - a. Appropriate Category of Housing Authority List of Piling Contractors; or
 - b. Buildings Department List of Registered Specialist Contractors (Foundation) who has undertaken in the past five years at least three contracts in relevant piling works under ICU's procedures or BD's control and of contract value not less than \$20M in one of the contracts and in aggregates total of not less than \$40M.
4. Piling Sub-sub-contractor for pile types other than Type 3 not on the lists in sub-clause (3) above may be considered and subject to CM's approval.

**PIL1.G520.8 SUB-CONTRACTOR FOR CONSTRUCTION OF FOOTING - FOR
BUILDING CONTRACT WITH FOOTING CONSTRUCTION**

1. In the event that the Contractor employs sub-contractor to carry out construction of footings, the sub-contractor must be on the following list:
 - a. Buildings Department List of Registered General Building Contractors; or
 - b. Buildings Department List of Registered Specialist Contractors (Foundation).
2. In this specification, construction of footing shall mean construction of spread and/or raft footing and include fixing of starter bars, if any.

**PIL1.G530.8 DEFINITION OF "PILING SUBCONTRACTOR" FOR ENGINEER'S
DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING
CONTRACT**

1. In this specification, Piling Subcontractor shall mean the subcontractor employed by the Contractor for the following piling activities:
 - a. Pile driving of Type 1, 2, & 4 Piles; and/or
 - b. Excavation and/or concreting of Type 3 Pile; and/or
 - c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles.

-
2. Such contract between the Contractor and the Piling Subcontractor shall be termed the Piling Subcontract.

PIL1.G535.8 DEFINITION OF "PILING SUBCONTRACTOR" FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. In this specification, Piling Subcontractor shall mean the subcontractor employed by the Contractor for the following piling activities:
 - a. Pile driving of Type 1, 2, & 4 Piles; and/or
 - b. Excavation and/or concreting of Type 3 Pile; and/or
 - c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles; and/or
 - d. Foundation design.
2. Such contract between the Contractor and the Piling Subcontractor shall be termed the Piling Subcontract.

PIL1.G540.8 DEFINITION OF "PILING SUB-SUBCONTRACTOR" FOR ENGINEER'S DESIGN COMBINED PILING AND BUILDING CONTRACT ONLY

1. In this specification, Piling Sub-subcontractor shall mean the subcontractor employed by the Piling Subcontractor for the following piling activities:
 - a. Pile driving of Type 1, 2, & 4 Piles; and/or
 - b. Excavation and/or concreting of Type 3 Pile; and/or
 - c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles.
2. Such contract between the Piling Subcontractor and the Piling Sub-subcontractor shall be termed the Piling Sub-subcontract.

PIL1.G545.8 DEFINITION OF "PILING SUB-SUBCONTRACTOR" FOR CONTRACTOR'S DESIGN COMBINED PILING AND BUILDING CONTRACT ONLY

1. In this specification, Piling Sub-subcontractor shall mean the subcontractor employed by the Piling Subcontractor for the following piling activities:
 - a. Pile driving of Type 1, 2, & 4 Piles; and/or
 - b. Excavation and/or concreting of Type 3 Pile; and/or
 - c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles; and/or
 - d. Foundation design.
2. Such contract between the Piling Subcontractor and the Piling Sub-subcontractor shall be termed the Piling Sub-subcontract.

PIL1.G550.8 RESTRICTION ON PILING SUBCONTRACT

The number of Piling Subcontractor shall be limited to one per each type of piles unless otherwise approved by the CM.

PIL1.G560.8 RESTRICTION ON PILING SUB-SUBCONTRACT - FOR COMBINED PILING AND BUILDING CONTRACT ONLY

The number of Piling Sub-subcontractor shall be limited to one per each type of piles unless otherwise approved by the CM.

PIL1.G570.8 INFORMATION ON PILING SUBCONTRACT

Submit with the tender the following information:

1. Letter of intent from the proposed Piling Subcontractor whom the tenderer intends to employ for the Contract should the tenderer be awarded the Contract, indicating his willingness to carry out the proposed Piling Subcontract;
2. The names of the directors or sole proprietor and site representatives of the proposed Piling Subcontractor;
3. The piling activity and the scope of the proposed Piling Subcontract;
4. The minimum numbers of self owned piling plants and directly employed piling plant operators to be provided by the tenderer;
5. The minimum numbers of self owned piling plants and directly employed piling plant operators to be provided by the proposed Piling Subcontractor.

PIL1.G580.8

INFORMATION ON PILING SUB-SUBCONTRACT - FOR COMBINED PILING AND BUILDING CONTRACT ONLY

Submit with the tender the following information:

1. Letter of intent from the proposed Piling Sub-subcontractor whom the proposed Piling Subcontractor intends to employ for the subcontract should the proposed Piling Subcontractor be awarded the subcontract, indicating his willingness to carry out the proposed Piling Sub-subcontract;
2. The names of the directors or sole proprietor and site representatives of the proposed Piling Sub-subcontractor;
3. The piling activity and the scope of the proposed Piling Sub-subcontract;
4. The minimum numbers of self owned piling plants and directly employed piling plant operators to be provided by the proposed Piling Subcontractor;
5. The minimum numbers of self owned piling plants and directly employed piling plant operators to be provided by the proposed Piling Sub-subcontractor.

PIL1.G590.8

CONDITIONS ON PILING SUBCONTRACT - FOR ENGINEER'S DESIGN PILING CONTRACT ONLY

Incorporate the following conditions into the Piling Sub-contract:

1. The piling activity and the scope of the Piling Sub-contract;
2. The Piling Sub-contractor is not allowed to subcontract the following piling activities:
 - a. Pile driving of Type 1, 2, & 4 Piles; and / or
 - b. Excavation and / or concreting of Type 3 Pile; and / or
 - c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles.
3. For the types of plants listed below which are required to be used on Site for piling works, the Piling Sub-contractor shall deploy and use only his self-owned plants save when necessary, he may use Contractor's self-owned plants deployed in accordance with **PIL1.W380**:
 - a. Crawler crane;
 - b. Oscillator or rotator;
 - c. Reverse circulation drill (RCD);
 - d. Pile driving hammer;
 - e. Pile driving rig.
4. The Piling Sub-contractor shall comply with the following in deploying self-owned plants listed in sub-clauses (3)(a) to (3)(e) above:
 - a. Self-owned plants of the Piling Sub-contractor shall mean plants owned by the Piling Sub-contractor or by the Piling Sub-contractor's parent, sister or subsidiary company for the exclusive use of the Piling Sub-contractor;
 - b. All the plants deployed to Site shall be in good working conditions;

-
- c. Deploy at least one number of self-owned plant that are required to be used on Site;
 - d. Submit documents to prove his ownership of the plants and, if applicable, the relationship between the Piling Sub-contractor and the Piling Sub-contractor's parent, sister or subsidiary company;
 - e. Submit document to confirm no further subcontracting of his part of the works.
5. The Contractor shall supply piling materials, which form whole or part of permanent works, to the Piling Sub-contractor;
6. A probity clause shall be included in the Piling Sub-contract such that:
- "If the Piling Sub-contractor or any of his agents or employees are found to have offered or given advantage, gratuity, bonus, discount, bribe or loan of any sort to any agent or employee of the Contractor, Hong Kong Housing Authority or Housing Department, the Contractor shall at liberty forthwith terminate the employment of the Piling Sub-contractor under the Piling Subcontract. The Contractor, Hong Kong Housing Authority or Housing Department shall hold the Piling Sub-contractor liable for any loss or damage which the Contractor, Hong Kong Housing Authority or Housing Department may thereby sustain."

PIL1.G595.8**CONDITIONS ON PILING SUBCONTRACT - FOR CONTRACTOR'S DESIGN PILING CONTRACT ONLY**

Incorporate the following conditions into the Piling Sub-contract:

- 1. The piling activity and the scope of the Piling Sub-contract;
- 2. The Piling Sub-contractor is not allowed to subcontract the following piling activities:
 - a. Pile driving of Type 1, 2, & 4 Piles; and / or
 - b. Excavation and / or concreting of Type 3 Pile; and / or
 - c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles; and / or
 - d. Foundation design.
- 3. For the types of plants listed below which are required to be used on Site for piling works, the Piling Sub-contractor shall deploy and use only his self-owned plants save when necessary, he may use Contractor's self-owned plants deployed in accordance with **PIL1.W380**:
 - a. Crawler crane;
 - b. Oscillator or rotator;
 - c. Reverse circulation drill (RCD);
 - d. Pile driving hammer;
 - e. Pile driving rig.
- 4. The Piling Sub-contractor shall comply with the following in deploying self-owned plants listed in sub-clauses (3)(a) to (3)(e) above:
 - a. Self-owned plants of the Piling Sub-contractor shall mean plants owned by the Piling Sub-contractor or by the Piling Sub-contractor's parent, sister or subsidiary company for the exclusive use of the Piling Sub-contractor;
 - b. All the plants deployed to Site shall be in good working conditions;
 - c. Deploy at least one number of self-owned plant that are required to be used on Site;
 - d. Submit documents to prove his ownership of the plants and, if applicable, the relationship between the Piling Sub-contractor and the Piling Sub-contractor's parent, sister or subsidiary company;
 - e. Submit document to confirm no further subcontracting of his part of the works.

5. The Contractor shall supply piling materials, which form whole or part of permanent works, to the Piling Sub-contractor;
6. A probity clause shall be included in the Piling Sub-contract such that:
 "If the Piling Sub-contractor or any of his agents or employees are found to have offered or given advantage, gratuity, bonus, discount, bribe or loan of any sort to any agent or employee of the Contractor, Hong Kong Housing Authority or Housing Department, the Contractor shall at liberty forthwith terminate the employment of the Piling Sub-contractor under the Piling Subcontract. The Contractor, Hong Kong Housing Authority or Housing Department shall hold the Piling Sub-contractor liable for any loss or damage which the Contractor, Hong Kong Housing Authority or Housing Department may thereby sustain."

PIL1.G600.8**CONDITIONS ON PILING SUBCONTRACT - FOR ENGINEER'S DESIGN
COMBINED PILING AND BUILDING CONTRACT ONLY**

Incorporate the following conditions into the Piling Sub-contract:

1. The piling activity and the scope of the Piling Sub-contract;
2. The Piling Sub-contractor is not allowed to subcontract the following piling activities to more than one Piling Sub-subcontractor:
 - a. Pile driving of Type 1, 2, & 4 Piles; and / or
 - b. Excavation and / or concreting of Type 3 Pile; and / or
 - c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles.
3. For the types of plants listed below which are required to be used on Site for piling works, the Piling Sub-contractor shall deploy at least one number of self-owned plant for each type of the plants, unless otherwise allowed by the CM:
 - a. Crawler crane;
 - b. Oscillator or rotator;
 - c. Reverse circulation drill (RCD);
 - d. Pile driving hammer;
 - e. Pile driving rig.
4. The Piling Sub-contractor shall comply with the following in deploying self-owned plants listed in sub-clauses (3)(a) to (3)(e) above:
 - a. Self-owned plants of the Piling Sub-contractor shall mean plants owned by the Piling Sub-contractor or by the Piling Sub-contractor's parent, sister or subsidiary company for the exclusive use of the Piling Sub-contractor;
 - b. All the plants deployed to Site shall be in good working conditions;
 - c. Submit documents to prove the plant ownership and, if applicable, the relationship between the Piling Sub-contractor and the Piling Sub-contractor's parent, sister or subsidiary company;
 - d. For piling works undertaken by Piling Sub-subcontractor, deployment of self-owned plants of the Piling Sub-subcontractor to Site shall comply with the requirements stated in **PIL1.G610**;
 - e. The self-owned plants deployed to Site according to sub-clauses (3)(a) to (3)(e) may be used by the Piling Sub-subcontractor when necessary.
5. A probity clause shall be included in the Piling Subcontract such that:

"If the Piling Sub-contractor or any of his agents or employees are found to have offered or given advantage, gratuity, bonus, discount, bribe or loan of any sort to any agent or employee of the Contractor, Hong Kong Housing Authority or Housing Department, the Contractor shall at liberty forthwith terminate the employment of the Piling Sub-contractor under the Piling Subcontract. The Contractor, Hong Kong Housing Authority or Housing Department shall hold the Piling Sub-contractor liable for any loss or damage which the Contractor, Hong Kong Housing Authority or Housing Department may thereby sustain."

PIL1.G605.8**CONDITIONS ON PILING SUBCONTRACT - FOR CONTRACTOR'S DESIGN COMBINED PILING AND BUILDING CONTRACT ONLY**

Incorporate the following conditions into the Piling Sub-contract:

1. The piling activity and the scope of the Piling Sub-contract;
2. The Piling Sub-contractor is not allowed to subcontract the following piling activities to more than one Piling Sub-subcontractor:
 - a. Pile driving of Type 1, 2, & 4 Piles; and / or
 - b. Excavation and / or concreting of Type 3 Pile; and / or
 - c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles; and / or
 - d. Foundation design.
3. For the types of plants listed below which are required to be used on Site for piling works, the Piling Sub-contractor shall deploy at least one number of self-owned plant for each type of the plants, unless otherwise allowed by the CM:
 - a. Crawler crane;
 - b. Oscillator or rotator;
 - c. Reverse circulation drill (RCD);
 - d. Pile driving hammer;
 - e. Pile driving rig.
4. The Piling Sub-contractor shall comply with the following in deploying self-owned plants listed in sub-clauses (3)(a) to (3)(e) above:
 - a. Self-owned plants of the Piling Sub-contractor shall mean plants owned by the Piling Sub-contractor or by the Piling Sub-contractor's parent, sister or subsidiary company for the exclusive use of the Piling Sub-contractor;
 - b. All the plants deployed to Site shall be in good working conditions;
 - c. Submit documents to prove the plant ownership and, if applicable, the relationship between the Piling Sub-contractor and the Piling Sub-contractor's parent, sister or subsidiary company;
 - d. For piling works undertaken by Piling Sub-subcontractor, deployment of self-owned plants of the Piling Sub-subcontractor to Site shall comply with the requirements stated in **PIL1.G610**;
 - e. The self-owned plants deployed to Site according to sub-clauses (3)(a) to (3)(e) may be used by the Piling Sub-subcontractor when necessary.
5. A probity clause shall be included in the Piling Subcontract such that:

"If the Piling Sub-contractor or any of his agents or employees are found to have offered or given advantage, gratuity, bonus, discount, bribe or loan of any sort to any agent or employee of the Contractor, Hong Kong Housing Authority or Housing Department, the Contractor shall at liberty forthwith terminate the employment of the Piling Sub-contractor under the Piling Subcontract. The Contractor, Hong Kong Housing Authority or Housing Department shall hold the Piling Sub-contractor liable for any loss or damage which the Contractor, Hong Kong Housing Authority or Housing Department may thereby sustain."

PIL1.G610.8**CONDITIONS ON PILING SUB-SUBCONTRACT - FOR ENGINEER'S DESIGN COMBINED PILING AND BUILDING CONTRACT ONLY**

Incorporate the following conditions into the Piling Sub-subcontract:

1. The piling activity and the scope of the Piling Sub-subcontract;
2. The Piling Sub-subcontractor is not allowed to subcontract the following piling activities:
 - a. Pile driving of Type 1, 2, & 4 Piles; and / or
 - b. Excavation and / or concreting of Type 3 Pile; and / or
 - c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles.
3. For the types of plants listed below which are required to be used on Site for piling works, the Piling Sub-subcontractor shall deploy and use only his self-owned plants save when necessary, he may use the Piling Sub-contractor's self-owned plants deployed in accordance with **PIL1.G600**:
 - a. Crawler crane;
 - b. Oscillator or rotator;
 - c. Reverse circulation drill (RCD);
 - d. Pile driving hammer;
 - e. Pile driving rig.
4. The Piling Sub-subcontractor shall comply with the following in deploying self-owned plants listed in sub-clauses (3)(a) to (3)(e) above:
 - a. Self-owned plants of the Piling Sub-subcontractor shall mean plants owned by the Piling Sub-subcontractor or by the Piling Sub-subcontractor's parent, sister or subsidiary company for the exclusive use of the Piling Sub-subcontractor;
 - b. All the plants deployed to Site shall be in good working conditions;
 - c. Deploy at least one number of self-owned plant that are required to be used on Site;
 - d. Submit documents to prove his ownership of the plants and, if applicable, the relationship between the Piling Sub-subcontractor and the Piling Sub-subcontractor's parent, sister or subsidiary company;
 - e. Submit document to confirm no further subcontracting of his part of the works.
5. The Piling Sub-contractor shall supply piling materials, which form whole or part of permanent works, to the Piling Sub-subcontractor;
6. A probity clause shall be included in the Piling Sub-subcontract such that:

"If the Piling Sub-subcontractor or any of his agents or employees are found to have offered or given advantage, gratuity, bonus, discount, bribe or loan of any sort to any agent or employee of the Piling Sub-contractor, the Contractor, Hong Kong Housing Authority or Housing Department, the Piling Sub-contractor shall at liberty forthwith terminate the employment of the Piling Sub-subcontractor under the Piling Sub-subcontract. The Piling Sub-contractor, the Contractor, Hong Kong Housing Authority or Housing Department shall hold the Piling Sub-subcontractor liable for any loss or damage which the Piling Sub-contractor, the Contractor, Hong Kong Housing Authority or Housing Department may thereby sustain."

PIL1.G615.8**CONDITIONS ON PILING SUB-SUBCONTRACT - FOR CONTRACTOR'S DESIGN COMBINED PILING AND BUILDING CONTRACT ONLY**

Incorporate the following conditions into the Piling Sub-subcontract:

1. The piling activity and the scope of the Piling Sub-subcontract;
2. The Piling Sub-subcontractor is not allowed to subcontract the following piling activities:
 - a. Pile driving of Type 1, 2, & 4 Piles; and / or

-
- b. Excavation and / or concreting of Type 3 Pile; and / or
 - c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles; and / or
 - d. Foundation design.
 3. For the types of plants listed below which are required to be used on Site for piling works, the Piling Sub-subcontractor shall deploy and use only his self-owned plants save when necessary, he may use the Piling Sub-contractor's self-owned plants deployed in accordance with **PIL1.G600**:
 - a. Crawler crane;
 - b. Oscillator or rotator;
 - c. Reverse circulation drill (RCD);
 - d. Pile driving hammer;
 - e. Pile driving rig.
 4. The Piling Sub-subcontractor shall comply with the following in deploying self-owned plants listed in sub-clauses (3)(a) to (3)(e) above:
 - a. Self-owned plants of the Piling Sub-subcontractor shall mean plants owned by the Piling Sub-subcontractor or by the Piling Sub-subcontractor's parent, sister or subsidiary company for the exclusive use of the Piling Sub-subcontractor;
 - b. All the plants deployed to Site shall be in good working conditions;
 - c. Deploy at least one number of self-owned plant that are required to be used on Site;
 - d. Submit documents to prove his ownership of the plants and, if applicable, the relationship between the Piling Sub-subcontractor and the Piling Sub-subcontractor's parent, sister or subsidiary company;
 - e. Submit document to confirm no further subcontracting of his part of the works.
 5. The Piling Sub-contractor shall supply piling materials, which form whole or part of permanent works, to the Piling Sub-subcontractor;
 6. A probity clause shall be included in the Piling Sub-subcontract such that:
 "If the Piling Sub-subcontractor or any of his agents or employees are found to have offered or given advantage, gratuity, bonus, discount, bribe or loan of any sort to any agent or employee of the Piling Sub-contractor, the Contractor, Hong Kong Housing Authority or Housing Department, the Piling Sub-contractor shall at liberty forthwith terminate the employment of the Piling Sub-subcontractor under the Piling Sub-subcontract. The Piling Sub-contractor, the Contractor, Hong Kong Housing Authority or Housing Department shall hold the Piling Sub-subcontractor liable for any loss or damage which the Piling Sub-contractor, the Contractor, Hong Kong Housing Authority or Housing Department may thereby sustain."

PIL1.G620.8**SUBMISSION OF CONTRACT DOCUMENTS OF PILING SUB-CONTRACT**

1. Before execution of the Piling Sub-contract works, submit to the CM a written confirmation signed by the Contractor and the Piling Sub-contractor confirming that the conditions stated in **PIL1.G590** or **PIL1.G600**, as appropriate, have been included into the Piling Sub-contract;
2. In the event that the Contractor takes up the role of Piling Sub-contractor as allowed in **PIL1.G515** for Combined Piling and Building Contract, submit to CM a written confirmation signed by the Contractor confirming that he shall take up the role of Piling Sub-contractor and act as if he is the Piling Sub-contractor in addition to his capacity.

PIL1.G630.8 SUBMISSION OF CONTRACT DOCUMENTS OF PILING SUB-SUBCONTRACT - FOR COMBINED PILING AND BUILDING CONTRACT ONLY

Before execution of the Piling Sub-subcontract works, submit to the CM a written confirmation signed by the Piling Sub-contractor and the Piling Sub-subcontractor confirming that the conditions stated in **PIL1.G610** have been included into the Piling Sub-subcontract.

DESIGN

GENERAL

PIL1.D010.8

GENERAL

All specification clauses in this section shall be applied to Contractor's Design Piling Contract / Combined Piling and Building Contract only unless otherwise stated.

PIL1.D020.8

ACCEPTABLE PILE TYPES

1. Only the type or types of piles specified in the **Project Specific Specification** shall be acceptable to be used in this Contract unless otherwise proposed by the Contractor and subsequently Approved by the CM in accordance with sub-clause (2) below;
2. Notwithstanding sub-clause (1) above, the Contractor may propose any other alternative types of pile as in clause **PIL1.G380**. The proposed alternative types of pile must be accepted by the Buildings Department of the Hong Kong Special Administrative Region;
3. Do not base the design on a system of hand dug caissons.

PIL1.D030.8

ACCEPTANCE OF THE DESIGN

Acceptance of the Contractor's design, whether prior to or during the contract period, will not relieve the Contractor's responsibility to comply with this Specification.

PIL1.D040.8

DESIGN CERTIFYING CONSULTANT

A director of the Design Certifying Consultant, who must be a Registered Structural Engineer registered with the Building Authority, must certify and sign all layouts, details and calculations submitted to the CM, including those for tendering purposes.

INFORMATION TO BE SUPPLIED WITH TENDER

PIL1.D110.8

SUBMISSIONS

Submit three copies of each of the following with the tender:

1. Fully detailed design and specification proposals for the Works;
2. Complete set of calculations;
3. Drawings showing the number and positions of the piles;
4. The estimated average, maximum and minimum net lengths of the piles below cut-off level;
5. Drawings showing the layout, details and founding levels of footings, if any;
6. Any other requirement as detailed elsewhere in this Specification.

PIL1.D120.8

ADDITIONAL REQUIREMENTS FOR TYPES 5, 6 AND 7 PILES

Submit also:

1. Details of grout mix as **PIL1.M410** and **PIL1.M420**;
2. Sequence and timing of grouting, including details of secondary pressure grouting;
3. Details of drilling method and equipment;
4. Details of reinforcement (including area of reinforcement at root of screw to coupler), pipe section, spacers, couplings and related test reports for Type 5 piles only;

-
5. Fabrication details of steel reinforcement cage (including installation details of single sonic access tube) for Type 7 piles only.

DESIGN SUBMISSIONS

PIL1.D210.8 SUBMISSIONS OF PILING AND/OR FOOTING DESIGN AT COMMENCEMENT OF THE WORKS

Submit four copies of drawings, calculations and any other relevant documents related to piling and/or footing design for Approval not later than 7 days from the notified date for commencement of the Works. The submissions shall include relevant foundation plans and supporting documents as described in clause 2.7 and clause 5.4.1, as appropriate, of the Code of Practice for Foundations. Any submission not to the satisfaction of the CM shall be re-submitted. Allow 37 days for each submission and re-submission for the checking of the CM.

PIL1.D220.8 SUBMISSIONS OF AMENDMENT OF PILING AND/OR FOOTING DESIGN

In the event that amendment of piling and/or footing design is required, submit four copies of drawings, calculations and any other relevant documents related to the amendment for Approval. Any submission not to the satisfaction of the CM shall be re-submitted. Allow 42 days for each submission and re-submission for the checking of the CM.

DESIGN PARAMETERS

PIL1.D320.8 DESIGN LOAD

All loads shown on the CM's drawings are deemed dead loads and imposed loads as defined in the Building (Construction) Regulations, irrespective of whether they are indicated on the drawings as characteristic or designed loads. Such loads have not been multiplied by the partial safety load factors.

PIL1.D330.8 TYPES OF PILE IN ONE CAP

Allow only one type of pile in each pile cap.

PIL1.D340.8 PILE SPACING

Comply with clause 5.1.3 of the Code of Practice for Foundations.

PIL1.D350.8 STRESS IN STEEL FOR PILING DESIGN

1. For Type 4 piles, comply with clause 2.5.5(4) of the Code of Practice for Foundations;
2. For Type 5 piles, comply with clauses 5.4.8(2)(a) and 5.4.8(2)(c) of the Code of Practice for Foundations;
3. For Type 6 piles, comply with clause 2.5.5(4) of the Code of Practice for Foundations;
4. For the combined effects of dead, imposed and wind loads, the allowable stress in sub-clauses (1), (2) & (3) above may be increased by not more than 25% where such increase is solely due to wind loads.

PIL1.D360.8 STRESS IN CONCRETE FOR PILING DESIGN

1. For Types 1a and 2 piles, comply with Regulation 26 of Building (Construction) Regulations and clause 2.5.5(2) of the Code of Practice for Foundations;
2. For Types 1c and 3 piles, comply with Regulation 27 of Building (Construction) Regulations and clause 2.5.5(2) of the Code of Practice for Foundations.

PIL1.D370.8 WIND EFFECT

Design the foundations to comply with the "Code of Practice on Wind Effects in Hong Kong 2004 " issued in December 2004 by the Buildings Department of the Hong Kong Special Administrative Region.

PIL1.D380.8 RESISTANCE TO SLIDING, UPLIFT, OVERTURNING AND BUOYANCY

1. Design the foundations to comply with Section 15 of the Building (Construction) Regulations of Hong Kong and clauses 2.5.4 and 5.1.6 of the Code of Practice for Foundations;
2. Comply also with clause 5.3.3 of the Code of Practice for Foundations regarding uplift resistance of piles.

PIL1.D390.8 SAFE LOAD CARRYING CAPACITY

1. The combined effects of dead, imposed and wind loads including negative skin friction shall not exceed the safe load carrying capacity of an individual pile times the group reduction factor, if necessary, in accordance with **PIL1.D400**;
2. The safe load carrying capacity of an individual pile shall not exceed the allowable structural capacity of the pile based on the allowable stresses in steel and concrete stipulated in **PIL1.D350** and **PIL1.D360**, respectively;
3. The compressive safe load carrying capacity of an individual Type 3 pile founded on Category 1(a), 1(b), 1(c), 1(d) or 2 rock defined in **PIL1.G450** shall not exceed the sum of:
 - a. the area of the designed pile base times 10 MPa, 7.5 MPa, 5 MPa, 3MPa or 3 MPa respectively; and
 - b. the bond or frictional resistance of the pile in a rock socket as allowed in clause 5.4.7 of the Code of Practice for Foundations.
4. The safe load carrying capacity of an individual Type 5 and Type 6 pile shall be derived according to the design principles stated in clause 5.4.8 and 5.4.2 respectively of the Code of Practice for Foundations;
5. For piles in compression designed not to rest on bedrock defined in **PIL1.G450**, base the pile design, in addition to the driving formula if the pile is a driven pile, on static formulae to achieve the required embedded length of the piles in the bearing stratum by using one of the following references:
 - a. Poulos H.G. and Davis E.H. (1980) - Pile Foundation Analysis and Design - John Wiley & Sons, New York, New York;
 - b. Tomlinson M.J. (1995) - Foundation Design and Construction, 6th Edition - John Wiley & Sons, New York, New York;
 - c. Tomlinson M.J. (1994) - Pile Design and Construction Practice, 4th Edition - E&FN Spon, London.
6. Propose the driving formula and the associated parameters for the CM's approval. Where hydraulic hammers are used, adopt the modified Hiley formula:

$$Q = \frac{K_h E}{(2s + c_1 + c_2 + c_3)}$$

where

Q = safe compressive load carrying capacity (kN);

E = Driving energy of the hammer immediately before impact (KNmm);

s = set per blow (mm);

c₁ = temporary compression allowance for pile head and cap (mm);

c₂+c₃ = elastic rebound (mm); and

K_h = Hydraulic Hammer Factor that, in any event should not be greater than the following values:

$K_h = 0.6$ where a pile cushion is used; and

$K_h = 0.7$ where no pile cushion is used; and

Appropriate adjustment should be made to the K_h value if a lower value is obtained from load testing results as stated in sub-clause (7) below;

7. Demonstrate the adequacy of the proposed driving formula or the modified Hiley formula and the associated parameters stated in sub-clause (6) in the determination of safe load carrying capacity of the pile by conducting load test(s) stipulated in **PIL1.T810** to **PIL1.T880**. Verify the value of E in the modified Hiley formula by a method agreed by the CM;
8. The overall length of each pile must be the greater of those derived from the following formulae:
 - a. The driving formula or the modified Hiley formula as stated in sub-clause (6) above; or
 - b. The static formula as stated in sub-clause (5).
9. Adopt an installation method that will ensure that the required embedded length is achieved;
10. For the purpose of design calculations for the safe load carrying capacity of piles in compression, the design soil parameters (bulk unit weight, effective cohesion and effective friction angle) of different soil type shall not exceed the values given in the **Project Specific Specification**;
11. Design ground water level shall be as given in the **Project Specific Specification**;
12. Make a detailed submission to the CM to substantiate any proposed modification to the soil parameters stated in sub-clause (10) above and:
 - a. Verify the proposed values by carrying out necessary Approved laboratory tests. The CM reserves the right to reject any proposed modification which is not to his entire satisfaction;
 - b. Submit, with the tender, details of the proposed tests all to the CM's satisfaction. Arrange for a sufficient number of laboratory tests to establish the lower bound design values for each major stratum with sufficient independent results for that stratum. Have all laboratory tests for this purpose carried out at own cost and without any extension of time.
13. Notwithstanding sub-clause (10) above, in relation to the design, the Contractor may establish unit side resistance and unit tip resistance of the driven piles to be used in the Contract for various ground conditions and depths by preliminary pile loading tests in addition to those described in **PIL1.T110** or separate side resistance and tip resistance tests. If design parameters derived from loading tests are to be used, submit the locations and instrumentation details of the proposed preliminary piles for such verification purpose, and a testing programme all to the satisfaction of the CM with the tender. The number of preliminary piles shall be sufficient to establish the lower bound design value for each major stratum with sufficient independent results for that stratum. Carry out all loading tests for this purpose at own cost, without any extension of time and complete them within two months of the notified date for the commencement of the Works. In the event of any failure to complete the above loading tests within two months of the notified date for the commencement of the Works, then no piling work, except for the loading tests, will be permitted to proceed any further until the completion of the loading tests, unless otherwise Approved. Bear the cost of any delay in this connection. No claim for additional costs or any extension of time will be considered by the CM;
14. In checking the allowable buckling capacity of Types 5 and 6 piles, the lateral restraints from the grout, steel casing if permanent and the surrounding soil may be allowed. Do not apply sub-clause (5) above to Types 5 and 6 piles.

PIL1.D395.8 SAFE LOAD CARRYING CAPACITY - TYPE 7 PILES FOR CONTRACTOR'S DESIGN

1. The theoretical safe compressive load carrying capacity (Q_p) in kN of Type 7 pile shall be the sum of allowable skin friction capacity (q_s) along the whole pile shaft and allowable end bearing capacity (q_b) of the pile base:

$$\begin{aligned} Q_p &= q_s + q_b \\ &= \mu \sum N_{av} P L_i + 5 N A \end{aligned}$$

where

μ = designed friction coefficient in kN/m² per SPT "N" value and to be verified by trial pile (maximum value to be used is limited to 1.6);

N_{av} = average SPT "N" value along the pile shaft in blows / 300 mm (maximum value to be used is limited to 40);

P = perimeter of the pile in m;

L_i = length of the pile shaft section i in m;

N = SPT value at the pile base in blows / 300 mm (maximum value to be used is limited to 200);

A = bearing area of the pile base in m²;

Shaft friction in filling materials and marine deposits shall be ignored;

2. Notwithstanding sub-clause (1) above, the Contractor shall build in a greater margin of safety in his design where necessary and subject to the CM's approval, having regard to the sub-soil conditions of the site and his method of pile installation;
3. The allowable compressive stress of grout shall be 5 N/mm² and may be increased by 25% where such increase is solely due to wind loads;
4. For axially loaded piles designed to take tension, provide reinforcement with tension lap length along the full length of the pile. For piles designed to take vertical and lateral loads, provide sufficient reinforcement to resist all actions including bending moment. Allow a minimum cover of 75 mm to reinforcement.

PIL1.D400.8 GROUP REDUCTION FACTOR

Allow for the reduction of bearing capacity of individual piles in a group in accordance with the requirements stated in clause 5.1.2 of the Code of Practice for Foundations.

PIL1.D410.8 PILES FOUND ON BEDROCK

Do not apply any group reduction factor where the piles are designed to found on bedrock defined in **PIL1.G450**. Submit details indicating the levels of pile bases for safe bearing of the proposed piles with the tender. For Type 4 Piles driven to bedrock, comply with clause 5.4.11 of the Code of Practice for Foundations.

PIL1.D420.8 CASING THICKNESS

Ensure that the thickness of casing to pile shaft for piles types 2 and 3 is sufficient to withstand soil and water pressure. If directed by the CM, increase the thickness of the casing at no extra cost to the Authority.

PIL1.D430.8 BOND STRENGTH IN TYPES 5 AND 6 PILES

The rock socket must be founded in bedrock as **PIL1.G450** and:

1. Design bond strength between rock and grout: not exceeding the value of the presumed allowable bond or friction between rock and concrete or grout for piles as stated in Table 2.2 of clause 2.2.2 of the Code of Practice for Foundations;

2. Design bond strength between grout and steel H-pile for Type 6 piles or grout and steel bars for Type 5 piles : not exceeding the allowable value stated in clause 2.5.5(4) or 5.4.8(2) respectively of the Code of Practice for Foundations;
3. If a different bond strength value is proposed, submit with the tender, details of the proposed founding method, design parameters, proposed testing methods to be applied to the trial pile (including loading test), design calculations, testing programme and proof of the validity of the parameters to the CM's satisfaction before applying them to the design. Establish the proposed value of bond strength between grout and rock with a sufficient number of tests or test piles. Carry out all the tests for this purpose without any extension of time and bear all associated costs;
4. Ignore the contribution of the grout to the structural capacity of the piles.

PIL1.D440.8**UNDERGROUND OBSTRUCTIONS IN TYPE 7 PILES FOR CONTRACTOR'S DESIGN**

1. For the underground obstruction encountered in the top few metres of the ground, subject to the CM's approval, remove the underground obstruction by some suitable forms of excavation and re-install the pile at its design location. Ignore the positive shaft friction above the bottom level of the obstruction in calculation of the allowable skin friction capacity of the pile;
2. For the underground obstruction encountered at greater depths causing auger refusal, such as the rate of penetration of the drilling is less than 300mm per minute, follow the procedures below:
 - a. If the pile is closer than 6 pile diameters from any completed Type 7 pile, the drilling hole shall be backfilled with cement grout and the pile shall be relocated;
 - b. For a pile with a centre to centre distance greater than 6 pile diameters from any completed pile, subject to the CM's approval, remove the obstruction by a method approved by the CM, backfill the bored hole with sand before re-installation of the pile. Ignore the positive shaft friction above the bottom level of the obstruction in calculation of the allowable skin friction capacity of the pile.

SETTLEMENT ANALYSIS**PIL1.D510.8****REQUIREMENT**

Design piles and/or footings which are not to be completely resting on bedrock to include settlement calculations based on the design layout and depths of piles to be installed and/or footings to be constructed.

PIL1.D520.8**BLOCK SETTLEMENT AND DIFFERENTIAL SETTLEMENT**

1. Comply with the requirements stated in clause 2.3.2 of the Code of Practice for Foundations;
2. Consider the effects of block and differential settlements on the performance of buildings or structures in the design;
3. Design the foundation to satisfy the following requirements:
 - a. The maximum angular rotation of the horizontal load-bearing surface of the pile cap and / or footing at any location under wind or other transient loads will not exceed the value given in the **Project Specific Specification** throughout its design life; and
 - b. The differential settlement between columns / vertical elements within the same building or structure under working loads will not exceed the value given in the **Project Specific Specification** throughout their design life; and
 - c. The maximum total settlement will not exceed the value given in the **Project Specific Specification** throughout their design life.

PIL1.D530.8 SCOPE OF CALCULATIONS

Clearly show in the calculations, the total and differential settlement at the end of the construction period of building structures and also in the long term. Demonstrate also in the design calculations, that the differential settlement criterion for the structure, set out in **PIL1.D520** above, will not be exceeded. The following may be considered in the design to minimize differential settlement:

1. Stiffness and layout of pile cap;
2. Pile location and pile size;
3. Any additional factors which the Contractor considers appropriate.

PIL1.D540.8 BASIS OF ANALYSIS

Base the settlement analysis in clause 2.3.1 of the Code of Practice for Foundations and / or on one of the following publications:

1. Poulos H.G. and Davis E.H. (1980) - Pile Foundation Analysis and Design - John Wiley & Sons, New York, New York;
2. Tomlinson M.J. (1995) - Foundation Design and Construction, 6th Edition - John Wiley & Sons, New York, New York;
3. Tomlinson M.J. (1994) - Pile Design and Construction Practice, 4th Edition - E&FN Spon, London.

PIL1.D550.8 SCHEDULE

Include, in the design, a separate schedule of basic principles, procedures and assumptions citing the source reference, page numbers and, in addition, the method of deriving rock mass and/or soil mass properties used in the design.

PIL1.D560.8 ELASTICITY MODULUS

For the assessment of foundation settlement, do not choose an elasticity modulus of soil greater than FN and in no case greater than 200 MN/m²:

where:

- | | | |
|---|---|---|
| E | = | elasticity modulus of soil in MN/m ² ; |
| N | = | Standard Penetration Test (SPT) results prior to pile installation; |
| F | = | 0.8 for N less than 100, and
1.0 for N equal to or greater than 100. |

PIL1.D570.8 SUBMISSION - ACTUAL CONDITIONS OF INSTALLATION

Submit a settlement analysis based on the actual conditions of piles installed before commencement of construction of pile caps and:

1. Consider the effect of block settlement;
2. Verify the assumed parameters and bear the cost of such verification.

RESISTANCE TO HORIZONTAL FORCES**PIL1.D610.8 GENERAL**

1. Piles (either vertical or raking), or pilecaps or both may be designed to resist horizontal forces and tenderers must submit with their tenders, detailed calculations which demonstrate that the design is both structurally and geotechnically acceptable. Make calculations in accordance with the criteria set out in **PIL1.D620** to **PIL1.D670**;
2. Footings may be designed to resist horizontal forces and tenderers must submit with their tenders, detailed calculations which demonstrate that the design is both structurally and geotechnically acceptable;

3. The formulae and publications given in this sub-section are for reference only. The designer may use data from other publications, but in this event, he must demonstrate that the publication proposed is applicable to the loading, building structures and founding material in this Contract. The publication proposed must be wholly compatible with the basic source data of this site. If the references in the publication proposed are derived from overseas, produce precedent cases to demonstrate that the design methods and procedures have been successfully applied in Hong Kong. No matter what publication is used in the Contractor's design, the Contractor will not be relieved of his design responsibilities under the Contract..

PIL1.D620.8**TYPE 5 PILES**

Do not design Type 5 piles to resist horizontal loads unless they are designed as raking piles.

PIL1.D630.8**HORIZONTAL RESISTANCE BY PILE CAPS ONLY**

1. Maximum horizontal displacement of pilecaps: 25 mm;
2. Design piles to resist any effect of pile cap movement due to horizontal forces;
3. Do not permit the allowable stresses in the piles to be exceeded.

PIL1.D640.8**HORIZONTAL RESISTANCE BY PILES ONLY WITH PILE TOPS FIXED AGAINST ROTATION**

1. Use the following formulae to determine the deflections and moments of the piles:

$$a. \quad T = \left(\frac{EI}{n_h} \right)^{\frac{1}{5}}$$

$$b. \quad M_p = F_m (PT)$$

$$c. \quad D_p = F_d \left(\frac{PT^3}{EI} \right)$$

where:

E = elastic modulus of pile material in kN/m².

I = moment of inertia of pile cross section in m⁴.

n_h = coefficient of variation of sub-grade reaction in kN/m³. For the purpose of calculation, a suggested value of n_h is given in the **Project Specific Specification**. Take responsibility to ensure that the assumed value of n_h on which the design is based is adequate for this Contract. Carry out boreholes, soil tests and other tests to verify to the satisfaction of the CM, the assumed value of n_h . Should the values of n_h so verified require more piles and / or pile cap quantities, carry out any necessary redesign, extra piling work etc. at own expense and without any extension of time.

T = relative stiffness of pile soil system, m.

M_p = moment at depth z, KNm.

D_p = deflection at depth z, m (25 mm maximum).

F_m = moment coefficient at depth z, as given in page 7.2 - 239 Fig. 12 of "FOUNDATIONS AND EARTH STRUCTURES, DESIGN MANUAL 7.2", May 1982 Edition, published by the Department of the Navy, Naval Facilities Engineering Command.

F_d = deflection coefficient at depth z as given in page 7.2 - 239 Fig 12 of "FOUNDATIONS AND EARTH STRUCTURES, DESIGN MANUAL 7.2", May 1982 Edition, published by the Department of the Navy, Naval Facilities Engineering Command.

P = horizontal load in kN.

2. Check the combined effect due to horizontal forces and vertical forces;

3. For a group of piles, reduce the coefficient of variation of sub-grade reaction (n_h), which is a function of pile spacing in the direction of loading, as below:

Spacing	n_h group	Spacing	n_h group
8D	$1.00n_h$	4D	$0.40n_h$
6D	$0.70n_h$	3D	$0.25n_h$

Notes:

- (1) D = pile diameter or diagonal width. Pile spacing normal to the direction of loading has no influence provided it is greater than 2.50D.
- (2) Subgrade reaction is to be reduced in the direction of loading.

PIL1.D650.8

HORIZONTAL RESISTANCE BY PILES ONLY WITH FLEXIBLE PILE CAPS OR HINGED END CONDITIONS

All as **PIL1.D640** above, except that the coefficients symbolized by the terms F_m and F_d are as given in page 7.2 - 238, Fig 11 of "FOUNDATIONS AND EARTH STRUCTURES, DESIGN MANUAL 7.2", May 1982 Edition, published by Department of the Navy, Naval Facilities Engineering Command.

PIL1.D660.8

HORIZONTAL RESISTANCE BY PILES AND PILE CAPS TOGETHER

1. Utilise a rational soil mechanics approach in the design and demonstrate the compatibility of the method chosen with the sub-soil conditions and the method and result of testing. The derivation of parameters and the method of computations must be mutually compatible and consistent;
2. Maximum design displacement of pile caps and piles: 25 mm;
3. The following publications may be used for reference:
 - a. Section 4.2, chapter 4 of "ELASTIC SOLUTIONS FOR SOIL AND ROCK MECHANICS" by H.G. Poulos and E. H. Davis, 1974 for relating the displacement and forces in the cap:
Maximum values for E (Young's Modulus for soil) shall be as given in the **Project Specific Specification**.
Suggested values of V (Poisson's ratio for soil) shall be as given in the **Project Specific Specification**.
It is the Contractor's responsibility to ensure that the values of E and V taken are adequate. The Contractor is to carry out boreholes, soil tests and other tests as necessary to verify his assumed values of E and V. If the values of E and V so verified require more piles and/or pile cap quantities, then the Contractor is to carry out any necessary redesign, extra piling work etc at his own expense and without any extension of time;
 - b. "FOUNDATIONS AND EARTH STRUCTURES DESIGN MANUAL 7.2", May 1982 Edition for calculating the displacement, moments and forces on the piles.

PIL1.D670.8

HORIZONTAL RESISTANCE BY ROCK SOCKET

Check for any additional stresses induced in the rock socket when the piles are designed with rock socket to resist horizontal loads. Comply with the requirements stated in clause 5.3.4 of the Code of Practice for Foundations.

NEGATIVE SKIN FRICTION

PIL1.D710.8

GENERAL

Make allowance in design calculations for negative skin friction and comply with clause 5.2 of the Code of Practice for Foundations.

PIL1.D720.8 BASIC FORMULA

1. The negative skin friction (NSF) caused by the settlement of the soil mass, is estimated by means of the equation in clause 5.2.2 of the Code of Practice for Foundations;
2. The minimum depth of the consolidation strata, l , for different blocks / structures shall be as given in the [Project Specific Specification](#);
3. Take responsibility to ensure that the assumed value of l on which the design is based is adequate for this Contract. Carry out boreholes, to the satisfaction of the CM, to verify the assumed value of l . Should the values of l so verified be greater than those on which the design is based, carry out any necessary redesign, extra piling work etc based on the greater values of l so verified at own expense and without any extension of time. Should the values of l so verified be less than the minimum values stated above, use the minimum values stated above in the design. In no case must l be longer than the length of the pile, measuring from ground level;
4. Water table level shall be as given in the [Project Specific Specification](#);
5. Ground level shall be as given in the [Project Specific Specification](#);
6. The at-rest earth pressure coefficient, K_0 , shall be as given in the [Project Specific Specification](#);
7. Make allowance for the effect of NSF between ground level and the soffit of the pile cap.

PIL1.D730.8 AVERAGE SOIL PROPERTIES

For the purposes of calculating negative skin friction, apply the average soil properties below ground as given in the [Project Specific Specification](#).

PIL1.D740.8 GROUPING EFFECT

Calculate the effect on negative skin friction of grouping effect based on the proposed design and the principles stated in clause 5.2.2 of the Code of Practice for Foundations. Submit all calculations with the tender.

PIL1.D760.8 REDUCTION OF NEGATIVE SKIN FRICTION

The design negative skin friction may be reduced in the case of tenders based on piles coated with a bitumen slip layer, provided that such material is acceptable to BD and provided that the proposed reduction in the design negative skin friction can be substantiated by reliable full scale field tests, preferably carried out locally under similar soil conditions. No reduction in negative skin friction due to grouping and boundary effects is permitted for bitumen coated piles. Tenders on this basis must include:

1. Proposed methods for proving that the slip layer is undamaged during pile driving and for determining the design reduction;
2. A guarantee that sufficient quantity of the material proposed for the slip layer will be available to enable the Works to be executed within the Contract period and that if it is not, the Contractor will redesign the piling system and execute it at no extra cost to the Authority and with no extension of time claimed.

PILE CAP DESIGN**PIL1.D810.8 STANDARDS**

Comply with Code of Practice for Structural Use of Concrete 2013 and Code of Practice for Foundations issued by the Buildings Department in respect of all design for reinforced concrete pile caps and for structural concrete above piles.

PIL1.D820.8 SUBMISSIONS (CONSTRUCTION OF PILE CAP IS NOT PART OF THE CONTRACT)

1. Prepare and submit a layout design of the pile caps with the tender, together with the schedule of pile cap quantities required by the Special Conditions of Tender;
2. Within two months following the notified date for commencement of the Works, complete the design of pile caps and submit four copies of working drawings and design calculations for Approval. Submit for further Approval any revisions made subsequent to this Approval within fourteen days following the completion of all piling works to each block/structure. Submit to the CM a complete set of the negatives for all working drawings of pile caps within fourteen days after the certified completion of the Contract;
3. Submit, with the tender, design calculations and details of reinforcement for pile caps for structural members specified in the [Project Specific Specification](#).

PIL1.D830.8 SUBMISSIONS (CONSTRUCTION OF PILE CAP IS PART OF THE CONTRACT)

Submit the following:

1. With the tender: drawings showing the layout and details of all the pile caps, together with all design calculations etc;
2. Within two months following the notified date for the commencement of the Works and before the commencement of any pile cap works on Site: four copies of working drawings for the pile caps for Approval. Submit, for Approval, any revisions made subsequent to this Approval.

DESIGN GUIDELINES**PIL1.D910.8 MANDATORY GUIDELINES**

Comply with the mandatory design guidelines as given in the [Project Specific Specification](#).

PIL1.D920.8 RECOMMENDED GUIDELINES

Recommended design guidelines which are considered suitable for the purpose of this Contract are included in the [Project Specific Specification](#) but the Contractor may propose a different design method for this part of the work.

PIL1.D930.8 CONTRACTOR'S RESPONSIBILITY

The provision of the mandatory and/or recommended guidelines in [PIL1.D910](#) and [PIL1.D920](#) above does not relieve the Contractor of any of his design responsibilities under the Contract.

MATERIALS

GENERAL

PIL1.M010.8 INFORMATION TO BE SUPPLIED WITH TENDER

Submit information of major materials proposed to be used in the piling works with the tender.

PIL1.M020.8 SAMPLES

Test representative samples of all materials being incorporated into the permanent works to show compliance with this Specification.

PIL1.M030.8 TEST CERTIFICATES

On Site delivery verification:

1. Submit to the CM the manufacturer's test certificates for each batch of piles delivered to Site;
2. Where piles Types 1(a), 1(b) and/or 2 are used in this Contract, and when the piles are not cast on the Site, submit the manufacturer's certificate signed by the manufacturer's engineer who should hold the qualification of MICE or MStructE or MHKIE for each delivery of piles to Site stating:
 - a. That the piles have been manufactured in accordance with the manufacturer's standards Approved by the Authority;
 - b. That the piles are satisfactory for the purpose intended;
 - c. What mix proportion and admixtures have been used in the concrete;
 - d. The results of all cube and core tests.
3. Where piles Types 4 and/or 6 are used in this Contract, submit the test certificates endorsed by the manufacturer for each delivery of steel H-piles to Site stating the results of chemical composition analysis, tensile tests and impact tests in accordance with the requirements of BS EN 10025 Part 1-6:2004.

PIL1.M040.8 QUALITY ASSURANCE

Carry out and conduct quality assurance on the production of pile Types 1a, 1b and 2 and/or Approved special proprietary types of piles under an Approved quality assurance scheme. The scheme must be inspected and certified by an independent engineer who should also hold the qualification as MHKIE, MICE or MStructE.

PIL1.M050.8 COLOUR CODE SYSTEM OF STEEL PILE SECTIONS

Colour Code System:

1. Submit for Approval a colour code system in the Quality Control System as stipulated in **PRE.B8.1425** for identification of steel pile sections for Types 4 and 6 Piles;
2. A batch of steel pile sections is defined as each delivery of steel pile sections to Site under one delivery order. Upon delivery of the steel pile sections to Site and before the material test results are known, apply colour markings (other than red and green) at both ends of the pile sections in accordance with the Approved colour code system submitted in sub-clause (1) above;
3. Upon material test results (including retest as permitted under the Specification) being available, change the colour at both ends of the pile sections as follows:
 - a. Green colour: for steel pile sections conforming to the Specification;
 - b. Red colour: for steel pile sections not conforming to the Specification.

STEEL PILES

PIL1.M110.8

'H' PILES AND PLATES

Quality requirements:

1. Complying with BS EN 10025 Part 1-6:2004; and
2. Use steel H-piles of types and brands recognized by BD. Material properties shall comply with the requirements stated in the recognition documentation issued by BD. Each section shall contain manufacturer's identification marked on it by means of engraving or similar techniques approved by the CM.

PIL1.M120.8

STEEL PIPE PILES

Quality requirements:

1. Complying with BS 3601:1987 or BS 6323:Parts 1 and 2:1982, except as regards the requirements of hydraulic pressure tests.

PERMANENT CASINGS

PIL1.M210.8

TYPE 5 PILES

1. Material: Grade S275 to BS EN 10210 Part 1-2:2006 for Hot-Finished Hollow Section and BS EN 10219 Part 1-2:2006 for Cold-Formed Hollow Section;
2. Minimum thickness: 5.0 mm;
3. Internal diameter: not less than the finished pile diameter shown or scheduled on the Drawings;
4. Free from:
 - a. Significant distortion and of uniform cross-section throughout the whole length;
 - b. Internal projections which might prevent the proper formation of the piles.

PILE SHOES

PIL1.M310.8

GENERAL

1. Submit full details of pile shoes together with the tender when specified in the [Project Specific Specification](#);
2. Take all necessary precautions including, where appropriate, or if required in the [Project Specific Specification](#), the provision of specially designed pile shoes to protect the ends of the piles during driving.

PIL1.M320.8

TYPES 1A AND 1B PILES

Provide flat or pointed co-axial shoes and:

1. Steel pile shoes: manufactured from steel complying with Grade S275 to BS EN 10025:2004;
2. Cast steel pile shoes: manufactured from steel complying with BS 3100:1991, grade A;
3. Cast steel pile shoes: manufactured from chill hardened iron, as used for making grey iron castings, complying with BS 1452:1996, grade 150 and free from major blow holes and other surface defects.

PIL1.M330.8

STRAPS AND FASTENINGS FOR CAST PILE SHOES FOR TYPES 1A AND 1B PILES

Manufactured from steel complying with Grade S275 to BS EN 10025:2004, cast into the point of the shoe to form an integral part of the shoe.

PIL1.M340.8**TYPE 1c PILES**

1. Manufactured from durable materials Approved by the CM and capable of withstanding driving stresses without damage;
2. Designed to provide a watertight joint with permanent casings.

PIL1.M350.8**TYPE 4 PILES**

Fit piles with Approved toe protection. The protection must be adequate to resist the driving stress.

GROUT AND CONCRETE**PIL1.M410.8****GROUT**

Consisting of ordinary Portland cement and water and:

1. Containing sand, PFA and admixtures only when Approved;
2. With a minimum cementitious content of 600 kg/m³;
3. When used to fill core holes, having a minimum characteristic compressive strength at 28 days of not less than the specified grade strength of the concrete surrounding the core hole;
4. With a maximum amount of bleeding of 2% in the first 3 hours and not exceeding 4% in total. The water must be reabsorbed by the grout during the 24 hours after mixing;
5. With a maximum free expansion of 10% at the nominal temperature;
6. With any Approved admixtures being chloride-free;
7. With a maximum total chloride content, expressed as a percentage relationship between the chloride ion and the cementitious content by mass in the grout, of 0.1%.

PIL1.M420.8**GROUT FOR TYPES 5, 6 AND 7 PILES**

In addition to the requirements of **PIL1.M410** above, ensure that grout for Types 5, 6 and 7 piles complies with the following:

1. Water used in the grout must be clean and fresh with a temperature not exceeding 30°C nor less than 5°C;
2. Additives and admixtures complying with BS 5075:1982 and only used with the prior agreement of the CM;
3. Non-shrink and having a minimum characteristic compressive strength of 30 N/mm² at 28 days;
4. For Type 7 piles,
 - a. Maximum grout temperature shall not exceed 38°C;
 - b. Sample each truckload of grout by using a 225 to 350 ml capacity disposable glass or cup to evaluate premature setting or initial set of the grout mix. Reject the use of the grout if the initial set has occurred under the condition of the grout starting forming the shape of the container when tilted.

PIL1.M430.8**FILLING TO STEEL PIPE PILES**

Fill for:

1. The uppermost 3 m from cut off level: concrete grade 10/20;
2. The remainder: Approved decomposed rock fill.

PIL1.M440.8**CONCRETE FOR PILE CAPS AND FOOTINGS**

1. For Contractor's Design Piling Contract / Combined Piling and Building Contract: use Grade 30/20;

-
2. For Engineer's Design Piling Contract / Combined Piling and Building Contract: concrete grade is specified in Drawings;
 3. Maximum free water/cement ratio allowed: as **CON1.M1170**;
 4. Inclusion of PFA as partial cement replacement: as **CON1.M170** and **CON1.M1190**.

ANCILLARY MATERIALS

PIL1.M510.8 PAINT FOR STEEL PILES AND STEEL OR CAST IRON COMPONENTS
Approved proprietary epoxy based paint.

PIL1.M520.8 WELDING ELECTRODES
As Worksection STR1.

PIL1.M540.8 EARTH FILLING
General Fill Material and Special Fill Material as **EAR1.M220**.

MECHANICAL COUPLER FOR TYPE 5 PILES

PIL1.M610.8 TYPE OF MECHANICAL COUPLER
The quality requirements of mechanical coupler shall be in accordance with **CON3.M310**.

PIL1.M620.8 SUBMISSION
Submission of the details of the mechanical coupler shall be in accordance with **CON3.M320**.

PIL1.M630.8 QUALITY ASSURANCE SCHEME FOR MECHANICAL COUPLER
Details of quality assurance scheme for mechanical coupler shall be in accordance with the **Project Specific Specification**.

WORKMANSHIP

GENERAL

PIL1.W010.8

REQUIREMENTS OF THE CONTRACT

Construct the works in a manner such as to satisfy the requirements of the Contract. In the event of any failure to comply with this requirement, rectify as necessary, until the requirements of this Specification are met.

PIL1.W020.8

REQUIREMENTS OF THE CONTRACTOR'S DESIGN

For Contractor's design piling contract / combined piling and building contract, the specification for design applies equally to construction. In the event of any failure to comply with this requirement, redesign and construct as necessary, until the requirements of this Specification are met.

PIL1.W030.8

DELIVERY, HANDLING AND STORAGE OF PILES

Carry out delivery, handling and lifting with due care and to Approval. Stack piles neatly, off the ground.

PIL1.W040.8

COLOUR MARKINGS OF STEEL PILE SECTIONS BY STOCKISTS OR SUPPLIERS PRIOR TO DELIVERY

1. Obtain steel pile sections from stockists / suppliers for Types 4 and 6 Piles preferably without red and / or green colour markings at either end of the steel pile sections;
2. If steel pile sections with red colour marking, or with other colour marking covering a previous red colour marking, or with green colour marking at either end of the steel pile sections are to be supplied:
 - a. Provide in advance of delivery of steel pile sections to Site an explanation of the presence of the said colour marking(s) to the satisfaction of the CM. In addition, for steel pile sections with red colour marking or other colour marking covering a previous red colour marking, provide to the CM before delivery to Site a written confirmation each from the Contractor and the stockist / supplier that the steel pile sections have not been rejected by other project(s);
 - b. The CM may refuse entry of steel pile sections to Site if:
 - i. No explanation is provided in advance; or
 - ii. The provided explanation is not satisfactory.

PIL1.W055.8

CONTOUR PLAN SUBMISSION FOR TYPE 4 PILES

1. Within 14 days from the notified date for commencement of the Works, submit a location plan showing the existing ground investigation drillholes and include any proposed additional ground investigation drillholes in accordance with the Specification for the approval of the CM before drilling work commences on Site;
2. Within two months from the notified date for commencement of the Works, complete the proposed additional drillholes, draw up a plan showing the contours of soil material with SPT N-value equal to or greater than 200 and submit to the CM for approval. The contours shall depict the highest level where SPT N-value is equal to or greater than 200 for at least the next 5m below;
3. Within 14 days after completion of the additional drillholes in the sub-clause (2) above, submit a plan showing the minimum depth of each pile, based on the Approved contour plan. The minimum depth shall in all cases be deeper than or equal to the depth as estimated from the Approved contour plan;

-
4. The contour plan in sub-clause (2) above shall be prepared and certified by the Design Certifying Consultant as provided in **PRE.B6.060** and submit to the CM for approval;
 5. Failure to comply with the above requirements may cause delay in the commencement of driving piles to final set. The Contractor shall be responsible for any time and cost implication in connection with such failure in complying with the above requirements.

PIL1.W070.8**SUBMISSION OF DRIVING FORMULA FOR TYPE 4 PILES**

1. Within 14 days from the notified date for commencement of the Works, submit for Approval by the CM a proposed driving formula with the appropriate choice of parameters for the Contractor's own plant and machinery, taking into account the complexity of the ground conditions and the tentative founding level of piles;
2. Include in the proposal a testing regime and acceptance criteria to ascertain the validity, applicability and reliability of the driving formula. The testing regime shall include test driving on pile(s) and any other additional tests to substantiate the driving formula. Bear cost and time for such additional tests. Allow 30 days for the CM to give comments on the proposal. Only implement the testing regime on Site after a written permission to commence is granted by the CM;
3. Substantiate the validity, applicability and reliability of the driving formula with the results of the test driving on pile(s) and any other tests proposed by the Contractor to the satisfaction of the CM. Review, modify and re-execute the testing regime as the case requires;
4. Submit final set tables based on the Approved driving formula and in a format to the satisfaction of the CM;
5. Do not commence driving without written permission from the CM, except for the implementation of the testing regime stated in sub-clause (2) above. Allow 42 days for the CM to approve the final set tables in sub-clause (4) above. Allow a further 22 days for obtaining the CM's written permission to commence driving using the Approved final set tables;
6. Ensure that the allowable pile capacity of the piles is achieved and developed after the final set driving with the use of the Approved driving formula. The ultimate pile capacity shall have such a safety factor as the proposed driving formula requires but the safety factor on design capacity of pile shall be not less than 2;
7. All submissions in relation to the proposed driving formula shall be prepared and certified by the Design Certifying Consultant as provided in **PRE.B6.060**;
8. During the progress of works, the Contractor may submit for Approval by the CM an alternative driving formula in accordance with the above sub-clauses (1) to (7).
9. Make due allowance in the programme for the time required for the above requirements. The Contractor shall not be entitled to any claim for extension of time and additional cost in relation to submission of driving formula or alternative driving formula;
10. Approval for the use of the driving formula or alternative driving formula shall not relieve the Contractor of any responsibility with respect to the required pile capacities under the Contract.

PROTECTION

PIL1.W110.8 COATING STEEL PILES AND COMPONENTS

Protect all steel piles from cut off level to a level as given in the **Project Specific Specification** and all steel and cast iron components in contact with soil of all other types of pile from corrosion by coating with at least two coats of an Approved coal tar epoxy paint. Apply the paint to a sufficient thickness to be suitable for resistance to damage during the driving process and be durable without deteriorating in the substrata environment. Prepare steel or metal surfaces and apply paint in accordance with the manufacturer's instructions.

ACCURACY AND TOLERANCES

PIL1.W210.8 GENERAL

1. Carefully set out the foundations, locate the piles in the correct positions and spacing and install the piles either plumb positions or to exact inclinations all in accordance with Drawings;
2. For manufacturing and installation tolerances, refer to Appendix H "Schedule of Tolerances" to this Specification and clause 7.5 of the Code of Practice for Foundations;
3. The permissible deviation shall not result in any part of the foundation element extending outside the site boundary.

PIL1.W220.8 EXCESSIVE DEVIATION

In the event of any pile varying from its correct position by more than either of the permitted tolerances for out of plumb and eccentricity, the CM may, if he deems it necessary, require the Contractor, to drive an additional pile or piles or to provide beams or other such works as are necessary to make good this or any other deviation.

PLANT AND EQUIPMENT

PIL1.W310.8 APPROVAL

Obtain Approval for plant and equipment before use.

PIL1.W320.8 SUBMISSIONS

1. Submit full details of plant, driving rig and hammer proposed to be used, with the tender;
2. For Type 7 piles, submit full details of plant, piling rig and auger proposed to be used, with the tender.

PIL1.W330.8 PILE HAMMER

1. Use a steel pile hammer capable of driving the pile to the required depth without overstressing or damage. For driven piles, ensure the weight of the hammer is at least half that of the pile and sufficient to achieve the required efficiency;
2. Where hydraulic hammers are used, submit technical details of both the hammer mechanism and instrumentation system. All hydraulic hammers should have on-board instrumentation capable of reporting the following data both for individual blows and for variable-sized groups of blows:
 - a. Hammer model and serial no. (header only);
 - b. Time and date (header only);
 - c. Blow number;
 - d. Blow-rate;

-
- e. Impact energy;
 - f. Stroke height (single-acting only).

PIL1.W340.8**FOLLOWERS**

Where followers are used, make allowance for a reduction of the efficiency of the pile hammers and the followers when calculating the driving resistance.

PIL1.W350.8**VERIFICATION OF EFFICIENCY**

Verify the efficiency of the pile hammers and the followers by calculation and insitu demonstration.

PIL1.W360.A**VIBRATION CONTROL**

1. Measure the peak particle velocity arising from piling and rock excavation machines and processes for foundation work;
2. Provide Approved equipment for measuring peak particle velocity for the exclusive use of the CM or his representatives and provide any necessary attendance during the course of the Contract;
3. Unless otherwise specified in the **Project Specific Specification**, comply with the requirements regarding peak particle velocity stated in Appendix A of PNAP APP-137 and clause 7.2.6 of the Code of Practice for Foundations;
4. Comply with any other requirements specified in the **Project Specific Specification**.

PIL1.W370.8**EXCESSIVE VIBRATION**

Where the peak particle velocity is found to exceed the limits given in **PIL1.W360** above, stop the machines or piling operations immediately:

1. Do not recommence work so suspended until effective means, or replacement machines, have been employed to reduce the peak particle velocity to within the acceptable limits;
2. Bear the cost of any stoppage under the terms of this clause and complete the Works without any consequent extension of time.

PIL1.W380.8**DEPLOYMENT OF SELF-OWNED PILING PLANTS FOR PILING CONTRACT**

1. For the types of plants listed below which are required to be used on Site for piling works, deploy at least one number of self-owned plant for each type of the plants, unless otherwise allowed by the CM:
 - a. Crawler crane;
 - b. Oscillator or rotator;
 - c. Reverse circulation drill (RCD);
 - d. Pile driving hammer;
 - e. Pile driving rig.
2. Comply with the following in deploying self-owned plants listed in sub-clauses (1)(a) to (1)(e) above:
 - a. Self-owned plants shall mean plants owned by the Contractor or by the Contractor's parent, sister or subsidiary company for the exclusive use of the Contractor;
 - b. All the plants deployed to Site shall be in good working conditions;
 - c. Submit documents to prove the ownership of the plants and, if applicable, the relationship between the Contractor and the Contractor's parent, sister or subsidiary company;
 - d. The self-owned plants deployed to Site in accordance with sub-clauses (1)(a) to (1)(e) may be used by the Piling Sub-contractor when necessary.

3. For piling works undertaken by Piling Sub-contractor, deployment of self-owned plants of the Piling Sub-contractor to Site shall comply with the requirements stated in **PIL1.G590**.

PIL1.W390.8 DEPLOYMENT OF SELF-OWNED PILING PLANTS FOR COMBINED PILING AND BUILDING CONTRACT

For piling works undertaken by Piling Sub-contractor, deployment of self-owned plants of the Piling Sub-contractor to Site shall comply with the requirements stated in **PIL1.G600**.

DRIVING

PIL1.W410.8 LENGTH OF DRIVEN PILES

Drive to a minimum net length below cut off level of 4500 mm.

PIL1.W420.8 PROXIMITY TO CAST INSITU PILES

Do not carry out driving within 3 m radius of any cast insitu pile within 48 hours of its being concreted.

PIL1.W430.8 DRIVING STRESSES FOR STEEL PILES

Do not exceed calculated driving stresses of $0.9 \times$ yield stress unless Approved.

PIL1.W440.8 TEMPORARY BRACING FOR DRIVEN PILES

Provide such temporary bracings as may be required during construction that are capable of keeping each pile accurately in its correct position. The method of bracing must be acceptable to the CM and must not be removed without prior Approval.

PIL1.W450.8 BITUMEN SLIP LAYER FOR DRIVEN PILES

Choose from either of the following methods and submit, with the tender, details of the method it is intended to adopt:

1. Case driven piles with bitumen slip layer for the depth over which the bitumen slip layer is to be provided; or
2. Excavate the ground within the depth over which the bitumen slip layer is to be provided prior to piling, and return and well ram the excavated material to a density not less than that of the surrounding soil on completion of the piling.

PIL1.W460.8 PROPRIETARY PILES WITH PROTECTIVE COATING

Proprietary pile types incorporating a protective coating without the requirement of casing or excavation, may be accepted subject to demonstration of the coating's effectiveness under site conditions and to spot checks on site.

PIL1.W470.8 DRIVING PILES DESIGNED NOT TO REST ON BEDROCK - FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Drive each pile to such layer or level as may be determined by a pile driving formula or static formula as **PIL1.D390**, whichever is the deeper, proposed by the Contractor and Approved by the CM.

PIL1.W480.8 DRIVING PILES DESIGNED NOT TO REST ON BEDROCK - FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. Drive each pile to the level as may be determined by either sub-clause (1)(a) or (1)(b) as follows:

-
- a.
- i. The proposed minimum pile length based on agreed SPT- $N \geq 200$ contours as required in **PIL1.W055** plus m, unless otherwise accepted by the CM;
 - ii. Satisfying the Approved pile driving formula as required in **PIL1.W070**.
- or
- b. A pile depth greater than that required by sub-clause (1)(a) if considered necessary by the CM, after taking into account the ground conditions and other relevant information, and satisfying the Approved pile driving formula as required in **PIL1.W070**.
2. Adopt a pile installation method, including but not limited to pre-boring, to ensure the required depth of pile is achieved without any damage, dislocation in position, out of plumb and reduction of its load carrying capacity;
 3. Do not drive a pile beyond the level as determined by sub-clause (1)(a)(i) unless it has been substantiated that the pile has not reached its design capacity at the level as determined by sub-clause (1)(a)(ii) by either final set measurements as specified in **PIL1.W520** using the Approved pile driving formula as required in **PIL1.W070**, or the set measurements using hydraulic hammer as specified in sub-clause (5), as appropriate;
 4. Unless otherwise approved by the CM, drive the pile to reach the level as determined by sub-clause (1)(a)(ii) progressively at an interval of not more than one metre beyond the level as determined by sub-clause (1)(a)(i) to avoid excessive driving of the pile. At the beginning of each of these intervals, take final set measurements as specified in **PIL1.W520** using the Approved pile driving formula as required in **PIL1.W070**, or set measurements using hydraulic hammers as specified in sub-clause (5), as appropriate;
 5. For any pile pitched by using hydraulic hammers and then driven to final sets by using drop hammers or other Approved types of hammers as allowed in **PIL1.W520**, establish a set of proposed hammer switching criteria for the CM's approval prior to installation of working piles to avoid excess pitching of the pile. The hammer switching criteria shall include but not be limited to a correlation between the final set measurements using drop hammers or other Approved types of hammers and the corresponding set measurements using hydraulic hammers, the results of pile driving analyser tests including CAPWAP analyses where appropriate, and the results of available static load tests;
 6. Review the proposed hammer switching criteria as specified in sub-clause (5) in respect of their accuracy, reliability and applicability from time to time when more measurements and testing data are available, and submit any necessary revisions of the proposed hammer switching criteria to the CM for approval. No extra cost and extension of time shall be entertained in the establishment of the proposed hammer switching criteria including their subsequent revisions;
 7. Bear the cost for any pile length driven beyond the level as determined by sub-clause (1)(a)(i) if the Contractor fails to take the final set measurements and / or the set measurements as specified in sub-clauses (4) and (5). The Contractor shall only be paid for the pile length to the level as determined by sub-clause (1)(a)(i);
 8. Where a pile depth greater than that required by sub-clause (1)(a) is considered necessary by the CM as mentioned in sub-clause (1)(b) above, the full length of pile up to the depth as instructed by the CM shall be measured and paid accordingly;
 9. Final set measurements and set measurements mentioned in the Specification shall include but not be limited to the measurements of set per blow, and temporary compression of pile and quake (elastic rebound) for determination of load carrying capacity of the pile.

PIL1.W490.8**DRIVING PILES DESIGNED TO REST ON BEDROCK**

Drive piles designed without allowance for group reduction factor and based on founding on bedrock as defined in **PIL1.G450** to refusal or to a final set not less than 10 blows per 10 mm with a hammer capacity adequate to allow twice of the safe load carrying capacity of the piles to be developed. Propose a pile hammer with details of the hammer, hammer efficiency and hammer capacity to be used, support the proposed hammer efficiency and hammer capacity by pile driving analyser tests and obtain approval from the CM before pile driving commences. For Type 4 piles designed to rest on bedrock, comply with clause 5.4.11 of the Code of Practice for Foundations and carry out test driving on at least two numbers of piles selected by the CM prior to commencement of pile installation.

PIL1.W500.8**FOUNDING LEVEL OF DRIVEN PILES**

For foundation designed to rest on bedrock, carry all foundations down to the insitu decomposed rock or bedrock as defined in **PIL1.G450**, and do not allow founding on boulders.

PIL1.W510.8**PENETRATION OF DRIVEN PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**

In addition to the requirements specified elsewhere in this Specification, ensure penetration of driven piles into insitu decomposed rock is adequate to allow the pile to develop twice the allowable bearing capacity specified in the Drawings.

PIL1.W515.8**PENETRATION OF DRIVEN PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**

In addition to the requirements specified elsewhere in this Specification, ensure penetration of driven piles into insitu decomposed rock is adequate to allow the pile to develop twice the safe load carrying capacity stipulated in **PIL1.D390**.

PIL1.W520.8**FINAL SETS OF DRIVEN PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**

Use either of the following methods to drive the piles to final sets:

1. Use hydraulic hammers to drive the piles to final sets according to the modified Hiley formula specified in the Drawings;
2. Use drop hammers or other Approved types of hammers to drive the piles to final sets according to an Approved driving formula.

PIL1.W525.8**FINAL SETS OF DRIVEN PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**

Use either of the following methods to drive the piles to final sets:

1. Use hydraulic hammers to drive the piles to final sets according to the modified Hiley formula stated in **PIL1.D390**;
2. Use drop hammers or other Approved types of hammers to drive the piles to final sets according to an Approved driving formula.

PIL1.W530.8**STEEL SET CHAIR**

Propose a steel set chair with a slot for CM's agreement to restrict the vertical movement of pencil for recording the final set:

1. A schematic sketch of a conceptual design of the steel set chair is given by Drawing No. CPT/SC/S/SK001 in Appendix C to this Specification;
2. The sketch is for reference only and given in good faith without prejudice to the Contractor's responsibilities and liabilities under the Contract.

INSTALLATION OF TYPE 3 PILES

PIL1.W610.8**BELL-OUT**

1. Form bell-out, if any, using an expandable drill bit mounted onto a reverse circulation drill rig or other means approved by CM;
2. Ensure that the size of the bell-out tools is checked and calibrated on ground before construction of the bell-out;
3. For Contractor's Design Piling Contract / Combined Piling and Building Contract, size of bell-out shall comply with clause 5.4.7 of the Code of Practice for Foundations.

PIL1.W620.8**RISK MANAGEMENT PLAN FOR TYPE 3 PILE**

Submit to the CM a risk management plan for Type 3 Pile within 21 days from the notified date for commencement of the Works. The risk management plan shall include, but not be limited to, identification of possible risks arising from or in connection with the following which may affect the quality of pile and or delay concreting work of pile beyond the statutory permitted working hours:

1. Extraction of temporary steel casing;
2. Concrete supply;
3. Concreting equipment;
4. Complex geotechnical conditions.

The plan shall also include analysis, assessment and evaluation of the risks identified and measures or action plans for avoiding, reducing or eliminating the risks.

INSTALLATION OF TYPES 5, 6 AND 7 PILES

PIL1.W710.8**GENERAL**

Install piles without the use of bentonite slurry or other drilling muds.

PIL1.W720.8**TRIAL PILES**

1. For Types 5 and 6 piles, install one vertical trial pile:
 - a. At a location agreed by the CM before the installation of any pile;
 - b. To demonstrate that the Contractor's proposed installation method will produce piles complying with this Specification; and
 - c. To carry out loading test according to the load testing requirements for working piles as and when Instructed.
2. For Type 7 piles, install at least two trial piles:
 - a. Of such length as calculated using two μ values agreed by the CM, taking into account the Contractor's capability and equipment to be used in pile installation, for the safe load carrying capacity;
 - b. At a location agreed by the CM before the installation of any pile;
 - c. To demonstrate that the Contractor's proposed installation method will produce piles complying with this Specification; and
 - d. To carry out loading test according to the load testing requirements for working piles as and when Instructed in order to validate the design and method of construction and to determine an appropriate μ value for the design of piles.
3. Subject to the CM's approval, a working pile may be selected as the trial pile;
4. For Types 6 and 7 piles, prior to installation of any other piles, submit a trial pile test installation report including but not be limited to the anticipated rates of advancement of boring operation in different soil/rock strata for the remaining piles upon satisfactory completion of trial pile installation.

PIL1.W730.8**INCLINATION OF PILES**

1. For Types 5 and 6 piles, check the inclination of piles, during installation, at every pile location. Arrange for a number of piles, as directed by the CM, to be checked by the use of an inclinometer or other Approved method before grouting and record the inclinations and orientations of the holes;
2. For Type 7 piles, check the inclination of piles, during installation, at every pile location. Arrange for a number of piles, as directed by the CM, to be checked by the use of an Approved method before grouting and record the inclinations and orientations of the holes.

PIL1.W740.8**CHANGE IN SUB-SOIL CONDITIONS FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**

If, during the installation of the piles, the excavated materials are found to be different from those specified in this Specification / the Drawings, or if such a situation is suspected, notify the CM.

PIL1.W745.8**CHANGE IN SUB-SOIL CONDITIONS FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**

If, during the installation of the piles, the sub-soil conditions prove to be different from those in the submitted design, or if such a situation is suspected, notify the CM and submit proposals to cope with the revealed sub-soil conditions.

PIL1.W750.8**PREBORED HOLE AND COVER FOR TYPE 6 PILES**

Ensure that the prebored hole shall be large enough to enable the installation of the steel H-pile and to allow a minimum cover of 40 mm to the steel H-pile (except at the base). Before inserting the steel H-pile in the prebored hole, ensure that the hole shall be cleaned and free from debris and soil.

PIL1.W760.8**TEST BORING PROPOSAL FOR TYPE 6 PILES**

Provide test boring proposal giving details of the actual boring system to be used on Site, operating mechanism of the drill bit, maximum volume of air supply and pressure to be applied in different soil and rock strata, minimum rate of advancement of drill bit, ground and piezometer monitoring arrangement, criteria for satisfactory performance of the boring operation, monitoring procedures for checking the rates of boring operation and any necessary precautionary measures to prevent excessive overbreak or ground loss and undue disturbance to sub-soil.

PIL1.W770.8**TEST BORING PROPOSAL - TYPE 7 PILES FOR CONTRACTOR'S DESIGN**

Prior to installation of trial piles and working piles, submit test boring proposal for the installation of Type 7 piles, which shall include but not be limited to the following information for the CM's approval:

1. Full technical details of the piles including grout strength, reinforcement details, cover to reinforcement, pile diameters and lengths;
2. Method statements for pile installation including equipment to be used, sequences of operation, drilling method, grouting method and installation of reinforcement cage;
3. All temporary works and precautionary measures required for prevention of settlement of adjacent ground during piling operation;
4. Ground settlement monitoring proposal;
5. Method of overcoming underground obstructions;
6. Grout mix and admixture;
7. Grout rate and pressure;
8. Minimum grout head to be maintained;

9. Testing regime and quality control for grouting;
10. Contingency plan for inclement weather during grouting and back-up plant and grout pump in case of breakdown.

PIL1.W775.8**TEST BORING PROPOSAL - TYPE 7 PILES FOR ENGINEER'S DESIGN**

Prior to installation of trial piles and working piles, submit test boring proposal for the installation of Type 7 piles, which shall include but not be limited to the following information for the CM's approval:

1. Method statements for pile installation including equipment to be used, sequences of operation, drilling method, grouting method and installation of reinforcement cage;
2. All temporary works and precautionary measures required for prevention of settlement of adjacent ground during piling operation;
3. Ground settlement monitoring proposal;
4. Method of overcoming underground obstructions;
5. Grout mix and admixture;
6. Grout rate and pressure;
7. Minimum grout head to be maintained;
8. Testing regime and quality control for grouting;
9. Contingency plan for inclement weather during grouting and back-up plant and grout pump in case of breakdown.

PIL1.W780.8**INSTALLATION PROCEDURES FOR TYPE 7 PILES**

1. In this clause, the following definitions are used:
 - a. Incremental grout factor for 1.5 m increment - Actual grout volume placed divided by theoretical grout volume for the 1.5 m increment;
 - b. Total grout factor - Actual grout volume placed divided by theoretical grout volume of pile;
 - c. Grout-return depth - The depth of the auger tip when the grout on the auger flight reaches the ground surface;
 - d. Auger refusal - The rate of auger penetration is less than 300 mm per minute of drilling.
2. Ensure that the size of the auger is checked and verified on ground before excavation of the piles. Advance the auger at a continuous rate preventing removal of excessive soil. Stop advancement after reaching the required embedment depth;
3. Prior to raising the auger, maintain a minimum grout head of 2 m. Determine the grout quantity by counting pump strokes and using the pre-determined grout volume per pump stroke. Maintain positive (clockwise) rotation of the auger at all times during placement of the grout. Coordinate the rate of grout injection and auger withdrawal so as to maintain:
 - a. Sufficient grout head at all times;
 - b. The incremental grout factor for each 1.5 m increment shall be not less than the smallest value obtained in the trial pile installation and in no case less than 1.15;
 - c. The total grout factor shall be not less than the value established in the trial pile installation and in no case less than 1.4;
 - d. The grout-return depth shall be equal to or greater than the grout head pumped at the bottom of the pile and shall be at least 2 m.
4. If grout pumping is interrupted for any reason, or if discontinued grout or slurry return at the ground surface is observed, or when grout pumping is interrupted or discontinued during pumping each truckload of grout, lower the auger at least 1.5 m below the level where the interruption occurred while pumping grout continuously;

5. If the volume of grout placed in any 1.5 m increment resulting in the incremental grout factor less than the minimum value observed in the trial pile installation, lower the auger 1.5 m or to the bottom of the pile if that is less, followed by controlled auger withdrawal while maintaining grout injection;
6. Provide auger turning and hoisting equipment enabling the auger to be rotated continuously in a positive (clockwise) direction while being withdrawn at a steady and continuous rate while pumping grout;
7. Clear away promptly the excess spoil accumulated around the auger due to the drilling process and grout injection;
8. Reinforcement cages to be free of soil, auger spoil or other deleterious materials prior to insertion into the grouted shafts;
9. Upon completion of the grouting operation and before the grout reaching its initial set, install the reinforcement cage immediately by lowering the reinforcement cage under its own weight to the specified level within the pile shaft. Prohibit vibrating or pushing the cage with equipment;
10. Pile excavation shall not be carried out within a centre to centre distance of 6 pile diameters from any pile under excavation or any newly cast pile with completion time elapsed not more than 24 hours.

PIL1.W790.8**REVIEW LOADING TEST RESULTS AND PROPOSED PILE LENGTHS - TYPE 7 PILES FOR CONTRACTOR'S DESIGN**

1. After completion of loading tests of trial piles with satisfactory results, review and revise the method statements and proposed pile lengths submitted under **PIL1.W770** as necessary. Prior to commencement of working piles, submit the revised method statements and proposed lengths of working piles with technical justifications to the CM for approval;
2. The proposed pile lengths in sub-clause (1) above shall in no case be less than the design pile lengths specified in the Contract. Bear all costs and time so incurred for any extra pile lengths installed beyond those specified in the Contract.

PIL1.W795.8**REVIEW LOADING TEST RESULTS - TYPE 7 PILES FOR ENGINEER'S DESIGN**

After completion of loading tests of trial piles with satisfactory results, review and revise the method statements as necessary. Prior to commencement of working piles, submit the revised method statements with technical justifications to the CM for approval.

FOUNDING OF BORED PILES**PIL1.W810.8****FOUNDING OF TYPE 3 PILES**

1. Comply with the following requirements for Contractor's Design Piling Contract / Combined Piling and Building Contract:
 - a. Excavate to form foundation for Type 3 piles so that the pile bases are socketed into bedrock as previously described in **PIL1.G450** and the socket depth shall comply with Note (3) of Table 2.1 of the Code of Practice for Foundations, or such other depths specified by the CM;
 - b. If the centre to centre spacing of two adjacent Type 3 piles is less than 2.5 times the diameter of the larger pile base and the difference in founding levels of these two piles is greater than the clear distance between their bases on plan, justify to the CM's satisfaction by an elastic analysis that:

- i. The compressive stress in the longer pile, including any additional stress induced by the shorter pile and/or any additional stress induced by any unfavorable ground conditions, will not exceed the limiting value set in **PIL1.D360**; and
 - ii. The bearing stress on the founding material supporting the longer pile, including any additional stress induced by the shorter pile and/or any additional stress induced by any unfavorable ground conditions, will not exceed the safe load carrying capacity set in **PIL1.D390**;
 - iii. When Instructed, carry out additional ground investigation works to justify the subsurface conditions assumed in his analysis to the CM's satisfaction at no additional cost and time.
- c. Notwithstanding the requirements of sub-clause (b) above, comply also the requirements stated in the last paragraph of clause 5.4.7 of the Code of Practice for Foundations, where steep bedrock profile is identified;
2. Comply with the following requirements for Engineer's Design Piling Contract / Combined Piling and Building Contract:
Excavate to form foundation for Type 3 piles so that the pile bases are socketed into bedrock as previously described in **PIL1.G450** and the socket depth shall comply with Note (3) of Table 2.1 of the Code of Practice for Foundations, or such other depths specified by the CM.

PIL1.W820.8 FOUNDING OF TYPES 5 AND 6 PILES

Found the rock socket in bedrock as **PIL1.G450**.

PIL1.W830.8 PROVING BEDROCK

1. See **PIL1.T220** for Type 3 piles; and
2. See **PIL1.T230** and **PIL1.T250** for Types 5 and 6 piles.

UNDERGROUND OBSTRUCTIONS

PIL1.W910.8 OBSTRUCTIONS TO PILES FOR CONTRACTOR'S DESIGN

1. When underground obstructions are encountered at any depth during piling operations, propose full details of the intended means of overcoming underground obstructions (the "intended means") for Approval prior to the works being put in hand, which Approval shall not relieve the Contractor of the responsibility for designing, constructing and completing the Works in accordance with the Contract;
2. The intended means shall not cause any adverse impact including, but not limited to, considerations of lateral stability, safe load carrying capacity and/or structural integrity, on the pile to be constructed and the piles already constructed; and
3. The Approved intended means shall be implemented and the obstructions shall be overcome by the Contractor at his own risk in respect of cost and time including the cost and time necessary to obtain Approval.

PIL1.W915.8 OBSTRUCTIONS TO PILES FOR ENGINEER'S DESIGN

1. When underground obstructions are encountered at any depth during piling operations, propose full details of the intended means of overcoming underground obstructions (the "intended means") for Approval prior to the works being put in hand, which Approval shall not relieve the Contractor of the responsibility for constructing and completing the Works in accordance with the Contract; and
2. The intended means shall not cause any adverse impact including, but not limited to, considerations of lateral stability, safe load carrying capacity and/or structural integrity, on the pile to be constructed and the piles already constructed.

PIL1.W920.8 INTENDED MEANS OF OVERCOMING UNDERGROUND OBSTRUCTIONS TO PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Subject to Approval, the intended means stated in **PIL1.W910** may include, but are not limited to, the following:

1. For Type 1, 2 and 4 piles,
 - a. Re-design of piles and/or pile caps;
 - b. Extraction and re-driving of piles;
 - c. Abandonment of piles and provision of replacement piles; and/or
 - d. Removal of underground obstructions by excavation and/or pre-boring through the underground obstructions.
2. For Type 3 piles,
 - a. Re-design of piles and/or pile caps;
 - b. Abandonment of piles and provision of replacement piles; and/or
 - c. Removal of underground obstructions by excavation and/or chiseling.
3. For Type 5, 6 and 7 piles,
 - a. Re-design of piles and/or pile caps;
 - b. Abandonment of piles and provision of replacement piles; and/or
 - c. Removal of underground obstructions by excavation and/or coring through the underground obstructions.

PIL1.W930.8 INTENDED MEANS OF OVERCOMING UNDERGROUND OBSTRUCTIONS TO PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Subject to Approval, the intended means stated in **PIL1.W910** may include, but are not limited to, the following:

1. For Type 1, 2 and 4 piles,
 - a. Extraction and re-driving of piles; and/or
 - b. Removal of underground obstructions by excavation and/or pre-boring through the underground obstructions.
2. For Type 3 piles, removal of underground obstructions by excavation and/or chiselling;
3. For Type 5, 6 and 7 piles, removal of underground obstructions by excavation and/or coring through the underground obstructions.

PIL1.W940.8 DESIGN CHANGES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Where the intended means of overcoming obstructions involve any changes to the design of the piles and pile caps accepted by the Employer at the date of acceptance of the Tender, any reduction in cost as may have resulted from the changes shall be subject to reduction in accordance with the provision of the Contract.

PIL1.W950.8 EXCAVATION OR PRE-BORING

Where underground obstructions are removed by excavation or pre-boring, cart away the excavated materials and backfill the boreholes or voids with Special Fill Material or other materials approved by the CM, well compacted, all to Approval.

PIL1.W955.8**SUBMISSION ON OVERCOMING ANTICIPATED UNDERGROUND OBSTRUCTIONS BEFORE PILE DRIVING OPERATION FOR TYPE 4 PILES**

1. Within 14 days from the notified date for commencement of the Works and before pile driving operation, submit a detailed proposal for overcoming anticipated underground obstructions to the CM for approval, taking into account the Contractor's own resources of labour, plant and equipment. The proposal shall not cause any adverse impact to, including but not be limited to, lateral stability, bearing capacity, and / or structural integrity of the pile to be constructed and the piles already constructed;
2. In the event that pre-boring is proposed to be adopted for overcoming anticipated underground obstructions as per sub-clause (1) above, the proposal shall also include detailed planning of locations and depths of wash bored holes and / or other methods acceptable to the CM to identify the extent, locations and depths of the anticipated underground obstructions;
3. Subject to no adverse comment by the CM, carry out the investigation as in sub-clause (2) above at the Contractor's own time and cost to identify the extent, locations and depths of the anticipated underground obstructions. In case wash bored holes are proposed, they shall be conducted by a RSC(GIFW) as specified in **PIL1.G460**;
4. Within 7 days upon completion of the investigation, prepare and submit to the CM for agreement a layout plan showing the number, locations and depths of the proposed pre-bored holes, which shall be reviewed and resubmitted when more information about the anticipated underground obstructions is available. The CM will consider available ground investigation, wash-boring results, other investigation findings, and other supporting documents as he considers relevant in approving or disapproving the proposed pre-boring requirements. The CM shall have sole discretion on the location and depth of pre-bored holes;
5. Subject to the approval by the CM, carry out the pre-bored holes to remove the anticipated underground obstructions. The Contractor shall make due allowance in his programme and pricing to comply with this requirement;
6. The Contractor shall be entitled to payment for the cost of Approved pre-boring work valued at the rates priced in the Bills of Quantities, but not be entitled to any claim for extension of time or any other cost claim. For the avoidance of doubt, irrespective of the repetitive operations of Approved pre-boring work done for the installation of a pile due to multi-layers of obstructions, the Contractor is only entitled to payment for one pre-bored hole based upon the deepest depth of pre-boring, subject to the requirement that the pile is successfully installed eventually;
7. When the pre-boring proposed by the Contractor for a specific pile location was disapproved by the CM, but subsequently underground obstructions are encountered during installation of the pile and pre-boring is further proposed by the Contractor and Approved by the CM, the Contractor is entitled to payment for the cost of pre-boring as per sub-clause (6) above but not entitled to any claim for extension of time or any other additional cost;
8. When no ground investigation and no pre-boring as in sub-clause (2) above are proposed by the Contractor for a specific pile location, but underground obstructions are encountered during installation of the pile and pre-boring is proposed by the Contractor and Approved by the CM, the Contractor is not entitled to payment for the cost of pre-boring and any claim on extension of time. The Contractor shall bear the risk in respect of cost and time to overcome the underground obstructions for that pile;
9. Other than the payment as per sub-clauses (6) and (7) above, the Contractor shall not be entitled to any other additional costs or claim for extension of time in connection with overcoming underground obstructions;

-
10. Bear all responsibility in the planning, executing and completing the Works and allow sufficient time in programme of the Works for the above requirements.

PILE SHAFT CASINGS

PIL1.W1010.A LININGS TO INSITU PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. Provide left-in steel linings when cast insitu piles are used and:
 - a. Extend the lining from cut-off level down to a level as given in the **Project Specific Specification**;
 - b. Ensure that the length of the lining is adequate for the purpose;
 - c. Increase the depth of the lining to suit actual site conditions, to prevent necking and bear the cost and time of such lengthening; and
 - d. Ensure that the lining does not protrude above the cut-off level or down into the bell-out and/or the designed rock socket.

PIL1.W1015.N LININGS TO INSITU PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. Provide left-in steel linings as given in the **Project Specific Specification**.

PIL1.W1020.8 PILE TYPE 2

Until insertion of precast concrete units, case the pile shafts for their entire length or for such length acceptable to the CM. Ensure casing is watertight and of sufficient strength to withstand soil pressure. Obtain Approval for details of casing.

PIL1.W1024.8 TEMPORARY CASING FOR TYPE 3 PILES

1. Provide temporary casing to the pile shaft for its entire length down to the inferred rockhead level of bedrock or such other depths acceptable to the CM;
2. Ensure casing is watertight and of sufficient strength to withstand soil pressure. Obtain Approval for details of casing;
3. Carry out all measures as considered necessary to prevent collapse of the bored hole during excavation and concreting;
4. Bear all responsibility in planning, executing and completing the Works and allow sufficient time in the programme of the Works for the above requirements; and
5. Bear all additional costs, including the cost of any temporary casing inevitably left in the ground in the course of pile construction for whatever reason by Contractor and no extension of time will be entertained for complying with the requirements of this clause.

PIL1.W1027.8 LEFT-IN TEMPORARY CASING FOR TYPE 3 PILES

1. When specified in the Drawings or as Instructed, leave the temporary casing behind to such depth as determined by the CM;
2. The Contractor may adjust the left-in temporary casing in sub-clause (1) above to a lower depth as considered necessary to suit the proposed method and sequence of construction. In this case, the Contractor shall bear all additional costs and no extension of time will be entertained for the adjustment.

PIL1.W1030.8 TYPE 5 PILES

Case pile shafts for their entire length except for that section in bedrock and ensure:

1. Casings are joined, where necessary, with watertight joints;
2. Casings are clean and free of any material adhering to them when first inserted into the pile position;

-
3. Dents in the casings do not exceed 5 mm in depression;
 4. The gap between the casing and soil is filled with grout or other Approved material.

PIL1.W1040.8 TEMPORARY CASING FOR TYPE 6 PILES

1. Ensure that temporary casing shall be lowered at the same time when the hole is made and that the casing must be seating on rock head or top of rock socket before the rock socket hole is formed;
2. Ensure also that the temporary casing shall be free from distortion, internal projection and hardened grout.

GROUTING PILE TYPES 2 AND 3**PIL1.W1110.8 PRESSURE GROUTING**

Where pressure grouting is required for the type of piling system proposed for this Contract, submit proposals for and details of the grouting with the tender.

PIL1.W1120.8 BASE OF TYPE 3 PILES

Grout the base of large diameter bored piles if soft material, debris, mud etc is found between the bottom of the concrete and the bearing stratum by test and:

1. Obtain Approval for the proposal and details of the grouting.

GROUTING TYPES 5, 6 AND 7 PILES**PIL1.W1210.8 BATCHING**

1. Batch dry materials by weight;
2. Measure the amount of water used by use of a calibrated flowmeter or a measuring tank.

PIL1.W1220.8 USE OF ADMIXTURES

State the use of admixtures prior to the commencement of trial piling and give evidence that the admixtures:

1. Will allow pumping to be carried out successfully;
2. Will yield concrete or grout of the required strength and durability;
3. Have been used successfully in previous practice.

PIL1.W1230.8 MIXING AND SIEVING

1. Mix grout by adding approximately two thirds of the cement to the water, followed by the additive, if any, then followed by the remaining third of the cement;
2. Use a high speed colloidal grout mixer with a minimum speed of 1000 rpm and mix for a sufficient time to produce a grout of uniform consistency;
3. Obtain Approval for the use of any alternative mixing procedures;
4. After mixing, keep the grout continuously agitated and, prior to injection, pass the grout through a nominal 2.36 mm sieve;
5. Use the grout as soon as possible after mixing and, in any case, within 30 minutes of the addition of cement unless special retarding agents are used.

PIL1.W1240.8 TESTING

Test after mixing and sieving and before injection as **PIL1.T330**.

PIL1.W1250.8 PREPARATION (FOR TYPES 5 AND 6 PILES)

Before steel reinforcement and/or steel H-pile is inserted in the pre-bored hole, clean the hole to ensure that it is free from debris and soil by a method approved by the CM.

PIL1.W1260.8 INJECTION

Obtain prior Approval for the method of placing the grout and:

1. Use an injection pump of the positive displacement type;
2. Measure the grout intake volume by a method agreed by the CM. Calibrate the measuring device and submit a calibration report to the CM 7 days before trial mix of grout is made;
3. Fill the entire shaft, inside the casing, solidly with grout, without voids, honeycombing or other defects; and
4. Cast each pile in one continuous operation and under no circumstances leave a pile partially grouted even if this involves working beyond normal hours and rates are to allow for such circumstances.

CONCRETING**PIL1.W1310.8 GENERAL**

1. Obtain Approval for the method of placing concrete;
2. Ensure that the entire shaft is solidly filled with concrete without voids, honeycombing or other defects.

PIL1.W1320.8 TYPE 3 PILES

For Type 3 piles, concrete may be placed under water subject to Approval and on submission of details. Clean the base of the excavation by using air lifting equipment or other Approved method, all subject to Approval.

PIL1.W1330.A CONTINUITY FOR TYPES 1c, 3 AND 5 PILES

1. Cast each pile in one continuous operation. In no case will it be permissible for a pile to be left partly concreted;
2. Submit a concreting plan for each Type 3 pile to the CM at least one week prior to commencement of concreting works to the respective pile for agreement. The concreting plan shall include an hourly concreting schedule and contingency measures to be taken for any slippage in concreting which may affect the timely completion of the scheduled concreting works. The contingency measures shall include, but not limited to, abandoning the retraction of part or entire length of the temporary casing to shorten the concreting time.

PIL1.W1340.8 REINFORCEMENT TO PILE TYPES 1 AND 2

Distribute reinforcement for pile types 1 and 2 uniformly. Ensure reinforcement is sufficient to withstand handling and driving stresses without fracture or cracking of the concrete.

PIL1.W1350.8 REINFORCEMENT TO TYPE 5 PILES

Lengthen the reinforcement by staggering the couplers using Approved methods. Separate each reinforcement bar by spacers at regular intervals.

FINISHING OFF PILE HEADS**PIL1.W1410.8 CAST INSITU PILES**

Cast insitu piles to a level of 750 mm above cut off levels.

PIL1.W1420.8 CUT OFF LEVELS

The top of pile cap levels shown on tender Drawings are provisional and may be altered if so required by the CM. It follows that the cut off levels of piles may also be varied. However, the extent of the variations will be limited to ± 1 metre of the levels shown on the tender Drawings.

PIL1.W1430.8 CUTTING AND TRIMMING

1. For Type 7 pile, a minimum period of 7 days has to elapse after completion of pile casting prior to cutting and trimming of pile head;
2. Excavate to expose, cut off and trim pile heads to the required levels, backfill with General Filling Material and import Special Filling Material to make up voids, and remove debris from Site.

PIL1.W1440.8 PRELIMINARY AND ABANDONED PILES

Excavate to expose, cut off and trim pile heads of any non-working preliminary piles to 2000 mm below finished ground level and of any abandoned piles to a level as given in the [Project Specific Specification](#) and backfill with General Filling Material, importing Special Filling Material to make up voids, and remove debris from Site.

PIL1.W1450.8 DOWEL BARS

For concrete piles, provide dowel bars. Straighten dowel bars subsequent to trimming pile head.

PIL1.W1460.8 CUTTING OFF STEEL PILES

For steel piles, execute cutting by Approved means. In the event of damage being done to the head of the pile, cut off the defective parts and make good the pile to the satisfaction of the CM.

PIL1.W1470.8 BEARING PLATES FOR STEEL PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. Weld a bearing plate to the top of each steel pile and ensure bearing plates are installed in accordance with the Drawings so that the imposed loads on bearing plates do not exceed the capacities of bearing plates as allowed in the Code of Practice for the Structural Use of Steel 2011.

PIL1.W1475.8 BEARING PLATES FOR STEEL PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. Weld a bearing plate to the top of each steel pile, sufficient to transfer the required load all to Approval;
2. Ensure bearing plates are proportioned so that the imposed loads on bearing plates do not exceed the capacities of bearing plates as allowed in the Code of Practice for the Structural Use of Steel 2011.

PIL1.W1480.8 ALTERNATIVE LOAD TRANSFER DETAILS FOR STEEL PILES

Obtain Approval for alternative load transfer details.

PIL1.W1490.8 WORK AT COMPLETION (WHERE CONSTRUCTION OF PILE CAP DOES NOT FORM PART OF THE CONTRACT)

At completion of the Works, where the method of working gives rise to changes in the levels from those agreed at the commencement of the Works, level off the Site to remove all high spots and fill in all hollows.

PILING RECORDS

PIL1.W1510.8**GENERAL**

Keep accurate and comprehensive records of each pile installed and submit daily a copy of these records signed by the site representative, to the CM, of each pile installation to its final position.

PIL1.W1520.8**STANDARD FORM**

Keep each record on standard forms as shown in Appendices III and IV to this Worksection showing, as appropriate to pile type, the following:

1. Pile reference number;
2. Date pile driven or installed;
3. Position of pile in the works and ground level at pile position;
4. Type and size of hammer and stroke;
5. Set throughout penetration of pile including the set for the last ten blows;
6. Measurements of temporary compression in the pile;
7. Details of any interruption in driving of the pile;
8. Details of obstructions and delays;
9. Level of tip of pile after completion of driving;
10. Length of pile;
11. Volume of concrete or grout placed in pile;
12. Length and toe level of casing;
13. Drilling rate and materials encountered;
14. Inclination of pile as installed per metre depth of pile;
15. Any other data requested by the CM;
16. Penetration of pile into bedrock.

PIL1.W1525.8**PILING RECORDS FOR TYPE 7 PILES**

Keep each pile installation record in an approved format for the following:

1. Pile reference number;
2. Weather conditions and temperature;
3. Date pile installed;
4. Position of pile in the works and ground level at pile position;
5. Grout truck number, arrival time on-site, batch time and batch volume;
6. Grout sampling time and time of initial set;
7. Grout cubes made by the Contractor;
8. Flow cone test results;
9. Auger diameter (actual diameter each time measured in field);
10. Time period for drilling of pile;
11. Rate of penetration of auger (revolution per auger pitch);
12. Abnormal drilling behaviour;
13. Details of obstructions and delay;
14. Pile drilled length/pile tip and top elevation;
15. Theoretical pile volume;
16. Time period for grouting of pile;
17. Range in pressure observed during grouting;
18. Grout return depth;

19. Grout volume pumped per 1.5 m increment of pile length;
20. Total number of pump strokes to complete pile (actual grout volume);
21. Total grout factor;
22. Reinforcing steel cage installed in the pile;
23. Special remarks (e.g. time of and reason for interruptions during grouting, extra grout cubes made);
24. Any other data requested by the CM.

PIL1.W1530.8 RECORDS OF TEMPORARY COMPRESSION FOR DRIVEN PILE

Keep and submit to the CM records of field measurements of temporary compression during the driving of the piles to the final set stages by recording same on a card or graph paper attached to the face of the pile.

PIL1.W1540.8 SUBMISSION OF RECORD PLAN

After completing all piling works of a block/structure or part of a block/structure as agreed by the CM, furnish to the CM four copies of a piling record plan showing, as appropriate, the position, identity number, length and final set of all the piles installed for that block/structure or that part of the block/structure. The piling record plan should not contain any amendments which have not been Approved. Submit four copies of a record plan showing offset of piles, if any. In addition, submit electronic copies of the record plans in a format as required by the CM.

PIL1.W1550.8 FOUNDING LEVEL RECORD

Provide a record of the founding level of the bedrock, for Approval.

PIL1.W1560.8 BORING RECORDS FOR TYPES 6 AND 7 PILES

Provide boring records in accordance with [PIL1.W1510](#), [PIL1.W1520](#), [PIL1.W1525](#), [PIL1.W1540](#) and [PIL1.W1550](#) and including the advancement rate of drill bit, air/grout pressure used, volume of air/grout supply, flushing medium, settlement and groundwater drawdown records, as appropriate to pile type.

REMEDIAL MEASURES

PIL1.W1610.8 PILES DESIGNED TO REST ON BEDROCK FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

When piles originally designed in accordance with [PIL1.D410](#) do not satisfy the founding conditions stated in that clause or the workmanship requirement stated in [PIL1.W490](#), the original design would be rejected. In this case, redesign the pile(s) in the same pile cap already installed and to be installed, as piles not found on bedrock in accordance with all the requirements for piles not found on bedrock.

PIL1.W1620.8 RISING PILES (FOR DRIVEN PILE)

1. Measure the top level of each pile immediately after driving to such a layer or level as is required;
2. Carry out further levelling checks for pile rising as and when directed by the CM;
3. Re-drive piles which have risen for any reason, to the original level (or to such other level as the CM may determine) unless otherwise directed by the CM.

PIL1.W1630.8 DEFECTIVE PILES

If in the opinion of the CM, any pile is defective because of the pile having been constructed or driven outside the specified tolerances or having been damaged during driving or by the construction of another pile nearby or otherwise failing to conform to this Specification:

1. Pull out and replace the pile with a sound pile complying in all respects with the requirements of this Specification;
2. If the pile cannot be pulled out, carry out Approved remedial measures.

PIL1.W1640.8 NON-COMPLIANCE (FOR TYPE 7 PILES)

For Type 7 piles not complying with the specified requirements stated in **PIL1.W780**:

1. Lower the auger to the bottom of the pile while the grout is still fluid and re-grout the bored hole; or otherwise,
2. Demonstrate to the CM by tests that the piles in doubt can sustain the design loading. Bear all costs and no extension of time is allowed for such tests as a consequence of the above non-compliance; and
3. If the test results indicate that the piles in doubt fail to sustain the design loading, bear all costs and no extension of time is allowed for the execution of remedial measures, including but not limited to the installation of additional piles and modifications of tie beams and pile caps.

SPLICING PILES**PIL1.W1710.8 GENERAL**

Where lengthening of a pile becomes necessary, or is directed by the CM, carry it out by the method directed or by any other Approved method. Do not resume the driving of a lengthened pile without the permission of the CM.

PIL1.W1720.8 STRENGTH OF SPLICES

Whenever necessary to splice a pile, the strength of the pile at the splice must be no less than the strength of pile at any normal section of the pile. Submit full details of proposed splicing methods with the tender.

WELDING**PIL1.W1810.8 TESTING OF WELDERS**

As Worksection STR1.

PIL1.W1820.8 ADVERSE WEATHER CONDITIONS

Do not carry out welding under adverse weather conditions as determined by the CM.

PIL1.W1830.8 WELDED JOINTS

Joint all piles by butt-welding in such a manner that the full strength of the original section is developed and:

1. Provide adequate facilities for supporting and aligning piles prior to welding;
2. Ensure that the joints are waterproof in the case of pipe piles.

PIL1.W1840.8 TACK WELDS

Keep tack welds to a minimum.

PIL1.W1850.8 STANDARDS

Weld by electric arc welding:

1. Comply with Worksection STR1 for welding Standards;
2. Where grade S450 steel H-piles are used, ensure that welding procedures is carried out on Site and Approved.

PIL1.W1860.8**PREPARATION**

Ensure the surface to be welded is free from all scale, grease, paint and rust and other matter.

PIL1.W1870.8**PILE SHOES**

Ensure welding is:

1. Adequate to transmit the ultimate pile load and to prevent the detachment of the points in the case of withdrawal to remove obstructions;
2. In accordance with the manufacturer's recommendations.

PIL1.W1880.8**FINISHING**

After every run of weld, chip out slags, and thoroughly wire brush surfaces.

PIL1.W1890.8**DEFECTS**

Make good any defects in a weld, such as distortion, spatter, cracks, undercut, slag holes, unequal width of bead, irregular ripple etc to the satisfaction of the CM.

PIL1.W1900.8**ETCHED SECTIONS**

Submit etched sections to the CM for examination when required.

RECORDS AND CERTIFICATES

PIL1.W2010.8

REPORT ON COMPLETION OF PILING WORKS FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. After all piles of a block or part of a structure as agreed by the CM have been installed, submit four copies of a report on completion of the piling works for that block or that part of the structure. The report shall be signed by the Authorized Signatory and the TCP Grade T4 as specified in the SP for foundation works and include the following:
 - a. Scope of the Works and foundations adopted;
 - b. General description of the geology of the Site, including an assessment report with rockhead contour plans as appropriate and at least one geological cross-section of the ground beneath that block or that part of the structure indicating the inferred soil layers' SPT - N values, bedrock and pile tip levels;
 - c. Piling records as **PIL1.W1510** to **PIL1.W1560**;
 - d. Schedule and summary of all pile test results excluding the proof tests specified in **PIL1.T030**;
 - e. As-built piling design certified by the Design Certifying Consultant;
 - f. Details of laboratory tests, instrumented pile tests and other load tests if the soil parameters given in this Specification have been modified;
 - g. Settlement analysis as **PIL1.D510** to **PIL1.D570** certified by the Design Certifying Consultant;
 - h. Final ground investigation reports prepared by the Ground Investigation Contractor;
 - i. Authorized Signatory's certification confirming that the completed piling works are satisfactory for the purpose intended and the piles, as installed, are properly penetrated into insitu decomposed rock or onto bedrock as approved by the CM;

-
- j. Report of remedial work, if any;
 - k. Any other relevant information;
 - l. Conclusion.
2. After submitting the report specified in sub-clause (1) above, request the CM to select piles for proof tests. The Contractor may, however, seek the CM's agreement to select piles for proof tests after submitting part of the report; in such an event, submit the outstanding part of the report not later than the time of submitting Form ICU14 as specified in sub-clause (3) below. Allow the CM 21 days to select piles for proof tests in accordance with **PIL1.T030**. If resubmission of the report is required, allow the CM another 21 days to select piles for proof tests after resubmission;
 3. Upon satisfactory completion of the proof tests, complete and submit Form ICU14 and report of further remedial work, if any, to the CM on block by block basis, unless otherwise agreed by the CM.

PIL1.W2020.8
**REPORT ON COMPLETION OF PILING WORKS FOR ENGINEER'S
DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING
CONTRACT**

1. After all piles of a block or part of a structure as agreed by the CM have been installed, submit four copies of a report on completion of piling works for that block or that part of the structure. The report shall be signed by the Authorized Signatory and the TCP Grade T4 as specified in the SP for foundation works and include the following:
 - a. Scope of the Works and foundations adopted;
 - b. General description of the geology of the Site, including an assessment report with rockhead contour plans as appropriate and at least one geological cross-section of the ground beneath that block or that part of the structure indicating the inferred soil layers' SPT - N values, bedrock and pile tip levels;
 - c. Piling records as **PIL1.W1510** to **PIL1.W1560**;
 - d. Schedule and summary of all pile test results excluding the proof tests specified in **PIL1.T030**;
 - e. Final ground investigation reports prepared by the Ground Investigation Contractor;
 - f. Authorized Signatory's certification confirming that the completed piling works are satisfactory for the purpose intended and the piles, as installed, are properly penetrated into insitu decomposed rock or onto bedrock as approved by the CM;
 - g. Report of remedial work, if any;
 - h. Any other relevant information;
 - i. Conclusion.
2. After submitting the report specified in sub-clause (1) above, request the CM to select piles for proof tests. The Contractor may, however, seek the CM's agreement to select piles for proof tests after submitting part of the report; in such an event, submit the outstanding part of the report not later than the time of submitting Form ICU14 as specified in sub-clause (3) below. Allow the CM 21 days to select piles for proof tests in accordance with **PIL1.T030**. If resubmission of the report is required, allow the CM another 21 days to select piles for proof tests after resubmission;
3. Upon satisfactory completion of the proof tests, complete and submit Form ICU14 and report of further remedial work, if any, to the CM on block by block basis, unless otherwise agreed by the CM.

PIL1.W2030.8**CERTIFICATION FOR CONTRACTOR'S DESIGN PILING CONTRACT /
COMBINED PILING AND BUILDING CONTRACT**

1. Submit the following prior to serving notice in writing to the CM on completion of the Works in accordance with GCC Clause 8.7:
 - a. Authorized Signatory's certification confirming that the completed job is satisfactory for the purpose intended and the piles, as installed, properly penetrate into insitu decomposed rock or onto bedrock as approved by the CM;
 - b. Four copies of the as-built pile cap design and drawings based on the as-built piling layout and/or four copies of the as-built footing design and drawings; the as-built pile cap and/or footing design and drawings should be certified by the Design Certifying Consultant and should not contain any amendments which have not been Approved;
 - c. Four copies of report listing the date of casting of concrete, the quality and quantity of materials used and the excavation record of each pile cap and/or footings;
 - d. Four copies of final test reports on the pile caps and/or footings not carried out by the Direct Testing Contractors;
 - e. Completed Form ICU 14;
 - f. Any other relevant information.
2. Any submission not to the satisfaction of the CM shall have to be re-submitted. Allow 21 days for each submission and re-submission for the checking of the CM.

PIL1.W2040.8**CERTIFICATION FOR ENGINEER'S DESIGN PILING CONTRACT /
COMBINED PILING AND BUILDING CONTRACT**

1. Submit the following prior to serving notice in writing to the CM on completion of the Works in accordance with GCC Clause 8.7:
 - a. Authorized Signatory's certification confirming that the completed job is satisfactory for the purpose intended and the piles, as installed, properly penetrate into insitu decomposed rock or onto bedrock as approved by the CM;
 - b. Four copies of the as-built pile cap drawings based on the as-built piling layout and/or four copies of the as-built footing drawings;
 - c. Four copies of report listing the date of casting of concrete, the quality and quantity of materials used and the excavation record of each pile cap and/or footings;
 - d. Four copies of final test reports on the pile caps and/or footings not carried out by the Direct Testing Contractors;
 - e. Completed Form ICU 14;
 - f. Any other relevant information.
2. Any submission not to the satisfaction of the CM shall have to be re-submitted. Allow 21 days for each submission and re-submission for the checking of the CM.

PILE CAPS AND FOOTINGS**PIL1.W2110.8****GENERAL**

Execute the work described in this Sub-section in accordance with the provisions of the other relevant Worksections in this Specification.

PIL1.W2120.8**APPROVED DESIGN FOR CONTRACTOR'S DESIGN PILING CONTRACT /
COMBINED PILING AND BUILDING CONTRACT**

Construct the pile caps and/or footings in accordance with the Approved, submitted design.

-
- PIL1.W2130.8 STARTER BARS FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**
- Apart from the execution of the pile caps and/or footings, provide and execute starter bars shown on the Drawings.
- PIL1.W2135.8 STARTER BARS FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**
- Apart from the design and execution of the pile caps and/or footings, provide and execute starter bars shown on the Drawings.
- PIL1.W2140.8 BACKFILLING EXCAVATIONS**
- Backfill excavation with Suitable Material up to the top level of the pile caps and/or footings and:
1. Form and maintain the sides of the backfill adjacent to the pile caps and/or footings to an angle of inclination as given in the **Project Specific Specification**;
 2. Deposit surplus excavated Suitable Material on Site in stockpiles in Approved locations;
 3. Remove Unsuitable Material from Site.
- PIL1.W2150.8 ALTERNATIVE PROPOSAL FOR CONCRETE COMPRESSIVE STRENGTH TEST**
- Where it is anticipated that the specified 28-day compressive strength tests for concrete of any pile caps / tie beams / footings cannot be completed upon the date for completion of the Works or the latest extended date for completion of the Works, whichever is the later, the CM may consider and approve at his own discretion without prejudice to the Contractor's responsibilities and liability under the Contract any proposal raised by the Contractor for earlier achievement of concrete strength for the completion of the Works after taking into account the timing of other tests of the Works, including but not limited to the use of a higher grade of concrete to that specified for the pile caps / tie beams / footings concerned, subject to the following:
1. Assess the results of these cube tests and core tests on basis of the grade of the concrete specified for the pile caps / tie beams / footings, but at the age less than 28 days in accordance with:
 - a. Clauses **CON1.T620** to **CON1.T650** inclusive for cubes;
 - b. Clause **CON1.T760** for cores; and
 - c. Do not make any adjustment to the measured strength in respect of the age of the cubes and cores when tested;
 2. For the purpose of Clause 8.7(1) of the General Conditions of Contract, the tests on a date before the 28th day after casting which showed the achievement of the specified 28-day compressive strength shall be regarded as an alternative to the tests for compressive strength of concrete for pile caps / tie beams / footings to be carried out on the 28th day after casting as prescribed by the Contract. If the test results under the Approved proposal, assessed in accordance with sub-clause (1) above show that the strength of concrete have achieved the specified 28-day compressive strength and the results of all other tests also satisfied with the requirements as prescribed by the Contract, the Contractor may notify the CM the completion of the Works in accordance with Clause 8.7 of the General Conditions of Contract provided that the Contractor shall provide an additional undertaking stating that:

"If the results of tests for compressive strength of concrete for pile caps / tie beams / footings as carried out on the 28th day after casting, received by the CM on a date after the issue of the certificate of completion, fail to comply with the specified 28-day compressive strength tests requirements for concrete of the pile caps / tie beams / footings prescribed in the Contract, the Contractor shall carry out further tests and / or remedial works, all at the Contractor's expenses, and shall bear all costs, expenses and loss of the Employer due to failure of the tests. Irrespective of whether the Site or the concerned part thereof be handed over to others at a later date, or if the Site or the concerned part thereof has been handed to others before the commencement of the remedial works, the Employer shall be at liberty to carry out such remedial works by his own workers or by other contractors or allow the Contractor to carry out the whole or remaining part of the remedial works. In any case, the Contractor shall indemnify the Employer against all losses, liabilities, damages, costs, legal costs, professional fees and other expenses of any nature whatsoever the Employer may suffer, sustain or incur, whether direct or consequential, arising out of or in connection with the carrying out and completion of the whole or remaining part of the remedial works."

3. The Contractor shall bear all the additional costs and time for complying with the requirements of this clause.

PIL1.W2160.8**FOUNDING AND PROVING BEDROCK FOR FOOTINGS**

Refer to **EAR1.W930** and **EAR1.W940**.

MECHANICAL COUPLER FOR TYPE 5 PILES**PIL1.W2210.8****QUALIFIED SUPERVISION**

Qualified supervision for mechanical coupler shall be in accordance with **CON3.W310**.

PIL1.W2220.8**INSPECTION LOG BOOK**

1. Record the details in an inspection log book as per **CON3.W320**.
2. Keep the inspection log book on Site for CM's inspection when required and submit the inspection log book to CM upon completion of the mechanical splice works.

TESTING

TESTING GENERALLY

PIL1.T010.8 NUMBER AND DISPOSITION OF TEST PILES

The number and disposition of the piles to be tested will be as Instructed. Make allowance for testing one preliminary pile early in the Contract to provide reasonable assurance that the Specification will be met.

PIL1.T020.8 REQUIRED MINIMUM NUMBER OF TESTS

1. Unless otherwise specified, the required minimum number of tests in this Worksection shall be calculated based on the testing frequency or sample size stated and the total number of piles installed in the whole Site. In case the calculated number of tests is not a whole number, any fraction of test shall be construed as one test;
2. Request the CM to select locations or piles for testing when all the piles have been installed and are ready for testing;
3. Upon agreement with the CM, the Contractor may request the CM to select locations or piles for testing when a portion of the piles have been installed and are ready for testing. In such an event, the required minimum number of tests for the portion shall be calculated based on the testing frequency or sample size stated and the total number of piles of that portion. In case the calculated number of tests is not a whole number, any fraction of test shall be construed as one test. As a consequence, the total number of tests carried out for all the portions may be more than the required minimum number of tests for the whole Site. Bear all additional costs and no extension of time is allowed.

PIL1.T030.8 PROOF TEST

1. After receiving the report on completion of piling works as specified in **PIL1.W2010** or **PIL1.W2020**, the CM shall select piles for proof test accordingly;
2. In this Specification, proof test shall mean:
 - a. Loading test of working piles as specified in **PIL1.T610** and **PIL1.T1010** to **PIL1.T1130** for Type 1, 2, 4, 5, 6 and 7 piles;
 - b. Core test as specified in **PIL1.T1210** to **PIL1.T1250** for Type 1c piles and Type 3 piles.
3. Notwithstanding the samples size specified in **PIL1.T610** for loading test and **PIL1.T1220** for core test, the CM shall select at least 1 pile per block for each type of proof test. For Type 4 piles driven to bedrock, the CM may select samples more than the sample size specified in **PIL1.T610**;
4. Allow the Direct Testing Contractor the number of working days as specified in the **Project Specific Specification** to carry out each proof test commencing after special attendance as stipulated in Worksection PRE.B12 or PRE.C12 as appropriate has been satisfactorily provided.

PIL1.T040.8 BATCH OF MECHANICAL COUPLER FOR TYPE 5 PILES

A batch of mechanical coupler is as specified in **CON3.T025**.

PRELIMINARY DRIVEN PILES

PIL1.T110.8

PRELIMINARY PILES - TYPES 1, 2 AND 4 FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Before driving any pile, install at least one preliminary additional pile, for each of the proposed pile types to verify the proposed design methods and parameters and as follows:

1. Install the pile at a location outside the building structure and to a design depth, all as Approved;
2. Refer to **PIL1.T130** for details of instrumentation;
3. Install a borehole adjacent to the preliminary pile and before it is driven to determine the geotechnical conditions;
4. Test the preliminary pile by Pile Driving Analyser with CAPWAP analysis after installation to the Approval founding depth;
5. Carry out a loading test on the preliminary pile as **PIL1.T810** to **PIL1.T880**, immediately after driving to determine the ultimate side resistance and tip resistance of the pile;
6. Unless otherwise instructed by the CM, the Contractor may choose to pitch the first sections of working piles before the test result is known but in the case of a test failure, the Contractor must revise the design parameters and submit them for Approval. Any piles driven on the basis of the original proposal will be deemed to be unacceptable;
7. Carry out Approved remedial measures for such unacceptable piles including extracting and disposing, off Site, of any abandoned piles, where necessary, without any claim for extension of time;
8. Install a preliminary pile for the revised Approved design, repeating the procedure described above as necessary until a successful test result is achieved;
9. No claim for an extension of time will be allowed in connection with the provisions of this clause;
10. Trim down the preliminary pile to two metres below the finished ground level, or as directed, after completion of the loading test.

PIL1.T120.8

PRELIMINARY PILES - TYPES 1, 2 AND 4 FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Before driving any pile, install a preliminary additional pile, for each pile type to verify the driveability and the design assumptions as follows:

1. Install the pile at a location outside the building structure and to a design depth, all as Approved;
2. Refer to **PIL1.T130** for details of instrumentation;
3. Install a borehole adjacent to the preliminary pile and before it is driven to determine the geotechnical conditions;
4. Test the preliminary pile by Pile Driving Analyser with CAPWAP analysis after installation to the Approval founding depth;
5. Carry out a loading test on the preliminary pile as **PIL1.T810** to **PIL1.T880**, immediately after driving to determine the ultimate side resistance and tip resistance of the pile;
6. Unless otherwise instructed by the CM, the Contractor may choose to pitch the first sections of working piles before the test result is known. If any of the loading tests fail, the CM may order the installation of additional piles and the repetition of the procedures specified in this clause until a successful result is achieved.

PIL1.T130.8 INSTRUMENTATION

1. Instrument the preliminary pile with calibrated strain gauges to determine the distribution of side resistance in each major soil stratum down the pile and tip resistance in the bearing stratum during the loading test;
2. Propose, for the above purpose, the type, number and locations of strain gauges to be installed in each preliminary pile as well as the method of installation and protection of the strain gauges;
3. Acceptance of the Contractor's proposal by the CM shall not relieve the Contractor from the responsibility for ensuring the proper installation of the strain gauges and their satisfactory performance during load testing of the piles;
4. Check the performance of the strain gauges installed in the preliminary pile before and after installation of each segment of the pile into the ground, and before and during load testing of the pile;
5. The preliminary pile will be deemed unacceptable should there be more than 20% of the required total number of installed strain gauges not functioning properly during load testing of the pile;
6. Install an additional preliminary pile as **PIL1.T110**;
7. No claim for an extension of time will be allowed in connection with the provisions of this clause;
8. Take strain gauge reading at each incremental change of test load during the load test;
9. Present the strain gauge results by an Approved personal computer compatible spreadsheet software in both tabular and pictorial forms agreed by the CM;
10. Submit two copies of the data stored on floppy diskettes to the CM within one week after completion of the loading test.

PIL1.T140.8 FAILURE OF PRELIMINARY PILES

A preliminary pile is deemed to have failed the loading test when any of the following conditions occur in loading stage 2 as defined in **PIL1.T830**:

1. The settlement of the pile head reaches the magnitude of settlement at failure as defined in **PIL1.T910**;
2. The permanent settlement after removal of stage load 2 exceeds the permitted value specified in **PIL1.T920**.

SAMPLING AND TESTING FOUNDING LEVELS TO PILE TYPES 3, 4, 5, 6 AND 7**PIL1.T210.A PROVING BEDROCK BEFORE INSTALLATION OF TYPE 3 PILES**

1. Testing arrangements and testing samples:
 - a. At every Type 3 pile location, carry out pre-drilling and take cores of minimum NX size to a minimum depth of 5000 mm into bedrock below the proposed pile base before commencement of excavation for the pile, when Instructed.
2. Testing methods:
 - a. Extract rock core samples from the core holes in the presence of the CM or his representatives and provide records of bores for CM's inspection;
 - b. When Instructed, carry out laboratory compression tests or field point load tests on recovered cores to determine rock strength;
 - c. Submit to the CM ground investigation reports within 3 days after completion of coring and not less than 10 days prior to the commencement of pile excavation;

- d. Take further cores at any location as the Contractor deems necessary and at his own expense as stated in **PIL1.G440**;
 - e. Keep the rock samples and a copy of the ground investigation reports in the container store rooms;
 - f. Backfill the drillholes with cement grout or Approved material.
3. Test on bearing strata:
 - a. Carry out the uniaxial compressive strength test or equivalent point load index test on the founding material for piles founded on Cat 1(c) or better rock in accordance with the testing methods stated in sub-clause (2)(b) above. Perform a minimum of 1 such test on rock specimen obtained at the location of each installed pile.

PIL1.T220.A**PROVING BEDROCK BEFORE REACHING FOUNDING LEVEL FOR TYPE 3 PILES**

1. Testing arrangements and testing samples:
 - a. When Instructed, upon excavation for Type 3 pile reaching bedrock as previously described in **PIL1.G450**, or the tentative founding level as specified in the Drawings or pile base, take an NX size core to a minimum depth of 5000 mm or such other depth as instructed by the CM into the bedrock below the proposed pile base. In order to ascertain bedrock profile within a pile, the CM may order more than one core per pile.
2. Testing methods:
 - a. Extract rock core samples from the core holes in the presence of the CM or his representatives and provide records of bores for CM's inspection;
 - b. When Instructed, carry out laboratory compression tests or field point load tests on recovered cores to determine rock strength;
 - c. Submit to the CM ground investigation reports within 3 days after completion of coring;
 - d. Take further cores at any location as the Contractor deems necessary and at his own expense as stated in **PIL1.G440**;
 - e. Keep the rock samples and a copy of the ground investigation reports in the container store rooms; and
 - f. Backfill the drillholes with cement grout or Approved material.

PIL1.T230.8**PROVING BEDROCK BEFORE INSTALLATION OF TYPES 5 AND 6 PILES AND OF TYPE 4 PILE DRIVEN TO BEDROCK**

1. Testing arrangements and testing methods:
 - a. Before the commencement of piling, carry out pre-drilling and take cores of minimum NX size down to at least 5 m deep into the bedrock below the rock head of the specified grade of rock, or to the bottom level of the designed rock socket length of the nearest pile, whichever is the deeper. Provide rock core samples and records of the bores for the CM's inspection. Backfill the drillholes with cement grout or Approved material. Submit to the CM ground investigation reports within 3 days after completion of the coring.
2. Testing samples:
 - a. The number of drillholes required shall be such that the pile tip of every pile shall be within 5 metres from a drillhole and there shall be at least a drillhole at every pile cap location.

PIL1.T240.8**PROVING BEDROCK DURING INSTALLATION OF TYPES 5 AND 6 PILES AND OF TYPE 4 PILE DRIVEN TO BEDROCK**

1. Testing arrangements:

- a. When Instructed, provide equipment for obtaining disturbed and undisturbed soil and rock samples in accordance with BS 5930:1981 from ground in the vicinity of the pile shaft during installation.
2. Testing methods:
 - a. When Instructed, carry out the following tests on Site or in the laboratory as directed by the CM:
 - i. The standard penetration test in accordance with BS1377 : 1975 (Test 19), modified by "Geoguide 2: Guide to Site Investigation", Hong Kong Government, 1987;
 - ii. Point load test in accordance with ISRM "Suggested Method for Determining Point Load Strength", International Journal of Rock Mechanics, Mining Sciences & Geomechanics, 1985, Volume 22, No. 2, Pages 51-60;
 - iii. Uniaxial compression strength test in accordance with ASTM Designation: D2938 – 86.
 - b. When the drillhole reaches the rockhead, recover continuous rock cores to at least 5 m deep into the bedrock below the rock head of the specified grade of rock, or to the bottom level of the designed rock socket length of the nearest pile, whichever is deeper. Log all rock cores to ensure the quality of the rock socket;
 - c. Provide suitable containers for samples of soil and ground water, ensuring that containers for cohesive material are airtight;
 - d. Arrange for the testing of the samples in an Approved laboratory; and
 - e. Backfill the drillholes with cement grout or Approved material.
3. Test on bearing strata for Types 5 and 6 Piles:
 - a. Carry out the uniaxial compressive strength test or equivalent point load index test on the founding material for piles socketed in Cat 1(c) or better rock in accordance with the testing methods stated in sub-clause (2)(a)(ii) and (iii) above. Perform at least 1 such test on rock specimen taken within 5m of each installed pile.
4. Submit to the CM ground investigation reports within 3 days after completion of the coring and test in sub-clause (2)(a)(i) above and test reports within 3 days after completion of the tests in sub-clause (2)(a)(ii) or (2)(a)(iii) above.

PIL1.T250.8**PROVING BEDROCK AFTER INSTALLATION OF TYPES 5 AND 6 PILES AND OF TYPE 4 PILE DRIVEN TO BEDROCK**

1. Testing arrangements:
 - a. After installation of the piles, the CM will order a Direct Testing Contractor to take cores of minimum NX size in accordance with the requirements stated in clause 7.4.4 of the Code of Practice for Foundations. The drillholes shall be in the vicinity of the piles;
 - b. Provide attendance on the Direct Testing Contractor as described in Worksection PRE.B12 or PRE.C12, as appropriate; and
 - c. Backfill the drillholes with cement grout or Approved material.
2. Testing samples:
 - a. The number of drillholes required shall be at least 2 or 1% of the total numbers of piles, whichever is the greater.

PIL1.T260.8**FOUNDING LEVEL FOR TYPE 7 PILES**

1. Testing arrangements and testing methods:

- a. Before the commencement of piling, carry out pre-drilling down to at least 5 m below the tentative founding level of the specified category in accordance with the Code of Practice for Foundations. Carry out standard penetration tests at maximum interval of 2 m along the drillholes from cut-off levels down to 5 m below the tentative founding levels. Provide records of the bores for the CM's inspection. Backfill the drillholes with cement grout or Approved material. Submit to the CM ground investigation reports within 3 days after completion of the coring.
2. Testing samples:
 - a. The number of drillholes required shall be such that the pile tip of every pile shall be within 5 metres from a drillhole.

TESTING GROUT FOR TYPES 3, 5, 6 AND 7 PILES

PIL1.T310.8

DEFINITION OF 'BATCH'

1. For the tests specified in **PIL1.T320** and **PIL1.T330**, a 'batch' of grout is any quantity of grout used for grouting in one continuous operation in one day;
2. For the test specified in **PIL1.T340**, a 'batch' of grout is the quantity of grout as stipulated in Clause 1.2 of CS1:2010.

PIL1.T320.8

TEST FOR BLEEDING AND FREE EXPANSION

1. Testing arrangements and testing samples:
 - a. Provide one sample of grout from each batch not more than 30 minutes after mixing and protect from changes in moisture content before tests are carried out.
2. Testing methods:
 - a. Divide each sample into three specimens and place a portion of each specimen in a covered cylinder with a diameter of 100 ± 10 mm to a depth of 100 ± 5 mm;
 - b. Measure the amount of bleeding and free expansion by a scale fixed to the outside of the cylinder.
3. Non-compliance:
 - a. If the result of any test for the amount of bleeding or free expansion of the grout does not comply with the specified requirements, submit particulars of proposed changes to the materials, grout mix or methods of production to the CM and carry out further grouting trials unless otherwise permitted by the CM;
 - b. For Type 7 piles, the acceptance criteria for the result of any test for the amount of bleeding or free expansion of the cement sand grout shall be reviewed, established and subject to the CM's agreement after conducting the trial mix of the grout.

PIL1.T330.8

FLOW CONE EFFLUX TEST

1. Testing samples:
 - a. After mixing and sieving and prior to injection, take one sample from each batch.
2. Testing methods:
 - a. Test the grout in accordance with ASTM C939-94 to determine the Flow Cone Efflux time;
 - b. For Type 7 piles, a 19 mm diameter flowcone shall be used. Flow rates shall be within 15 to 25 seconds.
3. Non-compliance:
 - a. Except with the CM's prior agreement for grout mixes containing additives and admixtures, grout having an efflux time of less than 15 seconds will be rejected.

PIL1.T340.8 TEST FOR CRUSHING STRENGTH

1. Testing samples:
 - a. Provide one sample (Type 3 Pile) from every 25 m³ or every 25 batches, whichever is the smaller volume. At least one sample shall be provided from grout produced on any one day;
 - b. Provide one sample (Types 5, 6 and 7 Piles) from every 10 m³ or every 10 batches, whichever is the smaller volume. At least one sample shall be provided from grout produced on any one day;
 - c. Each sample provided in sub-clauses (a) and (b) above shall not be taken at a time more than one hour after the grout is mixed and shall be protected from weather before test cubes are made.
2. Testing methods:
 - a. The DTC shall prepare two cubes of 100 mm size from each sample, cure and test the cubes for crushing strength at 28 days in accordance with CS1:2010;
 - b. The average of the two crushing strengths shall be taken as the test result. The criteria C1 and C2 shall be adopted as appropriate for assessing compliance stipulated in **CON1.T640** and **CON1.T660** of Worksection CON1;
 - c. The test result shall comply with the following requirements:
 - i. Individual test results: comply with the strength determined from limits given in Column A of the Table specified in **CON1.T650** of Worksection CON1;
 - ii. Average strength determined from any group of four consecutive test results: comply with the strength determined from limits given in Column B of the Table specified in **CON1.T650** of Worksection CON1. Where there are less than four available test results, treat the average of the first two or first three consecutive test results in the same manner as groups of four consecutive test results.

VISUAL INSPECTION**PIL1.T410.8 REQUIREMENT**

When Instructed, open up for inspection any piles covered up as specified in the following clauses in this sub-section.

PIL1.T420.8 METHOD

Excavate to expose piles for a minimum of 750 mm from face of the pile all round and:

1. Plank and strut and shore all faces of the excavation and keep the excavation free from water by pumping or baling;
2. Wash surfaces of piles to be inspected clean of all silt, mud or other adhering material;
3. Deposit excavated material in temporary spoil heaps on Site;
4. After inspection, fill in and well ram to the entire satisfaction of the CM, around the piles with Special Filling Material suitable for the piling system adopted. If necessary, remove excavated Unsuitable Filling Material from site and make up voids with Special Filling Material.

PIL1.T430.8 CRITERIA FOR FAILURE

Piles that upon inspection are found to be honeycombed, necked or cracked are deemed to be defective.

DESTRUCTIVE TESTS ON SAMPLES OF TYPES 4 AND 6 PILES

PIL1.T510.8

GENERAL

Testing arrangements:

1. Allow for providing additional piles for testing, making samples of steel plates and their delivery.

PIL1.T520.8

SAMPLES

Testing samples:

1. The CM will order approximately 1% of the number of the steel piles delivered to Site to be subjected to testing in accordance with this sub-section before driving;
2. Take two samples from the steel plates at both ends of each of the chosen piles for tensile testing;
3. Tensile tests on steel samples will be carried out by Direct Testing Contractor.

PIL1.T530.8

NON-COMPLIANCE

In the event that the tensile test results fail to comply with this Specification, all piles delivered on the same date will be deemed unacceptable and must be removed from the Site.

PIL1.T540.8

PREMATURE INSTALLATION

Where piles are installed before test results are known, submit, for Approval, proposals for remedying any unacceptable piles already installed.

LOADING TESTS GENERALLY

PIL1.T610.8

REQUIREMENT FOR TESTING

1. Test the preliminary pile(s) in accordance with this sub-section but do not test pile(s) before the concrete and/or grout has attained sufficient strength to withstand the test loads;
2. Loading tests for working piles of each type of Types 1, 2, 4, 5, 6 and 7 Piles:
 - a. Unless otherwise specified by the CM, the sampling rate for loading tests shall be in accordance with the following table:

Type of loading test	Category of pile	Sampling rate for loading tests
i. Compression Test	Pile designed to take compression only.	1% of or 1 number from the total number of piles under both categories, whichever is the greater
	Pile designed to take reversed tension and compression with tensile load resistance less than 50% of the compressive load resistance.	
ii. Tension Test	Pile designed to take tension only.	2% of or 1 number from the total number of piles under both categories, whichever is the greater
	Pile designed to take reversed tension and compression with tensile load resistance equals to or greater than 50% of the compressive load resistance.	

- a.
 - b. For loading tests in compression, the CM will order the Direct Testing Contractor to carry out the tests in accordance with this Worksection;

- c. For loading tests in tension, submit details of tests for CM's approval and carry out the tests according to the Approved procedures.
3. Testing arrangements:
 - a. Piles will not be tested before the concrete and/or grout has attained sufficient strength to withstand the test loads and selection of piles for testing shall be in accordance with **PIL1.T030**;
 - b. Allow sufficient time in the programming of the Works for the CM to order the piles to be load tested and for performing the number of tests stated before completion of the Works or the respective Section thereof;
 - c. Provide attendance on the Direct Testing Contractor as Worksection PRE.B12 or PRE.C12 as appropriate;
 - d. Pave the area around the test pile with chunam or other materials approved by the CM immediately after the pile has been selected for load test. The extent of the paved area to be determined by the CM. Keep the paved area from being damaged prior to the load test;
 - e. Provide adequate site safety to cater for the possible failure of the piles during testing;
 - f. For Type 7 piles, the pile shall be loaded at cut-off level. When the loading test is carried out before trimming the pile to cut-off level, the additional shaft friction above the cut-off level shall be taken into consideration for the test loading. The loading test proposal shall be submitted to the CM for approval at least 14 days before commencement of the loading test.

LOADING TESTS OF PRELIMINARY PILES

PIL1.T710.8

TESTING EQUIPMENT

1. Supply suitable platforms, hydraulic and other equipment together with four deflectometers reading to 0.025 mm and all other appliances necessary to record the settlement of the pile to Approval;
2. Ensure that the support of the reference beam is at least 2000 mm or 3 times the pile diameter, whichever is the greater, from the test and anchor piles.

PIL1.T720.8

CALIBRATION OF HYDRAULIC EQUIPMENT

Before commencement of the testing, submit to the CM, calibration test certificates from an independent laboratory in respect of all hydraulic equipment. Carry out the calibration:

1. In the period between the notified date for commencement of the Works and commencement of testing; or
2. Whenever the equipment has been adjusted.

PIL1.T730.8

MEASUREMENT OF TEST LOADS

Measure test loads by the use of a calibrated load cell and a calibrated pressure gauge included in the hydraulic system and:

1. Ensure that the load cell is axially loaded throughout the test;
2. Use the values given by the load cell for the interpretation of the test result, the pressure gauge readings being required as a check for gross error.

PIL1.T740.8

TEMPERATURE VARIATIONS

Provide suitable protection to minimise the effect of temperature variations on the test.

PROCEDURE FOR LOAD TESTS OF PRELIMINARY PILES

PIL1.T810.8 ANCHORAGES

1. Apply the load by jacking against suitable reactions provided by kentledge, anchor piles, or other anchorages to Approval;
2. Provide the centre of such reactions at a minimum distance of 2000 mm or three times the pile diameter, whichever is the greater, from the centre of the pile to be tested and from the centre of any adjacent pile.

PIL1.T820.8 PILE CAP TO TEST PILE

Extend the pile to be test loaded from its original level to a suitable level for the carrying out of the test and design and construct a suitable pile cap to the test pile.

PIL1.T830.8 LOADING OF A PRELIMINARY PILE

Apply and remove the test loading of a preliminary pile at cut off level or at other level agreed by the CM in three stages as follows:

Stage	Test Loading
1	100% P
2	200% P
3	360% P (for pile types 1 & 2) or 330% P (for pile type 4)

P = safe load carrying capacity as defined in **PIL1.D390** for Contractor's Design Piling Contract / Combined Piling and Building Contract; or

P = safe load carrying capacity as specified by the CM for Engineer's Design Piling Contract / Combined Piling and Building Contract.

PIL1.T840.8 SEQUENCE

Adopt the following sequence of testing of preliminary pile unless otherwise instructed:

1. Apply the load in increments of 50%P up to the stage 1 test loading;
2. Do not apply increments of loading until the rate of settlement of the pile is less than 0.05 mm in 10 minutes;
3. Remove the test load and determine the recovery of the pile before resuming loading;
4. Repeat procedures in sub-clauses (1) and (2) above for the stage 2 test loading;
5. Maintain the full stage 2 test loading for 72 hours before removal;
6. Remove the test load and record the recovery of the pile;
7. Apply the load in increments of 50%P up to the stage 2 test loading allowing 20 minutes between load increments;
8. Maintain the stage 2 test loading for 20 minutes;
9. Apply the load in increments of 10%P until the stage 3 test loading or the failure load as defined in **PIL1.T910** is reached, allowing 20 minutes between load increments;
10. Maintain the stage 3 test loading for 2 hours if failure of the pile does not occur;
11. Remove the test load in four equal decrements allowing 20 minutes between decrements, and record the recovery of the pile.

PIL1.T850.8 RECORDING AND CHECKING DATA

1. Carefully record the settlement of the pile under each increment of loading and the exact time at which such increment is applied or removed, in the presence of the CM;
2. Throughout the period of the test, make check observations of the settlement of the pile being tested by a suitable surveyor's level.

PIL1.T860.8 CONTRACTOR'S REPRESENTATIVE

Have a representative in attendance continuously throughout the period of the test to take and record all specified data hourly or at such other intervals as may be stipulated by the CM.

PIL1.T870.8 COMPLETION

On completion of the test, remove all testing equipment etc, demolish the test pile cap, make good the test pile and the Site back to their original condition and remove all debris arising from the test from the Site.

PIL1.T880.8 RECORDS AND SUBMISSION OF REPORT TO THE CM

Keep records of load tests on piles on the Site and submit a report to the CM within 12 hours of the test being completed. Keep the records on standard forms as shown in Appendix PIL1/V to this Worksection and available to the CM for inspection at all times. The records must include graphs showing load and settlement versus time, plotted in the format as agreed by the CM.

LOAD TEST RESULTS OF PRELIMINARY PILES**PIL1.T910.8 FAILURE LOAD**

Keep records during loading and unloading. The ultimate or failure load of the pile is that load which produces a settlement of the pile head exceeding:

$$f = D_e + D/120 + 4 \text{ mm}$$

where:

f = settlement at failure in mm.

D = least lateral dimension of the pile in mm.

D_e = elastic deformation of the pile shaft and is defined as:

$D_e = 3.7PL_p/AE$	for stage 3 test loading for preliminary pile of pile types 1 & 2; or
$3.3PL_p/AE$	for stage 3 test loading for preliminary pile of pile type 4; or
$2PL_p/AE$	for all other stages of test loading for preliminary pile.

where:

P = as defined in **PIL1.T830**; unit in kN

L_p = pile length in mm

A = cross sectional area of pile in mm²

E = Young's Modulus for pile material in kN/mm²

PIL1.T920.8 RESIDUAL SETTLEMENT

When the rate of recovery after the removal of the maximum test load is less than 0.1 mm/hour observed in a period of not less than 15 minutes, the residual settlement at the head of the pile exceeding the greater of $D/120 + 4$ mm or 25% of the maximum pile head settlement during the test, will be deemed a failure of the pile.

LOADING TESTS OF WORKING PILES

PIL1.T1010.8

GENERAL

The Direct Testing Contractor will carry out load tests of working piles in accordance with the requirements of the Specification.

PIL1.T1020.8

LOADING OF A WORKING PILE

As ordered by the CM, the Direct Testing Contractor will apply and remove the test loading of a working pile at cut off level or at other level agreed by the CM, in two stages as follows:

Stage	Test Loading for Pile Types 1, 2, 4, 5, 6 & 7
1	100% P
2	200% P

P = safe load carrying capacity as defined in **PIL1.D390** for Contractor's Design Piling Contract / Combined Piling and Building Contract; or

P = safe load carrying capacity as specified by the CM for Engineer's Design Piling Contract / Combined Piling and Building Contract.

PIL1.T1030.8

LOADING TYPES 5, 6 AND 7 PILES

The Direct Testing Contractor will not carry out the test until the grout has reached the 28-days characteristic compressive strength.

PIL1.T1040.8

SEQUENCE

The Direct Testing Contractor will adopt the following sequence of testing of working pile unless otherwise instructed:

1. Apply the load in increments of 50%P up to the stage 1 test loading;
2. Do not apply increments of loading until the rate of settlement of the pile is less than 0.05 mm in 10 minutes;
3. Remove the test load and determine the recovery of the pile before resuming loading;
4. Repeat procedures in sub-clauses (1) and (2) above for the stage 2 test loading;
5. Maintain the full stage 2 test loading for 72 hours before removal;
6. Remove the test load and record the recovery of the pile.

LOAD TEST RESULTS OF WORKING PILES

PIL1.T1110.8

FAILURE LOAD AND RESIDUAL SETTLEMENT

1. Keep records during loading and unloading. The ultimate or failure load of the pile is that load which produces a settlement of the pile head exceeding:

$$f = D_e + D/120 + 4 \text{ mm}$$

where:

f = settlement at failure in mm.

D = least lateral dimension of the pile in mm.

D_e = elastic deformation of the pile shaft and is defined as:

$$D_e = 2PL_p/AE \text{ for all other stages of test loading for working pile.}$$

where:

P = as defined in **PIL1.T1020** as appropriate; unit in kN

L_p = pile length in mm (For pile with rock sockets, L_p should be measured to the centre of the rock socket. For pile without rock sockets, L_p should be taken as the entire length of the pile)

A = cross sectional area of pile in mm^2

E = Young's Modulus for pile material in kN/mm^2

2. Consider the following in calculating the D_e :
 - a. For Type 5 pile, the contribution from steel bars, cement grout and steel casing along the whole pile length, L_p ; and
 - b. For Type 6 pile, the contribution from cement grout within the length of the rock socket.
3. When the rate of recovery after the removal of the maximum test load is less than 0.1 mm/hour observed in a period of not less than 15 minutes, the residual settlement at the head of the pile exceeding the greater of $D/120 + 4$ mm or 25% of the maximum pile head settlement during the test, will be deemed a failure of the pile.

REMEDIAL WORKS TO RECTIFY FAILED PILES

PIL1.T1120.8

FAILED PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Where a pile fails, install additional piles in accordance with the remedial proposal Approved and carry out all necessary tests to comply with the requirements of this Specification. The Contractor may be required to carry out all necessary tests as stated in **PIL1.T210** to **PIL1.T260** as appropriate in order to provide information for designing and positioning the additional piles to the CM's satisfaction. Carry out the extended/revised pile caps consequent upon the installation of the additional piles to an Approved design and in an Approved manner. Bear all additional costs and no extension of time will be entertained for complying with the requirements of this clause.

PIL1.T1130.8

FAILED PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. In the event that a pile fails, carry out investigation and report to the CM the causes of failure. The CM may further investigate the cause of failure and carry out any tests he deems necessary. Provide all necessary attendance to the CM's investigation and to the Direct Testing Contractor for execution of any tests as required by the CM for the investigation;
2. If the failure is due to poor workmanship or faulty materials, carry out remedial works, including but not limited to the carrying out of investigation and all necessary tests as stated in **PIL1.T210** to **PIL1.T260** as appropriate, submission of remedial proposal, construction of additional piles, extension/revision of pile caps and all associated tests, as follows:
 - a. Rectify such non-compliance in accordance with this Specification;
 - b. Where additional piles or extended/revised pile caps are required, carry out such works to an Approved design and in an Approved manner. Do not commence any remedial works until the remedial proposal is Approved; and
 - c. Bear all time and costs associated with the remedial works.
3. If the failure is not due to poor workmanship or faulty materials, carry out remedial works, including but not limited to the carrying out of investigation and all necessary tests as stated in **PIL1.T210** to **PIL1.T260** as appropriate, construction of additional piles, extension/revision of pile caps and all associated tests, as may be Instructed to rectify such non-compliance all in accordance with this Specification, as follows:

- a. Mobilize within 7 days after issue of the instruction by the CM all necessary plant and equipment, and commence the remedial works that are considered necessary by the CM;
- b. When Instructed, submit for CM's agreement the method statement and programme for the remedial works; and
- c. Bear all costs and time due to any late mobilization of plant and equipment, delay in commencement of the remedial works and failure to execute the remedial works diligently.

CONCRETE CORE TESTING (FULL-LENGTH CONCRETE CORE) FOR TYPE 1C AND TYPE 3 PILES

PIL1.T1210.8

GENERAL

Testing arrangements:

1. Core tests of piles as described in this sub-section will be carried out by Direct Testing Contractor(s) and selection of piles for testing shall be in accordance with **PIL1.T030**;
2. Provide attendance to the Direct Testing Contractor(s) as Worksection PRE.B12 or PRE.C12, as appropriate;
3. Allow sufficient time in the programming of the Works for the CM to order the piles to be tested and for performing the number of tests stated before completion of the Works or the respective Section thereof.

PIL1.T1220.8

CORE DIMENSIONS AND SAMPLE SIZE

The following works will be carried out by Direct Testing Contractor:

1. Testing samples
 - a. Take full-length concrete core specimens of minimum NX size for Type 1(c) piles or 100 mm diameter for Type 3 piles;
 - b. Take cores of minimum NX size down to not less than 600 mm, or one half of the diameter of the pile base, whichever is the larger, into the rock below the pile base;
 - c. Sample size: minimum 2 number or 5% of the total number of piles, whichever is the greater.
2. Testing methods:
 - a. Laboratory compression tests on 3 core samples selected from the full length concrete core; acceptance criteria for concrete core compression tests are given in **PIL1.T1240**.

PIL1.T1230.8

REINSTATEMENT OF CORE HOLES

Fill core holes solid with non-shrinkage grout of at least the same crushing strength as the pile cored.

PIL1.T1240.8

CRITERIA FOR FAILURE OR NON-COMPLIANCE OF PILE IN CONCRETE CORE TESTING

1. Concrete of the respective piles is considered failed if:
 - a.
 - i. The estimated in-situ cube strength of any core specimen is less than 75% of the specified grade strength or the average estimated in-situ cube strength of the three core specimens is less than 85% of the specified grade strength, for cases other than that stated in sub-clause (1)(a)(ii) below;

- ii. The estimated in-situ cube strength of any specimen is less than 60% of the specified grade strength or the average estimated in-situ cube strength of the three core specimens is less than 70% of the specified grade strength for the case where a reduction factor of 0.8 is applied to the design stresses of concrete placed under water; or
 - b. The concrete cores show evidence of honeycombing or segregation of individual constituent materials; or
 - c. In the opinion of the CM, the concrete fails to meet the specified requirements in any other respect.
2. The interface of concrete and rock of the respective pile is considered failed if, in the opinion of the CM, the concrete and rock of the core specimen is not in good contact;
3. The rock below the pile base is considered not complying with the requirements of this Specification if, by visual examination, the rock core obtained does not conform to the rock material specified in the design;
4. The respective pile will be considered not complying with the requirements of this Specification if any one of the failure or non-compliance criteria stated in sub-clause (1), (2) or (3) above is met; in such event:-
 - a. Comply with the requirements stated in **PIL1.T1120** or **PIL1.T1130** as appropriate; and
 - b. The CM may order the Direct Testing Contractor to carry out further tests on other piles, the number of piles to be tested for failure criteria as stated in sub-clause (1) shall be in accordance with **PIL1.T1410** unless otherwise Approved.

PIL1.T1250.8**REQUIREMENT FOR FURTHER TESTS**

Non-compliance:

1. Cube test results
 - a. When concrete cube compressive test result does not comply with **CON1.T630** to **CON1.T660**, the CM will order the Direct Testing Contractor to extract full length concrete core from each pile cast on the same concreting day and further select 3 core samples from each pile according to instruction of CM for compression test (the cores taken in this case are not included in the core sample specified in **PIL1.T1220**). Acceptance criteria and further actions arising from such tests shall be in accordance with **PIL1.T1240**.
2. Core test results
 - a. When the concrete of a pile fails according to sub-clause (1)(a) of **PIL1.T1240**, no further test on concrete core of this pile is allowed.
3. Bear all costs and no extension of time is allowed for testing, remedial works and installation of additional pile(s) as a consequence of the above non-compliance.

DESTRUCTIVE TESTING OF SAMPLES OF PRECAST CONCRETE PILES

PIL1.T1310.8**GENERAL**

Testing arrangements:

1. Allow for providing additional materials of piles for testing;
2. Arrange for the taking and testing of concrete cores by a Direct Testing Contractor employed direct by the Authority;
3. Provide attendance on the Direct Testing Contractor as **PRE.B12.530** or **PRE.C12.240** as appropriate and remove the tested piles from Site on completion of the tests.

PIL1.T1320.8**SAMPLE SIZE**

Testing samples:

1. Where precast concrete piles (Types 1(a) and 2) are proposed for the Contract, the CM will order approximately 1% of the number of piles delivered to Site to be subjected to the tests as specified in the following clauses in this sub-section, prior to driving;
2. Where precast prestressed spun concrete piles (Type 1(b)) are proposed for the Contract, the CM will order at least 2% of the number of piles with a minimum of one pile per batch per delivery to Site to be subjected to the tests as specified in the following clauses in this sub-section, prior to driving.

PIL1.T1330.8**CORING**

Testing methods:

1. For Types 1(a) and 2:
 - a. Direct Testing Contractor will take cores in accordance with **CON1.T710** to **CON1.T760** from each of the chosen precast concrete piles for core test.
2. For Type 1(b):
 - a. Direct Testing Contractor will take 3 sets of 3 cores (total 9 nos.) of 76 mm diameter taken normal to the length and from 3 transverse sections of a chosen precast prestressed spun concrete pile in accordance with **CON1.T710** and **CON1.T720** for core test;
 - b. Where the estimated insitu cube strength of any individual core is less than 85% of the specified grade strength, comply with any instruction of the CM for the taking of additional core samples to make up a total of 12 numbers of core samples in the same concreting day for further tests. Allow the time without any claim for extension of time and bear all the costs for such extra work;
 - c. Assess the coring test results in accordance with **CON1.T760**.
3. Do not apply the provisions of **CON1.T770** to precast concrete piles generally nor those of **CON1.T740** to precast prestressed spun concrete piles.

PIL1.T1340.8**TEST FAILURE**

In the event that the coring test results fail to comply with the Specification, all piles concreted on the same day will be deemed to be unacceptable and must be removed from the Site.

PIL1.T1350.8**PREMATURE DRIVING**

Where driving is carried out before test results are known, submit remedial proposals for those unacceptable piles, as described above, which have already been driven, for Approval.

FURTHER INSPECTION AND TESTING**PIL1.T1410.8****REQUIREMENT**

If inspection, loading tests, core tests (for Type 3 piles) or weld tests show that any pile is not in accordance with the Specification or the Drawings, the CM may order further inspection/tests, the number to be calculated by the application of the formula given below and no extension of time will be allowed. Bear the cost of such further inspection/tests.

$$\text{number of further inspections/tests} = (n^2 - 2n + 3)$$

where n = total number of unsuccessful inspections/tests progressively until all inspections/ tests are successful.

PIL1.T1420.8 SAMPLE EVALUATIONS

Typical examples of evaluations of number of further inspections/tests are given in Appendix II to this Worksection, for illustrative purposes only.

NON-DESTRUCTIVE TESTS ON WELDS**PIL1.T1510.8 GENERAL**

Testing arrangements:

1. Non-destructive tests on welds will be carried out by Direct Testing Contractor(s). Allow 3 working days for the execution of each weld test by the Direct Testing Contractor(s) commencing after special attendance as stipulated in Worksection PRE.B12 or PRE.C12 as appropriate has been satisfactorily provided;
2. Allow sufficient time in the programming of the Works for the CM to order the piles to be tested and for performing the number of tests stated before completion of the Works or the respective Section thereof.

PIL1.T1520.8 TYPES OF TEST AND SAMPLE SIZE

1. Testing methods and testing samples:
 - a. During the progress of the works, the CM will require testing of the butt and fillet welded joints to all types of piles to be examined by non-destructive tests as follows:
 - i. In accordance with the requirements stated in **STR1.T120**;
 - ii. For full penetration butt weld, the testing frequency shall be 100%, in accordance with clause 14.3.6.1 of Code of Practice for the Structural Use of Steel 2011. The CM may, at his discretion, reduce such testing frequency to a minimum of 10%.
 - b. In addition, the CM will order another Direct Testing Contractor to carry out the same test on 5% of the tested welds again.
2. Non-compliance:
 - a. In the event that the result of test carried out by either one of the Direct Testing Contractors failed, the tested weld shall be deemed not complying with the requirement of the Contract.

NON-DESTRUCTIVE TESTS ON PILES**PIL1.T1610.8 GENERAL**

1. Testing methods and test samples:
 - a. In addition to the normal requirements for testing of the piles, a proportion of the installed piles will be tested by Direct Testing Contractor(s), using non-destructive tests which include the following types of test:

Type of Test	Number of Piles to be Tested
Pile driving analyser	i. Minimum 5% of the total number of all driven piles excluding Type 4 piles driven to bedrock and driven concrete piles ii. Minimum 10% and 20% to verify the capacity and the integrity respectively of the total number of all Type 4 piles driven to bedrock in accordance with clauses 5.4.11(5)(c) and 5.4.11(5)(d) of Code of Practice for Foundations. iii. Refer to sub-clause (1)(b) for driven concrete piles
Pile Integrity Test	i. Minimum 15% of the total number of all Type 7 piles for compliance with ASTM D5882 or other Approved standard ii. Refer to sub-clause (1)(b) for driven concrete piles
Sonic logging	i. 100% of the total number of all Type 3 piles ii. 100% of the total number of all Type 7 piles

- b. The total number of driven concrete piles tested by pile driving analyser and Pile Integrity Test, taken together, will be minimum 5% of the total number of all driven concrete piles;
 - c. In addition, the CM will order another Direct Testing Contractor or the Housing Department Materials Testing Laboratory to carry out the same tests on 5% to 10% of the tested piles again.
2. Testing arrangements:
 - a. Inform the CM in writing at least 7 working days before all piles of each individual pile cap or every 20% of the total numbers of piles of the same block, whichever is less, are ready for the non-destructive test; allow at least 7 working days for the execution of non-destructive test on each pile by the Direct Testing Contractor(s);
 - b. Provide attendance on the Direct Testing Contractors and / or Housing Department Material Testing Laboratory as Worksection PRE.B12 or PRE.C12 as appropriate;
 - c. Allow sufficient time in the programming of the Works for the CM to order the piles to be tested and for performing the number of tests stated before completion of the Works or the respective Section thereof.
 3. Preparation works for sonic logging (for Type 3 piles):
 - a. Install sonic access tubes of mild steel with thickness not less than 2.5 mm for Type 3 pile of number as given in the following table:

Pile Diameter	No. of Sonic Access Tube
Less than 2 m diameter	4
Equal to or exceeding 2 m diameter	6

- b. Half of the number of the sonic access tubes installed in a Type 3 pile shall be used for both sonic logging test and confirmatory core testing. These tubes shall be of 150 mm internal diameter. The remaining half number of the sonic access tubes shall be used for sonic logging test only in accordance with the following table.

Pile Diameter (Pile Length)	Remaining half number of the Sonic Access Tube
Less than 2 m diameter (Length less than 50 m)	2 nos. of internal diameter not less than 42 mm
Less than 2 m diameter (Length equal to or longer than 50 m)	2 nos. of 150 mm internal diameter
Equal to or exceeding 2 m diameter (Length less than 50 m)	3 nos. of internal diameter not less than 42 mm
Equal to or exceeding 2 m diameter (Length equal to or longer than 50 m)	3 nos. of 150 mm internal diameter

(Pile Length = length of bored pile measured from cut off level to founding level)

- c. Install sonic access tubes for both sonic logging test and confirmatory core testing and those for sonic logging test only in alternate positions along the perimeter inside the pile shaft;
 - d. Fit all tubes with screw-on steel watertight shoes or other Approved means at both ends. Fix all tubes securely to the interior of the reinforcement cage of the pile by method to be approved by the CM;
 - e. All sonic access tubes to be watertight including any joints, evenly spaced, parallel to each other and to the axis of the pile, free from corrosion with clean internal and external faces so as to allow free and unobstructed passage of the testing probes;
 - f. Plug or cap all sonic access tubes before concreting. Extend the tubes along the depth of the pile from 300 mm approximately above the pile top level down to 1 m above the pile base for the 150 mm diameter tubes used for both sonic logging test and confirmatory core testing, and down to 500 mm above the pile base for the remaining half number of the sonic access tubes used for sonic logging test only;
 - g. Fill up the sonic access tubes with water prior to concreting of pile and during testing;
 - h. Cut off all tubes flush with the concrete surface of pile and fill up the tubes with non-shrinkage grout of at least the same crushing strength as the concrete of the pile upon completion of all testing.
4. Preparation works for sonic logging (for Type 7 piles):
- a. Install a single sonic access tube of uPVC with closed bottom end and internal diameter of 40 mm;
 - b. Fix the single tube securely to the centre of the reinforcement cage of the pile by method to be approved by the CM;
 - c. The single tube to be watertight including any joints, parallel to the axis of the pile, clean internal and external faces so as to allow free and unobstructed passage of the testing probe;
 - d. Plug or cap the single tube before inserting the reinforcement cage into the grouted shaft. Extend the single tube along the depth of the pile from 300 mm approximately above the pile top level down to the bottom level of the reinforcement cage for sonic logging test;
 - e. Fill up the single tube with water prior to installation of reinforcement cage and during testing;
 - f. Cut off the single tube flush with the grout surface of pile and fill up the tube with non-shrinkage grout of at least the same crushing strength as the grout of the pile upon completion of all testing.

PIL1.T1620.8 RELATIONSHIP TO LOAD TESTING OR CORE TESTING

The results of this testing will, in conjunction with other considerations, be used in selecting piles for load testing or core testing as appropriate.

PIL1.T1630.8 TEST REPORT

A report of these tests will be prepared by the Direct Testing Contractor(s) and will include the following:

1. Date of testing;
2. Pile reference number;
3. Measured pile length;
4. Record test data;
5. Defects such as cracks, fractures or other dis-continuities;
6. Pile stiffness for pile driving analyser.

PIL1.T1640.8 TESTING OF PILES DRIVEN BY HYDRAULIC HAMMERS FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1.
 - a. For piles pitched by using hydraulic hammers, the pile driving analyser tests as stipulated in **PIL1.T1610** shall be performed with CAPWAP analysis in accordance with the following table:

Pile Type (Type of Hammer Used for Final Set)	Number of Piles to be Tested by the Pile Driving Analyser (Number of Tests with CAPWAP Analysis)
All driven piles excluding Type 4 piles driven to bedrock and Type 1b piles (drop hammers or other types of hammers as allowed in PIL1.W520)	Minimum 5% of the total number of piles (at least half of the pile driving analyser tests)
Type 4 piles driven to bedrock (drop / hydraulic hammers or other types of hammers as allowed in PIL1.W520)	Minimum 10% and 20% to verify the capacity and the integrity respectively of the total number of all Type 4 piles driven to bedrock in accordance with clauses 5.4.11(5)(c) and 5.4.11(5)(d) of Code of Practice for Foundations. (all the pile driving analyser tests to verify the capacity)
Type 1b piles (drop hammers or other types of hammers as allowed in PIL1.W520)	Minimum 5% of the total number of piles (all the pile driving analyser tests)
All driven piles excluding Type 4 piles driven to bedrock (hydraulic hammers)	Minimum 10% of the total number of piles (all the pile driving analyser tests)

- b. Unless otherwise agreed by the CM, use only hydraulic hammers to carry out the tests.
2. Prepare and submit a report of hydraulic hammer performance which should include particularly the following:

- a. Correlation of the results of final sets measurement, the results of pile driving analyser tests with or without CAPWAP and the results of static load tests;
- b. Back calculate the values of the Hydraulic Hammer Factor, " K_h ", of the modified Hiley formula specified in the Drawings by using appropriate test results.

PIL1.T1645.8
**TESTING OF PILES DRIVEN BY HYDRAULIC HAMMERS FOR
CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND
BUILDING CONTRACT**

1.

- a. For piles pitched by using hydraulic hammers, the pile driving analyser tests as stipulated in **PIL1.T1610** shall be performed with CAPWAP analysis in accordance with the following table.

Pile Type (Type of Hammer Used for Final Set)	Number of Piles to be Tested by the Pile Driving Analyser (Number of Tests with CAPWAP Analysis)
All driven piles excluding Type 4 piles driven to bedrock and Type 1b piles (drop hammers or other types of hammers as allowed in PIL1.W525)	Minimum 5% of the total number of piles (at least half of the pile driving analyser tests)
Type 4 piles driven to bedrock (drop / hydraulic hammers or other types of hammers as allowed in PIL1.W525)	Minimum 10% and 20% to verify the capacity and the integrity respectively of the total number of all Type 4 piles driven to bedrock in accordance with clauses 5.4.11(5)(c) and 5.4.11(5)(d) of Code of Practice for Foundations. (all the pile driving analyser tests to verify the capacity)
Type 1b piles (drop hammers or other types of hammers as allowed in PIL1.W525)	Minimum 5% of the total number of piles (all the pile driving analyser tests)
All driven piles excluding Type 4 piles driven to bedrock (hydraulic hammers)	Minimum 10% of the total number of piles (all the pile driving analyser tests)

- b. Unless otherwise agreed by the CM, use only hydraulic hammers to carry out the tests.
2. Prepare and submit a report of hydraulic hammer performance which should include particularly the following:
 - a. Correlation of the results of final sets measurement, the results of pile driving analyser tests with or without CAPWAP and the results of static load tests;
 - b. Back calculate the values of the Hydraulic Hammer Factor, " K_h ", of the proposed modified Hiley formula stated in **PIL1.D390** by using appropriate test results.

PIL1.T1650.8 CHECKING OF SIZE OF PILE SHAFT AND BELL-OUT OF TYPE 3 PILE

1. Testing sample and method:

-
- a. Prior to installation of permanent lining and steel reinforcement of each Type 3 pile, check the correctness of the size of the pile shaft and the bell-out by using Ultrasonic Echo Sounder Test or other approved tests and submit the test report to the CM.
 2. Testing method:
 - a. Unless otherwise agreed by the CM, the testing equipment shall fulfil the following minimum quality and capability:
 - i. Comply with the requirements of clause 8.12 of the Code of Practice for Foundations;
 - ii. Be able to generate ultrasonic wave of suitable frequency and energy for reflection of the pile shaft and casing surface within 0.5 m to 8 m in distance;
 - iii. Have four sensors each mutually perpendicular to one another and be able to provide two cross sectional profiles of the pile simultaneously in one go;
 - iv. Have measurement accuracy within $\pm 0.5\%$ in horizontal distance;
 - v. Be able to measure up to a depth as stated in the **Project Specific Specification**;
 - b. The test report shall include the following:
 - i. The profile of the pile;
 - ii. The verticality of the pile – besides the verticality of the whole pile, the verticality of the pile from cut off level down to intermediate depths of maximum 10 m intervals shall be reported;
 - iii. The original electro-sensitive paper records which shall be endorsed by the QCM or SQCC of the Contractor and the field technician of the laboratory;
 - iv. Interpretation of the test results with respect to the acceptance criteria.
 3. Testing arrangement:
 - a. Employ a HOKLAS accredited laboratory to carry out the tests;
 - b. Prior to the tests, seek the CM's agreement on the following:
 - i. Testing procedures and equipment;
 - ii. Acceptance criteria of the tests other than those stated in the Specification;
 - iii. Test report format;
 - iv. Submission arrangement of the test reports.
 - c. In addition, the CM will order a Direct Testing Contractor to carry out the same tests on 5% of the total number of Type 3 piles; allow at least 7 working days for the execution of each test by the Direct Testing Contractor(s); provide attendance on the Direct Testing Contractor as specified in **PRE.B12.520** or **PRE.C12.260** as appropriate;
 - d. Carry out investigation and rectify any defect or irregularities identified by the test and carry out further tests, all to the CM's satisfaction, before proceeding to the next stage of work;
 - e. Allow sufficient time in the programming of the Works for the CM to order the piles to be tested and for performing the number of tests stated before completion of the Works or the respective Section thereof. No claim for additional cost and any extension of time as a result of complying this clause will be entertained by the CM.

CONFIRMATORY CORE TESTING OF FOUNDING STRATA OF TYPE 3 PILES

PIL1.T1710.8

REQUIREMENT FOR CONFIRMATORY CORE TESTING

1. Testing samples:
 - a. Take core of minimum NX size down the concrete/rock interface through one of the sonic tubes with its end installed 1 m above the bottom of the pile; the core taken shall include the 1 m of concrete above the interface and at least 1 m of rock below the interface. Use triple-tube core-barrels to extract cores;
 - b. Sample size: 100% of the total number of Type 3 piles.
2. Testing methods:
 - a. Laboratory compression tests and/or field point load tests on core specimens to determine the concrete or rock strength when ordered.
3. Testing arrangement:
 - a. Submit three copies of each of the reports of the confirmatory core tests within three working days after completion of each test;
 - b. In addition, the CM will order a Direct Testing Contractor to carry out confirmatory core tests on 5% of the total number of Type 3 piles; allow at least 7 working days for the execution of each confirmatory core testing by the Direct Testing Contractor(s); provide attendance on the Direct Testing Contractor(s) as Worksection PRE.B12 or PRE.C12 as appropriate;
 - c. Allow sufficient time in the programming of the Works for the CM to order the piles to be tested and for performing the number of tests stated before completion of the Works or the respective Section thereof.

PIL1.T1720.8

EQUIPMENT AND METHOD

Obtain Approval for the coring equipment and the method of executing the work.

PIL1.T1730.8

TREATMENT OF SPECIMENS

Deal with the concrete core specimens in accordance with CS1:2010 all as set out in Worksection CON1 of this Specification.

PIL1.T1740.8

REINSTATEMENT OF CORE HOLES

Fill core holes and sonic tubes solid with non-shrinkage grout of at least the same crushing strength as the pile cored.

PIL1.T1750.8

CRITERIA FOR FAILURE OR NON-CONFORMITY OF PILE IN CONFIRMATORY CORE TESTING

1. Concrete of the respective piles is considered failed if:
 - a. The concrete cores show evidence of honeycombing or segregation of individual constituent materials; or
 - b. In the opinion of the CM, the concrete fails to meet the specified requirements in any other respect.
2. The interface of concrete and rock of the respective pile is considered failed if, in the opinion of the CM, the concrete and rock of the core specimen is not in good contact;
3. The rock below the pile base is considered not complying with the requirements of this Specification if, by visual examination, the rock core obtained does not conform to the rock material specified in the design;

-
4. The respective pile will be considered not complying with the requirements of this Specification if any one of the failure or non-compliance criteria stated in sub-clause (1), (2) or (3) above is met; in such event, comply with the requirements stated in **PIL1.T1120** or **PIL1.T1130**, as appropriate.

MECHANICAL COUPLER FOR TYPE 5 PILES

PIL1.T1810.8

RATE OF SAMPLING

Provide test specimens as per **CON3.T510**.

PIL1.T1820.8

METHOD OF TESTING

Testing for splicing assemblies without ductility requirement shall be in accordance with **CON3.T520**.

PIL1.T1830.8

COMPLIANCE CRITERIA

1. Compliance criteria for mechanical coupler without ductility requirement shall be in accordance with **CON3.T530**;
2. Any non-complying batch is to be removed from Site.

PIL1.T1840.8

TIME REQUIRED FOR TESTING

1. Allow time for the availability of test results as per **CON3.T540**;
2. Do not use the mechanical couplers until the relevant test specimens have passed all tests.

APPENDICES

PIL1.APPEND2.8 CALCULATION OF NUMBER OF FURTHER INSPECTIONS/TESTS

APPENDIX PIL1/II - CALCULATION OF NUMBER OF FURTHER INSPECTIONS/TESTS

Typical Examples for Illustrative Purposes Only

1. Loading test shows 2 piles failed to meet the requirements of the Contract.
2. The Contractor when required, at his own expense, is to carry out further tests in accordance with the formula of:
$$(n^2 - 2n + 3)$$
$$= 2^2 - 2 \times 2 + 3$$
$$= \underline{3 \text{ further tests}}$$
3. If one of the above 3 further tests fails, the CM may order further tests to be carried out at the contractor's expense by re-applying the formula and taking into account the total number of failed piles. Altogether and based on the formula, the number of total retesting required:
$$= 3^2 - 2 \times 3 + 3$$
$$= 6$$
As 3 tests have been carried out the Contractor therefore when ordered by the CM is to carry out:
$$6 - 3 = \underline{3 \text{ further tests}}$$
4. If the next 3 further tests show further failed piles, the formula will be re-applied as before until all the tests are successful.

PIL1.APPEND3.8 PILE DRIVING RECORD (PRECAST CONCRETE, PREFABRICATED STEEL AND DRIVEN CAST-IN-PLACE PILES)
**APPENDIX PIL1/III - PILE DRIVING RECORD
(PRECAST CONCRETE, PREFABRICATED STEEL AND
DRIVEN CAST-IN-PLACE PILES)
(Sheet 1 of 2)**

Contract No: Title:

Contractor:

SLW1 GENERAL PLANTING REQUIREMENTS

MATERIALS

PLANTS GENERALLY

SLW1.M010.8 SPECIES

All plants, seeds etc. must be true to species.

SLW1.M020.8 HEALTH

Plants and seeds must be free from pests, disease, parasites, discolouration, and mechanical damage.

SLW1.M030.8 SOURCE

Obtain all plants from a recognised cultivated source and not from the wild.

SLW1.M040.8 HABIT

Ensure all plants exhibit the habit, growth and a well developed shape for the species specified and that all plants have a vigorous fibrous root system.

SLW1.M050.8 NAME

In the event of any discrepancy between the Scientific Name, English Common Name, and the Chinese Common Name for any plant specified, the Scientific Name shall prevail.

SLW1.M060.8 SUBSTITUTION

At no time, either make or allow any substitution, without prior Approval.

SLW1.M070.8 PARASITIC PLANTS

Do not allow any of the following species of parasitic plants to be present in any form on any plant or soil brought on to the Site:

1. *Cuscuta australis* (European Dodder);
2. *Cuscuta chinensis* (Chinese Dodder, Yellow Colour Thread);
3. *Cuscuta reflexa* (Yunnan Dodder);
4. *Cassytha filiformis* (Cassytha).

SLW1.M080.8 NOXIOUS WEEDS

Do not allow any of the following species of noxious weeds as defined by the Agriculture, Fisheries and Conservation Department (AFCD) to be present in any form on any plant or soil brought on to the Site:

1. *Mikania micrantha* (Mile-a-minute Weed)

Such noxious weeds shall be cleared manually from all affected areas within the Site and disposed off site, at the Contractor's expense, all in accordance with the guideline and practice notes promulgated by AFCD.

FERTILIZERS AND ADDITIVES

SLW1.M110.8

SLOW RELEASE FERTILIZER

Slow release fertilizer to be granular NPK chemical fertilizer with a minimum 12-week release period conforming to the following formula:

14 - 18	Parts N	(Nitrogen)
7 - 12	Parts P	(Phosphorus)
12 - 16	Parts K	(Potassium)
1 - 3	Parts MgO	(Magnesium Oxide plus other trace elements)

Apply at the rates specified in the appropriate planting Section.

SLW1.M130.8

QUICK RELEASE FERTILIZER

Quick release fertilizer to be granular NPK chemical fertilizer with a minimum two-week release period conforming with the following formula:

14 - 16	parts N	(Nitrogen)
14 - 16	parts P	(Phosphorus)
14 - 16	parts K	(Potassium)

Apply at the rates specified in the appropriate planting Section.

SLW1.M135.8

SPENT MUSHROOM COMPOST (SMC):

Option for Fertilizer

1. General

Spent mushroom compost (SMC) is also commonly called spent mushroom substrate (SMS) and spent mushroom waste. This is the solid residue left after harvest of the mushrooms from the growing compost / substrate;

2. Composition:

The following table lists out the specification of spent mushroom compost as fertilizer:

- a. Organic Matter: >85% (by dry weight);
- b. Chitin : 22 – 25%
by Official Methods of Analysis of AOAC International, 2012 (19th edition) or latest revision as appropriate;
- c. Minimum N (Nitrogen) : 1.2 – 2.5%, by 'Kjeldahl' Method;
- d. Minimum P (Phosphorus) : 0.11 – 0.40%
by Official Methods of Analysis of AOAC International, 2012 (19th edition) or latest revision as appropriate;
- e. K (Potassium), 2.7 - 3.7%
by Official Methods of Analysis of AOAC International, 2012 (19th edition) or latest revision as appropriate;
- f. Mg(Magnesium), 0.2 - 0.3%
by Official Methods of Analysis of AOAC International, 2012 (19th edition) or latest revision as appropriate.

3. Certification: prior to use and deliver on Site, take samples of SMC for analysis at an Approved laboratory and within 14 calendar days, produce the laboratory's Certificate stating the composition as per Para. 2 above;

4. Apply with the dosage as specified in the appropriate Planting Section.

SLW1.M140.8 DISCOURAGEMENT OF VERMIN

Do not use peanut cake as a fertilizer, nor any other substance likely to encourage vermin.

SLW1.M150.8 LIMESTONE

1. Composition: ground limestone containing a minimum of 90% calcium and magnesium carbonates and capable of passing through a 10mm mesh sieve;
2. Certification: prior to use and for every 500kg delivered to Site, take samples of the limestone for analysis at an Approved laboratory and within 14 calendar days, produce the laboratory's Certificate stating:
 - a. Calcium and magnesium carbonate content;
 - b. The particle size.

CHEMICALS**SLW1.M220.8 PESTICIDES**

Submit details of the pesticides for the approval of the CM. The pesticides must be registered under the Pesticide Ordinance (Cap. 133) with Agriculture, Fisheries and Conservation Department (AFCD) in Hong Kong, properly packed and clearly labelled bilingually both in English and Chinese and conform to regulations stipulated by the Government of the HKSAR.

MULCHES**SLW1.M310.8 MULCHES**

Mulch as shown on Drawings, to be:

1. Fibrous mulch to be organic material such as decomposed leaf litter, decomposed sawdust, prepared compost or spent mushroom compost; and / or
2. Wood chip mulch, to comprise:
 - a. Particle size: in the range 10mm to 30mm;
 - b. Thickness: in the range 2mm to 5mm.

ANCILLARY MATERIALS**SLW1.M410.8 PLANT LABELS**

Plant labels to be 120 mm x 80 mm x 2 mm thick, white acrylic or aluminium with:

1. 2 holes of 5 mm diameter, centred 50 mm apart, 10 mm from the top edge;
2. The Botanic name, English and Chinese Common names of the plant, heat - indented in black characters;
3. The size of the capital letter for Botanic and English Common names to be not less than 10 mm and the lower case to be not less than 7 mm;
4. Chinese characters not less than 13 mm high.

SLW1.M420.8 PROTECTIVE FENCING

Protective fencing as shown on Drawings, to be:

1. Proprietary bamboo fencing, comprising:
 - a. 10 to 20 mm diameter bamboo palings fastened together at each joint with galvanized metal staples and washers, which when erected forms a framework with palings at 150 mm centres;

-
- b. Vertical support stakes and inclined support struts, 600 mm longer than the finished height of the fence, of either:
 - i. 50 mm diameter bamboo; or
 - ii. 30 x 30 x 3 mm mild steel angle, painted black with one priming coat and one finishing coat.
 - c. Open ends of bamboo palings and stakes to be sealed with sealant approved by CM. No stagnant water should be found inside or outside of the stakes.
 - 2. Proprietary plastic lattices to be of UV stabilized HDPE plastic resin with 70 mm grid opening, and 4.4 mm thick, with appropriate supporting system, colour as specified;
 - 3. Finished height: Height of fencing, either 600 mm or 900 mm height as shown on Drawings, ± 25 mm.

SLW1.M430.8**PEA GRAVEL**

Pea gravel to be clean rounded river washed gravel:

Size: in the range 5 mm to 12 mm.

SLW1.M440.8**GRAVEL**

Gravel to be clean broken stone:

Size: in the range 10 mm to 30 mm.

SLW1.M450.8**GRAVEL FOR SAND BASED LAWN**

Gravel to be clean broken stone:

Size: 10mm \pm 5mm.

WORKMANSHIP

PROGRAMME

SLW1.W010.8 PLANTING SEASON

Unless specified otherwise for individual species or types of planting, do not plant between the period 1st December to the end of February, without prior or agreement Approval from CM.

SLW1.W020.8 PLANTING TREES

Where trees are planted in grass or shrub areas, plant trees before the seeding/grassing or shrub planting operations.

SLW1.W030.8 PLANTING SHRUBS

Where shrubs are planted in grass areas, plant the shrubs before the seeding/grassing operations.

LIFTING PLANTS

SLW1.W110.8 ROOT PRUNING

Carry out root pruning and undercutting of the root system of the rootballed stock twelve months prior to lifting from the nursery.

SLW1.W120.8 WATERING AND LIFTING

Water plants grown in open ground prior to lifting and carefully lift to ensure the specified root ball is obtained.

SLW1.W130.8 PROTECTIVE WRAPPING

Wrap rootballs in moist hessian sacking, or an Approved equivalent protective wrapping.

PROTECTION AND STORAGE PRIOR TO PLANTING

SLW1.W210.8 PROTECTION GENERALLY

1. Adequately wrap and protect all plants to prevent mechanical damage, excessive transpiration and wilting during lifting, transportation and storage;
2. Protect all plants against excessive sunlight, wind and drought;
3. Keep plants moist at all times.

SLW1.W220.8 STORAGE OF PLANTS ON SITE

Maintain plants in good condition and:

1. Store plants, other than trees, on level ground, standing upright;
2. Store trees on level ground at an angle greater than 45° to the horizontal;
3. Where trees and shrubs are delivered to the Site with shoots and branches bundled, remove all tying materials immediately to prevent heating up and subsequent defoliation.

PREPARATORY WORK

SLW1.W310.8**CLEARING**

Clear all areas to be planted of rubbish, weeds, deleterious matter, and stones larger than 50 mm in any dimension, and remove all such material from Site.

SLW1.W320.8**PREPARING PLANTS**

1. Cut loose and remove all wrapping materials around roots and containers;
2. Trim any broken roots with secateurs or a sharp knife.

SLW1.W330.8**WATERING**

Thoroughly soak all plants before planting. If rootballs or containers are very dry, immerse the roots in water until air bubbles cease to rise.

PLANTING

SLW1.W410.8**GENERAL**

1. Carry out all planting works in accordance with good horticultural practice;
2. Do not leave pits excavated for planting on or adjacent to slopes, open during wet weather.

SLW1.W420.8**TIMING**

Plant all plants in their final position within two days of delivery to Site.

SLW1.W430.8**FINISHED SOIL LEVELS**

1. Ensure that the finished soil level round the plant is the same as that in which the plant was growing in the nursery or container, with the root collar at ground level;
2. When planting in grassed areas finish soil level 50 mm below the surrounding soil level to allow for mulching.

SLW1.W440.8**FINISHING**

Rake planted areas through on completion of planting to leave the soil surface clean and tidy.

SLW1.W450.8**WATERING IN**

Immediately after planting and before mulching, thoroughly water all plants at a rate of 10 litres/m², unless required otherwise by the CM, to settle the soil around the roots.

POST PLANTING WORK

SLW1.W510.8**WEEDING AND MAINTENANCE**

Keep all planted areas weed free and maintain all plants in grass areas as **SLW9.W320** during the contract period.

SLW1.W520.8**WATERING PLANTS**

Continue watering as necessary to maintain a moist soil at all times during the Planting Period, having regard to the following or as directed by the CM:

1. Normally, water all planted areas on every day that the rainfall is less than 5 mm per day except on the day following a day that rainfall exceeded 20 mm per day or when the soil is saturated during the Time for Completion of the Works of the Planting Period;

-
2. For planted areas under cover, water every day unless the soil remains moist from previous day's watering during the Time for Completion of the Works of the Planting Period.

SLW1.W530.8 ERECTING PROTECTIVE FENCING

Erect fencing in locations shown on the Drawings, securing palings to support stakes with galvanized wire. Drive support stakes into the ground at 2000 mm centres.

DEALING WITH PARASITIC PLANTS**SLW1.W610.8 GENERAL**

Report to the CM any case of parasitic plants, as **SLW1.M070**, being inadvertently brought on to the Site. Take whatever action is specified in the following clauses, relating to the degree of infestation and as Instructed.

SLW1.W620.8 LIGHTLY AFFECTED PLANTS

Remove all parts of the parasitic plant and burn off site.

SLW1.W630.8 BADLY AFFECTED PLANTS

Remove the host plant and burn off site.

SLW1.W640.8 EXTENSIVE INFESTATION

Clear the whole area of all plants and burn off site.

SLW1.W650.8 CULTIVATION AFTER TREATMENT

Cultivate the area by turning the soil over to a depth of 100 mm to prevent germination of the parasitic plant seeds.

USE OF CHEMICALS**SLW1.W710.8 GENERAL**

Do not use pesticides without prior Approval.

SLW1.W720.8 STORING, MIXING, APPLYING AND DISPOSING PESTICIDES

Store, mix, apply and dispose in accordance with the requirements and the latest “Code of Practice for the Safe and Proper Use of Pesticides in Public Areas” of Agriculture, Fisheries and Conservation Department (AFCD) in Hong Kong and the manufacturer's instructions. Do not store pesticide on site without prior Approval.

TREE REMOVAL**SLW1.W810.8 GENERAL**

Fell and remove from Site diseased and dead trees as shown on the Drawings or as instructed.

1. These works shall apply to those trees and palms transplanted to the Site by the Employer's Direct Contractor, as refer to **PRE.B2.010** for relevance;
2. Take all necessary safety precautions to protect the people engaged in the tree felling and removal work, as well as the people and property in the vicinity throughout the whole process of tree felling;

-
3. Where applicable, the safety requirements and procedures as stipulated in the Guidelines on Arboriculture Occupational Safety and Health published by the Greening, Landscape and Tree Management Section of Development Bureau, HKSAR and other relevant guidelines published by other Government departments shall be applied;
 4. All voids formed as a result of the above works shall be backfilled with fabricated soil as appropriate.

SLW2 TREES

MATERIALS

GENERAL

SLW2.M010.8 GENERAL PLANTING REQUIREMENTS

Read this Worksection in conjunction with the appropriate clauses in Worksection SLW1.

SLW2.M020.8 HOME GROWN TREES

Complying in all respects with the requirements of this Specification at the time of planting.

SLW2.M030.8 IMPORTED TREES

Complying in all respects with the requirements of this Specification at the time of planting.

SLW2.M040.8 FEATHERED TREES

Trees described as feathered in the planting schedule or on the Drawings, must exhibit the characteristics required for the type, size and species of tree as specified, with the head/crown of the tree a defined, straight and upright leader, its stem well furnished with unpruned lateral shoots.

SLW2.M050.8 SPECIES

Tree species to be as shown or scheduled on the Drawings.

SLW2.M060.8 TREE GIRTH

Tree girth is the circumference of a tree trunk measured at 1300mm above ground level. Refer to AFCD Practice note No. 02/2003 for measurement of a tree.

SLW2.M100.8 TREE QUALITY GENERAL

Trees of light standard tree or above to exhibit all the following characteristics:

1. Healthy stock grown in nursery and free from any kinds of structural defects, dieback, cavities and decaying wounds;
2. The form and density of the crown shall be typical of the species or cultivar;
3. Unless otherwise specified as multi-stem trees or typically inhered of the species or cultivar, the tree shall have one central leader. No co-dominant stems shall be occurred within the lower half of the crown;
4. Have good taper to support the tree in vertical form;
5. Branches:
 - a. Scaffold branches shall be distributed along the centre leader evenly to form a balanced crown typical of the species or cultivar;
 - b. Branch diameter shall not exceed two-third (i.e. aspect ratio less than 0.66) the diameter of the central leader measured 25 mm above the branch union;
 - c. The attachment of the scaffold branches shall be free of included bark;
 - d. Scaffold branches shall distribute evenly on all sides.
6. Roots:
 - a. The surface root shall be free of wounds, scrapes, broken or split wood;

- b. Root distribution shall be uniform throughout the root ball and growth shall be appropriate for the species or cultivar;
 - c. Root collar shall be within the upper 50 mm of the soil;
 - d. Free of stem girdling roots over the root collar or kinked roots;
 - e. The centre of the stem shall be in the centre of the rootball;
 - f. Structural roots shall distribute evenly on all sides.
7. For container grown trees, the tree shall have well-established root system reaching the sides of the container to main a firm rootball, but shall not have excessive root growth encircling inside the container.

TREES CLASSIFIED BY SIZE

SLW2.M110.8

SEEDLING TREES

Seedling trees to exhibit all the following characteristics:

1. Age: between 1 and 2 years;
2. Conformation: a single slender stem;
3. With a well developed vigorous root system;
4. Height above soil level: between 150 mm and 600 mm;
5. Grown in a container not less than 75 mm in diameter and 100 mm deep or a tube not less than 60 mm in diameter and 150 mm long.

SLW2.M120.8

WHIPS

Whips to exhibit all the following characteristics:

1. Age: between 2 and 3 years;
2. Conformation: a single central stem and elementary branch system;
3. With a well developed vigorous root system;
4. Height above soil level: between 600 mm and 1500 mm;
5. Grown in a container not less than 125 mm in diameter and 150 mm deep.

SLW2.M130.8

LIGHT STANDARD TREES

Light standard trees to exhibit all the following characteristics:

1. Height from the root collar to the lowest branch: between 1600 mm and 2100 mm;
2. Total height above soil level: between 2400 mm and 3000 mm;
3. Stem diameter measured at a point one metre above the root collar: between 25 mm and 50 mm;
4. Conformation: a sturdy straight stem with a well balanced branching head, or a well defined straight and upright leader with branches growing out from the stem with good symmetry, and a minimum length of 500 mm;
5. Rootball size:
 - a. Diameter: not less than 300 mm;
 - b. Depth: not less than 300 mm.
6. When container grown trees are required, grow the tree in a container not less than 350 mm diameter and 400 mm deep.

SLW2.M140.8

STANDARD TREES

Standard trees to exhibit all the following characteristics:

1. Stem height from the root collar to the lowest branch: between 1700 mm and 2200 mm;
2. Total height above soil level: between 2750 mm and 3500 mm;

-
3. Stem diameter measured at a point one metre above the root collar: between 50 mm and 75 mm;
 4. Conformation: a sturdy straight stem with a well balanced branching head, or a well defined straight and upright leader with branches growing out from the stem with good symmetry, and a minimum length of 600 mm;
 5. Rootball dimensions:
 - a. Diameter: not less than 450 mm;
 - b. Depth: 300 mm.
 6. When container grown trees are required, grow the tree in a container not less than 500 mm in diameter and 500 mm deep.

SLW2.M150.8**HEAVY STANDARD TREES**

Heavy standard trees to exhibit all the following characteristics:

1. Stem height from the root collar to the lowest branch: between 1800 mm and 2400 mm;
2. Total height above soil level: between 3500 mm and 5000 mm;
3. Stem diameter measured at a point one metre above the root collar: between 75 mm and 150 mm;
4. Conformation: a sturdy straight stem, with a well balanced branching head, or a well defined straight and upright leader with branches growing out from the stem with good symmetry, and a minimum length of 800 mm;
5. Root ball dimensions:
 - a. Diameter: not less than 750 mm;
 - b. Depth: 400 mm.
6. When container grown trees are required, grow the tree in a container not less than 750 mm in diameter and 600 mm deep.

SLW2.M160.8**SEMI-MATURE TREES**

Semi-mature trees to exhibit all the following characteristics:

1. Stem height from soil level to the lowest branch: not less than 2000 mm;
2. Total height above soil level: greater than 6000 mm;
3. Stem diameter measured at a point one metre above the root collar: greater than 150 mm;
4. Conformation: a sturdy, straight stem with a well balanced branching head, or a well defined straight and upright leader with branches growing out from the stem with good symmetry, and a minimum length of 1500 mm;
5. Root ball dimensions:
 - a. Diameter: not less than 1200 mm;
 - b. Depth: 600 mm.
6. A root system previously undercut a minimum of one year prior to lifting, to encourage compact fibrous growth.

CONIFERS AND PALMS**SLW2.M210.8****CONIFERS**

Conifers to exhibit all the following characteristics:

1. A well developed upright stem and vigorous shoots with good symmetry;
2. A well-developed vigorous root system;

3. Minimum dimensions not less than those shown on the Drawings or plant schedule +300 mm, -0 mm;
4. A rootball appropriate and in proportion to the size of the plant.

SLW2.M220.8**PALMS**

Palms to exhibit all the following characteristics:

1. A well developed, upright habit and vigorous fronds with good symmetry;
2. A well developed, vigorous root system;
3. Minimum dimensions not less than those shown on the Drawings or plant schedule +300 mm, -0 mm. Palms with multi-stems to be measured with overall height. Palms with single trunk to be measured with "Stem Height". "Stem Height" shall be measured from the root collar to the base of the growing tip;
4. A root ball appropriate and in proportion to the size of the plant.

TREE SUPPORTS ETC.**SLW2.M310.8****METAL STAKES**

1. Material: mild steel angle, size: 30 mm x 30 mm x 3.5 mm thick;
2. Length: as specified in the table to **SLW2.W420** ±50 mm;
3. With 5 mm to 10 mm diameter hole drilled 40-45 mm from the top;
4. Finish: Approved paint, applied prior to installation, with one coat primer and one black top coat;
5. Protective caps: black plastic or neoprene cap, min. 25 mm deep to fit tightly on top of metal stake.

SLW2.M320.8**BAMBOO STAKES**

Open ends of bamboo stakes to be sealed with Approved sealant. No stagnant water should be found inside or outside of the stakes:

1. Bamboo stakes for whips to be 35 mm diameter poles, length as specified in the table to **SLW2.W420**;
2. Bamboo stakes for light standard, standard trees, palms and conifers (up to 2.5 m overall height) to be 50 mm diameter poles, length as specified in the table to **SLW2.W420**.

SLW2.M330.8**TIES**

Tie as shown on Drawings, to be:

1. Rot-proof rope: 5 mm diameter in dark colour; and/or
2. Plastic coated wire: 3 mm overall diameter in dark colour; and/or
3. Stainless steel braided wire: 3 mm diameter with 20 mm adjustable galvanized steel screw clamp.

SLW2.M340.8**GUYS**

Guys as shown on Drawings, to be:

1. Rot-proof rope: 8 mm diameter in dark colour; and/or
2. Plastic coated wire: 4 mm overall diameter in dark colour; and/or
3. Stainless steel braided wire: 4 mm diameter with 20 mm adjustable galvanized steel screw clamp.

SLW2.M350.8**GUYING TURNBUCKLES**

Turnbuckles and associated fittings to be stainless steel. Turnbuckles to be not less than 100 mm long. The specified length excludes any attached fittings, or adjusting screws.

SLW2.M360.8**GUYING STAKES**

1. Material: galvanized mild steel angle, size: 30 mm x 30 mm x 3.5 mm thick;
2. With 5 mm to 10 mm diameter hole drilled 40-45mm from the top prior to galvanizing.

SLW2.M365.8**UNDERGROUND GUYING SYSTEM**

Underground Guying System (Option 1), to be:

1. Flexible nylon straps with ratchet tensioner: not less than 50mm width in dark colour, with 3 – 5mm dia. stainless steel anchor ring and galvanized steel ratchet tensioner;
2. Stainless steel cables: not less than 5mm diameter and 20mm adjustable galvanized steel screw clamp or stainless steel anchor ring;
3. Timber deadman: not less than 1000mm x 150mm x 50mm.

Underground Guying System (Option 2), to be:

1. Flexible nylon straps: not less than 50mm width in dark colour, with 3 – 5mm dia. stainless steel anchor ring attached to straps at both ends;
2. Stainless steel cables: not less than 5mm diameter and 20mm adjustable galvanized steel screw clamp or stainless steel anchor ring;
3. Stainless steel turnbuckle: as **SLW2.M350**;
4. Timber deadman: not less than 1000mm x 150mm x 50mm.

SLW2.M370.8**TRUNK PROTECTION**

Trunk protection as shown on Drawings, to be:

1. Hosing: clear unplasticised polyvinyl chloride (uPVC) plastic hosing, 10 mm diameter; and/or
2. Rubber: 2 mm thick 150 mm wide rubber pad, long enough to wrap twice round the trunk.

SLW2.M380.8**EYE BOLTS**

Eye bolts to be stainless steel with:

1. 70 mm overall length;
2. Threaded shank;
3. 15 mm diameter eye.

SLW2.M390.8**ROOT BARRIERS AROUND TREE PITS**

Root barriers to be 5 mm thick copper lined root resistant bitumen membrane, or Approved proprietary type:

1. Depth: depth of tree pit below paving level less 100 mm;
2. Diameter: as for tree pit.

LABELS**SLW2.M410.8****LABELS FOR USE**

Labels to be as **SLW1.M410** for each type of tree.

SLW2.M420.8**LABELS FOR STOCK**

Supply additional labels to the housing manager, totalling 30% of those provided above and name on a pro-rata basis.

SLW2.M430.8**SECURING TREES IN PLANTERS WITH CONCRETE BASES**

1. Guy each tree with 4 No. guys, as **SLW2.M340**, fixed to tree trunk immediately above the lowest branch;
2. Tie each guy through an eye bolt, as **SLW2.M380**, drilled and plugged into the inner face of the planter walls 100mm below coping and tighten each end with a galvanized fastener;
3. Tension guys with turnbuckles, as **SLW.2.M350**, inserted 200mm from the eye bolt;
4. Ensure all guys are of an equal angle to the horizontal, sufficient to hold the tree firm.

WORKMANSHIP

GENERAL

SLW2.W010.8 GENERAL PLANTING REQUIREMENTS

Read this Worksection in conjunction with the appropriate clauses in Worksection SLW1.

NOTCH PLANTING

SLW2.W110.8 SEEDLING TREES

1. Form notch, using a hand held pick or spade, deep enough to accommodate the root of the plant;
2. Place the plant upright in the notch and take care to keep the soil and root intact;
3. Firm the plant in the ground with the shoot upright.

SLW2.W120.8 WHIPS

Unless specified otherwise on the Drawings or plant schedule:

1. Form notch, using a hand held pick or spade, deep enough to accommodate the root of the plant;
2. Place the plant upright in the notch and take care to keep the soil and root intact;
3. Firm the plant in the ground with the shoot upright.

PIT PLANTING

SLW2.W210.8 LIGHT STANDARD, STANDARD AND HEAVY STANDARD TREES, CONIFERS AND PALMS

Plant light standard, standard and heavy standard trees, conifers and palms in accordance with the following procedure and sequence:

1. Dig tree pit to size specified in [SLW2.W250](#);
2. Soak rootball;
3. Fork over base of tree pit to a depth of 150 mm;
4. Prepare backfill material, adding and mixing in fertilizer as [SLW2.W310](#), backfill base in layers and firm in to adjust planting depth;
5. Remove rootball covering, place tree, adjust orientation of the crown and check planting depth, adjusting as necessary;
6. Fix vertical stakes as [SLW2.W420](#);
7. Tie tree to stakes;
8. Backfill in layers, firming in each layer with heel and water thoroughly;
9. Adjust tree ties;
10. Water again and continue to water as required.

SLW2.W220.8 SEMI-MATURE TREES

Plant semi-mature trees in accordance with the following procedure and sequence:

1. Dig tree pit to size specified in [SLW2.W250](#);
2. Soak rootball;
3. Fork over base of tree pit to a depth of 150 mm;

4. Prepare backfill material, adding and mixing in fertilizer as **SLW2.W310**, backfill base in layers and firm in to adjust planting depth;
5. Remove rootball covering, place tree, adjust orientation of the crown and check planting depth, adjusting as necessary;
6. Fix guying stakes as **SLW2.W420**;
7. Secure trees with guys as **SLW2.W420**;
8. Backfill in layers, firming in each layer with heel and water thoroughly;
9. Water again and continue to water as required.

SLW2.W230.8 PLANTING IN PAVED AREAS

Where trees are planted in paved areas, carefully lift any tree grilles, lay them aside and:

1. Excavate tree pit, 900 mm deep, to the full area of the tree grille and expose the surface of aggregate layer over existing land drain at the base;
2. Carry out a water percolation test to check the functioning of the subsoil drain by filling the pit fully with water. If water does not drain away immediately or within 1 working day inform the CM;
3. Complete planting operations specified in this Worksection appropriate to the tree being planted and compact backfill to finish 75 mm below adjacent paving level;
4. Place a filter layer, as **EXT13.M110**, over the entire pit area tucking all edges into the soil;
5. Lay 50 mm of gravel, as **SLW1.M440**;
6. Transport from store on the estate, if necessary, and carefully replace tree grilles previously set aside, flush with the surrounding kerb or paving;
7. Fill the interstices and around the base of the trunk as shown on Drawings, with pea gravel, as **SLW1.M430**, or gravel as **SLW1.M440**.

SLW2.W240.8 BACKFILLING WITH DG

Where excavated soil is DG as Worksection EXT12, mix it with soil conditioner to form fabricated soil as **EXT12.M310**.

SLW2.W250.8 TREE PIT DIMENSIONS

Plant trees in pits 300 mm larger than the rootball or in accordance with the following table whichever is the greater except where planted in tree grilles (see **SLW2.W230**).

Type of tree	Size of Pit
Light Standard, Standard, Conifers and Palms	750 mm diameter x 600 mm deep
Heavy Standard	900 mm diameter x 750 mm deep
Semi-mature	1500 mm diameter x 900 mm deep

SLW2.W260.8 FIXING ROOT BARRIERS

Where indicated on Drawings fix root barrier, as **SLW2.M390**, in tree pits so that top edge finishes at underside of paving or tree grille level and bottom edge finishes 100 mm above bottom drainage layer of tree pit. Before fixing fully bond 100 mm minimum side laps by torching in accordance with manufacturer's instructions.

FERTILIZING

SLW2.W310.8 APPLICATION OF FERTILIZER

1. Apply slow release fertilizer, as **SLW1.M110**, in accordance with the following table:

Type of tree	Amount per tree	Application
Seedling trees	25 gm	Spread around each notch.
Small Conifers and Palms	50 gm	Mix with the backfilling soil.
Whips	50 gm	Mix with the backfilling soil or around the notch.
Light Standard trees	Note 1	Mix with the backfilling soil.
Standard trees, Medium Conifers and Palms	Note 1	Mix with the backfilling soil.
Heavy Standard trees, Large Conifers and Palms	Note 1	Mix with the backfilling soil.
Semi-mature trees	Note 1	Mix with the backfilling soil.

Note 1: Mix 0.5 kg of fertilizer with every m³ of backfilling soil.

2. Application of spent mushroom compost (SMC) as fertilizer
 - a. Apply SMC as fertilizer, as **SLW1.M135**, in accordance with the following dosage:
 - i. Add and mix SMC at a dose of 2% by volume to the top 30mm soil depth.

SUPPORTING TREES

SLW2.W410.8

STAKES

Drive vertical stakes firmly into the base of the pit prior to planting the tree; after planting fit protective caps as **SLW2.M310** (5) on top of metal stakes.

SLW2.W420.8

SECURING TREES - GENERAL

Secure trees in accordance with the following table, passing ties and guys through trunk protection as **SLW2.M370** to prevent trunk and branches being chafed or cut:

Type of tree	No. of stakes	Type of support	Method of fixing
Whips	1	Bamboo stake as SLW2.M320	Two-thirds the height of the plant. When driven into the ground one-third of its height
Light Standard and Standard Trees; Palms and Conifers (up to 2.5 m high)	2	Metal stake as SLW2.M310	1800 mm long, 300 mm from either side of the trunk. Drive into the ground to a depth of 900 mm with the point of the 'V' toward the tree. Stakes angled out at the top by approx. 15°. Ties as SLW2.M330 .
	3	Bamboo stake as SLW2.M320	1500 mm long, securely tied with 'scaffold tie' to form a tripod not exceeding 60% of the overall height of the plant.
Heavy Standard Trees; Palms and Conifers (over 2.5 m high)	3	Metal stake as SLW2.M310	As for Standard etc. but 2000 mm long, 600 mm from either side of the trunk. Drive into the ground to a depth of 1100 mm

Semi-mature Trees	3	Guys as SLW2.M340 ; Guying turn buckles as SLW2.M350 ; Guying stakes as SLW2.M360	Drive 900 mm long guying stakes 750 mm into the ground fix guys with turnbuckles to tree trunk immediately above the lowest branch and tie to each guying stake
-------------------	---	--	---

SLW2.W430.8**SECURING TREES IN PLANTERS WITH CONCRETE BASES**

1. Guy each tree with 4 No. guys, as **SLW2.M340**, fixed to tree trunk immediately above the lowest branch;
2. Tie each guy through an eye bolt, as **SLW2.M380**, drilled and plugged into the inner face of the planter walls 100 mm below coping and tighten each end with a galvanized fastener;
3. Tension guys with turnbuckles, as **SLW2.M350**, inserted 200 mm from the eye bolt;
4. Ensure all guys are of an equal angle to the horizontal, sufficient to hold the tree firm.

SLW2.W440.8**SECURING HEAVY STANDARD AND SEMI-MATURE TREES IN PAVED AREAS AND PODIUM PLANTERS**

Submit detailed proposals and shop drawings for underground guying (Option 1 or 2) for Approval.

LABELLING**SLW2.W510.8****FIXING LABELS**

1. Attach one label to each tree of Light Standard size and above at a height of 1500 mm above ground level;
2. Attach one label to each separate species in each plant bed for seedlings and whips;
3. Attach labels with dark coloured plastic coated wire and stainless steel coil spring protected with plastic covering;
4. Do not injure the tree.

SLW3 GROUND COVER, SHRUBS, CLIMBERS AND BAMBOOS

MATERIALS

GENERAL

SLW3.M010.8 GENERAL PLANTING REQUIREMENTS

Read this Worksection in conjunction with the appropriate clauses in Worksection SLW1.

PLANTS

SLW3.M110.8 SPECIES

Plant species are as shown or scheduled on the Drawings.

SLW3.M120.8 GROUND COVER PLANTS

Ground cover plants to exhibit all the following characteristics:

1. Well developed vigorous shoots, no fewer in number than specified on the Drawings or plant schedules;
2. A well-developed vigorous root system;
3. Minimum dimensions not less than those specified on the Drawings or plant schedule +50 mm, -0 mm;
4. Grown in a container not less than 125 mm in diameter and 150 mm deep.

SLW3.M130.8 SMALL SHRUBS

Small shrubs to be seedlings or rooted cuttings exhibiting all the following characteristics:

1. A minimum of three, one year old vigorous shoots with a well balanced shape;
2. A well-developed, vigorous root system;
3. Minimum dimensions not less than those specified on the Drawings or plant schedule +100 mm, -0 mm;
4. Grown in a container not less than 125 mm in diameter and 150 mm deep.

SLW3.M140.8 LARGE SHRUBS

Large shrubs to be transplanted seedlings or rooted cuttings exhibiting all the following characteristics:

1. Pruned to encourage bushiness with a minimum of three vigorous, one year old shoots, well furnished to produce a diameter two thirds that of the height;
2. A well-developed, vigorous root system;
3. Minimum dimensions not less than those specified on the Drawings or plant schedule +200 mm, -0 mm;
4. Grown in a container not less than 200 mm in diameter and 250 mm deep.

SLW3.M150.8 CLIMBERS

Climbers to exhibit all the following characteristics:

1. A minimum of four vigorous shoots not less than 600 mm long, except when specified otherwise on the Drawings or plant schedule;
2. A well developed vigorous root system;
3. Grown in a container not less than 125 mm in diameter and 150 mm deep.

SLW3.M160.8 BAMBOOS

Bamboos to exhibit all the following characteristics:

1. A minimum of four 1200 mm +150 mm, -0 mm high main shoots sprouting from the base unless specified otherwise on the Drawings or plant schedule;
2. A well developed, vigorous root system;
3. Grown in a container not less than 450 mm in diameter and 450 mm deep.

SUPPORTS**SLW3.M210.8 STAKES**

Stakes to be bamboo poles:

1. For general use:
 - a. Diameter: 15 mm;
 - b. Length: height of plant to be supported +50% in the ground.
2. As intermediate fixings where non self-clinging climbers are placed between columns of pergolas:
 - a. Diameter: 25 mm;
 - b. Length: height of pergola above ground +300 mm.

SLW3.M220.8 TIES

1. Ties to be either:
 - a. 3 mm diameter, bitumen impregnated, rot-proof string; or
 - b. 2 mm diameter, dark coloured plastic coated wire.
2. Do not use nylon string or plastic strapping.

SLW3.M230.8 CLIMBER WIRES

Climber wires to be 3 mm diameter, braided, stainless steel wire, with a clear plastic coating and galvanized clamps.

SLW3.M240.8 TURNBUCKLES

Turnbuckles and associated fittings to be stainless steel. Turnbuckles to be not less than 80 mm long. The specified length excludes any attached fittings, or adjusting screws.

SLW3.M250.8 TRUNK PROTECTION

Trunk protection to comprise 10 mm diameter clear unplasticized polyvinyl chloride (uPVC) hosing.

SLW3.M260.8 GUYING STAKES

1. Material: galvanized mild steel angle;
2. Size: 25 mm x 25 mm x 5 mm thick and 900 mm long;
3. With 5 mm to 10 mm diameter hole drilled 30 mm from top prior to galvanizing.

SLW3.M270.8 HORSESHOE NAILS

Horseshoe nails to be 25 mm long, galvanized, mild steel nails, horseshoe shaped and pointed at both ends, suitable for hammering into timber.

SLW3.M280.8**EYE BOLTS**

Eye bolts to be stainless steel with:

1. 70 mm overall length;
2. Threaded shank;
3. 15 mm diameter eye.

LABELS**SLW3.M310.8****LABELS FOR USE**

Provide plant labels as **SLW1.M410**, one label per species per plant or one label per 50 m² of planting as Instructed.

SLW3.M320.8**LABELS FOR STOCK**

Supply additional labels to the housing manager, totalling 30% of those provided above and name on a pro-rata basis.

WORKMANSHIP

PLANTING GENERALLY

SLW3.W010.8

SEQUENCE AND GENERAL PROCEDURE

1. Prepare plants in the nursery and plant beds just prior to planting in accordance with Worksection SLW1;
2. Soak rootball;
3. Set out the plant spacing in accordance with the plant schedule or drawing;
4. Excavate the planting hole to the dimensions given at **SLW3.W020**;
5. With the exception of climbing plants and other plants tied to climber wires or columns, as **SLW3.W110** to **SLW3.W130**, drive in a single support stake so as to leave two thirds of its height above finished ground level;
6. Remove the plant from its container and place it in the hole, spreading the roots as necessary and checking and adjusting the planting depth if required;
7. Tie the plant to its support stake, if one has been provided;
8. Backfill the hole and firm in the plant;
9. Thoroughly water in the plant and mulch to the depths specified at **SLW3.W310**;
10. Continue watering as **SLW1.W520**.

SLW3.W020.8

PLANTING HOLE SIZES

Excavate hole to the same depth as the rootball and:

1. For ground cover, small shrubs and climbers, to a diameter 100 mm greater than that of the rootball;
2. For large shrubs and bamboos, to a diameter 150 mm greater than that of the rootball.

SLW3.W030.8

CLIMBERS

Plant as **SLW3.W010**, at a distance of 150 mm from the structure which is to lend support.

SLW3.W040.8

BARE ROOTED PLANTS

Plant generally as **SLW3.W010** but spread out the roots evenly and, as backfilling proceeds, lightly shake the plant to ensure that the soil penetrates between the roots.

SLW3.W050.8

PLANTING IN GRASS AREAS (EXISTING OR NEW)

Plant as **SLW3.W010** to **SLW3.W040** except:

1. Fork over base of hole in existing grass areas; and
2. Finish top of mulch level with soil level of surrounding grass.

SLW3.W060.8

PLANTING SHRUBS AND GROUND COVERS

Plant generally as **SLW3.W010** but in staggered pattern, or as specified in Plant Schedule.

Option 1

SUPPORTING PLANTS OTHER THAN CLIMBERS

SLW3.W105.8 NON-CLIMBER SUPPORTS

Support plants whose natural habit is to be upright and cannot initially stand upright or which may be blown down by strong winds with a single bamboo stake as [SLW3.M210](#) (1). Drive support into the ground so as to leave two thirds of its height above finished ground level and loosely attach the plant to the stake with ties as [SLW3.M220](#).

SUPPORTING NON-SELF-CLINGING CLIMBERS

SLW3.W110.8 FIXING TO WALLS

For each support:

1. Fix the top of each of 3 no. of the climbing wires, 150 mm apart with a galvanized screw clamp to an eye bolt, plugged and screwed securely into the wall at a height of 3000 mm above the soil level, unless otherwise Instructed;
2. Secure the bottom of each wire via a turnbuckle:
 - a. To either an eyebolt plugged and screwed securely into the wall at a height of 200 mm above soil level;
 - b. To the hole at the top of a guying stake driven firmly 450 mm into the ground at a distance of 300 mm from the wall.
3. Use 20 mm screw clamps for all fixings;
4. Tension wires by adjusting the turnbuckle;
5. After planting the climber, remove all nursery restraining ties and carefully turn the plant around the wire supports with the leading shoots trained upwards;
6. Loosely attach the climber to the supports with ties, as [SLW3.M220](#).

SLW3.W120.8 FIXING TO PERGOLA COLUMNS

Where columns are in or immediately adjacent the plant bed, loosely attach the climber to the column with ties as [SLW3.M220](#).

SLW3.W130.8 FIXING TO WIRE SUPPORTS ON PERGOLAS

For each support:

1. Securely fix the top of each of 3 no. of the climbing wires to the top of the timber slats, using horseshoe nails;
2. Secure the bottom of each wire via a turnbuckle:
 - a. To either an eyebolt screwed into the support column of the pergola 200 mm above soil level; or
 - b. To the hole at the top of a guying stake driven firmly 450 mm into the ground, in an adjoining planter, as close to the pergola as possible;
3. After planting the climber, remove all nursery restraining ties and carefully turn the plant around the wire supports with the leading shoots trained upwards;
4. Loosely attach the climber to the supports with ties, as [SLW3.M220](#).

SLW3.W140.8 FIXING TO BAMBOO STAKES

1. Drive bamboo stakes, as [SLW3.M210](#) (2), 300 mm into the ground and tie against the top of the pergola;
2. After planting the climber, remove any nursery retaining ties and carefully turn the plant around the bamboo stake with the leading shoots trained upwards;
3. Loosely attach the climber to the wire supports with ties as [SLW3.M220](#).

FERTILIZING

SLW3.W210.8

RATES OF APPLICATION

Thoroughly mix fertilizer, as **SLW1.M110**, into the backfilling soil, at the following rates:

1. 50 g per plant for shrubs, climbers, and bamboos;
2. 20g per ground cover plant

Option 1

1. Rates of Application of spent mushroom compost (smc)
 - a. Apply SMC as fertilizer, as **SLW1.M135**, in accordance with the following dosage:
 - i. Add and mix SMC at a dose of 2% by volume to the top 30mm soil depth.

MULCHING

SLW3.W310.8

MULCHING DEPTHS

Apply mulch immediately after watering in, to the following depths:

1. 25 mm on all planting areas, except grassed area.

LABELLING

SLW3.W410.8

FIXING LABELS

1. Use one label, as **SLW1.M410**, per species per plant bed, or one label per 50 m² of species planting as Instructed;
2. Attach each label with 1 mm diameter, dark coloured, plastic coated wire 50 mm from the top of a 25 mm diameter bamboo pole, of the following lengths applicable to plant type:

Plant Type	Length of Pole	Height above Soil Level
Ground cover	300 mm	150 mm
Small shrub	500 mm	300 mm
Large shrub	800 mm	500 mm
Bamboo	800 mm	500 mm

3. Attach labels direct to climbers.

SLW4 HERBACEOUS PLANTS

MATERIALS

PLANTS AND SEEDS

SLW4.M010.8 SPECIES

Species are as shown or scheduled on the Drawings.

SLW4.M020.8 DEFINITIONS

1. Bulbs: modified shoot consisting of a small fleshy disk-like stem bearing a spherical mass of fleshy leaves above the developing adventitious root system;
2. Corms: solid swollen part of the stem at or near ground level that produces a bud at its apex;
3. Tuber: swollen underground branch, roundish in shape with buds or 'eyes' from which new plants are produced.

SLW4.M030.8 BULBS

Bulbs to be firm with good vigorous root system and free from rot.

SLW4.M040.8 CORMS

Corms to be firm with strong healthy bud, vigorous root system and free from rot.

SLW4.M050.8 TUBERS

Tubers to be firm with six 'eyes' minimum, strong root system and free from rot.

SLW4.M060.8 HERBACEOUS PLANTS

Herbaceous plants to exhibit all the following characteristics:

1. Number of shoots as specified on the Drawings or plant schedule;
2. Strong vigorous growth;
3. Strong vigorous root system;
4. Not pot bound;
5. Grown in pots, minimum size 150 mm diameter x 100 mm deep;
6. Size(s): as shown on Drawings or plant schedule +150 mm -0 mm.

STAKE TIES

SLW4.M110.8 TIES

Ties to be bitumen impregnated jute string:

1. Type: as Approved;
2. Colour: dark colour.

WORKMANSHIP

GENERAL

SLW4.W010.8 GENERAL PLANTING REQUIREMENTS

Read this Worksection in conjunction with the appropriate clauses in Worksection SLW1.

SLW4.W020.8 PLANTING PROGRAMME

Sow or plant herbaceous plants during the appropriate season for the species specified whether during the Planting or Establishment Periods as applicable.

SLW4.W030.8 PLANTING IN SHRUB BEDS

Plant herbaceous plants after shrubs ensuring shrubs are not disturbed or damaged during herbaceous planting operations.

SLW4.W040.8 PLANTING IN GRASSED AREAS

Plant herbaceous plants either:

1. Before grassed area is sown; or
2. After a suitable sward has been established.

SOWING SEEDS

SLW4.W110.8 BROADCAST SOWING

Broadcast seeds evenly at the rate of 30 gm/m² over the areas shown on the Drawings.

PLANTING

SLW4.W210.8 BULBS, CORMS AND TUBERS

1. Randomly scatter bulbs, corms or tubers by hand over previously prepared soil in locations shown on the Drawings;
2. Dig holes where bulbs, corms or tubers have landed between 50 mm and 100 mm deep, depending on species being planted, and 100 mm in diameter;
3. Place bulb, corm or tuber the right way up on the bottom of the hole and backfill with previously excavated soil.

SLW4.W220.8 HERBACEOUS PLANTS

1. Plant herbaceous plants in holes in previously prepared soil;
2. Dig holes to depth of rootball, or root system if bare-rooted and to a diameter 100 mm greater than rootball diameter or root spread;
3. Secure to stakes, as [SLW3.M210](#), where necessary with tie;
4. Place plants on the bottom of the hole and spread roots where bare without damage and backfill with previously excavated soil.

SLW5 AQUATIC PLANTS

MATERIALS

AQUATIC PLANTS

SLW5.M010.8 PLANTS

Plant species as shown or scheduled on the Drawings and exhibiting all the following characteristics:

1. Grown in pots but not pot bound;
2. Strong vigorous growth;
3. Be capable of maintaining strong vigorous growth for twelve months before requiring repotting or potting on;
4. Tolerance on size(s) shown on Drawings: +150 mm, -0 mm.

PLANTING MATERIALS

SLW5.M110.8 PLANTING MEDIUM

Planting medium comprises DG, as **EXT12.M120**, with a high plastic clay content thoroughly mixed with:

1. 20% by volume of animal manure compost as, **EXT12.M240**; and
2. 50% bone-meal to 50% dried blood mix fertilizer added at a rate of 250 g/m³ of planting medium.

SLW5.M120.8 GRASS SODS

Grass sods to be 20 mm thick x 200 mm square with a well developed fibrous root system.

SLW5.M130.8 HESSIAN

Natural woven jute, brown in colour and of a type used in the manufacture of sacks.

CONTAINERS AND SUPPORTS

SLW5.M210.8 UNGLAZED FIRECLAY CONTAINERS

1. Sound and free from cracks, chips etc.;
2. Of matching colour, preferably natural;
3. With adequate drainage holes in base;
4. With a depth to diameter ratio appropriate for plant species to be contained and as follows, in all situations pot depth to be greater than diameter.

Species	Pot dimensions
Cyperus alternifolius	300 mm dia. x 350 mm minimum depth
Nelumbo nucifera	450 mm dia. x 500 mm minimum depth
Nymphaea Spp.	450 mm dia. x 500 mm minimum depth
Other species as shown on drawing	As shown on drawing

SLW5.M220.8**PLASTICS MESH CONTAINERS**

1. Open mesh, bread and laundry basket pattern;
2. Colour: dark colour;
3. Shape: rectangular, circular or oval;
4. Minimum size: suitable for the species and plant size being contained but not less than:
 - a. 450 mm diameter x 300 mm deep for circular containers;
 - b. 500 mm x 400 mm x 300 mm deep for rectangular and oval containers.

SLW5.M230.8**WIRE MESH CAGES**

Wire mesh cages to be made from galvanized mild steel expanded metal, not more than 2 mm thick with 10 mm x 10 mm or 5 mm x 20 mm slot pattern.

SLW5.M240.8**CONTAINER SUPPORTS**

Container supports to be either:

1. Uprturned fireclay pots of same diameter as containers being supported; or
2. Precast concrete blocks of same size as containers being supported.

ANCILLARY MATERIALS**SLW5.M310.8****BALLAST**

Ballast to be clean rounded stone, evenly graded in the size range 30 - 75 mm diameter.

SLW5.M320.8**TIES**

Ties to be bitumen impregnated jute string:

1. Type: as Approved;
2. Colour: dark colour.

WORKMANSHIP

GENERAL

SLW5.W010.8 GENERAL PLANTING REQUIREMENTS

Read this Worksection in conjunction with the appropriate clauses in Worksection SLW1.

SLW5.W020.8 PLANTING PROGRAMME

Plant no more than two days prior to pool being filled with water.

SLW5.W030.8 SOAKING PLANTS

Keep plants thoroughly soaked at all time prior to being submerged or placed in the pool.

PLANTING, SUPPORT AND PROTECTION

SLW5.W110.8 PLANT BOX FILLING

Fill in-situ plant boxes with planting medium as [SLW5.M110](#), to a depth of 50 mm below lip of box.

SLW5.W120.8 PLANTING IN PLANT BOXES

Plant into in-situ plant boxes while the pool is empty. Remove plants from their pots and plant as follows:

1. In holes previously prepared in planting medium to a depth of the rootball. Diameter to be 100 mm greater than rootball diameter;
2. Place plants the right way up on the bottom of the hole and spread roots, where bare, without damaging and backfill with previously excavated soil;
3. Secure to stake, as [SLW3.M210](#), where necessary with tie.

SLW5.W130.8 PLANTING IN FIRECLAY CONTAINERS

1. Place a broken rock or flat stone over drainage hole in base of container;
2. Place a layer of planting medium, as [SLW5.M110](#), over base;
3. Position plant centrally in container and backfill with planting medium, as [SLW5.M110](#) firmed down around plant;
4. Fill to a depth 50 mm below container lip;
5. Secure to a stake, as [SLW3.M210](#), where necessary with a tie, as [SLW5.M320](#).

SLW5.W140.8 PLANTING IN PLASTICS MESH CONTAINERS

1. Line container with a double layer of hessian, as [SLW5.M130](#), folding the top level with basket lip and overlapping by 75 mm;
2. Place grass sods, as [SLW5.M120](#), tightly around the base and sides of baskets with grass facing inwards;
3. Place a layer of planting medium over base of container;
4. Position plant centrally in container and backfill with planting medium firmed down around plant;
5. Fill to a depth 50 mm below basket lip after settlement;
6. Secure to a stake, as [SLW3.M210](#), where necessary with a tie, as [SLW5.M320](#).

SLW5.W150.8 PLACING CONTAINERS

Place containers on supports, as **SLW5.M240**, at a level to ensure tops of containers are at the depths below water level as follows:

Species	Depth below water level (mm)
<i>Cyperus alternifolius</i>	at water level
<i>Nelumbo nucifera</i>	50 - 100 mm
<i>Nymphaea</i> Spp.	300 - 500 mm
Other species as shown on drawing	As shown on drawing

SLW5.W160.8 BALLAST COVER

After planting and before filling the pool with water, cover all planting medium with a 50 mm deep layer of ballast as **SLW5.M310**. Take care not to damage plants.

SLW5.W170.8 WIRE MESH CAGES

After placing containers in final positions and filling the pool with water surround each group of containers or large individual containers with a wire mesh cage, as **SLW5.M230**, that:

1. Is constructed to form a circle or oval shape as appropriate with ends lapped by 50 mm and securely fastened together with galvanized wire;
2. Protrudes a minimum of 50 mm above water level and is bent through 90° at the base to form a 100 mm plinth;
3. Is a distance from the plant to permit development and floating leaves to fully expand as follows:

Species	Distance from Container Edge to Edge of Cage
<i>Cyperus alternifolius</i>	300 mm
<i>Nelumbo nucifera</i>	300 mm
<i>Nymphaea</i> Spp.	1000 mm - 1500 mm
Other species as shown on drawing	As shown on drawing

SLW6 INDOOR PLANTS

MATERIALS

GENERAL

SLW6.M010.8 GENERAL PLANTING REQUIREMENTS

Read this Worksection in conjunction with the appropriate clauses in Worksection SLW1.

PLANTS

SLW6.M110.8 GENERAL

Plants must exhibit the following characteristics:

1. Not pot bound;
2. Capable of at least 12 months healthy, vigorous growth before requiring repotting or potting on.

SLW6.M120.8 ARTIFICIAL PLANTS

Obtain artificial plants from an Approved supplier subject to individual Approval and exhibiting the following characteristics:

1. Man-made, densely leafed with flowers and foliage of colour-fast silk or polyester appearing in colour, texture, form and habit like a real version of the species stated on the Drawings or plant schedule;
2. With real, preserved trunks and stems, free from insects and fungus;
3. Multi-stemmed when appropriate to the species stated on the Drawings or plant schedule;
4. With all leaves, flowers, stems, trunks and branches securely fixed;
5. Set in appropriately sized pots, entirely filled with dark brown coloured concrete, or an Approved equivalent without leaving a protruding lip.

POTS

SLW6.M210.8 PLAIN EARTHENWARE

Plain earthenware pots to be unglazed fireclay:

1. Sound and free from cracks, chips etc.;
2. Of matching colour;
3. With adequate drainage holes in the base;
4. With a depth to diameter ratio, appropriate to the plant it is intended to contain, but in any case greater than 1.

SLW6.M220.8 DRAGON POTS

Dragon pots used for individual feature plants to be:

1. True to type and of matching design;
2. Sound and free from cracks, chips etc.;
3. Colour: brown;
4. With adequate drainage holes in the base;

-
5. Size: 500 mm high x 510 mm diameter.

PLANTING MATERIALS

SLW6.M310.8 **POTTING COMPOST**

An Approved proprietary potting compost suitable for the species concerned.

SLW6.M320.8 **POT DRAINAGE LAYER**

Any of the following:

1. Clean pea gravel, as **SLW1.M430**;
2. Broken fireclay;
3. An Approved equivalent.

SLW6.M330.8 **PLANT BOX DRAINAGE LAYER**

Aggregate, as **EXT13.M010**.

SLW6.M340.8 **FILTER LAYER**

As **EXT13.M110**.

ANCILLARY MATERIALS

SLW6.M420.8 **WIRE NETTING**

Galvanized steel with a mesh size of 25 mm.

SLW6.M430.8 **WOOD CHIP MULCH**

As **SLW1.M310**.

SLW6.M440.8 **SURFACE COVER**

To artificial plant beds:

1. Type: wood chip mulch as **SLW1.M310**;
2. Thickness: 100 mm \pm 5 mm.

WORKMANSHIP

POTTING

SLW6.W010.8

GENERAL

Cultivate indoor plants in potting compost appropriate to the species concerned.

SLW6.W020.8

DRAINAGE LAYER

Lay a drainage layer, as **SLW6.M320**, in each pot to the following depths.

Diameter of Pot (mm)	Depth of Drainage Layer (mm)
75 - 150	15
175 - 300	25
Over 300	35

SLW6.W030.8

PLANTING

Fill pot to level of the base of the rootball with compost, place the plant and fill the remainder of the pot with compost to within 15 mm of the rim, firming as necessary.

PLANTING IN PLANT BOXES

SLW6.W110.8

DRAINAGE LAYER

Lay aggregate, as **SLW6.M330** to a depth of 100 mm in each plant box and cover with filter layer.

SLW6.W120.8

SOILING

Fill planting boxes with fabricated soil, as **EXT12.M310**, to a level 75 mm below the top of the box.

SLW6.W130.8

PLANTING

As shown on Drawing, place all plants in the planters in their pots, keeping the rim of each pot level with the soil surface in the plant box, and/or remove plants from pots and place in holes of appropriate size excavated in the plant box filling, ensuring that the soil level adjacent to the plant remains unchanged.

SLW6.W140.8

FERTILIZING

Apply fertilizer, as **SLW1.M110**, at the following rates ($\pm 5\%$):

Type of Plant	Rate of Application
Ground Cover and Herbaceous Plants	15 g per plant
Shrubs, Climbers and Bamboos	20 g per plant
Conifers and Whips	20 g per tree
Light Standard Trees	80 g per tree
Standard Trees and Palms	100 g per tree

Option

1. Fertilizing with spent mushroom compost (SMC)

-
- a. Apply SMC as fertilizer, as [SLW1.M135](#), in accordance with the following dosage:
 - i. Add and mix SMC at a dose of 2% by volume to the top 30mm soil depth.

SLW6.W160.8**MULCHING**

Apply wood chip mulch, as [SLW1.M310](#), to a depth of 50 mm ±5 mm.

ARTIFICIAL PLANTS**SLW6.W210.8****PLANT BEDS**

1. Place plant pots securely in beds and fill to a level 125 mm below the top with aggregate, as [EXT13.M010](#);
2. Where the depth of the plant bed is greater than that of the plant pot, adjust the height by placing the pot on appropriately sized, upturned empty pots before placing the aggregate.

SLW6.W220.8**SECURING PLANTS**

1. Cover the surface of the aggregate with wire mesh and tuck down the sides of the planter to secure the mesh in place;
2. Place artificial plants through cross-cuts in the mesh and retie the mesh securely around the stem to prevent theft.

SLW6.W230.8**SURFACE COVER**

Cover the surface of plant beds with cover, as [SLW6.M440](#).

SLW7 GRASSING

MATERIALS

SPRIGS

SLW7.M010.8

SPRIGS

Stoloniferous grass with sward / stolen / rhizome at least 150 mm long and some fibrous roots attached.

SLW7.M020.8

SPRIG SPECIES

One or a mixture of the following species unless otherwise specified:

Scientific Name	Chinese Name	English Name
<i>Cynodon dactylon</i>	百慕達草	Bermuda grass
<i>Cynodon dactylon</i> x <i>C. transvaalensis</i> cv. Tifway	雜交百慕達草 (Tifway)	Hybrid Bermuda grass (Tifway)
<i>Eremochloa ophiuroides</i>	假儉草	Centipede grass
<i>Paspalum conjugatum</i>	雙耳草	Hilo grass
<i>Paspalum varginatum</i>	海濱雀稗	Seashore Paspalum
<i>Zoysia japonica</i>	朝鮮草	Korean grass
<i>Zoysia matrella</i>	馬尼拉草	Manila grass
<i>Chrysopogon aciculatus</i>	竹節草	Wild Oat Grass
Other species as shown on Drawings	-	-

TURVES AND FIXINGS

SLW7.M110.8

TURVES

- Grass of even density, capable of healthy growth and free from weeds, impurities, pests, fungi and disease;
- With a sufficiently stolen / rhizome / root system to hold together when handled;
- Minimum 300 x 800 x 25mm thick;
- For area specified as "Sand Based Lawn", the turves used shall be free of soil, either by:
 - washed; or
 - produced from sand based turf farm.
- Certificate of sand composition used in sand base turf farm shall be provided;
- Hybrid Bermuda grass cultivar such as Tifway; Improved Seashore Paspalum cultivars such as Salam, SeaIsles 1, 2000, Supreme and Sea Star shall be procured from certified turf farm with appropriate certificate issued by authorized representative from International Turfgrass Genetic Assurance Program (ITGAP) or equivalent.

SLW7.M120.8 TURVES SPECIES

Any of the following grass species:

Scientific Name	Chinese Name	English Name
<i>Axonopus compressus</i>	地毯草 (大葉草)	Carpet grass
<i>Cynodon dactylon</i>	百慕達草	Bermuda grass
<i>Cynodon dactylon</i> x <i>C. transvaalensis</i> cv. Tifway	雜交百慕達草 (Tifway)	Hybrid Bermuda grass (Tifway)
<i>Paspalum conjugatum</i>	雙耳草	Hilo grass
<i>Paspalum vaginatum</i>	海濱雀稗	Seashore Paspalum
<i>Paspalum vaginatum</i> (Cultivars)	雜交海濱雀稗	Seashore Paspalum cultivars, e.g. Salam, SeaIsle series and SeaStar, etc.
<i>Eremochloa ophiuroides</i>	假儉草	Centipede grass
<i>Zoysia japonica</i>	朝鮮草	Korean grass
<i>Zoysia matrella</i>	馬尼拉草	Manila grass
<i>Chrysopogon aciculatus</i>	竹節草	Wild Oat Grass

SLW7.M130.8 TURF PINS

8 Standard Wire Gauge (SWG) galvanized wire bent to hairpin shape not less than 200 mm long.

SLW7.M140.8 SECURING PEGS

5 mm diameter, stainless steel rod, 450 mm long, with top bent over to form a 50 mm diameter loop.

GRASS SEED**SLW7.M210.8 GRASS SEED MIX**

Consisting of the following species and proportions:

Scientific Name	English Name	% by weight
<i>Cynodon dactylon</i>	Bermuda grass	30
<i>Paspalum notatum</i>	Bahia grass	60
<i>Zoysia japonica</i>	Korean lawngrass	10

SLW7.M220.8 GERMINATION

Germination capacity of each constituent of the grass seed mix to be at least 80%.

SLW7.M230.8 PURITY

Purity of each constituent of the grass seed mix to be greater than 90%. Total pernicious weed seed content to be less than 0.5% and total content of other crop seeds to be less than 1.0%.

SLW7.M240.8**CERTIFICATION**

Submit a certificate of testing for each species of grass seed, not less than 14 days before sowing, stating:

1. Grass species, both Botanic and Chinese names;
2. Date of tests (not more than 6 months prior to sowing);
3. Percentage germination;
4. Percentage purity.

SLW7.M270.8**GRASS SEED MIX FOR USE IN GRASS PAVING SYSTEM**

In the locations as shown on Drawings, the grass seed mix for use in grass paving system shall comprise of the following species and proportions at a rate of 1 kg/m³, incorporated with soil mix and other constituents as per **EXT12.M330**:

Mix 1		
Scientific Name	English Name	% by weight
Cynodon dactylon	Bermuda grass	66
Eragrostis curvula	Weeping lovegrass	34

Mix 2		
Scientific Name	English Name	% by weight
Cynodon dactylon	Bermuda grass	33
Paspalum notatum	Bahia grass	33
Eragrostis curvula	Weeping lovegrass	34

ANCILLARY MATERIALS**SLW7.M310.8****PRE-SEEDING FERTILIZER**

Pre-seeding fertilizer to be quick release fertilizer, as **SLW1.M130**.

SLW7.M330.8**SAND FOR TOP-DRESSING OR INFILLING**

Sand for top-dressing and infilling to be graded sand, as **EXT12.M235**.

SLW7.M340.8**WEED-KILLER**

Weed-killer, as **SLW1.M220**.

SLW7.M350.8**MACHINERY AND TOOLS**

For areas specified as “Sand Based Lawn”, provide the following machinery and tools for both planting and establishment operation as specified in this Specification:

1. Mowing Machine
Reel / cylinder or rotary type of mowing machine with height of cut adjustable between 25mm to 75mm in maximum 12.5mm increments; width of cut between 400mm to 600mm.
2. Aerator
Aerator with coring / spiking width tines 75mm to 100mm apart; coring / spiking depth between 75mm to 150mm; coring / spiking with adjustable solid / hollow tines between 10mm to 20mm in diameter or otherwise specified.
3. Turf Roller

-
- Pull-behind or ride-on turf rolling machine designed specific for turf with minimum 750mm rolling width; minimum 450kg in full weight. Heavier roller with vibration shall be needed when instructed by the CM.
4. Verticutting Machine
Walk behind verticutting machine or verticutting unit attached on reel type mowing machine with minimum 25mm working width; adjustable cutting depth between 10 to 50mm.
 5. Spiker
Walk behind or hand Spiker designed specific for turf with minimum 350-400mm working width and tines 75-100mm apart.
 6. Spreader
Rotary broadcast spreader designed specific for turf with minimum 350mm working width.

WORKMANSHIP

GENERAL

SLW7.W010.8 PROGRAMME

Where trees or shrubs are planted in grass areas, carry out all tree or shrub planting prior to any grassing operations.

PREPARATION

SLW7.W110.8 CULTIVATION

1. Prior to cultivation, remove all pernicious and perennial weeds, including complete root system;
2. When instructed by the CM, apply weed-killer in accordance with the manufacturer's recommendation;
3. Cultivate areas less steep than 1:2 to a depth of 150mm and bring to a 25mm deep fine tilth by hand ranking or Approved mechanical means;
4. If necessary, carry out regrading of the surface to conform to the prescribed finished levels and create free flowing contours free from humps and water collecting hollows;
5. Final level: 25 mm above any adjacent hard surfaces.

SLW7.W120.8 CULTIVATION ON EMBANKMENTS

On embankments with slopes of 1:2 or steeper, do not cultivate the existing soil, so that the slope remains stable and erosion is prevented.

SLW7.W130.8 STONE PICKING

Remove all stones larger than 30 mm in any dimension, except on embankments of a gradient of 1:2 or greater.

SLW7.W140.8 FINISHED LEVELS

Finish levels to those indicated on the Drawings, creating free flowing contours, free from water collecting hollows and level with (+25 mm, -0 mm) adjoining hard surfaces.

SPRIGGING

SLW7.W210.8 PROGRAMME

Plant sprigs in their final positions within 48 hours of lifting.

SLW7.W220.8 CULTIVATION

Cultivate all areas, as **SLW7.W110** and **SLW7.W120**, as appropriate. Scarify embankments, with a gradient of 1:2 or greater, to a depth of 5 mm with a hand rake to break up the surface.

SLW7.W230.8 APPLYING PRE-SPRIGGING FERTILIZER

Four to seven days prior to sprigging apply quick release fertilizer, as **SLW1.M130**, evenly at a rate of 40 g/m² and lightly rake into the soil.

SLW7.W240.8**WATERING**

Thoroughly moisten the previously prepared soil immediately prior to sprigging using a fine spray hose attachment to avoid soil erosion and run off.

SLW7.W250.8**SPRIGGING**

1. Lay the sprigs evenly at rates of not less than 15 bushels/100m² (approx. 27kg/100m²) on the surface until the entire area is covered;
2. Sprigs shall be laid flat on the surface and avoid protruding out;
3. Apply thin layer of top-dressing, as **SLW7.M330** to cover the sprigged area; alternatively, use a disc-roller (cutting blade interval of 100mm) to roll over and press the sprigs down to the rootzone at 50-75mm deep;
4. Roll the top-dressed or roll-planted area with a flat rollers, as **SLW7.M350**;
5. Apply a compound fertilizer, as **SLW1.M110** evenly at a rate of 20g/m²;
6. Water the sprigged area thoroughly and then cover with protective fabric as, **EXT14.M240**; the protective cover should be made of bio-degradable materials;
7. All sprigs delivered on Site shall be kept moist before sprigging.

SLW7.W260.8**POST-SPRIGGING OPERATION**

1. Water the sprigged area three times per day or more depending on weather condition;
2. Remove protective fabric when new leaf blades were found emerging from the surface;
3. Fence off the sprigged area until further instruction by the CM.

SLW7.W270.8**RE-SPRIGGING**

Where grassed areas do not show a 90% coverage 28 days after sprigging, immediately recultivate and re-sprig the areas, whether this date occurs in the Planting Period or Establishment Period.

TURFING**SLW7.W310.8****PROGRAMME**

Lay turves in their final positions within 48 hours of lifting.

SLW7.W320.8**CULTIVATION**

Cultivate all areas for turfing as **SLW7.W110** and **SLW7.W120** as appropriate. Scarify embankments, with a gradient of 1:2 or greater, to a depth of 5 mm with a hand rake to break up the surface.

SLW7.W330.8**APPLYING PRE-TURFING FERTILIZER**

Four to seven days prior to turfing, apply quick-release fertilizer, as **SLW1.M130** evenly at a rate of 40g/m² and lightly rake into the soil.

SLW7.W340.8**WATERING**

Thoroughly moisten the previously prepared soil immediately prior to turfing using a fine spray hose attachment to avoid erosion and run off.

SLW7.W350.8**DELIVERY AND STACKING**

Carefully unload turves and:

1. Store on cleared ground;
2. Stack not more than 1000 mm high unless palletted;

-
3. Do not allow turves to dry out.

SLW7.W360.8 PLANKED SUPPORTS

Transport turves from stacks to laying areas along planks laid closely side by side. Provide sufficient planks and always use to support workmen and barrows, and for access and laying.

SLW7.W370.8 TURF LAYING

Lay turves:

1. Working off planks;
2. In consecutive rows in stretcher bond to correct levels starting at near side of the area so that work proceeds over turf already laid;
3. Where necessary, lightly and evenly firm turves with approved wooden beaters, the bottom of the beaters being frequently scraped clean of accumulated soil or mud;
4. After laying, fill any gaps with top dressing, as **SLW7.M330** well brush in to fill all joints;
5. Use rollers, as **SLW7.M350** to roll the surface immediately after laying;
6. Water the grassed area thoroughly;
7. All turves delivered on Site shall be laid within 48 hours and keep moist before laying.

SLW7.W380.8 SLOPES EXCEEDING 1:2

1. Provide sufficient planks and ladders to ensure safe and efficient working;
2. Lay turves to the areas shown on the Drawings in consecutive rows either diagonally or horizontally, in stretcher bond with closely butted joints;
3. Firm as previously specified and secure each turf with one turf peg or turf pin, as appropriate, to provide a firm fixing, properly driven home, just below the surface.

SLW7.W390.8 UNEVENNESS OF FINISHED LEVEL

Adjust any unevenness in the finished level of turf as the work proceeds by lifting, raking out or infilling with graded sand as per **EXT12.M330** and replacing and refirming the turf.

SLW7.W400.8 ROLLERS

When instructed by the CM, use rollers as per **SLW7.M350** to roll the surface again until it reach an even surface to the satisfaction of the CM.

SLW7.W410.8 PERIMETERS

Use whole turves only and trim to clean, straight lines or regular curves as shown on Drawings.

SLW7.W420.8 TURF JOINTS

When instructed by the CM, refill the gaps with top dressing, as **SLW7.M330** well brush in to level the surface to the satisfaction of the CM and water in carefully with a fine spray hose.

SLW7.W430.8 SHRINKAGE

Should shrinkage occur, fill the open joints with graded sand, as **EXT12.M330** brush in and well water.

SLW7.W440.8 APPLYING POST-TURFING FERTILIZER

30 days after turving apply slow release fertilizer, as **SLW1.M110** evenly at a rate of 20 g/m².

SLW7.W450.8**TURFING TAKE**

Where bare patches still occur 21 days after laying, remove the whole turf, recultivate the soil and returf the patch.

SLW7.W460.8**LAYING TURF IN GRASS PAVING SYSTEM**

In the locations as shown on Drawings, lay turf to grass paving system as follows:

1. Apply soil filling mix, as **EXT12.M330** to the openings of the grass paving system and water lightly prior to laying turf;
2. Prepare turf for use by cutting to an appropriate size and shape to fit the openings in the grass paving system in use;
3. Lay the cut turf in each of the openings of the grass paving system with closely butted joints and firm the turf by lightly and evenly beating with approved wooden beaters. The bottom of the beaters being frequently scraped clean of accumulated soil or mud;
4. After laying, fill any gaps with top dressing, as **SLW7.M330** and brush in well to fill all joints and water carefully using a fine spray hose attachment;
5. Should shrinkage occur, refer to **SLW7.W430**;
6. Apply post-turfing fertilizers, as **SLW7.W440**;
7. Where bare patches within the turfed portions of the grass paving system still occur 21 days after laying, carry out turfing take, as **SLW7.W450**.

SEEDING**SLW7.W510.8****STORING SEED**

Store seed on boards off the ground, in a clean dry place, free from vermin.

SLW7.W520.8**APPLYING PRE-SEEDING FERTILIZER**

Four to seven days prior to broadcast sowing apply quick release fertilizer, as **SLW1.M130**, evenly at a rate of 40 g/m² (±5%) and lightly rake into the soil.

SLW7.W530.8**BROADCAST SOWING**

1. Evenly broadcast grass seed mix, **SLW7.M210**, over areas shown on the Drawings by sowing at half the rate specified below in two equal sowings at right angles to each other, either by hand or by an Approved mechanical drill;
2. Rate of sowing: 30 g/m².

SLW7.W540.8**RAKING, HARROWING AND ROLLING**

1. Lightly rake or harrow in the seed;
2. Roll and cross-roll with a lightweight roller.

SLW7.W550.8**APPLYING WEED-KILLER**

Apply weed-killer evenly to newly seeded areas, as **SLW1.W720**.

SLW7.W560.8**TURF EDGING TO SEEDED AREAS**

Edge seeded areas with turf 300 mm wide where shown on the Drawings. Adjust soil level to receive turf and marry-in surface of seed bed to surface of turf.

SLW7.W570.8**EDGE TRIMMING TO SEEDED AREAS**

Trim edges of seeded areas which have not been edged with turf when sufficiently established to clean, straight lines or regular curves as shown on Drawings.

-
- SLW7.W580.8 APPLYING POST-SEEDING FERTILIZER**
Ten days after broadcast sowing, apply slow release fertilizer, as **SLW1.M110** evenly at a rate of 20g/m².
- SLW7.W590.8 GERMINATION OF BROADCAST SOWN SEED**
Where grass areas do not show 90% cover over any 10 m² area, 28 days after sowing immediately re-cultivate and re-sow the area, whether this date occurs in the Planting Period or the Establishment Period.
- SLW7.W592.8 APPLICATION OF GRASS SEED AND SOIL FILLING MIXTURE IN GRASS PAVING SYSTEM**
In the locations as shown on Drawings, apply grass seed and soil filling mixture to grass paving system as follows:
1. Thoroughly mix grass seed, as **SLW7.M270** and soil filling, as **EXT12.M330** to form grass seed and soil filling mixture;
 2. Apply grass seed and soil filling mixture to the openings of the grass paving system;
 3. Lightly compact, and finish flush with the adjoining surfaces;
 4. Water immediately and continue to water, as **SLW1.W520** using a fine spray hose attachment to avoid erosion and run off;
 5. Apply weed-killer evenly to newly seeded areas in accordance with the manufacturer's recommendation;
 6. Apply post-seeding fertilizer, as **SLW7.W580**;
 7. Re-sow, as **SLW7.W590**;
 8. Carry out post-planting cutting, as **SLW7.W630**;
 9. After germination and throughout the Planting Period and Establishment Period, ensure that the soil surface within the seeded areas of the grass paving system remain flush with the surrounding surfaces by supplementing top dressing, as **SLW7.M330** and seed mixture, as **SLW7.M270**. Water in carefully using a fine spray hose attachment.

POST PLANTING OPERATIONS

- SLW7.W610.8 WATERING**
Water immediately after laying and continue to water, as **SLW1.W520** using a fine spray hose attachment to avoid erosion and run off.
- SLW7.W620.8 ROLLING OF GRASSED AREAS**
When instructed by the CM, roll the grassed area with rollers, as **SLW7.M350** to increase contact between the turves or sprigs and the rootzone medium.
- SLW7.W630.8 CUTTING**
1. Make the first cut when the grass sward is 75 mm high and reduce the sward to 25 mm high;
 2. Make subsequent cuts as soon as the grass sward is 50 mm high and reduce the sward to 25 mm high;
 3. Trim edges after cutting.
- SLW7.W640.8 MOWING**
1. Use mowing machine, as **SLW7.M350**;
 2. Make the first mowing when the turf is at 50mm high and reduce the turf to 35mm high;

-
3. Make subsequent mowing as soon as the turf is at 40mm high and reduce the turf to 32 - 37mm high, depends on the season, as **SLW9.W640**;
 4. Trim edges after cutting;
 5. Rake up and remove all cuttings from Site within 24 hours after mowing;
 6. Do not remove more than one-third of the height of the turf at each time.

SLW8 TREE SURGERY WORKS

MATERIALS

GENERAL

SLW8.M010.8

SCOPE OF WORK

The scope of the Works comprises the removal of dead, dying and diseased branches and stumps, cleaning out cavities, raising and thinning the crown, for transplanting purposes as Worksection EXT11 and generally improving the shape of existing trees, as scheduled and shown on the Drawings or as Instructed.

1. These works shall include those trees and palms transplanted to the Site by the Employer's Direct Contractor, as refer to **PRE.B2.010** for relevance.

WORKMANSHIP

TREE SURGERY

SLW8.W010.8 STANDARD

Carry out works in accordance with BS 3998:2010 "Recommendations for Tree Work" and "General Guidelines on Tree Pruning" posted as website:

<http://www.trees.gov.hk>.

SLW8.W020.8 PRUNING TECHNIQUES

1. Cut back dead branches to living tissue/growing point;
2. Where removal of a whole lateral branch is required, do not cut flush to the main trunk or leaving a stub. Apply under cut technique to prevent tearing the bark and cut limbs in two operations. Cut initially from the underside close to the trunk or parent limb, without cutting into the branch bark ridge or collar. Make the second cut from above at a point 25 mm further away from the trunk;
3. Cut all limbs sloping away from the main trunk at an angle of approximately 60° from the horizontal on a line above the branch bark ridge and the branch collar without leaving a stub, in accordance with BS 3998:1989; figure 1;
4. Long and heavy branches should be cut in sequence of section by section. Carefully lower all cut branches to the ground to prevent any damage to limbs being retained;
5. Keep the crown in a well-balanced form and natural shape after pruning. Do not remove more than one quarter of the original crown coverage in each pruning operation.

SLW8.W030.8 CUTTING BACK BARK

Cleanly cut back loose, dead or damaged bark to firm healthy bark, and trim to leave rounded edges.

SLW8.W040.8 TIMING OF PRUNING

Carry out pruning of evergreen trees just before spring. For deciduous trees, pruning after shedding leaves in winter when trees are dormant is preferred. Avoid pruning prior to flowering seasons of the trees.

SLW8.W050.8 CAVITY TREATMENT

Cut out rotten wood from cavities, without exposing clean healthy wood.

SLW8.W060.8 ADDITIONAL DAMAGE

Repair any additional damage to existing trees, caused by tree surgery operations or any other cause during the Contract Period, as Instructed.

SLW8.W070.8 TOOLS AND EQUIPMENT

Use the tools and equipment recommended by and in accordance with BS 3998: 2010.

SLW9 ESTABLISHMENT WORKS

WORKMANSHIP

DEFINITIONS

SLW9.W010.8 ESTABLISHMENT WORKS

Establishment Works (EW) is the works as defined in the Preliminaries Worksection to be carried out during the Establishment Period (EP) to establish the soft landscaping.

1. These works shall include those trees and palms transplanted to the Site by the Employer's Direct Contractor, as refer to **PRE.B2.010** for relevance.

SLW9.W020.8 ESTABLISHMENT PERIOD

Establishment Period (EP) is the 24 month period, commencing the day after the certified date for Completion of Section A - Planting Works, during which the EW are to be carried out.

GENERAL

SLW9.W100.8 TREE INVENTORY REPORT

1. No later than three(3) months from the certified date of completion of Section A, provide written Tree Inventory Report with information of all existing and newly planted trees, palms and conifers as indicated on Drawings and Plant Schedules for preparation of record plan of soft landscape works. In particular, attention is drawn to the following requirements:
 - a. To provide tree information including location with Geographic Information System (GIS) technology, dimensions including trunk girth at 1.3m above ground level, crown spread, overall height, current conditions of tree such as form and health, and tree identification number to trees of size of light-standard and above, palms and conifers;
 - b. To install tag to individual tree, palm or conifer with the tree identification (ID) number based on the tree layout plan. Format of the tree tag and the numbering system to be approved by the CM;
 - c. To take and complete the tree inventory record for each tree, palm or conifer with a photo showing the whole tree, palm or conifer.
2. No later than two (2) months before the date for completion of Section B, replace missing tree tag(s), update and submit the Tree Inventory Report to the CM.

SLW9.W110.8 VANDALISM DAMAGE TO PLANTING

The Authority will accept responsibility for replacing dead or damaged stock resulting from vandalism only when the Contractor

1. Proves that such death or damage was caused by circumstances outside his control; and
2. Submits written claims to the CM within three working days of the event happening.

SLW9.W120.8 TYPHOON DAMAGE

1. Within 48 hours of Typhoon Signal No. 8 or above being lowered:
 - a. Make a photographic record and detailed report of all plant damage;
 - b. Replant all plants blown over and firm up all other plants.

2. Within five days of Typhoon Signal No. 8 or above being lowered:
 - a. Remove dead plants and clear the Site of all debris;
 - b. Provide the above photographic record and report to the CM.
3. The Authority will accept responsibility for plants recorded as dead or dying after, and as a result of, the typhoon only when:
 - a. The CM is notified within one month of the end of the typhoon; and
 - b. Replanting works are carried out satisfactorily as specified and thorough watering is carried out each day.

SLW9.W130.8**REPLACEMENT PLANTING**

Replace any plant during the EP which is, in the opinion of the CM, dead, dying, ailing or no longer conforming to this Specification within two weeks of identification. Carry out replacement planting in accordance with this Specification. Bear all costs of replacement unless due to extreme weather conditions, vandalism, or typhoons as **SLW9.W110** and **SLW9.W120**.

1. Those trees and palms transplanted to the Site by the Employer's Direct contractor are excepted, as refer to **PRE.B2.010** for relevance.

SLW9.W140.8**PLANT DIVISION**

Where the CM considers ground cover and herbaceous planting to be overcrowded, divide and transplant as Instructed and in accordance with the following:

1. Dig up at an appropriate season;
2. Divide by teasing the roots apart by hand or using two forks back to back taking care to maintain an adequate root system with each divided part;
3. Replant one part in the original location and carry the other parts to another part of the estate as Instructed;
4. Replant in agreed positions, fertilize and water, all in accordance with this Specification.

SLW9.W150.8**THINNING**

Where Instructed reduce the number of plants due to overcrowding as

1. Dig up plants, transport and replant in locations as directed; or
2. Dig up plants, transport and replant in locations within a 20 km round trip of the original location as directed; or
3. Remove from site;
4. Fertilize and water all in accordance with this Specification.

SLW9.W160.8**PARASITIC PLANTS**

Parasitic plants, as defined as **SLW1.M070**, which become evident during the first four months of the EP are deemed to have been brought in on plants or soil delivered to the Site. Treat these parasitic plants as **SLW1.W610** to **SLW1.W650**.

SLW9.W170.8**RECORDS**

1. Ensure that the Approved Foreman reports to the Estate's Housing Manager's office before and after carrying out each day's establishment work and makes a signed record each day:
 - a. Stating the work carried out;
 - b. Indicating the percentage completed for each day's operation on the standard form (DLAP-F005) provided for the purpose.
2. Obtain countersignatures from the CM's site staff and keep the records available for inspection in the Estate Housing Manager's office.

SLW9.W180.8 WATER SUPPLY

See clauses **PRE.B10.1210** and **PRE.B10.1220**.

SCHEDULES OF ESTABLISHMENT WORKS OPERATIONS

SLW9.W210.8 GENERAL

In the event of the scheduled operations requiring amendment due to the site and weather conditions prevailing during the EP, seek Approval, at least four weeks before the operation on site, with full justification to exceed the numbers specified.

SLW9.W220.8 FIRST TWELVE MONTHS OF ESTABLISHMENT PERIOD

During the first twelve months of EP, carry out the operations as scheduled below as applicable to the Soft Landscaping Works in accordance with this Specification and shown or scheduled on the Drawings:

Operation	Anticipated No.	Timing
Watering (in open air) (under cover)	300 350	As specified. As specified.
Weeding	12	As specified.
Fertilizing	1	Early Summer, or otherwise Instructed.
Soil aeration	1	Immediately after fertilizer application.
Mulch application	1	Immediately after aeration operation.
Firming up	Min. 3	Immediately after strong wind and/or every four months.
Checking and adjusting tree ties	6	Check every two months; adjust/replace as necessary.
Tying climbers to supports and climber wires	As required	Check monthly, tie as necessary.
Climber wires	6	Check every two months; adjust/replace as necessary.
Pruning	Varies according to species	As scheduled in clause SLW9.W240 .
Grass cutting	12	As specified.
Pesticide	As required	Check monthly; treat immediately.
Fungicide	As required	Check monthly; treat immediately.
Cleaning indoor plants	12	1 per month.
Checking and making good artificial plants	12	1 per month.
Checking and repairing protective fencing	Continuous	Check weekly: repair immediately.
Typhoon damage; assessment and repair	As required	As specified.

Gravel mulch topping up to tree grilles	4	Three monthly intervals.
Clearance of existing vegetated areas	Min. 2	Check every three months and treat as necessary.
Hessian binding removal		Remove from transplanted trees when instructed

SLW9.W230.8**SECOND TWELVE MONTHS OF ESTABLISHMENT PERIOD**

During the second twelve months of EP, carry out the operations as scheduled below as applicable to the Soft Landscaping Works in accordance with this Specification and shown or scheduled on the Drawings:

Operation	Anticipated No.	Timing
Watering (in open air) (under cover)	280 350	As specified. As specified.
Weeding	9	As specified.
Fertilizing	2	Early Spring and Late Summer, or otherwise Instructed.
Soil aeration	2	a. Immediately after first fertilizer application; b. Immediately after second fertilizer application.
Mulch application	2	a. Immediately after first aeration operation; b. Immediately after second aeration operation.
Firming up	Min. 3	Immediately after strong wind and/or every four months.
Checking and adjusting tree ties	6	Check every two months; adjust/replace as necessary.
Tying climbers to supports and climber wires	As required	Check monthly; tie as necessary.
Climber wires	6	Check every 2 months; adjust/replace as necessary.
Pruning	Varies according to species	As scheduled in clause SLW9.W240.
Grass cutting	12	As specified.
Pesticide	As required	Check monthly; treat immediately.
Fungicide	As required	Check monthly; treat immediately.
Cleaning indoor plants	12	1 per month.
Checking and making good artificial plants	12	1 per month.
Checking and repairing protective fencing	Continuous	Check weekly: repair immediately.
Stakes	1	Remove as necessary.

Typhoon damage; assessment and repair	As required	As specified.
Gravel mulch topping up to tree grilles	4	Three monthly intervals.
Clearance of existing vegetated areas	Min. 2	Check every three months and treat as necessary.

SLW9.W240.8**PRUNING SCHEDULE**

Carry out pruning operations as schedule below as applicable to the Soft Landscaping Works:

Timing	Plant Species	Pruning Requirement
January	Palms:	
	All	Remove dead fronds.
	Small Shrub:	
	Nandina spp.	Remove dead leaves.
	Climbers:	
	Antigonon leptopus	Moderate pruning after flowering.
	Pyrostegia ignea	Moderate pruning after flowering.
	Aquatic:	
	All	Remove dead leaves and stems.

Timing	Plant Species	Pruning Requirement
February	Conifers:	
	Casuarina spp.	As hedge: heavy pruning to shape as specified.
	Palms:	
	All	Remove dead fronds.
	Ground Cover:	
	Tradescantia fluminensis	Prune hard back to 100 mm.
	Zebrina pendula	Prune hard back to 100 mm.
	Aquatic:	
	All	Remove dead leaves and stems.

Timing	Plant Species	Pruning Requirement
End of February	Large Shrubs:	
	Acalypha spp. (except A.hispida)	Prune hard back to 300 mm to remove previous year's growth.
	Barleria cristata	Prune hard back to 300 mm.
	Lagerstroemia spp.	Prune to 900 mm.
	Manihot spp.	Prune back to 300 mm.

	Mussaenda spp.	Prune to 600 mm.
	Tecoma stans	As mass planting: prune 900 mm. As feature plant: no pruning.
	Thunbergia erecta	Light pruning to remove dense overcrowded crossing branches. Shorten branches by one half. Prune as necessary to encourage even, natural free form habit.
	Small Shrubs:	
	Allamanda nerifolia	Prune hard back to 300 mm.
	Jasminum sambac	Prune hard back to 300 mm.
	Jasminum mesnyi	Thin out stems.
	Nandina spp.	Remove dead leaves.
	Ground Cover:	
	Catharanthus roseus	Prune hard back to 300 mm.

Timing	Plant Species	Pruning Requirement
March	Trees:	
	All	Remove dead wood and crossing branches. Clear trunks of adventitious budding.
	Conifers:	
	All	Remove dead branches.
	Palms:	
	All	Remove dead fronds.
	Large Shrubs:	
	All	Remove dead wood
	Ervatamia divaricata	Prune to 750 mm to encourage dense bushy growth of a natural form.
	Rhodomyrtus spp.	Prune to 900 mm maintaining a natural free branching form.
	Tecomaria spp.	As hedge: prune to shape as specified. As shrub: prune to 600 mm.
	Small Shrubs:	
	All	Remove dead wood.
	Cuphea hyssopifolia	Prune to 200 mm.
	Eranthemum spp.	Prune to 450 mm to encourage dense, basal branching.
	Nandina spp.	Remove dead leaves.
	Ground Cover:	
	All	Remove dead shoots and wood.

	Lantana montevidensis	After flowering prune back as necessary to maintain a tight cushion form or tight overhanging form if planted in balcony planters.
	Climbers:	
	All	Remove dead wood and withered leaves. Thin out when overcrowded.
	Allamanda cathartica	Prune hard back to 600 mm
	Bougainvillea spp.	Moderate pruning to remove old wood.
	Malvaviscus arboreus	Prune hard back to 900 mm.
	Aquatic:	
	All	Remove dead leaves and stems.

Timing	Plant Species	Pruning Requirement
April	Trees:	
	Callistemon spp.	Light pruning.
	Eucalyptus spp.	Light pruning.
	Palms:	
	All	Remove dead fronds.
	Bamboos:	
	All	Remove dead wood.
	Large Shrubs:	
	Agave spp.	Remove lower dead leaves.
	Cordyline spp.	Remove dead leaves.
	Duranta spp.	As hedge: prune to shape as specified. As shrub: remove dead wood.
	Hibiscus spp.	Prune hard back to 900 mm.
	Ligustrum sinense	As hedge: prune to shape as specified.
	Malvaviscus spp.	As hedge: prune to shape as specified. As shrub: prune to 900 mm.
	Schefflera arboricola	Shorten leggy branched by ½ to ⅓. Light pruning to encourage dense, balanced, bushy, natural growth form.
	Thevetia spp.	Prune to 900 mm.
	Small Shrubs:	
	Eranthemum spp.	Prune to 450 mm to encourage dense, basal branching.
	Nandina spp.	Remove dead leaves
	Ground Cover:	
	Wedelia trilobata	Prune hard back to prevent Wedelia from climbing over other plants. At edge of planter, cut back to 100 mm overhang.

	Aquatic:	
	All	Remove dead leaves and stems

Timing	Plant Species	Pruning Requirement
May	Palms:	
	All	Remove dead fronds.
	Large Shrubs:	
	Brunfelsia calycina	Prune hard back to 300 mm, after flowering.
	Melastoma spp.	Light pruning.
	Murraya spp.	Light pruning to remove rough foliage.
	Nerium spp.	Prune to 900 mm.
	Small Shrubs:	
	Nandina spp.	Remove dead leaves.
	Ground Cover:	
	Lantana montevidensis	Light pruning to maintain tight balanced form.
	Aquatic:	
	All	Remove dead leaves and stems.

Timing	Plant Species	Pruning Requirement
June	Palms:	
	All	Remove dead fronds.
	Small Shrubs:	
	Nandina spp.	Remove dead leaves.
	Ground Cover:	
	Wedelia trilobata	Prune hard back to prevent Wedelia from climbing over other plants. At edge of planter, cut back to 100 mm overhang.
	Aquatic:	
	All	Remove dead leaves and stems.

Timing	Plant Species	Pruning Requirement
July	Palms:	
	All	Remove dead fronds.
	Large Shrubs:	
	Agave spp.	Remove lower dead leaves.
	Small Shrubs:	
	Nandina spp.	Remove dead leaves.
	Aquatic:	

	All	Remove dead leaves and stems.
--	-----	-------------------------------

Timing	Plant Species	Pruning Requirement
August	Palms:	
	All	Remove dead fronds.
	Large Shrubs:	
	Acalypha spp. (except A.hispida)	Prune to reduce height to 500 mm.
	Cordyline spp.	Remove dead leaves.
	Small Shrubs:	
	Allamanda nerifolia	Prune hard back to 300 mm.
	Nandina spp.	Remove dead leaves.
	Ground Cover:	
	Gerbera jamesonii	Prune hard back to soil level
	Lantana montevidensis	Moderate pruning to maintain tight balanced form.
	Liriope spicata	Remove dead foliage.
	Aquatic:	
	All	Remove dead leaves and stems.

Timing	Plant Species	Pruning Requirement
September	Palms:	
	All	Remove dead fronds.
	Large Shrubs:	
	Dichroa febrifuga	Prune to 500 mm to encourage dense basal branching but maintain a natural free branching form.
	Schefflera arboricola	Shorten leggy branches by 1/2 or 1/3.
	Small Shrubs:	
	Nandina spp.	Light pruning to encourage dense, balanced, bushy, natural growth form. Remove dead leaves.
	Ground Cover:	
	Wedelia trilobata	Prune hard back to prevent Wedelia from climbing over other plants. At edge of planter, cut back to 100 mm overhang.
	Aquatic:	
	All	Remove dead leaves and stems.

Timing	Plant Species	Pruning Requirement
October	Trees:	

	All	Remove dead wood and crossing branches. Clear trunks of adventitious budding.
	Conifers:	
	All	Remove dead branches.
	Palms:	
	All	Remove dead fronds.
	Large Shrubs:	
	All	Remove dead wood.
	Agave spp.	Remove lower dead leaves.
	Small Shrubs:	
	All	Remove dead wood.
	Nandina spp.	Remove dead leaves
	Ground Cover:	
	All	Remove dead shoots and wood.
	Climbers:	
	All	Remove dead wood, and withered leaves. Thin out when overcrowded.

Timing	Plant Species	Pruning Requirement
November	Palms:	
	All	Remove dead fronds.
	Large Shrubs:	
	Calliandra spp.	Prune to 750 mm after flowering.
	Small Shrubs:	
	Nandina spp.	Remove dead leaves.
	Aquatic:	
	All	Remove dead leaves and stems.

Timing	Plant Species	Pruning Requirement
December	Palms:	
	All	Remove dead fronds.
	Livistona spp.	Remove old fruit branches.
	Phoenix spp.	Remove old fruit branches.
	Large Shrubs:	
	Cordyline spp.	Remove dead leaves.
	Small Shrubs:	
	Nandina spp.	Remove dead leaves.
	Aquatic:	
	All	Remove dead leaves and stems.

Timing	Plant Species	Pruning Requirement
As and when required	Herbaceous:	
	All	Cut back to ground level immediately after plant dies back for dormant period.

ESTABLISHMENT OPERATIONS

SLW9.W300.8

MAKING GOOD ERODED SEEDED AREAS

Make good any erosion of seeded, or hydroseeded, areas by broadcast sowing as **SLW7.W530** or hydroseeding as **EXT14.W310** as appropriate and carry out post application operations as specified.

SLW9.W310.8

WATERING

Water all planted areas so as to maintain a moist soil through the depth of the fabricated soil profile adequate to ensure satisfactory establishment and as a minimum:

1. For plants exposed to natural rainfall:
 - a. Water during the first 12 months of EP, on every day that the rainfall is less than 5 mm per day except on the day following a day that rainfall exceeded 20 mm per day or when the fabricated soil profile is saturated;
 - b. Water during the second 12 months of EP on every day that the rainfall is less than 2 mm per day except on the day following a day that rainfall exceeded 15 mm per day or when the fabricated soil profile is moist.
2. For plants NOT exposed to natural rainfall:

Water every two to three days irrespective of the weather conditions during the whole EP.

Carry out watering either early mornings or late afternoon or both.

SLW9.W320.8

WEEDING

Keep all planted areas weed-free and:

1. During the first twelve months of EP, undertake a weeding operation at least once every three weeks during the wet season, and at least once every two months during the dry season;
2. During the second twelve months of EP, undertake a weeding operation at least once every month during the wet season, and at least once every two months during the dry season;
3. Replace any mulch or soil disturbed or removed during this process;
4. Maintain a circle of bare soil, 200 mm diameter greater than that of the tree trunk or plant stem, around all plant bases in grassed areas;
5. Collect all arisings resulting from these operations and remove from the Site to a properly designated tip.

SLW9.W330.8

FERTILIZING

1. During the first twelve months of the EP, carry out one applications of fertilizer during early summer, as **SLW1.M110**, at the following rates ($\pm 5\%$):
 - a. 200 gm per semi-mature tree;
 - b. 150 gm per heavy standard tree, large palm and large conifer;
 - c. 100 gm per standard tree, light standard tree, medium size palm and medium size conifer;

- d. 50 gm per seedling tree, whip, small palm (up to 2000 mm high), small conifer;
 - e. 30 gm for shrub, climbing plant and bamboo;
 - f. 5 gm per ground cover and herbaceous plant;
 - g. 25 gm/m² for grass area.
2. During the second twelve months of the EP, carry out two applications of fertilizer, one during early spring as **SLW1.M110**, and one during later summer as **SLW1.M120**, at the following rates ($\pm 5\%$):
 - a. 200 gm per semi-mature tree;
 - b. 150 gm per heavy standard tree, large palm and large conifer;
 - c. 100 gm per standard and light standard tree, medium size palm and medium size conifer;
 - d. 50 gm per seedling tree, whip, small palm, small conifer;
 - e. 10 gm for shrub, climbing plant and bamboo;
 - f. 5 gm per ground cover and herbaceous plant;
 - g. 25 gm/m² for grass areas.
 3. For the purpose of this clause the following definitions apply:

	Conifer height (mm)	Palm height (mm)
Large:	Above 3000	Above 4000
Medium:	Above 1200 but not above 3000	Above 2000 but not above 4000
Small:	Not above 1200	Not above 2000
 4. These works shall include those trees and palms transplanted to the Site by the Employer's Direct Contractor, as refer to **PRE.B2.010** where relevant.

Option

1. Fertilizing with spent mushroom compost (SMC)
 - a. During the EP, carry out one application of SMC fertilizer every 6 months, as **SLW1.M135**, at the following dosage: Add SMC at a dose of 2% by volume by layering on the top soil;
 - b. These works shall include those trees and palms transplanted to the Site by the Employer's Direct Contractor, as refer to **PRE.B2.010** where relevant.

SLW9.W340.8**TOP DRESSING TO GRASSED AREAS**

Immediately after fertilizing, top dress all grass areas with top dressing, as specified at **SLW7.M330**, to smooth out minor depressions.

SLW9.W350.8**AERATION**

1. Shrub areas, including bamboos, climbers and herbaceous plants: immediately after fertilizing, cultivate the soil by hand using a fork to a depth of 100 mm;
2. Ground cover areas: immediately after fertilizing lightly break up the soil by hand using a fork to a depth of 75 mm;
3. Grass areas: immediately before fertilizing aerate the soil by inserting a tine or fork to a depth of 100 mm at 200 mm centres.

SLW9.W360.8**MULCHING**

Immediately after aeration, top up all shrub and ground cover areas, by adding mulch to match existing to the following minimum depths:

1. Shrubs, bamboo, climber and herbaceous plants: 25 mm;
2. Ground cover plants: restore to the original depth;
3. Plants in grassed areas: 25 mm in mulched circle.

SLW9.W370.8 AERATION AND MULCHING

Do not undertake aeration or mulching to ground cover areas once ground cover plants have successfully established and there are not visible bare areas of soil.

SLW9.W380.8 TOPPING UP GRAVEL MULCH TO TREE GRILLES

At three monthly intervals top-up gravel to match existing to fill the interstices of the tree grilles.

SLW9.W390.8 FIRMING UP

Firm up plants and tree stakes from time to time during the EP and particularly after heavy rain or wind.

SLW9.W400.8 TREE SUPPORTS

1. Tighten, slacken or replace tree ties, as **SLW2.M330**, as necessary for the healthy growth of the tree, and adjust or replace the trunk protection, as **SLW2.M370** as necessary to prevent chafing of the bark;
2. Adjust guying turnbuckles as necessary to ensure guys are taut.

SLW9.W410.8 GRASS CUTTING

Cut grass by hand or machine, as **SLW7.W630** and **EXT14.W350** or otherwise instructed. These works shall include those existing grassed / hydroseeded area on Site:

1. During the main growing period (April to October): at least once per month at 100mm height;
2. During the dry season (November to March): at least twice at equal intervals at 100mm height;
3. Rake up and remove all cuttings from site to a properly designated tip within 24 hours after cut.

SLW9.W420.8 PRUNING PROGRAMME

Carry out pruning:

1. At the appropriate time of year for each species as scheduled in **SLW9.W240**;
2. Once each year of the EP, except when otherwise specified.

SLW9.W430.8 PRUNING PROCEDURES

Carry out pruning using sharp tools to give a clean cut, free from ragged edges and:

1. Ensure cuts are immediately above buds or branches and slope away from an outward facing bud;
2. Prune back branches, to the main stem to encourage bushy growth and improve flowering;
3. Remove dead, damaged or crossing branches and dead flower heads;
4. Retain the individual habit and shape of the plant, unless otherwise directed or the intention of the design is to form a clipped hedge;
5. Prune flowering shrubs by removing the shoots bearing the dead flower heads and/or the new growth dependant on species.

SLW9.W440.8 TREATMENT OF PESTS AND FUNGAL GROWTH

1. Regularly check all plant and grass areas for signs of insect attack or fungal infestation, whether or not the insects or fungi are injurious to the plants or only cause a nuisance. Pay particular attention during known periods of activity;

2. Report immediately to the CM any signs of insect attack or fungal infestation, and carry on to identify, monitor, and assess the insect attack or fungal infestation and propose remedial measures according to prevailing guidelines on pest control laid down by AFCD and Guidelines on Occupational Safety and Health for Pest Control Operators laid down by Food and Environmental Hygiene Department (FEHD);
3. Post warning notices (e.g. poison, no-entry, name of pesticide, date and time of application, re-entry time etc.) at conspicuous locations to avoid the public from entering the area under treatment before and after spraying of pesticide. Inform Estate Management to notify residents on the application and on spray drift risks;
4. Effect remedial measures by applying pesticides approved by the CM in strict accordance with the manufacturer's recommendations and labelling instructions, and carry out associated arboriculture works to the infected and/or infested areas in the manner as stated in **PRE.B8.1260** sub-clauses (5)(a) and (5)(c) to (g);
5. Take due care and have regard to the safety and convenience of the general public and carefully control the spraying of the chemical pesticide to avoid unnecessary dispersion;
6. Plant parts pruned from diseased plants shall not be stockpiled anywhere on the Site and shall be disposed of from the Site.

SLW9.W445.8 CLEARANCE OF EXISTING VEGETATED AREAS

Keep existing vegetated areas clear as **EXT11.W110**.

SLW9.W450.8 CARE OF INDOOR PLANTS

Clean the leaves of all indoor plants at least once a month, and fertilize as **SLW9.W330**.

SLW9.W460.8 CARE OF ARTIFICIAL PLANTS

Maintain artificial plants as follows:

1. Clean each leaf and keep tidy once per month;
2. Replace leaves when they are loose or missing.

SLW9.W470.8 MAINTENANCE OF PROTECTIVE FENCING

Regularly check protective fencing and immediately carry out all necessary repairs to ensure that fencing is maintained in good condition at all times.

SLW9.W480.8 REMOVAL OF PROTECTIVE FENCING

Remove temporary protective fencing during or at the end of the EP as Instructed.

SLW9.W490.8 REMOVAL OF STAKES

Remove stakes when the plant root system is sufficiently developed to support the plant at the end of the EP unless otherwise instructed.

SLW9.W500.8 REMOVAL OF HESSIAN BINDING TO TRANSPLANTED TREES

Remove hessian binding from trunk and large branches of transplanted trees as soon as satisfactory growth has occurred as Instructed.

SLW9.W510.8 FINAL INSPECTION

1. In the presence of the CM carry out an inspection and formal check of the Works at the end of the EP;
2. Carry out the last of the operations scheduled immediately prior to the final handover inspection;
3. On satisfactory completion of any outstanding defective and replacement work, a completion Certificate will be issued in accordance with Clause 53 of the "said Conditions"

MAINTENANCE FOR SAND BASED LAWN

SLW9.W610.8 GENERAL

Maintenance operations listed in **SLW9.W620** to **SLW9.W680** only apply to areas specified as “Sand Based Lawn”.

SLW9.W620.8 CONTROL USAGE

Control the usage with fence for turf establishment or recovery when instructed by the CM.

SLW9.W630.8 OVERSEED DURING DRY SEASON

Overseed with dry season grass seeds by hand / overseeding machine during onset of cooler months when instructed by the CM.

SLW9.W640.8 TURF MOWING

Mow the turf by machine, as **SLW7.M350**:

1. During the main growing period: mow at 32 mm once per week;
2. During the dry season: mow at 37 mm once per week;
3. Rake up and remove all cuttings from site within 24 hours after cut.

SLW9.W650.8 TOPDRESSING

Apply 6mm thick topdressing by spreader as per **SLW7.M350** 2 times per year and any additional operation when instructed by the CM with graded sand as per **EXT12.M235**.

SLW9.W660.8 DETHATCHING

Remove the thatch layer by following operation:

1. Verti-cutting: 1-2 times per year and any additional operation when instructed by the CM by machine as per **SLW7.M350**. The depth of the cutting should be set at about 25mm below the thatch layer;
2. Hollow-tine coring: once per year with aerator installed with 12mm diameter hollow tine;
3. Solid-tine coring: once every 2 months with aerator installed with 6mm diameter solid tine.

SLW9.W670.8 SPIKING

Spike the grassed area with hand spiker, as **SLW7.M350** once every 2 months and any additional operation when instructed by the CM.

SLW9.W680.8 FERTILIZATION

Apply compound fertilizer as per **SLW1.M110** monthly.

ELE1.1 APPLICATION OF SPECIFICATION

ELE1.1.010.8 PRELIMINARIES

This Specification and this Worksection ELE1 in particular should be read in conjunction with Preliminaries for Building Services Sub-contracts.

ELE1.1.020.8 APPLICATION TO SYSTEMS

1. This Worksection ELE1 of this Specification is applicable to the whole of the Sub-contract Works while the other Worksections are applicable to the Systems described in the respective Worksection;
2. Worksection ELE2, which specifies general system requirements should be read in conjunction with subsequent Worksections of this Specification which are reference Worksections and define details of installations.

ELE1.2 THE WORKS

ELE1.2.010.8**SITE OF THE WORKS**

The site of the Works is given in the [Project Specific Specification](#).

ELE1.2.020.8**SCOPE OF THE WORKS**

The scope of the works is given in the [Project Specific Specification](#).

ELE1.3 CONTRACT DOCUMENTATION

ELE1.3.010.8 DRAWINGS AND DOCUMENTS

1. A Schedule of the Sub-contract Drawings is included in Appendix 'P';
2. The tenderer's attention is also drawn to the latest revision of the Standard Lighting Fitting Schedule issued by the Housing Department;
3. The Schedule is available for inspection at the Building Services Section, Housing Department during normal office hours upon application to the Contract Manager;
4. The Sub-contract Drawings and the Schedule shall hereinafter be referred to as the Drawings.

ELE1.3.020.8 TECHNICAL INFORMATION SUPPLIED WITH TENDER AND SUB-CONTRACTOR'S RESPONSIBILITY

1. All technical information supplied with the tender, including the tenderer's proposed design and the materials offered, is for tender assessment only;
2. Acceptance of the tender will not relieve the Sub-contractor of his responsibility for the proper working of the installation to meet the specified requirements in compliance with the Sub-contract documents to the entire satisfaction of the Contract Manager;
3. In the event of the installation being, in the opinion of the Contract Manager, not in compliance with the specified requirements, the Sub-contractor shall modify his design, replace any unsatisfactory materials and do everything necessary for compliance with the specified requirements at his own cost.

ELE1.3.030.8 DEFINITIONS AND ABBREVIATIONS

In this Specification the word "shall" is mandatory, the word "will" is informative, the word "should" is advisory and the word "provide" means supply and fix, or supply and install. In addition the following words shall have meanings herein assigned:

1. "Authority"
means Hong Kong Housing Authority.
2. "Indicated"
means indicated elsewhere in the Specification or on the Drawings.
3. "or Equal" or "or Similar"
means having similar characteristics and Specification, as regards type of construction, performance, general appearance and standard of quality of manufacture.
4. "Drawing"
means the drawings referred to in the Specification and any modification of such drawings Approved by the Contract Manager and such other drawings as may be, from time to time, furnished or Approved.
5. "Standard Drawings"
means the drawings prepared by the Authority to show detailed arrangements of the common standard installations.
6. "EMSD"
means the Electrical and Mechanical Services Department.

-
7. "WSD"
means the Water Supplies Department.
 8. "FSD"
means the Fire Services Department.
 9. "IET"
means the Institution of Engineering and Technology UK.
 10. "CSA"
means the conductor cross-sectional area.
 11. "BSI"
means the British Standards Institution.
 12. "BS"
means British Standards, including British Standard Specifications and British Standard Codes of Practice published by the British Standards Institution.
 13. "EN"
means European Standard.
 14. "ISO"
means International Organization for Standardization Publications.
 15. "IEC"
means International Electrotechnical Commission Publications.
 16. "BS EN"
means European Standard adopted by the British Standards Institution to replace any relevant British Standard.
 17. "ASTM"
means American Society for Testing and Materials.
 18. "ANSI"
means American National Standards Institution.
 19. "PASS"
means Performance Assessment Scoring System.
 20. "BSPASS"
means Building Services Performance Assessment Scoring System.

ELE1.3.040.8**SINGULAR AND PLURAL**

Words importing the singular only also include the plural vice versa where the context requires.

ELE1.4 COMPLIANCE WITH REGULATIONS AND STANDARDS

ELE1.4.010.8 STATUTORY REGULATIONS

The Sub-contractor shall comply with the latest edition of all relevant Ordinances and Regulations together with any amendments made thereto, Laws of Hong Kong and shall be responsible for giving notifications to the appropriate authorities and paying all fees in accordance with the Sub-contract.

The following are particularly relevant:

1. Electricity Ordinance Chapter 406, and other subsidiary legislation made under the Ordinance;
2. Regulations of the Telecommunication Authority, Government of Hong Kong;
3. Buildings Energy Efficiency Ordinance (Cap. 610);
4. Energy Efficiency (Labelling of Products) Ordinance Chapter 598;
5. Fire Safety (Commercial Premises) Ordinance and Fire Safety (Buildings) Ordinance;
6. Dangerous Goods Ordinance and Dangerous Goods (General) Regulations;
7. Occupational Safety and Health Ordinance, Chapter 509, and other subsidiary legislation made under the Ordinance;
8. Factories and Industrial Undertakings Ordinance, Chapter 59, and other subsidiary legislation made under the Ordinance;
9. Construction Site (Safety) Regulations;
10. Construction Site Safety Manual issued by the Development Bureau, the Government of the HKSAR;
11. All regulations, code of practices and guidelines on safety issued by the Labour Department from time to time;
12. Other relevant Ordinances and Regulations, Laws of Hong Kong;
13. Code of Practice for the Electricity (Wiring) Regulations (hereinafter referred to as the Electrical CoP);
14. Guidance Notes for the Electrical Products (Safety) Regulation (hereinafter referred to as the Electrical Product Guidance Notes), which applies to all electrical products designed for household use and supplied in Hong Kong;
15. Codes of Practice for minimum Fire Service Installations and Equipment and Inspection, Testing and Maintenance of Installations and Equipment, and Circular Letters issued by the Fire Services Department (hereinafter referred to as Fire Services COP);
16. Code of Practice for Energy Efficiency of Building Services Installation 2015 Edition, issued by the Electrical and Mechanical Services Department (hereinafter referred to as the BEC).

ELE1.4.020.8 STANDARDS

All materials and workmanship shall comply, where applicable, with all relevant sections, together with any revisions or amendments made thereto, of the following:

1. The Supply Rules issued by the respective Supply Company currently in operation in Hong Kong (hereinafter referred to as the Supply Rules);
2. 17th Edition of the Regulations for Electrical Installations, issued by the IET (hereinafter referred to as the 17th Edition IEE Wiring Regulations). The 17th Edition IEE Regulations was jointly published by the BSI and the IET as BS 7671(hereinafter referred to as BS 7671) and is the general standard now referred to in this Specification. Reference is also made to Guidance Notes published by the IET for use in conjunction with BS 7671;
3. Appropriate British Standards / International or National Standards / Code of Practice subject to clause **ELE1.4.040**. When a British Standard quoted in this Specification has been wholly or partially superseded by another equivalent or similar British Standard, the Sub-contractor is allowed to offer material in compliance with the latter in lieu for the Contract Manager's Approval;
4. Relevant parts of the HKHA Specification Library for Building Works (hereinafter referred to as the HKHA Building Works Specification) which may be viewed during normal office hours in the Authority's offices upon application to the Contract Manager;
5. General Technical Specifications for Monochrome and Colour Closed Circuit Television Systems (Specification No. ESG 14 March 2017 Edition) issued by the Electronic & Data Communication Division, Electrical and Mechanical Services Department, Hong Kong;
6. General Specification for Public Address System (Specification No. ESG11 Issue No. 5 October 2016 and Amendment 4 October 2016) issued by the Projects Division, Electrical and Mechanical Service Department, Hong Kong (hereinafter referred to as the General PA Specification);
7. Other International or National Standard Specifications as detailed in **ELE1.4.050** (hereinafter referred to as Equivalent Standards).

ELE1.4.030.8**PRECEDENCE**

In case of conflict between the requirements among the publications referred to in **ELE1.4.010** and **ELE1.4.020**, interpretation shall be in accordance with the following order of preference unless otherwise specified or directed by the Contract Manager:

1. Ordinances and subsidiary legislations, Regulations, Laws of Hong Kong;
2. The Project Specific Specification and / or the contract documents for a particular project;
3. The Specification and/or the Drawings;
4. The Electrical CoP;
5. Electrical Product Guidance Notes;
6. Supply Rules;
7. BS 7671 when specified;
8. British Standard Specifications and Codes of Practice;
9. Equivalent standard;
10. HKHA Building Works Specification.

ELE1.4.040.8 APPLICATION OF BRITISH STANDARDS/INTERNATIONAL OR NATIONAL STANDARDS / CODE OF PRACTICE

1. The date/year of British Standards (BS)/International or National Standards / Codes of Practice (CP) shall be referred to Appendix 1 of the Specification. Where it is not specified in the Specification, it shall be deemed to refer to any valid or latest version, and any applicable amendments to that version;
2. Where the date/year is specified, due to intended purposes, the specified version and any amendments to that version shall be compiled with unless otherwise approved by Contract Manager;
3. "Head standards" (HS) are not dated because they do not contain any technical content. However reference to a head standard invokes all relevant extant "parts" of that standard which are themselves dated. Reference to head standards is a practicable method of using a general BS reference in situations where detailed reference to each part would be cumbersome.

ELE1.4.050.8 OTHER INTERNATIONAL OR NATIONAL STANDARD SPECIFICATIONS

Materials or equipment manufactured to other International or National Standard Specifications (Equivalent Standard) may be considered for acceptance provided that:

1. The Equivalent Standard shall be no less stringent than the corresponding BS; and
2. The materials or equipment shall be compatible, in all respects, with and comply with the corresponding BS; and
3. The following documents shall be produced when required:
 - a. An English translation of the Equivalent Standard, certified true by the Equivalent Standard issuing organization or an acceptable authority;
 - b. A comparison table highlighting the differences between the Equivalent Standard and the corresponding BS.

ELE1.4.060.8 TESTING AND CERTIFICATION

1. Unless otherwise specified, equipment shall be type-tested in accordance with the testing requirements as stipulated in the appropriate recognised standard as stipulated in the Electrical CoP;
2. Test certificates for each type test complete with reports and drawings, where applicable, shall be produced when required, to prove to the satisfaction of the Contract Manager of the compliance with the recognised standard. If the original documents are not produced in English, an English translation of the documents, certified true by the issuing organisation or an acceptable authority, shall be produced when required;
3. For the purpose of product testing and certification, the following interpretation shall apply:
 - a. "Independent" shall mean not owned, managed or operated, either in whole or in part, by the manufacturer or its agents;
 - b. "Accredited Laboratory" shall mean a laboratory accredited to carry out the specified tests by:
 - i. IECEE (IEC System for Conformity Testing to Standards for Safety of Electrical Equipment) CB Scheme; or
 - ii. Hong Kong Accreditation Service (HKAS) or Hong Kong Laboratory Accreditation Scheme (HOKLAS); or

-
- iii. Other equivalent national laboratory accreditation schemes which have mutual recognition agreements with HKAS/HOKLAS as stipulated in the Electrical CoP.
 - c. "Short Circuit Testing Organisation" shall mean:
 - i. The Association of Short Circuit Testing Authorities (ASTA); or
 - ii. NV tot Keuring van Elektrotechnische Materialen (KEMA); or
 - iii. Association des Stations d'Essais Francaises d'Appareillage (ASEFA); or
 - iv. An Accredited Laboratory; or
 - v. Other short-circuit testing authorities internationally recognized as having equal standing as ASTA.
 - d. "Equivalent Quality Surveillance Scheme" shall mean equivalent quality surveillance schemes internationally recognized as having equal standing as the specified scheme(s).

ELE1.4.085.8**CODE OF PRACTICE FOR ENERGY EFFICIENCY OF BUILDING SERVICES INSTALLATION**

1. All materials and workmanship, where specified, shall comply with the BEC;
2. The Sub-contractor shall provide all necessary information and document to the CM for Registered Energy Assessor's preparation of all relevant submission as required under the Buildings Energy Efficiency Ordinance (Cap. 610);
3. Attend and provide necessary equipment for random check and site check upon requested by the CM.

ELE1.5 CONDITIONS OF SUPPLY

ELE1.5.010.8 ELECTRICITY SUPPLY

Unless otherwise specified, the complete electrical installation shall be suitable for operation under the supply system with a nominal frequency of 50 Hz and nominal voltage of 380V, 3-phase and 220V, single phase within the variation limits as declared by the local Supply Companies.

ELE1.5.020.8 SERVICE CONDITIONS

The complete electrical installation shall be suitable for use under Hong Kong climatic conditions with relative humidity and ambient temperature as shown below:

1. Relative Humidity: up to 0.99 saturation;
2. Ambient Temperature: peak from minus 5°C to plus 40°C for 4 hours continuously with an average from 0°C to plus 35°C over only 24 hours period.

ELE1.6 MATERIALS AND EQUIPMENT

ELE1.6.010.8 METRIC UNITS

Materials shall be of metric unit.

ELE1.6.020.8 SUBMISSIONS FOR APPROVAL

1. The Sub-contractor shall submit catalogues, technical information, certificate of safety compliance and samples of the materials proposed for Approval as required by the Contract Manager. The Sub-contractor shall also read in conjunction with the associated requirements stipulated at Preliminaries for Building Services Sub-contracts;
2. The Sub-contractor shall ensure the availability of the certificate of safety compliance for all proposed household products, prior to the submission for approval;
3. Approval of equipment will not be considered until and unless proper rating/type of sample complete with detailed information/technical data such as equipment catalogue, manufacturer's specification and certificates, when required are submitted for examination.

ELE1.6.030.8 SELECTION OF EQUIPMENT

1. Selection of equipment shall be based on this Specification and technical data contained on the Drawings for a particular installation;
2. Where items of equipment are interconnected to form an integral part of the complete electrical installation, their characteristics of performance and capacities shall be so matched as to give efficient, economical, safe and reliable operation of the complete electrical installation.

ELE1.6.040.8 EQUIPMENT CATALOGUES AND MANUFACTURER'S SPECIFICATIONS

1. Equipment Catalogues and manufacturers' Specification related to the proposed equipment shall be in the English language, specific and shall include all information necessary for the Contract Manager to ascertain that the equipment complies with this Specification and Drawings. Data and sales catalogue of a general nature will not normally be accepted;
2. Equipment catalogues and manufacturers' specifications must be submitted for the examination by and Approval of the Contract Manager before any equipment is to be ordered.

ELE1.6.050.8 CONSISTENCY

All equipment of the same category shall be the product of the same manufacturer and shall preferably be of the same colour scheme throughout.

ELE1.6.060.8 RESTRICTED USE OF ASBESTOS PRODUCTS

Asbestos or products containing asbestos shall not be used without prior Approval.

ELE1.7 WORKMANSHIP

ELE1.7.010.8 TRADESMEN

All tradesmen must be experienced in the trade and the works carried out shall be consistent with good practice in Hong Kong and to the satisfaction of the Contract Manager.

ELE1.7.020.8 TOOLS AND INSTRUMENTS

1. Proper tools shall be used to carry out the electrical installations;
2. Adequate and accurate testing/measuring instruments shall also be used to demonstrate compliance of the electrical installations with the relevant specifications and regulations;
3. The Contract Manager has the right to stop any work on which the correct tools and/or instruments are not being used;
4. Instruments used for acceptance test shall be calibrated at appropriate intervals and/or as specified in **Project Specific Specification**.

ELE1.7.030.8 SAFETY ON SITE

All works shall be carried out in such a manner as to comply with all regulations together with any amendments made thereto on safety aspects. These include but are not limited to the following:

1. Construction Sites (Safety) Regulations;
2. Factories & Industries Undertakings Electricity Regulations;
3. Electricity Ordinance, Chapter 406;
4. IEC 60364-7-704: Construction and Demolition Site Installation.

ELE1.7.040.8 GUARD AND RAILING FOR MOVING OR ROTATING PARTS OF EQUIPMENT

1. All moving or rotating parts of equipment shall be provided with an Approved guard and railing complying with the Factories & Industrial Undertakings (Guarding and Operation of Machinery) Regulations, published by the Labour Department, together with any amendments made thereto;
2. Guards shall be rigid and of substantial construction and shall consist of heavy mild steel angle frames, hinged and latched with either heavy galvanized mild steel wire crimped mesh securely fastened to frames or galvanised sheet metal of 1.2 mm minimum thickness;
3. All apertures shall be such that finger access to dangerous parts is not possible.
4. All sections shall be bolted or riveted;
5. Railings shall be 32 mm galvanized mild steel pipe and rail fittings.

ELE1.7.050.8 IDENTIFICATION OF CABLES AND CONDUITS

1. Cables for control circuits, inter-communication circuits, signalling circuits, and bell wiring shall be identified as required for each particular circumstance. Cables for power and lighting circuits shall be identified in accordance with the Electrical CoP Code 13D;

-
2. Electrical conduits, where required to be distinguished from pipelines of other services, shall use orange as the basic identification colour in compliance with BS 1710.

ELE1.7.060.8**SAMPLE FLATS AND SAMPLE WING**

During the construction for domestic building blocks, a specified sample flats and wing located on a typical floor and construction mock-up will be required to be completed by the Main Contractor including the flats, the corridor, the flights of common staircase leading to the floors immediately above and below the sample wing and the lift lobby etc. If necessary, flats at the adjacent wing may also be selected. The Sub-contractor shall complete the electrical installations in the specified sample flats, sample wing and construction mock-up in coordination with the Main Contractor to cope with the construction programme. The proposed samples and details of electrical installations in the sample flats and the sample wing shall be submitted to the CM for approval prior to commencement of works. The Sub-contractor shall be responsible to replace any electrical installations which are found damaged or deformed and to carry out the necessary adjustments to restore to as-new condition before building completion.

ELE1.8 SITE MANAGEMENT

ELE1.8.010.8 APPOINTMENT OF SUPERVISING ENGINEERS, SITE SUPERVISORS AND BLOCK FOREMEN

1. Immediately upon the award of the Sub-contract, the Sub-contractor shall appoint Supervising Engineer(s) and Site Supervisor(s) specified in **ELE1.8.020** and **ELE1.8.030** who shall be both English and Cantonese speaking and in the Sub-contractor's full-time employment for the supervision of the Sub-contract Works to the satisfaction of the Contract Manager;
2. The Sub-contractor shall also identify Block Foremen as in **ELE1.8.035**;
3. Immediately after the award of the Sub-contract, the name, qualifications and curriculum vitae of the Supervising Engineer(s) and Site Supervisor(s) shall be submitted for Approval to the satisfaction of the Contract Manager;
4. None of the Supervising Engineer(s) and Site Supervisor(s) shall be removed from their respective duties without prior Approval;
5. In the event of any of them being unsatisfactory, in the opinion of the Contract Manager, or misconducting themselves, they shall be removed forthwith and be replaced by suitable substitutes to the Contract Manager's satisfaction within seven days from the Contract Manager's instruction in writing.

ELE1.8.020.8 SUPERVISING ENGINEERS

1. Unless otherwise specified, the Sub-contractor is to employ for the supervision of all works on Site, at least one qualified Supervising Engineer. The Supervising Engineer shall generally represent the Sub-contractor in all respects of the Sub-contract and assume the following duties:
 - a. Coordinate and supervise the work in the Sub-contractor's office and the Site;
 - b. Develop, in conjunction with the Main Contractor, schedules of installation drawings, builder's work drawings, material submission and delivery, statutory submissions, the programme of works and testing and commissioning programme, for approval by the CM;
 - c. Liaison with the CM and other parties;
 - d. Attend at the office of the CM for the finalisation of drawings and equipment selection;
 - e. Attend progress meetings and coordination meetings;
 - f. Monitor and supervise installation drawings submission, builder's work drawings submission, material submission and delivery, statutory submissions in accordance with the respective submission schedules. Submit progress reports to the CM monthly or at shorter intervals when such requested by the CM;
 - g. Check and confirm the installation drawings, builder's work drawings and material submissions are suitable for the installation works and in compliance with the requirements of the Sub-contract;
 - h. Examine, verify and confirm in writing to the CM on a monthly basis that the material delivered to the Site under the Sub-contract has been approved by the CM;
 - i. Certify all material delivery vouchers in accordance with **PRE.B12.280** of the Main Contract;

-
- j. Prepare, in conjunction with the Main contractor, the delivery method statements for delivery of plant and equipment;
 - k. Undertake all site test and commissioning of the Sub-contract Works and endorse the test and commissioning reports to confirm that he is satisfied with the completeness, workmanship and performance of the installations which comply fully with the Sub-contract requirements, prior to submission to the CM.
2. Qualification requirements:
- At least one year of proven post qualification at supervisory level on electrical installations in buildings with the following qualification:
- a. Registered Professional Engineer (Electrical or BS Discipline) under the Engineers Registration Ordinance; or
 - b. Member of the Hong Kong Institution of Engineers (Electrical or BS Discipline) elected after 5 December 1975; or
 - c. Member (Electrical or BS Discipline) of an overseas engineering institution which has signed agreements for the mutual recognition of qualifications with the Hong Kong Institution of Engineers.
3. The Supervising Engineer(s) shall be highly competent and experienced, and shall be given a high level of delegated authority such that they can take decisions, including those involving expenditure.

ELE1.8.030.8**SITE SUPERVISORS**

- 1. Unless otherwise specified, the Sub-contractor is to employ at least one qualified Site Supervisor. The Site Supervisor(s) shall be stationed on site;
- 2. Qualifications requirements:
Registered Electrical Worker Grade B(2) or above registered under the Electricity Ordinance.

ELE1.8.035.8**BLOCK FOREMEN**

The Sub-contractor is to identify from time to time one Block Foreman per block who shall be answerable to the Contract Manager for the quality and progress of works for the block. The Block Foreman shall be stationed on Site. This Block Foreman and the Site Supervisor shall not be the same person.

ELE1.8.040.8**BUILDING SERVICES PERFORMANCE ASSESSMENT SCORING SYSTEM**

- 1. The Housing Authority has adopted a Building Services Performance Assessment Scoring System (BSPASS) to assess the performance of building services Nominated Sub-contractors undertaking works for the Authority;
- 2. BSPASS will be operated in this Sub-contract and assessments by Building Services PASS Assessment Team (BSPAT) or other staff of the HA will be conducted at quarterly intervals or other intervals as required by the Contract Manager;
- 3. Upon the Contract Manager's notification, the Sub-contractor's authorised representative shall attend all such assessments;
- 4. The Sub-contractor shall provide all necessary attendance, and all necessary measuring instruments, in addition to those specified in **PRE.BS1.630**, etc. to facilitate the BSPASS assessment as stipulated in the relevant BSPASS manuals;
- 5. In addition, the Sub-contractor shall also provide labours for the opening up and re-fixing of the works, the operation of the equipment and the testing, etc. as required by the assessment.

ELE1.8.050.8 COORDINATION WITH MAIN CONTRACTOR ON INTENDED CONSTRUCTION METHOD FOR INTERNAL PARTITION WALLS (PANEL WALLS) IN DOMESTIC FLATS, PRECAST CONCRETE WALL & PRECAST FACADE PANEL

The internal partition walls (panel walls) in the domestic flats, precast concrete walls and the precast facade panel are of prefabricated panel wall construction. The Sub-contractor shall coordinate with the Main Contractor on their intended panel wall construction method and makes necessary allowance for the conduit installation work. The provision and installation of GI / PVC conduits and conduit fittings on internal partition walls (panel walls), precast concrete walls and precast facade panel should be carried out by Main Contractor and the proposed installation details are shown on Drawings. The Sub-contractor should ensure that all the conduit systems are in compliance with the Specification & Drawings.

ELE1.8.060.8 MODIFICATION WORKS IN NON-DOMESTIC PREMISES DURING MAINTENANCE PERIOD

1. During the Maintenance Period, the Employer may employ other workmen or contractors to carry out modification works pertaining to the installation to suit the fitting out works of the tenants;
2. The Sub-contractor shall provide the necessary attendance, including operation of the installation, as instructed by the Contract Manager to facilitate such modification works;
3. The costs of the attendance will be determined by a fair valuation made by the Contract Manager in conjunction with the Sub-contractor and paid for separately;
4. The employment of other workmen or contractors by the Employer for the modification of the installation shall not in any way relieve the Sub-contractor of his responsibilities for the maintenance and defects of the Works, other than those parts which have been modified by others, in accordance with the Contract.

ELE1.8.070.8 NOTICES AND FEES

The Sub-contractor shall comply with the regulations and requirements of all relevant Authorities such as Fire Services Department, the Building Authority, the Telecommunications Authority, the Electrical and Mechanical Services Department, Utility Companies, etc and shall be responsible for giving notifications to the appropriate Authorities and for paying all fees levied; such fees shall be included in the Tender Price, and also for collecting all necessary certificates and licenses for the installation.

ELE1.9 SITE SECURITY

ELE1.9.010.8 SUB-CONTRACTOR'S STORE ROOMS

1. In addition to the storage shed to be constructed by the Main Contractor as required under **PRE.BS1.380** of the Preliminaries for Building Services Sub-contracts, the Main Contractor will also hand over to the Sub-contractor the switchroom of each building six months after the concreting of the structural frame and ceiling slab of the respective main switchroom, or four months before the completion of each building, whichever is the earlier;
2. The Sub-contractor may make use of the rooms for storage of materials, subject to the progress of the Works not being affected. The Sub-contractor shall make available to the Contractor the builder's work drawings and programme in good time to enable the Contractor to complete his works necessary for the handover of the rooms;
3. Immediately after the handover of the rooms, the Sub-contractor shall lock the doors with a good quality padlock. The padlock shall have proven reliability and in-service records for the Housing Authority projects. The Sub-contractor shall also provide and maintain in good operating conditions a burglar alarm system as specified in **ELE1.9.020**;
4. The Sub-contractor shall remove the padlocks and burglar alarm system upon completion of the respective building and upon Approval by the Contract Manager.

ELE1.9.020.8 BURGLAR ALARM SYSTEM FOR SUB-CONTRACTOR'S STORE ROOMS

The Sub-contractor shall provide the following whole burglar alarm system for each Electrical Sub-contractor's store room during the period as specified in **ELE1.9.010**:

1. System description
The system shall consist of:
 - a. Volumetric motion detector;
 - b. Magnetic door contacts;
 - c. Burglar alarm panel;
 - d. Self activated bell;
 - e. Dedicated-line remote alarm transmission circuit.
2. Volumetric motion detector
 - a. Volumetric detectors used shall make use of dual technology, including passive infra red and microwave/ultrasonic wave, such that the possibility of false alarm will be reduced to the minimum;
 - b. There shall be at least one detector installed facing each cable trench or any other weak points or openings.
3. Magnetic door contact
Surface-mounted magnetic door contacts shall be installed on the inner door frame. It will be used to detect door open.
4. Control panel

The control panel shall be installed inside the protected room. It shall be powered by AC mains and backed up by stand-by battery sufficient for 8 hours. The control panel shall have real time clock display and alarm latching display. The panel shall be able to be armed or disarmed by mechanical key or by keying in secret code via the panel keypad. The panel shall also be built-in with entry and exit delay timer, such that the timer will be triggered by the entry, exit route sensors.

5. Alarm annunciator

- a. Self-activated alarm bell shall be installed on outstanding location on the outer wall of the protected room. The bell shall be housed in strong steel housing with anti-corrosion finishing and are tamper protect against removal of the lid, the bolt or attempted removal of the housing from the wall. The bell shall be self-powered by rechargeable battery. If input circuit is cut off, it shall give out annunciation. Upon activation it shall give out alarm sound level not less than 100 db at 1 metre distance. There shall also be a strobe light on the bell to provide visual warning;
- b. A cut off timer adjustable from 1 minute to 15 minutes shall be provided. Should the bell ring for the pre-set period, it shall be cut off by the timer. However, the strobe light shall remain flashing. Should the built-in battery voltage goes below the threshold limit, the bell shall give intermittent audio and visual warning to signify the need for battery replacement.

6. Dedicated line remote alarm transmission

- a. Alarm signal shall be transmitted to a remote central station. The signal shall be transmitted through dedicated lease-line. The alarm transmission line shall also be supervised, such that communication failure can be detected from the central station;
- b. The transmitter used shall have identity signals sent back to the central station such that compromising by direct swapping of transmitter shall not be possible. Communication data shall also be encrypted to deter compromising;
- c. The alarm signal shall be terminated in the central station which shall be manned by at least 2 persons any time. The central station shall enforce stringent security measures and meeting BS 5979 is preferred. The central station shall be operated by a well established and reputable security service company, the name of which shall be submitted to the Contract Manager for Approval;
- d. In the central station, there shall be records of telephone numbers of site guard post and keyholders. Should there be any alarm received by the central station, its operator shall call site guard and the keyholder. Upon notification, the keyholder shall return to the protected premises to investigate and reset the control panel. Should there be any suspected theft or burglary, the operator shall call the police. All telephone conversations with central station must be recorded and kept for at least 30 days for later reference.

7. Operating cost

All operating costs for the burglar alarm system, including the rental charges for the lease-line, the charges for the remote central station etc. shall be borne by the Sub-contractor.

ELE1.9.030.8**MARKING OF RESIDUAL CURRENT CIRCUIT BREAKERS (RCCB)**

The name of the estate and the phase number (e.g. LOK FU 5), or the suitable description of the contract, shall be indelibly marked on an external surface of the enclosure of the RCCB in capital letters of not less than 3 mm high. The marking shall not affect the appearance and performance of the RCCB. A sample of the marked RCCB shall be submitted to the Contract Manager for Approval prior to installation.

ELE1.10 RECORD DOCUMENTATION

ELE1.10.010.8 REQUIREMENTS FOR SUB-CONTRACTOR'S DRAWINGS

1. Size of drawings

Drawings submitted by the Sub-contractor shall be of a standard size from A0 to A4 in accordance with BS EN ISO 5457. "As-fitted" drawings shall be of A0 or A1 size only.

2. Installation drawings

The Installation Drawings shall detail and dimension the following, where relevant and also read in conjunction with Preliminaries for Building Services Sub-contracts:

- a. Site distribution, cable and busduct routes;
- b. General layout drawings giving accurate and dimensioned locations of all plant and equipment included in the Sub-contract;
- c. Schematic diagrams for main and sub-main distribution;
- d. Main switchboard details, including schematic diagram, component layout, busbar arrangement, compartmentation, conductor sizes, cabling arrangement, termination details, control diagram;
- e. Details of distribution boards and consumer units, including types and rating of protective devices, sizes and types of incoming and outgoing cables, circuit description;
- f. Busduct installation details showing connections, mounting details and setting out of all components including straight runs elbows, offsets, tap-off units, etc.;
- g. Prefabricated Branch Cables installation details showing connections, mounting details and setting out of all components including straight runs elbows, offsets, tap-off units, etc.;
- h. Lighting layouts for normal and emergency fittings, detailing positions, mounting methods, types of luminaires, switch positions and wiring connections;
- i. Conduit routes with conduit sizes, showing adaptable boxes, details of cables and circuit references (see [ELE1.10.020](#));
- j. Trunking and cable tray routes with details of sizes, fixings, cables carried;
- k. Generator installation details, showing plant layout and sections, exhaust pipe details, fuel system details, acoustic treatment, control equipment;
- l. Earthing and equipotential bonding system with details of conductor sizes and routing, bonding arrangement;
- m. Lightning protection system with details of air terminations, down conductors and bonding;
- n. CABD, Security, CCTV, EAS, PA and carpark control systems, whichever included in the Sub-contract, with schematics, equipment details, cable routes, termination details, fixing details, etc.;
- o. Label schedules, showing wording and formats for the labelling of equipment and distribution board circuits;

Operating and maintenance clearances for the equipment and their static and dynamic structural loading shall be shown on the installation drawings wherever necessary.

3. "As-fitted" drawings

The "as-fitted" drawings shall be based on the full set of Approved Installation Drawings updated to show the actual positions and arrangement of all items installed. Any additional drawings which are considered necessary by the Contract Manager for showing the complete installation shall be included. The Drawings shall be drawn in black-ink lines on transparent linen or other Approved materials, suitable for reproduction of prints.

ELE1.10.020.8 CONDUIT RUN DRAWINGS

The Sub-contractor shall submit detailed conduit layout drawings for Approval prior to commencement of the installation. The Sub-contractor shall supply to the Contract Manager eight (8) sets of conduit run drawings after Approval.

ELE1.10.030.8 WORKING DRAWINGS AND AS-FITTED DRAWINGS

1. The Sub-contractor's attention is drawn to Preliminaries for Building Services Sub-contracts for installation drawings and **ELE1.10.020** above;
2. Schematic wiring diagrams for the electrical installation of each building shall be provided and fixed properly to the satisfaction of the Contract Manager, in the locations hereunder. The diagrams shall be of A1 size minimum and each diagram shall be treated with acrylic varnish to prevent deterioration and mounted in an anodised aluminium frame with transparent plastic front plate of 3 mm minimum thickness and wooden backing board of 5 mm minimum thickness;

System	Location of diagram
Electrical power distribution and associated systems	Main switchroom and near other main switches as required in compliance with the Electrical CoP
Security system	Meter room accommodating the main control equipment
Public address system	Adjacent to the main system amplifier

3. The complete set of as-fitted drawings shall consist of each of the drawings, which shall include but not be limited to the following:
 - a. Site plan and underground cable route of telecommunication lines, supply company cables, road lighting layout plan;
 - b. Schematic wiring diagrams;
 - c. Electrical floor layout plans;
 - d. Typical domestic flat layout plans;
 - e. Schematic wiring diagram of public lighting;
 - f. Public lighting layout plans;
 - g. External lighting layout plans;
 - h. Transformer room, main switch room and meter room layout plans;
 - i. Installation details - lateral main, trunking and mounting methods;
 - j. Lightning protection system;
 - k. Schematic diagram for doorphone system;
 - l. Control block diagram for doorphone system;

-
- m. Security system – schematic diagram for all sub-systems (showing the type of integrated circuits transistors, diodes and other semiconductor devices, voltage rating and values of all passive components etc), one to one scale printed board layout and the arrangement of components on the circuit boards;
 - n. CCTV installation layout plan;
 - o. Security alarm installation;
 - p. Public address system;
 - q. CABD system - site layout plan (showing antenna position and direction) and signal field strength.

ELE1.10.040.8**DOCUMENTS AND TECHNICAL LITERATURE TO BE SUBMITTED AFTER COMPLETION**

The Sub-contractor shall submit the following documents and technical literature to the Contract Manager for the whole installation and equipment provided under this Sub-contract which shall include, but not be limited to the following:

1. User manual consisting of:
 - a. Information (catalogue, manual, instruction etc.) on special precautions/procedures/methods required on the use, operation, cleaning, servicing, maintenance, repair and replacement of all proprietary material and equipment installed such as air circuit breaker(s)/moulded case circuit breaker(s) including protection and instrumentation devices, lighting fittings, amplifiers and cameras. Requirements on proper use and operation for durability, safety and statutory consideration shall be clearly stated;
 - b. A list of recommended spare parts;
 - c. Testing and commissioning reports on the system and equipment installed (electronic copy in PDF format stored on recordable compact disc shall be provided in addition to hard copies).
2. Original certificate of warranty for any material, equipment and installation with warranty period last beyond Maintenance Period; and
3. Other items as required by the Contract Manager.

For public address system, apart from the documents stipulated above, three sets of operation and maintenance manuals with detailed circuit diagrams and descriptions shall be submitted to the Contract Manager one month before the commissioning of the installation.

ELE2.1 DOMESTIC BLOCKS

ELE2.1.1 APPLICATION

ELE2.1.1.010.8 BLOCKS

ELE2.1 applies to the domestic blocks covered by this Sub-contract unless otherwise specified in Project Specific Specification or Drawings.

ELE2.1.1.020.8 REFERENCE DOCUMENTS

The Sub-contractor shall provide the whole of the electrical installation in each of the blocks/buildings as detailed on the Drawings and in this Specification including Project Specific Specification. This section of the Specification should be read in conjunction with other Worksections.

ELE2.1.2 MAINS SUPPLY

ELE2.1.2.010.8 PROVISION BY SUPPLY COMPANY

1. The Supply Company will provide an independent 380V, 3-phase, 4-wire, TT system supply to each block/building;
2. The Sub-contractor shall provide durable labels at the main incoming circuit breakers and along the risers at all floor levels to indicate the source transformers as per the power supply company's requirements and as otherwise specified in Project Specific Specification.

ELE2.1.2.020.8 ATTENDANCE BY SUB-CONTRACTOR

The Sub-contractor shall provide all necessary attendance, complete with all necessary work, and enforce all safety measures required for the connection of supply.

ELE2.1.3 MAIN CUBICLE SWITCHBOARD

ELE2.1.3.010.8 PROVISION OF DETAILS

The main cubicle switchboard shall be provided as shown on the Drawings. The Sub-contractor shall submit a set of detailed installation drawings showing the proposed layout, positioning and construction of the cubicle switchboard for Approval prior to assembly. The proposal shall take into account the actual site conditions and Supply Company's requirements with regard to incoming supply termination, clearance space for installation, operation and maintenance, incoming cable/bars and outgoing cable routing, supporting framework, etc.

ELE2.1.3.020.8 INSTALLATION OF SUPPLY COMPANY'S ELECTRICITY METERS

The Sub-contractor shall apply, collect and install the Supply Company's electricity meters, and liaise with the Supply Company to ensure that the provisions for termination of the incoming supply cables/busbars and installation of the electricity meters are suitable and meet the Supply Company's requirements.

ELE2.1.3.030.8 OFF-SITE INSPECTION

Inspection of the cubicle switchboard may be carried out by the Contract Manager or his representative at the manufacturer's works during the construction stage.

ELE2.1.3.040.8 TESTS

Tests shall be carried out by the Sub-contractor upon completion in the presence of the Contract Manager or his representative prior to acceptance and delivery to Site.

ELE2.1.3.050.8 SUPPLY FEEDING FROM HEC

1. Unless otherwise specified on Drawings, the Sub-contractor shall supply and install the LV transit blocks and single cores XLPE/PVCI/PVCS power supply cables connecting to the incoming air circuit breakers;
2. For design using busbar trunking system, the Sub-contractor shall supply and install the LV transit blocks and busbar trunking system connecting to the incoming air circuit breakers;
3. The busbar trunking system shall comply with IEC 60439-1 and shall be assembled by the same manufacturer of the main cubicle switchboard;
4. The copper busbars shall be of 2500A TP and full neutral and housed in an enclosure of IP 31. The system and its installation details shall be submitted for Approval prior to installation.

ELE2.1.3.060.8 POWER FACTOR CORRECTION EQUIPMENT

1. When power factor correction equipment is required, a separate floor-standing cubicle housing the power factor correction capacitor bank and the associated equipment shall be provided within the main switch room as shown on the Drawings;
2. The power factor correction cubicle shall be manufactured/assembled by the same manufacturer of the main cubicle switchboard;
3. The Sub-contractor shall submit a set of detailed installation drawings showing the proposed layout, positioning and construction of the power factor correction cubicle for Approval prior to assembly.

ELE2.1.3.070.8 PAINTING SWITCHGEAR

All the switchgears fed from essential supply circuitry shall be painted in red.

ELE2.1.4 RISING MAINS AND SUB-MAINS DISTRIBUTION SYSTEMS

ELE2.1.4.010.8 SCOPE OF WORK

The Sub-contractor shall supply, install and connect rising mains and sub-mains distribution systems comprising cables, busbar/pre-fabricated branch cable risers, conduit and accessories, MCB distribution boards, busbar chambers, etc as shown on the Drawings and otherwise as specified in [Project Specific Specification](#).

ELE2.1.4.020.8 BUSBAR/PRE-FABRICATED BRANCH CABLE RISING MAINS

The busbar/pre-fabricated branch cable rising mains shall be manufactured and designed for the particular job with all purpose-made fittings and accessories.

ELE2.1.4.030.8 BUSBAR/PRE-FABRICATED BRANCH CABLE RISERS

1. The Sub-contractor shall submit the manufacturer's drawings showing the details of the busbar/pre-fabricated branch cable risers to the Contract Manager or his representative for Approval prior to manufacture;
2. The busbar risers shall be securely fixed on the surface of the wall and shall be straight from the bottom to the top;
3. When the gap between a riser and wall is considerable due to uneven plastering or concrete at fixing point, the Sub-contractor shall install suitable packing or Approved galvanized steel brackets to which the trunking shall be fixed;
4. The minimum distance between the trunking case and the wall shall be 25 mm.

ELE2.1.4.040.8 FIXING ARMOURED CABLES

All armoured cables run on walls shall be fixed by cable cleats of the following types:

Cable Diameter (mm)	Type of Cable Cleat
dia. \leq 50	1-bolt Fixing Type
dia. $>$ 50	2-bolt Fixing Type

Also, the cables shall be fixed on wall by means of angle iron support or metal framework depending on actual site conditions.

ELE2.1.4.050.8 PAINTING SWITCHGEAR

All the switchgears fed from essential supply circuitry shall be painted in red.

ELE2.1.5 BRANCH-OFF CIRCUITS FROM RISING MAINS**ELE2.1.5.010.8 SCOPE OF WORK**

The Sub-contractor shall supply, install and connect the TP & N branch-off circuits from the busbar/pre-fabricated branch cable rising mains comprising cables, TP & N fuse combination unit and MCB distribution board etc. in the meter rooms of each domestic floor and at other locations as shown on the Drawings and otherwise as specified in [Project Specific Specification](#).

ELE2.1.6 RADIAL MAINS TO DOMESTIC UNITS**ELE2.1.6.010.8 THE INSTALLATION**

1. The mains supply to each domestic unit on one floor shall be fed from the appropriate MCB distribution board in the meter room on the same floor or the other floor as shown on the Drawings;
2. Each circuit commencing from the respective double pole MCB shall be fed via the Supply Company's electricity meter to each individual domestic unit by PVC insulated cable in a cable containment system such as surface steel conduit/PVC conduit/trunking system as shown on the Drawings inside the meter room(s), and in concealed PVC conduit system from the meter room(s) to the consumer unit in each domestic unit;
3. The meter board for the installation of Supply Company's meter shall be provided and installed by the Sub-contractor;

4. The Supply Company's meters will be supplied and installed on the meter board in Meter Rooms at each floor by the Supply Company as shown on the Drawings. The Sub-contractor shall be responsible for providing connection and fixing facilities, at the position and ready for installing Supply Company's meter. The Sub-contractor shall check and ensure everything of the circuit is in an orderly manner before meter connection by the Supply Company.

ELE2.1.6.020.8**METER CONNECTION AND ENERGISATION FOR DOMESTIC FLATS**

1. Before the installation and connection of the meters by Supply Company for the flats, the Sub-contractor shall switch off all the control switches i.e. the DP MCBs in the meter rooms and shall insulate properly any exposed conductors of the meter tails to the satisfaction of the Contract Manager;
2. The Sub-contractor shall also switch off all the main switches of consumer units in the flats and provide, next to each main switch, a temporary label/notice, in English and Chinese, as follows

"Danger : Do not switch on the main switch unless the meter is connected and the electricity supply to this flat is ready.
(Please check with the Management Office for the readiness of supply)."

危險： 在本單位電錶安裝和電源接駁妥當前
切勿閉合(開)電源總掣
(有關電錶 / 電源接駁時間，請與管理處聯絡)

The label/notice shall be legible and reasonably durable. Sample shall be submitted for Approval.

3. The Supply Company, before connecting the meters, will inspect and test the installation of the flats. The Sub-contractor shall provide all necessary attendance for such inspection and testing carried out within the Maintenance Period and shall pay all fees levied on retesting;
4. The Sub-contractor shall be responsible for switching on the supply circuits to individual flats subsequent to the installation of meters by the Supply Company. Immediately before switching on the supply to each flat, the Sub-contractor shall check to ensure that the switching will not cause any danger to other persons and the installation;
5. The Sub-contractor shall liaise with the Supply Co. and the Management Office for programming the meter connection and the switching operation before and within the Maintenance Period. The Sub-contractor shall complete the switching operation within 12 hours after collecting the daily return from the Management Office for those flats with the meter connected or upon notification by the Management Office. After the switching, the Sub-contractor shall return the record of flats energised to the Management Office immediately.

ELE2.1.7 INSTALLATION FOR DOMESTIC UNITS IN RENTAL BLOCKS

ELE2.1.7.010.8**SCOPE OF INSTALLATION**

Each installation shall comprise a door bell and push, 13A 3-pin single and twin sockets, 20A DP switches, connection units, lampholders, lighting switches etc, to complete as shown on the Drawings and otherwise as specified in **Project Specific Specification**.

ELE2.1.7.020.8 WIRING SYSTEM

The Sub-contractor shall supply, install and connect a concealed PVC conduit wiring system for lighting and power points in each domestic unit, commencing from the surface mounted consumer unit as shown on the Drawings.

ELE2.1.7.050.8 ACCESSORIES

1. All electrical accessories shall be of flush type;
2. Inscription is not required on front plate of control switches feeding fixed electrical appliances in domestic blocks;
3. The door bell shall operate at extra-low voltage, comprising double wound transformer, bell and push etc. Sample of the door bell shall be submitted for Approval prior to ordering of material.

ELE2.1.7.060.8 CONSUMER UNIT

1. A plastic label to indicate the on and off of the main switch and the function of each MCB and spare way shall be provided in accordance with Worksection ELE28.1;
2. The range of instantaneous tripping current for MCB for the A/C unit shall be in accordance with IEC 60898-1 or BS EN 60898-1 - type C tripping characteristics;
3. The range of instantaneous tripping current for MCB for lighting and power shall be in accordance with IEC 60898-1 or BS EN 60898-1 – type B tripping characteristics;
4. The earthing terminal of the consumer unit shall be connected by protective conductor of adequate size PVC insulated cable as shown on the Drawings to the proper earthing terminal of the incoming supply system.

ELE2.1.7.070.8 CONDUIT FOR COMMUNICATIONS INSTALLATIONS

1. A concealed PVC conduit system complete with draw wire and accessories shall be provided by the Sub-contractor for the Fixed Telecommunication Network Services (FTNS), Communal Aerial Broadcasting Distribution (CABD) installation, Subscription Television Distribution Network (STDN) installation, Towngas Automatic Meter Reading (AMR) system and security system installation as shown on the Drawings;
2. The Sub-contractor shall take the roles of coordinating other neighbouring services and determine the exact concealed conduit routes for communications installations while those given on the Drawings are for indicative and tendering purposes.

ELE2.1.7.080.8 EQUIPOTENTIAL BONDING - GENERAL

1. The Sub-contractor shall provide a system of main equipotential bonding and local supplementary bonding for all exposed and extraneous conductive parts for each domestic unit in accordance with the Electrical CoP, BS 7671, Supply Rules and ELE17;
2. The Sub-contractor shall ensure the bonding for extraneous conductive parts is sound and the result complies with the Electrical CoP and BS 7671 by proper measurement with records at good time. For those parts of equipotential bonding system found not electrical conductive, the Main Contractor and the Sub-contractor shall be responsible for rectification of their own works as early as possible.

ELE2.1.7.085.8 MAIN EQUIPOTENTIAL BONDING

The water and gas main incoming pipes inside the domestic flat shall be bonded at their point of entry to the flat to the earth terminal of the consumer unit by cables in concealed PVC conduit system and surface wires as shown on the Drawings.

ELE2.1.7.090.8 LOCAL SUPPLEMENTARY BONDING

1. Local supplementary bonding shall also be provided for the exposed metal cold/hot water pipes and/or gas pipes in the flats, when they are not connected to the main pipes by reliable metal-to-metal joints of negligible impedance. Local supplementary bonding for these pipes inside pipe duct, under sink, cooking bench or below bath tub may be by surface wiring;
2. The Sub-contractor shall provide, local supplementary bonding for the following extraneous conductive parts, which are not exhaustive in the domestic flat as shown on the Drawings:
 - a. Sink/combined unit/cooking bench;
 - b. Windows;
 - c. Louvers;
 - d. Bathroom fittings.
3. Supplementary Bonding
 - a. For sink/combined unit/cooking bench
 - i. The Main Contractor will provide a 1.5 mm thick stainless steel earthing lug with a 5 mm diameter hole welded to each sink/combined unit/cooking bench;
 - ii. The Sub-contractor shall provide the supplementary bonding for the sink/combined unit/cooking bench by surface wiring to the earthing terminal of the nearby extraneous/exposed conductive parts or BS 4662 or IEC 60670-1 box or the nearby fused connection unit via concealed PVC conduit to the BS 4662 or IEC 60670-1 box. For the former case, the bonding conductor shall be fixed by a 4 mm diameter stainless steel screw, washer and nut to the earthing lug.
 - b. For windows and louvers
 - i. The Main Contractor will provide at each of the extraneous conductive parts, a 20 mm wide, 1.5 mm thick hot-dip galvanized steel earthing lug one end of which will be fixed to the extraneous conductive part by 2 nos. M4 self-tapping stainless steel screws at 60 mm c/c and the other end with a 5 mm diameter hole provided, for the termination of the bonding conductor, will be extended to the nearby BS 4662 or IEC 60670-1 box via a recess slot;
 - ii. The Sub-contractor shall provide the bonding conductor which shall be fixed to the earthing lug by a 4 mm diameter stainless steel screw, washer and nut and to the earthing terminal of the nearby [BS 4662 or IEC 60670-1 box]/[lighting point or connection unit];
 - iii. The recess slot will be provided and backfilled after the fixing of the earthing lug by the Main Contractor;
 - iv. The Sub-contractor shall advise the Main Contractor of the location of the recess slot in conjunction with the layout of the BS 4662 or IEC 60670-1 box for equipotential bonding.

c. For bathroom fittings

- i. The Main Contractor will provide a concealed 30 mm wide, 1.5 mm thick hot-dip galvanized steel metal strip for equipotential bonding of the extraneous conductive parts as shown on the Drawings;
- ii. The Main Contractor will fix one end of the hot-dip galvanized steel metal strip to the extraneous conductive part and the other end with a 5 mm diameter hole provided, for the termination of the bonding conductor in the nearby BS 4662 or IEC 60670-1 box as shown on the Drawings;
- iii. The Sub-contractor shall provide the bonding conductor which shall be fixed to the metal strip by a 4 mm diameter stainless steel screw, washer and nut and to the earthing terminal of the nearby [BS 4662 or IEC 60670-1 box]/[lighting point or connection unit];

The Sub-contractor shall advise the Main Contractor of the location of the BS 4662 or IEC 60670-1 box for equipotential bonding.

ELE2.1.12 PUBLIC LIGHTING AND POWER

ELE2.1.12.010.8 SCOPE OF INSTALLATION

The Sub-contractor shall supply, install and connect concealed PVC conduit wiring systems for the electrical installations at all public areas and plant rooms, comprising conduits and fittings, cables, lighting fittings, switches, MCB boards, sockets, etc to complete as shown on the Drawings.

ELE2.1.12.020.8 ESSENTIAL LIGHTING

Part of the public lighting is essential lighting fed from the essential supply board as shown on the Drawings.

ELE2.1.12.030.8 LIGHTING CONTROLS

1. The public lighting shall be controlled by 24 hours time switches/photocells complete with metal box as shown on the Drawings;
2. A by-pass switch shall be provided for each time switch to control the operation manually;
3. The time switch/photocell shall be submitted for Approval before installation;
4. The control of the lightings on roof is timer controlled and interconnected with the fire alarm installation and door contacts for operation as shown on the Drawings and as otherwise specified in Project Specific Specification;
5. The public lighting main switch and MCB distribution boards shall be installed in switch/meter rooms at various floors and blocks as shown on the Drawings.

ELE2.1.12.050.8 EXIT SIGNS

The Sub-contractor shall supply and install the exit signs as shown on the Drawings.

ELE2.1.12.060.8 MCB UNIT

Unless otherwise specified, the range of instantaneous tripping current for MCB unit for lighting and power circuitry shall be in accordance with IEC 60898 or BS EN 60898-1 type B tripping characteristics.

ELE2.1.13 LIFT SUPPLY

ELE2.1.13.010.8 SCOPE OF INSTALLATION

1. The Sub-contractor shall supply, install and connect lift power supply system consisting of multi-core fire resistant armoured cables, floor mounted L.V. cubicle switchboard, isolator, changeover contactor, fuse combination units, busbar chamber, MCB distribution boards, etc, as shown on the Drawings and otherwise as specified in [Project Specific Specification](#);
2. The L.V. cubicle switchboard shall be provided as shown on the Drawings. The Sub-contractor shall submit a set of detailed installation drawings showing the proposed layout, position and construction of the cubicle switchboard for approval prior to assembly.

ELE2.1.13.020.8 INSTALLATION CABLES

The cables shall be installed with a minimum horizontal or vertical separation distance of 75 mm with other circuits.

ELE2.1.13.030.8 CONDUIT FOR LIFT ALARM BELLS

Except for surface mounted conduit which shall be of G. I. type, a system of concealed PVC conduit completed with draw wire and accessories reserved for lift alarm bells at ground floor and central lift alarm indication system shall be carried out by the Sub-contractor as shown on the Drawings.

ELE2.1.13.040.N TRIPPING OF POWER CIRCUITS FOR AFTER HOMING

The Lift Sub-contractor shall provide a homing signal to the Sub-Contractor, in form of a pair of normally open dry contacts, for each non-fireman's lift after completion of homing. Upon receiving the homing signal, the power supply of the corresponding sub-distribution board serving the lighting and small power of that lift shall be tripped off automatically. The power supply shall resume normal after the homing signal is removed. The Sub-Contractor shall supply and install all necessary contactors and control circuits to perform the above function.

ELE2.1.14 PUMP SUPPLY

ELE2.1.14.010.8 SCOPE OF INSTALLATION

The Sub-contractor shall supply, install and connect the pump power supply system consisting of multi-core armoured cable, switchgears, busbar chambers, MCB distribution board, etc inside the fire services pump rooms, and water pump room, as shown on the Drawings and otherwise as specified in [Project Specific Specification](#).

ELE2.1.14.020.8 FACILITIES PROVIDED BY OTHERS

All water pumps including fire pumps, starters, control panel, control wiring and accessories up to the roof tank will be provided by others.

ELE2.1.14.030.8 INSTALLATION OF CABLES

The circuit for fire pump supply shall be at a horizontal or vertical separation distance of 75 mm with other circuits.

ELE2.1.14.040.8 CONDUIT FOR PUMP SUPPLY

Except for surface mounted conduit which shall be of G. I. type, a system of concealed PVC conduits completed with draw wires and accessories, etc from the roof tanks down to the pump rooms for the pump control circuit, shall be carried out by the Sub-contractor as shown on the Drawings.

ELE2.1.15 PUMP, LIFT MACHINE, GENERATOR ROOMS, REFUSE STORAGE & MATERIAL RECOVERY CHAMBERS, REFUSE STORAGE & MATERIAL RECOVERY ROOMS AND REFUSE COLLECTION POINT/JUNK COLLECTION POINT**ELE2.1.15.010.8 SCOPE OF INSTALLATION**

1. The Sub-contractor shall supply, install and connect in surface steel conduit wiring system for the electrical installation in all lift machine rooms, FS pump rooms, water pump rooms and generator rooms as shown on the Drawings and otherwise as specified in the **Project Specific Specification**, whereas for refuse storage & material recovery chambers, refuse storage & material recovery rooms and refuse collection point/junk collection point, concealed PVC conduit system shall be used;
2. The Sub-contractor shall supply and install mechanical ventilation systems for the refuse collection point/junk collection point, refuse storage & material recovery chambers, refuse storage & material recovery rooms, refuse chutes, pump rooms, lift machine rooms, generator rooms and other rooms all as shown on the Drawings and otherwise as specified in the **Project Specific Specification** and ELE31.

ELE2.1.15.025.8 SCOPE AND REQUIREMENTS OF MECHANICAL VENTILATION SYSTEM

1. The Sub-contractor shall supply, install, commission, test and maintain the mechanical ventilation systems all as shown on the Drawings and as specified in this Specification;
2. The sections in ELE31 stipulate the performance specification to be supplied and installed by the Sub-contractor and set out in general the design criteria, minimum requirements, types and standards of the relevant equipment and materials to be provided. The Sub-contractor shall be fully responsible for the comprehensive application design, manufacture, supply, installation, testing and commissioning to meet the project requirements, whether or not installation details are indicated in the Specification and / or on the Drawings;
3. The system installation shall comply with this Specification, latest edition of General Specification for Air conditioning, Refrigeration, Ventilation and Central Monitoring & Control System Installation in Government Buildings of the Hong Kong Special Administrative Region issued by Architectural Services Department, Hong Kong (hereinafter referred to as "General AC Specification") and latest edition of Code of Practice for Energy Efficiency of Building Services Installation issued by Electrical and Mechanical Services Department, Hong Kong.

ELE2.1.15.030.8 EXECUTION OF WORK FOR MECHANICAL VENTILATION SYSTEM

The Sub-contractor shall employ a registered ventilation contractor to supply, install, commission, test and maintain the complete systems and to issue ventilation certificates to the Contract Manager during the Maintenance Period where required by Building (Ventilating Systems) Regulations.

ELE2.1.15.040.8 EXTRACTION SYSTEM FOR VEHICLE EXHAUST

Extraction system for vehicle exhaust shall be provided for the refuse collection point when specified in the [Project Specific Specification](#) and shown on the Drawings.

ELE2.1.15.050.8 FILTERS FOR MECHANICAL VENTILATION SYSTEM

Outdoor air shall be filtered by washable panel filter when shown on the Drawings to improve indoor air quality and protect equipment before it enters the mechanical ventilation system.

ELE2.1.16 TRANSFORMER ROOMS/H.V. SWITCH ROOMS**ELE2.1.16.010.8 SCOPE OF INSTALLATION FOR POWER SUPPLY FROM CLP**

The Sub-contractor shall supply, install and connect the electrical installation comprising surface steel conduits and accessories, cables, MCB distribution board, switches, socket-outlets, lighting fittings, cable tray, etc to complete as shown on the Drawings and otherwise as specified in the [Project Specific Specification](#).

ELE2.1.16.015.8 SCOPE OF INSTALLATION FOR POWER SUPPLY FROM HEC

The Sub-contractor shall supply, install and connect the electrical installation comprising surface steel conduits and accessories, cable, MCB distribution board, switches, socket-outlets, lighting fittings, etc to complete as shown on the Drawings and otherwise as specified in the [Project Specific Specification](#).

ELE2.1.16.020.8 SUPPLY

The supply to the MCB distribution board will be provided by the Supply Company.

ELE2.1.16.030.8 FANS FOR CLP TRANSFORMER ROOM

1. The exhaust fan and the temperature control panel will be provided by the Supply Company but shall be collected and installed by the Sub-contractor;
2. The mounting diaphragm and flexible connection for exhaust fan shall be supplied and installed by the Sub-contractor.

ELE2.1.16.035.8 FANS FOR HEC TRANSFORMER ROOM

1. The axial flow fan and silencer will be supplied by the Supply Company and will be installed by the Main Contractor;
2. The fan control cubicle will be supplied by the Supply Company and shall be installed by the Sub-contractor.

ELE2.1.16.040.8 AIR TRUNKING

The air trunking inside the transformer rooms/switch rooms will be provided and installed by the Main Contractor.

ELE2.1.16.050.8 EQUIPOTENTIAL BONDING

The Sub-contractor shall also provide the equipotential bonding for the air trunking, steel door, etc to the earthing terminal of the MCB distribution board as shown on the Drawings.

ELE2.1.17 PROVISION FOR FIXED TELECOMMUNICATION NETWORK SYSTEM (FTNS) INSTALLATION

ELE2.1.17.010.8 CONDUIT AND TRUNKING

Except for the surface mounted conduit which shall be of G. I. type, a system of concealed PVC conduit and steel trunking together with accessories only for fixed telecommunication network system (FTNS) installation shall be provided by the Sub-contractor as shown on the Drawings.

ELE2.1.17.020.8 EARTHING

An earthing terminal for the FTNS equipment shall be provided by the Sub-contractor at the location as shown on the Drawings.

ELE2.1.17.030.8 LIGHTING IN TBE ROOMS

The Sub-contractor shall supply and install lighting fittings and switches in TBE rooms in concealed PVC conduit system as shown on the Drawings.

ELE2.1.17.040.8 TBE ROOM SUPPLY

The Sub-contractor shall supply, install and connect power supply system for FTNS installation consisting of switchgear, MCB board, trunking and cables in TBE room as shown on the Drawings.

ELE2.1.18 PROVISION FOR SECURITY SYSTEM (SE) INSTALLATION

ELE2.1.18.010.8 PROVISION OF SYSTEM / INSTALLATION

The Sub-contractor shall supply, install and connect the SE installation as shown on the Drawings and otherwise as specified in the **Project Specific Specification** and ELE24.

The detail of the building to be provided with a separate security system is specified in the **Project Specific Specification**.

The provision of Security System, unless otherwise stated in the **Project Specific Specification** or the Drawings, shall consist of the following:

1. A complete doorphone system with doorphone panel in main entrance or other entrances as indicated on the Drawings for every domestic block;
2. A complete local CCTV monitoring system for lifts and entrances at every domestic block;
3. A complete local alarm and door monitoring system at every domestic block;
4. A complete central alarm and door monitoring system;
5. A complete central CCTV system for entrances and guard counter;
6. Telephone at guard counter and in Estate Office.

ELE2.1.18.020.8 PROVISION OF POWER SUPPLY AND CONDUIT

1. The Sub-contractor shall provide the power supply and surface steel conduit/trunking system inside the meter/service room for SE installation;

-
2. A system of concealed PVC conduit together with accessories from the meter/service rooms to the domestic units and roof shall be provided as shown on the Drawings and otherwise as specified in the [Project Specific Specification](#).

ELE2.1.19 PROVISION FOR SUBSCRIPTION TELEVISION DISTRIBUTION NETWORK (STDN) INSTALLATION

ELE2.1.19.010.8 CONDUIT AND TRUNKING

1. Except for surface mounted conduit which shall be of G.I. type, a system consisting of concealed PVC conduit and steel trunking together with accessories only for CABD & STDN installations shall be provided by the Sub-contractor as shown on the Drawings;
2. The Sub-contractor shall take the roles of coordinating other neighbouring services and determine the exact concealed conduit routes for communications installations while those given on the Drawings are for indicative and tendering purposes;
3. The Sub-contractor shall check and locate the exact location of the antenna in preparing the conduit run drawing from the meter/service room on the top floor to the roof and submit to the Contract Manager for Approval as this portion of conduit routing has not been shown on the Drawings;
4. The coordinated conduit layout for the entire CABD, STDN and any other television broadcasting distribution systems shall be submitted to the Contract Manager for approval prior to the commencement of works.

ELE2.1.19.020.8 COORDINATION

1. The Sub-contractor shall coordinate with the STDN operators and obtain a set of their exact technical requirements for installation. The Sub-contractor shall also install the CABD equipment in consideration of any space allocated for STDN installation;
2. The CABD equipment the Sub-contractor is installing shall not cause any interference that will impair the quality of to other neighbouring telecommunication services, including the STDN one.

ELE2.1.20 EARTHING AND FAULT PROTECTION

ELE2.1.20.010.8 GENERAL

This section should be read in conjunction with other Worksections relating to earthing and fault protection.

ELE2.1.20.020.8 EARTHING TERMINALS

1. An earthing terminal bonded to the reinforcement or steel piles of the building in each main switchroom will be provided by the Main Contractor as shown on the Drawings;
2. The Sub-contractor shall supervise the work and label the terminal and connect it up with copper tapes to the main earthing terminal in accordance with the Drawings;

-
3. The Sub-contractor shall follow Power Company Code of Practice 101 / Guide to Connection of Supply to provide bonding terminal and connection to the main earthing terminal as shown on the Drawings for bonding to the earthed point of transformer.

ELE2.1.20.030.8 EARTH ELECTRODE

The earth electrode shall be of rod electrode.

ELE2.1.20.040.8 EARTHING SYSTEM FOR TBE ROOM

In addition to earthing provided for exposed conductive parts of electrical installations in TBE room, a separate earthing system consisting of earth electrode(s), earthing conductor and earthing terminal shall be provided for telecommunication equipment as shown on the Drawings.

ELE2.1.20.050.8 CIRCUIT PROTECTIVE CONDUCTOR

1. For distribution boards supplying circuits for both sockets and fixed equipment, the Sub-contractor shall also check, in accordance with the offered equipment, and ensure that the impedance of the protective conductor between the exposed conductive parts and the point at which the protective conductor is connected to the main equipotential bonding of an installation does not exceed $50Z_s/U_o$ ohms, where Z_s is the earth fault loop impedance corresponding to a disconnection time of 5 sec. and U_o is the nominal voltage equivalent to 220V, failing which the Sub-contractor shall provide CPC with larger cross-sectional area wherever necessary;
2. For circuits supplying only fixed equipment within the equipotential zone, the earth fault loop impedance at every point of utilisation is such that disconnection occurs within 0.4 second or 5 seconds in accordance with Code 11B(b) (ii) of the Electrical CoP;
3. For circuits supplying fixed equipment outside the equipotential zone, the earth fault loop impedance at every point of utilisation is such that disconnection occurs within 0.2 second or 0.4 second in accordance with Code 11B(b) (iii) of the Electrical CoP.

ELE2.1.20.060.8 EQUIPOTENTIAL BONDING FOR EXTRANEIOUS CONDUCTIVE PARTS IN COMMUNAL AREA OF BUILDING

1. Notwithstanding the provisions of the following specification on workmanship and materials for installation of cast iron piping system by Main Contractor, the Sub-contractor has the responsibility to verify that the resistance of installed cast iron pipes to main earth is not less than 45,000 Ohm even under the worst conditions (e.g. high moisture) in accordance with the Electrical CoP and if otherwise and necessary to provide the equipotential bonding in accordance with the requirements of the Electrical CoP:
 - a. Use cold caulking compound for jointing of cast iron pipes and fittings in accordance with manufacturer's instruction;
 - b. The pipe brackets for mounting cast iron pipe shall be lined with resilient plastic at pipe clamp;
 - c. Paint cast iron pipes/fittings with at least 2 finish coats of bitumen to BS 3416 after installation.

ELE2.1.21 LIGHTNING PROTECTION SYSTEM

ELE2.1.21.010.8 STANDARD

The Sub-contractor shall supply, install and connect a lightning protection system at the roof top of Domestic Blocks as shown on the Drawings.

ELE2.1.21.020.8 CONSTRUCTION

The lightning protection system comprising aluminium tapes shall be complete with fixing saddles bonded to the structure as shown on the Drawings.

ELE2.1.21.030.8 EQUIPOTENTIAL BONDING

The Sub-contractor shall also provide equipotential bonding of the lightning protection system to the electrical system in accordance with the Electrical CoP.

ELE2.1.21.040.8 RESISTANCE

After the completion of the lightning protection system installation, the Sub-contractor shall measure the resistance of the down conductors between the air termination on roof and the structural earth terminal in the main switch room and report the measured results to the Contract Manager for checking purpose.

ELE2.1.22 STANDBY DIESEL GENERATING SET(S)

ELE2.1.22.010.8 APPLICATION

A standby diesel generating set shall be provided as an emergency supply to comply with the Fire Services Department requirements as shown on the Drawings.

ELE2.1.23 PROVISION FOR TOWN GAS AUTOMATIC METER READING (AMR) SYSTEM INSTALLATION

ELE2.1.23.010.8 CONDUIT AND TRUNKING

Except for surface mounted conduit which shall be of G.I. type, a system of consisting of concealed PVC conduit and steel trunking together with accessories for AMR system installation shall be provided as shown on the Drawings.

ELE2.1.24 COMMUNAL AERIAL BROADCAST DISTRIBUTION SYSTEM

ELE2.1.24.010.8 PROVISION OF SYSTEM / INSTALLATION

A complete communal aerial broadcast distribution system shall be provided as shown on the Drawings and otherwise as specified in the [Project Specific Specification](#) and ELE23.

ELE2.1.24.020.8 SPECIAL REQUIREMENTS

The special requirements are specified in the [Project Specific Specification](#).

ELE2.1.25 PUBLIC ADDRESS SYSTEM

ELE2.1.25.010.8 PROVISION OF SYSTEM / INSTALLATION

Complete public address systems shall be provided as shown on the Drawings and otherwise as specified in the [Project Specific Specification](#) and ELE25.

ELE2.1.26 SMART METER MONITORING AND ENERGY INFORMATION DISPLAY SYSTEM

ELE2.1.26.010.8 SCOPE OF INSTALLATION

The Sub-contractor shall design, supply and install a smart meter monitoring and energy information display system as shown on the Drawings and as specified in ELE35. The Sub-contractor shall supply and install a central monitoring and management workstation in the security control room at the Estate Management Office for central data processing, and which shall be connected to the local energy information display system in each domestic block as specified and shown on the Drawings. The central monitoring and management workstation shall oversee the local systems in all domestic blocks.

The Sub-contractor shall supply and install local energy information display system at the ground floor main entrance lobby of each domestic block and the associated data gathering units and equipment for displaying the information as described in ELE35. The complete display system shall include a LED TV display panel, integrated stereo speakers, display interfacing units and all peripheral devices and connections as specified and shown on Drawings.

The Sub-contract shall supply and install the complete communication network and cabling system including all connection cables and all associated interfaces and accessories between the central monitoring and management station at the EMO and all associated domestic blocks.

ELE2.1.27 AUTOMATIC METER READING (AMR) OUTSTATION FOR WATER SUPPLIES

ELE2.1.27.010.N PROVISION OF SYSTEM / INSTALLATION

The Sub-contractor shall design, supply and install AMR outstation for water supplies as shown on the Drawings and as Specification in ELE36.

ELE2.1.27.020.N CONDUIT AND TRUNKING

Except for surface mounted conduit which shall be of G.I. type, a system consisting of concealed PVC conduit and steel trunking together with accessories for AMR outstation for water supplies shall be provided as shown on the Drawings.

ELE2.2 EXTERNAL PUBLIC LIGHTING

ELE2.2.010.8 SCOPE

The Sub-contractor shall supply, install and connect the complete external public lighting system as shown on the Drawings and otherwise as specified in the [Project Specific Specification](#).

ELE2.2.020.8 INSTALLATION

1. Where the lighting fittings are mounted on the periphery of the block, they shall be wired in concealed conduits;
2. Power supply to each circuit of lighting fitting(s) shall be fed from MCB unit via individual residual current devices;
3. The Sub-contractor shall provide all necessary fixing facilities and accessories as recommended by manufacturers for installation of external lighting fittings as shown on the Drawings;
4. Provision of ducts, excavation, concrete foundation necessary for installation of external lighting fittings and the cement/soil filling will be carried out by the Main Contractor;
5. The Sub-contractor shall coordinate with the Main Contractor and submit drawings showing details of all builder's works requirements necessary to complete installation of external public lighting to the Main Contractor for subsequent transmission to and Approval by Contract Manager.

ELE2.2.030.8 SWITCH CONTROL

The public lighting shall be controlled by 24 hours time switches/photocell as shown on the Drawings.

ELE2.2.040.8 FLOODLIGHTING FITTINGS

The Sub-contractor shall also be responsible for adjusting the mounting heights and aiming angles of the flood lighting fittings (if any) for the ball courts, playgrounds, etc. This may be carried out at night when required.

ELE3.1 GENERAL

ELE3.1.010.8

SCOPE

1. This section specifies the general requirements of low voltage switchgear and associated equipments which are intended for assembly on site from individual items of components. Additional and specific requirements for factory built assemblies of switchgear and controlgear are given in ELE4, the Drawings, other documents issued by the Contract Manager or Project Specific Specification;
2. The component equipments covered in this Section shall include the following:
 - a. Fuse combination units and switch disconnectors;
 - b. Circuit-breakers comprising moulded case circuit-breakers (MCCBs), miniature circuit breakers (MCBs) and residual current-operated circuit-breakers (RCCBs);
 - c. Double-pole switch disconnectors;
 - d. Fuses;
 - e. Distribution boards including consumer units;
 - f. Starters and contactors;
 - g. Time switches;
 - h. Measuring instrument;
 - i. Site built assemblies.
3. The general requirements specified in **ELE3.1.020** to **ELE3.1.080** both inclusive shall apply to all items of switchgear and associated equipment where applicable unless explicitly mentioned otherwise.

ELE3.1.020.8

SERVICE CONDITIONS

The following conditions shall apply:

1. Ambient temperature: peak from minus 5°C to plus 40°C for 4 hours continuously with an average from 0°C to plus 35°C over only 24 hour period;
2. Relative humidity: up to 0.99 saturation.

ELE3.1.030.8

SHORT-CIRCUIT RATING AND CONTINUOUS CURRENT RATING

1. Low voltage switchgear shall be suitably rated for the specified prospective short-circuit current which can occur at the point of its installation. It shall also be rated for uninterrupted duty when carrying continuously the specified full load current. For non-automatic switching devices the rated short-time withstanding current shall be at least 12 times the continuous current rating for 1 second;
2. Where equipment components are installed in enclosures, they shall be suitable for operation at the actual maximum temperatures which will be reached within the enclosures under normal loaded conditions when the ambient temperature is 40°C.

ELE3.1.040.8

VOLTAGE RATING

Low voltage switchgear and associated equipment shall be suitable for use on 220V (single phase) or 380V (3 phase) 50Hz supply.

ELE3.1.050.8 DEGREE OF PROTECTION FOR ENCLOSURE

Enclosures for low voltage switchgear and associated equipment shall have an index of protection, in accordance with IEC 60529 of at least IP 30 for indoor applications and of at least IP 54 for outdoor applications.

ELE3.1.060.8 MATERIALS

1. Unless otherwise specified, low voltage switchgear and associated equipment except MCCBs and MCBs shall be metalclad. All ferrous metal parts shall be galvanised or chrome plated unless the final finish has been painted or enamelled in the manufacturer's factory;
2. All extraneous conductive parts shall be electrically continuous.

ELE3.1.070.8 ON AND OFF INDICATION

1. The design of a switching device shall incorporate some positive means to indicate clearly and reliably the ON (or CLOSE) and the OFF (or OPEN) positions of the contacts. Indication of either position shall only occur when the ON or OFF position on every pole has been attained. Such indication shall be provided on the outside of the device and shall be prominently visible to an operator when the device is installed in the normal manner;
2. When the switching device is also used for isolation purpose, then an indication of the OFF position shall occur only when all contacts are also in the OFF position and the isolating distance between contacts in every pole has attained a clearance not less than those specified in the respective equipment standards.

ELE3.1.080.8 IDENTIFICATION OF CIRCUIT

1. Labels or other means of identification shall be provided for every item of switchgear and associated equipment to indicate the purpose of the item. The labels shall either be fixed at the front cover or at the inside surface of the hinged front cover;
2. For a split-busbar consumer unit, the labels shall identify all outgoing MCBs which are protected by an RCCB from those which are not.

ELE3.2 SURFACE MOUNTED FUSE COMBINATION UNITS AND SWITCH-DISCONNECTORS

ELE3.2.1 GENERAL

ELE3.2.1.010.8 TYPE AND STANDARD

Surface mounted switch-disconnector fuses, fuse-switch disconnectors and switch-disconnectors (hereinafter referred to as "switching device" or "switching devices") shall be air-break, metalclad type and shall comply with IEC 60947-3.

ELE3.2.1.020.8 ARRANGEMENT

The switch-disconnector fuses or fuse-switch disconnectors shall be a combination of a switch-disconnector and one or more fuses in a composite unit.

ELE3.2.1.030.8 CLASS AND RATING

	Class	Rating
1.	Rated operational voltage	380/220V (min.)
2.	Rated frequency	50Hz
3.	Rated insulation voltage	415V (min.)
4.	Rated impulse withstand voltage	6 kV (min.)
5.	Conventional enclosed thermal current and rated operational current/power for uninterrupted duty	As shown on the drawings
6.	Utilization category	AC22B unless otherwise specified.
7.	Rated short-time withstand current (for switch-disconnectors protected by air circuit breakers/moulded case circuit breakers)	At least twelve times the maximum rated operational current for one second.
8.	Rated short-circuit current (for switch-disconnectors protected by bolt-type fuses as specified in ELE3.13.010 and for switch-disconnector fuses / fuse-switch disconnectors)	40 kA

ELE3.2.1.040.8 IN-SERVICE RECORDS

Prior to the time of material submission for Approval, the equipment shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.

ELE3.2.2 TYPE-TEST

ELE3.2.2.010.8 TEST STANDARDS

Switch-disconnector fuses, fuse-switch disconnectors and switch-disconnectors shall be type-tested in accordance with Clause 8.2 and Clause 8.3 of IEC 60947-3. For switch-disconnectors to be used in circuits protected by fuses, test sequence III of Clause 8.3.5 is not required, but test sequence IV of Clause 8.3.6 shall be performed to such switch-disconnectors connected in series with bolt-type fuse links as specified in **ELE3.13.010** of the corresponding rated maximum current.

ELE3.2.2.020.8 TYPE-TESTING

The following test sequences of IEC 60947-3 shall be carried out by a Short Circuit Testing Organisation.

1. For fuse combination units – test sequences I & IV;
2. For switch-disconnectors – test sequences I & III.

Switch disconnectors converted from type-tested switch-disconnector fuses/fuse-switch disconnectors by replacing the fuse links with copper short links for a rated operational current not greater than the maximum rated operational current for the original switch-disconnector fuses/fuse-switch disconnectors and are installed in circuits protected by bolt-type fuses as specified in **ELE3.13.010** are also acceptable.

ELE3.2.3 CONSTRUCTION AND DESIGN

ELE3.2.3.010.8 TYPE

Switch-disconnector fuses, fuse-switch disconnectors and switch-disconnectors shall be triple or single pole as shown on the Drawings, with detachable fully rated front accessible neutral link, or 4-pole as shown on the Drawings.

ELE3.2.3.020.8 CURRENT RATINGS ABOVE 100A

For fuse combination units with current ratings above 100A, the switching devices shall make and break on both the incoming supply side and the outgoing load side.

ELE3.2.3.030.8 CURRENT RATINGS OF 100A AND BELOW

For fuse combination units with current ratings of 100A and below, fuse bases and carriers shall be provided for housing the fuse links if the switching device are not making and breaking on both the incoming supply side and the outgoing load side.

ELE3.2.3.040.8 CURRENT CARRYING MATERIAL

The current carrying parts shall be made of hard drawn, high conductivity copper to BS EN 13601.

ELE3.2.3.050.8 ENCLOSURE

The enclosure shall be made of sheet steel of thickness not less than 1.6 mm for current ratings above 32A and not less than 1.2 mm for 32A and below, complete with stoved epoxy powder paint, or equal and Approved finish of a gloss light colour.

ELE3.2.3.060.8 FRONT COVER

The front cover of switching devices shall be hinged or of an equal and Approved construction, to enable easy access to the interior for replacement of fuse links. Gland plates shall be provided for top and bottom cable entry for switching devices of current ratings above 32A.

ELE3.2.3.070.8 DEGREE OF PROTECTION

1. Under normal service conditions, the enclosure shall be of totally enclosed type with a degree of protection against ingress of foreign solid bodies and liquids of at least IP41 as per IEC 60529 for the top surface and IP31 for the other surfaces of the enclosures. With the front-hinged door open and in replacing fuse links, the degree of protection to the live parts shall be at least IP2X. If the degree of protection to the neutral conductor of the live part cannot comply with this requirement, a warning label shall be provided next to the neutral conductor;
2. The switching devices shall be suitable for installation under environmental condition of pollution degree 3 unless otherwise specified.

ELE3.2.3.080.8 SPACE IN TERMINAL ENCLOSURE

1. Terminal connections shall be by means of screws so to ensure that the necessary contact pressure is maintained;
2. The terminal enclosure shall have sufficient space for accommodating cable lugs for the largest cables which the switching device is designed to receive, and also for proper cable termination with cable bending radius in accordance with the Electrical CoP otherwise proper extension cable terminals and/or cable boxes shall be provided. The palm width of the cable lugs shall comply with BS 91.

ELE3.2.3.090.8 FUSE COMBINATION UNITS

For switch-disconnector fuses or fuse-switch disconnectors, the fuse holders shall be capable of accepting any fuse links of physical dimension complying with the minimum and maximum limits of the respective fuse reference tabulated in the Specification for fuses (i.e. ELE3.13).

ELE3.2.3.100.8 EARTHING TERMINAL

An external accessible earthing terminal shall be provided at the side panel of the enclosure.

ELE3.2.4 OPERATION**ELE3.2.4.010.8 DESCRIPTION**

The switching devices shall be independent manual operated and shall have mechanical interlock to prevent access to the interior except when the switching devices are in the OFF position, and to prevent the contacts from being switched to close when the door is open.

ELE3.2.4.020.8 PERFORMANCE

The latter interlock shall be able to be defeated by trained personnel for maintenance when necessary.

ELE3.2.4.030.8 SECURITY

A facility shall be provided for padlocking the switching devices in the OFF position.

ELE3.3 CIRCUIT BREAKER - GENERAL

ELE3.3.010.8 SCOPE OF CIRCUIT BREAKER

This Sub-section covers the general requirements of ACBs, MCCBs, MCBs, and RCCBs. Additional requirements relevant to particular types of circuit-breakers shall be given in ELE3.4 to ELE3.6 both inclusive.

ELE3.3.020.8 NUMBER OF POLES

Circuit-breakers shall be of four-pole, three-pole, double-pole or single-pole, as specified and shall have air-break contacts.

ELE3.3.030.8 OPERATING MECHANISM

1. The operating mechanism of a circuit-breaker shall be trip-free;
2. When an MCCB or MCB or RCCB trips and opens its contacts, the operating toggle shall automatically resume the OFF or TRIPPED position.

ELE3.3.040.8 CASING

The casing of an MCCB, an MCB, an RCCB shall be formed from an insulating material. The construction shall be capable of withstanding the appropriate rated short circuit current and reasonably rough use without fracture or distortion.

ELE3.3.050.8 CURRENT RATING

The rated current of a circuit-breaker shall be taken as that rated continuous current when the circuit-breaker is installed in the enclosure together with other equipment, if any, under normal operating conditions as shown on the Drawings.

ELE3.4 MOULDED CASE CIRCUIT BREAKERS (MCCB)

ELE3.4.1 GENERAL

ELE3.4.1.010.8 STANDARD

Moulded Case Circuit Breakers (MCCB) shall comply with IEC 60947-2.

ELE3.4.1.020.8 CLASS AND RATING

	Class	Rating
a.	Rated operation voltage:	220/380V
b.	Rated insulation voltage:	415V
c.	Rated frequency:	50Hz
d.	Rated ultimate short-circuit breaking capacity:	40 kA unless otherwise specified
e.	Rated uninterrupted current:	As shown on the Drawings

ELE3.4.1.030.8 IN-SERVICE RECORDS

Prior to the time of material submission for Approval, the equipment shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.

ELE3.4.2 CONSTRUCTION AND DESIGN

ELE3.4.2.010.8 MCCB

1. MCCB shall be triple, double or single pole complete with overcurrent and/or earth leakage tripping device as shown on the Drawings, and suitable for direct mounting inside a metal enclosure or a cubicle switchboard. Both triple and single pole MCCB shall be provided with detachable, fully rated, front accessible neutral copper link mounted inside the enclosure;
2.
 - a. For surface mounted MCCB cable terminals shall be at the top and bottom with access from the front;
 - b. For MCCB housed in switchboard cubicles, the cable terminals shall be suitable for busbar connection;
 - c. Interphase barriers shall be provided when necessary to maintain safe electrical clearance.
3. MCCB shall be type-tested and comply with the additional requirements for circuit breakers suitable for isolation in accordance with Clause 7.1.2 of IEC 60947-2.

ELE3.4.2.020.8 ENCLOSURES FOR SURFACE-MOUNTED MCCB

- 1.

-
- a. The enclosure shall be of totally enclosed type with a degree of protection against ingress of foreign solid bodies and liquids of at least IP41 as per IEC 60529, for the top surface, and IP31 for the other surfaces of the enclosures;
 - b. The enclosure shall conform to the type-tested standard or as recommended by the manufacturer. The front cover of the enclosure shall be hinged or equal and approved. With the front-hinged cover opened, all live parts shall be protected to IP20. If the degree of protection to the neutral conductor of the live part cannot comply with this requirement, a warning label shall be provided next to the neutral conductor;
 - c. The enclosure shall have sufficient space for accommodating cable lugs for the largest cables which the MCCB is designed to receive;
 - d. The palm width of the cable lugs shall comply with BS 91;
 - e. There shall also be sufficient space for proper cable termination with cable bending radius in accordance with the Electrical CoP, otherwise proper extension cable terminals and/or cable box shall be provided.
2. An external accessible earthing terminal shall be provided at the side panel of the enclosure. The enclosure shall be formed from sheet steel 1.6 mm thick;
 3. All inside and outside surfaces of the enclosures shall be treated with either anti-rust protective coating followed by two stoved coats of gloss paint of contrasting colours, or an alternative acceptable finish such as phosphate treatment followed by epoxy powder paint. The finishing colour shall be approved by the Contract Manager.

ELE3.4.3 OPERATION

ELE3.4.3.010.8 OPERATING CHARACTERISTICS

1. MCCB shall have inverse time delay and instantaneous tripping time-current characteristic which cannot be inadvertently adjusted. The operating characteristic shall be such that:
 - a. The time delay on overload tripping shall be inversely proportional to the overcurrent up to a threshold value of approximately 7 times the rated current or as otherwise specified;
 - b. There shall be no intentional time-delay on overcurrent tripping due to short-circuit or heavy overcurrent exceeding the threshold value.
2. The operating characteristic shall be calibrated at 40°C. For earth leakage protection, the tripping current shall be as shown on the Drawings. The earth leakage relay and the zero-sequence current transformer, if any, shall comply with the relevant British Standard.

ELE3.4.3.020.A OPERATING MECHANISM AND INDICATIONS

1. The operating mechanism shall be independent manual and trip-free. Indication of OFF position shall occur only when the specified isolation distance on each pole has been attained. Reliable visual indication of ON and OFF position and trip indication shall be provided;

-
2. MCCBs shall be equipped with lockable function such that they can be locked off and only be able to be unlocked by the use of keys or tools used to lock off these devices. Additional proprietary assistive devices shall be provided where necessary to facilitate the lockable function using padlocks. In case of no supply of proprietary assistive devices from the MCCB manufacturer or in case of provision of assistive devices for existing MCCBs in existing buildings, alternative made may be proposed and shall be demonstrated by the Sub-contractor that the proposed devices are suitable for the MCCBs to facilitate the lockable function using padlocks.

ELE3.4.3.030.8**TYPE-TEST**

MCCB shall be type-tested to IEC 60947-2. Verification of short-circuit making and breaking capacity shall be carried out by a Short-Circuit Testing Organization.

ELE3.5 MINIATURE CIRCUIT BREAKERS (MCB)

ELE3.5.010.8 GENERAL

Miniature Circuit Breakers (MCBs) shall comply with IEC 60898-1 or BS EN 60898-1, suitable for 220/380V supply operation with rated current and number of poles as shown on the Drawings.

ELE3.5.020.8 CATEGORY OF DUTY

MCBs shall have a standard value of rated short-circuit capacity of not less than 4500A.

ELE3.5.030.8 TYPE

Unless otherwise specified or shown on the Drawings, MCBs shall have an instantaneous tripping operation of type B or type C in accordance with IEC 60898-1 or BS EN 60898-1.

ELE3.5.040.8 CABLE TERMINALS

Terminals suitable for terminating appropriate size of solid or stranded conductors shall be provided for the outgoing cables. The terminals shall be accessible from the front for easy cable termination.

ELE3.5.050.8 CONTACTS

Contacts shall be non-weld type.

ELE3.5.060.A TRIPPING MECHANISM, ISOLATION AND SWITCHING

1. Tripping elements shall be thermal magnetic type with instantaneous tripping characteristic under short-circuit conditions and inverse time delay tripping characteristic under overload conditions;
2. For domestic buildings, the double pole MCBs providing supply to domestic units before the power company's meters shall be capable of both isolating and switching the full load current of the respective circuits;
3. MCBs shall be equipped with lockable function such that they can be locked off and only be able to be unlocked by the use of keys or tools used to lock off these devices. Additional proprietary assistive devices shall be provided where necessary to facilitate the lockable function using padlocks. In case of no supply of proprietary assistive devices from the MCB manufacturer or in case of provision of assistive devices for existing MCBs in existing buildings, alternative made may be proposed and shall be demonstrated by the Sub-contractor that the proposed devices are suitable for the MCBs to facilitate the lockable function using padlocks.

ELE3.5.070.8 OPERATING MECHANISM

Operating mechanism shall be quick break, trip free type. Where the handle is used to indicate the position of the contacts, the handle, when released, shall automatically take up the position corresponding to that of the moving contacts; in this case, the handle shall have two distinct rest positions corresponding to the position of the contacts but, for automatic opening, a third distinct position of the handle may be provided.

ELE3.5.080.8**TYPE-TEST**

Full type-test certificates to Section 9 of BS EN 60898-1 or Section 9 of IEC 60898-1 shall be produced to the satisfaction of the Contract Manager. In addition, type-test to test sequences C, D and E of IEC 60898-1 or BS EN 60898-1 shall be carried out by a Short Circuit Testing Organization.

ELE3.6 RESIDUAL CURRENT OPERATED CIRCUIT BREAKERS (RCCB)

ELE3.6.010.8 PERFORMANCE

1. Residual current operated circuit breakers (RCCBs) shall comply with IEC 61008-1, and shall be suitable for 220/380V supply operation with rated current and number of poles as indicated on the Drawings. The rated residual operating current of RCCBs shall be 30 mA unless otherwise specified. RCCBs shall not require any auxiliary source for operation. However, 2-pole RCCB requiring an integral auxiliary source for operation will still be acceptable provided that in the event of failure of integral auxiliary source through the loss of neutral, it shall either still function as a RCCB or open automatically without delay;
2. The RCCBs shall be:
 - a. Type A for circuits serving electric vehicles charging facilities;
 - b. General type (Type AC) for other circuits.

ELE3.6.020.8 TYPE-TEST CERTIFICATES

Full type-test certificates to Section 9 of IEC 61008-1 shall be produced to the satisfaction of the Contract Manager.

ELE3.6.030.8 CIRCUIT FAULT CURRENT TEST

1. The short circuit tests as specified in Clause 9.11 of IEC 61008-1 shall be carried out by a Short-circuit Testing Organisation;
2. For RCCBs which form part of consumer units or miniature circuit breaker distribution boards which have been satisfactorily tested in accordance with ELE3.12.4 or ELE3.11.5 respectively, the short circuit tests as specified in Clause 9.11 of IEC 61008-1 will not be required.

ELE3.6.040.8 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall produce documentary evidences as **PRE.BS1.205** to verify the country / place of manufacture and authenticity of RCCBs delivered to Site or installed.

ELE3.8 DOUBLE POLE SWITCH-DISCONNECTORS

ELE3.8.010.8 PERFORMANCE

1. Double Pole Switch-disconnectors shall comply with IEC 60947-3, suitable for 220V supply operation with rated current as indicated on the Drawings;
2. They shall have Utilization Category AC22A and shall be provided with facility for padlocking the switch disconnectors in the isolated position;
3. Incoming terminal shall be protected against direct contact to IP2X.

ELE3.8.020.8 TYPE-TEST REPORTS

Full type-test report to Clause 8.1.2 of IEC 60947-3 shall be produced to the satisfaction of the Contract Manager.

ELE3.9 DISTRIBUTION BOARDS - GENERAL

ELE3.9.010.8 SCOPE OF DISTRIBUTION BOARDS

This sub-section covers the general requirements of MCCB distribution boards. Additional requirements relevant to a particular type of MCCB distribution board shall be given in ELE3.10.

ELE3.9.020.8 CONSTRUCTION OF ENCLOSURE

1. The enclosure of a distribution board shall be constructed from sheet steel, rust proofed and baked enamelled or stove epoxy powder painted;
2. The construction shall be of robust design, capable of withstanding the mechanical, electrical and thermal stresses under all working conditions, including fault conditions.

ELE3.9.030.8 ARRANGEMENT OF COMPONENT PARTS

1. Distribution boards shall include all necessary components and accessories to form a complete assembly;
2. Components and accessories shall be firmly fixed in position in the distribution board, and shall be assembled in such a way that it shall be possible to remove or replace any component parts and to carry out cable connections from the front;
3. Ample space shall be allowed for cabling;
4. MCCBs shall be arranged neatly in a row or rows;
5. All components shall be totally concealed: only the toggles of the MCCBs shall protrude through the cover plate of the distribution board.

ELE3.9.040.8 BUSBARS

All busbars shall be of hard drawn copper having ratings as specified and shall be electro-tinned. Neutral busbars shall be of the same CSA as the phase busbars, and shall have adequate number of terminals for all outgoing circuits including spare ways.

ELE3.9.050.8 EARTHING TERMINALS

1. Every distribution board shall be provided with an external earthing terminal for connection to the main earthing terminal. In addition, a multi-terminal connector shall be provided within the distribution board for connection of protective conductors of all outgoing circuits including spare ways;
2. Both the external earthing terminal and the multi-terminal connector for protective conductor shall be of hard drawn electro-tinned copper and shall be labelled in accordance with the requirements of IEC 60439-1.

ELE3.9.060.8 PROVISION OF SPARE WAYS

Each distribution board shall be provided with spare ways for future expansion. For new installations, the number of spare ways shall not be less than 20% of the total number of outgoing ways in the distribution board. Each spare way shall be blanked off with a suitable blanking plate having a finish comparable to that of the distribution board.

ELE3.9.070.8**SHROUDING OF LIVE PARTS**

1. All conductive parts shall be properly shrouded against accidental contact by means of rigid barriers, partitions of insulating materials such that accidental contact can be prevented during operation of component replacement or cable connection;
2. All conductive structural parts of the distribution boards shall comply with the protective circuit requirements of IEC 60439-1.

ELE3.10 MOULDED CASE CIRCUIT BREAKER (MCCB) DISTRIBUTION BOARDS

ELE3.10.010.8 GENERAL

1. The enclosure of an MCCB distribution board shall be constructed from sheet steel having a thickness of not less than 1.5 mm, and shall be designed for general commercial and light industrial applications;
2. The design, construction and testing specifications of the distribution boards shall comply with IEC 61439-1 and IEC 61439-2, or IEC 60439-1.

ELE3.10.020.8 TYPE OF MCCB DISTRIBUTION BOARD

1. MCCB distribution boards shall be of two types, viz. Type A and Type B. Type A MCCB distribution board shall be suitable for accommodating, in any combination, the double-pole and triple-pole MCCBs of 100A frame size. Type B MCCB distribution boards shall be suitable for accommodating triple-pole MCCBs of 225A framesize;
2. All MCCB distribution boards shall each be provided with a moulded-case isolating switch having a current rating not less than that of the supply side protective device. The moulded-case isolating switch shall meet the relevant requirements of ELE3.1 and ELE3.2.

ELE3.10.030.8 BUSBARS

1. MCCB distribution boards shall be provided with vertical triple-pole and neutral copper busbars of rating not less than that of the supply side protective device subject to a minimum of 250A;
2. The configuration of the busbars, busbar supports and busbar mounting arrangement shall be type-tested to a short-time withstanding current of not less than 14 kA in the case of type A boards or 22 kA in the case of type B boards for 0.2 seconds at a voltage of not less than 380V;
3. Outgoing MCCBs shall be mounted horizontally on both sides of the vertical busbars. The connection between the MCCBs and the phase busbars shall be by means of copper tapes and bolted joints. Plug-in type of current carrying contacts shall not be accepted.

ELE3.10.040.N ASSISTIVE DEVICE FOR LOCKING OF MCCB UNIT USING PADLOCK

1. For the MCCB distribution board fitted with MCCBs that cannot be locked by directly application of padlocks, two (2) assistive devices shall be provided for each MCCB distribution board irrespective of the number of outgoing ways to facilitate the locking of MCCBs using padlocks for isolation purpose during maintenance;
2. The assistive devices for all MCCB distribution boards installed within the electrical meter room shall be collectively housed inside a cabinet suitably wall mounted at a location within the electrical meter room;
3. The cabinet shall be made of sheet steel with finishing in baked enamelled or stove epoxy powder painted. The cabinet shall be suitably sized, fitted with front-hinged door and equipped inside with suitable hooks of sufficient numbers for hanging of all assistive devices.

ELE3.11 MINIATURE CIRCUIT BREAKER (MCB) DISTRIBUTION BOARDS

ELE3.11.1 GENERAL

ELE3.11.1.010.8 TYPE

Miniature Circuit Breaker Distribution Boards (MCB boards) shall be of surface mounted and enclosed type, and shall comply with IEC 60439-3 or BS EN 60439-3.

ELE3.11.1.020.8 GUARANTEE OF TYPE TEST EQUIVALENCE

In cases where miniature circuit breaker distribution boards are manufactured under licence from a Principal Company, letters of guarantee for products manufactured by the licensee from the Principal Company shall be produced to prove that such products are equivalent, in every respect, to the type-tested products.

ELE3.11.1.030.8 IN-SERVICE RECORDS

Prior to the time of material submission for Approval, the equipment including its major components shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.

ELE3.11.2 PERFORMANCE

ELE3.11.2.010.8 CLASS AND RATING

Class	Rating
1. Rated operational voltage:	220/380V (min)
2. Rated frequency:	50Hz
3. Rated insulated voltage:	415V (min)
4. Rated current:	a. MCB boards without integral incoming switch-disconnector: 200A; b. MCB boards with integral incoming switch-disconnector: not less than the current rating of the integral incoming switch-disconnector, subject to a minimum of 100A.
5. Rated conditional short-circuit current:	24 kA when backed up by 160A fuse as specified in ELE3.13.010 .

ELE3.11.3 ENCLOSURE

ELE3.11.3.010.8 CONSTRUCTION

MCB boards shall be fabricated from sheet steel with a thickness of not less than 1.2 mm. They shall be robustly constructed and rustproof.

ELE3.11.3.020.8 FINISH

All inside and outside surfaces of the enclosure shall be treated with either anti-rust protective coating followed by two stoved coats of gloss paint of contrasting colours or an alternative acceptable finish such as phosphate treatment followed by stove epoxy powder paint. The finishing coat shall be approved by the Contract Manager.

ELE3.11.3.030.8 KNOCKOUTS

Knockouts of appropriate size shall be provided on the top and bottom of the enclosure.

ELE3.11.3.040.8 FASTENING DEVICE

The fastening device (e.g. screws) for fixing the cover to the enclosure shall be captive and shall not cause damage to the enclosure during fastening and loosening.

ELE3.11.3.050.A DEGREE OF PROTECTION

1. The degree of protection for the enclosure with all functional units and blanking plates fitted shall be at least IP41 and IP 31 for the top surface and other surfaces respectively;
2. If any cover or blanking plate can be removed without a tool, the degree of protection against direct contact with live parts shall be at least IP 2X with the cover or blanking plate removed;
3. Insulated tooth covers should be provided and inserted to cover the exposed live parts protruding from the main busbar reserved for future connection of MCB units;
4. With the front cover removed or in replacing the MCB unit, any live parts which cannot be isolated by the MCB board's integral incoming switch-disconnector shall be provided with barrier or other means affording a degree of protection at least IP 2X. If the degree of protection to the neutral conductor of the live part cannot comply with this requirement, a warning label bearing "DANGER - 危險" in red legible letters and characters each not less than 10 mm high shall be provided next to the neutral conductor. And, if the MCB board is not provided with an integral incoming switch disconnector, a warning notice shall be placed in such a position that any person gaining access to live parts will be warned of the need to use the appropriate isolating device.

ELE3.11.3.060.8 DANGER LABEL

A label bearing "DANGER - 危險" in red legible letters and characters each not less than 10 mm high shall also be provided on the cover.

ELE3.11.4 COMPONENTS AND ARRANGEMENT**ELE3.11.4.010.8 SPECIFICATION**

The functional units such as MCBs, RCCBs, switch-disconnectors etc. shall comply with the relevant BS EN/BS/IEC and the relevant sections in this Specification.

ELE3.11.4.020.8 MOUNTING ARRANGEMENT

All the MCBs, RCCB (if provided) and switch-disconnectors (if provided) shall be mounted in a straight line manner and fixed firmly in position. The toggles of all devices shall be projected through the front panel of the MCB board. The on and off identifications for all these devices shall be clearly visible such that the close or open state of the devices shall be easily distinguished when they are mounted in the normal service position.

ELE3.11.4.030.8 MAIN BUSBARS

The main busbars shall be copper to BS EN 13601 and be completely tinned. Fixing of busbars shall not rely on any functional unit.

ELE3.11.4.040.8 NEUTRAL TERMINAL BLOCK

The neutral terminal block, where specified, shall allow the connection of copper conductors having current carrying capacity of the phase conductor. The number of outgoing terminals in the neutral blocks shall not be less than the maximum number of outgoing circuits.

ELE3.11.4.050.8 EARTHING TERMINAL BLOCK

The earthing terminal block shall be provided with sufficient terminals for the incoming and maximum number of outgoing circuits.

ELE3.11.4.060.8 SPACING

Sufficient space shall be provided for wiring and termination after all the functional units are fixed in position.

ELE3.11.4.070.8 MOUNTING

The functional units, terminal blocks, busbars, incoming switch-disconnector, etc. shall be mounted as skeleton units or on a backplate. The skeleton units shall not be disintegrated for the removal or replacement of any functional unit.

ELE3.11.4.080.8 REMOVAL

Removal of any skeleton unit or the backplate, replacement of MCB, or termination of cable shall not disturb or loosen the other components or wiring.

ELE3.11.4.090.8 STEEL SCREWS

All steel screws shall be zinc plated or chromate coated. Self tapping screws are not acceptable.

ELE3.11.4.100.8 IDENTIFICATION

1. For MCB board designed to incorporate both multi-pole and single pole MCBs, phase and neutral colour identification shall be provided adjacent to each MCB outgoing way and neutral connection;
2. Ferrules shall be provided for wires, including earthing, phase and neutral conductor, throughout the distribution board internally for circuit identification.

ELE3.11.4.110.8 CIRCUITRY

The circuitry of the MCB board shall be as shown on the Drawings.

ELE3.11.4.120.N ASSISTIVE DEVICE FOR LOCKING OF MCB UNIT USING PADLOCK

1. Two (2) assistive devices shall be provided for each MCB board irrespective of the number of outgoing ways to facilitate the locking of MCBs using padlocks for isolation purpose during maintenance;
2. The assistive devices for all MCB boards installed within the electrical meter room shall be collectively housed inside a cabinet suitably wall mounted at a location within the electrical meter room;
3. The cabinet shall be made of sheet steel with finishing in baked enamelled or stove epoxy powder painted. The cabinet shall be suitably sized, fitted with front-hinged door and equipped inside with suitable hooks of sufficient numbers for hanging of all assistive devices.

ELE3.11.5 TYPE-TEST**ELE3.11.5.010.8 STANDARD**

MCB boards shall be type-tested to Clause 8 of BS EN 60439-3 or IEC 60439-3. Partially type-tested assemblies (PTTA) will only be accepted provided that the non-type-tested arrangements are derived from and have been verified to comply with the standard of the type-tested ones and/or been tested to the satisfaction of the Contract Manager. PTTA shall be verified and substantiated by test certificates/reports and/or graphs, calculations, etc. together with the details of the type-tested arrangement from which the PTTA is derived.

ELE3.11.5.020.8 VERIFICATION

The short-circuit strength of the MCB board shall be type-tested and verified by a Short Circuit Testing Organization with the conditional short-circuit current specified in ELE3.11.2.

ELE3.11.5.030.8 SHORT-CIRCUIT

The short-circuit shall be made as follows:

1. For MCB boards designed to incorporate single pole MCBs only: across the phase and neutral;
2. For MCB boards designed to incorporate DP MCBs: across each phase and neutral. If the busbars in all phases are equally constructed and subject to the Approval of the Contract Manager, partially type tested assembly (PTTA) will be acceptable;
3. For MCB boards designed to incorporate TP and/or SP MCBs: across the three phases. Where a neutral bar exists, it shall be subjected to one test to prove its short-circuit withstand strength in relation to the nearest phase bar for the conditional short-circuit current specified in ELE3.11.2;
4. The bolted short-circuit connection shall be provided immediately at the terminals of the outgoing functional unit. The prospective short-circuit current shall pass through the integral incoming switch-disconnector (if provided), the main busbars, the neutral busbar (if provided), RCCB (if provided) and SP, DP or TP MCBs, as appropriate, located at the farthest position from the incoming supply point.

ELE3.12 CONSUMER UNITS

ELE3.12.1 GENERAL

ELE3.12.1.010.8 STANDARD

Consumer units shall comply with IEC 60439-3 or BS EN 60439-3 and shall be tropicalised for use in Hong Kong.

ELE3.12.1.020.8 GUARANTEE OF TYPE-TEST EQUIVALENCE

In case where consumer units are manufactured under licence from a Principal Company, a letter of guarantee for products manufactured by the licensee from the Principal Company shall be produced to prove that such products are equivalent, in every respect, to the type-tested standard products.

ELE3.12.1.030.8 IN-SERVICE RECORDS

Prior to the time of material submission for Approval, the equipment including its major components shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.

ELE3.12.2 ENCLOSURE

ELE3.12.2.010.8 CONSTRUCTION

Consumer units shall be fabricated from sheet steel with a thickness of not less than 1.2 mm for the enclosures, cover plates and hinged covers. They shall be robustly constructed and rustproof. The hinged covers shall be capable of covering up all functional units including labels fitted on the consumer units. The hinged covers together with hinges shall be so designed and fixed to the enclosures to enable their easy removal when and where required without causing any damage to the finish or impairing the integrity and the specified IP of the cover plates and enclosures.

ELE3.12.2.020.8 FINISH

1. All inside and outside surfaces of the enclosure, cover plate and hinged cover shall be treated with, either anti-rust protective coating followed by two stoved coats of gloss paint of contrasting colours, or an alternative acceptable finish such as phosphate treatment, followed by two stoved coats of gloss paint of contrasting colours, or an alternative acceptable finish such as phosphate treatment followed by stoved epoxy powder paint;
2. The finishing colour shall be the manufacturer's standard colour or a standard alternative light gray colour RAL 9002 according to the Classic RAL System, subject to the approval of the Contract Manager.

ELE3.12.2.030.8 KNOCKOUTS

Knockouts of appropriate size on the top and rear of the enclosure shall be provided.

ELE3.12.2.040.8 FASTENING DEVICE

The fastening device (e.g. screws) for fixing the cover plate/cover to the enclosure shall not cause damage to the enclosure during fastening and loosening. Hinges and screwed connections shall be properly designed and fixed to ensure permanent good conductivity between the enclosure, cover plates and hinged covers.

ELE3.12.2.050.A DEGREE OF PROTECTION

1. The degree of protection for the enclosure shall be at least IP 41 with all the functional units and blanking plates fitted;
2. If any cover or blanking plate can be removed without a tool, the degree of protection against direct contact with live parts shall be at least IP 2X with the cover or blanking plate removed;
3. Insulated tooth covers should be provided and inserted to cover the exposed live parts protruding from the main busbar reserved for future connection of MCB units.

ELE3.12.3 COMPONENTS AND ARRANGEMENT**ELE3.12.3.010.8 COMPONENTS**

Each consumer unit shall comprise, but not be limited to, the following items:

1. Tinned main copper busbars to BS EN 13601;
2. A double pole switch-disconnector;
3. A residual current operated circuit breaker (RCCB);
4. An assembly of miniature circuit breakers (MCBs);
5. Multi-terminal bar(s) for neutral conductors with one hole and screw of suitable size for each way; the bar(s) shall be properly supported to and insulated from the backplate or enclosure;
6. A multi-terminal bar for circuit protective conductors with one hole and screw of suitable size for each way, earthing lead and two bonding conductors;
7. Rigidly fixed but removable metal backplate or mounting rail assembly;
8. Plastic labels for incoming and outgoing circuits and RCCB on the cover;
9. Rigid blanking plates; and
10. Interconnecting tinned copper bars of appropriate rating to BS EN 13601 or copper cables of appropriate rating to BS EN 50525-2-31.

ELE3.12.3.020.8 CIRCUITRY

The circuitry of the consumer unit shall be as shown on the Drawings.

ELE3.12.3.030.8 SPECIFICATION

The functional units such as MCBs, RCCB, switch-disconnector, etc. shall comply with the relevant BS/BS EN/IEC and the relevant sections in this Specification.

ELE3.12.3.040.8 MOUNTING ARRANGEMENTS

All the MCBs, RCCB and switch-disconnector shall be mounted in a straight line manner and fixed firmly in position so as not to allow any lateral movement. Except for rotary type, the toggles of all devices shall be operated in the same direction and projected through the front panel of the unit. The on and off identifications for all these devices shall be clearly visible such that the close or open state of the devices shall be easily distinguished when they are mounted in the normal service position.

ELE3.12.3.050.8 SPACING

Sufficient space shall be provided for wiring and termination after all the circuit breakers are mounted in position.

ELE3.12.3.060.8 MOUNTING

All the MCBs, RCCB, switch-disconnector, main busbars and the interconnecting copper bars or cables shall form an integral assembly on the metal backplate or mounting rail in such a way that it can be easily removed from the enclosure without disintegration.

ELE3.12.3.070.8 MULTI-TERMINAL BARS

The multi-terminal bars for neutral and circuit protective conductors shall be fixed securely and held captive so that they cannot be rotated. These bars shall be of copper to BS EN 13601.

ELE3.12.3.080.8 STEEL SCREWS

All steel screws within the unit shall be zinc plated or chromate coated.

ELE3.12.3.090.N ASSISTIVE DEVICE FOR LOCKING OF MCB UNIT USING PADLOCK

1. For Public Rental Housing (PRH) development:
 - a. A total of fifty (50) assistive devices shall be provided for each domestic block of any size to facilitate the locking of MCBs using padlocks for isolation purpose during maintenance;
 - b. Twenty (20) assistive devices shall be collectively housed inside a cabinet suitably wall mounted at a location near guard counter of each domestic block. The cabinet shall be made of sheet steel with finishing in baked enamelled or stove epoxy powder painted or fabricated in other material as specified by the CM. The cabinet shall be suitably sized, fitted with front-hinged door with lock using key for access and equipped inside with suitable hooks of sufficient numbers for hanging of all assistive devices;
 - c. The rest thirty (30) assistive devices shall be collectively housed inside a cabinet suitably wall mounted at a location within the main switch room. The cabinet shall be made of sheet steel with finishing in baked enamelled or stove epoxy powder painted. The cabinet shall be suitably sized, fitted with front-hinged door and equipped inside with suitable hooks of sufficient numbers for hanging of all assistive devices; and
 - d. A label of durable material shall be provided with prominent red wordings on white ground with a size of not less than 100 x 50 mm inscribed in English and Chinese characters as follows:

**REW MAY BORROW ASSISTIVE DEVICE(S)
FOR LOCKING OFF MCB UNITS FROM
GUARD COUNTER**

電業工程人員可於大堂櫃位借取微型斷路器的
上鎖輔助器

Lettering shall be at least 5 mm high. The notice shall be securely affixed by adhesive means inside the cover of consumer unit.

2. For Subsidised Sale Flats (SSF) development:
 - a. Two (2) assistive devices shall be provided for each consumer unit irrespective of the number of outgoing ways to facilitate the locking of MCBs using padlocks for isolation purpose during maintenance; and
 - b. The assistive devices for all consumer units shall be handed over to the CM at contract completion.

ELE3.12.4 TYPE-TEST

ELE3.12.4.010.8 STANDARD

Consumer units shall be type-tested to Clause 8 of BS EN 60439-3 or IEC 60439-3. Partially type-tested assemblies (PTTA) will only be accepted provided that the non-type-tested arrangements are derived from and have been verified to comply with the standard of the type-tested ones and/or been tested to the satisfaction of the Contract Manager. PTTA shall be verified and substantiated by test certificates/reports and/or graphs, calculations, etc. together with the details of the type-tested arrangement from which the PTTA is derived.

ELE3.12.4.020.8 VERIFICATION

The short-circuit strength of the consumer unit shall be type-tested and verified by a Short Circuit Testing Organization in accordance with Annex ZA to BS EN 60439-3 or IEC 60439-3 at 16 kA minimum.

ELE3.13 FUSES

ELE3.13.010.8 GENERAL

1. Fuses shall comply with IEC 60269-1, IEC 60269-2 and BS 88:Section 2.2 or BS 88-2;
2. Fuses of compact dimensions to BS 88:Part 6 or BS 88-2 are only acceptable for metering circuits and/or control circuits provided that the rated breaking capacity of the fuse shall exceed the prospective short-circuit current at the point where the fuse is installed;
3. All fuses shall be of a.c. rating and their current ratings shall be as shown on the Drawings;
4. Fuse links shall be certified to use and shall bear the marking of "ASTA 20 CERT" or a similar and Approved Equivalent Quality Surveillance Scheme;
5. Unless otherwise specified, fuse links shall be of current limiting type with full-range breaking capacity for general application (i.e. Utilization Category "gG"). Fuse links shall have conventional fusing current not more than 1.45 times the rated current under the intended service conditions;
6. Fuse links other than those to be used in fuse combination units shall be provided with fuse holders. The maximum power dissipation of the fuse link shall not exceed the maximum rated power acceptance of the fuse holder under the intended service conditions;
7. When fuse holders are specified, the degree of protection against electric shock for the complete fuse shall be IP3X under normal service conditions. When replacing the fuse link or removing the fuse carrier, the degree of protection against electric shock shall be at least IP2X;
8. Type-test certificates and reports, time/current characteristics, cut-off characteristics, pre-arcing and operating $I^2 t$ characteristics and Letter of Authorisation to use "ASTA 20 CERT" endorsement or similar documents shall be submitted for reference and examination if required.

ELE3.13.020.8 FUSES TO BS 88:SECTION 2.2

1. Fuses shall comply with IEC 60269-1, IEC 60269-2 and BS 88:Section 2.2 or BS 88-2;
2. When the fuse link is to be used in a fuse combination unit, its rated power dissipating shall not exceed that of the fuse link used in carrying out the temperature-rise type test of the unit;
3. The physical dimensions of the fuse links shall be as shown in the following table:

Current rating of fuse link (I)	Dimension as fuse reference of BS 88:Section 2.2 or BS 88-2
$32 \geq I$	A2
$32 < I \leq 63$	A3
$63 < I \leq 100$	A4 or B1
$100 < I \leq 200$	B2
$200 < I \leq 315$	B3
$315 < I \leq 400$	B4 or C1

$400 < I \leq 630$	C2
$630 < I \leq 800$	C3

For fuse links rated at or below 100A mounted in cubicle switchboard, the physical dimensions of the fuse links as shown in Fig. 1 of BS 88:Section 2.2 or Figure 501 of BS 88-2 are also acceptable;

4. Fuses shall be type-tested to IEC, 60269-1, IEC 60269-2 and BS 88:Section 2.2 or BS 88-2. Type-test of 'Verification of Breaking Capacity' shall be carried out by a Short-Circuit Testing Organisation.

ELE3.13.030.8**FUSES TO BS 88:PART 6**

1. Fuses of compact dimensions shall comply with IEC 60269-1 and BS 88:Part 6 or BS 88-2;
2. Fuses shall be type-tested to IEC 60269-1 and BS 88:Part 6 or BS 88-2. Type test of 'Verification of Breaking Capacity' shall be carried out by a Short-Circuit Testing Organisation.

ELE3.15 CONTACTORS

ELE3.15.1 GENERAL APPLICATION

ELE3.15.1.010.8 STANDARD

Contactors shall comply with IEC 60947-4-1.

ELE3.15.1.020.8 RATINGS

1.	Rated operational voltage:	380/220V
2.	Rated insulation voltage:	415V
3.	Rated frequency:	50Hz
4.	Pollution degree:	3
5.	Conventional enclosed thermal current:	As shown on the drawings
6.	Rated operational current/power and duty:	As shown on the drawings

ELE3.15.1.030.8 CONSTRUCTION AND DESIGN

1. Contactors shall be four-pole, triple-pole, double-pole or single-pole as shown on the Drawings;
2. The mechanical endurance of the contactors shall not be less than 3 million no-load operating cycles;
3. Unless otherwise specified, the number of on-load operating cycles for category AC-3 shall not be less than 1/20 of the number of no-load operating cycles corresponding to the mechanical endurance of the contactor;
4. Contactors shall be silver or silver-faced;
5. Insulation shall be of class B of IEC 60085.

ELE3.15.1.040.8 OPERATION

Contactors shall be electro-magnetically controlled, double air-break type. The rated control circuit voltage shall be the same as that of the main circuit; otherwise it shall be 24V, 30V or 110V d.c. as specified.

ELE3.15.1.050.8 UTILISATION CATEGORY

1. Unless otherwise specified, contactors shall be of utilisation category AC-2 for general application;
2. For special applications described in clause ELE3.15.2, the utilisation categories of the contactors used shall comply with the correspondent requirements accordingly. Contactors with utilisation category other than the stipulated categories are acceptable provided that the test currents, voltages, power factors or time constants, number of operating cycles, the on and off times given in the Tables 7 and 8 of IEC 60947-4-1 and the test circuit for the assigned utilisation categories are not more severe than those of the contactor has been tested and the temperature rise has been verified at a current not less than the highest assigned rated operational current in continuous duty.

ELE3.15.1.060.8 TYPE TESTS

Contactors shall be type-tested to IEC 60947-1 and IEC 60947-4-1. Full type-test certificates shall be produced to the satisfaction of the Contract Manager.

ELE3.15.2 SPECIAL APPLICATIONS**ELE3.15.2.010.8 CHANGEOVER CONTACTORS FOR CUBICLE TYPE SWITCHBOARD**

1. Two identical contactors, mechanically and electrically interlocked such that only one of them can be closed at any one time, shall be used;
2. Each changeover contactor shall be enclosed in a separate and segregated compartment with a hinged front door as specified in **ELE4.2.050**. The contactor shall be provided with phase barriers and arcing chutes where applicable. At least one "a" contact and one "b" contact shall be provided for each contactor;
3. Contactors shall be rated for AC-3 utilisation category and intermittent duty of Class 30. When the main contacts of a contactor remain closed at either the main supply side or the essential supply side, the contactor shall be suitably rated for the specified current for uninterrupted duty;
4. Prior to the time of material submission for approval, the equipment shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.

ELE3.15.2.020.8 CONTROL CONTACTORS FOR POWER FACTOR CORRECTION EQUIPMENT

1. The contacts shall be of quick break and have a high arc resistance during switching operation;
2. Contactors shall be of utilisation category AC-6b and specifically designed for switching direct connected capacitor banks with intermittent duty of Class 30.

ELE3.15.2.030.8 CONTACTORS FOR MOTOR STARTER

1. Contactors for star/delta starting or reversing contactors shall be fitted with the necessary mechanical and electrical interlocks;
2. Contactors shall be of utilisation category AC-3 for general motor circuits and AC-4 for motor circuits with plugging or inching facilities. Contactors for motor starters of AC-3 utilisation category shall be of uninterrupted duty and intermittent duty Class 12, 60% on-load factor; and contactors for AC-4 category shall be of intermittent duty Class 30, 60% on-load factor.

ELE3.15.2.040.8 CONTROL CONTACTORS FOR DISCHARGE LAMPS

Contactors shall be of utilisation category AC-5a for electric discharge lamps. Also it shall be specifically designed for switching operations of the lamps with intermittent duty of Class 30.

ELE3.15.2.050.8 CONTROL CONTACTORS FOR HERMETIC REFRIGERANT COMPRESSOR MOTORS

Contactors shall be of utilisation category AC-8a for hermetic refrigerant compressor motors with manual reset of overload releases and AC-8b for the one with automatic reset of overload releases. Also it shall be specifically designed for switching operations of these items with intermittent duty of Class 30.

ELE3.16 STARTERS

ELE3.16.010.8 GENERAL

Starters shall be air-break triple pole electromagnetic contractor type and shall comply with and be tested to IEC 60947-4-1 or EN 60947-4-1. Unless otherwise specified, each starter shall comprise an isolating device, a thermal overload protective device, main and auxiliary contacts, on/off controls and indications.

ELE3.16.020.8 UTILISATION CATEGORY

Starters shall be of utilisation categories AC-3 for general motor circuits and AC-4 for motor circuits with plugging or inching facilities. Motor starters for AC-3 utilisation category shall be of both uninterrupted duty and intermittent duty Class 0.1 60% on-load factor. Starters of category AC-4 shall be of intermittent duty Class 0.3 60% on-load factor.

ELE3.16.030.8 MECHANICAL AND ELECTRICAL ENDURANCE

1. The mechanical and electrical endurance of the starters shall be tested in accordance with IEC 60947-4-1 or EN 60947-4-1;
2. The mechanical endurance of the starters shall not be less than 0.1 million no-load operating cycles for category AC-3 starters and 0.3 million no-load operating cycles for AC-4 starters;
3. The number of on-load operating cycles for category AC-3 starters shall not be less than 1/20 of the number of no-load operating cycles corresponding to the mechanical endurance of the starters.

ELE3.16.040.8 THERMAL OVERLOAD RELAY

Thermal overload relay shall be Type B compensated for ambient temperature of 40°C and have a setting range of 50% - 150% rated operational current.

ELE3.16.050.8 AUXILIARIES

For assisted start starters, timers shall be solid state plug-in type with 0 - 15 seconds setting. For star/delta and reversing starters, mechanical and electrical interlocks shall be fitted with the contactors.

ELE3.17 TIME SWITCHES

ELE3.17.010.8 OPERATION

Time switches shall be self-starting and driven by synchronous motor or an electronic operated clock.

ELE3.17.020.8 MOUNTING/HOUSING

Time switches shall be suitable for either flush, surface or panel mounting as specified in ELE2 and shall be housed in metal or robust moulded plastic enclosure with a removable clear plastic front cover.

ELE3.17.030.8 RATING

The time switches shall be rated at 15A (Resistive load) unless otherwise specified. The time accuracy shall be within ± 1 second per day.

ELE3.17.040.8 FEATURES

1. An automatic rewind spring reserve or lithium/NiMH battery backup, of not less than 72 hours, to drive the mechanism during power interruption;
2. A 24-hour dial with at least 2 "ON-OFF" operation cycles everyday;
3. An on/off or test switch to enable the circuit to be controlled at will without affecting the normal dial operation;
4. A minimum time setting period of 15 minutes shall be achievable.

ELE3.18 MEASURING INSTRUMENTS

ELE3.18.010.A KILOWATT-HOUR METERS

1. Kilowatt-hour meters shall be of a digital display type suitable for small rating circuits and have rated current not less than the rating of the circuit protection MCBs at the upstream of the corresponding circuits, single-phase or three-phase, as shown on the Drawings;
2. The meters shall comply with IEC 62053-21 or BS EN 62053-21, with IP51 in protective enclosure for indoor meters;
3. The meters shall be of direct connection type or connection with external measuring current transformers (MCTs) as appropriate to suit the rating of measured circuits;
4. The meters shall be mounted on a DIN rail and housed inside a metal enclosure with the display exposed to view on the front cover;
5. The display of the meter shall show the accumulative reading in kilowatt-hour and have minimum 4 digits. The reading shall be maintained even under power interruption and be continued upon power resumption;
6. The accuracy of the meters shall not be less than Class 1 according to IEC 62053-21 or BS EN 62053-21. The manufacturer shall issue a calibration certificate for every batch of meters at time of production and the calibration certificate shall be submitted to the Contract Manager. Such calibration shall be conducted by the manufacturer within one year prior to delivery of the meter on site. The manufacturer shall also declare in writing that the meter shall require no re-calibration for a minimum of 10 years from the time of issue of calibration certificate. A label marking the manufacturer's calibration date shall be fixed adjacent to the meter;
7. The meters shall comply with the Electromagnetic Compatibility (EMC) requirements in accordance with IEC 61000-4-2, IEC 61000-4-3, IEC 61000-4-4 and IEC 61000-4-5 standards.

ELE3.18.020.8 AMMETERS AND VOLTMETERS

1.
 - a. Ammeters and voltmeters shall be of moving iron type or moving magnet type or moving coil with transducer type, complying with IEC 60051-1 and IEC 60051-2;
 - b. The accuracy class shall be "2.5" or better in accordance with IEC 60051-1 and IEC 60051-2;
 - c. The dial shall have a nominal diameter of approximate 75 mm and shall have a minimum scale deflection of 90°.
2.
 - a. An ammeter for any circuit of rating up to 60A may be connected directly in series with the circuit, so that the full circuit current passes through the instrument;
 - b. For a circuit of rating exceeding 60A, the ammeter shall be fed through the secondary winding of a current transformer, and shall give a scale deflection with a secondary current of 5A.

ELE3.18.030.A CURRENT TRANSFORMERS

Current transformers for use with measuring instruments shall comply with IEC 61869-2 or BS EN 61869-2 having rated secondary current of 5A and rated output suitably matched with the burden of the measuring instrument.

ELE3.18.040.8 SELECTOR SWITCH FOR AMMETER

1. Where a single ammeter is used to measure the current in each phase, or the neutral of a three phase circuit, the ammeter shall be connected to a selector switch which shall enable the ammeter to be inserted in series with each phase and the neutral in turn;
2. When the ammeter is connected to the secondary windings of the measuring current transformers, the selector switch shall have facilities to prevent the current transformers from being open circuited during change-over and at OFF position.

ELE3.18.050.8 SELECTOR SWITCH FOR VOLTMETERS

1. In three phase circuits, in which a single voltmeter is used to measure the voltage, the voltmeter shall be provided with a selector switch to enable the following voltages to be measured:
 - a. Voltage between each phase to neutral;
 - b. Voltage between any two phases.
2. The selector switch shall also have an OFF position.

ELE3.18.060.8 MOUNTING POSITION OF SELECTOR SWITCHES

Selector switches for ammeters or voltmeters shall be mounted immediately below the meters with which they are associated.

ELE3.18.070.A METER CHAMBERS

1. Construction:
 - a. Meter chambers for housing kilowatt-hour meters shall be made of galvanised steel not less than 1.6 mm thick and shall be of ample size to accommodate the required number of kilowatt-hour meters and meter cables;
 - b. Provision shall be made to enable the kilowatt-hour meters to be fixed inside the chamber without removing the chamber from the wall or other supports;
 - c. Meter fixing screws shall not project through the back of the chamber.
2. Front covers:
 - a. When a meter chamber is installed indoors, it shall be fitted with a hinged metal front cover;
 - b. Meter chambers installed outdoors shall be weatherproof, with screw-on type front covers;
 - c. The degree of protection in the latter case shall be of at least IP54 in accordance with IEC 60529.
3. Windows:
 - a. Glass windows shall be provided in the front covers of meter chambers to enable the registers of the kilowatt-hour meters to be read easily;
 - b. A window shall be provided for each meter, and the size of the window shall be large enough to enable the serial number of the meter and the register to be clearly visible.

ELE3.18.080.8 MOUNTING OF CURRENT TRANSFORMERS ASSOCIATED WITH A WATT-HOUR METER

1. Current transformers, if required in association with a watt-hour meter, may be mounted inside the meter chamber, or in a separate current transformer chamber, as dictated by the circumstances of each particular job;
2. When current transformers are mounted in the meter chamber, the front cover shall be arranged so that the opening or removal of the front cover to gain access to the meters will not expose the current transformers;
3. A separate cover giving access to the current transformers compartment shall be provided;
4. Suitable engraved labels shall be fixed on the covers to identify the installed equipment therein.

ELE3.18.090.8 IDENTIFICATION OF INSTRUMENTS

Each measuring instrument shall be identified by means of a label fitted under the associated instrument. This label shall denote the function of the circuit connected to the meter.

ELE3.19 SITE BUILT ASSEMBLIES

ELE3.19.010.8 SITE BUILT ASSEMBLIES

Site built assemblies of switchgear and controlgear shall be constructed, assembled and installed in accordance with ELE2 or the Drawings. They shall also comply with and be tested to the relevant BS EN/BS/IEC Specifications.

ELE4.1 GENERAL

ELE4.1.005.8 STANDARDS

1. Switchboards shall be constructed to fully comply with either IEC 60439-1 standard, or alternatively the new IEC 61439-1 and IEC 61439-2 standards.
2. All switchboards provided for the Contract shall comply with the same standard(s).

ELE4.1.010.8 SWITCHBOARDS (FOR IEC 60439 COMPLIANCE)

1. Switchboards shall be low-voltage switchgear and controlgear assemblies (hereinafter referred to as "ASSEMBLY" or "ASSEMBLIES") in full compliance with IEC 60439-1. They shall be of the enclosed, stationary, floor-standing, multi-cubicle type ASSEMBLIES for indoor use;
2. The manufacturer shall operate quality management system including design, manufacture, installation and maintenance of the ASSEMBLIES conforming to ISO 9001 and be certified by a certification body which is accredited by one of the following accredited bodies:
 - a. Hong Kong Accreditation Services (HKAS);
 - b. An accredited body considered as having equivalent standard by the Development Bureau.
3. In the case where the ASSEMBLIES are manufactured under licence from a Principal Company, a letter of guarantee from the Principal Company shall be produced to prove that the products manufactured by the licences are equivalent, in every respect, to those type-tested standard products;
4. Prior to delivery to Site, the ASSEMBLIES shall have satisfactory proven record of reliability in local application for a minimum period of 12 months which shall be established after the satisfactory completion of the type tests stipulated in **ELE4.1.030**;
5. All materials and components used in the ASSEMBLIES shall be of the same make and brand of the type tested ones. Alternative materials or components will not be accepted without prior Approval;
6. The switchboards shall adopt the full compliance of IEC 60439-1 as a whole.

ELE4.1.015.8 SWITCHBOARDS (ALTERNATIVE TO CLAUSE ELE4.1.010 FOR IEC 61439 COMPLIANCE)

1. Switchboards shall be low-voltage switchgear and controlgear assemblies (hereinafter referred to as "ASSEMBLY" or "ASSEMBLIES") in full compliance with IEC 61439-1 and IEC 61439-2. They shall be of the enclosed, stationary, floor-standing, multi-cubicle type ASSEMBLIES for indoor use;
2. The manufacturer shall operate quality management system including design, manufacture, installation and maintenance of the ASSEMBLIES conforming to ISO 9001 and be certified by a certification body which is accredited by one of the following accredited bodies:
 - a. Hong Kong Accreditation Services (HKAS);
 - b. An accredited body considered as having equivalent standard by the Development Bureau.

-
3. In the case where the ASSEMBLIES are manufactured under licence from a Principal Company, a letter of guarantee from the Principal Company shall be produced to prove that the products manufactured by the licences are equivalent, in every respect, to those verified standard products;
 4. Prior to delivery to Site, the ASSEMBLIES shall have satisfactory proven record of reliability in local application for a minimum period of 12 months which shall be established after the satisfactory completion of the verification in compliance with IEC 61439-1 and IEC 61439-2 stipulated in **ELE4.1.035**;
 5. All materials and components used in the ASSEMBLIES shall be of the same make and brand of the verified ones. Alternative materials or components will not be accepted without prior Approval;
 6. The switchboards shall adopt the full compliance of IEC 61439-1 and IEC 61439-2 as a whole.

ELE4.1.020.8**TYPE-TEST (FOR IEC 60439 COMPLIANCE)**

1. Switchboards shall be of type-tested assemblies (TTA). Partially type-tested assemblies (PTTA) will only be accepted provided that the non-type-tested arrangements are derived from and have been verified to comply with the standard of the type-tested ones and/or been tested to the satisfaction of the Contract Manager;
2. ASSEMBLIES, circuit breakers and fuse combination units shall be type tested to comply with IEC 60439-1, IEC 60947-2 and IEC 60947-3 respectively. They shall be suitable for installation under environment condition of pollution degree 3 unless otherwise specified;
3. Test certificates for each type-test complete with reports and drawings showing enclosures and partitions of the TTA to demonstrate the segregation of circuits, the type and thickness of insulation barriers, details of insulating supports and the clearances of equipment that passed the type-tests shall be submitted if required by the Contract Manager;
4. Verification of PTTA shall be substantiated by test certificates/reports and/or graphs, calculations, etc. together with the details of the type-tested arrangement from which the PTTA is derived.

ELE4.1.025.8**VERIFICATION (ALTERNATIVE TO CLAUSE ELE4.1.020 FOR IEC 61439 COMPLIANCE)**

1. Three different but equivalent types of verification of requirements as stipulated in IEC 61439-1 shall be made for the ASSEMBLIES:
 - a. Verification by testing;
 - b. Verification by calculation / measurement;
 - c. Verification by satisfying design rules.
2. ASSEMBLIES, circuit breakers and fuse combination units shall be verified to comply with IEC 61439-1 and IEC 61439-2, IEC 60947-2 and IEC 60947-3 respectively. They shall be suitable for installation under environment condition of pollution degree 3 unless otherwise specified;
3. Certificates for verification complete with reports and drawings showing enclosures and partitions of the ASSEMBLIES to demonstrate the segregation of circuits, the type and thickness of insulation barriers, details of insulating supports and the clearances of equipment that passed the verification shall be submitted if required by the Contract Manager;

4. Verification shall be substantiated by test certificates/reports and/or graphs, calculations, etc. together with the details of the verified arrangement from which is derived.

ELE4.1.030.8**SHORT-CIRCUIT TEST (FOR IEC 60439 COMPLIANCE)****1. ASSEMBLIES:**

The following short-circuit type-tests on the main circuits of ASSEMBLIES shall be carried out by a Short Circuit Testing Organization in compliance with IEC 60439-1 at the value of short circuit currents specified in either Option 1 or Option 2 below:

Circuit	Test Current	
	Option 1	Option 2
a. Busbars connected to the outgoing terminals of the outgoing functional unit in accordance with paragraph (a) of Clause 8.2.3.2.3 of IEC 60439-1	40kA for 1 second when outgoing functional unit is an air circuit breaker; Prospective short-circuit current of 40kA to flow until it is broken when the outgoing functional unit is a fuse combination unit or MCCB unit.	50kA for 1 second when outgoing functional unit is an air circuit breaker; Prospective short-circuit current of 50kA to flow until it is broken when the outgoing functional unit is a fuse combination unit or MCCB unit.
b. Main busbars including riser/droppers in accordance with paragraph (b) of Clause 8.2.3.2.3 of IEC 60439-1	40kA for 1 second when circuit is below 1600A; 40kA for 3 seconds when the circuit is 1600A or above.	50kA for 1 second
c. Neutral busbars of the above circuits in accordance with paragraph (d) of Clause 8.2.3.2.3 of IEC 60439-1	24kA for 1 second when circuit is below 1600A; 24kA for 3 seconds when the circuit is 1600A or above.	30kA for 1 second
d. Separate protective conductors and the terminals for the outgoing protective conductor in accordance with Clause 8.2.4.2 of IEC 60439-1	24kA for 1 second at main earth bar; Prospective short-circuit current of 24kA to flow until it is broken at outgoing protective conductor in each modular section.	30kA for 1 second at main earth bar; Prospective short-circuit current of 30kA to flow until it is broken at outgoing protective conductor in each modular section.

2. Circuit breakers and fuse combination units:

The following short-circuit type-test on the circuit breakers and fuse combination units shall also be carried out by a Short Circuit Testing Organization in accordance with IEC 60947-2 and IEC 60947-3 respectively. The Option 1 or Option 2 of the test current shall correspond with that of ASSEMBLIES:

Test	Test Current	
	Option 1	Option 2
a. Air Circuit Breakers:		
i. Rated service short-circuit breaking capacities:	40kA	50kA
ii. Rated short-circuit making capacity:	84kA at 0.25p.f.	105kA at 0.25p.f.
iii. Rated short-time withstand current:	40kA for 3 seconds for circuit of 1600A or above; 40kA for 1 second for circuit below 1600A.	50kA for 1 second
b. MCCBs:		
Rated ultimate short-circuit breaking capacity:	40kA	50kA
c. Fuse Combination Units:		
Rated fused short-circuit current:	40kA	50kA

ELE4.1.035.8
**SHORT-CIRCUIT WITHSTAND STRENGTH VERIFICATION
(ALTERNATIVE TO CLAUSE ELE4.1.030 FOR IEC 61439 COMPLIANCE)**
1. ASSEMBLIES:

The following short-circuit withstand strength verification on the main circuits of ASSEMBLIES shall be carried out by a Short Circuit Testing Organization in compliance with IEC 61439-1 and IEC 61439-2 at the value of short circuit currents specified in either Option 1 or Option 2 below:

Circuit	Test Current	
	Option 1	Option 2
a. Busbars connected to the outgoing terminals of the outgoing functional unit in accordance with Clause 10.11.5.3.2 of IEC 61439-1	40kA for 1 second when outgoing functional unit is an air circuit breaker; Prospective short-circuit current of 40kA to flow until it is broken when the outgoing functional unit is a fuse combination unit or MCCB unit.	50kA for 1 second when outgoing functional unit is an air circuit breaker; Prospective short-circuit current of 50kA to flow until it is broken when the outgoing functional unit is a fuse combination unit or MCCB unit.
b. Main busbars including riser/droppers in accordance with Clause 10.11.5.3.3 of IEC 61439-1	40kA for 1 second when circuit is below 1600A; 40kA for 3 seconds when the circuit is 1600A or above.	50kA for 1 second

c. Neutral busbars of the above circuits in accordance with Clause 10.11.5.3.5 of IEC 61439-1	24kA for 1 second when circuit is below 1600A; 24kA for 3 seconds when the circuit is 1600A or above.	30kA for 1 second
d. Separate protective conductors and the terminals for the outgoing protective conductor in accordance with Clause 10.11.5.6 of IEC 61439-1	24kA for 1 second at main earth bar; Prospective short-circuit current of 24kA to flow until it is broken at outgoing protective conductor in each modular section.	30kA for 1 second at main earth bar; Prospective short-circuit current of 30kA to flow until it is broken at outgoing protective conductor in each modular section.

2. Circuit breakers and fuse combination units:

The following short-circuit type-test on the circuit breakers and fuse combination units shall also be carried out by a Short Circuit Testing Organization in accordance with IEC 60947-2 and IEC 60947-3 respectively. The Option 1 or Option 2 of the test current shall correspond with that of ASSEMBLIES:

Test	Test Current	
	Option 1	Option 2
a. Air Circuit Breakers:		
i. Rated service short-circuit breaking capacities:	40kA	50kA
ii. Rated short-circuit making capacity:	84kA at 0.25p.f.	105kA at 0.25p.f.
iii. Rated short-time withstand current:	40kA for 3 seconds for circuit of 1600A or above; 40kA for 1 second for circuit below 1600A.	50kA for 1 second
b. MCCBs:		
Rated ultimate short-circuit breaking capacity:	40kA	50kA
c. Fuse Combination Units:		
Rated fused short-circuit current:	40kA	50kA

ELE4.2 ASSEMBLIES - DESIGN AND CONSTRUCTION

ELE4.2.010.8 GENERAL ARRANGEMENT (FOR IEC 60439 COMPLIANCE)

1. ASSEMBLIES shall be formed from one or more modular sections (vertical-panel), each with a maximum width not exceeding 1000 mm and shall not accommodate more than two fuse combination units in the same row. They shall be fitted together to form a flush front continuous board of uniform height and depth front-to-back and be suitable for floor mounting without any mounting structure. ASSEMBLIES shall be pleasing in appearance and shall be extensible at both ends;
2. ASSEMBLIES shall be of the totally enclosed type with openings only for ventilating purposes. Ventilating grills or louvres located on top of the board shall be protected against ingress of condensate water (see also [ELE4.2.030](#)). In no case shall ventilating louvres be located at the front of ASSEMBLIES;
3. No forced ventilation to any components of ASSEMBLIES is allowed.

ELE4.2.015.8 GENERAL ARRANGEMENT (ALTERNATIVE TO CLAUSE ELE4.2.010 FOR IEC 61439 COMPLIANCE)

1. ASSEMBLIES shall be formed from one or more modular sections (vertical-panel), each with a maximum width not exceeding 1000 mm and shall not accommodate more than two fuse combination units in the same row. They shall be fitted together to form a flush front continuous board of uniform height and depth front-to-back and be suitable for floor mounting without any mounting structure. ASSEMBLIES shall be pleasing in appearance and shall be extensible at both ends;
2. ASSEMBLIES shall be of the totally enclosed type with openings only for ventilating purposes. Ventilating grills or louvres located on top of the board shall be protected against ingress of condensate water (see also [ELE4.2.035](#)). In no case shall ventilating louvres be located at the front of ASSEMBLIES;
3. No forced ventilation to any components of ASSEMBLIES is allowed.

ELE4.2.020.8 MECHANICAL DESIGN

1. ASSEMBLIES shall be of steel construction, self supporting, with the enclosures, covers, removable covers and cover plates made of sheet steel of not less than 2 mm thick. All removable covers and doors shall be notched and all joints shall be machined to give a rigid and smooth appearance to the satisfaction of the Contract Manager;
2. Marks of welding shall not be visible from the external surface of panels;
3. Detachable hinges shall be provided for the doors. Exposed hinges shall be bright cadmium or nickel chromium plated;
4. Gaskets shall be fitted on doors and removable covers and shall be continuous, without joints around corners, and suitably arranged to minimize the transmission of vibration, and to prevent the entry of dust.

ELE4.2.030.8 PROTECTION AGAINST ELECTRIC SHOCK AND EXTERNAL INFLUENCES (FOR IEC 60439 COMPLIANCE)

1. Protection against direct contact shall be by means of barriers of enclosures in accordance with IEC 60439-1;

2. All external surfaces of an ASSEMBLY shall have a degree of protection against ingress of solid foreign bodies and liquid of at least IP31 in the normal service condition in accordance with IEC 60439-1;
3. With the front-hinged door of the functional units open and in replacing the fuse links, the degree of protection to the live part shall be at least IP2X. If the degree of protection to the neutral conductor of the live part cannot comply with this requirement, a warning label shall be provided next to the neutral conductor;
4. The bottom of the ASSEMBLY shall be closed and made vermin-proof by means of barriers cut away, where required, to fit the cables passing through. The barriers in the cable compartment shall be made of phenolic resin bonded paper laminate sheet of a minimum thickness of 6 mm;
5. For PTTA, the construction of the enclosure shall be the same as the TTA, and be checked by visual inspection and standard test finger, if necessary, as IEC 60529;
6. Protection against indirect contact shall be by means of protective circuits in accordance with IEC 60439-1. The size and installation of the protective conductors in an ASSEMBLY shall be in accordance with **ELE4.3.1.070**.

ELE4.2.035.8**PROTECTION AGAINST ELECTRIC SHOCK AND EXTERNAL INFLUENCES (ALTERNATIVE TO CLAUSE ELE4.2.030 FOR IEC 61439 COMPLIANCE)**

1. Protection against direct contact shall be by means of barriers of enclosures in accordance with IEC 61439-1 and IEC 61439-2;
2. All external surfaces of an ASSEMBLY shall have a degree of protection against ingress of solid foreign bodies and liquid of at least IP31 in the normal service condition in accordance with IEC 61439-1 and IEC 61439-2;
3. With the front-hinged door of the functional units open and in replacing the fuse links, the degree of protection to the live part shall be at least IP2X. If the degree of protection to the neutral conductor of the live part cannot comply with this requirement, a warning label shall be provided next to the neutral conductor;
4. The bottom of the ASSEMBLY shall be closed and made vermin-proof by means of barriers cut away, where required, to fit the cables passing through. The barriers in the cable compartment shall be made of phenolic resin bonded paper laminate sheet of a minimum thickness of 6 mm;
5. The construction of the enclosure shall be the same for ASSEMBLIES under all types of verification, and be checked by visual inspection and standard test finger, if necessary, as IEC 60529;
6. Fault protection shall be by means of protective circuits in accordance with IEC 61439-1 and IEC 61439-2. The size and installation of the protective conductors in an ASSEMBLY shall be in accordance with **ELE4.3.1.075**.

ELE4.2.040.8**FINISH**

1. Before untreated steel work is painted, it shall be thoroughly cleaned by an Approved method, such as grit-blasting or chemical pickling and an Approved rust inhibitive priming coat applied. Treated steelwork e.g. zintec, shall be suitably cleaned and degreased;
2. Surfaces shall then have not less than two coats of stoved finish paint of contrasting colours; the finishing colour, both interior and exterior shall be equivalent to colour code 00A01 of BS 4800 (light grey) or lighter;
3. Care shall be taken to ensure that edges of metalwork have an adequate dry film thickness of paint and that paint build-up does not occur at edges;

-
4. Alternative finishing processes such as phosphate treatment followed by stoved epoxy powder paint conforming to BS EN 12476 will also be accepted.

ELE4.2.050.8**COMPARTMENTATION (FOR IEC 60439 COMPLIANCE)**

1. Internal separation of an ASSEMBLY shall be provided by means of barriers or partitions made of sheet steel or non-hygroscopic and flame retardant insulating materials rigidly fixed;
2. The size and construction of the compartments shall be the same as the type-tested ones;
3. Openings necessary for interconnection, control or ventilation shall be at least IP2X for protection against contact with live parts in the adjacent compartments, and be such that exhaust outlets of functional units shall not discharge directly to the live parts in adjacent compartments;
4. The ASSEMBLY shall be capable of withstanding any external fault. In the event of any internal arcing fault on a functional unit, the damage shall be confined to that unit so that the busbar and all other functional units remain fit for further service;
5. The internal separation shall be of Form 3a in accordance with IEC 60439-1. Further compartmentation shall also be provided for each of the following equipment:
 - a. Incoming power supply cables, conductors and connections to the incoming supply side terminals of each incoming circuit breakers;
 - b. Protective relays and terminal blocks;
 - c. Batteries and Battery Charger;
 - d. Supply Company's meter;
 - e. Supply Company's CT;
 - f. Capacitor bank;
 - g. Fuse combination unit for capacitor bank;
 - h. Control gears and relays for capacitor bank;
 - i. Each section (vertical-panel) except the horizontal busbar compartments;
 - j. Cable terminals for outgoing functional units.
6. Front doors shall be provided for items given in sub-clauses (5)(b), (5)(c), (5)(d), (5)(e), (5)(g) and (5)(h) above and each outgoing functional units;
7. Removal back covers shall be completed with pair of handles for easy fixing and removal and provided for items given in sub-clauses (5)(a), (5)(f) and (5)(i) above;
8. Voltmeters, ammeters together with associated switches and indication lamps are allowed to be mounted on the front cover/door of the respective functional unit monitored by the meters, provided that they do not obstruct the operation of the unit, are suitably protected against direct contact of live parts of at least IP2X, even when the door is open and, are properly earthed.

ELE4.2.055.8**COMPARTMENTATION (ALTERNATIVE TO CLAUSE ELE4.2.050 FOR IEC 61439 COMPLIANCE)**

1. Internal separation of an ASSEMBLY shall be provided by means of barriers or partitions made of sheet steel or non-hygroscopic and flame retardant insulating materials rigidly fixed;
2. The size and construction of the compartments shall be the same as the type-tested ones;

-
3. Openings necessary for interconnection, control or ventilation shall be at least IP2X for protection against contact with live parts in the adjacent compartments, and be such that exhaust outlets of functional units shall not discharge directly to the live parts in adjacent compartments;
 4. The ASSEMBLY shall be capable of withstanding any external fault. In the event of any internal arcing fault on a functional unit, the damage shall be confined to that unit so that the busbar and all other functional units remain fit for further service;
 5. The internal separation shall be of Form 3a in accordance with IEC 61439-1 and IEC 61439-2. Further compartmentation shall also be provided for each of the following equipment:
 - a. Incoming power supply cables, conductors and connections to the incoming supply side terminals of each incoming circuit breakers;
 - b. Protective relays and terminal blocks;
 - c. Batteries and Battery Charger;
 - d. Supply Company's meter;
 - e. Supply Company's CT;
 - f. Capacitor bank;
 - g. Fuse combination unit for capacitor bank;
 - h. Control gears and relays for capacitor bank;
 - i. Each section (vertical-panel) except the horizontal busbar compartments;
 - j. Cable terminals for outgoing functional units.
 6. Front doors shall be provided for items given in sub-clauses (5)(b), (5)(c), (5)(d), (5)(e), (5)(g) and (5)(h) above and each outgoing functional units;
 7. Removal back covers shall be completed with pair of handles for easy fixing and removal and provided for items given in sub-clauses (5)(a), (5)(f) and (5)(i) above;
 8. Voltmeters, ammeters together with associated switches and indication lamps are allowed to be mounted on the front cover/door of the respective functional unit monitored by the meters, provided that they do not obstruct the operation of the unit, are suitably protected against direct contact of live parts of at least IP2X, even when the door is open and, are properly earthed.

ELE4.3 ASSEMBLIES - COMPONENTS AND AUXILIARIES

ELE4.3.1 BUSBARS AND BUSBAR CONNECTIONS

ELE4.3.1.010.8 STANDARD (FOR IEC 60439 COMPLIANCE)

Assembly: IEC 60439-1.

ELE4.3.1.015.8 STANDARD (ALTERNATIVE TO CLAUSE ELE4.3.1.010 FOR IEC 61439 COMPLIANCE)

Assembly: IEC 61439-1 and IEC 61439-2.

ELE4.3.1.020.8 RATING (FOR IEC 60439 COMPLIANCE)

1. Rated insulation voltage:	415V minimum
2. Rated operational voltage:	380/220V
3. Rated current:	100A, 200A, 400A, 800A, 1200A, 1600A, 2500A as shown on the drawings
4. Rated frequency:	50Hz
5. Rated short-time withstand current:	as specified in ELE4.1.030

ELE4.3.1.025.8 RATING (ALTERNATIVE TO CLAUSE ELE4.3.1.020 FOR IEC 61439 COMPLIANCE)

1. Rated insulation voltage:	415V minimum
2. Rated operational voltage:	380/220V
3. Rated current:	100A, 200A, 400A, 800A, 1200A, 1600A, 2500A as shown on the drawings
4. Rated frequency:	50Hz
5. Rated short-time withstand current:	as specified in ELE4.1.035

ELE4.3.1.030.8 BUSBARS (FOR IEC 60439 COMPLIANCE)

1. Busbars shall be three phase and full rating neutral busbar made of hard drawn, high conductivity, bare solid copper bars to BS EN 13601 with electroplated finish. The temperature-rise type test with rated current on each busbar section shall be witnessed by an acceptable third-party;
2. Main busbars shall run horizontally and conform to the type-tested arrangement;
3. A vertical busbar riser/dropper shall be required for each section of the ASSEMBLY where switchgears are arranged in multi-tier, with a cross-section capable of carrying either the total rated current of all outgoing units connected to it or the current rating of the protective device protecting it, whichever is the less, without undue temperature-rise in accordance with Clause 8.2.1 of IEC 60439-1;
4. Busbars connecting the riser/dropper to the supply side of outgoing functional unit shall be with adequate insulation or shrouding;

-
5. Busbars shall be provided to connect between functional units and to extend each outgoing terminal of the functional units to the cabling compartment.

ELE4.3.1.035.8 BUSBARS (ALTERNATIVE TO CLAUSE ELE4.3.1.030 FOR IEC 61439 COMPLIANCE)

1. Busbars shall be three phase and full rating neutral busbar made of hard drawn, high conductivity, bare solid copper bars to BS EN 13601 with electroplated finish. The temperature-rise verification with rated current on each busbar section shall be witnessed by an acceptable third-party;
2. Main busbars shall run horizontally and conform to the verification arrangement;
3. A vertical busbar riser/dropper shall be required for each section of the ASSEMBLY where switchgears are arranged in multi-tier, with a cross-section capable of carrying either the total rated current of all outgoing units connected to it or the current rating of the protective device protecting it, whichever is the less, without undue temperature-rise in accordance with Clause 10.10 of IEC 61439-1 and IEC 61439-2;
4. Busbars connecting the riser/dropper to the supply side of outgoing functional unit shall be with adequate insulation or shrouding;
5. Busbars shall be provided to connect between functional units and to extend each outgoing terminal of the functional units to the cabling compartment.

ELE4.3.1.040.8 ARRANGEMENT OF BUSBARS AND CONNECTIONS

1. In the incoming terminal compartment, the busbars shall be arranged in a manner that the provision and arrangement for the cable/busbar terminations shall comply with the Supply Company's requirement;
2. Unless otherwise specified, busbars and main connections which are generally in one plane shall be arranged in the order of L1-L2-L3 phases as follows:
 - a. If the run of the conductors is horizontal, the L1 phase shall be the top, or the left or farthest away as viewed from the front of the ASSEMBLY;
 - b. If the run of the conductor is vertical, the L1 phase shall be the left or farthest away as viewed from the front of the ASSEMBLY.
3. The busbars from the incoming supply connections through the incomer circuit breaker to the nearest main horizontal busbars, which follow the phase notation of the Supply Company's incoming terminals, shall also be acceptable;
4. The neutral shall occupy the outer position and shall be clearly marked.

ELE4.3.1.050.8 BUSBAR IDENTIFICATION (FOR IEC 60439 COMPLIANCE)

Each busbar and protective conductor shall be identified by colours in accordance with the Electrical CoP. The terminals for external protective conductors shall be marked in accordance with IEC 60439-1.

ELE4.3.1.055.8 BUSBAR IDENTIFICATION (ALTERNATIVE TO CLAUSE ELE4.3.1.050 FOR IEC 61439 COMPLIANCE)

Each busbar and protective conductor shall be identified by colours in accordance with the Electrical CoP. The terminals for external protective conductors shall be marked in accordance with IEC 61439-1 and IEC 61439-2.

ELE4.3.1.060.8 BUSBAR JOINTING AND SUPPORT (FOR IEC 60439 COMPLIANCE)

1. Jointing of sections of busbars shall be made by bolts and nuts or clamps. Soldered, welded or riveted joints shall not be used;
2. Bolts for jointing busbars shall be of steel, either hot-dip galvanized or heavily electroplated with zinc or cadmium, to guard against corrosion;
3. Conductors shall be supported on insulators of non-hygroscopic and non-deteriorating materials as type-test;
4. The method and materials used in jointing and support shall conform to the type-tested arrangement.

ELE4.3.1.065.8 BUSBAR JOINTING AND SUPPORT (ALTERNATIVE TO CLAUSE ELE4.3.1.060 FOR IEC 61439 COMPLIANCE)

1. Jointing of sections of busbars shall be made by bolts and nuts or clamps. Soldered, welded or riveted joints shall not be used;
2. Bolts for jointing busbars shall be of steel, either hot-dip galvanized or heavily electroplated with zinc or cadmium, to guard against corrosion;
3. Conductors shall be supported on insulators of non-hygroscopic and non-deteriorating materials as verification;
4. The method and materials used in jointing and support shall conform to the verification arrangement.

ELE4.3.1.070.8 PROTECTIVE CONDUCTORS (FOR IEC 60439 COMPLIANCE)

1. Protective conductors shall be of size in accordance with IEC 60439-1;
2. The cross sectional area and the installation of the protective conductor shall be so selected and designed to eliminate the possibility of the fault current in the protective conductor causing a temperature rise that may damage the conductor or impair its electrical continuity before the operation of the protective device, for a duration that may last up to 5 seconds;
3. A continuous tinned copper bar of size satisfying the above requirement and in any case not less than 150 mm² shall be fixed at the rear interior bottom portion throughout the length of the ASSEMBLY, bonding the frame-work of all modular sections, terminals for the outgoing protective conductor(s) of each circuit, the circuit breaker's earthing terminal and finally connected to the earthing terminals on the external surface at the extreme ends of the ASSEMBLY.

ELE4.3.1.075.8 PROTECTIVE CONDUCTORS (ALTERNATIVE TO CLAUSE ELE4.3.1.070 FOR IEC 61439 COMPLIANCE)

1. Protective conductors shall be of size in accordance with IEC 61439-1 and IEC 61439-2;
2. The cross sectional area and the installation of the protective conductor shall be so selected and designed to eliminate the possibility of the fault current in the protective conductor causing a temperature rise that may damage the conductor or impair its electrical continuity before the operation of the protective device, for a duration that may last up to 5 seconds;

3. A continuous tinned copper bar of size satisfying the above requirement and in any case not less than 150 mm² shall be fixed at the rear interior bottom portion throughout the length of the ASSEMBLY, bonding the frame-work of all modular sections, terminals for the outgoing protective conductor(s) of each circuit, the circuit breaker's earthing terminal and finally connected to the earthing terminals on the external surface at the extreme ends of the ASSEMBLY.

ELE4.3.1.080.8 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall produce documentary evidences in accordance with **PRE.BS1.205** to verify the country / place of manufacture and authenticity of busbars delivered to Site or installed.

ELE4.3.2 AUXILIARY CIRCUITS

ELE4.3.2.010.8 WIRING

1. All auxiliary circuits shall be wired in PVC insulated copper cables to type CK of BS 6231 of not less than 2.5 mm² conductor;
2. All wiring shall be clipped in a neat and tidy manner by nylon type cable ties or installed in plastic wiring channels;
3. Wiring from the fixed part of the ASSEMBLY to equipment mounted on the hinged door shall be enclosed by a flexible PVC tubing.

ELE4.3.2.020.8 MARKING

1. Sleeve type cable markers shall be fitted to both ends of each length of cable to denote its function; the function letter shall be followed by a number identifying the individual wire;
2. Each branch of any connection shall bear the same identification mark. Where it is necessary to identify branches which are common, different identification marks for the branches shall be employed only if they are common through links or are connected to separate terminals which are then common by removable connections;
3. Numbering shall read from the terminals outwards on all wires;
4. Circuit function letters and wire numbers shall be in accordance with the following table:

Circuit		Test Current
C	Current transformers for over-current protection (including combined earth-fault protection) and instruments	10 - 29 : L1 phase 30 - 49 : L2 phase 50 - 69 : L3 phase 70 - 89 : residual circuit and neutral current transformer
D	Current transformers for metering and voltage control	90 : circuit protective conductors directly connected to the earthing bar
J	D.C. and d.c. supply	1 - 69
H	A.C. and a.c. supply	1 - 69
K	Closing and tripping control circuit	any number from 1 upwards

L	Alarms and indications initiated by auxiliary switches and relay contacts	any number from 1 upwards
---	---	---------------------------

ELE4.3.2.030.8**TERMINATION**

1. Wiring from one section to another section of an ASSEMBLY shall feed through terminal blocks;
2. Except for the Supply Company's metering, test/disconnect terminal blocks shall be provided for each measurement and protection current transformer. The terminal blocks shall be housed in the same relay compartment with hinged front door;
3. All terminal blocks shall be feed-through terminal blocks with screw clamp connections and conforming to the following requirements:
 - a. Electrical and mechanical characteristics to be type tested to IEC 60947-7-1;
 - b. Voltage rating 750V;
 - c. Moulding material to be melamine with low flammability as certified to UL94-V0(5V);
 - d. Designed to be mounted directly on assembly rail to BS 5825;
 - e. All current carrying parts to be copper coated with tin lead alloy. Clamping yokes and screw to be zinc plated steel with additional protection by a chromate layer.

In addition, test/disconnect terminal blocks complete with plugs and test sockets for tapping off/disconnection shall be provided for test and measurement circuits.
4. The terminal blocks shall be provided with manufacturer's standard assembly rails, end section, partition, bracket, cross connection plug, jumper bar, warning sign, plastic screw, marking tags, disconnect plugs, test plug bolt, test plug, etc.;
5. Only one cable shall be terminated in each terminal, where necessary, jumper bars or cross connecting plugs shall be used;
6. Terminal blocks for the live conductor shall be indicated with a warning sign and separated from other terminal blocks by partitions.

ELE4.3.3 AIR CIRCUIT BREAKERS**ELE4.3.3.010.8****STANDARDS (FOR IEC 60439 COMPLIANCE)**

1. Circuit Breaker: IEC 60947-2;
2. Assembly: IEC 60439-1.

ELE4.3.3.015.8**STANDARDS (ALTERNATIVE TO CLAUSE ELE4.3.3.010 FOR IEC 61439 COMPLIANCE)**

1. Circuit Breaker: IEC 60947-2;
2. Assembly: IEC 61439-1 and IEC 61439-2.

ELE4.3.3.020.8**RATING (FOR IEC 60439 COMPLIANCE)**

1. Rated operational voltage:	380V
2. Rated insulation voltage:	415V minimum

3. Rated frequency:	50Hz
4. Rated service short-circuit breaking capacity:	as specified in ELE4.1.030
5. Rated short-time withstand current:	as specified in ELE4.1.030
6. Rated-uninterrupted current:	800A, 1200A, 1600A and 2500A as shown on the drawings

ELE4.3.3.025.8**RATING (ALTERNATIVE TO CLAUSE ELE4.3.3.020 FOR IEC 61439 COMPLIANCE)**

1. Rated operational voltage:	380V
2. Rated insulation voltage:	415V minimum
3. Rated frequency:	50Hz
4. Rated service short-circuit breaking capacity:	as specified in ELE4.1.035
5. Rated short-time withstand current:	as specified in ELE4.1.035
6. Rated-uninterrupted current:	800A, 1200A, 1600A and 2500A as shown on the drawings

ELE4.3.3.030.8**CIRCUIT BREAKER (FOR IEC 60439 COMPLIANCE)**

1. The circuit breaker shall be triple pole or four pole as specified on the Drawings, air break and of metalclad, horizontal withdrawable type, fitted with a shunt trip coil and/or overcurrent release, depending on the type of protection scheme used, as specified in ELE4.4.1 and shown on the Drawings;
2. The circuit breaker shall be housed in a separate and segregated circuit breaker compartment as specified in **ELE4.2.050**. Each circuit breaker of triple pole type shall be complete with an accessible bolted type neutral link in accordance with the type-tested designs;
3. The circuit breaker shall have independent manual closing with stored energy or spring assisted mechanism, unless otherwise specified. Neutral link/pole shall be easily accessible for inspection and maintenance even after cabling;
4. Unless otherwise specified, opening and closing of incoming and bus-section ACB shall be capable of being remote controlled repeatedly by the integrally mounted shunt trip coil and shunt close coil respectively and shall be provided with on and off or "1" and "0" mechanical indicators on the front panel of the circuit breaker. The closing operation of the ACB shall be operable either by a solenoid coil or by a motorized mechanism;
5. For circuit breaker with mechanism controlled by a solenoid coil, the closing mechanism shall be controlled by the solenoid coil which replaces the standard closing spring. The a.c. supply to the rectifier for the solenoid coil shall be taken from the "Live" side of the circuit breaker. The closing contactor, rectifier and anti-hunting relay shall all be integrally mounted on the circuit breaker;
6. For circuit breaker with motorized mechanism, the closing spring shall be capable of being released electrically or manually and shall automatically be recharged upon each release operation with indication showing the mechanism is fully charged;
7. A push button shall be mounted on the front door of the circuit breaker to enable local closing for normal operation;

8. The remote closing and tripping function shall be designed to be operated through a pair of voltage free contacts on a remote operating device. A female 3-pin receptacle without the remote operating device shall be provided inside the IDMT Relay/Fuse chamber of the cubicle. The receptacle shall be of rating 250V 10A, a.c. to IEC 60320 or equivalent and approved standard. One number remote operating device shall be provided with each switchboard. The connection of the receptacle shall be as follows:
 - a. Earth: common;
 - b. Live: for remote closing;
 - c. Neutral: for remote tripping.
9. The circuit breaker shall be of horizontal withdrawable type with 'connected', 'test' and 'isolated' positions, fitted with mechanical position indicators and pad-locking facilities in each of the positions;
10. The circuit breaker shall be type-tested and comply with the additional requirements for circuit breakers suitable for isolation in accordance with Clause 7.1.2 of IEC 60947-2.

ELE4.3.3.035.8**CIRCUIT BREAKER (ALTERNATIVE TO CLAUSE ELE4.3.3.030 FOR IEC 61439 COMPLIANCE)**

1. The circuit breaker shall be triple pole or four pole as specified on the Drawings, air break and of metalclad, horizontal withdrawable type, fitted with a shunt trip coil and/or overcurrent release, depending on the type of protection scheme used, as specified in ELE4.4.1 and shown on the Drawings;
2. The circuit breaker shall be housed in a separate and segregated circuit breaker compartment as specified in **ELE4.2.055**. Each circuit breaker of triple pole type shall be complete with an accessible bolted type neutral link in accordance with the type-tested designs;
3. The circuit breaker shall have independent manual closing with stored energy or spring assisted mechanism, unless otherwise specified. Neutral link/pole shall be easily accessible for inspection and maintenance even after cabling;
4. Unless otherwise specified, opening and closing of incoming and bus-section ACB shall be capable of being remote controlled repeatedly by the integrally mounted shunt trip coil and shunt close coil respectively and shall be provided with on and off or "1" and "0" mechanical indicators on the front panel of the circuit breaker. The closing operation of the ACB shall be operable either by a solenoid coil or by a motorized mechanism;
5. For circuit breaker with mechanism controlled by a solenoid coil, the closing mechanism shall be controlled by the solenoid coil which replaces the standard closing spring. The a.c. supply to the rectifier for the solenoid coil shall be taken from the "Live" side of the circuit breaker. The closing contactor, rectifier and anti-hunting relay shall all be integrally mounted on the circuit breaker;
6. For circuit breaker with motorized mechanism, the closing spring shall be capable of being released electrically or manually and shall automatically be recharged upon each release operation with indication showing the mechanism is fully charged;
7. A push button shall be mounted on the front door of the circuit breaker to enable local closing for normal operation;

8. The remote closing and tripping function shall be designed to be operated through a pair of voltage free contacts on a remote operating device. A female 3-pin receptacle without the remote operating device shall be provided inside the IDMT Relay/Fuse chamber of the cubicle. The receptacle shall be of rating 250V 10A, a.c. to IEC 60320 or equivalent and approved standard. One number remote operating device shall be provided with each switchboard. The connection of the receptacle shall be as follows:
 - a. Earth: common;
 - b. Live: for remote closing;
 - c. Neutral: for remote tripping.
9. The circuit breaker shall be of horizontal withdrawable type with 'connected', 'test' and 'isolated' positions, fitted with mechanical position indicators and pad-locking facilities in each of the positions;
10. The circuit breaker shall be type-tested and comply with the additional requirements for circuit breakers suitable for isolation in accordance with Clause 7.1.2 of IEC 60947-2.

ELE4.3.3.040.8 MECHANICAL INTERLOCKS

The circuit breaker shall be provided with the following mechanical interlocks:

1. Circuit breaker cannot be racked in or withdrawn when in closed position;
2. Circuit breaker cannot be closed unless it is either the main circuit connection is fully connected, at test position or completely isolated;
3. In case that there is provision for maintenance and adjustment of contacts, circuit breaker shall be possible to 'slow close' in the fully isolated position;
4. With hand charged spring mechanism, initiation of the closing of the circuit breaker is not possible until the closing mechanism is fully charged;
5. Other mechanical interlocks if specified on the Drawings to facilitate sequential operation of circuit breakers/section switches of the ASSEMBLY incorporating more than one circuit breaker.

ELE4.3.3.050.8 CIRCUIT BREAKER COMPARTMENT/INTERLOCK

The circuit breaker compartment shall maintain a degree of protection against direct contact with live parts of at least IP 2X during normal operation without overriding the interlock. To ensure safety, the circuit breaker compartment shall be provided with the necessary mechanical interlock as follows, or other equal and Approved means of mechanical interlock, so that:

1. If a door is used to enclose the breaker, it can only be opened when the main circuit of the circuit breaker has opened and it shall not be possible to close the circuit breaker while the door is opened, except by overriding the interlock. The interlock shall be restored on reclosing the door; or
2. If a front panel is used to enclose the breaker, the panel shall be fitted to the withdrawable part of the breaker and carried in unity with it in the drawout/rack-in operation. It shall be possible to remove the panel with tools when the circuit breaker is in the 'isolated' position.

ELE4.3.3.060.8 SAFETY SHUTTERS

1. A set of safety shutters shall be provided to cover each three phase or three phase and neutral group of stationary isolating contacts for three pole or four pole circuit breaker respectively;

2. Shutters shall be opened automatically by a positive drive from the circuit breaker moving portion and, when closed, shall prevent access to stationary isolating contacts. When the circuit breaker is withdrawn, shutters shall be capable of being operated and padlocked in the closed position;
3. Each safety shutter shall bear a colour label with 15 mm minimum white lettering as follows:
 - a. Incoming supply : red/incomer;
 - b. Busbar : yellow/busbar;
 - c. Bus section : red/bus section;
 - d. Outgoing feeder : yellow/outgoing.

ELE4.3.3.070.8 AUXILIARY CONTACTS, CONTROL CONTACTS AND AUXILIARY SWITCHES

1. All the control and instrumentation wiring between the fixing part of the ASSEMBLY and the withdrawable part of the breaker shall through the auxiliary and control contacts. Automatic safety shutters or screens with warning signs shall be provided if they are still live when the circuit breaker is withdrawn;
2. The auxiliary contacts shall engage when the breaker is in the "connected" and "test" positions and disengage when in the "isolated" position;
3. At least one spare a - contact and one spare b - contact shall be provided.

ELE4.3.4 FUSE COMBINATION UNITS AND SWITCH-DISCONNECTORS

ELE4.3.4.010.8 COMPLIANCE WITH SPECIFICATION

Unless otherwise specified, cubicle mounted fuse combination units and switch-disconnectors shall comply with the relevant parts of Specification for surface mounted fuse combination units and switch-disconnector (i.e. ELE3.2).

ELE4.3.4.020.8 ASSEMBLY (FOR IEC 60439 COMPLIANCE)

The assembly of the switching devices in the ASSEMBLY shall also comply with IEC 60439-1.

ELE4.3.4.025.8 ASSEMBLY (ALTERNATIVE TO CLAUSE ELE4.3.4.020 FOR IEC 61439 COMPLIANCE)

The assembly of the switching devices in the ASSEMBLY shall also comply with IEC 61439-1 and IEC 61439-2.

ELE4.3.4.030.8 SWITCHING DEVICE (FOR IEC 60439 COMPLIANCE)

Each switching device shall be enclosed in a separate and segregated compartment with hinged front door as specified in [ELE4.2.050](#) and flush mounted on the front of the ASSEMBLY.

ELE4.3.4.035.8 SWITCHING DEVICE (ALTERNATIVE TO CLAUSE ELE4.3.4.030 FOR IEC 61439 COMPLIANCE)

Each switching device shall be enclosed in a separate and segregated compartment with hinged front door as specified in [ELE4.2.055](#) and flush mounted on the front of the ASSEMBLY.

ELE4.3.4.040.8 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall produce documentary evidences in accordance with **PRE.BS1.205** to verify the country / place of manufacture and authenticity of fuse combination units and switch-disconnectors delivered to Site or installed.

ELE4.3.5 CHANGEOVER CONTACTORS**ELE4.3.5.010.8 COMPLIANCE WITH SPECIFICATION**

Unless otherwise specified, changeover contactors shall comply with the relevant parts of Specification for contactors. (i.e. ELE3.15).

ELE4.3.5.020.8 INSTALLATION (FOR IEC 60439 COMPLIANCE)

The installation of the changeover contactors in the ASSEMBLY shall also comply with IEC 60439-1. The installation such as the ways of mounting, the connection of incoming and outgoing conductors, the clearance and creepage distance, the enclosure, etc. shall be identical to the type-tested one or as recommended by the contactor manufacturers.

ELE4.3.5.025.8 INSTALLATION (ALTERNATIVE TO CLAUSE ELE4.3.5.020 FOR IEC 61439 COMPLIANCE)

The installation of the changeover contactors in the ASSEMBLY shall also comply with IEC 61439-1 and IEC 61439-2. The installation such as the ways of mounting, the connection of incoming and outgoing conductors, the clearance and creepage distance, the enclosure, etc. shall be identical to the type-tested one or as recommended by the contactor manufacturers.

ELE4.3.5.030.8 SHORT-CIRCUIT WITHSTAND CAPACITY

For contactors protected by fuse, the short-circuit withstand capacity of the contactors shall be not less than the maximum let-through energy of the respective fuse and be verified by test.

ELE4.3.5.040.8 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall produce documentary evidences in accordance with **PRE.BS1.205** to verify the country / place of manufacture and authenticity of changeover contactors delivered to Site or installed.

ELE4.3.6 CABLE TERMINATION**ELE4.3.6.010.8 INCOMING/OUTGOING CABLES (FOR IEC 60439 COMPLIANCE)**

All incoming/outgoing cables, unless otherwise specified, shall be of bottom-entry and incoming/outgoing busbar trunking of top entry and terminated in separate compartments as stated in **ELE4.2.050**. The cables shall be located at the rear of the ASSEMBLY complete with removable back covers.

ELE4.3.6.015.8 INCOMING/OUTGOING CABLES (ALTERNATIVE TO CLAUSE ELE4.3.6.010 FOR IEC 61439 COMPLIANCE)

All incoming/outgoing cables, unless otherwise specified, shall be of bottom-entry and incoming/outgoing busbar trunking of top entry and terminated in separate compartments as stated in **ELE4.2.055**. The cables shall be located at the rear of the ASSEMBLY complete with removable back covers.

ELE4.3.6.020.8 CABLE GLAND PLATES

Cable gland plates made of brass or steel of not less than 2 mm thick shall be provided below the lug termination at a distance not exceeding 600 mm. Adequate space shall be reserved for future cabling for the spare functional units.

ELE4.3.6.030.8 CABLE SUPPORTS

Cable and cable supports shall be suitably installed to prevent terminals or cables being subjected to stresses, which may reduce their normal life or performance.

ELE4.3.7 SUPPLY COMPANY'S METERING EQUIPMENT**ELE4.3.7.010.8 METERING COMPARTMENTS**

1. Separate compartments shall be provided for accommodating the Supply Company's meter(s) on the front of the ASSEMBLY and for the corresponding current transformers;
2. The metering compartment shall be complete with a hinged glazed door for meter viewing and suitable support for mounting the meter.

ELE4.3.7.020.8 METERING EQUIPMENT

1. The metering equipment will be supplied and fixed by the Supply Company on site, but the ASSEMBLY shall be complete with fuses for the voltage coil, removable links for mounting the current transformers and the associated wiring to the meter;
2. The fuses shall be of rating according to the requirements of the Supply Company, with provision for sealing to prevent unauthorized removal and the incoming side of the fuseholders bolted to the incoming supply busbar.

ELE4.3.8 MOULDED CASE CIRCUIT BREAKERS (MCCB)**ELE4.3.8.010.8 COMPLIANCE WITH SPECIFICATION**

Unless otherwise specified, MCCBs mounted in the ASSEMBLY shall comply with the relevant parts of Specification for MCCB (i.e. ELE3.4). MCCB shall be type-tested and comply with the additional requirements for circuit breakers suitable for isolation in accordance with Clause 7.1.2 of IEC 60947-2.

ELE4.3.8.020.8 INSTALLATION (FOR IEC 60439 COMPLIANCE)

The installation of MCCBs mounted in the ASSEMBLY shall also comply with IEC 60439-1. The installation details such as the ways of mounting, mounting plates, termination of incoming and outgoing conductors, clearance and creepage distances, dimensions of enclosure, etc. shall be submitted to verify them in full compliance with the type-tested arrangements and/or the MCCB manufacturers' recommendations.

ELE4.3.8.025.8 INSTALLATION (ALTERNATIVE TO CLAUSE ELE4.3.8.020 FOR IEC 61439 COMPLIANCE)

The installation of MCCBs mounted in the ASSEMBLY shall also comply with IEC 61439-1 and IEC 61439-2. The installation details such as the ways of mounting, mounting plates, termination of incoming and outgoing conductors, clearance and creepage distances, dimensions of enclosure, etc. shall be submitted to verify them in full compliance with the type-tested arrangements and/or the MCCB manufacturers' recommendations.

ELE4.3.8.030.8 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall produce documentary evidences in accordance with **PRE.BS1.205** to verify the country / place of manufacture and authenticity of MCCBs delivered to Site or installed.

ELE4.3.9 POWER FACTOR CORRECTION EQUIPMENT**ELE4.3.9.010.8 COMPLIANCE WITH SPECIFICATION**

Unless otherwise specified, power factor correction equipment mounted on/housed in the ASSEMBLY shall comply with the Specification for Power Factor Correction Equipment (i.e. ELE5).

ELE4.4 PROTECTION AND INSTRUMENTATION

ELE4.4.1 CIRCUIT BREAKER PROTECTION

ELE4.4.1.010.8 COMPLIANCE WITH SPECIFICATION (FOR IEC 60439 COMPLIANCE)

The protection scheme for circuit breakers shall be in accordance with **ELE4.4.1.020** and **ELE4.4.1.030** as indicated on the Drawings.

ELE4.4.1.015.8 COMPLIANCE WITH SPECIFICATION (ALTERNATIVE TO CLAUSE ELE4.4.1.010 FOR IEC 61439 COMPLIANCE)

The protection scheme for circuit breakers shall be in accordance with **ELE4.4.1.020** and **ELE4.4.1.035** as indicated on the Drawings.

ELE4.4.1.020.8 PROTECTION SCHEME WITH EXTERNAL D.C. SOURCE FOR TRIPPING

For overcurrent or earth fault protection the circuit breaker shall trip by means of shunt trip release operated from the battery set and charger and controlled by protection relays. Three overcurrent relays, one for each phase, and one earth fault relay shall be provided.

ELE4.4.1.030.8 BATTERY SET AND CHARGER (FOR IEC 60439 COMPLIANCE)

1. General:

A set of battery and charger system shall be provided for the tripping circuit. The battery set and charger shall be manufactured by a specialised battery and charger manufacturer and be suitable for use under the intended service conditions;

2. Battery/Charger equipment:

The battery/charger equipment shall be housed in a segregated front accessible compartment as defined in **ELE4.2.050**. The input voltage of the battery charger shall be 220V a.c., 50Hz and the output voltage of the battery shall be 30V d.c;

3. Batteries:

- a. The batteries shall be sealed nickel cadmium to IEC 61951-1 or nickel-metal hydride to IEC 61951-2, maintenance free type, rated at 5 hours discharge rate. Type test report shall be submitted if required by the Contract Manager. Cells shall be of the sealed nickel cadmium sintered plate type or nickel-metal hydride type;
- b. The rated capacity of the battery for switchgear tripping auxiliary supplies shall be sufficient for at least 20 operations without charging and for at least two air circuit breakers tripping simultaneously, and shall be of at least 4 Ampere-hour rating.

4. Battery charger:

The battery charger shall be automatic trickle-charge type with two rates charging to suit the battery characteristics. The first rate of charging shall be capable of restoring full capacity and second rate shall maintain the batteries in a fully charged condition. The standard charge rate and the float charge rate of the battery charger shall be adjustable to meet requirements of battery rating up to 10 Ampere-hour;

5. Battery re-charging time:

The time required for re-charging batteries from fully discharged to fully charged condition shall be not more than eight hours. Battery over-current protection shall be provided to safeguard the battery under short circuit conditions and facilities shall also be provided to prevent the batteries from being overcharged;

6. Battery charger indication/facilities:

The battery charger shall be provided with the following indications/facilities which shall be extended and mounted on the front door of the compartment:

- a. Mains On;
- b. Charger Fail;
- c. Voltmeter;
- d. Ammeter;
- e. Test Facilities.

ELE4.4.1.035.8

BATTERY SET AND CHARGER (ALTERNATIVE TO CLAUSE ELE4.4.1.030 FOR IEC 61439 COMPLIANCE)

1. General:

A set of battery and charger system shall be provided for the tripping circuit. The battery set and charger shall be manufactured by a specialised battery and charger manufacturer and be suitable for use under the intended service conditions;

2. Battery/Charger equipment:

The battery/charger equipment shall be housed in a segregated front accessible compartment as defined in [ELE4.2.055](#). The input voltage of the battery charger shall be 220V a.c., 50Hz and the output voltage of the battery shall be 30V d.c;

3. Batteries:

- a. The batteries shall be sealed nickel cadmium to IEC 61951-1 or nickel-metal hydride to IEC 61951-2, maintenance free type, rated at 5 hours discharge rate. Type test report shall be submitted if required by the Contract Manager. Cells shall be of the sealed nickel cadmium sintered plate type or nickel-metal hydride type;
- b. The rated capacity of the battery for switchgear tripping auxiliary supplies shall be sufficient for at least 20 operations without charging and for at least two air circuit breakers tripping simultaneously, and shall be of at least 4 Ampere-hour rating.

4. Battery charger:

The battery charger shall be automatic trickle-charge type with two rates charging to suit the battery characteristics. The first rate of charging shall be capable of restoring full capacity and second rate shall maintain the batteries in a fully charged condition. The standard charge rate and the float charge rate of the battery charger shall be adjustable to meet requirements of battery rating up to 10 Ampere-hour;

5. Battery re-charging time:

The time required for re-charging batteries from fully discharged to fully charged condition shall be not more than eight hours. Battery over-current protection shall be provided to safeguard the battery under short circuit conditions and facilities shall also be provided to prevent the batteries from being overcharged;

6. Battery charger indication/facilities:

The battery charger shall be provided with the following indications/facilities which shall be extended and mounted on the front door of the compartment:

-
- a. Mains On;
 - b. Charger Fail;
 - c. Voltmeter;
 - d. Ammeter;
 - e. Test Facilities.

ELE4.4.1.040.8 ELECTROMECHANICAL TYPE PROTECTION RELAY

1. Overcurrent and earth/fault protection relays shall be of induction type to BS EN 60255 or IEC 60255 with IDMT characteristics in accordance with the time setting specified below;
2. The relays shall be accommodated in draw-out cases and contacts shall be fitted which shall short-circuit the associated current transformers on withdrawal of the relay. For the overcurrent relays, the three single phase elements shall be arrayed in one horizontal plane and accommodated in a common draw-out case, which shall be flush mounted on the front hinged door of the ASSEMBLY;
3. Operation indicators shall be provided for each protective element and installed within the same relay. They shall have a common hand-reset device openable without opening the relay case. The overcurrent relay shall comprise the following features:

a. Current setting:	50% to 200% of 5A (CT rating), adjustable in 7 equal steps;
b. Time setting:	0.63 second at 10 times current setting (for HEC supply); 1.3 seconds at 10 times current setting (for CLP supply);
c. Burden:	3.5VA maximum at current setting.

4. The earth fault relay shall comprise the following features:

a. Current setting:	10% to 40% of 5A (CT Rating), adjustable in 7 equal steps;
b. Time setting:	1.3 seconds at 10 times current setting;
c. Burden:	3.5VA maximum at current setting.

ELE4.4.1.050.8 ELECTRONIC TYPE PROTECTION RELAYS

1. Electronic type protection relays shall comply with BS EN 60255 or IEC 60255 with choice of the following characteristic curves:
 - a. Normal inverse IDMT curve;
 - b. Very inverse IDMT curve;
 - c. Extremely inverse IDMT curve.
2. The relay shall provide trip contact for overcurrent and earth fault protections, and separate signal contacts for time delayed phase fault, instantaneous high-set phase fault and time delayed earth fault operations;
3. Trip indicators shall be provided which will enable the type of fault condition to be identified. Each indicator shall be capable of being reset by hand without opening the relay case;
4. The relay shall comprise the following features:

- a. Current setting: 0.5 to 2 x I_n in step of 0.05 x I_n with instantaneous high-set of 5 to 10 x I_n for overcurrent protection; 0.1 to 0.4 x I_n in step of 0.05 x I_n for earth fault protection;
 - b. Time multiplier setting: 0.1 to 1.0 in 0.05 step;
 - c. AC burden: less than 0.5VA for 5A relay in any setting.
5. The relay shall be accommodated in a dust-proof case to IP51 and can be easily drawn out on front side in the event that the relay requires replacement. Facility shall be provided for short-circuiting the associated current transformers on withdrawal of the relay. The draw-out case shall be flush mounted on the front-hinged door of the ASSEMBLY. The relay shall be rated for an operating temperature up to 55°C;
 6. The relay shall be type-tested for compliance with the following international standards by an Accredited Laboratory:

Standards	Description
BS EN 61000-6-4 or IEC 61000-6-4	Electromagnetic Emission
BS EN 61000-6-2 or IEC 61000-6-2	Electromagnetic Immunity
BS EN 60255-3 or BS EN 60255-151 or IEC 60255-151	Accuracy
BS EN 60255-21-1 or IEC 60255-21-1	Vibration Tests - Class 1
BS EN 60255-21-2 or IEC 60255-21-2	Shock & Bump Tests - Class 1
BS EN 60255-22-2 or IEC 60255-22-2	Electrostatic Discharge Tests - Class 2

7. The relay shall be suitable for operation at 30V d.c. auxiliary power supply and accepts current inputs from standard protection current transformers with rated secondary current of 5A. An exclusive battery set and charger shall be provided for relay operation.

ELE4.4.1.060.8**EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY FOR ELECTROMECHANICAL AND ELECTRONIC TYPE PROTECTION RELAY**

The Sub-contractor shall produce documentary evidences in accordance with **PRE.BS1.205** to verify the country / place of manufacture and authenticity of electromechanical and electronic type protection relays delivered to Site or installed.

ELE4.4.3 FUSE PROTECTION**ELE4.4.3.010.8****METHOD OF PROTECTION**

All potential auxiliary and control circuits shall be protected by fuses.

ELE4.4.3.020.8**COMPLIANCE WITH SPECIFICATION**

All fuses used, including those used in fuse combination units, shall be in compliance with the Specification for Fuses (i.e. ELE3.13).

ELE4.4.4 CURRENT TRANSFORMERS

ELE4.4.4.010.8 STANDARD AND TYPE

Current transformers shall comply with IEC 60044-1 and shall be of ring and encapsulated type.

ELE4.4.4.020.8 MEASURING CURRENT TRANSFORMERS

Measuring current transformers shall have a minimum accuracy class of 1. The C.T. ratio for measuring current transformer shall match the corresponding indicating/measuring device.

ELE4.4.4.030.8 PROTECTION CURRENT TRANSFORMERS

Protection current transformers shall have a minimum accuracy class of 10P. The rating of the current transformer shall match the total burden of the trip circuit including the relays, connection leads and overcurrent release where applicable, to which the current transformer is connected, such that, under the most severe fault conditions, the current transformer does not saturate and is still capable of maintaining its accuracy. For 2500A incoming ACB obtaining power supply from CLP, the protection current transformer shall have a C.T. ratio of 2250/5 unless otherwise specified.

ELE4.4.4.040.8 FITTING

Unless otherwise specified, the protective current transformers shall be fitted on the outgoing side of the respective circuit breaker, whereas for the measuring current transformer, on the outgoing side of the functional unit, removable short links for mounting the current transformer shall be provided to facilitate subsequent easy replacement/maintenance.

ELE4.4.5 INDICATING METERS

ELE4.4.5.010.A STANDARD

Indicating meters of analogue type shall comply with class 2.5 of BS EN 60051 or IEC 60051. Multi-function electronic meters shall comply with BS EN 61557-12 or IEC 61557-12.

ELE4.4.5.020.A MOUNTING

Meters of analogue type with approximate 75 mm dial and with an external zero adjustment, and multi-function electronic meters shall be flush mounted on the front cover of the ASSEMBLY.

ELE4.4.5.030.A MONITORING

Multi-function electronic meters, analogue type ammeters and voltmeters etc. shall be provided as shown on the Drawings. The analogue type ammeters used for monitoring the total current carried by the incoming circuit breaker shall be of the combination type with the thermal demand and the instantaneous values shown. The thermal demand shall indicate the mean r.m.s. current over the past 15 minutes with a slave pointer showing the maximum value reached.

ELE4.4.5.040.A MULTI-FUNCTION ELECTRONIC METERS

1. Multi-function electronic meter shall be of a digital display type to measure the following electrical parameters by means of microprocessor technology:

Function of Measurement	Minimum Accuracy
True Root Mean Square (RMS) Current: per phase & neutral	±0.5%
True RMS Volts: all phase-to-phase & phase-to-neutral	±0.5%
Real Power (kW): per phase & three phase total	±1%
Apparent Power (kVA): per phase & three phase total	±1%
Reactive Power (kVAr): per phase & three phase total	±1%
Total Power Factor: per phase & three phase total	±1%
Frequency (Hz)	±1%
Maximum Demand Current (Id): per phase, present & peak	±1%
Real Power Demand (kWd): three phase total, present & peak	±1%
Apparent Power Demand (kVAd): three phase total, present & peak	±1%
Reactive Power Demand (kVAr d): three phase total	±1%
Real Energy (kWh): three phase total	±1%
Total Harmonic Distortion (THD): per phase, voltage & current (at least up to 31 st harmonic order)	±2%

2. The meter shall be suitable for operation at 380V/220V, 50Hz and accepts current inputs from standard measuring current transformers with rated secondary current of 5A. The meter shall be rated for an operating temperature up to 50°C and have a minimum overcurrent withstand rating of 100A for 1 second;
3. The meter shall be capable to trend the required parameters as stipulated in the BEC Code at every 15 minutes and include hourly, daily, monthly and annual data. The meter shall be equipped with sufficient built-in memory capable of maintaining all data collected for a minimum of 36 months. The Sub-contractor shall retrieve the data files from all meters and submit to the CM on annual basis or as required by the CM during the Maintenance Period;
4. The meter shall be equipped with a communication port at front panel, using either RS232, RS485, RJ45 or similar socket and plug as Approved, for communication with portable personal computer for energy control and audit purpose. The connection cable with the appropriate plug and a copy of proprietary-made software for data retrieval shall be provided;
5. The meter shall be flush mounted with protection to not less than IP2X at front face. All wiring shall be connected via terminal blocks to allow easy removal of the cable connectors in the event that the meter requires replacement;
6. The meter shall comply with the general electrical safety requirements as specified in IEC 61010-1 and should be suitably suppressed to fall within the limits allowed by BS EN 61000-6-4 or IEC 61000-6-4 and BS EN 61000-6-2 or IEC 61000-6-2 for electromagnetic emission and immunity;

7. The manufacturer shall operate a quality management system conforming to ISO 9001 or other equivalent national/international quality system. The manufacturer shall issue a calibration certificate for every meter at time of production and the calibration certificate shall be submitted to the CM. Such calibration shall be conducted by the manufacturer within one year prior to delivery of the meter on site or prior to the date of factory acceptance test if the meter is installed in a switchboard that factory acceptance test is required. The manufacturer shall also declare in writing that the meter shall require no re-calibration for a minimum of 10 years from the time of issue of calibration certificate. A label marking the manufacturer's calibration date shall be fixed adjacent to the meter;
8. For domestic building with Smart Meter Monitoring System provision:
 - a. The meters shall be fully compatible with Smart Meter Monitoring System as stipulated in ELE35 to allow connection for data retrieval by the System. Necessary data cables connections shall be included and wired to the interfacing terminals of the System.

ELE4.4.6 VOLTAGE SENSING RELAYS

ELE4.4.6.010.8 GENERAL

1. Two numbers of voltage sensing relays of different brands for monitoring the mains supply conditions shall be provided to control the operation of the automatic changeover contactors and to activate the starting of the standby generating set and alarm indication as shown on the drawings.

ELE4.4.6.020.8 FEATURES (FOR IEC 60439 COMPLIANCE)

1. The relay shall be suitable for monitoring voltage of 380/220V 3-phase 4-wire system;
2. The relay shall be provided with indication to show its operation status;
3. The voltage sensing elements shall operate from measured phase-to-neutral voltages. When the voltage at either one phase drops below the voltage setting and sustains for a period exceeding the time setting, the relay shall activate the dry contacts to open position. The dry contacts shall be reset to close position automatically when all the measured voltages resume normal;
4. The relay shall operate at 24V d.c. auxiliary power supply. The battery set and charger for the auxiliary power supply shall comply with the requirement as stipulated in [ELE4.4.1.030](#);
5. The relay shall comply with the following requirement:

Description	Requirements
Adjustable voltage monitoring element setting	Undervoltage: 75 – 100%
Adjustable time delay setting	0 – 1 sec.
Expected mechanical life	0.2 million operations
Standard	IEC 60255 or other reputable national/international standards.
Operating temperature	0°C to +55°C

ELE4.4.6.025.8 FEATURES (ALTERNATIVE TO CLAUSE ELE4.4.6.020 FOR IEC 61439 COMPLIANCE)

1. The relay shall be suitable for monitoring voltage of 380/220V 3-phase 4-wire system;
2. The relay shall be provided with indication to show its operation status;
3. The voltage sensing elements shall operate from measured phase-to-neutral voltages. When the voltage at either one phase drops below the voltage setting and sustains for a period exceeding the time setting, the relay shall activate the dry contacts to open position. The dry contacts shall be reset to close position automatically when all the measured voltages resume normal;
4. The relay shall operate at 24V d.c. auxiliary power supply. The battery set and charger for the auxiliary power supply shall comply with the requirement as stipulated in [ELE4.4.1.035](#);
5. The relay shall comply with the following requirement:

Description	Requirements
Adjustable voltage monitoring element setting	Undervoltage: 75 – 100%
Adjustable time delay setting	0 – 1 sec.
Expected mechanical life	0.2 million operations
Standard	IEC 60255 or other reputable national/international standards.
Operating temperature	0°C to +55°C

ELE4.4.6.030.8 FACTORY TESTING

1. The relay shall be tested on load with a dummy circuit at the switchboard manufacturer workshop for operation for at least 50 times with each operating voltage and time properly recorded before installed in the switchboard cubicle. Result shall be incorporated into the test report. The setting shall be properly sealed after the factory test.

ELE4.4.7 BATTERY SET AND CHARGER FOR CONTROL CIRCUIT**ELE4.4.7.010.8 BATTERY SET AND CHARGER (FOR IEC 60439 COMPLIANCE)**

1. General:

A separate battery and charger system shall be provided for the control circuit. The battery set and charger shall be manufactured by a specialised battery and charger manufacturer and be suitable for use under the intended service conditions;

2. Battery/Charger equipment:

The battery/charger equipment shall be housed in a segregated front accessible compartment as defined in [ELE4.2.050](#). The input voltage of the battery charger shall be 220V a.c., 50Hz and the output voltage of the battery shall be 24V d.c. for control circuit;

3. Batteries:

- a. The batteries shall be sealed nickel cadmium to IEC 61951-1 or nickel-metal hydride to IEC 61951-2, maintenance free type, rated at 5 hours discharge rate. Cells shall be of the sealed nickel cadmium sintered plate type or nickel-metal hydride type;
 - b. The rated capacity of the battery for control circuits shall be sufficient for at least 24 hours operations without charging including at least 10 times change of state of the control relays.
4. Battery charger:

The battery charger shall be automatic trickle-charge type with two rates charging to suit the batteries characteristics. The first rate of charging shall be capable of restoring full capacity and second rate shall maintain the batteries in a fully charged condition. The standard charge rate and the float charge rate of the battery charger shall be adjustable to meet requirements of battery rating up to 10 Ampere-hour;
5. Battery re-charging time:

The time required for re-charging batteries from fully discharged to fully charged condition shall be not more than eight hours. Battery over-current protection shall be provided to safeguard the battery under short circuit conditions and facilities shall also be provided to prevent the batteries from being overcharged;
6. Battery charger indication/facilities:

The battery charger shall be provided with the following indications/facilities which shall be extended and mounted on the front door of the compartment:

 - a. Mains On;
 - b. Charger Fail;
 - c. Voltmeter;
 - d. Ammeter;
 - e. Test Facilities.

ELE4.4.7.015.8**BATTERY SET AND CHARGER (ALTERNATIVE TO CLAUSE ELE4.4.7.010 FOR IEC 61439 COMPLIANCE)**

1. General:

A separate battery and charger system shall be provided for the control circuit. The battery set and charger shall be manufactured by a specialised battery and charger manufacturer and be suitable for use under the intended service conditions.
2. Battery/Charger equipment:

The battery/charger equipment shall be housed in a segregated front accessible compartment as defined in **ELE4.2.055**. The input voltage of the battery charger shall be 220V a.c., 50Hz and the output voltage of the battery shall be 24V d.c. for control circuit.
3. Batteries:
 - a. The batteries shall be sealed nickel cadmium to IEC 61951-1 or nickel-metal hydride to IEC 61951-2, maintenance free type, rated at 5 hours discharge rate. Cells shall be of the sealed nickel cadmium sintered plate type or nickel-metal hydride type;
 - b. The rated capacity of the battery for control circuits shall be sufficient for at least 24 hours operations without charging including at least 10 times change of state of the control relays.
4. Battery charger:

The battery charger shall be automatic trickle-charge type with two rates charging to suit the batteries characteristics. The first rate of charging shall be capable of restoring full capacity and second rate shall maintain the batteries in a fully charged condition. The standard charge rate and the float charge rate of the battery charger shall be adjustable to meet requirements of battery rating up to 10 Ampere-hour.

5. Battery re-charging time:

The time required for re-charging batteries from fully discharged to fully charged condition shall be not more than eight hours. Battery over-current protection shall be provided to safeguard the battery under short circuit conditions and facilities shall also be provided to prevent the batteries from being overcharged.

6. Battery charger indication/facilities:

The battery charger shall be provided with the following indications/facilities which shall be extended and mounted on the front door of the compartment:

- a. Mains On;
- b. Charger Fail;
- c. Voltmeter;
- d. Ammeter;
- e. Test Facilities.

ELE4.5 MISCELLANEOUS

ELE4.5.1 INFORMATION, MARKING AND LABELLING

ELE4.5.1.010.8 INFORMATION TO BE GIVEN (FOR IEC 60439 COMPLIANCE)

1. The ASSEMBLIES shall be provided with one or more plates, marked in a durable manner and located in a place such that they are visible and legible when the ASSEMBLIES is installed;
2. The following shall be given on the nameplates:
 - a. The manufacturer's name or trade mark;
 - b. Type designation or identification number or other means of identification making it possible to obtain relevant information from the manufacturer;
 - c. Standard of the ASSEMBLIES (e.g. IEC 60439-1);
 - d. Type of current;
 - e. Rated operation voltage and frequency;
 - f. Rated insulation voltage;
 - g. Short-circuit withstand strength;
 - h. Degree of protection; and
 - i. Rating of main busbars.

ELE4.5.1.015.8 INFORMATION TO BE GIVEN (ALTERNATIVE TO CLAUSE ELE4.5.1.010 FOR IEC 61439 COMPLIANCE)

1. The ASSEMBLIES shall be provided with one or more plates, marked in a durable manner and located in a place such that they are visible and legible when the ASSEMBLIES is installed;
2. The following shall be given on the nameplates:
 - a. The manufacturer's name or trade mark;
 - b. Type designation or identification number or other means of identification making it possible to obtain relevant information from the manufacturer;
 - c. Standard of the ASSEMBLIES (e.g. IEC 61439-1 and IEC 61439-2);
 - d. Type of current;
 - e. Rated operation voltage and frequency;
 - f. Rated insulation voltage;
 - g. Short-circuit withstand strength;
 - h. Degree of protection; and
 - i. Rating of main busbars.

ELE4.5.1.020.8 LABELS AND MARKINGS

1. Each equipment, functional unit and settings of overcurrent and earth fault protection of air circuit breakers and moulded case circuit breakers of the ASSEMBLY shall be marked or labelled in a durable and indelible manner in both English and Chinese for identification;
2. Unless otherwise specified, all warning labels referred to in the previous clauses shall be coloured in red with white lettering in both English and Chinese denoting,
 "DANGER 380/220V
 危險 380/220 伏特"
3. The removable cover of the incoming conductor and connection compartment shall bear a warning label coloured in red with white lettering in both English and Chinese denoting,
 "INCOMING CONNECTION - DANGER - 380/220 V - SWITCH OFF FROM SUPPLY COMPANY'S SIDE BEFORE REMOVING COVER
 電源接點 - 危險 - 380/220V
 開蓋前必須切斷電力公司來電"
4. For other circuits of the ASSEMBLY which may be still live when the incoming circuit breaker(s) are switched off, such as the essential busbars, the circuit for discharging the capacitive electrical energy, etc., the covers shall bear appropriate warning labels (e.g. LIVE BUSBAR 危險 - 帶電電巴) for personnel gaining access to those parts.

ELE4.5.2 VERIFICATION AND TESTING**ELE4.5.2.010.8 VERIFICATION (FOR IEC 60439 COMPLIANCE)**

1. Two sets of shop drawings showing the details of the proposed ASSEMBLY including the front and end elevations, single line busbar diagrams, control wiring diagrams, list of equipment schedule and any other details as required by the Contract Manager, shall be submitted for approval prior to assembly;
2. The drawings shall indicate which portions of the ASSEMBLY are TTA and PTTA if required by the Contract Manager. For PTTA, documents such as test reports, calculations, etc., to verify the conformity with the TTA shall be submitted for examination.

ELE4.5.2.015.8 VERIFICATION (ALTERNATIVE TO CLAUSE ELE4.5.2.010 FOR IEC 61439 COMPLIANCE)

1. Two sets of shop drawings showing the details of the proposed ASSEMBLY including the front and end elevations, single line busbar diagrams, control wiring diagrams, list of equipment schedule and any other details as required by the Contract Manager, shall be submitted for approval prior to assembly;
2. The drawings shall indicate which portions of the ASSEMBLY are verified by testing, by calculation, measurement or by satisfying design rules if required by the Contract Manager. Documents such as test reports, calculations, etc., to verify the above conformity shall be submitted for examination.

ELE4.5.2.020.8 WORKSHOP TESTS (FOR IEC 60439 COMPLIANCE)

1. The following tests shall be performed at the manufacturer's workshop during the course of assembly and on completion immediately prior to transportation to site:

-
- a. Inspection of the ASSEMBLY including wiring, electrical and mechanical connections, external and internal finish, degree of protection, creepage distance and clearance, etc.;
 - b. Mechanical test;
 - c. Primary and secondary injection tests to check that all measuring, protection and control circuits and associated components are operative;
 - d. Continuity test;
 - e. Dielectric properties test;
 - f. Functional check, including the shunt trip operation of breakers at 70% and 110% of the rated control supply voltage, if applicable.
2. All the above inspections and tests shall be carried out in accordance with IEC 60439-1, IEC 60947-2 and IEC 60947-3 and the standard test report format prepared by the Contract Manager.

ELE4.5.2.025.8**WORKSHOP TESTS (ALTERNATIVE TO CLAUSE ELE4.5.2.020 FOR IEC 61439 COMPLIANCE)**

1. The following tests shall be performed at the manufacturer's workshop during the course of assembly and on completion immediately prior to transportation to site:
 - a. Inspection of the ASSEMBLY including wiring, electrical and mechanical connections, external and internal finish, degree of protection, creepage distance and clearance, etc.;
 - b. Mechanical test;
 - c. Primary and secondary injection tests to check that all measuring, protection and control circuits and associated components are operative;
 - d. Continuity test;
 - e. Dielectric properties test;
 - f. Functional check, including the shunt trip operation of breakers at 70% and 110% of the rated control supply voltage, if applicable.
2. All the above inspections and tests shall be carried out in accordance with IEC 61439-1 and IEC 61439-2 and IEC 60947-2 and IEC 60947-3 and the standard test report format prepared by the Contract Manager.

ELE4.5.2.030.8**SITE TESTS**

After the erection of the ASSEMBLY on site, the following test/inspections shall also be carried out:

1. General inspection of the ASSEMBLY;
2. Mechanical tests;
3. Continuity and insulation resistance tests;
4. Function checks;
5. Contact resistance test (testing of a series of joints at one time for horizontal main busbars and vertical busbar riser/droppers; the test shall be recorded in the format approved by CM);
6. Secondary injection test to re-calibrate all measuring, protection and control circuits and associated components.

ELE4.5.2.040.8 COMMISSIONING TESTS

The following inspections and tests shall be carried out immediately before the ASSEMBLY is put into normal service:

1. Voltage tests between any two combinations of each phase, neutral and earth;
2. Phase sequence tests on each outgoing unit;
3. Functional checks, especially on the controlling devices.

ELE4.5.2.050.X DELETED**ELE4.5.3 AUXILIARY EQUIPMENT****ELE4.5.3.010.8 COMPLETENESS**

Each ASSEMBLY shall be supplied complete with all operating handles, jigs, etc. required for the normal operation and inspection of all circuit breakers and switchgears of the ASSEMBLY.

ELE5.1 GENERAL ARRANGEMENT

ELE5.1.010.8 HOUSING

The capacitor units shall be housed in a separated compartment to prevent the control equipment from being damaged by the capacitors in case of a fault.

ELE5.1.020.8 CONTROLS

For capacitor installation of ratings equal to 30 kVAr or less, no step-switching mechanism and control relay or regulator will be required. For ratings greater than 30 kVAr, the capacitor installation shall be switchable type complete with switching devices and automatic control relays.

ELE5.2 CUBICLE CABINET DESIGN

ELE5.2.010.8 CONSTRUCTION

The construction of the cabinet and the fixture of the capacitor installation shall be sufficiently rigid to stand the thermal, electrical and mechanical stresses due to short circuit, step-switching and discharging of the capacitor.

ELE5.2.020.8 MOUNTING OF SWITCHES

For switchable type capacitor cabinet, flush mounted indicating devices and selector control switches shall be fitted on the front panel which shall be in the form of a hinged door.

ELE5.2.030.8 DEGREE OF PROTECTION

The cubicle cabinet shall have a degree of protection not less than IP 31 and IP 2X when the cubicle door is in the "close" and "open" position respectively.

ELE5.2.040.8 POSITION OF MAIN FUSESWITCH

The main fuseswitch for the power factor correction equipment shall not be housed within the control cabinet.

ELE5.2.050.8 SPACING

1. Sufficient space shall be allowed between cables connecting distribution fuses to contactors and contactors to capacitor banks for insertion of clamp-on meters for current measurement.
2. The capacitor units shall be spaced to enable access to individual capacitor terminals for on-load electrical tests.

ELE5.3 CAPACITORS

ELE5.3.010.8 STANDARD

1. IEC 60831-1;
2. IEC 60831-2.

ELE5.3.020.8 RATED OUTPUT OF CAPACITOR BANK

The output kVAr rating of capacitor bank shall be provided according to the standard ratings listed below:

20, 25, 30, 40, 50, 60, 90, 120, 150, 180, 200, 240, 280 (subsequent increases in 40 kVAr steps).

ELE5.3.030.8 RATED OUTPUT OF CAPACITOR UNIT

The output kVAr rating of each capacitor unit shall be provided according to the standard ratings listed below (all in kVAr):

20, 25, 30, 40.

ELE5.3.040.8 SAFETY FEATURES

1. All capacitor elements shall be of self-healing type, capable of self-restoration after breakdown of insulation due to momentary over voltage. The self-healing process shall be complete within half-a-cycle and with no significant changes in capacitance and the loss angle;
2. The capacitor elements shall be completely encapsulated in metal or epoxy case and fitted with tear-off fuse or other effective means to minimize overpressure due to internal fault;
3. Capacitors shall be dry type only;
4. PCBs (polychlorinated biphenyls) shall not be used and dielectric shall be environment compatible, i.e. no pollution to environment in case of leakage;
5. All materials used in capacitors except the dielectric shall be non-flammable and self-extinguishing;
6. Fuses having a current rating 1.5 times the capacitor current shall be provided to protect each capacitor unit and shall comply with ELE3.13;
7. A label shall be fixed on the front surface of the cubicle to indicate, in English and Chinese, the operating procedures before accessing the live parts inside the cubicle compartment. The label shall be submitted to Contract Manager for Approval;
8. The metallic container of the capacitor units and also the cubicle cabinet shall be properly earthed by permanent connection.

ELE5.3.050.8 DISCHARGE DEVICE

1. A resistor discharge device of appropriate resistance value shall be provided to reduce the residual voltage to less than 50V within one minute after actuation of the device. The discharge device shall function automatically on loss of supply and the discharge circuit shall be rated to discharge the capacitor bank from the peak of 30% overvoltage;
2. The residual voltage shall be measured across the terminals of the whole capacitor bank, i.e. not across individual capacitor element or unit;

-
3. The discharge path shall have no disconnecting link, switch, fuse or series capacitor interposed.

ELE5.3.060.8**LOSSES**

1. The losses measured under nominal voltage and frequency shall be less than 0.5 W per kVAr. Type test report to the satisfaction of the Contract Manager shall be submitted to verify that this requirement has been met;
2. Puncture of insulation due to momentary overvoltage across electrodes shall not lead to significant increase in losses.

ELE5.3.070.8**CAPACITANCE TOLERANCES**

1. The capacitance shall not differ from the rated capacitance by more than:
 - a. -5% to 15% for units and banks up to 100 kVar;
 - b. 0% to 10% for units and banks above 100 kVar.
2. In three-phase units, the ratio of maximum and minimum value of the capacitance measured between any two-line terminals shall not exceed 1.08;
3. Rating plate bearing the information markings as stipulated in Sections 26 & 27 of IEC 60831-1, shall be provided for each capacitor unit and the capacitor bank.

ELE5.4 AUTOMATIC CONTROL EQUIPMENT

ELE5.4.010.8 APPLICATION

For capacitors of 40 kVAr and above, automatic control relay shall be provided to maintain the power factor at the specified value.

ELE5.4.020.8 OPERATION OF CONTROL SYSTEM

The control system shall continuously detect and measure the power factor and switch-in or switch-out bank(s) of capacitors in steps to maintain the designed power factor. The value of each step is determined as follows:

Total capacitor rating in kVAr	Minimum no. of steps	Maximum of each step
40	2	20 kVAr
50	2	25 kVAr
60	3	20 kVAr
90	3	30 kVAr
120	4	30 kVAr
150	5	30 kVAr
180	6	30 kVAr
200	5	40 kVAr
240	6	40 kVAr
280	7	40 kVAr

ELE5.4.030.8 STEPS

The number of steps shall be programmable within the range of 2 steps to 12 steps using a code switch.

ELE5.4.040.8 POWER FACTOR SELECTOR SWITCH

The power factor selector switch shall be continuously adjustable between 0.85 inductive to 0.95 capacitive.

ELE5.4.050.8 CONTROL RELAY

The control relay shall be designed in such a way that there shall be no relay hunting when the load power fluctuates. A starting reactive current (c/k ratio) setting device shall be provided to allow stepless adjustment between 0.075 to 1.0.

ELE5.4.060.8 SWITCHING TIME

The switching time between each switching stage shall be adjustable from 30 seconds to 60 seconds or above to give a time delay longer than the charging and discharging times of the previous stage so that there shall be no simultaneous charging or discharging of two stages.

ELE5.4.070.8 PROVISIONS FOR POWER FAILURE

In the event of power failure, all the capacitors shall be automatically disconnected and discharged. On restoration of supply, the relay shall, after a waiting time to ensure sufficient discharge of stored energy, commence operation in accordance with the selected switching programme and power factor setting.

ELE5.4.080.8 ACCESS TO CONTROL SWITCHES

Unless otherwise stated, all the control switches shall be front accessible without opening the cabinet door stated in [ELE5.2.020](#).

ELE5.5 MANUAL CONTROL

ELE5.5.010.8 SELECTOR SWITCH

A selector switch for manual or automatic control of the equipment shall be provided inside the cubicle cabinet.

ELE5.5.020.8 PUSH-BUTTONS

Push-buttons shall be provided for steps "switching-in" and "switching-out" in the manual mode with the switching time delay as provided at **ELE5.4.060**.

ELE5.5.030.8 CAPACITOR CONTROL

The number of capacitors "switching-in" or "switching-out" shall be entirely manually controlled irrespective of the mode of controller output.

ELE5.6 ADDITIONAL MANUAL CONTROL

ELE5.6.010.8 OVERRIDE SWITCH

An additional selector switch to override the automatic control relay in case of its failure shall be provided inside the control cabinet.

ELE5.6.020.8 CAPACITOR CONTROL LOCATION

Under this manual control, the number of capacitors "switching-in" or "switching-out" shall be entirely manually controlled by additional push-buttons inside the control cabinet.

ELE5.7 CONTACTORS

ELE5.7.010.8**NUMBER**

The number of contactors shall be determined by the number of switching stages stipulated in **ELE5.4.020**.

ELE5.7.020.8**SPECIFICATION**

Contactors shall be in compliance with ELE3.15.

ELE5.8 INDICATING INSTRUMENTS

ELE5.8.010.8 LOCATION OF INDICATORS

Indicators shall be fitted on the front panel of the cubicle cabinet.

ELE5.8.020.8 INDICATORS FOR RATINGS GREATER THAN 30 KVAR

1. Supply ON/OFF indicator;
2. Power factor meter for inductive/capacitive indication;
3. Indicator showing the number of stages of capacitors being connected;
4. Indicator showing mode of operation, automatic or manual control;
5. Warning plate which reads "WARNING : WAIT 5 MINUTES AFTER ISOLATING SUPPLY BEFORE HANDLING" in both English and Chinese.

ELE5.8.030.8 INDICATORS FOR RATINGS EQUAL TO 30 KVAR OR LESS

1. Warning plate which reads "WARNING : WAIT 5 MINUTES AFTER ISOLATING SUPPLY BEFORE HANDLING" in both English and Chinese;
2. The warning plate specified in sub-clause (1) above shall constitute the minimum requirements and extra indicators relevant to the operation of the control equipment shall be provided to suit the design features of the equipment offered. In particular, the warning plate shall be provided on all access panels or doors;
3. Labels in the cubicle cabinet for indicators and control switches shall be in English or internationally accepted abbreviation.

ELE5.9 TYPE-TESTS AND ROUTINE TESTS

ELE5.9.010.8 TYPE-TESTS

Type-test reports to verify compliance with the specified requirements and details in IEC 60831-1 and IEC 60831-2 shall be submitted to the Contract Manager.

ELE5.9.020.8 ROUTINE TESTS

Routine tests for every capacitor supplied shall be carried out at manufacturer's works and test certificates shall be submitted to the Contract Manager.

ELE5.10 COMMISSIONING AND ACCEPTANCE TESTS

ELE5.10.010.8 FACTORY TESTS

Before putting the equipment into operation, acceptance tests shall be carried out in the manufacturing factory.

ELE5.10.020.8 MINIMUM ACCEPTANCE TESTS

The acceptance tests shall comprise at least the following:

1. Capacitance measurement and output calculation;
2. Measurement of the tangent of the loss angle ($\tan \delta$) of the capacitor;
3. Voltage test between terminal and container;
4. Test of the internal discharge device;
5. Control simulation test.

ELE5.10.030.8 VOLTAGE TEST

During voltage test between terminals, self-healing breakdowns will be allowed. However, the capacitance and tangent of the loss angle shall be measured subsequently and no significant changes in value shall be allowed.

ELE5.10.040.8 CONTROL SIMULATION TEST

During control simulation test, adequate temporary facilities, including field testers to simulate the actual load variations for checking the operation of the control relay and the correct functions of the power factor correction equipment, shall be provided.

ELE5.10.050.8 REPORT FORMATS

The report formats for the tests listed in [ELE5.10.020](#) will be provided by the Contract Manager.

ELE5.10.060.8 ACCEPTANCE TEST REPORT

The acceptance test report for each capacitor installation should be submitted to the Contract Manager prior to delivery to Site.

ELE5.10.070.8 ACCEPTANCE TESTS DURING MAINTENANCE PERIOD

At the end of the Maintenance Period, or at any time instructed by the Contract Manager during the Maintenance Period, the Sub-contractor shall carry out the following and shall replace, at his own cost, any capacitor that fails the inspection and test:

1. Visual inspection;
2. Control simulation test;
3. 24-hour continuous measurements on power factor variations.

ELE6.1 BUSBAR CHAMBERS

ELE6.1.010.8 STANDARD

Busbar chambers shall comply with and be type-tested to IEC 60439-1 and IEC 60439-2.

ELE6.1.020.8 ENCLOSURE

1. The busbar chamber enclosure shall be made of sheet steel not less than 1.5 mm thick for ratings not exceeding 500A, and not less than 2 mm thick for rating above 500A;
2. The enclosure shall be formed in such a way as to give a rigid structure of sufficient strength;
3. The cover shall be provided with rubber gasket and fixed on to the main enclosure at the front by means of heavily electroplated hexagonal headed screws and nuts;
4. Either the screw or the nut shall be permanently fixed on to the main enclosure;
5. The enclosure shall be suitable for surface mounting with a degree of protection against ingress of foreign solid particles and liquids of at least IP31 of IEC 60529 with the cover closed.

ELE6.1.030.8 FINISH

All steel work shall be treated to prohibit corrosion by hot-dip galvanising or electrolytically coated with zinc. The inside and outside surfaces of the enclosure shall then be coated with not less than two layers of stove enamel finish paint of contrasting colours, or one layer of stoved enamel epoxy powder paint, of an Approved colour.

ELE6.1.040.8 BUSBARS

1. Busbars shall be hard drawn, high conductivity, air insulated, electro-tinned, solid copper bars to BS EN 13601;
2. The neutral busbar shall be of the same rating as the phase busbars;
3. Each busbar shall be marked with the appropriate phase colour at intervals of not more than 600 mm;
4. Busbars shall be mounted on insulators that shall follow the type-tested designs.

ELE6.1.050.8 TAP-OFF DEVICES

Unless otherwise Approved, proper tap-off devices in the form of tap-off clamps and cable lugs, where necessary, shall be provided for the tap-off cables and such devices shall not reduce the effective size or rating of the busbars. Slots through enclosures for tap-off cables shall be sealed with phenolic resin bonded paper laminated sheet not less than 6 mm thick.

ELE6.1.060.8 TYPE-TESTING

Busbar chambers shall be type-tested in accordance with Clause 8.1.1 of IEC 60439-1 and IEC 60439-2. The verification of short-circuit strength shall be carried out by a Short-Circuit Testing Organisation at the value of short circuit current specified below:

	Busbar rating	Test circuit
1.	Not exceeding 500A	*Fused short circuit of 40kA

2.	Over 500A	a. Short time withstand current of 40kA for one second; b. Peak withstand current of 84kA.
----	-----------	---

* IEC 60269-1: and IEC 60269-2: and BS 88: Section 2.2 or BS 88-2.

ELE6.3 ALL INSULATED BUSBAR TRUNKING SYSTEM (BUSDUCT)

ELE6.3.010.8

GENERAL

1. This specification covers the all-insulated busbar trunking system including fittings & accessories (hereinafter referred to as "busduct" or "busducts") up to and including 2500A;
2. Busducts shall comply with IEC 60439-2, and meeting all clauses as described in this Specification. Other standards, e.g. National Electrical Manufacturers Association (NEMA) or Underwriters Laboratories Inc. (UL) may be considered as acceptable provided that the standard is not inferior to the relevant IEC standards;
3. All the materials and components use for the busducts shall be of the same make and same country/place of manufacture of the typed-tested ones;
4. The busduct shall be manufactured at the base country/place of the original manufacturer. Licensed to make at other country/place will not be accepted;
5. Busduct current rating indicated on the Schedule of Rates, drawings or the particular specifications is the anticipated full load current (concentrated load) that the busduct must be capable of carrying continuously;
6. If the busduct is installed in flatwise mounting, appropriate de-rating factor as recommended by the manufacturer shall be applied to the busduct;
7. Busducts shall be totally enclosed type with ingress of protection not less than IP55 for indoor installation, including tap-off units, and IP66 for outdoor installation without tap-off units;
8. Unique model numbers shall be used to differentiate busducts with or without tap-off units;
9. Permanent nameplates shall be fixed on each busduct section and fitting. The use of stickers is not considered permanent in these circumstances.

ELE6.3.020.8

DESIGN AND CONSTRUCTION

1. The busducts shall be factory fabricated, fully insulated, totally enclosed, non-ventilated (sandwich) type. The busduct shall be designed to operate under the service conditions as specified in ELE1.5;
2. The busduct shall be of three phases and full size neutral busbar type;
3. Same length of busduct sections shall be interchangeable and polarized for phase relation. Each length of fitting shall bear the manufacturer's name, catalogue no. and rating. Each length or fitting shall bear the manufacturer's name, catalogue no. and rating;
4. All busducts can be mounted either flatwise or edgewise without loss in their mechanical strength and the current carrying capacity;
5. All plug-in sections provided shall be standardised to 1200 mm (4 feet) nominal length.

ELE6.3.030.8**BUSDUCT ENCLOSURE**

1. The enclosure of the busducts shall be rigidly constructed from galvanized sheet steel of not less than 1.5 mm thickness or aluminium of minimum 2.5 mm thickness. Where a combination of sheets of these two materials is used as the assembly, no apparent visible stress shall be observed during operation when the busducts are properly supported. However, the thickness of the metal sheets employed shall, in no case, be less than 1.5 mm each;
2. The enclosure shall have one of the following finishes and the colour shall be grey or the manufacturer's colour of standard production:
 - a. Stoved enamel paint;
 - b. Stoved epoxy powder paint;
 - c. Anodic oxidation coatings to Class 25 of EN 12373-1 for aluminum alloy;
 - d. Other equivalent finishes approved by the Contract Manager.
3. For plug-in type busduct, the plug-in access opening shall be equipped with a hinged cover which covers the opening when not in use. All openings shall be usable simultaneously, if required.

ELE6.3.040.8**BUSBARS**

1. Busbars shall be of hard drawn, high conductivity, solid copper bar to BS EN 13601 or alternatively hard drawn, high conductivity solid copper bars of 97% International Annealed Copper Standard Conductivity;
2. The busbar including all electrical contact surfaces shall be electroplated with silver or tin. The busbars shall be of adequate size to carry the rated current of the busducts continuously without exceeding the temperature rise limits specified in IEC 60439-2 when tested in accordance with sub-clause 8.2.1 of IEC 60439-2 at ambient temperature of 40°C;
3. Each busbar shall be insulated over its entire length except at joints and contact surfaces. The insulation material shall be of at least class B (130°C);
4. The insulation material shall be of heat-resistant, self-extinguishing, non-hygroscopic and high insulation resistance and mechanical strength to withstand the stresses under all services and fault conditions and it shall be tested in accordance with Clauses 8.2.14 of IEC 60439-2 or to the satisfaction of the CM;
5. The maximum voltage drop value of a three phases and neutral busduct shall be 10 volts per 100 metres run when the busduct is operating at a full rated sinusoidal a.c. current of 50 Hz (concentrated load), at a power factor of 0.85 and at an ambient temperature of 35°C. Use of higher current rating busducts to achieve the above maximum voltage drop value is acceptable subject to the maximum allowable structural opening size shown on the drawings not being exceeded;
6. Drilling of busbars for power take off shall not be permitted, unless otherwise approved by the CM.

ELE6.3.050.8**BUSBAR JOINTING**

1. Two sections of busducts shall be joined by connecting the joint-ends of the busbars in an interleaved manner;
2. The joints shall be of bolt-on type. The contact pressure shall be maintained by insulated bolts through the joint with the bolt at earth potential. Soldered, welded or riveted joints shall not be permitted;
3. The bolt shall be torque indicating and be tightened up by means of a torque wrench as recommended by the manufacturer;

4. The joint shall be protected by metal cover plates of same type of material and finish as the busduct casing so that the degree of protection shall not be less than that of an unjoined busduct;
5. The design of jointing shall permit safe, practical checking of joints for tightness without de-energising the busbars, or exposing maintenance personnel to any electrical hazard;
6. It shall be possible to tighten up a joint from one side only of the busducts. The joint shall be so designed and located that removal of any length should not result in the removal of the adjacent lengths.

ELE6.3.060.8**BUSBAR SUPPORT**

1. Busducts shall be securely fixed on the building structure by means of hangers and brackets specifically designed and supplied by the same manufacturers;
2. Unless otherwise specified, horizontal run busducts shall be supported by hangers spaced at intervals of not more than 2 meters. Extra number of hanger shall be required for joints. At least one hanger shall be provided for every section of the busducts. Additional supports as recommended by the busduct manufacturer shall be provided;
3. Vertical busducts shall be supported by spring hangers on every floor. The spring hangers shall be properly adjusted such that the loading of vertical busducts is evenly distributed among the supports. Additional guide brackets in intermediate position between two supports shall be provided, if necessary, to balance the offset loading of the tap-off units.

ELE6.3.070.8**EXPANSION UNIT**

1. Expansion unit shall be provided where busduct is installed across any structural expansion joint. The expansion unit shall be so constructed that any lateral or axial displacement on both the conductors and the casing caused by any movement of the building joint (in all directions) can be absorbed easily and cause no distortion to the busduct in whatever form;
2. Thermal expansion units, if required, shall be so constructed that any change in length on both the conductors and the casing so caused by thermal expansion and contraction in all direction can be absorbed easily and cause no distortion of the busduct in whatever form;
3. All expansion units shall be protected from water dripping by means of properly fabricated enclosure, details of which shall be submitted for Approval.

ELE6.3.080.8**TAP-OFF UNIT**

1. Power tapping-off from the busduct shall be taken by means of specially designed tap-off units. These devices shall be plug-in type units, which shall be held in position by means of wing nuts or other quick fastening and quick release device. Quick fastening device shall mean that no tools are required for the removal of tap-off units. The design and construction of tap-off units shall be such that the electricity supply to other floors will not be interrupted no matter the tap-off units were plugged in or removed;
2. All plug-in access openings shall be equipped with a hinged door which covers the openings when not in use. The plug-in access opening doors can only be opened by tools otherwise the plug-in access opening door should be padlockable. The Sub-contractor shall provide pad-locks to all spare padlockable doors. A master key shall open all pad-locks of the same busduct. Details of the plug-in access opening doors shall be submitted for Approval;

3. The plug-in or the bolt-on type tap-off unit boxes together with the jaws and internal connection terminals shall be of the same manufacturer and country / place of manufacture of the busducts. The Sub-contractor shall propose, with the support of the busduct manufacturer, a type of FCU complying with ELE3.2 for Approval. If any modification to the manufacturer's standard tap-off unit boxes is required to suit the particular type of FCU, such modification shall be designed and carried out by the busduct manufacturer. The manufacturer shall undertake that such modifications are safe and suitable for the intended purpose. No modification by the Sub-contractor on site is allowed. The plug-in box complete with built-in FCU and fuses shall be type tested to IEC 60439-1 & IEC 60439-2. Full fault level, protection coordination and earth fault calculations should be submitted by the Sub-contractor for CM's Approval;
4. The tap-off units shall be equipped with internal barriers so that when the covers of the boxes are removed / opened, a degree of protection of the least IP2X is still maintained. Internal phase barriers shall be provided where necessary;
5. The tap-off unit shall be mechanically inter-locked with the busduct to prevent installation or removal of the unit while the unit is in the ON position. In addition, the cover of the tap-off unit shall have interlocks to prevent the covers from being opened while the tap-off unit is in the ON position. Means shall also be provided to padlock the FCU in its OFF position;
6. Tap-off unit boxes shall make positive earth connection with the earthing conductors before the jaws make contact with the phase busbars. The earthing method shall be such that it cannot be defeated by future painting of the busduct housing;
7. Tap-off unit shall be equipped with means for direct positioning or hanging so that the weight of the unit is borne by the busduct before the plug-in jaws make contact.

ELE6.3.090.8**BUSDUCT FITTINGS AND ACCESSORIES**

1. All the busduct fittings, as listed below but not limited to, shall be specifically designed to suit the requirements of the busduct concerned and made by the some manufacturer:
 - a. Flanged end;
 - b. Flatwise and edgewise elbow;
 - c. Combination elbow;
 - d. Flatwise and edgewise offset;
 - e. End closer;
 - f. Tee-joints.

ELE6.3.100.8**LABELS AND WARNING NOTICES**

1. All labels and warning notices shall be in both English and Chinese characters. Details shall be submitted to the Contract Manager for Approval;
2. Warning notices shall be provided along the entire busduct with the following wording in both English and Chinese characters:

"DANGER - LIVE PART"

"危險 - 帶電部份"
3. The warning notice shall be in the form of durable self-adhesive type label with red lettering on yellow background. The label shall have a minimum size of 150 mm x 75 mm with the lettering not less than 20 mm high;

-
4. The warning notices shall be located on all visible sides of the busduct, including all fittings, with a maximum spacing of 2 m along each side.

ELE6.3.110.8**TESTING AND CERTIFICATION**

1. Short circuit test shall be carried out and certified by a Short Circuit Testing Organisation;
2. Short-circuit test for the busduct shall be carried out in accordance with Clause 8.2.3 of IEC 60439-1 or to the satisfaction of the Contract Manager at the value of short-circuit current specified below:

	Busbar Rating	Test Current
a.	Not exceeding 500A:	* Fused short-time withstand current of 40 kA
b.	Over 500A & below 1600A:	Short-time withstand current of 40 kA minimum for one (1) second.
c.	1600A & above:	Short-time withstanding current of 50kA for one (1) second.

*IEC 60269-1 and IEC 60269-2 and BS 88 : Section 2.2 or BS 88-2.

3. Before energization, the Sub-contractor shall carry out insulation resistance test for whole length of the busway, including feeders, expansion joints, and tap off/plug-in to verify the insulation resistance of the busway between phases and phases to earth to be not less than 10MΩ. For length of the busway exceeding 50 m, it is acceptable to carry out the insulation resistance test in two sections.

ELE6.3.120.8**IN-SERVICE RECORDS**

Prior to the time of material submission for Approval, the equipment including its major components shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.

ELE7.1 GENERAL REQUIREMENTS

ELE7.1.010.8 QUALITY SURVEILLANCE SCHEME

1. Where a national/international product standard exists, cables of the particular type shall be manufactured under BASEC licence or an Equivalent Quality Surveillance Scheme (EQSS) (e.g. HAR scheme recognized by the European Committee for Electrotechnical Standardization, CENELEC, etc.) and bear BASEC marking or the appropriate marking of the EQSS (e.g. 'X' □HAR□, where 'X' is one of the Approval Organizations' designation under CENELEC);
2. The EQSS shall be a System 5 product certification system in accordance with ISO/IEC 17067 for determining the conformity of a product with specified requirements through initial testing of samples of the product, assessment and surveillance of the involved quality system, and surveillance by testing of product samples taken from the manufacturer, the open market or the supply from the Purchasers;
3. The certification body providing the EQSS shall be accredited by Hong Kong Accreditation Services (HKAS) or its Mutual Recognition Agreement (MRA) partners in accordance with this Scheme, ISO/IEC 17065 and its corresponding International Accreditation Forum (IAF) Guidance;
4. The cable manufacturer shall have its own machineries and facilities to make the cables and laboratories to perform routine tests on cables. Cross licence and sub-contracting of cable manufacture can be acceptable subject to the advance approval is obtained from the approved certification body. Cables manufactured under Original Equipment Manufacture (OEM) or private labelling shall not be accepted;
5. The certification body providing the EQSS shall submit complete set of the EQSS document and substantiate with separate information to the satisfaction of the CM that their product certification work and quality surveillance scheme are equivalent to that of BASEC's by making reference and comparison to each of the following:
 - a. Each factory location where cable production occurs, and its product, is separately audited / tested and certified;
 - b. Audited quality management system requirements include all requirements of ISO 9001;
 - c. Audit includes production equipment and processes, and factory in-process and off-line testing equipment, calibration, etc.. Factories must maintain specified minimum suite of laboratory testing equipment;
 - d. Three year certification cycle in line with ISO requirements;
 - e. Audit / sample pickup frequency at each factory shall be four times per annum with at least one being unannounced. Sample numbers selected shall be up to 150 per annum for building wires / flexes, 50 per annum for armoured and fire performance cables, and 50 per annum for IEC or special types, which the number shall be geared by volume of production. Reduced level of surveillance can be acceptable only if a risk assessment system is established in the scheme and the licensee maintains persistent satisfactory quality results that meet the criteria for reduced surveillance as defined in the risk assessment. In any case, the risk assessment system and acceptable criteria shall not be less stringent than that adopted by BASEC;

-
- f. Alternative to item e above, EQSS having yearly routine surveillance test at each factory plus inspection acceptance tests to be carried out on each batch cables to be supplied for individual project will also be acceptable. The inspection acceptance tests shall be conducted on each size and type of cable and at least include the following:
 - i. verify all the results of routine tests conducted by the factory as defined in the corresponding cable standard and carry out supplementary auditing tests if necessary;
 - ii. conduct all the Sample Tests (S) as stipulated in the corresponding cable standards on minimum 10% of each size and type of cables reels;
 - iii. conduct the following verification tests on all cables:
 - resistance of conductors;
 - absence of faults in insulation (the spark test);
 - voltage test.

All the tests shall be carried out in an accredited laboratory. Identification of the tested batch of cables such as purchase order number(s) and date(s) shall be submitted for the CM's checking prior to delivery. The purchase order number(s) shall be printed on the cables as one of the markings on the cable.
 - g. Initial type testing covering all requirements of cable standards and any subsidiary materials, performance and test standards referenced;
 - h. Surveillance testing covers all type, sample and routine tests on each cable type over the certification cycle;
 - i. Full traceability maintained from incoming material, through production to factory final test, and for samples onwards from auditor selection of samples through to final test;
 - j. Minor irregularities of deviations on test results are handled as non-conformities and require root cause analysis, correction and corrective action;
 - k. In case of serious test failures product recall notices are issued to the manufacturer;
 - l. Complaints and appeals system in cases of concern, test failure or failure in-use, with range of sanctions applied;
 - m. Specific assessment criteria of test results for each type of cable;
 - n. The certified products, together with their links to news of suspensions, recalls, etc, shall be shown on the certification bodies' websites;
 - o. The surveillance test report shall be submitted to the CM for checking upon requested.

ELE7.1.020.8**CABLE COLOURS**

1. The compliance of electric cables with a national / international product standard shall require their design, construction and manufacture to adhere to that particular standard in all aspects except the cable colours that unless otherwise stated, should be in line with the Electrical CoP;
2. For any electrical installation based on the new cable core colour code, the registered electrical workers employed shall have satisfied the Electrical & Mechanical Services Department training requirements for new cable core colour code.

ELE7.2 WIRING SYSTEM IN CONDUIT

ELE7.2.010.8 TYPE OF CABLE

The cable installed in conduits shall be one of the following types with copper conductors unless otherwise stated:

1. Single-core, PVC-insulated cables to BS EN 50525-2-31 or IEC 60227-3;
2. PVC-insulated cables to BS 6231 Table 2;
3. Single-core, non-sheathed, non-armoured, low smoke zero halogen cables to BS EN 50525-3-41;
4. Single-core, non-sheathed, non-armoured, fire-resistant cables;
5. Single-core, sheathed, non-armoured, fire-resistant cables;
6. Multi-core, sheathed, non-armoured, fire-resistant cables.

ELE7.2.020.8 GRADE OF CABLE

The cable installed in conduits shall have the minimum voltage rating given in the table below:

	Type of Cables	Minimum Voltage Rating (V)
1.	Single-core, PVC-insulated cables to BS EN 50525-2-31 or IEC 60227-3	450/750
2.	PVC-insulated cables to BS 6231 Table 2	600/1000
3.	Single-core, non-sheathed, non-armoured, low smoke zero halogen cables to BS EN 50525-3-41	450/750
4.	Single-core, non-sheathed, non-armoured, fire-resistant cables	450/750
5.	Single-core, sheathed, non-armoured, fire-resistant cables	600/1000
6.	Multi-core, sheathed, non-armoured, fire-resistant cables	300/500

ELE7.3 WIRING SYSTEM IN TRUNKING

ELE7.3.010.8 TYPE OF CABLE

The cable installed in trunkings shall be one of the following types with copper conductors unless otherwise stated:

1. Single-core, PVC-insulated cables to BS EN 50525-2-31 or IEC 60227-3;
2. PVC-insulated cables to BS 6231 Table 2;
3. Single-core, non-sheathed, non-armoured, low smoke zero halogen cables to BS EN 50525-3-41;
4. Single-core, non-sheathed, non-armoured, fire-resistant cables;
5. Single-core, sheathed, non-armoured, fire-resistant cables;
6. Multi-core, sheathed, non-armoured, fire-resistant cables.

ELE7.3.020.8 GRADE OF CABLE

The cable installed in trunkings shall have the minimum voltage rating tabulated below:

	Type of Cables	Minimum Voltage Rating (V)
1.	Single-core, PVC-insulated cables to BS EN 50525-2-31 or IEC 60227-3	450/750
2.	PVC-insulated cables to BS 6231 Table 2	600/1000
3.	Single-core, non-sheathed, non-armoured, low smoke zero halogen cables to BS EN 50525-3-41	450/750
4.	Single-core, non-sheathed, non-armoured, fire-resistant cables	450/750
5.	Single-core, sheathed, non-armoured, fire-resistant cables	600/1000
6.	Multi-core, sheathed, non-armoured, fire-resistant cables	300/500

ELE7.4 SURFACE WIRING SYSTEM IN FIXED INSTALLATIONS

ELE7.4.010.8 CABLES - GENERAL

Unless otherwise stated, the cable having copper conductors shall be one of the following types with the respective minimum voltage rating:

	Type of Cables	Minimum Voltage Rating (V)
1.	Single-core, PVC-insulated cables to BS EN 50525-2-31 or IEC 60227-3	450/750
2.	PVC-insulated, PVC-sheathed, non-armoured cables, 35 mm ² and below, to BS 6004 Tables 3 & 4	300/500
3.	PVC-insulated cables to BS 6231 Table 2	600/1000
4.	XLPE-insulated, PVC-sheathed, non-armoured cables to BS 7889 or IEC 60502-1	600/1000
5.	Flexible cords to BS EN 50525-2-11	300/500
6.	Flexible cords to BS EN 50525-2-21	450/750
7.	XLPE-insulated, PVC-sheathed, armoured cables to BS 5467 or IEC 60502-1	600/1000
8.	Mineral-insulated cables to IEC 60702-1 or BS EN 60702-1	750
9.	Single-core, non-sheathed, non-armoured, low smoke zero halogen cables to BS EN 50525-3-41	450/750
10.	Single-core, flat twin and flat 3-core, sheathed, non-armoured, low smoke zero halogen cables with circuit protective conductor, to BS 7211 Table 5	300/500
11.	XLPE-insulated, low smoke zero halogen compound-sheathed, armoured cables to BS 6724, or IEC 60502-1 and IEC 60332-1-2 and IEC 61034-2 and IEC 60754-1	600/1000
12.	Single-core, non-sheathed, non-armoured, fire-resistant cables	450/750
13.	Single-core, sheathed, non-armoured, fire-resistant cables	600/1000
14.	Multi-core, sheathed, non-armoured, fire-resistant cables	300/500
15.	Multi-core, sheathed, armoured, fire-resistant cables	600/1000

ELE7.4.020.8 PVC-INSULATED, NON-SHEATHED, GENERAL PURPOSE, SINGLE-CORE CABLES

Cables shall comply with BS EN 50525-2-31 or IEC 60227-3.

ELE7.4.030.8 XLPE/PVC-INSULATED, PVC-SHEATHED, SINGLE-CORE CABLES

1. Cables with copper conductor sizes up to and including 35 mm² shall comply with BS 6004 Table 3;

-
2. Single-core cables with copper conductor sizes from 50 mm² to 1000 mm² inclusive shall comply with BS 7889 or IEC 60502-1.

ELE7.4.040.8 PVC-INSULATED, PVC-SHEATHED, FLAT TWIN CABLES

1. Cables with or without integral circuit protective conductor shall comply with BS 6004 Tables 3 & 4;
2. The colour of the PVC sheath shall be white.

ELE7.4.060.8 XLPE-INSULATED, PVC-SHEATHED, ARMOURED CABLES

1. XLPE-insulated, PVC-sheathed, armoured cables shall comply with BS 5467 or IEC 60502-1;
2. The XLPE insulated cable cores shall be sheathed with PVC which serves as bedding for the galvanized steel single-wire armouring of multi-core cables and for the aluminium single-wire armouring of single-core cables;
3. The XLPE insulation shall be able to operate continuously at a conductor operating temperature of 90°C.

ELE7.4.070.8 PVC-INSULATED CABLES FOR SWITCHGEAR AND CONTROLGEAR WIRING

Flexible cables shall comply with BS 6231 Table 2.

ELE7.4.090.8 MINIMUM SIZE OF LIVE CONDUCTOR

1. Cables for circuits of rating not exceeding 10A shall have CSA of not less than 1.5 mm²;
2. Cables for circuits rated at 15A and above shall have CSA of not less than 2.5 mm²;
3. Flexible cables and flexible cords shall have CSA of not less than 0.75 mm².

ELE7.4.100.8 CIRCUIT PROTECTIVE CONDUCTOR (CPC)

1. In installations where cables are clipped direct having CSA up to 16 mm² and below used for single phase circuit shall be twin-core with integral CPC except where:
 - a. They are used in earth free situations; or
 - b. They are used for extra low voltage circuits; or
 - c. The CSA of the integral CPC cannot meet the requirement of the adiabatic equation laid down in BS 7671 or IEC 60364.
2. Separate CPC shall be single-core cables, to BS EN 50525-2-31 or IEC 60227-3;
3. Tee connection in the CPC shall not be allowed;
4. The minimum CSA of a CPC shall be 1.0 mm² if the CPC is incorporated in the same cables as the associated live conductors, otherwise the minimum CSA shall be 4 mm²;
5. CPC shall be sized in accordance with ELE17.

ELE7.4.120.8 IDENTIFICATION OF CABLE CORE

The identification of cable cores shall follow the requirements of the Electrical CoP.

ELE7.5 WIRING SYSTEM USING MINERAL INSULATED CABLE

ELE7.5.010.8 TYPES OF CABLE

All mineral-insulated cables shall be copper sheathed with copper conductors complying with IEC 60702-1 or BS EN 60702-1.

ELE7.5.020.8 GRADE OF CABLE

Unless otherwise specified, all mineral-insulated cables shall be 750V (heavy duty) of IEC 60702-1 or BS EN 60702-1.

ELE7.5.030.8 LOW SMOKE ZERO HALOGEN (LSOH) OUTER COVERING

1. Mineral-insulated cables shall have LSOH thermoplastic outer covering when:
 - a. They are exposed to weather;
 - b. They are installed in situations where the atmosphere is likely to cause corrosion;
 - c. They are laid upon or fixed direct to a concrete or stone surface subject to dampness;
 - d. They are laid upon or fixed directly to a zinc coated surface, e.g. a galvanised cable tray or corrugated sheeting, subject to dampness;
 - e. They are buried direct in the ground;
 - f. They are as specified in ELE2 or the Drawings.
2. LSOH thermoplastic outer covering shall not be used in refrigerated spaces or other situations where the temperature is consistently below 0°C;
3. The LSOH thermoplastic outer covering shall have an orange colour.

ELE7.6 POWER DISTRIBUTION CABLES

ELE7.6.020.8 XLPE- INSULATED POWER CABLES WITH COPPER CONDUCTORS

XLPE insulated PVC-sheathed, armoured cable shall comply with the requirement specified in **ELE7.4.060**.

ELE7.6.040.8 GRADING OF POWER CABLES

All power cables for electricity supply shall have a grading of 600/1000V.

ELE7.7 CABLE GLANDS

ELE7.7.010.8 CONSTRUCTION

Cable glands shall be mechanical cable glands in compliance with BS 6121:Part 1 or BS EN 50262 and use brass as basic material.

ELE7.7.020.8 TERMINATION

For the termination of steel wire armoured cables of any of the following types, type DIW glands shall be employed for indoor applications while type EIW shall be employed for outdoor applications:

1. Cables to BS 5467 or IEC 60502-1;
2. Cables to BS 6724 or IEC 60502-1;
3. Fire-resistant cables.

ELE7.7.030.8 ATTACHMENTS

1. Each gland shall be provided with locknut and earth bond attachment of appropriate size and same material as the gland body for making electrical connection to the armour of the cable to be terminated;
2. Each gland shall be complete with a shroud made of the following materials according to the types of cables served:

Type of Cable	Material of Shroud
a. Cables to BS 5467 or IEC 60502-1	PVC
b. Cables to BS 6724, or IEC 60502-1 and IEC 60332-1-2 and IEC 61034-2 and IEC 60754-1	Low smoke zero halogen thermosetting or thermoplastic compound
c. Fire-resistant cables to BS 6387	Low smoke zero halogen thermosetting or thermoplastic compound

ELE7.7.040.8 CERTIFICATION

Test certificates giving the results of type-tests shall be produced to verify compliance with the test requirements stipulated in BS 6121: Part 1 or BS EN 50262.

ELE7.8 FIRE-RESISTANT CABLES

ELE7.8.010.8 GENERAL REQUIREMENTS

1. Fire-resistant cables shall be manufactured under licence of LPCB, BASEC or an Equivalent Quality Surveillance Scheme and shall comply, where applicable, the clauses specified in ELE8;
2. Valid approval documents issued by FSD and / or product certification bodies recognized by FSD for the fire-resistant cables shall be submitted to the Contract Manager for approval;
3. Fire-resistant cables and their application shall comply with the requirements stipulated in Fire Services COP, FSD's Circular Letters, and relevant BS or other international standards acceptable to the Director of Fire Services;
4. Fire-resistant cables shall have cross-sectional area of not less than 1.5 mm²;
5. Non fire-resistant cables wholly installed in embedded concealed conduits complying with FSD's Circular Letters are allowed to apply for EXIT / directional signs and emergency lightings except those of which exposed conduits will be involved. In such cases, fire resistant cables shall be provided. For avoidance of doubt, only fire-resistant cables in concealed or exposed conduits shall be provided for all EXIT / directional signs in the entire domestic block, emergency lightings on ground floor of domestic blocks and all EXIT / directional signs / emergency lightings of which exposed conduits are involved;
6. Save as modified in the above clauses, the minimum fire-resistant cable requirements in respect of various fire service installations are listed below:

Item	Type of Fire Service Installations	Minimum Requirements
1.	Audio / visual advisory system	<p><u>For standard cables or cable systems as defined in BS 5839-1, they shall comply with:</u></p> <p>(a) BS EN 50200 (PH30) and Annex E of BS EN 50200 (a duration of survival time of 30 minutes); or</p> <p>(b) BS EN 60702; or</p> <p>(c) BS 7629-1 (Cat. Standard 30); or</p> <p>(d) BS 7846 (Cat. F2 for cables of overall diameter not exceeding 20mm or Cat. F30 for cables of overall diameter exceeding 20mm); or</p> <p>(e) BS 6387 Cat. CWZ; or</p> <p>(f) Other international standards acceptable to the Director of Fire Services</p> <p><u>For enhanced cables or cable systems as defined in BS 5839-1, they shall comply with:</u></p> <p>(g) BS EN 50200 (PH120) and BS 8434-2 (a duration of survival time of 120 minutes); or</p> <p>(h) BS EN 60702; or</p>

		<ul style="list-style-type: none"> (i) BS 7629-1 (Cat. Enhanced 120); or (j) BS 7846 (Cat. F2 for cables of overall diameter not exceeding 20mm or Cat. F120 for cables of overall diameter exceeding 20mm); or (k) BS 6387 Cat. CWZ; or (l) Other international standards acceptable to the Director of Fire Services.
2.	Automatic actuating device	<u>Cables shall comply with:</u> <ul style="list-style-type: none"> (a) BS 6387 Cat. CWZ; or (b) BS EN 60702; or (c) BS 8491 (minimum fire survival time of 120 minutes); or (d) BS 7629-1 (Cat. Enhanced 120); or (e) BS 7846 (Cat. F2 for cables of overall diameter not exceeding 20mm or Cat. F120 for cables of overall diameter exceeding 20mm); or (f) BS EN 50200 (PH120) and BS 8434-2 (a duration of survival time of 120 minutes); or (g) Other international standards acceptable to the Director of Fire Services.
3.	Automatic fixed installation other than water	
4.	Automatic fixed installation using water (other than sprinkler system)	
5.	Deluge system	
6.	Drencher system	
7.	Fire hydrant / hose reel system	
8.	Fixed foam system	
9.	Pressurization of staircase	
10.	Ring main system with fixed pump(s)	
11.	Smoke extraction system	
12.	Street fire hydrant system	
13.	Water mist system	
14.	Water spray system	
15.	Fire Service water supply system	
16.	Emergency generator	Cables from emergency generator to main essential switchboard(s) for fire service installations shall comply with the same requirements as those for items 2 to 15.
17.	Emergency lighting	<u>For standard cables or cable systems as defined in BS 5266-1, they shall comply with:</u> <ul style="list-style-type: none"> (a) BS 5266-1; or (b) BS EN 50200 (PH60) and Annex E of BS EN 50200 (a duration of survival time of 30 minutes) and one of following standards:

		<ul style="list-style-type: none"> (i) BS EN 60702 (ii) BS 7629-1 (Cat. Standard 60) (iii) BS 7846 (Cat. F2 for cables of overall diameter not exceeding 20mm); or (c) BS 6387 Cat. CWZ; or (d) BS 7846 (Cat. F60 for cables of overall diameter exceeding 20mm); or (e) Other international standards acceptable to the Director of Fire Services. <p><u>For enhanced cables or cable systems as defined in BS 5266-1, they shall comply with:</u></p> <ul style="list-style-type: none"> (f) BS 5266-1; or (g) BS EN 50200 (PH120) and BS 8434-2 (a duration of survival time of 120 minutes) and one of the following standards: <ul style="list-style-type: none"> (i) BS EN 60702 (ii) BS 7846 (Cat. F2 for cables of overall diameter not exceeding 20mm); or (h) BS 7629-1 (Cat. Enhanced 120); or (i) BS 6387 Cat. CWZ; or (j) BS 7846 (Cat. F120 for cables of overall diameter exceeding 20mm); or (k) Other international standards acceptable to the Director of Fire Services.
18.	Exit sign	The same requirements as those for item 17.
19.	Fire alarm system	<p><u>For standard cables or cable systems as defined in BS 5839-1, they shall comply with:</u></p> <ul style="list-style-type: none"> (a) BS 5839-1; or (b) BS EN 50200 (PH30) and Annex E of BS EN 50200 (a duration of survival time of 30 minutes); or (c) BS EN 60702; or (d) BS 7629-1 (Cat. Standard 30); or (e) BS 7846 (Cat. F2 for cables of overall diameter not exceeding 20mm or Cat. F30 for cables of overall diameter exceeding 20mm); or (f) BS 6387 Cat. CWZ; or (g) Other international standards acceptable to the Director of Fire

		<p>Services.</p> <p><u>For enhanced cables or cable systems as defined in BS 5839-1, they shall comply with:</u></p> <p>(h) BS EN 50200 (PH120) and BS 8434-2 (a duration of survival time of 120 minutes); or</p> <p>(i) BS EN 60702; or</p> <p>(j) BS 7629-1 (Cat. Enhanced 120); or</p> <p>(k) BS 7846 (Cat. F2 for cables of overall diameter not exceeding 20mm or Cat. F120 for cables of overall diameter exceeding 20mm); or</p> <p>(l) BS 6387 Cat. CWZ; or</p> <p>(m) Other international standards acceptable to the Director of Fire Services.</p>
20.	Fire detection system	The same requirements as those for item 19.
21.	Fireman's lift	Cables from the main essential switchboard for fire service installations to the main switch for lift power circuit, car lighting, etc., in the lift machine room shall comply with the same requirements as those for items 2 to 15.
22.	Sprinkler system	The same requirements as those for items 2 to 15.

ELE7.8.030.8**EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY**

The Sub-contractor shall produce documentary evidences in accordance with **PRE.BS1.205** to verify the country / place of manufacture and authenticity of fire-resistant cables delivered to Site or installed.

ELE7.9 PREFABRICATED BRANCH CABLES

ELE7.9.010.8 GENERAL

1. Being XLPE-insulated, PVC-sheathed type, main and branch cables shall comply with one of the standards below:
 - a. BS 7889;
 - b. IEC 60502-1.
2. The sizes of main and branch cables shall be in line with those shown on the Drawings.

ELE7.9.020.8 TYPE OF CONDUCTORS

Main and branch cables shall be of copper conductors.

ELE7.9.030.8 TYPE OF BRANCH JOINTS

1. Each branch joint shall take the form of main and branch cables bound together to a compression connector that complies with one of the product standards below:
 - a. BS EN 61238-1;
 - b. JIS C 2810;
 - c. HD 623 S1 or BS EN 50393;
 - d. IEC 61238-1.
2. Each branch joint shall be assembled and encapsulated in a thermoplastic moulding, which is compatible with the cable sheath. The entire production process shall be under a quality management system to ISO 9001.

ELE7.9.040.8 VOLTAGE RATING

Prefabricated branch cables shall have a voltage rating of 600/1000V.

ELE7.9.050.8 INSTALLATION OF BRANCH CABLES

Prior to ordering, drawings to show the actual installation details of prefabricated branch cables shall be submitted to the Contract Manager for approval.

ELE7.9.060.8 PROTECTION

Cable ends for main and branch cables shall be sealed at factory before delivery to site.

ELE7.9.070.8 TYPE & ROUTINE TESTS

Prefabricated branch cables shall be assembled under a product specification that establishes at least the following test requirements:

1. Type tests:
 - a. Heat cycle test according to the method given in one of the following:
 - i. JIS C 2810 Class A;
 - ii. HD 623 S1 or BS EN 50393;
 - iii. BS EN 61238-1;

-
- iv. Total 125 test cycles undergone - after the 25th cycle, the surface temperature of the thermoplastic moulding shall not exceed 75°C. This temperature shall also not reach more than 8°C plus that at the 25th cycle when measurements are taken at the end of the 50th, 75th, 100th and 125th cycles.
 - b. Resistance to flame propagation according to one of the standards below:
 - i. JIS C 3005;
 - ii. BS 4066-1, or IEC 60332-1-1, or BS EN 60332-1-1 and BS EN 60332-1-2 and BS EN 60332-2-1;
 - iii. IEC 60332-1-2;
 - iv. IEC 60332-3 Category C.
 - c. Insulation resistance test: the cables in water shall have a minimum insulation resistance of 50MΩ;
 - d. Tensile strength test: the cables shall withstand without breakage twice the specified weight of main and branch cables for the duration of not less than 24 hours.
2. Routine tests:
- a. Voltage withstand test: The cables in water shall withstand a minimum voltage of 3.5kV for 1 minute without breakdown;
 - b. Connector resistance or conductivity test according to the method given in one of the following:
 - i. JIS C 3005;
 - ii. The resistance measured between the connector before and after the tensile test mentioned above shall agree to each other within 12%;
 - iii. $R_1/R_2 \leq 1.2$ where
 - R_1 is the cable resistance measured across the connector between the main and one of the branch cables; and
 - R_2 is the summation of the resistance of individual cables having the same length of cable up to the connector and conductor sizes as the main and branch cables respectively.

ELE7.9.080.8

FACTORY TEST REPORT

Prefabricated branch cables shall prove to have satisfactorily passed all tests stipulated in the product specification in **ELE7.9.070**. Prior to delivery to site, a factory test report on routine tests shall be submitted to the Contract Manager for approval.

ELE7.9.090.8

SITE TESTS/INSPECTION

Each prefabricated branch cable shall satisfactorily pass the site inspections/tests below along its entire route once its installation is completed:

1. Visual inspection;
2. Insulation resistance test: the cables in air shall have a minimum insulation resistance of 2MΩ.

ELE7.9.100.8**MANUFACTURERS' RECOMMENDATIONS & SPECIAL TOOLS**

Manufacturers' recommendations shall be followed and special tools/accessories shall be used in the installation of prefabricated branch cables on site.

ELE8.1 GENERAL INSTALLATION REQUIREMENTS

ELE8.1.010.8 IDENTIFICATION OF CORE

Each core of a power cable shall be identified continuously throughout its entire length. The identification shall take the form of appropriate colour or number codes in accordance with **ELE8.6.010** or the relevant British Standard specifications.

ELE8.1.020.8 IDENTIFICATION AT JOINT OR TERMINATION

At each joint or termination, a non-ferrous metallic label shall be fixed to the cable giving the size and identification of the cable, e.g. 50 mm² 4-core XLPE/SWA/PVCS copper cable to "Services Block".

ELE8.1.030.8 USE OF SINGLE-CORE POWER CABLES WITH STEEL WIRE ARMOURS

Single-core power cables with steel wire armours shall not be used for a.c. circuits.

ELE8.1.040.8 SIZE OF NEUTRAL CONDUCTOR

The CSA of the neutral conductor shall have the same size as that of the phase conductors, unless otherwise specified.

ELE8.1.050.8 BENDING RADIUS OF CABLE

The internal bending radius of every power cable shall not be less than the appropriate values given in **ELE8.6.020**.

ELE8.1.060.8 MINIMUM SIZE OF CABLE CONDUCTOR

1. Cables for lighting, bell and control circuits shall have CSA of not less than 1.5 mm², and cables for power circuits shall have CSA of not less than 2.5 mm²,
2. The CSA of any cable shall not be reduced at its point of termination, junction, joints etc.

ELE8.1.070.8 USE OF PVC-INSULATED CABLES AT LOW TEMPERATURE

PVC-insulated cables shall not be installed in refrigerated spaces or other situations where the temperature is consistently below 0°C.

ELE8.1.080.8 TERMINATION OF WIRING CONNECTIONS

All wiring connections are to be properly terminated.

ELE8.2 PARTICULAR INSTALLATION REQUIREMENTS

ELE8.2.010.8 CABLES MOUNTED ON SURFACE

1. Power cables mounted on the surface of walls or ceilings or other building structures shall either be cleated in position by Approved type cable cleats or cable saddles;
2. Cables cleats or cable saddles shall be provided along the entire cable route at regular intervals and at spacing in accordance with the requirements stipulated in the Electrical CoP unless otherwise specified on the Drawings;
3. Alternatively, the cables shall be supported on cable trays in accordance with the requirements of ELE9;
4. For vertical cable runs exceeding 100 m, tension releasing sections shall be provided in accordance with the recommendation of the cable manufacturer, failing which, a tension releasing section shall be provided for every 100 m vertical run.

ELE8.2.020.8 CABLES LAID IN ENCLOSED TRENCH

When more than one power cable is laid in an enclosed trench, the cables shall be spaced in accordance with BS 7671 or IEC 60364. Correction factors shall be applied to the current ratings as indicated in Table 4B and 4C of the above Standard. For cable sizes not shown in the above-mentioned tables, reference shall be made to the appropriate tables in the ERA Report 69-30 Part III.

ELE8.2.030.8 CABLES ENCLOSED IN DUCTS

1. General:
 - a. Power cables installed in ducts shall conform to the provisions of ELE9;
 - b. Prior to the drawing-in of the cables, the cylindrical ducts shall be cleaned with a cylindrical brush of appropriate size.
2. Pulling cables through ducts - general:
 - a. Attachment to facilitate the pulling of cables through a duct shall be made to the cores, insulation, inner and outer sheath and not to the armour in order to avoid twisting;
 - b. Attachment to the armour will only be permitted for small cables with the Approval of the Contract Manager;
 - c. When pulling power cables into small ducts, an emulsion of graphite powder and soft soap in water may be used for brushing onto the cable surfaces where they enter the duct to reduce friction during pulling;
 - d. The use of "French Chalk" or other methods will not be precluded provided that such materials or methods shall not damage the cables and that the prior Approval of the Contract Manager has been given.
3. Pulling cables through ducts - lead-sheathed insulated:
 - a. When pulling-in lead-sheathed insulated power cables, the following stresses shall not be exceeded:
 - i. Maximum stress in sheath - 10,000kPa (with stocking pulling grip);

-
- ii. Maximum stress in conductors - 70,000kPa (with pulling eye attached to conductors).
 - b. When the cables are being drawn into ducts, the maximum pull shall be limited to 220,000 Newtons.

ELE8.2.040.8 CABLES BURIED DIRECT IN GROUND

1. Power cables buried direct in ground shall be armoured;
2. They shall be buried at a depth of not less than 450 mm and shall be protected by means of Approved cable cover tiles;
3. The bottom of the trench shall be covered, to a depth of 100 mm with a bedding layer of sand or fine soil;
4. On top of the cables, a layer of sand or fine soil, also to a depth of 100 mm, shall again be provided;
5. The sand or fine soil shall not be larger than 13 mm sieve;
6. Particular care shall be taken to ensure that there shall be no pebbles or small stones in the bedding layer or after the layer of fine sand or soil;
7. The cables shall then be covered, throughout the entire route, by cable cover tiles which shall be laid on top of the after layer.

ELE8.2.050.8 CABLE MARKERS

1. The route of all power cables buried direct in ground shall be clearly indicated by cable markers laid in the ground;
2. Cable markers shall be placed at regular intervals not exceeding 60 m apart and also at positions where the cable route changes direction;
3. At the position of each underground junction box, a cable marker shall also be installed. Such markers shall be engraved with, in addition to the wordings mentioned above, the appropriate information, such as "3 way Joint Box".

ELE8.2.060.8 CABLES CONNECTED TO OR IN CONTACT WITH BARE CONDUCTORS OR BUSBARS

1. PVC cables for interconnection between busbar risers and their outgoing switchgears, or between busbar chambers and their incoming/outgoing switchgears shall be to type CK of BS 6231 or equal and Approved;
2. Where cables to BS EN 50525-2-31 or BS 5467 or IEC 60502-1 are terminated to bare conductors or busbars of ACBs, MCCBs, fuse combination units or switch-disconnectors in the applications other than those given in sub-clause (1) above, the insulation and sheath of the cables shall be suitable for the maximum temperature of the terminals of the switchgear or equipment.
3. If the Sub-contractor fails to verify the above requirement as given in sub-clause (2) above to the satisfaction of the Contract Manager, the insulation and/or sheath of the cables shall be removed for a distance of 150 mm from the termination and replaced by at least 0.21 mm thick heat-resisting insulating tapes complying with IEC 60454-3-1 and suitable for operating temperatures up to 105°C.

ELE8.3 WIRING SYSTEM USING PVC INSULATED AND PVC SHEATHED CABLES

ELE8.3.1 WIRING SYSTEM

ELE8.3.1.010.8 GENERAL

1. XLPE/PVC insulated and PVC sheathed non-flexible cables shall be used for surface wiring in fixed installations. The cables shall not be buried in concrete or plaster;
2. PVC insulated and PVC sheathed flexible cables or flexible cords shall be used for connection to apparatus, appliances or equipment via an appropriate wiring accessory;
3. Flexible cables or flexible cords shall not be used in a fixed installation, except for final connection to a fixed equipment.

ELE8.3.1.020.8 JOINTS IN CABLES OR CORDS

Joints in cables or cords shall not be allowed unless Approved. In such cases, the joints shall be electrically and mechanically sound and shall be accessible for inspection.

ELE8.3.2 MATERIALS FOR ACCESSORIES

ELE8.3.2.010.8 WIRING ACCESSORIES

Wiring accessories, e.g. switches and socket outlets, shall be of the all-insulated pattern suitable for flush mounting on to a moulded box or pattress. In all other respects, they shall comply with ELE20.

ELE8.3.2.020.8 BOXES OR PATTRESSES

Moulded boxes or pattresses or the enclosure of surface mounted wiring accessories shall be of insulating material and shall comply with BS EN/IEC 60670-1 with dimensions to BS 4662. Each box or pattress shall have a copper earth terminal for the connection of the circuit protective conductors.

ELE8.3.2.030.8 CABLE FIXING CLIPS AND PINS

Buckle clips shall be of heavy gauge, heavily tinned brass with countersunk fixing holes. Fixing pins shall be of copper or brass with a minimum length of 15 mm.

ELE8.3.2.040.8 CABLE FIXING SADDLES AND SCREWS

Saddles shall be of heavy gauge galvanised steel. The fixing screws shall be of non-ferrous metal.

ELE8.3.3 INSTALLATION OF NON-FLEXIBLE CABLES

ELE8.3.3.010.8 CABLE ROUTES

1. All cables shall be run in a vertical or horizontal direction, and shall be secured flat on the surface of walls, columns, partitions or ceilings, etc. throughout the entire route, including at bends. Fixing on to the ceiling shall be avoided unless the cable is required to feed a point on the ceiling;
2. Where required, the cables may be run under floors, between partitions or inside ceiling voids provided that they are enclosed in ducts, conduits or trunking which comply fully with the relevant clauses in ELE9, ELE11, ELE12 and ELE13;
3. When cables are routed along or across steel joints, beams, stanchions, etc. they shall be enclosed in steel trunking/conduit or rigid PVC conduit;
4. Cables shall not be run as a span between beams, trusses, etc. without rigid support throughout their length.

ELE8.3.3.020.8 PROTECTION TO CABLES SUSCEPTIBLE TO DAMAGE

Cables susceptible to damage shall be protected by means of metal channels. Where protection is required for cables running up a wall from the floor, the metal channel shall be fixed to a minimum height of 2 m above finished floor level.

ELE8.3.3.030.8 CABLES PASSING THROUGH A BUILDING STRUCTURE

Where cables pass through a building structure such as a wall or column, the cables shall be drawn through PVC sleeves inserted into the building structure. The size of the PVC sleeves shall be such that the space factor shall not exceed 45%.

ELE8.3.3.040.8 CABLES CROSSING EXPANSION JOINT

Cables passing an expansion joint shall be formed into a loop such that any movement in the joint shall not stress the cables.

ELE8.3.3.050.8 CABLES PASSING THROUGH METAL WORK

Rubber grommets or insulated bushes shall be used to protect the cables passing through metal parts of a distribution board, a luminaires, a metal box or any other metal work.

ELE8.3.3.060.8 SEGREGATION FROM OTHER SERVICES

Cables shall be run at least 150 mm clear of all other non-electrical services.

ELE8.3.3.070.8 "LOOPING-IN" WIRING SYSTEM

The cables shall be wired on the "looping-in" system. Cable joints of any type in cable runs shall not be allowed.

ELE8.3.3.080.8 NEUTRAL CONDUCTOR AT SWITCH POSITION

The neutral conductor of a cable for a lighting final circuit shall be looped through an insulated connector enclosed in the moulded box or pattress housing the switch.

ELE8.3.3.090.8 TERMINATION OF CABLES

1. Cables terminated at a moulded box or pattress, a luminaire or other fittings shall have the overall protective sheaths carried into the moulded box or pattress, luminaire or other fittings for a minimum of 13 mm;
2. The circuit protective conductor shall be terminated at the earth terminal provided in the moulded box or pattress housing the wiring accessories;
3. Where it is not required to terminate the circuit protective conductor in an accessory, the circuit protective conductor shall not be cut back or removed. Instead it shall be coiled away from the live terminals or any bare conductors and shall be insulated and sleeved with a green-and-yellow PVC sleeve.

ELE8.3.3.100.8 BENDING RADII OF CABLES

The internal radii of cables shall not be less than the values given below:

Cable type	Overall diameter of cable, D (mm)	Minimum internal radius of cable
BS EN 50525-2-31 Clause 4.1 and BS 7889 or IEC 60502-1	$D \leq 10$	3 D
	$10 < D \leq 25$	4 D
	$D > 25$	6 D

ELE8.3.3.110.8 FIXING OF CABLES

1. Cables having an overall diameter not exceeding 10 mm shall be fixed by means of buckle clips. Cables of other diameters shall be fixed by means of cable saddles.
2.
 - a. Where a number of cables running together on the surface of walls, columns, partitions or ceiling such that their aggregated width exceeds 50 mm, a 13 mm thick hardwood batten of adequate width shall be fixed along the cable route for mounting the cables;
 - b. The hardwood batten shall be finished with one coat of Approved priming on front and edges, and treated at the back with waterproof compound;
 - c. Lengths of the batten shall be properly fitted together and fixed in position by counter-sunk brass screws in rawplugs.

ELE8.3.3.120.8 FIXING OF CLIPS

1.
 - a. Buckle clips shall be fixed to the surface of wall, column, partition or ceiling by pins secured to one plug inserted to a minimum depth of 20 mm;
 - b. Where the buckle clips are fixed to plaster, concrete, etc. the plugs shall be made from teak dowelling of parallel length;
 - c. The head of every pin shall be level with the surface of the clip so that no damage to the sheath of the fixed cables can occur.
2. Every hole in the buckle clip shall require a fixing pin;
3. A separate buckle clip shall be required for every cable of size above 2.5 mm² twin with CPC, or of equivalent size. Not more than two cables shall be allowed in one clip under all circumstances;
4. Buckle clips shall be provided along the entire cable route at regular intervals not exceeding 250 mm on horizontal runs and 400 mm on vertical runs;

-
5. A clip shall also be provided at a distance not exceeding 75 mm from a termination and from both sides of a bend.

ELE8.3.3.130.8 FIXING OF CABLE SADDLES

Cable saddles shall be securely fixed by fixing screws. Saddles shall be provided along the entire cable route at regular intervals. The spacing between adjacent saddles shall be in accordance with the requirements stipulated in the Electrical CoP unless otherwise specified on the Drawings.

ELE8.3.3.140.8 RATING FACTORS TO CURRENT RATING OF CABLES

There more than two twin cables are fixed together, or when the cables are installed at or in thermally insulated materials, etc., suitable rating factors, as recommended by the electrical CoP or BS 7671 or IEC 60364 shall be applied in determining the size of the cables to be installed.

ELE8.3.4 INSTALLATION OF FLEXIBLE CABLES AND FLEXIBLE CORDS

ELE8.3.4.010.8 CONNECTIONS TO PORTABLE EQUIPMENT

Flexible cables or flexible cords for connections to portable appliances or equipment shall be of suitable length (preferably 1.5 m to 2 m) to avoid undue risk of mechanical damage.

ELE8.3.4.020.8 CONNECTIONS TO FIXED EQUIPMENT

Exposed lengths of flexible cable or flexible cord used for final connections to fixed equipment or appliance shall be as short as possible.

ELE8.3.4.030.8 CONNECTIONS TO LUMINAIRES

Where a flexible cord supports or partly supports a pendant luminaires, the maximum mass acting on the cord shall not exceed 3 kg for flexible cord of 0.75 mm², and shall not exceed 5 kg for flexible cord of larger conductor cross sectional area.

ELE8.4 WIRING SYSTEM USING MINERAL-INSULATED CABLES

ELE8.4.1 MATERIALS FOR ACCESSORIES

ELE8.4.1.010.8 CABLE SADDLES AND CLIPS

Saddles and clips for fixing mineral-insulated cables shall be of the type specially made by the cable manufacturer for this purpose. Where the cables are fitted with low smoke zero halogen (LSOH) thermoplastic outer covering, the saddles or clips used shall also have LSOH thermoplastic or thermosetting covering.

ELE8.4.1.020.8 CONDUIT/ADAPTABLE BOXES

Conduit/adaptable boxes shall meet the requirements of ELE11.3.

ELE8.4.2 INSTALLATION OF CABLES

ELE8.4.2.010.8 CABLE ROUTES

Mineral-insulated cables shall be run neatly on the surface of the walls, columns, beams or ceilings in a vertical or horizontal direction, and at least 150 mm clear of all plumbing and mechanical services. The use of conduit and/or cable trunking to enclose such cables shall be kept to the minimum.

ELE8.4.2.020.8 CABLE SUPPORTS

1. Mineral-insulated cables shall be adequately supported by saddles which shall be obtained from the same manufacturer as the cables;
2. Saddles shall be provided through the entire cable route at regular intervals;
3. The spacing between adjacent saddles shall not exceed the values given in **ELE8.4.3.010**;
4. Saddles shall also be provided at a distance not exceeding 150 mm away from termination and from both sides of a bend.

ELE8.4.2.030.8 BENDING RADIUS

The minimum internal bending radius for mineral-insulated cables shall be 6 times the overall diameter of the cable.

ELE8.4.2.040.8 CABLE LOOP FOR PREVENTION OF VIBRATION

A loop shall be introduced in a cable immediately before its entry into the connected equipment which is subject to vibration or occasional movement. A clear space of at least 10 mm shall be maintained at the point in the loop where the cable passes over itself.

ELE8.4.2.050.8 CABLE TERMINATIONS

1. Cable termination shall generally comply with IEC 60702-2 or BS EN 60702-2;

2. The cable to be terminated shall be cut, screwed, sealed with cold compound and fitted with brass terminating glands, nuts, compression ring, gland body, sealing pot, disc and sleeves. The conductors shall be carried unbroken through the sealing pot to the terminal sockets or clamping screws;
3. The sealing shall be properly carried out to protect the cable ends from moisture and the insulation shall be thoroughly dry before the sealing is applied. The sealing material and any material used to insulate the conductors when they emerge from the insulation shall have adequate insulating and moisture proofing properties and shall retain these properties throughout the range of temperature they may be subjected to in service;
4. Where a mineral insulated cable is terminated at an insulating casing or enamelled/painted metal casing, the sealing pot shall be provided with a copper circuit protective conductor, complying with the requirements of BS EN 60228 and of an appropriate size in accordance with IEC 60702-2 or BS EN 60702-2;
5. Where more than one cable terminates at a galvanised or zinc coated enclosure the gland plate shall be of brass or insulating materials;
6. LSOH thermoplastic or thermosetting shrouded terminating glands shall be used when the cables are fitted with LSOH thermoplastic outer covering;
7. Only tools recommended by the manufacturer of the cables shall be used and the manufacturer's recommended methods of cable termination shall be adopted in all cases.

ELE8.4.2.060.8**INSULATION RESISTANCE**

1. The insulation resistance between the cores and between each core and the sheath shall be measured before the cable end is sealed;
2. The measured insulation resistance, R_I dependent on its length, l , on a 500V insulation resistance tester shall be given as follows:

Length, l (km)	Requirements on insulation resistance, R_I
$l < 0.1$	$R_I \geq 10,000\text{M}\Omega$
$l = 0.1$	$R_I \geq 10,000\text{M}\Omega$
$l > 0.1$	$l R_I \geq 1,000\text{M}\Omega \text{ km}$

3. If the reading is less than the values given above, the cable shall be heated by means of a blow lamp or similar device so that moisture is driven out to the open end of the cable and evaporated there;
4. Heating shall be continued until the measured insulation resistance reaches the values given above and the sealing shall be applied without delay;
5. The insulation resistance shall be measured when the cable end has been sealed, and shall meet the values given above;
6. For mineral-insulated cable with LSOH thermoplastic outer covering, adequate length of the LSOH thermoplastic outer covering shall be cut out in the event of low insulation resistance to achieve the required insulation resistance.

ELE8.4.2.070.8**IDENTIFICATION OF CORE**

1. The cores of the mineral-insulated cables shall be identifiable at their termination by the application of sleeves or discs of appropriate colours as prescribed below:

Type	Colour
Single-phase circuit	Brown

Phase L1 of 3-phase circuit	Brown
Phase L2 of 3-phase circuit	Black
Phase L3 of 3-phase circuit	Grey
Neutral conductor of a circuit	Blue
Protective conductor	Green & Yellow

- Identification sleeves shall comply with BS 3858 Type 3 where appropriate and shall have temperature rating similar to that of the seals.

ELE8.4.2.080.8 BONDING OF CABLE SHEATH TO METALWORK

Where a mineral-insulated cable passes through or makes contact with any metal, the metal and cable sheath shall be effectively bonded together.

ELE8.4.2.090.8 USE OF SINGLE-CORE CABLES

Single-core mineral-insulated cables running together shall be laid with the cable sheaths in contact. Mineral-insulated cables for 3-phase circuits shall be laid in trefoil formation. Where the cables used are rated at 100A or above, gland plates of apparatus shall be of brass.

ELE8.4.2.100.8 PROTECTION FROM MECHANICAL DAMAGE

The mineral-insulated cables shall be protected by steel conduits or steel sheathings where the cables are exposed in vulnerable positions. Where cables pass through floors, ceilings and walls, the holes shall be made good with cement or other non-combustible material and where cables pass through steelwork, the holes must be bushed.

ELE8.4.2.110.8 RESTRICTION OF USE

Mineral-insulated cables shall not be used:

- In discharged lighting circuits unless suitable Approved precautions have been taken to avoid excessive voltage; or
- For earthed concentric wiring system.

ELE8.4.3 REFERENCE TABLE

ELE8.4.3.010.8 MAXIMUM SPACING OF SADDLES FOR MINERAL-INSULATED CABLES

- The spacing between adjacent saddles shall not exceed the values given in the table below:

Maximum Spacing of Saddles for Mineral-Insulated Cables		
Overall Diameter of Cable, D (mm)	Maximum Spacing (mm)	
	Horizontal Run †	Vertical Run †
$D \leq 9$	600	800
$9 < D \leq 15$	900	1200
$15 < D$	1500	2000

† The spacing stated for horizontal runs may be applied also to runs at an angle of more than 30° from the vertical. For runs at an angle of 30° or less from the vertical, the vertical spacing is applicable.

-
2. Saddles shall be provided at a distance not exceeding 150 mm away from a termination and away from both sides of a bend.

ELE8.5 CABLE JOINTS AND TERMINATIONS

ELE8.5.010.8 GENERAL

1. Joints and terminations of all power cables shall be made by skilled cable jointers who shall be approved by the Contract Manager before work commences;
2. No reduction in the number of strands of a cable core shall be allowed at a cable joint or termination;
3. Ferrules, compression connectors and bare portions of cable core resulting from a jointing or terminating process shall be insulated with an Approved type insulating tape or heat shrinkable tubing after completion of the process. Such insulating tape or heat shrinkable tubing shall have equal or better electrical and mechanical properties than those of the original insulation removed, and shall be adhered to the cores etc. securely and permanently. The final thickness shall be in a smooth contour throughout the whole length;
4. Every compression joint shall be of a type which has been the subject of a test certificate as described in BS 4579 or IEC 61238-1. When a compression joint is made, the appropriate tools specified by the manufacturer of the joint connectors shall be used.

ELE8.5.020.8 JOINT BOXES AND TERMINATING BOXES

1. Boxes for joints in all power cables shall be of cast-iron, compound filled and of adequate size;
2. The boxes shall be fitted with suitable armouring clamps and glands;
3. The armouring of the cables shall be terminated at the armouring clamps and the inner sheath shall pass through the gland;
4. The box shall be warmed thoroughly before the compound is poured to allow total adhesion between the compound and the box. The compound shall then be allowed to cool and tapped up before the box is closed. No air locks shall be formed within the box.

ELE8.5.030.8 USE OF COLD COMPOUND AND PLASTIC SHELLS

With the consent of the Contract Manager, plastic shells fitted with suitably sized armour bond and filled with Approved type cold pouring encapsulating compound may be used as an alternative to the compound filled cast iron joint boxes for jointing XLPE/PVC-insulated power cables. In such cases, the complete jointing kit, including plastic shell, compound, insulating tape etc., shall be from the same proprietary manufacturer who is specialised in manufacturing products for this purpose. The jointing method and procedure shall be in strict accordance with the manufacturer's recommendations.

ELE8.5.040.8 EARTH CONTINUITY ACROSS JOINTS

A circuit protective conductor having adequate CSA and of same material as the phase conductors shall be installed and connected to maintain the effectiveness of the earth continuity across every cable joint.

ELE8.5.050.8 STRAIGHT-THROUGH JOINTS FOR COPPER CONDUCTORS

1. In a straight-through joint for copper conductors, the two conductors shall be butted together after the strands have been soldered solid and shall be jointed by means of a weak back ferrule, soldered to the cores. Soldering shall be carried out by pouring tinman's solder over the cores and weak back ferrule. In no circumstances shall direct flame from a blowlamp be used for soldering;
2. As an alternative, conductors may be jointed by Approved type compression connectors using appropriate tools and connectors.

ELE8.5.060.8 TEE-JOINTS FOR COPPER CONDUCTORS

When two cables with copper conductors are tee-jointed, the branch conductor shall be connected to the main conductor by means of claw type or weak back ferrules. The strands in both branch and main conductors are to be sweated solid before sweating to the ferrule. Soldering shall be carried out as detailed in [ELE8.5.050](#).

ELE8.5.100.8 TERMINATION OF XLPE/PVC-INSULATED POWER CABLES WITH COPPER CONDUCTORS

1. XLPE/PVC-insulated power cables shall be terminated in a gland fitted with an armour clamp;
2. Provision shall be arranged to enable a watertight seal to be made between the gland and the inner PVC or low smoke zero halogen sheath;
3. The gland body shall be provided with an internal conical seating to receive the armour clamping cone and a clamping nut which shall secure the armour clamping cone firmly to the armour wires ensuring that the armour wires are tightly clamped between the armour cone and conical armour seating;
4. The spigot on the gland body shall be threaded to suit standard conduit accessories;
5. A shroud shall be fitted to cover the body of the gland and the exposed armour wires.

ELE8.5.120.8 USE OF HEAT SHRINKABLE TUBING

1. With the consent of the Contract Manager, heat shrinkable tubing and accessories may be used for cable joints or terminations. All tubing and accessories shall be specially designed for this purpose and shall be suitable for use with the type and construction of cable to be jointed or terminated;
2. The heat shrinkable materials shall have electrical and mechanical properties equal to or better than those of the cable insulation and sheath, where applicable. After the application of the heat, the heat shrinkable materials shall seal the interfaces between the heat shrinkable materials or between the heat shrinkable materials and the cable surfaces;
3. Whenever heat shrinkable tubing and accessories are used, the complete kit shall be from the same proprietary manufacturer who is specialised in manufacturing products for this purpose. The method and procedures adopted shall be strictly as those laid down by the manufacturer.

ELE8.5.130.8 OTHER METHODS OF JOINTING AND TERMINATION

Methods for jointing or terminating a power cable, other than those specified in the Section, will not be precluded provided that:

1. The method used shall be proven to be capable of affording the degree of safety and efficiency not less than that achieved by those specified in this Section;

-
2. The method used shall satisfy the requirements of the BS 7671 or IEC 60364;
 3. The prior Approval of the Contract Manager has been obtained.

ELE8.6 REFERENCE TABLES

ELE8.6.010.8

CORE IDENTIFICATION OF POWER CABLES

Function of core	Colour code	Number code
Phase conductor of a single phase circuit	Brown	L
Phase conductor of a three-phase circuit	Phase L1: Brown Phase L2: Black Phase L3: Grey	L1 or L2 or L3 according to the phase concerned
Neutral conductor	Blue	N

Note: Cores used as protective conductors shall have an exclusive colour identification of green-and-yellow, unless otherwise stated.

ELE8.6.020.8

INTERNAL BENDING RADII OF POWER CABLES

Type of cables	Minimum radii
1. XLPE-insulated cables to BS 5467 or IEC 60502-1 or BS 6724 with copper conductors	6 D
2. Multi-core, sheathed, armoured, fire-resistant cables to BS 7846	8 D
3. Single-core, sheathed, non-armoured, fire-resistant cables	
4. Multi-core, sheathed, non-armoured, fire-resistant cables not covered by BS 7629:Part 1	
5. Multi-core, sheathed, non-armoured, fire-resistant cables to BS 7629:Part 1	6 D

Where D is the overall diameter of the cable.

ELE9.1 CABLE DUCTS

ELE9.1.010.8 MATERIALS FOR DUCTS

Cable ducts shall be formed from concrete, PVC, metal or such other materials as may be specified by the Contract Manager in ELE2 or on the Drawings.

ELE9.1.020.8 METALLIC DUCTING

Metallic ducting shall comply with the same requirements as metal trunking.

ELE9.1.030.8 CONCRETE DUCTS CAST IN-SITU

Ducts cast in in-situ concrete shall be formed so that the radial thickness of the concrete or screed surrounding the cross-section of the complete ducting shall not be less than 15 mm at every point.

ELE9.1.040.8 CABLES IN CONCRETE DUCTS

Cables in ducts formed from concrete shall be PVC insulated and PVC sheathed with wire armour, or paper insulated with lead sheath and armoured or mineral insulated with PVC outer covering.

ELE9.1.050.8 CABLES IN WOOD DUCTS

Cables in ducts formed from wood shall be PVC insulated, or PVC insulated and PVC sheathed, and shall be held in position by clips, saddles, or equal and Approved fixings.

ELE9.1.060.8 CABLES IN UNDERGROUND DUCTS

Cables in underground ducts shall be of armoured type as specified in ELE7.

ELE9.1.070.8 INTERNAL BARRIERS

1. In every vertical duct, which is designed as totally enclosed without ventilation, internal barriers shall be provided to prevent the air at the top of the duct from attaining an excessively high temperature;
2. The distance between adjacent barriers shall be the distance between floors;
3. Where the floor to floor distance exceeds 5 m, additional barriers shall be provided at intervals not exceeding 5 m.

ELE9.1.080.8 FIRE BARRIERS

Where a cable duct passes through fire resistant structural elements, such as floors or walls designated as fire barriers, the opening thus formed shall be sealed with fire resistant materials having the same degree of fire resistance as the structural element. In addition, suitable internal fire barriers shall also be provided. An internal barrier may also serve as an internal barrier described previously in [ELE9.1.070](#) above.

ELE9.1.090.8 ACCESSORIES FASTENED TO DUCT COVER

Where a duct cover is used as a support for fixing socket outlet or other accessories, provision shall be made to enable the cover to be removed, so that the enclosed cables can be accessed without taking down the socket outlet or other accessories from the cover.

ELE9.1.100.8 STEEL CONDUITS TERMINATED AT A DUCT

Steel conduits terminating at a duct shall each be securely fixed by means of conduit coupler and brass male brush.

ELE9.1.110.8 RADIUS OF CURVATURE

Where a change in direction in a duct occurs, provision shall be made to enable the cables in the duct to have adequate radii of curvature in accordance with ELE7 and ELE8.

ELE9.1.120.8 DRAW-IN PITS

1. Where cables in a duct are inaccessible for the greater part of their lengths, adequate number of draw-in pits shall be provided at regular intervals of not greater than 45 m;
2. Sufficient room shall be available in the draw-in pits to enable cables to be manoeuvred without damage;
3. In the case of armoured cables, the draw-in pits shall be concrete or brick lined and shall be fitted with a waterproof heavy cast iron lid;
4. Draw-in pits shall not be filled with sand or other materials.

ELE9.1.130.8 SPACE FACTOR

The space factor in a cable duct shall not exceed 35%.

ELE9.1.140.8 SEGREGATION OF CABLES OF DIFFERENT CIRCUIT CATEGORIES

Separate ducts shall be provided for cables of different circuit categories. However, cables of different categories may be allowed to pass through the same draw-in pit provided that they are properly and appropriately segregated.

ELE9.1.150.8 SEALING OF DUCT ENTRIES TO BUILDING

1. After the cables have been installed, both the cables and the exposed duct end shall be sealed to form a gas, water and fire barrier;
2. Open ends of spare ducts shall be closed with duct plugs as shown on drawings to prevent gas and water ingress. If the open ends of spare ducts are located in two separate fire compartments, either one end shall be further sealed with fire resistant material of fire rating not less than the fire resistant requirement of the compartments.

ELE9.1.160.8 SEALING OF DUCT ENTRIES TO MANHOLES/DRAWPITS

After the cables have been installed, all cables duct ends at the manholes/drawpits, including the spare ducts shall be sealed up to form a gas and water barrier according to the installation details as shown on the Drawings.

ELE9.2 METAL CABLE TRAYS

ELE9.2.010.8 MATERIALS FOR TRAYS

Metal cable trays shall be perforated, formed from plain steel sheet complying with BS 1449:Part 1 and shall be hot-dipped galvanised to ISO 1460, ISO 1461 after perforation. Cable trays shall have corrosion protection not lower than medium protection to BS EN 50085-1 and BS EN 50085-2-1 or Class 5 to IEC 61537.

ELE9.2.020.8 DIMENSION OF TRAYS

Cable trays have the following dimensions:

Nominal width	Minimum height of upstand	Nominal thickness of steel sheet
100 mm	12 mm	1.2 mm
150 mm	12 mm	1.2 mm
225 mm	12 mm	1.5 mm
300 mm	20 mm	1.5 mm
450 mm	20 mm	2.0 mm
600 mm	20 mm	2.0 mm

ELE9.2.030.8 BEND PIECES

Bend pieces shall be of the same material, thickness and finish as the main body of the cable tray and shall have an inner radius of 50 mm and a straight length of 100 mm at each end.

ELE9.2.040.8 PERFORATIONS IN BEND PIECES

- No perforation shall be made in the circular portion of all bend pieces having a nominal width of 150 mm or 100 mm;
- Perforation may be allowed in bend pieces having a nominal width of 225 mm or above provided that the perforation is made along a line passing through the centre of curvature of the bend pieces and set at an angle θ to the normal of the axis of the cable tray;
- The values of θ are tabulated below:

Nominal width of cable tray	Value of θ
225 mm and 300 mm	45°
450 mm and 600 mm	30° and 60°

ELE9.2.050.8 TEE PIECES

Tee pieces shall be of the same material, thickness and finish as the main body of the cable tray. The distance measured between the point of the intersection and the end of the tee piece shall not be less than 100 mm.

ELE9.2.060.8 CONNECTIONS BETWEEN ADJACENT LENGTHS OF TRAY

1. Connections between adjacent lengths of tray, tee or bend pieces, shall be made by butt joints and fixed by mushroom-head steel roofing bolts and nuts complying with BS 1494:Part1;
2. The connection shall be mechanically strong so that no relative movement between the two lengths can occur.

ELE9.2.070.8 CUTTING OF TRAYS

Cable trays shall be cut along a line of plain metal only, i.e. they shall not be cut through the perforation. All cut edges of the galvanised cable tray shall be prepared and treated with a cold galvanised paint.

ELE9.2.080.8 CABLE TRAY ACCESSORIES

1. Manufacturer's standard items of accessories shall be used;
2. Site fabrication of accessories shall only be allowed after Approval and shall be kept to a minimum;
3. Where special sections are required, the material, thickness and finish shall be as specified for the standard items.

ELE9.2.090.8 HOLES IN TRAYS

Holes cut in a cable tray for the passage of cables shall be provided with grommets. Alternatively they shall be bushed or lined.

ELE9.2.100.8 SPACE BEHIND TRAYS

A minimum clear space of 20 mm shall be left behind all cable trays.

ELE9.2.110.8 FIXING OF TRAYS

1. Cable trays shall be fixed securely to the walls, ceiling or other structure by means of mild steel hangers or brackets of adequate mechanical strength;
2. The hangers or brackets shall be painted in accordance with ELE28.7;
3. Fixings for cable trays shall be disposed at regular intervals not exceeding 1200 mm and on both sides of, and at a distance not exceeding 225 mm from, a bend or intersection.

ELE9.2.120.8 FIXING OF CABLES ON TRAYS

1. For horizontal run of multi-core cables to BS 5467, cable ties for securing these cables to cable trays shall be made from nylon or polypropylene material. In the cases of low smoke zero halogen or fire-resistant multi-core cables, stainless steel cable ties shall be used;
2. For vertical run of multi-core armoured cables, cable cleats of cast iron with hot dipped galvanised finish or die cast aluminium shall be used for the fixture of multi-core armoured cables. In the case of multi-core non-armoured cables mounted vertically, metallic cable clamps or clips shall be used;
3. Single-core cables shall be secured to the cable tray by non-magnetic metallic cable cleats, clamps or clips specially designed to suit the dimensions of the cables. In the case of low smoke zero halogen or fire-resistant single-core cables, the cable cleats, clamps or clips shall be resistant to a flame at 950°C;

-
4. The cleats, clamps or clips of these single-core cables shall be secured to the cable tray by means of bolts, washers and nuts.

ELE11.1 CONDUIT SYSTEM

ELE11.1.010.8 CONCEALED CONDUIT SYSTEM

Unless otherwise specified in ELE2 or shown on the Drawings, conduits shall be concealed within walls, floor slabs, false ceilings, or other suitable space.

ELE11.1.020.8 SURFACE CONDUIT SYSTEM

Where surface conduits are specified, they shall be fixed by distance saddles, and shall run only in a vertical or horizontal direction.

ELE11.1.030.8 MINIMUM SIZE OF CONDUIT

The minimum outside diameter of any conduit to be used shall be 20 mm. Where special situations demands, 16 mm conduit may be used subject to prior Approval being obtained from the Contract Manager.

ELE11.1.040.8 STANDARD

Steel conduits, except flexible conduits, shall be of heavy gauge, screwed, longitudinally welded. All conduits shall comply with BS 4568: Part 1 or IEC 61386-21 or BS EN 61386-21.

ELE11.2 CONDUITS AND FITTINGS

ELE11.2.010.8 TYPE-TESTING

Steel conduits and conduit fittings shall be type-tested for complete compliance with the following Standards by an Accredited Laboratory:

1. Steel conduits: BS 4568:Part 1 or IEC 61386-21 or BS EN 61386-21;
2. Conduit fittings: BS EN 61386-1 or IEC 61386-1;
3. Steel boxes for Electrical Accessories: IEC 60670-1 with dimensions to BS 4662.

ELE11.2.020.8 FLEXIBLE STEEL CONDUITS

1. Flexible steel conduits and solid type brass adaptors shall comply with BS EN 61386-1, or IEC 61386-1 and IEC 61386-23. In addition, the conduits shall be of the metallic watertight pattern, PVC oversheathed and with a separate circuit protective conductor drawn into the conduit for each continuity. PVC oversheath will not be required for installations within ventilated ceiling voids;
2. Length of each flexible conduit shall not be more than 1 m for general applications or 2 m inside false ceiling and raised floor.

ELE11.2.030.8 CONDUIT FITTINGS

1. All conduit fittings shall comply with BS EN 61386-1 or IEC 61386-1;
2. Adaptable boxes complete with covers shall be of cast iron, galvanised, or sheet steel having a protection against corrosion in accordance with IEC 60670-1. Unless otherwise specified, boxes of the preferred sizes only, as given in IEC 60670-1, shall be used. Screws for securing the cover shall be of stainless steel;
3. Circular boxes, dome covers and hook covers shall be of galvanised malleable cast iron. Ceiling mounted boxes shall be of deep pattern type having an internal depth of not less than 60 mm;
4. Bushes and plugs shall be of brass;
5. Distance saddles shall be of galvanised cast iron. The screws for fixing the saddles shall be of brass;
6. Solid or inspection tee-pieces, couplers or elbows shall not be used on any conduit installation.

ELE11.2.040.8 METAL BOXES FOR ACCESSORIES

1. Metal boxes for the enclosure of electrical accessories in conduit installation shall comply with IEC 60670-1 with dimensions to BS 4662;
2. 35 mm and 47 mm deep boxes shall be used to house accessories such as domestic switches, socket outlets, etc.;
3. 16 mm and 25 mm deep boxes may be used to house specially designed electrical accessories of shallow pattern subject to prior Approval.

ELE11.2.050.8 CLASS OF PROTECTION AGAINST CORROSION

1. Steel conduits shall have Class 4 protection against corrosion in accordance with BS 4568: Part 1 or IEC 61386-1 or BS EN 61386-1 i.e. heavy protection both inside and outside (e.g. hot-dip zinc coating or sherardizing);

-
2. Steel conduit fittings shall have Class 4 protection in accordance with BS EN 61386-1 or IEC 61386-1 i.e. heavy protection both inside and outside (e.g. hot-dip zinc coating or sherardizing);
 3. Metal boxes for the enclosure of electrical accessories shall have protection both inside and outside in accordance with IEC 60670-1.

ELE11.2.060.8**CORROSION RESISTANCE TEST**

Upon request from the Contract Manager, documentary evidence that the batch/consignment of steel conduits and conduit fittings delivered to site having satisfied the corrosion protection requirement as stipulated in the relevant Standards mentioned in **ELE11.2.010** shall be provided.

ELE11.3 CONDUIT AND WIRING INSTALLATION

ELE11.3.010.8 CONDUIT CONTINUITY

1. The steel conduit installation shall be mechanically and electrically continuous throughout, and efficiently earthed;
2. Earth continuity of the conduit installation shall be tested before concreting of floors and walls and also on completion of the entire installation;
3. Where the circuit protective conductor is formed by the conduits, the terminal of the socket outlet shall be connected by a separate protective conductor, having the same cross sectional area and type as the live conductors, to an earth terminal incorporated in the associated metal box or enclosure;
4. Flexible conduit shall not be used as a protective conductor.

ELE11.3.020.8 JOINTS IN STEEL CONDUITS

1. Joints in steel conduits shall be made by means of a solid coupler into which the adjacent ends of the two conduits shall be inserted and screwed up tightly in order to make the conduit run mechanically and electrically continuous;
2. Running couplings shall be avoided. Where such a coupling cannot be avoided, the coupler shall be screwed up tightly onto the short threaded portion of one conduit, the threaded portion of which shall project approximately half way into the length of the coupler. The threaded portion of the mating conduit should also project approximately half way into the coupler;
3. Electrical continuity should be ensured by tightening up a hexagon locknut against the coupler;
4. Any exposed threads on either conduit shall be painted with at least two coats of anti-rust paint.

ELE11.3.030.8 PROVISION OF ADAPTABLE BOXES

1. An adequate number of suitably sized adaptable boxes shall be provided in all conduit runs to enable cables to be drawn in easily and without damage;
2. Adaptable boxes shall be provided immediately after every two bends, after a bend plus a total maximum straight run of 10 m or after a maximum straight run of 15 m;
3. Where an adaptable box is required for conduits installed in the floor screed, it shall be fitted in such a manner that the lid is covered by the same material as the remainder of the floor, and shall remain accessible at all times.

ELE11.3.040.8 SPACING BETWEEN CONDUITS

Adjacent or parallel conduits cast in concrete (except the first 200 mm straight runs from the same box) shall be separated by a spacing of not less than 25 mm so as to allow concrete aggregate to pass and set between them.

ELE11.3.050.8 TERMINATION OF STEEL CONDUITS AT METAL CASING

1.
 - a. Where a steel conduit terminates at a metal casing, a coupler or a brass adaptor for flexible conduit together with a brass male bush shall be used;

-
- b. The brass male bush shall be screwed into the coupler or adaptor from the inside of the metal casing through a clearance hole drilled in the metal casing to suit the bush;
 - c. Both the conduit and the bush shall be screwed tightly into the coupler or adaptor so as to grip the metal casing securely for mechanical and electrical continuity;
 - d. Threads on the steel conduit shall be at least half the coupler length, and no threads on the metal casing shall be allowed;
 - e. The connection between the flexible conduit and the adaptor shall be securely fixed and effectively watertight.
 2. Where the metal casing is painted or enamelled, the electrical continuity between the conduit and the casing shall be achieved by means of a separate protective conductor of adequate size connecting the conduit and an earth terminal inside the metal casing through a copper earthing placed between the bush and the metal casing. Neither the paint nor the enamel shall be damaged or removed to achieve electrical continuity.

ELE11.3.060.8 CONDUIT BENDS

Conduits shall not be bent with an acute angle. The internal radius of the bend shall not be less than 2.5 times the outside diameter of the conduit.

ELE11.3.070.8 CHASES FOR CONDUITS

Chases for conduits to be concealed in walls, columns or beams shall be vertical or horizontal.

ELE11.3.080.8 CONDUITS CROSSING EXPANSION JOINTS

1. Where a conduit crosses an expansion joint, special arrangements shall be made to allow relative movement to occur on either side of the expansion joint;
2. A separate circuit protective conductor shall be installed to maintain an effective electrical continuity across the expansion joint;
3. The circuit protective conductor shall have a cross-sectional area rated to suit the largest live conductors drawn into the conduits in accordance with for the Electrical CoP.

ELE11.3.090.8 USE OF EXTENSION PIECE

1. An extension piece shall be fitted to a conduit box where the plaster wall finish (including plaster) is more than 25 mm from the conduit box;
2. Only extension pieces of the correct depth shall be used;
3. Under no circumstances shall multiple extension pieces be permitted.

ELE11.3.100.8 PREVENTION OF INGRESS OF FOREIGN MATTER

1. During the building construction, all open ends of the conduit termination, which are liable to be filled with water, moisture or other foreign matter, shall be plugged with Approved conduit stopping plugs; paper or rag materials will NOT be allowed for this purpose;
2. Conduit boxes in similar circumstances shall also be similarly plugged to prevent concrete or plaster from entering the boxes during the building construction.

ELE11.3.110.8 PREVENTION OF ACCUMULATION OF WATER OR MOISTURE

1. The conduits shall be so laid to prevent accumulation of condensed moisture in any part of the installation. Due care shall also be taken to prevent the ingress of water into the conduits from leakage in walls and ceilings of the building structure;
2. Approved type of sealant for the prevention of condensed moisture shall be applied to ceiling conduit outlets installed in a cool space subject to the influx of warm air.

ELE11.3.120.8 CONDUITS LAID DIRECT IN THE GROUND

Steel conduits laid direct in ground or buried in soil shall be painted with two coats of bituminous paint before installation.

ELE11.3.130.8 FIXING OF SURFACE MOUNTED BOXES

In surface conduit installations, conduit boxes, adaptable boxes and metal boxes for accessories shall be securely fixed to walls, ceilings or other substantial parts of a structure by means of suitable brass screws correctly spaced. The fixing of these boxes shall be independent of the fixing of the associated conduits.

ELE11.3.140.8 FIXING OF SADDLES

1. Galvanised distance saddles, for the support of surface conduits, shall be provided throughout the entire route at regular intervals;
2. The spacing between the adjacent saddles shall not be more than those given in the Electrical CoP;
3. Each bend of a surface conduit shall be supported by a saddle on either side of the bend, and the saddles shall be fixed as near to the bend as practicable;
4. Distance saddles shall be fixed with brass screws in Rawplugs or other Approved method.

ELE11.3.150.8 CONDUITS INSTALLED OUTDOORS OR IN DAMP SITUATIONS

Where conduits are installed outdoors or in damp situations all conduit fittings and conduit accessories, shall not be placed in contact with other metals with which they are liable to set up electrolytic action. In addition, where the conduit installation is subjected to weather, the conduit fittings and conduit accessories shall be provided with weatherproof sealant or other materials to ensure that the installation is completely weatherproof.

ELE11.3.160.8 SWABBING OUT OF CONDUITS

Conduits shall be swabbed out and free from moisture before wiring work is commenced. The swabbing operation shall be carried out under the supervision of the authorised representative of the Contract Manager. Only Approved draw-in tape or wire of appropriate size and absorbent cloth shall be used.

ELE11.3.170.8 CONDUITS PASSING THROUGH FIRE RESISTANT BARRIERS

Where conduits pass through fire resistant structural elements, such as walls and floors designated as fire barriers, the opening made shall be sealed according to the appropriate degree of fire resistance of the wall and floor. In addition, where conduits are installed in channels, ducts, ducting, trunking or shafts which pass through such elements, suitable internal fire resistant barriers shall also be provided to prevent the spread of fire.

ELE11.3.180.8 IDENTIFICATION

Conduits, where required to be distinguished from pipelines of other services, shall use orange as the basic identification colour in compliance with BS 1710.

ELE11.3.190.8 CABLE CAPACITY OF CONDUITS

1. The number of cables drawn into a conduit shall be such that no damage will be caused to the cables or to the conduits during their installation;
2. In determining the size of the conduit, the "unit system" method as recommended by the Electrical CoP shall be adopted;
3. For cables and conduits NOT included in the Electrical CoP, the number of cables drawn into a conduit shall be such that the resulting space factor shall not exceed 40%.

ELE11.3.200.8 METHOD OF DRAWING CABLES INTO CONDUITS

Cables shall be drawn into conduits by using Approved draw-in tape or wire of the appropriate size. Only lubricating materials which are confirmed in writing from a cable manufacturer or recognised certification body that there will be no adverse effect on the cable insulation for the lifetime of the cable may be allowed to be used for drawing cables into conduits.

ELE11.3.210.8 SEGREGATION OF CABLES OF DIFFERENT CIRCUIT CATEGORIES

Separate conduits shall be provided for cables of different circuit categories.

ELE11.3.220.8 "LOOPING-IN" WIRING SYSTEM

Each conductor in a run shall be of one continuous length and wired on the "loop-in" system. No joint in cable run will be allowed.

ELE11.3.230.8 NUMBER OF FINAL CIRCUITS IN CONDUIT

A conduit serving final circuits direct from a distribution board or from an adaptable box used as a final distribution point shall contain one final circuit except in the case of lighting final circuit where two circuits with 1.5 mm² cables will be permitted in a 20 mm conduit. For 3 phase final circuits, a separate conduit shall be used for each circuit.

ELE11.3.240.8 GROUPING OF CABLES IN CONDUIT

1. Where an adaptable box is used as the final distributing point, a number of final circuits may be grouped together between the distribution board and the adaptable box by means of conduits of appropriate diameter. All live conductors of the same a.c. circuits shall be drawn into the same conduit;
2. Correction factors for grouping, as recommended by the Electrical CoP, shall be applied in determining the size of cables to be installed.

ELE11.3.250.8 NEUTRAL CABLE OF LIGHTING POINT

The neutral cable of a lighting final circuit shall be routed in the conduit direct to the lighting point and shall not pass through the switch box.

ELE11.4 TOOLS AND WORKMANSHIP

ELE11.4.010.8 TOOLS

Conduit bends shall be formed on a bending machine, and the conduits shall not be flattened at bends.

ELE11.4.020.8 CUTTING OF HOLES

Holes in metal work for the termination of conduits shall be drilled with a twist drill of the correct size or by means of other hole cutting device.

ELE11.4.030.8 REMOVAL OF BURRS AND SHARP EDGES

Burrs and sharp edges are to be removed from the ends of conduits before they are installed.

ELE11.4.040.8 MAKING GOOD OF DAMAGED COATING

Where the protective coating on a steel conduit has been damaged after installation, such surface shall be painted with at least two coats of an Approved anti-rust paint to prevent corrosion.

ELE12.4.020.8	CUTTING IN TRUNKING	8
ELE12.4.030.8	MAKING GOOD OF DAMAGED COATING	8

ELE12.1 TRUNKING SYSTEM

ELE12.1.010.8 ARRANGEMENT OF CABLES

Cables in each final circuit and/or in each sub-main shall be bunched and tied or clipped together.

ELE12.1.020.8 PROVISION OF CABLE RETAINING BARS AND CABLE SUPPORTS

1. Trunking, which is installed in such a position that the cables would fall out when the cover is removed, shall be fitted with cable retaining bars or other suitable devices to prevent cables from falling out;
2. Trunking installed in a vertical plane shall contain sufficient supporting devices within the trunking to prevent strain on the cables due to the weight of the cables, and to prevent vertical movement of the cables.

ELE12.1.030.8 CABLE CAPACITY OF TRUNKING

1. The number of cables put into a trunking shall be such that no damage is caused to the cable or the trunking;
2. In determining the size of the trunking required for a particular installation, the "unit system" method as recommended by the Electrical CoP shall be adopted;
3. For cables and trunking not included in the Electrical CoP, the number of cables to be enclosed in the trunking shall be such that the resulting space factor shall not exceed 45%.

ELE12.1.040.8 CORRECTION FACTORS FOR GROUPING

Where more than three loaded conductors or more than one multi-core cable are enclosed in a common trunking, suitable correction factors for grouping, as recommended by BS 7671 or IEC 60364, shall be applied in determining the size of the cables to be installed.

ELE12.1.050.8 SEGREGATION OF CABLES OF DIFFERENT CIRCUIT CATEGORIES

1. Where a common trunking is used to accommodate cables for different circuit categories, they shall be effectually segregated by means of partitions or dividers;
2. The partitions or dividers shall be adequately secured to the body of the trunking.

ELE12.2 MATERIALS FOR TRUNKING SYSTEM

ELE12.2.010.8 GENERAL

1. Trunkings and fittings shall comply with BS EN 50085-2-1, IEC 61084-2-1 or equivalent unless otherwise specified;
2. Manufacturer's standard fittings such as tee or angle pieces, connectors etc. shall be used throughout unless prior Approval has been obtained from the Contract Manager;
3. Factory prefabricated trunking assemblies of repetitive pattern can be used for congested areas like meter rooms on various floors. Mock-up installation shall be set up for the Contract Manager's approval prior to mass production of the prefabricated trunking assemblies.

ELE12.2.020.8 CLASS OF PROTECTION AGAINST CORROSION

Trunking and fittings shall have continuous hot-dip zinc coating on both sides with a minimum coating mass of 275 g/m².

ELE12.2.030.8 CONSTRUCTION

1. Trunking shall be of square or rectangular cross-section of which one side of the trunking shall be removable or hinged;
2. If screws are used to secure the cover or the connector, they shall not project internally over 2mm to avoid causing damage to the cables inside;
3. Where partitions or dividers are provided for the segregation of circuits, they shall be rigidly fixed to the main body of the trunking.

ELE12.2.040.8 MARKING ON TRUNKING

Every standard length of trunking shall bear an easily legible and durable marking by means of moulding, pressing or engraving showing the name or the trademark of the manufacturer, British Standard and / or International Electrotechnical Commission Standard, as appropriate. For short pieces without durable marking, the marking shall be provided at the internal wall of every piece of trunking in the form of painting or printed adhesive label.

ELE12.2.050.8 DIMENSIONS

1. The sizes, body and cover thicknesses and preferred lengths of surface trunking shall comply with Code 14C of the Electrical CoP;
2. Trunking to special order, having dimensions differing from those given in Code 14C of the Electrical CoP, may be used provided they meet all the other requirements as stated in this specification and with tolerance in external dimensions not exceeding +5%.

ELE12.2.060.8 CONNECTIONS BETWEEN LENGTHS OF TRUNKING

1. Connections between adjacent lengths of trunking, tee or angle pieces, accessories, etc. shall be made by means of U-shaped butt joints. The two adjacent ends of the trunking shall be fixed so that there shall be no relative movement between them. At least two screws shall be used to attach each connector to each section of the trunking;
2. Electrical continuity shall be achieved by means of a copper tape of minimum size 2mm x 12mm connecting the two adjacent ends of the trunking;
3. Prefabricated trunking assemblies shall have sections connected by welding or screws. Welding points shall be touched up with anti-rust paint.

ELE12.2.070.8 TRUNKING COVERS

1. Trunkings and fittings shall have removable or hinged covers extending over the entire length. The covers shall be of the same material and finish as those of the trunking body;
2. Removable covers shall be held in position on the trunking by the natural elasticity of the material of the cover (e.g. spring capped trunking); a means formed as an integral part of the cover (e.g. captive screws); or stainless steel spring clips fixed rigidly on trunking body by welding or by adhesive suitable for fixing metallic parts;
3. Bends, tee junctions, etc. shall be fitted with removable or hinged covers;
4. When trunking is mounted up-side-down or installed inside lift shaft, the trunking covers shall be fixed by screws.

ELE12.2.080.8 SCREWS

1. Screws used for securing the cover or connector and for the fixing of the trunking shall have isometric threads;
2. They shall be of brass or steel and if of steel they shall be protected against corrosion by a finish at least equal to the zinc coating specified in BS 7371-12;
3. Electro-brass plated screws or self-tapping screws will not be acceptable.

ELE12.3 INSTALLATION OF TRUNKING SYSTEM

ELE12.3.010.8 LAYOUT

Trunking shall be installed neatly on the surface of the walls, columns or beams and shall be truly vertical and horizontal.

ELE12.3.020.8 TRUNKING CONTINUITY

The trunking body and cover shall be mechanically and electrically continuous throughout, and efficiently earthed.

ELE12.3.030.8 CONNECTION TO APPARATUS

Connection between trunking and apparatus shall be by a screwed coupler and brass male bush, or a standard flange coupling or an adaptor neck, fabricated or casted. Direct attachment of trunking to apparatus will only be permitted if cable entries are provided with smooth bore bushes or grommets and the return edge of the lid of the trunking is left intact.

ELE12.3.040.8 CONNECTION TO DISTRIBUTION BOARD

Where connection is made between trunking and a distribution board, the cable entry or entries shall be sized to accept all cables from all used and "spare" ways.

ELE12.3.050.8 FIXING OF TRUNKING

1. Individual pieces of trunking shall be independently supported by means of at least two fixed points per piece;
2. On straight runs supports for trunking shall be fixed at regular intervals with maximum spacings as given in Code 25B of the Electrical CoP;
3. For runs with bends, supports shall be fixed as near to the bend as practicable;
4. Overhead trunking shall be suitably supported by means of mild steel hangers, brackets or other Approved devices, so that no visible sag is observed when loaded with cables. These supports shall be painted with at least two coats of an Approved anti-rust paint to prevent corrosion.

ELE12.3.060.8 CABLES THROUGH TRUNKING

Cables penetrating through trunking shall be protected by conduits except for PVC insulated and sheathed cables if such cables form part of a surface wiring system. In such cases, the holes in the trunking, through which such cables penetrate shall be fitted with suitable rubber grommets or insulated bushes.

ELE12.3.070.8 TRUNKING PASSING THROUGH FIRE RESISTANT BARRIERS

1. Whenever trunking passes through a fire resistant structural element, such as a floor or wall, designated as fire barrier, the opening thus formed shall be sealed with Approved type of fire resisting material according to the appropriate degree of fire protection required. In addition, suitable internal fire barriers shall also be provided to prevent the spread of fire or smoke through the trunking;
2. In vertical trunking installations, internal fire barriers shall be provided between floors or at intervals of 5 m apart whichever is less.

ELE12.3.080.8 PREVENTION OF ELECTROLYTIC ACTION

Whenever the trunking is installed in damp situations, or where the trunking is likely to be exposed to weather, the trunking shall be kept away from other metalwork with which electrolytic action is liable to be established.

ELE12.3.090.8 PREVENTION OF INGRESS WATER

Every entry to the trunking shall be so placed as to prevent and/or to be protected against the ingress of water.

ELE12.4 TOOLS AND WORKMANSHIP

ELE12.4.020.8 CUTTING IN TRUNKING

Holes in trunking shall be drilled, punched or cut by ring saw. After cutting, burrs and sharp edges on the trunking shall be removed to prevent abrasion of cables.

ELE12.4.030.8 MAKING GOOD OF DAMAGED COATING

Where the protective coating on the trunking has been damaged after installation or after welding, such surface shall be painted with at least two coats of an Approved anti-rust paint to prevent corrosion.

ELE13.1 CONDUIT SYSTEM

ELE13.1.020.8 STANDARDS

1. Rigid plain polyvinyl chloride (PVC) conduits, conduit fittings and PVC boxes shall comply with the respective Standards listed below:

PVC conduits	IEC 61386-21 or BS EN 61386-21
PVC conduits fittings	IEC 61386-1 or BS EN 61386-1 or BS 4607:Part 1 for male bush and female adaptor or BS 4607:Part 5 for plain moulded slip type couple and expansion type coupler
PVC circular conduit boxes and adaptable boxes	IEC 60670-1 or BS EN 61386-1 or BS 4607-5
PVC boxes for electrical accessories	IEC 60670-1 and dimensions to BS 4662

2. All PVC conduits, fittings and boxes shall be of the same make.

ELE13.1.030.8 COLOUR

All PVC conduits, fittings and boxes shall be white in colour.

ELE13.1.040.8 FLAME RESISTANCE

All PVC conduits, fittings and boxes shall be non-flame-propagating and self-extinguishing.

ELE13.1.050.8 TEMPERATURE CLASSIFICATION

All PVC conduits, fittings and boxes shall comply with the temperature classification for transport, installation and permanent application not less than -5°C. For PVC conduits, where the ambient temperature at the place of manufacture is likely to be below -5°C, the temperature classification of conduits shall be capable for transport, installation and permanent application not less than -25°C.

ELE13.2 RIGID PLAIN PVC CONDUITS

ELE13.2.010.8 CONSTRUCTION AND SIZE

1. PVC conduits shall be rigid, plain and of a non-threadable type;
2. The nominal diameter of rigid plain PVC conduits shall be within the range of 20 mm to 32 mm unless otherwise specified.

ELE13.2.020.8 MECHANICAL PROPERTIES

Rigid plain PVC conduits shall have heavy mechanical strength, capable of withstanding the heavy compression and impact tests specified in IEC 61386-21 or BS EN 61386-21.

ELE13.2.030.8 TYPE-TEST CERTIFICATES

1. Rigid plain PVC conduits shall be type-tested for complete compliance with IEC 61386-21 or BS EN 61386-21 by an Accredited Laboratory;
2. Test certificates or test reports are acceptable for the purpose of product testing and certification.

ELE13.2.040.8 MARKING

1. Rigid plain PVC conduits shall be marked on the surface with the first four digit classification code for declared properties in accordance with IEC 61386-21 or BS EN 61386-21;
2. The PVC conduits shall have a minimum classification code of 4421. If the ambient temperature at the place of manufacturer of the PVC conduits is likely to be below -5°C, the classification code of the PVC conduits shall be upgraded to 4441.

ELE13.4 PVC CONDUIT FITTINGS

ELE13.4.010.8 CONSTRUCTION

1. Plain, moulded slip-type couplers and expansion type couplers to IEC 61386-1 or BS EN 61386-1 shall be used in the jointing of conduits;
2. Saddles and spacers in compliance with IEC 61386-1 or BS EN 61386-1 shall be used for fixing of conduits unless otherwise specified.

ELE13.4.020.8 TYPE-TEST CERTIFICATES

1. PVC conduit fittings shall be type-tested for complete compliance with the following standards by an Accredited Laboratory:
 - a. Plain moulded slip type coupler: IEC 61386-1 or BS EN 61386-1 or BS 4607-5;
 - b. Male bush and female adaptor: IEC 61386-1 or BS EN 61386-1 or BS 4607-1.
2. Test certificates or test reports are acceptable for the purpose of product testing and certification.

ELE13.5 PVC CIRCULAR CONDUIT BOXES, PVC BOXES FOR ELECTRICAL ACCESSORIES AND PVC ADAPTABLE BOXES

ELE13.5.010.8 CONSTRUCTION AND DIMENSIONS

1. All PVC boxes and their covers shall comply with the relevant International Standard and British Standard Specifications listed above in **ELE13.1.020**;
2. All screw holes shall be fitted with metal inserts. Other than PVC adaptable boxes, each box shall be provided with a brass earthing terminal complete with screw for the connection of circuit protective conductor (CPC);
3. Ceiling-mounted circular conduit boxes shall be of deep pattern type having an internal depth of not less than 60 mm. Extension rings shall comply with IEC 60670-1;
4. Each PVC box shall be moulded in one piece;
5. The minimum wall thickness of IEC 60670-1 boxes and adaptable boxes shall be 2 mm;
6. For flush installation, the overall sizes of the covers of the PVC adaptable boxes shall be larger than the adaptable boxes on each edge by at least 5 mm. Screws for securing the cover shall be of stainless steel;
7. BS 4662/IEC 60670 boxes equipped with spouts for mounting wiring accessories can be used as an alternative for easy connection to conduits.

ELE13.5.020.8 MECHANICAL PROPERTIES

1. All PVC boxes shall comply with the requirements for mechanical properties stated in the relevant International Standard and British Standard Specifications listed in **ELE13.1.020** above;
2. PVC adaptable boxes shall be moulded of sufficient mechanical strength to withstand forces encountered in concealed conduit wiring system application and complete with provision for prevention of deformation of the boxes where necessary;
3. Boxes for the suspension of luminaires or other equipment, where considerable heat will be produced, shall be fitted with steel insert clips;
4. Plastic boxes shall not be used in situations where the temperature of the box is likely to exceed 60°C or where the mass suspended from the box exceeds 3 kg.

ELE13.5.030.8 TYPE-TEST CERTIFICATES

1. PVC circular conduit boxes, PVC boxes for electrical accessories and PVC adaptable boxes shall be type-tested for complete compliance with IEC 60670-1 by an Accredited Laboratory;
2. Test certificates or test reports are acceptable for the purpose of product testing and certification.

ELE13.5.040.8 TOLERANCE IN SETTING-OUT OF CONCEALED JUNCTION/ADAPTABLE BOXES ON WALLS AND SLABS INSIDE DOMESTIC FLATS AND AT PUBLIC AREAS IN STANDARD BLOCKS

The deviation of the installed position of concealed junction/adaptable boxes from the specified position as shown in the Drawings shall be within a tolerance of ± 150 mm with the following considerations:

1. Inside domestic flats:

In general, the sockets outlets and lighting switches etc. shall be at the same level in the same room. Vertical levels of boxes designed at the same level on the same structural wall shall be within ± 8 mm, and that on the same panel wall shall be within ± 3 mm.

2. At public areas:

In general, junction boxes shall be aligned and properly confined in a small area. The regular pattern of the boxes and their alignment along the corridors' ceiling slabs shall be maintained within ± 10 mm.

3. The installed position of boxes after taking the above tolerance into consideration shall not contravene the requirements of the position of switches/sockets as stipulated in the Design Manual - Barrier Free Access 2008; nor have conflict with other installations such as skirting, door frame, etc.;

4. Deviations exceeding the tolerance under special site condition shall be subject to the approval of the Contract Manager.

ELE13.5.050.8 CONCEALED CONDUITS INSTALLATION ON PANEL WALLS WITH PRE-INSTALLED CONDUITS

1. Coordinate with Main Contractor for the alignment of the concealed conduit in the slab and the pre-installed in panel walls;
2. Interconnect conduits from ceiling slab to pre-installed conduits in panel wall partitions including the provision of conduits, couplers, sockets and all electrical accessories;
3. Wherever necessary, adjust alignment of conduits in ceiling slab and conduit ends at the open slots of panel walls for smooth interconnection;
4. Interconnect the draw wires in the conduits in ceiling slab and the draw wires in the pre-installed conduits for subsequent wiring work;
5. Attend and coordinate with the Main Contractor for the making good of the open slots on panel wall;
6. Installation of concealed conduits in panel walls shall follow the Electrical CoP. Unless otherwise specified, mechanical protection cover for pre-installed conduits shall comply with the Electrical CoP.

ELE13.6 CONDUIT AND WIRING INSTALLATION

ELE13.6.010.8 CONDUIT BENDS

Conduit bends shall have an internal radius of at least 4 times the outside diameter of the conduit.

ELE13.6.020.8 BENDING, JOINTING AND TERMINATING OF CONDUITS

The method of carrying out the conduit bends, conduit joints, fixing conduits to boxes without spouts, and the tools and materials to be used shall be as recommended by the manufacturer of the conduits.

ELE13.6.030.8 EARTHING

Unless otherwise specified, a PVC insulated cable shall be drawn into the conduit system to serve as the circuit protective conductor (CPC), the cross-sectional area of which shall comply with Electrical CoP for the size of the largest live conductors enclosed.

ELE13.6.040.8 EARTHING FOR PRE-INSTALLED STEEL CONDUIT

In case pre-installed steel conduit is adopted in panel wall, provide earthing of the metal boxes to the corresponding wiring accessories with cost agreed with and borne by the Main Contractor.

ELE13.7 TRUNKING AND FIXING

ELE13.7.010.8 GENERAL

Trunking of sizes up to 100 mm x 100 mm shall have covers of the clip-on type. Larger sizes shall have covers secured by special plastic rivets.

ELE13.7.020.8 FIXING OF TRUNKING

1. The trunking shall be fixed and supported in the normal way by screws, but the holes in the trunking shall be made oversize to allow for the movement of expansion;
2. Washers shall be used under the head of the screw which should not be tightened to its full extent;
3. The spacing between adjacent supports for trunking shall not be larger than those given in the Electrical CoP.

ELE13.7.030.8 EARTHING

Unless otherwise specified, a PVC insulated cable shall be drawn into the trunking system to serve as the circuit protective conductor (CPC), the cross-sectional area of which shall comply with the Electrical CoP for the size of the largest live conductors enclosed.

ELE13.7.040.8 ALLOWANCE FOR THERMAL EXPANSION

Due allowance shall be made for the expansion of the PVC tubing at high temperatures. Expansion coupling or other fittings shall be included in a straight run of 8 m or more. Saddles or clips shall be of sliding fit.

ELE14 LIGHTNING PROTECTION SYSTEM

ELE14.1	PROTECTION OF STRUCTURES AGAINST LIGHTNING.....	3
ELE14.1.010.8	INSTALLATION OF LIGHTNING PROTECTION SYSTEMS	3
ELE14.1.020.8	SCOPE	3
ELE14.1.050.8	AIR TERMINATION ON ROOF AND UPPER ROOF	3
ELE14.1.055.8	AIR TERMINATION ON SIDE WALLS.....	3
ELE14.1.060.8	DOWN CONDUCTORS	3
ELE14.1.080.8	EARTH TERMINATION.....	4
ELE14.1.110.8	BONDING TO OTHER SERVICES	4
ELE14.1.120.8	BONDING TO METALWORK	4
ELE14.1.130.8	JOINTS IN CONDUCTORS	4
ELE14.1.140.8	TESTING.....	5

ELE14.1 PROTECTION OF STRUCTURES AGAINST LIGHTNING

ELE14.1.010.8 INSTALLATION OF LIGHTNING PROTECTION SYSTEMS

1. The lightning protection system shall comprise an air termination network connected by down conductors to earthing electrodes;
2. The lightning protection systems shall be installed in accordance with Project Specific Specification and Drawings, and as directed by the Contract Manager.

ELE14.1.020.8 SCOPE

1. This section covers lightning protection systems applicable to buildings and similar structures;
2. It does not cover the protection of overhead lines and other specialised applications;
3. The installation shall conform to the requirement and recommendations set out in IEC 62305-1 and IEC 62305-2 and IEC 62305-3 and IEC 62305-4, or BS EN 62305-1 and BS EN 62305-2 and BS EN 62305-3 and BS EN 62305-4, or AS/NZS 1768.

ELE14.1.050.8 AIR TERMINATION ON ROOF AND UPPER ROOF

1. An air termination consisting of a network of aluminium roof conductors shall be provided on roof and upper roof as shown on the Drawings;
2. All salient points of the roof structure shall be incorporated in the air termination network;
3. All metallic projections, chimneys, ducts, vent pipes, railings, gutters, etc., on or above the main surface of the roof of the roof structure, shall be fixed to, and form part of, the air termination network by appropriate clamps;
4. Aluminium roof conductors shall be of 25 mm x 3 mm and fixed to the roof structure at regular intervals of not more than 0.5 m by means of spacer saddles;
5. The spacer saddles shall be of pressing or casting aluminium alloys.

ELE14.1.055.8 AIR TERMINATION ON SIDE WALLS

1. Air termination on external wall of the building, if required, shall be in form of tinned copper plate of thickness not less than 4 mm mounted on the cast in bonding point as shown on the Drawings;
2. The cast in bonding point shall be of copper and pre-welded to a 70 mm² PVC insulated cable. The cable shall be bonded to two reinforcement bars by means of rod-to-cable clamps;
3. The tinned copper plate shall have good contact with the cast in bonding point and shall be properly protected to avoid covering up by the external wall paint. The fixing screws shall be welded to the tinned copper plate after testing to be having negligible resistance to the down conductor. The Sub-contractor shall coordinate with the Main Contractor on the sequence of installation during construction.

ELE14.1.060.8 DOWN CONDUCTORS

1. Down conductors shall be of 25 mm x 3 mm aluminium strips, or steel reinforcement bars as shown on the Drawings;

2. The reinforcement bars extended from the foundation shall be tested to be having low earthing resistance before selected as down conductors. At each down conductor position, two reinforcement bars shall be used;
3. Continuity shall be maintained between different sections of the selected reinforcement bars by using clamps as shown on the Drawings. Each connection shall be tested to be at negligible resistance before concreting. The Sub-contractor shall ensure the reinforcement bars at the same position, from foundation up to the roof, to be used as the down conductors;
4. The reinforcement bars selected as down conductors shall be connected to the aluminium roof conductors and the cast in bonding point on external wall according to the details and locations as shown on the Drawings;
5. The total resistance measured from the earth inspection pit to each down conductor on roof and to each cast in bonding point on external wall shall be recorded.

ELE14.1.080.8**EARTH TERMINATION**

The building foundation shall be used as the earth electrode of the lightning protection system. The steel reinforcement bars of the foundation shall be connected to earth inspection pits via cast in bonding point and copper tape as shown on the Drawings. The complete lightning protection system shall have a combined resistance to earth not exceeding 10 ohms. Where it is difficult, due to local conditions, to obtain a value of less than 10 ohms by the sole use of the foundation, additional rod electrodes complying with ELE17.3 shall be provided and connected to the copper link inside the earth inspection pits until the combined resistance to earth not exceeding 10 ohms. The proposed installation details shall be submitted for the Contract Manager's approval prior to commencement of works.

ELE14.1.110.8**BONDING TO OTHER SERVICES**

1. Lightning protection systems shall normally be kept segregated from the metalwork of other services;
2. The earthing of electrical system shall be bonded to the lightning protection system through the main earthing terminal provided inside the main switch room and services rooms as shown on the Drawings;
3. Cables, earthing systems and pipes belonging to the Supply Company, the Telephone Companies, the Hong Kong & China Gas Co. Ltd. and other utility companies shall not be bonded except with the written permission of such companies.

ELE14.1.120.8**BONDING TO METALWORK**

Unless otherwise stated, metalwork on roof shall be bonded to the roof conductor by means of 25 mm x 3 mm aluminium strip. The bonding of movable items to the lightning protection system shall use flexible copper braid with termination nut suitable for connection to aluminium conductor. The connections shall be of negligible resistance, metal to metal and mechanically sound with non-ferrous nuts, bolts and washers using clamps where necessary.

ELE14.1.130.8**JOINTS IN CONDUCTORS**

Joints in aluminium roof conductors shall be made by suitable tape clamps. The tape clamps shall each be provided with at least 4 screws or bolts. All such joints shall have negligible resistance and good mechanical strength.

ELE14.1.140.8 TESTING

1. On completion of the installation, the lightning protection system shall be tested and recorded in accordance with the checklists given in Appendix 13 of the Electrical CoP;
2. The earthing resistance of the foundation metalwork shall also be tested in accordance with Code 21 of the Electrical CoP with test instruments approved by the Contract Manager;
3. The results of all tests shall be submitted to the Contract Manager for record.

ELE16.2.140.8	SEGREGATION OF CIRCUITS	5

ELE16.1 TELECOMMUNICATION SYSTEMS

ELE16.1.010.8 SCOPE

1. This sub-section covers the conduit installations for the following systems:
 - a. Telephone;
 - b. Inter-communication and Public Address (PA) Systems;
 - c. Communal Aerial Broadcast Distribution (CABD) System;
 - d. Subscription Television Distribution Network (STDN).
2. Separate conduits shall be provided for each of these systems;
3. Nylon draw-wires of adequate strength shall be provided in all empty conduits.

ELE16.1.020.8 CONDUITS FOR TELEPHONE AND PA SYSTEMS

Conduits shall be of PVC not smaller than 20 mm in diameter, and shall be installed in accordance with ELE11.

ELE16.1.030.8 OUTLET BOXES FOR TELEPHONE POINTS

1. At each telephone outlet position, the conduit shall be terminated at a 47 mm deep BS 4662 box for electrical accessories with blank cover plate. If the outlet is installed with a telephone outlet plate by the FTNS operator, the provision of blank cover plate is not required;
2. Outlet boxes shall be located at skirting level or otherwise as stated on the Drawing;
3. The cover plate shall be of moulded material unless otherwise specified.

ELE16.1.040.8 OUTLET BOXES FOR PA SYSTEMS

1. At each PA outlet position, the conduit shall be terminated at a 47 mm deep BS 4662 box for electrical accessories with blank cover plate. If the outlet is installed with equipment on top, the provision of blank cover plate is not required;
2. Outlet boxes shall be fixed at skirting level or otherwise as stated on the Drawing.

ELE16.1.060.8 CONDUITS FOR CABD/STDN SYSTEMS

1. Conduits for CABD/STDN systems shall be of PVC, not smaller than 25 mm in diameter, and shall be installed generally in accordance with ELE11;
2. They shall be kept clear of power and telephone conduits and shall be arranged to cross them at right angles whenever possible;
3. Draw-in boxes shall be provided at intervals of not exceeding 10 metres and at all 90° changes of direction, unless otherwise shown on the Drawings.

ELE16.1.070.8 OUTLET BOXES FOR CABD/STDN SYSTEMS

1. At each CABD/STDN outlet position, the conduit shall be terminated in a 47 mm deep BS 4662 box for electrical accessories with blank cover plate. If the outlet is installed with CABD/STDN socket, the provision of blank cover plate is not required;
2. Outlet boxes shall be fixed at skirting outlet plate level or otherwise as shown on the Drawing.

ELE16.2 BELL AND AUDIBLE WARNING SYSTEM

ELE16.2.040.8 CALL BELL AND DOOR BELL SYSTEMS

1. Bells shall operate at a voltage not exceeding 24V a.c. obtained from a double wound transformer which shall be connected to the mains supply through a 2A fused connection unit, unless otherwise specified;
2. Unless otherwise specified cables shall be 1.5 mm² PVC insulated cables enclosed in conduit for concealed conduit installation.

ELE16.2.050.8 BELLS FOR EXTRA LOW VOLTAGE

1. Call bells shall be of the underdome type having a gong of approximately 75 mm diameter and shall be fixed to a substantial frame;
2. Door bell shall be 2 tones sound and of a wall mounted design with white or ivory colour cover and is to be free of any projection on the rear surface;
3. Door bell shall be classified, as a minimum requirement, to Class II as described in IEC 60335-1;
4. The insulating enclosure of the door bell shall be opened only with the use of a tool and this insulating enclosure shall provide a degree of protection of at least IP20 as described in IEC 60529. Where the enclosure can be opened without the use of a tool, every conductive part which is accessible if the enclosure is open shall be behind an insulating barrier which prevents a person from coming into contact with those parts; this insulating barrier shall provide a degree of protection of at least IP20 as described in IEC 60529 and be removable only by use of a tool.

ELE16.2.060.8 BELL TRANSFORMERS

1. Bell transformers shall be a single phase, double wound, safety isolating transformer specifically intended to supply domestic sound signalling equipment and comply with IEC 61558-2-8. Factory test certificates shall be submitted as evidence of compliance with the required standard;
2. The transformer shall be inherently short circuit proof. The reactance of the transformer winding shall be of such value that a continuous short circuit across the terminals of the secondary winding shall not damage the transformer, or cause dangerous overheating;
3. The windings, core and terminals of the transformer shall be contained within an insulating plastic case.

ELE16.2.070.8 CONNECTION OF BELL TRANSFORMERS

Bell transformers shall be connected to the lighting final circuit as shown on the Drawing, unless otherwise specified.

ELE16.2.080.8 CALL BELL PUSHES

1. Call bell pushes for indoor use shall be of flush pattern with white or ivory colour front plate;
2. Call bell pushes for outdoor use, or for areas where they may be subjected to rain or water, shall be weatherproof.

ELE16.2.090.8 MOUNTING OF CALL BELL PUSHES

1. In conduit installations, bell pushes shall be fixed in 35 mm deep, BS 4662 boxes for electrical accessories;
2. In surface cable installations, bell pushes shall be fixed in a plastic pattress;
3. Bell pushes shall not be mounted on doors without Approval.

ELE16.2.140.8 SEGREGATION OF CIRCUITS

Cables for operation at extra low voltage shall not be routed in the same conduit with cables for operation at higher voltages.

ELE17.1 GENERAL

ELE17.1.010.8 SCOPE

Unless otherwise specified the protective measures for fault protection is by earthed equipotential bonding and automatic disconnection of supply.

ELE17.1.020.8 COMPLIANCE WITH RULES AND REGULATIONS

The Sub-contractor shall provide the earthing system for the electrical installation, and also bond the electrical installation and extraneous conductive parts to fully comply with the Electrical CoP, BS 7671, Supply Rules and BS 7430 Code of practice for earthing.

ELE17.1.030.8 BONDING FOR EXTRANEEOUS CONDUCTIVE PARTS

1. Building exposed metallic parts such as metallic doors, windows, louvres, burglar bars, railings, water supply pipeworks, drainage pipe, catladder etc. are extraneous conductive parts requiring equipotential bonding;
2. Main equipotential bonding

Main equipotential bonding conductors should be provided in accordance with ELE17.5,
3. Supplementary Bonding

Supplementary bonding conductors should be provided in accordance with ELE17.6,
4. The Sub-contractor shall ensure the bonding for extraneous conductive parts is sound and the result complies with the Electrical CoP and BS 7671 by proper measurement with records at good time. For those parts of equipotential bonding system found not electrical conductive, the Main Contractor and the Sub-contractor shall be responsible for rectification of their own works as early as possible.

ELE17.2 MAIN EARTHING TERMINALS

ELE17.2.010.8 LOCATION

A solid copper main earthing terminal of ample size shall be provided for every electrical installation at a position near the main incoming switch or switchboard for the connection of the circuit protective conductors, the main equipotential bonding conductors, the structural earthing terminal and the earthing conductors to create the equipotential zone.

ELE17.2.020.8 SEPARATE BUILDINGS OR UNITS

Where an installation distributes to a number of buildings or units, a separate main earthing terminal shall be provided for each individual building or unit at the point of intake thereby creating a separate equipotential zone in each building or unit.

ELE17.2.030.8 CONNECTION TO EARTH

The mains earthing terminal shall be connected to Earth via an earthing conductor to an earth electrode or a group of electrodes.

ELE17.3 EARTH ELECTRODES

ELE17.3.010.8 TYPES OF EARTH ELECTRODES

Unless otherwise specified in Project Specific Specification or on the Drawings, rod electrodes shall be installed.

ELE17.3.020.8 ROD ELECTRODES

1.
 - a. Rod electrodes shall be of mild steel inner core with a bonded hard drawn copper sleeve of an Approved type.
 - b. The overall diameter of the rod shall not be less than 14 mm and the thickness of the copper sleeve shall not be less than 0.25 mm;
 - c. The minimum length shall be 2.4 m. The length shall comprise a single piece of rod or two 1.2 m pieces coupled together;
 - d. Additional lengths, whenever required, shall each be of 1.2 m, connected together by a coupling;
 - e. The penetrating end of the rod electrode shall be a hardened steel point.
2. Rod electrodes shall be driven into the ground within an earth pit. Only Approved tools e.g. electric hammer or pneumatic hammer shall be used for their installation;
3. The number of rod electrodes and the location of the earth pits shall be determined on site such that the resultant earth loop impedance will effect the disconnection of supply within 5 sec. by the protective device in case of any earth faults occurred at any part of the installation other than the final circuits;
4.
 - a. In cases where the earthing resistance achieved by one rod is not sufficiently low for the purpose required, additional lengths or additional rods shall be installed;
 - b. For the latter application, the additional rods shall be driven into the ground outside the resistance area of the previously installed rods;
 - c. Under normal circumstances, a mutual separation of 3.5 m is considered adequate;
 - d. All rods thus installed shall be connected together by means of 25 mm x 3 mm copper tapes enclosed in PVC ducts and laid at a minimum depth of 600 mm below ground surface;
 - e. The connecting copper tapes shall be run in direct lines between the rods.

ELE17.4 EARTHING CONDUCTORS

ELE17.4.010.8 CONDUCTOR MATERIALS

Earthing conductors shall be copper tapes 25 mm x 3 mm in cross section and for outdoor application, the copper tapes shall be tinned.

ELE17.4.020.8 CONNECTION TO ELECTRODES

1. The earthing conductor shall be connected to the earth electrode(s) by means of Approved copper connector-clamps such that the connection can only be disconnected by means of a tool;
2. The connection shall be contained within a concrete lined earth pit with a substantial removable cover to ensure accessibility and maintainability.

ELE17.5 MAIN EQUIPOTENTIAL BONDING CONDUCTORS

ELE17.5.010.8 CONDUCTOR MATERIALS

Unless otherwise specified, main equipotential bonding conductors shall be of copper.

ELE17.5.020.8 BONDING POSITIONS

1. Main equipotential bonding conductors shall connect the extraneous conductive parts of other services within the premises to the main earthing terminal of the installation;
2. Such extraneous conductive parts shall include main water and gas pipes, other service pipes and risers and exposed metallic parts of the building structure liable to transmit a potential;
3. Connections shall be made as near as practicable to the point of entry of the non-electrical services into the premises concerned, and shall be on the installation side of the possible breaks in the system, such as gas meter or water meter.

ELE17.5.030.8 BONDING METHOD

Unless otherwise specified or shown on Drawings, the main equipotential bonding conductors shall be securely and reliably connected to extraneous conductive parts of the non-electrical services by means of a connector-clamp of an Approved type suitable for the particular applications or other effective bonding methods approved by the Contract Manager. All contact surfaces shall be clean and free from non-conducting materials, such as grease or paint, before making the connection.

ELE17.6 SUPPLEMENTARY BONDING CONDUCTORS

ELE17.6.010.8 CONDUCTOR MATERIALS

Unless otherwise specified, supplementary bonding conductors shall be of copper.

ELE17.6.030.8 APPLICATION

Supplementary bonding of extraneous conductive parts will be required whenever such conductive parts are likely to be accessible simultaneously with other extraneous conductive parts, or exposed conductive parts, and are not electrically connected to the main equipotential bonding by means of permanent and reliable metal-to-metal joints of negligible impedance.

ELE17.6.040.8 BONDING METHODS

1. Unless otherwise specified or shown on Drawings, the supplementary bonding conductors shall be solidly and effectively connected to the extraneous or exposed conductive parts by means of a connector-clamp of an Approved type suitable for the application or other effective bonding methods approved by the Contract Manager. All contact surfaces shall be clean and free from non-conducting materials, such as grease or paint, before making the connection;
2. For surface conduit installations, the supplementary bonding conductors shall be terminated at the nearest conduit or conduit box forming an integral part of the conduit installation;
3. Unless otherwise specified or shown on Drawings, for concealed conduit installations, the subject extraneous or exposed conductive part shall be terminated via a cord outlet plate with 1 no. supplementary bonding conductor. The BS 4662 conduit box of the cord outlet plate, forming an integral part of the conduit installation shall be located as near as possible to the bonding position and the exposed part of the supplementary bonding conductor shall be made as short as possible;
4. When necessary and required, insulated connector enclosed in base box of cord outlet plate (for bonding conductor) or base box of electrical equipment in vicinity of extraneous or exposed conductive part can be used for interconnection of all associated supplementary bonding conductors from related extraneous or exposed conductive part or from earthing terminal of the nearby electrical equipment in order to achieve the requirements of the Electrical CoP on electrical bonding.

ELE17.7 CIRCUIT PROTECTIVE CONDUCTORS (CPC)

ELE17.7.010.8 GENERAL

Circuit protective conductors (CPC) may be formed by a separate conductor/cable, the metallic sheath or armour of a cable, part of the same cable as the associated live conductor, rigid steel conduits, trunking or ducting, or the metal enclosure of the wiring system. Flexible conduits and the exposed conductive parts of equipment shall not form part of the circuit protective conductors.

ELE17.7.030.8 CPC FOR FLEXIBLE CONDUIT

For every length of flexible conduit, a separate circuit protective conductor shall be provided inside the conduit to ensure the earth continuity of the installation between the two ends of the flexible conduit.

ELE17.7.040.8 CPC FOR BUSBAR TRUNKING AND BUSWAY

1. A copper tape, 25 mm x 3 mm in cross section shall be provided for the entire length of a busbar trunking or busway. The copper tape shall be bonded to the busbar trunking or busway at intervals not exceeding 3 m and at the position of each tape-off point;
2. Subject to prior Approval the provision of copper tapes for a busbar trunking or busway may be exempted provided that the enclosure of the busbar trunking or busway can be proved to satisfy the full requirements of the circuit protective conductor.

ELE17.7.050.8 CPC FOR FINAL RING CIRCUIT

For wiring systems using PVC insulated, PVC sheathed cables, the circuit protective conductor of every ring final circuit shall also be run in the form of a ring having both ends connected to the earth terminal at the origin of the circuit.

ELE17.8 JOINTS IN PROTECTIVE CONDUCTORS

ELE17.8.010.8 PROVISION FOR DISCONNECTION

Provision shall be made in an accessible position for disconnecting a protective conductor from the main earthing terminal or the earth electrode to permit testing and measurements of earthing resistance.

ELE17.8.020.8 MEANS OF DISCONNECTION

Such joints shall only be disconnected by means of a tool, be mechanically strong and shall be tinned to maintain the electrical continuity reliably.

ELE17.8.030.8 USE OF SWITCHING DEVICES

No switching devices shall be inserted in a protective conductor.

ELE17.9 IDENTIFICATION AND LABELLING

ELE17.9.010.8 COLOUR IDENTIFICATION

1. All cables used as protective conductors, including earthing conductors, main equipotential bonding conductors, supplementary bonding conductors and circuit protective conductors shall be identified by the colour combination "green and yellow";
2. Bare copper tapes used as protective conductors shall also be made similarly identifiable, by the application of tapes with the above colour combination at maximum 2 m intervals and at each tee-off points.

ELE17.9.020.8 LABELS FOR EARTHING AND BONDING CONNECTIONS

Every point of connection for earthing conductor to an earth electrode and the main equipotential bonding shall be provided with a warning notice in accordance with ELE28.1.

ELE17.10 SIZING OF PROTECTIVE CONDUCTORS

ELE17.10.010.8 PROTECTIVE CONDUCTORS

1. The cross sectional area of a protective conductor, excluding equipotential bonding conductors, shall comply with Code 11 C of the Electrical CoP. Alternatively, it can be calculated using the formula given in Regulation 543.1.3 of BS 7671;
2. When a separate PVC insulated copper cable is used as the protective conductor and not contained in conduit, trunking, ducting or other enclosure of a wiring system, it shall have a minimum cross sectional area of 4 mm² and shall be insulated to BS EN 50525-2-31 or better unless its CSA is greater than 6 mm²;
3. When metal enclosures for cables are used as protective conductors, they shall have CSA equivalent to that of copper, not less than that resulting from the above-mentioned adiabatic equation.

ELE17.10.020.8 PROTECTIVE CONDUCTORS BURIED IN SOIL

Where protective conductors are buried in the soil, they shall comply with Code 11H(a) of the Electrical CoP.

ELE17.10.030.8 EQUIPOTENTIAL BONDING CONDUCTORS

1. The cross sectional area of a main equipotential bonding conductor shall comply with Code 11E(d) of the Electrical CoP;
2. The cross-sectional area of a supplementary bonding conductor shall comply with Code 11F(d) of the Electrical CoP.

ELE17.11 EARTH FAULT LOOPS

ELE17.11.010.8 AUTOMATIC DISCONNECTION TIME

The characteristics of the protective devices for automatic disconnection shall be coordinated with the earthing impedances of the circuits and comply with Code 11B(b) of the Electrical CoP.

ELE17.11.030.8 MAXIMUM EARTH FAULT LOOP IMPEDANCE

1. The maximum permissible earth fault loop impedance shall comply with Code 11 I of the Electrical CoP;
2. Where the armouring of an armoured cable forms part of the circuit protective conductor, and if the maximum earth fault impedance exceeds the specified limits, a separate protective conductor of appropriate size shall be provided.

ELE17.12 USE OF RESIDUAL CURRENT-OPERATED CIRCUIT BREAKER (RCCB)

ELE17.12.010.8 GENERAL

1. RCCBs shall be installed for final circuits where the earth fault loop impedance is too high to allow sufficient earth fault current to operate the overcurrent protective device within the specified automatic disconnection time of 0.4 seconds or 5 seconds. In such cases, the product of the rated residual operating current in amperes of the residual current-operated circuit breaker and the earth fault loop impedance, in ohms, of the circuit shall not exceed 50;
2. Residual current-operated circuit breaker shall meet the requirements specified in ELE3.6.

ELE17.12.020.8 APPLICATION IN HOUSEHOLD INSTALLATIONS

RCCBs used to protect socket outlet circuits in a household or similar installation shall have a rated operating residual current not exceeding 30 mA.

ELE17.12.030.8 EQUIPMENT OUTSIDE SAME EQUIPOTENTIAL ZONE

For circuits supplying fixed equipment outside the equipotential zone shall refer to Code 11B(b)(iii) of the Electrical CoP.

ELE18.1 GENERAL

ELE18.1.010.8 COMPLIANCE WITH REGULATION

Domestic appliances together with their electric components and cabling shall comply with the currently-in-force edition of Electrical Products (Safety) Regulation, CAP 406G, Laws of Hong Kong.

ELE18.2 400MM SWEEP ROTARY CEILING FAN

ELE18.2.010.8 CAPACITY

The unit shall be capable of an air delivery of not less than 1.1 m³/s.

ELE18.2.020.8 DIMENSION

The sweep diameter of the unit shall be 400 mm.

ELE18.2.030.8 DUTY

1. The unit shall be suitable in all respects for operation in ambient air condition of 40°C and 95% R.H;
2. The unit shall be suitable for operation on 220V, 50Hz, single phase a.c. supply;
3. The fan shall not require periodic lubrication;
4. The fan shall operate quietly at all speeds.

ELE18.2.040.8 CONSTRUCTION

1. General:
 - a. The unit shall be of deluxe pattern with smooth, safe edges and "easy-to-disassemble" design for cleaning;
 - b. The fan shall have high quality aluminium or plastic blades;
 - c. The fan shall be fully balanced after assembly;
 - d. The blades shall be enclosed by chromed, closely meshed metal guard. The gap of the guard slots shall preferably be not greater than 13 mm at the widest;
 - e. The fan shall be provided with rotary mechanism for a swing of 360° when mounted on the ceiling;
 - f. The whole unit shall be finished to manufacturer's standard light colour Approved by the Contract Manager.
2. Electrics:
 - a. All electrical components, cables etc. shall conform to the appropriate British Standards Specification, or shall be of fully equivalent quality and capacity;
 - b. All exposed metal parts of the unit shall be suitably earthed via the 3 core flexible cable;
 - c. The fan shall be provided with two (2) metres of 0.75 mm², 3 core, PVC insulated and sheathed flexible cable.

ELE18.3 400MM SWEEP ELECTRIC WALL FAN

ELE18.3.010.8 CAPACITY

The unit shall be capable of an air delivery of not less than 1.1 m³/s.

ELE18.3.020.8 DIMENSION

The sweep diameter of the unit shall be 400 mm.

ELE18.3.030.8 DUTY

1. The unit shall be suitable in all respects for operation in ambient air condition of 40°C and 95% R.H;
2. The unit shall be suitable for operation on 220V, 50Hz, single phase a.c. supply;
3. The fan shall not require periodic lubrication;
4. The fan shall operate quietly at all speeds.

ELE18.3.040.8 CONSTRUCTION

1. General:
 - a. The unit shall be of deluxe pattern with smooth, safe edges and "easy-to-disassemble" design for cleaning;
 - b. The fan shall have high quality aluminium or plastic blades;
 - c. The fan shall be fully balanced after assembly;
 - d. The blades shall be enclosed by chromed, closely meshed metal guard. The gap of the guard slots shall preferably be not greater than 13 mm at the widest;
 - e. The unit shall be suitable for direct fixing on to a wall. Conversion from Desk Fan will NOT be accepted;
 - f. The unit shall be fitted with "3-speed and off" push bottom or pull switch.
 - g. The fan shall be provided with oscillating and tilting mechanism for horizontal swing and vertical adjustment respectively;
 - h. The oscillator shall have a clutch that slips or disengages if the fan meets an obstruction as it swings. The mechanism shall also be easily disengaged when not required;
 - i. The whole unit shall be finished to manufacturer's standard light colour Approved by the Contract Manager.
2. Electrics:
 - a. All electrical components, cables etc. shall conform to the appropriate British Standards Specification, or shall be of fully equivalent quality and capacity;
 - b. All exposed metal parts of the unit shall be suitably earthed via the 3 core flexible cable;
 - c. The fan shall be provided with two (2) metres of 0.75 mm², 3 core, PVC insulated and sheathed flexible cable.

ELE18.4 DOMESTIC EXHAUST FAN

ELE18.4.010.8 CAPACITY

The unit shall be capable of the following air extraction rate:

1. 0.06 m³/s for 150 mm diameter fan;
2. 0.23 m³/s for 230 mm diameter fan;
3. 0.47 m³/s for 300 mm diameter fan.

ELE18.4.020.8 DUTY

1. The unit shall be suitable in all respects for operation in ambient air condition of 40°C and 95% R.H;
2. The unit shall be suitable for operation on 220V, 50Hz, single phase a.c. supply;
3. The fan shall operate quietly at all speeds;
4. The unit casing, outlet grille, fan blade and shutters shall be moulded in rigid flame-retardant plastic. This shall also apply to the motor casing if not manufactured in metal.

ELE18.4.030.8 CONSTRUCTION

1. General:
 - a. The unit shall be suitable for mounting on window glass and partitions;
 - b. The unit shall have in-built draught excluding shutters suitable for remote control through an "on/off" switch;
 - c. The unit shall have "easy-to-disassemble" design for cleaning and maintenance;
 - d. The fan shall be fitted with silent running, self-aligning, self-oil bearings;
 - e. The fan shall be fully balanced after assembly;
 - f. The whole unit shall be finished in white or ivory colour or alternatively to manufacturer's standard light colour Approved by the Contract Manager.
2. Electrics:
 - a. The fan shall be driven by a totally enclosed, single phase, induction motor;
 - b. All exposed metal parts of the fan shall be suitably earthed via the 3-pin plug;
 - c. The fan shall be of single speed and be capable of being switched on and off by a remote 5A switch;
 - d. The fan shall be provided with two (2) metres of 0.75 mm², 3 core, PVC insulated and sheathed flexible cable.

ELE18.5 ELECTRIC HAND AND FACE DRYER

ELE18.5.010.8 GENERAL

1. The electrically operated hand and face dryer shall be of good design and pleasant appearance, suitable for heavy duty operation. It shall be of robust construction, intrinsically safe, tamperproof and the drying cycle shall not exceed 35 seconds;
2. The dryer shall be suitable for operation on 220V, 50Hz, single phase, a.c. supply with full bonding to earth through an amply sized 3 core supply cable;
3. The dryer shall be suitable for mounting on the surface of walls, including ceramic tiles.

ELE18.5.020.8 STANDARD CONSTRUCTION

1. The front shall be manufactured from a fully enveloping one piece metal, or Approved high strength plastic cover, fitted with a capacitive touch switch, or insulated metal push button marked "Touch or Push" (as applicable) to start, bi-directional air flow nozzle spring loaded to automatically return to the hand drying position and permanently engraved operating instructions recessed if applicable;
2. Metallic covers shall be finished with acid resistant porcelain enamel;
3. The cover shall be secured to the dryer base by recessed Allen head, or similar type bolts. The base shall be secured to the wall by at least three mounting bolts;
4. The air inlet shall be at the bottom and shall be protected by a suitably sized protective vaned grill. The air outlet shall similarly be protected by metal vanes inside the bi-directional nozzle;
5. All metal parts shall be of stainless, cadmium, or chromium plated steel;
6. The dryer shall be suitable for back and side cable entry with an insulated bushing;
7. The dryer shall be complete with internal electrical overload protection for the fan motor and preferably also for the heater unit.

ELE18.5.030.8 ALTERNATIVE CONSTRUCTION

As an alternative, tenderers may offer units having an infra-red proximity detector, in lieu of the touch switch, or push button control. In this case the operation instructions shall, by internationally recognisable symbols, clearly indicate the method of operation. It would also be preferable for these instructions to state in both English and Chinese:

"Place hands below the air outlet to start."

ELE18.5.040.8 MAINTAINABILITY

The equipment offered shall be designed for easy maintenance.

ELE18.6 QUARTZ MOVEMENT WALL CLOCK

ELE18.6.010.8 GENERAL

1. The clock shall be of deluxe wall hanging pattern having a nominal clock-face diameter of not less than 300 mm;
2. It shall be of Quartz-crystal oscillator controlled movement type and battery operated.

ELE18.6.020.8 CONSTRUCTION

1. The clock shall be of a design which can be flush mounted on the wall and is to be free of any projections on the rear surface;
2. The clock dial shall be white with large Arabic Numerals in black and graduated in minutes;
3. The hour, minutes and second full sweep hands shall preferably be of distinct colour complete with a glass or clear plastic covered front;
4. The rim of the clock shall either be metal or plastic finished in white or ivory colour and the clock movement shall be enclosed to protect it from dust;
5. The type and voltage of the battery powering the clock shall be specified in the supplier's quotation. It shall have a minimum normal use life of at least one year and shall be easily replaceable by non-skilled labour.

ELE18.6.030.8 ACCURACY

The accuracy of timekeeping shall not exceed ± 0.5 sec./day at room temperature (25°C) and the clock unit shall be tropicalised and dust-proof.

ELE18.7 CEILING FANS

ELE18.7.010.8 SCOPE

Each ceiling fan shall be complete with speed regulator. The sweep diameter of the unit shall be 900 mm, 1200 mm or 1400 mm as shown on the Drawings or specified in Project Specific Specification.

ELE18.7.020.8 CAPACITY

The unit shall be capable of an air delivery as below:

Sweep diameter of the unit (mm)	Air delivery (m ³ /s)
900	2.2
1200	3.9
1400	4.5

ELE18.7.030.8 DUTY

1. The unit shall be suitable in all respects for operation in ambient air condition of 40°C and 95% R.H.;
2. The unit shall be suitable for operation on 220V, 50Hz, single phase A.C. supply;
3. The unit shall be designed for heavy duty commercial and domestic usage;
4. The fan shall operate quietly at all speeds.

ELE18.7.040.8 CONSTRUCTION

1. Motor:
 - a. The motor shall be a totally enclosed, capacitor run induction motor, with internal stator and external squirrel-cage rotor;
 - b. The rotor shall be mounted in grease lubricated ball bearings;
 - c. The power factor shall not be less than 0.8 at any speed. The motor shall be rated for continuous operation under ambient air conditions of 40°C and 95% R.H. and the temperature of the windings shall not exceed 50°C after two (2) hours of continuous operation;
 - d. All electrical components, cables etc. shall conform to the appropriate British Standards Specification or shall be of fully equivalent quality and capacity.
2. Blades:
 - a. 900 mm Sweep diameter units:
 - i. The fan shall be fitted with three (3) blades. "Twisted" blades are preferred;
 - ii. The blade assemblies shall consist of one piece all aluminium blades of not less than 1.5 mm thickness;
 - iii. Where the one piece blades are twisted to give the required angle of incidence to the blades there shall be large radius bends to prevent stress concentrations in the blade roots;
 - iv. Anti-vibration bushes shall be installed between the one piece blades and the motor frame;

-
- v. The blades, shall be securely fastened to the frame of the motor by machine screws and spring washers, the whole designed to ensure that there is no possibility of a blade becoming detached during operation.
 - b. 1200 mm & 1400 mm Sweep diameter units:
 - i. The fan shall be fitted with three (3) blades. "Twisted" blades are preferred;
 - ii. The blade assemblies shall consist of blades manufactured from heavy gauge aluminium riveted to steel blade carriers. The rivets shall conform to appropriate British Standards Specification;
 - iii. The blade carriers will be manufactured from mild steel plate of not less than 3 mm in thickness and of not less than 40 mm width at the narrowest point, pressed to shape. The blades shall be of not less than 1.5 mm thickness;
 - iv. Where the blade carriers are twisted to give the required angle of incidence to the blades there shall be large radius bends to prevent stress concentrations in the blade roots;
 - v. Anti-vibration bushes shall be installed between the blades and blade carriers;
 - vi. The blade carriers shall be securely fastened to the frame of the motor by machine screws and spring washers, the whole designed to ensure that there is no possibility of a blade becoming detached during operation.
 - 3. Terminals and capacitor:
 - a.
 - i. The plastic terminal block and capacitor shall be mounted in a ferrous metal connecting piece, located between the fan and the down-rod;
 - ii. The leads from the stator windings shall be connected to the terminal block;
 - iii. An earthing terminal, consisting of a round head brass screw and washer shall be provided on the connecting piece;
 - iv. All exposed metal parts of the fan unit shall be connected to this earthing terminal.
 - b.
 - i. The bottom portion of the connecting piece shall be screwed on to the shaft of the motor;
 - ii. The connecting piece shall be tightened on to a shoulder formed on the motor shaft;
 - iii. A 4 mm minimum thickness steel hexagonal lock-nut shall then be fitted and tightened in position. The connecting piece shall additionally be secured in the fully tightened position by two hardened steel grub screws;
 - iv. These screws shall engage in shallow depressions drilled in the shaft after the connecting piece has been tightened in place to ensure positive locking.
 - 4. Down-rod assembly:
 - a. The down-rod assembly shall consist of a down-rod and a steel shackle with a hard rubber roller for suspension of the fan;
 - b.

-
- i. The down-rod shall be supplied, as required, in lengths of 200 mm, 300 mm, 450 mm, 600 mm, 750 mm, 900 mm and 1200 mm measured from the top of the connecting piece to the centre of the pin in the shackle at the top;
 - ii. Cables of a length to suit the down-rod shall be provided;
 - iii. The down-rod shall be manufactured from 12 mm bore standard mild steel/iron pipe of not less than 3 mm, wall thickness, having an external diameter of approximately 20 mm;
 - iv. It shall be accurately threaded at one end and shall be screwed into the top portion of the fan connecting piece (capacitor housing) from which it shall protrude by a minimum of 2 mm;
 - v. It shall be locked in position by two (2) hexagonal steel lock nuts, having a minimum thickness of 6 mm, tightened on to the upper machined surface of the fan connecting piece;
 - vi. The down-rod shall also be locked to the fan connecting piece by means of a steel split-pin, of not less than 5 mm diameter, passing through both the fan connecting piece and the down-rod.
- c.
- i. The split-pin holes in the fan connecting piece shall be of such a diameter that the split-pin is a light push fit therein;
 - ii. The matching split-pin holes in the down-rod shall be just sufficiently large so that the split-pin shall be a light push fit, when the hole is in its worst position relative to the threading;
 - iii. All burrs and sharp edges shall be removed from the split-pin holes in both the fan connecting piece and the down-rod.
- d.
- i. The steel suspension shackle shall be welded to the down-rod;
 - ii. Welding shall be of good quality and to the satisfaction of the Contract Manager;
 - iii. The rubber roller shall be mounted on an 8 mm diameter steel clevis pin secured by a split-pin.
- e.
- i. The ends of the down-rod shall be rounded off and free from burrs;
 - ii. There shall be no sharp edges which could cause damage to the insulation of the wiring.
5. Suspension joints and threaded parts:
- a. Joints along the suspension rod must be of double-locking design. i.e. at least two independent positive locking devices must be employed to prevent a joint from loosening itself;
 - b. All factory-assembled threaded components which form part of a suspension joint must be bonded with glue as approved by the Contract Manager;
 - c. The maximum clearance between threaded mating parts must not exceed 1% of their mean diameter;
 - d. The down-rod threaded end shall be interchangeable with the existing government ceiling fans;

-
- e. The direction of rotation of the fan shall be such that all screwed joints tend to be tightened when the fan is in operation.
6. Canopies:
- Two (2) canopies shall be provided manufactured from plastic or pressed steel sheet and fitted over the upper and lower ends of the down-rod. They shall be fixed to the down-rod by grub screws.
7. Balance:
