1. Where required, apply adhesive strictly in accordance with the waterproofing manufacturer's recommendations. All manufacturer's data about the shelf-life of adhesives must be noted, and no attempt should be made to use materials which are no longer fit for use;
2. Prohibit the spreading of adhesive over excessive large areas and / or subsequent over setting before placing of sheets.

WAT6.W270.8 BUBBLES
If bubbles formed in the membrane, submit the proprietary manufacturer's repair method for Approval before repairing. Otherwise, strip and clear the whole area and prepare the surface again and re-execute the work.

WAT6.W280.8 FINISHES TO ACCESSIBLE ROOFS (MAINTENANCE & PUBLIC TRAFFIC)
When indicated as accessible roof on Drawings, design the roofing system to allow for increased wear due to frequent foot traffic and protect the roofing system by finishing materials as specified.

WAT6.W290.8 FINISHES TO NON-ACCESSIBLE ROOFS (MAINTENANCE TRAFFIC)
When indicated as non-accessible roof on Drawings and as exposed system, protect roofing with a solar protection "light-reflective" paint or other protective finishes applicable to the particular proprietary roofing system except where it is a self-finished material or otherwise specified.

WAT6.W300.8 PROTECTION OF ROOFING AND EXTERNAL TANKING SYSTEM
1. Do not allow traffic on roof until 4 days after completion of tiling and permit only light traffic for a further 10 days;
2. Protect all completed tanking system during backfilling operation.

WAT6.W305.8 PROTECTION OF BENTONITE FROM PREMATURE HYDRATION
For waterproofing system using sodium bentonite carried on high density polyethylene sheet laid at horizontal position, immediately after testing, protect the bentonite granules from premature hydration due to weather conditions.

WAT6.W310.8 ROOF VENT
When specified, install approved proprietary roof vents in accordance with the manufacturer's recommendations and make good the roof covering up to and around the vents.

WAT6.W320.8 INSULATION
Ensure insulation board shall either have integrally bonded hard surfaces on both sides or be protected by inert hard sheeting or screed in accordance with the proprietary waterproofing system.

Inform the CM or his representatives for inspection upon the completion of each layer of the roofing system and prior to commencing installation of the next layer of construction including screed, insulation and finishes etc..

Inform the CM or his representatives for inspection when details demonstrated at the Construction Mock Up at WAT6.W215 are completed on site for the first time.
WAT6.W350.8  LAPPING

Width of lapping to be strictly in accordance with the waterproofing manufacturer's recommendations, or minimum 75mm if there is no recommendation.

WAT6.W360.8  OPEN BURNING

Open burning of asphalt is prohibited except where approval has already obtained from Environmental Protection Department.
TESTING

ON-SITE VERIFICATION TESTS

WAT6.T010.A WATER SPRAY TEST TO INTERNAL INSTALLATIONS

1. Testing Arrangements
   a. Carry out water spray test to all completed internal waterproofed areas after application of finishes. Tests to be witnessed and endorsed by the Contractor's representative and the CM or his representatives;
   b. Carry out joint inspection at the location being tested and at the floor below to check there is no seepage on the soffit within half an hour to two hours after the test;
   c. Submit three copies of the test reports, or other number of copies as required by the CM for the water spray tests for record.

2. Testing Locations:
   a. Test to the following percentages:
      i. 100% to all areas or rooms installed with waterproofing such as bathrooms, changing rooms, balconies etc.;
      ii. 100% or other percentage as approved by the CM for other areas or rooms such as kitchens, refuse rooms etc..

3. Testing Methods:
   a. Use a common domestic telephone type shower head fitted to a 13 mm diameter supply pipe delivering a water pressure of 210 to 240 kPa (30 to 35 psi). Locate the pressure gauge at a distance not exceeding 1500 mm from the shower head;
   b. Apply water by moving shower head to and fro along test surface at a perpendicular distance of between 300 mm and 600 mm;
   c. Carry out the following water spray test to walls and floors at the shower area after application of finishes:

<table>
<thead>
<tr>
<th>Location</th>
<th>Area to be Tested</th>
<th>Test Method</th>
<th>Acceptance Criteria</th>
</tr>
</thead>
</table>
| Bathroom shower area    | Walls and floor at shower area. | Spray water evenly for 5 minutes to the walls surrounding the shower area up to the height of the top of the waterproofing membrane. | - no ponding;
|                         |                   |                                                                           | - Water falls towards the floor drain;
|                         |                   |                                                                           | - no seepage through wall or floor;
|                         |                   |                                                                           | - no seepage at pipe sleeves;
|                         |                   |                                                                           | - no seepage at traps, connectors and outlets. |

   d. Carry out the following water spray test which applies to all waterproofed walls and floors after application of finishes. Include those in the bathrooms, toilets, kitchens, balconies, refuse rooms etc, but exclude those at shower areas in sub-clause (3)(c), roofs and lift pits (refer to other relevant clauses in WAT6).
<table>

<td></td>
<td>- no seepage at trap, connectors and outlets.</td>
</tr>
</tbody>
</table>

4. Non-compliance:
   a. In the event that any test fails to meet the requirements:
      i. Carry out remedial works subject to Approval and re-test until all the criteria specified has been satisfied;
      ii. Bear all costs of remedial works and the re-test. No extension of time will be allowed.

**WAT6.T125.8 WATER FLOOD TEST TO ROOF INSTALLATIONS**

1. Testing Arrangements:
   a. Carry out water flood test to roofing at CM's direction;
   b. Allow a Direct Testing Contractor (DTC) to carry out non-destructive tests to verify the watertightness of the roofing system;
   d. Provide all necessary attendance on the DTC including the requirements stated in sub-clause (3);
   e. Allow the DTC access to carry out infra-red scanning testing during the 24 to 48 hour period immediately following the draining of the roof area under test;
   f. Obtain from DTC test reports for the water flood test for record. The original report including the infra-red scanning results shall be sent directly by the DTC to the CM.

2. Testing Samples:
   a. Entire installed roofing system including canopy unless Instructed otherwise.

3. Testing Methods:
   a. Seal all outlets and construct suitable dam walls to compartmentalize large roof areas. Do not permit any debris to enter into drainage pipeworks;
   b. Carefully flood the roofs to levels agreed with the CM, generally no less than 150 mm, but in no case higher than existing curb levels and maintain for 24 hours;
   c. Mark the top water level at clearly visible locations and regularly inspect for leaks;
   d. Slowly drain roofs and remove all outlet blockages and dam walls.
4. Non-compliance:
   a. In the event of test failure:
      i. Submit to CM detailed proposals for remedial measures;
      ii. Carry out subsequent repairs and flood tests and further infra-red scanning tests until the roof is watertight;
      iii. Bear all associated costs and expense of any subsequent flood testing including subsequent infra-red scanning tests. No extension of time will be allowed.

WAT6.T130.A TESTING TO BASEMENT / SEMI-BASEMENT EXTERNAL TANKING INSTALLATIONS

1. Testing Arrangements:
   a. Carry out tests to tanking at CM's direction after all penetrations through the waterproofing layers (e.g. tie rods or struts from the ELSW) are patched up;
   b. Submit three copies of the test reports, or other number of copies as required by the CM for the tests carried out for record;
   c. Allow a Direct Testing Contractor (DTC) to carry out non-destructive tests or infra-red scanning to verify the watertightness of the tanking system;
   d. Provide all necessary attendance on the DTC including the requirements stated in sub-clause (3);
   e. Obtain from DTC test reports for record. The original report including the infra-red scanning results, if any, shall be sent directly by the DTC to the CM.

2. Testing Locations:
   a. Entire installed tanking system unless instructed otherwise.

3. Testing Methods:
   a. Propose testing method(s) compatible with the type of waterproofing system installed. A mix of test methods may be used;
   b. Water Test -
      i. Carry out water spray tests;
      ii. Spray water with water jets fitted to 13mm diameter supply pipes delivering a water pressure of 210 to 240kPa (30-35psi). Locate the pressure gauge at a distance not exceeding 1500mm from the water jet and apply water evenly to the test surface for 2 consecutive hours, maximum area per test to be 100m2;
      iii. Carry out infra-red scanning test to 50% of the waterproofed area proposed using this test method during the 24 to 48 hour period immediately following the water spray test;
      iv. Arrange and allow access for the DTC to carry out infra-red scanning test to the remaining 50% area using this test method during the 24 to 48 hour period immediately following the water spray test. Jointly inspect with the CM or his representatives to ensure thorough dryness and readiness for infra-red scanning.
   c. Spark Test -
      i. Carry out spark tests to 80% of the waterproofed area proposed using this test method;
ii. Arrange and allow access for the DTC to carry out spark tests to the remaining 20% area using this test method; jointly inspect with the CM or his representatives to ensure thorough dryness and readiness for the test;

iii. Not suitable at waterproofing applied to basement wall with steel ELSW as its struts would affect the testing result;

iv. Test by using a portable DC high voltage test detector. Test equipment used is to be the same type as per that used by DTC;

v. Move the broad brush probe of the detector across the surface of the installed waterproofing membrane to locate the flaw; once identified, move the probe across the flaw again to reconfirm the leak location;

vi. Fault at the waterproofing installation is identified by means of one of the following at the portable detector:
   - an audible alarm; or
   - an illumination indicator; or
   - a visual spark from the search electrode; or
   - a drop in the pre-set test voltage as shown on the output meter.

d. Smoke Test -

i. Carry out smoke tests to 80% of the waterproofed area proposed using this test method;

ii. Arrange and allow access for the DTC to carry out smoke tests to the remaining 20% area using this test method; jointly inspect with the CM or his representatives to ensure readiness for the test;

iii. Test by using smoke generator / blower system. Test equipment used is to be the same type as per that used by DTC;

iv. Obtain written confirmation from the waterproofing manufacturer that the smoke proposed for the test will not cause adverse effect to the installed waterproofing; only inert, non-toxic smoke to be used;

v. Test by injecting smoke into the inter-phase between the waterproofing installation and substrate. For horizontal installations, the blinding layer is the substrate. For vertical installations, in the case of sheet or pipe pile installations, the furring wall to the sheet or pipe pile wall is the substrate; in the case of open cut excavation, the concrete wall structure is the substrate;

vi. Activate smoke generator / blower system at nominal 150 cf/min to 450 cf/min flow rate and 250 pascal. Continue to purge system for 60 seconds after smoke begins to emerge from temporary vent outlet(s). Cap the temporary vent outlet(s). Adjust control valve to maintain 250-500 pascal. Monitor membrane for lifting. Reduce pressure if excessive lifting occurs;

vii. Visually identified smoke leakage locations indicate leakage points in the waterproofing installation.

4. Non-compliance:
   a. In the event of test failure:
      i. Submit to the CM detailed proposals for remedial measures;
ii. Carry out subsequent repairs and tests and further retests until the basement / semi-basement is watertight;

iii. Bear all additional time and costs arising from or in connection with failure to meet the testing requirements, including but not limited to those incurred in sub-clause (ii) above and subsequent tests by the DTC.

DRA1   DRAINAGE ABOVE GROUND

MATERIALS

PIES AND FITTINGS FOR SURFACE WATER DRAINAGE

DRA1.M010.8   CAST IRON RAINWATER PIPES, GUTTERS AND FITTINGS

1. Pipes and fittings:
   a. To BS 416:Part 1:1990;
   b. With type A or B sockets;
   c. Without ears;
   d. Suitably coated internally and externally to prevent corrosion. When cold applied bitumen-based coating is proposed, the coating material should comply with BS 3416 or other equivalent international standards. External coating should contain anti-corrosion inhibitors, and in a state to permit the application of additional external finishing coatings;
   e. Dimension and shape of access door as per relevant BS requirements. Covers of access door or rodding eye opening shall be supplied with minimum 4mm thick elastomeric gasket.

2. Gutters:
   a. To BS 416:Part 1:1990;
   b. Section: half round or ogee.

DRA1.M020.8   PLASTIC RAINWATER PIPES, GUTTERS AND FITTINGS

1. For pipes equal to and not exceeding 80 mm diameter: to BS 4576:1989 or BS EN 12200:Part1:2000 and for pipes exceeding 80 mm diameter to BS 4514:1983;
2. Use only pipes and fittings in the Works to either the specified BS standards or the specified BS EN standards, unless otherwise Approved;
3. Alternative: other Approved rainwater system;
4. Unless otherwise Approved, do not interchange individual manufacturer's plastic pipe products.

DRA1.M030.8   RAINWATER OUTLETS

2. Cast aluminium rainwater side outlets:
   b. Type: two-way outlet;
   c. Accessories: clamping ring, removable grating and screw thread adaptor for cast iron pipes.
3. uPVC rainwater outlet to BS 4576:1989:
An Approved proprietary type complete with sealing flange and screw fixed flat or domed grating;

4. Stainless steel rainwater outlets:
   a. Stainless steel (Grade 304) flat removable grating;
   b. Stainless steel (Grade 304) frame.

PIPPES AND FITTINGS FOR FOUL WATER DRAINAGE

DRA1.M110.8 CAST IRON SOIL, WASTE AND VENTILATING PIPES AND FITTINGS

1. For pipes not exceeding and equal to 150 mm diameter:
   a. To BS 416:Part 1:1990;
   b. With Type A or B sockets;
   c. Without ears and coated.

2. For pipes of 225 mm diameter: to BS 437:2008;

3. For pipes exceeding 225 mm diameter: to BS 4622:1970;

4. Suitably coated internally and externally to prevent corrosion. When cold applied bitumen-based coating is proposed, the coating material should comply with BS 3416 or other equivalent international standards. External coating should contain anti-corrosion inhibitors. The C.I. pipes shall be in a state to permit the application of additional external finishing coatings;

5. Dimension and shape of access door as per relevant BS requirements at sub-clauses (1), (2) & (3). Covers of access door or rodding eye opening shall be supplied with minimum 4mm thick elastomeric gasket.

DRA1.M115.A EPOXY COATED CAST IRON PIPES AND FITTINGS

1. Submission requirements:
   a. At sample submission and approval stage, submit a sample of each of the components of the proposed epoxy coated cast iron pipes and fittings including pipes, fittings, couplings and grip collars for CM's approval, together with all the following substantiation for CM's information:
      i. Catalogue, brand name / model name and job reference of the material;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agent / distributor in Hong Kong or document from the supplier showing the appointment of the manufacturer and manufacturer's agreement for the production of the proposed product;
      v. Installation procedures recommended by the manufacturer and shop drawings showing connection details between epoxy coated cast iron pipes / fittings and pipes / fittings of other materials, locations of grip collars and access for inspection;
vi. Original or certified true copy of the ISO 9001 certificate for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by either a certification body or the QCM. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS;

vii. Submit a sample board similar to the one maintained by the Housing Department showing the quality, detail technical information and application procedures for the proposed epoxy coated cast iron pipes and fittings. When the epoxy coated cast iron pipes and fittings are supplied for domestic blocks, submit an additional sample board of the approved sample for keeping in the Housing Department’s Sample Display Gallery if the material has not been approved for use in a public housing project in the past five years prior to the notified date for commencement of the Works.

b. Submit:

i. Original or a certified true copy of product conformity certificate from an accredited third party issued by an internationally recognized certification body such as a member of the European Co-operation for Accreditation (EA) or an accreditation body which has entered into a mutual recognition agreement with EA, certifying the continuous conformance of the products to BS EN 877. If a photocopy of the certificate is submitted, it shall be certified true by either the certification body or the QCM. Submit together with the certificate a summary of the test results under the audit testing of the certification scheme. The summary shall be prepared by the accredited laboratory carrying out the testing or the certified manufacturer. If the scope of the certification scheme does not fully cover the quality requirements stated in sub-clause (2)(b), or the date of test under the audit testing of the certification scheme is more than five years prior to the notified date for commencement of the Works, submit for the CM's information test reports as prescribed in (1)(b)(ii) showing compliance with the requirements that are not covered, or the requirements in respect of the date of test under audit testing; or

ii. Original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(b) for the CM's information unless the test requirements are already covered by the scope of certification in sub-clause (1)(b)(i) above:

- The date of the test shall be within five years prior to the notified date for commencement of the Works;

- The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);

- In the event that no test report has been submitted for the CM’s information when the materials are delivered to Site, remove all delivered materials off Site, bear all associated costs and no extension of time will be allowed.

2. Quality Requirements:

a. Epoxy coated cast iron pipes and fittings utilizing coupling joint to BS EN 877: 1999 + A1: 2006:
i. Pipes shall be centrifugal spun casting;

ii. Pipes and fittings shall be from the same manufacturer;

iii. Coupling shall be of austenitic stainless steel grade 316;

iv. Grip collars shall be of hot-dip galvanized or austenitic stainless steel grade 316;

v. Elastomeric gasket used at couplings shall be ethylene propylene diene monomer (EPDM);

vi. The coupling joints shall suit and accommodate the small dimensional difference which may occur between the outside diameter of the epoxy coated cast iron pipes / fittings and the interconnecting pipes / fittings of other materials;

vii. Pipes shall be internally coated with epoxy and externally coated with anti-corrosion red brown primer or epoxy;

viii. Fittings shall be internally and externally coated with epoxy;

ix. Pipes and fittings shall be installed with provision for electrical continuity;

x. Access opening, if provided, to be supplied with minimum 4mm thick elastomeric gasket.

b. The quality and performance requirements are as follows:

c. The Contractor shall warrant the epoxy coated cast iron pipeworks in accordance with the Special Conditions of Contract.

3. On Site Delivery Verification:
   a. At delivery stage, submit the following documents:
      i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a);
      ii. Original or certified true copy of the Certificate of Origin for every batch of delivery. One batch being the material quantity covered under each Delivery Note;
      iii. Delivery Notes for all material delivered to Site.
   b. Carry out and submit report on the following verifications for epoxy coated cast iron pipes and fittings upon delivery on Site. Prior to carrying out the verifications, inform the CM who may be present to witness the verifications:
      i. Method:
         | Verification Items | Method                | Acceptance Standards                      |
         |---------------------|-----------------------|--------------------------------------------|
         | Manufacturer's      | Document check        | From an Approved origin with information   |

</tbody>
</table>

### c. Where any of the verifications fail to meet the acceptance standards, either:

i. Remove the representative batch off Site; or

ii. When agreed by the CM, repeat all verification items on three separate sets of samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

**DRA1.M120.8 SPIGOT SPUN PIPES**

Obtain from an Approved manufacturer.

**DRA1.M150.A PLASTIC PIPES AND FITTINGS**

1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed uPVC pipes and fittings for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name / model name and job reference of the material;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
iv. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agent / distributor in Hong Kong or document from the supplier showing the appointment of the manufacturer and manufacturer's agreement for the production of the proposed product:

v. When the uPVC pipes and fittings are supplied for domestic blocks, also include the following in the submission:

- Submit a sample board similar to the one maintained by the Housing Department showing the quality, detail technical information and application procedures for the proposed uPVC pipes and fittings. Submit an additional sample board of the approved sample for keeping in the Housing Department’s Sample Display Gallery if the material has not been approved for use in a public housing project in the past five years prior to the notified date for commencement of the Works;

- Original or a certified true copy of the ISO 9001 certificate for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by a certification body or by the QCM. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a multilateral recognition arrangement with HKAS.

b. For uPVC pipes and fittings used in domestic blocks, submit original or a certified true copy of the product conformity certificate to the "Product Conformity Certification Scheme for uPVC Pipes and Fittings for Foul Water Drainage above Ground" (PCCS-UP) published by the Hong Kong Institution of Plumbing and Drainage Limited. The product conformity certificate shall be issued by a certification body accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a multilateral recognition arrangement with HKAS. If a photocopy of the product conformity certificate is submitted, it shall be certified true by the certification body or by the QCM:

i. The product conformity certificate shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a) above or at a time not later than 12 months from the date of commencement of the Works;

ii. In the event that the product conformity certificate has not been submitted for CM’s information, the CM may order the removal of materials or delivered products off Site. The Contractor shall bear all associated costs and no extension of time will be allowed.

c. Submit a summary of the test results under the audit testing of the PCCS-UP. The summary shall be prepared by the accredited laboratory carried out the testing or the certified manufacturer. If so directed by the CM, submit a full set of the audit test reports to the CM for record;

d. Submit original or certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(f) for the representative items in sub-clause (1)(d)(i) for CM's information unless the test requirements are covered by the scope of the PCCS-UP:

i. Pipes: 50 mm $\varnothing$ pipe and 100 mm $\varnothing$ pipe;
- Fittings: 32 mm Ø 88° Bend, 40 mm Ø 88° Bend W/I.O., 50 mm Ø 88° Junction W/I.O., 80 mm Ø 88° W/I.O., 100 mm Ø 88° Bend W/I.O. and 100 mm Ø 150 x 100 Reducer Fittings;

- Traps: 40 mm and 50 mm Ø traps including bottle trap, U-trap and W-trap;

- Two-way floor drain;

- 100mm Ø W.C. Connector;

- Adhesive for pipe joint.

ii. The date of the test shall be within five years prior to the notified date for commencement of the Works or at an earlier date for domestic blocks subject to CM's consideration on the track records as maintained by the Housing Department;

iii. The test reports shall either be submitted at the sample submission and approval stage as mentioned in sub-clause (1)(a), or at a time not later than the delivery of the material as mentioned in sub-clause (3)(a);

iv. In the event that no test report has been submitted for CM's information when the materials are delivered to Site, the Contractor shall remove all delivered materials off Site and bear all associated costs and no extension of time will be allowed.

e. Unless otherwise specified, pipes and fittings for use in the Works shall be to either BS standards or BS EN standards. Propose either BS standards or BS EN standards for all pipes and fittings for CM's approval. Only the Approved standards shall be used for the Works unless the piping components are not covered by the Approved standard.

2. Quality Requirements:

a. Provide from a single source;

b. uPVC pipes and fittings to:
   i. BS standards BS 4514:1983, BS 5255:1989 and BS 3943:1979; or

c. uPVC W.C. connector pipes to BS 5627:1984;

d. Adhesive for pipe joint to BS 4346-3:1982;

e. Colour: to Approval;

f. The quality and performance requirements are as follows:

   i. Pipes, fittings and traps to BS standards:

</table>
When the pipes and fittings are supplied for domestic blocks, standard of visual quality of pipes and fittings shall be comparable with the benchmark samples maintained by the Housing Department;

Anti-siphon traps are to be fitted with a one way valve disk of corrosion-resistant metal or alloy, e.g. brass or stainless steel. Corrosion resistant coating, e.g. chromium plating, is not acceptable. The one way valve disk is to be affixed with a similar metal or alloy pin complete with a rubber gasket. Ensure that pipes and fittings, including the anti-siphon traps, are suitable for their intended use, particularly where hot liquids and chemicals etc. may be discharged into the system.

3. On Site Delivery Verification:
   a. At delivery stage, submit the following information for CM's approval:
      i. Written confirmation that the material delivered to Site is in accordance with the Approved sample submitted under sub-clause (1)(a);
      ii. Relevant import / export documents from overseas and from Mainland China, original or certified true copy of Certificate of Origin for every batch of delivery. One batch being the material quantity covered under each Delivery Note;
      iii. Delivery Notes for all material delivered to Site.
   b. Carry out and submit report on the following verifications for uPVC pipes and fittings upon delivery on Site. Prior to carrying out the verifications, inform the CM who may present to witness the verifications:
      i. Method:
         | Verification Items                | Method       | Acceptance Standards                     |

</table>

c. Where any of the verifications fail to meet the acceptance standards, either:
   
   i. Remove the representative batch off Site; or
   
   ii. When agreed by the CM, repeat all verification items on three separate samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

DRA1.M160.8 BALLOON GRATING / VENT COWL

Of an Approved proprietary brand and either:

1. Galvanized steel wire or copper wire; or
2. uPVC or polypropylene, as shown on the Drawings.

DRA1.M170.8 PLASTIC VERTICAL GRATINGS

1. For non-fire protected areas such as domestic flats;

DRA1.M171.8 STAINLESS STEEL VERTICAL GRATINGS

1. For use at fire protected areas, exit routes or common areas;
2. Of an Approved proprietary brand:
   
   a. Minimum 1.5mm thick grade 304 stainless steel plate hairline finished;
   
   b. Submit shop drawings showing dimensions and fixing details for approval.

DRA1.M180.8 UPVC TWO-WAY FLOOR DRAIN OUTLET

1. Of an Approved proprietary brand comprise of the following:
   
   a. uPVC horizontal drain pipe with sealing flange;
   
   b. uPVC adaptor unit for vertical grating. The adaptor unit shall have built-in drainage fall towards downstream, and shall allow easy removal of vertical grating by unscrewing the fixing screws after the installation for maintenance purpose. Its spigot connecting to the drainpipe may also be cut short to suit the thickness of the wall finishes;
   
   c. uPVC adjustable horizontal grating unit with sealing flange and removable horizontal grating, and shall allow for cutting low to suit finished floor level;
   
   d. 2 Nos. uPVC gratings for vertical and horizontal use complete with stainless steel screws;
   
   e. Submission and quality requirements as per DRA1.M150.

2. Submit shop drawings showing dimensions and fixing details for approval.
**DRAINAGE ABOVE GROUND**

**DRA1 > MATERIALS**

**DRA1.M190.8**  **SMALL DIAMETER UPVC PIPES**

Upvc pipes of less than 30mm diameter shall be of an Approved proprietary brand to BS 3505:1986.

**BRACKETS AND FIXINGS**

**DRA1.M210.8**  **PIPE BRACKETS**

1. Stainless steel of Grade 304;
2. Pattern and type to suit the type of pipe and the surface to which they are to be fixed, as shown on the Drawings, including where appropriate:
   a. Flanged ends for building in;
   b. Plain round ends for fixing in drilled holes with an Approved grout;
   c. Approved expanding bolts or stud anchors for fixing to concrete, brickwork, blockwork and panel wall partition etc.;
   d. Threaded ends for fixing to steelwork, or wood, or panel wall with plug as required;
   e. Countersunk-holed face plates for screwing to wood or plugs, or panel wall with plug;
   f. Brackets lined with resilient plastic at pipe clamps.

**DRA1.M220.8**  **BOLTS FOR CAST IRON AND STEEL PIPEWORKS**

Brass, cadmium plated steel or other non-corrodible metal.

**DRA1.M230.8**  **BOLTS FOR SOIL STACK ACCESS DOORS FOR CAST IRON AND STEEL PIPEWORKS**

Gunmetal or a material compatible with the cast iron pipework system recommended / supplied by the same supplier / manufacturer.

**DRA1.M240.8**  **WOOD SCREWS**

Brass to BS 1210:1963, with countersunk heads and of a length sufficient to ensure a secure fixing.

**DRA1.M250.8**  **PLUGS**

1. For fixing to:
   a. Hard materials: proprietary plastic, fibre, soft metal or similar;
   b. Friable materials, plasterboard and the like: proprietary fixings specially designed for the purpose.
2. Do not use wooden plugs or plugs containing asbestos.

**PIPE SLEEVES AND COVER PLATES**

**DRA1.M310.8**  **UPVC PIPE SLEEVES FOR CASTING OR BUILDING IN**

To BS 3505:1986 and with 2 to 12 mm clearance to allow for expansion and movement of pipe.
DRAINAGE ABOVE GROUND

DRA1.M320.8  FIRE RESISTING PIPE SLEEVES
Medium duty galvanized mild steel pipe sleeve to BS 1387:1985 with 20 mm clearance.

DRA1.M330.8  CAST IRON OR MILD STEEL PIPE SLEEVES
Cast iron or 2.5 mm thick mild steel sleeve galvanized after fabrication with 2 - 12 mm clearance.

DRA1.M340.8  PIPE SLEEVES FOR BASEMENT WALLS
For pipes passing through external basement walls where ground water pressure is significant, provide:
1. A short length of cast iron pipe as sleeve with split bolt on puddle flange and with socket on outside;
2. A cast iron plug drilled to take long screw and back nuts as necessary.

DRA1.M350.8  PROTECTIVE TAPE
An Approved petroleum based tape.

DRA1.M360.A  FIRE RESISTANT BANDAGE AND WRAP
1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample board of the proposed bandage and wrap including fittings and accessories for CM's approval together with all the following substantiation for CM's information:
      i. Catalogue, brand name / model name and job reference of the material;
      ii. Name, address and contact person of the local supplier / distributor;
      iii. Name, address and contact person of the manufacturer;
      iv. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agent / distributor in Hong Kong or document from the supplier showing the appointment of the manufacturer and manufacturer's agreement for the production of the proposed product;
      v. Certified true copy of the ISO 9001 certificate for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by a certification body or by the QCM. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a multilateral recognition arrangement with HKAS.
   b. Test report or product certificate:
      i. Certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(b). Test shall be carried out within 3 years from the notified date for commencement of the Works; or
ii. Certified true copy of certificate for an accredited third party product conformity scheme issued by an internationally recognized certification body such as CE Making (CE), FM Approvals, Underwriters Laboratories (UL), Certifire, or equivalent, showing full compliance with the requirements of sub-clause (2)(b) for the proposed product; validity period of tests at the scheme shall be within 5 years from the notified date for commencement of the Works.

c. Shop drawings including manufacturers’ recommendations for the fire stopping system installation for CM’s approval prior to commencement of work.

2. Quality Requirements:

a. An Approved proprietary flexible intumescent graphite impregnated band or wrap fixed in accordance with the manufacturer’s recommendations to achieve the required fire resistance performance;

b. To BS 476:Part20:1987 or BS EN 1366:Part3:2009 and certified as being capable of resisting the action of fire for the specified periods by a laboratory which must be accredited for the specific test by HKAS under the Hong Kong Laboratory Accreditation Scheme (HOKLAS), or an equivalent organization which has signed a mutual recognition agreement with HOKLAS with appropriate qualifications and experience in fire resisting construction.

3. On Site Delivery Verification:

a. At delivery stage, submit the following documents:

i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a) and (b);

ii. For products with a third part product conformity scheme submitted as per sub-clause (1)(c)(ii), submit a Manufacturer Certificate from the local supplier / distributor at sub-clause (1)(a)(ii) confirming the products delivered to Site comply with the third party product conformity scheme requirements;

iii. Delivery Notes for all material delivered to Site, including the following:

- Confirmation in writing on the serial number of the fire resistant bandage and wrap delivered to Site; confirmation to be from the local supplier / distributor;

- Copy of docket showing the serial number of the fire resistant bandage and wrap delivered to Site; copy to be provided by the manufacturer at sub-clause (1)(a)(v).

b. Carry out and submit report on the following verifications upon delivery on Site.

Prior to carrying out the verifications, inform the CM who may be present to witness the verifications:

i. Method:

<table>
<thead>
<tr>
<th>Verification Items</th>

c. Where any of the verifications fail to meet the acceptance standards, either:

i. Remove the representative batch off Site; or

ii. When agreed by the CM, repeat all verification items on three separate sets of samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

DRA1.M370.B FIRE RESISTING PIPE COLLAR

1. Submission Requirements:

a. At sample submission and approval stage, submit a sample board of the proposed fire resisting fire collar including fittings and accessories for CM's approval together with all the following substantiation for CM's information:

i. Catalogue, brand name / model name and job reference of the material;

ii. Name, address and contact person of the local supplier / distributor;

iii. Name, address and contact person of the manufacturer;

iv. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agent / distributor in Hong Kong or document from the supplier showing the appointment of the manufacturer and manufacturer's agreement for the production of the proposed product;

v. A certified true copy of the ISO 9001 certificate for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by a certification body or by the QCM. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a multilateral recognition arrangement with HKAS.

b. Test report or product certificate:

i. Certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of the test reports showing full compliance with the requirements of sub-clause (2)(b). Test shall be carried out within 3 years from the notified date for commencement of the Works; or

ii. Certified true copy of certificate for an accredited third party product conformity scheme issued by an internationally recognized certification body such as CE Marking (CE), FM Approvals, Underwriters Laboratories (UL), Certifire, or equivalent, showing full compliance with the requirements of sub-clause (2)(b) for the proposed product; validity period of tests for the scheme shall be within 5 years after the notified date for commencement of the Works.

c. Shop drawings including manufacturers’ recommendations for the fire stopping system installation for CM's approval prior to commencement of work.

2. Quality Requirements:
a. An Approved proprietary surface mount pipe collar of metal enclosure containing intumescent material mechanically fixed to substrate in accordance with the manufacturer’s recommended installation methods to achieve the required fire resistance performance;

b. To BS 476:Part20:1987 or BS EN 1366:Part3:2009 and certified as being capable of resisting the action of fire for the specified periods by a laboratory which must be accredited for the specific test by HKAS under the Hong Kong Laboratory Accreditation Scheme (HOKLAS), or an equivalent organization which has signed a mutual recognition agreement with HOKLAS with appropriate qualifications and experience in fire resisting construction.

3. On Site Delivery Verification:

a. At delivery stage, submit the following documents:

i. Written confirmation that the material delivered to Site conforms with the Approved sample submitted under sub-clause (1)(a) and (b);

ii. For products with a third part product conformity scheme as per sub-clause (1)(b)(ii) requirements, submit a Manufacturer Certificate from the local supplier / distributor at sub-clause (1)(a)(ii) confirming the products delivered to Site comply with the third party product conformity scheme requirements;

iii. Delivery Notes for all material delivered to Site, including the following:
   - Confirmation in writing on the serial number of the fire resisting pipe collar delivered to Site; confirmation to be from the local supplier / distributor;
   - Copy of docket showing the serial number of the fire resisting pipe collar delivered to Site; copy to be provided by the manufacturer at sub-clause (1)(a)(v).

b. Carry out and submit report on the following verifications upon delivery on Site. Prior to carrying out the verifications, inform the CM who may be present to witness the verifications:

i. Method:

<table>
<thead>
<tr>
<th>Verification Items</th>
<th>Method</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delivery Note with content at sub-clause (3)(a)(iii)</td>
<td>Document check</td>
<td>Material delivered is from the manufacturer in sub-clause (1)(a)(v); Serial number same as sub-clause (3)(a)(iii)</td>
</tr>
<tr>
<td>Collar dimensions</td>
<td>Measurement</td>
<td>As per approved sample</td>
</tr>
</tbody>
</table>

ii. Frequency:

<table>
<thead>
<tr>
<th>Items</th>
<th>Sampling Frequency</th>
<th>Representative Batch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delivery Note</td>
<td>1 sample from each batch</td>
<td>Individual</td>
</tr>
</tbody>
</table>

c. Where any of the verifications fail to meet the acceptance standards, either:

i. Remove the representative batch off Site; or
ii. When agreed by the CM, repeat all verification items on three separate sets of samples selected by the CM. In case of failure of any verification to any one sample, remove the representative batch off Site, bear all associated costs, and no extension of time will be allowed.

**JOINTING MATERIALS**

**DRA1.M405.8**
**GENERAL**
Primer, caulking compound and all materials for jointing uPVC pipes shall be in compliance with the prescribed limits of VOC content as set out in the Air Pollution Control (Volatile Organic Compound) Regulation.

**DRA1.M410.8**
**JOINTING RINGS, COUPLINGS AND ADAPTORS GENERALLY**
Of types recommended by the manufacturer of the pipes being jointed.

**DRA1.M420.8**
**GASKIN**
Tarred spun yarn or hemp.

**DRA1.M430.8**
**COLD CAULKING COMPOUND**
An Approved proprietary brand.

**DRA1.M450.8**
**MORTAR**
Cement and sand, 1 : 2, mixed in accordance with Worksection MAS3.

**DRA1.M460.8**
**JOINTING COMPOUND FOR SCREWED JOINTS**
An Approved proprietary brand compatible with the pipes and fittings and recommended by the pipe supplier.

**DRA1.M470.8**
**PIPE THREAD TAPE**
Unsintered polytetrafluoroethylene (PTFE) tape to BS 7786:2006 of an Approved proprietary brand.

**DRA1.M480.8**
**PRIMER FOR THREADED JOINT TO STEEL PIPES**
An Approved non-toxic anti-corrosion epoxy base polyamide primer.

**SUNDRIES MATERIALS**

**DRA1.M510.8**
**FIRE SEALING SYSTEM FOR UPVC PIPES PASSING THROUGH FIRE RESISTING STRUCTURES**
In accordance with **WAT5.M200**.

**DRA1.M520.8**
**PRECAST CONCRETE WEDGE SUPPORT TO PIPES**
In accordance with **DRA2.M540**.
WORKMANSHIP

GENERAL

DRA1.W002.8 APPROVED CONTRACTOR FOR DRAINAGE WORKS ABOVE GROUND
The drainage works above ground required under the Contract shall be carried out by the plumbing installation sub-contractor employed by the Contractor under PLU1.G012 (1).

DRA1.W010.8 INSPECTION OF PIPES AND FITTINGS
Inspect pipes and fittings inside and out before fixing, reject any which appears defective.

DRA1.W020.8 HANDLING AND STORAGE
1. Store rubber jointing rings in protective bags and do not expose them to sunlight. Avoid any deformation;
2. Store pipes and fittings under cover and clear of a levelled, well-drained and maintained hard-standing ground;
3. Stack pipes without resting them on their sockets.

FIXING PIPES

DRA1.W110.8 GENERAL
1. Fix pipes and fittings securely with fixings and fastenings appropriate to the location and the material;
2. Do not use branch pipes that connect to vertical pipes as pipe supports;
3. Avoid pipe runs above electrical switchgear and at locations which may cause obstruction inside pump rooms.

DRA1.W120.8 INSTALLING FOUL DRAINAGE ABOVE GROUND

DRA1.W130.8 THERMAL MOVEMENT
1. Make adequate provision to control and/or allow for thermal movement in the length of pipes and gutters depending on material specified and in accordance with details shown on the Drawings;
2. Provide expansion joints in plastic pipes by means of loops or other methods in accordance with the manufacturer's recommendations.

DRA1.W140.8 PIPES ACCESSIBLE TO VERMIN
Place vertical pipes in situations which are accessible to rodents at least 100 mm away from any adjacent wall or pipe, to a minimum height from ground level of 1500 mm.
**DRA1.W150.8 PROVISION FOR ACCESS FOR CAST IRON AND STEEL PIPEWORKS**

Provide bolted access doors or inspection units to all branches and bends (other than ventilating and anti-syphon pipes) and at the foot of main soil stacks. Fit access doors to cast iron soil stacks with gunmetal bolts and rubber gaskets.

**DRA1.W160.8 SPACING OF PIPE SUPPORTS**

Space pipe supports as follows and in all cases, use not less than one fixing per length of pipe or as approved by CM:

<table>

**DRA1.W170.8 EMBEDDED PIPES**

Do not cast in or build pipes into chases in walls and floors unless this is unavoidable or directed, in which case:

1. Coat all pipes which come into direct contact with concrete with an Approved petroleum based tape;
2. Ensure that there are no joints in straight pipes built in other than elbows.

**DRA1.W180.8 PIPES ON FLAT ROOFS AND CANOPIES**

Support pipes on flat roofs and canopies at least 150 mm above roof and canopy finish on concrete blocks with pipe clamps.

**DRA1.W190.8 FIXING CAST IRON GUTTERS**

1. Fix cast iron gutters with screwed brackets at 1000 mm (maximum) centres to falls of 1 in 300 (minimum);
2. Joint gutters with jointing compound and bolt together.

**DRA1.W200.8 FIXING PLASTIC GUTTERS**

Fix gutters with screwed gutter brackets:

1. At 1000 mm (maximum) centres;
2. Generally to falls of 1 in 300 (minimum).
DRA1.W210.8  FIXING UPVC TWO-WAY FLOOR DRAIN OUTLET

1. Cast in uPVC horizontal drain pipe at the correct level fall and alignment as shown on the Drawings and to suit the thickness of wall and floor finishes;

2. Fix uPVC adaptor unit to the horizontal drain pipe. Cut the length of spigot if necessary where it connects onto the hopper of the drainpipe to suit the thickness of wall finishes, and ensure to maintain a minimum 8 mm of overlap between the spigot and the connecting hopper of the drainpipe;

3. Fix uPVC adjustable horizontal grating unit to the adaptor. Cut down the height of the unit if necessary to suit the finished floor level;

4. Ensure the fixing as mentioned in sub-clauses (2) and (3) above are to manufacturer's recommendations and all joints are watertight;

5. Seal the joints between the adaptor unit and wall tiles, and the joints between adjustable horizontal grating unit and floor tiles;

6. Install gratings to adaptor unit and adjustable horizontal grating unit with stainless steel screws.

DRA1.W220.8  INSTALLATION OF EPOXY COATED CAST IRON PIPES AND FITTINGS

1. The installation shall be carried out in strict compliance with the manufacturer’s recommendations. Particular attention shall be paid to the proper tightening of the bolts at the coupling joints;

2. The spacing and location of stainless steel brackets supports or hangers shall not deviate from the instructions of the manufacturer and in no case exceed 2m between pipes or 0.75m from couplings;

3. For bends used at the bottom of stack, grip collars and additional bracket / hanger shall be added to the underside of the bend to counterbalance the high hydraulic thrust;

4. Pipes shall be cut to the required length with the suitable tools in accordance with the manufacturer’s recommendation. All cut ends and areas where epoxy coating is damaged shall be touched up with epoxy resin as supplied or recommended by the manufacturer prior to installation;

5. After installation, any adjacent connecting pipes or fittings shall not have an angular deflection greater than 3 degree or over the maximum permissible limit as recommended by the manufacturer of the proposed epoxy coated cast iron pipes and fittings.

JOINTING PIPES AND FITTINGS

DRA1.W310.8  JOINTING PIPES AND FITTINGS GENERALLY

Carry out all pipe joints in accordance with the manufacturer's instructions and do not allow jointing material to project into bore of pipes or fittings.

DRA1.W320.8  CUTTING PIPES AND GUTTERS

Cut ends of pipes and gutters clean and square, chamfering internally or externally if required using equipment appropriate to the material.

DRA1.W330.8  JOINTS BETWEEN DISSIMILAR METALS

1. Make joints between different metals with proper adaptors;

2. Avoid contact between certain dissimilar metals as follows:
a. Aluminium alloys with copper alloys, nickel, lead or stainless steel;

b. Iron and steel with copper alloys;

c. Zinc with copper alloys. In particular avoid the direct contact of copper with galvanized iron or steel pipes;

d. If unavoidable, use gunmetal joints between the dissimilar metals.

**DRA1.W340.8**  PIPES REQUIRING CORROSION PROTECTION

Fix pipes requiring protection against corrosion with a 40 mm (minimum) clearance between pipe, structure and adjacent surfaces. Avoid fixing such pipes at internal angles.

**DRA1.W350.8**  CAST IRON SPIGOT AND SOCKET PIPES

1. Joint pipes with cold caulking compound in accordance with manufacturer's instruction;

2. Do not allow the jointing material projecting into bore of pipes or fittings.

**DRA1.W360.8**  CAST IRON SPUN SPIGOT PIPES

1. Joint pipes with flexible joints in accordance with the manufacturer's recommendations;

2. Do not joint the pipes with molten lead.

**DRA1.W370.8**  JOINTING STEEL PIPES GENERALLY

Joint steel pipes with screwed sockets:

1. With jointing compound or pipe thread tape;

2. Cutting threads with a tapered die. Threads found to be cut too deep will be rejected;

3. Paint all threaded surfaces with one coat of non-toxic anti-corrosion epoxy base polymide primer as DRA1.M480 and one coat compatible finish.

**DRA1.W380.8**  JOINTING STEEL PIPES TO CAST IRON PIPES

Joint steel pipes to sockets of cast iron pipes with cold caulking compound in accordance with manufacturer's instruction.

**DRA1.W390.8**  JOINTING PIPES TO CLAY PIPE SOCKETS

Joint pipes to clay spigot and socket pipes with gaskin and mortar.

**DRA1.W400.8**  JOINTING PLASTIC PIPES TO OTHER MATERIALS

Joint plastic pipes to pipes of other materials with proprietary adaptors.

**PIPES PENETRATING THE BUILDING STRUCTURE**

**DRA1.W510.8**  PIPES PASSING THROUGH WALLS AND FLOORS

Cast or build in uPVC sleeves as detailed on the Drawings, and:

1. Finish sleeves flush with the finished face of walls and ceilings and projecting 100 mm above finished floor level;

2. Point with Approved mastic sealant if required to be watertight;

3. Do not split uPVC sleeves.
DRA1.W520.8  PIPES PASSING THROUGH FIRE RESISTING STRUCTURES
Where pipes pass through fire rated walls or floors:
1. Cast or build in galvanized mild steel pipe sleeve with 20 mm clearance;
2. Finish sleeves flush with the finished face of walls and ceilings. Projection above finished floor level according to manufacturer's instruction;
3. Well caulk void between pipe and sleeve for the full length with non-flammable mineral wool or other products having equivalent functions or performance, point with Approved fire-rated sealant to maintain the required FPR of the wall/floor slab.

DRA1.W530.8  UPVC PIPES PASSING THROUGH FIRE RESISTING STRUCTURES
Where uPVC pipes pass through fire rated walls or floors:
1. Cast or build in galvanized mild steel pipe sleeve as shown on the Drawings;
2. Finish sleeves flush with the finished face of walls and ceilings. Projection above finished floor level according to manufacturer's instruction;
3. Well caulk void between pipe and sleeve for the full length with mineral wool and point with Approved fire-rated sealant, or pipe wrap or collar, all in accordance with manufacturer's recommendation;
4. Install the fire sealing system in accordance with manufacturer's instruction to maintain the required FPR of the wall/floor slab.

DRA1.W540.8  PIPES PASSING THROUGH BASEMENT WALLS
1. Where pipes pass through external basement walls:
   a. Cast or build in with 2-12 mm clearance, a cast iron or mild steel sleeve;
   b. Caulk space and point both ends with Approved mastic sealant.
2. Where pipes pass through external basement walls and ground water pressure is significant:
   a. Cast or build in short length of cast iron pipe as sleeve with split bolt on puddle flange and with socket on outside;
   b. Well caulk socket around pipe with yarn and lead including providing a cast iron plug drilled to take long screw and back nuts if necessary;
   c. Point inside with an Approved mastic sealant.

PROTECTION

DRA1.W610.8  SEALING THE SYSTEM
Prevent entry of foreign matter into any system by sealing off ends of pipes and openings during construction.

TOLERANCES

DRA1.W710.8  GENERAL
Refer to Appendix H "Schedule of Tolerances" to this Specification.
PIPELINE CONNECTION IDENTIFICATION

DRA1.W810.8 PIPEWORK CONNECTION IDENTIFICATION

1. Provide a temporary colour band around the circumference of the open end(s) of installed aboveground pipes to be connected to the underground pipes which discharge to manholes and back inlet gully trap. The colour and width of the band are as follows:

<table>
<thead>
<tr>
<th>Type of Drain Pipe</th>
<th>Colour</th>
<th>Width of Colour Band</th>
</tr>
</thead>
<tbody>
<tr>
<td>Storm water</td>
<td>White</td>
<td>75 mm</td>
</tr>
<tr>
<td>Waste water</td>
<td>Yellow</td>
<td>75 mm</td>
</tr>
<tr>
<td>Soil water</td>
<td>Green</td>
<td>75 mm</td>
</tr>
</tbody>
</table>

2. Upon the completion of drainage works, provide attendance and materials to facilitate inspection by CM’s representatives of the connection of aboveground pipes to manholes and back inlet gully trap.
TESTING

ON-SITE VERIFICATION TESTS

DRA1.T110.8 TESTING FOR SURFACE WATER DRAINAGE

1. Testing Arrangements:
   a. Carry out test in the presence of the CM's representatives;
   b. Provide clean water and appropriate apparatus for testing.

2. Testing Samples
   a. Test pipes as soon as practical after the completion of each section of pipework and before any work is concealed.

3. Testing Methods:
   a. Ensure that all pipe runs are clear of obstructions by visual examination, or by throwing a ball into the pipework or other method Approved by CM before testing;
   b. For internal pipes, pour water into the pipes and check for water leakage;
   c. Acceptance standard: no visual sign of leakage can be observed;
   d. Submit three copies, or other number of copies as directed by the CM, of the testing reports for the tests carried out, in a format to be agreed with the CM, within 1 week upon completion of testing for Approval.

4. Non-compliance:
   a. In the event that any test fails to meet the requirements:
      i. Locate and make good all defects;
      ii. Re-test to satisfaction of the CM;
      iii. Bear all costs of remedial works and the re-test. No extension of time will be allowed.

DRA1.T210.A TESTING FOR FOUL WATER DRAINAGE

1. Testing Arrangements:
   a. Carry out test to the installed foul water drainage pipework. Test to be carried out in the presence of the CM or his representatives;
   b. Submit method statements for testing, together with details of appropriate type of testing equipment, for Approval by the CM;
   c. Provide clean water, colour solution and appropriate apparatus for testing;
   d. Ensure colour solution do not stain or damage the installed permanent work including tile, tile grout, pipe and fittings etc.. Clean and remove water stain on the surface of the finishes and pipework, caused by the test if any, carefully.

2. Testing Samples:
   a. Test pipes as soon as practical after the completion of each section of pipework and before the installation of the kitchen sinks, wc pans, wash hand basins and the associated bottle traps in accordance with the following requirements:
i. For foul water drainage pipe above the level of the lowest sanitary appliance, one test for every 50 domestic flats or part thereof;

ii. For foul water drainage pipe below the level of the lowest sanitary appliance, one test for every 20 pipes or part thereof.

b. Each test section and the exact extent of the pipework arrangement for each test shall be determined by the CM.

3. Testing Methods:

a. Ensure that all pipe runs are clear of obstructions by visual examination, or by throwing a ball into the pipework or other method Approved by the CM before testing;

b. Test foul water drainage pipe above the level of the lowest sanitary appliance in accordance with either air test or water test as follows:

i. Air Test to BS 5572:1994, in particular:
   - Fully charge water seals of all sanitary appliances;
   - Insert test plugs in open ends of pipework being tested;
   - Test with air using Approved testing equipment, at a pressure equal to 38 mm water gauge;
   - Acceptance standard: the testing pressure specified above can be maintained for 3 minutes;

ii. Water Test:
   - Maximum height of each test section to be one storey high;
   - Disconnect P-traps from the floor drains and insert plugs to the open ends of the P-traps;
   - Insert upstand pipes to extend the w.c. soil pipe, the washing machine P-trap, the wash hand basin and the kitchen sink bottle traps, such that the tops of the extended pipes are about 150 mm higher than the top of the horizontal anti-syphonage pipe (asp) installed at the external wall;
   - Plug the lower end of both the soil and waste pipe and the main ventilating pipe being tested;
   - Fill pipework with coloured water up to the tops of the upstand pipes;
   - Acceptance standard: no visual sign of leakage shall be observed within 5 minutes after the coloured water has topped the upstand pipes;
   - Make good the pipework after testing in accordance with method Approved by the CM, e.g. using slip or plain coupling fittings.

c. Water test foul water drainage pipe below the level of the lowest sanitary appliance up to the first underground manhole to be generally in accordance with BS 5572:1994 and as follows:

i. Inspect the whole section of pipework to ensure no visual defects are found;

ii. Insert test plug in the lower end of pipe within the first underground manhole;

iii. Fill pipe with water up to flood level of lowest sanitary appliance or to a maximum static head of 5 m measured from the plugged end;
iv. Acceptance standard: no visual sign of leakage can be observed within 15 minutes after the filling of water.

d. Submit three copies, or other number of copies as directed by the CM, of the testing reports for the tests carried out, in a format to be agreed with the CM, within 1 week upon completion of testing for Approval.

4. Non-compliance:
   a. In the event that any one set of the test as specified in sub-clauses (3)(b) & (3)(c) above fails to meet the requirements:
      i. Take three separate samples for re-test of the same type of pipework arrangement that failed the test;
      ii. In the event of any failure on the re-test, take 3 additional samples of the same type of pipework arrangement for further re-tests. Repeat the re-test until all samples are tested satisfactorily to the acceptance standards of the air test as stated in (3)(b)(i) or the water test as stated in (3)(b)(ii) of (3)(c)(iv) as appropriate;
      iii. Rectify all pipeworks that failed the tests;
      iv. Re-test all rectified pipeworks to satisfaction of the CM;
      v. Bear all associated costs, including re-tests and rectification works, and no extension of time will be allowed.

DRA.T220.A

REPETITIVE FLUSHING TEST (RFT) FOR COMMON W-TRAP SYSTEM

1. Testing Arrangements:
   a. Carry out test to the installed foul water drainage pipework at sample flat(s) / mock-up flat(s) fitted with sanitary fitments in accordance with sub-clause (3) below, and in the presence of the CM. The sample flat(s) / mock-up flat(s) shall be selected by the CM;
   b. Prepare the result for CM's submission to ICU for record;
   c. Provide clean water, detergent and appropriate apparatus for testing. Submit the details of the appropriate type of testing equipment to the CM for approval;
   d. Clean and remove dirt / blockage on the pipework and fitments, which may affect the test result.

2. Testing Samples:
   a. Test the pipes and fitments connected to the common W-trap system as soon as practical after the completion of the pipework installation for shower areas and wash hand basins of the various flat types of selected sample flat(s) / mock-up flat(s) including the installation of the wash hand basins completed with the associated bottle traps;
   b. One test for each W-trap connected to the floor drain in bathroom / kitchen of each flat type of selected sample flat(s) / mock-up flat(s);
   c. One set of tests for each flat type of drainage arrangement for the selected sample flat(s) / mock-up flat(s). The number of selected sample flat(s) / mock-up flat(s) shall be determined by the CM.

3. Testing Methods:
   a. Ensure that all pipe runs are clear of obstructions by visual examination or other method. Obtain CM's approval before commencing the test;
b. Carry out test to the 40 mm diameter W-trap connected to wash hand basin as follows:
   i. Measure and mark the water level of the wash hand basin filled up with approximate 6 litres of water;
   ii. Measure and control the speed of water flowing from the tap of the wash hand basin at 0.15 litre per second;
   iii. Fill the wash hand basin with water to reach the marked level;
   iv. Add 10 gram of detergent into the water and stir it well to form a soap solution. Do not beat up the soap solution to create a large amount of foam;
   v. Unplug the outlet of the wash hand basin and turn on the tap to flush all the residual foam (if any) out of the wash hand basin simultaneously. The time taken to flush out all the residual foam should be from 30 seconds to 1 minute;
   vi. Observe and record any overflowing of foam from the floor drain;
   vii. Repeat the test cycle as described in sub-clauses (b)(i) to (b)(vi) above for 7 times and observe any foam flooding from the floor drain;
   viii. Acceptance standard: no visual sign of overflowing of foam from the floor drain is observed throughout the 7 test cycles. If any foam discharges outside the vertical grating and floods the bathroom or kitchen floor in any one test cycle, it is not required to continue with the remaining test cycles and the test is deemed to be failed.

c. Carry out test to the 50 mm diameter W-trap connected to the shower area as follows:
   i. Measure and control the speed of water flowing from the shower head at 0.1 litre per second;
   ii. Fill the shower area with water to reach approximate 40 mm deep measured at lowest point;
   iii. Add 10 gram of detergent into the water and stir it well to form a soap solution. Do not beat up the soap solution to create a large amount of foam;
   iv. Unplug the outlet of the shower area and flush all the residual foam with water from shower head (if any) out of the shower area simultaneously. The time taken to flush out all the residual foam should be from 1 minute to 2 minutes;
   v. Observe and record any overflowing of foam from the floor drain;
   vi. Repeat the test cycle as described in sub-clauses (c)(i) to (c)(v) above for 10 times and observe any foam flooding from the floor drain;
   vii. Acceptance standard: no visual sign of overflowing of foam from the floor drain is observed throughout the 10 test cycles. If any foam discharges outside the vertical grating and floods the bathroom or kitchen floor in any one test cycle, it is not required to continue with the remaining test cycles and the test is deemed to be failed.

d. Within one week upon completion of the tests, submit for Approval three copies of test reports or other number of copies of test reports as directed by the CM. Agree with the CM the format of the test report.

4. Non-compliance:
DRAINAGE ABOVE GROUND

DRA1 > TESTING

DRA1.T230.A MULTIPLE FLUSHING TEST (MFT) FOR COMMON W-TRAP SYSTEM

1. Testing Arrangements:

   a. Carry out test to the installed foul water drainage pipework fitted with sanitary fitments and connected to the manholes in accordance with sub-clause (3) below, and in the presence of the CM or his representatives;

   b. Carry out the test procedure simultaneously in each flat served by the same soil and waste stack at 6 selected floors as determined by the CM;

   c. Provide clean water, detergent and appropriate apparatus for testing. Submit the details of the appropriate type of testing equipment to the CM for approval;

   d. Clean and remove dirt / blockage on the pipework and fitments, which may affect the test result.

2. Testing Samples:

   a. Test the pipes and fitments connected to common W-trap system as soon as practical after the completion of the installation of the pipework and fitments of all the flats served by the selected soil and waste stack(s);

   b. Only one set of tests for the selected soil and waste stack as determined by the CM;

   c. One test for each W-trap connected to the floor drain in bathroom / kitchen of each flat at the 6 selected floors as determined by the CM. The selected floors shall include the lowest 2 floors served by soil and waste stack, 3 other consecutive floors share the same cross vent / balancing pipe of the soil and waste stack and one extra floor from other levels of the same soil and waste stack.

3. Testing Methods:

   a. Ensure that all pipe runs are clear of obstructions by visual examination or other method. Obtain CM's approval before commencing the test;

   b. Carry out test to the 40 mm diameter W-trap connected to wash hand basin as follows:

   i. Record the no. of the test cycle for which the test has failed;

   ii. Clean out the pipeworks and check the pipe alignment and arrangement;

   iii. Take the same pipework arrangement that has failed the test for re-test in accordance with sub-clause (3) above.

   b. In the event that the same pipework arrangement has failed the re-test, carry out further tests as follows:

   i. Take the pipework arrangement of other selected flats for testing;

   ii. Carry out the tests in accordance with sub-clause (3) until all selected samples have satisfactorily fulfilled the acceptance standards stated in sub-clauses (3)(b)(viii) or (3)(c)(vii) as appropriate;

   iii. Rectify all pipeworks that have failed the tests as instructed by the CM;

   iv. Re-test all rectified pipeworks to satisfaction of the CM;

   v. Bear all associated costs including costs for carrying out re-tests and rectification works, and no extension of time will be allowed.
i. Measure and mark the water level of the wash hand basin filled up with approximate 6 litres of water;

ii. Measure and control the speed of water flowing from the tap of the wash hand basin at 0.15 litre per second;

iii. Ensure sufficient supply of flush water is available for refilling the cistern of water closet after flushing;

iv. Fill the wash hand basin with water to reach the marked level;

v. Add 10 gram of detergent into the water and stir it well to form a soap solution. Do not beat up the soap solution to create a large amount of foam;

vi. Unplug the outlet of the wash hand basin and turn on the tap to flush all the residual foam (if any) out of the wash hand basin and flush the water closet simultaneously at all 6 selected floors. The time taken to flush out all the residual foam in wash hand basin should be from 30 seconds to 1 minute;

vii. Observe any abnormal flow speed of discharge from wash hand basins and record any overflowing of foam from the floor drain and any bubbling / flooding from the water closet;

viii. Repeat the test cycles as described in sub-clauses (b)(i) to (b)(vii) for 3 times and observe any foam flooding from the floor drain and any bubbling / flooding from the water closet;

ix. Acceptance standard: no visual sign of overflowing of foam from the floor drain or bubbling / flooding from the water closet can be observed throughout the 3 test cycles. If any foam discharges outside the vertical grating and floods the bathroom or kitchen floor in any one test cycle, or there is bubbling / flooding from the water closet in any one test cycle, it is not required to continue with the remaining test cycles and the test is deemed to be failed.

c. Carry out test to the 50 mm diameter W-trap connected to shower area as follows:

i. Measure and control the speed of water flowing from the shower head at 0.1 litre per second;

ii. Ensure sufficient supply of flush water is available for refilling the cistern of water closet after flushing;

iii. Fill the shower area with water to reach approximate 40 mm deep measured at lowest point;

iv. Add 10 gram of detergent into the water and stir it well to form a soap solution. Do not beat up the soap solution to create a large amount of foam;

v. Unplug the outlet of the shower area and flush all the residual foam with water from shower head (if any) out of the shower area and flush the water closet simultaneously. The time taken to flush out all the residual foam from the shower area should be from 1 minute to 2 minutes;

vi. Observe any abnormal flow speed of discharge from shower areas and record any overflowing of foam from the floor drain and any bubbling / flooding from the water closet;
vii. Repeat the test cycle as described in sub-clause (c)(i) to (c)(vi) for 3 times and observe any foam overflowing from the floor drain and any bubbling / flooding from the water closet;

viii. Acceptance standard: no visual sign of overflowing of foam from the floor drain is observed throughout the 3 test cycles. If any foam discharges outside the vertical grating and floods the bathroom or kitchen floor in any one test cycle, or there is any bubbling / flooding from the water closet in any one test cycle, it is not required to continue with the remaining test cycles and the test is deemed to be failed.

d. Within one week upon completion of the tests, submit for Approval three copies of test reports or other number of copies of test reports as directed by the CM. Agree with the CM the format of the report;

e. Prepare the findings for the CM's submission to ICU for record.

4. Non-compliance:
   a. In the event that any one set of the test as specified in sub-clauses (3)(b) and (3)(c) above has failed to meet the requirements, carry out re-testing as follows:
      i. Record the no. of test cycle for which the test has failed;
      ii. Clean out the pipeworks and check the pipe alignment and arrangement;
      iii. Take the same selected soil and waste stack that has failed the test for re-test in accordance with sub-clause (3) above.
   b. In the event that the same selected soil and waste stack has failed the re-test, carry out further tests as follows:
      i. Take the pipework arrangement of other selected soil and waste stack for testing;
      ii. Carry out the tests in accordance with sub-clause (3) above until all selected samples have satisfactorily fulfilled the acceptance standards stated in sub-clauses (3)(b) (ix) or (3)(c)(viii) as appropriate;
      iii. Rectify all pipeworks that have failed the tests as instructed by the CM;
      iv. Re-test all rectified pipeworks to satisfaction of the CM;
      v. Bear all associated costs including costs for carrying out re-tests and rectification works, and no extension of time will be allowed.

SURVEILLANCE TESTS FOR UPVC DRAINAGE PIPES AND FITTINGS

DRA1.T310.A SURVEILLANCE TESTS

1. Testing Arrangements:
   a. When Instructed, surveillance tests shall be carried out by the CM, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the following pertaining to surveillance tests:
      i. Provide attendance on the Site;
      ii. Provide, deliver and collect samples etc. as directed by the CM or as specified.
2. Testing Samples:
   a. Provide one set of test sample from the batch of material delivered to Site under the delivery note as specified in DRA1.M150 (3)(a)(ii) or as instructed by the CM;
   b. One set of test sample shall consist of pipes and fittings sufficient to carry out test in DRA1.M150 (2)(f)(i) and (iii) or (2)(f)(ii) and (iii) or as instructed by the CM.

3. Testing methods:
   As per DRA1.M150 (2)(f);

4. Non-compliance:
   a. In the event that the testing samples fail to meet the testing requirements, follow either one of the following actions:
      i. Remove the representative batch off Site; or
      ii. Carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 on three separate sets of samples selected by the CM from the representative batch. In case of any one sample fails the re-test, remove the representative batch off Site.
   b. When the representative batch of uPVC pipes and fittings is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 for one sample selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clauses (4)(a);
   c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.

SURVEILLANCE TESTS FOR EPOXY COATED CAST IRON PIPES AND FITTINGS

DRA1.T410.A

SURVEILLANCE TESTS

1. Testing Arrangements:
   a. When Instructed, surveillance tests shall be carried out by the CM, a Direct Testing Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the following pertaining to the surveillance tests:
      i. Provide attendance on the Site;
      ii. Provide, deliver and collect samples etc. as directed by the CM or as specified.

2. Test Samples:
   a. Provide one set of test sample from the batch of material delivered to Site under the delivery note as specified DRA1.M115 (3)(a) (hereinafter referred to as the “representative batch”) selected and as instructed by the CM;
   b. One set of test sample shall consist of three sections of pipes or fittings or as instructed by the CM.

3. Testing methods:
a. As per DRA1.M115 (2)(b) for resistance to salt spray test on internal epoxy coating;

b. As per DRA1.M115 (2)(b) for resistance to temperature cycling test on internal epoxy coating;

c. As per DRA1.M115 (2)(b) for dry coating thickness test on internal epoxy coating and external coating;

d. As per DRA1.M115 (2)(b) for adhesion test on internal epoxy coating and external coating.

4. Non-compliance:

a. In the event that the any of the test samples fails to meet the test requirements, follow either one of the following actions:

   i. Remove the representative batch off Site; or

   ii. Carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 on three separate sets of samples selected by the CM from the representative batch. In case of any one sample fails the re-test, remove the representative batch off Site.

b. When the representative batch of epoxy coated cast iron pipes and fittings is removed off Site, replace with another new batch (hereinafter referred to as the “replacement batch”). Carry out test in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 for one set of samples selected by the CM from the replacement batch. In case any one sample fails the test, follow action stated in sub-clauses (4)(a);

c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.
DRA2 DRAINAGE BELOW GROUND MATERIALS

GENERAL

DRA2.M010.8 APPLICATION OF OTHER WORKSECTIONS
The following works and materials must comply with the following Worksections:
1. Handrailing, ladders, stairs, metal flooring, toe plates and safety chains:
   a. Worksection MEW for works carried out under site formation / road and drainage works and slopeworks contracts; or
   b. Worksection MET1 for all other works not mentioned in sub-clause (1)(a) above.
2. Earthworks: Worksection EAR1;
3. Concrete and reinforcement: Worksections CON1 and CON3 respectively;
4. Formwork: Worksection FOR;

DRA2.M020.8 DEFINITIONS
In this Section, pipes for drainage works are defined as pipes for conveying sewage or surface water.

PIPES AND FITTINGS

DRA2.M110.8 PRECAST CONCRETE PIPES AND FITTINGS
Complying with BS 5911-1:2002 for nominal sizes of 225mm or above and BS 5911-100:1988 for nominal size of 150mm, having flexible, spigot and socket joints.

DRA2.M120.8 VITRIFIED CLAY PIPES AND FITTINGS
Complying with BS 65:1991 (2003) and:
1. Of the normal glazed, chemical resistant type;
2. With flexible mechanical joints.

DRA2.M130.8 DUCTILE IRON PIPES AND FITTINGS
Complying with BS 4772:1988 and:
1. Lined internally with cement mortar;
2. Coated externally with a bituminous coating.

DRA2.M140.8 FLEXIBLE JOINTS FOR DUCTILE IRON PIPES AND FITTINGS
Push fit type and capable of withstanding:
1. A minimum angular deflection of 4º;
2. A minimum withdrawal of 38 mm when there is no deflection of the joint.

**DRA2.M150.8 FLANGED JOINTS FOR DUCTILE IRON PIPES AND FITTINGS**

**DRA2.M160.8 DUCTILE IRON PIPES TO BE BUILT IN**

Provide puddle flanges by welding to pipes which are to be built into structures.

**DRA2.M170.8 GREY IRON PIPES AND FITTINGS**

Complying with BS 4622:1970.

**DRA2.M180.8 SUB-SOIL PIPES AND FITTINGS**

1. Vitrified clay pipes and fittings complying with BS 65:1991 and of the normal glazed, chemical resistant type with plain ends and flexible sleeved joints;
2. Precast porous concrete pipes complying with BS 5911 Part 114:1992;

**DRA2.M190.8 UPVC GRAVITY SEWAGE AND SURFACE WATER PIPES AND FITTINGS**

Complying with the following:
1. Pipes from 110 mm to 160 mm in diameter: BS 4660:2000;

**DRA2.M200.8 JOINTING SYSTEM FOR UPVC PIPES AND FITTINGS**

Solvent welded, spigot and socket joints.

**DRA2.M210.8 JOINTING SYSTEM FOR UPVC PIPES AND FITTINGS**

Flexible spigot and socket joints with elastomeric joint rings.

**DRA2.M220.8 UPVC PRESSURE PIPES AND FITTINGS**

Complying with BS 3506:1969:
1. Class: dependant on the pressure rating;
2. With joints and fittings complying with the following:

**DRA2.M230.8 CAST IRON PIPES AND FITTINGS**

Complying with BS 437:1978.

**JOINTING MATERIALS**

**DRA2.M305.8 GENERAL**

Caulking compound and all solvent cement for jointing uPVC pressure pipes shall be in compliance with the prescribed limits of VOC content as set out in the Air Pollution Control (Volatile Organic Compound) Regulation.
**DRA2.M310.8**  **SOLVENT CEMENT FOR UPVC PRESSURE PIPES**

**DRA2.M320.8**  **ELASTOMERIC JOINT RINGS**
To BS EN 681-1:1996, Type WC and:
1. Compatible with the type of joint;
2. Unless otherwise Approved, obtained from the same manufacturer as the joint.

**DRA2.M330.8**  **ELASTOMERIC JOINT RINGS FOR FLANGED PIPES**
Of the inside diameter, bolt circle type, and:
1. Natural rubber;
2. 3.2 mm thick, with other dimensions in accordance with BS 4865:Part 1:1989.

**DRA2.M340.8**  **DETACHABLE COUPLINGS AND FLANGE ADAPTERS**
Approved proprietary type in compliance with clause 5.3.3 and Table 10(b) of Sewerage Manual (Part 1) – Key Planning Issues and Gravity Collection System (3rd Edition) published by the Drainage Services Department and capable of accommodating the angular deflection and straight draw stated in the following table:

<table>

</tbody>
</table>

**DRA2.M350.8**  **JOINTING RINGS**
Of types recommended by the manufacturer of the pipes being jointed.

**DRA2.M370.8**  **GASKIN**
Tarred spun yarn or hemp.

**DRA2.M380.8**  **COLD CAULKING COMPOUND**
An Approved proprietary brand.

**DRA2.M390.8**  **LUBRICANT**
Compatible with the elastomeric joint ring to be applied on.
BOLTS, NUTS AND WASHERS

DRA2.M410.8 GENERAL

Ensure that all bolts and nuts are compatible with the type of joint and, unless otherwise Approved, obtained from the same manufacturer as the joint.

DRA2.M420.8 FLANGED JOINTS, DETACHABLE COUPLINGS AND FLANGE ADAPTORS

Complying with the following:
1. ISO metric, black, hexagon bolts, screws and nuts: BS 4190:2001;
2. Metal washers: BS 4320:1968;
3. Coating to bolts, nuts and washers: hot dip galvanised, or treated as otherwise Approved.

DRA2.M430.8 STAINLESS STEEL

1. Bolts and nuts: to BS EN ISO 3506-1&2:1998, Steel grade A4 and property Class 80;

DRA2.M440.8 SPHEROIDAL GRAPHITE IRON BOLTS

Grade 500/7 metal, complying with BS 2789:1985.

BEDDING, HAUNCHING AND SURROUNDING MATERIALS

DRA2.M510.8 AGGREGATES FOR GRANULAR BED AND GRANULAR FILL

1. Granular bed to be Type A material and granular fill to be Type B material;
2. Type A or Type B material to be hard, clean, crushed slag, gravel, crushed rock, crushed concrete or crushed inert demolition material and:
   a. Having the ten percent fines values of at least 50 kN;
   b. Material passing the 425 µm BS test sieve to be non-plastic when tested in accordance with BS 1377:Part 2:1990 (as modified in accordance with Geospec 3);
   c. Having a grading within the limits of the following table:
### Range of grading of Type A and Type B materials

<table>
<thead>
<tr>

</tbody>
</table>

d. Obtained from an Approved source.

3. Aggregates for granular bed to have the compaction fraction values stated in DRA2.T290.

### JOINT FILLER

**DRA2.M520.8**

For joints in concrete bed, haunch and surround:

1. A firm, single thickness, non-rotting filler;
2. Unless otherwise specified in the Drawings, the thicknesses of joint filler are shown in the following table:

<table>
<thead>
<tr>
<th>Joint Filler for Concrete Bed, Haunch and Surround</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nominal Diameter of Pipe</td>
</tr>
<tr>
<td>-------------------------</td>

<tr>
<td>exceeding 1200 mm</td>
</tr>
</tbody>
</table>

### COMPRESSIBLE PADDING

**DRA2.M530.8**

For insertion between pipes and supports: bitumen damp-proof sheeting to BS 743: 1970.

### CONCRETE

**DRA2.M540.8**

1. Concrete grade 20/20 or higher strength as Worksection CON1, unless otherwise specified;
2. The aggregate for such Grade 20 or higher strength concrete to be natural stone, crushed rock or crushed concrete and to comply with the following minimum cementitious content:

<table>
<thead>
<tr>
<th>Exposure condition (as stated in the Contract)</th>
<th>Minimum cementitious content (kg/m³)</th>
</tr>
</thead>

</table>
MANHOLES, CHAMBERS, GULLIES AND CHANNELS

DRA2.M610.8  PRECAST CONCRETE MANHOLES
To BS 5911-3:2002, with cover slabs and reducing slabs reinforced as required to comply with the load test requirements stated in BS 5911-3:2002 and with rebated joints.

DRA2.M620.8  PRECAST CONCRETE CHAMBERS AND GULLIES
To BS 5911:Part 2:1982 with:
1. Cover slabs reinforced as required to comply with the load test requirements stated in BS 5911:Part 2:1982;
2. Rebated joints between precast units;
3. Types of cement used in manufacture either:
   a. As stated in BS 5911:Part 2:1982; or
   b. A combination of PFA and PC or PFAC to BS EN 197-1:2000 in which the PFA does not exceed 40% by mass of the total cementitious content.

DRA2.M630.8  VITRIFIED CLAY GULLIES

DRA2.M640.8  STEP IRONS
To BS 1247:1990 and:
1. Manufactured from malleable cast iron to BS 6681:1986;
2. Hot dip galvanised.

DRA2.M650.8  CAST IRON MANHOLE COVERS, GULLY GRATINGS AND OVERFLOW WEIRS
Grade EN-GJL-150 cast iron to BS EN 1561:1997 and:
1. With nuts and bolts complying with BS 4190:2001;
2. Cleanly cast, free from air holes, sand holes, voids due to shrinkage, gas inclusions or other causes, cold shuts and chill and neatly dressed and fettled;
3. With dimensions as indicated on the Drawings;
4. With manufacturer's name cast integrally with the unit in a raised form, protected with bituminous coating. Covers shall have the raised design as shown on the Drawings;
5. Capable of withstanding the minimum test loads and having the minimum masses given in the following tables as appropriate:

<table>

**DRA2.M660.8  DUCTILE IRON MANHOLE COVERS AND FRAMES**

Spheroidal graphite cast iron (ductile iron) of grades EN-GJS-500-7 to BS EN 1563:1997 and:

1. Conform to the relevant requirements of BS EN 124:1994;
2. Bolts for loosely coupling separate sections of covers shall be stainless steel hexagon headed complete with hexagon nuts, of grade 302 or 304 to BS 970:Part 1:1996 with dimensions complying with BS 4190:2001;

3. Cleanly cast, free from air holes, sand holes, voids due to shrinkage, gas inclusions or other causes, cold shuts, chill and any surface defects and neatly dressed and fettled;

4. With dimensions as indicated on the Drawings and have sharp edges removed;

5. Covers shall have the raised design as shown on the Drawings with manufacturer's name cast integrally with the unit in a raised form. All markings shall be clearly legible;

6. Coated with 2 layers of black non-toxic water-based bituminous coating to BS 3416:1991 after thoroughly cleaned to remove moulding sands, rust or any other impurity. The coating shall be free of bare patches or lack of adhesion;

7. Compatible with their seatings which shall be manufactured in such a way to ensure stability and quietness in use;

8. Bedding material for manhole frames shall be non-shrinkage with compressive strength exceeding 30 N/mm²;

9. Capable of withstanding the minimum test loads as per BS EN 124:1994 and having the minimum masses given in the following table:

<table>
<thead>
<tr>
<th>Details of manhole cover and frame</th>
<th>Test Requirements</th>
</tr>
</thead>

**DRA2.M670.8 RECESSED MANHOLE COVERS AND FRAMES**

1. All steel members shall be of Grade 43 steel to BS EN 10029:1991, BS EN 10113:1993 Parts 1 to 3 and BS EN 10210-1:1994;

2. Cover and frame shall be hot-dip galvanized to BS EN ISO 1461:2009. All welds shall be 4mm continuous fillet weld complying with BS 4872;

3. Other materials of better corrosion resistance or durability, such as stainless steel, with equivalent strength may be used if approved by the CM;

4. The external edges of the cover and internal faces of the frame shall be coated with a non-setting, thick lubricant, such as petroleum gel, in order to prevent jamming the cover and frame due to sand grains entering the gap after final fixing;

5. The recessed cover shall be designed to accommodate paving block up to a maximum thickness of 80mm. For areas used by pedal cyclists (i.e. light duty), the infilling shall be 10mm wearing course bituminous materials, unless otherwise approved by the CM;

6. The paving block within the recessed cover shall be bedded on cement mortar. Jointing sand shall be applied to the whole cover with compaction;

7. Bedding material for manhole frames shall be of non-shrinkage type with compressive strength exceeding 30 N/mm²;
8. Capable of withstanding the minimum test loads as per BS EN 124:1994 given in the following table:

<table>
<thead>
<tr>

DRA2.M680.8 CAST IRON CHANNEL GRATINGS AND FRAMES
Grade EN-GJL-150 cast iron to BS EN 1561:1997 and:
1. All cast units shall be coated with a bituminous coating in accordance with clause DRA2.M830 or DRA2.M840;
2. All grating corners shall be rounded to approximately 2mm;
3. Manufacturers should cast their trademarks and grating reference number for identification on the upper face of grating. Logos, letters, numerals, etc. shall not exceed 15mm height and 1mm proud of grating surface. Housing Logo shall be cast embossed on upper face of grating, minimum 30x30x1mm.

DRA2.M690.8 PRECAST CONCRETE CHANNEL COVERS
1. Concrete grade 30/20 or higher strength as Worksection CON1, unless otherwise specified;
2. All exposed formed surface finishes to be fair-faced and worked surface finishes to be steel trowel.

DRA2.M695.N PRECAST CONCRETE SURFACE CHANNEL
1. Concrete grade 30/20 or higher strength as Worksection CON1, unless otherwise specified;
2. All exposed formed surface finishes to be fair-faced and worked surface finishes to be steel trowel.

VALVES

DRA2.M710.8 GENERAL
Ensure:
1. Handwheels and tee keys turn in a clockwise direction to close the valve;
2. Handwheels have a smooth rim with the direction of opening and closing clearly cast in;
3. The opening effort required at any point on the handwheel does not exceed 250 N when operated against the full unbalanced pressure;
4. Extension stems are of the same grade of stainless steel as the stems and are connected by muff couplings;
5. Handwheels, tee keys, headstocks, guide brackets for stems, supporting brackets, surface boxes and other fittings are cast iron to BS EN 1561:1997.
GATE VALVES

Double flange ended, solid wedge type, to BS 5150:1990 and with:

1. A nominal pressure designation of PN 16 and PN 16 flanges to BS 4504: Part 3:1989;
2. Bodies and wedges of cast iron to BS EN 1561:1997, grade EN-GJL-220 with renewable seat rings made from gunmetal to BS 1400:1985, grade LG2;
3. Stem nuts made from gunmetal to BS 1400:1985, grade LG2;
4. Stems of aluminium bronze to BS 2874:1986, grade CA 104;
5. Stainless steel assembly bolts, as DRA2.M430;
6. Outside screw rising stems with perspex protection tubes and open/close indicators;
7. A fitted plate showing the position of the valve in the closed, quarter closed, half closed, three quarters closed and fully open positions.

CHAINS FOR CHAIN OPERATED GATE VALVES

FLAP VALVES

With the following:

1. Frames and flaps of cast iron to BS EN 1561:1997, grade EN-GJL-220;
2. Sealing faces and hinge pins of gunmetal to BS 1400:1985, grade LG2;
3. The flap hung with double hinges, secured with hinge pins.

FLANGE MOUNTING FLAP VALVES

With flanges PN 16 to BS 4504:Section 3.1:1989.

SLUDGE VALVES

With the following:

1. Bodies and valve sections of cast iron to BS EN 1561:1997, grade EN-GJL-220;
2. Sealing faces and stem nuts of gunmetal to BS 1400:1985, grade LG2;
3. Stems of aluminium bronze to BS 2874:1986, grade CA 104, operating through non-rising stem nuts, housed in bridges bolted over the body sections;

AIR VALVES

Dual orifice elongated body type, with a small orifice valve for releasing air at working pressure, a large orifice valve for allowing air to pass at atmospheric pressure during emptying and filling of the pipework and:

1. A pressure rating to 3 bars;
2. The bodies and covers of small and large orifice valves in cast iron to BS EN 1561:1997, grade EN-GJL-220;
4. Small orifice valves with an adjustable Viton orifice button to ensure positive sealing and:
   a. Valve inlet size: 75 mm;
   b. Valve outlet size: 25 mm;
   c. Venting orifice size: 5 mm.
5. Large orifice valves with a Buna-N seat and a valve inlet and outlet size of 75 mm.

**DRA2.M780.8 BOLTS AND NUTS FOR SECURING VALVES**

Indented stainless steel foundation bolts, as DRA2.M430.

**ANCILLARY MATERIALS**

**DRA2.M810.8 ANTI-CORROSION TAPE**

Approved proprietary type of a rubber/bitumen compound with a fabric reinforcement, backed with a PVC film, and:

1. With a high resistance to cathodic disbonding, acids and alkalis;
2. Having the minimum properties stated in the following table:

<table>
<thead>
<tr>
<th>Properties of Anti-corrosion Tape</th>
<th>Minimum Value (except where stated)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Type 1 (for pipes below 700 mm diameter)</td>
</tr>
<tr>
<td>Thickness of PVC backing (µm)</td>
<td>85</td>
</tr>
<tr>
<td>Tensile strength (N/mm)</td>
<td>8</td>

</tr>
<tr>
<td>Mass (kg/m²)</td>
<td>1.8</td>
</tr>
</tbody>
</table>

**DRA2.M820.8 PRIMER AND MASTIC FILLER FOR USE WITH ANTI-CORROSION TAPE**

An Approved type recommended by the tape manufacturer and compatible with the tape.

**DRA2.M830.8 BITUMINOUS COATINGS FOR HOT APPLICATION**

For the protection of iron and steel, including suitable primers where required: to BS 4147:1980 (1987), Type I, grade C.
DRAINAGE BELOW GROUND

DRA2 > MATERIALS

DRA2.M840.8  BLACK BITUMEN COATING FOR COLD APPLICATION
To BS 3416:1991, Type II.

DRA2.M850.8  BITUMINOUS COATINGS FOR REPAIRS
Compatible with the adjacent coating.

DRA2.M860.8  POLYETHYLENE SHEETING
Impermeable sheeting, 0.125 mm thick.

DRA2.M870.8  GROUT FOR FILLING REBATES AND BOX-OUTS
An Approved proprietary type containing a non-shrink additive.

DRA2.M880.8  FOAM CONCRETE FILLING FOR ABANDONED SYSTEMS
Composed of PC (or PFAC), fine aggregate obtained from natural or recycled aggregate, water, admixtures for accelerating or retarding the setting time and a foaming agent to reduce the density and to produce a flowing, self levelling material.

DRA2.M890.8  GROUT FILLING FOR ABANDONED SYSTEMS
A mixture of one part PC, 15 parts PFA and the minimum of water necessary to achieve a consistency suitable for flowing into pipes, culverts, manholes and voids, without the addition of sand or admixtures unless otherwise Approved.

DRA2.M900.8  CONCRETE FOR THRUST AND ANCHOR BLOCKS
In accordance with clause DRA2.M540.

DRA2.M910.8  MORTAR
Consisting of (by mass):
1. 1 part cement (complying with CON1); to
2. 3 parts of fine aggregate (sand or crushed rock to BS 1200:1967 and passing a 5 mm BS Test Sieve); with
3. The minimum amount of water to achieve a consistency suited to the required work.

DRA2.M920.8  MARKER BLOCKS
Precast in grade 20/20 concrete as Worksection CON1 and:
1. Size: 150 mm × 150 mm × 150 mm;
2. With the letters ‘CD’ marked on the upper surface;
3. With a hook cast into the lower surface.

SUBMISSIONS

DRA2.M1010.8  PIPES, JOINTS AND FITTINGS
Submit the following to the CM at least 14 days before the first delivery of the material to the Site:
1. Manufacturer's literature including details of:
   a. Manufacturing process;
b. Pressure and temperature ratings;

c. Permissible values of straight draw and angular deflection of flexible joints;

d. Recommendations for handling, storage, laying, jointing and repair;

e. Drilling and tapping equipment for connections to pipes.

2. A certificate showing the manufacturer's name, the date and place of manufacture and showing that the material complies with the requirements of this specification and including the results of any tests specified. Submit such a certificate for each batch of material delivered to Site.

DRA2.M1020.8 ANTI-CORROSION TAPE AND JOINT FILLER

Submit the following to the CM at least 14 days before the first delivery of the material to the Site:

1. Manufacturer's literature for anti-corrosion tape;

2. Certificates for anti-corrosion tape and joint filler delivered to Site showing the manufacturer's name, the date and place of manufacture and showing that the material complies with the requirements of this specification and including the results of any tests specified. Submit such certificates for each batch of material delivered to Site.

DRA2.M1030.8 AGGREGATES FOR GRANULAR BED

At least 14 days before the first delivery of any aggregate to the Site and thereafter each time the source is changed, submit to the CM, a certificate for each type of aggregate showing its source and that it complies with the requirements of this specification and including the results of any tests specified.

MANHOLES, CHAMBERS, GULLIES AND CHANNELS

DRA2.M1035.N DESIGN RESPONSIBILITY FOR PRECAST MANHOLES

1. All structural drawings, layouts, details and calculations for precast manholes submitted including those submitted with tender, must be prepared and signed by the Registered Structural Engineer;

2. The Registered Structural Engineer is registered under Buildings Department of the Government of Hong Kong Special Administrative Region.

DRA2.M1040.8 MANHOLES, CHAMBERS, GULLIES AND CHANNELS

At least 14 days before the first delivery of the material to the Site and thereafter, with each batch delivered to the Site, submit the following to the CM:

1. A certificate for each type of manhole, chamber unit and typical section of channel, and for each type of gully, showing the manufacturer's name, the date and place of manufacture and showing that the material complies with the requirements of this specification and including the results of any tests specified;

2. A certificate for step irons, showing the manufacturer's name, the date and place of manufacture and showing that they comply with the requirements of this specification and including the results of any tests specified;

3. A certificate for each type of manhole cover, gully grating, kerb overflow weir and channel cover, showing the manufacturer's name, the date and place of manufacture and showing that the material complies with the requirements of this specification and including the results of any tests specified.
DRA2.M1050.8 VALVES
Submit the following particulars to the CM at least 28 days before the first delivery of the material to the Site:

1. Manufacturer's literature, including details of:
   a. Materials;
   b. Pressure ratings;
   c. Recommendations for handling, storage and installation;
2. Drawings showing details of the valves, including lengths of stems and details of handwheels, tee keys, extension stems, headstocks, guide brackets for stems, supporting brackets, surface boxes and other fittings, and positions and sizes of rebates and box-outs.

DRA2.M1060.8 CONCRETE AND GROUT FILLING FOR ABANDONED INSTALLATIONS
At least 7 days before grouting starts, submit to the CM, the following particulars of the foam concrete and grouting procedure for filling abandoned pipes, culverts, manholes and voids:

1. Proportions of each constituent;
2. Source of supply;
3. Details of mixing;
4. Setting time;
5. Strength;
6. Shrinkage expected (for PC/PFA grout);
7. Details of mixing and grouting equipment;
8. Method of grouting including details of trials.
WORKMANSHIP

GENERAL

DRA2.W010.8 DIVERSIONS OF FLOW
Unless otherwise permitted by the CM, submit particulars of any proposed procedures for the diversion of any existing flows, at least 14 days before the diversion starts.

TRANSPORT, HANDLING AND STORAGE

DRA2.W110.8 PIPES, JOINTS AND FITTINGS GENERALLY
Transport, handle and store pipes, joints and fittings in accordance with the manufacturer’s recommendations and:
1. In a manner which will not result in their damage, deformation or contamination;
2. Protect pipes, joints and fittings from damage;
3. Do not use any damaged pipes, joints and fittings in the permanent work unless otherwise Approved;
4. Handle pipes and fittings manually or by using lifting appliances or chains, wire rope or canvas slings of a type recommended by the manufacturer and agreed by the CM and:
   a. Do not use hooks;
   b. Place slings around the pipes and fittings and provide padding at the points of contact between pipes and fittings and metal lifting appliances and slings;
   c. Do not handle pipes by means of metal slings passed through the pipes.
5. Do not subject pipes and fittings to rough handling, shock loading, or dropping and do not roll down ramps unless otherwise Approved, in which case the ramps must be padded.

DRA2.W120.8 UPVC PIPES, JOINTS AND FITTINGS
Protect from exposure to conditions which may affect the material.

DRA2.W130.8 BOLTS AND NUTS
Ensure bolts and nuts are packed in sealed metal containers.

DRA2.W140.8 ELASTOMERIC JOINT RINGS
1. Ensure elastomeric joint rings are packed in bags and that lubricant for joints is stored in sealed containers, marked to identify the contents;
2. Protect the rings and lubricant from conditions which may affect the material.

DRA2.W150.8 STORING PIPES
1. Store pipes horizontally at least 75 mm above the ground on wedged timber bearers. Securely wedge the bottom layers and the outer pipes in each layer to prevent sideways movement;
2. Store spigot and socket pipes with the sockets alternating and in such a manner that loads are not applied to the sockets;
3. Do not allow the stacks to exceed 2 m in height unless recommended by the manufacturer or otherwise Approved;
4. Do not string pipes out along the route of the pipeline unless otherwise approved.

**DRA2.W160.8**  
**STORING ANTI-CORROSION TAPE AND JOINT FILLER**  
Store in accordance with the manufacturer’s recommendations in a dry, weatherproof store with a raised floor.

**DRA2.W170.8**  
**GRANULAR BEDDING MATERIALS**  
Do not handle aggregates for granular bedding in a manner which will result in the mixing of the different types and sizes, or in contamination of the aggregates. Store different types and sizes of aggregates in separate stockpiles.

**DRA2.W180.8**  
**MANHOLES, CHAMBERS AND GULLIES**
1. Lift units for manholes, chambers and gullies only at the lifting points recommended by the manufacturer and do not subject them to rough handling, shock loading or dropping;
2. Store units off the ground on level supports which will not result in their damage, deformation or contamination. Protect all units from damage and do not use damaged units in the permanent work unless otherwise Approved.

**DRA2.W190.8**  
**STORING COVERS, GRATINGS AND KERB OVERFLOW WEIRS**  
Store manhole covers, gully gratings, kerb overflow weirs and valves, including fittings, off the ground on level supports which will not result in their damage, deformation or contamination. Protect all units from damage and do not use damaged units in the permanent work unless otherwise Approved.

**EXCAVATION**

**DRA2.W20.8**  
**GENERAL**  
Only commence the excavation of a trench when the nature, location and size of existing utilities which may be affected by the excavation have been ascertained and the setting out details have been Approved.

**DRA2.W22.8**  
**TRENCH WIDTH**  
Do not exceed the relevant effective trench widths stated in the following table for the different diameters of pipe:

<table>
<thead>
<tr>
<th>Nominal Diameter of Pipe (mm)</th>
<th>Effective Trench Width (mm)</th>
<th>Nominal Diameter of Pipe (mm)</th>
<th>Effective Trench Width (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>550</td>
<td>1125</td>
<td>2200</td>
</tr>
<tr>
<td>150</td>
<td>600</td>
<td>1200</td>
<td>2300</td>
</tr>
<tr>
<td>225</td>
<td>700</td>
<td>1350</td>
<td>2450</td>
</tr>
<tr>
<td>300</td>
<td>750</td>
<td>1500</td>
<td>2600</td>
</tr>
<tr>
<td>375</td>
<td>1050</td>
<td>1650</td>
<td>2800</td>
</tr>
</tbody>
</table>
Measure the effective trench width as stated in the Contract.

**LAYING AND BEDDING PIPES**

**DRA2.W310.8 GENERAL**

Allow the CM to inspect the trenches, bedding, pipes, joints, fittings and valves before pipelaying for drainage works starts. Inform the CM 24 hours, or such shorter period as may be agreed by the CM, before pipelaying starts in any part of the permanent work and obtain his permission to commence.

**DRA2.W320.8 INSPECTION**

Inspect pipes, joints, fittings and valves, including internal and external coatings, immediately before and after pipelaying. Inspect valves to ensure that they are in working order and are capable of being fully opened and closed. Remove all deleterious material and repair all damage immediately before and after pipelaying.

**DRA2.W330.8 CLEANLINESS**

Keep the inside of pipelines clean and free from water, dirt, stones, debris and other deleterious material. Except when pipes are being jointed, seal the open ends of pipelines with a wooden plug or by other Approved methods.

**DRA2.W340.8 FLOTATION**

Undertake measures to prevent the flotation of pipes.

**DRA2.W350.8 LAYING PIPES**

Lay, test and backfill to follow as closely as possible on the excavation of the trench and:

1. Unless otherwise permitted by the CM, lay pipelines in an uphill direction with the sockets facing uphill;
2. Lay pipes in such a manner that water will not pond in locations with zero or shallow gradients and such that the pipes will comply with the specified tolerances.

**DRA2.W360.8 BEDDING PIPES**

1. Clean surfaces on which pipes will be laid and remove any objects which may damage the pipes before they are laid;
2. Shape the bottoms of trenches on which pipes will be laid directly, to support the pipes uniformly along the length of the barrel;
3. Dig holes to prevent pipes from resting on their sockets and to allow the pipes to be jointed.

### BLANK ENDS

Mark the ends of pipes which do not terminate at a manhole, chamber, gully or structure with marker blocks, and:

1. Connect the marker block to the plug at the end of the pipe with a wire;
2. Set the marker block flush with the surface of the adjacent permanent works.

### CUTTING PIPES

### GENERAL

Cut pipes and prepare ends in accordance with the manufacturer's recommendations, using purpose made equipment recommended by the manufacturer or otherwise Approved for cutting the pipes and:

1. Cut ends of pipes square or to the correct angle;
2. Do not damage the pipe coatings;
3. Trim and chamfer the cut ends to suit the type of joint;
4. Cut pipes which terminate at the inside face of underground structure such that the end of the pipe is flush with the face.

### ELASTOMERIC JOINTS

Trim and chamfer cut ends in such a manner that elastomeric joint rings will not be damaged by them.

### CLOSING LENGTHS

Do not cut pipes requiring to be cut to form closing lengths until adjacent pipes have been laid and jointed and the length to be cut can be accurately measured.

### PRECAST CONCRETE PIPES

Cut reinforcement in precast concrete pipes which are to be cut, back flush with the concrete and protect with epoxy resin or by other Approved methods.

### JOINTING PIPES AND FITTINGS

### GENERAL

Joint pipes in accordance with the manufacturer's recommendations, using Approved equipment and materials recommended by the manufacturer and:

1. Inspect the pipes, joints, fittings and valves, including internal and external coatings, immediately before and after jointing. Remove deleterious material and repair any damage immediately before and after jointing. Clean surfaces which are to be jointed immediately before jointing and clean out pipes with clean water;
2. Ensure all joints in pipelines are watertight;
3. Ensure the width of gaps at joints are in accordance with the manufacturer's recommendations and achieved by marking the outside of the pipe, by using metal feelers or by other Approved methods. Check the position of elastomeric joint rings with by using metal feelers after jointing;

4. Protect gaps at joints in pipes, after jointing, using Approved methods, to prevent dirt, stones or other material from entering the joint.

**DRA2.W520.8 FLANGED JOINTS**

Correctly orientate bolt holes in flanged joints and joints incorporating bolted components before the bolts are tightened and:

1. Orient holes in flanged joints symmetrically about the vertical diameter, with no bolt holes on the vertical diameter;

2. Position elastomeric joint rings so they will not protrude into the bore of the pipe, temporarily fixing to the face of the flange using the minimum amount of adhesive of a type recommended by the manufacturer. Do not use jointing compound or paste for this purpose;

3. Use the correct size of bolts and nuts and lubricate the threads before tightening using the correct size of spanner. Tighten the bolts to the torque recommended by the manufacturer in diametrically opposite pairs, working around the bolt circle.

**DRA2.W530.8 FLEXIBLE COLLAR JOINTS**

1. Place elastomeric joint rings in position inside the grooves of the sleeve;

2. Mark each pipe with a location mark at a distance of half the length of the sleeve, minus 3 mm from the end;

3. Smear the ends of the pipes well with lubricant over a distance of at least 100 mm from the end of the pipe;

4. Place the sleeve on the end of the laid pipe and push home to the location mark on the pipe;

5. Place the pipe which is to be jointed to the laid pipe in the sleeve and push home to the location mark.

**DRA2.W540.8 PUSH-IN JOINTS**

Make push-in joints by smearing the elastomeric joint ring with lubricant and placing the ring in position on the spigot end of the pipe. Place the spigot in the socket of the laid pipe and push home.

**DRA2.W550.8 DETACHABLE JOINTS**

1. Place both cast iron flanges, the elastomeric joint rings and the central collar over the ends of the pipes before the pipes are placed to the required line and level, leaving a gap of between 5 mm and 6 mm between the ends of the pipes;

2. Move the flanges, elastomeric joint rings and central collar into position at the ends of the pipes, the central collar being placed centrally over the gap between the ends of the pipes before the bolts are tightened.

**DRA2.W560.8 FLANGE ADAPTERS**

Make joints by placing the flange adapter on the plain end of the pipe before tightening the bolts.
DRA2.W570.8  SOLVENT WELDED JOINTS

Make solvent welded joints by applying solvent cement to the pipes to be jointed, pushing the pipes home and:

1. Do not apply excess solvent and remove surplus cement after jointing;
2. Do not place in the trench, solvent welded pipes jointed outside the trench, until the solvent setting period recommended by the manufacturer has elapsed;
3. Additionally, do not allow any material or thing, contaminated by the solvent to remain in the pipe or in the trench.

DRA2.W580.8  ELECTROCHEMICAL INSULATION

Insulate all bolts, nuts and washers from electrochemical interaction with dissimilar metals by non-metallic washers and sleeves.

DRA2.W590.8  PROTECTION OF FLANGED JOINTS, DETACHABLE COUPLINGS AND FLANGE ADAPTERS

1. Clean the joint, including bolts and nuts, to remove all moisture, dust, oil grease and deleterious material;
2. Paint nuts and bolts with two coats of bituminous paint and coat the joint with primer;
3. Apply mastic filler in such a manner that all depressions, corners and voids between the bolts and the nuts are filled and a smooth surface is available on which to apply the anti-corrosion tape;
4. Apply at least two layers of anti-corrosion tape to all parts of the joint and to the adjacent pipe for at least 200 mm beyond each end of the joint. Apply the tape in accordance with the manufacturer's recommendations, wrapping it spirally around the joint and the pipe with at least 55% overlap per spiral;
5. Mould the tape manually after application to take up the contours of the parts being protected.

DRA2.W600.8  CAST IRON PIPES

Join pipes with either of the following:

1. Cold caulking compound:
   Carry out all pipe joints in accordance with the manufacturer's instructions and do not allow jointing material to project into the bore of pipes or fittings.

2. Flexible joints of Approved type:
   Carry out all pipe joints in accordance with the manufacturer's recommendations.

DRA2.W710.8  GENERAL

Do not repair damage to coatings and linings unless permitted by the CM. If permitted, carry out repairs using Approved materials recommended by the manufacturer.
THRUST AND ANCHOR BLOCKS

DRA2.W810.8  GENERAL
Use thrust and anchor blocks to resist forces at bends, branches and stopends in pressure pipelines, except where self anchoring joints are used.

DRA2.W820.8  EXCAVATION
Cast the bearing faces or other faces as indicated on the drawings, directly against undisturbed ground and:
1. Trim the faces of excavations to remove all loose material before concreting;
2. Carry out any excavation required for the block beyond the trench width after the pipe or fitting has been jointed;
3. Fill any excess excavation beyond the face of the block with concrete of the same grade as the block.

DRA2.W830.8  APPLYING PRESSURE
Do not apply internal pressure to the pipeline until thrust and anchor blocks have developed the specified grade strength.

BED, HAUNCH AND SURROUND

DRA2.W910.8  GRANULAR BED
1. Deposit aggregates for granular bed in the trench in layers not exceeding 150 mm thick for the complete width of the trench. Compact each layer using a plate vibrator or by other Approved methods;
2. Dig holes in the granular bed to prevent pipes resting on the sockets and to allow the pipes to be jointed. Lay the pipes directly on the granular bed without using any form of temporary support;
3. After the pipes have been jointed, deposit aggregate in layers not exceeding 150 mm thick, equally on both sides of the pipe to the level indicated on the drawings for the complete width of the trench. Compact each layer using a plate vibrator or by other Approved methods.

DRA2.W920.8  CONCRETE BED, HAUNCH AND SURROUND
1. Place polyethylene sheeting or a blinding layer on the trench bottom before concreting;
2. Support pipes at the required level by grade 20/20 as Worksection CON1, precast concrete wedges, blocks or cradles or by other Approved methods. Place one support adjacent to each end of each pipe and at intervals between these supports not exceeding 3 m. Place compressible sheeting between pipes and the supports;
3. Form flexible joints in the concrete bed, haunch and surround at flexible joints in pipelines. Place joint filler next to the flexible joint in the pipeline to extend for the complete thickness of the bed, haunch and surround;
4. Place concrete evenly over the complete width of the bed and over the complete length of the pipe being concreted up to a level of 25 mm below the underside of the pipe. Then place concrete on one side of the pipe only and work it under the pipe until the concrete spreads under it. Then place concrete equally on both sides of the pipe to the level indicated on the drawings.
**DRA2.W930.8**  **PIPES UNDER ROADS**

Protect pipes which are 1 m or less below the surface of a carriageway by concrete surround.

**DRA2.W940.8**  **FILL MATERIAL SURROUND**

Deposit fill material surround to pipelines as EAR1.W1410 and EAR1.W1420.

**TOLERANCES**

**DRA2.W1010.8**  **GENERAL**

Refer to Appendix H “Schedule of Tolerances” to this Specification.

**CONNECTIONS**

**DRA2.W1110.8**  **CONNECTIONS TO STRUCTURES**

1. Ensure that the joints between pipes and structures into which they are built are watertight. Remove protective coatings over the length to be built in and do not build pipe collars and sockets into structures;

2. Provide two flexible joints in pipelines adjacent to the outside faces of the structures into which they are built, with the distances from the outside face of the structure to the first joint and from the first joint to the second joint as specified in the following table:

<table>
<thead>
<tr>
<th>Diameter of Pipe</th>
<th>Position of First Flexible Joint from Structure</th>
<th>Distance of Second Flexible Joint</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not exceeding 450 mm</td>
<td>Minimum 150 mm</td>
<td>Maximum 500 mm or diameter of pipe whichever is less</td>
</tr>
<tr>
<td>Exceeding 450 mm but not exceeding 1050 mm</td>
<td>Minimum 150 mm</td>
<td>Maximum 900 mm - 1200 mm</td>
</tr>
<tr>
<td>Exceeding 1050 mm</td>
<td>Minimum 1500 mm - 1800 mm</td>
<td></td>
</tr>
</tbody>
</table>

3. Temporarily seal the ends of pipes which are built in to structures with a blank flange, brickwork or timber boarding as instructed by the CM. The temporary seals shall be left in position until the CM instructs their removal.

**DRA2.W1120.8**  **SADDLE CONNECTIONS TO CONCRETE AND CLAY PIPES**

Connect the saddle to concrete and vitrified clay pipes by bedding the saddle on a cement mortar bed and forming a cement mortar fillet to provide at least 50 mm cover to the base of the saddle.

**DRA2.W1130.8**  **SPRAY CUT CONNECTIONS TO CONCRETE AND CLAY PIPES**

Where pipes are to be connected to concrete or clay pipes without a Y-junction or purpose made pipe saddle:
1. Cut the pipe on the splay to form a junction such that the incoming pipe is at an angle of between 30° and 60° to the main pipe, upstream of the joint. Cut the hole in the main pipe to an elliptical shape suited to the cut end of the branch pipe. Cut the branch pipe to a length such that:
   a. The cut end of the pipe rests on the outside barrel of the main pipe; and
   b. The cut pipe does not project inside the main pipe.
2. Seal the joint between the cut pipe and the main pipe externally and unless otherwise Approved, internally flush with the main pipe, with mortar.

**DRA2.W1140.8 SADDLE CONNECTIONS TO UPVC PIPES**
Fix uPVC pipe saddles to uPVC pipes using a purpose-made mechanical clip or solvent cement of a type recommended by the manufacturer and Approved.

**DRA2.W1150.8 BRANCH PIPELINES**
Unless otherwise Approved, connect branch pipelines to main pipelines using Y-junctions of the same type and strength as the stronger of the pipes being jointed and of an angle between 30° and 45°.

**DRA2.W1160.8 RECORDING POSITIONS OF JUNCTIONS**
Measure the positions of pipe junctions relative to the manhole or structure immediately downstream and record before backfilling.

**DRA2.W1170.8 CONNECTING PIPES NOT REQUIRED FOR IMMEDIATE USE**
Seal the ends of connecting pipes not required for immediate use with a blank flange, brickwork or other Approved methods and measure and record their positions before backfilling.

**MANHOLES, CHAMBERS, GULLIES AND CHANNELS**

**DRA2.W1210.8 MANHOLES, CHAMBERS AND GULLIES**
1. Construct bases, invert and benching for precast concrete manholes using grade 20/20 as in Worksection CON1 unless otherwise specified in Drawings;
2. Set precast concrete units for manholes and chambers vertically with step irons staggered and vertically aligned above each other. Seal joints between precast units and lifting holes with cement mortar, removing any excess and pointing the joints;
3. Fill concrete surround to gullies up to the sides of the excavation;
4. Set the frames for manhole covers and gully gratings to the same level of the surrounding surface, allowing for falls and cambers, using brickwork or concrete as shown on the drawings; and
   a. Do not exceed three courses of brickwork below frames;
   b. Use concrete of a minimum grade of 20/20 as in Worksection CON1.

**DRA2.W1220.8 FILLING AROUND MANHOLES AND CHAMBERS**
1. Fill excavations around manholes and chambers in carriageways using grade 10/40 concrete as Worksection CON1;
2. Fill around other manholes and chambers with fine fill material.
DRAINAGE BELOW GROUND

DRA2.W1230.8 CONCRETE OPEN CHANNELS
Construct the top surfaces of side walls of concrete open channels to the same levels as the adjoining permanent works. Fill any excess excavation beyond the channel walls with grade 10/40 concrete, as Worksection CON1.

INSTALLING VALVES

DRA2.W1310.8 GENERAL
Install valves in accordance with the manufacturer's recommendations and in the closed position.

DRA2.W1320.8 BOX-OUTS AND REBATES
Fill box-outs and rebates for valve frames and other gaps between frames and concrete surfaces with cement mortar.

DRA2.W1330.8 CLEANING AND CHECKING
After installation, clean valves, lightly grease moving parts and check for ease of operation. Leave valves in the closed position.

DRA2.W1340.8 AIR VALVES
Provide air valves with isolating gate valves.

PIPES AND MANHOLES TO BE ABANDONED

DRA2.W1410.8 INSTALLATIONS NOT EXCEEDING 1.2M DEEP BENEATH CARRIAGEWAYS OR NOT EXCEEDING 1M DEEP BENEATH OTHER AREAS
If the top of a pipe or culvert, or the bottom of a manhole, chamber or gully, which is to be abandoned is at a depth not exceeding 1.2 m below the finished ground level for carriageways or not exceeding 1.0 m below the finished ground level for areas other than carriageways whichever is applicable, remove and dispose of the pipe, manhole, chamber or gully unless otherwise Approved. Fill the void with foam concrete, granular fill material or special fill material as directed by the CM. Recycled aggregate may be used for filling the void subject to CM's Approval.

DRA2.W1420.8 INSTALLATIONS EXCEEDING 1.2M DEEP BENEATH CARRIAGEWAYS OR EXCEEDING 1M DEEP BENEATH OTHER AREAS
If the top of a pipe or culvert, or the bottom of a manhole, chamber or gully, which is to be abandoned is at a depth exceeding 1.2 m below the finished ground level for carriageways or exceeding 1.0 m below the finished ground level for areas other than carriageways whichever is applicable:

1. Demolish the manholes, chambers and gullies to at least 1.2 m and 1.0 m below the finished ground level for carriageways and areas other than carriageways respectively unless otherwise indicated on the drawings;
2. Seal the lowest points of abandoned pipelines with concrete, bricks or other Approved methods;
3. Fill abandoned pipes, culverts, manholes, chambers and gullies with foam concrete or grout, by pumping or by gravity, starting from the lowest point on the system and continuing until all voids are completely filled.
CLEANING PIPELINES

DRA2.W1510.8  TIMING

Carry out cleaning:
1. After the pipeline has been tested;
2. After temporary works required for testing have been removed and any parts of the pipeline removed for testing have been reconnected;
3. Not more than 7 days before the pipeline is handed over.

DRA2.W1520.8  PROCEDURE

Clean pipelines by high pressure water jetting, pigging or by other Approved methods and clean and wash manholes and chambers.

INSPECTION OF PIPELINES

DRA2.W1610.8  GENERAL

Unless otherwise permitted by the CM, check the cleanliness, bore, linearity and joints of pipelines of 450 mm diameter or less by pulling a mandrel through the completed pipeline, or parts of the pipeline if so Approved. The mandrel must be 750 mm long and 12 mm less in diameter than the nominal diameter of the pipe.

DRA2.W1620.8  TEMPORARY COLOUR IDENTIFICATION

1. Provide a temporary colour band around the circumference of the open end(s) of installed underground pipes to be terminated at a manhole, chamber, gully or structure which cannot be cast before or when the pipes are laid. The colour and width of the band are as follows:

<table>
<thead>
<tr>
<th>Type of Drain Pipe</th>
<th>Colour</th>
<th>Width of Colour Band</th>
</tr>
</thead>
<tbody>
<tr>
<td>Storm water</td>
<td>White</td>
<td>75 mm</td>
</tr>
<tr>
<td>Waste water</td>
<td>Yellow</td>
<td>75 mm</td>
</tr>
<tr>
<td>Foul water</td>
<td>Green</td>
<td>75 mm</td>
</tr>
</tbody>
</table>

2. Paint identification colour mark on the top and the edge of the access opening of the manhole and back inlet gully trap to which one or more pipe(s) cannot be connected when the manhole is cast. The colour and size of the mark are as follows:

<table>
<thead>
<tr>
<th>Type of Manhole / Back Inlet Gully Trap (B.I.G.T.)</th>
<th>Colour</th>
<th>Size of Each Colour Mark</th>
</tr>
</thead>
<tbody>
<tr>
<td>Storm water (manhole)</td>
<td>White</td>
<td>200 mm x 100 mm</td>
</tr>
<tr>
<td>Foul water (manhole)</td>
<td>Green</td>
<td>200 mm x 100 mm</td>
</tr>
<tr>
<td>Storm water (B.I.G.T.)</td>
<td>White</td>
<td>200 mm x 100 mm</td>
</tr>
<tr>
<td>Waste water (B.I.G.T.)</td>
<td>Yellow</td>
<td>200 mm x 100 mm</td>
</tr>
</tbody>
</table>
CLOSED CIRCUIT TELEVISION (CCTV) INSPECTION

DRA2.W1710.8 **SCOPE**

Carry out CCTV inspection for the pipelines as listed below, in accordance with the remaining clauses in this sub-section:

1. Horizontal underground pipelines;
2. Vertical and horizontal pipelines up to first domestic floor level of the buildings including the easy bends underground and above ground;
3. Manholes, gullies, inspection chambers and catchpits;
4. Pipelines as shown on Drawings.

DRA2.W1720.8 **SUBMISSIONS**

At least 28 days before the inspection starts, submit the following particulars of the proposed procedure for CCTV inspections to the CM:

1. Name of the CCTV survey contractor and experience of his staff delegated to carry out or supervise the inspections;
2. Details of equipment;
3. Details of the format of the report;
4. Examples of video films, compact disc - recordable and photographs obtained from inspections employing the same equipment.

DRA2.W1730.8 **EQUIPMENT**

Provide the following equipment:

1. A CCTV colour camera with integral lighting unit. The camera must be of a type designed and constructed for the specified purpose, capable of operating in 100% relative humidity and fitted with a rotating mirror for complete circumferential viewing. The system must be capable of producing an accurate, clear, high quality picture of the entire periphery of the pipe on the monitor screen and recording tape. The camera and lighting unit must be mounted on a self-propelled crawler or on skids linked to a manual or power operated winch;
2. A monitor screen which displays the camera view during the inspection and which is housed in covered accommodation with facilities for inspection by the CM and others;
3. A screen writer which displays, on the monitor screen, details of the inspection, including the date, location, pipe material, pipe diameter, direction of view and comments on the condition of the pipe;
4. A measuring device which displays the camera location automatically on the monitor screen and is capable of measuring to within an accuracy of 0.1% of the length of the pipeline or to ±0.3 m, whichever is the greater;
5. A control unit which controls the camera movement, lighting intensity, focusing and recording;
6. A video recording system approved by the CM to record the inspection and information displayed on the monitor screen;
7. A digital camera capable of producing photographs with a superimposed date.
DRA2.W1740.A PROCEDURE

1. Move the camera through the pipeline at the following speed:
   a. Not exceeding 0.1 m/s for pipes of diameter less than or equal to 200 mm;
   b. Not exceeding 0.15 m/s for pipes of diameter exceeding 200 mm; or
   c. Such speed as agreed by the CM to enable all details to be extracted from the
      video recording system.

2. If the camera cannot pass through the complete pipeline in one operation, carry out
   the inspection from both ends of the pipeline;

3. Stop the camera whenever instructed to do so by the CM to allow his inspection;

4. Ensure that the video recording system is operated during the complete inspection to
   provide a continuous record of the inspection and information on the monitor screen.
   Record in the video record a location signboard supported at each end of the
   pipeline;

5. Take photographs of the monitor screen for continuing and point defects, blocked
   areas of pipelines and whenever instructed;

6. Submit a duplicate copy of the video and a preliminary report recording the work
   done of the day and defects identified to the CM at end of each day;

7. Rectify all identified blocked or defective pipelines. Re-inspect the rectified
   pipelines with video record.

DRA2.W1750.8 RECORDING RESULTS

Keep a record of the inspections on Site and submit 3 copies of the report to the CM,
within 7 days of the completion of the inspection and same for the re-inspection,
containing the following details:

1. A key map showing the pipelines inspected and associated manholes, chambers and
   structures;

2. Tables listing details of inspection, including date, location, pipe material, pipe
   diameter, chainage, manholes, junctions and other features and the condition of the
   pipes and joints, illustrated by a coding system in accordance with the 'Manual of
   Sewer Condition Classification' 4th Edition (2003), published by the UK National
   Water Council;

3. A summary showing the number, position and type of defects in each pipeline
   inspected. The summary shall include photographs to illustrate degree of mortar
   loss, size of a crack/fracture, size of a void or any other quantifiable defect. A
   suitable metric scale shall be included and be clearly visible and in focus within the
   photograph.

DRA2.W1760.8 VIDEO AND PHOTOGRAPHS

Submit 3 copies, to the CM, at the same time as the report:

1. Video providing a continuous record of the inspection and information on the
   monitor screen. The media shall be of high quality, new and unused before
   recording and shall be of a digital format (DVD+/R or CD-R) or Video Home
   System (VHS) format, subject to approval of the CM; and

2. 3R size photographs of the monitor screen, including the date and the chainage,
   mounted in photograph albums.
PROTECTION

DRA2.W1805.8 HOT DIP GALVANIZING

1. Unless otherwise specified, galvanized coatings to be applied by hot-dip galvanizing to be in accordance with BS EN ISO 1461:2009 with minimum mean coating thickness of 45 microns to 85 microns depending on thickness of article as stipulated in Table 3 of BS EN ISO 1461:2009, unless otherwise specified. The coating thickness to comply with the following Table:

<table>
<thead>
<tr>
<th>Article Thickness</th>
<th>Minimum Mean Coating Thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt; 6 mm</td>
<td>85 µm</td>
</tr>
<tr>
<td>&gt; 3 mm to ≤ 6 mm</td>
<td>70 µm</td>
</tr>
<tr>
<td>≥ 1.5 mm to ≤ 3 mm</td>
<td>55 µm</td>
</tr>
<tr>
<td>&lt; 1.5 mm</td>
<td>45 µm</td>
</tr>
</tbody>
</table>

2. Unless Approved, all components are to be galvanized after welding, drilling and cutting operations are complete;

3. All hot dip galvanizing, including the galvanizing work specified in other Worksections, is to be carried out by galvanizers with ISO 9001 certification. Submit the name of galvanizer for Approval;

4. Submit original invoice/delivery note and galvanizing certification for each delivery. These documents shall include the following information:
   a. Project title/number;
   b. Name of galvanizer;
   c. Types and dimensions of articles;
   d. Quantities.

5. Attach a durable identification tape to each batch of galvanized articles indicating the project title, galvanizing certification number and name of galvanizer.

DRA2.W1810.8 ANTI-CORROSION TAPE

Apply anti-corrosion tape to all valves, flanged joints, slip-on couplings and flange adapters.

WORKS OUTSIDE SITE BOUNDARY

DRA2.W1910.8 APPROVED CONTRACTOR FOR PUBLIC WORKS

Underground drainage works required to be carried out by a contractor or sub-contractor who is on the current List of Approved Contractors for Public Works for Roads and Drains are specified in Project Specific Specification.

DRA2.W1920.8 SPECIFICATION

Carry out the works specified under DRA2.W1910 in accordance with Sections 5, 6, 13, 14, 16, 19 and 23 of the Hong Kong Government General Specification for Civil Engineering Works (2006 Edition) and its amendments published 42 days prior to the date for the return of tenders unless otherwise specified.

DRA2.W1930.8 INSPECTION

1. Initial Site Inspection
a. Notify the CM to arrange with Drainage Services Department for an initial site inspection of the works before backfilling to pipelines or covering up. Allow the CM to give one week advance notice by fax for this inspection.

2. Handing Over Inspection
   a. Notify the CM to arrange with Drainage Services Department for a handing over inspection when all works for the drainage connections are completed and ready for handing over. Allow the CM to give one week advance notice by fax for this inspection.

DRA2.W1940.8 RECORD DRAWINGS AND TEST REPORTS

Provide the following as-constructed records to the CM for submitting to Drainage Services Department:

1. Material quality records (brand name, grade, class etc.);
2. Acceptance test records (water test etc.);
3. Colour closed circuit television survey report; and
4. As-built record drawings.
TESTING

GENERAL

DRA2.T010.8 SUBMISSIONS
At least 14 days before the start of testing, submit the following details relating to pipeline testing to the CM:

1. Name of testing laboratory accredited by HOKLAS for the relevant tests, if available;
2. Test equipment and method of setting up the equipment;
3. Calibration certificates for pressure gauges;
4. Procedure for carrying out the test;
5. Programme for testing.

DRA2.T020.8 QUALITY ASSURANCE SCHEMES
Tests stated in this Worksection may be reduced in number as agreed by the CM if such materials or articles delivered to Site satisfy the following conditions:

1. To bear the stamps of the registered certification trade mark of the BA Institution, known as the BS Kitemark; or
2. To be covered by a manufacturer's quality assurance scheme stated in the Contract or approved by the CM.

TESTING PIPES

DRA2.T110.8 DEFINITION OF 'BATCH'
A batch of pipes or fittings is any quantity of pipes or fittings of the same type and nominal diameter, manufactured by the same manufacturer, covered by the same certificates as stipulated under DRA2.M1010 delivered to the Site.

DRA2.T120.8 SAMPLES
Provide one sample of pipe or fitting from each 50 pipes or fittings or part thereof in a batch unless:

1. Such materials or articles delivered to Site satisfy the conditions stipulated in DRA2.T020 (1) & (2); and
2. Smaller quantities are agreed by the CM.

DRA2.T130.8 TESTING PROCEDURES
Unless otherwise Approved, test each sample of pipes and fittings in accordance with the relevant British Standard, as follows:

1. Concrete pipes and fittings: BS 5911-1:2002 for nominal sizes of 225mm or above; and BS 5911-100:1988 for nominal size of 150mm;
2. Vitrified clay pipes, fittings and joints: BS 65:1991 (2003);
3. Ductile iron pipes and fittings: BS 4772:1988;
5. uPVC pipes for industrial purposes: BS 3506:1969;
6. uPVC underground drain pipes and fittings: BS 4660:2000;
7. uPVC pipes and fittings for gravity sewers: BS 5481:1977 (1989);

**DRA2.T140.8 NON-COMPLIANCE**

1. If the result of any test required in accordance with the relevant British Standard does not comply with the specified requirements for the test, provide one additional sample from the same batch and carry out additional tests for the property;
2. The batch will be considered as not complying with the specified requirements for the property if the result of any additional test does not comply with the specified requirements for the property.

**TESTING AGGREGATES FOR GRANULAR BED**

**DRA2.T210.8 DEFINITION OF 'BATCH'**

Any quantity of aggregates for granular bed of the same type, produced at the same time, in the same place, covered by the same certificates and delivered to the Site at any one time.

**DRA2.T220.8 SAMPLES**

Unless otherwise permitted by the CM, provide one sample of aggregates for granular bed from each batch delivered to Site as follows:

1. Size: 40 kg;
3. With a moisture content representative of the moisture content of the batch.

**DRA2.T230.8 TEST FOR PARTICLE SIZE DISTRIBUTION**

Test each sample in accordance with BS 812:Section 103.1:1985.

**DRA2.T240.8 TEST FOR TEN PERCENT FINES VALUE**

Test each sample in accordance with BS 812:Part 111:1990.

**DRA2.T250.8 TEST FOR COMPACTION FRACTION VALUE - EQUIPMENT**

Provide the following equipment:

1. A steel open-ended cylinder, 150 mm internal diameter by 250 mm high, with a wall thickness of not less than 3.5 mm;
2. A steel rammer of 40 mm diameter weighing approximately 1 kg;
3. A steel rule calibrated to 1 mm.

**DRA2.T260.8 TEST FOR COMPACTION FRACTION VALUE - PROCEDURE**

1. Place the sample on a clean surface and divide by quartering or by using a riffle box to obtain a specimen weighing approximately 10 kg;
2. Place the cylinder on a firm, level surface and fill, without tamping, with material taken from the sample. Strike off surplus material level with the top of the cylinder and clear from the area around the cylinder;

3. Lift the cylinder clear of the contents and place it alongside the material;

4. Replace approximately one quarter in the cylinder and compact using the rammer until no further compaction can be achieved. Repeat this procedure for each of the remaining three quarters of the material and compact the top of the material as level as possible;

5. Measure the distance from the top of the cylinder to the top surface of the material to the nearest 1 mm.

**DRA2.T270.8 TEST FOR COMPACTION FRACTION VALUE - CALCULATION**

Calculate the compaction fraction value of the material from the following equation:

\[
\text{Compaction fraction value} = \frac{d}{h}
\]

where:

- \(d\) is the distance from the top of the cylinder to the top surface of the material (mm);
- \(h\) is the height of the cylinder (mm).

**DRA2.T280.8 TEST FOR COMPACTION FRACTION VALUE - RESULTS**

Report the following:

1. Identification of sample;
2. The compaction fraction value to the nearest 0.01;
3. The source and type of material;
4. Date of the test;
5. That the test method used was in accordance with this specification.

**DRA2.T290.8 COMPLIANCE CRITERIA**

The results of tests for compaction fraction value tests must comply with the following requirements:

1. Maximum compaction fraction value for bed for pipes not exceeding 300 mm nominal diameter: 0.3;
2. Maximum compaction fraction value for bed for pipes exceeding 300 mm nominal diameter: 0.15.

**TESTING PRECAST CONCRETE UNITS FOR MANHOLES, CHAMBERS AND GULLIES**

**DRA2.T310.8 DEFINITION OF 'BATCH'**

Any quantity of precast concrete units for manholes, chambers or gullies of the same type and size, manufactured by the same manufacturer, covered by the same certificates as stipulated under DRA2.M1040 (1) delivered to the Site.
DRA2.T320.8 SAMPLES

Unless otherwise permitted by the CM, provide one sample of precast units for manholes, chambers or gullies from each 50 precast concrete units, or part thereof, in a batch.

DRA2.T330.8 METHODS OF TEST

Unless otherwise permitted by the CM, test each sample of the precast concrete units for manholes, chambers and gullies in accordance with the relevant British Standard as follows:

1. Precast concrete units for manholes: BS 5911-3:2002;

DRA2.T340.8 NON-COMPLIANCE

1. If the result of any test required in accordance with the relevant British Standard does not comply with the specified requirements for the test, provide one additional sample from the same batch and carry out additional tests for the property;
2. The batch will be considered as not complying with the specified requirements for the property if the result of any additional test does not comply with the specified requirements for the property.

TESTING MANHOLE COVERS, GULLY GRATINGS AND KERB OVERFLOW WEIRS

DRA2.T410.8 DEFINITION OF 'BATCH'

Any quantity of manhole covers, gully gratings and kerb overflow weirs of the same type, manufactured by the same manufacturer, covered by the same certificates as stipulated under DRA2.M1040 (3) delivered to the Site.

DRA2.T420.8 SAMPLES

Provide one sample of manhole covers, gully gratings or kerb overflow weirs from each 20 covers, gratings or weirs, or part thereof in a batch.

DRA2.T430.8 PROCEDURE

Weigh each sample of manhole covers, gully grating and kerb overflow weirs and load test manhole covers and, gully gratings by the method described in the remainder of this Sub-section, to the loads stated in the tables in clause DRA2.M650.

DRA2.T440.8 EQUIPMENT FOR LOAD TESTING

Provide the following equipment:

1. The manufacturer's recommended for the manhole cover or gully grating or a fabricated test frame of an Approved type which will simulate the normal conditions of use of the cover or grating;
2. A circular hardwood bearing block faced with hard rubber or other resilient material, the diameter of which is as stated in the relevant table in clause DRA2.M650 and which is sufficiently rigid to ensure that the load is equally distributed over the whole area of the block;
3. Test loads;
4. Equipment for measuring the loads applied, readable and accurate to 0.05t or 2% of the specified test load, whichever is greater.

**DRA2.T450.8 LOAD TEST PROCEDURE**

1. Rigidly support the full bearing area of the frame;
2. Place the cover or grating in the frame and place the bearing block centrally on the cover or grating;
3. Apply the specified test load without shock;
4. Maintain the specified test load for at least 30 seconds and then remove it.

**DRA2.T460.8 LOAD TEST RESULTS**

Report the following:

1. Identification of sample;
2. The load applied to the nearest 0.05t or 2% of the specified test load, whichever is the greater;
3. Details of any fracture or cracks;
4. That the test method used was in accordance with this specification.

**DRA2.T470.8 COMPLIANCE CRITERION FOR RESISTANCE TO FRACTURE OF COVERS AND GRATINGS**

Manhole covers and gully gratings must withstand the specified test load without fracture or cracking.

**DRA2.T480.8 NON-COMPLIANCE FOR MASS OF COVERS, GRATINGS AND WEIR**

If any manhole cover, gully grating or kerb overflow weir does not comply with the specified requirements for mass:

1. Weigh every cover, grating and weir in the batch to determine its mass;
2. Do not use any cover, grating and weir not complying with the specified requirement for mass in the permanent work.

**DRA2.T490.8 NON-COMPLIANCE FOR RESISTANCE TO FRACTURE OF COVERS AND GRATINGS**

If any manhole cover or gully grating does not comply with the specified requirements for resistance to fracture:

1. Provide two additional samples from the same batch and test to determine their resistance to fracture;
2. The batch will be considered as not complying with the specified requirements for resistance to fracture if the result of any additional test does not comply with the specified requirements for resistance to fracture.

**TESTING GRAVITY PIPELINES**

**DRA2.T510.8 TESTS ON SEWAGE PIPELINES GENERALLY**

Test gravity pipelines for sewage by the methods and at the times stated in the following table:
### Testing Gravity Sewage Pipelines

<table>
<thead>
<tr>
<th>Diameter of Pipe</th>
<th>Time of Test</th>
<th>Method of Test</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not exceeding 900 mm</td>
<td>As sub-clause (1) Note</td>
<td>Water test or air test</td>
</tr>
<tr>
<td></td>
<td>As sub-clause (2)</td>
<td>Water test or air test</td>
</tr>
<tr>
<td></td>
<td>As sub-clause (3)</td>
<td>Infiltration test</td>
</tr>
<tr>
<td>Exceeding 900 mm</td>
<td>As sub-clause (1)</td>
<td>Visual inspection</td>
</tr>
<tr>
<td></td>
<td>As sub-clause (2)</td>
<td>Water test or air test</td>
</tr>
<tr>
<td></td>
<td>As sub-clause (3)</td>
<td>Infiltration test</td>
</tr>
</tbody>
</table>

Note: Applicable to pipe section laid in a depth > 4.5 m. Pipe sections laid in a depth ≤ 4.5 m are not required to be tested at this stage with the specified method.

1. After the pipes have been jointed and the bedding has been placed and immediately before haunch or surround is placed or fill material is deposited;
2. After haunch and surround has been placed and fill material has been deposited and compacted;
3. Test to the following details:
   a. Not more than 7 days before the pipeline is to be handed over to other departments as specified by the CM; or
   b. Not more than 7 days before the pipeline is to be handed over when required by the CM pursuant to BS 8301:1985, clause 25.7.2.

### DRA2.T520.8 TESTS ON SURFACE WATER PIPELINES GENERALLY

Test gravity pipelines for surface water by the methods and at the times stated in the following table:

<table>
<thead>
<tr>
<th>Diameter of Pipe</th>
<th>Time of Test</th>
<th>Method of Test</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not exceeding 900 mm</td>
<td>As sub-clause (2)</td>
<td>Water test or air test</td>
</tr>
<tr>
<td>Exceeding 900 mm</td>
<td>As sub-clause (1)</td>
<td>Visual inspection</td>
</tr>
<tr>
<td></td>
<td>As sub-clause (2)</td>
<td>Water test or air test</td>
</tr>
</tbody>
</table>

1. After the pipes have been jointed and the bedding has been placed and immediately before haunch or surround is placed or fill material is deposited;
2. After haunch and surround has been placed and fill material has been deposited and compacted.

### DRA2.T530.8 WATER AND AIR TESTS GENERALLY

Carry out the tests on the complete pipeline between manholes, chambers and structures and do not test pipelines in parts unless Approved or unless the specified test pressure would otherwise be exceeded. Test short branch pipelines with the main pipeline and long branch pipelines separately.

### DRA2.T540.8 INFILTRATION TESTS GENERALLY

Carry out tests on the complete pipeline between manholes, chambers and structures, including manholes, chambers and branches within the system unless otherwise agreed by the CM.
DRAINAGE BELOW GROUND

DRA2.T550.8  
**EQUIPMENT**

Provide the following:

1. Expanding disc stoppers, air bags or other Approved methods of sealing pipes;
2. Struts and wedges;
3. Force pump for water test;
4. Standpipe for water test;
5. Measuring vessel for water test, readable and accurate to 0.01 litre;
6. U-tube for air test;
7. Trolleys to obtain access inside pipelines for visual inspections and mechanical fans to ensure that an adequate air supply is available. Provide engine driven fans with a flexible exhaust or other methods of keeping exhaust fumes clear of the fresh air intake.

DRA2.T560.8  
**PREPARATION**

Before tests and inspections:

1. Remove debris and water from the pipeline;
2. Seal openings to the pipeline using expanding disc stoppers, air bags or other Approved methods and secure seals against movement.

DRA2.T570.8  
**WATER TEST PROCEDURE**

1. Test pipe of diameter up to and including 300 mm in accordance with BS 8301:1985, clause 25.6.2; or
2. For pipe of diameter larger than 300 mm or works to be handed over to other departments as specified by the CM, carry out the test as follows:
   a. Fill the pipeline with water and keep it filled for two hours before testing starts to allow absorption to take place;
   b. Apply a test pressure at the standpipe of 1.2 m head above the soffit of the pipe, at the high end, and maintain it for 30 minutes. Do not exceed a 6 m head of water at the invert of the low end of the pipe;
   c. Top up the head of water at the standpipe at 5-minute intervals during the test and fill to the specified head at the end of the test period. Measure the amounts of water added to the standpipe using the measuring vessel;
   d. Measure the leakage of water from the pipeline by the amount of water added to maintain the specified head of water.

DRA2.T580.8  
**WATER TEST CALCULATION**

Calculate the permitted leakage of water from the pipeline from the equation:

\[
\text{permitted leakage} = d \times l \times \frac{t}{60} \text{ litre}
\]

where:

- \(d\) is the internal diameter of the pipe (m);
- \(l\) is the length of the pipeline tested (m);
- \(t\) is the test period (min).
DRA2.T590.8  AIR TEST PROCEDURE

Carry out the test as follows:

1. Pump air into the pipeline until a test pressure of slightly more than 100 mm is registered on a U-tube manometer connected to the pipeline. Allow five minutes for the stabilisation of the air temperature and then adjust the air pressure to 100 mm of water;

2. Read the pressure from the U-tube at the end of a five-minute period, without further pumping.

DRA2.T600.8  VISUAL INSPECTION

Examine the inside of the pipeline visually and record infiltration or damage to pipes.

DRA2.T610.8  INFILTRATION TEST PROCEDURE

1. Test in accordance with BS 8301:1985, clause 25.7.6; or

2. Test in accordance with BS 8005:Part 1:1987, clause 13.6 for works to be handed over to other departments as specified by the CM.

DRA2.T620.8  REPORTING OF RESULTS

Report the following:

1. The nominal internal diameter of the pipe;

2. The location and the length of the pipeline tested to the nearest 0.3 m;

3. The test pressure applied during the water test to the nearest 0.01 m and during the air test to the nearest 1 mm head of water;

4. The test period to the nearest 1 minute;

5. The leakage and permitted leakage for the water test to the nearest 0.1 litre;

6. The amount of infiltration for the infiltration test to the nearest 0.1 litre;

7. Details of any discernible leakage of water from the pipe or from any joint during the water test;

8. That the test method used was in accordance with this specification.

DRA2.T630.8  COMPLIANCE CRITERIA

The results of tests on gravity pipelines must comply with the following requirements:

1. The leakage of water from the pipeline, determined by the water test must not exceed the permitted leakage calculated in accordance with clause DRA2.T580;

2. There must be no discernible leakage from the pipe or from any joint during the water test;

3. The air pressure must remain above 75 mm head of water at the end of the air test;

4. There must be no infiltration or damage to the pipes or joints as determined by the visual inspection.

DRA2.T640.8  NON-COMPLIANCE

If the result of any test on gravity pipelines does not comply with the specified requirements for the test, investigate the reason and carry out the necessary Approved replacement or remedial work. Retest the pipeline.
PRESSURE PIPELINES

DRA2.T710.8 TIMING OF TESTS

1. Test the pipeline at the following times:
   a. After the pipes have been jointed and the bedding has been placed and immediately before haunch or surround is placed or fill material is deposited;
   b. After haunch and surround has been placed and fill material has been deposited and compacted.

2. Do not carry out the tests covered in sub-clause (1)(a) above on parts of a pipeline unless permitted by the CM or unless the specified test pressure would otherwise be exceeded. Carry out the test covered by sub-clause (1)(b) above on the complete pipeline.

DRA2.T720.8 TEST PRESSURES

Carry out tests to 1.5 times the maximum working pressure in the part of the pipeline being tested unless otherwise specified in the Drawings.

DRA2.T730.8 SIMULTANEOUS TESTING

Do not carry out testing on more than one pipeline in the same trench.

DRA2.T740.8 ALTERNATIVE TEST METHODS

Do not substitute tests on individual joints for the tests required by this specification unless permitted by the CM, in which case the CM will approve the method of testing and the compliance criteria.

DRA2.T750.8 EQUIPMENT

Provide the following:

1. Blank flanges or caps;
2. Struts and wedges;
3. Temporary concrete blocks or other anchors;
4. Force pump;
5. Pressure gauge, readable and accurate to 0.01 m head of water and either the conventional circular type of at least 300 mm diameter or a digital indicator type;
6. Measuring vessel, readable and accurate to 0.01 litre.

DRA2.T760.8 PROCEDURE

Carry out the test as follows:

1. Clean pipes and valves and check the operation of the valves. Isolate air valves;
2. Fix blank flanges or caps to the ends of the pipeline or to the part of the pipeline to be tested. Do not make tests against closed valves unless otherwise Approved;
3. Secure blank flanges and end caps and closed valves against which tests are to be made with struts and wedges against temporary concrete blocks or other anchors. Ensure the blocks are completed and sufficiently hardened and that thrust and anchor blocks, pipe straps and other devices required to prevent movement of the pipes and fittings are completed, before testing begins;
4. Fill the pipeline with water and remove all the air, taking measures during filling to provide free outlets for air and to prevent water hammer;

5. Increase the pressure in the pipeline to working pressure and allow it to remain filled at this pressure for 2 hours to allow absorption to take place and to achieve conditions which are as stable as practicable;

6. Increase the pressure in the pipeline slowly by pumping water into the pipeline using a force pump until the specified test pressure is reached at the lowest part of the pipeline being tested;

7. Maintain the specified test pressure in the pipeline, using the force pump if necessary, for a period of at least one hour;

8. At the end of the one hour period, increase the pressure, if necessary, to the specified test pressure and disconnect pumps and water supply points;

9. Leave the pipeline in this condition for a test period of one hour, no water being allowed to enter the pipeline during the test period;

10. Record the pressure in the pipeline at the end of the test period;

11. Reconnect the pumps and water supply points and increase the pressure to the specified test pressure;

12. Draw water from the pipeline until the pressure in the pipeline is the same as at the end of the test period. Measure the leakage of water from the pipeline as the amount of water drawn off.

**DRA2.T770.8**

**CALCULATION**

1. Calculate the average test pressure (P) as the average of the specified test pressure and the pressure at the end of the test period;

2. Calculate the permitted leakage of water from the pipeline during the pressure test from the equation:

   \[
   \text{permitted leakage} = d \times l \times \frac{t}{120} \times P \text{ litre}
   \]

   where:

   - d. is the nominal internal diameter of the pipe (m);
   - l. is the length of the pipeline tested (km);
   - t. is the test period (hr);
   - P. is the average test pressure (m).

**DRA2.T780.8**

**REPORTING OF RESULTS**

Report the following:

1. The nominal internal diameter of the pipe;

2. The location and length of the pipeline to the nearest 0.3 m;

3. The test period to the nearest one minute;

4. The specified test pressure to the nearest 0.01 m head of water;

5. The pressure at the end of the test period to the nearest 0.01 m head of water;

6. The average test pressure to the nearest 0.01 m head of water;

7. The leakage and permitted leakage to the nearest 0.1 litre;
8. Details of any discernible leakage of water from the pipeline during the test;
9. That the test method used was in accordance with this specification.

**DRA2.T790.8 COMPLIANCE CRITERIA**

The results of tests on pressure pipelines must comply with the following requirements:

1. The leakage of water from the pipeline, determined by the pressure test, must not exceed the permitted leakage calculated in accordance with clause **DRA2.T770**;
2. There must be no discernible leakage of water from the pipeline or from any joint during the pressure test.

**DRA2.T800.8 NON-COMPLIANCE**

If the result of any test on pressure pipelines does not comply with the specified requirements for the test, investigate the reason and carry out the necessary Approved replacement or remedial work. Retest the pipeline.

**SUB-BASES, BITUMINOUS ROADWAYS AND RELATED FOOTPATHS**

**DESIGN**

**DESIGN PARAMETERS**

**EXT1.D010.8**  
**SUB-BASE AND BITUMINOUS ROADBASE MATERIALS**

1. Sub-base and bituminous roadbase materials to be recipe mixes. Laboratory design mixes other than those for sub-base and bituminous roadbase materials must be made and tested as part of the design procedure at an Approved laboratory;

2. Unless otherwise permitted by the CM, carry out mix designs and associated tests in the presence of the CM. Notify the CM at least 7 days, or a shorter period agreed with the CM, before carrying out the mix designs.

**EXT1.D020.8**  
**BITUMINOUS MATERIALS**

1. Consisting of:
   a. Coarse and fine aggregates as EXT1.M410;
   b. Filler as EXT1.M420; and
   c. Bitumen as EXT1.M430.

2. With particle size distribution within the limits stated in the table to EXT1.M410;

3. With properties as stated in the following table:

<table>
<thead>
<tr>
<th>Properties of designed bituminous materials</th>
<th>Type of bituminous material</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Base course</td>
</tr>
<tr>
<td>Nominal maximum aggregate size (mm)</td>

</tr>
<tr>
<td>Minimum Marshall stability (kN)</td>
<td>10.0</td>
</tr>
<tr>
<td>Maximum flow value (mm)</td>
<td>4.0</td>
</tr>
<tr>
<td>Minimum voids in mineral aggregate as a percentage of total bulk volume</td>
<td>12.5</td>
</tr>
<tr>
<td>Air voids in mix as a percentage of total bulk volume</td>
<td>3.0 - 5.0</td>
</tr>
</tbody>
</table>

4. Design bituminous materials of all aggregate sizes, other than bituminous roadbase material, in accordance with the Marshall Method of Mix Design stated in the Asphalt Institute Handbook ‘MS - 2 Mix Design Methods for Asphalt Concrete and other Hot-mix Types’ 1984 with modifications only if agreed by the CM. The compaction standard must be 75 blows per side;
5. Ensure design procedures for bituminous friction course material comply with sub-clause (4) except for mixing and compaction temperatures that must be consistent with bitumen viscosities of $900 \pm 100$ centistokes and $2000 \pm 200$ centistokes respectively.
MATERIALS

DEFINITIONS

EXT1.M010.8 NORMINAL MAXIMUM AGGREGATE SIZE
The smallest BS sieve size for which the upper limit of the percentage of the aggregate by mass passing is 100%.

SUBMISSIONS

EXT1.M110.8 DETAILS OF AGGREGATES, FILLER AND BITUMEN FOR BITUMINOUS MATERIALS
1. Submit details, to the CM, of the following particulars of the aggregates filler and bitumen proposed for use in bituminous materials:
   a. A certificate from the manufacturer for each nominal maximum aggregate size showing the source of the aggregate and confirming that the aggregate complies with the requirement stated in this Specification;
   b. A certificate from the manufacturer for each type of filler showing the manufacturer's name, the date and place of manufacture and confirming that the filler complies with the requirements stated in this Specification and including test reports for particle size distribution; and
   c. A certificate from the bitumen manufacturer, showing the manufacturer's name, the date and place of manufacture and confirming that the bitumen complies with the requirements stated in this Specification, including a temperature-viscosity relationship for the bitumen, and including test reports for:
      i. Relative density;
      ii. Softening point;
      iii. Penetration;
      iv. Ductility;
      v. Retained penetration after thin film oven test;
      vi. Solubility;
      vii. Viscosity;
      viii. Loss on heating;
      ix. Wax content.
2. Submit particulars, including certificates, to the CM at the time stated in EXT1.M120 (3);
3. Submit, at intervals agreed with the CM, further certificates and test reports showing material's compliance with this Specification;
4. Test reports shall show the properties of aggregates, filler and bitumen for bituminous materials as determined by the methods stated in the following table:

<table>
<thead>
<tr>
<th>Testing Aggregates, Filler and Bitumen for Bituminous Materials</th>
</tr>
</thead>
<tbody>
<tr>
<td>Material</td>

</tr>
</tbody>
</table>
## EXT1.M120.8 DETAILS OF MIXES FOR SUB-BASE AND BITUMINOUS MATERIALS

1. Submit details to the CM of the following particulars for the sub-base material and bituminous roadbase materials:
   a. Source and type of aggregates;
   b. Grading details in tabular and graphical form;
   c. Details of each mixing plant proposed for use.

2. In addition submit, to the CM, details of the following particulars for bituminous materials:
   a. Certified copies of work sheets for mix designs that include the relative density of the mixed aggregates;
   b. Source of bitumen; and
   c. If requested by the CM, past test records of the same mix produced in the same plant.

3. Submit particulars to the CM at least 21 days before
   a. Trial areas are constructed; or
   b. The mix is placed in the permanent work if trial areas are not required.

## EXT1.M130.8 PARTICULARS OF RECYCLED SUB-BASE MATERIAL

Submit details to the CM of the following particulars for the recycled sub-base material:

1. Details of the recycling plant, and test results for:
   a. Ten percent fines value;
   b. Soundness value;
   c. CBR value;
   d. Content of contaminant in percentage by mass;
   e. Water-soluble sulphate content;
f. Organic material content; and
2. Grading details in tabular and graphical form.

**EXT1.M140.8 DETAILS OF SUPPLIER**
Submit the name of the supplier and the location of each plant from which it is proposed to obtain sub-base material and bituminous materials to the CM at the time stated in **EXT1.M120 (3)**.

**EXT1.M150.8 METHOD OF LAYING AND COMPACTING**
Submit to the CM
1. The following particulars of the proposed methods of laying and compacting sub-bases and bituminous materials
   a. Details of constructional plant; and
   b. Programme and rate of working.
2. Particulars at the time stated in **EXT1.M120 (3)**.

**SAMPLES**

**EXT1.M210.8 SUB-BASE MATERIAL, AGGREGATE FILLER AND BITUMEN**
Submit one sample of each type of sub-base material, and one sample of each type of aggregate, filler and bitumen for bituminous material to the CM at the same time as submission of particulars.

**SUB-BASE MATERIALS**

**EXT1.M310.8 SUB-BASE**
Crushed rock with the properties stated in the following table. Sub-base material passing the 425 micron BS Test Sieve, when tested as **EXT1.T130 (4)**, shall be non-plastic.

<table>
<thead>
<tr>
<th>Properties</th>
<th>BS Test Sieve</th>

<tr>
<td></td>
<td>75 microns</td>
<td>0 - 10</td>
</tr>
<tr>
<td>Ten percent fines value</td>
<td></td>
<td>&gt; 50 kN</td>
</tr>
</tbody>
</table>

**EXT1.M320.8 RECYCLED SUB-BASE**
1. Recycled sub-base material shall be crushed rock, crushed concrete or clean crushed inert demolition material and may contain up to 12.5% by mass of natural sand, which passes the 5 mm BS test sieve. The material may lie within the grading limits of the following Table, and not be gap graded:
2. The material shall have a ten percent fines value of 50 kN or more when tested in accordance with EXT1.T140 (3);

3. The material passing the 425 μm BS test sieve shall be non-plastic when tested in accordance with EXT1.T140 (4);

4. The aggregate shall be considered suitable if it has a soundness value greater than 65;

5. The material shall have a water-soluble sulphate content of less than 1.9 g of sulphate (expressed as SO₃) per litre, if used within 500 mm of cement-bound material, concrete pavements, concrete structures or concrete products;

6. The material shall have a minimum laboratory CBR value of 30% or such other higher value as specified by the Contract Manager;

7. The material shall not contain quantities of contaminants in excess of the percentages given in the following Table unless otherwise approved by the Contract Manager:

<table>
<thead>
<tr>
<th>Allowable contamination of recycled sub-base material</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sub-base type</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Recycled sub-base</td>
</tr>
</tbody>
</table>

8. In the event that there is a shortage of supply of recycled aggregates, virgin aggregates can be used in lieu of recycled aggregates in the sub-base material subject to CM's approval.

**BITUMINOUS MATERIALS**

**EXT1.M410.8 AGGREGATES FOR BITUMINOUS MATERIALS**

1. Coarse aggregate
   Crushed rock all retained on a 5 mm BS Test Sieve and with the properties stated in the following table:

<table>
<thead>
<tr>
<th>Properties of coarse aggregate for bituminous materials</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Flakiness Index</td>
</tr>
</tbody>
</table>
2. Fine aggregate
Crushed rock, river sand or a mixture of crushed rock and river sand all passing 5 mm BS test sieve. Water absorption of fine aggregate must not exceed 2.0%.

3. For mix design purposes, ensure the combined grading of aggregates for bituminous materials is such that the particle size distribution lies within the limits stated in the following table:

<table>
<thead>
<tr>
<th>Particle size distribution</th>

**EXT1.M420.8 FILLER**
Free flowing, dry before addition to the bituminous mixture and

1. **Type**
   a. Filler for bituminous materials to be crushed rock filler, PC, PFAC, PFA or hydrated lime;
b. Filler for bituminous friction course material to contain hydrated lime; the amount of hydrated lime, expressed as a percentage by mass of the total aggregates, at least 1.5%.

2. Material
   a. PC to BS EN 197-1:2000;
   b. PFAC to BS EN 197-1:2000;
   c. PFA to BS 3892:Part 1:1997 except that the criterion for maximum water requirement does not apply;
   d. Crushed rock filler and hydrated lime to ASTM D 242-85.

EXT1.M430.8 BITUMEN
Bituminous materials:
1. To ASTM D 946-82, Grade 60-70, with a softening point exceeding 44°C and less than 55°C;
2. The wax content of the bitumen shall comply with requirements for Grade A specified in JTG F40-2004;
3. Unless otherwise permitted by the CM, blending and mixing of bitumen must be carried out at an Approved refinery.

EXT1.M440.8 EMULSION
Bituminous emulsion
1. Anionic bituminous emulsion to BS 434 Part 1:1984, Table 1, Class A1-40; or
2. Cationic bituminous emulsion to BS 434 Part 1:1984, Table 2, Class K1-40.

EXT1.M450.8 PRIMER
Bituminous priming material of medium curing-grade cutback bitumen to ASTM D 2027-76, Table 1, Class MC-30.
WORKMANSHIP

GENERAL

USE OF APPROVED MIX

1. Do not place bituminous material in the permanent work until the mix has been Approved;
2. Do not change the materials and methods of production used in producing the Approved mixes and the methods of construction used in trial areas unless permitted by the CM.

HANDLING AND STORAGE

1. Store
   a. Bagged cement in a dry, weatherproof store with a raised floor. Identify each delivery, store separately and use in order of delivery;
   b. Bulk cement and PFA in dry, weatherproof silos. Identify and store separately different types and materials from different sources. Clearly mark silos to identify contents.
2. Do not handle or store sub-base and bituminous materials in a manner that results in mixing of the different types and sizes, or in segregation or contamination of the materials;
3. Do not store bituminous materials in heated surge bins for more than 12 hours or in transport vehicles for more than 3 hours, unless otherwise permitted by the CM;
4. Do not store bituminous friction course material in surge bins for more than 30 minutes.

TRANSPORTING

1. Protect sub-base material and bituminous materials with covers during transportation and before laying;
2. Use heavy canvas or a similar insulating material for covering bituminous materials;
3. Completely cover the material with covers and ensure a secure fixing to minimise loss of heat and protect the materials from contamination by dust or other deleterious materials;
4. Transport sub-base material and bituminous materials in clean vehicles with smooth trays and sides;
5. The trays of vehicles transporting bituminous materials may be lubricated with soap solution or light oil sprayed on the trays. Do not lubricate vehicles transporting bituminous friction course material with light oil.

MIXING

PLANT

1. Ensure
   a. The mixing plant for bituminous materials has at least four separate cold feed bins for preliminary cold batching of the coarse and fine aggregates, and a rotary drum dryer that continuously agitates the aggregates during the heating and drying process. After passing through the dryer, the aggregates must be screened into at least four hot storage bins before mixing;
b. Bituminous heating and storage tanks are fitted with circulating pumps to ensure an even temperature throughout the tanks;

c. The mixing plant is fitted with sampling devices to enable samples of hot aggregates, filler and bitumen to be taken before mixing;

d. Insulated surge bins, if fitted to the mixing plant, are designed and operated to prevent segregation occurring in the mix. Heating devices fitted to surge bins must be capable of maintaining the temperature of the mix to within the specified limits;

e. Measuring and weighing equipment is maintained in a clean serviceable condition. The equipment must be set to zero daily and calibrated before mixes for the permanent work are produced, and at regular intervals not exceeding 6 months.

2. Alternative methods of mixing bituminous materials may be used when Approved.

**EXT1.W120.8**  
**SUB-BASE AND BITUMINOUS MATERIALS**

1. Carry out mixing of sub-base material and mixing of bituminous materials before delivery to the Site at Approved mixing plants. Plants to be designed and operated to produce uniform mixes which comply with the specified requirements;

2. Measure aggregates and filler for bituminous materials to an accuracy of ± 3.0% by mass. The aggregate moisture content after drying not to exceed 0.4% by mass;

3. Ensure that aggregates and filler are uniformly coated with bitumen by the continued mixing of the bituminous materials for the necessary period;

4. Ensure bituminous materials comply with the temperature requirements as stated in the following table during and after mixing:

<table>
<thead>
<tr>
<th>Type of bituminous material</th>
<th>Roadbase, base course and wearing course</th>
<th>Friction course</th>
</tr>
</thead>

**PRELIMINARY WORK**

**EXT1.W210.8**  
**INSTALLATION OF UTILITIES**

1. Pipes, cables, manholes, chambers, gullies and other utilities below carriageways must be completed and fill material deposited and compacted in trenches before the carriageway is constructed. Protect openings to manholes, chambers and gullies by temporary covers or by other methods agreed by the CM;

2. Do not fix in position covers, frames and other hardware that will prevent continuous laying of bituminous materials for roadbase and base course until such work is complete;
3. After the penultimate layer of bituminous material has been laid and compacted, cut out the layers of asphalt, remove temporary covers and install the permanent covers, frames and other hardware;

4. Carry out finishing around covers, frames and other hardware using bituminous material of the same type as that for adjacent surfaces, unless otherwise permitted by the CM. Compact the material in layers not exceeding 50 mm thick, using handrammers or mechanical equipment to the underside of the wearing course or friction course.

**LAYING AND COMPACTING**

**EXT1.W310.8 SUB-BASE MATERIAL**

1. Lay and compact sub-base material in a manner that does not result in segregation of the material and with a moisture content that achieves the compaction stated at sub-clause (6) below. The moisture content must not be less than 2%;

2. Lay sub-base material in layers that when compacted do not exceed 225 mm thick. If the final compacted thickness of the sub-base exceeds 225 mm, lay the material in two or more layers, with a minimum thickness for each layer of 100 mm and, if the layers are of unequal thickness, the lowest layer the thickest;

3. Evenly spread each layer of sub-base material immediately after placing in position. Compact immediately after spreading;

4. As a minimum requirement use the compaction plant specified at EXT1.W360 (1) for compaction of sub-base material;

5. Obtain permission from the CM before placing the next layer on each layer of compacted sub-base material;

6. Compact sub-base material to obtain a relative compaction of at least 95% maximum dry density throughout;

7. Maintain the surface of each layer of sub-base in a compacted condition until the next layer of sub-base material or roadbase material is laid. Do not disturb the surface by the use of construction plant or other vehicles, and keep free from ridges, cracks, loose material, pot-holes, ruts or other defects.

**EXT1.W320.8 RECYCLED SUB-BASE MATERIAL**

1. Lay and compact in a manner which will not result in segregation of the material and at a moisture content which allows the compaction stated in sub-clause (7) to be achieved. The moisture content shall not be less than 2%;

2. The recycled sub-base shall consist of an upper layer of virgin sub-base material overlying an underlying layer of recycled sub-base material. The ratio of the thickness of the recycled sub-base layer to that of the virgin sub-base layer shall be approximately 6 to 4. During laying and compaction, the thickness of each of these two layers shall take into account the layer thickness requirements given in sub-clause (3) below;

3. Lay recycled sub-base material in layers in such a manner that the compacted thickness of each layer will not exceed 225 mm. If the specified final compacted thickness of the sub-base exceeds 225 mm, the material shall be laid in two or more layers; the minimum thickness of each layer shall be 100 mm and, if the layers are of unequal thickness, the lowest layer shall be the thickest;

4. Evenly spread each layer of recycled sub-base material immediately after placing in position. Compact immediately after spreading;

5. As a minimum requirement, use the compaction plant specified at EXT1.W360 (1) for compaction of recycled sub-base material;
6. Obtain the permission of the CM before the next layer is placed on each layer of compacted recycled sub-base material;
7. Compact recycled sub-base material to obtain a relative compaction of at least 95% maximum dry density throughout;
8. Maintain the surface of each layer of recycled sub-base in a compacted condition until the next layer of sub-base material or roadbase material is laid. Do not disturb the surface by constructional plant or other vehicles, and keep free from ridges, cracks, loose material, pot-holes, ruts or other defects.

**EXT1.W330.8 BITUMINOUS MATERIALS**

1. Do not lay bituminous materials during periods of wet weather or when ponded water is present on the underlying surface unless in the opinion of the CM, the works will not be adversely affected;
2. Do not lay
   a. Bituminous wearing course material when the ambient air temperature is below 8°C;
   b. Bituminous friction course material when the ambient air temperature is below 10°C. Measure temperatures in the shade near to the surface on which laying is to be carried out.
3. Ensure surfaces to receive bituminous materials are clean, free from mud, grit and other deleterious material;
4. When Instructed apply a tack coat of bituminous emulsion to surfaces on or against which bituminous materials will be laid as follows:
   a. Apply tack coat evenly at a rate of between 0.4 L/m² and 0.6 L/m² using a spray machine complying with BS 434 Part 2:1984;
   b. Do not lay bituminous materials until the tack coat has cured;
   c. Only allow construction plant and other vehicles necessary to lay the bituminous materials to run on the tack coat.
5. When Approved, surfaces of existing carriageways may be regulated before application of overlaying bituminous material. In this case ensure
   a. Bituminous regulating course material is Approved as complying with the requirements of the 10 mm nominal maximum aggregate size wearing course material as stated in the table to EXT1.M410 (3);
   b. Regulating course material is laid by paving machines unless laying by manual methods is Instructed.
6. Ensure bituminous materials comply with the temperature requirements stated in the table to EXT1.W120 during laying and compaction.

**EXT1.W340.8 LAYING BY PAVING MACHINE**

1. Unless otherwise permitted by the CM place and spread bituminous materials using a self-propelled paving machine with a screw auger and attached screed capable of spreading and laying the material to the full width required and of giving initial compaction to the material and finishing it to a level suitable for subsequent compacting operations;
2. Paving machines may be fitted with cut-off shoes or extensions to limit or extend the width of the screed; do not use screed extensions unless the screw auger is extended in accordance with the manufacturer’s recommendations. Ensure the surface texture produced by paving machines is free from segregation and from pushing or dragging marks;
3. Place bituminous materials laid by paving machines directly from the vehicles transporting the material into the hopper of the paving machine. Ensure delivery of materials to the paving machine and laying of the materials is at a uniform rate appropriate to the capacity of the paving machine and compaction plant;

4. When any delay in laying operations occurs remove the paving machine and the uncompacted cold material and form a transverse joint as stated in EXT1.W370;

5. Ensure paving machines working in echelon are as close as practicable; machines must not be more than 30 m apart unless a longitudinal joint is formed as EXT1.W370;

6. Only use manual placing of materials on freshly laid surfaces for the purpose of locally correcting levels as paving operations proceed and before compaction by rolling is commenced.

EXT1.W350.8 LAYING BY MANUAL METHODS

Only lay bituminous materials by manual methods if in the opinion of the CM, the use of a paving machine is impracticable. If Approved, bituminous materials may be laid by manual methods in the following situations:

1. In courses of irregular shape and varying thickness;
2. In confined locations;
3. Adjacent to expansion joints, covers, frames and other hardware; and,
4. In reinstatements to trenches.

EXT1.W360.8 COMPACTING

1. As a minimum requirement use compaction plant to compact bituminous roadbase, base course, regulating course, wearing course and sub-base material as follows:
   a. i. A smooth three steel-wheeled roller with a mass of between 6 t and 12 t, or a vibratory tandem steel-wheeled roller with an effective mass of between 6 t and 12 t; and
      ii. A smooth pneumatic tyred-roller with a mass of between 12 t and 25 t, and with not less than seven overlapping wheels which have tyres that are capable of having pressures varying between 300 MPa and 800 MPa; and
   iii. Suitable mechanical rammers and hand tools; or

b. Other Approved types of rollers, vibrating plates, or other similar plant necessary to produce the required degree of compaction.

2. Initially roll bituminous roadbase, base course, regulating course and wearing course materials with a steel-wheeled roller operated in a longitudinal direction along the carriageway with the driving wheels nearest the paving machine;

3. Remove all roller marks from the surface of bituminous roadbase, base course and wearing course materials with either a smooth-wheeled dead-weight roller or a smooth-wheeled vibratory roller in non-vibrating mode;

4. Compact bituminous friction course material using rollers as sub-clause (1)(a) above without the application of vibration; roller must not have an excessive film of water over the front and rear wheels. Compact bituminous friction course material until all roller marks are removed and compaction is complete;

5. Do not park rollers on newly laid or compacted bituminous materials;

**EXT1.W370.8 JOINTING BITUMINOUS MATERIALS**

1. Ensure the screed of the paving machine overlaps previously laid strips of bituminous material by at least 50 mm and is sufficiently high so that compaction produces a smooth dense flush joint. Push back bituminous materials overlapping the previously laid strip to the edge of the previously laid strip and remove excess material;

2. Form longitudinal joints in friction or wearing courses to coincide with the position of the lane-markings unless otherwise permitted by the CM;

3. Form a prepared joint between hot bituminous material and cold material or existing bituminous material at a temperature below the minimum specified laying temperature;

4. Ensure the distance between prepared
   a. Longitudinal joints in different layers is at least 150 mm;
   b. Transverse joints in different layers is at least 500 mm.

5. Form prepared joints in base course and wearing course as follows:
   a. Cut back the face of the cold material or existing bituminous material for a minimum distance of twice the depth of the layer or 100 mm, whichever is greater; cut a vertical face for the full depth of the layer;
   b. Remove all loosened materials and coat with bituminous emulsion; do not apply the bituminous emulsion beyond the edges of the joint;
   c. Lay and compact the hot bituminous materials against the coated face with a joint formed as stated in this clause.

6. Unless otherwise permitted by the CM, do not coat friction course joints with bituminous emulsion.

**PERMISSIBLE TOLERANCES**

**EXT1.W410.8 CARRIAGeway ALIGNMENT**

Form carriageway edgelines within the following tolerances from the dimensions indicated on the Drawings:

1. Generally within 25 mm;
2. Adjacent edges of structures within 6 mm.

**EXT1.W420.8 CARRIAGeway LEVELS**

Refer to Appendix H "Schedule of Tolerances" to this Specification.

**EXT1.W430.8 COVERs, FRAMEs AND OTHER HARDWARE**

Set in position to ensure

1. The level of covers, frames and other hardware are not lower than, and not more than 5 mm higher than the surface of the adjacent carriageway;
2. The level of gully gratings are not higher than, and not more than 5 mm lower than the surface of the adjacent carriageway.

**PROTECTION**

**EXT1.W510.8 SURFACES OF SUB-BASES AND BITUMINOUS CARRIAGEWAYS**

1. Keep the surface of each layer of sub-base material and bituminous materials clean and free from deleterious material. When Instructed apply bituminous priming coat to the final surface of the sub-base layer at a rate of between 0.9 L/m² and 1.1 L/m²;
2. Do not permit the use of carriageway layers under construction by construction plant or vehicles other than those which in the opinion of the CM are essential for construction purposes;

3. Unless otherwise permitted by the CM, do not permit the use of bituminous courses by construction plant or other vehicles until 6 hours after the material has been laid and compacted.

WORKS OUTSIDE SITE BOUNDARY

EXT1.W610.8 APPROVED CONTRACTOR FOR PUBLIC WORKS
Road and footway works required to be carried out by a contractor or sub-contractor who is on the current List of Approved Contractors for Public Works for Roads and Drains are specified in Project Specific Specification.

EXT1.W620.8 SPECIFICATION
Carry out the works specified under EXT1.W610 in accordance with Section 9 of the Hong Kong Government General Specification for Civil Engineering Works (2006 Edition) and its amendments published 42 days prior to the date for the return of tenders unless otherwise specified.

EXT1.W630.8 HANDING OVER INSPECTION
Notify the CM to arrange with Highways Department for a joint handing over inspection. Allow the CM to give at least 2 working days advance notice for this inspection.

EXT1.W640.8 RECORD DRAWINGS AND TEST REPORTS
Provide as-built record drawings and all test reports to the CM for submitting to Highways Department.
TESTING

BITUMINOUS CARRIAGEWAY TRIALS

EXT1.T010.8 TRIAL AREAS
1. Construct trial areas of each type and layer of bituminous materials to demonstrate that the proposed materials, mixes, methods of production and methods of construction are capable of producing a carriageway which complies with the specified requirements except in the following circumstances:
   a. With approval of the CM in the case that the area of work is less than 200 m²; or
   b. When the materials are supplied by contractors included in Development Bureau's Special Contractors List of Supply of Bituminous Pavement Materials and Construction of Special Bituminous Surfacing and paving works are carried out by contractors on the List of Approved Contractors for Public Works under the Roads and Drainage Category.
2. Unless otherwise instructed, construct the trial areas as part of the permanent carriageway at locations agreed by the CM;
3. Trial area size:
   a. Width of each trial area not less than one lane of carriageway;
   b. Length of each trial area not less than 60 m unless otherwise approved by the CM.
4. Construct trial areas using the same materials, mixes, methods of production and methods of construction as the details submitted to the CM. Deliver materials in not less than two loads;
5. Inform the CM 48 hours before constructing trial areas, or at an interval agreed by the CM;
6. Obtain the CM’s permission before each layer of material is placed in the trial area;
7. Give the CM sufficient time to determine whether the specified requirements have been produced in the trial area before further material of the same type is placed in the permanent carriageway;
8. Protect trial areas from damage and leave in position unless the CM instructs their removal. Do not remove trial areas which form part of the permanent carriageway and which comply with the specified requirements.

EXT1.T020.8 SAMPLES OF MATERIALS USED IN TRIAL AREAS
1. Provide one sample of bituminous materials, excluding bituminous roadbase materials, from each mix used in trial areas. Method of sampling as stated in the table to EXT1.T030;
2. Cut ten cores from each layer of base course and wearing course in trial areas. Method of taking core as EXT1.T510.

EXT1.T030.8 SAMPLING AND TEST METHODS FOR TRIAL AREAS
1. Test each sample of bituminous material taken as EXT1.T020 to determine the properties stated in the following table;
2. Where the layer is to form part of the permanent work, test each layer of bituminous material in trial areas, excluding bituminous roadbase material, as EXT1.W420 to determine the level of the surface;
3. Test the layer which will form the final layer of the carriageway in each trial area as EXT1.T610 and EXT1.T620 to determine the surface regularity, if the layer is to form part of the permanent work;
4. Test the friction course layer in each trial area as EXT1.T710 to EXT1.T730 to determine the texture depth and permeability;
5. Test cores as EXT1.T510 to EXT1.T540 to determine the compacted layer thickness and air void content.

### EXT1.T040.8 COMPLIANCE CRITERIA

The properties of the materials, the levels of the surface, compaction, surface regularity, texture depth and permeability of bituminous materials laid in the trial areas must comply with the specified requirements for the permanent carriageway.

### EXT1.T050.8 NON-COMPLIANCE

1. In the event of non-compliance of any trial area test with the specified requirements submit details of proposed changes to the materials, mixes, methods of production or construction required to meet the compliance criteria. Construct further trial areas as necessary until the result of every test on trial areas complies with the specified requirements for the trial areas;
2. Unless otherwise permitted by the CM, remove trial areas, or parts of trial areas, which do not comply with the specified requirements for the trial area.

### EXT1.T060.8 APPROVED MIX

1. A mix for bituminous materials other than bituminous roadbase material which complies with the specified requirements for designed mixes and for trial areas will be regarded as an Approved mix;
2. The Approved gradation envelope for bituminous materials other than bituminous roadbase material will be the gradation envelope found by applying the tolerances stated in the following table to the particle size distribution of the Approved mix:

<table>
<thead>
<tr>
<th>BS Test Sieve</th>
<th>Tolerance of particle size distribution in percentage by mass of total mix passing BS Test Sieve</th>

<td>±7</td>
</tr>
</tbody>
</table>
3. The Approved bitumen content range for bituminous materials other than bituminous roadbase material will be the bitumen content range formed by applying a tolerance of ±0.5% to the bitumen content of the Approved mix.

**SUB-BASE MATERIALS**

**EXT1.T110.8 BATCHES FOR TESTING**

A batch of sub-base material is a quantity not exceeding 250 m³ of sub-base material of the same type and same mix produced at the same mixing plant, and delivered to the Site.

**EXT1.T120.8 SAMPLES FOR TESTING**

1. Unless otherwise permitted by the CM, provide one sample of each type of sub-base material from each batch of sub-base material delivered to the Site;
2. Sample size at least 50 kg;

**EXT1.T130.8 TEST METHODS**

1. Test each sample of sub-base materials to determine the particle size distribution, ten percent fines value, maximum dry density, optimum moisture content and plasticity index of the portion passing a 425 micron BS Test Sieve;
2. Method of testing for particle size distribution to BS 812:Section 103.1:1985;
3. Method of testing for ten percent fines to BS 812:Part 111:1990, except that the sample must be soaked in water at room temperature for 24 hours and not be oven-dried before testing;
4. Method of testing for plasticity index comply with Geospec 3, Test Method 6.1, except that same preparation must be by wet sieving the material over a 425 μm BS test sieve;
5. Method of testing for maximum dry density and optimum moisture content comply with Geospec 3, Test Method 10.1, 10.2, 10.3, 10.4, 10.5, 10.6, 10.7 or 10.8 and EAR1.T310 to EAR1.T370, whichever as Instructed.

**EXT1.T140.8 TEST METHODS - RECYCLED SUB-BASE MATERIAL**

1. Test each sample of recycled sub-base material to determine the particle size distribution, ten percent fines value, maximum dry density, optimum moisture content, plasticity index of the portion passing a 425 μm BS test sieve, CBR value, soundness value, water-soluble sulphate content and percentage of contaminants as defined in EXT1.M320 (7);
2. Method of testing for particle size distribution to BS 812:Section 103.1:1985;
3. Method of testing for ten percent fines value to BS 812:Part 111:1990, except that the sample shall be soaked in water at room temperature for 24 hours and shall not be oven-dried before testing;
4. Method of testing for plasticity index to be in accordance with Geospec 3, Test Method 6.1, except that sample preparation shall be by wet sieving the material over a 425 μm BS test sieve;
5. Method of testing for maximum dry density and optimum moisture content to be in accordance with Geospec 3, Test Method 10.1, 10.2, 10.3, 10.4, 10.5, 10.6, 10.7 or 10.8, and EAR1.T310 to EAR1.T370, whichever as Instructed;

6. Soundness value to be determined in accordance with BS 812:Part 121:1989;

7. Water-soluble sulphate content to be determined in accordance with Geospec 3;

8. The maximum organic material content to be determined in accordance with Geospec 3;

9. The maximum metals and foreign material content to be determined in accordance with the following procedure:
   a. Using the sampling procedure detailed in BS 812:Part 101:1984, obtain a sample of the aggregate containing at least 500 particles. Sort the particles manually into the following separate fractions:
      i. Concrete and dense or normal weight aggregates;
      ii. Brick, mortar, lightweight block and lightweight aggregate;
      iii. Asphalt, bitumen, tar and mixtures of these materials with aggregate;
      iv. Wood;
      v. Glass;
      vi. Metal;
      vii. Other foreign material such as clay lumps and plastics.
   b. Because of the adherence of dust or ash, break some particles where necessary to make a positive identification. Weigh the resulting fractions and express as a percentage of the total weight of material;
   c. Note lightweight block materials as a separate category if more than 1% by volume (approx. 5 pieces in 500) is detected. Take record of ultra-lightweight materials (e.g. insulation) if more than 1% by volume (5 pieces in 500) is identified.

10. Determine CBR value in accordance with Geospec 3 with surcharge discs. Test the material at the density and moisture content likely to develop in equilibrium pavement conditions, which shall be taken as being the density relating to an uniform air voids content of 5% and the optimum moisture content determined in compliance with BS 5835:Part 1:1980.

**EXT1.T150.8 DETERMINATION OF RELATIVE COMPACTION**

1. Test each area of sub-base which contains sub-base material of the same type and same mix produced at the same mixing plant and which is laid and compacted in a single layer in one day to determine the relative compaction. Carry out tests after the sub-base material has been laid and compacted in the final position;

2. Carry out two tests on each area of 1000 m² or part thereof laid and compacted each day;

3. Carry out tests at positions which in the opinion of the CM are representative of the area of compacted sub-base as a whole;

4. Comply with the method of testing for relative compaction as EAR1.T530.

**EXT1.T160.8 COMPLIANCE CRITERIA FOR RELATIVE COMPACTION**

The results of tests for relative compaction of sub-base must comply with the requirements specified at EXT1.W310 (6).

**EXT1.T170.8 NON-COMPLIANCE OF RELATIVE COMPACTION**

In the event of non-compliance of any test for relative compaction of sub-base with the specified requirements, recompact the area and carry out two additional tests for relative compaction of sub-base on the area.
BITUMINOUS MATERIALS OTHER THAN BITUMINOUS FRICTION COURSE MATERIAL

EXT1.T310.8 Batches for Testing
A batch of bituminous materials other than bituminous friction coarse material is a quantity not exceeding the limits stated in the following table of bituminous materials of the same type and same mix produced at the same mixing plant in one day:

<table>
<thead>
<tr>
<th>Material</th>
<th>Maximum batch size</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wearing course</td>
<td>100 t</td>
</tr>
<tr>
<td>Base course</td>
<td>150 t</td>
</tr>
<tr>
<td>Roadbase</td>
<td>200 t</td>
</tr>
</tbody>
</table>

EXT1.T320.8 Samples for Testing
1. Provide one sample of bituminous materials other than bituminous friction course material from each batch unless otherwise required by the CM;
2. Sample size of each as stated in the following table:

<table>
<thead>
<tr>
<th>Material</th>
<th>Minimum size of sample (kg)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wearing course (10 mm nominal maximum aggregate size)</td>
<td>10</td>
</tr>
<tr>
<td>Wearing course (20 mm nominal maximum aggregate size)</td>
<td>16</td>
</tr>
<tr>
<td>Base course</td>
<td>24</td>
</tr>
<tr>
<td>Roadbase</td>
<td>24</td>
</tr>
</tbody>
</table>

3. Take samples at the mixing plant or at the location where the bituminous material will be laid as instructed. When applicable, take samples at the mixing plant from the delivery vehicle immediately after loading from the plant or from the surge bin. When applicable, take samples at the location where the bituminous materials will be laid from the delivery vehicle;
4. Unless otherwise agreed by the CM the method of sampling to comply with ASTM D 979-89.

EXT1.T330.8 Test Methods
1. Test each sample of bituminous materials taken as EXT1.T320 (1) to determine the particle size distribution, bitumen content, Rice's specific gravity and bulk specific gravity;
2. The method of testing to comply with the following:
   a. Particle size distribution: ASTM C 136-96a with modifications and ASTM C 117-95, Method B;
   b. Bitumen content: ASTM D 6307-05 or ASTM D 2172-95, Method A;
3. For particle size distribution tests in accordance with ASTM C 136-96a, the modifications are:
a. Use sieves to BS 410:1986 instead of sieves to ASTM E 11-95;
b. Reduce each sample of bituminous materials taken as stated in EXT1.T330 to a
test specimen of suitable size as follows:

<table>
<thead>
<tr>
<th>Nominal Maximum Aggregate Size (mm)</th>
<th>Minimum Sample Size (kg)</th>
</tr>
</thead>
<tbody>
<tr>
<td>37.5</td>
<td>2.5</td>
</tr>
<tr>
<td>28.0</td>
<td>2.0</td>
</tr>
<tr>
<td>20.0</td>
<td>1.5</td>
</tr>
<tr>
<td>10.0</td>
<td>1.0</td>
</tr>
</tbody>
</table>

4. The residual pressure manometer specified in ASTM D 2041-94 may be replaced
by a vacuum gauge.

EXT1.T340.8  COMPLIANCE CRITERIA
1. The results of tests on bituminous materials other than bituminous roadbase and
friction course materials must comply with the following requirements:
a. The particle size distribution must be such that not more than two points on the
particle size distribution curve are outside the Approved gradation envelopes
determined as EXT1.T060 (2). The percentage passing the 75 micron BS test
sieve must not exceed the Approved design value by more than 3%;
b. The bitumen content must be within the Approved bitumen content range
determined as EXT1.T060 (3).

2. The results of tests on bituminous roadbase material must comply with the
following requirements:
a. The particle size distribution must be such that not more than two points on the
particle size distribution curve are outside the design limits as stated in
EXT1.M410 (3). The percentage passing the 75 micron BS test sieve must not
exceed 8% as specified in EXT1.M410 (3);
b. The bitumen content must be within the allowable bitumen content range as
specified in EXT1.M410 (3).

BITUMINOUS FRICTION COURSE MATERIAL

EXT1.T410.8  BATCHES FOR TESTING
A batch of bituminous friction course material is a quantity not exceeding 100 tonnes of
bituminous friction course material of the same mix produced at the same mixing plant
in one day.

EXT1.T420.8  SAMPLES FOR TESTING
1. Provide one sample of bituminous friction course material from each batch of
bituminous friction course material;
2. The size of each sample must be at least 15 kg;
3. Take samples at the mixing plant from the delivery vehicle immediately after
loading from the plant or from the surge bin;
4. Unless otherwise agreed by the CM the method of sampling to comply with ASTM
D 979-89.

EXT1.T430.8  TEST METHODS
1. Test each sample of bituminous friction course material to determine the particle
size distribution and bitumen content;
2. The method of testing to comply with the following:
a. Particle size distribution: ASTM C 136-96a with modifications and ASTM C 117-95, Method B;

b. Bitumen content: ASTM D 2172-95, Method A.

3. For particle size distribution tests in accordance with ASTM C 136-96a, the modifications are:
   a. Use sieves to BS 410:1986 instead of sieves to ASTM E 11-95;
   b. Reduce each sample of bituminous materials taken as stated in EXT1.T420 to a test specimen of suitable size as follows:

<table>
<thead>
<tr>
<th>Nominal Maximum Aggregate Size (mm)</th>
<th>Minimum Sample Size (kg)</th>
</tr>
</thead>
<tbody>
<tr>
<td>37.5</td>
<td>2.5</td>
</tr>
<tr>
<td>28.0</td>
<td>2.0</td>
</tr>
<tr>
<td>20.0</td>
<td>1.5</td>
</tr>
<tr>
<td>10.0</td>
<td>1.0</td>
</tr>
</tbody>
</table>

EXT1.T440.8 COMPLIANCE CRITERIA

The results of test on bituminous friction course material must comply with the following requirements:

1. The particle size distribution must be within the Approved gradation envelopes as EXT1.T060 (2);

2. The bitumen content must be within the Approved bitumen content range determined as EXT1.T060 (3).

CORES FROM BITUMINOUS ROADWAYS

EXT1.T510.8 SAMPLE LOCATIONS AND METHODOLOGY

1. Test each area of roadbase, base course and wearing course which contains bituminous material of the same type and same mix produced at the same mixing plant and which is laid and compacted in a single layer in one day to determine the compacted layer thickness;

2. Unless otherwise Approved, divide each area of bituminous material to be tested into approximately equal sub-areas as stated in the following table. Take one core at random from each sub-area:

<table>
<thead>
<tr>
<th>Rate of Sampling for Bituminous Material Cores</th>
</tr>
</thead>
<tbody>
<tr>
<td>Area of bituminous material laid and compacted in one day</td>
</tr>
<tr>
<td>---------------------------------------------------------</td>
</tr>
<tr>
<td>Roadbase</td>
</tr>
<tr>
<td>&lt; 5,000 m²</td>
</tr>
<tr>
<td>5,000 - 10,000 m²</td>
</tr>
<tr>
<td>&gt; 10,000 m²</td>
</tr>
</tbody>
</table>

3. Do not take cores from within 300 mm of covers, frames and other hardware, or construction joints in the bituminous material;

4. Take cores with a mechanically operated coring machine;

5. Core sizes
   a. 150 mm diameter for bituminous material with a designed layer thickness of 40 mm or greater;
b. 100 mm diameter for bituminous material with a designed layer thickness of less than 40 mm.

6. Take cores as soon as practicable but not later than 48 hours after completion of the paving operation;
7. If agreed by the CM, the sampling rate for roadbase may be applied to wearing and base courses;
8. Fill holes formed by taking cores with compatible bituminous material as soon as practicable after the core has been taken.

**EXT1.T520.8 TEST METHOD**

1. Measure each bituminous material core to determine the compacted layer thickness of the bituminous material and test to determine the air void content;
2. Method of testing for air void content complying with ASTM D 3203-94.

**EXT1.T530.8 COMPLIANCE CRITERIA**

The results of tests on bituminous material cores must comply with the following requirements:

1. The average air void content of the cores taken from an area of bituminous base course or wearing course material must be not less than 3.0% and not greater than 6.0%;
2. The air void content of each core taken from an area of bituminous base course or wearing course material must be not less than 2.5% and not greater than 7.5%;
3. The air void content of each core taken from an area of bituminous roadbase material must not be not less than 3.0% and not greater than 9.0%;
4. The compacted layer thickness as measured from each core must comply with the thickness requirements and be compatible with the levels of tolerances stated in EXT1.W420.

**EXT1.T540.8 NON-COMPLIANCE**

1. If the result of any test for air void content of cores does not comply with the specified requirements for air void content, carry out the following procedures:
   a. Take four additional cores, from each sub-area for which the original core did not comply with the specified requirements for air void content. Take the cores at locations evenly spaced through the sub-area so that in the opinion of the CM they are representative of the sub-area as a whole;
   b. Test each additional core to determine the air void content and average the test results of the additional cores from the same sub-area;
   c. The average air void content of the sub-area thus obtained replaces the original air void content of the respective sub-area. Use the new average air void content calculation of the area of bituminous material tested for compliance checking.
2. If the air void content of any of the four additional cores determined as EXT1.T520 (2) is less than 2.5% or greater than 7.5% for bituminous base course material and bituminous wearing course material, or less than 3.0% or greater than 9.0% for bituminous roadbase material, the sub-area from which the cores were taken will be considered as not complying with the specified requirements;
3. The area of bituminous material tested will be considered as not complying with the specified requirements for average air void content if the average air void content of the cores taken from the area does not comply with the specified requirements for average air void content;
4. If the results of any tests for compacted layer thickness of cores is not compatible with the requirements as stated in the table to EXT1.W420, take four additional cores from the same sub-area and determine the average compacted layer thickness. Take the cores at locations evenly spaced throughout the sub-area so that in the opinion of the CM they are representative of the sub-area as a whole;

5. If the average compacted layer thickness determined as sub-clause (4) above is not in accordance with the permitted compacted layer thickness as EXT1.T530 (4), the sub-area from which the cores were taken will be considered as not complying with the specified requirements.

SURFACE REGULARITY

EXT1.T610.8 DEFINITION AND TEST METHODS

Carry out the following testing to determine the surface regularity:

1. The surface regularity of the final layer of the pavement will be determined by measuring the number of irregularities in the surface. An irregularity is defined as when the gap between the surface of the carriageway, and a 3 m straight-edge placed on the surface of the carriageway, exceeds the specified amount. Measured irregularities will be in millimeters perpendicular to the straight-edge;

2. The longitudinal surface regularity of carriageways with a total length of 75 m or more may be measured using a rolling straight-edge of the type designed by the UK Transport and Road Research Laboratory. The longitudinal surface regularity of carriageways, with a total length of less than 75 m, and the transverse surface regularity of carriageways will be measured using a 3 m straight-edge;

3. The longitudinal surface regularity will be measured along lines parallel to the longitudinal axis of the carriageway and approximately 1 m from the near side edge of each carriageway lane. The transverse surface regularity will be measured along lines at right angles to the longitudinal axis on the carriageway at 10 m intervals along the length of the carriageway.

EXT1.T620.8 COMPLIANCE CRITERIA

The results of tests for surface regularity of carriageways must comply with the following requirements

1. The size and number of irregularities in the longitudinal direction must not exceed the size and permitted number of irregularities stated in the following table:

<table>
<thead>
<tr>
<th>Total length of carriageway</th>
<th>Size of irregularity</th>
<th>Permitted number of irregularities (Category A road)</th>
<th>Permitted number of irregularities (Category B road)</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt; 75 m</td>
<td>&gt; 4 mm</td>
<td>(9 x total length)/75</td>
<td>(18 x total length)/75</td>
</tr>
<tr>
<td></td>
<td>&gt; 7 mm</td>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>75 m – 300 m</td>
<td>&gt; 4 mm</td>
<td>9 in any 75 m length</td>
<td>18 in any 75 m length</td>
</tr>
<tr>
<td></td>
<td>&gt; 7 mm</td>
<td>1 in any 75 m length</td>
<td>2 in any 75 m length</td>
</tr>
<tr>
<td>&gt; 300 m</td>
<td>&gt; 4 mm</td>
<td>20 in any 300 m length</td>
<td>40 in any 300 m length</td>
</tr>
<tr>
<td></td>
<td>&gt; 7 mm</td>
<td>9 in any 75 m length</td>
<td>18 in any 75 m length</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2 in any 300 m length</td>
<td>4 in any 300 m length</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1 in any 75 m length</td>
<td>2 in any 75 m length</td>
</tr>
</tbody>
</table>

Notes to table:

a. Category A roads are roads with a legal speed limit greater than 70 kilometers per hour; all other roads are Category B roads;
b. Irregularities greater than 7 mm will also be counted as greater than 4 mm;
c. No irregularity greater than 10 mm will be permitted.

2. No irregularity exceeding 4 mm in a 3 m length in the transverse direction for Category A roads and no irregularity exceeding 7 mm in a 3 m length in the transverse direction for Category B roads will be permitted.

TEXTURE DEPTH AND PERMEABILITY

EXT1.T710.8 TEST LOCATIONS AND METHODOLOGY

Carry out testing to determine the texture depth and permeability. The method of testing will be as follows

1. Unless otherwise agreed by the CM each area of friction course to be tested will be divided into approximately equal sub-areas as stated in the following table. Tests for texture depth and permeability will be carried out on each sub-area at positions which in the opinion of the CM are representative of the sub-area of friction course as a whole. No measurement will be taken within 300 mm of the longitudinal edge of the carriageway;

2. If agreed by the CM the number of tests for texture depth and permeability may be reduced to the minimum stated in the following table:

<table>
<thead>
<tr>
<th>Area of bituminous material laid and compacted in one day</th>
<th>No of sub-areas/tests</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt; 5,000 m²</td>
<td>10 Normal</td>
</tr>
<tr>
<td></td>
<td>4 Minimum</td>
</tr>
<tr>
<td>5,000 - 10,000 m²</td>
<td>15</td>
</tr>
<tr>
<td></td>
<td>10 Minimum</td>
</tr>
<tr>
<td>&gt; 10,000 m²</td>
<td>20</td>
</tr>
<tr>
<td></td>
<td>20 Minimum</td>
</tr>
</tbody>
</table>

3. Test will be carried out before the area of friction course is used by Constructional Plant or other vehicles;

4. The test method for the determination of the permeability of friction course material measures the time taken for 150 ml of water to drain into the material:

a. Apparatus

   i. A non-porous ring with an internal diameter of 150 mm ± 2 mm, and a minimum height of 20 mm;

   ii. Suitable sealant for sealing one end of the ring onto the friction course surface;

   iii. A measuring cylinder for measuring 150 ml of water to an accuracy of 1 ml;

   iv. Two containers, each suitable for containing and pouring 150 ml of water;

   v. A stop watch.

b. Procedure

   i. The test location will be carefully inspected and any unusual features recorded;

   ii. One end of the ring will be placed on the friction course at the location to be tested, and the interface sealed with sealant to prevent any leakage of water;

   iii. Two volumes of water of 150 ml each will be prepared using the measuring cylinder and the two containers;

   iv. One 150 ml measure of water will be poured into the ring quickly and steadily without spillage;
v. As soon as all of the water has drained into the friction course, the second 150 ml of water will be poured into the ring quickly and steadily without spillage, and at the same time the stop watch started;

vi. The time taken for the second 150 ml of water to drain into the friction course surface will be recorded.

c. The following information will be recorded

i. The test location;

ii. The time taken for the second 150 ml of water to drain into the friction course surface, to the nearest one second;

iii. That the test was carried out in accordance with this Specification.

5. The test method for determination of the texture depth of carriageways covers the determination of the texture depth of carriageways by the sand patch test:

a. Material dry natural sand, with a rounded particle shape, which has been washed and then screened such that it meets the grading stated in the following table:

<table>
<thead>
<tr>
<th>Grading of Sand</th>
<th>BS test sieve</th>
<th>Percentage by mass passing</th>
</tr>
</thead>
<tbody>
<tr>
<td>600 microns</td>
<td>100</td>
<td></td>
</tr>
<tr>
<td>300 microns</td>
<td>95 - 100</td>
<td></td>
</tr>
<tr>
<td>150 microns</td>
<td>0 - 6</td>
<td></td>
</tr>
</tbody>
</table>

b. Apparatus

i. A soft brush;

ii. A robust measuring cylinder having an internal diameter of 20 ± 2 mm and a flat top surface such that its internal volume is 25 ± 0.1 ml;

iii. A flat wooden disc of 65 mm diameter with a 1.5 mm thick hard rubber disc attached to one face and a handle fixed to the other face;

iv. A steel rule calibrated to 1 mm;

v. A suitable wind shield;

vi. A funnel with an outlet tube at least 100 mm long with a bore of between 4 mm and 6 mm, and capable of accepting a volume of at least 200 ml;

vii. A steel straight edge for screeding off the measuring cylinder;

viii. A steel-wire brush.

c. Procedure

i. The test location will be at least 300 mm square. It will be vigorously brushed ten times in two directions at right angles using the steel wire brush, and then dried and swept clean with the soft brush;

ii. Sand will be poured into the measuring cylinder to fill it to overflowing, and any excess sand will be screeded off using the straight edge. All sand on the outside of the cylinder will be removed, taking care not to drop any sand onto the test location. Alternatively, this step in the procedure may be carried out in a laboratory, and the sand transferred to a suitable container ready for pouring;

iii. The measured volume of sand will be poured onto the centre of the test location through the funnel to form a heap. The wind shield will be used to protect the test location if required;
iv. The sand will be spread outwards with a circular motion over the test location, using the rubber-face disc with its face parallel to the surface of the carriageway. This will be continued until the patch of sand is approximately circular and will spread outwards no more;

v. The size of the circular patch of sand will be measured to the nearest 1 mm along three diameters which are aligned at approximately 120 degrees to each other;

vi. If the difference between the maximum and minimum of the three measurements exceeds 20% of the average of the three measurements, then all the measurements will be discarded and the test repeated at an adjacent location;

vii. The test will be repeated for all the ten test locations for each section of carriageway lane.

d. Method of calculation

i. The texture depth (T) for each test will be calculated from the equation

\[ T = \frac{31000}{D^2} \text{ mm} \]

Where D is the average of the three diameter measurements of the sand patch calculated to the nearest 1 mm;

ii. The average texture depth for the ten tests will be calculated.

e. The following information will be recorded

i. The test location;

ii. The average diameter of the sand patch for each test to the nearest 1 mm;

iii. The texture depth for each test to the nearest 0.1 mm;

iv. The average texture depth to the nearest 0.1 mm;

v. That the test was carried out in accordance with this Specification.

**EXT1.T720.8 COMPLIANCE CRITERIA FOR TEXTURE DEPTH**

The results of tests for texture depth on an area of friction course must comply with the following requirements:

1. The average texture depth not less than 1.5 mm;

2. Not more than one of the tests for texture depth giving a result of less than 1.2 mm will be permitted.

**EXT1.T730.8 COMPLIANCE CRITERIA FOR PERMEABILITY**

The time for 150 ml of water to drain into the friction course in the permeability test as stated in EXT1.T710 must not exceed 30 seconds.
EXT2 CONCRETE CARRIAGeways

MATERIALS

GENERAL

EXT2.M010.8 APPLICATION OF OTHER WORKSECTIONS
Comply with the relevant provisions of the following Sections unless otherwise specified in this Worksection:
1. Concrete: Worksection CON1;
2. Formwork and finishes to concrete:
   a. Worksection FOR for works carried out under site formation / road and drainage works contract; or
   b. Worksection CON2 for all other works not mentioned in sub-clause (2)(a)
      above.
3. Reinforcement: Worksection CON3;
4. Curing compound: Worksection CON1;

CONCRETE

EXT2.M110.8 CONCRETE FOR CARRIAGeway CONSTRUCTION
Complying with the following requirements:
1. Designed mix, grade: 40/20;
2. Containing either PFAC, or a minimum of 265 kg of PC plus a minimum of 85 kg
   of PFA per m³ of compacted concrete;
3. At least 30% by mass content of fine aggregate to total aggregate;
4. Workability, in terms of designed slump value: not exceeding 75 mm;
5. Minimum cementitious content: 350 kg/m³.

ANCILLARY MATERIALS

EXT2.M205.8 GENERAL
Adhesives, adhesive primer, sealant, sealant primer, and caulking material shall be in compliance with the prescribed limits of VOC content as set out in the Air Pollution Control (Volatile Organic Compound) Regulation.

EXT2.M210.8 REINFORCEMENT
Steel fabric to BS 4483:1998:
1. Manufactured from steel wire to BS 4482:1985;
2. Having a type 2 bond classification.

EXT2.M220.8 DOWEL BARS, TIE BARS, CRADLES AND TIE BARS FOR CRADLES
Plain, round steel bars to CS2:1995 and:
1. Grade 250;
2. With dowel bars straight and with both ends sawn square and burrs removed;
3. With tie bars straight and with one end sawn square and burrs removed.

EXT2.M230.8  **CEMENT MORTAR**  
Consisting of:  
1. 1 part cement (complying with CON1) to 3 parts of fine aggregate (sand or crushed rock to BS 1200:1976 and passing a 5 mm BS Test Sieve); and  
2. The minimum amount of water to achieve a consistency suited to the required work.

EXT2.M240.8  **FINE AGGREGATE FOR CONCRETE**  
1. Clean, hard and durable crushed rock in accordance with CON1;  
2. Do not use natural sand unless with prior agreement of the CM.

EXT2.M250.8  **COARSE AGGREGATE FOR CONCRETE**  
1. Clean, hard, durable crushed rock complying with BS 882:1992;  
2. Ten percent fines values of at least 100 kN;  
3. Water absorption not exceeding 0.8%;  
4. Flakiness index not exceeding 35%.

EXT2.M260.8  **POLYETHYLENE SHEETING**  
Impermeable and having a nominal thickness of 0.125 mm.

EXT2.M270.8  **JOINT FILLER**  
Approved proprietary type consisting of a firm, compressible, single thickness, non-rotting filler.

EXT2.M280.8  **JOINT SEALANT**  
Cold poured, two part polymer based sealant to BS 5212 Part 1:1990:Type N, and:  
1. Suited to the climatic conditions of Hong Kong, performing effectively over a temperature range of 0°C to 60°C;  
2. For use in conjunction with Approved proprietary types of primers and caulking material as recommended by the joint sealant manufacturer.

EXT2.M290.8  **BOND BREAKER TAPE**  
Of an Approved proprietary type recommended by the joint sealant manufacturer and comprising a polyethylene film with adhesive applied to one side and covering the full width of the groove.

EXT2.M300.8  **GROOVE FORMING STRIP**  
Of an Approved proprietary type:  
1. Comprising a firm compressible strip of either:  
   a. Ethylene vinyl acetate foam with a density of at least 90 kg/m³; or  
   b. Synthetic rubber.  
2. 25 mm deep and 5 mm thick;  
3. Sufficiently rigid to remain in position during concreting without deforming or stretching.

EXT2.M310.8  **ADHESIVE FOR GROOVE FORMING STRIP**  
An Approved proprietary type recommended by the groove forming strip manufacturer.

EXT2.M320.8  **SLEEVES FOR DOWEL BARS AND TIE BARS**  
Manufactured from PVC and:
1. With a wall thickness not exceeding 1.5 mm;
2. Of an internal diameter allowing a tight fit to the bars.

EXT2.M330.8 EPOXY RESIN GROUT
An Approved proprietary type.

SUBMISSIONS

EXT2.M410.8 GENERAL
Submit the particulars and certificates required for Approval under the terms of this sub-section, at least 14 days before the first delivery of the material to the Site. Submit certificates for each batch of the material delivered to the Site.

EXT2.M420.8 JOINT FILLER
Submit manufacturer's literature and a certificate for Approval, showing:
1. The manufacturer's name;
2. The date and place of manufacture;
3. That the joint filler complies with the requirements of this Specification and including results of tests for:
   a. Disintegration and shrinkage;
   b. Recovery value and reduction in mass;
   c. Extrusion.

EXT2.M430.8 JOINT SEALANT
Submit manufacturer's literature for Approval, including:
1. The manufacturer's name;
2. Details of the method and time required for mixing the different components;
3. A certificate showing the date and place of manufacture, that the sealant complies with this Specification and results of tests for:
   a. Application life;
   b. Tack-free time;
   c. Resistance to flow;
   d. Recovery;
   e. Adhesion and cohesion in tension and compression;
   f. Resistance to heat ageing.

EXT2.M440.8 GROOVE FORMING STRIP
Submit manufacturer's literature and a certificate for Approval, showing:
1. The manufacturer's name;
2. The date and place of manufacture;
3. That the groove forming strip complies with this Specification;
4. The results of tests for density.

EXT2.M450.8 JOINT SEALANT PRIMER
Submit particulars of the following for Approval:
1. Caulking material for joint sealant;
2. Adhesive for groove forming strip;
3. Bond breaker tape;
4. Sleeves for dowel bars and tie bars.
EXT2.M460.8  SAMPLES

Submit samples of the following proposed materials for Approval at the same time as the particulars of the material:

1. Polyethylene sheeting;
2. Joint filler;
3. Bond breaker tape;
4. Groove forming strip;
5. Sleeves for dowel bars, including compressible filler, and for tie bars.
WORKMANSHIP

MATERIAL

EXT2.W010.8 SUBMISSION FOR APPROVAL
Submit particulars of proposed methods of construction of concrete carriageways, for Approval at least 7 days before the construction of the trial length.

STORAGE OF MATERIALS

EXT2.W110.8 JOINT SEALANT ETC
1. Store joint sealant, and adhesive for groove forming strip:
   a. In sealed containers, marked to identify the contents;
   b. Protected from exposure to conditions which may adversely affect the material;
   c. In accordance with the manufacturer's recommendations.
2. Do not use materials after their recommended shelf life has been exceeded.

EXT2.W120.8 POLYETHYLENE SHEETING ETC
Store polyethylene sheeting, joint filler, bond breaker tape, groove forming strip and sleeves for dowel bars and tie bars in accordance with the manufacturer's recommendations in a dry, weatherproof store, with a raised floor. Store joint filler in sealed plastic bags and do not expose to moisture or the air.

PRELIMINARY WORK

EXT2.W210.8 INSTALLATION OF UTILITIES
Complete pipes, cables, manholes, chambers, gullies and other utilities below concrete carriageways and:
1. Deposit and compact fill material in trenches before carriageway is constructed;
2. Protect openings to manholes, chambers and gullies by the use of temporary covers or other Approved means.

EXT2.W220.8 BOX-OUT CONSTRUCTION
Form box-outs in concrete carriageways for covers, frames and other hardware for fixing in position after the main slab has been cast and before the infill slab is concreted.

EXT2.W230.8 FORMATION AND SUB-BASE
Start the construction of concrete carriageways as soon as practicable after the formation or sub-base has been completed and protect the following until construction of the carriageway starts:
1. Formation: as EAR1.W2320;

EXT2.W240.8 CONCRETING PERMANENT CARRIAGeway
1. Do not place concrete in the permanent carriageway, other than in the trial length, until the results of every test on the trial length complies with the specified requirements for the trial length;
2. Concrete may be placed in the permanent carriageway before the results of compressive tests on the trial mix are available, provided that the result of every other test on the trial mix and the trial length complies with the specified requirements for trial mix concrete and for the trial length.

EXT2.W250.8 CHANGES IN MATERIALS AND METHODS OF CONSTRUCTION
Unless permitted by the CM, do not change the materials, mix design, methods of production and methods of construction used to produce a trial length which complies with the specified requirements.

EXT2.W260.8 LAYING POLYTHENE SHEETING
Lay polythene sheeting flat and without creases below concrete carriageways, making laps at least 300 mm and leaving no gaps at the edges of bays.

FORMWORK

EXT2.W310.8 FORMWORK
1. Unless otherwise Approved, use steel formwork for concrete carriageways.
2. Do not place concrete against excavated surfaces or against kerbs unless permitted by the CM.

EXT2.W320.8 FINISHES
As struck from the formwork, with an even surface, without grout runs and:
1. Transverse and longitudinal joints:
   a. Maximum permitted abrupt irregularities: 3 mm;
   b. Maximum permitted gradual irregularities: 5 mm in 2 m.
2. Other edges of the carriageway:
   a. Maximum permitted abrupt irregularities: 5 mm;
   b. Maximum permitted gradual irregularities: 10 mm in 2 m.

EXT2.W330.8 REMOVAL OF FORMWORK
Do not loosen or remove formwork to excavated surfaces and kerbs until at least 7 hours after concreting has been completed.

PLACING AND COMPACTING CONCRETE

EXT2.W410.8 GENERAL
Unless otherwise Approved, place concrete continuously between the joints in the concrete carriageway.

EXT2.W420.8 UNREINFORCED SLABS
Place and compact concrete to the full thickness of the slab in one operation.

EXT2.W430.8 REINFORCED SLABS
Unless otherwise Approved:
1. Place and compact concrete to the level of the reinforcement as shown on the Drawings;
2. Place the fabric reinforcement in position and place and compact concrete to the remaining thickness of the slab;
3. Ensure that the time between compaction of the first layer and placing of the remaining layer does not exceed 30 minutes unless, in the opinion of the CM, the concrete already placed is sufficiently workable and his permission has been obtained. Where such permission is not given, form a construction joint as CON1.W510 to CON1.W570 and do not place concrete against concrete already laid for at least 24 hours unless permitted by the CM.

**INFLIGHT SLABS**

1. Place and compact concrete in infill slabs around covers, frames and other hardware after they have been fixed in position;
2. Do not place and compact concrete in infill slabs at the same time as the concrete in the main slab.

**CONSTRUCTION JOINTS**

**GENERAL**

Form construction joints only where Approved or in cases of emergency, if concreting is interrupted by bad weather, plant breakdown or similar circumstances. Do not form construction joints within 2.5 m of an existing or planned expansion or contraction joint.

**TRANSVERSE CONSTRUCTION JOINTS**

Form by either:
1. Using formwork and cast-in tie bars; or
2. Breaking back from an unformed edge and fixing the tie bars and sleeves with epoxy resin grout in drilled holes.

**SURFACE FINISH**

**STRIKING OFF**

Unless combined double beam compactor levellers are being used, strike the concrete off after compaction to slightly above the levels of the formwork and regulate the surface by the use of a regulating machine or a vibrating beam.

**REGULATING MACHINES**

Use purpose made regulating machines that are:
1. Spanning the full width of the slab, either transversely or obliquely;
2. Equipped with at least two oscillating-type transverse screeds;
3. Supported on a carriage.

**VIBRATING BEAMS**

Must:
1. Have a steel or aluminium surface;
2. Be mounted on a separate carriage;
3. Be driven by a motor to provide a vibration frequency of at least 3500 cycles per minute.

**SCRAPING STRAIGHT-EDGES**

After regulation by regulating machine or vibrating beam:
1. Regulate the surface of the carriageway with at least two passes of a scraping straight-edge with a blade length of at least 1.8 m;
2. Where scraping straight-edges operate in conjunction with regulating machines, ensure that they pass across the surface at right angles to the longitudinal axis of the carriageway;
3. If the surface is torn by the straight-edge, regulate again using the regulation machine or vibrating beam and then by the scraping straight-edge.

EXT2.W650.8  
REGULATION OF SMALL AREAS
1. Use wooden floats to tamp and regulate small areas of the carriageway, as Approved;
2. Do not use steel trowels or floats.

SURFACE TEXTURING

EXT2.W710.8  
GENERAL
After the surface of the concrete carriageway has been regulated and before the application of curing compound, texture the surface by brushing with a wire broom, except for surface channels and the edges of slabs which do not require to be textured.

EXT2.W720.8  
WIRE BROOMS FOR SURFACE TEXTURING
1. Use wire brooms which:
   a. Are at least 450 mm wide;  
   b. Have two rows of tufts 20 mm apart with the tufts in each row in line with the gaps in the other and at 10 mm centres;  
   c. Have tufts containing an average of 14 wires, each of 32 gauge and initially 100 mm long.
2. Replace the broom if any of the tufts wears down to 90 mm.

EXT2.W730.8  
PROCEDURE
Produce the surface texture by brushing evenly across the slab, in one direction, at right angles to the longitudinal axis of the carriageway. Carry out brushing after the moisture film has disappeared from the concrete surface and before the initial set is complete.

CURING CONCRETE

EXT2.W810.8  
CURING METHODS
Protect the surfaces and edges of concrete carriageways by one of the methods stated in CON1.W1410 to CON1.W1490. Apply curing compound, if used, to the surface immediately after texturing and to the edges immediately after the formwork has been removed.

FORMING MOVEMENT JOINTS

EXT2.W910.8  
GENERAL
1. Use materials for joints in concrete carriageways in accordance with the manufacturer's recommendations or as otherwise specified herein;
2. Form joints perpendicular to the top surface of the slab.

EXT2.W920.8  
FIXING DOWEL BARS
Securely fix dowel bars, tie bars and their sleeves in position through holes in the formwork before concreting and ensure:
1. Bars are parallel to the top surface of the slab and to each other;
2. Bars at transverse joints are parallel to the adjacent longitudinal joint or to the longitudinal axis of the carriageway if there is no longitudinal joint, or to other lines as instructed.

**EXT2.W930.8  FIXING JOINT FILLER**
Cut joint filler to size before fixing and:
1. Securely fix in position to the existing concrete surface before concreting;
2. Ensure that there are no gaps between the joint filler and the formation;
3. Cut holes in the filler for dowel bars to form a sliding fit to the sleeved bar.

**EXT2.W940.8  TRANSVERSE JOINTS GENERALLY**
Ensure that transverse joints are straight and perpendicular to the longitudinal axis of the carriageway, unless otherwise permitted by the CM.

**EXT2.W950.8  FORMING TRANSVERSE JOINTS**
Form transverse expansion and contraction joints at the locations marked on the Drawings and ensure that:
1. The joints are continued across the longitudinal joints and are in line and of the same type on both sides of the longitudinal joint;
2. The joints are continued through kerbs, edgings and quadrants, their foundation and backing where they must be of the same dimensions and materials as the transverse joints, with the omission of the dowel bars;
3. Additional contraction joints are formed at intervals not exceeding 4 m;
4. The joint filler and groove sealant in expansion joints provides complete separation of adjacent slabs.

**EXT2.W960.8  LONGITUDINAL JOINTS**
Form longitudinal joints only where shown on the Drawings.

**EXT2.W970.8  ISOLATION JOINTS**
Form isolation joints at manholes and chambers.

**EXT2.W980.8  FORMING GROOVES GENERALLY**
Ensure that the grooves for joint sealant:
1. Are straight;
2. Have parallel sides perpendicular to the top surface of the slab;
3. Have a flat bottom surface, parallel to the top surface of the slab.

**EXT2.W990.8  TRANSVERSE EXPANSION AND ISOLATION JOINT GROOVES**
Form by sawing the groove to the width and depth shown on the Drawings not less than 7 days after concreting. Ensure that the grooves are located directly above the joint filler such that its upper surface is entirely contained within the groove.

**EXT2.W1000.8  TRANSVERSE CONTRACTION JOINT GROOVES**
Form using one of the following methods:
1. Method 1:
   a. Saw an initial groove as soon as practicable after concreting without spalling the edges;
   b. Ensure that the width of the initial groove is less than that required for the final groove and its depth is between ¼ and ⅜ of the thickness of the slab;
   c. Saw the final groove to the width and depth shown on the Drawings not less than 7 days after concreting;
d. Ensure that the centre lines of the initial and the final grooves coincide.

2. Method 2: saw the final groove to the width and depth shown on the Drawings as soon as practicable after concreting, without spalling the edges.

**EXT2.W1010.8 GROOVES AT TRANSVERSE CONSTRUCTION JOINTS**

Form by fixing groove forming strip, with adhesive, to concrete already placed before concreting the adjacent slab.

**EXT2.W1020.8 PROTECTION OF GROOVES**

Before permanent sealing, protect grooves from contamination by temporary sealing strip or by other Approved methods.

**EXT2.W1030.8 GROOVE CONDITION PRIOR TO SEALING**

Ensure that the groove is clean and dry at the time of applying the primer and the joint sealant.

**EXT2.W1040.8 SEALING JOINTS**

Unless otherwise Approved, carry out the permanent sealing of joints at least 7 days after concreting and:

1. Immediately before permanent sealing, remove groove forming strips, temporary seals, dirt and loose material from the groove and the sides and clean and roughen the groove with water jetting, sand blasting or other Approved methods;
2. Where the joint sealant is not required to extend to the bottom of the groove, firmly pack caulking material into the bottom of the groove;
3. Fix bond breaker tape continuously and evenly along the bottom of the groove for its full width and length;
4. Apply primer to the sides of the groove in accordance with the manufacturer's recommendations;
5. Apply joint sealant between the minimum and maximum drying times of the primer recommended by the manufacturer and:
   a. Mix the components of the sealer thoroughly in accordance with the manufacturer's recommendations, using a power operated paddle mixer for sufficient time to produce a homogeneous mass without entrapped air;
   b. Dispense the sealant into the groove as soon as practicable after mixing and within the time recommended by the manufacturer.

**EXT2.W1050.8 FINISHING JOINTS**

Remove excess joint sealant, using a purpose made finishing tool, so that the finished surface of the sealant is between 4 mm and 6 mm below the surface of the slab.

**PROTECTION**

**EXT2.W1110.8 PEDESTRIAN LOADS**

Immediately after the application of the concrete curing system:

1. Fence the carriageway off from pedestrian traffic; and
2. Cover the carriageway with protective sheeting, lapped and held securely in position in such a manner as to prevent damage to the carriageway, for at least 24 hours.

**EXT2.W1120.8 LOADS FROM PLANT AND MATERIALS**

Do not apply loads from materials not forming part of the permanent works or from construction plant and other vehicles until:

1. At least 7 days after concreting;
2. All joints have been permanently or temporarily sealed or protected.

**TOLERANCES**

**EXT2.W1210.8 GENERAL**
Refer to Appendix H "Schedule of Tolerances" to this Specification.

**WORKS OUTSIDE SITE BOUNDARY**

**EXT2.W1310.8 APPROVED CONTRACTOR FOR PUBLIC WORKS**
Concrete carriageway works required to be carried out by a contractor or sub-contractor who is on the current List of Approved Contractors for Public Works for Roads and Drains are specified in Project Specific Specification.

**EXT2.W1320.8 SPECIFICATION**
Carry out the works specified under EXT2.W1310 in accordance with Sections 6, 10, 14, 15 and 16 of the Hong Kong Government General Specification for Civil Engineering Works (2006 Edition) and its amendments published 42 days prior to the date for the return of tenders unless otherwise specified.

**EXT2.W1330.8 HANDING OVER INSPECTION**
Notify the CM to arrange with Highways Department for a joint handing over inspection. Allow the CM to give at least 2 working days advance notice for this inspection.

**EXT2.W1340.8 RECORD DRAWINGS AND TEST REPORTS**
Provide as-built record drawings and all test reports to the CM for submitting to Highways Department.
TESTING

TRIAL MIX CONCRETE

EXT2.T010.8 WORKABILITY
Ensure that trial mix concrete complies with the following requirements:
1. Each of the six slump values: not exceeding 85 mm;
2. Average of the six slump values: not exceeding 80 mm.

TRIAL LENGTH OF CARRIAGEWAY

EXT2.T110.8 GENERAL
1. Construct a trial length of carriageway to demonstrate that the proposed materials, mix design, methods of production and methods of construction will produce a carriageway complying with the Drawings and this Specification;
2. For construction of the trial length, use all the materials, mix design, methods of production and methods of construction submitted for Approval;
3. Construct the trial length over a width of two bays and include at least one expansion joint, one contraction joint and the longitudinal joint between the bays.

EXT2.T120.8 LOCATION
Unless shown otherwise on the Drawings, construct the trial length as the first 30 m of the permanent carriageway, or such other length as Approved.

EXT2.T130.8 NOTIFICATION
Inform the CM at least 48 hours, or whatever shorter period is agreed with him, before commencing the construction of the trial length.

EXT2.T140.8 COMPLETION
Complete the trial length in sufficient time before the permanent carriageway is constructed to allow the CM a period of at least 7 days to determine if the specified requirements have been complied with in the trial length.

EXT2.T150.8 PROTECTION
1. Protect the trial length from damage and retain it in position unless otherwise Instructed;
2. Do not remove a trial length which forms part of the permanent carriageway and which complies with the specified requirements.

TESTS ON THE TRIAL LENGTH

EXT2.T210.8 ALIGNMENT, LEVEL, SURFACE REGULARITY AND TEXTURE DEPTH
1. Survey the trial length to determine the accuracy of the alignment and level;
2. Test the surface regularity as EXT2.T810 to EXT2.T850;
3. Test the texture depth as EXT2.T910 to EXT2.T1010.

EXT2.T220.8 CONCRETE CORES
1. Take concrete cores from the trial length to determine:
   a. The thickness of the slab;
b. The positions of the reinforcement and the joint components;
c. The amount of segregation of the constituents;
d. The amount of voids.

2. Take, prepare, inspect and test the cores as EXT2.T310 to EXT2.T340.

EXT2.T230.8 COMPLIANCE CRITERIA
The results of tests on trial lengths must comply with the following:
1. Alignment, levels and slab thickness: as EXT2.W1210;
2. Surface regularity: as EXT2.T850;
3. Texture depth: as EXT2.T1010;
4. Positions of reinforcement and joint components: refer to Appendix H "Schedule of Tolerances" to this Specification;

EXT2.T240.8 NON-COMPLIANCE
If the result of any test on the trial length does not comply with the specified requirements:
1. Submit particulars of proposed changes to the materials, mix design, methods of production or methods of construction to the CM;
2. Construct further trial lengths until the result of every test on the trial length complies with the specified requirements;
3. Make further trial mixes unless, in the opinion of the CM, non-compliance was not due to the trial mix.

EXT2.T250.8 FAILED TRIAL LENGTHS
Unless otherwise permitted by the CM, remove trial lengths, or parts of trial lengths, which do not comply with the specified requirements.

TESTING CORES FROM TRIAL LENGTHS

EXT2.T310.8 TAKING CORES
Take cores in accordance with CS1:2010 as follows:
1. Take cores as soon as the concrete has hardened sufficiently for them to be taken;
2. Provide two cores from each bay and one core from each joint from positions as Instructed;
3. Take 150 mm diameter cores unless otherwise Approved to the full depth of the slab.

EXT2.T320.8 REINSTATEMENT
1. Reinstate core holes using the Approved concrete mix;
2. Repair joints as Instructed.

EXT2.T330.8 INSPECTION
Prepare and inspect cores in accordance with CS1:2010 to determine:
1. The thickness of the slab and the positions of the reinforcement and joint components;
2. Evidence of segregation of the constituents and the presence of voids.

EXT2.T340.8 COMPLIANCE CRITERIA
Cores must not exhibit honeycombing which means interconnected voids arising from, for example, inadequate compaction or lack of mortar.
CONCRETE

EXT2.T410.8 GENERAL
Test to determine the workability and compressive strength in accordance with CON1.T510 to CON1.T670 except in respect of the provisions of the following clauses in this sub-section.

EXT2.T420.8 COMPLIANCE CRITERIA - WORKABILITY
The average slump value of the two specimens taken from one sample of concrete must not exceed that Approved by more than 10 mm.

EXT2.T430.8 SAMPLING FOR COMpressive STRENGTH TESTING
Provide one sample of concrete from each 25 m³ or 25 batches of concrete, or from the amount of concrete produced each day, whichever is the less.

MATERIALS FOR JOINTS

EXT2.T510.8 DEFINITION OF "BATCH"
A batch of joint filler or joint sealant is defined as any quantity of the material of the same type, manufactured by the same manufacturer, covered by the same certificates and delivered to the Site at any one time.

EXT2.T520.8 SAMPLING
1. Provide one sample of each type of joint filler and sealant at the same time as particulars of the material are submitted to the CM;
2. Unless otherwise permitted by the CM, provide one sample of each material from each batch delivered to the Site;
3. Unless otherwise permitted by the CM, provide one sample of mixed joint sealant on each day that joints are sealed;
4. Size of sample of joint filler: sufficient to permit testing in accordance with this Specification;
5. Take samples of unmixed joint sealant and associated primers from sealed containers delivered to the Site. Take samples of mixed joint sealant immediately before the sealant is applied to the joint. Sample in accordance with BS 2499:Part 3:1993, taking samples of the following sizes:
   a. Unmixed joint sealant: 1 kg;
   b. Mixed joint sealant: 1.5 kg;
   c. Primer for joint sealant: 1 litre.

TESTING JOINT FILLER

EXT2.T610.8 TESTING LABORATORY
Employ a laboratory accredited by HOKLAS to carry out the relevant tests.

EXT2.T620.8 SCOPE OF TESTS
Test samples of joint filler, in accordance with the following clauses in this sub-section, to determine the recovery value, the reduction in mass and the extrusion.

EXT2.T630.8 APPARATUS
Use the following apparatus to carry out the tests:
1. Equipment for measuring the plan dimensions of the joint filler, accurate to 0.5 mm;
2. Equipment for measuring the thickness of the joint filler, accurate to 0.1 mm;
3. A balance, accurate to 0.1% of the specimen mass;
4. A compression test machine complying with BS 1610:Part 1:1992, with auxiliary platens, 100 mm × 100 mm and a minimum thickness of 13 mm;
5. An extrusion mould, open on one side only and rigidly fixed to a base plate and:
   a. 100 mm × 100 mm (+0.5 mm, -0.0 mm) internal dimensions;
   b. Sufficiently deep to test the specimen;
   c. Provided with a close fitting pressure plate which fits, without binding;
   d. Provided with a horizontal measuring dial gauge or device, readable and accurate to 0.1 mm.

**EXT2.T640.8 COMPRESSION AND RECOVERY TEST**

Carry out the test as follows:

1. Prepare four specimens from the sample, each 100 mm × 100 mm (±2.5 mm);
2. Measure the thickness \( t_1 \) of the four specimens to the nearest 0.1 mm and weigh two specimens to within 0.1% of their mass \( m_1 \);
3. Subject each specimen to three applications of load in the compression test machine at 24 hour intervals. During each application of the load, compress the specimen to 50% of its original thickness at a strain rate of 1.3 mm per minute. Ensure that the load required to achieve the compression is at least 0.07 N/mm² and does not exceed 10 N/mm². Release the load as soon as the specified compression is achieved;
4. After the third application of the load, allow a recovery period of 30 minutes and then measure the thickness \( t_2 \) of each specimen to the nearest 0.1 mm;
5. Reweigh the two previously weighed specimens to within 0.1% of their mass \( m_2 \).

**EXT2.T650.8 EXTRUSION TEST**

Carry out the test as follows:

1. Prepare one specimen, 100 mm × 100 mm (±0.5 mm);
2. Measure the thickness of the specimen to the nearest 0.1 mm;
3. Place the specimen in the extrusion mould and subject it to one application of the load as **EXT2.T640 (3)**. Measure the extrusion at the open side of the mould to the nearest 0.1 mm, with the gauge or device, when the specimen is compressed to 50% of the original thickness and before the load is released.

**EXT2.T660.8 CALCULATION**

1. Calculate the recovery value \( R \) for each specimen from the following equation:
   \[ R = \frac{t_2}{t_1} \times 100 \%
   \]
   Where:
   \( t_1 \) is the original thickness of the specimen (mm);
   \( t_2 \) is the thickness of the specimen after the third application of load (mm);
2. Calculate the reduction in mass \( M \) of each specimen from the following equation:
   \[ M = \frac{(m_1 - m_2)}{m_1} \times 100 \%
   \]
   Where:
   \( m_1 \) is the original mass of the specimen (g);
   \( m_2 \) is the mass of the specimen after the third application of load (g).

**EXT2.T670.8 TEST RESULTS**

Report the following to the CM:

1. Type and source of filler;
2. The recovery values to the nearest 0.5%;
3. The reductions in mass to the nearest 0.1%;
4. The extrusion to the nearest 0.1 mm;
5. That the test methods used were in accordance with this Specification.

EXT2.T680.8 COMPLIANCE CRITERIA
The results of tests on joint filler must comply with the following requirements:
1. Each of the four specimens in the in the compression and recovery test must have a recovery value of at least 70% and the reduction in mass of the two new specimens must not exceed 1%;
2. The extrusion of the free edge of the specimen must not exceed 6 mm as determined by the extrusion test.

TESTING SEALANTS
EXT2.T710.8 TEST METHOD
Test sealants in accordance with BS 5212:Part 3:1990, for:
1. Application life;
2. Tack-free time;
3. Resistance to flow;
4. Recovery;
5. Adhesion and cohesion in compression and tension;
6. Resistance to heat ageing.

SURFACE REGULARITY
EXT2.T810.8 GENERAL
Carry out testing to determine the surface regularity.

EXT2.T820.8 SCOPE OF THE TEST
1. The surface regularity of the carriageway will be determined by measuring the number of irregularities in the surface;
2. An irregularity is defined as a gap between the surface of the carriageway and a 3 m straight edge placed on the carriageway exceeding the specified amount;
3. Irregularities are measured in millimetres, perpendicular to the straight edge.

EXT2.T830.8 TEST METHODS
1. The longitudinal surface regularity of carriageways with a total length of 75 m or more may be measured using a rolling straight-edge of the type designed by the UK Transport and Road Research Laboratory;
2. The longitudinal surface regularity of carriageways with a total length not exceeding 75 m and the transverse regularity of all carriageways will be measured using a 3 m straight-edge.

EXT2.T840.8 PROCEDURE
1. The longitudinal surface regularity will be measured along lines parallel to the longitudinal axis of the carriageway and approximately 1 m from the near side edge of each carriageway lane;
2. The transverse surface regularity will be measured along lines at right angles to the longitudinal axis of the carriageway at 10 m intervals along the length of the carriageway.
### COMPLIANCE CRITERIA

1. The maximum number of irregularities in the longitudinal direction must not exceed those stated in the following table:

<table>
<thead>
<tr>
<th>Total Length of Carriageway</th>
<th>Size of Irregularity</th>
<th>Permitted N° of Irregularities (Category A Road)</th>
<th>Permitted N° of Irregularities (Category B Road)</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;75 m</td>
<td>&gt;4 mm</td>
<td>$(9 \times \text{total length})/75$</td>
<td>$(18 \times \text{total length})/75$</td>
</tr>
<tr>
<td></td>
<td>&gt;7 mm</td>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>75 m – 300 m</td>
<td>&gt;4 mm</td>
<td>9 in any 75 m length</td>
<td>18 in any 75 m length</td>
</tr>
<tr>
<td></td>
<td>&gt;7 mm</td>
<td>1 in any 75 m length</td>
<td>2 in any 75 m length</td>
</tr>
<tr>
<td>&gt;300 mm</td>
<td>&gt;4 mm</td>
<td>20 in any 300 m length</td>
<td>40 in any 300 m length</td>
</tr>
<tr>
<td></td>
<td>&gt;7 mm</td>
<td>9 in any 75 m length</td>
<td>18 in any 75 m length</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2 in any 300 m length</td>
<td>4 in any 300 m length</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1 in any 75 m length</td>
<td>2 in any 75 m length</td>
</tr>
</tbody>
</table>

Notes:

- Category A roads are those with a legal speed limit greater than 70 kilometres/hour, all other roads being Category B;
- Irregularities greater than 7 mm will also be counted as being greater than 4 mm;
- No irregularity is to exceed 10 mm;

2. There must be no irregularity exceeding 4 mm in a 3 m length in the transverse direction for Category A roads and no irregularity exceeding 7 mm in a 3 m length in a transverse direction for Category B roads.

### TEXTURE DEPTH

**EXT2.T910.8**  
**GENERAL**  
Carry out testing to determine the texture depth.

**EXT2.T920.8**  
**SCOPE OF THE TEST**  
The texture depth of concrete carriageways will be determined by the sand patch test.

**EXT2.T930.8**  
**TIMING OF THE TEST**  
Testing will be carried out at least 2 days after the surface texturing has been carried out and before the area is used by construction plant or other vehicles.

**EXT2.T940.8**  
**TEST LOCATIONS**  
Each carriageway lane will be divided into sections of equal length not exceeding 150 m and testing will be carried out at 10 locations on each section at approximately equal spacing. No measurement will be taken within 300 mm of the longitudinal edges of the sections.

**EXT2.T950.8**  
**PROVISION OF TEST APPARATUS AND MATERIALS**  
Provide all apparatus and materials for the test to be carried out as EXT2.T960 and EXT2.T970.

**EXT2.T960.8**  
**SAND FOR THE TEST**  
Provide dry, natural sand, with a rounded shape, which has been washed and then screened so that it meets the grading stated in the following table:
### EXT2.T970.8 APPARATUS

The test will be carried out using the following:

1. A soft brush;
2. A robust measuring cylinder having an internal diameter of 20 mm ± 2 mm and a flat top surface, such that its internal volume is 25 ml ± 0.1 ml;
3. A flat wooden disc of 65 ± 2 mm diameter with a 1.5 mm minimum thickness hard rubber disc attached to one face and a handle fixed to the other face;
4. A steel rule calibrated to 1 mm;
5. A suitable wind shield;
6. A funnel with an outlet tube at least 100 mm long with a bore of between 4 mm and 6 mm and capable of accepting a volume of at least 200 ml;
7. A steel straight-edge for screeding off the measuring cylinder;
8. A steel-wire brush.

### EXT2.T980.8 PROCEDURE

The test will be carried out as follows:

1. The test location which will be at least 300 mm square will be vigorously brushed at least 10 times in two directions at right angles, using the steel-wire brush, then dried and swept clean with the soft brush;
2. Sand will be poured into the measuring cylinder to fill it to overflowing and any excess screeded off using the straight-edge. All sand on the outside of the cylinder will be removed without dropping any onto the test location. This step of the procedure may, alternatively, be carried out in the laboratory and the sand transferred to a suitable container, ready for pouring;
3. The measured volume of sand will be poured onto the centre of the test location, through the funnel to form a heap, using the wind shield to protect the test location, if necessary;
4. The sand will be spread outwards with a circular motion over the test location, using the rubber faced disc with its face parallel to the carriageway. This will be continued until the patch of sand is approximately circular and will spread outwards no more;
5. The size of the sand patch will be measured to the nearest 1 mm along three diameters which are aligned at approximately 120° to each other;
6. If the difference between the maximum and minimum of the three measurements exceeds 20% of the average of the three measurements, then all the measurements will be discarded and the test repeated in an adjacent location;
7. The test will be repeated for all the 10 test locations for each section of carriageway lane.

### EXT2.T990.8 CALCULATION

1. The texture depth (T) for each test will be calculated from the equation:
   \[ T = \frac{31000}{D^2} \text{ mm} \]
   Where:

<table>
<thead>
<tr>
<th>Test Sieve to BS 410:1986</th>
<th>Percentage by Mass Passing</th>
</tr>
</thead>
<tbody>
<tr>
<td>600 microns</td>
<td>100</td>
</tr>
<tr>
<td>300 microns</td>
<td>95 - 100</td>
</tr>
<tr>
<td>150 microns</td>
<td>0 - 6</td>
</tr>
</tbody>
</table>
D is the average of the three diameter measurements of the sand patch calculated to the nearest mm;
2. The average texture depth for the 10 tests will be calculated.

**EXT2.T1000.8 TEST REPORT**
The test report will comprise the following:
1. Test location;
2. The average diameter of the sand patch for each test to the nearest 1 mm;
3. The texture depth for each test to the nearest 0.1 mm;
4. The average texture depth to the nearest 0.1 mm;
5. Confirmation that the test was carried out in accordance with this Specification.

**EXT2.T1010.8 COMPLIANCE CRITERIA**
The results for each section of carriageway lane must comply with the following requirements:
1. Average texture depth: not less than 0.7 mm; and
2. Not more than one of the 10 measured texture depths less than 0.6 mm.
EXT3  PATHS AND PAVED AREAS

MATERIALS

GENERAL

EXT3.M010.8  APPLICATION OF OTHER SECTIONS
Where applicable comply with the relevant provisions of the following Worksections unless otherwise specified in this Worksection:
1. Earthworks: Worksection EAR1;
2. Sub-bases and bituminous materials: Worksection EXT1;
3. Concrete pavings (including formwork, reinforcement, concreting, jointing and finishing): Worksection EXT2.

EXT3.M020.8  DEFINITION
1. The term "paving unit" is used in this Specification to describe a precast concrete paving slab or interlocking block;
2. Paving units are classified as either Grade A or Grade B in accordance with the following:
   a. Grade A paving units shall comply with all clauses of EXT3;
   b. Grade B paving units shall comply with all clauses of EXT3 except for those requirements specified for Grade A paving units only.
3. Grade A paving units shall be used unless otherwise stated on drawings.

EXT3.M030.8  DETAILS OF UNITS
Submit the following particulars for Approval at least 14 days before commencement of laying:
1. Name and address of manufacturer;
2. Original certification or a certified true copy of the certification to ISO 9001 for the manufacturing plant. If a copy of the ISO certificate is submitted, it shall be certified true by the certification body or by the QCM. The certification body shall either be accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS;
3. A certificate from the manufacturer showing the manufacturer's name and the date and place of manufacture and including results of tests for:
   a. Compressive strength of concrete cubes at 28 days;
   b. Compressive strength of interlocking blocks; and
4. A certificate from the manufacturer showing the source and the particle size distribution of the recycled aggregates;
5. Drawings showing the layout of the units within the paved area;
6. A certificate from the manufacturer showing the results of the following tests for Grade A paving units:
   a. Dimensional deviations of paving slabs to BS 7263-1:2001;
   b. Dimensional deviations of paving blocks to BS 6717:2001;
   c. Slip/skid resistance value of paving slabs to BS EN 1344:2002;
d. Slip/skid resistance value of paving blocks to BS EN 1344:2002 or unpolished slip/skid resistance value of paving block to BS 6717:2001;

e. 24-hour cold water absorption value of paving slabs and blocks to AS/NZS 4456.14:1997; and

7. For interlocking concrete blocks, a statement of compliance from the manufacturer showing that the manufacturer has put in place a system to assure that the paving units contain 20% to 25% of recycled glass cullet by weight of the total aggregates. The statement of compliance shall be issued by an independent assessment body with recognized status (e.g. Hong Kong Productivity Council, Hong Kong Quality Assurance Agency, etc.) and it will only be valid within 6 months from the date of statement issue date. The independent assessment body shall be approved by the CM;

8. Where percentage of recycled aggregates as specified in EXT3.M130 cannot be fully complied with due to shortage in supply of recycled aggregates in the market, the Contractor shall submit the following additional particulars to the CM:

   a. a written confirmation from the manufacturer confirming the shortage in supply of recycled aggregates in the market; and

   b. proposed quantities of paving units for which recycled aggregates as specified in EXT3.M130 cannot be fully complied with.

EXT3.M040.8 SAMPLES

1. Submit samples of each type of paving unit showing the actual size, colour, variation in colour, finish/texture as specified, and general characteristics of the appearance for Approval of the source and type of the units at the same time as the particulars of the units are submitted;

2. The submitted samples of Grade A paving units shall be subject to a visual inspection by the CM and in compliance with the following requirements:

   a. The samples shall not have significant visible differences in colour and texture between samples when examined in accordance with BS 6717:2001;

   b. The samples shall not exhibit defects such as cracking, flaking or dislodging of aggregates when examined in accordance with BS 6717:2001;

   c. Fine materials shall not be easily dislodged from the surfaces of any samples during gentle manual handling; and

   d. The samples shall have sharp and straight edges without any defect.

PAVING MATERIAL

EXT3.M110.8 CONCRETE

As specified in Worksection EXT2: designed mix grade: 30/20.

EXT3.M120.8 BITUMINOUS MATERIALS

As specified in Worksection EXT1.

EXT3.M130.A INTERLOCKING CONCRETE BLOCKS

1. Concrete grade:

   a. Blocks used in footways and cycle tracks: Grade 30/10;

   b. Blocks used in areas subject to vehicular access: Grade 45/10.

2. Aggregates:

   a. The aggregates shall contain not less than 70% by weight of recycled aggregates;
b. The recycled fine aggregates shall constitute not less than 40% by weight of the total recycled aggregates. The recycled glass cullet shall be included as recycled fine aggregates and shall constitute 20% to 25% by weight of the total aggregates;

c. The recycled glass cullet shall all pass a 3.35 mm BS test sieve and shall be integrated with other constituents in such a manner that there is no sharp edge nor burr exposed to put the pedestrian at risk when the paving unit surface is eroded;

d. Coarse recycled aggregates shall be retained on a 5 mm BS test sieve;

e. Fine recycled aggregates shall all pass a 5 mm BS test sieve;

f. The recycled aggregates shall contain not more than 0.5% of wood and other materials less dense than water by using the manual sorting test method in accordance with BRE Digest 433;

g. The recycled aggregates shall contain not more than 1% of other foreign materials (e.g. metals, plastics, clay lumps, asphalt and tar etc.) by using the manual sorting test method in accordance with BRE Digest 433;

h. The recycled aggregates, except recycled glass cullet, shall be recycled from inert construction and demolition materials sourced from the public fill banks managed by the Civil Engineering and Development Department or other sources approved by the CM;

i. The recycled glass cullet shall be produced from glass waste generated from local sources approved by the CM;

j. The nominal maximum aggregate size for concrete in precast units shall be 10 mm.

3. Dimensions:
   a. Size: as shown on Drawings;
   b. Chamfers: not to exceed 5 mm unless otherwise approved by the CM.

4. Shape: rectangular;

5. Vertical nibs:
   a. Provide at least one nib on one of the stretcher faces and one nib on one of the header faces;
   b. Depth of nib to be less than the width of the joint;
   c. Do not include nibs into working dimensions.

6. Colour:
   a. As shown on Drawings and consistent over the paved area, stable and fade resistant under any outdoor climate situations;
   b. Colour pigments for Grade A paving units shall comply with the following requirements unless otherwise approved by the CM:
      i. To BS EN 12878:2005;
      ii. Be UV-stable; and
      iii. Be composed of iron oxides, chrome oxide, titanium oxide or cobalt aluminium oxide.

7. Abrasion resistance for Grade A paving units: not more than 23 mm to BS 6717:2001;

8. Each precast unit shall bear an inscribed mark for the identification purpose that the unit contains recycled glass cullet of 20% to 25% by weight of the total aggregates;

9. Notwithstanding sub-clause (2) above,
   a. The Contractor may propose for the CM's approval the use of recycled fine aggregates without recycled glass cullet in the concrete where there is shortage of supply of recycled glass cullet; and/or
b. The Contractor may propose for the CM's approval the use of virgin aggregates in lieu of recycled aggregates in the concrete when there is a shortage of supply of recycled aggregates.

10. Notwithstanding sub-clause (2) above, subject to the CM's agreement, the Contractor may use recycled fine aggregates without recycled glass cullet in the concrete for the minor repair works to existing concrete pavers;

11. Meeting the test requirements specified;

12. For tactile blocks, slip resistance value shall be determined by Wet Pendulum Test using slider 55 in accordance with AS 4586-2013 and achieve the minimum requirements tabulated below:

<table>
<thead>
<tr>
<th>Gradient of footways</th>
<th>Minimum slip resistance value measured by Wet Pendulum Test</th>

</table>

EXT3.M140.A PRECAST CONCRETE PAVING SLABS

1. Concrete grade: 30/10;

2. Aggregates:
   a. The aggregates shall contain not less than 70% by weight of recycled aggregates;
   b. The recycled fine aggregates shall constitute not less than 40% by weight of the total recycled aggregates;
   c. Coarse recycled aggregates shall be retained on a 5 mm BS test sieve;
   d. Fine recycled aggregates shall all pass a 5 mm BS test sieve;
   e. The recycled aggregates shall contain not more than 0.5% of wood and other materials less dense than water by using the manual sorting test method in accordance with BRE Digest 433;
   f. The recycled aggregates shall contain not more than 1% of other foreign materials (e.g. metals, plastics, clay lumps, asphalt and tar, glass etc.) by using the manual sorting test method in accordance with BRE Digest 433;
   g. The recycled aggregates shall be recycled from inert construction and demolition materials sourced from public fill banks managed by the Civil Engineering and Development Department or other sources approved by the CM.

3. Dimensions:
   a. Size: as shown on Drawings;
   b. Chamfers: not exceeding 5 mm unless otherwise approved by the CM.

4. Shape: as shown on Drawings;

5. Vertical nibs:
   a. Provide at least one nib on one of the stretcher faces and one nib on one of the header faces;
   b. Depth of nib to be less than the width of the joint;
   c. Do not include nibs into working dimensions.

6. Colour:
   a. As shown on Drawings and consistent over the paved area, stable and fade resistant under any outdoor climate situations;
b. Colour pigments for Grade A paving units shall comply with the following requirements unless otherwise approved by the CM:
   i. To BS EN 12878:2005;
   ii. Be UV-stable; and
   iii. Be composed of iron oxides, chrome oxide, titanium oxide or cobalt aluminium oxide.

7. Abrasion resistance for Grade A paving units: not more than 23 mm to BS 6717:2001;

8. Notwithstanding sub-clause (2) above, the Contractor may propose for the CM's approval the use of 100% virgin aggregates, or a mix of any proportions of virgin aggregates and recycled aggregates, in the concrete when there is a shortage of supply of recycled aggregates;

9. Meeting the test requirements specified;

10. For tactile paving slab, slip resistance value shall be determined by Wet Pendulum Test using slider 55 in accordance with AS 4586-2013 and achieve the minimum requirements tabulated below:

<table>
<thead>
<tr>
<th>Gradient of footways</th>

EXT3.M150.8 CLAY BRICK PAVERS

1. To consist essentially of clay or other argillaceous material, and be dried and fired at a high temperature with exposed faces of an extruded, wire cut or pressed finish to the required shape;

2. Dimensions:
   a. Size: as shown on Drawings;
   b. Chamfers: not exceeding 7 mm.

3. Shape: as shown on Drawings;

4. Vertical nibs:
   a. Provide at least one nib on one of the stretcher faces and one nib on one of the header faces;
   b. Depth of nib to be less than the width of the joint;
   c. Do not include nibs into working dimensions.

5. Colour: as shown on Drawings and consistent over the paved area;

6. Type: to BS EN 1344:2002 and as shown on Drawings.

BEDDING, POINTING AND SEALING MATERIALS

EXT3.M210.8 BEDDING SAND

Sand with:

1. Moisture content exceeding 4% but not more than 8% at time of laying;

2. Particle size distribution as stated in the following table:
Particle size distribution of sand for bedding precast units

<table>
<thead>
<tr>
<th>BS test sieve size</th>
<th>Percentage by mass passing</th>

EXT3.M230.8 CEMENT MORTAR SEALING

Consisting of:
1. One part of cement to three parts of fine aggregate by volume together with the minimum amount of water necessary to achieve a consistency suitable for the required work;
2. Fine aggregate of sand or crushed rock to BS 1200:1976 passing a 5 mm BS Test Sieve;
3. Colouring pigment as Approved.

EXT3.M240.8 POLYTHENE SHEETING

Impermeable and having a nominal thickness of 0.125 mm.

ACCURACY AND TOLERANCES

EXT3.M310.8 GENERAL

Refer to Appendix H "Schedule of Tolerances" to this Specification.
WORKMANSHIP

HANDLING AND STORAGE

EXT3.W010.8 PRECAST UNITS
1. Handle and store units on pallets to avoid damage to corners and chamfered edges;
2. Store pallets on a levelled, well-drained and maintained hard-standing ground and in a manner which will not result in damage or contamination of the units;
3. Protect the units from damage and do not use damaged units unless permitted by the CM.

EXT3.W020.8 SAND
Store sand for filling joints between units in waterproof bags and keep under cover until used.

LAYING IN-SITU CONCRETE PAVING

EXT3.W110.8 LAVING
Lay insitu concrete paved areas in bays not exceeding 20 m².

EXT3.W120.8 FINISH
Finish concrete surfaces as follows:
1. Method of producing finish: levelling the surface of the compacted concrete with a screed board, wood floating or power floating the surface and brushing the surface with a stiff brush;
2. Abrupt irregularities permitted: brush marks < 3 mm
3. Gradual irregularities permitted: < 10 mm in 2 m
4. Specific requirement: Rough Texture.

LAYING BITUMINOUS PAVING

EXT3.W210.8 LAVING
1. Lay and compact bituminous materials for footways, cycletracks and paved areas with steel-wheeled and pneumatic-tyred rollers. Compaction shall start before the temperature of the newly laid material falls below 100°C and shall continue until all roller marks have been removed. For locations where rollers cannot operate effectively, compact the bituminous material by hand-operated mechanical compaction plant approved by the CM;
2. Take cores in accordance with EXT1.T510 for the checking of air void content and compacted layer thickness of the bituminous material for works with area of not less than 200 m². For works with area smaller than 200 m² but greater than 50 m², at least 2 cores shall be taken from each layer of bituminous material laid. For works with area less than 50 m², no coring is required unless otherwise instructed by the CM;
3. Test the cores taken in accordance with sub-clause (2) to determine the air void content. The average air void content of the cores shall be not less than 3% nor greater than 9%. If the test result does not comply with the specified requirement, 2 additional cores shall be taken at locations agreed by the CM and the average air void content determined from these 2 cores shall replace the original value for compliance checking. Notwithstanding this, no cores shall have an air void content of less than 2.5% nor greater than 10%;

4. Measure each core taken from the final surfacing layer to determine the compacted layer thickness that shall not deviate by more than 5 mm from the specified thickness. If the measured thickness does not comply with the requirement, 2 additional cores shall be taken at locations agreed by the CM and the average thickness determined from these 2 cores shall replace the original measured value for compliance checking;

5. If no bulk sample is taken for determination of the Rice's specific gravity, the corresponding value obtained from the mix design shall be used in determining the air void content of the core unless other value is suggested by the Contractor and agreed by the Contract Manager;

6. If either the air void content or the compacted thickness of the core is outside the specified limits, the sub-area from which the cores were taken shall be considered as not complying with the requirements specified in this clause.

**LAYING CLAY BRICK PAVERS**

**EXT3.W310.8 LAYING**

1. Do not lay clay brick pavers until the layout has been Approved;

2. Commence laying clay brick pavers in the permanent area after the layout and the method of construction have been Approved, and the trial area is constructed to the satisfaction of the CM pursuant to the specified requirements;

3. Lay clay brick pavers in herringbone pattern with a header course at 90 degrees to all edge restraints, except where adjacent to flush concrete restraining beams and public utility access covers;

5. Lay all full units first and ensure the best laying face is chosen;

6. For clay brick pavers laying over concrete aprons surrounding public utility access covers, lay on a bed of fresh mortar of one part cement to three parts sand, where a minimum bedding sand thickness as specified in **EXT3.W470** cannot be achieved.

**LAYING PRECAST CONCRETE UNITS**

**EXT3.W410.8 LAYOUT**

1. Submit particulars of proposed method of construction for Approval and arrange a trial area to be constructed on site;

2. Commence laying paving slabs or interlocking blocks in the permanent area after the layout and the method of construction have been Approved, and the trial area is constructed to the satisfaction of the CM pursuant to the specified requirements.

**EXT3.W420.8 KERBS AND EDGINGS**

1. Complete bedding of kerbs and edgings prior to laying paving units;

2. Ensure concrete used for in situ concrete kerbs and edgings reaches the compressive strength of at least 20 MPa before units are laid.
**EXT3.W430.8**  
**PRECAUTIONARY MEASURES FOR DRAINAGE**  
Ensure measures are taken to prevent drainage across or through the area of paving during laying, bedding and compaction of the units.

**EXT3.W440.8**  
**FORMATION LEVEL**  
1. Lay units as soon as practicable after completion of formation layers(s);  
2. Protect formation until laying of units commences as Worksection EAR1.

**EXT3.W450.8**  
**INTERLOCKING BLOCK PATTERN**  
Lay interlocking blocks for carriageways and paved areas where vehicles will have access to a herring-bone pattern unless otherwise stated in the Contract.

**EXT3.W460.8**  
**CUTTING UNITS**  
Where cutting of units is required use a mechanical cutting device. Ensure quality of any cut edge is as that for uncut edge with a true line and free from chips and cracks.

**EXT3.W470.8**  
**BEDDING LAYER**  
Lay bedding layer as follows:  
1. Lay a layer of sand, screeded and tamped to a uniform depth, over the complete width of the area to be paved. The quantity of sand must be sufficient to permit screeding to waste and to achieve a tamped thickness which exceeds 20 mm and does not exceed 30 mm;  
2. Do not disturb the sand layer by additional compaction, foot-marks or other damage after the layer has been screeded and tamped to the required level and before the units are laid;  
3. Do not screed and tamp sand more than 1 m in advance of the units which have been laid.

**EXT3.W480.8**  
**BEDDING PAVING SLABS**  
Lay paving slabs as follows:  
1. Lay on the prepared sand layer immediately after screeding and tamping in such a manner that the sand is not disturbed;  
2. Adjust slabs to form uniform joints between 2 mm and 3 mm wide and bed into the final position using a wooden mallet or a plate vibrator fitted with a rubber base-pad;  
3. Do not bed paving slabs closer than 1 m behind the laying edge other than on completion of the paved area against a kerb or edging;  
4. Carry out final levelling of the slabs as soon as practicable after bedding and before changes in the moisture content of the prepared sand layer occur;  
5. Remove and replace damage paving slabs immediately.

**EXT3.W490.8**  
**BEDDING INTERLOCKING BLOCKS**  
Lay interlocking blocks as follows:  
1. Lay on the prepared sand layer immediately after screeding and tamping in such a manner that the sand is not disturbed. Lay interlocking blocks individually on the prepared sand layer by manual methods or in clusters by mechanical methods;  
2. Lay in such a manner that the blocks are not in direct contact with each other and that uniform joints of between 2 mm and 3 mm wide are formed. Bed interlocking blocks flush by at least two passes of a heavy-duty plate compactor fitted with a rubber-pad;  
3. Do not bed blocks closer than 1 m behind the laying edge other than on completion of the paved area, against a kerb or edging;
4. Carry out final levelling of the blocks as soon as practicable after bedding and before changes in the moisture content of the prepared sand layer occur;
5. Remove and replace damaged interlocking blocks immediately.

**EXT3.W500.8 JOINT FILLING AND COMPACTION OF UNITS**

1. After the units have been bedded, spread sand for filling the joints over the surface of the units and brush into the joints in such a manner that all joints are completely filled;
2. Fill joints as soon as practicable after bedding and on the day the units are laid and bedded;
3. Further compact paved areas by at least two passes of a plate compactor fitted with a rubber base-pad after filling the joints to ensure that the joints are completely filled. Add sand as required and compact into the joints;
4. Compact carriageways and paved areas to which vehicles will have access by either one of the following way and add sand as required and brush and compact into the joints:
   a. At least ten evenly-spaced passes of a pneumatic tyred roller having a gross weight of between 10 tonnes and 12 tonnes;
   b. A plate compactor which shall have the following capacity:
      i. Minimum plate area of 0.25 m²;
      ii. Minimum effective force per unit area of plate of 75 kN/m²;
      iii. Frequency of 65 – 100 Hz; and
      iv. Minimum mass of 200 kg.
5. Remove excess sand after completion of compaction;
6. Remove and replace damage units immediately.

**EXT3.W510.8 SEALING AT ABUTMENTS**

Place pigmented mortar or concrete matching colour of paving units, unless otherwise instructed, to the full depth of units to form a seal between units and adjacent kerbs, edgings, quadrants, covers, frames etc.

**EXT3.W520.8 REINSTATEMENT**

Where excavation is to be carried out in paved areas constructed of paving slabs or interlocking blocks, extract the units as follows:
1. Use manual methods for a distance of at least 300 mm beyond the limit of the excavation;
2. Thoroughly clean unbroken units to remove all sand and deleterious material. Stack the units on pallets for re-use;
3. Re-lay units to be re-used in accordance with the relevant requirements of this Worksection.

**PROTECTION**

**EXT3.W610.8 PAVED AREA SURFACES**

Do not permit the use of footways, cycle tracks and other paved areas by constructional plant or vehicles other than those which, in the opinion of the CM, are essential in the construction of subsequent work. In any case do not use such plant and vehicles that will damage or overload the surface.
ACCURACY AND TOLERANCES

EXT3.W710.8 GENERAL
Refer to Appendix H "Schedule of Tolerances" to this Specification.

WORKS OUTSIDE SITE BOUNDARY

EXT3.W810.8 APPROVED CONTRACTOR FOR PUBLIC WORKS
Path and paving works required to be carried out by a contractor or sub-contractor who is on the current List of Approved Contractors for Public Works for Roads and Drains are specified in Project Specific Specification.

EXT3.W820.8 SPECIFICATION
Carry out the works specified under EXT3.W810 in accordance with Sections 6, 9, 10, 11, 14, 15, 16 and 18 of the Hong Kong Government General Specification for Civil Engineering Works (2006 Edition) and its amendments published 42 days prior to the date for the return of tenders unless otherwise specified.

EXT3.W830.8 HANDING OVER INSPECTION
Notify the CM to arrange with Highways Department for a joint handing over inspection. Allow the CM to give at least 2 working days advance notice for this inspection.

EXT3.W840.8 RECORD DRAWINGS AND TEST REPORTS
Provide as-built record drawings and all test reports to the CM for submitting to Highways Department.
TESTING

GENERAL

EXT3.T010.8 QUALITY ASSURANCE SCHEMES
Tests stated in this Worksection may be reduced in number as agreed by the CM if such materials or articles delivered to Site satisfy the following conditions:
1. To bear the stamps of the registered certification trade mark of the BA Institution, known as the BS Kitemark; or
2. To be covered by a manufacturer’s quality assurance scheme stated in the Contract or approved by the CM.

CHARACTERISTIC COMPRRESSIVE STRENGTH OF INTERLOCKING BLOCKS

EXT3.T110.8 DEFINITION OF 'BATCH'

a. A batch of interlocking blocks is any quantity of interlocking blocks of the same type, size and finish, of the same concrete grade, manufactured in the same place, covered by the same certificates stipulated under EXT3.M030 (2) delivered to the Site;
b. Interlocking blocks of different colours can be grouped together to form a batch provided that they are manufactured with the same type of materials and production methods.

EXT3.T120.8 SAMPLES FOR TESTING

1. Provide one sample of interlocking blocks from every 1000 m² of interlocking blocks, or part thereof, in a batch;
2. Number of interlocking blocks in each sample: 8;
3. Carry out sampling at random so that the sample comprises interlocking blocks that are distributed throughout the batch.

EXT3.T130.8 TEST PROCEDURE

Test each sample to determine the characteristic compressive strength at 28 days by means of a load test as follows:
1. Apparatus:
   a. A compression test machine complying with CS1:2010. Bearing faces of the platens on the test machine must be at least as large as the interlocking blocks and with a flatness tolerance of 0.05 mm;
   b. If a test machine with platens smaller than the interlocking blocks is used, auxiliary plates of adequate size must be placed centrally between the platens and the interlocking block to be tested. The flatness tolerance of the bearing faces of the auxiliary platens measured in accordance with CS1:2010 must not be more than 0.05 mm and the thickness of the plates at least 25 mm;
   c. Two pieces of packing, each with a thickness of between 5 mm and 6 mm and dimensions exceeding the interlocking block by between 15 mm and 25 mm. Use plywood, chipboard or medium density hardboard packing.
2. Adopt the following procedure:
a. Cap the interlocking block on the running surface and underside with a suitable capping material in accordance with Clause 15.5.2 of CS1:2010 and immerse in water for at least 24 hours before compression;

b. Place the interlocking block symmetrically on the lower platen of the test machine, between the two pieces of packing with the running surface facing upwards;

c. Apply the load without shock and steadily increase at a constant rate within a stress range of between 150 kPa/s and 700 kPa/s;

d. Record the load at which the interlocking block fractures as the breaking load;

e. Repeat the test for the other blocks.

**EXT3.T140.8 CALCULATIONS**

Make calculations in accordance with the following:

1. Calculate the compressive strength (C) of each interlocking block from the equation:

\[
C = \frac{W}{A} \times \frac{2.5}{15 + \frac{L}{H}} \text{ MPa}
\]

Where:
- W is the breaking load (N)
- A is the nominal gross plan area based on the manufacturing dimensions of the interlocking blocks or the area of the tested portion if the interlocking block size is reduced for testing (mm²)
- L is the lesser of the two plan dimensions (mm)
- H is the thickness of the block (mm)

2. Calculate the unbiased standard deviation (s) from the following equation:

\[
s = \sqrt{\frac{\sum C^2 - n(Cm)^2}{n-1}} \text{ MPa}
\]

Where:
- n is the number of interlocking blocks in each sample
- \( \sum C^2 \) is the sum of the square of the compressive strengths of the n interlocking blocks (MPa)
- Cm is the average of the compressive strengths of the n interlocking blocks

3. Calculate the characteristic strength (Cc) of the batch from the following equation:

\[
Cc = Cm - 1.65s \text{ MPa}
\]

Where:
- Cm is the average of the compressive strengths of the n interlocking blocks and stated in (2) above
- s is the unbiased standard deviation as stated in (2) above.

**EXT3.T150.8 REPORTING**

Report on the following:

1. Source, name of manufacturer and type of blocks;
2. Identification marks of blocks;
3. Date of manufacture of blocks;
4. Nominal gross plan area of each block to the nearest 100 mm²;
5. Nominal height of each block to the nearest mm;
6. Breaking load of each block to the nearest kN;
7. Compressive strength of each block to the nearest MPa;
8. Average of the eight compressive strengths to the nearest MPa;
9. Unbiased standard deviation to the nearest MPa;
10. Characteristic compressive strength to the nearest MPa;
11. That the test method used was in accordance with this Specification.

EXT3.T160.8 COMPLIANCE CRITERIA
The characteristic compressive strength of the interlocking blocks sample must be:
1. 30 MPa for blocks in footways and cycle tracks; and
2. 45 MPa for blocks in carriageways and paved areas to which vehicles will have access.

TRANSVERSE BREAKING LOAD OF CLAY BRICK PAVERS

EXT3.T210.8 DEFINITION OF "BATCH"
A batch of clay brick pavers is any quantity of pavers of the same type and size, of the same strength, manufactured in the same place, covered by the same certificates and delivered to the Site at any one time.

EXT3.T220.8 SAMPLES FOR TESTING
1. No bulk sample shall represent more than 10,000 pavers from the same batch;
2. The sample size of each bulk sample of each type of clay brick pavers for each test shall be as stated in BS EN 1344:2002. The number of specimens in each sample shall be 10.

EXT3.T230.8 TEST PROCEDURE
Test clay brick pavers in accordance with the procedures laid down in BS EN 1344:2002.

EXT3.T240.8 CALCULATIONS
Divide the load by the measured width of each paver, and round the result to the nearest N/mm. Calculate the arithmetic mean of the results from the specimens comprising the test sample to the nearest N/mm.

EXT3.T250.8 REPORTING
Report on the following:
1. Source, name of manufacturer and type of pavers;
2. Identification marks of pavers;
3. Date of manufacture of pavers;
4. Nominal length, width and height of each paver to the nearest mm;
5. Transverse breaking load of each paver to the nearest N/mm;
6. Mean transverse breaking load of the pavers to the nearest N/mm;
7. That the test method used was in accordance with this Specification.

EXT3.T260.8 COMPLIANCE CRITERIA
The mean transverse breaking load of a sample of clay pavers shall not be less than:
1. 30 N/mm with no individual result less than 24 N/mm for Class T2 clay pavers in footways and cycle tracks;
2. 80 N/mm with no individual result less than 50 N/mm for Class T3 clay pavers in carriageways, run-ins and other paved areas to which vehicles will have access, footways and cycle tracks where vehicular loads due to frequent illegal parking or other reasons are anticipated.

BENDING STRENGTH OF PRECAST CONCRETE PAVING SLABS

EXT3.T310.8 DEFINITION OF "BATCH"

a. A batch of precast concrete paving slabs is any quantity of paving slabs of the same type, size and finish, of the same concrete grade, manufactured in the same place covered by the same certificates stipulated under EXT3.M030 (2) delivered to the Site;

b. Paving slabs of different colours can be grouped together to form a batch provided that they are manufactured with the same type of materials and production methods.

EXT3.T320.8 SAMPLES FOR TESTING

1. Provide one sample of paving slabs from every 1000 m² of paving slabs, or part thereof, in a batch;

2. Number of paving slabs in each sample: 8;

3. Carry out sampling at random so that the sample comprises paving slabs that are distributed throughout the batch.

EXT3.T330.8 TEST PROCEDURE

Test precast concrete paving slabs in accordance with the procedures laid down in BS 7263-1:2001:Annex E.

EXT3.T340.8 CALCULATIONS

Calculate the mean strength of the sample to the nearest 0.1 MPa.

EXT3.T350.8 REPORTING

Report on the following:

1. Source, name of manufacturer and type of paving slabs;

2. Identification marks of paving slabs;

3. Date of manufacture of paving slabs;

4. Nominal length, width and height of each paving slab to the nearest mm;

5. Failure load of each paving slab to the nearest 0.1 kN;

6. Strength of each paving slab to the nearest 0.1 MPa;

7. Mean strength of the three paving slabs tested to the nearest 0.1 MPa;

8. That the test method used was in accordance with this Specification.

EXT3.T360.8 COMPLIANCE CRITERIA

1. The mean bending strength of a sample of paving slabs shall not be less than 3.7 MPa; and

2. Bending strengths of individual slabs shall not be less than 3.0 MPa.
**ADDITIONAL TESTS FOR GRADE A PAVING UNITS**

**EXT3.T410.8 DEFINITION OF "BATCH"
**
- a. A batch of paving units is any quantity of paving units of the same type, size and finish, of the same concrete grade, manufactured in the same place covered by the same certificates and delivered to the Site at any one time;
- b. Paving units of different colours can be grouped together to form their respective batches provided that they are manufactured with the same type of materials and production methods.

**EXT3.T420.8 SAMPLES FOR TESTING
**
1. Provide one sample of Grade A paving units from every 1000 m² of the paving units, or part thereof, in a batch, each for the following tests:

<table>
<thead>
<tr>
<th>Test</th>
<th>Number of paving units in each sample</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Dimensional deviation</td>
<td>8</td>
</tr>
<tr>
<td>b. Slip/Skid resistance</td>
<td>5</td>
</tr>
<tr>
<td>c. Water absorption value</td>
<td>10</td>
</tr>
</tbody>
</table>

2. Carry out sampling at random so that the sample comprises paving units that are distributed throughout the batch;
3. The sample can be used for other tests.

**EXT3.T430.8 DIMENSIONAL DEVIATION
**
1. Carry out the test as follows:
- a. Measure the overall dimensions and thickness of each sample of paving blocks to BS 6717:2001;
- b. Measure the overall dimensions and thickness of each sample of paving slabs to BS 7263-1:2001.
2. Compliance criteria:
   Tolerances for the dimensions of each individual paving unit shall be within ±2 mm for length and width, and ±3 mm for thickness.

**EXT3.T440.8 SLIP/SKID RESISTANCE
**
1. Test the slip/skid resistance of each sample of paving units to BS EN 1344:2002;
2. Compliance criteria:
   The mean slip/skid resistance of a sample is specified in Project Specific Specification.

**EXT3.T450.8 WATER ABSORPTION VALUE
**
1. Carry out the test as follows:
   a. Test the 24-hour cold water absorption value of each sample of paving units to AS/NZS 4456.14:1997;
   b. Calculate the characteristic water absorption value (Wc) from the following equation:
      \[ Wc = Wm + 1.65 \times Xs \% \]
      Where:
      - Wm is the average water absorption rate of the sample;
      - Xs is the unbiased standard deviation as stated in AS/NZS 4456.2:1997.
2. Compliance criteria:
The sample shall have a characteristic water absorption value not more than 6% by 24-hour cold immersion method to AS/NZS 4456.14:1997.

SURVEILLANCE TESTS FOR TACTILE BLOCKS AND PAVING SLABS

EXT3.T510.A SURVEILLANCE TEST FOR TACTILE INTERLOCKING CONCRETE BLOCKS
1. Test Arrangements:
   a. When Instructed, surveillance tests shall be carried out by the CM, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the following pertaining to surveillance tests:
      i. Provide attendance on the Site;
      ii. Provide, deliver and collect samples etc. as specified or as directed by the CM.
2. Testing Samples:
   a. Provide one set of test sample for each type of tactile blocks from the batch of material delivered to Site under one delivery note or as instructed by the CM;
   b. One set of test sample shall consist of three tactile interlocking concrete blocks.
3. Testing methods:
   As per EXT3.M130 (12);
4. Non-compliance:
   a. In the event that the testing samples fail to meet the testing requirements, follow either one of the following actions:
      i. Remove the representative batch off Site; or
      ii. Carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 on three separate sets of samples selected by the CM from the representative batch. In case of any one sample fails the re-test, remove the representative batch off Site.
   b. When the representative batch of tactile interlocking concrete blocks is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 for one sample selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clause (4)(a);
   c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.

EXT3.T520.8 SURVEILLANCE TEST FOR TACTILE PRECAST CONCRETE PAVING SLABS
1. Test Arrangements:
   a. When Instructed, surveillance tests shall be carried out by the CM, a Direct Contractor or the Housing Department Material Testing Laboratory;
   b. Comply with the following pertaining to surveillance tests:
      i. Provide attendance on the Site;
      ii. Provide, deliver and collect samples etc. as specified or as directed by CM.
2. Testing Samples:
a. Provide one set of test sample for each type of tactile paving slabs from the batch of material delivered to Site under one delivery note or as instructed by CM;
b. One set of test sample shall consist of three tactile precast concrete paving slabs.

3. Testing methods:
   As per EXT3.M140 (10);

4. Non-compliance:
a. In the event that the testing samples fail to meet the testing requirements, follow either one of the following actions:
   i. Remove the representative batch off Site; or
   ii. Carry out re-test for the representative batch in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 on three separate sets of samples selected by the CM from the representative batch. In case of any one sample fails the re-test, remove the representative batch off Site.
b. When the representative batch of tactile precast concrete paving slabs is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clause (3) in a laboratory that complies with the requirements stated in PRE.B9.570 for one sample selected by the CM from the replacing batch. In case of such test fails, follow action stated in sub-clause (4)(a);
c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.
EXT4 ROUTE INDICATORS

MATERIALS

GENERAL

EXT4.M010.8 STATUTORY REQUIREMENTS
Comply with the following:
1. Road Traffic Ordinance, Cap 374;
2. Road Tunnels (Government) Ordinance, Cap 368; and
3. All their subsidiary legislation.

EXT4.M020.8 DESIGN
Design traffic signs, including letters, characters, numbers, symbols and borders in accordance with the conditions and restrictions imposed by the Commissioner for Transport.

EXT4.M030.8 COMPATIBILITY OF MATERIALS
Ensure all materials used in traffic sign construction are mutually compatible with each other.

SUBMISSIONS

EXT4.M110.8 TRAFFIC SIGNS
Submit to the CM the following details at least 14 days prior to fabrication:
1. Manufacturer's name;
2. Details of materials and finishes to be used in the manufacture of the signs.

EXT4.M120.8 ILLUMINATION OF SIGNS
As scheduled or shown on Drawings.

MATERIALS FOR TRAFFIC SIGNS

EXT4.M210.8 STANDARDS
Comply with BS EN 12899:Part 1:2001 except that the requirements for marking signs shall not be applied.

EXT4.M220.8 GENERAL
1. Use only galvanized bolts, nuts, screws and rivets with traffic signs secured to galvanized pedestrian guard railing;
2. Insulate aluminium fixings from ferrous materials with an Approved type non-conductive insulator at least 2 mm thick.

EXT4.M230.8 HOT FINISHED SEAMLESS TUBES

EXT4.M240.8 HOT ROLLED SECTIONS
EXT4.M250.8  HOT ROLLED STRUCTURAL STEEL SECTIONS

EXT4.M260.8  WELDABLE STRUCTURAL STEELS
To BS 4360:1986.

EXT4.M270.8  STAINLESS STEEL
To BS EN 10088-2:2005, Grade 1.4401.

EXT4.M280.8  STAINLESS STEEL TUBES
To BS 6362:1990, suitable for threading in accordance with BS 21:1985; grade: 304 S 11.

EXT4.M290.8  ALUMINIUM ALLOY
Free from defects and surface blemishes and in accordance with the following:
1. Grade: EN AW-6082 in the T6, T651 or T62 tempers;

EXT4.M300.8  WROUGHT ALUMINIUM AND ALUMINIUM ALLOYS SUITABLE FOR GENERAL ENGINEERING PURPOSES

EXT4.M310.8  FACES FOR TRAFFIC SIGNS
Background letters, characters, numerals, symbols and borders to:
1. Be clear cut, sharp edged and free from cracks;
2. Be matched for colour;
3. Provide a uniform appearance by day and by night.

EXT4.M320.8  BACKING PLATES AND SPILL SCREENS
1. Material: aluminium;
2. Thickness: 3 mm.

EXT4.M330.8  RETROREFLECTIVE SHEETING
Class Ref 1 or Class Ref 2 material to BS EN 12899:Part 1:2001, Tables 8 and 9 or Type IX material complying with ASTM D 4956-05.

EXT4.M340.8  NON-RETROREFLECTIVE SHEETING

EXT4.M350.8  PLASTIC SHEETING
An Approved proprietary type.
FIXINGS FOR TRAFFIC SIGNS

EXT4.M410.8 GENERAL
Ensure fixing materials are compatible to the materials that they are to be fixed.

EXT4.M420.8 ISO METRIC BLACK HEXAGON BOLTS, SCREWS AND NUTS
To BS 4190:2001.

EXT4.M430.8 ISO METRIC BLACK CUP AND COUNTERSUNK HEAD BOLTS AND SCREWS WITH HEXAGON NUTS
To BS 4933:1973.

EXT4.M440.8 METAL WASHERS
To BS 4320:1968.

EXT4.M450.8 RIVETS
To BS 4620:1970.

EXT4.M460.8 BANDING
Stainless steel.

EXT4.M470.8 WROUGHT ALUMINIUM AND ALUMINIUM ALLOYS
Rivet, bolt and screw stock to BS 1473:1972.

EXT4.M480.8 CARBON, CARBON MANGANESE AND STAINLESS STEELS
Specific requirements, general inspection and testing procedures to BS EN ISO 3560-1:2009 for bolts, screws and studs, and to BS EN ISO 3506-2:2009 for nuts.

EXT4.M490.8 BOLT LENGTH
The thread position of bolt to project through the nut by a minimum of one thread and a maximum of four threads.

EXT4.M500.8 RAG AND INDENTED BOLTS

EXT4.M510.8 EXPANSION AND RESIN BONDED BOLTS
An Approved proprietary type capable of withstanding the design loading.

PAINT TO TRAFFIC SIGN FACES

EXT4.M610.8 GENERAL

EXT4.M620.8 PAINTED FINISH
For the following areas on the sign face:
1. Colour: homogeneous and uniform, to BS 381C:1996 and referenced as follows:

<table>
<thead>
<tr>
<th>Colour</th>
<th>Reference Number</th>
<th>Colour Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>537</td>
<td>Signal Red</td>
</tr>
<tr>
<td>Orange</td>
<td>557</td>
<td>Light Orange</td>
</tr>
<tr>
<td>Yellow</td>
<td>355</td>
<td>Lemon Yellow</td>
</tr>
</tbody>
</table>
2. Black:
   a. Type: non-reflective;
   b. Luminance factor: maximum 0.03, measured in accordance with BS EN 12899:Part 1:2001.

**MATERIALS FOR ROAD STUDS**

**EXT4.M710.8 ROAD STUDS**
1. To Road Traffic Ordinance, Cap 374 and its subsidiary legislation;
2. An Approved proprietary type;
3. Permanent reflecting road studs to be used as lane line markers on dual carriageway trunk roads and primary distributor roads must be a type to which traffic cylinders of an Approved type can be attached. The method of attachment must be such that the traffic cylinder can be easily detached from the road stud;
4. Temporary reflecting road studs to be used as markers for temporary traffic routes must be yellow.

**EXT4.M720.8 BITUMEN GROUT FOR ROAD STUDS**
1. Comprising:
   a. Bitumen:
      i. Bitumen content: 25 to 30% of the total mass;
   b. Hydrated lime filler:
      i. Percentage by mass of hydrated lime passing a 75 micron BS test sieve: minimum of 85%.
2. Properties:
   a. Penetration at 25°C: 12±4;
   b. Softening point: 105°C ± 5°C;
   c. Specific gravity: not to exceed 1.8.
WORKMANSHIP

DELIVERY AND STORAGE OF MATERIALS

EXT4.W010.8 TRAFFIC SIGNS
Store sheets in a dry, weatherproof store in a manner which will not result in damage or deformation. Separate traffic signs which are stored together by the use of slip sheets.

FABRICATION OF TRAFFIC SIGNS

EXT4.W110.8 POSTS
1. Colour:
   a. Beacons at zebra crossings: paint with alternate black and white stripes;
   b. Other posts:
      i. Paint grey in accordance with BS 5252F:1976, Code 18B19; or
      ii. Galvanize to BS EN ISO 1461:2009 and comply with EXT7.W020. Treat galvanized areas affected by cutting and drilling using an Approved method;
2. Length:
   a. Posts supporting external luminaries: length protruding above top of signs to be as short as practicable;
   b. Other posts: must not protrude above the top of signs.

EXT4.W120.8 BACKING PLATES
1. For signs not exceeding 1200 mm high x 2400 mm wide fabricate from a single sheet;
2. For signs exceeding 1200 mm high x 2400 mm long use a minimum number of sheets, rectangular in shape and approximately the same size;
3. Drill holes in the backing plate prior to painting or the application of retroreflective or non-reflective sheeting.

EXT4.W130.8 SPILL SCREENS
1. Extend spill screens to the entire width of the backing plate;
2. Cut corners to the same radius as the corners of the backing plate;
3. Consider spill screens to be part of the backing plate and design stiffeners and mountings to accommodate the combined size.

EXT4.W140.8 FACES FOR TRAFFIC SIGNS
1. Fabricate from a single sheet of retroreflective or non-retroreflective plastic sheeting unless otherwise Instructed;
2. If more than one sheet is required, keep the number of sheets used to a minimum;
3. Fix sheeting material, including letters, characters, numerals, symbols and borders using adhesive. Ensure there are no bubbles, creases, cracks or other blemishes;
4. Fix in accordance with the manufacturer's instructions.

EXT4.W150.8 LACQUER COATINGS
1. Apply to the face of traffic signs at the time of manufacture.
2. Ensure coatings are uniform and continuous.
EXT4.W160.8 PAINT TO TRAFFIC SIGN FACES
1. Thoroughly clean and pre-treat, by anodising, using and etching primer or another approved process, the traffic sign face prior to painting or stoving;
2. Apply a minimum of one undercoat and one finishing coat of paint and stover to a thickness of 0.0315 mm - 0.0375 mm of enamel over a minimum thickness of 0.025 mm of primer. Where light colours are applied over dark colours, apply a minimum of two coats. Ensure the final surface has a uniform thickness, an egg-shell flat finish and is smooth and free from defects.

ASSEMBLY OF TRAFFIC SIGNS

EXT4.W210.8 JOINTS
Weld or join using brackets, nuts, bolts and washers where joints for framework and stiffeners are not an integral part of the backing plate.

EXT4.W220.8 FIXINGS
1. Spacing of rivets and other fixings to be uniform and not to exceed 150 mm around the outside edge of the sheet and 300 mm on cross braces;
2. Use an additional neoprene, nylon or other approved material washer to protect face of sign from metal nuts, bolts, washers and screws.

EXT4.W230.8 COVER PLATES FOR FIXINGS
Use a material of the same colour as the part of the face in which it is in contact.

EXT4.W240.8 CONNECTIONS TO ROAD LIGHTING COLUMNS
When fixing traffic signs to columns do not drill columns.

EXT4.W250.8 BACKING PLATES
1. Connect to posts by an approved method;
2. Drill holes if ferrous components before finishes are applied.

EXT4.W260.8 LACQUER COATINGS
Apply to the edges of holes drilled in plates with plastic sheeting immediately before fixings are inserted.

COVERING OF TRAFFIC SIGNS

EXT4.W310.8 GENERAL
1. Ensure coverings are sufficiently opaque to prevent reflection from the covered sign. Do not remove coverings until instructed;
2. Unless otherwise instructed, blank out the faces of traffic signs which have been erected but do not relate either wholly or in part to the traffic situation in operation.

EXT4.W320.8 METHOD OF COVERING
Where required blank out traffic signs using the following methods:
1. A 1.5 mm thick sheet compatible with the sign material;
2. A self-adhesive plastic film if the sign is to be covered for a period of more than 12 months;
3. An approved loose cover sheet.
**EXT4.W330.8 FIXING COVER SHEETS**

1. Fix using 5 mm diameter stainless steel bolts, washers and nuts or non-ferrous rivets at maximum 600 mm spacing;
2. Pass bolts through 5 x 12 mm diameter plastic distance piece between the face of the sign and the cover plate;
3. Fill holes remaining on the finished face of the sign using blocked rivets;
4. Colour rivet face by an Approved method.

**EXT4.W340.8 PLASTIC FILM**

Fix and remove in accordance with the manufacturer's recommendations. Ensure that the self-adhesive plastic film is compatible with the material it is to be adhered to.

**EXT4.W350.8 LOOSE COVERS**

Fasten securely to the back of the sign. Do not apply tape or adhesive material to the face of the sign.

**INSTALLATION OF ROAD STUDS**

**EXT4.W410.8 ROAD STUDS**

1. Install in accordance with the manufacturer's recommendations;
2. Do not install road studs until concrete work has reached the specified grade strength;
3. Ensure surfaces to which bonded road studs are to be fixed are clean, and free from dust, grease and other deleterious matter prior to installation of the road studs.

**EXT4.W420.8 DEPRESSIBLE ROAD STUDS**

Fix in place with bitumen grout.
TESTING

TESTING TRAFFIC SIGNS

EXT4.T010.8 TESTING
In accordance with BS 873: Part 1:1983 and:
1. The number of signs tested to be as Instructed or indicated on the Drawings;
2. The number and type of tests to be carried out on the traffic signs to be as Instructed;
3. Carry out testing in such a manner that will not cause damage to the traffic signs;
4. Carry out testing at an Approved laboratory.

EXT4.T020.8 COMPLIANCE CRITERIA
The results of tests of traffic signs must comply with BS 873:Part 1:1983.
EXT5  KERBS, EDGINGS AND QUADRANTS

MATERIALS

KERBS, EDGINGS AND QUADRANTS

EXT5.M010.8  INSITU CONCRETE
1. Kerbs, edgings and quadrants: concrete grade 30/20;

EXT5.M020.8  PRECAST CONCRETE
Hydraulically pressed and complying with BS 7263:Part 1:1990, excluding the testing of water absorption and:
1. Nominal length of kerbs: 1000 mm;
2. Nominal length of edgings: 750 mm.

EXT5.M030.8  GRANITE
Kerbs, edgings and quadrants:
1. Worked straight or circular;
2. Corners: square;
3. Top front and back edges: parallel;
4. Ends: chisel-dress square to form a close butt-joint with adjacent kerbs and:
   a. Depth on the front face: 140 mm minimum;
   b. Depth on the back face and full width of the top face: 75 mm minimum.
5. Length: 600 mm minimum.
WORKMANSHIP

PRECAST CONCRETE AND GRANITE KERBS, EDGINGS AND QUADRANTS

EXT5.W010.8 LAYING
1. Lay on a regulating layer of cement mortar;
2. Thickness: 10 mm minimum and not exceeding 40 mm.

EXT5.W020.8 JOINTS
1. Generally:
   a. Not exceeding 10 mm in width;
   b. Filled and flush pointed with cement mortar.
2. Expansion joints on bridge decks: as shown on the Drawings;
3. Transverse expansion and contraction joints laid on or adjacent to concrete carriageways: in accordance with Worksection EXT2.

EXT5.W030.8 RADIUS KERBS
Use for kerbs less than 10 m external radius.

INSITU KERBS, EDGINGS AND QUADRANTS

EXT5.W110.8 LAYING
Construct in accordance with BS 5931:1980 and lay using an Approved type of automatic extrusion machine or by other Approved alternative method.

EXT5.W120.8 FINISHING
1. Kerbs, quadrants and edgings must have regular sides, edges, arrises and chamfers;
2. Finish concrete surfaces as follows:
   a. Method of producing finish: levelling the surface of the compacted concrete with a screed board and steel trowelling the surface under firm pressure or power floating the surface;
   b. Abrupt irregularities permitted: Nil;
   c. Gradual irregularities permitted: <5 mm in 2 m;
   d. Specific requirement: Uniform, dense and smooth surface, free from trowel marks. No staining or discolouration.
3. Do not finish or dress kerbs, edges and quadrants with cement mortar.

EXT5.W130.8 JOINTS
1. Generally: flush pointed with cement mortar;
2. Contraction joints: form at intervals not greater than 4 m;
3. Transverse expansion and contraction joints laid on or adjacent to concrete carriageways: in accordance with Worksection EXT2.
KERBS, EDGINGS AND QUADRANTS

GENERAL
Refer to Appendix H "Schedule of Tolerances" to this Specification.

WORKS OUTSIDE SITE BOUNDARY

APPROVED CONTRACTOR FOR PUBLIC WORKS
Kerbs, edging and quadrant works required to be carried out by a contractor or sub-contractor who is on the current List of Approved Contractors for Public Works for Roads and Drains are specified in Project Specific Specification.

SPECIFICATION
Carry out the works specified under EXT5.W310 in accordance with Sections 6, 9, 10, 11, 14, 15, 16 and 18 of the Hong Kong Government General Specification for Civil Engineering Works (2006 Edition) and its amendments published 42 days prior to the date for the return of tenders unless otherwise specified.

HANDING OVER INSPECTION
Notify the CM to arrange with Highways Department for a joint handing over inspection. Allow the CM to give at least 2 working days advance notice for this inspection.

RECORD DRAWINGS AND TEST REPORTS
Provide as-built record drawings and all test reports to the CM for submitting to Highways Department.
EXT6 CONCRETE PROFILE BARRIERS

MATERIALS

EXT6.M010.8 CONCRETE MIX
Grade 30/20 as Worksection CON1.

EXT6.M020.8 FORMWORK
Use steel formwork unless otherwise permitted by the CM. Do not loosen or remove formwork until at least 7 hours after completion of concreting.

EXT6.M030.8 CONCRETE FINISH
Finish concrete surfaces as follows:
1. Unformed concrete surfaces, Class U5, as follows:
   a. Method of producing finish: Level the surface of the compacted concrete with a screed board, wood float or power float the surface and steel trowel the surface under firm pressure or power float the surface;
   b. Abrupt irregularities permitted: nil;
   c. Gradual irregularities permitted: < 5 mm in 2 m;
   d. Specific requirements: uniform, dense and smooth surface, free from trowel marks, no staining or discolouration.
2. Concrete surfaces for transverse joints, use Class F3 as follows:
   a. Type of formwork normally used: plywood; Note: formwork of this type will normally produce a concrete surface which complies with the characteristics of finish stated but other types of formwork may be used to produce the specified finish.
   b. Formwork pattern: pattern of formwork joints and tie holes as stated in sub-clauses (4) and (5) below;
   c. Abrupt irregularities permitted: < 3 mm;
   d. Gradual irregularities permitted: < 5 mm in 2 m;
   e. Specific requirements: even surface, no grout runs.
3. Exposed concrete surfaces, use Class F5 as follows:
   a. Type of formwork normally used: sealed plywood Note: formwork of this type will normally produce a concrete surface which complies with the characteristics of finish stated but other types of formwork may be used to produce the specified finish;
   b. Formwork pattern: pattern of formwork joints and tie holes as stated in sub-clauses (4) and (5) below;
   c. Abrupt irregularities permitted: < 2 mm;
   d. Gradual irregularities permitted: < 3 mm in 2 m;
   e. Specific requirements: even surface, uniform, dense and smooth surface, no grout runs, no grain pattern, no crazing, no blemishes, no staining or discolouration.
4. Panel joints: formwork panels for the finishes in sub-clauses (2) and (3) above shall be the same size and shall form a regular pattern approved by the CM. The lines of joints between panels shall be straight and continuous, horizontal and vertical, or inclined to suit the pattern of profiled formwork, and shall be coincident with construction joints and other joints and with recesses in the concrete surface. The number of make-up pieces shall be kept to a minimum;

5. Tie holes: holes left by formwork ties and components in concrete surfaces with the finishes in sub-clauses (2) and (3) above shall be in line horizontally and vertically and shall form a regular pattern approved by the CM. Unless otherwise permitted by the CM, holes in profiled formwork shall be located in such a manner that the holes are completely within recesses in the concrete surface.

EXT6.M040.8 JOINTS IN CONCRETE PROFILE BARRIERS
Form joints:
1. At locations which coincide with expansion or construction joints in the adjoining structure or carriageway; or
2. At intervals not exceeding 12 m, whichever is less; and
3. In accordance with the appropriate provisions of Worksection CON6.

EXT6.M050.8 PROTECTIVE POLYTHENE SHEETING
Impermeable polythene sheeting with a nominal thickness of 0.125 mm.

EXT6.M060.8 CEMENT MORTAR
Cement mortar consisting of one part of cement to three parts of fine aggregate by volume together with the minimum amount of water necessary to achieve a consistency suitable for the required work. Fine aggregates to be sand or crushed rock to BS 1200:1976 passing a 5 mm BS Test Sieve.
WORKMANSHIP

CONSTRUCTION OF PROFILE BARRIERS

EXT6.W010.8 SLIP-FORMED CONCRETE PROFILE BARRIERS
Construct by slip-form machine between sliding forms to BS 5931:1980. Slip-form machines to comply with BS 5931:1980, Appendix A.

EXT6.W020.8 PRECAST CONCRETE PROFILE BARRIERS
Lay on a cement mortar regulating layer, 10 – 40 mm thick.

SUBMISSIONS

EXT6.W110.8 PARTICULARS OF CONCRETE PROFILE BARRIERS
Submit the following particulars to the CM of the proposed methods of construction of the concrete profile barriers at least 14 days before construction of the concrete profile barriers starts:

1. Particulars of formwork for insitu construction using fixed forms as stated in:
   a. Worksection FOR for works carried out under site formation / road and drainage works contracts; or
   b. Worksection CON2 for all other works not mentioned in sub-clause (1)(a) above.
2. Details of slip-form machine for insitu construction between sliding forms; and
3. Methods of manufacture, handling, transport, storing and fixing in position of precast units.

PROTECTION OF WORKS

EXT6.W210.8 PROTECTION
1. Immediately after the formwork has been removed or the curing compound applied, protect concrete profile barriers with polythene sheeting for at least 24 hours from exposure to conditions which may adversely affect the concrete;
2. Ensure the sheeting is lapped and held securely in position in a manner that will not damage the concrete surface.

TOLERANCES

EXT6.W310.8 GENERAL
1. Refer to Appendix H 'Schedule of Tolerances' to this Specification;
2. Form a smooth alignment of the barriers.
TESTING

TRIALS

EXT6.T010.8 TRIAL LENGTHS
1. Construct trial lengths to demonstrate that the proposed materials, mixes, methods of production and methods of construction will produce concrete profile barriers complying with this Specification;
2. Construct trial length:
   a. In a location separate from the permanent concrete profile barrier; or
   b. Over the first 25 m of the permanent concrete profile barrier; as Instructed;
3. Allow the CM sufficient time, at least 7 days, to determine whether the specified requirements have been produced in the trial area before further material of the same type is used to construct the concrete profile barrier;
4. Construct trial lengths using the same materials, mixes, method of production and methods of construction as the details submitted to the CM;
5. Inform the CM at least 24 hours before constructing trial lengths, or at another interval agreed by the CM;
6. Unless otherwise Instructed to remove, protect trial lengths from damage and leave in position. Do not remove trial lengths which form part of the permanent barrier and which comply with this Specification.

EXT6.T020.8 SAMPLING AND TEST METHODS FOR TRIAL LENGTHS
1. Test the trial length to determine the accuracy of the alignment, the level and the finish of the concrete surface;
2. Cut cores from the trial length to determine the amount of segregation of the constituents and the presence of voids. Take cores as EXT6.T070.

EXT6.T030.8 COMPLIANCE CRITERIA
1. Alignment and levels of barrier: as EXT6.W310;
2. Finish of concrete surface: as the appropriate provisions of EXT6.M030;
3. Amount of segregation of constituent materials and the presence of voids: as the appropriate provisions of Worksection EXT2.

EXT6.T040.8 NON-COMPLIANCE
1. In the event of non-compliance of any trial length with the specified requirements, submit details of proposed changes to the materials, mixes, methods of production or construction, required to meet the compliance criteria. Construct further trial areas as necessary until the result of every test on trial lengths complies with the specified requirements;
2. Unless otherwise Instructed remove trial lengths, or parts of the trial lengths, which do not comply with the specified requirements for the trial length.

EXT6.T050.8 USE IN THE PERMANENT WORKS
1. Notwithstanding the requirements of sub-clause (2) do not place concrete in the permanent barriers until the result of all the tests on the trial length confirm the specified requirements for the trial length;
2. Concrete may be placed in the permanent barriers before the results of tests for compressive strength of the trial mix are available, provided that the result of every other test or the trial mix and trial length complies with the specified requirements for trial mix concrete and for the trial length.

EXT6.T060.8  SPECIFICATION CHANGES

Unless otherwise permitted by the CM do not change the materials, mixes, methods of production and construction required to meet the compliance criteria. Construct further trial lengths to demonstrate compliance of any proposed changes, unless otherwise Instructed.

EXT6.T070.8  CONCRETE CORES FROM TRIAL LENGTHS

1. Provide two concrete cores from each trial length of concrete profile barriers, taken from positions as Instructed;

2. Samples, testing and compliance criteria for concrete cores from trial lengths: as Worksection EXT2.
EXT7 UNTENSIONED BEAM BARRIERS

MATERIALS

SUBMISSIONS

EXT7.M010.8 DETAILS
Submit details of the following, for Approval, at least 14 days prior to installation of beams:

1. A certificate for each batch of beams delivered to Site from the manufacturer in the format of BS 4360:1986 stating the manufacturer’s name, the date and place of manufacture and showing that the beams comply with the requirements of this Specification, including the carbon equivalent values;

EXT7.M020.8 SAMPLES
Submit samples of the following beam barrier materials for Approval of the source and type.

1. Beams;
2. Posts, cleats and struts;
3. Bolts, nuts and washers.

MATERIALS

EXT7.M110.8 UNTENSIONED BEAM BARRIERS
1. Where applicable, steelworks to Worksection STW for works to be handed over to other government departments upon completion as stated in the Contract unless otherwise stated;
2. Steel plates to BS 1449-1.1:1991, Type BHR, and BS EN 10149-3:1996, Grade S315NC capable of withstanding a tensile force of at least 300 kN which will not deflect by more than 40 mm when loaded centrally with a point load of 1 t over a simply supported span of 3 m;
3. Hop dip galvanized with a minimum coating thickness of 85 µm.

EXT7.M120.8 BOLT SLOTS IN BEAMS FOR CONNECTION POSTS
1. Prepare in the workshop by cold saw-cutting;
2. Spacing: 2 m or 4 m as shown on the Drawings;
3. Hot dip galvanized with a minimum coating thickness of 70 µm.

EXT7.M140.8 WELDS FOR END BEAM SECTIONS
Full-penetration butt welds.

EXT7.M150.8 CONCRETE FOR FOOTINGS
As Worksection CON1 and:
1. Concrete mix: Grade 20/20;
2. Finish: Class U5 as EXT7.M170.
EXT7.M160.8 CONCRETE FOR ANCHOR BLOCKS
Grade 20/20 as Worksection CON1.

EXT7.M170.8 FINISH TO CONCRETE SURFACES OF ANCHOR BLOCKS
Finish concrete surfaces as follows:
1. Formed finishes:

POSTS

EXT7.M210.8 POSTS FOR UNTENSIONED BEAM BARRIERS
1. Grade 43A steel to BS 4360:1986;
2. Hot dip galvanized with a minimum coating thickness of 85 µm.

EXT7.M230.8 POSTS FABRICATED FROM HOLLOW SECTIONS
1. Seal by welding mild steel sealing plates over the open ends;
2. Plate thickness: 3 mm.

FIXINGS

EXT7.M310.8 CLEATS AND STRUTS
1. Fabricated from angle sections to BS 4:1980;
2. Material: weldable structural steel to BS 4360:1986:Grade 43A;
3. Hot dip galvanized with a minimum coating thickness of 85 µm.

EXT7.M320.8 BOLTS
To BS 4190:2001, and:
1. Size: M 16;
2. Strength: Grade 4.6;
3. Bolts for beam splicing, connecting beams to posts and for connecting beams to cleats: round or button-headed with oval shoulders;
4. Other bolt types: ISO metric black hexagon type;
5. Hot dip galvanized with a minimum coating thickness of 55 µm;
6. Bolt length: such that the threaded portion of each bolt projects through the nut by not more than four threads;
7. Rag, indented and expansion bolts and resin bonded bolts: Approved proprietary type and capable of withstanding the design loading.

EXT7.M330.8 NUTS
To BS 4190:2001, and:
1. Strength: Grade 4 or 5;
2. Hot dip galvanized with a minimum coating thickness of 55 µm;
3. Tapped 0.4 mm oversize to accommodate galvanized coating.

EXT7.M340.8 WASHERS
Black, mild steel to BS 4320:1968, Form E, F or G and manufactured from steel to BS 1449-1.1:1991 and BS EN 10149-3:1996, Grade S315NC.
EXT7.M350.8  **PLAIN WASHERS**
1. Of dimensions suitable for use with M 16 bolts and nuts;
2. Thickness: 2 mm;
3. Hot-dip galvanized with a minimum coating thickness of 55 µm.

EXT7.M360.8  **SHAPED WASHERS**
To BS 3468:1986 and shaped to fit the curvature of circular hollow sections used as posts:
1. Material: cast iron;
2. Thickness: 5 mm minimum.
WORKMANSHIP

GENERAL

EXT7.W010.8 STORAGE AND PROTECTION
1. Store beams and posts off the ground on level supports in a manner which will not damage, deform or contaminate the materials;
2. Protect beams and posts from damage and ensure that damaged materials are not used in permanent work unless permitted by the CM.

EXT7.W020.8 HOT DIP GALVANIZING
1. Unless otherwise specified, galvanized coatings to be applied by hot-dip galvanizing to be in accordance with BS EN ISO 1461:2009 with minimum mean coating thickness of 45 microns to 85 microns depending on thickness of article as stipulated in Table 3 of BS EN ISO 1461:2009, unless otherwise specified. The coating thickness to comply with the following Table:

<table>
<thead>
<tr>
<th>Article Thickness</th>
<th>Minimum Mean Coating Thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt; 6 mm</td>
<td>85 μm</td>
</tr>
<tr>
<td>&gt; 3 mm to ≤ 6 mm</td>
<td>70 μm</td>
</tr>
<tr>
<td>≥ 1.5 mm to ≤ 3 mm</td>
<td>55 μm</td>
</tr>
<tr>
<td>&lt; 1.5 mm</td>
<td>45 μm</td>
</tr>
</tbody>
</table>

2. Unless Approved, all components are to be galvanized after welding, drilling and cutting operations are complete;
3. All hot dip galvanizing is to be carried out by galvanizers with ISO 9001 certification. Submit the name of galvanizer for Approval;
4. Submit original invoice/delivery note and galvanizing certification for each delivery. These documents shall include the following information:
   a. Project title/number;
   b. Name of galvanizer;
   c. Types and dimensions of articles;
   d. Quantities.
5. Attach a durable identification tape to each batch of galvanized articles indicating the project title, galvanizing certification number and name of galvanizer.

FORMING FOOTINGS

EXT7.W110.8 COMPACTED EARTH FOOTINGS
1. Deposit and compact the following to obtain a relative compaction of at least 95% throughout:
   a. Sub-base material: to the bottom 250 mm of the foundation pit;
   b. Fine fill material: to the remainder of the pit;
2. Posts: securely fix in position during deposition and compaction of the fill material.

EXT7.W120.8 CONCRETE FOOTINGS
1. Ensure the top surface of the footings is finished level with the adjoining ground;
2. Posts:
a. Surround posts with polyethylene sheeting prior to placing of concrete;
b. Ensure posts are securely fixed in position during concreting.

CONSTRUCTION OF BEAM BARRIERS

EXT7.W210.8 GENERAL
Untensioned beam barriers when delivered to site must be ready for assembly. Beams and posts shall be free from blisters, flux, uncoated spots and other defects.

EXT7.W220.8 INSTALLATION AND FIXING
1. Install beam barriers to a smooth alignment and within 10 mm of the position and height as shown on the Drawings. Ensure transition sections provide a smooth and uniform transition;
2. Curve in the workshop those beams to be installed to a radius less than 45 m;
3. Use rag, indented, expansion or resin bonded bolts for fixing to concrete. Fit bolts into pockets and fill with cement mortar or resin grout;
4. Bolt beam barriers to metalwork.

TOLERANCES

EXT7.W310.8 GENERAL
Refer to Appendix H 'Schedule of Tolerances' to this Specification.
EXT8 ROAD MARKING

MATERIALS

GENERAL

EXT8.M010.8 ROAD MARKING
Road markings are white or yellow continuous or intermittent lines, letters, characters, figures, arrows or symbols marked on the carriageway to guide road users and pedestrian.

EXT8.M020.8 SKID RESISTANCE
The minimum skid resistance of road marking materials when measured in accordance with the method contained in Annex D of BS EN 1436:1998 shall be Class S1.

EXT8.M030.8 FUNCTIONAL LIFE
The functional life of the road-marking material shall be at least 1 year after laying is carried out as defined in BS EN 1436:1998.

THERMOPLASTIC MATERIALS

EXT8.M110.8 HOT APPLIED THERMOPLASTIC MATERIAL
1. Unless otherwise specified in Drawings, use either one of the following materials:
   a. Type ‘A’ - Standard hot applied thermoplastic material;
   b. Type ‘B’ - Alkyd resin hot applied thermoplastic material.
2. Complying with BS EN 1871:2000, with particular attention to the following material properties:
   a. Softening point: Class SP2 when tested in accordance with Annex F of BS EN 1871:2000;
   b. Luminance factor: Class LF4 for white material and Class LF2 for yellow material when tested in accordance with Annex E of BS EN 1871:2000.
3. Solvent-free marking substance supplied in block, granular or powder forms, which can be heated to a molten state and then applied with an appropriate hand or mechanical applicator, and form a cohesive film by cooling;
4. With solid glass beads to BS EN 1423:1998 of reflective index conforming to Class A when determined in accordance with Annex A of BS EN 1423:1998 so that not less than 25% of the volume of material comprises glass beads;
5. Colour: as shown on Drawings.

EXT8.M120.8 CERTIFICATION
When required by the CM, submit, 14 days before the commencement of the Works, a test certificate prepared and signed by an independent laboratory, showing the manufacturer’s name, the place and date of manufacture and certifying that samples taken from the road marking materials to be used in the Contract have been tested and are in compliance with the specified standards.
PREFORMED MATERIALS

EXT8.M210.8 COLD APPLIED ROAD MARKINGS
1. An Approved proprietary type with glass beads to BS EN 1423:1998 of reflective index conforming to Class A when determined in accordance with Annex A of BS EN 1423:1998, applied during manufacture;
2. Colour: as shown on Drawings.

EXT8.M250.8 COLD PLASTIC ROAD MARKINGS
To BS EN 1871:2000. The luminance factor shall be Class LF4 for white material and Class LF2 for yellow material when applied at the manufacturer's state thickness and tested in accordance with Annex A of BS EN 1871:2000.

PAINT

EXT8.M310.8 ROAD MARKING PAINT
1. To BS EN 1871:2000, in particular the following:
   a. Luminance factor: Class LF6 for white material and Class LF2 for yellow material when tested in accordance with Annex A of BS EN 1871:2000;
   b. Difference in luminance factor after UV ageing: Class UV1;
   c. Difference in luminance factor after bleed resistance test: Class BR1.
2. Colour: as shown on Drawings.

ANCILLARY MATERIALS

EXT8.M410.8 TACK COAT
Compatible with the road marking material.

EXT8.M420.8 REFLECTIVE GLASS BEADS FOR SURFACE APPLICATION
WORKMANSHP

PREPARATION FOR ROAD MARKING

EXT8.W010.8 ROAD CONDITION
Ensure that the road surface is clean, dry and free from any loose detritus, mud, old and/or flaking road marking materials or similar extraneous matters.

EXT8.W020.8 CLEANING
When directed, remove oil and grease by high pressure water jetting, shot blasting, grinding or other Approved methods.

EXT8.W030.8 BITUMINOUS SURFACES
No surface preparation is required to bituminous road surfaces which have not been opened to traffic.

EXT8.W040.8 CONCRETE SURFACES
1. If the road has not previously been opened to traffic, remove all curing compound and laitance from the road surface by wire brushing or other Approved method;
2. Apply a tack coat to the road surface in accordance with the manufacturer's recommendations.

EXT8.W050.8 EXISTING ROAD MARKINGS
1. Where road markings are to be replaced by material of a different type, remove the existing material by high pressure water jetting, shot blasting, grinding or other Approved methods; do not mask the existing markings using black paint or similar method;
2. Where road markings are to be replaced by material of a similar type, roughen the existing marking by an Approved method until the thickness of the existing material is reduced by approximately 50%;
3. Carry out the removal or roughening of existing road markings adjacent to any longitudinal or transverse joint by an Approved method which will not damage the joint.

LAYING THERMOPLASTIC MATERIALS

EXT8.W110.8 SUPPLY, DELIVERY AND STORAGE
Ensure that road marking materials are supplied, delivered and stored in accordance with the following:
1. Thermoplastic materials: each container shall be clearly and indelibly marked with the following information:
   a. The name, trade mark or other means of identification of the manufacturer;
   b. Batch number;
   c. Date of manufacturer;
   d. The number and date of the Standard, i.e. BS EN 1871:2000;
   e. Whether reflectorized;
   f. Colour (white, yellow or black);
   g. Chemical description and type of resin;
   h. Maximum application temperature and maximum safe heating temperature;
i. Relative density;
j. The class of its content if applicable;
k. A warning about the use of lead pigment if applicable.

2. Road marking paint material: shall be discarded after expiry of the shelf life;
3. Preformed material: in accordance with the manufacturer's recommendations.

EXT8.W120.8 CODE OF PRACTICE
Prepare thermoplastic road marking materials on site and lay in accordance with clauses 4 and 5 of BS 3262: Part 3:1989.

EXT8.W130.8 AMBIENT CONDITIONS
Do not lay road markings when:
1. The road surface is wet; or
2. When the ambient air temperature in the shade is below 10ºC.

EXT8.W140.8 LAYING PLANT
Ensure that the apparatus employed for the laying of road markings is capable of producing markings to a uniform thickness and width. The marking must have clean edges and be free from streaks, lumps and blisters.

EXT8.W150.8 THICKNESS
Thickness of road markings laid and measured in accordance with Appendices B of BS 3262: Part 3:1989:
1. Screed markings: 4 mm;
2. Sprayed markings
   (other than yellow edge lines): ≥1.5 mm;
3. Sprayed yellow edge lines: ≥0.8 mm.

LAYING PREFORMED MATERIAL

EXT8.W210.8 LAYING COLD APPLIED ROAD MARKINGS
Lay:
1. In accordance with the manufacturer's recommendations;
2. When the surface of the carriageway is dry;
3. To a thickness of at least 1.5 mm.

APPLYING ROAD-MARKING PAINT

EXT8.W240.8 APPLICATION OF ROAD-MARKING PAINT
1. Use road-marking plant only where the use of other road marking material, such as thermoplastic, will affect the functional performance of the road markings and with the written approval of the CM;
2. Apply in accordance with the manufacturer's recommendation;
3. Do not apply road-marking paint for temporary road markings and covering up existing road markings.
PERFORMANCE REQUIREMENTS

EXT8.W270.8 ROAD MARKING PERFORMANCE FOR ROAD USERS
Comply with BS EN 1436:1998, in particular the following:

1. Minimum luminance coefficient under diffuse illumination: Class Q2 and Q3 on asphaltic surface and concrete surface respectively for white markings, and Class Q1 for yellow markings when measured in accordance with Annex A of BS EN 1436:1998;

2. Minimum coefficient of retroreflected luminance for dry road markings: Class R2 and R1 for permanent white and yellow markings respectively, and Class R3 for temporary markings when measured in accordance with Annex B of BS EN 1436:1998;

TEMPORARY ROAD MARKINGS

EXT8.W310.8 GENERAL
1. Use cold-applied performed material for temporary road markings;
2. Use proprietary black tape approved by the CM for covering up existing road markings temporarily during the course of road works;
3. Remove temporary road markings.

EXT8.W320.8 DISPOSAL
Dispose of temporary markings after removal and:
1. Remove all traces of tape from the surface of the carriageway;
2. Make good any existing, permanent road markings to Approval and so that it is safe for traffic to use the road.

REMOVAL OF EXISTING ROAD MARKINGS

EXT8.W360.8 REMOVAL OF EXISTING ROAD MARKINGS BY SHOT-BLASTING
Where directed by the CM to remove the existing road marking by steel shot-blasting, use Approved self-propelled shot-blasting machine with a minimum cleaning path of 350 mm.

TOLERANCES

EXT8.W410.8 GENERAL
Refer to Appendix H "Schedule of Tolerances" to this Specification.
FENCING, GATES AND GUARDRAILS

MATERIALS

GENERAL

EXT9.M010.8 ALTERNATIVE DESIGN
The Contractor may offer an alternative design for the pedestrian guard railing or that which is to be erected as temporary works and shown on the Drawings or detailed in this Specification. Such design must be in accordance with BS 7818, Table 1, Class C.

EXT9.M020.8 SUBMISSIONS
Submit the following details to the CM at least 28 days prior to fabrication:
1. A certificate from the manufacturer stating their name, date and place of manufacture and a statement confirming that the materials comply with the requirements of this Specification; and
2. Details of alternative design proposals as EXT9.M010 where applicable.

EXT9.M030.8 SAMPLES
Submit with the other details required by EXT9.M020 samples of the following for Approval of source and type:
1. Each type of pedestrian guard railing to be used;
2. Mesh infill;
3. Each type of bolt, nut and washer to be used in the fabrication.

FENCING

EXT9.M120.8 GALVANIZED STEEL WIRE FOR FENCING
To BS 4102:1990.

EXT9.M130.8 GALVANIZED WIRE NETTING FENCING
To BS 1485:1983 or of Approved local manufacture.

CONCRETE POSTS

EXT9.M210.8 PRECAST CONCRETE FENCING POSTS
Reinforced concrete to dimensions shown on the Drawings and the following:
1. Concrete: Grade 25/10 as Worksection CON1;
2. Reinforcement: as Worksection CON3;
3. Finish: fair faced as Worksection CON2.
STEEL AND ALUMINIUM FOR GATES, POSTS AND GUARD RAILS

EXT9.M310.8 HOT FINISHED SEAMLESS STEEL TUBES
To BS 6323:Part 31982.

EXT9.M320.8 STEEL TUBES AND TUBULARS SUITABLE FOR SCREWING TO BS 21 PIPE THREADS
To BS 1387:1985.

EXT9.M330.8 HOT ROLLED STEEL SECTIONS

EXT9.M340.8 HOT ROLLED STRUCTURAL STEEL SECTIONS (EQUAL AND UNEQUAL ANGLES)

EXT9.M350.8 WELDABLE STRUCTURAL STEELS
To BS 4360:1986.

EXT9.M360.8 STAINLESS STEEL
To BS EN 10088-2:2005, Grade 1.4401.

EXT9.M370.8 STAINLESS STEEL TUBES
To BS 6362:1990 Grade 316 S 31, and a type suitable for threading in accordance with BS 21:1985.

EXT9.M380.8 ALUMINIUM
1. Grade: H30TF;

EXT9.M390.8 WROUGHT ALUMINIUM AND ALUMINIUM ALLOYS SUITABLE FOR GENERAL ENGINEERING PURPOSES
1. Plate, sheet and strip: to BS 1470:1987;
2. Drawn tube: to BS 1471:1972;

FIXINGS

EXT9.M410.8 TYPE
1. Use only galvanized bolts, nuts, screws and rivets with galvanized pedestrian guard railing;
2. Insulate aluminium fixings from ferrous materials with an Approved type non-conductive insulator at least 2 mm thick.

EXT9.M420.8 ISO METRIC BLACK HEXAGON BOLTS, SCREWS AND NUTS
To BS 4190:1967.

EXT9.M430.8 ISO METRIC BLACK CUP AND COUNTERSUNK HEAD BOLTS AND SCREWS WITH HEXAGONAL NUTS
To BS 4933:1973.
EXT9.M440.8  METAL WASHERS  
To BS 4320:1968.

EXT9.M450.8  RIVETS  

EXT9.M460.8  RIVET, BOLT AND SCREW STOCK  
Wrought aluminium and aluminium alloys to BS 1473:1972.

EXT9.M470.8  BOLT LENGTH  
The thread position of bolt to project through the nut by a minimum of one thread and a maximum of four threads.

EXT9.M480.8  RAG, INDENTED, EXPANSION AND RESIN BONDED BOLTS  
An Approved proprietary type capable of withstanding the design loading.

INFILL PANELS FOR GUARD RAILINGS

EXT9.M510.8  MESH INFILL PANELS  
To BS 4483:1985 and free from surface defects, surface irregularities and mesh misalignment.
WORKMANSHIP

ERECTING FENCING

EXT9.W010.8 LOCATION
Erect fencing to lines and levels as shown on the Drawings.

EXT9.W020.8 ERECTION
Comply with BS 1722:Part 1:1986:Section 3 in respect of:
1. Level of top of fence (sub-section 3.1);
2. Fixing posts and struts (sub-section 3.2);
3. Fixing fencing infill (sub-section 3.3);
4. Fixing gates within fencing (sub-section 3.4);
5. Renovation of damaged coatings (sub-section 3.5).

EXT9.W030.8 FIXING
1. Fix selvage wires at top, bottom and mid points of fencing and strain tight to each straining post by means of eye bolts or other suitable straining device;
2. Strain fence between straining posts and secure to straining and intermediate posts using galvanized mild steel flats fixed with galvanized mild steel bolts, nuts and washers.

FABRICATION, PROTECTION AND INSTALLATION OF PEDESTRIAN GUARD RAILING

EXT9.W110.8 STORAGE AND PROTECTION
1. Store and protect guard railing off the ground on level supports in a manner that will not result in damage, deformation or contamination;
2. Do not use any damaged guard railing in the permanent works unless permitted by CM.

EXT9.W120.8 WELDING
1. Unless otherwise permitted by the CM, do not make welded joints after galvanizing. Where permitted, ensure welded areas are free from scale and slag and treated with an alternative zinc-coating system;
2. Type of weld: fillet;
3. Ensure welded surfaces are clean and flush, prior to application of the protective coating.

EXT9.W130.8 HOT DIP GALVANIZING
Hot dip galvanize all steel components forming pedestrian guard railing to BS EN ISO 1461:2009 with minimum mean coating thickness of 45 microns to 85 microns depending on thickness of article as stipulated in Table 3 of BS EN ISO 1461:2009, unless otherwise specified. Galvanize components after welding, drilling and cutting operations are complete. The coating thickness to comply with the following Table:
FENCING, GATES AND GUARDRAILS

<table>
<thead>
<tr>
<th>Article Thickness</th>
<th>Minimum Mean Coating Thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt; 6 mm</td>
<td>85 μm</td>
</tr>
<tr>
<td>&gt; 3 mm to ≤ 6 mm</td>
<td>70 μm</td>
</tr>
<tr>
<td>≥ 1.5 mm to ≤ 3 mm</td>
<td>55 μm</td>
</tr>
<tr>
<td>&lt; 1.5 mm</td>
<td>45 μm</td>
</tr>
</tbody>
</table>

EXT9.W140.8 INSTALLATION

1. Use guard railing curved in the workshop for radii of less than 45 m. Do not use straight lengths in this application;
2. Fix guard railing to concrete using rag, indented, expansion or resin bonded bolts. Fix bolts into pockets and fill with cement mortar or resin grout;
3. Bolt fix guard railing to metalwork.

ACCURACY AND TOLERANCES

EXT9.W210.8 GENERAL

Refer to Appendix H "Schedule of Tolerances" to this Specification.
EXT10 PLAY/FITNESS EQUIPMENT AND
PLAY SURFACES

MATERIALS

PLAY/FITNESS EQUIPMENT

EXT10.M010.8 PLAY / FITNESS EQUIPMENT

1. Play / fitness equipment in the Specification refers to a proprietary play and / or fitness equipment item, which shall be supplied and installed by an Approved sub-contractor selected by the Contractor from the Housing Authority Play / fitness Equipment Agents Reference List as approved by the HA Play Equipment Review Board (abbreviated as “the List” hereunder), this Approved sub-contractor is hereinafter referred to as the “agent”. The List, listing requirements and guiding principles for reviewing the listing of agents are given in Appendix ……;

2. Play equipment item as mentioned in sub-clause (1) of this clause also refers to a fixed integral physical structure installed in a designated play area that is accessible to users for participation in various play activities such as balancing, climbing, crawling, creeping, spinning, rocking, rotating, tilting, sliding, springing, swinging, etc. thereof. Individual component of a play equipment item refers to any portion of the play equipment that provides a specific play activity;

3. a. A multi-play equipment item is a play equipment item that shall be able to perform the specified ‘core play activities’ and shall comply with the requirements on the number(s) of ‘non-core play activities’ which is / are to be proposed by the Contractor as specified in EXT10.M015 (8)(a)(i);

b. An individual play equipment item is a play equipment item that shall be able to perform the play activity as specified in EXT10.M015 (8)(a)(ii).

4. Fitness equipment item as mentioned in sub-clause (1) of this clause also refers to a fixed integral physical structure installed in a designated fitness area that is accessible to users for participation in various exercise activities complying with the requirements of ‘core exercise activities and ‘non-core exercise activities’ as specified in EXT10.M015 (8)(b). Individual component of a fitness equipment item refers to any portion of the fitness equipment that provides a specific exercise activity;

5. Type and play activity of a play equipment item for respective target user age groups (aged 2-5 and / or 5-12, or adults or elderly), safety margin / use zone and critical fall height (or the free height of fall) in the designed play / fitness area shall be designed in accordance with international standards of safety, namely BS EN 1176:2008 and / or ASTM F1487-11, the latest edition of the standards referred to shall apply;

6. A Play Consultant (PCon) is a company which:

a. Has more than three years of relevant experience in playground safety inspection;

b. Has at least one certified inspector who possesses the qualification of Certified Playground Safety Inspector (CPSI) – National Recreation and Park Association (NRPA), US;
c. Has at least one certified inspector who possesses the qualification of Certified Annual Outdoor Inspector – Register of Play Inspector International Ltd (RPII), UK.

7. Nomination and engagement of PCon:
   a. Nominate a candidate for the CM’s approval to be the PCon and submit the candidate’s declaration of no conflict of interest in carrying out compliance check, safety audit or other duties specified in the Contract;
   b. Upon the CM’s approval, the Contractor shall enter into a written contract for service with the PCon and the contract for service shall be made available for the CM’s inspection upon request by the CM;
   c. In the event that the Contractor fails to comply with any of the requirements in sub-clauses 7(a) and 7(b) above, the Employer shall be entitled to engage a PCon forthwith and deduct all costs, charges and expenses arising from or in connection with the engagement of a PCon in accordance with the Contract and / or recover such costs, charges and expenses as a debt from the Contractor.

8. Nomination and engagement of replacement PCon:
   a. In the event that the PCon employed by the Contractor is unable or refuses to carry out such duties as specified in the Contract or is not performing satisfactorily in the opinion of the CM, the CM may withdraw his approval for engagement of the PCon at any time;
   b. Within seven (7) days of the CM’s notice of withdrawal, nominate a candidate for the CM’s approval to be the replacement PCon and submit the candidate’s declaration of no conflict of interest in carrying out compliance check, safety audit or other duties specified in the Contract;
   c. Upon the CM’s approval, the Contractor shall enter into a written contract for service with the replacement PCon and the contract for service shall be made available for the CM’s inspection upon request by the CM;
   d. In the event that a replacement PCon engaged as per sub-clauses 8(b) and 8(c) above is unable or refuses to carry out such duties as specified in the Contract or is not performing satisfactorily in the opinion of the CM, the CM may withdraw his approval for the replacement PCon at any time;
   e. Within seven (7) days of the CM’s notice of withdrawal of approval for the replacement PCon, nominate a candidate to be engaged as the further replacement PCon as per sub-clauses 8(b) and 8(c) above;
   f. In the event that the Contractor fails to comply with any of the requirements in sub-clauses 8(a) to 8(e) above, the Employer shall be entitled to engage a replacement PCon forthwith and deduct all costs, charges and expenses arising from or in connection with the engagement of a replacement PCon in accordance with the Contract and / or recover such costs, charges and expenses as a debt from the Contractor.

EXT10.M015.8 DESIGN SUBMISSION

1. Before expiry of the …. months from the notified date for commencement of the Works, submit to the CM design proposal provided by the proposed agent(s) selected from the List stated in sub-clause (1) of EXT10.M010 for the designated play / fitness area(s) for the CM's Approval. The Contractor shall obtain the current List from the CM for preparation of design proposal. The design proposal shall:
   a. Include suitable equipment items, fixing details and other builder's works requirements in compliance with the Drawings, the requirements stated in EXT10.M010 and this clause;
   b. Provide information on the international safety standard complied with, the place of origin, place of manufacture, name of manufacturer, brand name, model number and manufacturer's installation manual;
c. Include play equipment item that complies with international standards of safety. The international standards of safety are namely BS EN 1176:2008 and/or ASTM F1487-11 for all aspects including safety margin/use zone, critical fall height (or the free height of fall), separation of age group etc., the latest edition of the standards referred to shall apply. Document and certifications issued by the testing laboratory with international accreditation to prove the compliance of the equipment item, not individual component of the equipment item, with recognised international standards of safety shall be submitted;

d. Include at least one or one third of the total required numbers of equipment items for the respective play/fitness area, whichever is more, which shall be accessible to the disabled or in compliance with the latest Americans with Disabilities Act Accessibility Guidelines for Building and Facilities (ADAAG) or equivalent. Physical barriers shall be provided as far as practicable to separate equipment for different age groups in those areas;

e. Include the audit report of compliance check/safety audit of the design proposal to demonstrate compliance with the international standards of safety in sub-clause (1)(c) above by the appointment of either:
   i. a Play Consultant (PCon) as specified in EXT10.M010 (6); or
   ii. a laboratory accredited under the Hong Kong Laboratory Accreditation Scheme (HOKLAS) or by an accreditation body with mutual recognition arrangements with HOKLAS who is qualified to carry out safety compliance check.

   who shall carry out the compliance check/safety audit on the design proposal in accordance with BS EN 1176:2008 and/or ASTM F1487-11, the latest edition of the standards referred to shall apply, and compile the audit report.

   The compliance check/safety audit shall take into account all elements within the designated play/fitness area including signage, furniture, lamp pole, bollard, boundary fence and planter wall etc. as shown on the Drawings;

f. Include drawings showing bilingual signage in Chinese and English for each designated play/fitness area to indicate the designated user groups and the users’ guides on the proper use of the equipment items.

2. The Contractor shall be responsible for the identification of proposed agent(s).

   *There shall be at least two proposed agents included in the proposal and each shall be involved in play equipment items amounting to at least one third of the total sum of play equipment items for the whole Site;

3. There shall be no more than 3 proposed agents supplying and installing the equipment items for the whole Site;

4. Submit revised design proposal, drawings and relevant information upon comment or where considered necessary by the CM;

5. In the situation if the proposed agent(s) providing the equipment items of the design proposal is suspended or removed from the List before the design proposal is approved, the Contractor shall re-submit a new design proposal;

6. Upon notification in writing by the CM of the Approved design proposal, the Contractor shall engage with the agent(s) in providing the equipment items of the Approved design proposal as the Approved sub-contractor(s) for the supply and installation of the Approved equipment items;

7. Within 28 days from the date of the CM's notification of the Approval of the design proposal, submit detailed information comprising shop drawings and fixing details of the equipment items for the CM's approval;

8. The equipment items included in the design proposal in sub-clauses (1), (4) and (5) of this clause shall be suitable equipment items with detailed functional component type and play/exercise activity meeting, but not be limited to, the following requirements:
a. CPA [ ] as shown on Drawing no. ………………………, in accordance with the international standards of safety * BS EN 1176:2008 / *ASTM F1487-11, the latest edition of the standards referred to shall apply, consisting of …… number(s) of multi-play equipment item(s), and …… number(s) of individual play equipment item(s) with critical fall height of ………. mm, detailed as follows:

i. *Multi-play equipment item [ ] for children with an age range of *2-5 / *5-12 years capable of performing a minimum of …… number(s) of core play activities which are ..........(Insert project specific requirements)....... , and a minimum of …… number(s) of non-core play activities which play activities are to be proposed by the Contractor in the design proposal submission;

ii. *Individual play equipment item [ ] for children with an age range of *2-5 / *5-12 years capable of performing at least one play activity per play equipment item;

| CPA [ ] | Play Equipment Item [ ] |
|----------------|
| Core Play Activity | Component Type | Descriptions |
| Sliding | ……… (type) Slide | Made of ……… (material); (Description of component(s): shape, features and relations with other components) ………………… |
| Climbing | …… (type) Climber | Made of ……… (material); (Description of component(s): shape, features and relations with other components) ………………… |
| Climbing | ……… (type) Staircase / ladder | Made of ……… (material); (Description of component(s): shape, features and relations with other components) ………………… |
| Standing | ……… (type) Deck | Made of ……… (material); (Description of component(s): shape, features and relations with other components) ………………… |
| Cover | ……… (type) Roof | Made of ……… (material); (Description of component(s): shape, features and relations with other components) ………………… |
| Walking | ……… (type) Bridge | Made of ……… (material); (Description of component(s): shape, features and relations with other components) ………………… |
b. Fitness Area [ ] as shown on Drawing no(s). …………………… consisting of:-
  i.  *Elderly fitness equipment item(s) capable of performing a minimum of ……..
      number(s) of core exercise activities which are ..........(Insert project 
      specific requirements)........... , and a minimum of ...... number(s) of non-
      core exercise activities which exercise activities are to be proposed by the
      Contractor in the design proposal submission *with critical fall height 
      of .......... mm;

  ii. *Fitness equipment item(s) capable of performing a minimum of ......
      number(s) of core exercise activities which are ..........(Insert project specific 
      requirements)........... , and a minimum of ...... number(s) of non-core 
      exercise activities which exercise activities are to be proposed by the
      Contractor in the design proposal submission *with critical fall height 
      of .......... mm;

The Contractor may in respect of any fitness area propose a quantity of elderly 
fitness equipment items that does not correspond to the number of core exercise 
activities as long as the required number of core exercise activities and non-core 
exercise activities are fulfilled. For fitness equipment item(s), arrangement 
similar to that for elderly fitness equipment item(s) is also acceptable.

9. Each play / fitness component is counted for one core play / exercise activity only. Play / fitness component once counted as core play / exercise activity shall not be recounted as non-core play / exercise activity.

**EXT10.M020.8 WARRANTY**

The Contractor and the agent for the design, supply and installation of the play / fitness equipment shall separately warrant the Employer in respect of the play / fitness equipment as detailed in Clause SCC7.6 of the Special Conditions of Contract. In particular, the structural integrity of the play / fitness equipment, and the timber parts and polyethylene components thereof shall be subject to the specified periods of warranty.

**PLAY SURFACES - BALL COURT SURFACES**

**EXT10.M110.8 BALL COURT SURFACES**

As scheduled on Drawings.

**EXT10.M120.8 INTERNAL BALL COURT SURFACING**

An Approved proprietary product.

**EXT10.M130.8 EXTERNAL BALL COURT SURFACING**

An Approved proprietary product.

**EXT10.M140.8 MARKING PAINT FOR BALL COURT SURFACES**

An Approved proprietary product.

**ADHESIVE AND FIXINGS FOR BALL COURT SURFACING**

**EXT10.M210.8 ADHESIVES**

1. As recommended by the ball court surfacing manufacturer;
2. Adhesives and adhesive primer shall be in compliance with the prescribed limits of VOC content as set out in the Air Pollution Control (Volatile Organic Compound) Regulation.

**EXT10.M220.8 FIXINGS**

As recommended by the ball court surfacing manufacturer.
PLAY SURFACES - IMPACT ABSORBING SURFACING MATERIALS (IASM)

**EXT10.M310.8 GENERAL REQUIREMENTS**

1. The extent of IASM is shown on the Drawing(s) and shall include safety margin / use zone, underneath and surrounding of the play / fitness equipment as specified in sub-clause (8) of EXT10.M015;

2. In addition to compliance with other requirements stipulated in the Specification for IASM, IASM shall comply with the manufacturers' recommendations for safety, design and installation requirements of the play / fitness equipment under which the surfacing material is to be installed;

3. The IASM shall be in the form of pre-fabricated modular units. Wet-pour IASM applied in-situ shall not be accepted.

**EXT10.M320.8 QUALITY REQUIREMENTS**

1. The quality requirements of IASM are as follows:
   a. A proprietary pre-fabricated synthetic rubber or Ethylene-Propylene-Diene-Monomer (EPDM) product, details as specified by the manufacturer, to comply in all aspects with BS 7188:1998+A2:2009 and / or BS EN 1177:2008, the latest edition of the standards referred to shall apply, and be tested by a recognized laboratory. The laboratory shall be accredited under the Hong Kong Laboratory Accreditation Scheme (HOKLAS) or by an accreditation body with mutual recognition arrangements with HOKLAS for performing the tests on IASM. The laboratory shall issue the test results on all test items in one submission of HOKLAS endorsed test certificates or equivalent. The full scope of accreditation shall be submitted for the CM's Approval and acceptance;
   b. The "critical fall height" (as defined in BS EN 1177:2008) of the IASM on which the play / fitness equipment is placed shall be greater than the "free height of fall" (as defined in ASTM F1292-13 & ASTM F 1487-11) of the play / fitness equipment. The latest edition of the standards referred to shall apply;
   c. The IASM material used shall comply with the toxicity requirement of BS EN 71-3, or DIN18035 Part 6 & 7. Before installation, the Contractor shall submit to the CM the certificate from the manufacturer and the associated test report(s) certifying compliance of the IASM materials with the aforesaid international standards;
   d. The IASM material used shall comply with weathering test requirement of ASTM D4214, D1729, D2616, or UV resistance of DIN EN1297 and DIN EN ISO3386-2.

2. When instructed by the CM, collect samples from the Site prior to the installation of IASM for laboratory tests in accordance as per EXT10.T005.

**EXT10.M330.8 DESIGN SUBMISSION**

1. Before expiry of the …. months from the notified date for commencement of the Works, submit to the CM design proposal(s) from supplier(s) for the IASM to be laid in the designated play / fitness area(s) for each of the area(s) as shown on Drawing no(s). …………… for the CM's Approval. The supplier(s) to be proposed by the Contractor for such purpose shall supply and install IASM. The design proposal shall:
a. Include the IASM catering for the critical fall height requirements in individual designated play / fitness area stated in EXT10.M015 (8) (according to Drawing no(s) …….. or the recommended critical fall height of play equipment submitted in the design proposal whichever the higher), fixing details and other builder's works requirements in compliance with the Drawings, the requirements stated in EXT10.M310, EXT10.M320 and this clause;
b. Provide information including but not limited to the country of origin, place of manufacture, and date of manufacture, manufacturer's instruction on installation, maintenance and inspection procedures of the IASM;
c. Indicate design patterns and maximum critical fall height of IASM in each designated play / fitness areas as shown on Drawing nos. ……………………………

The Contractor shall be responsible for the identification of supplier(s), and there shall be no more than 3 suppliers supplying and installing the IASM for the whole Site;
2. Submit revised proposal, drawings and relevant information upon comment or where considered necessary by the CM;
3. Upon notification in writing by the CM of the Approved design proposal, engage the supplier providing the IASM of the Approved design proposal as the Approved sub-contractor for the supply and installation of the Approved IASM;
4. The supply and installation of the IASM shall comply with international standards of safety. Those international standards of safety are namely BS 7188:1998+A2:2009, BS EN 1177:2008 and / or ASTM F1292-13, ASTM F1487-11 for all aspects including critical fall height etc., the latest edition of the standards referred to shall apply. Document and certifications issued by the accredited international testing laboratory to prove that the IASM is in compliance with recognised international standards shall be submitted. Submit samples of IASM with test certificates to the CM for approval prior to ordering / purchasing.

EXT10.M340.8 DELIVERY
1. The IASM delivered to the Site shall be labelled in batch with country of origin, place of manufacture, date of manufacture etc. by the manufacturer and in good condition with intact packaging by the manufacturer. Any batch / lot / piece of the IASM that was manufactured earlier than a period of 9 months before delivery to the Site shall not be accepted or installed;
2. Submit written confirmation from the manufacturer of the place of origin and relevant documentary evidence such as Delivery Note with batch numbers and Laboratory Test Certificate.

EXT10.M350.8 WARRANTY
The Contractor and Approved sub-contractor for the design, supply and installation of the IASM shall separately warrant the Employer in respect of the IASM as detailed in Clause SCC7.6 of the Special Conditions of Contract.

EXT10.M360.8 APPLICATION OF REQUIREMENTS OF OTHER WORKSECTIONS
Where applicable, comply with the relevant provisions of the following Worksections unless otherwise specified in this Worksection:
1. Earthworks: Worksection EAR1;
2. Sub-bases and bituminous materials: Worksection EXT1;
3. Concrete pavings (including formwork, reinforcement, concreting, jointing and finishing): Worksection EXT2.
WORKMANSHIP

GENERAL

EXT10.W010.8 HANDLING AND STORAGE
Handle and store equipment and surfacing materials carefully as per the manufacturer’s recommendations and in a manner that:
1. Prevents damage to pre-finished surfaces;
2. Retains protective coverings in position;
3. Prevents contact with harmful elements.

EXT10.W020.8 BUILDER'S WORK IN CONNECTION

EXT10.W030.8 FIXING, ASSEMBLING AND LAYING
Carry out any fixing, assembling or laying in accordance with the manufacturer's instructions.

INSTALLATION OF PLAY/FITNESS EQUIPMENT

EXT10.W110.8 GENERAL
1. Install play / fitness equipment in accordance with manufacturer's instructions, which should comply with BS EN 1176: 2008 and / or ASTM F1487-11, the latest edition of the standards referred to shall apply;
2. All materials and workmanship shall be of the respective character, quality or kind required by this Contract and shall be subject to such examinations, measurements or tests as required by this Contract or as ordered by CM. The measurements and tests are to be carried out by the Contractor;
3. The Contractor shall submit to the CM upon the arrival of the play / fitness equipment and signage on Site, the original or certified true copy of manufacturers’ certificates and invoices for verification of the origin of the play / fitness equipment and signage delivered to the Site against the Approved design proposal as stated in EXT10.M015.

EXT10.W120.8 INSTALLATION
1. Ensure play / fitness equipment is placed and fixed in the position and in accordance with safety margin / use zone requirement as shown on the Drawings or to manufacturer's recommendation;
2. Before installing any play / fitness equipment, check and ensure that all permanent draw pits, catch pits, manhole covers and surface channels shall be located outside the safety margin / use zone of the designated play / fitness area as shown on the Drawings and / or Approved design proposal as stated in EXT10.M015. If any permanent draw pits, catch pits, manhole covers or surface channels are found within the safety margin / use zone of the play area, revise the Approved design proposal as necessary to avoid them and re-submit to the CM for approval. Allow sufficient time for any associated checking, re-submission and CM's approval;
3. Upon completion of the installation of play / fitness equipment, the agent(s) shall self-certify that all installed play / fitness equipment on the Site are in compliance with the manufacturer’s instruction of installation as stated in EXT10.M010 and the Approved design proposal as stated in EXT10.M015;
4. Upon completion of the installation of play / fitness equipment, the Contractor shall also include the audit report of compliance check / safety audit for all installed play / fitness equipment within each play area which has to be in compliance with the international standards of safety in EXT10.M015(1)(c) by the appointment of either:

a. A Play Consultant (PCon) as specified in EXT10.M010 (6);

b. A laboratory accredited under the Hong Kong Laboratory Accreditation Scheme (HOKLAS) or by an accreditation body with mutual recognition arrangements with HOKLAS who is qualified to carry out safety compliance check.

who shall carry out the compliance check / safety audit on the completed installation in accordance with BS 7188:1998+A2:2009, BS EN 1177:2008 and / or ASTM F1292-13, ASTM F1487-11, the latest edition of the standards referred to shall apply.

EXT10.W130.8 EXISTING PLAY / FITNESS EQUIPMENT
Dismantle and set aside existing play / fitness equipment(s) that is / are to be retained in a secure enclosure. Re-assemble once the playground surface has been completed.

LAYING OF BALL COURT SURFACES

EXT10.W210.8 GENERAL
Lay the ball court surfaces in accordance with manufacturer's instructions.

EXT10.W220.8 INSPECTION PRIOR TO LAYING SURFACING MATERIALS
1. Inspect existing surface to ascertain suitability to receive the surfacing materials. Ensure the existing surface is clean, free from defects, projections and deleterious material that would affect the laying of the surfacing materials;

2. Carry out all works necessary to ensure correct installation of the surfacing materials;

3. Where applicable, obtain manufacturer's/specialist sub-contractor's agreement to suitability of the bed prior to laying the surfacing materials.

EXT10.W230.8 SURFACES PREPARATION
1. Sweep, clean and prepare base removing all dirt, grease and loose or other extraneous matter;

2. Cut out and fill, using material compatible with the base, all cracks, hollows or other imperfections;

3. Ensure that the base is dry prior to surfacing materials being laid.

EXT10.W240.8 DRAINAGE
Lay base to falls and levels as shown on the Drawings.

EXT10.W250.8 LAYING
1. Recess all fixing bolts and eyelets below the surfacing materials;

2. Ensure no gaps are left between the surfacing materials and the adjoining hard surface;

3. Cut and fit the surfacing materials to form a close and neat joint around edge and all upstands;

4. Ensure the finished surfacing is even and free from irregularities or projections.
EXT10.W260.8 GROUND CLEARANCE
Maintain sufficient ground clearance under all equipment. Adjust height of equipment or level of base if necessary.

EXT10.W270.8 ADHESIVES
Ensure all adhesive and jointing materials used are compatible with the ball court surface and the base material.

EXT10.W280.8 LINE MARKING FOR BALL COURT SURFACES
Employ a specialist recommended by the marking paint supplier to apply line marking in accordance with the paint manufacturer's instructions.

INSTALLATION OF IMPACT ABSORBING SURFACING MATERIALS (IASM)

EXT10.W310.8 GENERAL INSTALLATION REQUIREMENTS
Install the IASM in strict compliance with manufacturer's instructions and specification.

EXT10.W320.8 SAMPLES AND DATA
1. Submit samples of the IASM as stated in EXT10.M330, adhesives and fixings for CM's approval before installation;
2. Before the installation works, submit material testing results as stated in EXT10.T005 and safety data for the adhesive in connection with the installation / laying of the IASM accompanied with the manufacturer's requirements and recommendation on safety precautionary measures.

EXT10.W330.8 SURFACING MATERIAL AND ITS FOUNDATION
1. Lay the IASM in accordance with manufacturer's instructions and ensure all adhesive and jointing materials used are compatible with the IASM and the base material;
2. Prepare the base and foundation properly to receive the IASM in accordance with the manufacturer's requirements;
3. The surfacing material shall fit the designated play / fitness area as shown on the Drawings with no gap and level difference between adjoining IASM units and between the peripheral IASM units and its surrounding surface, and shall also fit closely around all play / fitness equipment (and its posts / fittings).

EXT10.W340.8 DRAINAGE
*Install surface drainage under the IASM as specified in Project Specification and in accordance with the Drawings.
*Lay base to falls and levels as shown on the Drawings.
TESTING

ON-SITE VERIFICATION TEST - IMPACT
ABSORBING SURFACING MATERIALS (IASM)

EXT10.T005.A VERIFICATION TESTING

1. Test Arrangements:
   a. Carry out verification test in an Approved Laboratory when:
      i. Upon delivery of IASM material to site under a Delivery Note;
      ii. During the course of construction when directed by the CM.
   b. Comply with the followings pertaining to tests:
      i. Provide attendance on the Site;
      ii. Provide, deliver and collect samples etc. as directed by the CM or as specified.

2. Testing Samples:
   a. Samples shall be selected by the CM and witnessed by representative of the Contractor;
   b. Collect one set of samples (minimum four whole piece samples for each thickness);
   c. Bear all cost for any replacement samples.

3. Testing Methods:
   a. By a laboratory complying with PRE.B9.570 carried out in accordance with BS 7188:1998+A2:2009, BS EN 1177:2008 and / or ASTM F1292-13, ASTM F1487-11, and BS EN 71-3, or DIN18035 Part 6 & 7 in relation to the toxicity requirement, the latest edition of the standards referred to shall apply, but not limited to, the following quality and performance requirements of the IASM:
      i. Critical fall height;
      ii. Resistance to indentation;
      iii. Ease of ignition;
      iv. Slip resistance;
      v. Toxicity requirement.
   b. The laboratory shall issue to the CM with copy to Contractor the test results on HOKLAS or by an accreditation body with mutual recognition arrangements with ‘HOKLAS Approved Signatory’ test reports, stating the final testing result on all test items with supporting data for each tested item, directly to the CM.

4. Non-compliance:
   a. In the event that any one of the tests fails to meet the test requirements as stated in sub-clause 3(a):
      i. Remove the representative batch off Site, a representative batch means the materials delivered to Site under the same Delivery Note; or
      ii. Apply to the CM for re-test for the representative batch in accordance with sub-clause (1) on three separate samples, each sample with a minimum of four whole pieces and make up of a total of 12 pieces selected by the CM in a laboratory that complies with the requirements as stated in sub-clause (1). In case of any one sample fails the re-test, remove the representative batch off Site.
b. When the representative batch of IASM material is removed off Site, re-deliver and re-test as stated in sub-clause (1);
c. Bear all additional time and costs arising from or in connection with any re-tests.

5. When instructed, further verification tests shall be carried out by the CM, a Direct Contractor or the Housing Department Material Testing Laboratory during the course of construction as directed by the CM.
   a. Comply with the following pertaining to the verification tests:
      i. Provide attendance on the Site;
      ii. Provide, deliver and collect samples etc. as directed by the CM or as specified.
   b. Test Samples as per sub-clause (2);
   c. Test Methods as per sub-clause (3);
   d. Non-compliance as per sub-clause (4).

**EXT10.T010.8 IN-SITU DROP TEST**

1. Upon completion of installation of the IASM, carry out the in-situ drop test on critical fall height in accordance with BS EN 1177:2008 and / or ASTM F1292-13, ASTM 1487-11, the latest edition of the standards referred to shall apply, at random sampling of not more than 5% by area or four pieces of mats / tiles, whichever is larger by area, in each designated play / fitness area, to be agreed with the CM, for each thickness category of IASM installed, inclusive of all ingress / egress, landing zone of the play / fitness equipment and submit to CM the in-situ drop test / re-test results on HOKLAS endorsed test certificates with written certification;

2. Exact locations for carrying out the in-situ test shall be verified by the CM;

3. Non-compliance:
   a. In the event that any in-situ drop test fails to meet the critical fall height requirements, remove and re-install the IASM that failed the test, and take three separate in-situ drop tests of the same designated play area of IASM supplied and installed by the same Approved sub-contractor in sub-clause (1) at three separate locations within the same designated play / fitness area for re-test;
   b. Where any of the re-tests fails to meet the testing requirements as specified in sub-clause (1), all IASM of the same batch supplied and installed by the same Approved sub-contractor represented by the failed mats / tiles shall be removed;
   c. When the representative batch of IASM material is removed off Site, re-install the IASM and re-test the rectified areas in accordance to sub-clauses (1) and (2);
   d. Bear all additional time and costs arising from or in connection with any re-tests.

4. At a date to be agreed with the CM but not prior to the expiry of 18 months from the date of completion of the respective Section of Works as certified by CM, carry out the in-situ drop test on the critical fall height in accordance with the test version in sub-clauses (1) and (2) above. Re-conduct the in-situ drop test(s) on the IASM in accordance with sub-clause (3) should the in-situ drop test fail. Bear all associated costs and time incurred for the retesting required and replacement of sub-standard IASM;

5. Testing of critical fall height should refer to critical fall height of IASM specified and as shown on Drawings.
EXT11 EXISTING VEGETATION TREATMENT

MATERIALS

GENERAL

EXT11.M010.8 ANTI-DESIICCANT SPRAY
Anti-desiccant spray to be approved proprietary water dispersed plastic spray type.

EXT11.M020.8 HESSIAN BINDING
Hessian binding to be natural woven jute, natural brown colour, 150 to 200 mm wide in a continuous roll.

EXT11.M030.8 JUTE STRING
Jute string to be braided jute fibres, total 3 mm diameter, natural brown colour.
WORKMANSHIP

GENERAL

**EXT11.W010.8  SCOPE OF EXISTING VEGETATION TREATMENT**
The extent of works required, conditions of site, tree felling, vegetation treatment, weed and creeper removal etc. and any individual plants requiring treatment and/or transplanting are detailed and shown on Drawings, or as Instructed by CM.

**EXT11.W020.8  PRE-TENDER INSPECTION**
Prior to tendering inspect the site to confirm the extent of the works and that maintenance works specified can properly be carried out.

**EXT11.W030.8  TOOLS AND EQUIPMENT**
Ensure tools and equipment used are sharp and appropriate for the works specified.

**EXT11.W040.8  EROSION**
Carry out all operations taking precautions to prevent erosion and slippage of slopes.

**PREVENTION OF EXISTING TREES AND SHRUBS**

**EXT11.W052.8  PROTECTION OF EXISTING VEGETATIONS**
1. Protect all existing trees, palms, bamboos and other vegetations as shown on Drawings, unless specified or instructed to be pruned or felled by CM;
2. Protect the branch structure, crown and root zone of all existing trees, palms and bamboos to be retained and any overhanging vegetation, unless specified or Instructed to be pruned;
3. Erect necessary structural support constructed with GMS hollow sections or I-beams as directed by CM when working around existing trees to ensure their structural stability and proper growth throughout the construction period.

**EXT11.W055.8  PROTECTION FOR PRESERVED TREES**
Exercise the greatest care to avoid any damage to the preserved trees by complying with the following:
1. Take all necessary precautions to ensure that:
   a. No nails or other fixings shall be driven into the trees, including the exposed tree roots;
   b. No fencing, services, or signs other than the identification labels or markings required under sub-clause (5) of PRE.B8.1116 shall be attached to any part of the trees;
   c. No trees shall be used as anchorages for ropes or chains used in guying or pulling or for equipment used for removing stumps, roots or other trees, or for any other purposes;
   d. No soil, materials, equipment or machinery shall be stockpiled or stored within the tree protection zones;
   e. No site offices, workshops, canteens, containers or similar structures shall be installed within the tree protection zones;
   f. Petrol, oil, bitumen, creosote, cement and other materials likely to be injurious to the trees shall be kept away from the tree protection zones, and any accidental spills of these materials shall be cleaned up immediately;
g. Excessive water shall be drained away from the tree protection zones to prevent damage to tree roots by asphyxiation;

h. The surface on slopes shall be shaped so that water will not drain to the tree trunks but bypass them;

i. No passage or parking of vehicles and no operation of equipment or machinery shall take place within the tree protection zones unless otherwise agreed by the CM;

j. No stripping of surface vegetation or top layer of soil, and no paving or earth filling shall be carried out within the tree protection zones unless otherwise agreed by the CM;

k. No fires shall be lit within the tree protection zones or in a position where the flames will likely extend to within 5 m of foliage, branches or trunks of the trees, taking into consideration the size of the fire and the wind direction;

l. No concrete mixing, gas tank filling, paintbrush and tool cleaning, or equipment maintenance shall be carried out within the tree protection zones;

m. Any necessary scarification or cultivation within the tree protection zones shall be carried out carefully by hand so as not to cause damage to the trees, in particular the bark and the roots;

n. Any equipment, in particular delivery vehicles, overhead cranes, excavation machines, drilling rigs and piling rigs, shall be carefully operated so as not to cause striking of the trunks, branches, foliage or root collars of the trees;

o. The trees to be felled that are adjacent to, or that lie within a continuous canopy of, the preserved trees, shall be carefully removed, and if necessary in sections but not using bulldozers in any circumstances, so as not to cause damage to the preserved trees such as scraping bark off trunks or breaking branches of trees;

p. Do not use herbicides that can leach through the soil, such as the products containing sodium chlorate, and any other herbicides that are injurious to the trees when it is necessary to use herbicides to kill any vegetation;

q. Make allowance for the slope of the ground so that damaging materials such as concrete washings, mortar or diesel oil cannot run towards the trees;

r. Do not use alkaline clays or limestones for filling or paving. Mix concrete on a thick plastic tarpaulin or outside the Site and rinse the mixing trucks out on the Site, so as not to cause changes, in particular increases, in soil pH;

s. Haul away all building debris and chemical wastes for proper disposal. In any circumstances, do not burn or bury them on the Site and do not dispose them by pouring them on the soil within the Site.

2. Repair any damage to the trees in accordance with the requirements stipulated in EXT11.W712;

3. Where the passage or parking of vehicles or the operation of equipment or machinery within the tree protection zones as referred to in sub-clause (1)(i) above is considered necessary and is agreed by the CM, carry out the following measures to reduce soil compaction:
   a. Minimise the traffic of the vehicles, equipment or machinery;
   b. Confine the passage or parking of vehicles or operation of equipment or machinery to the areas laid with temporary protective mulching and also with double, overlapping, thick metal sheet coverings, or other materials of equivalent strength as agreed by the CM, placed on top.

4. Where it is necessary to clear the existing undergrowth within the tree protection zones to allow access and visibility for, and operation of any construction work, comply with the following:
a. Prune shrubs and grass or cut other herbaceous plants to a height of not less than 50 mm above the ground level that they shall not be pulled out by equipment in any circumstances;
b. Obtain CM's agreement prior to commencing the vegetation clearance.
5. Protect the preserved trees, where necessary, from increased exposure to sun and wind due to removal of adjacent trees;
6. Align all routes of the overhead services within the Site and all access routes to the Site or within the Site away from the preserved trees as far as possible and seek the CM's approval to the alignment;
7. Report to the CM of any preserved tree having structural defects or unhealthy or decaying symptoms which may pose danger to the public if the tree falls.

**PHOTOGRAPHIC RECORD OF EXISTING TREES**

1. Provide a full set of photographs of each individually numbered tree as shown on Drawings or as Instructed at the commencement of the Works for the CM's agreement on the existing conditions of the trees. Comply with the following requirements for the photographs:
   a. All photographs shall be date-stamped to indicate the dates that the photographs are taken and shall be well-annotated; and
   b. The photograph of each tree shall show clearly the whole tree as far as possible, the identification number of the tree, and the status of the tree as identified by the labelling or marking system on the Site.

2. Update the photographic record of the non-OVT taken in accordance with sub-clause (5)(e) of PRE.B8.1116 and submit a report on the updated photographic record to the CM at every three months intervals. Comply with the following requirements for the photographic record:
   a. Each of the reports shall comprise all preserved non-OVT;
   b. Each of the reports shall be in the form of an A4-sized, bound document which shall bear a report cover indicating the Contract number, Contract title, and date of the report;
   c. The format of the reports shall be agreed by the CM prior to the submission of the first report;
   d. All photographs shall be date-stamped to indicate the dates that the photographs are taken and shall be well-annotated;
   e. The photograph of each tree shall show clearly the whole tree as far as possible, the identification number of the tree, and the status of the tree as identified by the labelling or marking system on the Site as required in sub-clause (5) of PRE.B8.1116;
   f. Each of the reports shall include details of any damage caused to the trees and any signs of health deterioration of the trees in the reporting period, accompanied with photographic record of the damage and the tree deterioration.

**RECORD OF OLD AND VALUABLE TREE**

1. Engage a Qualified Arborist (QAr) to prepare and submit the monitoring reports on the OVT in accordance with the following requirements:
   a. The timetable for submission of reports shall be as follows:

<table>
<thead>
<tr>
<th>Period</th>
<th>Frequency of submission of monitoring reports</th>
<th>Time frames for submission of monitoring reports</th>
</tr>
</thead>
<tbody>
<tr>
<td>From the date of commencement of the employment of the QAr to</td>
<td>At monthly intervals</td>
<td>Within the first week of each</td>
</tr>
</tbody>
</table>

Specification Library 2018 Edition (Batch 2)
b. The reports shall be in the form of an A4-sized, bound document which shall bear a report cover indicating the Contract number, Contract title, and date of the report and shall be signed by the QAr;

c. The format of the reports shall be agreed by the CM prior to the submission of the first report.

2. Submit method statements for the work, the site activities, and the precautionary or mitigation measures in respect of the OVT, as described in the following items:
   a. Work planned to be carried out to each of the OVT in the next reporting period, including but not limited to the recommended arboricultural work as part of tree maintenance, repair to damage or health deterioration, or precautionary or mitigation measures against damage by site activities;
   b. Other site activities planned to be carried out within the tree protection zone of each of the OVT in the next reporting period, including but not limited to the tree preservation and protection work stipulated in PRE.B8 and EXT11;
   c. Potential damage to the OVT by the site activities planned to be carried in the next reporting period and proposed precautionary or mitigation measures;
   d. Any other details relevant and specific to the purpose of the reports.

3. Obtain the CM's approval prior to the commencement of such works / activities, and ensure that the QAr shall carry out the following:
   a. Provide arboricultural advice in the preparation of the method statements as per sub-clause (2) above and the preparation of any reports on repair of damage of the OVT;
   b. Supervise arboricultural work to the OVT;
   c. Provide on-site advice in relation to site control within the tree protection zones of the OVT and at their adjacent areas.

**EXT11.W075.8 WATERING EXISTING VEGETATION**

Water existing vegetation with non-toxic water to keep it in a healthy condition; during the dry season, water at least three time per week at the rate of 10 litres per sq. m.

**EXT11.W085.8 PRUNING OF EXISTING TREES**

1. Do not carry out pruning to the preserved trees without the prior approval of the CM unless the pruning work is required under the Contract or is directed by the CM. Notify the CM of any preserved trees whose branches interfere with the Works and thus require pruning. Carry out the approved pruning work during the site clearance stage unless otherwise instructed or agreed by the CM;

2. Comply with the following when carrying out the pruning work:
   a. Provide all necessary tools and equipment, and physical support, and take all necessary safety precautions to protect the people engaged in the pruning work as well as the people and property in the vicinity;
   b. For all pruning work to the OVT, the extent of pruning shall be agreed between the QAr and the CM on the Site prior to the commencement of the pruning work and the pruning work shall only be carried out under the supervision of the QAr;
c. Carry out all pruning work in accordance with good horticultural practice and the recommendations of BS 3998;

d. Do the pruning and removal of branches by using sharp, clean implements to give a single flat, sloping face;

e. Trim ragged, rough edges of bark or wood cleanly from around wounds with a sharp knife to the minimum extent that is necessary so as to hasten wound closure, and cut twigs less than 15 mm diameter with sharp secateurs;

f. Carry out pruning with the cut just above and sloping away from an outward-facing healthy bud, and carry out the removal of branch by having the final cut of the last branch segment made just outside the branch collar when it is present or at an angle being the mirror image of the branch bark ridge when there is no branch collar, so that no part of the stem is damaged or torn, and no snags or stumps are left;

g. Remove large branches in stages beginning with the removal of the main weight of the branch from perimeter of crown in towards the trunk and with the final cut of the last branch segment made in a way as described in sub-clause (2)(f) above, without leaving a stub and damaging the bark;

h. Make all cuts to avoid splintering or tearing of bark that would catch water and encourage rot, and cut back cracks, cavities or rotten wood with a clean, sharp implement to remove the dead, damaged and decayed tissue without damaging the living tissue;

i. Do not carry out topping, which is cutting off all of the top branches to the same height, in any circumstances;

j. Unless otherwise instructed by the CM, leave any cuts or wounds uncovered instead of painting them with wound dressing or coating so as to avoid water retention and disease development;

k. Remove any material pruned from the trees away from the Site as soon as possible;

l. Reinstate any adjacent areas affected by the pruning work.

**EXT11.W090.8 CONTROL OF PEST AND DISEASE FOR EXISTING TREES**

1. Take all necessary precautionary measures to protect the preserved trees from pest and disease attack, and all necessary control measures to eradicate pest and disease from the infected trees in the execution of the Works;

2. Before commencing the application of the pest and disease control measures, submit the method statements for the control measures to the CM for approval:

   a. The method statements for the pest and disease control measures shall cover, amongst other aspects as required by the CM, the pesticide or fungicide to be used and any other necessary associated arboricultural work to the infected areas.

3. Commence the application of the control measures only after obtaining the CM’s approval to the method statements;

4. Comply with the following requirements in applying the pest and disease control measures:

   a. Adopt environmental friendly measures; and

   b. Follow strictly the safety precautions as the manufacturer's instruction in using pesticide or fungicide so as to avoid causing danger or harm to the public and the environment.
SITE CLEARANCE

EXT11.W110.8 GENERAL
1. Clear all existing vegetated areas of all rubbish, waste materials and felled timber, including any generated from the works specified herein;
2. Clear all debris, rubbish, silt etc. from drainage channels, catchpits and grilles thereon;
3. Clear each part of the site at times and to the extent required by this Specification and as Instructed;
4. Remove cleared materials from site to a properly designated tip.

EXT11.W120.8 UNDERGROWTH CUTTING
Carry out a complete undergrowth cut and clear scrub and bushes by hand or by Approved mechanical means.

EXT11.W130.8 CREEPER CLEARANCE
Clear all wild creepers entwining existing trees and shrubs and grub up their entire root systems.

REMOVAL OF EXISTING TREES

EXT11.W210.8 GENERAL
Fell diseased and dead trees as shown on the Drawings or as Instructed.

EXT11.W220.8 TREE REMOVAL
Completely remove the tree including the stump to the extent of the depth of the root system below ground, by hand, machine hacking or grubbing out.

EXT11.W230.8 LARGE TREES IN CONFINED SPACES
Carefully take down in sections any large trees in confined spaces or near other trees which are to be retained.

EXT11.W240.8 PROTECTION MEASURES FOR TREES TO BE FELLED/TRANSPLANTED
The limits of site clearance shall be agreed by the CM on the Site before site clearance commences. Comply with the following requirements in respect of tree removal, either by felling or by transplanting:
1. In respect of tree felling, comply with the following:
   a. Fell only those trees earmarked for such under the Contract and labelled for such on the Site pursuant to sub-clause (5) of PRE.B8.1116 or those as directed or approved by the CM;
   b. Take all necessary precautions to protect the people engaged in the tree felling work as well as the people and property in the vicinity;
   c. Fell the trees by cutting them near the ground, with their stumps ground rather than pulled so that the roots of the nearby plants to be retained are not injured;
   d. Remove the stumps and rootballs of the felled trees carefully to avoid causing damage to the roots of the nearby plants to be retained, where it is necessary to have such removal as directed by the CM;
   e. Remove all debris, wood, and roots where necessary pursuant to sub-clause (1)(d) above, from the trees felled from the Site as soon as possible.
2. In respect of tree transplanting either within or off the Site, comply with the following:
a. Transplant only those trees earmarked for such under the Contract and labelled for such on the Site pursuant to sub-clause (5) of PRE.B8.1116 or those as directed or approved by the CM;
b. Commence any work related to tree transplanting on the Site only after having complied with the requirements stipulated to be completed prior to commencing the tree transplanting work.

3. Where it is found necessary for the completion of the Works to remove, either by felling or by transplanting, any trees other than those earmarked for such under the Contract or those directed or approved for such during the progress of the Works by the CM, carry out the following:
   a. Report to the CM the necessity of such tree removal;
   b. Provide all reasonable assistance as required by the CM in the tree survey and the justification for the proposed tree removal with substantiation and the necessary details such as method statement, site formation plan and architectural or engineering drawings, for the CM’s preparation of the tree felling or transplanting application for the tree removal.

TRANSPLANTING EXISTING TREES AND PALMS

EXT11.W310.8 GENERAL
1. Make reference to Development Bureau’s ‘Guidelines on Tree Transplanting’ and submit a 'Method Statement' for CM's approval;
2. Carry out tree transplantation in accordance with true horticultural practice and use specialist equipment as required;
3. Wrap trunk and large lower branches with hessian binding, as EXT11.M020, and tie with jute string, as EXT11.M030, at least one day prior to rootball preparation;
4. Sever lateral roots in stages over a period of at least 8 weeks prior to transplantation when instructed;
5. Treat all trees transplanted as new planting with respect to planting methods and defects liability except that any replacements as SLW9.W130 will be limited to the normal maximum size commercially available for that plant species;
6. Protect trees during transportation as SLW1.W210 (1).

EXT11.W320.8 IMMEDIATE TRANSPLANTATION
Transplant existing semi-mature trees, within two hours of uplifting, either:
1. To their final positions; or
2. To Contractor's temporary store as Instructed.

EXT11.W330.8 ROOTBALLS
1. Make reference to Development Bureau's 'Guidelines on Tree Transplanting' for rootball preparation; and
2. Keep rootballs intact with the soil to the appropriate sizes as shown on the Drawings and wrapped in hessian.

EXT11.W340.8 WATERING
1. Fill tree pit with water and allow to drain before planting;
2. Keep the whole tree, including rootball and hessian binding, moist at all times;
3. Water the transplanted trees (thoroughly soaked into the rootball soil) everyday during the first three months after transplant to keep them in healthy condition, irrespective of temperature, except in periods of heavy rainfall as determined by the CM;
4. Afterwards, water to field capacity the area covered by the spread of transplanted trees three times per week or as Instructed by the CM.

**CROWN THINNING**

EXT11.W350.8

Carry out limited crown thinning prior to rootball preparation, to those trees scheduled and/or shown on the Drawings, as Worksection SLW8. Retain form and shape of tree.

**ANTI-DESIERTANT SPRAY APPLICATION**

EXT11.W360.8

Prior to rootball preparation spray trees thoroughly when required, covering whole of leaves, branches and trunks:

Apply spray in accordance with manufacturer's instructions.

**TRANSPLANTING EXISTING SHRUBS AND BAMBOOS**

**GENERAL**

EXT11.W410.8

Treat all shrubs transplanted as new planting with respect to planting methods and defects liability except that any replacements, as SLW9.W130, will be limited to the normal maximum size commercially available for that plant species.

**TRANSPLANTATION**

EXT11.W420.8

Transplant existing shrubs and bamboos within two hours of uplifting either:

1. To their final positions as shown on Drawing or as Instructed; or
2. To Contractor's temporary store as Instructed.

**ROOTBALLS**

EXT11.W430.8

Keep rootballs intact with the soil to a minimum size of 750 mm diameter and 450 mm depth and wrapped with hessian. Transplant in a suitable size basket and keep moist at all times.

**EXISTING SHRUBS**

**PRUNING**

EXT11.W510.8

Prune existing shrubs as SLW9.W430 unless otherwise Instructed.

**EXISTING GRASSED AREAS**

**REINSTATMENT**

EXT11.W610.8

Reinstate existing grassed areas including levelling, grass seeding and post planting operations as Worksection SLW7.

**CUTTING**

EXT11.W620.8

Cut grass, on existing grassed areas, to 25 mm sward and make subsequent cuts as SLW9.W410.
TREATMENT/REPLACEMENT OF DAMAGED TREES AND SHRUBS

EXT11.W710.8 RESPONSIBILITY
Accept responsibility and costs of treatment or replacement of existing trees/shrubs arising from the execution of the works whether on or surrounding the site.

EXT11.W712.8 REPAIR OF DAMAGE TO EXISTING TREES AND OTHER Affected PLANTS
1. Carry out all necessary work of repair of any damage to the preserved trees and any other damaged plants within the Site together with the necessary mitigation landscape works to reinstate the affected land. Bear all costs for all necessary work of repair of damage and reinstatement works if the necessity for such work is, in the opinion of the CM, due to neglect or failure on the part of the Contractor to comply with any obligation expressed or implied on the Contractor's part under the Contract;

2. The work of repair of damage as per sub-clause (1) above shall include the following:
   a. All necessary arboricultural work to the preserved trees and any other damaged plants, which may include:
      i. Tree surgery work to remove dead, damaged, diseased or hazardous parts, to repair wounds, or to provide cables or braces for additional support;
      ii. Watering and / or mulching in case of water deficiency;
      iii. Applying appropriate fertilizers in case of nutrient deficiency;
      iv. Applying appropriate pest and disease control measures in case of pest and disease attack.
   b. The replacement planting pursuant to sub-clause (7) below for the trees and any other plants damaged to an extent as described in sub-clause (6) below and the subsequent Establishment Works for the new plants for 2 years, when instructed by the CM;
   c. Any other reinstatement work necessary to bring the damaged plants to their original condition prior to the occurrence of the damage, as directed by the CM.

3. Notify the CM of any damage to the preserved trees and other affected plants within the same day of the occurrence of damage and submit to the CM within 24 hours of the occurrence of damage, a report comprising the following information in a format agreed by the CM:
   a. The timing of the damage;
   b. The nature and extent of the damage;
   c. Photographic records of the damage;
   d. The proposed work of repair of the damage;
   e. The proposed protection measures to avoid recurrence of similar incident.

4. When directed by the CM, firm up and secure all dislodged trees and any other dislodged plants and treat all wounds of the damaged plants within 3 days of the occurrence of the damage;

5. Save as stated in sub-clause (4) above, do not carry out any work of repair of the damage prior to the CM's acceptance of the report as required in sub-clause (3) above;

6. Provide replacement planting of the damaged trees and any other affected plants under the following circumstances:
   a. In the opinion of the QAr in the case of an OVT, or the CM in the case of a non-OVT, the damaged plants are dead;
b. In the opinion of the QAr in the case of an OVT, or the CM in the case of a non-OVT, the trees or other affected plants have been substantially damaged and have become moribund, resulting in one or more of the following conditions:
   i. Imminent plant death within the coming growing season is predicted;
   ii. The structural integrity of the damaged trees or other affected plants is permanently compromised and consequently the trees or other affected plants become an irreparable public hazard;
   iii. Any major parts of the damaged trees or other affected plants have been lost and consequently their form, habit and balance have been grossly altered so that their function cannot be reasonably recovered or the trees or other affected plants are causing harm to other preserved trees.

7. When instructed by the CM, carry out the following:
   a. Carry out the removal of the damaged plants for which replacement planting as sub-clause (6) above is required, in accordance with the following requirements:
      i. For the removal of the damaged trees including any damaged OVT, prepare a tree felling application document to the CM's satisfaction and provide any other assistance or information as required by the CM for applying approval from the appropriate Government approving authority to the felling of the damaged trees;
      ii. Fell the damaged trees including any damaged OVT only after obtaining the CM's approval to the tree felling, which shall normally be given only after the tree felling application has been approved by the appropriate Government approving authority;
      iii. Remove the damaged plants including any damaged OVT from the Site as soon as possible.
   b. Carry out the replacement planting of new plants to compensate for the damaged plants including any damaged OVT in accordance with the following requirements:
      i. Complete the replacement planting within 28 days from the CM's instruction or other time duration as agreed by the CM;
      ii. For the replacement planting for the damaged plants including any damaged OVT, plant new plants of the same species and of similar size and form as the damaged plants prior to the damage, or provide other alternative replacement planting together with the necessary mitigation landscape works to reinstate the affected land as agreed by the CM.

EXT11.W714.8  AFTERCARE TO OLD AND VALUABLE TREE

1. Provide the Aftercare to the Old and Valuable Tree for the period as stated in the Contract;
2. Perform the following during the period for the Aftercare to the Old and Valuable Tree as per sub-clause (1) above:
   a. Ensure that the QAr shall prepare and submit monitoring reports on the OVT comprising the details and within the time frames as stipulated in EXT11.W062; the requirements of the report format shall be in accordance with sub-clause (6) of PRE.B8.1116;
   b. Ensure that the QAr shall conduct a final survey of the OVT and a final site survey and final soil tests of its tree protection zone, and submit a report on the same comprising the details and within the time frames as stipulated in EXT11.W062; the requirements of the report format shall be in accordance with sub-clause (6) of PRE.B8.1116;
c. Carry out any tree maintenance work, work of repair to damage or health deterioration, or precautionary or mitigation measures against damage, to the OVT as recommended by the QAr in the monitoring reports as per sub-clause (2)(a) above, or in the report on final tree survey / final site survey / final soil tests as per sub-clause (2)(b) above, or in any other written advice given by the QAr during the period for the Aftercare to the Old and Valuable Tree.

**EXT11.W716.8 ESTABLISHMENT OPERATIONS DURING AFTERCARE PERIOD**

During the Aftercare Period, carry out the operations as scheduled below applicable to the Old and Valuable Tree, and in accordance with this Specification:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Anticipated No.</th>
<th>Timing</th>
</tr>
</thead>
<tbody>
<tr>
<td>Watering</td>
<td>180</td>
<td>Min. twice per week during dry seasons, or as Instructed.</td>
</tr>
<tr>
<td>Fertilizing</td>
<td>2</td>
<td>Once per year as Instructed.</td>
</tr>
<tr>
<td>Soil aeration</td>
<td>2</td>
<td>Immediately after fertilizer application.</td>

<td>As required</td>
<td>As specified.</td>
</tr>
</tbody>
</table>

**EXT11.W720.8 CIRCUMSTANCES FOR TREE/SHRUB REPLACEMENT**

Provide replacement trees for those existing trees/shrubs which were to be retained in the following circumstances:

1. Death of the existing tree/shrub;
2. Substantial damage resulting in a condition that tree/shrub-death is confidently predicted within one year or that the tree/shrub's structural integrity is permanently compromised and consequently is a public hazard;
3. Substantial damage resulting in a condition that the form, habit and balance of the tree/shrub has been grossly spoiled.

**EXT11.W730.8 REPLACEMENT TREES/SHRUBS**

Replacement trees/shrubs as near as is technically possible to the stature and species as that existing at Contract commencement will be specified.
EXT12 EARTHWORKS

MATERIALS

EXISTING SOILS

EXT12.M010.8 GENERAL

1. Prior to tender, inspect the existing subsoil and topsoil to ensure that it is acceptable for the work specified herein;
2. No claims shall subsequently be considered in respect of existing soils which would relieve the Contractor of his responsibilities under Worksection SLW9 of this Specification.

EXT12.M020.8 EXISTING SUBSOIL

Existing subsoil consists mainly of granular DG, generally derived from original deposits.

EXT12.M030.8 DG AS PLANTING MEDIUM

Soil as EXT12.M020 for planting and grassing has in certain areas been roughly spread by others, and forms the basic constituent of fabricated soil, when mixed with other materials, for planting areas at existing ground levels, and areas already made up.

IMPORTED SOILS

EXT12.M110.8 SUBSOIL

Subsoil to be evenly textured, good clean granular DG containing no stones larger than 50 mm in any dimension, nor any deleterious matter. Do not use any subsoil from land which have been used by industries identified as having potential for causing land contamination as stipulated in “Guidance Note for Contaminated Land Assessment and Remediation” issued by Environmental Protection Department.

EXT12.M120.8 DG AS PLANTING MEDIUM

DG as planting medium to be evenly textured, granular soil free from weeds, deleterious matter, and stones larger than 50 mm in any dimension. Do not use any DG from land which have been used by industries identified as having potential for causing land contamination as stipulated in “Guidance Note for Contaminated Land Assessment and Remediation” issued by Environmental Protection Department.

SOIL CONDITIONERS

EXT12.M210.8 MANUFACTURED SOIL CONDITIONER

Manufactured soil conditioner to be properly composted organic material with the following characteristics:
1. Fine, free flowing consistency;
2. Stable composition;
3. Not capable of raising the temperature of the treated soil more than 5°C above the temperature of the untreated soil;
4. Not made with materials that are known to contain pathogens or other toxic materials injurious to plants, humans, or animals;
5. Giving off neither toxic nor obnoxious fumes;
6. With a pH value between 6.5 and 7.75;
7. With a moisture content of less than 80% (moisture weight as a proportion of overall weight);
8. With an organic matter content of not less than 85% (dry matter);
9. With a carbon to nitrogen ratio between 20 and 55;
10. Heavy Metal:
    a. Arsenic ≤ 41 mg/kg dw;
    b. Cadmium ≤ 39 mg/kg dw;
    c. Chromium ≤ 1200 mg/kg dw;
    d. Copper ≤ 1500 mg/kg dw;
    e. Mercury ≤ 17 mg/kg dw;
    f. Nickel ≤ 420 mg/kg dw;
    g. Lead ≤ 300 mg/kg dw;
    h. Selenium ≤ 36 mg/kg dw;
    i. Zinc ≤ 2800 mg/kg dw.
11. Pathogen:
    a. Salmonella sp. ≤ 3 MPN/4g;
    b. E. coli ≤ 1000 MPN/g.

EXT12.M220.8 CERTIFICATION
For every batch of soil conditioner as EXT12.M210 of 300m³ or part thereof delivered to Site, take one sample for testing as directed by the CM. Every batch of soil conditioner set aside for sampling and testing should be properly segregated and labelled, and not to be used until the CM’s approval is given. Within 14 calendar days of taking the samples, submit to the CM certificates of analysis from an Approved laboratory stating:
1. pH (H₂O) value;
2. Moisture content (calculated as the loss in weight between the dry weight and the overall weight as a percentage of the overall weight);
3. Organic matter content (dry weight);
4. Organic carbon content (using loss of ignition `Ashing' method of testing);
5. Nitrogen content (`Kjeldahl' Method);
6. Carbon: nitrogen ratio;
7. Heavy metal content; and
8. Pathogen content.
This sampling and certification requirement may be exempted if the supply of soil conditioner is from an Approved source, such as the composting facilities operated by the Environmental Protection Department. In such case, Contractor is required to submit relevant product literature and quality documents to demonstrate conformation of specified properties for the CM’s review and consideration to grant exemption. The operator of the Approved source shall deliver the soil conditioner direct to Site.

EXT12.M230.8 SAND
Sand to be clean, graded non-marine sand of size 4 mm or below.
EXT12.M235.8 GRADED SAND FOR SAND BASED LAWN
Sand to be clean, sharp graded quartz or non-marine sand with particle size distribution as stated in the following table. Certificate of analysis shall be submitted to the CM together with a sample of the sand for every 100 m³ of graded sand to be used in the Works and prior to execution of any works using the sand.

<table>
<thead>
<tr>
<th>BS test sieve size</th>

</tbody>
</table>

EXT12.M236.8 AGGREGATE FOR SAND BASED LAWN
For area specified as “Sand Based Lawn”, aggregate to be washed clean stone, 10 to 15mm in size.

EXT12.M240.8 COMPOST
Compost as shown on Drawings, to be:
1. Manufactured soil conditioner: as EXT12.M210, with a Certificate of Analysis as EXT12.M220; and/or

EXT12.M245.8 ANIMAL MANURE
Animal manure as shown on Drawings, to be:
1. Well rotted, fully mature and without smell;

EXT12.M250.A SYNTHETIC SOIL CONDITIONER
Synthetic soil conditioner to be free flowing synthetic acrylamide polymer crystals, 0.15-5mm in diameter when dry:
1. Capable of absorbing water and nutrients in gel form swelling to 100-550 times of original dry weight;
2. Having a minimum effective life of 2 years when used in the soil.

EXT12.M260.8 COCO PEAT
Coco peat to be finely textured fibrous material derived from the husk of the coconut.

EXT12.M270.8 SOIL BINDER
Soil binder to be an Approved proprietary type and consisted of a binding medium applied in aqueous suspension by spraying onto the surface of the soil to stabilise the soil. The binding agent shall not be injurious to plant growth.

FABRICATED SOILS

EXT12.M310.8 GENERAL MIX
Fabricated soils as shown on Drawings, to be:
1. Comprise a mixture of:
a. 3 parts DG, as per EXT12.M030; or EXT12.M120;
b. 1 part manufactured soil conditioner, as per EXT12.M210; or
c. 1 part animal manure, as per EXT12.M245.

2. Comprise a soil which sustains healthy plant growth in a variety of landscape situations free from pernicious weeds, roots, clay lumps, non-soil material and chemical contamination;

3. Certification:
Take one sample for testing prior to planting, and one sample for every 2,000 m² of planting area or part thereof prepared on Site. Submit to the CM certificates of analysis from an Approved laboratory within 14 calendar days of taking the samples. Apply mitigation measures as per EXT12.W260, EXT12.W270, EXT12.W280, and EXT12.W290 if the tested samples do not comply with the following characteristics:

a. pH value between 5.5 and 6.5;
b. Organic matter more than 4%;
c. Nitrogen content more than 0.2%.

EXT12.M320.8 LIGHTWEIGHT MIX
Lightweight soil to comprise a mixture of:
1. 2 parts DG, as EXT12.M120;
2. 1 part manufactured soil conditioner, as EXT12.M210;
3. 1 part vermiculite or volcanic pellets, with a particle size of 5-10 mm.

EXT12.M330.8 SOIL FILLING MIX FOR USE IN GRASS PAVING SYSTEM
Soil filling mix as shown on Drawings, for use in reinforced grass surfaces which are to receive either grass seed as SLW7.M270 or turves as SLW7.M110, to comprise of:
1. 4 parts DG, as EXT12.M030 or EXT12.M120;
2. 1 part manufactured soil conditioner, as EXT12.M210;
3. 2 parts sand as EXT12.M230;
4. Quick release fertilizer as SLW1.M130 at a rate of 300 g/m³.

EXT12.M340.8 ROOT ZONE MEDIUM MIX FOR USE IN SAND BASED LAWN
At top 30mm of root zone medium mix as shown on Drawings, for use in area specified as “Sand Based Lawn”, to comprise a mixture of:
1. 9 parts of graded sand, as per EXT12.M235;
2. 1 part manufactured soil conditioner, as per EXT12.M210.

BOULDER AND ROCKS

EXT12.M410.8 GRANITE
Granite boulders and rocks to have a natural, weathered appearance, free from blasting and drill marks, obtained from a local source and:
1. Shape: rounded;
2. Size: various, ranging from a minimum of 750 x 600 x 500 mm to a maximum size of 1800 x 1200 x 900 mm;

EXT12.M420.8 SERPENTINE
Serpentine boulders and rocks to comprise hard, metamorphic rock (normally obtained from Taiwan):
1. Size: various, ranging from a minimum of 500 x 500 x 500 mm to a maximum of 1800 x 1200 x 900 mm;
2. Colour: strongly veined blue and white.

EXT12.M430.8 GREAT LAKE ROCK
Great lake rocks to be from the Great Lake (Tai Hu), near Suzhou, or from other Approved regions of China, and:
1. Each rock being of one piece;
2. Appearance: slender, with folds and a large number of holes on the surface and containing such shapes as "deep hollows", "eye holes", "twists" and "strange grooves" without visual defects;
3. Colour: blackish grey;
4. Size: various, ranging from a minimum 800 x 500 x 300 mm to a maximum of 3000 x 1200 x 900 mm.

EXT12.M440.8 REJECTS
Remove, at own expense, any boulders and rocks rejected by the CM.
WORKMANSHIP

GENERAL

EXT12.W010.8 STOCKPILES
1. Obtain Approval of stockpile areas prior to the commencement of any stockpiling of materials;
2. Stabilise firmly all materials stockpiled against wind blow and erosion by water, at all times.

SUBSOIL PREPARATION

EXT12.W110.8 GRADING
Grade existing subsoil or DG as planting medium to form free flowing contours without water collecting hollows.
For area specified as “Sand Based Lawn”, prepare the sub-base as follows:
1. Grade existing subsoil to minimum 400mm below finished levels;
2. Compact formations to obtain a relative compaction of at least 95% to a depth of 200 mm below the formation;
3. Fill aggregate as per EXT12.M236 to 200mm below finished levels;
4. Protect the finished sub-base with impermeable protective sheeting before laying of graded sand as per EXT12.M235.

EXT12.W120.8 CLEANING
1. Remove rubbish, weeds, metal, deleterious material, and all stones exceeding 50mm in any dimension from existing subsoil or DG as planting medium, to a depth of 400mm;
2. Backfill any voids left by this operation with imported DG as planting medium, as per EXT12.M120.

EXT12.W130.8 RIPPING
Rip subsoil or DG as planting medium prior to spreading topsoil:
1. At 500 mm centres to a depth of 400mm or as shown on Drawings, to improve water and air movement;
2. Removing from site all obstructions to cultivation, or deleterious material brought to the surface;
3. Backfilling any voids left by this operation with imported DG as planting medium, as per EXT12.M120;
4. Do not rip ground at a slope exceeding 15° to the horizontal.

PREPARATION OF PLANTING MEDIA

EXT12.W210.8 CONTAMINATED GROUND
Obtain Approval to confirm the location and volume of all areas contaminated by petrol, or other toxic substances, and:
1. Excavate all such contaminated ground to be planted or sown to 500 mm below the depths specified in EXT12.W410;
2. Remove the contaminated material to a properly designated tip;
3. Backfill all such excavated areas with fabricated soil, as EXT12.M310.

EXT12.W225.8 PREPARATION OF PLANTING MEDIUM
1. Remove contaminated soil as per EXT12.W210;
2. Grade, rip and clean existing subsoil or DG as planting medium as per EXT12.W110, EXT12.W120 and EXT12.W130.

EXT12.W230.8 FABRICATED SOIL MIX
Where the finished levels comprise existing DG as EXT12.M030, mix with manufactured soil conditioner as EXT12.M210, and/or animal manure, as EXT12.M245 to form Fabricated Soil, as EXT12.M310, to the depths given in EXT12.W410. Take samples and test the same for every 1,000 m² of planting area or part thereof.

EXT12.W240.8 POLYMER MIX
Mix thoroughly, fully hydrated synthetic soil conditioner, as EXT12.M250, at a rate of 1.5 kg dry polymer to 1 m³ fabricated soil, as EXT12.M310, and incorporate 600 gms of slow release fertilizer, as SLW1.M110.

EXT12.W250.8 COMPOST MIX
Mix thoroughly 50 mm thick layer of compost, as EXT12.M240, into the top 150 mm of topsoil or fabricated soil.

EXT12.W255.8 ROOTZONE MEDIUM MIX
Mix thoroughly 10 mm thick layer of manufactured soil conditioner as per EXT12.M210, into the top 30 mm of graded sand for area specified as “Sand Based lawn”.

EXT12.W260.8 RAISING NITROGEN CONTENT
Mix slow or controlled release nitrogen fertilizer at the rate calculated using the formula:

\[ F = \frac{11,400 \times B}{Z} \]

where

- \( F \) = Fertilizer required in gm/sq.m.
- \( B \) = Nitrogen deficiency in percent.
- \( Z \) = Nitrogen content of fertilizer in percent.

EXT12.W270.8 RAISING PH LEVEL
Add limestone, as SLW1.M150, at the rate of 100 g/m² per application as required to raise pH of fabricated soil to within the range 5.5 to 6.5.

EXT12.W280.8 LOWERING PH LEVEL
Thorougly mix in appropriate quantities of either:
1. Sulphate of ammonia (during periods of wet weather only);
2. Natural sphagnum peat moss with pH of 4 to 4.5.

EXT12.W290.8 INCREASING ORGANIC MATTER CONTENT
Add, as a separate operation, either manufactured soil conditioner, as EXT12.M210, or Coco Peat, as EXT12.M260, to the fabricated soil at the rate of 5 mm thickness for each 1% shortfall in organic matter content, spread over the deficient area and thoroughly mix through the full depth of the fabricated soil.
MAKING UP LEVELS

**EXT12.W310.8  FABRICATED SOIL**
Where the levels are required to be made up to the finished level, import fabricated soil, as EXT12.M310, and spread and grade to the depths given in EXT12.W410.

**EXT12.W320.8  POLYMER MIX**
Import polymer mix, as EXT12.W240, to make up levels to the depths given in EXT12.W410, in the locations as shown on Drawings.

**EXT12.W325.8  ROOTZONE MEDIUM MIX**
Where the levels are required to be made up to the finished level, import graded sand, as per EXT12.M235, and spread and grade to the depths given in EXT12.W410 before cultivate with manufactured soil conditioner to form the rootzone medium mix.

**EXT12.W330.8  GENERAL SOIL FILLING IN GRASS PAVING SYSTEM**
Fill openings of the grass paving system, in the location as shown on Drawings, with:
1. Soil filling mix, as EXT12.M330 to receive turves as SLW7.M110 for turf finish; or
2. Grass seed and soil filling mix as SLW7.M270 for grass seed finish.

DEPTHS OF PLANTING MEDIA

**EXT12.W410.8  FABRICATED SOIL**
Provide to the depth(s) for the following planting situations:
1. Shrub and ground-cover areas: 300 mm;
2. Grassed Area: 200 mm;
3. Sand Based Lawn: 200 mm with root zone medium mix as per EXT12.M340;
4. Tree pits: as per SLW2.W250;
5. Grass paving system: to depths to suit the system in use and / or as shown in the Drawings or indicated in the schedules issued for individual Works Order.

FINAL GRADING

**EXT12.W510.8  GENERAL**
Grade all areas to free flowing contours and without humps or water collecting hollows.

**EXT12.W520.8  PLANT BEDS**
Slightly mound plant beds to levels shown on the Drawings ±150 mm at the top of the mound.

**EXT12.W530.8  BEHIND RETAINING WALLS**
Finish soil levels, immediately behind retaining walls, 75 mm ±25 mm below the top of the wall after settlement.

**EXT12.W540.8  ADJACENT PAVED AREAS**
1. Finish soil 25 mm ±25 mm below adjacent paving to plant beds at ground level;
2. Finish soil flush +25 mm -0 mm with adjacent paving to grassed areas at ground level.
EXT12.W550.8  GRASS PAVING SYSTEM
The turf finish or grass seed finish of the grass paving system to flush with the surrounding finished levels, or to depths to suit the system in use and/or as shown on Drawings, with allowance of settlement.

EXT12.W555.8  SAND BASED LAWN
The finished grading of rootzone medium mix after compaction by rollers shall be flushed with the surrounding finished levels, kerb or to depths as shown on Drawings, with allowance of settlement.

BACKFILLING RAISED PLANTERS WITH IMPERMEABLE BASES

EXT12.W610.8  PROCEDURE
1. Spread drainage layer in accordance with Worksection EXT13 in the bottom of the container;
2. Place filter layer, as EXT13.M110, over aggregate;
3. Place planting medium in 250 mm ±25 mm thick layers, lightly consolidating each layer before spreading the next;
4. Fill ground level containers to 50 mm ±10 mm below the top with fabricated soil, as EXT12.M310;
5. Fill podium level containers with lightweight soil, as EXT12.M320;
6. Leave the surface smooth and level to receive plants.

BOULDERS AND ROCKS

EXT12.W710.8  PLACING
Place boulders in the required positions during backfilling but prior to planting.

EXT12.W720.8  FIXING GRANITE AND SERPENTINE BOULDERS
Ensure complete stability, with 25% by volume of the boulder below finished ground level to the satisfaction of the CM.

EXT12.W730.8  FIXING GREAT LAKE ROCKS
Place rocks in their required positions, prior to planting, in locations as directed by the CM on site, and:
1. For rocks at least 3000 mm high x 1200 mm long x 900 mm wide, place in a concrete base 1200 mm long x 900 mm wide x 300 mm deep;
2. For rocks at least 3000 mm high x 1200 mm long x 900 mm wide, place and wedge with small rocks to prevent movement, with 25% by volume of the boulder below finished ground level to the satisfaction of the CM.

SURPLUS MATERIAL

EXT12.W810.8  REMOVAL
Remove all surplus soils, arising from the Works to a properly designated tip.
EXT13 DRAINAGE TO PLANTERS

MATERIALS

DRAINAGE LAYER

EXT13.M010.8 AGGREGATE
Aggregate to be clean stone, 25 – 50 mm diameter.

EXT13.M020.8 LIGHTWEIGHT AGGREGATE
Lightweight aggregate to be clean clinker, or other Approved equivalent material.
1. Size: 20 – 50 mm diameter;
2. Density: 500 kg per m³ maximum weight when compacted.

FILTER LAYER

EXT13.M110.8 FILTER LAYER FOR PLANTERS
Permeable, non-woven, thermally bonded geotextile, type not affected by acids, alkalis, bacteria, humidity, or rotting and shall meet performance requirements set out in the table:

<table>
<thead>
<tr>
<th>Properties</th>
<th>Test Method</th>
<th>Acceptance Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mechanical Properties</td>
<td></td>

WORKMANSHIP

DRAINAGE LAYER

EXT13.W010.8 CLEANING OUT WEEPHOLES
Prior to placing the drainage layer clean out all weepholes. When drainage layer has been placed by others, prior to any soiling operations, clean out all weepholes taking care not to damage any rodent grilles. Advise CM of any weepholes which cannot be cleared or are missing.

EXT13.W020.8 LEVELS
Place the base of the drainage layer level (+0 mm -25 mm) with the bottom of weepholes.

EXT13.W030.8 PRECAST CONCRETE / PORTABLE PLANT BOXES
Lay drainage layers evenly over the base of precast concrete / portable plant boxes to compacted depths indicated below:

<table>
<thead>
<tr>
<th>Plant Box</th>
<th>Aggregate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Height (mm)</td>
<td>Position</td>

<td>Podium level</td>
</tr>
<tr>
<td>Above 750</td>
<td>Podium level</td>
</tr>
</tbody>
</table>

EXT13.W040.8 IN-SITU CONCRETE PLANTERS WITH IMPERMEABLE BASES
Lay drainage layers evenly over base of in-situ concrete plant boxes with impermeable bases to compacted depths indicated below:

<table>
<thead>
<tr>
<th>Plant Box</th>
<th>Aggregate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Height not exceeding (mm)</td>
<td>Position</td>
</tr>
<tr>
<td>750 or less</td>

<tr>
<td>Above 750</td>
<td>Ground level</td>
</tr>
<tr>
<td>750 or less</td>
<td>Podium level</td>
</tr>
<tr>
<td>Above 750</td>
<td>Podium level</td>
</tr>
</tbody>
</table>

EXT13.W050.8 IN-SITU CONCRETE PLANTERS WITH PERMEABLE BASES
Form drainage strips of aggregate along back of perimeter walls of in-situ concrete planters with permeable bases to dimensions and in positions indicated below:

<table>
<thead>
<tr>
<th>Plant Box Type</th>
<th>Aggregate (EXT13.M010)</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>Level &amp; sloping</td>
<td>200 x 200 high x 500 long</td>
</tr>
</tbody>
</table>
FILTER LAYER

EXT13.W110.8  APPLICATION

Cover all drainage aggregate, where exposed to soil, with filter layer, as EXT13.M110. Lap joints between sheets and overlap other materials by 200 mm.
EXT14 HYDROSEEDING

MATERIALS

GENERAL

EXT14.M010.8 SCOPE
The application, by high pressure spraying, of a specified mixture of grass seed, fertilizer, mulch and other additives in aqueous suspension.

EXT14.M020.8 METHOD STATEMENT
Submit to the CM, at least 14 days before starting hydroseeding operations, details of materials to be used and method of application to be employed. Include the following:
1. Species and rate of application of seed;
2. Type and rate of application of fertilizer, mulch, soil binder and soil conditioner;
3. Type and colour of dye;
4. Type of protective fabric material;
5. Details of the company employed to carry out the hydroseeding;
6. Equipment to be used.

SEED MIXES

EXT14.M110.8 BASIC MINIMUM SEED MIX FOR USE BETWEEN APRIL AND AUGUST
30 g/m² (spreading rate) mix comprising:

<table>
<thead>
<tr>
<th>Species</th>
<th>Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cynodon dactylon (Bermuda grass)</td>
<td>13 – 15 g/m²</td>
</tr>
<tr>
<td>Paspalum notatum (Bahia grass)</td>
<td>8 – 10 g/m²</td>
</tr>
<tr>
<td>Others selected from &quot;other recommended species&quot; listed in EXT14.M120</td>
<td>0 – 4 g/m²</td>
</tr>
<tr>
<td>Shrub species selected from EXT14.M145, when instructed by the CM</td>
<td>5 g/m²</td>
</tr>
<tr>
<td>Fern species leaf fragments full of mature sporangia selected from EXT14.M145, when instructed by the CM</td>
<td>2 g/m²</td>
</tr>
</tbody>
</table>

EXT14.M120.8 OTHER RECOMMENDED SPECIES
1. Chloris gayana (Rhodes grass);
2. Eragrostis curvula (Weeping love grass) (not more than 2%);
3. Eremochloa ophiuroides (Centipede grass);
4. Zoysia japonica (Korean Grass).

EXT14.M130.8 BASIC MINIMUM SEED MIX FOR USE BETWEEN SEPTEMBER AND MARCH
35 g/m² (spreading rate) mix comprising:
### HYDROSEEDING

#### EXT14 > MATERIALS

**Table: Seed Rates**

<table>
<thead>
<tr>
<th>Species</th>
<th>Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cynodon dactylon (Bermuda grass)</td>

</tr>
<tr>
<td>Ground fern fond laden with mature sporangia selected from <strong>EXT14.M146</strong>, when instructed by the CM</td>
<td>1 g/m²</td>
</tr>
</tbody>
</table>

**EXT14.M145.8** **SHRUB SPECIES**

Any of the three listed below:
1. Raphiolepis indica;
2. Melastoma sanguineum;
3. Lespedeza spp.;
4. Desmodium spp.;
5. Crotalaria pallida;
6. Crotalaria retusa;
7. Others accepted by the CM.

**EXT14.M146.8** **FERN SPECIES**

1. Any one of the following:
2. Cibotium barometz;
3. Dicranopteris pedata;
4. Nephrolepis auriculata;
5. Woodwardia japonica;
6. Others accepted by the CM.

**EXT14.M150.8** **GERMINATION**

Germination capacity of each variety to be at least 80%.

**EXT14.M160.8** **PURITY**

1. Purity of each variety to be greater than 90%;
2. Total weed seed content not more than 0.5%;
3. Other crop seed not more than 1%.

**EXT14.M170.8** **CERTIFICATION**

Provide a certificate of testing, no less than 14 days before hydroseeding starts, stating:
1. Date of tests (within 6 months of hydroseeding);
2. Species variety;
3. Percentage germination (with date of assessment);  
4. Percentage composition by weight (with statement of impurities).
ANCILLARY MATERIALS

EXT14.M210.8 FERTILIZER INCLUDED IN THE HYDROSEEDING MIX
A soluble compound fertilizer in the ratio 15:15:15 NPK, or similar Approved compound applied at a rate of at least 100 g/m² in the hydroseeding mix.

EXT14.M220.8 DYE AND SOIL BINDER
The application rate of dye and soil binders shall strictly refer to manufacturer recommendation.
1. Dye, to be: an Approved type, suitable for hydroseeding purposes and non-injurious to plant growth;
2. Soil binder, as EXT12.M270.

EXT14.M230.8 MULCH FOR HYDROSEEDING
A proprietary type manufactured from cellulose or paper based materials for application at a minimum rate of 170 g/m².

EXT14.M240.8 PROTECTIVE FABRIC MATERIAL FOR HYDROSEEDING
An Approved proprietary type of degradable fabric that does not degrade within 100 days after application or until the specified grass cover has been established.

EXT14.M250.8 HYDROSEEDING POST-PLANTING FERTILIZER
Consisting of 15:15:15 (nitrogen/phosphorus/potassium) mix or an Approved equivalent.
WORKMANSHIP

GENERAL

EXT14.W010.8 PROGRAMME
1. Carry out hydroseeding between 1st March and 31st August. Hydroseeding outside this period may be Approved on condition that any additional maintenance requirements specified by the CM are carried out at the Contractor's expense;
2. Carry out hydroseeding during damp overcast conditions, but not during rain or periods of strong winds.

EXT14.W020.8 STORING GRASS SEED
Store grass seed in bags off the ground in a clean, dry, well ventilated location free from vermin. Carry out prolonged storage under controlled conditions of temperature and humidity.

EXT14.W030.8 STORING FERTILIZER
Store fertilizer off the ground in sealed waterproof bags and protect from exposure to conditions which may adversely affect the fertilizer.

EXT14.W040.8 HYDROSEEDING EQUIPMENT
Use hydroseeding plant for application of mix.

PREPARATION

EXT14.W110.8 SURFACE FINISH
1. Clear away rubbish and vegetation from areas to be hydroseeded and form site to the levels indicated;
2. Lightly scarify to leave a coarse, open textured surface, level with (+25 mm -0 mm) adjoining hard surfaces;
3. Carry out finishing work by machines across the direction of slope;
4. Do not leave vehicle track marks or bucket teeth marks parallel to the line of maximum gradient of the slope.

EXT14.W120.8 CULTIVATION
1. Cultivate areas less steep than 1:2 to a depth of 125 mm and bring to a 25 mm deep fine tilth by Approved mechanical means or by hand raking;
2. Remove all stones larger than 30 mm in any dimension;
3. If necessary, carry out regrading of the surface to conform to the prescribed finished levels and create free flowing contours free from humps and water collecting hollows;
4. Finish final level (+25 mm -0 mm) with any adjacent hard surfaces.

EXT14.W130.8 CULTIVATION ON EMBANKMENTS
Do not cultivate the existing soil on embankments with slopes of 1:2 or steeper, to ensure that the slope remains stable and to prevent erosion.

EXT14.W140.8 WATERING
When Instructed thoroughly moisten the previously prepared soil prior to hydroseeding, and use a fine spray hose attachment to avoid soil erosion and run off.
PREPARING TREE SEEDS

1. Soak all tree seeds to be included in the hydroseeding mix (except Acacia Species) in water at room temperature, for 4 to 8 hours immediately before mixing with other ingredients of the hydroseeding mix;

2. Immerse seeds of Acacia confusa in water, bring water to boil, remove seeds immediately and mix seeds with other ingredients of the hydroseeding mix.

APPLICATION

MIXING

1. Thoroughly mix materials for hydroseeding on site in the hydroseeding equipment immediately before spraying, ensuring that seed is not damaged;

2. Blend in water at the rate of 5 litres/m² to form an aqueous gel solution, unless otherwise instructed.

APPLYING SOIL BINDERS

1. Apply soil binders as EXT12.M270 at the rate recommended by the manufacturer, modified as necessary to suit conditions in Hong Kong;

2. Use dye to demonstrate that adequate cover has been achieved unless otherwise instructed due to the fact that run off or water courses are coloured to an unacceptable level.

SPRAYING HYDROSEEDING SOLUTION

Spray the solution by high pressure pump to evenly cover the area and:

1. Constantly agitate the hydroseeding mixture during spraying to keep it homogeneous and avoid blockage to pipes;

2. Ensure that material is not lost during application due to run off.

POST APPLICATION OPERATIONS

PATCHING UP

1. Where hydroseeded areas do not show 90% cover over any 10 m² area, 28 days after hydroseeding:
   a. Respray areas where, in the opinion of the CM germination has been unsuccessful;
   b. Respray areas affected by repairs to washout and gullies and other erosion on slopes.

2. Patch up areas which, in the opinion of the CM, are not accessible or are too small for the use of a hydroseeder, by broadcasting seeding as follows:
   a. Lightly scarify the area with a rake or similar implement;
   b. Broadcast the seed and fertilizer over the area at a rate of not less than 75 g/m² (±5%);
   c. Cover the seed by lightly working into the surface or by spreading sufficient soil to just cover the seed;
   d. Carry out broadcast seeding using Bermuda grass (Cynodon dactylon), perennial ryegrass (Lolium perenne) or carpet grass (Axonopus compressus).
EXT14.W320.8 PROTECTION OF HYDROSEEDING
1. Following hydroseeding, including patching up, cover the area with bio-degradable erosion resistant fabric, as EXT14.M240 and fix securely with 100 mm long staples at 1000 mm staggered centres, with a minimum of 150 mm overlap between adjacent sheets of fabric sufficient to avoid local erosion;
2. On sloping ground lay fabric along the greatest slope and fully adhere to the hydroseeded surface by sprinkling with water with an Approved spray;
3. Do not permit walking on areas that have been hydroseeded unless for fixing protective material and for patching up.

EXT14.W330.8 WATERING DURING DRY WEATHER
During dry weather water hydroseeded slopes to encourage germination and growth of the grass as follows:
1. During periods of dry weather determine watering requirements with the CM twice weekly;
2. Thoroughly water areas as necessary or as Instructed and complete watering within 24 hours of receiving such instruction;
3. Use fresh water only for the works;
4. When required obtain an analysis of the water to be used for Approval;
5. Apply water using an Approved hose or sprinkler so as not to erode the slope;
6. Make good any erosion of hydroseeding that may occur.

EXT14.W340.8 APPLYING POST-PLANTING FERTILIZER
Apply post-planting fertilizer at a rate of 50 g/m² (±5%) between two months and nine months after application of hydroseeding and, unless otherwise permitted by the CM, during the period 1st March and 31st August.

EXT14.W350.8 CUTTING
1. Reduce by cutting to a height of 100 mm when the grass sward is 300 mm high;
2. Rake off and dispose of all cuttings within 24 hours of cut.

TESTING GRASS COVER

EXT14.W410.8 TESTING
1. Attend with CM when carrying out tests to determine grass cover 100 days after grassing and at the end of the Establishment Period;
2. The number of tests will be determined by the CM in locations which, in his opinion, are representative of the grassed area as a whole;
3. Mark out an approximately square area of 10 m² at each test location and cut grass to a height of 300 mm if necessary;
4. Measure the percentage of bare ground, other than rock and other hard material, in each 10 m² test area.

EXT14.W420.8 ACCEPTANCE CRITERIA
1. Hydroseeding to achieve a cover by grass species of at least 90% of the surface area of each 10 m² of the area to be hydroseeded within 100 days after the area has been hydroseeded;
2. Grass cover to be healthy, vigorous and free from perennial and other weeds.
EXT14.W430.8  NON-COMPLIANCE
If the result of any test for grass cover does not comply with the specified requirements for grass cover, re-hydroseed or reseed the area as EXT14.W310 (1) or (2), as Instructed depending upon the size of the defective area.
EXT15 MISCELLANEOUS EXTERNAL WORKS

DESIGN

GENERAL

EXT15.D010.8 EXTERNAL FURNITURE
External furniture in this Specification refers to a series of proprietary external furniture comprising, but not be limited to, seating bench, litter bin, chess table set, table tennis table, bollard and bicycle rack, in accordance with the performance requirements and design intent as specified.

EXT15.D020.A DESIGN SUBMISSION

1. Unless the CM instructs otherwise, submit to the CM at the time as specified in the Project Specific Specification at least 3 design proposals from different agents/suppliers for the external furniture specified in EXT15.M010 to EXT15.M060 meeting with the requirements as specified in the Specification and shown on the design intent Drawing(s) for CM's selection and approval. Each design proposal shall include plans, elevations, sections and details, and the following information:
   a. The place of origin of the external furniture, name of manufacturer, brand name, model number, manufacturer's instruction on installation procedures;
   b. Product details and descriptions etc. with detailed layout drawing indicating the relationship of the furniture to the surrounding external works;
   c. Materials, colours, sizes, dimensions, assemblage and fixing of various components of the external furniture and other items as instructed by the CM and/or as shown on the design intent Drawing(s);
   d. Minimum design loading for seating bench, chess chair, chess table and table tennis table;
   e. Copy of structural calculation by RSE verifying the proposed minimum design loading for the external furniture. The copy of the structural calculation shall be certified true by the QCM;
   f. Builder's works requirements and method statement on fixing the external furniture to the substrate, wall or pavement surface;
   g. Test certificates for the specified tests in clauses EXT15.M110 and EXT15.M120, where appropriate.

Each design proposal shall also be accompanied with a quotation from the respective agents/suppliers. The Contractor shall be responsible for the identification of agents/suppliers, preparation of invitation documents and invitation of quotations. Sufficient time shall be allowed for agents/suppliers to prepare and return their quotations. The quotation closing date and time, and location of the quotation box of the Contractor for deposition of quotations shall be specified in the invitation of quotations. Make invitation to the CM at least 14 days before the quotation closing date for his arrangement of representation to witness the opening of quotations at the Contractor's office. Quotations received shall be opened promptly after the specified closing date and time. Opening of the quotations shall be witnessed by at least two representatives of the Contractor and two representatives of the CM;
2. Re-submit revised design proposals, quotations, drawings and relevant information where commented or considered necessary by the CM;

3. Upon notification in writing by the CM of his selected and approved design proposal among the submitted design proposals (a copy of the Contractor's submitted quotation in respect of the Approved design proposal may be attached with CM's notification for the sake of reference), engage the respective agents/suppliers for the supply and installation of the external furniture of the Approved design proposal provided that the actual cost of procuring each of the approved external furniture shall not exceed the amount shown on the quotation submitted to the CM for the Approved design proposal;

4. If, prior to entering into sub-contract with the agents/suppliers providing the Approved external furniture, it becomes apparent to the Contractor that the actual cost of any of the Approved external furniture exceeds the amount shown on the quotation submitted to the CM for the Approved design proposal for whatever reasons, give immediate notice to the CM for further instruction. Any claim for additional costs due to higher actual costs than the quotation submitted to the CM for the Approved design proposal arising from or after entering into sub-contract with the agent/supplier providing the Approved external furniture shall not be considered. Submit certified true copy of the sub-contract(s) to substantiate the actual costs of the procurement of the Approved external furniture;

5. In addition to sub-clause (1) above, the CM may at his own discretion before or after the Contractor's submissions in sub-clause (1), obtain design proposals and quotations directly from agents/suppliers of external furniture and instruct the Contractor as appropriate;

6. Within 28 days from the date of CM's notification of selection and approval of the design proposal, submit detailed information comprising shop drawings and fixing details of the external furniture for CM's approval;

7. Allow at least 6 months for the process of ordering, material delivery and installation.

**EXT15.D030.8 SAMPLE SUBMISSION**

After being notified in writing by the CM of his selected and approved design proposal and before ordering of the products, submit samples of the components of the external furniture showing their physical properties such as material, colour, texture and fixing details etc. for the CM's approval.

**EXT15.D040.8 DELIVERY**

Submit original or certified true copies of Certificate of Origin for the external furniture delivered to the Site.
MATERIAL

EXTERNAL FURNITURE

EXT15.M010.8 SEATING BENCH
1. Seating bench: as specified in Project Specific Specification;
2. The design of the seating bench shall fit for purpose. The product shall be rigid, well supported and not prone to deformation. The components shall have no sharp edge, corner and projections etc.;
3. Material used shall be able to withstand cigarette burns and discoloring from exposure to ultraviolet radiation from the sun. There shall be no toxic emission upon combustion of any components and parts;
4. Allow a range of colours on materials used for CM's selection.

EXT15.M020.8 LITTER BIN
1. Litter bin: as specified in Project Specific Specification;
2. Provide litter bin with ash tray at designated smoking areas only as specified by CM and/or shown on the landscape layout plan;
3. The design of the litter bin shall fit for purpose. The product shall be rigid, well supported and not prone to deformation. The components shall have no sharp edge, corner and projections etc.;
4. Materials used must be able to withstand cigarette burns and discoloring from exposure to ultraviolet radiation from the sun. There shall be no toxic emission upon combustion of any components and parts;
5. Allow a range of colours on materials used for CM's selection.

EXT15.M030.8 CHESS TABLE SET
1. Chess table set: as specified in Project Specific Specification;
2. Allow at least one seating place for wheelchair user to access the chess table;
3. The design of the chess table set shall fit for purpose. The product shall be rigid, well supported and not prone to deformation. The components shall have no sharp edge, corner and projections etc.;
4. Materials used shall be able to withstand cigarette burns and discoloring from exposure to ultraviolet radiation from the sun. There shall be no toxic emission upon combustion of any components and parts;
5. Allow a range of colours on materials used for CM's selection.

EXT15.M040.8 BOLLARD
1. Bollard: as specified in Project Specific Specification;
2. The design of the bollard shall fit for purpose. The product shall be rigid, well supported and not prone to deformation. The components shall have no sharp edge, corner and projections etc.;
3. Materials used shall be able to withstand cigarette burns and discoloring from exposure to ultraviolet radiation from the sun. There shall be no toxic emission upon combustion of any components and parts;
4. Allow a range of colours on materials used for CM's selection;
5. Avoid protruding projections and loose-fixed component parts that are easy to be stolen.
**COMPONENTS OF EXTERNAL FURNITURE**

**EXT15.M115.A WOOD PLASTIC COMPOSITE (WPC)**

1. Submission Requirements:
   a. At sample submission and approval stage, submit a sample of the proposed WPC and accessories for the CM's approval together with all the following substantiation for the CM’s information:
      i. Job reference of the proposed WPC;
      ii. Name, address and contact person of the local supplier;
      iii. Name, address and contact person of the manufacturer;
      iv. Where applicable, either the document from the manufacturer showing his authorization for the supplier as the agent or distributor in Hong Kong or document from the supplier showing the appointment of the manufacturer and manufacturer's agreement for the production of the proposed WPC;
      v. Original or a certified true copy (issued or certified by the laboratory that complies with PRE.B9.570) of test reports showing full compliance with the requirements of sub-clause 2(b), 2(c) and 2(d) below for the CM’s information of the proposed WPC:
         - The test reports shall be submitted at sample submission and approval stage, or at a time not later than the delivery of the materials;
         - In the event that no test report has been submitted for the CM’s information when the materials are delivered to Site, remove all the delivered materials off Site. Bear all associated costs so incurred and no extension of time will be allowed.
   b. After approval of the submitted sample of the proposed WPC, submit shop drawings for the CM’s approval showing the materials, fixing, joints, hatch opening details, loading requirements, supporting frames and drainage for the application of the proposed WPC in the outdoor landscape furniture;
c. For decking and cladding components using the proposed WPC, submit detailed structural calculations of the supporting frames endorsed by RSE and the shop drawings and associated information as specified in sub-clause (1)(b) above. Any junctions between WPC decking components specified in the shop drawings shall not produce any gaps jeopardizing pedestrians.

2. Quality Requirements:
   a. A proprietary product made of plastic and wood fibre;
   b. Surface spread of flame shall comply with Class 2 of BS 476 Part 7:1997, or Class C of BS EN 13501-1:2007 when used in indoor site furniture, cladding or decking;
   c. Composition of the submitted WPC shall contain a minimum of 35% wood fibre;

EXT15.M116.8 MAINTENANCE MANUAL FOR WPC
Submit to the CM five sets of maintenance manuals for the completed works within three months after the certified date of completion of the Works. This should be developed in parallel with the design and should include, but not be limited to, the following information:

1. Name, address and telephone number of each supplier and / or sub-contractor involved in the supply of materials, components, assemblies and finishes;
2. Recommendations in English and Chinese for maintenance procedures and routine maintenance activities;
3. A full set of as-built drawings including the structural calculations;
4. Submit one set electronic copy of the as-built drawings in AutoCAD file format or other editable format as approved by the CM.

EXT15.M120.8 FINISHES TO GALVANIZED MILD STEEL
Show no sign of rusting when tested to ASTM B117-97:2009 for 1000 hours.
WORKMANSHIP

GENERAL

EXT15.W010.8 HANDLEING AND STORAGE
Handle and store all external furniture carefully and in a manner that:
1. Prevent damage to pre-finished surfaces;
2. Retain protective coverings in position for as long as possible;
3. Prevent contact with harmful elements.

EXT15.W020.8 FIXING, ASSEMBLING AND LAYING
1. Carry out any fixing, assembling or installation in accordance with the manufacturer's instructions;
2. Ensure all external furniture is/are placed and fixed in the position as set out in the Drawings, and in accordance with manufacturer's recommendation;
3. Avoid exposing the base plate which may cause potential hazard in hurting the feet of pedestrians.

INSTALLATION OF EXTERNAL FURNITURE

EXT15.W110.8 SEATING BENCH
Install seating bench in accordance with manufacturer's specifications and instructions.

EXT15.W120.8 LITTER BIN
Install litter bin in accordance with manufacturer's specifications and instructions.

EXT15.W130.8 CHESS TABLE SET
Install chess table set in accordance with manufacturer's specifications and instructions.

EXT15.W140.8 TABLE TENNIS TABLE
1. Assemble table tennis table in accordance with manufacturer's specifications and instructions;
2. Location of the table tennis table to be advised by CM;
3. The table tennis table shall be firmly fixed to the ground or be secured against displacement either by its own weight or by anchoring. The table tennis table installed in accordance with the manufacturer's instructions shall withstand without any displacement or toppling over a horizontal force of 1.5 kN per meter length of the table structure, applied in the middle of the highest part of the structure (excluding the net), in both the length and the width of the table.

EXT15.W150.8 BOLLARD
1. Install bollard onto the pavement surface in accordance with manufacturer's specifications and instructions;
2. Should the installed bollard become off-plumbed due to ground settlement and/or soil displacement etc., the Contractor shall rectify the situation where applies to ensure the bollard is firmly upright.
EXT15.W160.8  BICYCLE RACK
1. Assemble bicycle rack in accordance with manufacturer's specifications and instructions;
2. Install bicycle rack with the adjacent pavement surface in accordance with manufacturer's specifications and instructions.
EXT16  ZERO IRRIGATION SYSTEM (ZIS) - INSITU TYPE

MATERIALS

GENERAL

EXT16.M010.8  DEFINITION
Zero Irrigation System (ZIS) - Insitu Type is an at-grade sub-irrigation system which utilizes capillary action to deliver storm water stored in water retention boxes to top soil.

EXT16.M020.8  COMPOSITION
The ZIS shall comprise the following major components:
1. In-situ reinforced concrete planter wall;
2. Waterproofing membrane - Sodium bentonite layer, as EXT16.M110;
3. Filter layer, as EXT16.M140;
4. Water retention box as EXT16.M130;
5. Drainage cell as EXT16.M130;
6. River sand as FIN1.M410;
7. Decomposed Granite (DG) as EXT12.M120;
9. Mechanical water level indicator & lockable inspection chamber as EXT16.M160;
10. Fixing device for tree anchorage.

EXT16.M030.8  APPLICATION OF OTHER WORKSECTIONS
Where applicable, comply with the relevant provisions of the following Worksections unless otherwise specified in this Worksection:
1. Concrete Works: Worksection CON;
2. Earthworks: Worksection EXT12;
3. Drainage to Planter: Worksection EXT13;
4. Pipes and fitting: Worksection DRA;
5. Soft Landscape Works (Planting): Worksection SLW.

EXT16.M040.8  ACCESSORIES
The ZIS shall comprise the following accessories in the installation:
1. Sodium bentonite powder;
2. Sodium bentonite strip.

EXT16.M050.8  MATERIAL SUBMISSIONS AND SHOP DRAWINGS
1. Submit material submission and shop drawings to CM for Approval at least 6 months before construction;
2. Re-submit material submission and shop drawings to CM for Approval within 14 days upon receipt of CM’s comments which require amendments to be made;
3. The shop drawings above shall include but not be limited to the following:
   i. The layout and configuration of ZIS;
   ii. The water proofing;
iii. The configuration of ground water recharge devices and overflow pipes;
iv. The mounting of water pipes;
v. The location, access and details of inspection chambers within mechanical water level indicator;
vi. The dimensions and setting out;
vii. Other builder’s work requirements;
viii. The interfacing details with structure in the vicinity.

4. The material submission above shall include but not be limited to the following:
i. Particulars of all materials for the construction of ZIS;
ii. Manufacturer’s literature and certificates of material compliance with the requirements of this Specification.

EXT16.M060.8 METHOD STATMENT
Submit to the CM, at least 6 months before construction, and resubmit if amendments are necessary, the method statement comprising but not limited to the following:
1. Details and particulars of materials to be used;
2. Method of application of the materials to be deployed in relation to ZIS;
3. Description of the complete procedures for construction of all components of ZIS;
4. Programme of the construction works including verification testing.

EXT16.M070.8 SAMPLES
Submit samples of components of the ZIS including but not limited to the following for CM’s approval at least six months prior to construction of ZIS:
1. Sodium bentonite waterproofing layer;
2. Filter layer;
3. Water retention box;
4. Drainage cell;
5. River sand;
6. Lockable inspection chamber with cover;
7. Pipes & fittings for ground water recharge and overflow pipe;
8. Mechanical water level indicator.

EXT16.M080.8 AS-BUILT RECORD FOR PLANTERS WITH ZIS
Submit full particulars of the as-built ZIS for CM’s review and record. The record shall include all relevant information such as estimated water retention capacity, depth and as-built dimensions.

MAJOR COMPONENTS

EXT16.M110.8 SODIUM BENTONITE WATERPROOFING LAYER
The sodium bentonite waterproofing layer shall be a geo-synthetic clay liner coated with polyethylene layer to the entire surface of the woven side, with the following characteristics:
1. An even and continuous bentonite layer made mainly of sodium bentonite powder;
2. Mass per unit area: minimum 4,300 g/m²;
3. Thickness: minimum 6mm;
4. Maximum tensile strength in accordance with EN ISO 10319: machine direction not less than 12.0 kN/m; or ASTM D6768: machine direction not less than 12.0 kN/m;
5. Peel strength in accordance with ASTM D6496: not less than 60N/10cm;
6. Static puncture strength in accordance with EN ISO 12236 or ASTM D6241 not less than 2,000N;
7. Hydraulic Conductivity in accordance with EN 14150 or ASTM D5084-90: not more than 10-14 m/s;
8. Index Flux (q10) in accordance ASTM D 5887: minimum 2.7 x 10-9 (m³/m²)/s;

EXT16.M120.8 FILTER LAYER
Refer to EXT13.M110.

EXT16.M130.8 WATER RETENTION BOX
The water retention box shall be a modular polyethylene or polypropylene tank resistant to bacteria, moulds and algae, soil-borne chemicals. The water retention box shall possess the following characteristics:
1. Type: prefabricated modular tank intended for underground application;
2. Compressive strength in accordance with ASTM D1621: not less than 210 kPa or equivalent;
3. Approximate size: (Length) 600-800mm, (Width) 375-475mm, (Height) 375-475mm.
   Refer to drawing no. LA/STD/L/AS-01.

EXT16.M135.8 DRAINAGE CELL
A minimum 40mm thick polyethylene moulded drainage layer shall have the following functions and properties. Delivery and installation shall be in accordance with the manufacturer’s instructions.
1. To allow water to be distributed evenly across water-retention boxes;
2. High crush strength to support the loading of vegetation and soil to be provided;
3. Biological and chemical resistance: unaffected by moulds and algae, soil-borne chemicals, bacteria and bitumen;
4. Flow rate in accordance with ASTM D4716: not less than 16 litres/ m²/ second at 1% gradient;
5. Compressive strength in accordance with ASTM D1621: not less than 980 kPa or equivalent.

EXT16.M140.8 SAND
Refer to EXT12.M230.

EXT16.M145.8 GROUND WATER RECHARGE DEVICE
Once the designated water discharge level is reached, the ground water recharge device shall allow discharge of excess water from in-situ reinforced concrete planter wall to adjoining packets of aggregates.

EXT16.M150.8 OVERFLOW PIPE
Once the designated water discharge level is reached, the overflow pipe shall allow direct discharge of excess water from in-situ reinforced concrete planter wall directly to nearby drainage provision.
MECHANICAL WATER LEVEL INDICATOR

1. The mechanical water level indicator shall be installed inside the lockable inspection chamber at the appropriate locations of the system to reflect the level of retained water. The dial should be conveniently readable from outside the lockable inspection chamber upon removal of cap;

2. The water level indicator should possess the following properties:
   a. Mechanically operable without the need of batteries or electric wiring;
   b. Dial face with empty and full indicator.

ACCESSORIES

SODIUM BENTONITE POWDER
Sodium bentonite in powder form.

SODIUM BENTONITE STRIP
Flexible hydrophilic strip made of but not limited to natural sodium bentonite clay and synthetic rubber as per manufacturer’s recommendations.
WORKMANSHIP

GENERAL

EXT16.W010.8 HANDLING AND STORAGE
Handle and store the materials carefully as per the manufacturer’s recommendations and in a manner that:
1. Prevents damage to surface coating;
2. Prevents contact with harmful elements.

EXT16.W020.8 BUILDER'S WORK IN CONNECTION
1. In-situ reinforced concrete planter wall for ZIS as CON1;
2. Sub-soil drainage pipe as DRA2.

EXT16.W030.8 FIXING, ASSEMBLING AND LAYING
Carry out any fixing, assembling or laying in accordance with the manufacturer's instructions.

INSTALLATION OF MAJOR COMPONENTS

EXT16.W110.8 INSTALLATION
1. Compact the soil within the confines of planters to prepare for the base of ZIS as EXT3.W120;
2. Laying sodium bentonite layer up to 200mm lap down of the reinforced concrete planter wall with minimum 150mm overlapping or as per manufacturers’ recommendations between each sodium bentonite layer. Fix and apply the sodium bentonite layer in accordance with the manufacturer's instructions;
3. Lay drainage cell flat at the base of reinforced concrete planter in accordance with manufacturer's instructions;
4. Lay filter fabric on top of the drainage cell;
5. Connect the ground water recharge device from ZIS to adjacent subsoil area;
6. Verify level of pipe opening against nearby silt trap or sub-soil drainage system before connecting to the overflow pipe from the ZIS;
7. Seal pipe opening of the reinforced concrete planter wall by the sodium bentonite grout (bentonite powder or bentonite strip) in accordance with the manufacturer's instructions;
8. Laying the water retention boxes wrapped with filter layer in accordance with the manufacturer's instructions;
9. Filling the spaces between water retention boxes with river sand up to 50mm above the boxes;
10. Install lockable inspection chamber and mechanical water level indicator;
11. Lay the filter layer on top of river sand;
12. Carry out water flood test as EXT16.T110;
TESTING

ON-SITE VERIFICATION TEST

EXT16.T110.A WATER FLOOD TEST TO ZIS

1. Test Arrangements:
   a. Carry out water flood test to verify the water-tightness of the ZIS planters prior to backfilling of DG; test to be carried out in the presence of the CM or his representatives;
   b. The difference of water level recorded from the beginning of water flood test and after 48 hours shall not be more than 10mm;
   c. The test report and water level records shall be submitted to the CM within 7 days after the test.

2. Test Samples:
   a. All and entire ZIS planters unless instructed otherwise.

3. Test Method:
   a. Carefully flood the ZIS planter to a level agreed with the CM and maintain for 48 hours;
   b. Mark the top water level at clearly visible locations and regularly inspect for any drop of water level.

4. Non-compliance:
   a. In the event of test failing to meet the requirement stated in sub-clause 1(b) above:
      i. Submit to the CM detailed proposals for remedial measures;
      ii. Carry out subsequent repairs and flood tests until the ZIS is watertight;
      iii. Bear all associated time and costs of any subsequent flood testing.
EXT17 AUTOMATIC DRIP IRRIGATION SYSTEM

DESIGN

GENERAL

EXT17.D010.N DEFINITION
1. Automatic Drip Irrigation System (ADIS) is a surface drip irrigation system which delivers water to the planting areas at low water pressure through a network of driplines fitted with emitters. A typical ADIS shall comprise a Control Zone and Watering Zone(s);

2. The demarcation of the Control Zone is measured from a water supply point teed-off from the main water supply pipes, up to the boundary of the Watering Zone(s) where water is distributed through a network of driplines. This zone comprises all the regulating devices such as controller unit, valves, filter and pressure regulator for controlling the proper operation of the system, and to ensure that a specified amount of water is delivered to all the planting areas within the specified period;

3. A Watering Zone is demarcated by a set of driplines arranged in continuous loop served by one single solenoid valve. Isolation valves shall be provided to enable proper isolation of different zones for maintenance. The operation of one or more Watering Zones in an ADIS is controlled by the regulating devices in the Control Zone.

EXT17.D020.N GENERAL REQUIREMENTS
1. The ADIS shall be designed, supplied and installed by a sub-contractor Approved by the CM;

2. Subject to the CM’s Approval, the sub-contractor shall be a company which has:
   a. More than three years of relevant experience in ADIS design, installation and maintenance; and
   b. At least one Technical Manager who has more than three years of design experience and he / she shall be responsible for all technical issues including design submission, certification and checking after installation.

3. ADIS shall be installed for the areas indicated in Drawing Nos. ……… and ………, and comply with the following requirements:
   a. The ADIS shall be designed to effectively water all planting areas and to allow operational flexibility to cater for different watering requirements in different planting areas (Watering Zones) separately due to variation in plant type / species and soil condition;
   b. All plantings shall receive specific amount of water within the day for proper and healthy growth and sufficient soaking into the soil for encouragement of vigorous root growth;
   c. All above ground services, e.g., intermediate junction boxes, shall be arranged in concealed but accessible locations, and demarcated for easy identification;
   d. Coordinate the design and installation works to avoid abortive works. Coordination at early design stage is required when installation of underground connection pipe across planters is necessary.
GENERAL SCOPE OF WORKS

1. Technical design of the ADIS shall meet the design criteria and parameters specified in EXT17.D040. The design and installation of the plumbing works of the ADIS shall comply in all aspects with the requirements of the Water Authority;

2. The ADIS shall be installed in accordance with the Approved design proposal including installation of teed-off fittings to the main water supply point;

3. Check and test of every system component. The completed installation shall be subject to satisfactory testing as EXT17.T020;

4. Provide training to the management and maintenance staff during the Maintenance Period;

5. Inspection of the ADIS on a monthly basis during the Maintenance Period as EXT17.T040 to ensure proper performance of the system.

DESIGN PARAMETERS

1. Dripline design shall meet the following requirements:
   a. Dripline emitter spacing to be 300mm +/-10%;
   b. Dripline to dripline placing to be 300mm +/-10% apart;
   c. Driplines to be installed in “Ring” or “Grid” connection;
   d. The lateral run length of dripline at a given water pressure shall not exceed the maximum lateral run length as recommended by the manufacturer.

2. Watering Zone
   a. The aggregate flow rate for each Watering Zone shall not exceed 0.7 litre/second;
   b. The number of Watering Zones should be minimised as far as practicable;
   c. The area of each Watering Zone shall not exceed the effective area in relation to the maximum lateral length of the dripline in design calculation or 100 m², whichever is less;
   d. One Watering Zone may serve more than one individual planter. The driplines in each planter may be linked up using distribution tubing as EXT17.M130 for connecting the driplines system between planters within each Watering Zone. Distribution tubing shall pass through the pipe sleeve pre-installed in planter walls; or underground PVC conduit for kerb planters;
   e. The water velocity in headers shall be designed to no more than 1.5 metre/second and no more than 3.5 bar to reduce friction loss, long-term wear and hydraulic water hammer.

3. Component Security
   a. All system components requiring subsurface protection during installation or for maintenance shall be accommodated in irrigation valve boxes as EXT17.M100. The irrigation valve boxes shall be arranged in concealed but accessible locations and clearly demarcated with irrigation valve box labels as EXT17.M110 for easy identification for future maintenance;
   b. Alternatively, the controller unit in the Control Zone may be mounted on wall or a post in upright position. In this situation, the controller unit shall be stored inside a proprietary IP66 stainless steel enclosure fitted with a stainless steel lock.

4. Rain sensor
   Mount the rain sensor on the top of a stainless steel post at min. 1500 mm above ground level. For best performance, the sensor shall be positioned in an open area where the rain sensor head receive direct rainfall without physical obstruction and within lightning protection zone which provide protection against lightning strike.
EXT17.D050.N  WATER CONSUMPTION RATE

*Option 1*

The irrigation patterns and programmes shall be optimized to suit the plant growth with minimum water consumption. The average annual water consumption shall be ……… litre/day/m².

*Option 2*

The irrigation patterns and programmes shall be optimized to suit the plant growth with minimum water consumption. The average annual water consumption shall be not more than 3.5 litre/day/m² of net planting area.

EXT17.D060.N  TECHNICAL DESIGN PROPOSAL SUBMISSION

1. At least six months before the programmed commencement of the installation work on Site, submit for CM’s approval the technical design proposal, including shop drawings, installation details, calculations, manuals, method statement, installation programme, testing proposal and training proposal as EXT17.T020. The submission shall detail the installation procedures and other relevant technical information to substantiate the system design;

2. Shop drawings shall include but not be limited to the following:
   a. Schematic design layout and configuration of ADIS showing the location of controller / timer and other components;
   b. Number, setting out and the covering area of each Watering Zone. Each zone shall be controlled by means of a solenoid valve to fulfill the system performance;
   c. Design calculation to demonstrate compliance with the design criteria and parameters, adequacy of the supply pressure, flow rate and pipe sizes for effective operation of the system;
   d. Other builder’s work requirements; and
   e. Interfacing details with structure services and works in the vicinity.

3. Resubmit for Approval within 14 days upon receipt of CM’s comments. Allow the times for submission / resubmission for obtaining the CM’s Approval. Bear all associated costs and no extension of time will be granted.

EXT17.D070.N  MATERIAL SUBMISSION

1. Within 14 days upon acceptance of the technical design proposal by the CM, submit samples of material to the CM for approval;

2. The list of samples of the proposed materials shall include but not be limited to the following:
   a. Battery powered controller unit with external rain sensor input port;
   b. *Rain sensor;
   c. Solenoid valve;
   d. Stainless Steel Screen Filter;
   e. Ball Valve;
   f. Non-return Valve;
   g. Pressure Regulator;
   h. Irrigation Valve Box;
   i. Dripline;
   j. Air Relief Valve;
   k. Flush Valve;
   l. Dripline Operation Indicator; and
   m. Others accessories - uPVC pipes and fittings.
3. All pipes and fittings for plumbing works under sub-clause (2) shall comply with the requirement of the Water Authority for the intended application;

4. Submission Requirements:
   Full particular of all materials including:
   a. Catalogue, brand name / model name and job reference;
   b. Name, address and contact person of the local supplier;
   c. Name, address and contact person of the manufacturer;
   d. Approval by the Water Authority with a valid approval document if applicable;
   e. Manufacturer’s literature and certificates of components showing compliance with the requirements of this Specification;
   f. Other specified submission requirements for the materials.

5. Sample Board:
   a. Provide sample board(s) to display samples of components, pipes, fittings and jointing materials and accessories to be used in the ADIS installation and listed in sub-clause (2) above;
   b. The sample board is to be kept by the CM on Site together with associated relevant certificates / test reports / catalogues / supporting documents upon submission;
   c. Each sample, with clear numbering and labelling, shall be firmly fixed onto a rigid wooden or metal board. A list shall also be affixed on the sample board to show the item description, make and brand, country of origin and locations of installation.
MATERIAL

GENERAL

EXT17.M010.N GENERAL REQUIREMENTS
All materials of the ADIS shall comply with the relevant clauses in other Worksections of the Specification unless otherwise stated in this Worksection EXT17. Alternative materials may be used only with prior Approval before ordering / installation.

EXT17.M020.N COMPOSITION
The ADIS shall comprise a Control Zone and Watering Zone(s):
1. Control Zone
   a. Battery powered controller unit with external rain sensor input port, as EXT17.M030;
   b. *Rain sensor as EXT17.M040;
   c. Solenoid valve as EXT17.M050;
   d. Screen Filter as EXT17.M060;
   e. Other accessories including but not limited to
      i. Ball Valve as EXT17.M070;
      ii. Non-return Valve as EXT17.M080;
      iii. Pressure Regulator as EXT17.M090;
      iv. Irrigation Valve Box as EXT17.M100.
2. Watering Zone
   a. Dripline with built-in check valve, as EXT17.M120;
   b. Other accessories including but not limited to
      i. Air Relief Valve as EXT17.M140;
      ii. Flush Valve as EXT17.M150;
      iii. Dripline Operation Indicator as EXT17.M160;
      iv. uPVC pipes and fittings as EXT17.M170.

MAJOR COMPONENTS

EXT17.M030.N BATTERY POWERED CONTROLLER UNIT
The controller unit shall possess the following characteristics:
1. Power Source: non-built-in battery powered using AA or 9V alkaline battery;
2. With external rain sensor input port;
3. With output terminals to independent solenoid valves using DC pulse (controller unit with built-in solenoid valve as one single unit not acceptable);
4. Water adjustment ranging from at least 0 to 150% to accommodate changing weather condition;
5. Non-volatile memory holding all programmes without batteries;
6. Low battery indicator;
7. Water resistance rating:
   IP24 rating or above for above ground installation and IP68 rating for below ground installation;
8. Underwriters Laboratories (UL) or Conformité Européenne (CE) Approved;
9. For Control Zone serving more than one Watering Zone, the controller unit provided shall be a multi-stations model with multiple programming options;

**EXT17.M040.N RAIN SENSOR (OPTIONAL)**

The rain sensor shall have the following characteristics:

1. Compatible with controller unit as EXT17.M030;
2. Multiple rainfall setting;
3. Adjustable device to control drying time;
4. With latching hinge and bracket to maintain alignment;
5. Switch electrical rating: 24 V, 3A or above;
6. UL or CE Approved.

**EXT17.M050.N SOLENOID VALVE**

The solenoid valve shall possess the following characteristics:

1. One-piece solenoid design with captured plunger and springs;
2. Operate with DC latching solenoid;
3. Compatible with system controller unit as EXT17.M030;
4. With flow control device for precise zone adjustment and manual shutoff;
5. Internal bleed with manual override;
6. Minimum Operating pressure range: 1.5 to 10 bars;
7. Water Temperature rating: up to 40 °C;
8. Operating range: 9VDC.

**EXT17.M060.N SCREEN FILTER**

The filter shall possess the following characteristics:

1. The filter case is made up of UV-resistant, durable corrosive-resistant plastic material;
2. With replaceable 150-200 mm mesh stainless steel screen;
3. With flush cap or flush valve for easy flushing of particles;
4. Operating pressure up to 8 bars;
5. Operating ceiling flow rate not less than 60 litre/minute.

**EXT17.M070.N BALL VALVE**

Refer to PLU1.M610 and PLU1.M660.

**EXT17.M080.N NON-RETURN VALVE**

Refer to PLU1.M640.

**EXT17.M090.N PRESSURE REGULATOR**

Refer to PLU1.M910 and PLU1.M920.

**EXT17.M100.N IRRIGATION VALVE BOX**

The irrigation valve box shall possess the following characteristics:

1. Made up of UV-resistant materials;
2. Reinforced cover with bevelled edges;
3. Lid shall be securely fastened to body with stainless steel bolts, washers and clips;
4. Skid-resistant lid texture;
5. Pre-moulded pipe slots;

**EXT17.M110.N**  
**IRRIGATION VALVE BOX LABEL**  
Irrigation Valve box labels to be 250 mm x 140 mm x 2 mm thick, white acrylic or aluminium with:

1. Typical wording includes “Control Zone / Watering Zone” as heading and “Automatic Controller / Gate valve / non-returning valve / filter / pressure regulator / solenoid valve etc.” as contents;
2. If there is more than one Watering Zone, the heading shall be subdivided into zone 1, zone 2, zone 3, etc.;
3. The wording shall be heat - indented in black characters;
4. The size of the capital letter to be not less than 16 mm and the lower case to be not less than 9 mm;
5. The size of Chinese character to be not less than 20 mm;
6. Fix the label to the top cover of the irrigation valve box with silicon adhesive sealant.

**EXT17.M120.N**  
**DRIPLINE WITH BUILT-IN CHECK VALVE**  
The dripline shall possess the following characteristics:

1. 17mm diameter;
2. Constructed with pressure compensation, integral emitters with an internal check valve;
3. Protection to minimize dirt intrusion;
4. UV resistant tubing;
5. Flow rates: 2.2-2.3 litre/hour;
6. Minimum Operating Pressure: ≤ 1.4 bars;
7. Emitter spacing 300mm +/- 10%.

**EXT17.M130.N**  
**DISTRIBUTION TUBING**  
The distribution tubing shall possess the following characteristics:

1. 17mm diameter;
2. UV resistant tubing;

**EXT17.M140.N**  
**AIR RELIEF VALVE**  
1. Operating pressure range: up to 4.13 bars;

**EXT17.M150.N**  
**FLUSH VALVE**  
1. Operating pressure range: up to 3.0 bars;
2. Parts removable for maintenance;

**EXT17.M160.N**  
**DRIPLINE OPERATION INDICATOR**  
The indicator provides visual confirmation that the ADIS is in operation and shall possess the following characteristics:

1. Minimum operating pressure should be compatible with the minimum operating pressure of the dripline system;
2. Indicator stem shall extend to a height of at least 12 cm for vertical pop-up stem type, or the color flag shall be at upright position (90°) for flag type operation indicator;

**EXT17.M170.N** UNPLASTICIZED PVC (UPVC) PIPES AND FITTINGS

Refer to PLU1.M200.

**EXT17.M180.N** PIPE SLEEVES

1. Refer to PLU1.M430;

2. Diameter of pipe sleeves shall be at least one size larger than the PVC conduit that passes through the wall partition.

**EXT17.M190.N** SILICON SEALANT

Refer to WAT5.M170.
WORKMANSHIP

GENERAL

SITE ASSEMBLY AND INSTALLATION
1. Prior to installing the ADIS, ensure the main water supply system is functioning properly, and is suitable for the proposed ADIS;
2. Install ADIS strictly in accordance with the manufacturer’s recommendations and the Approved installation details;
3. Coordinate the planter wall / kerb construction and makes necessary allowance for connection fittings to link up with driplines in adjacent planters to form one Watering Zone. The provision and installation of PVC conduits and pipe sleeve fittings on planter walls / kerb should comply with the Specification and Drawings.

HANDLING AND STORAGE
Handle and store the materials carefully as per the manufacturer’s recommendations.

BUILDERS WORK IN CONNECTION
*1. In-situ reinforced concrete planter wall as CON1;
*2. Masonry walls as MAS1;
3. ……………………………

FIXING, ASSEMBLING AND LAYING
1. Ensure adequate protection to the existing waterproofing layer during the installation process;
2. Provide adequate temporary protection to the installed irrigation system in the field during construction and liaise closely with the Approved sub-contractor on the protection required during construction;
3. Carry out any fixing, assembling or laying in accordance with the manufacturer's recommendations.

INSTALLATION OF MAJOR COMPONENTS

SEQUENCE AND GENERAL PROCEDURES
1. Preparatory Works
   a. Check and confirm the water pressure and flow rate of the water supply point, to which the ADIS is to be connected, are in order;
   b. Do not remove the non-return and air vacuum valves from the water supply point;
   c. Check and confirm the installation locations of the controller unit of the Control Zone;
   d. Remove any stones or sharp-edged objects or construction debris from the soil to avoid damage to the drip tubing;
   e. Keep all pipes and fittings clear of dirt and debris, protect exposed ends by plugging while the installation of other components is in progress.
2. Control Zone Installation
a. Place irrigation valve box at appropriate location and connect pipe fitting to the water supply point through pre-molded pipe slots of the irrigation valve box. Accommodate all controller unit, gate valves and non-return valves into irrigation valve box(es);

b. For upright installation of the controller unit, mount the stainless steel controller box to wall or a stainless steel post with conduit clamp at 1,100-1,500 mm above ground level;

c. Mount the rain sensor (if provided) on the top of a stainless steel post at 1,500-2,000 mm above ground level;

d. Fix a copy of laminated schematic design layout plan of the ADIS referred to at EXT17.D060 (2)(a) inside the enclosure where the controller unit is located;

e. Connect and accommodate solenoid valve, screen filter and pressure regulator into irrigation valve box(es);

f. Fix the irrigation valve box labels as EXT17.M110 on the top of the irrigation valve boxes;

g. Determine the number of Watering Zones.

3. Watering Zone Installation

a. Identify the zone boundaries of each Watering Zone;

b. Determine the maximum lateral run length for a given water pressure;

c. Determine the dripline layout based on the configuration of the planter and identify the locations of supply header and flush header. The location of all headers shall be 150mm from the planter wall;

d. Establish the overall grid pattern by connecting the supply header and the flush header with driplines using manufacturer’s fittings as appropriate. The spacing between driplines is 300mm +/- 10% apart and 150mm from planter edge;

e. For Watering Zone serving more than one planter, connect the driplines system in each planter by distribution tubing which may pass through the pipe sleeves pre-installed in planters wall or underground PVC conduits for kerb planters;

f. Perform a pressure loss calculation from the water supply point to the farthest end of the header to confirm that the water pressure at all driplines is adequate;

g. The lateral run length of a Watering Zone is measured from the supply header to the flush header, which should not exceed the maximum lateral run length as recommended by the manufacturer;

h. Use Approved dripline stakes to hold driplines in place;

i. Install the air relief valve at the highest point of the Watering Zone;

j. Install the flush valve at the lowest point of the flush header or at the end of the dripline;

k. Install the operation indicator at the appropriate location;

l. Flush the dripline systems thoroughly prior to installing the last connections on each header;

m. Repeat the process as described in sub-clauses (3)(a) to (3)(l) above for each Watering Zone.

4. Final Check

a. Check all valves, tubing and connections for leaks;

b. Verify the location of each air relief valve in field, ensuring one is installed at each localized high point;

c. Check and record water pressure at the supply header and flush header to ensure the system runs below the maximum operating pressure.

EXT17.W060.N  JOINTING UNPLASTICIZED PVC (UPVC) PIPES

Refer to PLU1.W291.
TESTING

GENERAL

EXT17.T010.N GENERAL REQUIREMENTS
1. Carry out complete performance tests for all components and systems installed, make all necessary adjustments and commission the installations in accordance with the Specification, manufacturers' recommendations and the completed installation satisfies the functional requirements specified;
2. Prior to any tests, submit detailed procedures and a programme for testing for CM's approval;
3. Submit the followings for CM's approval:
   a. Test reports;
   b. Operation and Maintenance manuals;
   c. As-built record drawings.
4. Provide training on management and maintenance of the ADIS to estate management and maintenance staff.

EXT17.T020.N TESTING AND TRAINING
1. At least two (2) weeks before scheduled testing, submit testing schedule to the CM for approval. The testing shall demonstrate the ADIS is designed and installed in accordance with the Specification and manufacturers’ recommendation;
2. The tests shall include but not limited to the following items:
   a. Test the proper functioning of the controller units, including manual activation of each control valve in sequence, and automatically by using the program setting function of controller unit;
   b. Test the proper functioning of the rain sensor (if provided);
   c. Test the proper functioning of all valves, screen filters and pressure regulators;
   d. Carry out water tightness test in accordance with PLU1.T050;
   e. Carry out water pressure test in each Watering Zone to ensure that the pressure variation within the Watering Zone falls within 10 percent range;
   f. Carry out water consumption rate test to ensure that the water consumption rate falls within +/- 5 percent of the range specified in EXT17.D050;
   g. Test the uniformity of the wetting pattern formed around emitters of the driplines by visual observation during operation to demonstrate uniform water delivery;
   h. Test the proper functioning of the locking devices in the irrigation valve boxes, operation indicator and other provisions.
3. In the event of any test failures, investigate the cause(s) of the failure, modify the installation works and replace all defective components as required. Carry out re-test for compliance as required under sub-clauses (1) and (2). Should any preceding test result may have been impacted by a particular fault, repeat such test after the fault has been rectified. Bear all associated costs for investigation / modification / replacement works etc. and the test / re-test required. No extension of time will be granted;
4. Upon completion of all tests, submit test records to the CM for final review;
5. Provide appropriate training to the estate management and maintenance staff on the proper operation and maintenance of the system including but not limited to briefing session, on-site familiarization visit and technical demonstration.
EXT17.T030.N  OPERATION AND MAINTENANCE MANUALS

1. Within one month after completion of the whole ADIS system, submit an Operation and Maintenance Manuals in both English and Chinese, to the CM for approval. Provide to the CM one (1) digital copy and three (3) sets of binded hard copy of the Operation & Maintenance Manuals;

2. The manuals shall include but not limited to the following information:
   a. A full set of as-built drawings, updated to include any changes made up to the time of completion of the ADIS system;
   b. A simplified user manual and troubleshooting guide covering the major components of the ADIS for frontline estate management and maintenance staff, in both English and Chinese, highlighting the key operation and maintenance procedures;
   c. Recommendations for routine maintenance works including:
      i. Irrigation schedule (daily watering quantity and intervals);
      ii. Operating schedule (adjustment of timer under different seasons);
      iii. Timing and method for cleaning, checking and replacement of any components;
      iv. A method statement covering the procedures for replacement of damaged or otherwise defective materials or components.
   d. Training video with audio clips on the following topics:
      i. Setting up of controller units, rain sensor, solenoid valve and pressure regulator;
      ii. Maintenance issues such as cleansing of filter and flushing of driplines;
      iii. Trouble-shooting and checking procedures in case the system breakdowns;
      iv. Replacement of defective components such as controller units and driplines.
   e. Technical specification, schedules, catalogues and user manuals of major components including contacts (i.e. designated contact persons, e-mail addresses, postal addresses and telephone numbers) of each agent and / or manufacturers involved in the supply of materials, components and accessories;
   f. Provide two sets of laminated schematic design layout plans showing the location of controller units, irrigation valve boxes and other components of the ADIS;
   g. The terms and conditions of any guarantees / warranties relating to the installed system.

EXT17.T040.N  REGULAR INSPECTION REPORT DURING MAINTENANCE PERIOD

During the Maintenance Period, the Contractor shall deploy competent technicians or such other suitable personnel to carry out any necessary inspection, testing and repair work on a monthly basis. The Contractor shall submit to the CM contact information of the personnel including their mobile telephone numbers.

EXT17.T050.N  FINAL INSPECTION

1. At one month before the end of the Maintenance Period, the Contractor shall carry out final inspection of the whole ADIS;
2. The Contractor shall carry out any adjustment, rectification, replacement, or alteration, as may be required to correct any faulty works prior to the expiry of the Maintenance Period;
3. Update the Operation and Maintenance Manuals as stipulated in EXT17.T030 and submit the final version of the Operation and Maintenance Manuals to the CM for approval within one month upon completion of the Maintenance Period if any alterations or adjustments are conducted during the Maintenance Period;
4. Provide final on-site familiarization visit and technical demonstration to the estate management and maintenance staff.

CON1 INSITU CONCRETE

MATERIALS

GENERAL

CON1.M010.8 STANDARD

Unless otherwise specified, comply with 'Code of Practice for Structural Use of Concrete 2013' issued by the Buildings Department, BS8007:1987 and BS5400:Part 4:1990 as appropriate.

CON1.M020.8 STATUS OF THE SPECIFICATION

Where any clauses in this Specification vary from the Regulations of the HKQAA "Quality Scheme for the Production and Supply of Concrete", the clauses in this Specification shall take precedence.

CON1.M025.8 STATUS OF THE WORKSECTION

Worksection EXT2 takes precedence over this Worksection for the construction of the concrete carriageways and bus terminus as indicated on the Drawings.

CON1.M030.8 GRADES OF CONCRETE

In this Specification:

1. The grade of Designed mix concrete is denoted by the characteristic strength in MPa and the nominal maximum size of aggregate in mm with suffix "D";

2. The grade of Standardised designed mix concrete is denoted by the characteristic strength in MPa and the nominal maximum size of aggregate in mm with suffix "S";

3. The characteristic strength of Designed mix concrete with any type of cement is the 28 day cube strength below which not more than 5% of the test results are expected to fall;

4. For any clause of this Section where no suffix "D" or "S" is indicated in the concrete grade, the requirements of that particular clause shall deem to apply to both Designed mix and Standardised designed mix concrete;

5. Obtain CM's approval prior to the use of concrete of grade above 60 in the Works;

6. Where any grade of concrete is designated in other Worksections of this Specification, in Drawings, in design guidelines, in Bills of Quantities or in any other documents relating to this Contract, as one of the grades listed in column (1) of the Table below, such grade is deemed to be the grade of concrete set out in the corresponding column (2) below:

<table>

</tbody>
</table>
CEMENTITIOUS CONTENT

Cementitious content of concrete, for the purpose of this Specification, is defined as:

1. The mass of cement per cubic metre of compacted concrete if sub-clause (2) is not applicable; or
2. The combined mass of the mass of cement and the mass of either pulverised fuel ash (PFA) or ground granulated blastfurnace slag (GGBS) per cubic metre of compacted concrete, if either PFA or GGBS is used as a partial cement replacement.

FREE WATER/CEMENT RATIO

Free water/cement ratio, for the purpose of this Specification, is defined as the ratio between the mass of the free water in the concrete mix and the cementitious content.

CEMENTS

SUBMISSIONS

Submit to the CM for provisional approval, a sample for each type of cement, PFA and GGBS together with a certificate issued by an Approved laboratory not more than six months before the submission, showing the following:

1. For each type of cement:
   a. The manufacturer's name;
   b. The date and place of manufacture;
   c. With test results that the cement complies with the requirements of this Specification.
2. For PFA:
   a. The manufacturer's name (it must be stated explicitly if high lime PFA, as defined in CON1.M150 (1)(b), is submitted);
   b. The date and place of manufacture;
   c. With test results that the PFA complies with the requirements of this Specification and the tests required in Clause 14.1 of BS 3892:Part 1:1997.
3. For GGBS:
   a. The manufacturer's name;
   b. The date and place of manufacture;
   c. With test results that the GGBS complies with the requirements of this Specification and the tests required for factory production control as stipulated in CON1.M180.

PORTLAND CEMENT (PC)

1. To BS EN 197-1:2000: type CEM I with strength class of cement for structural concrete to be 52.5N, unless otherwise approved by the CM;
2. Comply with the limiting values given in Table NC.1 of National annex NC of BS EN 197-1:2000 for acceptance inspection of cement at delivery.

SULPHATE RESISTING PORTLAND CEMENT (SRPC)

To BS 4027:1980.

HIGH ALUMINA CEMENT (HAC)

Do not use high alumina cement in structural concrete.

PULVERISED FUEL ASH (PFA)

To BS3892:Part 1:1997 with the following modifications:

1. Lime content in PFA:
a. PFA shall contain up to 10% total lime content; or
b. High lime PFA shall contain up to 20% total lime content and with soundness value not more than 10 mm.

2. Water requirement and strength factor at 28 days: not requirements of this Specification, but the values as determined shall be stated in the certificates for submission;

3. Cement to be used to determine water requirement, strength factor at 28 days, soundness and initial setting time: Portland cement CEM I (strength class 52.5N) to BS EN 197-1.

CON1.M160.8  PORTLAND FLY ASH CEMENT (PFAC)
1. To BS EN 197-1:2000: types CEM II/A-V and CEM II/B-V with strength class of cement for structural concrete to be 42.5N or higher, unless otherwise approved by the CM;
2. Comply with the limiting values given in Table NC.1 of National annex NC of BS EN 197-1:2000 for acceptance inspection of cement at delivery.

CON1.M170.8  USE OF PULVERISED FUEL ASH
1. Incorporate PFA to Portland cement (PC) only, as a partial cement replacement:
   a. In all structural concrete for foundation works including caissons, bored piles, caisson caps, pile caps (including pile caps to driven piles), tie beams and footings of all structures. PFA content to be 35% by mass of the cementitious content of the concrete;
   b. In all structural concrete shown as PFA concrete up to grade 60D on the Drawings. PFA content to be 25% by mass of the cementitious content of the concrete;
   c. In all concrete, with the exception of sprayed concrete, for external works including concrete carriageway, other paving and hard landscaping unless otherwise specified. PFA content to be 25% by mass of the cementitious content of the concrete;
   d. Notwithstanding the minimum striking period stipulated in CON2.W630, submit for the CM's agreement on the striking period of vertical formwork for PFA concrete in sub-clauses (1)(b) and (1)(c) above but in no case less than 1 day.
2. At the discretion of the Contractor and where approved by the CM, incorporate PFA to PC as a partial cement replacement in structural concrete not shown as PFA concrete on the Drawings. PFA content to be 25% by mass of the cementitious content of the concrete;
3. Prior to the use of PFA concrete in sub-clause (2) above:
   a. Carry out necessary tests and trials to provide evidence to the satisfaction of the CM that the use of PFA concrete shall not adversely affect the construction cycle, curing of the concrete and the application of finishes; and
   b. Submit details for sub-clause (3)(a) before carrying out the tests and trials for the Approval of the CM.
4. PFAC may be used where PFA concrete with PFA content of 25% by mass of the cementitious content of concrete is specified or permitted;
5. Use of PC in the works specified in sub-clauses (1)(a) to (1)(c) above may be accepted provided that:
   a. Satisfactory evidence can be furnished to the CM showing that supply of PFA or PFAC from all available sources cannot be obtained;
b. The highest grade of PC concrete for caissons and bored piles shall not exceed 35/20D. For pile caps or footings and transfer structures submit a detailed method statement of the proposed temperature control and monitoring strategy as stipulated in CON1.W470 to the CM for approval at least 7 days before concreting;

c. Where necessary, submit re-design of the foundation works resulting from such a change to the CM for approval at least 21 days before commencement of affected works. Submit re-design according to PIL1.D030 and any other requirement as detailed elsewhere in this Specification;

d. Be liable for any additional cost or time as a result of any such change. The Surveyor shall, if he considers that there is a saving in cost arising from any such change determine the sum which in his opinion shall be deducted from the contract sum as result of such saving and certify in accordance with the General Conditions of Contract.

**GROUND GRANULATED BLASTFURNACE SLAG (GGBS)**

To BS EN 15167-1:2006 with the following modifications:

1. Cement to be used to determine initial setting time and activity indices at 7 days and 28 days: Portland cement CEM I (strength class 52.5N) to BS EN 197-1:2000;

2. Factory production control: In the absence of autocontrol testing, proof of the GGBS manufacturer's testing on the quality control for Class S95 in accordance with Chinese National Standard GB/T 18046:2008 is acceptable.

**USE OF GGBS IN PRECAST FACADE AND PRECAST STAIRCASE**

1. Incorporate GGBS as a partial replacement of Portland cement (PC) in the production of precast façade and precast staircase;

2. GGBS content to be 35% by mass of the cementitious content of the concrete;

3. The use of PC concrete without GGBS to produce precast façade and precast staircase for the period from December to March will be allowed. Inform the CM in advance if PC concrete will be used for the production of precast façade and precast staircase in such period.

**AGGREGATES**

**SUBMISSIONS**

Submit to the CM, for provisional approval, a sample of each type of aggregate together with a certificate showing that the aggregate producer has a quality assurance system certified to the ISO 9001, and a certificate for each nominal maximum aggregate size showing:

1. The name of the quarry / locality of the aggregate and documentary evidence from the supplier for subsequent verification;

2. Where available, evidence that the aggregates from the same source have been used in other HA Contracts in the past 12 months;

3. That the aggregate complies with the requirements of this Specification;

4. Results of tests carried out by HOKLAS laboratories and presented in HOKLAS endorsed test reports of all the typical properties listed in CS3:2013 Clause 6.2.2 with the following validity period on the test data:

   a. Not older than three months:
      i. Grading.

   b. Not older than six months:
      i. All other properties.
**CON1.M215.8** RECYCLED COARSE AGGREGATES

1. Use recycled coarse aggregates produced by crushing old concrete and complying with the requirements in CON1.T410 for external works as specified in the Contract or as permitted by the CM. The concrete shall be with 100% recycled coarse aggregates for grade strength 20 MPa and 20% for grade strengths 25-35 MPa. Recycled coarse aggregates shall not be used in concrete above grade strength 35 MPa for Portland cement concrete and 30 MPa for PFA concrete;
2. Thoroughly wet recycled coarse aggregates before use;
3. Store recycled coarse aggregates in separate stockpiles or silos to prevent inadvertent mixing with natural aggregates. Provide a separate compartment for recycled coarse aggregates in the batching plant;
4. Obtain recycled coarse aggregates for incorporation into the Works from Approved source as specified or permitted by the CM.

**CON1.M220.8** SOURCES OF AGGREGATES

1. Obtain crushed rock aggregates for each Approved Designed concrete mix from a single Approved source which may be either an Approved quarry or an Approved source of rock;
2. Where the aggregates are obtained through a crushing plant, the rock from which the aggregates for the Approved Designed concrete mix are obtained must be from the same single Approved source;
3. Obtain natural sand fine aggregates for each Approved Designed concrete mix from a single Approved locality within a defined boundary agreed with the CM;
4. Clear overburden as far as practicable from the working area prior to rock excavation. Overburden is defined as all unwanted material including vegetation, top soil and material of varying degrees of decomposition from the parent rock. The latter category may appear as intrusive bands between volumes of massive rock;
5. Remove rock from igneous intrusions as far as practicable from the working area;
6. Incorporate sufficient scalping and screening facilities in the aggregate production plant to remove all overburden from the aggregates;
7. Keep separate in clearly defined areas the materials both before and after processing where the aggregate production plant is rock from more than one quarry or rock source.

**CON1.M230.8** COARSE AGGREGATE

Clean, hard, durable crushed rock complying with CS3:2013 except for the requirement of Aggregate Impact Value and Los Angeles Value.

**CON1.M240.8** FINE AGGREGATE

1. Clean, hard durable crushed rock, complying with CS3:2013;
2. Do not use natural sand unless with prior agreement of the CM.

**CON1.M250.8** ALL-IN AGGREGATE

Do not use all-in aggregate.

**CON1.M260.8** LIGHTWEIGHT AGGREGATE

To BS 3797:1990 except not to use clinker and furnace bottom ash.

**CON1.M270.8** AGGREGATES FOR AQUEOUS LIQUID RETAINING STRUCTURES

Having a water absorption, as measured in accordance with CS3:2013 Section 17 of not greater than 3%.
GRADING OF COMBINED AGGREGATES

The grading of the combined fine and coarse aggregates must ensure a dense concrete of suitable workability, using the specified proportions of cement and water.

WATER

1. In accordance with PRE.B10.1210 to PRE.B10.1260 or PRE.C11.090 as appropriate, and;
2. Use only clean fresh water from Water Supplies Department mains supply for making concrete. Unless otherwise specified, do not use recycled water;
3. If the water from Water Supplies Department mains supply is not available, submit to the CM for provisional approval:
   a. The source of water;
   b. A certificate showing that the water complies with the requirement of this Specification.
4. Where specified in the Contract, use recycled water to make concrete for minor structures.

RECYCLED WATER

1. Where specified on the Drawings, use recycled water in the mixing of concrete of grade strength not exceeding 30 MPa for minor structures, including ground pavings not subjected to vehicular traffic, footpaths, benches and stools, planter walls and non-structural concrete fill;
2. Produce recycled water by combining clean fresh water from Water Supplies Department mains supply with wash water from mixer washout operations in compliance with the properties specified in CON1.T330;

ADMIXTURES

ADMIXTURES GENERALLY

Ensure that the chloride ion content of admixtures for concrete containing embedded metal or for concrete made with SRPC does not exceed 2% by mass of the admixture or 0.03% by mass of the cement, whichever is the less.

SUBMISSIONS

Submit to the CM for provisional approval:
1. Manufacturer's information on admixtures;
2. Confirmation from the manufacturer that the admixtures comply with the requirements of this Specification;
3. Details of toxicity, proposed dosage, detrimental effects, if any, of under-dosage or over-dosage;
4. Details of chloride content and method of adding to the concrete mix;
5. One sample of each type of admixtures.

PIGMENTS FOR PORTLAND CEMENT AND PORTLAND CEMENT PRODUCTS

To BS 1014:1975.
ADMIXTURES AND SUPERPLASTICISERS

CURING COMPOUNDS

GENERAL
1. Of an Approved type and:
   a. Having an efficiency index of at least 85% when tested to BS 7542:1992;
   b. Either wax or aluminised resin based and containing a fugitive dye.
2. Do not use curing compound containing organic solvents for public roads and bus terminuses which are to be handed over to the Highways Department of the HKSAR on completion.

SUBMISSIONS
Submit to the CM for provisional approval:
1. Manufacturer's information on curing compounds showing that the curing compounds comply with the requirements of this Specification;
2. Test certificates prepared by an Approved testing laboratory, to show that the curing compounds will provide the required efficiency index;
3. A sample of each type of curing compound.

PROPERTIES
The compound when applied according to the manufacturer's recommendations must:
1. Be stable and impervious to evaporation of water from the concrete surface within 60 minutes after application;
2. Not react chemically with the concrete to be cured and not crack, peel or disintegrate within 1 week after application;
3. Degrade completely within 3 weeks after application.

CONCRETE CARRIAGEWAY CONSTRUCTION
Non-pigmented liquid resin or wax-resin based membrane curing compound of a proprietary brand, and available both with and without a fugitive dye.

STRUCTURES TO CONTAIN POTABLE WATER
Concrete curing compound for use on concrete surfaces against which potable or fresh water will be stored or conveyed must be non-toxic and incapable of imparting a taste to the water.

ANCILLARY MATERIALS

UNDERLAGS TO CONCRETE PAVINGS AND SLABS ON HARDCORE
Either:
1. Subsoil grade reinforced waterproof building paper to BS 1521:1972, grade B1F; or
2. 0.125 mm nominal thick impermeable polythene sheet.

POLYETHYLENE SHEETING FOR CURING
Impermeable and of a minimum thickness of 0.125 mm.

WATERPROOF ADHESIVE TAPE
Of proprietary manufacture.
CON1.M640.8 BITUMASTIC PAINT
Tar based complying with BS 1070:1993, type B.

CON1.M650.8 REPAIR MORTAR
1. Of proprietary manufacture and certified to the "Product Conformity Certification Scheme for Repair Mortars" (PCCS-RM) published by the Hong Kong Concrete Institute. The product conformity certificate shall be issued by a certification body accredited by Hong Kong Accreditation Service (HKAS) or its Multilateral Recognition Arrangement (MRA) partners;

2. Cement based product comprising Portland cement, fines/sand, admixture and/or non-shrink additives packed in bags and complying with the performance characteristics given in the Table below:

<table>
<thead>
<tr>
<th>Properties</th>
<th>Testing method</th>
<th>Performance characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compressive strength at 28 days (MPa)</td>
<td>CS1: Section 12, using 100 mm cube test specimens</td>

<td>ASTM C1090-01(05)</td>
<td>0% ≤ V ≤ 0.4%</td>
</tr>
</tbody>
</table>

3. The repair mortar shall not release substances hazardous to health, hygiene and environment.

4. Submit the following for CM's information:
   a. The original or a certified true copy of the product conformity certificate to PCCS-RM stipulated in sub-clause (1). Certified true copy shall be certified true by the issuer of the original copy or by the QCM;
   b. A summary of the results on tests stipulated in the 'initial type test' and 'audit testing' of the PCCS-RM. The summary shall be prepared by the accredited laboratory who carried out the testing or by the certified manufacturer. If so directed by CM, submit a full set of the audit test reports to CM for information.

CON1.M660.8 LOW VISCOSITY POLYMER RESIN
Of proprietary manufacture.

CON1.M670.8 EPOXY RESIN FOR INJECTION
Of proprietary manufacture.

CON1.M680.8 CAST IN STEEL INSERT CHANNELS
As MET1.M080.
CON1.M710.8 READY MIXED CONCRETE

Ready-mixed concrete and any concrete batched off site, may be used only with Approval and must comply with all requirements of this Specification in respect of materials, quality and strength of such concrete.

CON1.M720.8 SUBMISSION FOR APPROVAL

1. Submit the following information to CM for approval, upon commencement of the Contract or during the course of Contract when concrete supply from a new source is to be used, at a minimum time specified in sub-clause (2):
   a. A statement advising whether the concrete is to be site-batched or ready-mixed. In case on-site concrete batching is proposed, submit further details to the CM on suitability of the plant in relation with statutory requirements and possible effects on adjoining localities;
   b. The name(s) of the proposed concrete supplier(s) as specified in CON1.M730 (who may be the Contractor) and details of the concrete supply;
   c. The name of each supplier's Quality Representative taking specific responsibility and authority for ensuring compliance with the requirements of the following:
      i. “Quality Scheme for the Production and Supply of Concrete” (QSPSC) issued by the Hong Kong Quality Assurance Agency (HKQAA);
      ii. ISO 14001 on environmental management.
   d. For high strength concrete works (concrete of grade strength higher than 60 MPa), a quality assurance proposal with sufficient preliminary test results is required to confirm that reliable and consistent concrete can be produced. The proposal should include a detailed assessment of the concreting materials, the mix design and the quality control procedures of the batching plant. In this respect the designed mean resistance to crushing, it shall initially exceed the specified resistance to crushing by a margin of not less than 12 MPa. Details of any subsequent revision of the mix design are to be submitted.

2. The time of submission for Approval for the respective concrete shall be at least:
   a. Concrete to be ready-mixed: 7 days before placing concrete or 7 days before the trial mixes if trial mixes are made;
   b. Concrete to be site-batched: 52 days for the first submission and a further 45 days for each re-submission before the commencement of batching plant erection.

3. Where provisional approval has been given by the CM on site-batched concrete supply, submit to CM for approval the following documents certified by Registered Structural Engineer for the on-site concrete batching plant:
   a. Location plan of the on-site concrete batching plant;
   b. General arrangement plans with adequate details for construction;
   c. Structural and foundation plans and calculations;
   d. Approval from relevant Government Departments, where applicable.

4. Do not commence plant erection without written approval from CM;

5. Submit Form ICU 13 to CM for approval on commencement of operation of the plant at least 22 days before completion of plant erection;

6. Programme the Works by taking into account of the submission and re-submissions that may be required under sub-clauses (3) to (5);

7. Comply with sub-clauses (3) to (6) for any subsequent relocation of the on-site concrete batching plant.
**CON1.M730.8** SUPPLIER'S CERTIFICATE

1. Obtain concrete only from suppliers who have achieved the following certification in respect of each batching plant supplying concrete under the Contract:
   a. QSPSC as stipulated in CON1.M720 for concrete production;
   b. ISO 14001 for environmental management.

2. Submit a copy of the certificates as stated in sub-clause (1) above in respect of each batching plant to the CM. All certification bodies shall be accredited by:
   a. The Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with HKAS to QSPSC in the category of product certification system;
   b. The HKAS or the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS to ISO 14001 in the category of environmental management system.

3. Newly erected batching plant shall be deemed to have achieved the certification valid for the following period if evidence is provided to CM that the concrete supplier has given written notice to the concerned certification body:
   a. QSPSC: in accordance with the Administrative Regulations of QSPSC;
   b. ISO 14001: not more than 2 months or such lesser time that is required for assessment and certification.

**CON1.M740.8** WITHDRAWAL OF CERTIFICATION

In the event that certification in CON1.M730 is not obtained, suspended or withdrawn in respect of any supplier or batching plant supplying concrete under the Contract:

1. Inform the CM immediately and cease using concrete from that supplier or batching plant;
2. Do not resume the supply of concrete from that supplier or batching plant without Approval, notwithstanding any suspended or withdrawn certification being subsequently reinstated.

**CON1.M750.8** SITE BATCHING

Where site batching plant is used, concrete supply from plants as defined in CON1.M760 below may be acceptable under the following conditions provided that evidence can be furnished to the CM showing that supply from other sources, including the contingency measure proposal as required under CON1.M1110 complying with CON1.M730 cannot be obtained:

1. At the first two months from commencement before operation of the site batching plant;
2. After dismantling of the site batching plant with only minor concrete work including small concrete structures still outstanding.

**CON1.M760.8** SITE BATCHING PLANT

Concrete supplied by the following plants may be acceptable if CON1.M750 as given above is satisfied:

1. Plants operated in another Housing Authority contract by the same Contractor, and having achieved certification under the QSPSC for concrete production and ISO 14001 for environmental management as approved by CM. Evidence must also be furnished to the CM to show that the proposal shall not affect the progress and works on the projects with the proposed plants;
2. Plants operated within the Contract, without a QSPSC and/or ISO 14001 certificate may only supply concrete under the condition as stated in sub-clause (2) of CON1.M750, provided that the following requirements are satisfied:
a. The operation of the plants is to comply with the Technical Regulations of QSPSC and ISO 14001 for environmental management;

b. Minor specific deviations from the Technical Regulations to cater for smaller plants may be acceptable. These may include tolerance on weighing equipments and use of single hopper for all constituent materials. All deviations must be submitted to the CM for approval;

c. An Independent Qualified Person (IQP) holding the qualification of MHKIE, MStructE or MICE shall be engaged and is responsible for monitoring the quality standards of the said plant. IQP is required to submit monthly statement to CM to confirm that the required quality standards and environmental management system are maintained. Submit details of IQP to CM for approval.

CONCRETE MIXES GENERALLY

CON1.M810.8 CHLORIDE CONTENT

The total chloride content of the concrete must not exceed the limits shown in the Table below, expressed as a percentage relationship between chloride ion and cementitious content of mix:

<table>
<thead>
<tr>
<th>Type of concrete</th>
<th>Maximum total chloride content %</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prestressed concrete. Steam cured structural concrete</td>
<td>0.1</td>
</tr>
<tr>
<td>Reinforced concrete. Concrete with embedded metal</td>
<td>0.35</td>
</tr>
<tr>
<td>Concrete made with SRPC</td>
<td>0.2</td>
</tr>
</tbody>
</table>

CON1.M820.8 DESIGNED CONCRETE MIXES

Use Designed concrete mixes for all concrete.

CON1.M830.8 USE OF SULPHATE RESISTING PORTLAND CEMENT

Do not use pulverised fuel ash with sulphate resisting Portland cement.

CON1.M840.8 USE OF PFA AND PFAC

Do not use pulverised fuel ash in addition to Portland fly ash cement.

CON1.M850.8 CONTROL OF ALKALI-AGGREGATE REACTIONS

1. Submit measures to control the occurrence of alkali-aggregate reaction in concrete for Approval;

2. In the absence of alternative proposals, the reactive alkali of concrete expressed as the equivalent sodium oxide (Na₂O) per cubic metre of concrete shall not exceed 3.0 kg:

   a. The equivalent Na₂O shall be calculated by the expression:

   \[
   \text{Equivalent Na}_2\text{O} = A + B + C
   \]

   where

   \begin{align*}
   A \quad & \text{is the sum of the acid-soluble alkalis (expressed as equivalent Na}_2\text{O) of cement, admixtures and water;} \\
   B \quad & \text{is equal to either 1/6 the total alkalis of PFA or 1/2 the total alkalis of GGBS (expressed as equivalent Na}_2\text{O); and} \\
   C \quad & \text{is equal to 0.76 times the chloride ion (Cl²⁻) of}
   \end{align*}
b. The acid-soluble alkali content of the cement shall be determined in accordance with BS EN 196-21:1992 and shall be taken as the average of the latest 25 daily determinations of equivalent sodium oxide plus twice the standard deviation of the results;

c. The acid-soluble alkali content of admixtures shall be determined in accordance with BS 1881:Part 124:1988;

d. The acid-soluble alkali content of water shall be determined in accordance with BS EN 1008:2002;

e. The total alkali content of the PFA or the GGBS shall be determined in accordance with BS EN 196-21:1992 and shall be taken as the average of 25 weekly determinations plus twice the standard deviation of the results. For a casting yard where there are less than twenty-five weekly determinations available, use the average and the standard deviation of all the available weekly determinations for calculation;

f. The equivalent Na₂O content of the coarse and fine aggregates shall be calculated from the quantity of Cl⁻ present which shall be measured in accordance with CS3:2013 Clause 21.3.

3. Submit the following particulars for each concrete mix:
   a. At Contract commencement:
      i. HOKLAS-endorsed test certificates, issued in less than six months' time from the date of commencement of the Works, giving the results of tests required in sub-clauses (2)(b) to (2)(f) above;
      ii. Calculation of the reactive alkali of the proposed mix.
   b. At quarterly intervals after Approval:
      i. HOKLAS-endorsed test certificates giving the results of tests required in sub-clauses (2)(b) to (2)(f) above;
      ii. Any further calculations necessary to demonstrate that the mix continues to comply with the limit on reactive alkali.

4. When Instructed, arrange for the parallel sampling of constituent materials in sub-clauses (2)(b) to (2)(f) by the HDMTL or the DTC for testing.

NO FINES CONCRETE

CON1.M910.8 COMPOSITION
1. Cement: Portland cement;
2. Aggregate: nominal maximum size 20 mm of which not more than 15% by mass is retained on a 20 mm BS test sieve, and not more than 10% by mass passes a 10 mm BS test sieve.

CON1.M920.8 AGGREGATE/CEMENT CONTENT RATIO
Lying within the range 10 to 15 by weight.

CON1.M930.8 CEMENT CONTENT
The cement content is such that each particle of aggregate is coated with cement paste but the compacted concrete has an open texture which permits the flow of water through the hardened concrete.
STANDARDISED DESIGNED CONCRETE MIX PROPORTIONS

CON1.M1010.8  CEMENT
To be Portland cement type CEM I in BS EN 197-1:2000.

CON1.M1020.8  MIX PROPORTIONS

1. Except for concrete with recycled coarse aggregates, select the mix proportions for standardised designed mix concrete from Tables A and B below. Select the appropriate content of water and water-reducing admixtures in accordance with CON1.M1170 and CON1.M1040 respectively. If mix proportions are so selected, no trial mixes as stipulated in CON1.T010 to CON1.T120 are required:

<table>

<td></td>
</tr>
<tr>
<td>10 mm</td>
<td>90 kg</td>
</tr>
<tr>
<td>Fine aggregate</td>
<td>180 kg</td>
</tr>
</tbody>
</table>

a. Fine aggregates to be within the limits of grading M in Table 3.2 of CS3:2013;
b. Do not derive fine aggregates from concrete rubble;
c. Conduct laboratory trial mix for concrete with recycled coarse aggregates in accordance with CON1.T050 prior to Approval.
CON1.M1030.8 **CONTRACTOR'S RESPONSIBILITY**
Notwithstanding full compliance with the other provisions of this Worksection, the Contractor's attention is drawn to his full responsibility in ensuring compliance with the strength, workability and all other requirements for Designed concrete mixes, taking due consideration of the characteristics of the materials used in the mix, and the Specification provisions allowed for Contractor's design within specified ranges.

CON1.M1040.8 **USE OF ADMIXTURES**
Do not use admixtures, other than water-reducing admixtures, without Approval.

**DESIGNED CONCRETE MIXES**

CON1.M1110.8 **SUBMISSIONS**
Submit details of mix design to the CM for provisional Approval at least 7 days before trial mixes are made or, if trial mixes are not required, at least 7 days before the mix is placed in the permanent work. Include the following:
1. Quantities of each constituent per m³ of compacted concrete;
2. Details of aggregates, including specific gravities and absorbencies, in support of sub-clause (1)(a) above;
3. Nominal grading details of fine and coarse aggregates in tabular and graphic form;
4. Nominal grading details, in tabular and graphic form, of the combined aggregate;
5. Free water / cement ratio by weight;
6. Designed workability, in terms of designed slump value or designed flow value;
7. Type of plant to be used, location of offsite ready-mixed plant, and a contingency proposal to demonstrate that continuous and adequate supply of concrete can be secured in the event of disruption to the planned supply. Include in such proposal measures to mitigate sudden break down of concrete supply during concreting;
8. System of mixing, i.e. what proportion of the minimum required mixing time will be carried out at the batching plant;
9. Total chloride ion content of mix;

CON1.M1120.A **MAXIMUM CEMENTITIOUS CONTENT**
1. The cementitious content of any mix up to Grade 60 must not exceed:
   a. 400 kg/m³ for concrete containing PC only, used for aqueous liquid retaining structures;
   b. 450 kg/m³ for concrete containing either (a) PFA and PC, or (b) GGBS and PC or (c) PFAC, used for aqueous liquid retaining structures;
   c. 550 kg/m³ for concrete used for any other structures.
2. Mass of cement of the cementitious content of any mix higher than Grade 60 should be limited to not more than 450 kg/m³.

CON1.M1130.8 **MINIMUM CEMENTITIOUS CONTENT**
Design mix of Grade 20 or greater in reinforced concrete or prestressed concrete to have the required minimum cementitious content, in kg/m³, given in the Table below:

<table>
<thead>
<tr>
<th>PC/PFA/GGBS Reinforced Concrete</th>
<th>Grade Strength (MPa)</th>

### AQUEOUS LIQUID RETAINING STRUCTURES

Subject to the limits set out in the Table to CON1.M1130 above the minimum cementitious content for aqueous liquid retaining structures is 325 kg/m³. The maximum cementitious content for aqueous liquid retaining structures shall be in accordance with CON1.M1120.

### INCREASING CEMENTITIOUS CONTENT

After Approval of the designed concrete mixes, the Approved cementitious content may be increased by up to 20 kg/m³ without the CM's consent, provided that the specified maximum and minimum limits for cementitious content are maintained.

### MAXIMUM FREE WATER / CEMENT RATIO

Do not exceed the following maximum free water/cement ratio figures for concrete grades 20D and above:

1. Unreinforced concrete: 0.60 or the ratio stipulated in Table 4.4 of 'Code of Practice for Structural Use of Concrete 2013' issued by the Buildings Department, whichever is the less;
2. Reinforced concrete: 0.55 or the ratio stipulated in Table 4.2 of 'Code of Practice for Structural Use of Concrete 2013' issued by the Buildings Department, whichever is the less;
3. Aqueous liquid retaining concrete: 0.50.

### MINIMUM SLUMP VALUE

The designed slump value must not be less than 75 mm except:

1. Blinding, unreinforced mass concrete and road pavement concrete;
2. Where otherwise agreed by the CM.

### CEMENT CONTENT IN CONCRETE WITH PFA OR GGBS

1. When PFA is used as a partial cement replacement and incorporated into the concrete as a separate material, ensure that:
   a. For foundation works, 65% by mass of the cementitious content of the mix is Portland cement to BS EN 197-1:2000: type CEM I;
   b. For all other works, 75% by mass of the cementitious content of the mix is Portland cement to BS EN 197-1:2000: type CEM I.
2. When GGBS is used as a partial cement replacement and incorporated into the concrete as a separate material for the production of precast facade and precast staircase, ensure that 65% by mass of the cementitious content of the mix is Portland cement to BS EN 197-1:2000: type CEM I.
CON1.M1200.8  ADJUSTMENT OF FINE AND COARSE AGGREGATES IN DESIGNED CONCRETE MIXES

After Approval of the designed concrete mixes, the Approved fine and coarse aggregate content may be adjusted without the CM’s consent up to a maximum of ±20 kg per 100 kg of cementitious content provided that the adjusted mixes comply with all requirements of this Specification in respect of materials, quality and strength of such mixes, and the aggregate / cementitious content ratio is kept unchanged. In the event that the Approved fine aggregate content is adjusted, the Approved coarse aggregate content shall be adjusted accordingly to keep the Approved aggregate / cementitious content ratio unchanged. The same is for the adjustment of the Approved coarse aggregate content.

MATERIALS FOR REMEDIAL WORK

CON1.M1210.8  GENERAL

Obtain Approval for all materials for remedial work.
WORKMANSHIP

HANDLING AND STORAGE OF MATERIALS

CON1.W010.8  BAGGED CEMENT

Store cement in bags:
1. In a dry, weatherproof store with a raised floor;
2. Cover every stock of more than 20 bags of cement or dry pulverized fuel ash (PFA) or dry ground granulated blastfurnace slag (GGBS) entirely with impervious sheeting or place them in an area sheltered on the top and the three sides;
3. With each delivery identified and kept separate;
4. For use in the order of delivery.

CON1.W020.8  BULK CEMENT, PFA AND GGBS

Store bulk cement, PFA and GGBS:
1. In dry, weatherproof and closed silos fitted with overflow detection device so that when the silo is approaching overflowing, a high level audible alarm is triggered and the material filling stops automatically within one minute. Do not overfill silos;
2. Carry out the loading, unloading, transfer, handling or storage of bulk cement or dry PFA or dry GGBS; or any cement or dry PFA during or after the debagging process in a totally enclosed system or facility and fit any vent or exhaust with fabric filter or equivalent air pollution control system or equipment;
3. Of different types and from different sources in separate silos clearly marked to identify the different contents of each.

CON1.W030.8  AGGREGATES

1. Do not handle or store aggregates in a manner which will result in the mixing of different types and sizes or in the segregation or contamination of the aggregates;
2. Store different types and sizes of aggregates in separate hoppers or in separate stockpiles. Provide the stockpiles with well drained concrete floors and dividing walls of sufficient height to keep the different aggregates separate.

CON1.W040.8  ADMIXTURES AND CURING COMPOUNDS

1. Store admixtures and curing compounds:
   a. In sealed containers, marked to identify the contents;
   b. Protected from exposure to conditions which may affect the material;
   c. In accordance with the manufacturers’ recommendations.
2. Do not use the materials after the recommended shelf life has been exceeded.
BATCHING AND MIXING CONCRETE

CON1.W110.8 BATCHING PLANT
1. Maintain the weighing mechanisms for all batching plant in good working order and ensure their accuracy is maintained within the tolerances given in the "Quality Scheme for the Production and Supply of Concrete" (QSPSC) issued by the Hong Kong Quality Assurance Agency (HKQAA). Check them against accurate weights and volumes at least once per month when required by the CM. Use separate weighing equipment for cement and aggregates. Arrange for calibration of all weighing mechanisms, water meters and admixture dispensers at three monthly intervals by an Approved independent consultant;
2. Obtain Approval for all dispensing equipment for admixtures which shall be accurate to within ±5% of the quantity of any admixture being used. The weights of cement, PFA, water and each size of aggregate as indicated by the mechanisms employed shall be accurate to within ±2% of the respective weights per batch agreed by the CM.

CON1.W120.8 ALLOWANCE FOR WATER CONTENT OF AGGREGATES
Adjust the weights fine and coarse aggregates to allow for the free water contained in them.

CON1.W130.8 QUANTITY OF WATER
Add that quantity of water to the mix required to produce concrete of the Approved workability.

CON1.W140.8 CONCRETE MIXING PLANT
Mixing plant must comply with BS 1305:1974 and BS 4251:1980 for batch and truck type concrete mixers respectively, and the requirement in BS 4251:1980 for revolution counters on truck mixer drum is not mandatory.

CON1.W150.8 MIXING CONCRETE
1. Comply with the mixer manufacturer's recommended batch capacity, method of loading, mixing time and speed of operation and do not change mixing time without Approval;
2. For production of concrete using bagged cement, dry PFA or dry GGBS in a standard bag (not exceeding 50 kg), carry out de-bagging, batching and mixing processes in an area sheltered on the top and the three sides.

CON1.W160.8 CEMENT FROM DIFFERING SOURCES
The use of cement from differing sources in same concrete pour and same structure shall be subject to the standards stipulated in CON1.W165 and CON1.T075 and approved by the CM, unless:
1. At different locations without any physical contact;
2. In the same structure with a construction joint already formed in accordance with CON1.W510 to CON1.W570 prior to the placing of fresh concrete with different cement source against the hardened concrete.

CON1.W165.8 PRE-REQUISITES ON MIXING TWO CONCRETE MIXES WITH CEMENT FROM TWO DIFFERING SOURCES
1. Each of the two concrete mixes, when used individually, shall comply with all requirements in the Specification, including the strength, workability and durability requirements;
2. The grade of strength, workability, durability and maximum size of aggregate of the two concrete mixes must be the same;
3. The types and proportions of the cementitious materials used in the two concrete mixes must be the same;
4. The types and brand of admixtures used in the two concrete mixes must be the same. The difference in the dosages of the admixtures between the two concrete mixes shall not be more than 5%, unless otherwise approved by the CM;
5. The difference in the water / cementitious materials ratio between the two concrete mixes shall not be more than 0.02;
6. The two concrete mixes may be produced from different sources of aggregates provided that the sources of the two difference aggregates have each been approved before for concrete production and the aggregates are of the same type. The difference in the fines content of the fine aggregate between the two concrete mixes shall not be more than 5%.

**CON1.W170.8 REMIXING**
Do not remix partially hardened concrete with or without additional cement, aggregate or water.

**CON1.W180.8 TRUCK MIXED CONCRETE**
When using truck mixed concrete:
1. Add water at the batching plant as agreed by the CM;
2. Do not add water in transit;
3. Do not add water at the Site without Approval.

**CON1.W190.8 CLEANLINESS OF MIXER**
1. Do not load mixer in excess of its rated capacity and empty the mixer before recharging;
2. Clean mixers which have been out of use for more than 30 minutes before fresh concrete is mixed; and whenever there is a change in the type of cement being used.

**CON1.W200.8 LIGHT-WEIGHT CONCRETE**
Mix and place light-weight concrete as indicated on the Drawings in accordance with the aggregate manufacturer's instructions and as required by the CM.

**CON1.W210.8 WATERPROOF CONCRETE**
For concrete specified as "waterproof," incorporate water-proofing material strictly in accordance with the manufacturer's instructions, and complying with aqueous liquid retaining concrete.

**PROGRAMME AND SITE RECORDS FOR CONCRETING**

**CON1.W305.8 PROGRAMME FOR CONCRETING**
1. Provide monthly programme for concreting showing concreting works for the coming month for information and discussion at each Monthly Site Meeting;
2. Provide the monthly programme for concreting in sub-clause (1) above to the concrete supplier for advanced planning within one week after each Monthly Site Meeting;
3. Submit a summary report on concrete supply status monthly or at an agreed interval with the CM for record for any concrete pour larger than 100 m³. The report shall include, but not be limited to, the name of the supplier, the quantities and the dates of each concrete grade ordered and delivered on Site, and the dates that the orders are placed within the reporting period. In case if any order is cancelled, the date that the cancellation order is placed and an explanation for the cancellation shall be provided in the report.

CON1.W310.8 REQUIREMENTS ON SITE RECORDS FOR CONCRETING

1. Provide delivery notes on Site, relating to each delivery of concrete available for inspection by the CM at all times and containing the following information:
   a. Serial number of delivery note;
   b. Date;
   c. Name of supplier and location of batching and mixing plant;
   d. Registration number of delivery vehicle;
   e. Name of purchaser;
   f. Name and location of the Site;
   g. Sources and actual quantities of each constituent, including admixtures, if any;
   h. Designation of concrete mix and approved workability value;
   i. Quantity of concrete;
   j. Time of introduction of cement to the mix.

2. Keep records of concreting operations on the Site available for inspection by the CM at all times, and containing the following details:
   a. Date;
   b. Designation of concrete mix and approved workability value;
   c. Serial number of delivery note;
   d. Arrival time of delivery vehicle;
   e. Time of completion of discharge;
   f. Position where concrete is placed;
   g. Results of workability tests in terms of measured slump or flow table values as appropriate;
   h. Details of test cubes markings, and whether test cubes were taken from the delivery;
   i. Total quantity of each concrete mix placed that day;
   j. Temperature of fresh concrete when it is placed in position where temperature control is required in accordance with CON1.W470. (For practical reasons the CM may accept that the temperature of concrete measured immediately before it is placed in position is taken as the temperature of concrete when it is placed in position.)

3. For public roads and bus termini which will become the properties of the Highways Department of the HKSAR after the handing over of the works, submit all the related Delivery Notes and record book to the Employer on completion of the Works.

TRANSPORTING AND PLACING CONCRETE

CON1.W410.8 GENERAL

1. Transport and place concrete by Approved methods which ensure that there is no contamination, segregation or loss of the constituent materials;
2. Place and compact concrete in such a way as to avoid disturbance to the formwork and reinforcement. Where sections of the work are carried out in lifts, support the reinforcement projecting above the lift being cast to prevent movement of the bars during the casting and setting of the concrete.

**CON1.W420.8**** CONCRETE BATCHED OFF-SITE**
For concrete batched off-site:
1. Carry the concrete in purpose made agitators operating continuously, or in truck mixers;
2. Submit to the CM for verification details of the methods for agitating the concrete during transport and immediately prior to placing.

**CON1.W430.8**** CLEANLINESS**
1. Clean all areas where concrete is to be placed and, except for concrete placed under water, remove all standing water immediately before placing the concrete;
2. Protect slab formwork surfaces from concrete droppings and spillage during concreting.

**CON1.W440.8**** APPROVAL BEFORE PLACING CONCRETE**
1. Do not place concrete in any part of the structure until Approval has been given;
2. Obtain Approval again if concreting is not started within 24 hours of Approval being given.

**CON1.W450.8**** PROCEDURE**
1. Place concrete continuously between construction joints as close as practicable to its final position;
2. Do not allow concrete to free fall in excess of 2.7 m unless otherwise Approved;
3. Deposit concrete in horizontal layers to a compacted depth not exceeding 450 mm where internal vibrators are used or 150 mm in all other cases unless otherwise Approved. Do not force concrete into place by vibrator;
4. Do not place fresh concrete against insitu concrete which has been in position for more than 30 minutes unless the insitu concrete has been kept damp with a layer of wet hessian and protected from the weather to the satisfaction of the CM;
5. When insitu concrete has been in place for 4 hours or in the opinion of the CM the concrete has stiffened to such an extent that it no longer responds to the action of an internal vibrator, do not place further concrete against it for a further 20 hours unless otherwise Approved and form a construction joint in accordance with CON1.W510 to CON1.W570 as appropriate;
6. Compact concrete in its final position within 2½ hours of the introduction of cement to the mix. Concrete, which in the opinion of the CM is no longer sufficiently workable, will be rejected;
7. Place concrete by skip or such other Approved methods as specified by the requirements of the Specifications;
8. Do not place concrete in flowing water.

**CON1.W460.8**** USE OF TRUNKING AND CHUTES**
Keep trunking or chutes clean and use them in such a way as to avoid segregation.

**CON1.W465.8**** TEMPERATURE CONTROL IN FRESH CONCRETE**
1. Submit to the CM for approval details of measures on control of fresh concrete to a temperature not higher than 30°C:
   a. For the structural elements with concrete grade strength greater than 60 MPa;
b. For the massive structural elements as specified in CON1.W470;

c. For mass concrete retaining walls with concrete grade strength greater than 60MPa.

2. The CM may reject any concrete for which the temperature, as measured on Site by the DTC, exceeds 30°C.

**CON1.W470.A TEMPERATURE CONTROL IN MASSIVE STRUCTURAL ELEMENTS**

1. Comply with CON1.W465 and submit the following to the CM for approval on the temperature control for massive structural elements as specified in the Project Specific Specification at least two months before concreting:
   a. A method statement of the proposed temperature control;
   b. Calculations of the forecast concrete temperature, temperature gradients and resulting stresses. The calculation of temperature in concrete shall be in accordance with the CIRIA Report No. C660 “Early Age Thermal Crack Control in Concrete” or other Approved recognised method.

**TRANSPORTING AND PLACING CONCRETE**

**CON1.W480.N CONCRETING PLAN**

Submit a concreting plan for each concreting pour to the CM at least one week prior to commencement of concreting works of the respective pour for agreement. The concreting plan shall demonstrate that the concreting works is able to be completed within the statutorily permitted working hours, with content including but not limited to the following:

1. Volume of the pour and planned timeline of the concreting works; and
2. Contingency measures to be taken once there is a slippage in concreting affecting the timely completion of the scheduled concreting works within the permitted working hours. The contingency measures shall include planning and details of construction joint(s) to be formed if necessary.

**FORMING CONSTRUCTION JOINTS**

**CON1.W510.8 LOCATION OF JOINTS**

1. Obtain Approval for the position and details of any construction joints not specified in the Contract;
2. Arrange such joints so as to minimise the possibility of the occurrence of shrinkage cracks;
3. Arrange construction joints horizontally or vertically unless otherwise Approved.

**CON1.W520.8 AQUEOUS LIQUID RETAINING STRUCTURES**

1. Cast the bottom slab and walls of aqueous liquid retaining structures in one operation where no pre-determined construction joints are specified, unless otherwise Approved;
2. Where construction joints are shown on Drawings, provide Approved proprietary type waterstops at construction joints and:
   a. Securely fix waterstops in position to formwork in such a manner that compaction of the concrete will not be affected;
   b. Make in-situ joints in waterstops using methods and equipment recommended by the manufacturer;
   c. Protect exposed waterstops from exposure to conditions that may affect the waterstops; and
d. Keep the waterstops free from rust, hydrocarbons and other deleterious material.

**CON1.W530.8 WALLS AND COLUMNS**

Finish the upper surface of lifts of concrete walls and columns horizontally and clean the formwork of adhering concrete before the next lift is placed.

**CON1.W540.8 EXPOSING AGGREGATE**

Remove laitance and all loose material and expose the aggregate by an Approved method as soon as is practical after casting, but:

1. Where an air jet is used—allow a minimum period of 4 hours after casting to elapse;
2. Where a water jet is used—allow a minimum period of 12 hours after casting to elapse.

**CON1.W550.8 FOOTINGS AND PILE CAPS PREPARED BY OTHERS**

Where the footings or pile caps have been constructed by others:

1. Hack off and expose aggregate by an Approved method of all construction joints of columns and walls on footings and pile caps prepared by a previous contractor;
2. Remove the cement slurry coating on column and wall starter bars.

**CON1.W560.8 PLACING ADJACENT CONCRETE**

Ensure the surface of the construction joint is clean and moist when fresh concrete is placed against it.

**CON1.W570.A INTERRUPTED POURS**

Form construction joint(s) in accordance with the provisions of the preceding clauses of this subsection under the following circumstances:

1. Placing of concrete has to be unexpectedly stopped; or
2. There is a slippage in concreting which may affect the timely completion of the scheduled concreting works within the statutorily permitted working hours.

**CON1.W580.8 CONSTRUCTION JOINTS FOR CONCRETE CARRIAGEWAY AND PAVED AREA**

Arrange construction joints normal to the axis or plane of the element being constructed unless otherwise permitted by the CM.

**COMPACATION**

**CON1.W610.8 GENERAL**

Compact concrete to produce a dense homogeneous mass with vibrators unless otherwise Approved and:

1. Provide types of vibrating equipment which will effectively compact the concrete;
2. Provide a sufficient number of vibrators in serviceable condition on Site to ensure that reserves are always immediately available in the event of breakdowns.

**CON1.W620.8 VIBRATING EQUIPMENT**

To BS 2769:Part 2:1984 and:

1. Internal vibrators: operating at a minimum of 10,000 cycles per minute;
2. External vibrators: operating at a minimum of 3,000 cycles per minute;
3. Vibrating tables: operating at a minimum of 5,000 oscillations per minute may be used for pre-cast elements subject to Approval;
4. Do not use external clamp-on type vibrators without Approval.
CON1.W630.8 USING VIBRATORS
Use vibrators in such a manner that vibration is applied continuously and systematically during placing of the concrete until the expulsion of air has practically ceased and:
1. Do not use vibrators in a manner which will result in segregation;
2. Do not apply vibration by way of the reinforcement;
3. Where vibrators of the immersion type are used, avoid all contact with reinforcement, formwork and inserts as far as is practicable;
4. Do no use vibration as a means of distributing concrete into position.

CON1.W640.8 NEW CONCRETE
Do not vibrate concrete between 4 and 24 hours after compaction.

CON1.W650.8 COMPACTING NO-FINES CONCRETE
Compact using a minimum amount of punning.

PUMPING CONCRETE

CON1.W710.8 CM'S APPROVAL
Do not use concrete pumps without prior Approval.

CON1.W720.8 PUMPING EQUIPMENT
Operate and maintain concrete pumps in accordance with the manufacturer's recommendations and:
1. Keep pumps and pipelines maintained in a clean condition;
2. Do not use pipelines with internal surfaces of aluminium;
3. Ensure joints in pipelines are tightly fixed and do not permit grout loss.

CON1.W730.8 PIPELINES
Position concrete pumps such that pipelines are as short and straight as practicable and require as little repositioning as practicable and arrange bends in such a manner that the concrete, formwork, reinforcement or built-in components are not disturbed.

CON1.W740.8 LUBRICATING PIPELINES
Lubricate pipelines by passing cement grout or concrete through the pipeline before the concrete is pumped. Do not place the initial discharge of pumped concrete in the permanent work.

PLACING CONCRETE UNDER WATER

CON1.W810.8 GENERAL
Do not place concrete underwater without prior Approval.

CON1.W820.8 STANDARD
Place underwater concrete in accordance with the recommendations given in BS 8004:1986.

CON1.W830.8 TREMIES
Securely support tremies used to place concrete in position and ensure the joints are watertight. Use a temporary seal of an Approved type to keep the water and the concrete separate at the start of concreting.
CON1.W840.8 PROCEDURE
After the concrete is flowing, raise the tremie in a manner agreed by the CM and:
1. Keep the lower end of the tremie immersed in the concrete to a depth of at least 1 m;
2. Prevent water, mud and other deleterious material from entering the tremie after concreting has started.

CON1.W850.8 DEALING WITH BLOCKAGES
Unless otherwise permitted by the CM, stop concreting immediately if the tremie becomes blocked or is removed from the concrete and:
1. Do not recommence concreting for at least 24 hours without Approval;
2. Remove contaminated concrete before concreting recommences.

CON1.W860.8 SURCHARGE AND CONTAMINATED CONCRETE
1. Surcharge concrete placed by tremie above the specified level by an amount which is sufficient to allow for the removal of any contaminated concrete;
2. Remove contaminated concrete.

LAYERING HOLLOW BLOCK FOR SLABS

CON1.W910.8 GENERAL
See CON2.W300.

WATERTIGHT BASEMENT CONSTRUCTION

CON1.W1010.8 GENERAL
Ensure that the completed work is free from leaks and damp patches.

CON1.W1020.8 BLINDING LAYER
Lay blinding layer to the grade and thickness shown on the Drawings, to form a clean and dry base for the main structural slab, ensuring that there is no loss of cement to, nor gain of water from the base.

CON1.W1030.8 WATER/VAPOUR PROOF MEMBRANE
Exercise special care to prepare the surface for application of asphalt waterproofing in accordance with Worksection WAT1 and to avoid damage to the membrane after application.

CON1.W1040.8 FORMWORK TIES
Use only formwork-ties which leave no open holes through the concrete.

CON1.W1050.8 CONCRETE SUPPLY
If ready-mixed concrete is used, supply to the site at regular intervals.

CON1.W1060.8 CONSTRUCTION JOINTS
1. Provide waterstops as specified in CON6.M210 and CON6.W210 to CON6.W230 for all construction joints, plan the positions of the construction joints according to planned daily production of concrete and keep their number to a minimum;
2. Position the joint between the base slab and the walls a minimum of 250 mm above the top of the base slab.
GROUND WATER
Keep ground water levels below the blinding level so that the cast concrete will not be subjected to water pressure until it has attained sufficient strength.

REMEDIAL WORK TO LEAKS ETC.
Carry out remedial work required to eliminate any leaks and damp patches that occur, and obtain Approval of method to be used.

MASS CONCRETE RETAINING WALLS

CONCRETE GRADE
Grade 20/20, unless otherwise specified.

ADDED STONES AND BOULDERS
The addition of granite stones or boulders will be Approved provided that their weight does not exceed 20% of that of the finished concrete and that any two stones or boulders are spaced at a clear distance of at least 225 mm.

WEEN HOLES
Build in 75 mm diameter plastic weep pipes through the full thickness of walls, falling to the outside and spaced at staggered centres of 1.5 m.

TEMPERATURE CONTROL
Comply with the provisions of CON1.W470 when specified grade strength greater than 20 MPa and up to 60 MPa.

GROUND SLABS

LAYING UNDERLAYS TO SLABS LAID ON HARDCORE
Lap and tape underlays at least 300 mm at joints.

BLINDING LAYER
Unless otherwise specified, provide a blinding layer of Grade 15/20 concrete to underside of all reinforced concrete works in contact with earth to the following thicknesses:
1. Pilecaps and footings: 75 mm;
2. All other cases: 50 mm.

KICKERS

WALLS AND COLUMNS
See CON2.W410 to CON2.W440.

CURING

METHODS OF CURING - GENERAL
1. Immediately after compaction, protect finished concrete against the harmful effects of weather, running water and drying out;
2. Close any cracks developed on the concrete surface immediately while the concrete is still plastic with suitable methods such as trowelling and brushing before curing;
3. Ensure proper protection by using one of the following methods which are minimum requirements and apply them for the minimum periods stated in CON1.W1490:
   a. Method A (as CON1.W1420): For all concrete slabs in domestic floors and transfer structures except for areas which in the opinion of the CM are of such irregular shape which renders the method impractical;
   b. Method F (as CON1.W1470): For caps or footings where the least dimension exceeds 500 mm;
   c. Methods B, C, D or E (as CON1.W1430 to CON1.W1460): At the Contractor's option for all other concrete elements including domestic floor slabs and transfer structures with irregular shapes.

4. Where concrete is to be kept moist by spraying water for curing methods stipulated in sub-clause (3), or during temporary removal of the protection to facilitate construction stipulated in CON1.W1500, take due consideration and necessary measures to avoid thermal shock to the concrete.

CON1.W1420.8 CURING - METHOD A
Cover the concrete with waterproof Approved tarpaulin sheets of good quality and condition suitable for the intended purpose, and:
   1. Make tarpaulin sheets to size to suit the shape, size and number of slab panels such that the number of tarpaulin sheets to cover the area is as few as is practical;
   2. Lap tarpaulin sheets 600 mm (minimum) at joints;
   3. Effectively hold down the tarpaulin sheets during the curing period in such a manner as not to damage the concrete surface;
   4. Ensure the concrete is constantly moist;
   5. For strips not more than 300 mm wide around walls or columns, use hessian or similar absorbent material in lieu of tarpaulin sheets and keep constantly wet.

CON1.W1430.8 CURING - METHOD B
Except for surfaces against which concrete or applied finishes have subsequently to be placed, cure the concrete by the application of an Approved liquid curing compound and apply:
   1. By means of a low-pressure spray at the rate recommended by the manufacturer;
   2. On horizontal surfaces immediately after finishing the concrete;
   3. On vertical surfaces immediately after removing the formwork.

CON1.W1440.8 CURING - METHOD C
After thoroughly wetting, cover the concrete with polyethylene sheeting, lapped and securely held in position in such a manner as not to damage the concrete surface, and ensure the concrete is kept constantly moist.

CON1.W1450.8 CURING - METHOD D
Cover the concrete with a layer of fine aggregate minimum 25 mm thick, then hessian, sacking, canvas or similar absorbent material, lapped and securely held in position in such a manner as not to damage the concrete surface. Keep this covering layer constantly wet.

CON1.W1460.8 CURING - METHOD E
1. Cover the concrete with polythene sheeting, lapped and securely held in position in such a manner as not to damage the concrete surface, until the concrete has hardened sufficiently for water curing to be carried out;
2. Water cure by spraying the concrete surface continuously with water or by ponding immediately after the sheeting is removed.

**CON1.W1470.8 CURING - METHOD F**
1. Formwork is to be stripped at least 3 days after concreting;
2. After thoroughly wetting the concrete, cover the concrete with polyethylene sheeting, lapped and securely held in position in such a manner as not to damage the concrete surface, then cover the polyethylene sheeting with hessian bags, and ensure the hessian bags are kept wet throughout the curing period. This also applies to the locations of columns and walls with starter bars.

**CON1.W1480.8 PROTECTION OF NEW CONCRETE FROM THE WEATHER**
Provide adequate amount of polyethylene sheets to protect freshly placed concrete against heavy rain as required or directed by the CM.

**CON1.W1490.8 MINIMUM PERIODS OF PROTECTION FOR CONCRETE**
1. Maintain the following minimum curing periods after the concrete has been placed:

<table>
<thead>
<tr>
<th>Type of Structure</th>
<th>Minimum Period of Protection (Days)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Concrete not Containing PFA, PFAC or GGBS</td>
</tr>
<tr>
<td>Aqueous liquid retaining and watertight structures</td>
<td>B</td>
</tr>
<tr>
<td>Aqueous liquid retaining and watertight structures</td>
<td>C, D, E</td>
</tr>
<tr>
<td>Cap or footing where the least dimension exceed 500 mm</td>
<td>B</td>
</tr>
<tr>
<td></td>
<td>F</td>
</tr>
<tr>
<td>Others</td>
<td>B</td>
</tr>
<tr>
<td>Others</td>
<td>A, C, D, E</td>
</tr>
<tr>
<td>Transfer structure</td>
<td>A</td>
</tr>
</tbody>
</table>

2. The figures given in the above table may be reduced by the number of days during which formwork has been left in place.

**CON1.W1500.8 TEMPORARY REMOVAL OF PROTECTION**
Where protection to concrete slabs must temporarily be removed to facilitate setting out or other follow-up operations, ensure that the exposed concrete is adequately sprayed with water and kept moist for the duration of these operations and that the protective covering is restored as soon as practicable.

**CON1.W1510.8 ENHANCED CURING CONTROL IN ROOF SLAB**
1. In addition to the curing measures in CON1.W1410, provide the following enhanced curing control to the roof slab of domestic blocks:
   a. Artificial fogging from nozzles to the concrete slab surface immediately after concrete is cast until the slab is proper protected;
   b. Ensure that the protection is implemented at the shortest possible time but shall not be more than two hours under all circumstances.
2. Where specified in Project Specific Specification, cast the wing slabs and central core slab in separate pours and allow for late cast strips between the slabs.

LOADING NEW CONCRETE STRUCTURES

**CON1.W1610.8** LIMITATIONS
Unless otherwise specified, do not subject concrete at any time to a loading which will induce a compressive stress exceeding 33% of the compressive strength of the concrete at the time of loading, or of the grade strength whichever is the least and:

1. When determining the loading, make due allowance for the self-weight of the concrete;
2. For the purpose of this clause, the assessment of the strength of concrete and the stresses produced by the loads is subject to Approval.

WORKED FINISHES TO CONCRETE

**CON1.W1710.8** TYPES OF FINISH
Apply to the following finishes where shown or scheduled on the Drawings and execute in an Approved manner:

1. Wood float: to give an even textured surface;
2. Steel trowel or power float: to give a smooth untextured surface;
3. Scratch with a stiff brush: to give a slightly roughened even texture;
4. Tamp with the edge of a board: to give an even texture of parallel ribs.

**CON1.W1720.8** ADDED CEMENT OR WATER
Do not, without Approval:

1. Wet the surface to assist working;
2. Add cement to produce the specified finish.

**CON1.W1730.8** PROTECTION OF LIVING ROOM FLOORS
Protect from damage the power float finish of all living room floor slabs of domestic flats. Obtain Approval for method of protection.

APPLIED SURFACE FINISHES

**CON1.W1810.8** HARDENING
Where shown or scheduled on the Drawings mix the concrete with an Approved hardening admixture in accordance with the manufacturer's recommendations.

**CON1.W1820.8** SURFACE HARDENING
Where shown or scheduled on the Drawings, apply an Approved liquid surface hardener in accordance with the manufacturer's recommendations.

**CON1.W1830.8** METALLIC OR MINERAL TREATMENTS
Where shown or scheduled on the Drawings, apply an Approved metallic or mineral surface treatment in accordance with the manufacturer's recommendations.
CRACK REPAIR

CON1.W1910.8 GENERAL
All visual cracks to hardened structural and non-structural concrete in domestic and non-domestic buildings discovered during the construction period and/or Maintenance Period, whether they are less than, equal to or greater than the calculated maximum crack width as stated in Code of Practice for Structural Use of Concrete 2013, shall be regarded as defects, imperfections or faults for which the Contractor is liable under GCC Clause 10.3(2), unless such cracks are proved by the Contractor to be due to a design fault of the Authority. If any cracks prove to be due to a design fault of the Authority, then the expense incurred in any investigation and remedial work carried out by the Contractor, as hereunder specified, will be valued in accordance with GCC Clause 10.3(3).

CON1.W1920.8 INVESTIGATION
Investigate all visual cracks as directed by the CM and repair in accordance with the classification methods described in the Table contained in CON1.W1990.

CON1.W1930.8 METHOD STATEMENT
Before commencement of repairs to cracks, submit, for Approval, a method statement detailing the materials and methods to be used.

CON1.W1940.8 CONTRACTOR'S RESPONSIBILITY
1. Take responsibility for initiating the inspection of cracks and the programming of subsequent remedial repairs to ensure all such cracks are repaired before hand-over of the structures to the Authority;
2. Likewise define and repair all visible cracks discovered during the Maintenance Period in accordance with the remaining clauses in this Section.

CON1.W1950.8 PROCEDURE FOR CLASSIFICATION - TYPE OF MEMBER
Types of elements are classified in this specification as follows:
1. (U) All concrete placed below ground level which is not part of a water-retaining structure or water barrier;
2. (S) Slabs (including ribbed slabs): horizontal or inclined elements of concrete in which two dimensions in the horizontal or inclined plane exceed the dimension in the vertical plane;
3. (B) Beams: horizontal elements of concrete in which one dimension in the horizontal plane exceeds the other dimension in the horizontal plane and also exceeds the dimension in the vertical plane;
4. (W) Walls: vertical elements of concrete in which one dimension in the vertical plane and one dimension in the horizontal plane both exceed the other dimension in the horizontal plane;
5. (C) Columns: vertical elements in which one dimension in the vertical plane exceeds the other two dimensions in the horizontal plane.

CON1.W1960.8 PROCEDURE FOR CLASSIFICATION - WIDTH OF CRACK
Determine the width of the crack at the surface of the concrete with the aid of a transparent sheet on which lines of different width are printed or by examining the crack with a low power microscope incorporating a measuring graticule. The classifications of crack width in this specification are:
1. F: maximum width at any point 0.3 mm or less.
2. C: maximum width at any point greater than 0.3 mm.
**CON1.W1970.8** PROCEDURE FOR CLASSIFICATION - DEPTH OF CRACK

Determine the depth of a crack in one of the following ways:

1. Slabs: observe whether water on the top surface of the slab passes through the crack and can be seen as a moistened patch on the underside of the slab:
   a. If water is seen to pass through the slab, the crack is deemed to be a through crack of type T;
   b. In all other cases it is deemed to be a non-through crack of type NT.

2. In all other elements, if the line of the crack on one surface can be traced on another surface parallel to the first surface or in the case of a beam, if the crack can be seen to traverse two adjacent surfaces in different planes, it is deemed to be a through crack of type T;

3. If a crack follows an irregular pattern on one surface of an element only and is branched at least two points it is deemed to be a non-through crack of type NT.

**CON1.W1980.8** METHODS OF REMEDIAL REPAIR

Use the following permissible methods for rectifying cracks according to the overall classification of the crack as given in the table in CON1.W1990:

1. Simply surface seal the crack by brushing into it, wherever it is visible, a coat of heavy grade bitumastic paint or other approved durable inert waterproof material;

2. Fill the crack by brushing in dry cement and moistening after the treatment;

3. Brush cement grout or cement paint into the crack until it appears to be filled;

4. Cut a V-groove and fill with repair mortar, applied in accordance with the manufacturer's recommendations, or other equivalent Approved material;

5. Seal by arranging for a low viscosity polymer resin to flow, under the influence of gravity or injection, into the crack to fill it and harden;

6. Inject epoxy resin under pressure into the crack until it exudes at weep holes located so as to ensure that when this occurs the crack may reasonably be expected to have been completely filled and all air to have been displaced by resin; and

7. Apply the method in sub-clause (6), and a coat of heavy grade bitumastic paint over the surface of the crack or other method as approved by CM.

**CON1.W1990.8** REPAIR ACCORDING TO CLASSIFICATION

Carry out crack repair according to the treatment method in the following table unless otherwise instructed by CM:

<table>
<thead>

### TOLERANCES

**CON1.W2010.8 GENERAL**

1. For tolerances other than civil engineering works and slopeworks, refer to:
   a. Code of Practice for Structural Use of Concrete 2013 published by the BD;
   b. Appendix H "Schedule of Tolerances" to this Specification;
   c. Where any ambiguity, discrepancy or conflict arises between sub-clauses 1(a) and 1(b) above, the provisions given in Appendix H shall prevail.

2. For any abrupt projections in excess of 5 mm at inner surfaces of liftwell walls:
   a. Use Approved non-shrink cementitious material to form a hard smooth surface to splay the abrupt projections, to an angle of not less than 75° from the horizontal plane, and extend for a distance of not less than 20 mm;
   b. Submit remedial details for the CM's approval.

3. For civil engineering works and slopeworks, tolerances given in this Worksection should be read in conjunction with additional tolerances given in Worksection FOR. Tolerances on joints:
   a. The best fit straight line of straight joints shall be within 25 mm of a specified line. The line of straight joints shall be within 10 mm of the best fit straight line;
   b. The best fit curved line of curved joints shall be as agreed by the CM and shall be within 25 mm of the specified line. The line of curved joints shall be within 10 mm of the best fit curved line;
   c. Joints shall be continuous across intersections of joints to within 5 mm of the best fit straight lines or best fit curved lines of each joint.

TESTING

TRIALS OF DESIGNED CONCRETE MIXES

CON1.T010.8 REQUIREMENT FOR TRIAL MIXES
1. Trial mixes are not required for Designed concrete mix of grade strength 20 MPa and below;
2. Where a Designed concrete mix of grade strength above 20 MPa is to be used, carry out trial mixes to determine the suitability of the proposed mix proportions for production of concrete of the required quality, at the intended workability for compaction of the concrete in the position, shape and location as described on the Drawings.

CON1.T020.8 TIMING OF TRIALS
Prepare trial mixes on receipt of the provisional Approval of the mix design and complete at least 35 days before commencement of concreting.

CON1.T030.8 PLANT AND LABORATORY TRIALS
Testing arrangements:
1. Make trial mixes for mix designs details under CON1.M1110 using the plant proposed for the Works for Plant Trials and in an Approved Laboratory for Laboratory Mix Trials. Sample the concrete, make and test concrete cubes in accordance with CS1:2010;
2. Plant Trials may be required, if test or trial mix data for designed concrete mix of the proposed grade with similar materials to that of the proposed mix and produced in plant other than that proposed for the Works are submitted and are acceptable to the CM;
3. Laboratory Mix Trials may be required, if test or trial mix data for designed concrete mix of similar grade or with different materials to that of the proposed mix and produced in plant proposed for the Works are submitted and are acceptable to the CM;
4. Laboratory Mix Trials may be required in addition to Plant Trials, if no satisfactory test or trial mix data for designed mix concrete or if test or trial mix data submitted do not demonstrate the suitability of the proposed plant and mix design.

CON1.T040.8 PROCEDURE OF PLANT TRIALS FOR CONCRETE FROM SINGLE BATCHING PLANT
Testing samples:
1. Make one trial mix on each of three different days for each mix design using materials typical of the proposed supply, the volume of each to be at least 60% of the nominal volume of the mixer's discharge;
2. Take three samples on each day from each mix in accordance with the sampling method stipulated in CS1:2010;
3. Allow sufficient size of each sample for the following:
   a. Carry out one slump test or one flow table test as instructed by the CM to determine the workability;
   b. Make two test cubes for compressive strength test at 28 days.
4. For the GGBS concrete in the production of precast facade and precast staircase, make two additional test cubes on each day for compressive strength test at the time of demoulding.
**CON1.T045.A**  
**PROCEDURE OF PLANT TRIALS FOR MIXING CONCRETES FROM TWO BATCHING PLANTS WITH DIFFERENT CEMENT SOURCES**

The two concrete mixes from two different batching plants (plant A and plant B) shall be added with water and mixed at their batching plants within 10 minutes from each other. Upon delivery to testing area, the two concrete mixes shall be mixed together following the mix proportions shown below:

1. 100% from plant A + 0% from plant B (unmixed concrete A);
2. 80% from plant A + 20% from plant B;
3. 50% from plant A + 50% from plant B;
4. 20% from plant A + 80% from plant B;
5. 0% from plant A + 100% from plant B (unmixed concrete B).

Testing samples:
1. Make one trial mix on each of three different days for each mixed concrete of the three different mix proportions and each of the two unmixed concretes mentioned above, using materials typical of the proposed supply, the volume of each to be at least 60% of the nominal volume of the mixer's discharge;
2. Take three samples on each day from each mixed concrete of the three different mix proportions and each of the two unmixed concrete in accordance with the sampling method stipulated in CS1:2010;
3. Allow sufficient size of each sample for the following:
   a. Carry out one slump test or one flow table test as instructed by the CM to determine the workability;
   b. Make two test cubes for compressive strength test at 28 days.

**CON1.T050.8**  
**PROCEDURE OF LABORATORY MIX TRIALS**

Testing samples:
1. Make 3 separate batches of concrete for each mix design using materials typical of the proposed supply;
2. Take one sample from each batch in accordance with the sampling method stipulated in CS1:2010;
3. Allow sufficient size of each sample for the following:
   a. Carry out two slump tests or two flow table tests as instructed by the CM to determine the workability;
   b. Make six test cubes for compressive strength test at 28 days.

**CON1.T070.A**  
**STANDARD FOR APPROVAL OF PLANT TRIALS FOR CONCRETE FROM SINGLE BATCHING PLANT**

1. The results of tests for compressive strength at 28 days of the test cubes must comply with the following requirements:
   a. The average strength of the eighteen test cubes exceeds the specified characteristic strength by at least 12 MPa;
   b. The compressive strength of each individual test cube exceeds the specified characteristic strength by at least 5 MPa.
2. The results of tests for workability must comply with the following requirements:
   a. Slump test:
      i. The range of the three measured slump values for each of the three days must not exceed the average of the three measured slump values by ±20%;
      ii. The average of the nine measured slump values for the three days must fall within ±20 mm or ±25% of the designed slump value, whichever is the greater.
b. Flow table test:
   i. The range of the three measured flow values for each of the three days must not exceed the designed flow value by ±70 mm;
   ii. The average of the nine measured flow values for the three days must fall within ±50 mm of the designed flow value.

3. The results of tests on compressive strength of concrete in precast concrete components at demoulding of the test cubes must comply with the following requirement:
   a. The compressive strength of each individual test cube attains a compressive strength of at least 15 MPa.

CON1.T075.8 STANDARD FOR APPROVAL OF PLANT TRIALS FOR MIXING CONCRETE FROM TWO BATCHING PLANTS WITH DIFFERENT CEMENT SOURCES

1. The results of tests for compressive strength at 28 days of the five mixed concretes, consisted of the three different mix proportions and the two unmixed concretes, stipulated in CON1.T045 must comply with the following requirements:
   a. The average strength of the 90 test cubes, consisted of the 18 test cubes from each of the five mixed concretes prepared on the three days, exceeds the specified characteristic strength by at least 12MPa;
   b. The compressive strength of each individual test cube exceeds the specified characteristic strength by at least 5 MPa.

2. The results of tests for workability of the five mixed concretes, consisted of the three different mix proportions and the two unmixed concretes, stipulated in CON1.T045 must comply with the following requirements:
   a. Slump test:
      i. The range of the 15 measured slump values, consisted of the three measured slump values from each of the five mixed concretes taken on each of the three days, must not exceed the average of the 15 measured slump values by ±20%;
      ii. The average of the 45 measured slump values, consisted of the nine measured slump values from each of the five mixed concretes taken on the three days, must fall within ±20 mm or ±25% of the designed slump value, whichever is the greater.
   b. Flow table test:
      i. The range of the 15 measured flow values, consisted of the three measured slump values from each of the five mixed concretes taken on each of the three days, must not exceed the designed flow value by ±70 mm;
      ii. The average of the 45 measured flow values, consisted of the nine measured slump values from each of the five mixed concretes taken on the three days, must fall within ±50 mm of the designed flow value.

CON1.T080.8 STANDARD FOR APPROVAL OF LABORATORY MIX TRIALS

1. Except for concrete of grade strength 20 MPa with recycled coarse aggregates, the results of tests for compressive strength at 28 days of the test cubes must comply with the following requirements:
   a. The average strength of the eighteen test cubes exceeds the specified grade strength by at least 14 MPa, or 10 MPa if test data submitted show that the operating standard deviation of the proposed plant does not exceed 5.5 MPa and the data are acceptable to the CM;
b. The compressive strength of each individual test cube exceeds the specified grade strength by at least 7 MPa, or 3 MPa if test data submitted show that the operating standard deviation of the proposed plant does not exceed 5.5 MPa and the data are acceptable to the CM.

2. For concrete of grade strength 20 MPa with recycled coarse aggregates, the compressive strength of each individual test cube at 28 days shall exceed the specified grade strength by at least 6 MPa;

3. The results of tests for workability must comply with the following requirements:
   a. Slump test: the average of the six measured slump values for the three batches must fall within ±20 mm or ±25% of the designed slump value, whichever is the greater;
   b. Flow table test: the average of the six measured flow values for the three batches must fall within ±50 mm of the designed flow value.

CON1.T085.8 PROVISIONAL APPROVAL OF PLANT AND LABORATORY MIX TRIALS
Provisional approval of the proposed mixes based on 7-days cube results may be given provided that the following are satisfied:

1. Prepare test cubes (from the corresponding batch of concrete taken for 28-days strength test) for compressive strength test at 7 days in accordance with CON1.T040 and CON1.T050;

2. The results of tests for compressive strength at 7 days of the test cubes must comply with CON1.T070 and CON1.T080 except that the specified grade strength (and the difference between average strength/individual compressive strength and specified grade strength) given in CON1.T070 and CON1.T080 can be reduced by 25%;

3. The results of tests for workability comply with the specified requirements;

4. If the results of tests for compressive strength at 28 days of the test cubes are subsequently found not to comply with CON1.T070 and CON1.T080, the provisional approval of concrete shall be nullified. The concrete cast for the works based on the provisional approval shall be deemed to be unacceptable and where necessary, carry out Approved remedial works and bear all the cost and time of such works.

CON1.T090.8 NON-COMPLIANCE
If the result of any test for workability or strength of trial mix concrete, whether the trial mix concrete is as stated in CON1.T040 or as stated in CON1.T045, does not comply with the specified requirements, further trial mixes are to be made until the results of every test complies with the specified requirements of trial mix concrete.

CON1.T100.8 VARIATIONS TO APPROVED MIXES
When the mix has been Approved do not make variations in the proportions and sources of materials or in the type, size and grading of aggregates without the consent of the CM, who may require further trial mixes to be made.

CON1.T110.8 PRACTICAL TESTS FOR SUITABILITY OF THE MIX
The CM may also require practical tests to be made on Site by filling trial moulds or by pumping to confirm the suitability of the mix for the Works. Ensure that, in such tests, the type of plant used for mixing, transporting and placing, the method of compaction used, the formwork face to the mould and the size and disposition of reinforcement are similar in all respects to those intended for use in the Works.

CON1.T120.8 CERTIFIED EVIDENCE OF MIX SUITABILITY
Trial mixes need not be made, if test or trial mix data for designed concrete mix of the proposed grade with similar materials to that of the proposed mix and produced in the plant proposed for the Works are submitted and are acceptable to the CM.
SAMPLING AND TESTING GENERALLY

CON1.T205.8 GENERAL
When Instructed:
1. Arrange and provide attendance necessary for the sampling of cement, PFA, GGBS, aggregates (excluding recycled aggregates) and other concrete constituent materials by the DTC; and
2. Submit the samples to the CM in accordance with CON1.T220 to CON1.T240.

CON1.T210.8 DEFINITION OF "BATCH"
In this Specification:
1. A batch of cement, PFA, GGBS, aggregate, admixture or curing compound is defined as any quantity of the material of the same type, manufactured or produced at the same time in the same place, covered by the same certificates and delivered to the site, or stored at the ready-mixed concrete plant, at any one time;
2. A batch of fresh concrete for testing purposes is as defined in clause 1.2 of CS1:2010.

CON1.T220.8 SAMPLES FOR TESTING BY DIRECT TESTING CONTRACTOR (DTC)
When Instructed, arrange and submit to the CM, one sample of each type of material, from each specified concreting day that the concrete is placed in the permanent work, for testing by Direct Testing Contractors (DTC) employed by the Housing Authority.

CON1.T230.8 TESTING PROGRAMME
For recycled aggregates to be tested by DTC, ascertain and allow sufficient time for carrying out the tests and issue of test results by DTC.

CON1.T240.8 SAMPLE SIZES
When Instructed, take samples of the sizes and using the methods of sampling stated in the Table below:

<table>
<thead>
<tr>
<th>Material</th>
<th>Size of Sample</th>
<th>Method of Sampling</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cement</td>

</tbody>
</table>
### SAMPLING

**CON1.T320.8 COARSE AND FINE AGGREGATES**

1. Except for recycled coarse aggregates, the DTC shall sample coarse and fine aggregates at each stockpile and carry out sieve analyses only when instructed by the CM;

2. For recycled coarse aggregates from a particular source, the DTC shall carry out tests stipulated in CON1.T410 once at the start of the Contract and at weekly intervals thereafter.

**CON1.T330.8 WATER FOR MAKING CONCRETE**

1. If clean fresh water from Water Supplies Department mains supply is not available, provide:
   a. One sample of water at the same time as particulars of the water are submitted to the CM in accordance with PRE.B10.1230 or PRE.C11.090 as appropriate; and
   b. One sample of water, for testing by the DTC, during each month that the concrete is being placed in the permanent work unless otherwise Approved.

2. For recycled water specified in CON1.M320:
   a. Arrange to use laboratories which have obtained HOKLAS accreditation to carry out the required tests, unless otherwise permitted by the CM;
   b. Obtain samples of recycled water at each batching plant for testing by the Approved laboratory according to the test frequency in the following table:

<table>
<thead>
<tr>
<th>Property</th>
<th>Limit</th>
<th>Test method</th>
<th>Test frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>(i) Density</td>
<td>≤ 1,030 kg/m³</td>
<td>BS 718:1991 Appendix E (Alternative test method may be used subject to the CM's approval)</td>
<td>At least once per day</td>
</tr>
<tr>
<td>(ii) Initial setting time of cement with recycled water</td>
<td>Deviation not earlier than 1 hour and not later than 1.5 hour as from that of control cubes (Test in parallel with those using recycled water is required on control cubes using clean fresh water only to determine the initial setting time and the deviation)</td>
<td>BS EN 196-3:1995</td>
<td>Once every 3 months for the first year; once every 6 months for subsequent years</td>
</tr>
<tr>
<td>(iii) Chloride content (as Cl)</td>
<td>≤ 500 ppm</td>
<td>American Public Health Association (APHA) Standard, APHA 4500-C1-B, 18th edition (1992)</td>
<td>Once every week for the first two months; once every month for subsequent months</td>
</tr>
<tr>
<td>- Prestressed concrete or steam cured structural concrete</td>
<td>≤ 1,000 ppm</td>
<td>APHA 4500-C1-B, 18th edition (1992)</td>
<td></td>
</tr>
<tr>
<td>- Concrete with reinforcement or other embedded metal</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>(iv) Sulphate content (as SO₄)</td>
<td>≤ 3,000 ppm</td>
<td>APHA 4500-SO42-C, 18th edition (1992)</td>
<td></td>
</tr>
</tbody>
</table>
c. Submit test reports to the CM to show that the recycled water is in compliance with this Specification;

d. If the test results do not comply with the limits:
   i. Suspend the use of recycled water immediately and carry out investigation to propose remedial works;
   ii. Submit two sets of consecutive satisfactory test results taken from the same source for the CM's consideration to resume the use of recycled water for subsequent concrete mixing.

**CON1.T340.8 FRESH CONCRETE**

**Testing arrangements:**

1. Sampling of concrete for testing will be carried out by the DTC in accordance with the requirements given in CS1:2010 and as follows:
   a. Location of batches to be sampled: as required by the CM;
   b. The times of day at which samples are taken will be at random;
   c. Frequency of sampling for compressive strength testing:
      i. Except for concrete of grade strength 20 MPa with recycled coarse aggregates or concrete of grade strength higher than 60 MPa, the sampling rates are as set out in the table below, provided that a minimum of one sample is taken from each mix of concrete produced on any one day. Where the type of structure is not specified all concrete is deemed to be for 'other types' of structure;

<table>
<thead>
<tr>
<th>Types of Structure</th>
<th>Approximate quantity of concrete to be represented by each sample</th>
</tr>
</thead>
<tbody>
<tr>
<td>Masts, Cantilevers with span ≥3 m, Prestressed elements, Columns and shear walls, Transfer beams and transfer plates, other critical elements</td>
<td>10 m³ or 10 batches whichever is the smaller volume</td>
</tr>
<tr>
<td>Other types</td>
<td>25 m³ or 25 batches whichever is the smaller volume</td>
</tr>
<tr>
<td>Solid rafts, Pile caps, Mass concrete</td>
<td>100 m³ or 100 batches whichever is the smaller volume</td>
</tr>
</tbody>
</table>

      ii. For concrete of grade strength 20 MPa with recycled coarse aggregates, make four test cubes for compressive strength testing on each concreting day, two to be tested at 7 days and two at 28 days;
      iii. For concrete of grade 15/20 or below, take a minimum of one sample per 100 m³, irrespective of concreting day, for compressive strength test;
      iv. For high strength concrete of grade strength higher than 60 MPa, take at least one sample of concrete from every ready mixed vehicle arriving on Site. If the concrete is site batched, take a minimum of one sample per every 10 m³, irrespective of concreting day, for compressive strength test.

d. To determine the workability of the concrete: one sample of concrete from each batch of concrete;

e. The CM may agree to a reduced frequency of sampling for exceptionally large pours;
f. For concrete used for construction of hoardings and associated covered walkways and gantries, the frequency of sampling stated in the sub-clauses (1)(c) and 1(d) above may be reduced at the discretion of the CM;
g. For blinding layer concrete to underside of pile caps and suspended ground slabs / beams in contact with earth, the tests stated in sub-clauses (1)(c) and 1(d) above are not required.

2. Tests on workability, making and curing of concrete cubes for precast concrete components shall be carried out by the Contractor / manufacturer of the precast concrete components. Tests on compressive strength of concrete cubes shall be carried out by the DTC and / or HDMTL.

CON1.T350.8  FACILITIES FOR SAMPLING FRESH CONCRETE

Provide, at the normal point or points of discharge of the mixer, a mobile shelter/shelters to accommodate workability test and cube making processes.

TESTS ON AGGREGATES

CON1.T410.8  STANDARD

1. The DTC shall test recycled coarse aggregates for the following properties:

<table>
<thead>
<tr>
<th>Requirements</th>
<th>Limits</th>
<th>Testing Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum dry particle density</td>
<td>2000 kg/m³</td>
<td>CS3:2013 Section 17</td>
</tr>
<tr>
<td>Maximum water absorption</td>
<td>10%</td>
<td>CS3:2013 Section 17</td>
</tr>
<tr>
<td>Maximum content of wood and other material less dense than water (by mass)</td>
<td>0.5%</td>
<td>Manual sorting in accordance with BRE Digest 433</td>
</tr>
<tr>
<td>Maximum content of other foreign material (e.g. metals, plastics, clay lumps, asphalt and tar, glass etc.) (by mass)</td>
<td>1.0%</td>
<td>Manual sorting in accordance with BRE Digest 433</td>
</tr>
<tr>
<td>Maximum fines (by mass)</td>
<td>4%</td>
<td>CS3:2013 Section 10</td>
</tr>
<tr>
<td>Maximum content of sand (&lt;4 mm) (by mass)</td>
<td>5% m/m</td>
<td>CS3:2013 Section 10</td>
</tr>
<tr>
<td>Maximum content of sulphate (by mass)</td>
<td>1% m/m</td>
<td>CS3:2013 Section 21</td>
</tr>
<tr>
<td>Flakiness index</td>
<td>40%</td>
<td>CS3:2013 Section 11</td>
</tr>
<tr>
<td>10% fines test</td>
<td>100 kN</td>
<td>CS3:2013 Section 16</td>
</tr>
<tr>
<td>Grading</td>
<td>Table 3.1 of CS3:2013 for single-sized 20 mm and 10 mm aggregates</td>
<td>CS3:2013 Section 10</td>
</tr>
<tr>
<td>Maximum chloride content</td>
<td>Table 5.1 of CS3:2013 - 0.05% by mass of chloride ion of combined aggregate</td>
<td>CS3:2013 Section 21</td>
</tr>
</tbody>
</table>

2. Limits of acceptance in accordance with the values in the Table above.
**CON1.T420.8**  **FURTHER ANALYSIS**

The CM may require further analysis, including submission stated in CON1.M210, to be made if there is any alteration to the type of aggregate.

**TESTS FOR WORKABILITY**

**CON1.T510.8**  **STANDARD**

Testing arrangements:

1. Sample for workability testing shall:
   a. Be in accordance with CS1:2010;
   b. Not be taken from the first 0.3 m³ and the last 0.3 m³ of concrete discharged from the truck;
   c. Be remixed and divided into two specimens. Each specimen shall be tested by DTC to determine the workability of the concrete either by the slump test or by the flow table test all in accordance with CS1:2010.

2. Unless otherwise specified by the CM, adopt the testing method for workability as below:

<table>
<thead>
<tr>
<th>Normal Workability</th>
<th>High Workability</th>
</tr>
</thead>
<tbody>
<tr>
<td>(designed slump value</td>
<td>(designed flow value</td>
</tr>
<tr>
<td>from 20 mm to 200 mm)</td>
<td>from 340 mm to 600 mm)</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Slump Test</td>
<td>Flow Table Test</td>
</tr>
<tr>
<td>(For designed slump value exceeding 175mm and ≤ 200mm, see the Note to Clause 2.1.1 of CS1)</td>
<td></td>
</tr>
</tbody>
</table>

3. Notwithstanding the sampling requirement specified in sub-clause (1)(b) above, the first 0.3 m³ discharged concrete may be used in the Works provided that:
   a. The discharged concrete is properly protected from contamination to CM's satisfaction; and
   b. The measured workability of the concrete is in compliance with this Specification.

4. For pre-batched concrete or concrete with volume less than 1 m³ as defined in Clause 1.2 of CS1:2010, the requirement to disregard the first 0.3 m³ and the last 0.3 m³ of concrete before sampling from a mixer for making concrete cube is waived.

**CON1.T520.8**  **ACCEPTANCE VALUES FOR APPROVED MIXES**

1. The Approved workability value is that used to produce the mix Approved under CON1.T010 to CON1.T120;

2. For standardised designed mixes: the average of two measured slumps shall be within the corresponding range specified in Table A of CON1.M1020;

3. For designed concrete mixes:
   a. Where slump test is used to determine the workability, the average of the two measured slumps must fall within ±25 mm or ±33% of the Approved designed slump value, whichever is greater, up to the limit of ±50 mm. No correction to the nearest 5 mm shall be made in determining the average of the measured slumps and the acceptance limits;
   b. Where flow table test is used, the average of the two measured flow values must fall within ±60 mm of the Approved designed flow value, and no correction to the nearest 10 mm shall be made in determining the average of the measured flow values.
4. The CM may reject any concrete for which the measured workability falls outside the limits specified in sub-clauses (2) and (3) as appropriate.

**TESTS ON COMpressive Strength of CONcrete CUBES**

**CON1.T610.8 STANDARD FOR CUBE TESTS**

Testing arrangements:

1. For compressive strength testing on concrete cast on Site, the DTC will take samples, make, cure and test concrete cubes of 100 mm size in accordance with CS1:2010;

2. For compressive strength testing on concrete cast at manufacturer’s factory, the Contractor / manufacturer of precast concrete components shall take samples, make and cure the concrete cubes of 100 mm size and the DTC and / or HDMTL shall test the concrete cubes in accordance with CS1:2010.

**CON1.T620.A SAMPLES FOR DESIGNED CONCRETE MIXES**

Testing samples:

1. Prepare two cubes from a single sample taken at random from a batch of concrete selected at random as follows:
   a. At the point of discharge from the mixer; or,
   b. In the case of ready-mixed concrete, at the point of discharge from the delivery vehicle; or
   c. Elsewhere as directed by the CM;
   d. In no case to be from the first 0.3 m³ of concrete discharged from the truck.

2. For concrete cast on Site, Radio Frequency Identification (RFID) tag to be provided and installed on the surface of each cube by the Direct Testing Contractor, to authenticate the identity of the cube throughout the whole testing process. A typical RFID tag is shown on Sketch no. RFID/TAG/SK-01;

3. For concrete cast at manufacturer’s factory where precast concrete components are constructed, Radio Frequency Identification (RFID) tag is to be provided by DTC or the CM or his representatives resident at manufacturer's factory, and is to be installed by the manufacturer's factory, to authenticate the identity of the cube throughout the whole testing process. A typical RFID tag is shown on Sketch no. RFID/TAG/SK-01;

4. On completion of curing for 28 days, the two tagged cubes will be tested and the average of the two results taken as the test result;

5. If requested, or if the CM instructs that the concrete be tested for compressive strength at ages other than 28 days, provide additional samples;

6. Take cubes with installed RFID tags for 7 days work cube compressive strength tests at a frequency of 2 cubes per concrete mix used per day for all concreting days, or at any other frequency as considered appropriate by the CM.

**CON1.T630.8 RESULTS FOR DESIGNED CONCRETE MIXES**

1. The results of tests on compressive strength at 28 days of designed mix concrete must comply with the following requirements:
   a. Individual test results: to comply with the strength determined from limits given in Column A in the Table to CON1.T650 below;
b. Average strength determined from any group of four consecutive test results: to comply with the strength determined from limits given in Column B in the Table in CON1.T650 below. Where there are less than four available test results, treat the average of the first two or first three consecutive test results in the same manner as groups of four consecutive test results.

2. If the difference between the compressive strengths of 2 test cubes made from one sample of designed mix concrete exceeds 15% but does not exceed 20% of the test result:
   a. Use the higher of the compressive strengths of the 2 test cubes to assess compliance as stated in sub-clause (1)(a) above; and
   b. Do not use the test results for that sample to assess compliance as set out in sub-clause (1)(b) above nor to calculate the standard deviation.

3. If the difference between the compressive strengths of 2 test cubes made from one sample of designed mix concrete exceeds 20% of the test result:
   a. Discard the test result for that sample; and
   b. Propose investigation for Approval to establish if the concrete represented by the sample is acceptable or not.

CON1.T640.8 COMPLIANCE CRITERIA FOR DESIGNED CONCRETE MIXES

1. Except for concrete of grade strength 20 MPa with recycled coarse aggregates,
   a. Apply compliance criteria C3 given in the table to CON1.T650 for concrete of grade below 20;
   b. Adopt compliance criteria C2 under the following conditions for concrete of grade 20 and above:
      i. Where there is sufficient previous production data using similar materials from the same plant under similar supervision to establish that the standard deviation for at least 40 test results will not exceed 5.5 MPa; or
      ii. Where the calculated standard deviation of 40 previous consecutive test results does not exceed 5.5 MPa.
   c. Adopt compliance criteria C1 if compliance criteria C2 in sub-clause (1)(b) is not applicable;
   d. For concrete grade 20 and above, the standard deviation is the standard deviation for each mix of concrete to be calculated after every test result using the last 40 test results judged by the same compliance criteria. Apply compliance criteria C2 to subsequent test results if the standard deviation does not exceed 5.5 MPa. Apply compliance criteria C1 to subsequent test results if the standard deviation exceeds 5.5 MPa.

2. For concrete of grade strength 20 MPa with recycled coarse aggregates, the result of any test on compressive strength shall not be less than:
   a. 70% of the grade strength when tested at 7 days; or
   b. The grade strength when tested at 28 days.

3. If the compliance criteria is changed from C1 to C2 or from C2 to C1, in the table to CON1.T650, apply the new compliance criteria from the 35th day after making the last pair of test cubes in the set of 40 on which the decision to change was based. For the purpose of sub-clause CON1.T630 (1)(b), treat test results immediately before and after the change separately.

CON1.T650.8 TABLE OF COMPLIANCE CRITERIA FOR DESIGNED CONCRETE MIXES

The specified grade strength for concrete shall deem to have been attained if the test results comply with both of the requirements specified in Column A and Column B of the table below:
### Strength compliance requirements for designed concrete mixes

<table>
<thead>
<tr>
<th>Specified Grade Strength</th>

#### CON1.T660.A  NON-COMPLIANCE OF DESIGNED CONCRETE MIXES

1. When the following situation occurs, place no further concrete in the permanent work until an investigation of the materials, mix design and methods of production has been carried out and measures have been taken which, in the opinion of the CM, will result in restoring a satisfactory standard of quality control:
   a. For concrete grade not exceeding 60D, the calculated standard deviation exceeds 8.5 MPa;
   b. For concrete grade exceeding 60D, the coefficient of variation as calculated after every 40 test results exceeds 14%.

2. If the average strength determined from any group of four consecutive test results, or the first two or first three consecutive test results if applicable, fails to meet the requirement of Column B in table to CON1.T650, then all the concrete in all the batches represented by the samples to be deemed defective. For the purposes of this clause, the batches of concrete represented by a group of two, three or four consecutive test results include the batches from which the first and last samples in the group were taken together with all the intervening batches.

   When there is a period exceeding two weeks between any two consecutive test results in a group, the CM may direct that the test results immediately before and immediately after the intervening period be treated separately;

3. If any individual test result fails to meet the requirement in Column A of the Table to CON1.T650, then that result may be considered to represent only the particular batch of concrete from which the sample was taken, provided that the average of any 4 consecutive results, which contained the failed individual test result, satisfies the requirement of Column B of the Table.

#### CON1.T670.8  FURTHER TESTS ON DESIGNED CONCRETE MIXES

If the strength requirements of this Specification are not satisfied, comply with any Instruction of the CM for further testing, including chemical analysis of samples of hardened concrete in the structure, that he considers necessary.

### TESTS ON COMPRRESSIVE STRENGTH OF CONCRETE CORES

#### CON1.T710.8  GENERAL

Provide all necessary facilities and attendance for coring and testing of concrete cores carried out by DTC.
**CON1.T720.8 STANDARD**

1. Comply with CS1:2010 in respect of the method of preparing, inspecting and testing concrete cores to determine compressive strength;

2. Witness the sampling of cores by the DTC who shall avoid the following concrete as far as practicable:
   a. The top 50 mm or 20% layer of concrete in a lift, whichever is the greater, where the depth of lift is less than 1.5 m;
   b. The top 300 mm layer of concrete in a lift, where the depth of lift is 1.5 m or more.

3. Agree with the CM on the section of the core samples to be selected as test specimens, including those cores sampled from concrete in thin lift where such layer stated in sub-clause (2) cannot be avoided.

**CON1.T730.C SIZE AND NUMBER OF ROUTINE CORE TEST SAMPLES**

**Testing samples:**

1. Provide necessary facilities and attendance for taking 3 Nos. or 12 Nos. of the following core samples for testing by DTC from finished concrete works for the same concreting day, at locations selected by the CM:
   a. 150 mm diameter core samples: for 40 mm aggregate concrete;
   b. 75 mm diameter core samples: early core test for volumetric precast bathroom (VPB), volumetric precast kitchen (VPK), volumetric precast lift shafts and volumetric precast lift machine room components as described under Worksection CON8, precast façades, precast structural walls, precast balconies and precast staircases as described under Worksections CON5 and CON7;
   c. 100 mm diameter core samples: for 20 mm aggregate concrete and all cases other than sub-clauses (1)(a) and (1)(b) above.

2. Provide necessary facilities and attendance for taking core samples by DTC from the finished high strength concrete works of which the concrete grade strength is higher than 60 MPa for each concreting day. The number of cores and locations are to be decided by the CM and in accordance with the coring proposal acknowledged by ICU;

3. The length of core samples shall be at least 95% of the core diameter after end preparation;

4. The ratio of core diameter to the maximum aggregate size shall be not less than 3;

5. The diameter of cores should preferably be 150 mm for 40 mm aggregate and 100 mm for 20 mm aggregate or less, and must not be less than 75 mm.

**CON1.T740.C AGE OF CORE SAMPLES**

1. Do not take cores for strength test at ages less than 28 days except the cores for early core tests on volumetric precast bathroom (VPB), volumetric precast kitchen (VPK), volumetric precast lift shafts and volumetric precast lift machine room as described under Worksection CON8 and precast façades, precast structural walls, precast balconies and precast staircases as described under Worksections CON5 and CON7;

2. Do not make any adjustment to the measured strength in respect of the age of the core when tested.

**CON1.T750.8 REQUIREMENT FOR FURTHER CONCRETE CORE SAMPLES**

Carry out further concrete core tests if any of the following apply:

1. Failure of recycled aggregate:
Should a test result on recycled aggregate used in the concrete fail to meet any of the properties as stipulated in CON1.T410, comply with any instruction of the CM for the taking of three core samples (these cores are exclusive from the routine core tests in CON1.T730), in each concreting day for further tests and bear all the cost and time of such extra work;

2. Low concrete core strength:
Where 3 core samples have been taken in accordance with CON1.T730 or CON1.T750 (1), and the estimated insitu cube strength of any individual core is less than 85% of the specified grade strength, comply with any instruction of the CM for the taking of additional core samples to make up a total of 12 numbers of core samples in the same concreting day for further tests. Allow the time without any claim for extension of time and bear all the costs for such extra work;

3. Failure of concrete cube test:
If concrete represented by test cubes in any concreting day fails to meet the standard of acceptance specified in CON1.T640 and CON1.T650, comply with any instruction of the CM for the taking of additional core samples (in addition to the routine cores required under CON1.T730) to make up a total of 12 numbers of cores in the same concreting day for further tests. Allow the time without any claim for extension of time and bear all costs for such extra work.

CON1.T760.8 ASSESSING COMPRESSION STRENGTH OF CONCRETE CORES
1. In assessing the results of compressive strength on concrete cores for cases other than that stated in sub-clause (2) below, all relevant concrete represented by the cores in the same concreting day is deemed not to comply with this Specification if the strength of the core, when adjusted for length / diameter ratio and converted to estimated insitu cube strength in accordance with CS1:2010, is either:
   a. Less than 85% of the specified grade strength, for an average result of twelve cores; or
   b. Less than 75% of the specified grade strength for any individual result.

2. In assessing the results of compressive strength of concrete cores for the case where a reduction factor of 0.8 is applied to the design stresses of concrete placed under water (Type 1(c) and Type 3 piles), all concrete represented by the cores in the same concreting day is deemed not to comply with this Specification if the compressive strength of the core, when adjusted for length / diameter ratio and converted to estimated in-situ cube strength in accordance with CS1:2010, is either:
   a. Less than 70% of the specified grade strength, for an average result of three cores; or
   b. Less than 60% of the specified grade strength for any individual result.

CON1.T770.8 MAKING GOOD CORE HOLES
Make good core holes to Approval with cement mortar or concrete of same concrete strength to that originally specified for the parent concrete.

ADDITIONAL TESTS

CON1.T810.8 GENERAL
1. During the progress of the Works, the CM has the power to order tests other than cube tests and core tests. Comply with CS1:2010 or with the relevant British Standard and Code of Practice where CS1:2010 does not apply;

2. The method of sampling, preparing and testing of hardened concrete to determine cement content is to be in accordance with CS1:2010.
CON1.T820.8 CEMENT CONTENT TEST
For Portland cement (PC) concrete, test all core samples taken in the same concreting day to determine their cement content should the estimated in-situ cube strength of any individual core taken in accordance with CON1.T710 to CON1.T760 be less than 85% of the specified strength. The test is to be carried out after the completion of the core compression test and by the Direct Testing Contractors employed by the Housing Authority.

CON1.T830.8 NON-COMPLIANCE OF CEMENT CONTENT TEST
Should the average of the test results of all core samples taken in the same concreting day be less than 83% of the minimum cement content stated in CON1.M1130 to CON1.M1160, all relevant concrete represented by these samples in the same concreting day to be deemed not to comply with Specification.

CON1.T840.8 AQUEOUS LIQUID RETAINING STRUCTURES
Test aqueous liquid retaining structures such as water tanks in accordance with clause 9.2 of BS 8007:1987.

FAILURE TO MEET REQUIRED CRITERIA

CON1.T910.8 AQUEOUS LIQUID RETAINING STRUCTURES
Non-compliance:
1. If any aqueous liquid retaining structure fails to meet the requirements of CON1.T630, CON1.T640 or CON1.T650 or evidence of seepage is observed during testing according to CON1.T840, then the structure is deemed defective.

TESTS FOR REPAIR MORTAR

CON1.T1010.8 SAMPLES FROM REPAIR MORTAR
When Instructed, take testing samples in accordance with the following sub-clauses:
1. A set of two 100 mm or a set of three 70.7 mm cubes from a single sample taken from a batch of repair mortar selected at random for compressive strength test for each testing age as directed by the CM;
2. RFID tag to be provided and installed on the surface of each cube by the Direct Testing Contractor, to authenticate the identity of the cube throughout the whole testing process. A typical RFID tag is shown on Sketch no. RFID/TAG/SK-01;
3. Take the average of the cube results in the set as the test result.

TESTS ON GGBS

CON1.T1110.8 PURCHASER TESTS
1. Employ an Approved testing laboratory as stipulated in CON7.W010 for carrying out the tests to verify the physical and chemical properties of GGBS in accordance with BS EN 15167-1:2006 before production of the precast facade and precast staircase units;
2. Submit the test reports to the CM in accordance with CON7.T010.

**INVESTIGATION BY EXTENSIVE CORE TESTING**

**CON1.T1210.8 GENERAL**

1. When concrete is deemed not complying with this Specification as assessed in accordance with **CON1.T750** or **CON1.T830**, the CM shall issue a condemnation letter;

2. Apply the procedure in **CON1.T1220** to investigate the extent of non-compliance and re-execute the works;

3. The provisions stated hereinafter shall be without prejudice to the Employer's right, the CM's power and the Contractor's obligations in connection with the removal of unsatisfactory material and work, and subsequent re-execution of work under the Contract.

**CON1.T1220.8 INVESTIGATION AND REPORTS**

1. Within 14 days from the date of condemnation letter issued by the CM, submit the following for Approval:
   a. A statement of request to identify the extent of non-complying concrete in the affected structural elements on the concreting day(s) as stated in the condemnation letter;
   b. An investigation plan as stipulated in **CON1.T1230**;
   c. A statement of undertaking to complete the investigation and re-execution of works within a duration agreed by the CM; and
   d. A statement of confirmation to bear all costs and time so incurred in connection with or arising from the investigation.

2. Confirm in writing to accept the conditions, if any, as stipulated by the CM related to the Approval in sub-clause (1) before the investigation proceeds;

3. Within 7 days upon completion of the investigation, report to the CM with details as stipulated in **CON1.T1250** for Approval;

4. Confirm in writing to accept the conditions, if any, as stipulated by the CM related to the Approval in sub-clause (3) before re-execution of works proceeds; and

5. Within 7 days upon completion of the re-execution of works, report to the CM with details as stipulated in **CON1.T1260**.

**CON1.T1230.8 INVESTIGATION PLAN SUBMISSION**

The investigation plan shall be endorsed by an Approved RSE and shall include the following details:

1. Delineation of concrete to be investigated;

2. Method statement of the extensive core testing and the details of a HOKLAS accredited laboratory, to be approved by the CM, responsible for sampling and carrying out the compressive strength test;

3. Volume of concrete represented by each core; and

4. Programme of the investigation works.

**CON1.T1240.8 ASSESSMENT CRITERIA**

1. Include the cores taken in accordance with **CON1.T750** in addition to the cores obtained from the investigation plan in identifying the extent of non-complying concrete; and

2. The volume of concrete represented by an individual core is deemed not to comply with this Specification if the following test result of the individual core is found:
   a. Criterion applicable to all types of concrete: The estimated in-situ cube strength is less than 85% of the specified grade strength; or
b. Criterion applicable to Portland Cement (PC) concrete only: The cement content is less than 83% of the minimum cement content stated in CON1.M1130 to CON1.M1160, for Portland cement (PC) concrete.

CON1.T1250.8 INVESTIGATION REPORT SUBMISSION
Submit an investigation report, endorsed by the Approved RSE in CON1.T1230, with the following details:
1. Delineation of non-complying concrete;
2. Method statement for the re-execution of works; and
3. Programme of the re-execution of works including verification testings.

CON1.T1260.8 RE-EXECUTION OF WORKS REPORT SUBMISSION
Submit a report, substantiated by results of verification testings and endorsed by the Approved RSE in CON1.T1230, to confirm that the Works subsequent to the re-execution of works comply with this Specification.

CON2 FORMWORK

DESIGN

FORMWORK DESIGN GENERALLY

CON2.D010.8 LOADINGS
Design and construct falsework and formwork to withstand any combination of the following loadings and to maintain the position and shape of the formwork to achieve the required shape and finish of the hardened concrete:

1. Total weight of formwork, falsework and wet concrete;
2. Construction loads including dynamic effects of placing, compacting and construction traffic;
3. Wind loads in accordance with the Code of Practice on Wind Effects in Hong Kong 2004 issued by the Buildings Department;
4. Any other relevant loading described in BS 5975:1982.

CON2.D020.8 STANDARD
Comply with the requirements of BS 5975:1982 regarding design, construction and dismantling of falsework and formwork.

CON2.D030.8 INCLINED SURFACES
Provide formwork to the top surface of concrete where inclined at a slope exceeding 15° to the horizontal.

CON2.D040.8 DISMANTLING AND REMOVAL
Design falsework and formwork so that they can be dismantled and removed without disturbing or overloading the finished concrete work or the structure.

CON2.D050.8 BRIDGE AND TRANSFER STRUCTURE CONSTRUCTION
1. Appoint a Registered Structural Engineer to design and control the temporary works for the construction of the bridge and the transfer structure;
2. The submission shall include drawings and supporting calculations and shall be submitted to the CM not less than 4 weeks before the Contractor proposes to put such work in hand. Do not commence the proposed work without the prior consent of the CM. Such consent shall, however, in no way relieve the Contractor of any of his responsibilities for the design of the falsework;
3. Monitor falsework levels and make any necessary adjustments for settlement or other deflection or movements;
4. Unless otherwise approved by the CM, the falsework supporting system for the transfer structure shall be carried down directly to the pile cap levels and shall not impose any additional loadings on the floors, columns and walls.

CON2.D060.8 FORMWORK FOR STRUCTURAL WALLS IN DOMESTIC BLOCKS
1. Design and use large panel formwork, in accordance with CON2.D310, for all structural walls in domestic floors between first domestic floor level and main roof level;
2. For domestic blocks without rotational symmetry and where the use of large panel formwork at critical areas of a domestic floor would lead to an unacceptable prolonged construction cycle, the Contractor may propose the use of small panel metal formwork, together with justification in the submission stipulated in CON2.D240, for CM's approval.

FALSEWORK SPANNING PUBLIC HIGHWAYS

CON2.D110.8 DESIGN RESPONSIBILITY
Employ a Registered Structural Engineer to take responsibility for the design and construction of all temporary works and falsework spanning public highways. No consent or dissent of the CM will relieve the Contractor of his sole responsibility for the falsework design, construction and obtaining Approval.

CON2.D120.8 FALSEWORK SPANNING A PUBLIC HIGHWAY
Ensure the falsework system does not interfere with normal traffic flow and does not reduce the width of the traffic lanes. Design clearances to falsework spanning a public highway in accordance with Section 35 of the Transport Planning and Design Manual Volume 2 - Highway Design Characteristics.

CON2.D130.8 APPROVALS
1. Take responsibility for obtaining all necessary approvals of any proposed falsework design and construction, through the Authority, from the Highways Department, the Commissioner of Police and the Commissioner for Transport;
2. Do not commence any temporary works, including falsework spanning a public highway, unless the falsework design and construction method has been approved by the Highways Department and Commissioner of Police and Commissioner for Transport.

SUBMISSIONS

CON2.D210.8 TIMING
Submit details of formwork and falsework to the CM for information before commencement of construction.

CON2.D220.8 FALSEWORK SPANNING A PUBLIC HIGHWAY
Submit proposals for falsework spanning a public highway to the CM in the form of proper, numbered, fully dimensioned drawings accompanied by full structural calculations endorsed by the Contractor's Registered Structural Engineer. Make any amendments required by the CM and submit copies to the CM in order to obtain all necessary approvals from the Highways Department and Commissioners. See also CON2.D130 (2) above.

CON2.D230.8 PLYWOOD SHEATHING
Before commencement of the superstructure and where the sheathing is timber plywood, submit for Approval, details of the method of identifying and recording the number of uses to which the sheathing will be subjected to. Upon Approval, provide all labour and equipment and carry out marking and recording to the satisfaction of the CM.

CON2.D240.8 LARGE PANEL FORMWORK AND SMALL PANEL METAL FORMWORK FOR DOMESTIC BLOCK
Submit the following information for CM's approval:
1. Details of the system, including drawings and calculations;
2. Details of safety requirements regarding the designated storage yard for large panel formwork as stipulated in PRE.B8.262;
3. Details for holding down and stabilising the panels of the wallforms including horizontal ties at the top of wallforms;
4. Details of kicker construction, both for precast kicker blocks and cast-in-situ kickers, including proposed bedding and grouting material for precast kicker blocks;
5. Details of metal formwork, and its fixings, for slab edges which form an integral part of wall elevations;
6. Proposals for curing and protecting the concrete;
7. Method statement for placing and compacting the concrete;
8. Details of any relaxation to the minimum periods for retaining formwork and falsework in position before striking as stated in CON2.W630 which may be required to suit the proposed formwork systems;
9. Details of assembling and striking of any small panel metal formwork, including the maintenance of the panels for repeated uses;
10. Documentary evidence, such as previous project references, indicating that the finished concrete surface produced by the small panel metal formwork is not to be of a lesser standard than that produced by the large panel formwork, together with a method statement for applying skim coat to the wall joints in accordance with CON2.W315.

CON2.D250.8 BRIDGE AND TRANSFER STRUCTURE CONSTRUCTION
Submit the following details of formwork and falsework to the CM at least 4 weeks before commencement of construction:
1. Details of the system, including drawings and calculations;
2. Details of holding down and stabilising the system including horizontal ties;
3. Method statement for construction of the structure;
4. Proposal for curing and protecting the concrete; and
5. Method statement for placing and compacting the concrete.

CON2.D260.8 INSPECTION RECORDS
Submit records of inspection on the completed formwork and falsework to the CM for information before carrying out any further works that may affect the stability of the formwork and falsework. Such records are to be certified by a contractor's superintendent holding qualification equivalent to TCP Grade T4 in civil or structural engineering discipline.

DESIGN OF LARGE PANEL FORMWORK FOR DOMESTIC BLOCK

CON2.D300.8 GENERAL DEFINITION
Large panel formwork refers to metal formwork complying clauses CON2.D320 to CON2.D450.

CON2.D320.8 WALLS NOT EXCEEDING 7.5 M LONG
For walls not exceeding 7.5 m long, design the whole of the formwork assembly for one face of the wall per storey as one complete reusable panel.
**CON2.D330.8 WALLS EXCEEDING 7.5 M LONG WITHOUT OPENINGS**

For walls exceeding 7.5 m long, without door or window openings, design the whole of the formwork assembly, for one face of the wall per storey, as one or two complete reusable panels.

**CON2.D340.8 WALLS EXCEEDING 7.5 M LONG WITH OPENINGS**

For walls exceeding 7.5 m long with door/window openings, the whole of the formwork assembly for one face of the wall per storey may comprise a no. of panels provided that any joints between panels must fall within the width of the door/window openings.

**CON2.D350.8 JUNCTIONS**

At any wall junction, where it is not practicable to position the edge of the formwork assembly at the junction, position the edge at a clear distance of not more than 300 mm from the junction line.

**CON2.D360.8 USE OF OTHER TYPES OF FORMWORK**

Where it is not practicable to use large panel formwork, e.g. at staircases, columns at wall ends etc, adopt other types of formwork, including small panel metal formwork or traditional formwork, and submit details for Approval.

**CON2.D370.8 JOINTS IN SHEATHING**

1. Design the sheathing of the formwork free of horizontal joints;
2. Position any vertical joints at minimum 1 m centres maintaining a continuous smooth surface across the joints.

**CON2.D380.8 BACKING STRUCTURE**

Support the sheathing with a backing structure of metal or other Approved material.

**CON2.D390.8 SEALING BASE OF WALLFORMS**

With the exception of where in-situ monolithic kickers are used, seal the toes of all wallforms with a compressible rubber hose placed between the floor slab and the base of the wallform, backed with a cement mortar seal to prevent grout loss.

**CON2.D400.8 TOP BRACING**

Securely brace every panel of wallform at the top by at least two horizontal ties to ensure vertical alignment.

**CON2.D410.8 SLAB EDGES**

Fabricate slab edge formwork in metal to match the wallform system where any part of a wall is formed as a slab edge.

**CON2.D420.8 ACCESS WALKWAY**

In addition to GCC Clauses 7.1(2):

1. Provide continuous walkway around the edges of the building under construction. Working platforms and table forms may be used;
2. Comply with details of safety requirements regarding working platforms as stipulated in PRE.B8.262;
3. Provide a minimum walkway width of at least 1000 mm with a minimum width of 650 mm at joints with any adjacent walkway. The walkway must be close boarded or planked in timber of 25 mm minimum thickness, plated or of metalwork;
4. Provide toe boards to a minimum height of 200 mm on the platform side where a person or object could fall for more than two metres;
5. Read this Specification in conjunction with drawing No. SES/LP/S/EG001 in Appendix B which details the access walkway.

CON2.D430.8 OTHER TYPES OF FORMWORK - ACCESS WALKWAY
Propose and provide alternative platforms and access walkway and maintain continuity where large panel formwork is not used in accordance with CON2.D360 and obtain Approval before use, provided that the alternative is not of a lesser standard in conforms to the requirements in CON2.D420.

CON2.D440.8 PATENT WALLFORM SYSTEMS
Obtain prior Approval for use of patent wallform systems not complying with this Specification, provided that the finished products produced by such system proposed are not to be of a lesser standard than that produced by formwork conforming to the above formwork design requirements.

CON2.D450.8 ALTERNATIVE GROUT SEALING SYSTEMS
Obtain Approval before using any alternative grout sealing system:
1. The CM may Approve any other proposed system, provided that the Contractor can demonstrate that the finished product provided can match the requirements of the Specification before commencement of construction;
2. At any time the CM may withdraw such Approval of the proposed system if he considers that it will fail to produce the required finished product;
3. In such a case, revert to the system described in this Specification. No monetary claims whatsoever will be entertained or extensions of time granted in the event of such a withdrawal of Approval.

DESIGN OF SMALL PANEL METAL FORMWORK FOR DOMESTIC BLOCK

CON2.D510.8 GENERAL DEFINITION
Small panel metal formwork, e.g. aluminium formwork, refers to small metal formwork complying clauses CON2.D520 to CON2.D600.

CON2.D520.8 JUNCTIONS
As CON2.D350.

CON2.D530.8 JOINTS IN SHEATHING
Maintain a continuous smooth surface across all horizontal and vertical joints.

CON2.D540.8 BACKING STRUCTURE
As CON2.D380.

CON2.D550.8 SEALING BASE OF WALLFORMS
As CON2.D390.

CON2.D560.8 TOP BRACING
1. For walls not exceeding 7.5 m long, securely brace each wallform at the top by at least two horizontal ties to ensure vertical alignment;
2. For walls exceeding 7.5 m long, securely brace each wallform at the top by at least four horizontal ties to ensure vertical alignment.

CON2.D570.8 SLAB EDGES
As CON2.D410.

MATERIALS

DEFINITIONS

CON2.M010.8 FORMWORK OR FORM
That section of the temporary works used to give the required shape and support to poured concrete, consisting of sheathing material in direct contact with the concrete and joists or stringers that directly support the sheathing.

CON2.M020.8 FALSEWORK
Any temporary structure used to support a permanent structure while it is not self-supporting.

CON2.M030.8 TRADITIONAL FORMWORK
Formwork assembled from individual elements comprising sheathing material as described in BS 5975:1982 and separate backing structure supporting the sheathing.

CON2.M040.8 PERMANENT OR LEFT IN FORMWORK
Formwork designed to remain in position as part of the permanent work.

CON2.M050.8 LARGE PANEL FORMWORK
Formwork as CON2.D310.

CON2.M060.8 SMALL PANEL METAL FORMWORK
Formwork as CON2.D510.

CON2.M080.8 TIMBER FOR FORMWORK
Use sustainable timber as specified in PRE.B8.2450 and reuse timber whenever possible as specified in PRE.B8.2460.

SHEATHING

CON2.M110.8 SUITABLE MATERIALS
Material against which the concrete will be cast must be suitable for providing the specified concrete finish, formed for example, in metal, timber, plywood, film faced plywood or plastic.

ANCILLARY MATERIALS

CON2.M210.8 RELEASE AGENT
An Approved type which will not:
1. Stain or colour the concrete;
2. Affect the adhesion between the concrete and any subsequent finishings.

CON2.M220.8 SURFACE RETARDERS
An Approved type which will not stain or colour the concrete.

CON2.M230.8 HOLLOW CONCRETE BLOCKS FOR SLABS
Manufactured as follows:
1. Concrete:
   a. Mix comprising cement, granite fines and granite aggregate passing a 10 mm sieve but retained on a 5 mm sieve;
   b. Grade: 20/10.
2. Dimensions:
   a. Outer casing and web: 25 mm thick;
   b. With a 25 mm x 5 mm groove formed along both sides for key.

**CON2.M240.8 PRECAST KICKER BLOCKS**

Of solid construction and:
1. Cast in the same grade of concrete as the wall into which they are to be cast. Provide evidence of the grade of concrete to CM for approval;
2. Having a length of 100 mm parallel to the wall face, the same thickness as the wall and a minimum height of 75 mm above the highest slab abutting the wall at the level at which the kicker is formed.

**MATERIAL FOR SEALING FORMWORK TIE HOLES**

**CON2.M250.8 MORTAR**

Shall be:
1. One-part prebagged non-shrink cementitious mortar made by mixing on Site with water to form a trowellable consistency in application;
2. In accordance with mortar manufacturer’s specified application procedures (including bond cost if required by the mortar manufacturer);
3. All mortar shall be subject to tests specified in **CON2.T110, CON2.T120, CON2.T130, CON2.T140 (2), CON2.T150** and **CON2.T160** before approval by the CM.

**CON2.M260.8 POLYURETHANE FOAM**

1. The polyurethane foam shall be formed from a system of components which expands and sets to become a rigid foam;
2. The polyurethane foam shall be subjected to watertightness test specified in **CON2.T140 (1) & (2)(b)**, before approval by the CM.
WORKMANSHIP

HANDLING AND STORAGE

CON2.W010.8 FORMWORK
1. For superstructure works:
   a. Store formwork, including large panel formwork and small panel metal formwork, off a levelled, well-drained and maintained hard-standing ground on level supports and in a manner which will not result in damage, deformation or contamination;
   b. Store large panel formwork and small panel metal formwork safely and securely with struts or supports according to the method statement approved;
   c. Comply with details of safety requirements regarding prevention of falling objects as stipulated in PRE.B8.262.
2. For works other than that in sub-clause (1):
   a. Store formwork off the ground on level supports and in a manner which will not result in damage or deformation to the formwork or in contamination of the formwork.

CON2.W020.8 ANCILLARY MATERIALS
Store:
1. Release agents and surface retarders in sealed containers marked to identify the contents and protected from exposure to conditions which may affect the material;
2. All materials in accordance with the manufacturer's recommendations and do not use the materials after the recommended shelf life has been exceeded.

SAFETY AND PROTECTION

CON2.W110.8 PERIMETER WALKWAY
Do not stack any materials or debris on the perimeter formwork walkway at any time.

ERECTING FORMWORK

CON2.W210.8 CHECKING AND INSPECTION
Check the alignment of all kickers and wallforms prior to concreting and:
1. Allow the CM to inspect the completed formwork before any work, including fixing reinforcement adjacent to formwork, makes access for inspection difficult;
2. Inform the CM 24 hours, or sooner if agreed with the CM, before carrying out such work.

CON2.W220.8 KICKERS
Fix wall and column forms tightly against kickers by an Approved method.

CON2.W230.8 JOINTS
Construct joints between formwork panels, stop ends and adjoining concrete to prevent loss of grout. Cut formwork in such a manner that reinforcement and built-in components passing through the formwork are maintained in position and grout loss is prevented.
CON2.W240.8  TEMPORARY ACCESS
Provide temporary openings in the formwork for cleaning or inspection if required.

CON2.W250.8  PIPE SLEEVES ETC
1. Provide galvanised mild steel or PVC pipe sleeves through floors and walls etc as required for all trades as specified elsewhere;
2. Fix pipe sleeves, inserts, void formers and box outs to specified sizes and in correct positions before placing concrete. Do not cut hardened concrete to provide holes or chases unless otherwise Approved;
3. Do not use polystyrene for void formers or box outs larger than 150 mm x 150 mm x 150 mm unless otherwise Approved.

CON2.W260.8  FORMWORK FIXINGS GENERALLY
Do not allow any devices for securing formwork and falsework to remain within the specified concrete cover.

CON2.W270.8  FORMWORK TIES
Fix formwork ties and components in such a manner that they do not touch reinforcement or any other built-in component. Any part left in the concrete must be at least 40 mm or the specified nominal cover to the reinforcement, whichever is greater, from the concrete surface.

CON2.W280.8  TIES IN STRUCTURAL ELEMENTS WITH WATERTIGHT FUNCTION
1. Use only ties which leave no open holes through the concrete having a watertight function, including:
   a. Aqueous liquid retaining structures;
   b. All structural elements constructed below finished ground level; and
   c. Roof parapets below the upturn level of waterproofing membrane as shown on Drawings.
2. Provide precautionary measures, which may be nylon, epoxy, plastics or other dielectric material coating, to ties left in aqueous liquid retaining structures to avoid damaging the epoxy coating of reinforcement bar.

CON2.W290.8  FORMING CONSTRUCTION JOINTS
Ensure formwork to construction joints is rigid and accommodates projecting reinforcement without bending or displacement.

CON2.W300.8  LAYING HOLLOW BLOCKS FOR SLABS
1. Do not use blocks within 28 days of their being cast;
2. Lay on formwork in straight rows with butt joints;
3. Seal exposed, open ends with similar concrete to a depth of 25 mm.

CON2.W310.8  JOINTS IN LARGE PANEL FORMWORK
Ensure close contact between the edges of panels used on the same wall side, with maximum tolerance measured perpendicular to the wall not to exceed 3 mm after concreting.

CON2.W315.8  JOINTS IN SMALL PANEL METAL FORMWORK
1. Ensure close contact between the edges of panels used on the same wall side, with maximum tolerance on abrupt changes/irregularities of a continuous fair-face finished concrete surface measured perpendicular to the wall tightened to not to exceed 2 mm after concreting;
2. Unless otherwise instructed by the CM, apply skim coat as specified in FIN7.M790 to the wall joints to cover up and smoothen any abrupt changes/irregularities notwithstanding that the tolerance on abrupt changes/irregularities is met. Bear all associated costs and no extension of time shall be allowed.

CON2.W320.8 ARRISES
Erect formwork to provide smooth arrises free from damage and cracks.

KICKERS FOR LARGE PANEL FORMWORK AND SMALL PANEL METAL FORMWORK

CON2.W410.8 DEFINITIONS
For the purposes of this Worksection the following apply:
1. An external wall is defined as a complete length or section of a wall which is abutted by a floor slab on one side only, at the level where the kicker is formed;
2. An internal wall is defined as a complete length or section of a wall which is abutted by floor slabs on both sides, at the level where the kicker is formed.

CON2.W420.8 PROVISION OF KICKERS
Provide kickers at the toes of all walls constructed by large panel formwork and/or small panel metal formwork for the purpose of maintaining correct alignment and preventing grout loss.

CON2.W430.8 KICKERS FOR EXTERNAL WALLS
1. Form in-situ kicker, using metal formwork, monolithically with the floor slab abutting the wall in one continuous casting operation;
2. The concrete grade of the kicker shall be the same as that of the abutting floor slab and the dimensional details are as follows:
   a. Length: over the whole length of the wall;
   b. Thickness: same as that of the wall;
   c. Top level: 100 mm above the highest level of the abutting floor slab.

CON2.W440.8 KICKERS FOR INTERNAL WALLS
Use evenly spaced precast blocks as specified in CON2.M240 to form the kickers of internal walls, with a minimum of two blocks provided per wall as follows:
1. Place the kicker blocks in position after the slabs abutting walls have been cast and bed to the correct level using an approved bedding material;
2. Fix the blocks firmly to the top of the slabs either by cast in or drilled anchor bolts. Fill any voids around bolts with an Approved grouting material. Ensure fixings prevent blocks being displaced during the wall construction;
3. Adjust reinforcement locally, and only with prior Approval, to enable precast kicker blocks to be fixed.

WORK BELOW GROUND

CON2.W510.8 FORMING AGAINST EXCAVATION FACES
Do not cast concrete below ground against sides of excavation unless with the CM's prior Approval.
STRIKING FORMWORK

CON2.W610.8 GENERAL
Strike formwork and falsework without disturbing, damaging or overloading the finished concrete work or the structure and without affecting other formwork and falsework.

CON2.W620.8 CONTRACTOR'S RESPONSIBILITY
Notwithstanding any other clauses in this Specification accept sole responsibility for the safe removal of formwork and falsework.

CON2.W630.8 MINIMUM PERIODS BEFORE STRIKING
Minimum periods for retaining formwork and falsework in position are as follows:

<table>
<thead>
<tr>
<th>Type of Formwork and Falsework</th>
<th>Striking Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inclined formwork to top Surfaces</td>
<td>12 hours</td>
</tr>
<tr>
<td>Vertical formwork to columns, beams and walls</td>
<td>16 hours</td>
</tr>
<tr>
<td>Soffit formwork to Slabs (Props left under)</td>
<td>3 days</td>
</tr>
<tr>
<td>Props to slabs (unloaded)</td>
<td>7 days</td>
</tr>
<tr>
<td>Soffit formwork to beams (Prop left under)</td>
<td>7 days</td>
</tr>
<tr>
<td>Props to beams (unloaded)</td>
<td>16 days</td>
</tr>
<tr>
<td>Prop to cantilevers (unloaded)</td>
<td>28 days</td>
</tr>
</tbody>
</table>

CON2.W640.8 STRIKING AT LOW TEMPERATURE
Obtain instructions from the CM for increased striking times of formwork at lower temperatures. The periods stated in CON2.W630 are for Portland cement at 15°C ambient temperature and the conditions stated in the table.

CON2.W650.8 STRIKING LARGE PANEL FORMWORK AND SMALL PANEL METAL FORMWORK
Alternative minimum periods before striking large panel formwork and small panel metal formwork may be Approved, if the design allows, provided that:

1. Props for soffits of insitu slabs or combined precast and insitu slab construction, must remain in place for a minimum of five days and until the concrete has achieved two thirds of the required 28 day crushing strength;
2. The props supporting the floor immediately below the cast slab or soffit must remain in place for a minimum period of 2½ days after the upper floor is concreted and until the concrete has achieved a crushing strength of 10 MPa, or twice the stress to which the concrete will be subjected, whichever is the greater. No re-propping is permitted within the minimum periods;
3. In the event that a request for relaxation of the minimum periods before striking, if any, is not accepted by the CM, the design of the formwork system is deemed to have been prepared on the basis of the minimum periods detailed in CON2.W630 or this sub-clause, provided the conditions referred to are complied with;
4. As evidence that concrete placed insitu or in combined precast and insitu slabs has attained the minimum strengths specified, from test results obtained from the laboratory established on site in accordance with the requirements for testing contained in the Preliminaries PRE.B9 of this Specification.
CON2.W660.8 BACK PROPPING SOFFITS
Where the props are to be left in place whilst the soffit formwork to slabs and beams are removed, design such props either to remain in position throughout the striking process without having to be temporarily removed or alternatively, if agreed by the CM, so that a few can be removed at a time and replaced immediately.

CON2.W670.8 LOADING THE STRUCTURE
Do not place construction loads on any unshored portion of the structure under construction. Agree the number of floors requiring propping with the CM, according to the design loads of such floors.

TRIAL PANELS

CON2.W710.8 SAMPLES
Provide samples of any exposed formed or worked finishes as detailed in the Project Specific Specification, and obtain Approval.

CON2.W720.8 CONSTRUCTION OF TRIAL PANEL
Subject to CM's instruction, construct on Site a trial panel before the commencement of typical floor construction as detailed in the Project Specific Specification to demonstrate that the proposed formwork and falsework system is adequate in providing the required quality standard of finishes to concrete.

CON2.W730.8 SUB-STANDARD TRIALS
Should the finish to the trial panels not be to the standard specified and not to the satisfaction of the CM, modify the formwork system and construct further trial panels until, in the opinion of the CM, the finish to the concrete produced is satisfactory. Adopt the formwork system producing the required finish as the standard for all subsequent formwork used.

STANDARD PANEL

CON2.W810.8 INSITU STANDARD PANEL
As soon as is practical after commencement of superstructure work, select a sample area from the insitu works as being representative of the minimum standard of the specified finish for inspection by the CM. Upon agreement in writing by the CM the finish to the sample area will become the minimum standard for that specified finish for all subsequent concrete.

FORMED FINISHES FOR CONCRETE

CON2.W910.8 TYPE A : ROUGH BOARD FINISH
1. Formwork or formwork linings to consist of Approved rough textured seasoned wood boards with moisture content of between 10% and 20%;
2. Arrange boards of varying textures to give uniform overall effect;
3. Assemble boards to prevent leakage of grout between them;
4. Soak formwork with water before erecting, and keep damp until concrete is placed;
5. Position cover spacers and bolts to the satisfaction of the CM;
6. The number of uses of formwork lining will be limited to its ability to provide the required finish;
7. The finish to be left as struck. Do not make good until inspected by the CM;
8. Discoloration will not be permitted;
9. Fill minor voids and irregularities on surfaces with a matching mortar to Approval, using a sponge rubber face float.

**TYPE B : FAIR-FACED FINISH**

1. Produce an even finish with a sheet material (e.g. plywood);
2. Arrange panels in pattern as specified;
3. The finish to be left as struck. Submit method statement for rectification works for approval prior to carrying out any remedial works. Do not make good until inspected by the CM;
4. Blowholes not exceeding 10 mm diameter will be permitted, but otherwise surface to be free from voids, honey-combing or other large defects;
5. Variations in colour will be permitted when the finished concrete is to receive an applied decoration;
6. Make good small defects, and fill blowholes and formwork tie holes with Approved materials.

**MAINTENANCE OF FORMWORK**

**PREPARATION FOR RE-USE**

Clean and repair formwork which has been previously used before it is re-erected.

**DAMAGED AND DETERIORATED FORMWORK**

Do not re-use formwork where strength and composition has so far deteriorated due to repeated use that, in the opinion of the CM, it will no longer adequately perform its function in accordance with the Specification but remove it from Site.

**RUBBER SEALS**

Properly maintain the rubber hose seals and replace when required or as Instructed but in no case subject seals to more than nine uses.

**RE-USE OF TIMBER FORMWORK**

Do not subject plywood sheathing to formwork to more than nine uses, irrespective of the use of one or both faces of such sheathing.

**SEALING FORMWORK TIE HOLES**

**GENERAL**

Seal all tie holes left in walls by formwork ties and components in accordance with Sketch no. SES/TB/S/SK-001/A.

**SEALING THE TIE HOLES**

1. Procedures for external walls with tile finishes:
   a. Knock out the PVC tubing;
   b. Drive in and secure a piece of minimum 30 mm thick cork at 40 mm from each end of a formwork tie hole;
   c. Wet thoroughly to achieve saturation and clean concrete surfaces inside the hole to remove dust and loose materials prior to applying mortar (and bond coat if required by the mortar manufacturer);
d. Using the cork as a backing, apply and completely fill the hole ends by prebagged non-shrink cementitious mortar as described and Approved in accordance with CON2.M250;

e. Cure the mortar to CON1.W1410 or in accordance with the mortar manufacturer's recommendations as Approved by the CM.

2. Procedures for external walls without tile finishes:
   a. Knock out the PVC tubing;
   b. Clean thoroughly concrete surfaces inside the hole to remove dust and loose materials prior to applying polyurethane foam;
   c. Drive in and secure a piece of minimum 30 mm thick cork at 40 mm from the external side of the wall;
   d. Using the cork as a backing, apply the polyurethane foam Approved by the CM in accordance with CON2.M260 from the internal side of the wall in such quantity that it expands, fills the hole entirely and moves it way out away from the backing cork. Allow adequate time for full development and setting of the foam rigidity as recommended by the manufacturer;
   e. Cut back all excess polyurethane foam by 40 mm from the internal side of the wall. Remove all traces of foam remaining on the hole concrete surfaces;
   f. Repeat procedures as described in CON2.W1120 (1)(c) to (1)(e) for application of mortar (and bond coat if required by the mortar manufacturer) at either end of the hole.

3. Procedures for internal walls:
   a. Knock out the PVC tubing;
   b. Wet thoroughly to achieve saturation and clean concrete surfaces inside the hole to remove dust and loose materials prior to applying mortar (and bond coat if required by the mortar manufacturer);
   c. Apply and completely fill the hole by prebagged non-shrink cementitious mortar as described and Approved in accordance with CON2.M250;
   d. Cure the mortar to CON1.W1410 or in accordance with the mortar manufacturer's recommendations as Approved by the CM.

**TOLERANCES**

**CON2.W1210.8 GENERAL**

Refer to Appendix H "Schedule of Tolerances" to this Specification.
TESTING

TESTING OF MORTAR FOR SEALING FORMWORK TIE HOLES

CON2.T110.8 LABORATORY TESTING
1. Submission requirements:
   a. Submit technical details and test reports done by Approved local independent testing laboratory at Contractor's own costs to demonstrate the following mortar characteristics:
      i. 1-4% of change in height of specimen tested to ASTM C827 - 95a(97);
      ii. Minimum value of 200 seconds for Figg air permeability.

2. Testing samples:
   a. Submit samples of mortar for carrying out one set of the tests as stated in CON2.T110 (1) by the Direct Testing Contractor to demonstrate the mortar characteristics for Approval and thereafter every 750 kg of mortar to be used on site for routine monitoring test as instructed by the CM;
   b. Unless otherwise Approved or specified elsewhere, testing of mortar shall be carried out by the Direct Testing Contractor;
   c. Allow sufficient time for testing of the materials by the Direct Testing Contractor.

CON2.T120.8 TESTING FOR CHARACTERISTICS OF MORTAR
Testing methods:
1. Early change in height test: test shall be carried out to C827 - 95a(97) as specified by American Society for Testing and Materials;

2. Permeability test: the permeability of the mortar shall be determined by the modified Figg air permeability test described in "Improvements to the Figg method for determining the air permeability of concrete" Cather, Figg, Marsden and O'Brien. Mag. Conc. Res 36 No. 129 Dec 1984. The specimen shall be a 100 mm cast cube conditioned at a temperature of 27±2°C and 55±5% relative humidity, demoulded 72 hours after casting and kept in the same environment for a further 18 days. The permeability test shall be carried out after conditioning at 50°C for 14 days.

CON2.T130.8 REQUIREMENT FOR FURTHER TEST
Non-compliance:
1. Two additional tests shall be carried out by the Direct Testing Contractor for each failure of the laboratory test result obtained for any one mortar characteristic;

2. The mortar is considered as not complying with the specified property if the result of any additional test fails to comply with the specified requirements for the property;

3. Submit another mortar for Approval.

CON2.T140.8 WATERTIGHTNESS TEST ON SITE
1. All watertightness tests made on Site are at Contractor's own costs, time and to be witnessed and certified both by the CM and the Contractor's representative. Testing procedures to carry out watertightness test as follows:
   a. Construct working platforms where necessary for carrying out water test safely;
b. A continuous jet of water is to be sprayed from a nozzle at water pressure of 210 to 240 KPa at the nozzle inlet to the joint and along the longitudinal axis of the formwork tie hole for a minimum of 5 minutes. The nozzle shall be stationary while an observer inspects carefully on the indoor side of the formwork tie hole with the assistance of adequate lighting where necessary. The nozzle used for the tests shall be to the requirements of Architectural Aluminium Manufacturers' Association (AAMA) 501.2-83, unless otherwise Approved.

2. Before sealing any formwork tie holes, carry out watertightness test on Site for the following:
   a. Watertightness test for mortar only: the CM to select 10 nos. of formwork tie holes sealed with mortar at one end of hole only and without polyurethane, prepared in accordance with CON2.W1120. Watertightness test to be applied on the mortar side for a minimum of 5 minutes;
   b. Watertightness test for polyurethane foam only: the CM to select 10 nos. of formwork tie holes sealed with polyurethane foam only and without mortar, prepared in accordance with CON2.W1120 (2)(a) to (2)(f). Watertightness test to be applied on the cork side for a minimum of 5 minutes.

3. Carry out watertightness test for completely sealed formwork tie holes on Site for 10% of formwork tie holes at each floor of every block sealed complete in accordance with CON2.W1120 (1) or CON2.W1120 (2) and selected by the CM. Watertightness test to be applied on one side of a wall only (external side if applicable) for a minimum of 5 minutes.

CON2.T150.8 FAILURE OF WATERTIGHTNESS TEST
If sign of water seeping through the hole, including sign of damp patches, is observed on the opposite side of the wall face subject to test during the test and within the subsequent 2 hours after the test, the watertightness test is deemed to have failed.

CON2.T160.8 ADDITIONAL TESTS UPON FAILURE OF WATERTIGHTNESS TEST
Is carried out in accordance with the following procedures:
1. For any one hole failed for the watertightness test made in accordance with CON2.T140 (2)(a) or (2)(b), two additional holes are selected by the CM for watertightness test in accordance with CON2.T140 (1);
2. The mortar or polyurethane foam is considered not complying with the specified field watertightness requirements when result of any additional test made upon mortar or polyurethane foam respectively according to CON2.T140 (2)(a) or (2)(b) fails in accordance with CON2.T150;
3. For any tests carried out according to CON2.T140 (3) and fails in accordance with CON2.T150 the Contractor shall carry out further tests progressively as described in CON2.T160 (1) above until all tests are successful.

CON2.T170.8 MAKE GOOD FORMWORK TIE HOLES
The work is carried out in accordance to the following:
1. Make good all formwork tie holes which have failed the watertightness test carried out in accordance with CON2.T140 (3) and CON2.T160 (3) to CM's satisfaction at Contractor's own costs and time;
2. All repaired holes shall be subject to watertightness test as specified in CON2.T140 (1).

CON2.T180.8 BLOWHOLES
All blowholes shall be filled with one-part prebagged non-shrink cementitious mortar Approved in CON2.M250.
CON3 REINFORCEMENT

MATERIALS

REINFORCEMENT GENERALLY

CON3.M010.8 STOCKIST’S OR SUPPLIER’S CERTIFICATION
Submission requirements:

1. For bar reinforcement, submit certificates from quality assured stockist and/or supplier to demonstrate that the bar reinforcement supplied complies with the requirements of CS2: 2012 Section 4.

2. For fabric reinforcement, submit a certificate from the manufacturer to the CM, stating:
   a. That the fabric reinforcement supplied has been tested and complies with the requirements of BS 4449:2005, BS 4483:2005 and this Specification;
   b. Evidence that the cold reduced steel wire in fabric reinforcement has complied with the bond classification as specified in BS 4449:2005.

CON3.M020.8 VERIFICATION OF SOURCE
When instructed provide evidence that each load of steel reinforcement which includes the bars for fabric reinforcement delivered to site forms part of the same consignment and originates from the same source as that in respect of which the specimen and the manufacturer’s certificate relate.

CON3.M030.8 QUALITY ASSURANCE SCHEME FOR FABRIC REINFORCEMENT
1. Obtain a quality assurance scheme from the manufacturer and submit for Approval. Details of the scheme must include a routine inspection complying with BS 8666:2005 Annex A;

2. Unless the quality assurance scheme has been certified under ISO 9001, it shall be assessed by an Approved third party certification authority who shall audit the manufacturer’s inspection records in accordance with BS 8666:2005 Annex B. If instructed, submit the audit report to the CM.

CON3.M035.8 PRODUCT CONFORMITY CERTIFICATION SCHEME FOR FABRIC REINFORCEMENT
1. Submit original or a certified true copy of the product conformity certificate to the "Product Conformity Certification Scheme For Mesh Reinforcements" (PCCS-MR) published by the Hong Kong Concrete Institute. The product conformity certificate shall be issued by a certification body accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a multilateral recognition arrangement with HKAS. If a photocopy of the product conformity certificate is submitted, it shall be certified true by the certification body or by the QCM;

2. The product conformity certificate shall either be submitted before the first delivery to Site or precast concrete casting yard whichever the earlier, or at a time not later than 12 months from the date of commencement of the Works;

3. When directed by CM, submit full set of original or certified true copy of the test reports under the audit testing of the PCCS-MR:
a. The test reports shall be issued by a laboratory accredited by Hong Kong Laboratory Accreditation Scheme (HOKLAS) or an accredited laboratory which has entered into a mutual recognition arrangement with HOKLAS, showing full compliance with the requirements of PCCS-MR. If a photocopy of the test report is submitted, it shall be certified true by the accredited laboratory carried out the testing or by the QCM;

b. The date of the test report shall be within three years prior to the date of commencement of the Works.

**CON3.M040.8 COLOUR CODE SYSTEM OF REINFORCEMENT**

Submit for Approval a colour code system in the Quality Control System as stipulated in PRE.B8.1425 for identification of reinforcement unloaded to designated areas by the Contractor on Site:

1. For different batches, as defined in CON3.T010, before any testing:
   a. Use white, yellow, blue, grey or other specific colours at the ends of reinforcement bar as directed by the CM;
   b. Avoid to use any colours similar to rust and do not use green and/or red colours.

2. For each batch available with all test results, including the re-test results as permitted in the Specification, add:
   a. Green colour: for reinforcement conforming to the Specification;
   b. Red colour: for reinforcement not conforming to the Specification.

**REINFORCEMENT**

**CON3.M110.8 BAR REINFORCEMENT**

Quality requirements:
1. Hot rolled steel bars: to CS2:2012;

**CON3.M130.8 FABRIC REINFORCEMENT**

Quality Requirements: to BS4483:2005.

**CON3.M140.8 REPLACING FABRIC REINFORCEMENT TO BAR REINFORCEMENT**

Do not replace the fabric reinforcement by bar reinforcement. Where bar reinforcement proposed for replacement in the event of non-availability of fabric reinforcement, the bar reinforcement proposed for replacement conforming with the equivalent standards set for fabric reinforcement as shown on drawings will be acceptable subject to Approval.

**ANCILLARY MATERIALS**

**CON3.M210.8 COVER SPACERS**

Quality requirements:
1. Unless specified elsewhere, type as shown on Standard Drawing STD/FD/S/EG001 or STD/FD/S/EG001/A as appropriate, and as small as practicable, consistent with their purposes, capable of supporting the weight of reinforcement and construction loads without breaking, deforming or overturning;
2. Be one of the following types:
   a. Plastic: Approved type(s);
b. Concrete (for foundations only): precast or proprietary concrete of strength and durability not less than that of the surrounding concrete. Provide evidence of the grade of concrete to CM for approval.

CON3.M220.8 CHAIRS AND SUPPORTS
Quality requirements:
1. To BS7973:Part 1:2001;
2. Unless otherwise shown on the Drawings, to be steel with plastic-coated feet or Approved anti-rust treatment if not properly protected by concrete. Steel is cut and bent to BS8666:2005.

CON3.M230.8 REINFORCEMENT TYING WIRE
Quality requirements:
1. Diameter of annealed iron wire:
   a. For bars up to and including 16 mm diameter: 0.9 mm;
   b. For bars of 20 mm diameter and over: 1.2 mm.

EPOXY COATED REINFORCEMENT

CON3.M250.8 MANUFACTURER'S DOCUMENT AND TEST RESULTS
Submission requirements:
1. Submit the following particulars, including certificates and test results, for each batch of epoxy coated reinforcement bars at least 60 days before the first delivery of the epoxy coated reinforcement bars to Site:
   a. Name and location of the coating factory;
   b. Mill sheets of the steel reinforcement bars complying with CS2:2012;
   c. Date and place of the coating application;
   d. Certificate of the coating materials in compliance with BS 7295:Part1:1990, including:
      i. Corrosion resistance;
      ii. Chemical resistance;
      iii. Cathodic disbonding of coating;
      iv. Adhesion;
      v. Abrasion resistance;
      vi. Impact strength;
      vii. Hardness.
   e. A contingency plan for dealing with epoxy coated reinforcement bars which are found to be non-conforming to the requirements of Worksection CON3.
2. Re-submit the particulars in sub-clause (1)(d) when the relevant tests have been carried out over 5 years or when there are changes in the composition of the coating materials, whichever the earlier.

CON3.M260.8 EPOXY COATING TO REINFORCEMENT
Quality requirements:
2. Epoxy coating applied by electrostatic spray method to BS 7295:Part 1:1990 at a factory approved by CM;
3. The bond classification of coated bars determined in bond performance tests not less than that of uncoated bars.

CON3.M270.8  CHAIRS, SUPPORTS AND SPACERS
Quality requirements:
1. Steel coated with nylon, epoxy, plastics or other dielectric material for epoxy coated reinforcement.

CON3.M280.8  TYING WIRE
Quality requirements:
1. 1.6 mm diameter soft annealed steel wire coated with nylon, epoxy, plastic or other dielectric material.

MECHANICAL COUPLER

CON3.M310.8  TYPE OF MECHANICAL COUPLER
Quality Requirements of mechanical coupler: Type 1 and Type 2 mechanical couplers as stipulated in the Code of Practice for Structural Use of Concrete 2013 published by the Buildings Department.

CON3.M320.8  SUBMISSION
1. Commencement of the mechanical coupler works is subject to CM's written permission;
2. Submit the following details to the CM for approval at least 30 days prior to the commencement of the mechanical coupler works:
   a. The name and model number of the mechanical coupler;
   b. The name of the manufacturer and the address of manufacturing factory;
   c. The information / documents of the quality assurance scheme as set out in CON3.M330;
   d. A description of the sampling procedures including the arrangement from collecting samples to delivery of samples to laboratory for testing the quality of the mechanical splice assemblies;
   e. For Type 2 mechanical coupler, the quality supervision plan as set out in CON3.W310.
3. Upon completion of the mechanical splice works, submit the following documents to the CM for record:
   a. The inspection log book as detailed in CON3.W320;
   b. A copy of mill certificates of the constituent materials used to produce the couplers.

CON3.M330.8  QUALITY ASSURANCE SCHEME FOR MECHANICAL COUPLER
The quality assurance scheme of the manufacturer shall include the information as specified in the Project Specific Specification.
WORKMANSHIP

GENERAL

CON3.W010.8 STORAGE OF REINFORCEMENT
Store:
1. All reinforcement clear of a levelled, well-drained and maintained hard-standing ground in a manner that will avoid damage, deformation and contamination of the reinforcement;
2. Fabric reinforcement horizontally;
3. Different types and sizes of reinforcement separately.

CON3.W015.8 STORAGE OF FABRIC REINFORCEMENT IN FACTORY/STOCKYARD
Provide a fenced-off area in the manufacturer’s factory or stockyard for the exclusive storage of fabric reinforcement.

CON3.W020.8 SURFACE CONDITION OF REINFORCING STEEL
Clean and free from loose mill scale, loose rust, oil, grease or any substance, which in the opinion of the CM, is likely to reduce the bond or affect the reinforcement or concrete chemically.

CON3.W030.8 CONTAMINATED OR HEAVILY RUSTED REINFORCEMENT
Remove contaminated or heavily rusted reinforcement from Site unless it has been cleaned or satisfactorily treated by an Approved method.

CON3.W040.8 PROTECTION OF EXPOSED REINFORCEMENT
Where specified or instructed by the CM, protect reinforcement left exposed after completion of the Works by the specified method or by other Approved methods.

CON3.W050.8 COLOUR MARKINGS OF REINFORCEMENT BY STOCKISTS OR SUPPLIERS PRIOR TO DELIVERY
1. Obtain reinforcement preferably without red and green colour markings from stockists /suppliers;
2. If reinforcement with red colour marking, or with a colour marking covering a previous red colour, or with green colour marking is to be supplied:
   a. Provide in advance an explanation to the CM before delivery to Site. In addition, for reinforcement with red colour marking or a colour marking covering a previous red colour, provide to the CM before delivery to Site confirmation each from the Contractor and the stockist /supplier that as far as it is aware, the reinforcement is not non compliant with CS2 and/or rejected by other project;
   b. The CM may refuse entry of reinforcement to Site if:
      i. No explanation is provided in advance; or
      ii. The provided explanation is not satisfactory.
Fixing Reinforcement

CON3.W110.8 Cutting and Bending Reinforcement
Reinforcement bars are to be cut and bent in accordance with the dimensional requirements of BS 8666:2005 unless otherwise shown on Drawing.

CON3.W120.8 Cold Bending
Bend bars cold, using a proprietary bending machine, and do not re-bend unless permitted by the CM.

CON3.W130.8 Securing Reinforcement
1. Secure with tying wire of the correct gauge for the sizes of bars, steel clips of an Approved type, or where Approved, by tack welding;
2. Ensure that the tying wire, including the wire ends, tying devices and clips do not encroach into the nominal cover to the reinforcement;
3. Demonstrate the adequacy of the system employed when instructed;
4. Submit method statement on the fabrication of reinforcement cages of Barrette or Large Diameter Bored Piles to the CM for approval. The method statement shall include:
   a. Set-up of the fabrication yard;
   b. Step-by-step procedures of reinforcement cage fabrication;
   c. Stability support system;
   d. Working platform arrangement;
   e. Safety plan.
5. The Contractor shall refer to the conceptual method for fixing single layer of reinforcement bars for Large Diameter Bored Piles as shown in Drawings No.CPT/LDBP/S/SK-001 to SK-004 and the conceptual method for fixing double layers of reinforcement bars for Large Diameter Bored Piles as shown in Drawings No. CPT/LDBP/S/SK-101 to SK-106 in Appendix C to this Specification. The Drawings are for reference only and are given in good faith without prejudice to the Contractor's responsibilities and liability under the Contract;
6. Riggers with Silver Card will also be accepted as skilled trade tested workers for fixing of U-bolts for the reinforcement cages.

CON3.W140.8 Locating Reinforcement
Provide sufficient cover spacers, chairs and supports, having regard to Table 3 of BS 8000:Part 2:Section 2.2:1990, to maintain the reinforcement in its correct location and to maintain the specified cover at all positions.

CON3.W150.8 Welding
1. Do not weld bars without Approval;
2. Where Approved, weld in accordance with BS EN ISO 17660-1:2006, and the relevant parts of Code of Practice for Structural Use of Concrete 2013.

CON3.W160.8 Concrete Cover
Provide minimum 25mm concrete cover to all reinforcement unless otherwise specified in Drawing.

CON3.W170.8 Compliance with Drawings
Check that completed reinforcement complies with the drawings, in particular with respect to:
1. Bar conditions;
2. Size of bars;
3. Provision of trimming bars;
4. Number of bars;
5. Spacing;
6. Cover.

CON3.W180.8 CM'S INSPECTION
1. Ensure all completed reinforcement is inspected by the CM before carrying out any work, including erecting any formwork adjacent to the reinforcement, which makes access for inspection difficult;
2. Notify the CM 24 hours, or a shorter period agreed by the CM, prior to carrying out such work.

TOLERANCES

CON3.W210.8 GENERAL
Refer to Appendix H "Schedule of Tolerances" to this Specification.

EPOXY COATED REINFORCEMENT

CON3.W220.8 HANDLING OF REINFORCEMENT
1. Do not subject the reinforcement to rough handling, shock loading or dropping from a height;
2. Lift epoxy coated reinforcement with nylon, rope or padded slings and lift bundles with strongback or with multiple supports to prevent abrasion.

CON3.W230.8 STORAGE OF REINFORCEMENT
Store on wooden or padded cribbing.

CON3.W240.8 CUTTING AND BENDING REINFORCEMENT
1. Bend epoxy coated reinforcement cold;
2. Provide padded supports for bar cutting and bar bending equipment for epoxy coated reinforcement and fit all contact areas of the equipment with nylon or plastic mandrels.

CON3.W250.8 REPAIRS TO EPOXY COATING ON SITE
1. Do not use the epoxy reinforcement in the permanent work if the coating is delaminated, split or damaged:
   a. At any point by an amount exceeding 25 mm² in area or 50 mm in length;
   b. At more than three points in a 1 m length by amounts each even not exceeding 25 mm² in area and 50 mm in length;
   c. At more than six points in the cut and bent length of a bar by amounts each even not exceeding 25 mm² in area or 50 mm in length.
2. Repair all cut ends and damaged areas not exceeding 25 mm² in area or 50 mm in length with patching material applied in accordance with manufacturer's recommendations;
3. Carry out repairs to epoxy coatings within 8 hours of cutting or damage and remove traces of rust from the surface of the reinforcement before carrying out the repair.
MECHANICAL COUPLER

CON3.W310.8 QUALIFIED SUPERVISION

1. Assign a Mechanical Coupler Quality Control Coordinator (MCQCC), with a minimum qualification and experience of a Grade T1 TCP for Type 1 mechanical coupler and a Grade T3 TCP for Type 2 mechanical coupler under the Registered Contractor’s stream in the CoPSS, to:
   a. Supervise mechanical splice works and ensure that these are all carried out in accordance with approved plans and comply with the requirements on quality and workmanship;
   b. Devise inspection check list of the mechanical couplers works;
   c. Provide full time continuous supervision of the manufacturing process of the connecting ends of the steel reinforcing bars and the installation of steel reinforcing bars to the mechanical couplers.

2. For Type 1 mechanical coupler, submit the details as specified in the Project Specific Specification to the CM for approval;

3. For Type 2 mechanical coupler, submit a quality supervision plan as specified in the Project Specific Specification to the CM for approval;

4. The duties of MCQCC can be taken up by SQCC as stipulated in PRE.B6.130.

CON3.W320.8 INSPECTION LOG BOOK

1. Record the following details in an inspection log book:
   a. The names and qualifications of the supervisory personnel assigned by the CM and by the Contractor as stipulated in CON3.W310;
   b. The date, time, items inspected and inspection results.

2. Keep the inspection log book on Site for CM’s inspection when required and submit the inspection log book to CM upon completion of the mechanical splice works.
TESTING

DEFINITIONS

CON3.T010.8 BATCH OF BAR REINFORCEMENT
1. Subject to the maximum tonnage in sub-clause (2) below, a batch of bar reinforcement is the quantity of bar reinforcement delivered to Site within a week under one delivery order, of one nominal diameter, and one steel grade and produced by the same manufacturer;
2. The maximum tonnage of a batch shall not exceed:
   a. For bars of diameter 20 mm and above : 200 tonnes;
   b. For bars of diameter less than 20 mm : 100 tonnes.

CON3.T020.A BATCH AND LOT OF FABRIC REINFORCEMENT
1. A batch of fabric reinforcement is any quantity of fabric reinforcement of the same combination of steel grades and diameters, produced by the same welding machine with defined bar pattern, covered by the same mill and testing certificates and produced and properly identified by the CM in an Approved fenced off area in factory or in the stockholder's yard under one consignment;
2. A lot of fabric reinforcement is any quantity of fabric reinforcement of the same combination of steel grades and diameters, produced by the same welding machine with defined bar pattern, covered by the same mill and testing certificates and delivered to Site at any one time.

CON3.T025.8 BATCH OF MECHANICAL COUPLER
In this Specification, a batch of mechanical coupler is any quantity of coupler of the same type and size delivered to the Site as one consignment and covered by the same mill and testing certificates.

CON3.T030.8 TESTING BY DIRECT TESTING CONTRACTOR (DTC) AND HOUSING DEPARTMENT'S MATERIALS TESTING LABORATORY (HDMTL)
Unless otherwise Approved or specified elsewhere, provide reinforcement samples to the CM for testing by the DTC or HDMTL.

CON3.T040.8 TESTING PROGRAMME
1. Allow sufficient time for the testing of specimens;
2. Do not cut, bend, fix or incorporate steel reinforcement into permanent works until all relevant test specimens have successfully passed all tests carried out by the DTC and HDMTL.

PURCHASERS TESTING

CON3.T110.8 RATE OF SAMPLING
1. For bar reinforcement, provide adequate test specimens from each batch delivered to the Site in accordance with CS2:2012. The number of test specimens taken from each batch and the rate of sampling shall be in accordance with Table 10 of CS2:2012;
2. For fabric reinforcement in factory/stockholder's yard, provide samples from each batch as follows:
### Sampling Rate of Fabric Reinforcement

<table>
<thead>
<tr>
<th>Size of Batch</th>
<th>No. of Samples per Batch</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - 50 tonnes</td>
<td>1</td>
</tr>
<tr>
<td>Each additional 50 tonnes or part of 50 tonnes</td>
<td>1</td>
</tr>
</tbody>
</table>

3. For reinforcement used for construction of hoardings and associated covered walkways and gantries, the rate of sampling stated in the sub-clauses (1) and (2) above may be reduced at the discretion of the CM.

### CON3.T120.A PROCEDURE

Testing arrangement:

1. Under the supervision of the CM,
   a. Cut and take test specimens selected at random from bar reinforcement on Site or samples selected at random from fabric reinforcement in factory/stockholder's yard;
   b. Ensure size of specimens/samples to be:
      i. Bar reinforcement: each specimen to be minimum 1 m long;
      ii. Fabric reinforcement: each sample to be 1.2 m long x 1.2 m wide containing at least four wires in each direction.
   c. Appropriately mark and deliver the test specimens or samples to the DTC for testing.

### CON3.T130.8 TESTING BY HDMTL

Testing samples:

1. Provide additional bar reinforcement specimens to HDMTL for test as follows:
   a. Take specimens from bars adjacent to those from which specimens have been cut for testing by the DTC;
   b. Rate of sampling: approximately one-fifth of the rate specified in CON3.T110 with same number of test specimens or samples;
   c. Size of specimens/samples: in accordance with CON3.T120;
   d. Scope, number of tests and method of testing as specified in CON3.T210 and CON3.T220.

2. Provide additional samples from fabric reinforcement in factory/stockholder's yard under the same testing regime in sub-clause (1).

### CON3.T140.8 ADDITIONAL SAMPLES OF FABRIC REINFORCEMENT DELIVERED TO SITE

When Instructed, provide additional samples of fabric reinforcement for testing by DTC. The rate of sampling shall be minimum one sample for every total 100 tonnes of fabric reinforcement delivered to Site, irrespective of batches/consignments numbers assigned in the factory/stockholder's yard. Each sample so selected by the CM represents the particular lot delivered to Site.

### TESTING BY DTC

### CON3.T210.A SCOPE AND NUMBER OF TESTS

Testing samples:

1. Tests will be carried out on each specimen of bar reinforcement in accordance with CS2:2012;
2. Number of tests on each specimen of bar reinforcement in accordance with Table 10 of CS2:2012;
3. Tests will be carried out on each sample of fabric reinforcement to determine:
   a. Yield stress;
   b. Elongation;
   c. Tensile strength;
   d. Rebending and/or bending properties;
   e. Unit mass;
   f. Pitch dimension;
   g. Surface geometry (determination for relative rib area (fR) only).
4. Number of tests on each sample of fabric reinforcement as follow:

<table>
<thead>
<tr>
<th>Description</th>
<th>Tensile</th>
<th>Bend</th>
<th>Rebend</th>
<th>Unit Mass</th>
<th>Pitch Dimension</th>
<th>Surface Geometry</th>
</tr>
</thead>
<tbody>
<tr>
<td>Steel fabric</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>1</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>- fabric sheet</td>
<td>1</td>
<td>-</td>
<td>1</td>
<td>-</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>- longitudinal wire</td>
<td>1</td>
<td>-</td>
<td>1</td>
<td>-</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>- transverse wire</td>
<td>1</td>
<td>-</td>
<td>1</td>
<td>-</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

CON3.T220.8 METHODS OF TESTING
Tests will be carried out at a temperature between 5°C to 35°C and in accordance with the following standards:
1. CS2:2012: for hot rolled steel bars;
2. BS4449:2005: for cold reduced steel bars;

CON3.T310.8 COMPLIANCE CRITERIA - BAR REINFORCEMENT
A batch of bar reinforcement is deemed to comply with the specification if the test results meet the requirements of CS2:2012. Any non-complying batch of bar reinforcement is to be removed from Site.

CON3.T320.8 COMPLIANCE CRITERIA - FABRIC REINFORCEMENT
1. For fabric reinforcement in factory/stockholder's yard, a batch is considered as not complying with the specified requirements for grade strength if the yield stress in any tensile test carried out on any sample taken from the batch is less than 93% of the specified grade strength. The non-complying batch is not to be delivered to Site;
2. For fabric reinforcement delivered to Site, a lot is considered as not complying with the specified requirements for grade strength if the yield stress in any tensile test carried out on any sample taken from the lot is less than 93% of the specified grade strength. The non-complying lot is to be removed from Site;
3. If the yield stress in any tensile test for fabric reinforcement in sub-clauses (1) and (2) is less than the specified grade strength but equal to or greater than 93% of the specified grade strength, provide additional samples from the same batch or lot for additional test on yield stress. The number of additional samples is to be in accordance with CON3.T110.

**RE-TESTS**

**CON3.T410.8 REQUIREMENTS FOR BAR REINFORCEMENT**
Non-compliance:
1. If the result of any test for bar reinforcement does not comply with the specified requirements for the property, provide additional test specimens from the same batch for additional tests for the property in accordance with CS2:2012. The number of additional specimens must be as stated in CS2:2012.

**CON3.T420.A REQUIREMENTS FOR FABRIC REINFORCEMENT**
Non-compliance:
1. If the result of any test for fabric reinforcement for elongation, tensile strength, bending, rebending, unit mass, pitch dimension and surface geometry does not comply with the specified requirements for the property, provide additional samples from the same batch for additional tests for the property. The number of additional samples is the total number of samples taken in accordance with CON3.T110 and each additional sample shall comprise 2 pieces of 1200 mm x 1200 mm fabric reinforcement;
2. Test in accordance with the following:
   a. Number of tests on each additional sample of fabric reinforcement in accordance with the following table:

<table>
<thead>
<tr>
<th>Description</th>
<th>Tensile</th>
<th>Bend</th>
<th>Rebend</th>
<th>Unit Mass</th>
<th>Pitch Dimension</th>
<th>Surface Geometry</th>
</tr>
</thead>
<tbody>
<tr>
<td>Steel fabric</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>- fabric sheet</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>2</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>- longitudinal wire</td>
<td>2</td>
<td>-</td>
<td>2</td>
<td>-</td>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>- transverse wire</td>
<td>2</td>
<td>-</td>
<td>2</td>
<td>-</td>
<td>2</td>
<td>2</td>
</tr>
</tbody>
</table>

**CON3.T430.8 STANDARD FOR REJECTION**
The batch or lot of reinforcement is considered as not complying with the specified requirements for any particular property if the result of any additional test does not comply with the specified requirements for that property, then:
1. The non-complying batch of bar reinforcement or lot of fabric reinforcement shall be removed from Site;
2. The non-complying batch of fabric reinforcement in the factory/stockholder's yard shall not be delivered to Site.
EPOXY COATED REINFORCEMENT

CON3.T440.8 ADDITIONAL TEST SPECIMENS FOR EPOXY COATING TEST FOR EACH BATCH
1. Provide and cut 2 test specimens each two metre length from each batch of reinforcement, as directed by CM for epoxy coating tests;
2. Cut each specimen at least 1 m from the ends of a 12 m length bar and select test specimens from different bundles of the reinforcement batch.

CON3.T450.8 TESTING OF THE EPOXY COATING
The DTC shall carry out thickness, adhesion and continuity tests on each additional test specimen as selected in accordance with CON3.T440:
1. Perform the tests in accordance with the following Standards:
   a. Adhesion and continuity tests: to BS 7295:Part 1:1990 with 180° bend test replaced by 90°;
   b. Thickness test for bars of 12 mm diameter or below: to Method No. 6Aa of BS 3900:Part C5:1992;
   c. Thickness test for bars of 16 mm diameter or above to: Method No. 6Aa or No. 6Ab of BS 3900:Part C5:1992.
2. Carry out tests on specimens within a temperature range of between 5 degree Celsius and 30 degree Celsius;
3. Take 5 pairs of readings along two opposite sides of each specimen for thickness test (a total of ten recorded measurements per bar). A single recorded thickness measurement is the average of three individual reading obtained in between the ribs of three consecutive deformations;
4. Perform two bend tests for adhesion at a uniform rate within 15 seconds.

CON3.T460.8 COMPLIANCE CRITERIA FOR EPOXY COATINGS TO REINFORCEMENT
Results of tests for thickness, adhesion and continuity for epoxy coatings to reinforcement to comply with the following requirements:
1. All coating thickness measured from the 2 specimens not less than 0.13 mm. The average of the recorded thickness measurements of coating not less than 0.18 mm and not exceed 0.30 mm;
2. Cracking or debonding of the coating not visible to the unaided eye on any part of the bent bar;

CON3.T470.8 NON-COMPLIANCE FOR THICKNESS, ADHESION AND CONTINUITY TESTS
1. Retests of specimens of the same batch are permitted if one test specimen fails to meet the coating thickness, coating adhesion or coating continuity requirements;
2. Take two further specimens from the same batch for the test or tests in which the original specimens failed;
3. The batch is deemed to comply with the specification if both additional specimens pass the retests;
4. The batch is deemed not to comply with the specification if either or both specimens fails in the retests;
5. Reject and remove the non-complying batch from Site.
**CON3.T480.8 TIME REQUIRED FOR TESTING OF THE EPOXY COATED REINFORCEMENT**

1. Allow minimum 20 working days for the availability of test results after delivery of the test specimens to the DTC;
2. Do not use the epoxy coated reinforcement until the relevant test specimens have passed all tests.

**MECHANICAL COUPLER**

**CON3.T510.8 RATE OF SAMPLING**

Provide test specimens, each with two reinforcing bars of the relevant diameter either threaded or grouted in sleeve in accordance with the manufacturer’s recommended assembly method, from each batch for testing by DTC as follows;

1. For Type 1 mechanical coupler:

<table>
<thead>
<tr>
<th>Size of batch (No.)</th>
<th>Minimum number of test specimens per batch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 100</td>
<td>3</td>
</tr>
<tr>
<td>100 – 500</td>
<td>6</td>
</tr>
<tr>
<td>Exceeding 500</td>
<td>9</td>
</tr>
</tbody>
</table>

2. For Type 2 mechanical coupler:

<table>
<thead>
<tr>
<th>Size of batch (No.)</th>
<th>Minimum number of test specimens per batch</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Tests as per clause 3.2.8.4 (b), (c) &amp; (d) of the CoP for Structural Use of Concrete 2013 (per test)</td>
</tr>
<tr>
<td>Less than 100</td>
<td>5</td>
</tr>
<tr>
<td>100-500</td>
<td>6</td>
</tr>
<tr>
<td>Exceeding 500</td>
<td>9</td>
</tr>
</tbody>
</table>

**CON3.T520.8 METHOD OF TESTING**

The testing for splicing assemblies of Type 1 and Type 2 mechanical couplers shall be in accordance with the Code of Practice for Structural Use of Concrete 2013 published by the Buildings Department.

**CON3.T530.8 COMPLIANCE CRITERIA**

1. A batch of Type 1 mechanical coupler is deemed to comply with the specification if the test results of all the splicing assemblies meet the requirements of clause 3.2.8.3 of the Code of Practice for Structural Use of Concrete 2013;
2. A batch of Type 2 mechanical coupler is deemed to comply with the specification if the test results of all the splicing assemblies meet the requirements of clause 3.2.8.4 of the Code of Practice for Structural Use of Concrete 2013;
3. For Type 2 mechanical coupler, if any one of the tests as specified in sub-clause (2) above cannot be completed due to the reinforcement breakage with the testing load below 125% of the characteristic yield strength of the reinforcement, disregard the test result and provide another test specimen for repetition of that particular test;
4. For Type 2 mechanical coupler, further repetition of tests may be carried out if there is subsequent failure with reinforcement breakage at below 125% of the characteristic yield strength of the reinforcement;

5. Any non-complying batch is to be removed from Site.

**CON3.T540.8**  
**TIME REQUIRED FOR TESTING**

1. Allow minimum 15 days for the availability of test results after delivery of the test specimens to the DTC;

2. Allow extra time for carrying out repetition of tests as mentioned in sub-clauses (3) and (4) of **CON3.T530**;

3. Do not use the batch of mechanical couplers until the relevant test specimens have passed all tests.
CON4 PRECAST CONCRETE

DESIGN

DESIGN PARAMETERS

CON4.D010.8 PRECAST CONCRETE
1. Design in accordance with this Worksection and Worksection CON1;
2. Where any ambiguity, discrepancy or conflict arises between this Worksection and any clauses in any other Worksections of this Specification, ensure that the provisions of this Worksection prevail.

CON4.D020.8 STRUCTURAL JOINT DESIGN
Design structural joints between precast concrete units and insitu concrete to transmit the worst anticipated combination of moment, shear, axial force, temperature stresses, shrinkage, creep and torsion in accordance with Worksection CON1 unless specified otherwise.

CON4.D030.8 STEEL LIFTING FRAMES
Design and construct steel lifting frames in accordance with the Code of Practice for the Structural Use of Steel 2011 issued by the Buildings Department.

CON4.D040.8 LIFTING POINTS
Submit for Approval the proposed positions of lifting holes and/or points of attachment of lifting slings to precast concrete units if not shown on the Drawings.

DRAWINGS AND CALCULATIONS

CON4.D110.8 GENERAL
All drawings and calculations relating to the structural design must be prepared and signed by a Registered Structural Engineer who is registered under the Buildings Department.

DESIGN SUBMISSIONS

CON4.D210.8 GENERAL

CON4.D220.8 PROGRAMME FOR SUBMISSIONS
Agree a programme for all submissions during the Contract with the CM prior to the notified date for commencement of Works.

CON4.D230.8 SHOP DRAWINGS
Unless otherwise agreed, submit five sets of fully dimensioned shop drawings for Approval in accordance with CON4.D220.
JOINTS

CON4.D310.8 JOINTS
For application of back-up materials, bond breakers and sealants, see Worksection WAT5.

CON4.D320.8 GASKETS
Gasket may be used in weatherproofing joint provided that:
1. The joint is horizontal; and
2. The gasket is always under compression.

CON4.D330.8 MORTAR STOPS
Use backing rods or other Approved method as mortar stops in grouting panel joints when necessary.

WEATHERPROOF JOINTS

CON4.D410.8 JOINT DESIGN
Design weatherproof external joints to ensure airtightness and watertightness and in accordance with BS 6093:1993.

CON4.D420.8 TYPES OF JOINT
Use weatherproof joints of one of the following types and in accordance with BS 6093:1993:
1. Sealed joint (one-stage joint);
2. Drained joint (two-stage joint).

CON4.D430.8 DESIGN WIDTH OF JOINTS
Design the joint width in accordance with BS 6093:1993 and BS 6213:1982.

CON4.D440.8 CONTRACTOR'S RESPONSIBILITY
Approval of the proposed jointing system including the weatherproofing materials does not relieve the Contractor from any liability on the performance of the joints.

MODIFICATIONS TO THE BUILDING STRUCTURE

CON4.D510.8 CONTRACTOR'S RESPONSIBILITY
The Contractor's responsibility for the design of his proposed modification is covered under GCC Clauses 5.15 and 11.8 and the Appendix E to the Specification.

CON4.D520.8 COMPLIANCE WITH GUIDELINES AND REGULATIONS
Any proposed structural modifications must comply with the following:
1. The relevant structural design guidelines published by the Housing Department and included as Appendix E to this Specification; and
2. The Regulations currently in use.

CON4.D530.8 REINFORCEMENT CHANGES
Obtain CM's approval for any proposed changes to reinforcement details, as shown on the Drawings, required to suit the proposed method of casting and installation.
MATERIALS

GENERAL

CON4.M010.8 SUBSTITUTION OF NON-STRUCTURAL CONCRETE
Submission requirements:
1. Submit for Approval any proposal to substitute non-structural in-situ concrete or non-structural partitions, excluding panel wall partitions, with precast concrete.

CON4.M020.8 PRECAST CONCRETE
Where precast work is proposed and Approved, comply with the relevant provisions of:
1. Worksection CON1;
2. Worksection CON2 or FOR; and
3. Worksection CON3.

CON4.M030.8 PRECAST CONCRETE COMPONENTS
See Worksection CON7.

CON4.M040.8 OFF-SITE MANUFACTURE
Obtain Approval for off-site manufacture. For precast concrete components, see CON7.D010.

SUBMISSIONS

CON4.M110.8 GENERAL
Submit the following details for Approval:
1. Drawings, calculations and any other information indicating the location and/or element of precast concrete and any changes resulting from the use of precast concrete;
2. Calculations which show all loading imposed on the precast concrete due to lifting, handling, stacking, shock or any other reason, complies with the relevant British Standards, unless specified otherwise;
3. A method for identifying and recording the daily production of precast concrete units and their final position after installation;
4. The joints required between the proposed precast concrete and in-situ concrete;
5. Drawings and calculations of lifting frames for precast units where specified.

CON4.M120.8 REINFORCEMENT CHANGES
Obtain prior Approval for any proposed changes to reinforcement details, as shown on the Drawings and/or to the bar bending schedules, required to suit the proposed method of casting and installation.

CONCRETE GRADE

CON4.M210.8 CONCRETE FOR LINTELS
Cast precast lintels in concrete Grade 35/20, unless otherwise specified.
CON4.M220.8  CONCRETE FOR STAIRS
Cast precast stairs in concrete Grade 35/20, unless otherwise specified.

CON4.M222.8  CONCRETE FOR REFUSE CHUTE
Cast precast refuse chute in concrete Grade 35/20, unless otherwise specified.

NON-SHRINK GROUT FOR PRECAST STAIRS

CON4.M230.8  APPROVED MIX
For non-shrink grout, the submitted grout mix shall have the specified characteristic as stated in CON4.M260. Submit samples of non-shrink grout for carrying out the tests as stated in CON4.M260 by the Direct Testing Contractor for Approval.

CON4.M240.8  CONSTITUENT MATERIALS OF NON-SHRINK GROUT
To be a pre-packaged cement base product which contains Portland cement, selected sand and non-shrink additives.

CON4.M250.8  WATER/POWDER RATIO OR WATER CONTENT
For pre-packaged non-shrink grout product, comply with the manufacturer's recommendations.

CON4.M260.8  NON-SHRINK GROUT
Quality requirements:
1. To be pre-packaged cement based product which contains Portland cement, selected sand and non-shrink additives with the following required properties:
   a. A 28 days strength equal to or higher than the grade of the adjoining structures. The compressive strength shall be determined by compressive strength test as CON4.T080;
   b. Chloride content of grout shall not exceed 0.1% by mass of the cement. Submit documentary evidence that the summation of chloride contents of constituent materials complies with the aforesaid requirement;
   c. Setting time of the non-shrink grout when tested in accordance with ASTM C953 - 87(97) shall be greater than 1 hour for initial set and be less than 24 hours for final set;
   d. Free expansion within 24 hours shall be of maximum 4% when measured in accordance with ASTM C827 - 95a(97). Expansion between 3 to 28 days when measured in accordance with ASTM C1090 - 96 shall be between 0% to 0.4%.

CON4.M270.8  CONCRETE WITH NON-SHRINK ADDITIVES
Submit for Approval and:
1. Maximum aggregate size: 10 mm;
2. Grade strength: a 28 days strength equal to or higher than the grade strength of the adjoining structure;
3. To comply with the manufacturer's recommendations on non-shrink additives;
4. Do not contain chlorides.

WEATHER PROOF JOINTS

CON4.M310.8  GENERAL
Weatherproofing materials to comply with BS 6093:1993 and subject to Approval.

WORKMANSHIP

CASTING PRECAST UNITS

CON4.W005.8 QUALITY SYSTEMS AND QUALIFIED SUPERVISION
Comply with CON7.W010 to CON7.W120 and relevant provisions of Worksection CON7 on quality systems and qualified supervision for precast works.

CON4.W010.8 PLACING CONCRETE
Cast precast concrete in a single pour unless otherwise Approved.

CASTING LINTELS

CON4.W110.8 GENERAL
Except where unusual or exceptional loading conditions apply or specified elsewhere, construct lintels as shown below:

<table>
<thead>
<tr>
<th>Clear Span (metres)</th>
<th>Depth of Lintel (mm)</th>
<th>No. and diameter of mild steel bars per 105 mm (or part) in width</th>

</tr>
</tbody>
</table>

CON4.W120.8 COVER TO REINFORCEMENT
Unless otherwise specified, provide 25 mm minimum concrete cover to steel bar reinforcement.

CON4.W130.8 BEARING ALLOWANCE
Unless otherwise specified, allow for a minimum bearing of 150 mm over its full width at each end.

CASTING STAIRS

CON4.W210.8 CONSTRUCTION
Construct stairs in accordance with details given on the Drawing.

CON4.W220.8 FORMWORK
As CON2.W920, unless otherwise specified.

CURING

CON4.W310.8 GENERAL
Cure concrete in accordance with CON1.W1410 to CON1.W1490, unless otherwise Approved.
CON4.W320.8  OTHER CURING METHODS
Carry out a full scale trial, where curing methods other than those specified in CON4.W310 are proposed, to demonstrate satisfactory performance. Obtain Approval before precast concrete work commences.

STORAGE, TRANSPORTATION AND LIFTING OF UNITS

CON4.W410.8  STRENGTH OF UNITS
Unless otherwise specified, do not lift precast units for at least 24 hours after casting or until the concrete has attained a strength adequate to resist the resultant stresses without inducing cracking or other damage to the concrete.

CON4.W420.8  STORING UNITS
1. For superstructure works:
   a. Store units on a levelled, well-drained and maintained hard-standing ground which will not result in damage, contamination or injury to others, and separate using Approved methods. Store different types of precast units separately. Protect as necessary from the weather and from staining;
2. For works other than that in sub-clause (1):
   a. Store units on a clean, firm base and separate using Approved methods. Store different types of precast units separately. Protect as necessary from the weather and from staining.

CON4.W430.8  DAMAGED UNITS
Replace or repair all units damaged by handling, hoisting into position or during transporting.

ERECTING PRECAST UNITS

CON4.W510.8  STANDARD AND SEQUENCE
Erect precast units in accordance with BS 5531:1988 and in an Approved sequence.

CON4.W520.8  TEMPORARY BRACING
Provide temporary bracing to units where appropriate.

CON4.W530.8  DOWEL FIXINGS FOR PRECAST STAIRS
Locate box cutouts of precast stairs over cast-in dowel bars and fill with non-shrink grout.

CON4.W540.8  BEDDING AND JOINTING PRECAST STAIRS
Bed and joint precast stairs in non-shrink grout or cement mortar where shown on Drawings.

ACCURACY AND TOLERANCES

CON4.W610.A  GENERAL
1. Refer to:
   a. Code of Practice for Precast Concrete Construction 2016 published by the BD;
   b. Appendix H "Schedule of Tolerances" to this Specification.
2. Where any ambiguity, discrepancy or conflict arises between sub-clauses (1)(a) and (1)(b) above, the provisions given in Appendix H shall prevail.

IDENTIFICATION FOR PRECAST UNITS

CON4.W710.8 IDENTIFICATIONS AND RECORDS
Submit a method for identifying and recording the daily production of precast concrete units and their final position after installation.

DEFECTS

CON4.W810.8 MINOR CHIPPING
Subject to Approval, carry out repairs to minor chipping only by patching up after installation.

CON4.W820.8 OTHER REPAIRS
For repairs to other damaged units, carry out any repair work to the satisfaction of the CM.
TESTING

SAMPLING AND TESTING

CON4.T010.8 FULL SCALE MOCK UP
Where required by the CM, provide full scale mock up to demonstrate the precast units and the system of joints proposed as detailed in the Project Specific Specification, all to the satisfaction of the CM.

CON4.T020.8 WATERTIGHTNESS TEST
Before Approval to use precast concrete as CON4.M110, carry out watertightness test on the mock up on the precast unit of a particular type, with the jointing system in place.

CON4.T030.8 SAMPLING FOR WATERTIGHTNESS TEST
Testing samples:
1. Carry out full scale watertightness test on the precast unit of a particular type, with the jointing system in place, at the rate of 0.5% or each type proposed or one precast unit, whichever is the greater.

CON4.T040.8 AGREED TEST PROCEDURES
Test with a water pressure, duration, frequency and procedure as agreed by the CM.

CON4.T050.8 CRITERIA FOR FAILURE
The precast units and joints will be deemed failures if any sign of water seeping through the joints or the body of the cast unit, including signs of damp patches, is observed during the test.

CON4.T060.8 REMEDIAL ACTION
Non-compliance:
1. Upon failure of the watertightness test as CON4.T050:
   a. Remove the precast unit and scrape out all jointing materials;
   b. Redesign the precast unit or the jointing system, if the CM considers appropriate; and
   c. Reconstruct and retest as directed by the CM.

CON4.T070.8 TESTING OF NON-SHRINK GROUT
Testing method and testing samples:
1. Test grout in accordance with CS1:2010 as follows:
   a. Provide one sample for each grout mix from every 10 batches of grout or every 10 m³ of grout produced in a day, whichever is the lesser. At least one sample shall be provided for each grout mix produced on any one day or less than 10m³ of grout produced. For the purpose of this clause, a batch of grout is any quantity of grout produced in one cycle of operations of a mixer;
   b. Each sample provided in sub-clause (1)(a) above shall not be taken at a time more than one hour after the grout is mixed and shall be protected from weather before test cubes are made.

CON4.T080.8 COMpressive STRENGTH Test FOR NON-SHRINK GROUT
1. The DTC shall prepare two grout cubes of 100 mm size from each sample, cure and test the grout cubes for crushing strength at 28 days in accordance with CS1:2010;
2. The average of the crushing strengths of the two grout cubes shall be taken as the test result. The compliance criteria C1 and C2 shall be adopted as appropriate for assessing compliance requirements stipulated in CON1.T640 and CON1.T660;

3. The test result shall comply with the following requirements:
   a. Individual test results: comply with the requirement given in Column A of the Table specified in CON1.T650;
   b. Average strength determined from any group of four consecutive test results: comply with the requirement given in Column B of the Table specified in CON1.T650. Where there are less than four available test results, treat the average of the first two or first three consecutive test results in the same manner as groups of four consecutive test results.

4. If the difference between the compressive strengths of two grout cubes made from one sample of grout mix exceeds 15% but does not exceed 20% of the test result:
   a. Use the higher of the compressive strengths of the two grout cubes to assess compliance as stated in sub-clause (3)(a) above; and
   b. Do not use the test results for that sample to assess compliance as set out in sub-clause (3)(b) above nor to calculate the standard deviation.

5. If the difference between the compressive strengths of two grout cubes made from one sample of grout mix exceeds 20% of the test result:
   a. Discard the test result for that sample; and
   b. Propose investigation for Approval to establish if the grout represented by the sample is acceptable or not.

TESTING FIXINGS

CON4.T110.8 TENSILE TESTING
Testing method:

CON4.T120.8 SHEAR TESTING
Testing method:
CON5 PRECAST FACADE UNITS (CONTRACTOR'S DESIGN)

DESIGN

GENERAL

CON5.D010.8 RELEVANCE OF OTHER SPECIFICATION WORKSECTIONS
1. Design and construct precast facades in accordance with this Worksection and with the relevant provisions of the following Worksections:
   a. CON1, Insitu Concrete;
   b. CON2, Formwork;
   c. CON3, Reinforcement;
   d. CON4, Precast Concrete;
   e. COM11, Radio Frequency Identification and Web-Based Database System for Building Components.
2. Where any ambiguity, discrepancy or conflict arises between this Worksection, and any clauses in any other Worksections of this Specification, ensure that the provisions of this Worksection prevail.

CON5.D020.8 STANDARD
Comply particularly with CON1.M010.

SCOPE OF THE WORK

GENERAL

CON5.D110.8
1. Refer to the Drawings for the definition of the extent of the precast facades including window installation;
2. For off-Site casting, coordinate with the precast facade supplier for the installation of windows, pre-formed holes, surface finishes, earthing lugs as shown on the Drawings;
3. Include the following with the precast facades delivered to or fabricated on Site:
   a. Precast concrete panel as shown on the Drawings;
   b. Aluminium or uPVC window obtained from a supplier approved by the CM;
   c. Pre-formed holes for the installation of drainage pipes;
   d. Earthing lugs as shown on the Drawings;
   e. Concealed electrical PVC conduit system installations as shown on Drawings and as specified;
   f. A certificate indicating the date of casting;
   g. Work completion certificate for pre-installed electrical conduit system installation;
   h. Embed Radio Frequency Identification tag as specified.
INSITU CONCRETE ELEMENTS INCLUDED

In addition to the precast elements shown on the Drawings, any insitu facades at F1 and roof-minus-one floors and any other floor indicated as such on the Drawings, designed and cast as insitu concrete, also form part of the whole precast facade system. For such insitu facade elements, comply with Worksections CON1, CON2, CON3 and CON6 of this Specification and those provisions of this Worksection as may apply to insitu facades.

SCOPE OF THE DESIGN

Include the following in the scope of the design of the precast facade system:
1. The structural design of the facade units to the dimensions shown on the Drawings;
2. The design of the structural connections by which the facade units are joined monolithically with the building structure;
3. The design of one-stage weatherproof joints between the facade units and the building structure;
4. The design of the connection to the supporting system for the air conditioning unit as shown on the Drawings, (maximum net weight 100 kg);
5. The design of the fixing of the windows to the openings;
6. The design of electrical conduit system installation.

DESIGN PARAMETERS

GENERAL

Design the facade units generally as a one-piece design.

MINIMUM THICKNESSES

Design each facade unit with the line of the inner side of the unit fixed as shown on the Drawings and:
1. With a general minimum thickness of not less than 150 mm;
2. With the thickness of the ledge for the air conditioning hood not less than 125 mm.

OVERHANG AT BASE OF UNITS

Incorporate a 575 mm overhang at the base of each facade unit designed monolithically with the wall of that facade unit.

WINDOW OPENINGS

Design openings for windows in the facade unit:
1. To the dimensions shown on the Drawings;
2. Restrained at the top with a beam and at either side with a wall or a post.

LOADINGS

Design facade units to sustain all possible loadings acting upon the units. In particular, take the following loading conditions into account:
1. Dead loads and superimposed loads;
2. Wind loads in accordance with the Code of Practice on Wind Effects in Hong Kong 2004 issued by the Buildings Department except that the total pressure coefficient (Cp) is 1.4;
3. Eccentric loads which arise either as a result of the centre of gravity of the facade units being offset from the support or from random inaccuracies occurring during construction. Allow a minimum of 25 mm eccentricity in the design for such random inaccuracies;
4. Tensile loads if the facade units are designed to be hung from the top or from the sides;
5. Buckling loads if the facade units are subject to vertical compression;
6. Temperature stresses;
7. Temporary loads which arise during demoulding, storage, lifting, transporting and erection of the facade units. In particular, design for the complex stresses arising out of lifting from stacked position into lifting position.

CON5.D260.8 MINIMUM CONCRETE GRADE
For facade units: Grade 35/20.

CON5.D270.8 CONCRETE COVER TO REINFORCEMENT
Minimum cover to reinforcing bars in facade units:
1. External face: 30 mm;
2. Internal face: 25 mm.

CON5.D280.A LIFTING AND LOCATING DEVICES
1. Design lifting and location devices for embedding or fixing to the facade units in accordance with the Code of Practice for Precast Concrete Construction 2016 issued by the BD;
2. Allow a minimum safety factor of 4 for lifting inserts under normal circumstances;
3. Check and make necessary provisions in the facade units to prevent local rupture or cracking as a result of using lifting and locating devices.

CON5.D290.8 LOCATION POINTS
1. Make provision on each facade unit for locating, plumbing and levelling to the designed location within acceptable tolerance limits;
2. Include details of location points as part of the submission under sub-clause (7) of CON5.D860.

CON5.D300.8 PERMANENT CONNECTIONS
Design permanent structural connections using one, or a combination of both, of the following methods:
1. Insitu connection by which the facade units are joined monolithically with the building structure;
2. Mechanical connections by which the facade units are secured to the building structure at attachment points using brackets, cleats and fixings.

CON5.D310.8 ERECTION RESTRAINTS
1. Design vertical and horizontal restraints for temporary connections of the facade units to the main structure such that displacement of the facade unit cannot occur before making the permanent structural connection;
2. Design horizontal restraint to resist a minimum horizontal live load of ± 0.5 kN/m run acting at 1.5 m from the base of the facade unit.

CON5.D320.8 ADJUSTMENT DEVICES
1. Provide the facade units with separate vertical and horizontal adjustment devices;
2. Do not use adjustment devices in the vertical plane for horizontal location devices or horizontal restraint and do not design such devices to take any permanent shear (horizontal) loads;
3. Do not design any adjustment devices in the horizontal plane to take permanent vertical loads.
STRUCTURAL SUPPORT

1. Design the facade units at each floor to derive their support from the building structure at the same floor via the specified permanent structural connections;
2. Do not allow any permanent loading from the facade units to be transferred to the facade units above or below.

INSITU CONNECTION DESIGN

GENERAL

Design the insitu connection as CON5.D130:
1. To withstand the stresses induced by the facade units described in CON5.D250, sub-clauses (1) to (6);
2. To be watertight;
3. In concrete of the same grade as that for the precast units.

REINFORCEMENT, SHEAR CONNECTORS ETC

Ensure reinforcement, shear connectors, etc used for the insitu connection design are adequately embedded or anchored into the building structure.

VERTICAL CONNECTIONS

For vertical insitu connections:
1. If the minimum dimension of the void to be in filled is more than 150 mm, use non-shrink grout or concrete with non-shrinking additives;
2. If the minimum dimension of the void is less than 150 mm, use only non-shrink grout.

HORIZONTAL CONNECTIONS

Concrete with non-shrinking additives may be permitted for horizontal insitu connections, in lieu of non-shrink grout, subject to the provisions of CON5.M050.

MECHANICAL CONNECTIONS

GENERAL

Design the mechanical connections referred to in sub-clause (2) of CON5.D130 to withstand the stresses transmitted by the facade units to the building structure, described in CON5.D250 sub-clauses (1) to (6), in one of the following two groups:
1. Tying back fixing;
2. Location fixing.

LOAD BEARING FIXINGS

Adopt load bearing fixing where the facade unit is designed to bear upon the building structure. Design the fixing so that the supporting area is adequate to carry the weight of the facade unit.

TYING BACK FIXINGS

Adopt tying back fixing for securing the facade units into position. Design the fixing and the facade units to sustain the forces due to the restraint of the relative movement between the facade units and the building structure including movements caused by the effect of temperature, moisture movement, shrinkage and creep based on Hong Kong conditions.
LOCATION FIXINGS
Adopt location fixing for positioning and levelling the facade unit before it is connected. Allow for all handling and positioning loads.

TYPES OF ATTACHMENT TO STRUCTURE
1. Fix the facade units to the building structure by one of the following methods:
   a. Cast in anchorages (Type A);
   b. Grouted in dowel bars (Type B);
   c. Expanding anchorages (Type C).
2. Comply with CON5.D530 to CON5.D540 for Type A and B anchorages;
3. For Type C anchorages, submit manufacturer's certificates and conduct pull out tests to check compliance with manufacturer's recommendations;
4. Submit for Approval any proposed alternative anchorage methods.

LINKS BETWEEN ANCHORAGES
Angle cleats may be used to form the link between anchorages. Assembly adjustments may be made in three dimensions using horizontal and vertical slotted holes. Submit for Approval any proposed alternative devices to link between anchorages.

CONCEALMENT OF FIXINGS
Conceal all permanent fixing connections by Approved methods.

RESISTANCE TO CORROSION
All metal parts of connections must either be:
1. Corrosion resistant, being constructed of non-ferrous metal or stainless steel but avoiding any contact of such materials with the reinforcement; or
2. Protected against corrosion by an Approved method.

WEATHERPROOF JOINTS

GENERAL
Design weatherproof joints between the facade units and the structure or between two adjacent facade units to ensure air and water tightness and in accordance with BS 6093:1993 and include joint seals in accordance with CON5.M110 and CON5.M120.

TYPES OF JOINT
Use weatherproof joints of one of the following types:
1. Sealed joint (one-stage joint);
2. Drained joint (two-stage joint).

DESIGN WIDTH OF JOINTS
Design the joint width in accordance with BS 6093:1993 and BS 6213:1982.

COMBINATIONS OF JOINT TYPE AND STRUCTURAL CONNECTIONS
Use only the following combinations of weatherproof joint and permanent structural connection in the design of the precast facades:
1. Either one-stage or two-stage weatherproof joint with insitu connections specified in CON5.D300 (1);
2. Two-stage weatherproof joint with mechanical connections specified in CON5.D300 (2).
CONTRACTOR'S RESPONSIBILITY

Approval of the proposed jointing system including the weatherproofing materials does not relieve the Contractor from any liability on the performance of the joints.

MODIFICATIONS TO THE BUILDING STRUCTURE

CONTRACTOR'S RESPONSIBILITY

The Contractor's responsibility for the design of his proposed modification is covered under GCC Clauses 5.15 and 11.8 and the Appendix E to the Specification.

TYPES OF MODIFICATION

Modification to the design of the building structure to accommodate the precast facade design is permitted under the following circumstances subject to detailed submissions and Approval:

1. Modification for constructing the permanent structural connections. Reinforcement may be required to be relocated and/or added to the building structure provided that the resulting reinforcement arrangements produce an equivalent or higher overall design strength to that of the original structure;

2. Modification to incorporate the weatherproof joints. Grooves may be required to be formed provided that the resulting section produces an equivalent or higher overall design strength to that of the original structure.

COMPLIANCE WITH GUIDELINES AND REGULATIONS

Any proposed structural modifications to accommodate the precast facade design must comply with the Regulations currently in use.

WIND LOADINGS

For the purposes of designing for wind, the values and requirements must be not less than those specified in relevant structural design guidelines published by the Housing Department and included as Appendix E to this Specification.

SUBMISSIONS

TENDER DESIGN PROPOSAL

Submit for Approval, full details of tender design proposals including drawings, layouts, details, calculations and any other information required by the CM.

REGISTERED STRUCTURAL ENGINEER

All structural drawings, layouts, details and calculations submitted to the CM, including those submitted with tender, must be prepared and signed by a Registered Structural Engineer registered under Buildings Department of Hong Kong Government.

PROGRAMME FOR SUBMISSIONS

Agree a programme for all submissions during the Contract to the CM prior to the notified date for commencement of Works. Include in the programme, the CM's undertaking to reply to design submissions within the following periods:

1. Initial submission - Within 28 days;
2. Resubmission - Within 14 days.
CON5.D850.8  **SHOP DRAWINGS**
Within two months of the notified date for commencement of the Works, submit five sets of fully dimensioned shop drawings for each type of facade unit, including shop drawings for windows to COM2.D210 and electrical conduit system complete with its accessories, for approval.

CON5.D860.8  **DRAWINGS AND METHOD STATEMENT**
Within two months of the notified date for commencement of the works, submit, for agreement, the following items:
1. Design of moulds, layout arrangements, casting methods (horizontal or vertical), tilting mechanism (if any), demoulding methods and the provision for attachments of openings for window fixing;
2. The complete procedures for fabrication, curing, demoulding, application of finishes, lifting, transporting, storage, erection and installation of weatherproof joints;
3. Method of protecting the facade units from damage at all times;
4. Minimum concrete strength required for the facade units for demoulding, handling, storage, transportation and erection;
5. Position and design of lifting points;
6. Calculated weights of the facade units;
7. The proposed Radio Frequency Identification tag and the fixing method as specified in the Worksection COM11.

CON5.D870.8  **METHOD OF FIXING WINDOWS**
Within two months of the notified date for the commencement of the Works, submit for agreement, the method of fixing window frames or windows before casting of the facade units commences. Obtain either aluminium or uPVC windows from a supplier approved by CM.

CON5.D880.8  **DETAILS OF WEATHERPROOFING**
Within two months of the notified date for the commencement of the Works, submit details of weatherproofing materials in accordance with CON5.M110 and CON5.M120 for Approval, including technical information, samples, test reports and proven performance records of proposed materials.

CON5.D890.8  **QUALITY ASSURANCE SCHEME**
Within two months of the notified date for the commencement of the Works, submit details of the Quality Assurance Scheme for manufacturing the facade units, in accordance with CON5.W030 to CON5.W050 as applicable, for Approval.

CON5.D900.8  **QUALITY CONTROL PROCEDURES**
Within three months from the notified date for commencement of Works, submit for Approval, details of quality control procedures for erection of the facade units in accordance with CON5.W640.

CON5.D910.8  **PROGRAMMES**
Within one month of the notified date for the commencement of the Works, submit, for agreement:
1. When instructed by the CM, the programme for the design and the testing of the trial samples of the facade units;
2. The programme for manufacture of the facade units showing the rate of production for each month and the dates for clearing the area of casting yard and associated plant upon completion of the manufacture of the facade units;
3. The programme for the erection of facade units in accordance with CON5.W610.
CON5.D920.8  LOADING OF INSITU STRUCTURAL MEMBERS
Submit calculations to demonstrate that the insitu structural members are not subject to excessive stresses arising from the erection method of the facade units and to demonstrate the adequacy of any temporary supports which may be required.

SUBMISSIONS FOR PRECASTING

CON5.D1010.8  PRELIMINARY DESIGN
Submit preliminary design of moulds indicating the material to be used, layout arrangements, casting methods (horizontal or vertical), tilting mechanism (if any), demoulding methods of the main and side panels of the moulds and the provision for attachments of openings for window fixing.

CON5.D1020.8  METHOD STATEMENTS
Submit a method statement:
1. Describing the complete procedures for fabrication, curing, demoulding, application of finishes, lifting, transporting, storage, erection including fixing, grouting and installation of weatherproof joints;
2. Designed to ensure the dimensional accuracy both of the facade units and the structural elements adjoining them.

CON5.D1030.8  CASTING FACILITIES
Submit for Approval in accordance with CON5.W010.

CON5.D1040.8  PRELIMINARY PROGRAMME
Submit a preliminary programme for the design, manufacture, erection, testing and full size trial samples of the facade units including dates for clearing the area of any on-Site casting yard and associated plant upon completion of manufacture of the facade units.
MATERIALS

NON-SHRINK GROUT AND CONCRETE

CON5.M010.8 APPROVED MIX
For non-shrink grout, the submitted grout mix shall have the specified characteristic as stated in CON5.M040. Submit samples of non-shrink grout for carrying out the tests as stated in CON5.M040 by the Approved testing laboratory.

CON5.M020.8 CONSTITUENT MATERIALS OF NON-SHRINK GROUT
To be a pre-packaged cement base product which contains Portland cement, selected sand and non-shrink additives.

CON5.M030.8 WATER/POWDER RATIO OR WATER CONTENT
For pre-packaged non-shrink grout product, comply with the manufacturer's recommendations.

CON5.M040.8 NON-SHRINK GROUT
Quality requirements:
1. To be pre-packaged cement base product with the following required properties:
   a. A 28 days strength equal to or higher than the grade of the adjoining structures. The compressive strength shall be determined by compressive strength test as CON5.T260;
   b. Chloride content of grout shall not exceed 0.1% by mass of the cement. Submit documentary evidence that the summation of chloride contents of constituent materials complies with the aforesaid requirement;
   c. Setting time of the non-shrink grout when tested in accordance with ASTM C953 - 87(97) shall be greater than 1 hour for initial set and be less than 24 hours for final set;
   d. Free expansion within 24 hours shall be of maximum 4% when measured in accordance with ASTM C827 - 95a(97). Expansion between 3 to 28 days when measured in accordance with ASTM C1090 - 96 shall be between 0% to 0.4%.

CON5.M050.8 CONCRETE WITH NON-SHRINK ADDITIVES
Submit for Approval and:
1. Maximum aggregate size: 10 mm;
2. Grade strength: a 28 days strength equal to or higher than the grade strength of the adjoining structure;
3. To comply with the manufacturer's recommendations on non-shrink additives;
4. Do not contain chlorides.

WEATHERPROOFING

CON5.M110.8 GENERAL
Quality requirements:
1. Weatherproofing materials to comply with BS 6093:1993 and subject to Approval.

CON5.M120.8 SEALANTS
As shown or scheduled on the Drawings as WAT5.M180.
PRECAST FACADE UNITS (CONTRACTOR'S...... CON5 > MATERIALS

CON5.M130.8 MORTAR STOP BACKING RODS
Polyethylene foam or other Approved.

CONDUIT SYSTEM

CON5.M210.8 STANDARDS
1. For rigid plain polyvinyl chloride (PVC) conduits, conduit fittings and PVC boxes, comply with the following British Standards:

<table>
<thead>
<tr>
<th>Conduits and Fittings</th>
<th>British Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>PVC conduits:</td>
<td>BS 6099:Section 2.2:1982(1988)</td>
</tr>
</tbody>
</table>

2. Ensure that all PVC conduits, fittings and boxes are of the same make.

CON5.M220.8 COLOUR
PVC conduits, fittings and boxes: white in colour.

CON5.M230.8 FLAME RESISTANCE
PVC conduits, fittings and boxes: non-flame-propagating and self-extinguishing.

CON5.M240.8 TEMPERATURE CLASSIFICATION
1. For all PVC conduits, fittings and boxes, comply with the temperature classification of -5 in accordance with BS 6099:Section 2.2:1982(1988);
2. For PVC conduits, where the ambient temperature at the country of manufacture is likely to be below -5ºC, the temperature classification is -25.

RIGID PLAIN PVC CONDUITS

CON5.M310.8 CONSTRUCTION AND SIZE
1. PVC conduits: rigid, plain and of a non-threadable type;
2. Nominal diameter of PVC conduits: within the range of 20 mm to 32 mm unless otherwise specified.

CON5.M320.8 MECHANICAL PROPERTIES
PVC conduits are:
1. Of heavy mechanical strength;

CON5.M330.8 TYPE-TESTING FOR ELECTRICAL PVC CONDUITS
1. Rigid plain PVC conduits shall be type-tested for complete compliance with BS 6099:Section 2.2:1982(1988) by an Independent Accredited Laboratory or an Independent Short-Circuit Testing Organisation;
2. Upon request from CM, provide documentary evidence that the batch/consignment of PVC conduits delivered to Site have satisfied the requirement as stipulated in the relevant British Standards mentioned in sub-clause (1) above.
PVC CONDUIT FITTINGS

CON5.M410.8 CONSTRUCTION
1. Use plain, moulded slip-type couplers and expansion type couplers to BS 4607:Part 5:1982 (1988) in the jointing of conduits;

CON5.M420.8 TYPE-TESTING FOR ELECTRICAL PVC CONDUIT FITTINGS
1. PVC conduit fittings shall be type-tested for complete compliance with the following British Standards by an Independent Accredited Laboratory or an Independent Short-Circuit Testing Organisation:

<table>
<thead>
<tr>
<th>PVC Conduit Fittings</th>
<th>British Standards</th>
</tr>
</thead>
</table>

2. Upon request from CM, provide documentary evidence that the batch/consignment of PVC conduit fittings delivered to Site have satisfied the requirement as stipulated in the relevant British Standards mentioned in sub-clause (1) above.

PVC CIRCULAR CONDUIT BOXES, PVC BOXES FOR ELECTRICAL ACCESSORIES AND PVC ADAPTABLE BOXES

CON5.M510.8 CONSTRUCTION AND DIMENSIONS
1. For PVC boxes and their covers, comply with the relevant British Standard specification listed in CON5.M210;
2. Fit all screw holes with metal inserts. Except for PVC adaptable boxes, provide each box with a brass earthing terminal complete with screw for the connection of circuit protective conductor (CPC);
3. Ceiling-mounted circular conduit boxes: deep pattern type having an internal depth of not less than 60 mm;
4. For extension rings, comply with BS 4607:Part 5:1982 (1988);
5. Mould each PVC box in one piece;

CON5.M520.8 MECHANICAL PROPERTIES
1. For PVC boxes, comply with the requirements for mechanical properties stated in the relevant British Standard specification listed in CON5.M210;
2. PVC adaptable boxes are:
   a. Moulded;
   b. Of sufficient mechanical strength to withstand forces encountered in concealed conduit wiring system application;
   c. Complete with provision for prevention of deformation of the boxes where necessary.
3. Plastic boxes are of:
   a. Dimensions: can be interchangeable with steel boxes;
   b. Wall thickness: 2 mm minimum;
   c. Cover sizes: larger than the adaptable box on each edge by at least 5 mm.
4. Where considerable heat is produced, fit boxes for the suspension of luminaires or other equipment with steel insert clips;

5. Do not use plastic boxes where:
   a. Temperature of the box is likely to exceed 60°C;
   b. The mass suspended from the box exceeds 3 kg.

**CON5.M530.8 TYPE-TESTING FOR ELECTRICAL PVC CONDUIT BOXES**

1. PVC circular conduit boxes, PVC boxes for electrical accessories and PVC adaptable boxes shall be type-tested for complete compliance with the following British Standards by an Independent Accredited Laboratory or an Independent Short-Circuit Testing Organisation:

<table>
<thead>
<tr>
<th>PVC Conduit Boxes</th>
<th>British Standards</th>

</tbody>
</table>

2. Upon request from CM, provide documentary evidence that the batch/consignment of PVC conduit boxes delivered to Site have satisfied the requirement as stipulated in the relevant British Standards mentioned in sub-clause (1) above.
WORKMANSHIP

GENERAL

CON5.W010.8 CASTING YARD

Within one month from the notified date for commencement of the Works, submit for Approval on the following:

1. For on-Site casting:
   a. The location of casting yard for manufacture of precast concrete components;
   b. Details of plant and equipment including the location, boom radii and lifting capacities of cranes, gantry capacities, curing facilities, number of moulds and means of transporting the concrete components within the Site.

2. For off-Site casting:
   a. The name, casting yard address with street maps and job reference of the manufacturer and the following:
      i. Details of organisation structure and top management;
      ii. Self-certified true copy of the business licence of the manufacturer;
      iii. Annual production capacity of the casting yard in terms of concrete volume, numbers of products and the current workload;
      iv. Details of the Quality Assurance Scheme required in CON5.W030;
      v. Details of the audit plan and previous audit report, if any, carried out by the Precast Concrete Construction Auditing Consultant required in CON5.W050;
      vi. Details of compliance with requirements of this specification on batching plant and concrete mixes in accordance with Worksection CON1;
      vii. Test results for quality tests being carried out for the precast concrete components to demonstrate the compliance with requirements of this specification;
      viii. Other details of construction quality as required in CON5.W090 (1).
   b. Scaled and dimensioned layout plan of the casting yard with fenced boundaries showing the office, the production lines for the products including hardstanding and covered casting yards, disposition of steel moulds, vibration plant, handling and lifting plants, steam or hot air curing room / facilities, storage areas for finished products, steel reinforcement storage and bending yards, storage sheds for incoming materials, samples room, batching plant if any, testing laboratory, concrete cubes curing facilities, means of transporting the concrete components to the Site;
   c. The laboratory for carrying out the tests and issuing test certificates shall be approved by the Housing Department, or accredited either by Hong Kong Accreditation Scheme (HKAS) under the Hong Kong Laboratory Accreditation Scheme (HOKLAS), or an equivalent organization which has signed a mutual recognition agreement with HOKLAS. All expenses / costs related to the tests carried out by the laboratory shall be borne by the Contractor.

CON5.W015.8 MANAGEMENT SCHEMES FOR OFF-SITE CASTING

1. Ensure that the casting yards for the off-Site casting of precast concrete components are operating on the following management schemes:
   a. An Environmental Management Scheme certified under ISO 14001;
b. An Occupational Health and Safety Management Scheme certified under OHSAS 18001.

2. Submit the original or certified true copy of the respective certificates for the manufacturing plant within the following time frame:
   a. ISO 14001: At not later than 15 days before the commencement of the production of precast concrete components;
   b. OHSAS 18001: At not later than 12 months from the date of commencement of the Works.

3. When the photocopy of certificate is submitted, it shall be certified by the certification body or by the QCM. The certification body shall be accredited by the Hong Kong Accreditation Service (HKAS), or the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS for the respective certification.

CON5.W020.8 QUALITY ASSURANCE SCHEME FOR OFF-SITE CASTING
Ensure that casting yards for the off-Site casting of units are operating on an Approved Quality Assurance Scheme in accordance with CON5.W030 to CON5.W050.

CON5.W025.8 QUALITY ASSURANCE FOR ON-SITE CASTING
Within two months from the notified date for the commencement of the Works, submit for Approval details of the Quality Assurance Scheme for manufacturing the precast concrete components, in accordance with CON5.W030 to CON5.W040 as applicable.

CON5.W030.8 QUALITY ASSURANCE SCHEME
1. Ensure that the facade units are manufactured under a Quality Assurance Scheme which covers the following items and is certified under ISO 9001:
   a. Quality control tests of materials, including proprietary products such as lifting anchors for handling precast concrete components;
   b. Calibration of laboratory equipment for quality control tests;
   c. Efficiency and proper operation of equipment at the casting yard;
   d. Production process;
   e. Sampling / testing procedures and requirements by an independent Approved laboratory;
   f. Quality control procedures including the frequency and extent of inspection by manufacturer's staff and independent parties;
   g. Regular audits at a minimum frequency of once per month by manufacturer's staff and independent parties.

2. Endorse the Quality Assurance Scheme and submit to the CM for approval at least 15 days before the commencement of the production of precast facade.

CON5.W035.A PRECAST CONCRETE CONSTRUCTION AUDITING CONSULTANT
1. Select a consultant on the Architectural and Associated Consultants Selection Board's (AACS) List of Structural Engineering Consultants (the "List") for CM's approval as the Precast Concrete Construction Auditing Consultant to carry out technical audits at the manufacturer's factory in accordance with the Code of Practice for Precast Concrete Construction 2016 issued by the BD;

2. A Precast Concrete Construction Auditing Consultant on the "List" in sub-clause (1) appointed by the manufacturer may be proposed for Approval;

3. Notify the CM immediately if there is any subsequent change of the Precast Concrete Construction Auditing Consultant during the course of services.
CON5.W040.8 QUALIFIED SUPERVISION
1. Assign a Precast Quality Control Manager (PQCM), with a minimum qualification and experience of a Grade T4 TCP in the civil or structural engineering discipline under the Registered Contractor's stream in the CoPSS, to certify all control documentation or test certificates required for the QA Scheme;

2. Assign a Precast Quality Control Coordinator (PQCC), with a minimum qualification and experience of a Grade T3 TCP under the Registered Contractor's stream in the CoPSS, to provide continuous supervision of the precast concrete production works at the casting yard;

3. Submit the details of the PQCM and the PQCC for Approval. For on-Site casting, it is permissible for the PQCM to be the same person as the QCM and the PQCC to be the same person as the SQCC;

4. Provide attendance to an RSE who is nominated by the CM, to carry out audit checks to the casting yard at least once every month;

5. The Authorized Signatory as stipulated in PRE.B6.060 is to carry out inspection and audit checks to the casting yard at least once every month and submit a monthly audit report to the RSE as stipulated in sub-clause (4) above and then to the CM for endorsement and onward submission to ICU.

CON5.W050.A RECTIFICATION TO QUALITY NON-COMPLIANCE
1. For off-Site casting in CON5.W010 (2), the manufacturer shall be under regular technical audits in a manner as stipulated in CON5.W030 (5) and supervision of the CM or his representatives resident at the manufacturer's factory;

2. The Contractor shall:
   a. Ensure that the manufacturer shall rectify any non-conformance to the Specification revealed by the audit or the supervision of the CM or his representatives resident at manufacturer's factory and if necessary, modify the QA Scheme and temporarily suspend the manufacture of the precast facade panels until the non-conformance is rectified;
   b. Report to the CM of the non-conformance and rectification carried out.

3. Notwithstanding sub-clause (2) above, bear full responsibility to assure that all the precast concrete components delivered to Site comply with the requirements of the Specification at all times.

CON5.W055.8 INSPECTION LOG BOOK
1. Record the following in an inspection log book:
   a. The names and qualifications of the supervisory personnel assigned by the CM and by the Contractor as stipulated in CON5.W040;
   b. The details of concrete production, inspection, auditing and testing.

2. Keep the inspection log book in the casting yard and provide a duplicate of the inspection log book on Site for CM's inspection when required.

CON5.W060.8 EQUIPMENT
Ensure casting yards, erected on-Site or off-Site are equipped with all the necessary facilities, including efficient vibration plant, necessary curing facilities, storage, handling and lifting facilities to secure compliance with all the provisions of this Specification.

CON5.W070.8 USE OF CASTING YARD
Do not use any on-Site casting yard for manufacture of any components for other sites. See PRE.B8.010.
CON5.W080.8 SUBMISSION AND PILOT PRODUCTION RUN BEFORE APPROVAL

1. Submission:
   a. Submit the shop drawings, for the production of the precast components for Approval, including any proposed changes to the products so as to suit individual production process / plant;
   b. Use concrete mix for the manufacture of precast components all in accordance with the requirements in Worksection CON1;
   c. Provide relevant information / samples associated with the proposed precast components for Approval including:
      i. Engraved manufacturer’s logo and casting date;
      ii. Printed precast concrete components identity numbers on surface of products;
      iii. Schmidt hammer test certificate and covermeter tests record endorsed by the manufacturer’s Quality Control Personnel;
      iv. Delivery Order / Invoice;
      v. Import and Export Manifests or Bill of Lading.

2. Before obtaining Approval for mass production, carry out a pilot production run with the CM on the proposed manufacturer to demonstrate the technical capability and effectiveness of the Quality Management System;

3. In the pilot production run:
   a. Provide, for each category of products:
      i. One sample with the reinforcement fixed in steel mould for the inspection of workmanship including reinforcement fixing and provision of bar spacers;
      ii. One sample with concrete cast in steel mould for the inspection of conditions of the steel mould, checking of the finished sample.
   b. Carry out trial run to demonstrate the manufacturing process including installation of windows, lifting operation, curing, storage, fixing of mosaic tiles, quality tests at factory laboratory, applied finishes and quality controls in accordance with the required drawings and specification;
   c. Carry out verification check for engraved logo, casting date, identity number, Schmidt hammer test certificate and covermeter tests record, dimensions, size, spacing, position of starter bars and finishes.

4. The pilot production run may not be required, if the following documents are submitted and are acceptable to the CM:
   a. Track records on similar types of precast concrete components supplied by the proposed manufacturer to other HA construction projects, within five years prior to the notified date for commencement of the Works; or
   b. In the absence of the track records, detailed records of the pilot production run for similar types of precast concrete components carried out in other HA construction projects, within five years prior to the notified date for commencement of the Works.

CON5.W090.8 FIRST JOINT INSPECTION AT MANUFACTURER’S FACTORY

1. Prior to mass production, carry out the first joint inspection between the Contractor and the CM at factory for Approval on the minimum standard of the product for all subsequent concrete and the specified finish. Arrange for the transportation and provide all facilities for the first joint inspection;
2. Provide samples, including those samples in CON5.W080 (3)(a) and those accepted samples in previous pilot production run carried out in accordance with CON5.W080, for Approval as being representative of the minimum standard of the product for all subsequent concrete and the specified finish;

3. Maintain accepted facade sample at a minimum of one number, or as directed by the CM, in an area in the factory and do not remove the accepted samples from the area unless otherwise instructed by the CM. Incorporate a further set of samples to the trial panel on Site;

4. Carry out further joint inspections as in CON5.T710.

PRODUCING PRECAST UNITS

CON5.W110.8 MOULDS
1. Construct moulds from steel or other materials to produce a standard suitable for the 'Surface finishes' specified in CON5.W310 to CON5.W350;

2. Construct and maintain moulds so that:
   a. Dismantling and re-assembly of moulds after each casting allows the production of subsequent facade units within permitted tolerance limits;
   b. The positioning of securing components and fixings etc. are within the permitted tolerances;
   c. Adequate stiffness for the control of dimensional tolerances is maintained.

CON5.W120.8 DEFECTIVE MOULDS
Replace any mould which fails to produce facade units within the permitted tolerance limits as specified in Appendix H, the "Schedule of Tolerances", or to the standards of surface finishes as CON5.W310 to CON5.W350.

CON5.W130.8 HORIZONTAL CASTING
Provide moulds designed to facilitate horizontal casting with devices to enable rotation from horizontal to vertical through 90° so that the facade units can be lifted vertically on demoulding.

CON5.W140.8 USE OF RELEASE AGENTS
Apply mould release agent of an Approved type, to the surfaces of moulds either by brush or by spraying before the fixing of steel reinforcement at a rate in accordance with the manufacturer's recommendations.

CON5.W150.8 CONCRETING, COMPACTION AND CURING GENERALLY
See CON1.

CON5.W160.8 EXTERNAL VIBRATORS
Obtain Approval for the use of external vibrators.

CON5.W170.8 CURING BY APPLICATION OF HEAT
Obtain Approval for heat curing by means of steam, hot air, etc. and:
1. Ensure that the total chloride content of the concrete mix for facade units subject to heat curing, is less than 0.1% by weight of that of the cement;
2. Carry out a site trial to demonstrate the adequacy of the proposed method to the satisfaction of the CM.
CON5.W180.8 DEMOULDLING GENERALLY
1. Unless otherwise Approved, do not disturb the facade units within 24 hours of casting;
2. Demould by means of an Approved method and:
   a. Do not use crowbars;
   b. Do not subject the mould to any form of impact.

CON5.W190.8 CONCRETE STRENGTH BEFORE DEMOULDLING
1. Demould the facade units only after concrete has achieved the Approved strength;
2. To determine the concrete strength required for demoulding or handling:
   a. Make the necessary concrete cubes in pairs from the same batch of concrete used for casting the facade units and cure the concrete cubes under the same conditions as the concrete in the facade units;
   b. Specially identify the cubes and do not use them for normal quality control or for compliance testing;
   c. Determine the concrete cube strength by compression test as CON5.T210 and satisfy the CM that the concrete cubes have acquired the required strength before the demoulding or handling the facade units.
3. If Instructed, prepare beam specimens for determination of flexural strength for those facade units that are subject to bending during demoulding and lifting.

CON5.W200.8 IDENTIFICATION AND RECORDS
1. Mark all facade units with date of manufacture and a unique reference number;
2. Record in a master register the dates of casting, the concrete grades and the final locations of all facade units;
3. Update records specified in above sub-clause (2) for all facade units to the RFID Web-Based Database System.

CON5.W210.8 HANDLING INSTRUCTIONS
If the facade units are designed for handling in a particular direction only, make this clear by means of instructions on shop drawings and appropriate markings on the facade units.

CON5.W220.8 REQUIREMENTS OF OTHER TRADES AND COMPONENTS
Incorporate the requirements of all trades such as blockouts, recesses, notches, embedded metal works or any other items before casting the facade units.

CON5.W230.8 WINDOWS FIXING TO FACADE UNITS
Fix window frames / windows complete with or without opening sashes before casting the facade units as specified in COM2 Worksection and:
1. Obtain Approval for the method of fixing window frames / windows;
2. Do not fix window frames / windows into preformed openings after casting;
3. For off-Site casting, coordinate with the PCF and window suppliers approved by the CM.

SURFACE FINISHES

CON5.W310.8 EXTERNAL FACE
Finish outside faces except edges and overhang soffits to give an even textured surface suitable for fixing glazed ceramic tiles by adhesive, or cast the tiles into the mould as required by the Contract.
CON5.W320.8 EDGE AND OVERHANG SOFFIT
Finish top, edge and soffit of overhang to give a smooth untextured surface suitable for applying acrylic paint.

CON5.W330.8 INTERNAL FACE - LIVING / DINING / BEDROOMS
Finish to give:
1. A smooth untextured surface suitable for applying plastic emulsion paint for rental blocks;
2. An even textured surface suitable for receiving internal cement lime plaster for SSF blocks as required by the Contract.

CON5.W340.8 INTERNAL FACE - BATHROOM
Finish to give an even textured surface suitable for fixing glazed ceramic tiles in accordance with FIN5.W210 and FIN5.W220 as appropriate.

CON5.W345.8 INTERNAL FACE - KITCHEN
Finish to give an even textured surface suitable for fixing glazed ceramic tiles in accordance with FIN5.W210 and FIN5.W220 as appropriate.

CON5.W350.8 INTERNAL FACE - UTILITY AREA
Finish to give an even textured surface suitable for fixing glass mosaic tiles by adhesive.

ACCURACY AND TOLERANCES

CON5.W410.A MANUFACTURING AND ERECTION TOLERANCES
1. Refer to:
   a. Code of Practice for Precast Concrete Construction 2016 published by the BD;
   b. Appendix H "Schedule of Tolerances" to this Specification.
2. Where any ambiguity, discrepancy or conflict arises between sub-clauses (1)(a) and (1)(b) above, the provisions given in Appendix H shall prevail.

CON5.W420.8 CHECKING TOLERANCES
Check the manufacturing dimensional tolerances of the facade units by an Approved method at a rate of 1 in every 10 facade units produced and report the result to CM within two days of checking.

CON5.W430.8 DEFECTIVE UNITS
1. Any facade unit that falls outside the tolerance limits is considered defective and must be replaced as instructed. Indelibly mark rejected facade units for identification purposes;
2. In the event of the CM agreeing to accept any defective facade unit, execute all necessary remedial and modification work to the CM's satisfaction.

HANDLING, TRANSPORTATION AND STORAGE

CON5.W510.8 LIFTING FRAME
Lift facade units within the casting yard by means of a purpose-made steel lifting frame designed to the Code of Practice for the Structural Use of Steel 2011 issued by the Buildings Department.
CON5.W520.8 LIFTING INSERTS AND SUPPORTS
Determine exact number, size and location of lifting inserts and proper supports with locations for transportation and storage.

CON5.W522.8 TEMPORARY SUPPORTS FOR TRANSPORTATION AND STORAGE
Determine proper supports with locations for transportation and storage.

CON5.W530.8 INSPECTION
Inspect each facade unit before lifting to ensure that neither damage nor hazard occurs during lifting.

CON5.W540.8 LIFTING
During lifting, keep the facade units vertical and:
1. Ensure that all connections between the lifting frame and lifting points remain vertical as far as possible;
2. Lift the facade units only at appropriate lifting points as shown on the Approved shop drawings;
3. Locate lifting points that the line of the resistant force passes through the centre of gravity of the facade unit.

CON5.W550.8 LIFTING PLANT AND EQUIPMENT
1. Ensure plant used for lifting including cranes, hoists, lifting frames, hooks, etc possess adequate safety margins, are maintained in good working order and are regularly tested. Provide details of plant and maintenance records and current test certificates when required by the CM;
2. Maintain crane rope in a sound condition. Discard all frayed bridle ropes or slings;
3. Notwithstanding sub-clause (1) above, provide test certificates of lifting anchors to the CM in accordance with CON5.T810 to CON5.T850.

CON5.W560.8 STORING UNITS
1. Store the facade units in the vertical plane on a level, well drained and maintained concrete surface and protect against staining or physical damage;
2. Support the facade units by an Approved method to prevent their warping, bowing, chipping or cracking;
3. Store different types of facade units separately;
4. The facade units shall be supported by a device in storage area to prevent toppling. For off-site casting yards, racks shall be used and detailed in the submitted QA scheme.

CON5.W570.8 TRANSPORTING FROM CASTING YARD
Stack facade units vertically on vehicles during transportation from the casting yard and:
1. Support the units on special cradles so that the units are completely protected against damage and adverse stresses;
2. Provide the details of the support and the support locations to the CM for comment.

CON5.W580.8 LOADING AND OFF-LOADING
Carry out lifting for loading or off-loading the facade units in one movement. Lift off and re-position any facade unit which is not properly positioned after lifting, rather than levering it into place.
PRECAST FACADE UNITS (CONTRACTOR’S......  CON5 > WORKMANSHIP

CON5.W590.8 TRANSPORT VEHICLES
Maintain lorries or trolleys used for the transportation of the facade units in a good condition. Ensure trolleys are equipped with suspension systems to minimise shock loading.

CON5.W610.8 PROGRAMME
Provide a programme for the erection of the facade units, showing the rate of erection for each month. Make due allowance for all restrictions on the age of concrete in the facade units for handling, storage, transportation and erection.

CON5.W620.8 SITE RECORDS
Provide, at the end of each week during erection of the facade units, records in a form to be agreed with the CM, showing:
1. Dates and the locations of structural connections completed;
2. Dates of removal and locations of props and temporary supports to the facade units.

CON5.W630.8 CM’S INSPECTION
Allow and facilitate inspection of the facade units at any time before erection and after installation.

CON5.W640.8 QUALITY CONTROL PROCEDURES
Carry out erection of the facade units under Approved quality control procedures covering the following:
1. Protective measures to avoid cracking and chipping of the facade units and damage to the applied finishes and to the built-in items such as window frames;
2. Checking the accuracy of the in situ structural members receiving the facade units, including location and level of all bearing surfaces, joints, bolts, horizontal and vertical restraining devices and adjustment devices. Carry out checking by means of a template or measurement frame or a similar Approved method;
3. Checking of erection tolerances;
4. Testing of the compressive strength of the grouting materials in accordance with CON5.T250.

CON5.W650.8 LIFTING UNITS INTO POSITION
1. Lift the facade units by steel lifting frame complying with CON5.W510 except otherwise stipulated in sub-clause (4) below;
2. Maintain all cables connecting the lifting frame and the lifting points of the facade units in a vertical direction. Provide the cables with devices for the adjustment of their length;
3. Do not allow devices such as sockets or bolts for lifting purposes to be used for fixing the facade units to the main structure;
4. Submit detailed method statement including the design, drawing and installation procedures with endorsement of the Contractor’s RSE demonstrating to the satisfaction of the CM that the precast concrete component will not subject to excessive stresses arising from their proposed erection method without the steel lifting frame, exemption from using the steel lifting frame as stated in sub-clause (1) above can be allowed only for the lifting of precast facade with the maximum horizontal dimension less than or equal to 1.8m;
5. In connection with sub-clause (4) above, address the safety use of the proposed lifting anchor system, including but not limited to the proprietary anchor bolt with clutch. The proposed lifting anchor system shall be flexible enough to allow for both vertical and slant lifting sling.

CON5.W660.8 TEMPORARY SUPPORT
1. During fixing of the facade units, prop adjacent insitu structural members adequately to avoid excessive deflection or adverse stresses;
2. Maintain all temporary supports, props and restraints in position during casting of concrete / grout in the structural joint. Remove temporary supports, props and restraints upon satisfactory testing and calculation to Approval;
3. Unless specifically designed for, do not allow temporary support to be derived from the facade units fixed at lower floors;
4. For off-Site casting, coordinate with the supplier regarding the details of all temporary supports, props and inserts to suit the proposed lifting and installation method;
5. For the temporary support of the facade on the floor, refer to the drawings detailed in Project Specific Specification, which are provided for reference only;
6. Submit design calculations and detail drawings of installation and fixing for the CM's approval at least 4 weeks before commencement of constructing the temporary support.

CON5.W670.8 UNITS DAMAGED ON TRANSPORTATION, LIFTING OR ERECTION
Replace any facade unit which has been damaged on transportation, lifting or erection.

CON5.W680.8 APPROVAL FOR PERMANENT FIXING
Do not carry out permanent jointing or connection between any facade unit and another, or to any part of the insitu structure, without prior Approval.

CON5.W690.8 PREPARING AND PLACING GROUTING MATERIALS
Obtain Approval for the method of preparing and placing grouting materials in structural joints between the facade units and insitu structural members.

DEFECTS

CON5.W710.8 MINOR CHIPPING
Carry out repairs only to minor chipping by patching up after installation subject to Approval.

CON5.W720.8 OTHER REPAIRS
The CM may at his discretion approve other proposals for repairs to damaged facade units. Carry out any repair work to the satisfaction of the CM.

CON5.W730.8 REJECTED PANELS
Replace any defective or damaged facade panels rejected by the CM.
JOINTS

CON5.W810.8 GENERAL
1. Prepare and construct joints strictly in accordance with the Drawings and in accordance with the relevant manufacturer's recommendations so as to provide continuous weathertightness of buildings and give a neat, uniform and smooth appearance;
2. For application of back-up materials, bond breakers and sealants, see Worksection WAT5.

CON5.W820.8 GASKETS
Gasket may be used in weatherproofing joint provided that:
1. The joint is horizontal; and
2. The gasket is always under compression.

CON5.W830.8 MORTAR STOPS
Use backing rods or other Approved method as mortar stops in grouting panel joints when necessary.

CON5.W840.8 JOINT WIDTH
Unless otherwise Approved, the installed joint width must not be less than 6 mm nor greater than 30 mm.

CONDUIT SYSTEM

CON5.W910.8 APPLICATION
Supply and install conceal rigid plain PVC conduit system complete with steel draw wires for precast facade as indicated on the Drawings.

CON5.W920.8 SHOP DRAWINGS PREPARATION
Prepare shop drawings, coordinate and agree with the Nominated Sub-contractor for electrical installation and Supplier for precast facade before submitting shop drawings for Approval.

CON5.W930.8 SUBMISSION AND APPROVAL
Submit for Approval technical details, samples and type-tested certificates for the conduit system as specified in clauses CON5.M330, CON5.M420 and CON5.M530.

CON5.W940.8 COMPLETION CERTIFICATION FOR ELECTRICAL CONDUIT SYSTEM INSTALLATION
1. All conduits, fittings and accessories installed have to be certified by at least Grade A2 of Registered Electrical Workers (REW);
2. When delivered to Site, the precast facade units must be accomplished with a Work Completion Certificate Form WR1(A) specified by Electrical and Mechanical Services Department which shall be duly signed by a Registered Electrical Contractor and a REW certifying that the conduit system installation is in full compliance with the Specification and the Code of Practice for the Electricity (Wiring) Regulations;
3. A single certificate can be issued for delivered lots of precast concrete components which are produced in each production lot. The certificate shall also carry information e.g. reference number etc. for traceability purpose;
4. Provide CM and the Nominated Sub-contractor for Electrical Installation each a copy of the Work Completion Certificate for record.

**CONDUIT AND WIRING INSTALLATION**

**CON5.W1010.8**  
**CONDUIT BENDS**  
Internal radius: At least 4 times the outside diameter of the conduit.

**CON5.W1020.8**  
**BENDING, JOINTING AND TERMINATING OF CONDUITS**  
Follow conduit manufacturers’ recommendation for:  
1. Method of carrying out the conduit bends and conduit joints;  
2. Method of fixing conduits to boxes without spouts;  
3. Use of tools and materials.
TESTING

SAMPLING AND TESTING GENERALLY

CON5.T010.8 RECORDS
1. Keep a complete record of all sampling and testing, in a form agreed with the CM;
2. Submit test reports and certificates to the CM within 14 days from the date of test.

CON5.T020.A WITNESSING SAMPLING AND TESTING BY THE CM
The CM will witness any sampling and testing carried out under the Quality Assurance Scheme:
1. Make the records of sampling and testing available for inspection by the CM or his representatives resident at manufacturer's factory;
2. The CM or his representatives resident at manufacturer's factory is entitled to reject individual facade unit represented by any failed test result on the facade unit.

CON5.T030.A TESTS AT MANUFACTURER'S FACTORY
Provide samples, all necessary facilities and attendance to the DTC or the CM or his representatives resident at manufacturer's factory to carry out the following tests:
1. Schmidt hammer tests and covermeter tests on the construction quality of precast concrete components;
2. Tests on concrete constituent materials, tests on compressive strength of concrete cubes and concrete cores, tests on reinforcement bars and tests on fabric reinforcement by the DTC and / or HDMTL.

CON5.T040.A INSTALLATION OF RFID TAG IN CONCRETE CUBE FOR CUBE COMPRESSION TEST TO BE CARRIED OUT BY DTC OR HDMTL
1. Install a Radio Frequency Identification (RFID) tag as detailed on Sketch no. RFID/TAG/SK-01 onto the trowelled surface of each of the concrete cubes immediately after preparation of cubes at the manufacturer’s factory under the witness of the CM or his representatives resident at manufacturer's factory unless otherwise instructed by the CM;
2. The RFID tags are to be provided by DTC or the CM or his representatives resident at manufacturer's factory in batches;
3. Validate and scan the RFID tag with the Bluetooth RFID reader provided by DTC or the CM or his representatives resident at manufacturer's factory before use, and ensure that information such as tag unique identification (UID), electronic product code (EPC) number and timestamp have been uploaded to the PC provided by the DTC or the CM or his representatives resident at manufacturer's factory and incorporated into the DTC’s database system (through 3G or above internet service);
4. Input the mould number and / or sampling certificate number against the concerned tag EPC number through the DTC’s database system;
5. Before the tagged cubes are sent from the manufacturer’s factory to HDMTL or are collected by the DTC, scan the tag again using the Bluetooth RFID reader and ensure that information such as tag UID, EPC number and timestamp have been uploaded to the PC and incorporated into the DTC’s database system (through 3G or above internet service);
6. Deliver the tagged cubes to HDMTL or arrange the tagged cubes to be collected by the DTC with due care at a time such that a minimum of 4 days is allowed for curing the cubes in DTC or HDMTL before testing on compressive strength at 28 days by DTC or HDMTL;
7. In case any damaged RFID tags are discovered, report to the CM or his representatives resident at manufacturer's factory immediately without any delay;
8. Maintain an inventory record of all RFID tags including those damaged and submit the inventory record to the CM or his representatives resident at manufacturer's factory.

TRIAL UNITS

CON5.T110.8 GENERAL
Prior to mass production of the facade units:
1. Produce a full size trial sample for the Type T1 facade unit complete with joints, windows, glazing and the electrical conduit system installation etc. and all finishing at ground level for Approval;
2. Maintain the Approved sample facade unit as the yardstick for the standard and quality necessary for all facade units unless otherwise required under the terms of CON5.T120;
3. When construction of a trial panel is required in CON2.W720, structurally connect the trial sample to surrounding structural frames and with interfacing services as detailed on the Drawings.

CON5.T120.8 ADDITIONAL TRIAL UNITS
Non-compliance:
1. In the event that the trial sample, in the opinion of the CM, cannot represent any one of the other facade types due to different designs proposed or methods of manufacture and erection, the CM is entitled to order additional trial samples for those different facade types including the surrounding structural frames all at the Contractor's own expense and without detriment to the programme.

CON5.T130.8 PROTECTION AND DISPOSAL
Ensure that the Approved sample facade units remain undamaged and remove both the samples and surrounding structural frames upon the completion of erection of all facade units.

TESTS ON WORKABILITY

CON5.T131.8 STANDARD
As CON1.T510.

CON5.T132.8 ACCEPTANCE VALUES FOR APPROVED CONCRETE MIXES
As CON1.T520.

TESTS ON COMpressive STRENGTH OF CONCRETE CUBES

CON5.T210.8 STANDARD
As CON1.T610.

CON5.T211.8 SAMPLES FOR DESIGNED CONCRETE MIXES
As CON1.T620.
CON5.T221.A  GENERAL
1. Provide all necessary facilities and attendance for carrying out coring and testing of concrete cores by DTC, including the provision of a secure and lockable storage for DTC to store the coring machine and other associated equipment;
2. Tests are to be witnessed and endorsed by the Contractor's representative and the CM or his representatives resident at manufacturer’s factory;
3. Allow 2-day advance notice for preparation by DTC before the taking of core samples at the manufacturer’s factory;
4. Upon completion of the taking of core samples by DTC at the manufacturer’s factory, allow a minimum of 6 more days and a maximum of 15 more days for DTC to provide the core test results;
5. Make due allowance in the programme for the aforesaid arrangement and no claim for extension of time shall be allowed;
6. Subject to CM’s approval, omission of early core test may be permitted for a particular batch of precast facades in order not to affect the construction work on Site. In such case, core test shall be carried out in accordance with the procedures set out in CON1.T710 to CON1.T760 to prove the compliance of that particular batch of precast facades to compressive test on cores as stipulated in this Specification.

CON5.T222.8  STANDARD
Comply with CS1:2010 in respect of the method of preparing, inspecting and testing concrete cores to determine the compressive strength except the measurement of saturated density.

CON5.T223.8  SIZE AND NUMBER OF EARLY CORE SAMPLES
Testing samples:
1. Provide necessary facilities and attendance to the taking of 3 Nos. of core samples by the DTC from the precast facades of the same concreting day, at locations decided by the CM, for test as follows:
   a. 75 mm diameter core samples;
   b. For vertically casted precast facades, the length of core samples shall be at least 90 mm;
c. For horizontally casted precast facade, the length of core samples shall be at least 90 mm plus top 50 mm or 20% of depth of concrete being cored whichever is greater.

**CON5.T224.8**  
**AGE OF EARLY CORE SAMPLES**
1. Do not take cores for compressive test at ages less than 3 days;
2. Do not carry out compressive test on the core samples at ages less than 9 days.

**CON5.T225.8**  
**ASSESSING COMpressive STRENGTH OF EARLY CORES**
In assessing the compressive strength of early cores, the precast facades of the same concreting day represented by the early cores are deemed to comply with this Specification if the compressive strength of the early core, when adjusted for length / diameter ratio and converted to estimated insitu cube strength in accordance with CS1:2010, is:
1. Not less than 85% of the specified grade strength for any individual results.

**CON5.T226.8**  
**NON-COMPLIANCE AND FURTHER TESTS ON COMpressive STRENGTH OF CONCRETE CORES FOR PRECAST FACADES**
1. For precast facades of the same concreting day represented by the early cores that the compressive strength of the early cores comply with **CON5.T225**, their core test results are deemed to be acceptable under this Specification, and further coring test at 28 days is not necessary unless compressive strength test of concrete cube of the same batch of concrete not comply with **CON5.T212** or instructed otherwise by the CM;
2. For precast facades of the same concreting day represented by the early cores that the compressive strength of the early cores do not comply with **CON5.T225**:
   a. if the concreting ages of the precast facades are less than 28 days, carry out further early core tests by DTC. If the result of the further early core test does not comply with **CON5.T225**, the precast facades are not allowed to be lifted into place or installed on Site, and further early core test may be carried out in accordance with this sub-clause;
   b. if the concreting ages of the precast facades are 28 days or over, carry out further core test by DTC in accordance with **CON1.T710** to **CON1.T760**. If the result of this further core test does not comply with **CON1.T760**, the precast facades are not allowed to be lifted into place or installed on Site. All relevant concrete of precast facades represented by this further core test in the same concreting day is deemed not complying with this Specification. Investigate the extent of non-compliance and re-execute the works in accordance with **CON1.T1210** to **CON1.T1260**.
3. Make due allowance in the programme for the aforesaid arrangement and bear all time and cost for compliance with this clause.

**CON5.T227.8**  
**MAKING GOOD CORE HOLES**
As **CON1.T770**.

**TESTS ON COMpressive STRENGTH OF CONCRETE CORES**

**CON5.T230.8**  
**GENERAL**
As **CON1.T710**.

**CON5.T231.8**  
**STANDARD**
As **CON1.T720**.
CON5.T232.8 SIZE AND NUMBER OF CORE SAMPLES
Testing samples:
1. Provide necessary facilities and attendance for taking 3 Nos. of 100 mm diameter core samples from the facade units for the same concreting day, at the location selected by CM;
2. Take concrete cores at the rate of three per precast facade unit so selected.

CON5.T233.8 AGE OF CORE SAMPLES
As CON1.T740.

CON5.T234.8 REQUIREMENT FOR FURTHER CONCRETE CORE SAMPLES
As CON1.T750.

CON5.T235.8 ASSESSING COMPRESSIVE STRENGTH OF CONCRETE CORES
As CON1.T760.

CON5.T240.8 NON-COMPLIANCE AND FURTHER TESTING
Should any core fail to meet the requirements of compressive strength of concrete cores as specified in CON1.T760:
1. All relevant concrete represented by the cores in the same concreting day is deemed not to comply with this Specification;
2. The CM may order further tests on cores taken from the failed precast facade units or other precast facade units cast from the same batch of concrete used for casting the failed units all at the Contractor's own expense.

CON5.T245.8 MAKE GOOD CORE HOLES
As CON1.T770.

CON5.T250.8 TESTING ON NON-SHRINK GROUT
As CON4.T070.

CON5.T260.8 TESTS ON COMPRESSIVE STRENGTH OF GROUT CUBES
As CON4.T080.

CON5.T280.8 COUTINHO RING TEST
Testing method:
1. The mould for this test shall be formed from steel to provide an annular specimen with an inner diameter of 115 ± 0.1 mm, an outer diameter of 175 ± 0.1 mm and a depth of 50 ± 0.1 mm;
2. The grout shall be mixed in accordance with the manufacturer's specification and placed within the mould. Materials, moulds and specimens shall be kept at a temperature of 27°C ± 2°C and a relative humidity of 55% ± 5%;
3. After 72 hours the outer mould ring shall be removed from the hardened grout specimen and the specimen with the inner ring still in place shall be returned to the conditioning environment.
4. The grout specimen shall be examined at 7, 14, 21 and 28 days and any cracking shall be reported.
**SCHMIDT HAMMER TESTS**

**CON5.T290.A TESTING FREQUENCY**

1. Provide all necessary facilities and attendance for carrying out of Schmidt hammer test on all precast facades by the CM or his representatives resident at manufacturer’s factory when the concreting age of the precast facades is at least 3 days;
2. Subject to CM’s approval, the testing frequency may be reduced when satisfactory and consistent standard is established.

**LABORATORY WATERTIGHTNESS TEST**

**CON5.T310.8 NATURE AND PURPOSE OF TEST**

Testing arrangements:

1. Prior to the Approval of the proposed jointing system, carry out the watertightness test at an Approved independent laboratory to demonstrate that the proposed jointing system within the facade unit resists water penetration as CON5.T450;
2. Where an insitu connection, specified in CON5.D410 to CON5.D440, is designed in combination with joint sealing compound specified in CON5.M120, carry out the watertightness test without the joint sealing compound in place to test the watertightness of the insitu connection.

**CON5.T320.8 EXEMPTION FROM TEST**

Laboratory testing of the proposed jointing system is not required if satisfactory test evidence relating to a similar joint system can be furnished to the CM. Test data for such a similar jointing system made from the Works or used on other Authority contracts may be accepted for this purpose.

**CON5.T330.8 TEST PROCEDURE**

Arrange for testing to be carried out generally in accordance with the procedure stipulated in BS 5368:Part 2:1980 with the following modifications:

1. Test specimen prepared according to the Drawings and submitted to the Approved independent laboratory for testing;
2. The water-spraying system employed according to method No. 2 of BS 5368:Part 2:1980 but installed with additional nozzles to provide uniformity of water spray at the jointing system of the test specimen;
3. The spray set to apply water at a minimum rate of 5.0 litres/m²/min;
4. A maximum pressure difference Pmax maintained, as stated in BS 5368:Part 2:1980 Clause 8, of 1 kPa, together with the water spray for 15 minutes.

**CON5.T340.8 JOINT PERFORMANCE**

Do not cast or manufacture facade units prior to the proposed jointing system performing satisfactorily in the laboratory tests.

**SITE WATERTIGHTNESS TESTS**

**CON5.T410.8 TESTING TRIAL UNIT**

Testing arrangements:

1. Carry out watertightness tests to the jointing system of the full size trial samples specified in CON5.T110 in accordance with the procedures set out in CON5.T430;
2. Extend the watertightness tests to cover testing on joints of windows fixed to the full size trial sample all to the requirements specified in COM2.T210.

CON5.T420.A TESTING INSTALLED JOINTS
Testing samples:
1. Carry out watertightness tests in accordance with the procedures set out in CON5.T430 to all joints of the properly installed facade units not connected monolithically to in-situ concrete at the rate of 50% of each particular type in locations as instructed by the CM or his representatives;
2. Where a jointing system is constructed in combination with joint sealing compound specified in CON5.M120, carry out the watertightness test prior to the application of the sealing compound to test the watertightness of the joint.

CON5.T430.8 TEST PROCEDURE
Test joints of each selected facade unit according to the procedures as follows:
1. Construct working platforms where necessary for carrying out water test safely;
2. Working from the exterior, wet the facade unit selectively, starting from the lowest horizontal joint, followed by the vertical joints and then the horizontal joint above;
3. Spray a continuous jet of water from a nozzle at a water pressure of 210 to 240 kPa at the nozzle inlet to the joint and perpendicular to the face of the facade unit. Move the nozzle slowly along the joint, at a distance of 300 mm from it, for a period of 5 minutes in every 1.5 metre of joint length while an observer carefully inspects on the interior side of the facade unit with the assistance of adequate lighting where necessary;
4. Unless otherwise Approved, use a nozzle to the requirements of the Architectural Aluminium Manufacturer's Association (AAMA) 501.2-83;
5. Repeat the process specified in sub-clause (3) above on all joints and joint intersections using increments of exposed joint length not exceeding 1.5 metres upward until all the joints are covered.

CON5.T440.8 WITNESSES TO TEST
All watertightness tests carried out on Site must be witnessed and certified both by the CM and the Contractor's representative.

CON5.T450.8 FAILURE OF UNITS
The facade units and joints are deemed to have failed if signs of water seeping through the joints or through the facade unit, including signs of damp patches, are observed during the test and within the subsequent 2 hours after the test.

CON5.T460.A REMEDIAL WORK TO UNITS FOR RE-TEST AND ADDITIONAL TESTING
Non-compliance:
1. Carry out remedial work to facade units and joints which have failed the watertightness test. Methods of carrying out the remedial work are subject to Approval;
2. After the remedial work is completed, re-test the facade units and joints in accordance with the procedures set out in CON5.T430;
3. Repeat sub-clauses (1) & (2) above until the facade unit and joint comply with the specified criteria of watertightness;
4. For any one facade unit fails the watertightness test, carry out additional tests as follows:
a. Select three additional samples as instructed by the CM or his representatives for testing. Each sample shall comprise three facade units of the same type as the failed facade unit;

b. Carry out watertightness test to the additional samples in accordance with the procedures set out in CON5.T430;

c. When any facade unit fails the test, repeat sub-clauses (1) & (2) above until the facade unit and joint comply with the specified criteria of watertightness.

5. Repeat sub-clause (4) above until all testing facade units and joints have complied with specified criteria of watertightness;

6. Bear all associated costs for the re-tests and additional tests as specified in the above sub-clauses. No extension of time will be allowed.

TESTING FIXINGS

CON5.T510.8 TENSILE TESTING
Testing method:

CON5.T520.8 SHEAR TESTING
Testing method:

SURVEILLANCE INSPECTION

CON5.T710.B JOINT INSPECTION AT MANUFACTURER'S FACTORY AND BREAKING UP INSPECTION
For off-site casting:
1. Arrange transportation for the CM and/or his representatives and carry out joint inspections at the manufacturer's factory;

2. Carry out up to 4 breaking-up inspections which may be instructed by the CM, each comprising the following:
   a. Provide a sample of precast standard facade unit randomly selected by the CM or his representatives, break up the unit for inspection and remove the broken unit after inspection;
   b. Carry out the following inspection in the presence of the CM or his representatives:
      i. Reinforcement details including total number of bars and bar size in accordance with standard design drawings;
      ii. Bar pattern of the reinforcement used against the Mill Certificate and the requirements of purchaser test in CS2:2012;
      iii. The installation, markings and brand name of concealed electrical conduit, fittings and conduit accessories etc. when pre-installed electrical conduit system is installed.

3. In the event of sample failing to meet any one of the requirements in the breaking-up inspection above, take further samples according to the following formula until all samples satisfy the requirements as above:
   Nos. of further samples = \((n^2 - 2n +3)\)
   where \(n\) is equal to the total number of unsuccessful components;

4. Bear the costs of all further breaking up inspections that may be required under sub-clause (3) above and no extension of time will be allowed.
LIFTING ANCHOR

CON5.T810.8 DEFINITION OF BATCH
In this Specification, a batch is defined as any quantity of lifting anchor of the same type and same working load capacity, delivered to the casting yard as one consignment and covered by the same test certificate issued by the lifting anchor manufacturer.

CON5.T820.8 TYPE AND LOAD CAPACITY
Unless otherwise specified on Drawings, lifting anchors shall be either eye anchor type or foot anchor type, and with a working load of 0.25 times the ultimate load capacity.

CON5.T830.8 RATE OF SAMPLING
1. The rate of sampling for ultimate load capacity for each batch of lifting anchor shall be a minimum of one sample, which comprises three test specimens, for every 3,000 anchors or part thereof;
2. When Instructed, provide an additional sample comprising three test specimens for testing by DTC.

CON5.T840.8 COMPLIANCE CRITERION
No test result of ultimate load capacity of individual test specimen shall be less than 4 times the working load as stipulated in CON5.T820.

CON5.T850.8 SUBMISSION
Prior to the production of precast concrete components, provide test certificates issued by:
1. The lifting anchor manufacturer/agent supplier; and
2. An Approved testing laboratory employed by the manufacturer of precast concrete component on the ultimate load capacity of lifting anchors for each batch under the Quality Assurance System as stipulated in CON5.W030.
CON6 MOVEMENT JOINTS

MATERIALS

JOINT FILLERS

CON6.M010.8 COMPRESSIBLE JOINT FILLER
Quality requirements:
1. Firm, compressible, single thickness, non-rotting proprietary type approved by the CM.

CON6.M020.8 INORGANIC COMPRESSIBLE JOINT FILLERS, BOND BREAKERS AND BACKUP MATERIALS
Quality requirements:
1. Sheet form or strip and cord sections of an Approved type.

SEALANTS

CON6.M110.8 GENERAL
Refer to Worksection WAT5 for all sealants, primers, back-up materials and bond breakers.

WATER STOPS

CON6.M210.8 WATER STOPS
Quality requirements:
1. Of an Approved type made with prefabricated angle and intersection pieces with details on the type of materials required, its intended location and purpose of use as specified in the Project Specific Specification and on the Drawings.

PROPRIETARY EXPANSION JOINTS

CON6.M310.8 MECHANICAL EXPANSION JOINTS
Quality requirements:
1. From an Approved manufacturer with details on the type of materials required, its intended location and purpose of use as specified in the Project Specific Specification and on the Drawings.

ANCILLARY MATERIALS

CON6.M410.8 ADHESIVE FOR JOINT FILLER
Quality requirements:
1. Bituminous type recommended by the joint filler manufacturer.
WORKMANSHIP

GENERAL

CON6.W010.8 JOINT CONSTRUCTION
1. Construct joints strictly in accordance with the drawings and in accordance with the relevant manufacturer’s recommendations;
2. Keep edges true, free from cracks, spalling or other imperfections. Ensure that edges or joints are clean and free from dust or grease immediately before fixing fillers or applying sealants.

CON6.W020.8 APPLYING SEALANTS
Refer to the Workmanship section of Worksection WAT5 for the application of primers, back-up materials bond breakers and sealants.

MOVEMENT JOINTS

CON6.W110.8 FIXING JOINT FILLER
Fix joint filler to the concrete with bituminous adhesive before casting the adjoining bay. Form a sealing slot by casting in a removable former.

CON6.W120.8 PLACING CONCRETE
Do not place concrete on both sides of a movement joint simultaneously.

WATER STOPS

CON6.W210.8 INSTALLATION
Adequately install waterstops to ensure their correct position is maintained during concrete placement.

CON6.W220.8 JOINTING
Make all joints using hot or cold vulcanizing.

CON6.W230.8 CONCRETING
Compact concrete fully around waterstops to ensure that no voids or porous areas remain.
CON7 PRECAST CONCRETE COMPONENTS (ENGINEER'S DESIGN)

GENERAL

SCOPE OF THE WORK
Precast concrete components specified in this Worksection include:
1. Precast facades (including precast roof parapet);
2. Semi-precast slabs (including semi-precast roof slabs and semi-precast corridor slabs);
3. Precast balconies;
4. Precast staircases (including precast roof staircases);
5. Precast structural walls; and
6. Precast partition walls.

Refer to the Drawings for the extent of fixtures, finishing, fittings and building services installations associated with precast concrete components.

Refer to the Drawings and relevant Specification clauses for the scope of builders, structural and building services works to be prefabricated in off-site yards.

SUBMISSIONS

LOADING OF INSITU STRUCTURAL MEMBERS
Submit calculations to demonstrate that the insitu structural members are not subject to excessive stresses arising from the erection method of the precast concrete components and to demonstrate the adequacy of any temporary supports which may be required.

PRECAST FAÇADE / PRECAST BALCONY - DESIGN PARAMETERS

ERECTION RESTRAINTS
1. Design vertical and horizontal restraints for temporary connections of the precast façade / precast balcony to the main structure such that displacement of the precast façade / precast balcony unit cannot occur before making the permanent structural connection;
2. Design horizontal restraint to resist a minimum horizontal live load of ±0.5 kN/m run acting at 1.5 m from the base of the precast façade / precast balcony unit.

ADJUSTMENT DEVICES
1. Provide the precast façade / precast balcony units with separate vertical and horizontal adjustment devices;
2. Do not use adjustment devices in the vertical plane for horizontal location devices or horizontal restraint and do not design such devices to take any permanent shear (horizontal) loads;
3. Do not design any adjustment devices in the horizontal plane to take permanent vertical loads.
MATERIALS

GENERAL

CON7.M010.8 RELEVANCE OF OTHER SPECIFICATION WORKSECTIONS

1. Construct precast concrete components for Standards Domestic in accordance with this Worksection and with the relevant provisions of the following Worksections:
   a. CON1, Insitu Concrete;
   b. CON2, Formwork;
   c. CON3, Reinforcement;
   d. CON4, Precast Concrete;
   e. COM11, Radio Frequency Identification and Web-Based Database System for Building Components.

2. Construct aluminium window or uPVC window frames in accordance with Worksections COM2 or COM3 respectively;

3. Where any ambiguity, discrepancy or conflict arises between this Worksection and any clauses in any other Worksections of this Specification, ensure that the provisions of this Worksection prevail.

PRECAST FACADE, PRECAST BALCONY, SEMI-PRECAST SLAB, PRECAST STRUCTURAL WALL AND PRECAST PARTITION WALL - CONDUIT SYSTEM

CON7.M110.8 STANDARDS

1. For rigid plain polyvinyl chloride (PVC) conduits, conduit fittings and PVC boxes, comply with the following British Standards:

<table>
<thead>
<tr>
<th>Conduits and Fittings</th>
<th>British Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>PVC conduits:</td>
<td>BS 6099:Section 2.2:1982(1988)</td>
</tr>
</tbody>
</table>

2. Ensure that all PVC conduits, fittings and boxes are of the same make.

CON7.M120.8 COLOUR

PVC conduits, fittings and boxes: white in colour.

CON7.M130.8 FLAME RESISTANCE

PVC conduits, fittings and boxes: non-flame-propagating and self-extinguishing.

CON7.M140.8 TEMPERATURE CLASSIFICATION

1. For all PVC conduits, fittings and boxes, comply with the temperature classification of -5 in accordance with BS 6099:Section 2.2:1982(1988);
2. For PVC conduits, where the ambient temperature at the country of manufacture is likely to be below -5°C, the temperature classification is -25.

**PRECAST FACADE, PRECAST BALCONY, SEMI-PRECAST SLAB, PRECAST STRUCTURAL WALL AND PRECAST PARTITION WALL - RIGID PLAIN PVC CONDUITS**

CON7.M210.8 CONSTRUCTION AND SIZE
1. PVC conduits: rigid, plain and of a non-threadable type;
2. Nominal diameter of PVC conduits: within the range of 20 mm to 32 mm unless otherwise specified.

CON7.M220.8 MECHANICAL PROPERTIES
PVC conduits are:
1. Of heavy mechanical strength;

CON7.M230.8 TYPE-TESTING FOR ELECTRICAL PVC CONDUITS
1. Rigid plain PVC conduits shall be type-tested for complete compliance with BS 6099:Section 2.2:1982(1988) by an Independent Accredited Laboratory or an Independent Short-Circuit Testing Organisation;
2. Upon request from CM, provide documentary evidence that the batch/consignment of PVC conduits delivered to Site have satisfied the requirement as stipulated in the relevant British Standards mentioned in sub-clause (1) above.

**PRECAST FACADE, PRECAST BALCONY, SEMI-PRECAST SLAB, PRECAST STRUCTURAL WALL AND PRECAST PARTITION WALL - PVC CONDUIT FITTINGS**

CON7.M310.8 CONSTRUCTION
1. Use plain, moulded slip-type couplers and expansion type couplers to BS 4607:Part 5:1982 (1988) in the jointing of conduits;

CON7.M320.8 TYPE-TESTING FOR ELECTRICAL PVC CONDUIT FITTINGS
1. PVC conduit fittings shall be type-tested for complete compliance with the following British Standards by an Independent Accredited Laboratory or an Independent Short-Circuit Testing Organisation:

<table>
<thead>
<tr>
<th>PVC Conduit Fittings</th>
<th>British Standards</th>
</tr>
</thead>
</table>

2. Upon request from CM, provide documentary evidence that the batch/consignment of PVC conduit fittings delivered to Site have satisfied the requirement as stipulated in the relevant British Standards mentioned in sub-clause (1) above.
CONSTRUC
TION AND DIMENSIONS
1. For PVC boxes and their covers, comply with the relevant British Standard specification listed in CON7.M110;
2. Fit all screw holes with metal inserts. Other than for PVC adaptable boxes, provide each box with a brass earthing terminal complete with screw for the connection of circuit protective conductor (CPC);
3. Ceiling-mounted circular conduit boxes: Deep pattern type having an internal depth of not less than 60 mm. Extension rings shall comply with BS 4607:Part 5:1982 (1988);
4. Mould each PVC box in one piece;

MECHANICAL PROPERTIES
1. For PVC boxes, comply with the requirements for mechanical properties stated in the relevant British Standard specification listed in CON7.M110;
2. PVC adaptable boxes are:
   a. Moulded;
   b. Of sufficient mechanical strength to withstand forces encountered in concealed conduit wiring system application;
   c. Complete with provision for prevention of deformation of the boxes where necessary.
3. Plastic boxes are of:
   a. Dimensions: can be interchangeable with steel boxes;
   b. Wall thickness: 2 mm minimum;
   c. Cover sizes: larger than the adaptable box on each edge by at least 5 mm.
4. Fit boxes for the suspension of luminaires or other equipment, where considerable heat will be produced with steel insert clips;
5. Do not use plastic boxes where:
   a. Temperature of the box is likely to exceed 60°C; or
   b. The mass suspended from the box exceeds 3 kg.

TYPE-TESTING FOR ELECTRICAL PVC CONDUIT BOXES
1. PVC circular conduit boxes, PVC boxes for electrical accessories and PVC adaptable boxes shall be type-tested for complete compliance with the following British Standards by an Independent Accredited Laboratory or an Independent Short-Circuit Testing Organisation:

<table>
<thead>
<tr>
<th>PVC Conduit Boxes</th>
<th>British Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>PVC circular conduit boxes</td>
<td>BS 4607:Part 5:1982(1988) with the following conditions:</td>
</tr>
<tr>
<td></td>
<td>a. The marking of the PVC circular conduit boxes shall be 60/10 kg;</td>
</tr>
<tr>
<td></td>
<td>b. The PVC circular conduit boxes shall be type-tested to 10 kg suspended load.</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>------------------</td>
</tr>
<tr>
<td>PVC adaptable boxes</td>
<td></td>
</tr>
<tr>
<td>Clause 6   Dimensions</td>
<td></td>
</tr>
<tr>
<td>Clause 7.3 Safety on impact test</td>
<td></td>
</tr>
<tr>
<td>Clause 8   Resistance to heat</td>
<td></td>
</tr>
<tr>
<td>Clause 9   Resistance to burning</td>
<td></td>
</tr>
<tr>
<td>Clause 10  Insulating characteristics</td>
<td></td>
</tr>
</tbody>
</table>

2. Upon request from CM, provide documentary evidence that the batch/consignment of PVC conduit boxes delivered to Site have satisfied the requirement as stipulated in the relevant British Standards mentioned in sub-clause (1) above.
WORKMANSHIP

GENERAL

CON7.W010.8 CASTING YARD
Within one month from the notified date for commencement of the Works, submit for Approval on the following:
1. For on-Site casting:
   a. The location of casting yard for manufacture of precast concrete components;
   b. Details of plant and equipment including the location, boom radii and lifting capacities of cranes, gantry capacities, curing facilities, number of moulds and means of transporting the concrete components within the Site;
2. For off-Site casting:
   a. The name, casting yard address with street maps and job reference of the manufacturer and the following:
      i. Details of organisation structure and top management;
      ii. Self-certified true copy of the business licence of the manufacturer;
      iii. Annual production capacity of the casting yard in terms of concrete volume, numbers of products and the current workload;
      iv. Details of the Quality Assurance Scheme required in CON7.W030;
      v. Details of the audit plan and previous audit report, if any, carried out by the Precast Concrete Construction Audit Consultant required in CON7.W060;
      vi. Details of compliance with requirements of this specification on batching plant and concrete mixes in accordance with Worksection CON1;
      vii. Test results for quality tests being carried out for the precast concrete components to demonstrate the compliance with requirements of this specification;
      viii. Other details of construction quality as required in CON7.W120 (1).
   b. Scaled and dimensioned layout plan of the casting yard with fenced boundaries showing the office, the production lines for the products including hardstanding and covered casting yards, disposition of steel moulds, vibration plant, handling and lifting plants, steam or hot air curing room / facilities, storage areas for finished products, steel reinforcement storage and bending yards, storage sheds for incoming materials, samples room, batching plant if any, testing laboratory, concrete cubes curing facilities, means of transporting the concrete components to the Site;
   c. The laboratory for carrying out the tests and issuing test certificates shall be approved by the Housing Department, or accredited either by Hong Kong Accreditation Scheme (HKAS) under the Hong Kong Laboratory Accreditation Scheme (HOKLAS), or an equivalent organization which has signed a mutual recognition agreement with HOKLAS. All expenses / costs related to the tests carried out by the laboratory shall be borne by the Contractor.

CON7.W015.8 MANAGEMENT SCHEMES FOR OFF-SITE CASTING
1. Ensure that the casting yards for the off-Site casting of precast concrete components are operating on the following management schemes:
   a. An Environmental Management Scheme certified under ISO 14001;
b. An Occupational Health and Safety Management Scheme certified under OHSAS 18001.

2. Submit the original or certified true copy of the respective certificates for the manufacturing plant within the following time frame:
   a. ISO 14001: At not later than 15 days before the commencement of the production of precast concrete components;
   b. OHSAS 18001: At not later than 12 months from the date of commencement of the Works.

3. When the photocopy of certificate is submitted, it shall be certified by the certification body or by the QCM. The certification body shall be accredited by the Hong Kong Accreditation Service (HKAS), or the China National Accreditation Service (CNAS), or an accreditation body which has entered into a mutual recognition agreement with HKAS for the respective certification.

CON7.W020.8 QUALITY ASSURANCE FOR ON-SITE CASTING
Within two months from the notified date for the commencement of the Works, submit for Approval details of the Quality Assurance Scheme for manufacturing the precast concrete components, in accordance with CON7.W040 to CON7.W050 as applicable.

CON7.W030.8 QUALITY ASSURANCE FOR OFF-SITE CASTING
Ensure that casting yards for the off-Site casting of precast concrete components are operating on a Quality Assurance Scheme certified under ISO 9001 in accordance with CON7.W040 to CON7.W060.

CON7.W040.8 QUALITY ASSURANCE SCHEME
1. Ensure that the precast concrete components are manufactured under a Quality Assurance Scheme which covers the following items and is certified under ISO 9001:
   a. Quality control tests of materials, including proprietary products such as lifting anchors for handling precast concrete components;
   b. Calibration of laboratory equipment for quality control tests;
   c. Efficiency and proper operation of equipment at the casting yard;
   d. Production process;
   e. Sampling/testing procedures and requirements by an independent Approved laboratory;
   f. Quality control procedures including the frequency and extent of inspection by manufacturer's staff and independent parties;
   g. Regular audits at a minimum frequency of once per month by manufacturer's staff and independent parties.

2. Endorse the Quality Assurance Scheme and submit to CM for approval at least 15 days before the commencement of the production of precast concrete components.

CON7.W045.A PRECAST CONCRETE CONSTRUCTION AUDITING CONSULTANT
1. Select a consultant on the Architectural and Associated Consultants Selection Board's (AACSB) List of Structural Engineering Consultants (the "List") for CM's approval as the Precast Concrete Construction Auditing Consultant to carry out technical audits at the manufacturer's factory in accordance with the Code of Practice for Precast Concrete Construction 2016 issued by the BD;

2. A Precast Concrete Construction Auditing Consultant on the "List" in sub-clause (1) appointed by the manufacturer may be proposed for Approval;
3. Notify the CM immediately if there is any subsequent change of the Precast Concrete Construction Auditing Consultant during the course of services.

**CON7.W050.8 QUALIFIED SUPERVISION**

1. Assign a Precast Quality Control Manager (PQCM), with a minimum qualification and experience of a Grade T4 TCP in the civil or structural engineering discipline under the Registered Contractor's stream in the CoPSS, to certify all control documentation or test certificates required for the QA Scheme;

2. Assign a Precast Quality Control Coordinator (PQCC), with a minimum qualification and experience of a Grade T3 TCP under the Registered Contractor's stream in the CoPSS, to provide continuous supervision of the precast concrete production works at the casting yard;

3. Submit the details of the PQCM and the PQCC for Approval. For on-Site casting, it is permissible for the PQCM to be the same person as the QCM and the PQCC to be the same person as the SQCC;

4. Provide attendance to an RSE who is nominated by the CM, to carry out audit checks to the casting yard at least once every month;

5. The Authorized Signatory as stipulated in PRE.B6.060 is to carry out inspection and audit checks to the casting yard at least once every month and submit a monthly audit report to the RSE as stipulated in sub-clause (4) above and then to the CM for endorsement and onward submission to ICU.

**CON7.W055.8 INSPECTION LOG BOOK**

1. Record the following in an inspection log book:
   a. The names and qualifications of the supervisory personnel assigned by the CM and by the Contractor as stipulated in CON7.W050;
   b. The details of concrete production, inspection, auditing and testing.

2. Keep the inspection log book in the casting yard and provide a duplicate of the inspection log book on Site for CM's inspection when required.

**CON7.W060.A RECTIFICATION TO QUALITY NON-COMPLIANCE**

1. For off-Site casting in CON7.W010 (2), the manufacturer shall be under regular technical audits in a manner as stipulated in CON7.W040 (1)(g) and supervision of the CM or his representatives resident at the manufacturer's factory;

2. The Contractor shall:
   a. Ensure that the manufacturer shall rectify any non-conformance to the Specification revealed by the audit or the supervision of CM's resident representatives and if necessary, modify the QA Scheme and temporarily suspend the manufacture of the precast concrete components until the non-conformance is rectified;
   b. Report to the CM of the non-conformance and rectification carried out.

3. Notwithstanding sub-clause (2) above, bear full responsibility to assure that all the precast concrete components delivered to Site comply with the requirements of the Specification at all times.

**CON7.W070.8 DRAWINGS AND METHOD STATEMENT FOR ON-SITE CASTING**

Within two months of the notified date for commencement of the Works, submit, for agreement, the following items:

1. Details of moulds, layout arrangements, casting methods (horizontal or vertical), tilting mechanism (if any), demoulding methods and the provision for attachments of openings for window fixing (if any);

2. The complete procedures for fabrication, curing, demoulding, application of finishes, lifting, transporting, storage, erection, grouting (if any);
3. Method of protecting the precast concrete components from damage at all times;
4. The proposed Radio Frequency Identification tag and the fixing method as specified in the Worksection COM11.

**CON7.W080.8**  
**PROGRAMME**

Provide a programme for manufacture of the precast concrete components showing the rate of production for each month. For on site precasting, the dates for clearing the area of casting yard and associated plant upon completion of the manufacture of the precast concrete components must also be shown.

**CON7.W090.8**  
**EQUIPMENT**

Ensure casting yards, erected on-Site or off-Site are equipped with all the necessary facilities, including efficient vibration plant, necessary curing facilities, storage, handling and lifting facilities to secure compliance with all the provisions of this Specification.

**CON7.W100.8**  
**USE OF CASTING YARD**

Do not use any on-Site casting yard for manufacture of any components for other sites. See PRE.B8.010.

**CON7.W110.A**  
**SUBMISSION AND PILOT PRODUCTION RUN BEFORE APPROVAL**

1. Submission:
   a. Submit the shop drawings, for the production of the precast components for Approval, including any proposed changes to the products so as to suit individual production process / plant;
   b. Use concrete mix for the manufacture of precast components all in accordance with the requirements in Worksection CON1;
   c. Provide relevant information / samples associated with the proposed precast components for Approval including:
      i. Engraved manufacturer's logo and casting date;
      ii. Printed precast concrete components identity numbers on surface of products;
      iii. Schmidt hammer test certificate and covermeter tests record endorsed by the manufacturer's Quality Control Personnel;
      iv. Delivery Order / Invoice;
      v. Import and Export Manifests or Bill of Lading.
   d. The proposed Radio Frequency Identification tag and the fixing method as specified in the Worksection COM11.

2. Before obtaining Approval for mass production, carry out a pilot production run with the CM or his representatives on the proposed manufacturer to demonstrate the technical capability and effectiveness of the Quality Management System;

3. In the pilot production run:
   a. Provide, for each category of products:
      i. One sample with the reinforcement fixed in steel mould for the inspection of workmanship including reinforcement fixing and provision of bar spacers;
      ii. One sample with concrete cast in steel mould for the inspection of conditions of the steel mould, checking of the finished sample.
b. Carry out trial run to demonstrate the manufacturing process including installation of windows, lifting operation, curing, storage, fixing of mosaic tiles, quality tests at factory laboratory, applied finishes and quality controls in accordance with the required drawings and specification;

c. Carry out verification check for engraved logo, casting date, identity number, Schmidt hammer test certificate and covermeter tests record, dimensions, size, spacing, position of starter bars and finishes.

4. The pilot production run may not be required, if the following documents are submitted and are acceptable to the CM:

   a. Track records on similar types of precast concrete components supplied by the proposed manufacturer to other HA construction projects, within five years prior to the notified date for commencement of the Works; or

   b. In the absence of the track records, detailed records of the pilot production run for similar types of precast concrete components carried out in other HA construction projects, within five years prior to the notified date for commencement of the Works.

---

**CON7.W120.8 FIRST JOINT INSPECTION AT MANUFACTURER'S FACTORY**

1. Prior to mass production, carry out the first joint inspection between the Contractor and the CM at factory for Approval on the minimum standard of the product for all subsequent concrete and the specified finish. Arrange for the transportation and provide all facilities for the first joint inspection;

2. Provide samples, including those samples in CON7.W110 (3)(a) and those accepted samples in previous pilot production run carried out in accordance with CON7.W110, for Approval as being representative of the minimum standard of the product for all subsequent concrete and the specified finish;

3. Maintain accepted sample of precast façade / precast balcony and semi-precast slab at a minimum of one number, or as directed by the CM, in an area in the factory and do not remove the accepted samples from the area unless otherwise instructed by the CM. Incorporate a further set of samples to the trial panel on Site;

---

**PRODUCING PRECAST UNITS**

**CON7.W210.A MOULDS**

Construct and maintain moulds so that:

1. Dismantling and re-assembly of moulds after each casting allows the production of subsequent precast concrete components within permitted tolerance limits;

2. The positioning of securing components and fixings etc. are within the permitted tolerances;

3. Adequate stiffness for the control of dimensional tolerances is maintained.

**CON7.W220.8 DEFECTIVE MOULDS**

Replace any mould which fails to produce precast concrete components within the permitted tolerance limits as specified in Appendix H, the "Schedule of Tolerances".

**CON7.W230.8 USE OF RELEASE AGENTS**

Apply mould release agent of an Approved type, to the surfaces of moulds either by brush or by spraying before the fixing of steel reinforcement at a rate in accordance with the manufacturer's recommendations.
CON7.W240.8  CONCRETING, COMPACTION AND CURING GENERALLY
See CON1.

CON7.W250.8  EXTERNAL VIBRATORS
Obtain Approval for the use of external vibrators.

CON7.W260.8  CURING BY APPLICATION OF HEAT
Obtain Approval for heat curing by means of steam, hot air, etc. and:
1. Ensure that the total chloride content of the concrete mix for precast concrete components subject to heat curing, is less than 0.1% by weight of that of the cement;
2. Carry out a site trial to demonstrate the adequacy of the proposed method to the satisfaction of the CM.

CON7.W270.8  DEMOULDING GENERALLY
Demould by means of an Approved method and:
1. Do not use crowbars;
2. Do not subject the mould to any form of impact.

CON7.W280.8  CONCRETE STRENGTH BEFORE DEMOULDING
1. Demould the precast concrete components only after concrete has achieved the required strength;
2. To determine the concrete strength required for demoulding or handling:
   a. Make the necessary concrete cubes in pairs from the same batch of concrete used for casting the concrete components and cure the concrete cubes under the same conditions as the concrete in the precast concrete components;
   b. Specially identify the cubes and do not use them for normal quality control or for compliance testing;
   c. Determine the concrete cube strength by compression test as CON7.T110 and satisfy the CM that the concrete cubes have acquired the required strength before the demoulding or handling the precast concrete components.

CON7.W290.8  IDENTIFICATION AND RECORDS
1. Mark all precast concrete components with date of manufacture and a unique reference number;
2. Record in a master register the dates of casting, the concrete grades and the final locations of all precast concrete components;
3. Update records specified in above sub-clause (2) for all precast façade / precast balcony units to the RFID Web-Based Database System.

CON7.W300.8  REQUIREMENTS OF OTHER TRAVES AND COMPONENTS
Incorporate the requirements of all trades such as blockouts, recesses, notches, embedded metal works or any other items before casting the precast concrete components units.

ACCURACY AND TOLERANCES

CON7.W410.A  MANUFACTURING AND ERECTION TOLERANCES
1. Refer to:
   a. Code of Practice for Precast Concrete Construction 2016 published by the BD;
   b. Appendix H "Schedule of Tolerances" to this Specification.
2. Where any ambiguity, discrepancy or conflict arises between sub-clauses (1)(a) and (1)(b) above, the provisions given in Appendix H shall prevail.

CON7.W420.8 CHECKING TOLERANCES
Check the manufacturing dimensional tolerances of the precast concrete components by an Approved method for each type of components at a rate of 1 in every 10 units produced and report the result to CM within two days of checking.

CON7.W430.8 DEFECTIVE UNITS
1. Any precast concrete components that falls outside the tolerance limits is considered defective and must be replaced as instructed. Indelible mark on rejected units for identification purposes;
2. In the event of the CM agreeing to accept any defective precast concrete components, execute all necessary remedial and modification work to the CM's satisfaction.

HANDLING, TRANSPORTATION AND STORAGE

CON7.W510.8 LIFTING FRAME
Lift precast concrete components within the casting yard by means of a purpose-made steel lifting frame designed to the Code of Practice for the Structural Use of Steel 2011 issued by the Buildings Department.

CON7.W520.8 INSPECTION
Inspect each precast concrete components before lifting to ensure that neither damage nor hazard occurs during lifting.

CON7.W530.8 LIFTING
Lift the precast concrete components only at appropriate lifting points as shown on the Drawings.

CON7.W540.8 LIFTING PLANT AND EQUIPMENT
1. Ensure plant used for lifting including cranes, hoists, lifting frames, hooks, etc possess adequate safety margins, are maintained in good working order and are regularly tested. Provide details of plant and maintenance records and current test certificates when required by the CM;
2. Maintain crane rope in a sound condition. Discard all frayed bridle ropes or slings;
3. Notwithstanding sub-clause (1) above, provide test certificates of lifting anchor to the CM in accordance with CON7.T610 to CON7.T650.

CON7.W550.8 LOADING AND OFF-LOADING
Carry out lifting for loading or off-loading the precast concrete components in one movement. Lift off and re-position any precast concrete components which is not properly positioned after lifting, rather than levering it into place.

CON7.W560.8 TRANSPORT VEHICLES
Maintain lorries or trolleys used for the transportation of the precast concrete components in a good condition. Ensure trolleys are equipped with suspension systems to minimize shock loading.
**ERECTING UNITS**

**CON7.W610.8 PROGRAMME**

Provide a programme for the erection of the precast concrete components showing the rate of erection for each month. Make due allowance for all restrictions on the age of concrete in the precast concrete components for handling, storage, transportation and erection.

**CON7.W620.8 SITE RECORDS**

Provide, at the end of each week during erection of the precast concrete components, records in a form to be agreed with the CM, showing:

1. Dates and the locations of structural connections completed;
2. Dates of removal and locations of props and temporary supports to the precast concrete components.

**CON7.W630.8 CM'S INSPECTION**

Allow and facilitate inspection of the precast concrete components at any time before erection and after installation.

**CON7.W640.8 QUALITY CONTROL PROCEDURES**

Within three months from the notified date of commencement of Works, submit for Approval, details of erection of the precast concrete components under Approved quality control procedures covering the following:

1. Protective measures to avoid cracking and chipping;
2. Checking the accuracy of the insitu structural members receiving the precast concrete components, including location and level of all bearing surfaces, joints, bolts, horizontal and vertical restraining devices and adjustment devices. Carry out checking by means of a template or measurement frame or a similar Approved method;
3. Checking of erection tolerances.

**CON7.W650.A LIFTING UNITS INTO POSITION**

1. Lift the precast concrete components by steel lifting frame complying with CON7.W510 except otherwise stipulated in sub-clause (4) and (5) below;
2. Maintain all cables connecting the lifting frame and the lifting points of the precast concrete components in a vertical direction. Provide the cables with devices for the adjustment of their length;
3. Do not allow devices such as sockets or bolts for lifting purposes to be used for fixing the precast concrete components to the main structure;
4. Submit detailed method statement including the design, drawing and installation procedures with endorsement of the Contractor’s RSE demonstrating to the satisfaction of the CM that the precast concrete component will not subject to excessive stresses arising from their proposed erection method without the steel lifting frame, exemption from using the steel lifting frame as stated in sub-clause (1) above can be allowed only for the lifting of the following precast concrete components.
   a. Vertically lifting precast elements:
      - Precast façade, precast balcony, precast structural wall, precast partition wall, precast refuse chute, lost form (semi-precast wall), precast roof parapet and precast A/C hood with the maximum horizontal dimension less than or equal to 1.8m;
   b. Horizontally lifting precast elements:
Full precast slab, semi-precast slab, precast staircase and precast tie beam with the maximum horizontal dimension less than or equal to 6m.

5. In connection with sub-clause (4) above, address the safety use of the proposed lifting anchor system, including but not limited to the proprietary anchor bolt with clutch. The proposed lifting anchor system shall be flexible enough to allow for both vertical and slant lifting sling.

### CON7.W660.8 UNITS DAMAGED ON TRANSPORTATION, LIFTING OR ERECTION

Replace any precast concrete components which has been damaged on transportation, lifting or erection.

### TRAIL UNIT

### CON7.W710.8 GENERAL

Prior to mass production of the precast concrete component units:

1. Produce a full size trial sample for the precast façade / precast balcony unit and semi-precast slabs (if any) complete with joints, windows and glazing and the electrical conduit system installation and all finishing;

2. Maintain the Approved sample units as the yardstick for the standard and quality necessary for all precast concrete components;

3. When construction of a trial panel is required in CON2.W720, structurally connect the trial sample to surrounding structural frames and with interfacing services as detailed on the Drawings.

### TRIAL ASSEMBLY

### CON7.W750.X DELETE

### PRODUCING PRECAST FAÇADE / PRECAST BALCONY UNITS

### CON7.W810.8 SCOPE OF WORK

For off-Site casting, coordinate with the precast concrete components supplier and include the following provisions with the precast facades and / or precast balconies delivered to Site.

1. Aluminium windows or uPVC windows obtained from a supplier approved by the CM in accordance with COM2.M005 or COM3.M010 respectively;

2. Pre-formed holes for the installation of drainage pipes;

3. Earthing lugs as shown on the Drawings;

4. Concealed electrical PVC conduit system installations as shown on the Drawings and as specified;

5. A certificate indicating the date of casting;

6. Work completion certificate for pre-installed electrical conduit system installation;

### CON7.W820.8 MOULDS

Construct moulds from steel or other materials to produce a standard in accordance with the 'Surface finishes' specified in CON7.W850 to CON7.W900. Replace any mould which fails to comply with the standard.
CON7.W830.8 HORIZONTAL CASTING
Provide moulds designed to facilitate horizontal casting with devices to enable rotation from horizontal to vertical through 90° so that the precast façade / precast balcony units can be lifted vertically on demoulding.

CON7.W840.8 WINDOWS FIXING TO PRECAST FAÇADE / PRECAST BALCONY UNITS
Fix window frames / windows complete with or without opening sashes before casting the precast facade / windows as specified in COM2 Worksection and:
1. Obtain Approval for the method of fixing window frames / windows;
2. Do not fix window frames / windows into preformed openings after casting.

CON7.W850.8 SURFACE FINISHES TO EXTERNAL FACE
Finish outside faces except edges and overhang soffits to give an even textured surface suitable for fixing glazed ceramic tiles by adhesive, or cast the tiles into the mould.

CON7.W860.8 SURFACE FINISHES TO EDGES AND OVERHANG SOFFIT
Finish top, edge and soffit of overhang to give a smooth untextured surface suitable for applying acrylic paint.

CON7.W870.8 SURFACE FINISHES TO LIVING / DINING / BEDROOMS
Finish to give:
1. A smooth untextured surface suitable for applying plastic emulsion paint for rental blocks;
2. An even textured surface suitable for receiving internal cement lime plaster for SSF blocks as required by the Contract.

CON7.W880.8 SURFACE FINISHES TO BATHROOM
Finish to give an even textured surface suitable for fixing tiles by method as shown or specified on the Drawings.

CON7.W890.8 SURFACE FINISHES TO KITCHEN
Finish to give an even textured surface suitable for fixing tiles by method as shown or specified on the Drawings.

CON7.W900.8 SURFACE FINISHES TO UTILITY AREA
Finish to give an even textured surface suitable for fixing glass mosaic tiles by adhesive.

CON7.W910.8 STORING UNITS
1. Store the precast facade / precast balcony units in the vertical plane on a level, well drained and maintained concrete surface and protect against staining or physical damage;
2. Support the precast facade / precast balcony units by an Approved method to prevent their warping, bowing, chipping or cracking;
3. Store different types of precast facade / precast balcony units components separately;
4. The precast facade / precast balcony units shall be supported by a device in storage area to prevent toppling. For off-site casting yards, racks shall be used and detailed in the submitted QA scheme.

CON7.W920.8 TRANSPORTING FROM CASTING YARD
Stack precast facade / precast balcony units vertically, on vehicles during transportation from the casting yard and:
1. Support the precast facade / precast balcony units on special cradles so that the units are completely protected against damage and adverse stresses;
2. Provide the details of the support and the support locations to the CM for comment.

CON7.W930.8 PROTECTIVE MEASURE FOR ERECTING UNITS
Provide protective measures to avoid cracking and chipping of the precast facade / precast balcony units and damage to the applied finishes and to the built-in items such as window frames.

CON7.W940.8 TEMPORARY SUPPORT
1. During fixing of the precast facade / precast balcony units, prop adjacent insitu structural members adequately to avoid excessive deflection or adverse stresses;
2. Maintain all temporary supports, props and restraints in position during casting of concrete in the structural joint. Remove temporary supports, props and restraints upon satisfactory testing and calculation to Approval;
3. Unless specifically designed for, do not allow temporary support to be derived from the precast facade / precast balcony units fixed at lower floors;
4. For off-Site casting, coordinate with the supplier regarding the details of all temporary supports, props and inserts to suit the proposed lifting and installation method.

CON7.W950.8 APPROVAL FOR PERMANENT FIXING
Do not carry out permanent jointing or connection between any precast facade / precast balcony unit and another, or to any part of the insitu structure, without prior Approval.

CON7.W960.8 CONDUIT INSTALLATION
Supply and install conceal rigid plain PVC conduit system complete with steel draw wires for precast facade and / or precast balcony as indicated on the Drawings.

CON7.W970.8 SHOP DRAWINGS OF CONDUITS
Prepare shop drawings, coordinate and agree with the Nominated Sub-contractor for electrical installation and Supplier for precast facade and / or precast balcony before submitting shop drawings for Approval.

CON7.W980.8 SUBMISSION AND APPROVAL OF CONDUITS

CON7.W990.8 CONDUIT BENDS
Internal radius: at least 4 times the outside diameter of the conduit.

CON7.W1000.8 BENDING, JOINTING AND TERMINATING OF CONDUITS
Follow conduit manufacturers' recommendation for:
1. Method of carrying out the conduit bends and conduit joints;
2. Method of fixing conduits to boxes without spouts;
3. Use of tools and materials.

CON7.W1010.8 COMPLETION CERTIFICATION FOR ELECTRICAL CONDUIT SYSTEM INSTALLATION
1. All conduits and accessories installed have to be certified by at least Grade A2 of Registered Electrical Workers (REW);
2. When delivered to Site, the precast concrete components must be accompanied with a Work Completion Certificate Form WR1(A) specified by Electrical and Mechanical Services Department which shall be duly signed by a Registered Electrical Contractor and a REW certifying that the pre-installed conduit system installation is in full compliance with the Specification and the Code of Practice for the Electricity (Wiring) Regulations;

3. A single certificate can be issued for delivered lots of precast concrete components which are produced in each production lot. The certificate shall also carry information e.g. reference number etc. for traceability purpose;

4. Provide CM and the Nominated Sub-contractor for Electrical Installation each a copy of the Work Completion Certificate for record.

**PRODUCING AND ERECTING SEMI-PRECAST SLAB**

**CON7.W1105.8 ERECTION OF SEMI-PRECAST SLAB**

1. For erection of semi-precast slab, refer to the drawings detailed in Project Specific Specification, which are provided for reference only;

2. Submit design calculations and detail drawings of the shoring layouts and details for CM's approval at least 4 weeks before commencement of constructing the erection support.

**PRODUCING AND ERECTING SEMI-PRECAST SLAB**

**CON7.W1110.A STORING AND TRANSPORTING**

1. Unless otherwise Approved, the semi-precast slabs must be stacked and separated by 75 mm x 75 mm timber joints to the full length of the elements symmetrically placed next to the lifting hook and vertically aligned;

2. Provide details of the support and the support locations to the CM for comment;

3. Ensure that stacking of semi-precast slab does not generate unintended bearing, compressive, tensile or flexural stresses on the prefabricated reinforcement and conduit system.

**CON7.W1120.A CLEANSING AND CRACK INSPECTION BEFORE INSITU CONCRETE TOPPING**

1. Remove all laitance, loose materials, dirt and grease from the top surface of the semi-precast slab to the satisfaction of the CM before applying insitu concrete topping:
   a. Use water jet with a minimum pressure of 10,000 kPa (100 bar) for cleansing;
   b. Maintain the cleansing as specified in sub-clause (a) above for a minimum period of 4 minutes per flat of about 30 m² and adjust the operation duration for different flat size.

2. After water-jet cleansing in sub-clause (1) above, check for cracks at the underside of semi-precast slab:
   a. Through cracks are deemed to exist if signs of water seepage or damp patches are observed at the bottom of semi-precast slab;

**CON7.W1130.N CONDUIT INSTALLATION**

Supply and install concealed rigid plain PVC conduit system completed with draw wires for semi-precast slab as shown on Drawings.
CON7.W1140.N  SHOP DRAWINGS OF CONDUITS
Submit to the CM for approval within two months prior to production, 5 sets shop drawings of conduits mounted on semi-precast slab, which have been coordinated and agreed with all relevant building services Nominated Sub-contractors and suppliers.

CON7.W1150.N  SUBMISSION AND APPROVAL OF CONDUITS

CON7.W1160.N  CONDUIT BENDS
Internal radius: at least 4 times the outside diameter of the conduit.

Follow conduit manufacturers’ recommendation for:
1. Method of carrying out the conduit bends and conduit joints;
2. Method of fixing conduits to boxes without spouts;
3. Use of tools and materials.

CON7.W1180.N  COMPLETION CERTIFICATION FOR ELECTRICAL CONDUIT SYSTEM INSTALLATION
1. All conduits and accessories installed have to be certified by Registered Electrical Workers (REW) of Grade A2 or above;
2. When delivered to Site, the precast concrete components shall be accompanied with a Work Completion Certificate Form WR1(A) specified by Electrical and Mechanical Services Department which shall be duly signed by a Registered Electrical Contractor and a REW certifying that the conduit system installation is in full compliance with the Specification and the Code of Practice for the Electricity (Wiring) Regulations;
3. A single or multiple certificates shall be issued for delivered lots of precast concrete components which are produced in each production lot. The certificate shall also carry information, e.g. reference number, etc., for traceability purpose;
4. Provide the CM and the Nominated Sub-contractor for Electrical Installation each a copy of the Work Completion Certificate for record.

ERECTING PRECAST STAIRS

CON7.W1210.8  DOWEL FIXING
Locate box cutouts of precast stairs over cast-in dowel bars and fill with non-shrink grout.

CON7.W1220.8  BEDDING AND JOINTING
Bed and joint precast stairs in non-shrink grout or cement mortar where shown on Drawings.

PRODUCING AND ERECTING PRECAST STRUCTURAL WALL / PRECAST PARTITION WALL

CON7.W1310.A  STORING AND TRANSPORTING
Unless otherwise Approved, the precast structural walls / precast partition walls must be stacked and separated by 75 mm x 75 mm timber joints to the full length of the elements symmetrically placed next to the lifting hook and vertically aligned.
CON7.W1320.A CLEANSING AND INSPECTION OF JOINTS BEFORE POURING SLAB CONCRETE
1. Before fixing the concealed conduits and void formers, remove all laitance, loose materials, dirt and grease from the top of the precast structural walls / precast partition walls by using high pressure waterjet with minimum pressure of 10,000 Kpa (100 bar) to the satisfaction of the CM;
2. Allow and facilitate inspection of joints by the CM before applying insitu concrete topping to the semi-precast slabs.

CON7.W1330.A TEMPORARY SUPPORT
1. During fixing the precast structural walls / precast partition walls, prop adjacent insitu structural members adequately to avoid excessive deflection or adverse stresses;
2. Maintain all temporary supports, props and restraints in position during applying insitu concrete topping to the semi-precast slabs. Remove temporary supports, props and restraints upon satisfactory testing and calculation to Approval;
3. Do not use precast partition walls as temporary or permanent supports for other structural and non-structural members;
4. For off site casting, coordinate with the supplier regarding the details of all temporary supports, props and inserts to suit the proposed lifting and installation method.

CON7.W1340.A PROTECTIVE MEASURE FOR ERECTING UNITS
Provide protective measures to avoid cracking and chipping of the precast structural walls / precast partition walls and damage to the applied finishes and to the built-in items such as fabricated U-channels and embedded steel plates.

CON7.W1350.A BEDDING AND JOINTING
Locate embedded steel plates of precast structural walls / precast partition walls over cast-in locking steel plates. Bed and joint precast structural walls / precast partition walls in non-shrink cement mortar where shown on Drawings.

CON7.W1360.A APPROVAL FOR PERMANENT FIXING
Do not carry out permanent jointing or connection between any precast structural walls / precast partition walls and another, or to any part of the insitu structure, without prior Approval.

CON7.W1370.A CONDUIT INSTALLATION
Supply and install concealed rigid plain PVC conduit system complete with draw wires for precast structural walls / precast partition walls / precast lift shafts / volumetric precast concrete components etc. as shown on Drawings.

CON7.W1380.A SHOP DRAWINGS OF CONDUITS
Submit to the CM for approval within two months prior to production, 5 sets shop drawings of conduits mounted on precast structural walls / precast partition walls, which have been coordinated and agreed with all relevant building services Nominated Sub-contractors and suppliers.

CON7.W1390.8 SUBMISSION AND APPROVAL OF CONDUITS

CON7.W1400.8 CONDUIT BENDS
Internal radius: at least 4 times the outside diameter of the conduit.
CON7.W1410.8  BENDING, JOINTING AND TERMINATING OF CONDUITS
Follow conduit manufacturers’ recommendation for:
1. Method of carrying out the conduit bends and conduit joints;
2. Method of fixing conduits to boxes without spouts;
3. Use of tools and materials.

CON7.W1420.8  COMPLETION CERTIFICATION FOR ELECTRICAL CONDUIT SYSTEM INSTALLATION
1. All conduits and accessories installed have to be certified by at least Grade A2 of Registered Electrical Workers (REW);
2. Where delivered to Site, the precast concrete components must be accompanied with a Work Completion Certificate Form WR1(A) specified by Electrical and Mechanical Services Department which shall be duly signed by a Registered Electrical Contractor and a REW certifying that the conduit system installation is in full compliance with the Specification and the Code of Practice for the Electricity (Wiring) Regulations;
3. A single certificate can be issued for delivered lots of precast concrete components which are produced in each production lot. The certificate shall also carry information e.g. reference number etc. for traceability purpose;
4. Provide CM and the Nominated Sub-contractor for Electrical Installation each a copy of the Work Completion Certificate for record.
TESTING

SAMPLING AND TESTING GENERALLY

CON7.T010.8 RECORDS
1. Keep a complete record of all sampling and testing, in a form agreed with the CM;
2. Submit test reports and certificates to the CM within 14 days from the date of test.

CON7.T020.A WITNESSING SAMPLING AND TESTING BY THE CM
The CM will witness any sampling and testing carried out under the Quality Assurance Scheme:
1. Make the records of sampling and testing available for inspection by the CM or his representatives resident at manufacturer's factory;
2. The CM or his representatives resident at manufacturer's factory is entitled to reject individual precast concrete components represented by any failed test result on the precast concrete component.

CON7.T030.A TESTS AT MANUFACTURER'S FACTORY
Provide samples, all necessary facilities and attendance to the DTC or the CM or his representatives resident at manufacturer's factory to carry out the following tests:
1. Schmidt hammer tests and covermeter tests on the construction quality of precast concrete components;
2. Tests on concrete constituent materials, tests on compressive strength of concrete cubes and concrete cores, tests on reinforcement bars and tests on fabric reinforcement by the DTC and/or HDML.

CON7.T040.A INSTALLATION OF RFID TAG IN CONCRETE CUBE FOR CUBE COMPRESSION TEST TO BE CARRIED OUT BY DTC OR HDML
1. Install a Radio Frequency Identification (RFID) tag as detailed on Sketch no. RFID/TAG/SK-01 onto the trowelled surface of each of the concrete cubes immediately after preparation of cubes at the manufacturer's factory under the witness of the CM or his representatives resident at manufacturer's factory unless otherwise instructed by the CM;
2. The RFID tags are to be provided by DTC or the CM or his representatives resident at manufacturer's factory in batches;
3. Validate and scan the RFID tag with the Bluetooth RFID reader provided by DTC or the CM or his representatives resident at manufacturer's factory before use, and ensure that information such as tag unique identification (UID), electronic product code (EPC) number and timestamp have been uploaded to the PC provided by the DTC or the CM or his representatives resident at manufacturer's factory and incorporated into the DTC's database system (through 3G or above internet service);
4. Input the mould number and/or sampling certificate number against the concerned tag EPC number through the DTC's database system;
5. Before the tagged cubes are sent from the manufacturer's factory to HDML or are collected by the DTC, scan the tag again using the Bluetooth RFID reader and ensure that information such as tag UID, EPC number and timestamp have been uploaded to the PC and incorporated into the DTC's database system (through 3G or above internet service);
6. Deliver the tagged cubes to HDMTL or arrange the tagged cubes to be collected by the DTC with due care at a time such that a minimum of 4 days is allowed for curing the cubes in DTC or HDMTL before testing on compressive strength at 28 days by DTC or HDMTL;

7. In case any damaged RFID tags are discovered, report to the CM or his representatives resident at manufacturer's factory immediately without any delay;

8. Maintain an inventory record of all RFID tags including those damaged and submit the inventory record to the CM or his representatives resident at manufacturer's factory for endorsement.

TESTS ON WORKABILITY

CON7.T050.8 STANDARD
As CON1.T510.

CON7.T051.8 ACCEPTANCE VALUES FOR APPROVED CONCRETE MIXES
As CON1.T520.

TESTS ON COMPRESSIVE STRENGTH OF CONCRETE CUBES

CON7.T052.8 STANDARD
As CON1.T610.

CON7.T053.8 SAMPLES FOR DESIGNED CONCRETE MIXES
As CON1.T620.

CON7.T054.8 RESULTS FOR DESIGNED CONCRETE MIXES
As CON1.T630.

CON7.T055.8 COMPLIANCE CRITERIA FOR DESIGNED CONCRETE MIXES
As CON1.T640.

CON7.T056.8 TABLES OF COMPLIANCE REQUIREMENT FOR DESIGNED CONCRETE MIXES
As CON1.T650.

CON7.T057.8 NON-COMPLIANCE OF DESIGNED CONCRETE MIXES
As CON1.T660.

CON7.T058.8 FURTHER TESTS ON DESIGNED CONCRETE MIXES
As CON1.T670.

COMPRESSIVE TEST ON CONCRETE CUBES

CON7.T110.8 GENERAL
Testing arrangements:

1. Carry out tests on workability, make and cure concrete cubes made from the concrete used for casting the precast concrete components, by the Contractor / manufacturer for precast concrete components;
2. All details, including sampling frequency, of the concrete cubes tests must be in accordance with Worksection CON1;

3. The tests on compressive strength of concrete cubes shall be carried out by the DTC and/or HDMTL.

TESTS ON COMPRESSIVE STRENGTH OF EARLY CORES FOR PRECAST CONCRETE COMPONENTS EXCEPT SEMI-PRECAST SLAB AND PRECAST PARTITION WALL

CON7.T121.A GENERAL

1. Provide all necessary facilities and attendance for carrying out coring and testing of concrete cores by DTC, including the provision of a secure and lockable storage for DTC to store the coring machine and other associated equipment;

2. Tests are to be witnessed and endorsed by the Contractor's representative and the CM or his representatives resident at manufacturer’s factory;

3. Allow 2-day advance notice for preparation by DTC before the taking of core samples at the manufacturer’s factory;

4. Upon completion of the taking of core samples by DTC at the manufacturer’s factory, allow a minimum of 6 more days and a maximum of 15 more days for DTC to provide the core test results;

5. Make due allowance in the programme for the aforesaid arrangement and no claim for extension of time shall be allowed;

6. Subject to CM’s approval, omission of early core test may be permitted for a particular batch of precast concrete components in order not to affect the construction work on Site. In such case, core test shall be carried out in accordance with the procedures set out in CON1.T710 to CON1.T760 to prove the compliance of that particular batch of precast concrete components to compressive test on cores as stipulated in this Specification.

CON7.T122.8 STANDARD

Comply with CS1:2010 in respect of the method of preparing, inspecting and testing concrete cores to determine the compressive strength except the measurement of saturated density.

CON7.T123.A SIZE AND NUMBER OF EARLY CORE SAMPLES

Testing samples:

1. Provide necessary facilities and attendance to the taking of 3 Nos. of core samples by the DTC from each of the following precast concrete components for the same concreting day, at locations selected by the CM:
   a. Precast facades (including precast roof parapet);
   b. Precast balconies;
   c. Precast staircases (including precast roof staircases);
   d. Precast structural walls;
   e. Other precast elements as directed by the CM.

2. Size of core samples:
   a. 75 mm diameter core samples for precast concrete components;
   b. For vertically casted precast concrete components, the length of core samples shall be at least 90 mm;
c. For horizontally casted precast concrete components, the length of core samples shall be at least 90 mm plus top 50 mm or 20% of depth of concrete being cored whichever is greater.

**CON7.T124.8**

**AGE OF EARLY CORE SAMPLES**

1. Do not take cores for compressive test at ages less than 3 days;
2. Do not carry out compressive test on the core samples at ages less than 9 days.

**CON7.T125.8**

**ASSESSING COMPRESSIVE STRENGTH OF EARLY CORES**

In assessing the compressive strength of early cores, the precast concrete components of the same concreting day represented by the early cores are deemed to comply with this Specification if the compressive strength of the early core, when adjusted for length / diameter ratio and converted to estimated insitu cube strength in accordance with CS1:2010, is:

1. Not less than 85% of the specified grade strength for any individual results.

**CON7.T126.8**

**NON-COMPLIANCE AND FURTHER TESTS ON COMPRESSIVE STRENGTH OF CONCRETE CORES FOR PRECAST CONCRETE COMPONENTS**

1. For precast concrete components of the same concreting day represented by the early cores that the compressive strength of the early cores comply with CON7.T125, their core test results are deemed to be acceptable under this Specification, and further coring test at 28 days is not necessary unless compressive strength test of concrete cube of the same batch of concrete not comply with CON7.T054 or instructed otherwise by the CM;

2. For precast concrete components of the same concreting day represented by the early cores that the compressive strength of the early cores do not comply with CON7.T125:
   a. if the concreting ages of the precast concrete components are less than 28 days, carry out further early core tests by DTC. If the result of the further early core test does not comply with CON7.T125, the precast concrete components are not allowed to be lifted into place or installed on Site, and further early core test may be carried out in accordance with this sub-clause;
   b. if the concreting ages of the precast concrete components are 28 days or over, carry out further core test by DTC in accordance with CON1.T710 to CON1.T760. If the result of this further core test does not comply with CON1.T760, the precast concrete components are not allowed to be lifted into place or installed on Site. All relevant concrete of precast concrete components represented by this further core test in the same concreting day is deemed not complying with this Specification. Investigate the extent of non-compliance and re-execute the works in accordance with CON1.T1210 to CON1.T1260.

3. Make due allowance in the programme for the aforesaid arrangement and bear all time and cost for compliance with this clause.

**CON7.T127.8**

**MAKING GOOD CORE HOLES**

As CON1.T770.

**TESTS ON COMPRESSIVE STRENGTH OF CONCRETE CORES EXCEPT PRECAST PARTITION WALL**

**CON7.T128.8**

**GENERAL**

As CON1.T710.
CON7.T129.8  STANDARD
As CON1.T720.

CON7.T130.C  SIZE AND NUMBER OF CORE SAMPLES
1. Testing samples:
   a. Provide necessary facilities and attendance for taking 3 Nos. 100 mm diameter cores by DTC from each of the following precast concrete components for the same concreting day, at the location selected by the CM:
      i. Precast facades (including precast roof parapets);
      ii. Semi-precast slabs with insitu concrete topping;
      iii. Precast balconies;
      iv. Precast staircases (including precast roof staircases);
      v. Volumetric precast bathroom (VPB) and / or Combined VPB components;
      vi. Volumetric precast kitchen (VPK) and / or Combined VPK and / or Combined VPB and VPK components;
      vii. Volumetric precast lift shafts;
      viii. Volumetric precast lift machine room;
      ix. Other precast elements as directed by the CM.
   b. Provide necessary facilities and attendance for taking 3 Nos. 75 mm diameter cores by DTC from the precast structural walls for the same concreting day, at the location selected by the CM.

CON7.T135.8  AGE OF CORE SAMPLES
As CON1.T740.

CON7.T136.8  NON-COMPLIANCE AND FURTHER TESTS ON COMPRESSIVE STRENGTH OF CONCRETE CORES FOR SEMI-PRECAST SLAB
1. In the event that any of the core samples taken from the semi-precast slab with the insitu concrete topping debonds at the location between the semi-precast slab and insitu concrete topping, the core is deemed to be unacceptable for compression test. Take core from another slab that its insitu topping was cast on the same concreting day as the semi-precast slab with debonded core sample for compression test;
2. For the semi-precast slab panel with debonded core sample, the slab panel is deemed to be unacceptable. In addition, to confirm that debonding will not occur in other semi-precast slab panel of the same concreting day when insitu topping was cast, take further cores according to the following formula:
   Nos. of further cores = \((n^2 - 2n + 3)\).
   Where n is equal to the total number of unsuccessful cores, progressively until all cores are satisfactory (i.e. no debonding occurs). All semi-precast slab panels at which the cores had deboned shall be demolished and recast to the satisfaction of the CM all at contractor's own expense.

CON7.T140.8  CORE TESTING FOR SEMI-PRECAST SLAB
In respect of semi-precast slab, the concrete represented by the cores is to include:
1. The insitu concrete for the same concreting day;
2. The precast concrete slabs manufactured in the casting yard within the same casting day.

CON7.T150.8  REQUIREMENT FOR FURTHER CORE SAMPLES
As CON1.T750.
CON7.T160.8  ASSESSING COMPRESSIVE STRENGTH OF CONCRETE CORES
As CON1.T760.

CON7.T180.8  MAKE GOOD OF CORE HOLES
As CON1.T770.

CON7.T190.8  TESTING OF NON-SHRINK GROUT
As CON4.T070.

CON7.T200.8  TESTS ON COMPRESSIVE STRENGTH OF GROUT CUBES
As CON4.T080.

SCHMIDT HAMMER TESTS

CON7.T205.A  TESTING FREQUENCY
1. Provide all necessary facilities and attendance for carrying out of Schmidt hammer test on all structural element(s) of precast concrete components by the CM or his representatives resident at manufacturer’s factory when the concreting age of the precast concrete components is at least 3 days;
2. Subject to CM’s approval, the testing frequency may be reduced when satisfactory and consistent standard is established.

SITE WATERTIGHTNESS TESTS TO PRECAST FAÇADE / PRECAST BALCONY

CON7.T210.8  TESTING TRIAL UNIT
Testing arrangements:
1. Carry out watertightness tests to the jointing system of the full size trial samples specified in CON7.W710 in accordance with the procedures set out in CON7.T230;
2. Extend the watertightness tests to cover testing on joints of windows fixed to the full size trial sample all to the requirements specified in COM2.T210.

CON7.T220.A  TESTING INSTALLED JOINTS
Testing samples:
1. Carry out watertightness tests in accordance with the procedures set out in CON7.T230 to all joints of the properly installed precast facade / precast balcony units not connected monolithically to in-situ concrete at the rate of 50% of each particular type in locations as instructed by the CM or his representatives.

CON7.T230.8  TEST PROCEDURE
Test joints of each selected precast facade / precast balcony unit according to the procedures as follows:
1. Construct working platforms where necessary for carrying out water test safely;
2. Working from the exterior, wet the precast facade / precast balcony unit selectively, starting from the lowest horizontal joint, followed by the vertical joints and then the horizontal joint above;
3. Spray a continuous jet of water from a nozzle at a water pressure of 210 to 240 kPa at the nozzle inlet to the joint and perpendicular to the face of the precast facade / precast balcony unit. Move the nozzle slowly along the joint, at a distance of 300 mm from it, for a period of 5 minutes in every 1.5 metre of joint length while an observer carefully inspects on the interior side of the precast facade / precast balcony unit with the assistance of adequate lighting where necessary;

4. Unless otherwise Approved, use a nozzle to the requirements of the Architectural Aluminium Manufacturer’s Association (AAMA) 501.2-83;

5. Repeat the process specified in sub-clause (3) above on all joints and joint intersections using increments of exposed joint length not exceeding 1.5 metres upward until all the joints are covered.

CON7.T240.8 WITNESSES TO TEST
All watertightness tests carried out on Site must be witnessed and certified both by the CM and the Contractor's representative.

CON7.T250.8 FAILURE OF UNITS
The precast facade / precast balcony units and joints are deemed to have failed if signs of water seeping through the joints or through the precast facade / precast balcony unit, including signs of damp patches, are observed during the test and within the subsequent 2 hours after the test.

CON7.T260.A REMEDIAL WORK TO UNITS FOR RE-TEST AND ADDITIONAL TESTING
Non-compliance:
1. Carry out remedial work to precast facade / precast balcony units and joints which have failed the watertightness test. Methods of carrying out the remedial work are subject to Approval;

2. After the remedial work is completed, re-test the precast facade / precast balcony units and joints in accordance with the procedures set out in CON7.T230;

3. Repeat sub-clauses (1) & (2) above until the precast facade / precast balcony unit and joint comply with the specified criteria of watertightness;

4. For any one precast facade / precast balcony unit fails the watertightness test, carry out additional tests as follows:
   a. Select three additional samples as instructed by the CM or his representatives for testing. Each sample shall comprise three precast facade / precast balcony units of the same type as the failed precast facade / precast balcony unit;
   b. Carry out watertightness test to the additional samples in accordance with the procedures set out in CON7.T230;
   c. When any precast facade / precast balcony unit fails the test, repeat sub-clauses (1) & (2) above until the precast facade / precast balcony unit and joint comply with the specified criteria of watertightness.

5. Repeat sub-clause (4) above until all testing precast facade / precast balcony units and joints have complied with specified criteria of watertightness;

6. Bear all associated costs for the re-tests and additional tests as specified in the above sub-clauses. No extension of time will be allowed.

CORE TEST AND CRACK INSPECTION FOR SEMI-PRECAST SLAB

CON7.T410.8 CORE TEST IN SAMPLE FLAT UNIT
1. Testing samples:
The CM may select 3 Nos. of samples of standard cores through the roof slab at Trial Panels in CON7.W710 to determine the cleansing standard of semi-precast slab.

2. Non-compliance:
   If debonding is observed at the interface between the semi-precast slab and topping concrete, the cleansing standard under CON7.W1120 should be reviewed and the roof slab at Trial Panels recast for further core testing to the satisfaction of the CM.

**SURVEILLANCE INSPECTION**

**CON7.T510.B** JOINT INSPECTION AT MANUFACTURER'S FACTORY AND BREAKING UP INSPECTION

For off-site casting:

1. Arrange transportation for the CM and/or his representatives and carry out joint inspections at the manufacturer's factory;

2. Carry out up to 4 breaking-up inspections which may be instructed by the CM, each comprising the following:
   a. Provide samples of precast concrete component randomly selected by the CM or his representatives, break up the component for inspection and remove the broken component after inspection;
   b. Carry out the following inspection in the presence of the CM or his representatives:
      i. Reinforcement details including total number of bars and bar size in accordance with standard design drawings;
      ii. Bar pattern of the reinforcement used against the Mill Certificate and the requirements of purchaser test in CS2:2012;
      iii. The installation, markings and brand name of concealed electrical conduits, fittings and conduit accessories etc. when pre-installed electrical conduit system is installed.

3. In the event of samples of a type of components failing to meet any one of the requirements in the breaking-up inspection above, take further precast concrete components of that particular type according to the following formula until all precast concrete components satisfy the requirements as above:
   
   Nos. of further samples = \((n^2 - 2n + 3)\)
   
   where \(n\) is equal to the total number of unsuccessful components;

4. Bear the costs of all further breaking-up inspections that may be required under sub-clause (3) above and no extension of time will be allowed.

**LIFTING ANCHOR**

**CON7.T610.8** DEFINITION OF BATCH

In this Specification, a batch is defined as any quantity of lifting anchor of the same type and same working load capacity, delivered to the casting yard as one consignment and covered by the same test certificate issued by the lifting anchor manufacturer.

**CON7.T620.8** TYPE AND LOAD CAPACITY

Unless otherwise specified on Drawings, lifting anchors shall be either eye anchor type or foot anchor type, and with a working load of 0.25 times the ultimate load capacity.
CON7.T630.8  RATE OF SAMPLING
1. The rate of sampling for ultimate load capacity for each batch of lifting anchor shall be a minimum of one sample, which comprises three test specimens, for every 3,000 anchors or part thereof;
2. When Instructed, provide an additional sample comprising three test specimens for testing by DTC.

CON7.T640.8  COMPLIANCE CRITERION
No test result of ultimate load capacity of individual test specimen shall be less than 4 times the working load as stipulated in CON7.T620.

CON7.T650.8  SUBMISSION
Prior to the production of precast concrete components, provide test certificates issued by:
1. The lifting anchor manufacturer/agent supplier; and
2. An Approved testing laboratory employed by the manufacturer of precast concrete component on the ultimate load capacity of lifting anchors for each batch under the Quality Assurance System as stipulated in CON7.W040.
CON8 VOLUMETRIC PRECAST CONCRETE COMPONENTS FOR DOMESTIC BLOCKS

DESIGN

GENERAL

CON8.D010.A DEFINITION OF VOLUMETRIC PRECAST CONCRETE CONSTRUCTION
Construction of three-dimensional precast concrete building components or units, with fixtures, fittings and finishes, but excluding the following precast concrete components:
1. Precast facades (including precast roof parapet) (refer to CON7);
2. Semi-precast slabs (including semi-precast roof slabs and semi-precast corridor slabs) (refer to CON7);
3. Precast balconies (refer to CON7);
4. Precast staircases (including precast roof staircases) (refer to CON7);
5. Precast structural walls (refer to CON7);
6. Precast partition walls (refer to CON7);
7. Precast refuse chutes (refer to CON4).

CON8.D020.B USE OF VOLUMETRIC PRECAST CONCRETE COMPONENTS
Volumetric precast concrete components, including but not limited to the following, are covered by the specification in this Worksection:
1. Volumetric precast lift lobbies;
2. Volumetric precast kitchens;
3. Volumetric precast lift shafts;
4. Volumetric precast bathrooms;
5. Volumetric precast roof water tanks;
6. Volumetric precast ground floor water tanks;
7. Volumetric precast lift machine room.

CON8.D030.A RELEVANCE OF OTHER SPECIFICATION WORKSECTIONS
1. Comply with the requirements of this Worksection and relevant provisions of the Specification, in particular, the following Worksections:
a. CON1, In-situ Concrete;
b. CON2, Formwork;
c. CON3, Reinforcement;
d. CON4, Precast Concrete;
e. CON6, Movement Joints;
f. CON7, Precast Concrete Components;
g. COM2, Aluminium Windows and Louvres;
h. COM3, uPVC Windows;
i. COM5, Timber Doorsets;
j. COM11, Radio Frequency Identification and Web-based Database System for Building Components;
k. DRA1, Drainage Above Ground;
l. FIN1, Plastered and Rendered Finishes;
m. FIN3, Screeds;
n. FIN5, Floor and Wall Tiles and Slabs;
o. FIN6, Flexible Sheet and Tile Finishes;
p. FIN7, Painting;
q. MAS1, Brickwork, Blockwork and Panel Partitions;
r. MAS3, Mortar;
s. MET1, General Metalwork;
t. STR1, Structural Steel;
u. PLU1, Water Supply;
v. PLU2, Sanitary Appliances;
w. WAT5, Sealants;
x. WAT6, Proprietary Tanking and Waterproofing Systems.

Where building services installations are associated with volumetric precast concrete components, comply with the requirements and relevant provisions of the following Worksections:

a. ELE1 - ELE31, Electrical Installation;
b. FWP1 - FWP14, Fire Services & Water Pump Installation;
c. LTE1 - LTE2, Lift Installation.

Where any ambiguity, discrepancy or conflict arises between this Worksection and any clauses in any other Worksections, the provisions of this Worksection prevail.

CON8.D040.A DESIGN STANDARDS

1. For reinforced concrete structures, comply with CON1.M010;
2. For precast concrete, comply with CON4.D010 and Code of Practice for Precast Concrete Construction 2016 published by Buildings Department;
3. For structural joint design, comply with CON4.D020;
4. Where any ambiguity, discrepancy or conflict arises between this Worksection and any clauses in any other Worksections or standards, the most onerous conditions shall apply. Agree with the CM on the interpretation in advance of design.

SCOPE OF WORK

CON8.D110.A GENERAL (ENGINEER'S DESIGN)

1. Refer to the Drawings for the extent of volumetric precast concrete components including the identification of parts of the component that will function as facades;
2. Refer to the Drawings for the extent of fixtures, finishing, fittings and building services installations associated with volumetric precast concrete components;
3. Refer to the Drawings and relevant Specification clauses for the scope of builders, structural and building services works to be prefabricated in off-site yards.

CON8.D120.A SCOPE OF THE DESIGN (CONTRACTOR'S DESIGN)

Design the volumetric precast concrete components in accordance with the requirements specified in this Worksection, Worksections CON4 and CON7 as appropriate. Include the following in the scope of the design of those components:

1. The structural design of the volumetric precast concrete components;
2. The design of permanent structural connections between volumetric precast concrete components and/or building structure;
3. The design of the waterproof joints between volumetric precast concrete components functioning as a facade and/or the building structure;
4. The design of the installation of fixtures and finishes, including the finishing textures, associated with volumetric precast concrete components;
5. Building services installations as required and included in the fabrication of volumetric precast concrete components as a whole module;
6. Inspection method.

DESIGN PARAMETERS (CONTRACTOR'S DESIGN)

CON8.D210.A STABILITY
Design the volumetric precast concrete components to be stable at all times. Provide designs for both the component and for any necessary temporary props, ties and supports.

CON8.D220.A RESISTANCE TO PROGRESSIVE COLLAPSE
Design the volumetric precast concrete components in two ways, both as an assembly of individual walls and floors, and also as a complete unit in a progressive collapse design situation, providing additional ties to the rest of the structure for each case.

CON8.D230.A DEFORMATIONS
Design the volumetric precast concrete components to be located in the structure without deforming excessively before all of the joints and permanent structural connections are made. Include consideration of any temporary stiffening, support jigs or frames in the design.

CON8.D240.A INTERFACE WITH OTHER STRUCTURAL COMPONENTS
Design the volumetric precast concrete components so that all interfaces between other volumetric precast concrete components or the rest of the structure can be made neatly to the required standards of finish and tolerance.

CON8.D250.A EXTERNAL FACES
Design the volumetric precast concrete components so that any external faces can be inspected before erection and the main jointing can be made safely from within the structural envelope.

CON8.D260.A LOADING
1. Design the volumetric precast concrete components to be either load bearing or non-load bearing to sustain all possible loading acting upon them;
2. If load bearing, then design the component to carry the loads placed on it in both the temporary and permanent situations taking into consideration of any creep on vertical shortening of walls which may be more highly stressed than outer adjacent precast or in-situ vertical load bearing elements;
3. Submit calculations to demonstrate that in-situ structural members are not subject to excessive stresses arising from the erection method of the volumetric precast concrete components and to demonstrate the adequacy of any temporary supports which may be required;
4. Where volumetric precast concrete components include a facade element, the loading conditions should be determined in accordance with CON5.D250.
CON8.D270.A MINIMUM CONCRETE GRADE
Where volumetric precast concrete components include a facade element, the minimum concrete grade shall be Grade 35/20.

CON8.D280.A CONCRETE COVER TO REINFORCEMENT
Minimum cover to reinforcing bars in the facade elements of the volumetric precast concrete components:
1. External face: 30 mm;
2. Internal face: 25 mm.

CON8.D290.A CONCRETE COVER TO PVC CONDUIT
Minimum cover to PVC conduits concealed within volumetric precast concrete components: 30 mm.

CON8.D300.A CONCEALMENT OF FIXINGS
Conceal all permanent fixing connections by Approved methods.

JOINTS

CON8.D410.A JOINTS
Apply back-up materials, bond breakers and sealants in accordance with Worksection WAT5.

CON8.D420.A GASKETS
Gaskets may be used in weatherproofing joints provided that:
1. The joint is horizontal; and
2. The gasket is always under compression.

CON8.D430.A MORTAR STOPS
Use backing rods or other Approved methods as mortar stops in grouting panel joints when necessary.

WEATHERPROOF JOINTS (CONTRACTOR'S DESIGN)

CON8.D510.A JOINT DESIGN
Design weatherproof external joints to be maintenance free, and ensure airtightness and watertightness in accordance with BS 6093:1993.

CON8.D520.A TYPES OF JOINT
Use one of the following types of weatherproof joints in accordance with BS 6093:1993:
1. Sealed joint (one-stage joint);
2. Drained joint (two-stage joint).

CON8.D530.A DESIGN WIDTH OF JOINTS
Design the joint width in accordance with BS 6093:1993 and BS 6213:1982.

PERMANENT STRUCTURAL CONNECTIONS

CON8.D610.A GENERAL (CONTRACTOR'S DESIGN)
Design the permanent structural connections:
1. To withstand the stresses induced by the volumetric precast concrete components described in CON8.D260;
2. To be watertight;
3. To be of the same grade of concrete as that for the volumetric precast concrete components.

CON8.D620.8 REINFORCEMENT, SHEAR CONNECTORS ETC
Ensure reinforcement, shear connectors, etc used for the permanent structural connections are adequately embedded or anchored into the building structure.

CON8.D630.A VERTICAL PERMANENT STRUCTURAL CONNECTIONS
At the vertical permanent structural connections between volumetric precast concrete components that are to be infilled,
1. Use non-shrink grout or concrete with non-shrinking additives if the minimum dimension is more than 150 mm;
2. Use only non-shrink grout if the minimum dimension is less than 150 mm.

CON8.D640.8 HORIZONTAL PERMANENT STRUCTURAL CONNECTIONS
For horizontal permanent structural connections, concrete with non-shrinking additives in lieu of non-shrink grout may be permitted subject to the provisions of CON4.M270.

DESIGN TOLERANCES

CON8.D710.A OVERALL TOLERANCES (CONTRACTOR'S DESIGN)
1. Design the volumetric precast concrete components and the associated joints/connections to the in-situ structure, other volumetric precast concrete components, precast concrete components, architectural and building services installations, including all cast in elements, to conform with the relevant tolerances given in Appendix H and the Code of Practice for Precast Concrete Construction 2016;
2. Where any ambiguity, discrepancy or conflict arises between the tolerances given in Appendix H and the CoP for Precast Concrete Construction, the provisions given in Appendix H shall prevail.

CON8.D720.A VOLUMETRIC PRECAST CONCRETE COMPONENTS MANUFACTURE TOLERANCE (CONTRACTOR'S DESIGN)
Design the volumetric precast concrete components and propose the manufacture tolerances in order to satisfy the overall tolerances given in Appendix H and Code of Practice for Precast Concrete Construction 2016, taking into account the erection tolerances.

CON8.D730.A VOLUMETRIC PRECAST CONCRETE COMPONENTS ERECTION TOLERANCE
Propose a set of erection tolerances that is in compliance with the overall tolerance allowed when taken together with the set of manufacture tolerances proposed taking into consideration all possible interfaces with adjacent precast units or in-situ elements.
LIFTING OF VOLUMETRIC PRECAST CONCRETE COMPONENTS

CON8.D810.A  LIFTING DESIGN
1. Ensure that the design of the lifting mechanism for volumetric precast concrete components provides a safe and robust means of lifting and holds the component in a truly vertical position and is adjustable to ensure verticality if necessary;
2. Submit for Approval the proposed lifting positions and any points of attachments on the components for lifting slings if not shown on the drawings.

CON8.D820.8  STEEL LIFTING FRAMES
Design and construct steel lifting frames in accordance with the Code of Practice for the Structural Use of Steel 2011 issued by the Buildings Department.

CON8.D830.8  LIFTING METHOD
Ensure that:
1. The design for lifting takes into account all loads on the component, friction against mould faces, snatch, impact and self weight of all fittings, lifting frame and equipment with an appropriate factor of safety;
2. Any lifting system that has a number of bolts, chains or ropes that work in parallel, is either designed such that all internal loads are calculable and statically determinate or, if not, that each bolt, chain, or rope possesses sufficient reserve of strength for any likely load distribution;
3. The equipment is capable of supporting the component if any single individual fastening, chain or bolt fails, taking into account any realignment of the component as it moves to place the centre of gravity under the new lifting arrangement.

SUBMISSIONS

CON8.D910.8  TENDER DESIGN PROPOSAL
Submit for Approval, full details of tender design proposals including drawings, specifications, layouts, details, calculations and any other information required.

CON8.D920.8  REGISTERED STRUCTURAL ENGINEER
All structural drawings, layouts, details and calculations submitted, including those submitted with tender, must be prepared and signed by a Registered Structural Engineer registered under Buildings Department of the Government of Hong Kong Special Administrative Region.

CON8.D930.A  PROGRAMME FOR SUBMISSIONS
1. Agree with the CM a programme for all submissions during the Contract prior to the notified date for commencement of Works;
2. Agree with the CM a programme for all ICU submissions for building works prior to the notified date for commencement of Works;
3. Within one month after the notified date for commencement of the Works, submit to the CM for approval, a programme for the design, planning and coordination with NSCs, ICU approval, manufacturing, erection and testing of a study mock up of the volumetric precast concrete components;
4. No extension of time will be allowed for any delay related to ICU’s approval.
CON8.D940.A  DRAWINGS AND METHOD STATEMENT (CONTRACTOR'S DESIGN)
Within two months after the notified date for commencement of the Works, submit the following to the CM for review and comment:
1. 5 sets of design drawings;
2. 5 sets of shop drawings including, but not limited to, coordinated services drawings, combined builder's works drawings, building services drawings, fixtures and fittings drawings. All shop drawings shall be fully dimensioned with tolerances and properly coordinated;
3. Calculations and any other information indicating the location of the volumetric precast concrete components and any changes resulting from the use of volumetric precast concrete components;
4. Calculations which show all loading imposed on the volumetric precast concrete components due to lifting, handling, stacking, shock or any other reason, complies with the relevant standards, unless specified otherwise;
5. Jointing details and/or permanent structural connections, which can accommodate building movements, between the proposed volumetric precast concrete components and insitu concrete;
6. Design of moulds with tolerance, layout arrangements, casting methods (horizontal or vertical), tilting mechanism, demoulding methods and the provision for attachments of openings for door and/or window fixing;
7. The complete procedures for fabrication, curing, demoulding, application of finishes, lifting, transporting, storage, erection of volumetric precast concrete components, installation of weatherproof joints, and its associated temporary works;
8. Method for identifying and recording the daily production of volumetric precast concrete components and their final position after installation;
9. Method of protecting the volumetric precast concrete components, including all building services installations and associated equipment fabricated within the units, from damage at all times;
10. Minimum concrete strength required for the volumetric precast concrete components for demoulding, handling, storage, transportation and erection;
11. Position and design of lifting points with tolerances;
12. Calculated weight and size, including projections beyond transportation vehicles, of each type of volumetric precast concrete components;

CON8.D950.A  DRAWINGS AND METHOD STATEMENT (ENGINEER'S DESIGN)
Within two months after the notified date for commencement of the Works, submit the following to the CM for review and comment:
1. Design of moulds with tolerance, layout arrangements, casting methods (horizontal or vertical), tilting mechanism, demoulding methods and the provision for attachments of openings for door and/or window fixing;
2. The complete procedures for fabrication, curing, demoulding, application of finishes, lifting, transporting, storage, erection of volumetric precast concrete components, installation of weatherproof joints and its associated temporary works;
3. Method for identifying and recording the daily production of volumetric precast concrete components and their final position after installation;
4. Method of protecting the volumetric precast concrete components, including all building services installations and associated equipment fabricated within the units, from damage at all times;
5. The proposed Radio Frequency Identification tag and the associated fixing method as stipulated in Worksection COM11;
6. 5 sets shop drawings of volumetric precast concrete components, which have been coordinated and agreed with all relevant building services Nominated Sub-contractors and suppliers.

**STRUCTURAL MODIFICATIONS TO THE BUILDING STRUCTURE (ENGINEER'S DESIGN)**

**CON8.D1010.8 CONTRACTOR'S RESPONSIBILITY (ENGINEER'S DESIGN)**
The Contractor's responsibility for the design of his proposed modification is covered under GCC Clauses 5.15 and 11.8 and the Appendix E to the Specification.

**CON8.D1020.8 COMPLIANCE WITH GUIDELINES AND REGULATIONS (ENGINEER'S DESIGN)**
Any proposed structural modifications to the building structure must comply with the following:
1. The structural design guidelines as appropriate to the building structure published by the Housing Department and included as Appendix E to this Specification;
2. The relevant Regulations, PNAP, CoP, etc. currently in use.

**CON8.D1030.8 REINFORCEMENT CHANGES (ENGINEER'S DESIGN)**
Obtain CM's Approval for any proposed changes to reinforcement details, as shown on the Drawings, required to suit the proposed method of casting and installation.

**STUDY MOCK-UP**

**CON8.D1110.A GENERAL**
1. Set up a study mock-up in order to demonstrate, prior to mass production, that the use of the proposed volumetric precast concrete components is feasible and that the volumetric precast concrete components are constructable, structurally safe, architecturally and functionally satisfactory when gauging against the following aspects:
   a. Buildability - speed, safety, structural & building services connections & interfaces, safe system of working;
   b. Tolerances, accuracy;
   c. Quality;
   d. Manufacturing process;
   e. Joint integrity;
   f. Testing on watertightness, strength and, structural integrity.
2. Implement any improvements shown to be necessary to the proposed volumetric precast concrete components in a timely manner to ensure that mass production of such components will meet the required standards and to minimise risk associated with new construction processes and methods.

**CON8.D1120.8 LOCATION OF CASTING YARD**
Within one month of the notified date for the awarded tender, state the location of the casting yard for the manufacture of the study mock-up for CM's approval.
### CON8.D1130.A SIZE OF STUDY MOCK-UP

1. Unless otherwise agreed by the CM, the study mock-up should be at least 2 storeys high, comprising all the different types of volumetric precast concrete components (except volumetric precast lift shafts) that will be adopted for construction in a typical floor with modular layout, for demonstrating all interfaces and joints with adjacent units, either in-situ or precast elements;

2. The study mock-up shall be in accordance with the overall size, shape, layout and external envelope of the typical floor. For Engineer's design, the actual extent of the study mock up is as shown on Drawings.

### CON8.D1140.A EXTENT OF COVERAGE OF STUDY MOCK-UP

Unless otherwise agreed by the CM, the study mock-up should include all internal and external finishes, doors and windows, electrical lighting, fittings, sockets, concealed conduits, sanitary fittings, internal and external services, plumbing and drainage, and any other accessories required for the proper functioning of the volumetric precast concrete components.

### CON8.D1150.A RESPONSIBILITIES OF THE CONTRACTOR

1. Be responsible for the design, submission, manufacture, transportation and installation of the proposed volumetric precast concrete components for the study mock-up;

2. All structural submissions, such as design principles, calculation and construction details, etc. shall be prepared and endorsed by a Registered Structural Engineer (RSE), registered with the Buildings Department as mentioned in CON8.D920;

3. Demonstrate that the design of the study mock-up can sustain the required dead, imposed, wind load and any other loads;

4. Design and execute any temporary works for the safe erection of the study mock-up;

5. Coordinate the interfacing works of the building services installation contained within the proposed volumetric precast concrete components of the study mock-up;

6. Allow adequate time for the application of design approval from the ICU prior to mass production of the volumetric precast concrete components;

7. Acquire the necessary approval from the relevant Authorities related to the following aspects:
   a. Architectural;
   b. Structural;
   c. Building services;
   d. Safety;
   e. Environmental.

8. Submit a method statement, together with all necessary shop drawings, for the study mock-up for review and comment by the CM prior to its execution. The method statement shall contain details on the manufacturing and transportation of the volumetric precast concrete components as well as their construction methodology, construction cycle, labour force required, major machineries and plants to be employed, and detailed work program;

9. Construct the study mock-up in strict accordance with the commented shop drawings and all methods of the study mock-up joint assembly are to faithfully represent actual job conditions. Do not use special measures or techniques that are not representative of those to be used on the building;

10. After the completion of the erection of the study mock-up, submit a report detailing the following:
   a. Assessment of the performance of the study mock-up and identification of any deficiencies or defects, conflicts or interface with building services;
b. Proposed improvement measures, covering the design, manufacture, transportation and erection aspects of the study mock-up;

c. Dimensional checking results;

d. Test results;

e. RSE's appraisal of the jointing system;

f. Digital photographs and video records of the erection procedures, in particular the fixing of the jointing system, and any in-situ testing.

11. Bear all costs for any required laboratory and field tests, including any additional fees, penalties or retest costs, and no extension of time will be allowed for any delay related to ICU's approval.

CON8.D1160.8 SHOP DRAWINGS

1. Coordinate the study mock-up drawings in order to construct the mock-up including adjacent interfacing elements, either in-situ or other precast components;

2. Submit 2 sets of shop drawings of the study mock-up, which include plans, elevations, sections and jointing details for review and comment by the CM prior to its manufacturing;

3. Submit 2 sets of Coordinated Services Drawings (CSD) and/or Combined Builders Work (CBW) Drawings of the study mock-up, demonstrating the proper coordination of interfacing works of the building services installation, for review and comment by the CM prior to its manufacturing.

CON8.D1170.8 CM'S COMMENT AND INSPECTION OF STUDY MOCK-UP

1. Do not commence the manufacturing and erection of the study mock-up until the comments from CM on the submitted shop drawings and proposed method statement had been received;

2. Alter or revise the study mock-up as directed upon CM's inspection.

CON8.D1180.8 AS-BUILT DRAWINGS FOR APPROVAL

1. Submit one set of as-built drawings, including as-built CSD and/or CBW, immediately upon completion of the study mock-up for Approval;

2. Incorporate and clearly shown on the as-built drawings any changes made to the study mock-up or deviations from the previously commented shop drawings.

CON8.D1190.A MAINTENANCE MANUAL

Submit a maintenance manual for the replaceable structural items of the volumetric precast concrete components. This should be developed in parallel with the study mock-up and should include, but not be limited to, the following information:

1. Name, address and telephone number of each firm and/or Sub-contractor involved in the supply of materials, components and/or assemblies of the replaceable structural items;

2. A clear and concise description of the method used to construct the concerned replaceable structural items;

3. Copies of certification and test reports of the material and/or component of the replaceable structural items;

4. A method statement covering the procedures for replacement of damaged or otherwise defective materials or components of the structural items, and materials and components that have a design life less than the design life of the volumetric precast concrete components and will therefore require replacement during the life of the volumetric precast concrete components;
5. Recommendations for routine maintenance, cleaning, suitable cleaning agents and any special inspection method of the materials and/or components of the replaceable structural items;

6. A full set of Approved as-built drawings, described in CON8.D1180, with particular emphasis on the details of the replaceable structural items;

7. The terms and conditions of any guarantees or warranties associated with the installed materials or components of the replaceable structural items.

**CON8.D1200.A**  
**CM'S APPROVAL TO PROCEED**

Obtain CM's Approval to proceed with the mass production of volumetric precast concrete components.

**CON8.D1210.A**  
**VALIDATION OF DESIGN ON STUDY MOCK-UP**

1. Conduct testing to the study mock-up in accordance with the relevant clauses of Worksections CON4, CON7 and CON8, subject to CM's agreement;

2. All joints and permanent structural connections, as demonstrated on the study mock-up which are designed to withstand any loadings, shall be tested in a HOKLAS laboratory to demonstrate their effectiveness in the transfer of loadings;

3. Carry out watertightness test to all external vertical and horizontal joints and permanent structural connections, as demonstrated on the study mock-up, in accordance with the procedures set out in CON8.T320;

4. Where a joint or permanent structural connection, as demonstrated on the study mock-up, is designed in combination with joint sealing compound specified in WAT5.M180, carry out the watertightness test prior to the application of the sealing compound to test the watertightness of the joint or permanent structural connection;

5. Conduct all necessary tests to the study mock-up in the presence of the CM or his representatives.

**CON8.D1310.8**  
**CORE TEST TO STUDY MOCK-UP**

1. Upon completion of grouting of joints and permanent structural connections, with large box out, of the study mock-up, provide all necessary facilities and attendance for concrete cores to be taken out from the grouted joints and permanent structural connections;

2. Take 3 nos. 100 mm diameter cores from selected grouted joints or permanent structural connections, as demonstrated on the study mock-up, to validate the effectiveness of the proposed grouting procedure for the joints or permanent structural connections;

3. In the event that any of the cores taken show any signs of irregularity or voids, such core and grouting procedure are deemed to be unacceptable. Review and revise the grouting procedures accordingly;

4. Replace and re-grout all such joints or permanent structural connections on the study mock-up, at which the cores show signs of irregularity or voids, and repeat the core test as described in sub-clause (2) above to the satisfaction of the CM;

5. Bear all costs of any further cores and no extension of time will be allowed.
MATERIALS

GENERAL

CON8.M010.A RELEVANCE OF OTHER SPECIFICATION WORKSECTIONS
1. Construct volumetric precast concrete components in accordance with this Worksection and the relevant provisions of the following Worksections:
   a. CON1, In-situ Concrete;
   b. CON2, Formwork;
   c. CON3, Reinforcement;
   d. CON4, Precast Concrete;
   e. CON6, Movement Joints;
   f. CON7, Precast Concrete Components;
   g. COM11, Radio Frequency Identification and Web-based Database System for Building Components.
2. Construct architectural, plumbing & drainage and structural works in accordance with the Worksections listed in CON8.D030;
3. Construct building services installations in accordance with the Worksections listed in CON8.D030;
4. Where any ambiguity, discrepancy or conflict arises between this Worksection and any clauses in any other Worksections of this specification, the provisions of this Worksection shall prevail.

SUBMISSIONS

CON8.M110.8 CONCRETE MIX
As CON1.

CON8.M120.8 DETAILS OF WEATHERPROOFING
Within two months of the notified date for the commencement of Works, submit details of weatherproofing materials in accordance with CON4.M310 and CON4.M320 for Approval, including technical information, samples, test reports and proven performance records of proposed materials.

CON8.M130.8 CONDUIT SYSTEM
Submit technical details and samples of the conduit system for Approval before commencement of works.

CONCRETE

CON8.M210.A CONCRETE MIX
<table>
<thead>
<tr>
<th>Specification Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CON8.M220.8</strong></td>
<td><strong>CONCRETE STRENGTH</strong></td>
</tr>
<tr>
<td>Design the mix to have a sufficient compressive and tensile strength. The compressive strength of the mix in load bearing components shall be compatible with the strength of other adjacent load bearing components.</td>
<td></td>
</tr>
</tbody>
</table>

| **CON8.M230.A**    | **DURABILITY** |
| Use the appropriate concrete mix for volumetric precast concrete components which is compatible with the defined exposure conditions of the internal and external faces of the components. |

| **CON8.M240.8**    | **NON-SHRINK GROUT AND CONCRETE WITH NON-SHRINK ADDITIVES** |
| As **CON4.M230** to **CON4.M270**. |

**JOINTS**

| **CON8.M310.8**    | **WEATHERPROOF JOINTS** |
| As **CON4.M310** to **CON4.M340**. |

**PERMANENT STRUCTURAL CONNECTIONS**

| **CON8.M410.8**    | **RESISTANCE TO CORROSION** |
| All metal parts of permanent structural connections must either be: |
| 1. Corrosion resistant, being constructed of non-ferrous metal or stainless steel but avoiding any contact of such materials with the reinforcement; or |
| 2. Protected against corrosion by an Approved method. |

**CONDUIT SYSTEMS**

| **CON8.M510.A**    | **GENERAL** |
| Conduit systems incorporated into volumetric precast concrete components shall comply in general with the requirements of clauses **CON7.M110** to **CON7.M430** inclusive. |

**DIMENSIONS AND TOLERANCES**

| **CON8.M610.A**    | **DIMENSIONAL CHECK** |
| 1. Ensure that manufacture tolerances are met by checking the volumetric precast concrete components using suitably designed jigs and gauges; |
| 2. Provide a means of checking the jigs and gauges which cannot be damaged. |

**ON SITE DELIVERY VERIFICATION**

<p>| <strong>CON8.M710.A</strong>    | <strong>INSPECTION</strong> |
| 1. Carry out the following verifications for volumetric precast concrete components upon delivery on Site in the presence of the CM or his representatives: |

c. Keep proper record of inspections, together with photographs, for CM's inspection at any time.

2. Non-compliance:
   a. In case of non-compliance, identify clearly such volumetric precast concrete components;
   b. Repair such identified volumetric precast concrete components in accordance with the Approved repair methods / procedures as per CON8.W420.

CON8.M720.A  BREAKING-UP INSPECTION

1. When instructed, provide a sample of volumetric precast concrete components randomly selected by the CM or his representatives upon delivery on Site, break up the component, carry out the following verifications in the presence of the CM or his representatives and remove the broken component after verification:
   a. Method:

---

2. Non-compliance:

   a. In the event of samples failing to meet any of the requirements given above:
      i. Remove the broken volumetric precast concrete components off site;
      ii. Take further volumetric precast concrete components as sample for re-test progressively according to the formula \(n^2 - 2n + 3\) where \(n = \) total number of unsuccessful volumetric precast concrete components and the maximum value of \(n\) is limited to 3; until all samples satisfy the requirements as above;
iii. In the event that \( n = 3 \) and not all samples satisfy the above requirements, all volumetric precast concrete components of the same type cast on the same date as per those samples that failed the breaking-up inspection shall be condemned and removed off site.

b. Bear all associated costs of any further breaking-up inspections that are instructed by the CM and no extension of time will be allowed.
WORKMANSHIP

GENERAL

CON8.W010.8 OFF SITE CASTING YARD
Unless otherwise specified in this Worksection, comply with the requirements of CON7.W010 to CON7.W090 pertaining to off-site casting.

CON8.W020.8 ARCHITECTURAL WORKS
Comply with the relevant requirements of architectural works as given in the Worksections in CON8.D030 unless specified otherwise in this Worksection.

CON8.W030.8 BUILDING SERVICES INSTALLATION
Comply with the relevant requirements of building services installation as given in the Worksections listed in CON8.D030.

CON8.W040.B QUALIFIED SUPERVISION FOR VOLUMETRIC PRECAST CONCRETE COMPONENTS
1. For production of volumetric precast concrete components, assign a Precast Quality Control Co-ordinator (PQCC), with a minimum qualification and experience of a Grade T3 TCP under the Registered Contractor's stream in the CoPSS, to provide full time supervision at the casting yard;
2. Submit the details of the PQCC for Approval;
3. It is permissible for the PQCC assigned under sub-clause (1) above to be the same person assigned as the PQCC under CON5.W040 or CON7.W050 provided that the qualification and experience of the PQCC assigned under CON5.W040 or CON7.W050 can satisfy the qualification and experience stipulated in the sub-clause (1) above;
4. For off site casting, subject to CM’s approval, the PQCC assigned under sub-clause (1) above may supervise the production of volumetric precast concrete components for more than one HA Contract of the same Contractor at the same casting yard.

SUBMISSIONS

CON8.W110.A MOULDS
1. Submit for CM's approval details of the mould for volumetric precast concrete construction showing its support and design to fulfil the functional requirements. Comply with the provisions given in CON7.W210;
2. Obtain CM's approval before casting any components.

CON8.W120.A METHOD STATEMENT
Submit a method statement, covering the following, for CM's approval:
1. Mould set up, inspection, approved mix, demoulding, curing, finishing and lifting;
2. Method of fixing window frames or windows, in accordance with CON7.W840, before casting of the volumetric precast concrete components commences;
3. Repair methods / procedures to typical defective components likely to be encountered;
4. Method to rectify starter bars which are out of position but within tolerances;
5. Details of the proposed means of support and storage of volumetric precast concrete components in the casting yard;
6. A layout of the storage yard which allows any components to be removed without disturbing other components on demand and minimises the need to sequence stacking and removal;

7. Erection of volumetric precast concrete components at their final locations in the structure;

8. The proposed Radio Frequency Identification tag and the associated fixing method as stipulated in Worksection COM11.

CON8.W130.8 CONDUIT SYSTEM SHOP DRAWINGS
Prepare shop drawings, coordinate and agree on the interfacing and connection method with the Nominated Sub-contractor for electrical installation before submitting shop drawings for Approval.

CON8.W140.A PROGRAMMES
Within one month after the notified date for commencement of the Works, submit, for Approval, the following:
1. Programme for manufacturing volumetric precast concrete components showing the rate of manufacture for each month and the dates for clearing the area of casting yard and associated plant upon completion of the manufacture of the components;
2. Programme for the erection of the volumetric precast concrete components showing the rate of erection for each month. Make due allowance for all restrictions on the age of concrete in the volumetric precast concrete components for handling, storage, transportation and erection.

CON8.W150.A QUALITY ASSURANCE SCHEME FOR MANUFACTURE OF VOLUMETRIC PRECAST CONCRETE COMPONENTS
Within two months after the notified date for commencement of the Works, submit details of the Quality Assurance Scheme for manufacturing the volumetric precast concrete components, in accordance with CON7.W040 to CON7.W060 as applicable, for Approval.

CON8.W160.A QUALITY CONTROL PROCEDURES FOR ERECTING VOLUMETRIC PRECAST CONCRETE COMPONENTS
Within three months after the notified date for commencement of the Works, submit for Approval, details of erection of the volumetric precast concrete components under Approved quality control procedures covering the following:
1. Protective measures to avoid cracking and chipping;
2. Checking the accuracy of the insitu structural members receiving the volumetric precast concrete components, including location and level of all bearing surfaces, joints, bolts, horizontal and vertical restraining devices and adjustment devices. Carry out checking by means of a template or measurement frame or a similar Approved method;
3. Checking of erection tolerances;
4. Provision and removal of temporary works;
5. Procedure for grouting of permanent structural connections with details to prevent air lock.

MOULD ASSEMBLY

CON8.W210.A TOLERANCE
Ensure that the mould is capable of manufacturing a component that, after erection, will be within the overall tolerances and manufacture tolerances for volumetric precast concrete components.
CON8.W220.8  **GROUT SEALS**
Ensure that:
1. The mould has grout seals appropriate to avoid leakage, or
2. If the concrete is to be vibrated, the seal design is appropriate to the means of filling and vibration.

CON8.W230.8  **GAUGES**
Provide details of gauges and fittings to check the correct set up of the mould before casting.

CON8.W240.8  **FITTINGS**
Ensure that the means of securing fittings to the mould is robust, suitable for repeated use, and will result in achieving the required tolerances without damage to the component.

CON8.W250.8  **EXTERNAL FACES**
Ensure that any concrete surfaces that will be external to the structure have, after casting, no metal fixings exposed and any holes have been filled.

CON8.W260.A  **DEFECTIVE MOULDS**
Replace any part of the mould system that fails to manufacture volumetric precast concrete components within the permitted tolerance limits.

CON8.W270.8  **USE OF RELEASE AGENTS**
Apply mould release agent, in accordance with CON2.M210, to the surfaces of moulds either by brush or by spraying before the fixing of steel reinforcement at a rate in accordance with the manufacturer's recommendations.

**MANUFACTURING OF VOLUMETRIC PRECAST CONCRETE COMPONENTS**

CON8.W310.A  **GENERAL**
Unless otherwise specified in this Worksection, comply with the provisions for manufacturing volumetric precast concrete components as given in Worksection CON7.

CON8.W320.A  **CONCRETE MIX**
1. Provide concrete in quantities such that casting is continuous using the Approved mix and method statement;
2. Arrange back up supplies for large volumetric precast concrete components if breaks in main supply are possible.

CON8.W330.8  **CONCRETING, COMPACTION AND CURING GENERALLY**
As CON1.

CON8.W340.A  **CONSTRUCTION JOINTS**
Demonstrate, for CM’s approval, that if the volumetric precast concrete components have construction joints within it, the detail and form of those joints will satisfy the requirements for the finishes requirement.

CON8.W350.8  **EXTERNAL VIBRATORS**
Obtain Approval for the use of external vibrators.
**CURING BY APPLICATION OF HEAT**

Obtain Approval for heat curing by means of steam, hot air, etc. and:

1. Ensure that the total chloride content of the concrete mix for volumetric precast concrete components, subject to heat curing, is less than 0.1% by weight of that of the cement;
2. Carry out a trial to demonstrate the adequacy of the proposed method to the satisfaction of the CM.

**DEMOULDING AND STRIPPING MOULDS**

Demould by means of an Approved method:

1. Do not use crowbars;
2. Do not subject the mould to any form of impact;
3. Fully, or partially, strip moulds when the concrete has gained sufficient strength, measured on specimens kept with the mould after casting;
4. Prove the stripping strength by test as given in CON8.W380 and check against the method statement.

**CONCRETE STRENGTH BEFORE DEMOULDING**

1. Demould the volumetric precast concrete components only after concrete has achieved the required strength;
2. To determine if the concrete has achieved the strength required for demoulding or handling:
   a. Make the necessary concrete cubes in pairs from the same batch of concrete used for casting the volumetric precast concrete components and cure the concrete cubes under the same conditions as the concrete in the volumetric precast concrete components;
   b. Specially identify the cubes and do not use them for normal quality control or for compliance testing;
   c. Determine the concrete cube strength by compression test as CON7.T110 and satisfy the CM that the concrete cubes have acquired the required strength before the demoulding or handling the volumetric precast concrete components.

**IDENTIFICATION AND RECORDS**

1. Mark all volumetric precast concrete components with date of manufacture and a unique reference number;
2. Record in a master register the dates of casting, the concrete grades and the final locations of all volumetric precast concrete components;
3. Where required by the CM, each of the volumetric precast concrete components is to be delivered to Site with an appropriate QA certificate endorsed by the Quality Control Engineer;
4. Update the records stipulated in above sub-clause (2) above for all volumetric precast concrete units to the RFID Web-Based Database System.

**REQUIREMENTS OF OTHER TRADES AND COMPONENTS**

Incorporate the requirements of all trades such as blockouts, recesses, notches, embedded metal works, building services installations or any other items etc. before casting the volumetric precast concrete components.

**SCOPE OF MINOR REPAIR**

1. Use suitable filler to fill blow holes, small voids and repair non structural damage in accordance with the Approved procedures as given in the method statement required under CON8.W120;
2. Test those procedures and, if required by the CM, demonstrate the procedures on the study mock-up.

**CON8.W420.A** DEFECTIVE COMPONENTS

1. Any volumetric precast concrete components that falls outside the manufacture tolerance is considered defective and must be rejected. Apply indelible mark on rejected units for identification purposes;

2. For other defects, including but not limited to minor chipping, damage to finishes or exposed conduits, etc., quarantine for inspection in accordance with the Approved QA scheme within the casting yard. Agree with the CM special repair methods or rejection of any defective volumetric precast concrete components that cannot be repaired and finished by the Approved repair methods / procedures as required under CON8.W120;

3. In the event of the CM agreeing to accept any quarantined volumetric precast concrete components, execute all necessary remedial and modification work to CM's satisfaction.

**CON8.W430.A** CLEANING

1. Ensure that all fittings that will be used to make connections in-situ are cleaned and checked prior to delivery of the volumetric precast concrete components to Site;

2. Ensure that all internal surfaces of the volumetric precast concrete components are cleaned to the standard agreed with the CM before the components are delivered to Site.

**CON8.W440.A** PROTECTION

Protect volumetric precast concrete components to ensure that no damage is done during and after storage, lifting, transportation or erection.

**CON8.W450.A** LIFTING

1. Lift volumetric precast concrete components only when the concrete has achieved the required lifting strength, measured on specimens kept with the volumetric precast concrete components in accordance with the Approved method statement required under CON8.D940 and CON8.W380;

2. Lift volumetric precast concrete components within the yard by means of a lifting system designed in accordance with CON8.D810 to CON8.D830;

3. Ensure that lifting plant and equipment complies with the requirements of CON7.W540.

**CON8.W460.A** SIZE AND WEIGHT OF VOLUMETRIC PRECAST CONCRETE COMPONENTS FOR TRANSPORTATION AND CRANEAGE

1. Indicate, in the method statement required under CON8.D940, the maximum projected horizontal and vertical dimensions of the component, including any protection, packing or protruding steel, beyond transportation vehicles, to ensure compliance with the limitations stipulated by local legislation;

2. Indicate, in the method statement required under CON8.D940, the maximum weight of the component including the weight of any props, supporting frame, protection or packing. Make clear any lifting or other components that are not included in this value. This weight shall not be exceeded;

3. Weigh each type of volumetric precast concrete components prototype component and any subsequent components as required by the CM.
CON8.W470.A  TEMPORARY STORAGE SUPPORT
1. Provide temporary support for storage of volumetric precast concrete components that does not place excessive bearing, compressive, tensile or flexural stresses on the component or cause spalling, cracking or unintended deformations;
2. Provide calculations to demonstrate that the likely deformation of volumetric precast concrete components, temporarily supported in the storage yard, is not detrimental to the manufacture tolerances, and, after erection, to the overall tolerance;
3. Ensure that stacking of volumetric precast concrete components does not generate unintended bearing, compressive, tensile or flexural stresses on the component or cause spalling, cracking or unintended deformations;
4. Store volumetric precast concrete components in the vertical plane on a levelled, well-drained and maintained concrete surface and protect against staining or physical damage.

CON8.W480.A  TRANSPORTATION
1. Provide a transportation system, complying with CON7.W510 to CON7.W560, such that damage to the component is prevented preferably without reliance on any protection cover;
2. Maintain lorries or wagons used for the transportation of the volumetric precast concrete components in a good condition. Ensure wagons are equipped with suspension systems to minimize shock loading;
3. Ensure all lifting of volumetric precast concrete components during transportation, including loading and unloading from lorries or wagons, comply with the lifting method as per CON8.W450.

ERECTING VOLUMETRIC PRECAST CONCRETE COMPONENTS

CON8.W510.A  SITE RECORDS
Provide, at the end of each week during erection of the volumetric precast concrete components, records in a form to be agreed with the CM, showing:
1. Delivery and installation dates, and the locations of joints and permanent structural connections completed on a location plan for each floor;
2. Dates of removal and locations of any props and temporary supports to the volumetric precast concrete components.

CON8.W520.A  CM'S INSPECTION
Allow and facilitate inspection of the volumetric precast concrete components at any time before and after erection.

CON8.W530.A  LIFTING UNITS INTO POSITION
1. Prove, by demonstration, that the lifting method is capable of meeting the design requirements given in CON8.D810 to CON8.D830;
2. Lift the volumetric precast concrete components using the lifting system complying with CON8.W450;
3. Maintain all cables connecting the lifting frame and the lifting points of the volumetric precast concrete components in a vertical direction. Provide the cables with devices for the adjustment of their length;
4. Do not allow devices such as sockets or bolts for lifting purposes to be used for fixing the volumetric precast concrete components to the main structure.
UNITS DAMAGED ON TRANSPORTATION, LIFTING OR ERECTION

Repair or replace as agreed with the CM any volumetric precast concrete components which have been damaged on transportation, lifting or erection in accordance with the Approved repair methods / procedures as required under CON8.W120.

JOINTS AND PERMANENT STRUCTURAL CONNECTIONS

GENERAL

Prepare and construct joints strictly in accordance with the Approved drawing details and in accordance with the relevant manufacturer's recommendations so as to provide continuous weathertightness of buildings and give a neat, uniform and smooth appearance.

GROUTING OF PERMANENT STRUCTURAL CONNECTION

Clean the connection by methods approved by the CM before the grout is placed. Take measures to prevent the accumulation of dirt and other material at the connection and the presence of air lock.

JOINT WIDTH

Unless otherwise Approved, the installed joint width must not be less than 6 mm nor greater than 30 mm.

CONDUIT SYSTEM

APPLICATION

Supply and install concealed rigid plain PVC conduit system complete with steel draw wires for volumetric precast concrete components as shown on Drawings.

COMPLETION CERTIFICATION

Comply with CON7.W1010.

CONDUIT AND WIRING INSTALLATION

CONDUIT BENDS

As CON7.W990.

BENDING, JOINTING AND TERMINATING OF CONDUITS

As CON7.W1000.

PROTOTYPE MOCK-UP

1. Erect a prototype mock-up on Site, in full accordance with the Approved as-built drawings of the study mock-up;

2. If proposed by the Contractor and approved by the CM, the prototype mock-up can be part of the permanent works;

3. Obtain Approval from the CM upon inspection of the completed prototype mock-up to set the standard and quality of workmanship necessary for all volumetric precast concrete components;
4. Do not alter, move, or destroy the Approved prototype mock-up unless permitted by the CM.

**CON8.W920.A**  
**REMOVAL OF PROTOTYPE MOCK-UP**
Subject to CM’s approval, remove the prototype mock-up as well as the surrounding structural frames upon completion of erection of all the volumetric precast concrete components.

**CON8.W930.8**  
**VERIFICATION OF PROTOTYPE MOCK-UP**
1. Carry out watertightness tests on the jointing system of the full size prototype mock-up specified in **CON8.W910** in accordance with the procedures set out in **CON8.T320**;
2. Extend the watertightness tests to cover testing on joints of windows fixed to the full size prototype mock-up all to the requirements specified in **COM2.T210**;
3. Conduct tests to finishes in accordance with the relevant clauses in Worksections **FIN1 to FIN7** as referred to in **CON8.D030**.
TESTING

SAMPLING AND TESTING

CON8.T010.8 RECORDS
1. Keep a complete record of all sampling and testing, in a form agreed with the CM;
2. Submit test reports and certificates to the CM within 14 days from the date of test.

CON8.T020.A WITNESSING SAMPLING AND TESTING BY THE CM
The CM will witness any sampling and testing carried out under the Quality Assurance Scheme:
1. Make monthly records of sampling and testing available for inspection by the CM or his representatives resident at manufacturer's factory.

CON8.T030.A TESTS AT MANUFACTURER'S FACTORY
Provide samples, all necessary facilities and attendance to the DTC or the CM or his representatives resident at manufacturer's factory to carry out the following tests:
1. Schmidt hammer tests and cover meter tests on the construction quality of precast concrete components;
2. Tests on concrete constituent materials, tests on compressive strength of concrete cubes and concrete cores, tests on reinforcement bars and tests on fabric reinforcement by the DTC and / or HDMTL.

CON8.T035.A INSTALLATION OF RFID TAG IN CONCRETE CUBE FOR CUBE COMPRESSION TEST TO BE CARRIED OUT BY DTC OR HDMTL
1. Install a Radio Frequency Identification (RFID) tag as detailed on Sketch no. RFID/TAG/SK-01 onto the trowelled surface of each of the concrete cubes immediately after preparation of cubes at the manufacturer’s factory under the witness of the CM or his representatives resident at manufacturer’s factory unless otherwise instructed by the CM;
2. The RFID tags are to be provided by DTC or the CM or his representatives resident at manufacturer’s factory in batches;
3. Validate and scan the RFID tag with the Bluetooth RFID reader provided by DTC or the CM or his representatives resident at manufacturer's factory before use, and ensure that information such as tag unique identification (UID), electronic product code (EPC) number and timestamp have been uploaded to the PC provided by the DTC or the CM or his representatives resident at manufacturer's factory and incorporated into the DTC’s database system (through 3G or above internet service);
4. Input the mould number and / or sampling certificate number against the concerned tag EPC number through the DTC’s database system;
5. Before the tagged cubes are sent from the manufacturer’s factory to HDMTL or are collected by the DTC, scan the tag again using the Bluetooth RFID reader and ensure that information such as tag UID, EPC number and timestamp have been uploaded to the PC and incorporated into the DTC’s database system (through 3G or above internet service);
6. Deliver the tagged cubes to HDMTL or arrange the tagged cubes to be collected by the DTC with due care at a time such that a minimum of 4 days is allowed for curing the cubes in DTC or HDMTL before testing on compressive strength at 28 days by DTC or HDMTL;
7. In case any damaged RFID tags are discovered, report to the CM or his representatives resident at manufacturer’s factory immediately without any delay;
8. Maintain an inventory record of all RFID tags including those damaged and submit the inventory record to the CM or his representatives resident at manufacturer’s factory for endorsement.

CON8.T040.A FULL SCALE MOCK UP FOR VPB AND VPK
1. Where required by the CM, design and provide full scale mock up as detailed in the Project Specific Specification to demonstrate that the volumetric precast bathroom (VPB) and volumetric precast bathroom (VPK) components, the installation of the VPB and VPK, and the workmanship of jointing are adequate, all to the satisfaction of the CM;
2. If agreed by the CM, the requirements of this full scale mock up shall be provided and demonstrated by the study mock-up as stipulated under CON8.D1110 to CON8.D1310.

TESTS ON WORKABILITY

CON8.T045.8 STANDARD
As CON1.T510.

CON8.T050.8 ACCEPTANCE VALUES FOR APPROVED CONCRETE MIXES
As CON1.T520.

TESTS ON COMPRESSIVE STRENGTH OF CONCRETE CUBES

CON8.T060.8 STANDARD
As CON1.T610.

CON8.T061.8 SAMPLES FOR DESIGNED CONCRETE MIXES
As CON1.T620.

CON8.T062.8 RESULTS FOR DESIGNED CONCRETE MIXES
As CON1.T630.

CON8.T063.8 COMPLIANCE CRITERIA FOR DESIGNED CONCRETE MIXES
As CON1.T640.

CON8.T064.8 TABLES OF COMPLIANCE REQUIREMENT FOR DESIGNED CONCRETE MIXES
As CON1.T650.

CON8.T065.8 NON-COMPLIANCE OF DESIGNED CONCRETE MIXES
As CON1.T660.

CON8.T066.8 FURTHER TESTS ON DESIGNED CONCRETE MIXES
As CON1.T670.
MIX TESTS

CON8.T110.8  GENERAL
Unless otherwise specified in this Worksection, comply with the requirements for trial concrete mixes and associated tests of both concrete and grout as given in Worksections CON1, CON4 and CON7.

SCHMIDT HAMMER TESTS

CON8.T120.B  TESTING FREQUENCY
1. Provide all necessary facilities and attendance for carrying out of Schmidt hammer test on the volumetric precast concrete components by the CM or his representatives resident at manufacturer’s factory when the concreting age of the volumetric precast concrete components is at least 3 days;
2. Subject to CM’s approval, the testing frequency may be reduced when satisfactory and consistent standard is established.

TESTS ON COMPRESSIVE STRENGTH ON EARLY CORES FOR VPB, VPK, VOLUMETRIC PRECAST LIFT SHAFT AND VOLUMETRIC PRECAST LIFT MACHINE ROOM COMPONENTS

CON8.T130.C  GENERAL
1. Provide all necessary facilities and attendance for carrying out coring and testing of concrete cores by DTC, including the provision of a secure and lockable storage for DTC to store the coring machine and other associated equipment;
2. Tests are to be witnessed and endorsed by the Contractor’s representative and the CM or his representatives resident at manufacturer’s factory;
3. Allow 2-day advance notice for preparation by DTC before the taking of core samples at the manufacturer’s factory;
4. Upon completion of the taking of core samples by DTC at the manufacturer’s factory, allow a minimum of 6 more days and a maximum of 15 more days for DTC to provide the core test results;
5. Make due allowance in the programme for the aforesaid arrangement and no claim for extension of time shall be allowed;
6. Subject to CM’s approval, omission of early core test may be permitted for a particular batch of volumetric precast bathroom (VPB), volumetric precast kitchen (VPK), volumetric precast lift shaft and volumetric precast lift machine room components in order not to affect the construction work on Site. In such case, carry out core test in accordance with the procedures set out in CON1.T710 to CON1.T760 to prove the compliance of that particular batch of VPB, VPK, volumetric precast lift shaft and volumetric precast lift machine room components to compressive test on cores as stipulated in this Specification.

CON8.T140.8  STANDARD
Comply with CS1:2010 in respect of the method of preparing, inspecting and testing concrete cores to determine the compressive strength except the measurement of saturated density.

CON8.T150.C  SIZE AND NUMBER OF EARLY CORE SAMPLES
Testing samples:
1. Provide necessary facilities and attendance to the taking of 3 Nos. of core samples by the DTC from each of the following volumetric precast components of the same concreting day, at locations decided by the CM:
   a. Volumetric precast bathroom (VPB) including Combined VPB components;
   b. Volumetric precast kitchen (VPK) including Combined VPK and Combined VPB and VPK components;
   c. Volumetric precast lift shaft components;
   d. Volumetric precast lift machine room.

2. Size of core sample:
   a. 75 mm diameter core samples;
   b. For vertically casted VPB, VPK, volumetric precast lift shaft and volumetric precast lift machine room components, the length of core samples shall be at least 90 mm;
   c. For horizontally casted VPB, VPK, volumetric precast lift shaft and volumetric precast lift machine room components, the length of core samples shall be at least 90 mm, plus top 50 mm or 20% of depth of concrete being cored whichever is greater.

CON8.T160.8 AGE OF EARLY CORE SAMPLES
1. Do not take cores for compressive test at ages less than 3 days;
2. Do not carry out compressive test on the core samples at ages less than 9 days.

CON8.T170.C ASSESSING COMPRESSIVE STRENGTH ON EARLY CORES
In assessing the results of compressive strength on early cores, the volumetric precast bathroom (VPB), volumetric precast kitchen (VPK), volumetric precast lift shaft and volumetric precast lift machine room components of the same concreting day represented by the early cores are deemed to comply with this Specification if the strength of the early core, when adjusted for length / diameter ratio and converted to estimated insitu cube strength in accordance with CS1:2010, is:
1. Not less than 85% of the specified grade strength for any individual results.

CON8.T180.C NON-COMPLIANCE AND FURTHER TESTS ON COMPRESSIVE STRENGTH OF CONCRETE CORES FOR VPB, VPK, VOLUMETRIC PRECAST LIFT SHAFT AND VOLUMETRIC PRECAST LIFT MACHINE ROOM COMPONENTS
1. For volumetric precast bathroom (VPB), volumetric precast kitchen (VPK), volumetric precast lift shaft and volumetric precast lift machine room components of the same concreting day represented by the early cores that comply with CON8.T170, their core test results are deemed to be acceptable under this Specification, and further coring test at 28 days is not necessary unless compressive strength test of concrete cube of the same batch of concrete not comply with CON8.T062 or instructed otherwise by the CM;
2. For VPB, VPK, volumetric precast lift shaft and volumetric precast lift machine room components of the same concreting day represented by the early cores that the compressive strength of the early cores do not comply with CON8.T170:
   a. if the concreting ages of the VPB, VPK, volumetric precast lift shaft and volumetric precast lift machine room components are less than 28 days, carry out further early core tests by DTC. If the result of the further early core test does not comply with CON8.T170, the VPB, VPK, volumetric precast lift shaft and volumetric precast lift machine room components are not allowed to be lifted into place or installed on Site, and further early core test may be carried out in accordance with this sub-clause;
b. if the concreting ages of the VPB, VPK, volumetric precast lift shaft and volumetric precast lift machine room components are 28 days or over, carry out further core test by DTC in accordance with CON1.T710 to CON1.T760. If the result of this further core test does not comply with CON1.T760, the VPB, VPK, volumetric precast lift shaft and volumetric precast lift machine room components are not allowed to be lifted into place or installed on Site. All relevant concrete of the VPB, VPK, volumetric precast lift shaft and volumetric precast lift machine room components represented by this further core test in the same concreting day is deemed not complying with this Specification. Investigate the extent of non-compliance and re-execute the works in accordance with CON1.T1210 to CON1.T1260.

3. Make due allowance in the programme for the aforesaid arrangement and bear all time and cost for compliance with this clause.

CON8.T190.8 MAKING GOOD CORE HOLES
As CON1.T770.

CON8.T195.8 TESTING ON NON-SHRINK GROUT
As CON4.T070.

CON8.T200.8 TESTS ON COMPRESSIVE STRENGTH OF GROUT CUBES
As CON4.T080.

TESTING FIXINGS

CON8.T210.8 TENSILE AND SHEAR TESTING
As CON4.T110 and CON4.T120.

SITE WATERTIGHTNESS TESTS TO EXTERNAL FACES ELEMENT OF VOLUMETRIC PRECAST CONCRETE COMPONENTS

CON8.T310.A TESTING INSTALLED JOINTS
Carry out watertightness tests to the jointing system of the external faces of the properly installed volumetric precast concrete components at the rate of 100% of each particular type in accordance with the procedures set out in CON8.T320.

CON8.T320.A TEST PROCEDURE
Test joints on each selected external face of volumetric precast concrete components according to the procedures as follows:

1. Construct working platforms where necessary for carrying out water test safely;
2. Working from the exterior, wet the external face of the volumetric precast concrete components selectively, starting from the lowest horizontal joint, followed by the vertical joints and then the horizontal joint above;
3. Spray a continuous jet of water from a nozzle at a water pressure of 210 to 240 kPa at the nozzle inlet to the joint and perpendicular to the external face of the volumetric precast concrete components. Move the nozzle slowly along the joint, at a distance of 300 mm from it, for a period of 5 minutes in every 1.5 metre of joint length while an observer carefully inspects on the interior side of the external face of the volumetric precast concrete components with the assistance of adequate lighting where necessary;
4. Unless otherwise Approved, use a nozzle to the requirements of the Architectural Aluminium Manufacturer's Association (AAMA) 501.2-83;

5. Repeat the process specified in sub-clause (3) above on all joints and joint intersections using increments of exposed joint length not exceeding 1.5 metres upward until all the joints are covered.

CON8.T330.8 WITNESSES TO TEST
All watertightness tests carried out on Site must be witnessed and certified both by the CM and the Contractor's representative.

CON8.T340.A FAILURE OF UNITS
The volumetric precast concrete components and joints are deemed to have failed if signs of water seeping through the joints or through the external face of the volumetric precast concrete components, including signs of damp patches, are observed during the test and within the subsequent 2 hours after the test.

CON8.T350.A REMEDIAL WORK TO VOLUMETRIC PRECAST CONCRETE COMPONENTS FOR RE-TEST
Carry out remedial work to volumetric precast concrete components and joints which fail in the watertightness test. Methods of carrying out the remedial work are subject to Approval. After the remedial work is completed, re-test the external face of the volumetric precast concrete components and joints as CON8.T320 until all specified criteria have been satisfied.

SITE TESTING OF JOINTS AND PERMANENT STRUCTURAL CONNECTIONS

CON8.T410.A SITE TESTING OF JOINTS AND PERMANENT STRUCTURAL CONNECTIONS
1. When instructed, carry out the following tests on Site in the presence of the CM or his representatives:
   a. Prior to grouting the joints or permanent structural connections:
      i. Check integrity of welds of any structural steelworks, for connection purpose, present at the permanent structural connections in accordance with STR1.T120, as appropriate, against the acceptance criteria as stipulated in STR1.T130.
   b. Upon completion of grouting:
      i. Check location and cover of rebars, with the use of Approved steel reinforcement detector or cover meter, against Approved drawings.

2. Non-compliance:
   a. In the event that any test result on a weld does not comply with the acceptance criteria, conduct further weld test in accordance with STR1.T120 (5);
   b. Cut out and repair all defective welds in accordance with STR1.T140 and re-test the welds in accordance with STR1.T120;
   c. Bear all costs of any further tests and no extension of time will be allowed.
LIFTING ANCHOR

CON8.T510.8 DEFINITION OF BATCH
In this Specification, a batch is defined as any quantity of lifting anchor of the same type and same working load capacity, delivered to the casting yard as one consignment and covered by the same test certificate issued by the lifting anchor manufacturer.

CON8.T520.8 TYPE AND LOAD CAPACITY
Unless otherwise specified on Drawings, lifting anchors shall be either eye anchor type or foot anchor type, and with a working load of 0.25 times the ultimate load capacity.

CON8.T530.8 RATE OF SAMPLING
1. The rate of sampling for ultimate load capacity for each batch of lifting anchor shall be a minimum of one sample, which comprises three test specimens, for every 3,000 anchors or part thereof;
2. When Instructed, provide an additional sample comprising three test specimens for testing by DTC.

CON8.T540.8 COMPLIANCE CRITERION
No test result of ultimate load capacity of individual test specimen shall be less than 4 times the working load as stipulated in CON8.T520.

CON8.T550.8 SUBMISSION
Prior to the production of precast concrete components, provide test certificates issued by:
1. The lifting anchor manufacturer/agent supplier; and
2. An Approved testing laboratory employed by the manufacturer of precast concrete component on the ultimate load capacity of lifting anchors for each batch under the Quality Assurance System as stipulated in CON7.W040.

FACTORY VERIFICATION TESTS

CON8.T610.A WATER FLOOD TEST TO INTERNAL INSTALLATIONS
1. Testing Arrangements:
   a. Carry out water flood test on the completed internal waterproofed volumetric precast bathroom (VPB) components at a rate of 1 to 25 numbers at the manufacturer’s factory;
   b. Place the VPB component on an elevated temporary support platform and connect the floor drains where necessary for carrying out water flood test;
   c. Submit three copies of the test reports, or other number of copies as required by the CM for the water flood tests for record.
2. Testing Methods:
   a. Seal all outlets and do not permit any debris to enter into the drainage pipeworks;
   b. Carefully flood the internal floor of the VPB component to levels agreed with the CM or his representatives resident at manufacturer's factory, generally no less than 50 mm, but in no case higher than the curb levels and maintain for 24 hours;
   c. Mark the top water level at clearly visible locations and regularly inspect for leaks;
d. Carry out joint inspections with the CM or his representatives resident at manufacturer's factory at the external side of the walls and at the underside of the floor slab to check that there is no water leakage, water seepage or visible damp patch within half an hour after the flooding has maintained for 24 hours;

e. If required by the CM, provide records in the form of photos or video clips to prove that the inspected surfaces are free from water leakage, water seepage or visible damp patch;

f. Subject to CM’s approval, in case the test results cannot be verified due to wet weather, record such condition in the test report and the whole batch of VPB components can be exempted from this test.

3. Non-compliance:

   a. In the event that any VPB component fails to meet the requirement stipulated in sub-clause (2)(d) above:

      i. Carry out re-test to the non-complying VPB component, after repaired according to the Approved remedial works, and until the criteria stipulated in sub-clause (2)(d) above are complied with;

      ii. Carry out further water flood tests to the batch of VPB components represented by the non-complying VPB component according to the following formula:

             Nos. of further water flood tests = (n²-2n+3)

             Where n is equal to the total number of the failed water flood tests progressively until all the water flood tests complied with the criteria specified;

      iii. Bear all associated costs and expenses incurred for the re-tests and further tests. No extension of time will be allowed.
CON9 OFF-SITE STEEL REINFORCING BAR PREFABRICATION YARD

GENERAL

SCOPE AND TYPES

CON9.G010.A SCOPE OF OFF-SITE STEEL REINFORCING BAR PREFABRICATION YARD
1. Worksection CON9 applies where off-site steel reinforcing bar prefabrication yard (OSRPY) is adopted;
2. The scope of OSRPY in this Worksection covers the following:
   a. Storage of steel reinforcing bar, where steel reinforcing bar is defined in Clause 1.2.18 of CS2:2012;
   b. Cutting and bending of steel reinforcing bar;
   c. Fabrication of reinforcement cage; and
   d. Threading of steel reinforcing bar for coupling with reinforcement connectors.
3. This Worksection is not applicable to the prefabrication of the following:
   a. Precast concrete component produced outside the Hong Kong Special Administrative Region; and
   b. All fabric reinforcement.

The OSRPY shall be one of the following:
1. An OSRPY on the “List of Approved Steel Reinforcing Bar Prefabrication Yards” (the “List”), referred to as “Type 1 Yard”. The List has been set up and maintained by the Civil Engineering and Development Department (CEDD) in accordance with the Development Bureau Technical Circular (Works) No. 10/2018;
2. An OSRPY not on the List which includes:
   a. An OSRPY at the Contractor’s workshop and run by the Contractor, referred to as “Type 2 Yard”;
   b. An OSRPY other than the types in sub-clauses (1) and 2(a) above referred to as “Type 3 Yard”.

CON9.G030.X DELETED.

SUBMISSION

CON9.G110.A GENERAL
1. For Type 1 Yard, submit the following within one month from the notified date for commencement of the Works for CM’s information:
   a. The name, address with street map of the OSRPY;
   b. Details of the organisation structure of the OSRPY, including the management and supervision teams;
   c. Self-certified true copy of the valid registration document under the List as stated in CON9.G020 (1);
d. Monthly production capacity of the OSRPY in terms of tonnage and the current workload;

e. Where carrying out of the fabrication of reinforcement cage or threading for steel reinforcing bar using reinforcement connector is involved, records showing separate approval from the Government has been obtained for such fabrication process to be carried out at this prefabrication yard; and

f. The storage and traceability system of steel reinforcing bar products within the Site for identifying the steel reinforcing bar and the prefabricated steel reinforcing bar products produced by this prefabrication yard and other steel reinforcing bar for on-site cutting and bending or for fabrication of reinforcement cage or threading for steel reinforcing bar using reinforcement connector for on-site installation. Approval from the CM shall be obtained for such storage and traceability system prior to the delivery of prefabricated products to the Site.

2. For Type 2 Yard, submit the following within one month from the notified date for commencement of the Works for CM’s approval:

a. The address with street map of the OSRPY and details of the quality management system as stipulated in CON9.G120;

b. A scaled and dimensioned layout plan of the OSRPY with fenced boundaries showing locations of entrances, exits, designated storage areas for incoming steel reinforcing bar, and prefabricated steel reinforcing bar products, and areas for prefabrication;

c. Details of the security and traceability requirements as stated in CON9.G310 and CON9.G320 respectively.

3. For Type 3 Yard, submit the following within one month from the notified date for commencement of the Works for CM’s approval:

a. The name, address with street maps, organisation structure, and job reference of the OSRPY and details of the quality management system as stipulated in CON9.G120;

b. A scaled and dimensioned layout plan of the OSRPY with fenced boundaries showing locations of entrances, exits, designated storage areas for incoming steel reinforcing bar and prefabricated steel reinforcing bar products, and areas for prefabrication;

CON9.G120.A QUALITY MANAGEMENT SYSTEM

1. The Type 3 Yard shall be certified to the requirements of ISO 9001 and ISO 14001 by a relevant certification body accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into mutual recognition agreement with HKAS for key operations of the yard with a scope relating but not limited to storage, handling, fabrication, sampling, testing and supply of prefabricated steel reinforcing bar products in accordance with the requirements stipulated in the CS2:2012, BS4449:2005+A2:2009, BS4482:2005, BS 8666:2005, etc. where appropriate;

2. Both the Type 2 and Type 3 Yards, shall establish, document and maintain a quality management system complying with the relevant provisions of Worksection CON3.
TYPE 1 YARD

The CM or his representatives shall be allowed to enter the OSRPy to carry out surveillance audit / inspection at any time without advance notice. They shall be allowed to:

1. Check and make copy, if necessary, of all quality control records, test reports and certificates associated with the prefabricated steel reinforcing bar products of the Contract, which have been or will be delivered to the Site;

2. Inspect and take photo of, if necessary, all the steel reinforcing bars and prefabrication steel reinforcing bar products of the Contract at the designated storage area and the prefabrication lines.

CON9.G220.A TRACEABILITY
When the prefabricated steel reinforcing bar products are delivered to Site, they shall be affixed firmly with traceability tags which shall include, but not be limited to, the information such as contract title, contract number, delivery note number / stockist certificate number, test report number, bending schedule number, bar marks, shape, bar size quantity and fabrication date.

CON9.G230.A PREFABRICATED STEEL REINFORCING BAR PRODUCTS SUMMARY REPORT
Submit a summary report on the prefabricated steel reinforcing bar products monthly or at an interval agreed by the CM. The report shall include, but not be limited to, the following:

1. Quantities of each size of each type of prefabricated steel reinforcing bar products delivered to the Site but not yet installed at the beginning of the reporting period;

2. Quantities of each size of each type of prefabricated steel reinforcing bar products delivered to the Site within the reporting period;

3. Tentative quantities of each size of each type of prefabricated steel reinforcing bar products planned to be delivered to the Site in the next reporting period;

4. Accumulated quantities of each size of each type of prefabricated steel reinforcing bar products delivered to the Site since the notified date for commencement of the Works;

5. Bending schedule of each size of each type of prefabricated steel reinforcing bar products delivered to the Site within the reporting period with details of bar marks, bar types, bar size, quantities, dimensions, bending shape codes and weights;

6. Copy of mill certificates issued by the stockist suppliers and the test report issued by the Direct Testing Contractor (DTC) and / or Housing Department’s Materials Testing Laboratory (HDMTL) and / or CEDD’s Public Works Laboratories showing that the test results of the prefabricated steel reinforcing bar products delivered to the Site within the reporting period meet the requirements of CS2:2012 or BS4449:2005+A2:2009 as appropriate.
All prefabricated steel reinforcing bar products produced by the Type 1 Yard and delivered to the Site shall be attached with a certificate issued by the OSRPY confirming that all the products are fabricated under a valid registration of the List. In the event that the OSRPY is removed from the List, all of the OSRPY’s products, fabricated on and after the removal date, whether or not delivered to the Site shall not be used. Bear all time and cost for, including but not be limited to, the removal of non-conforming prefabricated steel reinforcing bar products delivered on Site, dismantling the non-conforming prefabricated steel reinforcing bar products that were installed, reinstating and making good all damages to the Works arising out of or in connection with the removal of the OSRPY from the List and no extension of time or monetary claims will be entertained under the Contract.

TYPE 2 AND TYPE 3 YARDS

**CON9.G310.A**  
**REQUIREMENTS ON SECURITY PROCEDURE**

1. The CM and his representatives shall be allowed to enter the OSRPY to carry out inspection at any time without advance notice. They shall be allowed to:
   
   (a) Check and make copy, if necessary, of all quality control records, test reports and certificates associated with the prefabricated steel reinforcing bar products of the Contract, which have been or will be delivered to the Site;
   
   (b) Inspect and take photo of, if necessary, all the steel reinforcing bars and prefabrication steel reinforcing bar products of the Contract at the designated storage area and the prefabrication lines.

2. At least two closed circuit television (CCTV) cameras shall be provided at opposite corner of the designated storage area to monitor and video record all of the steel reinforcing bar stored at the designed storage area at all times subject to CM’s satisfaction that the Contractor’s proposed number and / or position of the cameras(s) can have clear and full view of the designed storage area. The CCTV cameras shall also be positioned in such a way that they can record the arrival and departure of the steel reinforcing bar to and from the designated storage area. Sign(s) shall be put up indicating the steel reinforcing bar is to be used for HA’s contracts with the contract information, i.e. contract title, contract number, contractor’s name, etc., of each contract clearly shown to the CCTV for ease of identification and monitoring;

3. The internal transportation of the steel reinforcing bar between designated storage area and prefabrication lines shall be monitored by CCTV camera(s) at all times. If this cannot be achieved throughout the whole route, then the movement of the steel reinforcing bar shall be monitored and recorded by a car video recorder or an equivalent equipment at all times during the transportation. Sign(s) shall be put up on top of the steel reinforcing bar or attached at suitable location of the steel reinforcing bar with the contract information, i.e. contract title, contract number, contractor’s name, etc., and clearly shown to the CCTV or equivalent equipment for ease of identification and monitoring during the transportation process;
4. The steel reinforcing bar at the prefabrication lines shall be monitored by CCTV camera(s) or equivalent equipment at all times. The video recording at the prefabrication lines shall include the recording of the arrival of the steel reinforcing bar from the designated storage area, the prefabrication process at the prefabrication lines, and the departure of the steel reinforcing bar and prefabricated steel reinforcing bar products from the prefabrication lines. Sign(s) shall be put up on top or attached at suitable location of the steel reinforcing bar and / or the prefabricated steel reinforcing bar products with the contract information, i.e. contract title, contract number, contractor’s name, etc., and clearly shown to the CCTV or equivalent equipment for ease of identification and monitoring during the transportation and prefabrication process;

5. The prefabrication of the steel reinforcing bar shall be executed in a designated time slot. No prefabrication of reinforcement of other non-HA contract(s) shall be carried out in this designated time slot and in this prefabrication lines to avoid the mixing up of the steel reinforcing bar. A schedule showing the designated time slot for the prefabrication of the steel reinforcing bar shall be submitted to the CM one month prior to the commencement of prefabrication of the steel reinforcing bar or at a time interval agreed by the CM. Any revised schedule(s) shall be submitted to the CM at least one week or at a time interval agreed by the CM prior to the prefabrication of the steel reinforcing bar;

6. The external transportation of the prefabricated steel reinforcing bar products from the OSRPY to the Site shall be monitored and recorded by a car video recorder or an equivalent equipment at all times during the transportation. Sign(s) shall be put up on top or attached at suitable location of the prefabricated steel reinforcing bar products with the contract information, i.e. contract title, contract number, contractor’s name, etc., and clearly shown to the car video recorder or equivalent equipment for ease of identification and monitoring during the transportation process;

7. Video records of all CCTV cameras, car video recorders and equivalent equipment, if any, shall have the date and time shown in the video, and shall be retained for 60 days. Moreover, a copy of all video records shall be submitted to the CM within 24 hours of the recording or at a time interval agreed by the CM for monitoring / inspection; and

8. Photo records as means of recording the storage and internal and external transportation of steel reinforcing bar or prefabricated steel reinforcing bar products are not acceptable unless under unforeseen incident, i.e. sudden breakdown of CCTV or video recorder. Any such incident shall be reported with the photo records to the CM within 3 days and a written report shall be submitted to the CM within 7 days of the incident. Any breakdown of CCTV or video recorder shall have their functions restored within 24 hours or a period agreed by the CM.

**CON9.G320.A REQUIREMENTS ON TRACEABILITY PROCEDURE**

1. All steel reinforcing bars shall be stored in designated storage areas. Sign(s) shall be put up at the designated storage area indicating the steel reinforcing bar is to be used for HA’s contracts with the contract information, i.e. contract title, contract number, contractor’s name, etc., of each contract clearly shown for ease of identification and monitoring;

2. All steel reinforcing bar shall be traceable with unique tags or equivalent means (Unique Tags) affixed firmly when the steel reinforcing bar is delivered to OSRPY. The Unique Tags shall include information such as, but not limited to, the identification that the reinforcement is to be used for HA’s contract, the contract title, the contract number, the contractor’s name, the delivery note number / stockist certificate number, the steel reinforcing bar’s type and size and length, the bundle weight and / or number of bars, and the heat / lot number;
3. All Unique Tags shall always be available and kept in good condition for inspection throughout the period from delivery, storage, internal transportation and up to prefabrication processes;

4. After prefabrication, the Unique Tags shall be updated, or a second set of traceability tags (Traceability Tags) for the prefabricated steel reinforcing bar products shall be provided, to include information such as the contract title, the contract number; the contractor’s name, the delivery note number / stockist certificate number, the testing report number, the bar bending schedule number, the bar mark, the shape, the bar size, and the quantity.

CON9.G330.A PREFABRICATED STEEL REINFORCING BAR PRODUCTS SUMMARY REPORT

Submit a summary report on the prefabricated steel reinforcing bar products monthly or at an interval agreed by the CM. The report shall include, but not be limited to, the following:

1. Quantities of each size of each type of prefabricated steel reinforcing bar products delivered to the Site but not yet installed at the beginning of the reporting period;

2. Quantities of each size of each type of prefabricated steel reinforcing bar products delivered to the Site within the reporting period;

3. Tentative quantities of each size of each type of prefabricated steel reinforcing bar products planned to be delivered to the Site in the next reporting period;

4. Accumulated quantities of each size of each type of prefabricated steel reinforcing bar products delivered to the Site since the notified date for commencement of the Works;

5. Bending schedule of each size of each type of prefabricated steel reinforcing bar products delivered to the Site within the reporting period with details of bar marks, bar types, bar size, quantities, dimensions, bending shape codes and weights;

6. Copy of mill certificates issued by the stockist suppliers and the test report issued by the Direct Testing Contractor (DTC) and / or Housing Department’s Materials Testing Laboratory (HDMTL) and / or CEDD’s Public Works Laboratories showing that the test results of the prefabricated steel reinforcing bar products delivered to the Site within the reporting period meet the requirements of CS2:2012 or BS4449:2005+A2:2009 as appropriate.
MATERIALS

REINFORCEMENT GENERALLY

CON9.M010.A  STOCKIST'S OR SUPPLIER'S CERTIFICATION
Submission requirements:
1. For bar reinforcement delivered to the OSRPY, submit certificates from quality assured stockist and / or supplier to demonstrate that the bar reinforcement supplied complies with the requirements of Section 4 of CS2: 2012;
2. For reinforcement delivered in the form of coil (coil reinforcement) to the OSRPY, submit certificate from quality assured stockist and / or supplier to demonstrate the coil reinforcement supplied complies with the requirements of Section 4 of CS2: 2012 or alternatively compliance of the following requirements:
   a. The coil reinforcement has been manufactured and tested to comply with the requirements of BS 4449:2005+A2:2009 Sections 7 and 8;
   b. The coil reinforcement is produced by a manufacturer certified by a third party certification body. The certification body shall be accredited by the Hong Kong Accreditation Service or its ‘Multilateral Recognition Agreements / Arrangements’ (MLA) partner(s) to the requirements of ISO 9001 for its quality management system with a scope related to good practices of reinforcing steel production to meet requirements of BS 4449:2005+A2:2009.

When Instructed, provide evidence that each load of steel reinforcing bar delivered to the OSRPY forms part of the same consignment and originates from the same source as that in respect of which the specimen and the manufacturer’s certificate are related.

CON9.M030.A  COLOUR CODE SYSTEM OF REINFORCEMENT
Submit for Approval a colour code system in the Quality Control System as stipulated in PRE.B8.1425 for identification of steel reinforcing bar unloaded to designated areas in the OSRPY:
1. For different batches, as defined in CON9.T110, before any testing:
   a. Use white, yellow, blue, grey or other specific colours for marking at the ends of reinforcement bar or at an agreed location with the CM for the coil reinforcement;
   b. Avoid to use any colours similar to rust and do not use green and / or red colours.
2. For each batch available with all test results, including the re-test results as permitted in the Specification, add markings in:
   a. Green colour: for reinforcement conforming to the Specification;
   b. Red colour: for reinforcement not conforming to the Specification.

REINFORCEMENT

CON9.M110.A  BAR / COIL REINFORCEMENT
Quality requirement:
1. Bar reinforcement of hot rolled steel reinforcement shall be in accordance with CS2:2012;
2. Coil reinforcement of hot rolled steel reinforcement shall be in accordance with CS2:2012 or BS 4449:2005+A2:2009;

3. The bar / coil reinforcement shall be classified as follows:
   a. Class 1 steel reinforcing bar that is fully traceable to their manufacturer and production data;
   b. Class 2 steel reinforcing bar that is traceable to their manufacturers and production data except their heat / cast number.

ANCILLARY MATERIALS

**CON9.M210.8 COVER SPACERS**
Cover spacers shall be in accordance with CON3.M210.

**CON9.M220.8 CHAIRS AND SUPPORTS**
Chair and supports shall be in accordance with CON3.M220.

**CON9.M230.8 REINFORCEMENT TYING WIRE**
Reinforcement tying wire shall be in accordance with CON3.M230.
WORKMANSHIP

GENERAL

CON9.W010.A STORAGE OF STEEL REINFORCING BAR DELIVERED TO OSRPY BEFORE PREFABRICATION

Store:
1. All steel reinforcing bar in designated storage area(s);
2. All steel reinforcing bar on a levelled, well-drained and maintained hard-standing ground in a manner that will avoid damage, deformation and contamination of the steel reinforcing bar;
3. Different types and sizes of steel reinforcing bar separately.

CON9.W020.A SURFACE CONDITION OF STEEL REINFORCING BAR

Surface condition of steel reinforcing bar shall be in accordance with CON3.W020.

CON9.W030.8 CONTAMINATED OR HEAVILY RUSTED REINFORCEMENT

Remove contaminated or heavily rusted reinforcement from the designated area of the OSRPY unless it has been cleaned or satisfactorily treated by an Approved method.

CON9.W040.A COLOUR MARKINGS OF STEEL REINFORCING BAR BY STOCKISTS OR SUPPLIERS PRIOR TO DELIVERY TO THE OSRPY

1. Obtain steel reinforcing bar preferably without red and green colour markings from stockists / suppliers;
2. If steel reinforcing bar with red colour marking, or with a colour marking covering a previous marking in red, or with green colour marking is to be supplied, then:
   a. Provide in advance an explanation to the CM before delivery to the OSRPY. In addition, for steel reinforcing bar with red colour marking or a colour marking covering a previous marking in red, provide to the CM before delivery to the OSRPY confirmation from each of the Contractor, the stockist / supplier and owner of the OSRPY as far as it is aware, the reinforcement is not non-compliant with CS2:2012 or BS4449:2005+A2:2009 whichever is appropriate and / or is rejected by other project;
   b. The CM may reject the use of the steel reinforcing bar if:
      i. No explanation is provided in advance; or
      ii. The provided explanation is not satisfactory.

FIXING REINFORCEMENT

CON9.W110.A CUTTING AND BENDING STEEL REINFORCING BAR

1. Steel reinforcing bar shall be cut and bent in accordance with the dimensional requirements of BS 8666:2005 unless otherwise shown on the Drawing;
2. For coil reinforcement, it shall be straightened before cutting and bending in accordance with sub-clause (1) above. The straightening process shall be done by Quality Assured (QA) Coil Processor with an automated machine made for this purpose.

CON9.W120.A COLD BENDING

Bend steel reinforcing bar in accordance with CON3.W120.
OFF-SITE STEEL REINFORCING BAR......

**Specification Library 2018 Edition (Batch 2)**

### SECURING REINFORCEMENT
Secure reinforcement in accordance with CON3.W130.

### LOCATING REINFORCEMENT
Provide sufficient cover spacers, chairs and supports in accordance with CON3.W140 where appropriate.

### WELDING
Welding of reinforcement shall be in accordance with CON3.W150.

### CONCRETE COVER
The provision of concrete cover shall be in accordance with CON3.W160.

### COMPLIANCE WITH DRAWINGS
Checking of completed reinforcement shall be in accordance with CON3.W170.

### CM’S INSPECTION
1. Ensure all prefabricated steel reinforcing bar products delivered to the Site are inspected by the CM before carrying out any work, including erecting any formwork adjacent to the reinforcement, which makes access for inspection difficult;
2. Notify the CM within 24 hours, or a shorter period agreed by the CM, prior to carrying out the inspection work.

### FIXING REINFORCEMENT

#### QUALIFIED SUPERVISION
Assign an OSRYP Quality Control Coordinator (OSRYP-QCC), with a minimum qualification and experience of a Grade T1 TCP under the Registered Contractor’s stream in the CoPSS, to:
1. Supervise steel reinforcing bar prefabrication works and ensure that these are all carried out in accordance with approved plans and comply with the requirements on quality and workmanship;
2. Devise inspection check list of the off-site steel reinforcing bar prefabrication works;
3. Provide full time continuous supervision of the off-site steel reinforcing bar prefabrication works, including sampling of steel reinforcing bars.

#### INSPECTION LOG BOOK
1. Record the following details in an inspection log book:
   a. The names and qualifications of the supervisory personnel assigned by the CM and by the Contractor as stipulated in CON9.W190;
   b. The date, time, items inspected and inspection results.
2. Keep the inspection log book in the prefabrication yard and a copy of it on Site for CM’s inspection when required and submit the inspection log book to the CM upon completion of the works.

### TOLERANCES

#### GENERAL
TESTING

GENERAL

CON9.T010.A TESTING ARRANGEMENT
Unless otherwise stated, testing arrangement of steel reinforcing bar in the OSRPY as defined in CON9.G020 shall be in accordance with this Worksection.

DEFINITIONS

CON9.T110.A BATCH OF STEEL REINFORCING BAR
1. Subject to the maximum tonnage in sub-clause (2) below, a batch of steel reinforcing bar is the quantity of steel reinforcing bar delivered to the OSRPY within a week under one delivery order, of one nominal diameter, and one steel grade and produced by the same manufacturer;
2. The maximum tonnage of a batch shall not exceed:
   a. For steel reinforcing bars of diameter 20 mm and above: 200 tonnes;
   b. For steel reinforcing bars of diameter less than 20 mm: 100 tonnes.

CON9.T120.A TESTING BY DIRECT TESTING CONTRACTOR (DTC) AND HOUSING DEPARTMENT'S MATERIALS TESTING LABORATORY (HDMTL)
Unless otherwise Approved or specified elsewhere, provide steel reinforcing bar samples to the CM for testing by the DTC and/or HDMTL.

CON9.T130.A TESTING PROGRAMME
1. Allow sufficient time for the testing of specimens;
2. For Type 1 Yard, do not commence any steel reinforcing bar prefabrication work until all relevant test specimens have successfully passed all tests carried out by the DTC and/or HDMTL and/or CEDD’s Public Works Laboratories;
3. For Type 2 Yard and Type 3 Yard, do not commence any steel reinforcing bar prefabrication work until all relevant test specimens have successfully passed all tests carried out by the DTC and HDMTL.

PURCHASERS TESTING

CON9.T210.A RATE OF SAMPLING
1. For bar reinforcement and coil reinforcement complying CS2:2012, provide adequate test specimens from each batch delivered to the OSRPY in accordance with CS2:2012. The number of test specimens taken from each batch and the rate of sampling shall be in accordance with Table 10 of CS2:2012;
2. For coil reinforcement complying BS 4449:2005+A2:2009, provide samples from each batch as follows:
   a. Class 1 coil reinforcement:

<table>
<thead>
<tr>
<th>Description</th>
<th>Size of batch</th>
<th>Tensile properties</th>
<th>Bend performance</th>
<th>Mass per metre</th>
<th>Chemical composition (product analysis)</th>
<th>Bond property</th>
</tr>
</thead>
</table>

Specification Library 2018 Edition (Batch 2)
## CON9.T220.A PROCEDURE

### Testing arrangement:

1. Under the supervision of the CM or his representatives,
   a. Cut and take test specimens selected at random from steel reinforcing bar in the OSRPY as defined in CON9.G020;
   b. Each steel reinforcing bar specimen shall be minimum 1 m long;
   c. Test specimens taken from coil reinforcement shall have been straightened according to BS EN ISO 15630-1:2010 Clause 4 or CS2:2012. The means of straightening the test specimen (manual, machine) shall be indicated in the test request form;
   d. Appropriately mark and keep the test specimens or samples on yard for collection and testing by the DTC and / or HDMTL;
   e. The test specimens or samples shall be stored in a lockable steel box before collection.

### b. Class 2 coil reinforcement:

<table>
<thead>
<tr>
<th>Description</th>
<th>Size of batch</th>
<th>No. of test specimens per batch</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Tensile properties</td>
</tr>
<tr>
<td>Coil Reinforcement nominal size 10 mm - 16 mm</td>
<td>0 - 30 tonnes</td>
<td>3</td>
</tr>
<tr>

<td>each additional 45 tonnes or part of 45 tonnes</td>
<td></td>
</tr>
</tbody>
</table>

3. For steel reinforcing bar used for construction of hoardings and associated covered walkways and gantries, the rate of sampling stated in the sub-clause (1) above may be reduced at the discretion of the CM.
CON9.T230.A TESTING BY HDMTL
Testing samples:
1. Provide additional steel reinforcing bar specimens to HDMTL for test as follows:
   a. Take specimens from steel reinforcing bars adjacent to those from which specimens have been cut for testing by the DTC;
   b. Rate of sampling: approximately one for every five batches selected randomly with the same number of test specimens to be tested by the DTC for each test type as specified in CON9.T210, and the cumulative total number of specimens tested by HDMTL shall be approximately one-fifth of that tested by DTC;
   c. Size of specimens / samples: in accordance with CON9.T220;

TESTING BY DTC

Testing samples:
1. Tests shall be carried out on each specimen in accordance with
   a. CS2:2012 for bar reinforcement; and
2. Number of tests on each specimen shall be in accordance with
   a. Table 10 of CS2:2012 for bar reinforcement; and
   b. CON9.T210 (2) for coil reinforcement.

CON9.T320.A METHODS OF TESTING
Tests will be carried out at room temperature between 5°C and 35°C and in accordance with the following standards:
1. CS2:2012 for bar reinforcement;

COMPLIANCE

CON9.T410.A COMPLIANCE CRITERIA – STEEL REINFORCING BAR
1. Bar reinforcement
   A batch of bar reinforcement is deemed to comply with the Specification if the test results meet the requirements of CS2:2012. Any non-complying batch of bar reinforcement shall not be used and shall be removed from the designated area in the OSRPY;
2. Coil reinforcement
   A batch of coil reinforcement is deemed to comply with the Specification if the test results meet the requirements of CS2:2012 or BS 4449:2005+A2:2009. Any non-complying batch of coil reinforcement shall not be used and shall be removed from the designated area in the OSRPY.

RE-TESTS

CON9.T510.A REQUIREMENTS FOR STEEL REINFORCING BAR
Non-compliance:
1. Bar reinforcement
If the result of any test for bar reinforcement does not comply with the specified requirements for the property, provide additional test specimens from the same batch for additional tests for the property in accordance with CS2:2012. The number of additional specimens must be as stated in CS2:2012;

2. Coil reinforcement

For each test specimen taken in accordance with CON9.T210 and failing to meet the requirement for the mass per meter, chemical composition, tensile properties and bend performance or bond property, two additional test specimens shall be taken from the remainder of the same batch and be subjected to the test or tests which the original specimen failed.

CON9.T520.8 STANDARD FOR REJECTION

1. Bar reinforcement

A batch of bar reinforcement shall be deemed not complying with the specified requirements for any particular property if the result of any additional test in accordance with CON9.T510 (1) does not comply with the specified requirements for that property. The non-complying batch of bar reinforcement shall not be used and shall be removed from the designated area in the OSRPY;

2. Coil reinforcement

For properties other than chemical composition, a batch of coil reinforcement shall be deemed not complying with the Specification if any of the additional tests in accordance with CON9.T510 (2) fails. For chemical composition, a batch of coil reinforcement shall be deemed not complying with the Specification if any of them fails unless it is demonstrated to the CM’s satisfaction by alternative method acceptable under the International Standards listed in the bibliography of BS EN ISO 15630-1:2010. The non-complying batch of coil reinforcement shall not be used and shall be removed from the designated area in the OSRPY.

**EAR1 EXCAVATION AND FILLING**

**DESIGN**

**GENERAL**

**EAR1.D010.8 DESIGN RESPONSIBILITY**

1. Submit for Approval, within 7 days of the notified date for commencement of the Works, the name and particulars of the Registered Structural Engineer (RSE) and Registered Geotechnical Engineer (RGE) who will be employed on the Project in accordance with the Preliminaries Worksection. The RSE and RGE must have relevant experience to design, supervise and control all temporary works, excavation, dewatering and any specified design and built items. Comply with PNAP APP-141 for the division of responsibilities between RSE and RGE in connection with the excavation and lateral support works;

2. Prior to the notified date for commencement of the Works, the CM has provided reference design for the Excavation and Lateral Support Works (ELSW) for permanent works construction as specified in sub-clause (2) of EAR1.D030. The Contractor shall review and decide whether to dispense with, adopt in full or modify the reference design provided by the CM;

3. Should the Contractor choose to adopt in full the reference design provided by the CM, the procedures for submitting the Excavation and Lateral Support Plan (ELSP) to the CM as stipulated in sub-clause (3) of EAR1.D030 shall be followed;

4. Should the Contractor choose to dispense with or modify the reference design provided by the CM, the procedures for obtaining the CM's approval of the Contractor's design or the modified design as stipulated in sub-clause (4) of EAR1.D030 shall be followed;

5. If the reference design provided by the CM is adopted in full by the Contractor, the Contractor shall assume full design responsibility for the said ELSW in sub-clause (2);

6. If the Contractor decides to dispense with or modify the reference design provided by the CM, the Contractor shall be solely responsible for the design of ELSW or the modified design (including submission of ELSP).

**EAR1.D020.8 METHOD STATEMENT FOR TEMPORARY WORKS**

1. Prior to commencement of the temporary work submit a method statement which takes account of geotechnical considerations and gives full details of all materials, plant and timing and sequence of operations involved in the construction of the temporary work, for the structures as specified in the Project Specific Specification;

2. As part of the information provided with the method statement submit for Approval full details of the temporary earth support systems it is proposed to use associated with the construction of the structures listed above;

3. Give due considerations to any drainage pipe works and existing retaining walls nearby along any Estate Roads;

4. Ensure particulars include, but are not limited to, the following:
a. A detailed programme for the works showing phases of construction with associated traffic arrangements and provision for the existing utility services necessitated by the method of construction;

b. Details of construction method including:
   i. Plant, equipment and labour to be deployed;
   ii. Sequence for temporary works installation and excavation;
   iii. Sequence for temporary works removal and backfilling;
   iv. Temporary drainage measures to prevent flooding during rainstorms.

c. The workmanship submission requirements specified at EAR1.W050.

5. Allow adequate time in the construction programme for the CM's processing of the specified submissions. The time allowed must be in no circumstances less than 42 days. Do not commence the temporary work without the CM's consent.

**EAR1.D030.8 EXCAVATION AND LATERAL SUPPORT PLAN (ELSP)**

1. Submit ELSP and allow at least the number of days as specified in the Project Specific Specification for obtaining CM's approval. Allow a further number of days as specified in the Project Specific Specification for granting of approval by CM for each ELSP re-submission. The structural calculations and drawings submitted are prepared and signed by the RSE referred to in sub-clause (1) of EAR1.D010. The geotechnical report / supporting documentation for the ELSP shall be prepared and signed by the RGE appointed in accordance with the Preliminaries Worksection in case of having excavation depth deeper than 4.5 m and / or involving significant geotechnical elements. ELSP submission is required where the excavation is one of the following types:

   a. Deeper than 2.5 m and greater than 5 m in length;
   b. Liable to affect any road, building, structure, slope steeper than 30 degrees or water main 75 mm in diameter or greater, the affected area being defined as within the 45 degree line up from the base of the excavation to the ground surface;
   c. Of substantial depth, the collapse of which would cause serious consequences to public safety as per PNAP APP-57;
   d. Any other ELSW requiring ELSP submission as specified by CM.

Notwithstanding the approval of the ELSP, the commencement of the ELSW shall be subject to the CM's written permission referred to in PRE.B4.050.

2. The reference design for the ELSW is provided for the location(s) as specified in the Project Specific Specification with details in reference drawings listed in Appendix U to this Specification. The reference drawings are given in good faith for the Contractor's information and reference only, and are by no means exhaustive nor represent the design provided therein or any part thereof being in compliance with the Specification. Notwithstanding these reference drawings which the Contractor is free to adopt or not, or to modify in whole or in part, the Contractor shall be solely responsible for the design (including submission of ELSP) and construction of the ELSW. The provision of these reference drawings shall not prejudice the Contractor's obligations and liabilities under the Contract;
3. Where the Contractor chooses to adopt in full the said reference design of the ELSW referred to in sub-clause (3) of EAR1.D010, submit ELSP based on the said reference design of the ELSW duly signed by the RSE and / or RGE as appropriate appointed in accordance with the Preliminaries Worksection and allow at least the number of days as specified in the Project Specific Specification to obtain CM’s approval for such submission before commencement of the ELSW. Notwithstanding the approval of the ELSP, the commencement of the ELSW shall be subject to the CM’s written permission referred to in PRE.B4.050;

4. Where the Contractor chooses to dispense with or modify the said reference design of the ELSW referred to in sub-clause (4) of EAR1.D010, the Contractor shall submit ELSP to CM and allow at least the number of days as specified in the Project Specific Specification to obtain CM’s approval for the new or modified design before commencement of the ELSW. The structural calculations and drawings submitted are prepared and signed by the RSE referred to in sub-clause (1) of EAR1.D010. The geotechnical report / supporting documentation for the ELSP shall be prepared and signed by the RGE appointed in accordance with the Preliminaries Worksection in case of having excavation depth deeper than 4.5 m and / or involving significant geotechnical elements. Allow for a further number of days as specified in the Project Specific Specification for granting of approval by the CM for each ELSP re-submission. ELSP submission is required where the excavation is one of the following types:
   a. Deeper than 2.5 m and greater than 5 m in length;
   b. Liable to affect any road, building, structure, slope steeper than 30 degrees or water main 75 mm in diameter or greater, the affected area being defined as within the 45 degree line up from the base of the excavation to the ground surface;
   c. Of substantial depth, the collapse of which would cause serious consequences to public safety as per PNAP APP-57;
   d. Any other ELSW requiring ELSP submission as specified by CM.

Notwithstanding the approval of the ELSP, the commencement of the ELSW shall be subject to the CM’s written permission referred to in PRE.B4.050.

5. The ELSP submission shall include information as specified in the Project Specific Specification;

6. For ELSW with pile walls and bulk excavation, comply with the following:
   a. Refer to the Project Specific Specification on restrictions on commencement for pile walls driving work;
   b. Comply with the requirements of the Approved ELSP;
   c. At the completion of pile walls driving works, submit record plans showing the actual penetration depth of the pile walls to CM for approval. Allow at least of 22 days for granting of approval by CM on:
      i. Certification of completion of the works using Form ICU 14;
      ii. Commencement of bulk excavation works.
   d. Allow sufficient time in the programme of Works for obtaining the said Approvals. Do not commence driving of pile walls and bulk excavations without written Approval for commencement from the CM.

7. For ELSW with bulk excavation only, comply with the following:
   a. Refer to the Project Specific Specification on restrictions on commencement on bulk excavation works;
b. Allow sufficient time in the programme of Works for obtaining the said Approvals. Do not commence ELSW without written Approval for commencement from the CM;

c. Comply with the requirements under the Approved ELSP.

**EAR1.D040.8 SHORING AND EXCAVATION PROCEDURE DETAILS**

1. Unless ELSP has been submitted in accordance with **EAR1.D030**, submit 'Shoring and Excavation Procedure Details' to CM and allow the number of days as specified in Project Specific Specification after obtaining CM’s written approval of such procedure details for obtaining CM’s written permission to commence such work;

2. Comply with the requirements under the submitted 'Shoring and Excavation Procedure Details'.

**EAR1.D050.8 DESIGN PARAMETERS**

1. Design temporary works, excavation and dewatering methods and submit proposals for review and Approval. Include in the submission of the details of the temporary earth support systems the following:

   a. Design philosophy; bearing in mind that design is such that the risk of failure is not more than that which would be adopted if the temporary works were to be permanent. Allowance may be made in the design for the shorter design life and for the risk to persons and property and the surface water and ground water conditions which are likely to occur during construction;

   b. Detailed design calculations and drawings;

   c. Specification for the works including procedures for installation and removal;

   d. Prediction of deformation of the temporary works and ground settlement and horizontal movement;

   e. Assessment of ground vibrations resulting from the temporary works that must not exceed the limits set down in **EAR2.W200**. In case where the temporary works involve installation of pile walls by percussive or vibratory methods, assessment of ground vibrations resulting from such works that must not exceed the limits set down in Appendix A of PNAP APP-137;

   f. Precautionary measures to safeguard the integrity of the existing drainage pipe work and retaining wall in vicinity of the temporary works.

2. Refer to **EAR1.D030** on the design requirement and method of construction of the ELSW;

3. Include in the design contingency measures to be adopted should site conditions deviate from the design assumptions;

4. Ensure all calculations and drawings submitted are certified and signed by the Registered Structural Engineer referred to at **EAR1.D010** and ensure all geotechnical reports and supporting documents are certified and signed by the Registered Geotechnical Engineer referred to in **EAR1.D010**;

5. Allow in the design for the subsequent removal of the temporary works while maintaining the stability of the excavation upon completion of the Works;

6. Make a detailed submission to the CM to provide design parameters and design ground water levels with supporting document/calculation/justification for the design and:
a. Verify the proposed design parameters and design ground water levels by carrying out necessary Approved laboratory tests and monitoring. The CM reserves the right to reject any proposed design parameters and design ground water levels that are not to the CM's satisfaction;

b. Submit details of all required tests to the CM's satisfaction. Arrange for sufficient number of laboratory tests and investigation to establish the design parameters for each major stratum with sufficient independent results for that stratum. Carry out all laboratory tests and investigation for this purpose at the expense of the Contractor and bear all the time involved.

7. Where the Contractor chooses to adopt in full the reference design of ELSW for permanent works construction referred to in sub-clause (2) of EAR1.D030:
   a. Refer to EAR1.D030 on the design requirement and method of construction of the ELSW;
   b. Include in the design contingency measures to be adopted should site conditions deviate from the design assumptions;
   c. Submit details of all required tests to the CM's satisfaction. Arrange for sufficient number of laboratory tests and investigation to establish the design parameters for each major stratum with sufficient independent results for that stratum. Carry out all laboratory tests and investigation for this purpose at the expense of the Contractor and bear all the time involved.

8. Where the Contractor chooses to dispense with or modify the reference design of ELSW for permanent works construction referred to in sub-clause (2) of EAR1.D030:
   a. Design temporary works, excavation and dewatering methods and submit proposals for review and Approval. Include in the submission of the details of the temporary earth support systems the following:
      i. Design philosophy; bearing in mind that design is such that the risk of failure is not more than that which would be adopted if the temporary works were to be permanent. Allowance may be made in the design for the shorter design life and for the risk to persons and property and the surface water and ground water conditions which are likely to occur during construction;
      ii. Detailed design calculations and drawings;
      iii. Specification for the works including procedures for installation and removal;
      iv. Prediction of deformation of the temporary works and ground settlement and horizontal movement;
      v. Assessment of ground vibrations resulting from the temporary works that must not exceed the limits set down in EAR2.W200. In case where the temporary works involve installation of pile walls by percussive or vibratory methods, assessment of ground vibrations resulting from such works that must not exceed the limits set down in Appendix A of PNAP APP-137;
      vi. Precautionary measures to safeguard the integrity of the existing drainage pipe work and retaining wall in vicinity of the temporary works.
   b. Refer to EAR1.D030 on the design requirement and method of construction of the ELSW;
c. Include in the design contingency measures to be adopted should site conditions
deviate from the design assumptions;

d. Ensure all calculations and drawings submitted are certified and signed by the
Registered Structural Engineer referred to at EAR1.D010 and ensure all
geotechnical reports and supporting documents are certified and signed by the
Registered Geotechnical Engineer referred to in EAR1.D010;

e. Allow in the design for the subsequent removal of the temporary works while
maintaining the stability of the excavation upon completion of the Works;

f. Make a detailed submission to the CM to provide design parameters and design
ground water levels with supporting document/calculation/justification for the design and:

i. Verify the proposed design parameters and design ground water levels by
carrying out necessary Approved laboratory tests and monitoring. The CM
reserves the right to reject any proposed design parameters and design
ground water levels that are not to the CM's satisfaction;

ii. Submit details of all required tests to the CM's satisfaction. Arrange for
sufficient number of laboratory tests and investigation to establish the
design parameters for each major stratum with sufficient independent
results for that stratum. Carry out all laboratory tests and investigation for
this purpose at the expense of the Contractor and bear all the time involved.

**EAR1.D060.8 EFFECT OF WORKS ON OTHERS**

1. Where temporary work, ELSW and dewatering proposals could have an effect on
the properties of others, the CM may require submission of the design proposals to
be presented to the Geotechnical Engineering Office (GEO), Technical Services
Division of Civil Engineering Development Department, Highways Department,
Mass Transit Railway Corporation, Kowloon Canton Railway Corporation, Water
Supplies Department and Drainage Services Department, etc. for comments and / or
acceptance;

2. When Instructed abide by such requirements;

3. Where this is the case allow sufficient time in the programme for comment by
various Government Departments. Incorporate all comments and requirements
from various Government Departments into the ELSP prior to submission to CM in
accordance with EAR1.D030;

4. Address all queries raised by the various Government Departments;

5. Do not commence construction works until formal Approval has been given.

**EAR1.D070.8 INFORMATION PROVIDED BY THE AUTHORITY**

1. Drillhole data, laboratory testing data, structural design criteria and any other
information relevant to the Works may be viewed at the Authority's office by
appointment at any time during normal office hours;

2. The following soil parameters may be taken as reference values for design of ELSW:

<table>
<thead>
<tr>
<th>Soil material</th>
<th>Soil Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>c’ (kPa)</td>
</tr>
<tr>
<td></td>
<td>ϕ’ (deg.)</td>
</tr>
<tr>
<td></td>
<td>γ (kN/m³)</td>
</tr>
<tr>
<td></td>
<td>E’ (MPa)</td>
</tr>
<tr>
<td></td>
<td>ν’</td>
</tr>
</tbody>
</table>
Notes to table:

a. $c' = \text{effective cohesion of soil}$;
b. $\phi' = \text{effective friction angle of soil}$;
c. $\gamma = \text{bulk unit weight of soil}$;
d. $E' = \text{Young's modulus (for drained loading)}$; and
e. $\nu' = \text{Poisson's ratio (for drained loading)}$

3. The above information is given in good faith for reference only and is not meant to be exhaustive or to be representative of the whole or any part of the Site or in any way limiting the obligations and liabilities of the Contractor under the Contract. No guarantee can be given nor responsibility be taken by the Employer or the CM for their accuracy, consistency or sufficiency, and no claim whatsoever will be entertained on account of any errors, discrepancies and insufficiency in relation to the information given.

**EAR1.D080.8 GEOTECHNICAL STUDY AND GROUND INVESTIGATION**

1. In addition to the general responsibilities provided under the Contract, carry out a geotechnical study and any necessary ground investigation so as to become fully aware of the geotechnical characteristics of the design of temporary works or the execution of the works;

2. Comply with the requirements as specified in Project Specific Specification.

**EAR1.D090.8 BUILDING REGULATIONS**

Carry out calculations for temporary works in accordance with the relevant Building Regulations made under the Building Ordinance, slope manual, geoguide and model specification of Geotechnical Engineering Office and the relevant British Standards. Wherever there is conflict between British Standards and Building Regulations, the latter shall take precedence.

**EAR1.D100.8 DESIGN OF LOAD CARRYING ELEMENTS**

Ensure all materials used as load carrying elements conform to the relevant British Standards in respect of quality, and that the design conforms with the safe working stresses laid down in those Standards.

**EAR1.D110.8 TRENCH EXCAVATION**

Without prejudice to other provisions in the Contract, comply with the provisions in the "Guide to Trench Excavations (Shoring Support and Drainage Measures)" published jointly by the Highways Department and the Civil Engineering and Development Department, Hong Kong Government or its updates as may be promulgated from time to time in the design of temporary support to trench excavations.
MATERIALS

DEFINITIONS

EAR1.M005.8  INERT CONSTRUCTION AND DEMOLITION MATERIAL
Rock, rubble, earth, soil, concrete, asphalt, brick, tile and masonry generated from construction and demolition works.

EAR1.M010.8  EARTHWORKS MATERIAL
Soil, rock, or inert construction and demolition material on or below the Site at the commencement of the Works, or which is imported to the Site to carry out the Works.

EAR1.M020.8  OWNERSHIP OF EARTHWORKS MATERIAL
1. Ownership of the Employer - earthworks material within the Site at the commencement of the Works, except as in sub-clause (2) below;
2. Ownership of the Contractor - earthworks material which is required to be disposed of by the Contractor is the property of the Contractor when it is removed from the Site. Dispose of in tips provided by the Contractor, unless otherwise stated in the Contract.

EAR1.M030.8  SUITABLE MATERIAL
1. Naturally occurring or processed material, or inert construction and demolition material, which at the time of deposition is capable of being compacted in accordance with the specified requirements to form stable areas of fill;
2. Grade 200 Recycled Rock Fill as EAR1.M045 where specified in the Drawings or approved by CM;
3. Do not use unsuitable materials as listed in EAR1.M050.

EAR1.M040.8  PUBLIC FILL
1. Public fill shall mean the inert material arising from construction and demolition activities such as site clearance, excavation, construction, refurbishment, renovation, demolition and roadworks. Public fill comprises material including stone, rock, masonry, brick, concrete, soil and other inert material. There is no size limitation on the public fill, and a small amount of timber mixed with otherwise suitable material is permissible. The public fill may also consist of wet soil;
2. The use of public fill as fill material for earthwork may be permitted and the size limitation, transportation, stockpiling, deposit, spreading, compaction and any particular requirements of such material shall be as stated in the Contract.

EAR1.M045.8  GRADE 200 RECYCLED ROCK FILL
1. Grade 200 Recycled Rock Fill (RR 200) shall mean a type of recycled rock or inert construction and demolition material which is hard and durable, and free from cracks, veins, and other evidence of decomposition;
2. RR 200 shall be collected from the recycling facilities managed by the Fill Management Division of Civil Engineering and Development Department as specified in the Project Specific Specification;
3. In the event that RR200 is used in the Works, comply with the following:
a. Comply with the relevant ordering and collection procedures of RR 200 as specified by the CEDD;
b. Complete and submit the order form to the CM at least 10 days before the collection of RR 200 from the recycling facilities. The ordering and collection procedures together with the order form can be obtained from the CEDD website;
c. Make due allowance in the works programme for the time associated with ordering and collection of RR200 and bear all associated costs, and no extension of time will be allowed.

**EAR1.M050.8**  **UNSAFE MATERIAL**

Other than Suitable Material and Grade 200 Recycled Rock Fill, and including the following:

1. Peat, vegetation, timber, organic, soluble or perishable material, or rubbish;
2. Swelling clays or collapsible soils;
3. Dangerous or toxic material or material susceptible to combustion;
4. Material susceptible to volume change, including marine mud, materials from swamps, nullahs, stream courses and culverts, or soil with a liquid limit exceeding 65% or a plasticity index exceeding 35%; and
5. Metal, rubber, plastic or synthetic material.

**EAR1.M055.8**  **MARINE MUD**

The term "mud" shall be as defined in Table 11 of 'Geoguide 3: Guide to Rock and Soil Descriptions' GEO, which is broadly classified as marine deposits with fine soils of over 35% by mass of silts and clays of particle sizes up to 0.06 mm.

**EAR1.M060.8**  **ROCK**

1. Naturally occurring hard material which in the opinion of the CM can only be removed by:
   a. Blasting;
   b. Pneumatic tools other than clay spades;
   c. Wedges and sledge hammers;
   d. Drilling and the use of mechanical bursting;
   e. Drilling and the use of expanding agents.
2. Any isolated, solid boulder or detached piece of rock exceeding 0.2 m³.

**EAR1.M070.8**  **TOPSOIL**

Soil capable of supporting vegetable growth.

**EAR1.M080.8**  **EMBANKMENT**

An area on the Site, other than a foreshore or sea-bed, where the ground level is to be raised by filling in layers as part of the Works.

**EAR1.M090.8**  **TRENCH EXCAVATION**

Excavation starting at ground level and not exceeding 5 m in width at the surface.
BULK EXCAVATION
Excavation in the open, other than trench excavation.

FILL MATERIALS

GENERAL
1. Use only suitable material as previously defined;
2. Unless otherwise specified, form areas of fill by general fill material;
3. Obtain fill material from excavation within the Site. If there is insufficient fill material of the required types within the Site, provide imported fill material from sources outside the Site subject to approval by the CM.

PARTICLE SIZE DISTRIBUTION AND TYPES OF FILL MATERIAL
For different types of fill material, keep particle size distribution within the following table:

<table>
<thead>
<tr>
<th>Type of fill material</th>
<th>Percentage by mass passing</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Size</td>
</tr>
<tr>
<td></td>
<td>400 mm</td>
</tr>
<tr>
<td>Fine fill</td>
<td>-</td>
</tr>
<tr>
<td>General fill</td>
<td>-</td>
</tr>
<tr>
<td>Special fill</td>
<td>-</td>
</tr>
<tr>
<td>Granular fill</td>
<td>-</td>
</tr>
<tr>
<td>Rock fill (Grade 200)</td>
<td>-</td>
</tr>
<tr>
<td>Recycled rock fill (Grade 200)</td>
<td>-</td>
</tr>
<tr>
<td>Rock fill (Grade 400)</td>
<td>100</td>
</tr>
</tbody>
</table>

Notes to table:
1. Special fill material is to consist of material which has a liquid limit not exceeding 45%, a plasticity index not exceeding 20% and a coefficient of uniformity exceeding 50. For those special fill material which contains less than 30% by weight of particles less than 63 μm, testing on the liquid limit and plasticity index of the material is not required;
2. Granular fill material is to consist of clean, hard, durable material including recycled aggregates, rock and concrete;
3. Rock fill material is to consist of pieces of hard and durable rock of which the maximum size shall not be greater than three times the minimum dimension of individual pieces and in the opinion of the CM not more than 30% by mass is discoloured or shows other evidence of decomposition. Crushed rock or crushed concrete may be permitted subject to approval by the CM;
4. The soluble sulphate content of fill material placed within 500 mm of concrete, cement bound material or cementitious material must not exceed 1.9 grams of sulphate, expressed as SO₃, per litre;
5. The total sulphate content, expressed as SO₃, of fill material placed within 500 mm of metalwork must not exceed 0.5% by mass;
6. Well-graded material to consist of material which has a coefficient of uniformity exceeding 10;
7. Uniform-graded material to consist of material which has a coefficient of uniformity of 10 or less.

**EAR1.M230.8 FILTER MATERIAL**

1. Hard, durable, inert material. When placed and compacted this material, either:
   a. Conforms with the grading limits specified; or
   b. Other limits separately designed by the Contractor to suit the type of adjacent material in accordance with filter rules acceptable to the GEO, as agreed by the CM; and
   c. Submitted to the CM at least 4 weeks prior to actual incorporation into the Works; and
   d. Graded - in accordance with Test Method 8.2 of Geospec 3: Model Specification for Soil Testing, GEO, and free from organic or other impurities.

**EAR1.M240.8 HARDCORE**

To comprise either:
1. Rock fill, or;
2. Broken stone, hard brick, concrete or other comparable hard, inert material, free from dust, rubbish or deleterious foreign matter and capable of passing through a 150 mm diameter ring in every direction.

**EAR1.M250.8 HYDROSEEDING**

Refer to Project Specific Specification.

**EAR1.M260.8 SOFT LANDSCAPING**

Refer to Project Specific Specification.
WORKMANSHIP

DEFINITIONS AND SUBMISSIONS

EAR1.W010.8 AREAS OF FILL
Areas within the Site, including areas in embankments, platforms and slopes and in excavations for structures, pits and trenches, in which fill material is deposited and compacted as part of the permanent work.

EAR1.W020.8 EARTHWORKS FINAL SURFACE
The surface to which the work included in this Worksection is finished.

EAR1.W030.8 FORMATION
That part of the earthworks final surface on which a pavement, structure or utility, is constructed, or on which the blinding or bedding for a pavement, structure or utility is placed.

EAR1.W040.8 INTERMEDIATE AREAS OF FILL
Areas of fill in which fill material is deposited and compacted directly into shallow water or onto naturally occurring soft ground.

EAR1.W050.8 SUBMISSION OF PARTICULARS
Submit the following particulars of proposed methods of construction for earthworks to the CM at least 14 days before relevant work starts:
1. Details of constructional plant and haulage vehicles;
2. Methods of excavation and of deposition and compaction of fill material;
3. Use of different type of excavated material and sources of imported fill material;
4. Arrangements for stockpiling, sorting and separating excavated material, earthworks material and fill material and for reusing and disposing of such materials;
5. Methods of controlling the moisture content of fill material;
6. Methods of controlling surface water and groundwater and of protecting earthworks and earthworks material from damage due to water and from weather conditions which may affect the earthworks or earthworks material;
7. Methods of monitoring groundwater levels;
8. Methods of monitoring the ground and structures for movements;
9. Methods, with detailed design of supporting excavations adjacent to slopes, retaining walls, structures, roads, private developments or other properties;
10. Stability calculations of unsupported excavations adjacent to slopes, retaining walls, structures, roads, private developments or other properties.

USE OF BLASTING

EAR1.W110.8 USE OF BLASTING METHOD
Refer to Project Specific Specification.
SURVEYS

EAR1.W210.8  DATUM
Spot levels and contours shown on the Drawings are, unless otherwise specified, reduced to Hong Kong Principal Datum for levels and the latest edition of Hong Kong Geodetic Datum for coordinate locations.

EAR1.W220.8  COMMENCEMENT SURVEY
1. Upon possession of the Site, and before any work is carried out, carry out and record a topographical survey of the whole of the Site in the presence of the representatives of the CM;
2. Obtain Approval to the method of survey and the instrument to be used from the CM before the commencement of the survey;
3. Submit the survey drawings to the CM within 14 days after commencement of the survey for endorsement and adopt the endorsed survey drawings as the true record of the Site at commencement;
4. Use the endorsed survey drawings for measurement of earthwork quantities as applicable;
5. Do not start earthworks on any location prior to the endorsement of the survey drawings;
6. When instructed by the CM, carry out a joint survey of the Site with the previous piling contractor immediately upon award of the Contract in the presence of the CM or his representatives as specified in PRE.B3.080.

EAR1.W230.8  INTERIM AND FINAL SURVEYS
1. Carry out interim surveys at intervals requested by the CM;
2. Carry out final topographical survey upon completion of the works;
3. Follow instructions of the CM for any extra surveys required to resolve any doubts on the correctness of survey records;
4. Adopt the same process for interim, final, and extra surveys as specified in EAR1.W220;
5. When instructed by the CM, carry out a joint survey with the subsequent building contractor after completion of the Works and upon award of the subsequent building contract to record the site topography and the works to be handed over to the subsequent building contractor in the presence of the CM or his representatives as specified in PRE.B9.130.

EAR1.W240.8  SURVEY INFORMATION
All topographical surveys:
1. Must be reduced to Hong Kong Principal Datum and coordinate locations to be to the latest edition of the Hong Kong Geodetic Datum;
2. Must include plans and sections;
3. Must be reproduced on transparent film of dimensionally stable material to scale of 1:200 (or as instructed);
4. Must be signed by the Contractor and the responsible party involved in case of a joint survey and the CM as being a true record of the Site.
TEMPORARY WORKS, SLOPES AND GROUND DRAINAGE

EAR1.W310.8 TEMPORARY DRAINAGE SYSTEM
Rapidly disperse water, whether shed on to the excavation or earthwork or arising from any other source, including flowing into the Site from elsewhere and:

1. Obtain Approval to the discharge points of the temporary drainage and pumping systems;
2. Make all arrangements with and obtain necessary approvals and inspections from the relevant authorities for discharging water to drains, watercourses or the sea;
3. Do not start the work until the Approved arrangements for disposal of the water have been implemented;
4. Take measures to prevent floatation of new and existing structures;
5. Provide temporary watercourses, ditches, catchpits, drains, pumping or other means of maintaining the excavations and earthworks free from water;
6. Discharge the water into the permanent outfall of the piped drainage system whenever possible;
7. Provide Approved means of trapping silt on temporary systems discharging into the permanent drainage systems;
8. Ensure that temporary and permanent drainage systems are adequately maintained and clear of rubbish and debris.

EAR1.W320.8 TEMPORARY SUPPORTS TO EARTHWORKS
1. Use temporary supports or other methods to maintain excavations in a stable condition and to prevent settlement of structures or utilities due to excavation or dewatering;
2. Do not operate or park construction plant or other vehicles adjacent to excavations unless this has been allowed for in the design of the temporary works for the support of the excavation. Erect barriers at a distance from excavations not less than the depth of excavations, or where space is not permitted, at a shorter distance from excavations as agreed with the CM;
3. Do not place earthworks material or other materials adjacent to excavations unless this has been allowed for in the design of the temporary works for the support of the excavation;
4. Securely support all sides of trenches, pits, excavations, slopes or stockpiles exceeding 1.2 m vertical height/depth unless formed to a safe batter substantiated by design calculation agreed with the CM.

EAR1.W330.8 GENERAL SAFETY PRECAUTIONS
1. Carry out excavations and earthworks in such a manner to prevent erosion or slips;
2. Do not stockpile material where it might cause a landslide;
3. Do not store excavated materials adjacent to the top edge of mass excavations, slopes or stockpiles exceeding 1.2 m high unless otherwise agreed;
4. When Instructed trim and seal final faces of excavations to remove all loose rocks to prevent falling which might cause injury to workmen;
5. Limit working surfaces to safe slopes and height.
SAFETY PRECAUTIONS FOR OPEN EXCAVATION EARTHWORKS

1. Provide open board fencing, or equivalent, and warning signs to:
   a. Excavations, slopes or stockpiles exceeding the following heights:
      i. Vertical slope face: 2 m
      ii. Battered slope face: 3 m
   b. Trenches or pits exceeding 2 m deep.

2. Provide temporary fencing or warning ribbons to excavations, slopes, stockpiles, trenches or pits less than the heights/depth given in sub-clause (1) above but exceeding 1.2 m.

GENERAL

EXCAVATION AND EARTHWORKS

1. Carry out excavations and earthworks in dry conditions unless otherwise permitted by the CM, except where the excavations and earthworks are required to be carried out in or with water or other fluids;

2. Suppress dust generation during excavation and earthworks operations by spraying the work area of any excavation or earth moving equipment operation with water or a dust suppression chemical immediately before, during and immediately after the operation so as to maintain the entire surface wet. Dispose cement, pulverized fuel ash or any other dusty materials collected by fabric filters or other air pollution control system or equipment in totally enclosed containers;

3. Control height from which excavated materials are dropped to a practical minimum;

4. Carry out the formation of cuttings and filling in such a manner that the surfaces have at all times a sufficient minimum crossfall and, where practicable a sufficient longitudinal gradient to enable them to shed water and prevent ponding;

5. Adopt a method of working which minimises the area of exposed soil across the Site;

6. Carry out excavation to the lines, levels, dimensions and slopes specified;

7. Carefully level the bottom of excavation and step or bench horizontally as specified.

PROTECTION FROM WATER AND WEATHER

1. Keep earthworks after site clearance, excavation or filling and earthworks material after excavation free of water and:
   a. Protect from damage due to water;
   b. Protect from exposure to weather conditions which may affect the earthworks or earthworks material.

2. Take measures including but not limited to the following:
   a. Use temporary drainage, pumping systems or other effective measures approved by the CM. Intercept silt and debris with traps before water is discharged from the Site;
   b. Obtain Approval from the CM for the discharge points of temporary drainage and pumping systems. Make all arrangement with and obtain the necessary approvals and inspections from the relevant authorities for discharging water to drains, watercourses or the sea. Do not start the relevant works until the approved arrangements for disposal of the water have been implemented;
**EXCAVATION AND FILLING**

**EAR1 > WORKMANSHIP**

---

c. Do not carry out works in weather conditions that may adversely affect the works unless protection by methods agreed by the CM is provided;
d. Maintain surfaces in a stable condition;
e. Form surfaces to falls to shed water and to prevent ponding;
f. Keep the area of exposed surfaces to a minimum;
g. Seal or cover with impermeable sheeting or protect by other Approved methods surfaces which are temporarily exposed.

---

**EAR1.W430.8 WORK NEAR SLOPES**

Do not carry out excavations on or adjacent to slopes unless measures are taken to drain the excavation and to prevent water from the excavation entering the slopes.

---

**EAR1.W440.8 UNSUITABLE EARTHWORKS MATERIAL**

1. Replace the following materials or deal with by the methods agreed by the CM:
   
a. Earthworks material which has been used, or is required for use, in the permanent work and which is allowed to become unsuitable such that in the opinion of the CM it no longer complies with the specified requirements for that type of material;
   
b. Earthworks material which is not specified to be excavated and which the Contractor causes or allows to deteriorate such that in the opinion of the CM the permanent work will be affected.

2. Dispose of all unsuitable material;

3. Material provided to replace earthworks material, which has been allowed to become unsuitable, or which the Contractor causes or allows to deteriorate, shall be an equivalent material approved by the CM. The replacement material shall have the same volume after compaction as the material replaced.

---

**EAR1.W450.8 ADDITIONAL EXCAVATION AND STABILIZATION**

When Instructed, carry out additional excavation to remove earthworks material which in the opinion of the CM has inadequate strength, durability or stability and treat the voids as follows:

1. Deposit and compact general fill, fine fill, or special fill material below areas of fill and below formations other than in rock;

2. Place and compact Grade 10 concrete as specified in Worksection CON1 below formations in rock;

3. Deposit granular fill material below standing water;

4. In other circumstances where the CM requires stabilisation of existing material, use rock fill material (Grade 400) deposited directly into the original material and compacted to form a stable foundation on which to construct the subsequent work.

---

**EAR1.W460.8 HANDLING AND STORAGE OF EARTHWORKS MATERIAL**

1. Do not handle or store in a manner which will result in segregation, deterioration, erosion or instability of the material;

2. Keep different types of earthworks material separate from each other. Maintain earthworks material which is suitable for use as fill material in a suitable condition and free from contamination by other materials;
3. Stockpile excavated materials away from nullahs, stream courses and covered culverts at a point convenient for direct loading onto transport in such a manner as to cause the minimum nuisance to the public;

4. Remove topsoil when required before starting excavation or filling and, unless otherwise specified, deposit on Site in temporary heaps not greater than 2 m in height for re-use. Ensure the soil is kept free from contamination and undue compaction;

5. Temporary spoil heaps will not be allowed in certain areas. Obtain CM's permission for location;

6. Level and drain properly the material handling and storage areas. Spray stockpiles of material with water or a dust suppression chemical to minimize dust generation.

**EAR1.W470.8 EXISTING DRAINS AND SERVICES**

During excavation and earthworks:

1. Take all precautions to prevent damage and excessive settlement to existing drains and services;

2. Notify the CM and the Authority of any damage and any settlement in excess of the limits allowed by relevant authority immediately and make good;

3. Temporarily divert ditches, land drains and other waterways found in excavation and subsequently reinstate to Approval;

4. Excavate by hand adjacent to utilities that are known, proven or suspected to exist.

**EAR1.W480.8 EXCAVATION ADJACENT EXISTING STRUCTURES**

Excavate by hand unless otherwise permitted by the CM.

**EAR1.W490.8 TRIMMING**

Neatly trim the face of excavations. Do not trim the side faces of excavation for at least 24 hours after placing any blinding concrete.

**EAR1.W500.8 EXCAVATION OF TRENCHES FOR UTILITIES**

1. The length of trench excavation left open at any one time shall not exceed that agreed by the CM;

2. Unless otherwise permitted by the CM, do not excavate trenches for utilities in areas of fill until the fill material has been deposited and compacted up to the earthworks final surface or formation or up to 1 m above the top of the utility, whichever is lower.

**OBSTRUCTIONS**

**EAR1.W610.8 BURIED OBSTRUCTIONS**

Notify the CM without delay of the location and nature of any unforeseen obstruction encountered during excavation.

**EAR1.W620.8 DISUSED DRAINS AND MANHOLES**

If required by the CM, take up disused drains encountered during the excavation, clear away and:

1. Remove any contaminated earth;
2. Disinfect as necessary and seal off ends with concrete;
3. Break up and remove disused manholes and backfill where required, properly compacted;
4. Submit details of filling materials to be used for Approval.

**EAR1.W630.8 OLD UNDERGROUND STRUCTURES**

1. If required by the CM, break out and remove old walls, foundations, piles and other underground structures encountered during the excavation and backfill where required, properly compacted;
2. Submit details of filling materials to be used for Approval.

**EAR1.W640.8 BOULDERS**

Treat boulders that intersect the earthworks final surface or formation as excavation proceeds by methods agreed by the CM. Do not leave boulders protruding unless permitted by the CM.

**EAR1.W650.8 PILED FOUNDATIONS**

Take necessary precautions to prevent damage to tops of piles during excavation.

**CUTTINGS**

**EAR1.W710.8 SURFACES OF CUTTINGS**

Remove the following from surfaces as required by the CM:
1. Inferior stone or soft material occurring between layers of compact rock;
2. Rock which the CM considers will not withstand weather sufficiently;
3. Rock fragments which move when prised with a crow-bar.

**EAR1.W720.8 DEPTH OF REMOVAL**

Comply with the CM's instructions on the depth from the face of cuttings to which material is to be removed.

**EAR1.W730.8 MAKING GOOD**

Build up to required profile with Grade 15/20 concrete as specified in Worksection CON1 or masonry laid with cement mortar finishing in "rock texture" similar to adjoining natural rock faces.

**DISPOSAL OF EXCAVATED MATERIAL**

**EAR1.W810.8 UNSUITABLE AND SURPLUS MATERIAL**

1. Unless otherwise stated in the Contract:
   a. Take measures to sort and separate excavated material on Site for use in the permanent works according to the Environmental Management Plan;
   b. Dispose of the excavated material, which in the opinion of the CM cannot be selected, processed or mixed in a practical manner to make it suitable for use in the permanent work;
c. Dispose of excavated material that is surplus to the requirements of the permanent works. Take measures to sort and separate the surplus material according to the Environmental Management Plan before disposal.

2. Take possession of unsuitable material and surplus material, unless otherwise provided for in the Contract.

**EAR1.W820.8** **SUITABLE MATERIAL**
Do not remove suitable material from Site without the permission of the CM, unless surplus to the requirements of the Contract.

**EAR1.W830.8** **DUMPING OF UNSUITABLE AND SURPLUS MATERIALS**
Inform the CM of the proposed dumping areas and take responsibility for making arrangements for disposal of these materials. Notwithstanding the foregoing, the CM retains the right to direct the manner in which the dumping is carried out.

**EAR1.W835.8** **DISPOSAL OR REUSE OF MARINE MUD**
Refer to Project Specific Specification.

**EAR1.W840.8** **ON SITE SORTING OF CONSTRUCTION AND DEMOLITION MATERIALS**
1. All construction and demolition (C&D) materials arising from or in connection with the works shall be sorted on-site and be separated into different groups for disposal at landfills, public filling areas, in filling areas within the Site, in filling areas outside the Site provided by the Contractor, or recycling as appropriate. The inert portion of the C&D material is the public fill. All public fills to be disposed of at public filling areas shall be sorted and broken down according to the Dumping Licence conditions. The non-inert portion of the C&D material is the C&D waste which shall be disposed of at the landfill;

2. Unless otherwise stated in the Contract, all C&D material arising from or in connection with the works shall become the property of the Contractor when it is removed from the Site. Promptly remove all sorted and processed materials arising from or in connection with the works from the Site on a regular basis as the works proceed;

3. A method statement for the sorting, processing and disposal of C&D materials arising from or in connection with the works shall be submitted to the CM's Representative for approval 14 days before the commencement of any sections of the Works.

**EAR1.W845.8** **TRIP-TICKET SYSTEM**
Comply with the Trip-ticket System as specified in Preliminaries Specification for the disposal of construction and demolition (C&D) materials generated from the Works.

**RETAINING WALLS, SHALLOW FOUNDATIONS AND OTHER STRUCTURES**

**EAR1.W910.8** **SIZE OF EXCAVATIONS**
1. When excavating for structures, pits, and trenches keep to the minimum size necessary to construct the permanent work. Keep the sides of excavations vertical unless otherwise permitted by the CM;
2. Obtain Approval for the length of trench excavation left open at any one time and do not exceed that amount.

**EAR1.W920.8 APPROVAL OF EXCAVATION BOTTOMS**

Bottoms of excavations are to be Approved before any new work is laid on them. Inform the CM when the excavation is ready for inspection.

**EAR1.W930.8 FOUNDING OF SHALLOW FOUNDATIONS**

1. All shallow foundations (rafts or pads) of the structures specified in Project Specific Specification shall be founded on material of the type and / or bearing capacity specified and at the founding levels shown on the drawings unless otherwise instructed by the CM;

2. The founding bases of shallow foundations shall be free of unsuitable materials. If the base lies below the groundwater table and where necessary, proper means shall be provided to divert and / or lower the groundwater such that the integrity of the exposed founding material(s) and the subsequent concrete casting will be ensured;

3. Sink drillholes for carrying out Standard Penetration tests (SPT) in accordance with BS EN ISO 22476-3:2005, modified by Geoguide 2 as necessary, to the founding materials (except for foundations on rock). The SPT shall be carried out by a contractor on the Housing Authority List of Ground Investigation Contractors. The minimum number and depth of the drillholes shall be as specified in Project Specific Specification. Unless otherwise Instructed, commence the drillhole at existing ground level before excavation for the foundations and carry out the SPT at intervals as specified in Project Specific Specification. Submit to the CM the preliminary test reports within 2 days and the final test reports within 2 weeks upon completion of the SPT;

4. If Instructed, carry out Plate Load Test for shallow foundations (except for foundations on rock) in accordance with GIN.T190 and the Code of Practice for Foundations issued by the Buildings Department;

5. If Instructed, take down the excavations for founding of shallow foundations (except for foundations on rock) first to not less than 300 mm above the designed founding level and carry out dynamic probe tests or other tests. The dynamic probe tests shall be in accordance with Appendix 7.1 of the ‘General Specification for Civil Engineering Works’, The Government of the Hong Kong Special Administrative Region, 2006 Edition. Submit the test results within 2 days and a record plan showing all the locations and levels of the dynamic probe tests within 1 week upon completion of the tests;

6. If considered necessary after examining the actual ground exposures and / or test results, the CM may order further excavation to deepen the founding level of the foundations and / or other measures to ensure a satisfactory foundation. The bases shall be inspected and approved by the CM before concreting;

7. If considered necessary the CM may order compaction of the whole or parts of the founding bases of shallow foundations by at least 12 passes of a vibratory roller, or other accepted construction plant, with a minimum static load per 100 mm width of roll of 2kN or 4kN. In areas adjacent to structures and utilities, which are existing or constructed as part of the permanent works, compaction shall be carried out by hand-rammers or manually operated power equipment in a manner that these structures and utilities are not disturbed or damaged.
**PROVING BEDROCK FOR FOOTINGS (RAFTS AND PADS)**

1. Where footings (rafts/pads) are specified to be founded on bedrock, carry out proving of bedrock in accordance with the following sub-clauses as directed by the CM. Clear completed excavations for footings of all soils and loose materials;

2. Footings shall be founded on bedrock of minimum bearing capacity as specified in Project Specific Specification;

3. When Instructed, upon excavation reaching bedrock, take NX size cores for a depth of 5000 mm into the bedrock and provide rock core samples and records of bores for the CM's inspection; cores to be taken at the frequency as specified in Project Specific Specification;

4. When Instructed, carry out laboratory compression tests or field point load tests on recovered cores to determine rock strength;

5. Fill core holes for the full depth with 1:3 cement and sand grout with water/cement ratio of 0.6;

6. When Instructed, upon excavation reaching bedrock, proving test at the frequency as specified in the Project Specific Specification shall be conducted with a percussive air rock drill to be supplied by the Contractor, of not less than 35 kg in weight and fitted with newly sharpened 40 mm diameter steel drilling bit. The proving test shall be performed with 25 mm diameter steel drilling rods. At the completion of each 1.5 m of drilling, the drilling bit shall be replaced with a newly sharpened 40 mm diameter bit. Additional lengths of drilling rock shall be fitted at that time as appropriate. The rock drill shall be at all times free to penetrate under its own weight and in a vertical direction. Perform the proving test by drilling minimum 5.0 m below the founding level. The results of each proving test shall be recorded by the Contractor, and he shall plot the time in minutes taken to drill each 300 mm on a graph. A 20 mm diameter steel rod 5.5 m long shall be placed in each completed drillhole for the CM's inspection. Fill drill holes for the full depth with 1:3 cement and sand grout with water/cement ratio of 0.6.

**REMEDIAL WORKS**

**EXCAVATION BOTTOMS DAMAGED AFTER APPROVAL**

If, due to water or other causes, the bottom of the excavation becomes unsuitable after Approval, excavate further to a new Approved level, and backfill with Grade 15/20 concrete as specified in Worksection CON1.

**OVER EXCAVATION**

Backfill and compact in accordance with this Specification or other Approved means those areas where the Contractor's method involves excavation in excess of that specified.

**DAMAGED SURFACES**

1. Make good surfaces after excavation which, due to exposure to weather conditions, flooding or other cause, have been allowed to deteriorate to a condition unacceptable to the CM;

2. Where this is the case carry out additional excavation and filling in accordance with this Specification, or by waiting until the condition of the exposed material is, in the opinion of the CM, fit to receive the backfill.
FILLING GENERALLY

EAR1.W1110.8 USE OF ROCK CRUSHING PLANT
Do not use rock crushing plant on the Site unless permitted by the CM to do so.

EAR1.W1115.8 USE OF GRADE 200 RECYCLED ROCK FILL
Where the use of Grade 200 Recycled Rock Fill (RR 200) is specified in the Contract, comply with the requirements stated in EAR1.W1720 to EAR1.W1750 and EAR1.W1910 to EAR1.W1930 in respect of the deposition and compaction of this material.

EAR1.W1120.8 HAULAGE OF FILL MATERIAL
Do not haul fill material to the area of fill until compaction plant operating at the area of fill is sufficient to achieve the specified requirements for relative compaction of the fill material.

EAR1.W1130.8 REMOVAL OF EARTHWORKS MATERIAL
Do not remove from the Site any earthworks material that is required for use in the permanent work as fill material without prior Approval. Notify the CM before any earthworks material is removed from the Site.

PREPARATION FOR FILLING

EAR1.W1210.8 EXISTING GROUND
Prepare the surfaces on which fill material is to be deposited after site clearance in accordance with the following requirements:
1. Remove topsoil, grass, and other organic matter;
2. Remove soft spots, boulders, and other materials, which in the opinion of the CM are unsuitable or unstable;
3. Deal with voids as stated in the Contract or Instructed.

EAR1.W1220.8 WATER-COURSES
Do not place fill material until watercourses have been diverted or under-drained.

EAR1.W1230.8 SLOPING GROUND
1. Cut benches and install sub-soil drainage system as stated in the Contract;
2. Do not place fill material on sloping ground until benches have been completed at the area receiving the fill material.

EAR1.W1240.8 AVAILABILITY OF PLANT
Commence filling works only when sufficient compaction plant is in operation at the place of deposition to ensure compliance with the requirements of this Specification and when the CM's permission has been obtained.

EAR1.W1250.8 SCARIFYING
Scarify surfaces other than rock to a depth of 200 mm and compact to the same standard as the fill material which is to be deposited.
FILLING OPERATIONS

EAR1.W1310.8 DISPOSAL OF WATER
1. Keep the fill area free of water;
2. Leave surfaces with no area that can retain water at the end of each day's work and, if necessary, cut ditches to achieve this.

EAR1.W1320.8 APPROVAL
Obtain Approval before deposition of fill material starts and before any fill layer is covered.

EAR1.W1330.8 ADVERSE WEATHER CONDITIONS
Stop work when the state of the weather is such that, in the opinion of the CM, it will adversely affect the placing and compacting of fill.

EAR1.W1340.8 APPROVAL OF REMEDIAL MEASURES
Obtain Approval for and prior to carrying out remedial measures.

EAR1.W1350.8 REMEDIAL MEASURES FOR DAMAGED FILL AREAS
Adopt one of the following procedures when material placed and compacted or awaiting compaction reaches a condition which, in the opinion of the CM does not comply with this Specification or has been damaged either by weather or in any other way:
1. Remove the material from Site, replacing it with equivalent suitable material;
2. Remove the material to stockpile until it is in a condition suitable for re-use;
3. Make good the material by mechanical or chemical means;
4. Cease work on the material until it is in a suitable physical condition for re-use.

EAR1.W1360.8 REMEDIAL MEASURES WHERE FILL OVERLAID
Remove, and adopt sub-clause (1) or (2) in EAR1.W1350 for any material not complying with this Specification that has been overlaid by more recently laid material.

EAR1.W1370.8 RESTRICTIONS ON USE OF FILL MATERIAL
1. Do not use excavated material required for use in the permanent works which is capable of being selected, processed and mixed to make it suitable for use as fill material for any other purposes unless permitted by the CM;
2. Replace any such excavated material which the CM permits to be removed from the Site or used for other purposes by an equivalent Approved material of the same volume after compaction as the material replaced.

EAR1.W1380.8 MIX PROPORTIONS, MIXING AND PLACING RECONSTITUTED SOIL
1. For reconstituted soil use 1:3:12 cement, sand, special filling material by weight;
2. Mix in a concrete mixer with sufficient water to ensure the mix is just damp enough to enable it to be properly mixed and compacted;
3. Place each batch in its final position and compact within 30 minutes of the water being added. Mixed material not placed and compacted within this time limit will be rejected;
4. Hand mixing of small quantities may be permitted by the CM.

**SETTLEMENT**

Make good, to the satisfaction of the CM, settlement in filling and backfilling and any consequential damage that may occur up to the end of the Maintenance Period.

---

**FILLING FOUNDATION PITS AND TRENCHES ETC**

---

**ADJACENT UTILITIES OR STRUCTURES**

1. Within 500 mm of a structure or utility except as stated in EAR1.W1420, deposit fill material of:
   a. Fine fill material, unless otherwise stated in the Contract;
   b. The fine fill material may contain no more than 5% by weight of fresh, slightly decomposed or moderately decomposed rock fragments of up to 200 mm maximum size provided these rock fragments do not cause any damage to the structures or utilities and do not interfere with compaction requirements.

2. Do not deposit fill material adjacent to or above structures or utilities until the construction of the structure or utility is sufficiently advanced to accept the imposed forces without disturbance or damage;

3. Deposit evenly on all sides of structures or utilities and in such a manner that the structure or utility is not disturbed or damaged;

4. Compact the fill material in such a manner that the structure or utility is not disturbed or damaged;

5. Where sheet piling, timbering or other temporary supports to the excavations are not to be left in place, remove the sheet piling, timbering or other temporary supports as deposition of fill material proceeds, in such a manner that the stability of the adjacent ground is maintained and the compacted fill material is not disturbed.

---

**FILLING AROUND WATER, SEWERAGE AND DRAINAGE PIPES**

Where these have been laid as part of the permanent works:

1. Use special filling material unless otherwise stated in the Contract;

2. Deposit the fill material in layers not exceeding 100 mm thick to a level of 300 mm above the top of the pipe;

3. Deposit the fill material in such a manner that the layer on one side of the pipe is not more than 100 mm higher than the layer on the other side;

4. Compact the fill material by hand rammers or manually operated power equipment;

5. Compact the fill material within 300 mm above the top of sewage and drainage pipes to obtain a relative compaction of at least 85% throughout.

---

**BACKFILLING TO FOUNDATIONS**

Backfill to top of foundations with general filling materials.

---

**BACKFILLING TO TRENCHES FOR AUTOMATED REFUSE COLLECTION SYSTEM (ARCS)**

Backfill to top of trenches with excavated or Approved general filling materials. Cover to ARCS conveyance pipe to be minimum 600 mm generally and 800 mm in vehicle circulation areas.
FILLING EXISTING WATERCOURSES

EAR1.W1510.8 PREPARATION
Divert existing watercourses and channels as required and clear the same of all vegetation growth and unsuitable material.

EAR1.W1520.8 FILLING
Filling materials and method of construction to be used are specified in Project Specific Specification.

BACKFILLING BEHIND RETAINING WALLS

EAR1.W1610.8 PLACING FILTER MATERIAL
1. Carefully place filter material to avoid contamination and damage;
2. Bed in layers simultaneously with the filling material and compact.

EAR1.W1620.8 FILLING
Unless otherwise specified place special filling material as backfilling and compact by the Performance Specification method of compaction: EAR1.W1810 - EAR1.W1860. Compaction plant is to be of such a size as to ensure that no undue stress is placed on the wall during compaction.

FORMING EMBANKMENTS AND PLATFORMS

EAR1.W1710.8 MATERIAL SELECTION
Form embankments with special fill material unless otherwise specified.

EAR1.W1720.8 DEPOSITION OF FILL MATERIAL
1. Deposit fill material obtained from excavation within the Site in its final location as soon as practicable after it has been excavated;
2. Build up embankments evenly over the full width;
3. Control the construction method to ensure that any compaction of the fill material resulting from the passage of construction plant or haulage vehicles is uniform;
4. In areas of fill formed of fill material other than rock fill material, form earthworks final surfaces sloping at a gradient exceeding 1 to 3 (vertical to horizontal) by overfilling and cutting back after compaction. Extend the over-filling beyond the earthworks final surface by a horizontal distance of 500 mm or three times the thickness of the compacted layer, whichever is greater;
5. Deposit fill material in layers of a thickness appropriate to the compaction method to be used. In deposition of fill material, ensure that a good bonding is achieved between layers of fill, and unless otherwise directed by the CM, do not place fill material on previously compacted layers unless the surface has been scarified or otherwise broken up and, if necessary, watered;
6. Unless otherwise permitted by the CM, construct layers of fill material horizontally, except for any gradient required for drainage, and keep the thickness of each layer uniform over the area to be filled. Bring up the fill material from the bottom in uniform horizontal layers, with the top of each layer graded to enable surface water to drain readily;

7. If the difference in level between adjacent areas to be filled exceeds 1 m, bench the edge of the higher area before fill material is placed against it;

8. Except for intermediate fill area, do not deposit fill material by end-tipping, by pushing loose material down slope faces or by other methods which may result in segregation or inadequate compaction of the fill material;

9. Make good damage to compacted layers caused by construction traffic.

**EAR1.W1730.8 COMPACT**

1. Compact filling material, other than rock fill and material as stated in EAR1.W1940 in accordance with the Compaction by Performance Specification: EAR1.W1810 - EAR1.W1860 unless otherwise specified;

3. Compact general fill material with a large portion of coarse material in accordance with EAR1.W1940.

**EAR1.W1740.8 ROCK FILL EMBANKMENTS AND PLATFORMS**

1. Place rock fill material so that the final compacted thickness of each layer exceeds 1.5 times and does not exceed twice the nominal Grade size of the rock fill material;

2. Spread and level the fill material by a crawler tractor weighing not less than 15 tonnes and compact the fill material in accordance with the Compaction by Method Specification: EAR1.W1910 - EAR1.W1930;

3. Ensure each layer consists of reasonably graded rock and fill the surface voids with fragments of rock before the next layer is deposited.

**EAR1.W1750.8 BLINDING ROCK FILL EMBANKMENTS AND PLATFORM**

1. Blind the top surface and side slopes with fine fill material to seal the surface;

2. Top soil may be used to blind side slopes and verges.

**EAR1.W1760.8 ISOLATED BOULDERS**

At the discretion of the CM isolated boulders, each within the range 0.015 m³ to 0.1 m³ in volume, may be incorporated into embankments not of rock fill, provided that the specified compaction requirements are met. Any boulders exceeding 0.015 m³ must be placed at a minimum of 2 m below formation level of carriageways or hard shoulders.

**EAR1.W1770.8 CULVERTS AND DRAINS ETC**

Form embankments equally on both sides of culverts or drain pipes and the like.

**EAR1.W1780.8 SURFACES USED BY CONSTRUCTION TRAFFIC**

1. Where surfaces of embankments are required for use by construction traffic, build up and maintain at a minimum of 300 mm above formation level, the area between extremities of carriageways, including any central reserve and hard shoulders before subsequently trimming to formation level;
2. Make good surface damage;
3. Ensure that no construction traffic uses the area once trimming to final formation level has commenced, with the exception of constructional plant necessary for such trimming and ensure that no damage is caused to the surface by such constructional plant.

**REUSE OF MARINE MUD FOR BACKFILLING**

**EAR1.W1785.8**  
**REUSE OF MARINE MUD FOR BACKFILLING**

Where specified to reuse marine mud for backfilling, at least 28 days before commencement of excavation works, obtain CM's approval for backfilling with cement-stabilized marine mud, which shall have undergone an approved cement-stabilization process to avoid undue ground settlement in future, and comply with the following requirements:

1. Submit a detailed method statement of the proposed cement-stabilization and backfilling processes, which shall include but not be limited to the method and procedure of the proposed cement-stabilization process, the sorting and temporary storage of the materials to prevent cross-contamination with other materials, the mix proportion with cement, granular soil, water and other approved additives, the methods of mixing, backfilling, compacting, curing, sampling and testing of the cement-stabilized materials to achieve 7-day cube test of 100 kN/m\(^2\) minimum in accordance with CS1;

2. Prepare sufficient test samples on Site and test the cement-stabilized materials at 7-day in accordance with CS1 for determination of the 7-day cube strength to demonstrate the suitability of the proposed mix proportion and method of construction. Appoint a HOKLAS accredited testing laboratory approved by the CM to carry out the test;

3. Carry out trials on Site and all necessary testing to demonstrate the suitability of the proposed cement-stabilization and backfilling processes for the Works to the satisfaction of the CM;

4. Backfill with and compact the cement-stabilized materials in accordance with the approved method statement and in layers of not greater than 300 mm thick to achieve a standard of compaction as stipulated in EAR1.W1850 and EAR1.W1860, unless otherwise approved by the CM;

5. All areas backfilled with cement-stabilized marine mud should be covered on top by suitable materials all in accordance with Worksection EAR1 and/or other specified materials for a minimum thickness of 500 mm;

6. For piling works, do not backfill the fill areas between future ground level and 1.5 m below the future ground level with cement-stabilized marine mud unless otherwise approved by the CM;

7. Do not backfill the fill areas between top of pile caps and underside of ground slabs of domestic blocks with cement-stabilized marine mud without CM's prior approval. Restrictions on backfilling of cement-stabilized marine mud for external areas are as follow:
### Pipes/ducts

<table>
<thead>
<tr>
<th></th>
<th>Range in level at carriageway where ducts/pipes are located with which no backfilling of Cement–Stabilized Marine Mud is allowed</th>
<th>Range in level at locations other than carriageway where ducts/pipes are located with which no backfilling of Cement–Stabilized Marine Mud is allowed</th>
<th>Drainage for Cable /valve pit required</th>

</table>

(FGL = Finished Ground Level)

Backfilling by cement-stabilized marine mud directly underneath the cable pits or valve pits is not allowed for proper drainage of water from the pits. Water pipes and gas pipes are not allowed to be directly surrounded by backfilled cement-stabilized marine mud for ease of maintenance. Cable ducts are allowed to be surrounded by cement-stabilized marine mud subject to proper coordination of works sequence with utility undertakings and sub-contractors;

8. Sink drillholes for carrying out Standard Penetration Tests (SPT) in accordance with BS1377:Part 9:1990 (Test 3.3), modified by Geoguide 2 at 1.5 m intervals to below the backfilled material to demonstrate that the relative strength of the stabilized material is achieved. Appoint a contractor on the Housing Authority List of Ground Investigation Contractors to carry out the SPT 7 days after backfilling. The minimum number of the drillholes shall be one drillhole for 100 m³ of the backfilling or part thereof in each foundation base on each operation day, and to a depth and location as directed by the CM;

9. Submit to the CM preliminary test reports within 1 day and final test reports within 1 week upon completion of the SPT;

10. In any situation, a SPT N-value of less than 10 shall render the backfilling unsuccessful. In this situation, submit a remedial proposal, which shall include but not be limited to excavation of the backfilled material, adjustment of the mix proportion and method of construction, and re-execution of the Works, to the CM for approval. Bear all costs and no extension of time is allowed for the remedial works and all associated consequences;

11. Obtain EPD's permit for disposal of all surplus cement-stabilized materials to a suitable dumping facility and dispose the materials accordingly after the backfilling. Make reference to ETWB Technical Circular (Works) No. 34/2002 and 19/2005 and other relevant regulations and guidelines for obtaining the permit;

12. Refer to the drawing in Appendix APC to this Specification for the profile of backfilling around foundations.

13. Provide adequate personal protective equipments to the workers to protect them against direct contact with contaminated marine mud.
COMPACATION BY PERFORMANCE SPECIFICATION

EAR1.W1810.8 PROCEDURE
1. Compact fill material in areas of fill in uniform layers to a stable condition as soon as practicable after deposition and in a manner appropriate to the location and to the material to be compacted;
2. Obtain the permission of the CM before the next layer is deposited on each layer of compact fill material;
3. Agree with the CM the thickness of each layer which is to be compatible with the compaction plant used. Carry out carefully controlled tests to determine the optimum placing thickness for the particular fill and the number of passes to achieve the required density with the compaction plant provided;
4. Do not place any permanent fill until such tests have been agreed with the CM. Earthmoving plant will not be accepted as compaction equipment.

EAR1.W1820.8 TESTING
Test each class of material to be compacted in accordance with the compaction tests specified in the Testing section of this Worksection.

EAR1.W1830.8 MOISTURE CONTENT
Other than rock fill material and the material as stated in EAR1.W1940, the moisture content of the fill material during compaction shall be within ±3% of the optimum moisture content determined in accordance with the test methods specified in the Testing section of this Worksection, provided that the fill material is still capable of being compacted in accordance with the specified requirements to form stable areas of fill. Take all necessary measures to achieve and maintain the specified moisture content.

EAR1.W1840.8 FIELD DENSITY
After compaction carry out in situ field density tests in accordance with the compaction tests specified in the Testing section of this Worksection. Test each layer and obtain Approval before placing of the next layer.

EAR1.W1850.8 STANDARD OF COMPACTION
Unless specified otherwise, compact fill material to obtain a relative compaction of at least 95% of the maximum dry density in general and at least 98% for fill within 200 mm of any formation level or slope profile.

EAR1.W1860.8 STANDARD OF COMPACTION BETWEEN PILE CAPS AND SUSPENDED SLABS AND AROUND PILE CAPS
The relative compaction of compacted material in the fill areas between top of pile cap and underside of suspended slab to be minimum 90% of the maximum dry density. Compact fill material around pile caps to achieve a relative compaction of at least 95%.

COMPACATION BY METHOD SPECIFICATION

EAR1.W1910.8 ADOPTION
Use for rock fill material and in exceptional circumstances for other suitable material when Approved.
EAR1.W1920.8 ROLLERS

Use vibratory rollers having a static load of at least 2 kN per 100 mm width of roll for layers with a compacted thickness not exceeding 500 mm, and at least 4 kN for layers with a compacted thickness exceeding 500 mm.

EAR1.W1930.8 COMPACTION METHOD

1. Compact each layer of rock fill material by at least eight passes of a vibrating roller, or by other Approved equivalent compaction method;

2. Compact the final surface of rock fill material by at least two additional passes of a vibrating roller or by other Approved equivalent method;

3. Fill voids as compaction proceeds.

EAR1.W1940.8 COMPACTATION OF GENERAL FILL MATERIAL WITH A LARGE PORTION OF COARSE MATERIAL

1. For general fill material of which less than 90% passes a 20 mm BS test sieve, it will be difficult to permit determination of the moisture content and maximum dry density according to EAR1.T350, EAR1.T420 and EAR1.T540. This type of material shall be compacted to the requirements of sub-clauses (2), (3) and (4);

2. Spread and level each horizontal layer of general fill material with a thickness not less than 1.5 times of the maximum size of the general fill material and not exceeding the maximum depth of compacted layer in accordance with the following Table. If this criterion is not met due to the presence of over-sized coarse material in the general fill, remove and break down the over-sized coarse material to sizes acceptable to the CM. Compact each layer systematically by a vibratory roller with the stipulated minimum number of passes corresponding to the minimum static load per 100 mm width of the roller;

</tbody>
</table>

3. Count only the number of passes of the roller when the roller is travelled on the material to be compacted at a speed of not more than 2 km per hour with full vibration. Disregard plant other than vibratory roller carrying out material spreading or providing some preliminary compaction, to assist the use of heavier plant in counting the number of passes;
4. Variation from the method or the use of plant different from that specified in sub-
clause (2) will be permitted only if the Contractor demonstrates at site trials that
equivalent compaction is achieved by the alternative method or plant. Agree with
CM and obtain CM’s approval on the procedure to be adopted for these site trials;

5. Without prejudice to the provision of the Conditions of Contract and in order that
the CM may take proper provision for the supervision of compaction in the
permanent work, apply in writing to the CM for permission to carry out compaction
not less than 24 hours before the compaction process;

6. When materials of widely divergent grading are used in embankments and fill areas,
spread and compact the materials in separate clearly defined areas;

7. If more than one class of material is being used in such a way that in the opinion of
the CM, it is not practicable to define the areas in which each class occurs, operate
the compaction plant as if only the material which requires the greatest compaction
effort is being compacted.

INTERMEDIATE AREAS OF FILL

EAR1.W2010.8 DEPOSITING
Fill material may be deposited in intermediate areas of fill by end-tipping or by pushing
into position until, in the opinion of the CM, it is sufficient to form a stable foundation
on which to construct the subsequent work.

EAR1.W2020.8 COMPACTION
Except in areas of fill formed of rock fill material or fill material as stated in
EAR1.W1940, compact fill material in intermediate areas of fill to a degree which in the
opinion of the CM is practicable. Compact fill material above the level stated in clause
EAR1.W2010 to obtain a relative compaction of at least:
1. 90% throughout;
2. 95% within 1500 mm of earthworks final surfaces and formations; and
3. 98% within 200 mm of formations.

COMPLETION OF GENERAL EARTHWORKS
SURFACES

EAR1.W2110.8 GENERAL
1. Complete earthworks final surfaces to a stable condition as soon as practicable after
excavation or after deposition and compaction of fill material has been completed;
2. Carry out the subsequent permanent work or surface protection as soon as
practicable after the earthworks final surface has been completed;
3. Properly treat exposed earth by compaction, turfing, hydroseeding, vegetable
planting or sealing with latex, vinyl, bitumen, shotcrete or other suitable surface
stabilizer within six months after the last construction activity on the exposed earth;
4. Complete earthworks final surfaces to smooth alignments without abrupt
irregularities unless otherwise stated in the Contract;
5. Complete formations above structures or utilities after construction of the structure
or utility.
EXCAVATION AND FILLING

EAR1.W2120.8 COMPACTION
Compact formations to obtain a relative compaction of at least 98% to a depth of 200 mm below the formation.

EAR1.W2130.8 PROOF ROLLING
1. Unless otherwise agreed by the CM, carry out proof rolling on formations;
2. Roll the formation in the presence of the CM by at least two passes of a non-vibrating rubber tyred roller;
3. The roller must have a static load per 100 mm width of roll of at least 4 kN and travel at a speed not exceeding 2 km/h.

EAR1.W2140.8 MAKING GOOD DEFECTS
Make good to Approval any defect in the formation which is revealed during proof rolling by deformation of the formation which in the opinion of the CM is excessive.

EAR1.W2150.8 PAVEMENT FORMATIONS
After all other formation work and testing have been completed and damage caused by testing reinstated, roll any pavement formation with one pass of a smooth steel-wheeled non-vibrating roller. The roller must have a load per 100 mm width of roll of at least 2 kN.

EAR1.W2160.8 PROTECTION OF FORMATIONS
Carry out the following procedures:
1. Unless otherwise permitted by the CM, protect formation surfaces which will not be immediately covered by the subsequent permanent work by methods agreed by the CM;
2. Maintain earthworks final surfaces and formations in a stable condition and protect from damage due to water or other causes and from exposure to conditions which may adversely affect the surface;
3. Do not allow formations to be used by construction plant or vehicles other than those which, in the opinion of the CM, are essential to construct the subsequent work.

EAR1.W2170.8 HYDROSEEDING
Refer to Project Specific Specification.

ADDITIONAL REQUIREMENTS FOR SOFT LANDSCAPING

EAR1.W2210.8 GENERAL
Refer to Project Specific Specification.
ADDITIONAL REQUIREMENTS FOR SURFACE PREPARATION OF ROAD FORMATIONS

**EAR1.W2310.8** SEQUENCE
Carry out preparation and surface treatment of the road formation after completion of any specified sub-grade drainage and, unless otherwise agreed by the CM, immediately prior to laying the sub-base or the road-base where no sub-base is required.

**EAR1.W2320.8** FORMATIONS OTHER THAN ROCK FILL
Carry out the following sequence of operations:
1. Remove all mud and slurry from surfaces below carriageways, lay-bys, cycle tracks, footpaths and hard shoulders after general reinstatement of any soft areas;
2. Unless otherwise permitted by the CM to carry out proof rolling on the road formation. Roll in the presence of the CM by at least 2 passes of a non-vibrating roller with rubber tyres. Roller to have a static load per 100 mm width of at least 4 kN and travel at speeds not exceeding 2 km/h;
3. Make good any defect in the formation during proof rolling where required by the CM;
4. Trim the formation after testing and when any damaged reinstatement has been carried out;
5. Roll the trimmed formation by one pass of a smooth steel-wheeled non-vibrating roller having a minimum load per 100 mm of 2 kN.

**EAR1.W2330.8** ROCK FILL FORMATIONS
Carry out the following sequence of operations:
1. Trim and blind the formation as **EAR1.W1740** and **EAR1.W1750**;
2. Roll the trimmed formation as **EAR1.W2320** (5);
3. Make good with Grade 15/20 concrete as specified in Worksection CON1 any surface irregularities under the formation which remain after trimming the rock excavation.

ADDITIONAL REQUIREMENTS FOR FILL SLOPES

**EAR1.W2410.8** GENERAL
1. Comply with the following sub-clauses for the fill slopes as specified in the Drawings and submit to the CM the date of commencement of the filling works for these slopes;
2. Notwithstanding the requirements on filling works as specified in other clauses of this Worksection, comply with the "Standards for Filling Works" specified in Appendix A of PNAP APP-15;
3. During construction, submit monthly reports to the CM giving records of tests on compaction of fill slopes together with a covering assessment on the adequacy of compaction. Submit the format of the report to the CM for prior approval. The reports shall be prepared and signed by the TCP Grade T4 and the AS of RSC(SF) (provided in accordance with the Preliminaries Worksection);
4. Incorporate in the report all the test results determined in accordance with this clause and the Testing section of this Worksection, including those tests carried out by the Direct Testing Contractor(s). Keep records on drawings the soil type, plan location and elevation reference to Principal Datum of each test. Graphs of dry density vs. moisture content, laboratory test record sheets, field sheets, calculation sheets and a complete soil description are to be kept in a companion folder;

5. Carry out all tests under the supervision of the TCP Grade T4 as mentioned in sub-clause (3);

6. Include in the contents of the covering assessment:
   a. A summary of the results of insitu density tests and laboratory compaction tests of the fill, highlighting areas of non-compliance with the specified compaction standards;
   b. Details of any corrective measures taken to rectify areas of inadequate compaction; and
   c. An overall assessment to all the filling works completed at the time of assessment.

7. Keep records of compaction tests also on site for inspection by the CM, ICU and the officers of Geotechnical Engineering Office (GEO). The costs of providing the monthly reports are deemed to be included in the Contract rates of the filling works;

8. Where there is reason to believe that the placed fill may be loose, or if the CM from time to time directs, carry out field checks under the CM's direction, initially by dynamic probe tests (supplemented by observations of fill materials in trial pits if an appreciable cobble and boulder content in the fill is suspected). Provide the necessary equipment, apparatus and labourers for the dynamic probe tests and trial pit excavation. Carry out dynamic probe tests in accordance with Appendix 7.1 of the 'General Specification for Civil Engineering Works', The Government of the Hong Kong Special Administrative Region, 2006;

9. If loose fill is detected, arrange for the Approved Laboratory to carry out insitu density tests of the loose layer in accordance with the Testing section of this Worksection in the presence of the CM or his representatives. Carry out the tests within seven days after the detection of the loose fill. If the test results fail to comply with the Contract requirements, rectify the filling works to the satisfaction of the CM as a matter of urgency. Where extensive loose fill is found which could pose a significant threat if not rectified, the CM may issue an order to suspend the progress of the Works in accordance with GCC Clause 9.2;

10. If the filling work has been done after compliance with the requirements of GCC Clause 7.3, and is found to be executed in accordance with the Contract, the expense of investigation, testing, reinstating and making good the same shall be valued at the relevant Contract rates but in any other case the expense shall be borne by the Contractor;

11. Upon completion of the filling work, submit to the CM:
   a. "As-built" plans and sections of the work showing its relationship to existing and proposed structures; and
   b. Records of insitu density tests and laboratory compaction tests of the fill.

   The costs of providing as-built records are deemed to be included in the Contract rates of the filling works;

12. Bear all associated costs and make due allowance in the programme of the Works for the provisions as stated in the above sub-clauses. No claim for extension of time will be entertained in connection therewith.
REMOVAL OF TEMPORARY WORKS

EAR1.W2510.8  DISMANTLING AND REMOVAL
Dismantle and remove temporary works after completion of the permanent works unless otherwise agreed by the CM.

TOLERANCES

EAR1.W2610.8  GENERAL
Refer to Appendix H 'Schedule of Tolerances' to this Specification.
TESTING

FILL MATERIAL - GENERAL REQUIREMENTS

EAR1.T020.8  BATCH

A batch of fill material is any quantity of fill material of the same type and which, in the opinion of the CM, has similar properties throughout. For the purpose of testing for moisture content and relative compaction, a batch is also any fill material which is deposited in a single layer in any area of fill presented by the Contractor for testing on one occasion.

EAR1.T030.8  SAMPLES

Each sample of fill material must consist of at least four increments taken from different parts of the batch. Combine the increments and thoroughly mix and divide by quartering or by using a riffle box to obtain specimens of an appropriate size to carry out the individual tests.

EAR1.T040.8  SAMPLE SIZE

Take the size of samples of fill material, other than rock fill, in accordance with Clauses 2.5.1, 4.2 and Table 2.1 of 'Geospec 3: Model Specification for Soil Testing', GEO, 2001. Each sample of rock fill material of grade size not exceeding 200 is to have a mass of at least 250 kg and each sample of rock fill material of grade size exceeding 200 must have a mass of at least 1000 kg.

SITE TESTS FOR SOIL AND GROUNDWATER

EAR1.T110.8  GENERAL

1. Arrange for an independent laboratory to carry out the tests described in 'Geospec 3: Model Specification for Soil Testing', GEO, 2001;

2. Select the laboratory from one of those listed on the Development Bureau's List of Approved Suppliers of Materials and Specialist Contractors for Public Works: Soil and Rock Testing and Approved. In addition, the laboratory must be accredited by HOKLAS for the said tests.

EAR1.T115.8  COMPACTATION TEST FOR FILL SLOPES

1. Arrange for independent laboratories as stated in EAR1.T110 on a roster system to carry out compaction tests stated in EAR1.T510 to EAR1.T550 for all fill slopes specified in the Drawings. No independent laboratories shall carry out compaction tests for a cumulative period longer than 3 months within any twelve-month period;

2. Instruct the independent laboratories to deliver directly to the CM in a sealed envelope or by other means agreed by the CM, without routing through the Contractor, a copy of all test reports including preliminary testing results compiled by the independent laboratories, not later than the copy sent to the Contractor;

3. In addition, where considered necessary, the CM will order Direct Testing Contractor(s) (DTC) to carry out the same tests as mentioned in sub-clause (1) above;
**FILL MATERIAL - PARTICLE SIZE DISTRIBUTION, LIQUID LIMIT, PLASTICITY INDEX, COEFFICIENT OF UNIFORMITY AND SULPHATE CONTENT**

**EAR1.T210.8 GENERAL**

The size of sample and method of sampling to be in accordance with "Geospec 3: Model Specification for Soil Testing published by GEO". Where required test samples of fill material for particle size distribution, liquid limit, plasticity index coefficient of uniformity and sulphate content and deliver results at least 14 days, or such shorter period agreed by the CM, before deposition of the fill material starts. Provide samples from each batch as stated in the following table:

<table>
<thead>
<tr>
<th>Description</th>
<th>Size of Batch</th>
<th>No. of samples per Batch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Special fill material</td>
<td>0 - 3,000 m³</td>
<td>3</td>
</tr>
<tr>
<td></td>
<td>Exceeding 3,000 m³</td>
<td>1 for each 1,000 m³ or part thereof</td>
</tr>
<tr>
<td>Fill material other than special fill material</td>
<td>0 - 15,000 m³</td>
<td>3</td>
</tr>
<tr>
<td></td>
<td>Exceeding 15,000 m³</td>
<td>1 for each 5,000 m³ or part thereof</td>
</tr>
</tbody>
</table>

**EAR1.T220.8 TESTING CRITERIA**

For samples of fill material in the table to **EAR1.T210**:

1. Particle size distribution: test as **EAR1.T230** (1);
2. Special fill material: test for the coefficient of uniformity as **EAR1.T230** (2);
3. Liquid limit: test all samples other than rock fill material (unless otherwise agreed by the CM) as **EAR1.T230** (3);
4. Plasticity index: as sub-clause (3) above and **EAR1.T230** (4);
5. Soluble sulphate: test each sample of fill that will be deposited within 500 mm of concrete, cement bound, or cementitious material, or metalwork as **EAR1.T230** (5).
**TEST METHODS**

Test in accordance with 'Geospec 3: Model Specification for Soil Testing', GEO, 2001 as follows:

1. **Particle size:** test as Test Method 8.1 or 8.2 whichever is Instructed for particles passing a 75 mm BS Test Sieve. Take the size of particles of fill material which do not pass a 75 mm BS test Sieve as the largest dimension measured in any plane;

2. **Coefficient of uniformity:** calculate the coefficient of uniformity (Cu) from the equation:

   \[ Cu = \frac{D_{60}}{D_{10}} \]

   where:

   \( D_{60} \) and \( D_{10} \) are the equivalent sieve sizes in millimetres, interpolated from the particle size distribution curve, through which 60% and 10% of the fill material would pass respectively;

3. **Liquid limit:** test in accordance with Test Method 6.1 for that proportion of fill passing a 425 micron BS Test Sieve;

4. **Plasticity index:** test in accordance with Test Method 6.1 for that proportion of fill passing a 425 micron BS Test Sieve;

5. **Soluble sulphate:** test as Test Method 9.3;

6. **Total sulphate:** test as Test Method 9.3.

**NON-COMPLIANCE WITH TESTS**

Where the tests show non-compliance, adopt the following procedures:

1. **Soluble sulphate content:** test each sample to determine the total sulphate content as in Test Method 9.3 of 'Geospec 3: Model Specification for Soil Testing', GEO, 2001;

2. **Particle size distribution, liquid limit, plasticity index, coefficient of uniformity or total sulphate content:** provide additional samples, in numbers as stated in the table to EAR1.T210, from same batch and retest as before.

**FILL MATERIAL - OPTIMUM MOISTURE CONTENT AND MAXIMUM DRY DENSITY**

**GENERAL**

Where required, test samples of fill material for optimum moisture content and maximum dry density and deliver results at least 72 hours, or such shorter period agreed by the CM, before deposition of the fill material starts. Provide samples from each batch as specified in the table to EAR1.T210.

**LOCATION**

Inform the CM of the exact location in which the fill material from which each sample is taken is to be deposited.

**ADDITIONAL SAMPLES**

Take additional samples to test for optimum moisture content and maximum dry density after the fill material has been deposited in its final position, at intervals of not more than 28 days.
MATERIALS NOT FOR SAMPLING

Do not take samples from the following material:

1. Fill material including rock fill material which contains an insufficient proportion of particles passing a 20 mm BS Test Sieve to permit determination of the moisture content and maximum dry density; and
2. Fill material which is to be deposited as intermediate areas of fill, as specified under EAR1.W2010.

TESTING METHODS

1. Test each sample for:
   a. Optimum moisture content, as Test Method 10.1, 10.2, 10.3, 10.4, 10.5, 10.6, 10.7 or 10.8 of 'Geospec 3: Model Specification for Soil Testing', GEO, whichever is Instructed;
   b. Maximum dry density, as for sub-clause (1)(a) above and whichever is Instructed.
2. If agreed by the CM, use the Hilf method as specified in EAR1.T860 to EAR1.T900 instead of the methods stipulated in sub-clause (1) above to determine the optimum moisture content and maximum dry density;
3. If in the opinion of the CM that there is any undue discrepancy between the results of tests for optimum moisture content of fill material using methods as stipulated in sub-clause (1)(a) above and the results of tests using the Hilf method, adopt only the results of tests using methods stipulated in sub-clause (1)(a) above.

INCONSISTENT MATERIALS

Where tests for optimum moisture content or maximum dry density indicate inconsistencies in the fill material and are likely, in the opinion of the CM, to affect subsequent relative compaction tests:

1. Divide the batch into smaller batches of material with similar properties throughout;
2. Provide additional samples from each of the smaller batches, the number of samples being as in accordance with the table to EAR1.T210;
3. Carry out additional tests for optimum moisture content and maximum dry density, of each sample.

FILL MATERIAL - MOISTURE CONTENT

SAMPLES

1. Test samples of fill material for moisture content during deposition and compaction and not more than 1 hour after the fill material has been deposited in its final position;
2. Provide the number of samples from each batch in accordance with the table to EAR1.T440. Do not provide samples if, in accordance with EAR1.T340 (1) or EAR1.T340 (2), the optimum moisture content has not been determined.

TESTING METHODS

Test each sample to determine moisture content by Method 1, or by Method 2 if agreed by the CM, as follows:
1. Method 1: Test Method 5.1 or 5.2 of 'Geospec 3: Model Specification for Soil Testing', GEO, whichever is Instructed;

**EAR1.T430.8 MOISTURE CONTENT COMPLIANCE CRITERIA**

If, in the opinion of the CM, there is any undue discrepancy between the results of tests for moisture content of fill material using Method 1 and the results of tests using Method 2, adopt only the results using Method 1.

**EAR1.T440.8 DIFFERENCES BETWEEN MOISTURE CONTENT AND OPTIMUM MOISTURE CONTENT RESULTS**

1. If the result of any test for moisture content of fill material differs from the optimum moisture content by more than the specified amount and, if Instructed, adjust the moisture content of the whole of the batch of fill material;  
2. Provide additional samples from the same batch and undertake additional tests for moisture content;  
3. Take the number of additional samples as stated in the following table:

<table>
<thead>
<tr>
<th>Description</th>
<th>Size of area of fill in batch</th>
<th>No. of samples/ tests per batch</th>
</tr>
</thead>
<tbody>
<tr>

**FILL MATERIAL - RELATIVE COMPACTION**

**EAR1.T510.8 REQUIREMENT FOR TESTING**

1. Unless otherwise agreed by the CM, test each batch of fill material to determine relative compaction;  
2. Carry out each test after the fill material has been deposited and compacted in its final position;  
3. The number of tests will be in accordance with the requirements of the table to EAR1.T440;  
4. Do not test the following:  
   a. Fill material including rock fill materials which contain an insufficient proportion of particles passing a 20 mm BS test sieve to permit determination of the relative compaction; and
b. Fill material which has been deposited as intermediate areas of fill as EAR1.W2010.

EAR1.T520.8  LOCATION OF TESTS

Carry out tests at positions which, in the opinion of the CM, are representative of the batch of compacted fill material as a whole.

EAR1.T530.8  METHODS

1. Adopt Method 1, or adopt Method 2 if agreed by the CM, to determine the relative compaction of fill material as follows:
   a. Method 1: Test Method 11.4, Geospec 3, GEO
      Determine the relative compaction (RC) of fill material from the equation:
      \[ RC = \frac{\text{IDD}}{\text{MDD}} \times 100\% \]
      where:
      - IDD is the in-situ dry density determined as EAR1.T540;
      - MDD is the maximum dry density determined as EAR1.T350 (1)(b);
   b. Method 2: The relative compaction (RC) shall be calculated from the equation:
      \[ RC = \frac{\text{IBulkD}}{\text{MCBulkD}} \times 100\% \]
      where:
      - IBulkD is the in-situ bulk density determined as EAR1.T540;
      - MCBulkD is the maximum converted bulk density determined by Hilf method as EAR1.T350 (2). If the amount of material retained on a 20 mm BS test sieve is more than 5% of the mass of the sample, adjust the maximum converted bulk density (MCBulkD) of fill material in accordance with EAR1.T910 to EAR1.T950.

2. If in the opinion of the CM that there is any undue discrepancy between the results of tests for relative compaction of fill using Method 1 stipulated in sub-clause (1)(a) above and the results of tests using Method 2 stipulated in sub-clause (1)(b), adopt only the results of tests using the Method 1.

EAR1.T540.8  IN-SITU BULK DENSITY AND IN-SITU DRY DENSITY

Adopt Method 1, or adopt Method 2 if agreed by the CM, to determine in-situ bulk density and in-situ dry density as follows:

1. Method 1: Test Method 11.1 or 11.2 of 'Geospec 3: Model Specification for Soil Testing', GEO, as appropriate to the grain size of the fill material;

EAR1.T550.8  NON-COMPLIANCE OF RELATIVE COMPACTION TEST

If the result of any test for relative compaction of fill material does not comply with the specified requirements for relative compaction, carry out additional tests for relative compaction on the same batch. The number of additional tests are stated in the table to EAR1.T440.
TEST METHODS FOR FILL MATERIALS

EAR1.T710.8 GENERAL
The definitions, terms, abbreviations symbols, and grouping of materials stated in the relevant parts of 'Geospec 3: Model Specification for Soil Testing', GEO, apply except as stated in EAR1.T720 and EAR1.T730.

EAR1.T720.8 ABBREVIATIONS AND SYMBOLS
Terms used in this Worksection and in the relevant parts of 'Geospec 3: Model Specification for Soil Testing', GEO, are identified by the following abbreviations and symbols:

EAR1.T730.8 GROUPING OF MATERIALS
1. Fine grained material is material of which at least 90% passes a 2 mm BS Test Sieve;
2. Medium grained material is material of which at least 90% passes a 20 mm BS Test Sieve and more than 10% is retained on a 2 mm BS Test Sieve.

DETERMINATION OF THE MOISTURE CONTENT OF FINE GRAINED AND MEDIUM GRAINED MATERIAL BY THE MICROWAVE OVEN DRYING METHOD

EAR1.T810.8 SCOPE
This method covers the determination of the moisture content of fine grained and medium grained material as a percentage of the mass of the dry material.

EAR1.T820.8 APPARATUS
Use the following apparatus:
1. A microwave oven with a timer and an adjustable power setting;
2. An airtight container of microwave safe and non-reflective material;
3. A balance readable and accurate to 0.01 g;
4. A desiccator containing anhydrous silica gel.

**EAR1.T830.8  PROCEDURE**

Adopt the following procedure:

1. The container must be clean, dry and weighed to the nearest 0.01 g (m₁);

2. Crumble a specimen and place loosely in the container and replace the lid. Ensure each specimen of fine grained material is at least 30 g and each specimen of medium grained material at least 300 g. Specimens of medium grained material may be tested in several parts each less than 300 g and the results aggregated;

3. Weigh the container and contents to the nearest 0.01 g (m₂);

4. Remove the lid of the specimen container and place the container with its lid and content in the microwave oven and dry. Consider the specimen to be dry when, after an initial drying period, successive weighing at intervals of 1 minute produce results which are the same to the nearest 0.01 g. Alternatively, the oven may be set to an appropriate time and power setting to dry the specimen as determined by calibration of the oven on soil of a similar type;

5. After drying, remove the container and contents from the microwave oven and place in the desiccator to cool;

6. Replace the lid and weigh the container and contents to the nearest 0.01 g (m₃).

**EAR1.T840.8  CALCULATION**

Calculate the moisture content of the material (w) as a percentage of the dry mass of the material from the equation:

\[ w = \frac{(m₂ - m₃)/(m₃ - m₁)}{100\%} \]

where:

- \( m₁ \) is the mass of the container (g)
- \( m₂ \) is the mass of the container and contents before drying (g)
- \( m₃ \) is the mass of the container and contents after drying (g).

**EAR1.T850.8  REPORTING**

Report on the following:

1. Source and identification of the soil;

2. The moisture content of the material to the nearest 0.1%;

3. That the test method used was in accordance with this Specification.

**DETERMINATION OF THE MAXIMUM CONVERTED BULK DENSITY BY THE HILF METHOD**

**EAR1.T860.8  SCOPE**

This method covers the determination of the maximum converted bulk density and the difference between the optimum moisture content and the in-situ moisture content of a material by relating the converted bulk density and the moisture content added.

**EAR1.T870.8  APPARATUS**

Use the following apparatus:
1. Apparatus in accordance with Geospec 3, Test Method 10.1 or 10.2, whichever as instructed by the CM;

2. Apparatus for determination of the moisture content in accordance with either Geospec 3, Test Method 5.1 or 5.2 or EAR1.T820, whichever as instructed by the CM;

3. Apparatus to extract specimen from the mould;

4. Apparatus, such as a warm air blower, for rapid drying of the material.

**EAR1.T880.8 PROCEDURE**

Adopt the following procedures:

1. Take a sample of material immediately after completing the in-situ bulk density test at the same location as the test. The sample shall be obtained by digging to the same depth as that of the in-situ bulk density test, keeping the sides of the excavation vertical and bottom flat and level. The size of the sample shall be sufficient to yield a maximum of 10 kg after screening over a 20 mm BS test sieve;

2. Weigh the sample to the nearest 0.01 g;

3. Screen the sample over a 20 mm BS test sieve, ensuring that moisture loss is kept to a minimum and that any free moisture appearing in the container is worked back into the sample;

4. Weigh the amount retained on the sieve to the nearest 0.01 g and express as a percentage of the mass of the sample. If the percentage exceeds 5%, adjust for coarse material in accordance with EAR1.T910 to EAR1.T950. If the percentage does not exceed 5%, no adjustment is required;

5. Mix the material to be tested thoroughly and divide by quartering or by using a riffle box to obtain a maximum of four specimens of at least 2,500 g each, ensuring that the moisture loss is kept to a minimum. Alternatively, if it has previously been ascertained that the material is not susceptible to crushing, use a single specimen of at least 2,500 g for repeating the testing;

6. Weigh each specimen to the nearest 0.01 g and take the result as the mass of the specimen at the in-situ moisture content;

7. Place and seal each specimen and any remaining material in separate moisture-tight containers;

8. Plot the converted bulk density of at least three specimens against the amount of water added or removed as a percentage of the mass of the specimen at the in-situ moisture content (z) on a graph as shown in Civil Engineering and Development Department Standard Drawing No. C2006, in accordance with the procedure stated in sub-clauses (9) to (15) below;

9. Obtain the first point on the graph as follows:
   a. Compact a specimen at its in-situ moisture content in accordance with Geospec 3, Test Method 10.1, Clause 10.1.5 or Test Method 10.2, Clause 10.2.5, whichever is instructed by the CM;
   b. Cut a diametrical slice of approximately 400 g to 500 g from the specimen along its entire length. Determine the in-situ moisture content of the slice (w) in accordance with either Geospec 3, Test Method 5.1 or 5.2 or EAR1.T810 to EAR1.T850, whichever as instructed by the CM;
   c. Calculate the bulk density (Bold_1) as stated in EAR1.T890 (1) and plot on the 0% ordinate of the graph as the converted bulk density (CBold_1).

10. Obtain the second point on the graph as follows:
a. Examine a second specimen and, if the in-situ moisture content obviously exceeds the optimum moisture content, follow the procedure stated in sub-clause (11) below;

b. Increase the moisture content of the specimen by adding an amount of water equal to 2% of the mass of the specimen. Mix the specimen thoroughly and compact in accordance with the method stipulated in sub-clause (9) above;

c. Calculate the bulk density ($\text{BulkD}_2$) as stated in EAR1.T890 (1), adjust to converted bulk density ($\text{CBulkD}_2$) as stated in EAR1.T890 (2) and plot on the +2% ordinate of the graph.

11. If the in-situ moisture content of the second specimen obviously exceeds the optimum moisture content, dry and cool the specimen until the amount of water removed is approximately 2% of the mass of the specimen. Mix the specimen thoroughly and compact in accordance with the method stipulated in sub-clause (9) above. Determine the amount of water removed. Calculate the bulk density ($\text{BulkD}_2$) as stated in EAR1.T890 (1), adjust to converted bulk density ($\text{CBulkD}_2$) as stated in EAR1.T890 (2) and plot on the negative ordinate of the graph at a point which corresponds to the amount of water removed.

12. Obtain the third point on the graph as follows:

a. If the plotted value of $\text{CBulkD}_2$ is equal to or greater than the plotted value of $\text{CBulkD}_1$, increase the moisture content of the third specimen by adding an amount of water equal to 4% of the mass of the specimen. Alternatively, if the procedure of sub-clause (11) above has been followed, dry and cool the specimen until the amount of water removed is approximately 4% of the specimen after cooling;

b. If the plotted value of the $\text{CBulkD}_2$ is less than the plotted value of $\text{CBulkD}_1$, dry and cool the third specimen until the amount of water removed is approximately 2% of the specimen after cooling. Alternatively, if the procedure of sub-clause (11) above has been followed, increase the moisture content by adding an amount of water equal to 2% of the mass of the specimen;

c. Mix the specimen thoroughly and compact in accordance with the method stipulated in sub-clause (9) above. Determine the amount of water removed if applicable;

d. Calculate the bulk density ($\text{BulkD}_3$) as stated in EAR1.T890 (1), adjust to converted bulk density ($\text{CBulkD}_3$) as stated in EAR1.T890 (2) and plot on the graph at a point corresponds to the amount of water added or removed.

13. If the centre point of the three points plotted is lower than one of the other two points, or is higher than one point and equal to the other, obtain an additional point or points by proceeding in 2% increments or decrements as appropriate;

14. If it is apparent that the moisture condition of the material is such that a total five points will not result in the determination of the optimum moisture content, adopt increments or decrements of 3% moisture content for the entire procedure;

15. Draw a smooth parabolic curve to the plotted points. Determine the peak of the curve as the maximum converted bulk density ($\text{MCBulkD}$);

16. Determine the amount of water added of removed as a percentage of the mass of the specimen at the in-situ moisture content corresponding to the maximum converted bulk density ($z_m$);

17. Determine the value of moisture correction curve passing through the peak value of the plotted parabolic curve ($z_c$). If there is no moisture correction curve passing through the peak value of the curve, draw a moisture correction curve through the peak by interpolating to the nearest 0.1%.
**EAR1.T890.8  CALCULATION**

1. Calculate the bulk density (BulkD) from the equation:
   \[
   \text{BulkD} = \frac{(m_2 - m_1)}{V} \quad \text{Mg/m}^3
   \]
   where:
   - \(m_1\) is the mass of the mould and base (g)
   - \(m_2\) is the mass of the mould and base and wet material (g)
   - \(V\) is the mass of the volume of the mould (mL).

2. Calculate the converted bulk density (CBulkD) from the equation:
   \[
   \text{CBulkD} = \text{BulkD}/(1 + z/100) \quad \text{Mg/m}^3
   \]
   where:
   - \(z\) is the amount of water added or removed as a percentage of mass of the specimen at the in-situ moisture content (%)
   - \(z\) is negative for values below the in-situ moisture content.

3. Calculate the difference between the optimum moisture content (\(w_o\)) and the in-situ moisture content (\(w_i\)) of the material from the equation:
   \[
   w_o - w_i = z_m + z_c \quad \%
   \]
   where:
   - \(z_m\) is the amount of water added or removed as a percentage of mass of the specimen at the in-situ moisture content corresponding to the maximum converted bulk density (%)
   - \(z_c\) is the value of the moisture correction curve passing through the peak value of the plotted parabolic curve (%).

4. Calculate the optimum moisture content (\(w_o\)) from the equation:
   \[
   w_o = w_i + (1 + w_i/100)z_m \quad \%
   \]
   where:
   - \(w_i\) is the in-situ moisture content of the material (%).

5. Calculate the maximum dry density (MDD) from the equation:
   \[
   \text{MDD} = \frac{\text{MCBulkD}}{1 + w_i/100} \quad \text{Mg/m}^3
   \]
   where:
   - \(\text{MCBulkD}\) is the maximum converted bulk density of the material (Mg/m³).

6. Calculate the relative compaction (RC), if required, from the equation:
   \[
   \text{RC} = \frac{\text{IBulkD}}{\text{MCBulkD}} \times 100\%
   \]
   where:
   - \(\text{IBulkD}\) is the in-situ bulk density of the material determined in accordance with Geospec 3, Test Method 11.1 or 11.2 as appropriate to the grain size of the material.

**EAR1.T900.8  REPORTING**

Report on the following:

1. Source and identification of the soil;
2. The graph showing the plotted points and the parabolic curve passing through them;
3. The maximum converted bulk density to the nearest 0.01 Mg/m³;
4. The optimum moisture content to the nearest 0.1%;
5. The maximum dry density to the nearest 0.01 Mg/m³;
6. The relative compaction to the nearest 0.1 %, if determined;
7. The percentage retained on the 20 mm BS test sieve and the percentage retained on the 37.5 mm BS test sieve to the nearest 1%;
8. Whether the test was carried out using individual specimens or repeat testing of a single specimen;
9. Whether a manual or an automatic compaction rammer was used;
10. That the test method used was in accordance with this Specification.

ADJUSTMENT OF THE MAXIMUM CONVERTED BULK DENSITY FOR DETERMINATION OF RELATIVE COMPACTION

EAR1.T910.8 SCOPE
This method covers the adjustment of the maximum converted bulk density determined in accordance with EAR1.T860 to EAR1.T900 for the determination of relative compaction of a material containing more than 5% of the mass of the material at the in-situ moisture content retained on a 20 mm BS test sieve.

EAR1.T920.8 APPARATUS
Use the following apparatus:
1. Apparatus in accordance with EAR1.T870;
2. A 20 mm and a 37.5 mm BS test sieve;
3. A mould with collar as used for determination of the California Bearing Ratio (CBR mould);
4. An extrusion device as used for determination of the California Bearing Ratio.

EAR1.T930.8 PROCEDURE
Adopt the following procedures:
1. If the amount of material retained on the 20 mm BS test sieve exceeds 5% and does not exceeds 20%, compact the material passing the sieve in accordance with EAR1.T860 to EAR1.T900. Determine and adjust the maximum converted bulk density (MCBulkD) as stated in EAR1.T940;
2. If the amount of material retained on the 20 mm BS test sieve exceeds 20%, screen the retained material over the 37.5 mm BS test sieve. Follow the procedure stated in either sub-clause (3) or (4) below as appropriate;
3. If the amount of material retained on the 37.5 mm BS test sieve does not exceed 5%, follow the procedure stated in sub-clause (5);
4. If the amount of material retained on the 37.5 mm BS test sieve exceeds 5% and does not exceed 20%, replace the retained material with an equal mass of material which is of similar nature and which is retained on a 20 mm BS test sieve but passes a 37.5 mm BS test sieve. Follow the procedure stated in sub-clause (5) below;
5. Follow the procedure in EAR1.T860 to EAR1.T900 except that the material shall be compacted into the CBR mould and each layer shall be subject to 62 blows of the rammer.
CALCULATION

Calculate the maximum converted bulk density (MCBulkD) from the equation:

\[ \text{MCBulkD} = \text{MCBulkD}_{20} \left[ 1 + m(1 - \frac{\text{MCBulkD}_{20}}{G_s})/(1 + z/100) \right] \text{ Mg/m}^3 \]

where:

- \( \text{MCBulkD}_{20} \) is the maximum converted bulk density of the material passing 20 mm BS test sieve (Mg/m\(^3\))
- \( m \) is the mass of material not passing the 20 mm BS test sieve expressed as a fraction of the mass of the material at the in-situ moisture content
- \( G_s \) is the specific gravity of the material not passing 20 mm BS test sieve
- \( z \) is the amount of water added as a percentage of the mass of the specimen at the in-situ moisture content corresponding to the maximum converted bulk density (%)

REPORTING

Report on the following:

1. Source and identification of the soil;
2. The results in accordance with EAR1.T900;
3. The mass of the original material not passing the 20 mm BS test sieve and 37.5 mm BS test sieve as a percentage of the mass of the material at the in-situ moisture content to the nearest 0.1%;
4. The type of mould used;
5. The number of blows per layer;
6. Whether the specific gravity was measured or assumed and, if measured, the method used;
7. That the test method used and the results adjusted were in accordance with this Specification.
EAR2 BLASTING MATERIALS

EXPLOSIVES

EAR2.M010.8 NITRO-GLYCERINE BASED EXPLOSIVES
Do not use.

EAR2.M020.8 PRE-SPLIT BLASTING EXPLOSIVES
Only use explosives for pre-split blasting that are specifically recommended by the explosives manufacturer for pre-splitting.
WORKMANSHIP

GENERALLY

EAR2.W010.8  STATUTORY REQUIREMENTS
1. Comply with conditions and restrictions imposed by the Commissioner of Mines for:
   a. Blasting operations;
   b. Supply, transportation, storage, use and disposal of explosives.
2. Make all arrangements with and obtain all licences and permits from the Commissioner of Mines in connection with blasting operations;
3. Ensure that the Mines and Quarries Division, Civil Engineering Development Department is given adequate notice to arrange visits to the site to consider blasting conditions, and thereafter comply promptly and fully with any instruction issued by the Commissioner of Mines, or his representative, in connection with blasting;
4. Allow access to the Site by the staff of the Mines and Quarries Division at all times;
5. Employ at least one registered shotfirer who holds a valid Hong Kong Mine Blasting Certificate and is approved by the Mines and Quarries Division and the CM.

EAR2.W020.8  TRAFFIC CONTROL
Liaise with the Hong Kong Police Force in respect of traffic control on adjacent roads during blasting operations.

EAR2.W030.8  RESTRICTIONS ON TIMING
Do not carry out blasting at the following times:
1. General holidays;
2. Before 8:30 am or after 5:30 pm on any day;
3. When a Hong Kong Observatory thunderstorm warning is in force (unless permitted by the Commissioner of Mines);
4. When strong wind signal or tropical cyclone warning No. 3 or higher is hoisted (unless permitted by the Commissioner of Mines).

EAR2.W040.8  PARTICULARS OF BLASTING
Submit the following particulars to the CM at least 48 hours before blasting starts:
1. Any conditions or restrictions imposed by the Commissioner of Mines, including copies of applications, licences, permits and correspondence;
2. Names, qualifications and experience of the persons responsible for the design and supervision of blasting operations;
3. Location, diameter, inclination and depth of holes to be charged with explosive;
4. Type and total mass of explosive to be used and its mass and distribution in each hole;
5. Dimensions of stemming and decking;
6. Initiation sequence, delay periods and mass of explosive per delay;
7. Burden and bench height;
8. Ratio of diameter of explosive to diameter of hole;
9. Arrangements for and methods of instrumentation and monitoring the effects of blasting;
10. Details of velocity seismographs, including manufacturer's literature;
11. Method of controlled blasting;
12. Details of blasting trials; and
13. Protective measures.

**EAR2.W050.8 PARTICULARS OF PRE-SPLIT BLASTING**

In addition to the data required by clause **EAR2.W040** submit to the CM the following information at least 48 hours before pre-split blasting starts:

1. Plan showing proposed method of working;
2. Pre-split burden;
3. No of pre-split holes to be fired at each delay;
4. Distance from the pre-split face to the nearest primary blast drillholes;
5. Decoupling ratio;
6. Delay arrangements between pre-split and primary blasts.

**EAR2.W060.8 BLASTING ASSESSMENT**

Prior to carrying out blasting works, submit to the Geotechnical Engineering Office a Blasting Assessment containing the following information:

1. Assessment of site geology and the condition of existing structures, slopes, retaining walls and services;
2. Assessment of the stability of existing structures, slopes and retaining walls under the effects of blasting;
3. Proposals for preventive and precautionary measures to be implemented to ensure stability and integrity of the affected structures, slopes, retaining walls and services both during blasting and in the long term;
4. Outline blast design to demonstrate the practicability of satisfying any constraints imposed under sub-clause (3) above;
5. Proposals for instrumentation and monitoring of the effects of blasting;
6. Details of site supervision to ensure professional input during the blasting work by the Blasting Control Engineer; and
7. Curriculum vitae of the Blasting Control Engineer who prepared the Blasting Assessment.

**EAR2.W070.8 GEOTECHNICAL ENGINEERING OFFICE (GEO) REQUIREMENTS**

Comply with all requirements, comments and conditions imposed on the blasting works by the GEO in respect of the submitted Blasting Assessment.
SAFETY PRECAUTIONS, RESTRICTIONS AND BLASTING PROCEDURES

EAR2.W110.8 SAFETY PRECAUTIONS AND RESTRICTIONS
1. The CM may regulate, restrict or prohibit blasting if, in his opinion, it is necessary to do so for the safety of persons or property, to limit noise or to safeguard the Works. Notify the CM, by not later than noon of the previous day, any intention to bring any Explosives to the Site or to carry out any blasting;

2. Store, transport and use explosives at all times in accordance with the Dangerous Goods Ordinance (Cap 295) and such other Statutory Regulations concerned with the possession and use of explosives which may be in force. Do not store explosives and detonators on the Site overnight unless permitted by the Commissioner of Mines;

3. Safeguard, and relocate if necessary, any structures or services within the Site;

4. Consult Power Companies when blasting near high voltage underground or overhead cables and observe restrictions imposed by these Companies; make good any damage caused by, or consequential to, blasting operations;

5. Provide a system approved by the CM for warning and preparing the general public and all site personnel of an impending blast, both by audible and visual means, and ensure that the blasting area is cleared of all personnel immediately prior to blasting. This warning system is to comply with all statutory requirements;

6. Take all necessary precautions to prevent accident, injury or loss to persons and damage to works or property, within and outside the Site, resulting from the use or handling of explosives. Obtain agreement from the CM of such precautions and the method of handling and using explosives;

7. Blasting will be allowed only within the area outlined on the site plan attached to the Commissioner of Mines permit;

8. Do not use ANFO or emulsion, that is not in cartridge form, for blasting within 5 m from an excavation free face;

9. Dispose of unused explosives and detonators at the end of each day as stipulated by the Commissioner of Mines.

EAR2.W120.8 GENERAL PROCEDURES
1. Wet areas within 30 m from the blasting area with water prior to blasting;

2. Clear all loose materials to expose the final rock face as soon as practicable after the blast and scale all final rock faces to remove loose rock fragments;

3. Do not blast to form drainage channel, cascade, catchpit and the like, on the final rock face;

4. Utilise uncharged guide holes to form any corner in the final slope profile. When the final profile design includes the provision of berms between slopes, exercise extreme care to ensure no drilling below berm level and in the selection of toe charging details to produce the required profile.

EAR2.W130.8 SURFACE PREPARATION
Before assessments of blasting safety precautions are made, remove all vegetation, overburden, and soft or loose materials, and expose the rock that is to be blasted.

**EAR2.W140.8** PROTECTIVE SCREENS

Unless otherwise permitted by the Commissioner of Mines, erect screens and other protective covers to prevent the projection of flying fragments of material resulting from blasting. Construct screens using wire mesh securely supported on steel frames; use wire of nominal diameter at least 3.5 mm and wire mesh size not exceeding 25 mm.

**EAR2.W150.8** PLASTER BLASTING

Do not use plaster blasting unless permitted by the Commissioner of Mines.

**EAR2.W160.8** BLAST HOLES

Unless otherwise permitted by the Commissioner of Mines provide blast holes stemmed and decked using free-flowing granular materials. Cover charges with thick gunny sacking and 2 m by 2 m square of steel fabric reinforcement weighted down with filled sandbags. Except on slopes cover surface detonating cords, knots, detonating relay conductors and initiating detonators with a 300 mm thickness of sand or soil.

**EAR2.W170.8** DETONATORS

Do not use electrical detonators within 60 m of overhead power lines unless permitted by the Commissioner of Mines. When using electrical detonators in the vicinity of static or mobile radios transmitters comply with BS 6657:1991.

**EAR2.W180.8** DELAY BLASTING

Use delay-blasting at all times with millisecond delays unless otherwise permitted by the Commissioner of Mines, or as specified under pre-splitting.

**EAR2.W190.8** PROXIMITY TO CERTAIN STRUCTURES

Unless permitted by the CM, do not carry out blasting within a distance of:

1. 60 m from water retaining structure or water tunnels; and
2. 6 m from water mains or other water supply structures or installations.

**EAR2.W200.8** VIBRATIONS TO INSTALLATIONS OR STRUCTURES

Unless permitted by the CM the vibrations at structures and installations due to blasting, measured in terms of peak particle velocity and vibrational amplitude, must not exceed the values stated in the following table:

<table>
<thead>
<tr>
<th>Type of structure or installation</th>
<th>Peak particle velocity (mm/s)</th>
<th>Vibrational amplitude (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Water retaining structures.</td>
<td>13</td>
<td>0.1</td>
</tr>
<tr>
<td>Water tunnels.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Under any reinforced concrete structure that has been cast less than 24 hours previously.</td>
<td>25</td>
<td>0.2</td>
</tr>
<tr>
<td>Water mains.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Other structures and pipes.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**EAR2.W210.8** VIBRATIONS TO ADJOINING LAND

Unless otherwise permitted by the CM, the vibration at adjoining slopes and land due to blasting measured in terms of peak particle acceleration and peak particle velocity must not exceed the values stated in the Contract.
BLASTING

EAR2.W220.8 RECORDING VIBRATIONS

1. Take measurements of vibrations due to blasting at locations stated in the Contract, or instructed by the CM, at all times when blasting is carried out. Keep records of vibrations on the Site and provide a copy for the CM. Make any arrangements for installing instruments and taking measurements both inside and outside the Site;

2. Measure vibrations due to blasting in terms of peak particle velocity, peak particle acceleration and vibration amplitude. Take peak values as the maximum resultant calculated by vector summation of the three components of velocity and amplitude respectively, measured as instantaneously as the resolution of the recording instrument permits;

3. Take measurements with velocity seismographs, which have operating instructions in English of a type agreed by the CM. Seismographs must be capable of:
   a. Recording vibrations in terms of peak particle velocity and vibration amplitude over a frequency of 0 - 200 Hz in three mutually perpendicular directions; and
   b. Producing a permanent record of vibrations by tracing an ultra-violet light beam on sensitised paper, or by other methods agreed by the CM;

4. Check the accuracy of seismographs at regular intervals agreed with the CM.

PRE-SPLIT BLASTING

EAR2.W310.8 FORMING FINAL SURFACES

1. Form earthworks final surfaces and formations, which are to be formed by blasting, and which slope at a gradient exceeding 2 vertical to 1 horizontal and exceed 3 m in height by pre-splitting. Do not use other methods of controlled blasting unless permitted by the CM;

2. Ensure that:
   a. Other blast holes are located at a sufficient distance from the earthwork final surface to avoid damaging the surface; and
   b. The row of blast holes nearest to that surface is inclined parallel to the slope face.

EAR2.W320.8 METHODOLOGY

1. Carry out pre-splitting and other methods of controlled blasting in such a manner that the rock mass is cleanly split on the required plane and that rock outside the earthworks final surface is not shattered or loosened;

2. Faces formed by pre-splitting or other methods of controlled blasting must not exceed 15 m in height in any one blasting operation unless permitted by the CM.

EAR2.W330.8 HOLES FOR PRE-SPLITTING

1. Drill a single row of holes at the appropriate inclination along the line of the earthworks final surface. Load holes with explosives not exceeding half the diameter of the hole. Detonate the explosives simultaneously or with the minimum amount of delay necessary to reduce ground vibrations;

2. Drill holes for pre-splitting at least 50 mm in diameter with the ratio of the distance between the centre of the holes and the diameter of the hole not exceeding 10;

3. Form the holes so that they are within a distance of 0.015 times the length of the hole from their designed position;
4. Do not drill holes for pre-splitting into the sub-grade below berm levels. Remove rock which remains in position on berms after blasting by method other than blasting.

TRIAL BLASTS

EAR2.W410.8 REASON FOR TRIAL BLASTS
Carry out trial blasts to demonstrate that:
1. The procedure is safe;
2. The resulting ground vibrations at locations stated in the Contract or instructed by the CM can be satisfactorily predicted, recorded and are within acceptable limits, do not adversely affect the safety and stability of adjoining structures, installations, slopes and land.

EAR2.W420.8 PARTICULARS OF TRIAL BLASTING
Submit to the CM details of blasting trials in accordance with EAR2.W040 at least 14 days in advance of blasting.

EAR2.W430.8 PRE-SPLIT BLASTING TRIALS
Carry out the blasting trials for pre-splitting and other methods of controlled blasting to form a face at least 6 m wide by 6 m high, on rock which has similar properties to that of the earthwork final surface and which is at least 6 m away from the earthwork final surface.

EAR2.W440.8 RESULTS OF BLAST TRIALS
If in the opinion of the CM any aspect of the proposed blasting procedures as demonstrated by blasting trials is unsatisfactory, submit details of proposed changes in the procedure to the CM. Carry out further blasting trials until the procedure is satisfactory.

EAR2.W450.8 CHANGES IN PROCEDURE
Do not vary the satisfactorily Approved blasting procedure. Demonstrate any proposed changes in procedure by further blast trials, unless otherwise permitted by the CM.

EAR2.W460.8 COMPLETION OF TRIAL BLASTS
1. Complete all trials at least 7 days before the related blasting is due to start;
2. Carry out blasting trials in accordance with the trial procedure submitted to and agreed by the CM. The location and size of blasting trials shall be as agreed by the CM.

EAR2.W470.8 COMMENCEMENT OF BLASTING
Do not proceed with blasting until in the opinion of the CM the procedure as demonstrated by the relevant blasting trials is satisfactory.

TOLERANCES

EAR2.W510.8 GENERAL
Refer to Appendix H 'Schedule of Tolerances' to this Specification.

**APPENDIX STR1/I**

| STR1.APPEND1.8 | CALCULATION OF NUMBER OF FURTHER INSPECTIONS / TESTS | 49 |
STR1  STRUCTURAL STEEL

GENERAL

STANDARDS

STR1.G010.8  CODE OF PRACTICE AND STANDARDS

1. Comply with the Code of Practice for the Structural Use of Steel 2011 issued by the Buildings Department;

2. Unless otherwise approved, comply with the British Standards stated in this Specification. Where the Contractor proposes to substitute any other standard or code of practice either in its entirety or in part, for any of those specified, submit details of such together with two complete copies for Approval. Generally, Approval will only be given where the CM considers the proposals to give at least an equivalent standard of the finished work;

3. In the case of any conflict, ambiguity or contradiction between the Code of Practice for the Structural Use of Steel 2011 and the British Standards or other Approved Standards, unless expressly stated otherwise in this Specification, the conditions of the Code of Practice for the Structural Use of Steel 2011 shall prevail.

STR1.G020.8  STATUS OF THE SPECIFICATION

Where this Specification includes provisions additional to, or more stringent than those of the aforementioned Code of Practice for the Structural Use of Steel 2011 and the British Standards, the provisions of this Specification shall prevail overall.

STR1.G030.8  RESPONSIBLE ENGINEER

Employ a Registered Structural Engineer as specified in PRE.B6.060 to take up the role of Responsible Engineer stated in the Code of Practice for the Structural Use of Steel 2011. The Responsible Engineer shall take responsibility for the design, erection and construction of all permanent and/or temporary works and falsework for the construction of major structural steelwork. No consent or dissent of the CM will relieve the Contractor of his sole responsibility for the design, construction and obtaining Approval.

STR1.G040.8  MINOR STEEL STRUCTURES

1. The list of minor steel structures is given in the Project Specific Specification;

2. Specification clauses not applicable to the minor steel structures are listed in the Project Specific Specification.
DESIGN

GENERAL

STR1.D010.8 STRUCTURAL STEEL DESIGN
Comply with the information given on the Drawings and the following information. In general member sizes on the Drawings will be given as serial sizes and loads will be indicated under dead and superimposed live loads only. Wind loading, seismic loading and thermal loading will not generally be shown.

STR1.D020.8 DESIGN STANDARDS
Ensure compliance of the design with the requirements of Code of Practice for the Structural Use of Steel 2011 for all building works. For steel bridges the design must also comply with BS 5400 and the Structure Design Manual for Highways and Railways issued by the Highways Department.

STR1.D030.8 WIND LOADING
Calculate the wind loads in accordance with the Code of Practice on Wind Effects in Hong Kong 2004 issued by the Buildings Department.

STR1.D040.8 SEISMIC LOADING
Ensure that seismic loading, (where this needs to be considered) is in compliance with the appropriate national standard for the design of structures in relation to earthquakes.

STR1.D050.8 ALTERNATIVE DESIGN
Loading tests in accordance with Chapter 16 of the Code of Practice for the Structural Use of Steel 2011 may be used to verify alternative design or construction that is not entirely in accordance with the design requirements of the same Code.

STR1.D060.8 DESIGN SUBMISSION FOR MINOR STEEL STRUCTURE
1. Notwithstanding the submission requirements stated in PRE.B6.085, submit for CM’s approval calculation and drawings, which have been certified by a Registered Structural Engineer, to demonstrate that the design of minor steel structure, including the details of the materials of the structure, shown on the manufacturer’s drawings, manuals or catalogues complied with the Specification and the Code of Practice for Structural Use of Steel 2011;
2. Agree with CM the programme for submission.

FABRICATION AND ERECTION DOCUMENTS

STR1.D110.8 FABRICATION DOCUMENTS
1. Prepare and submit to the CM at least six weeks before starting fabrication, complete details of fabrication to include the following:
   a. All connections including relevant calculations;
   b. Methods of fabrication;
   c. Welding process and procedure, see STR1.T090 and STR1.T100;
d. Temporary guys and bracing for use during the erection;
e. Details of holding down bolts and fittings to be built into the concrete or masonry.

2. Do not commence fabrication or deviate from the Drawings prior to receiving Approval.

STR1.D120.8 ERECTION DOCUMENTS
1. Prepare and submit to the CM at least six weeks before starting to erect steelwork, details of the following:
   a. Method of erection;
   b. Type of craneage;
   c. Calculations of erection stresses;
   d. Temporary guys and bracing for use during the erection.

2. Do not commence erection or deviate from the Drawings prior to receiving Approval.

STR1.D150.8 WELDING SYMBOLS
Show welding on the drawings using welding symbols to the Code of Practice for the Structural Use of Steel 2011.

STR1.D160.8 DRAWINGS RESPONSIBILITY
Accept responsibility for any errors in fabrication drawings subsequently found whether or not Approval to the drawings has been obtained.

STR1.D170.8 RECORD DRAWINGS
On completion of the erection, revise or redraw fabrication drawings to show any agreed modifications made during the course of the Contract. Submit one copy negative or velograph of each drawing to the CM for record purposes.

DESIGN OF SPACE FRAMES

STR1.D210.8 GENERAL
This Specification and the Drawings show the works for the purpose of defining the design intent and performance requirements. Details show the preferred arrangements to other building elements and do not provide solutions to structural and thermal movements, fixings and anchorages etc.

STR1.D220.8 DESIGN RESPONSIBILITY
Accept responsibility for the complete suitability of the design. Approval to the design does not relieve the Contractor from this responsibility.

STR1.D230.8 SCOPE OF WORKS
The space frame works comprise the design, supply and erection of the whole of the space frame structure in accordance with this Specification including delivery to the site, all testing as required by this Specification, assembling, erecting in position and painting.
STR1.D240.8 DESCRIPTION OF WORKS
Design the space structure with dimensions as indicated in the Project Specific Specification. General Layout, structural supports and all other relevant information pertaining to the space frame are depicted in Project Specific Specification.

STR1.D250.8 SPACE FRAME SYSTEM
1. Propose a specialist supplier/contractor on the Hong Kong Special Administrative Region Development Bureau's 'List of Approved Suppliers of Materials and Specialist Contractors for Public Works' in the category of Space Frame System for the CM's approval and obtain the space frame from the Approved specialist supplier/contractor;
2. Design the space frame which shall be a proprietary system complying with the details as specified in the Project Specific Specification.

STR1.D260.8 TENDER INFORMATION
Provide the following information with return of Tender:
1. The manufacturer's certificate of origin, certificates of chemical composition and physical tests;
2. A complete design calculation of the space frame structure certified by a Registered Structural Engineer;
3. The approximate total weight, loads on each supports, anchorages/anchor bolts required for the fixing of the space frame structure;

STR1.D270.8 DESIGN
Design proprietary space frame system:
1. To comply with the Code of Practice for the Structural Use of Steel 2011 for steel or BS 8118 for aluminium, as appropriate;
2. To be capable of withstanding thermal movement and induced stresses under a temperature variation ranging from 0º C to 40º C and other loads as shown on Drawings.

STR1.D280.8 ERECTION INFORMATION
1. Submit for the CM's consent at least one month before the proposed erection of the space frame:
   a. Organization chart and details of the erection supervisory staff;
   b. Detail programme for erection;
   c. Method and procedure of erection with the system employed complete with sketches, drawings, or photographs;
   d. Details including capacities of all lifting equipment to be used;
   e. A quality control & assurance system for the verification of the compliance of specification in all materials and workmanship;
   f. A copy of full set of design calculations including those for the erection stage, certified by the Responsible Engineer;
   g. Four copies of a full set of shop drawings of the space frame structure and the supporting parts complete with bearings, required for the proper execution of works, certified by the same Responsible Engineer; and
h. Manufacturer’s certificates of origin and chemical composition of, and
certificates of results of physical tests for, structural elements showing
compliance with the specification.

2. The CM undertakes to reply to the Contractor’s submissions and re-submissions
within 42 days.

MATERIALS FOR AND FABRICATION OF SPACE FRAMES

STR1.D310.8 MATERIALS STANDARDS
Design with materials of standard hollow section complying with Code of Practice for
members of circular section connected by spherical nodes of the same material. Make
the configuration of the nodes such that all resultant forces from members coincide with
the centroid of nodes. Where a proprietary space frame is proposed based on other
recognized international standards, submit the relevant material specification for
Approval.

STR1.D320.8 ROOF FALLS
Design the finished roof with a minimum fall as specified in the Project Specific
Specification. Fall to be effected by the space frame structure and/or the purlin systems,
after being loaded with all roofing materials.

STR1.D330.8 SIZE OF MEMBERS
Give consideration to providing an aesthetic proportion and balance between members
when selecting member sizes.

STR1.D340.8 FABRICATION
Ensure all members are free from twist, true to profile and dead straight or truly curved
as shown on the Drawings. Materials damaged whilst being straightened or curved to
be rectified or rejected as the CM directs.

STR1.D350.8 CUTTING AND FITTING
Cut to exact lengths the ends of members and other parts abutting against or upon other
parts, true and square, so as to provide a good bed or joints as the case may be. Proper
cover plates must be provided where necessary.

STR1.D360.8 FASTENERS
1. Provide and fit all bolts with washers, splayed if necessary, to give a level and even
bearing on the nuts;
2. Washers to be minimum of 2.4 mm thick;
3. When required by the CM, provide tapered washers for connections with a
difference in slope of 3 degrees or greater. Tapered washers are to be used with
bolts through flanges. As far as possible, fix the bolt heads to the upper side of the
connections.
STR1.D370.8 LIGHT FITTINGS
Provide supports for all light fittings and as shown on drawings and as specified in the Project Specific Specification. Derive support from nodal joints and not from chords, unless otherwise Approved.

STR1.D380.8 ACCESS CATWALKS
Provide internal catwalks together with catladders to the layout shown on the Drawings. Number of catladders required are as specified in the Project Specific Specification. Design catwalks to fit within the depth of the space frame structure and be minimum 600 mm wide unless otherwise stated. Catwalks to be maximum 400 mm from each light fitting. The position of each light fitting may be adjusted from the position shown on the Drawings by up to maximum of 200 mm in any direction to accommodate the design and construction method of the space frame structure and the catwalks.

STR1.D390.8 SECURITY GATE
Allow for provision of a 600 mm wide hinged, opening inward, lockable gate at location as shown on Drawings and specified in the Project Specific Specification.

STR1.D400.8 ELECTRICAL CONNECTIONS
Allow for provision of screw holes or other suitable connection points for the purpose of connection, by the Nominated Sub-contractor for electrical installation and of equipotential bonding conductors as required by the IEE Wiring Regulations.

TREATMENTS AND FINISHES TO SPACE FRAMES

STR1.D510.8 ELECTROPLATING
Electroplate spherical nodes with zinc layer 25 microns minimum.

STR1.D520.8 HOT DIP GALVANIZING
Hot dip galvanize all other components (both inside and outside of tube members) to BS EN ISO 1461:2009 with minimum mean coating thickness of 45 microns to 85 microns depending on thickness of tube walls as stipulated in Table 3 of BS EN ISO 1461:2009, unless otherwise specified.

STR1.D530.8 POWDER COATINGS
Apply finishing coat to space frame members of factory applied polyester powder. Coat of minimum dry film thickness of 80 microns. Colour to be selected from Standard colour chart.

ERECTION OF SPACE FRAMES

STR1.D610.8 ERECTION SUBMISSION
Submit for the CM's consent the proposed method and procedure of erection of the space frame prior to installation. Ensure compatibility with the requirements of the proposed construction programme and the site conditions. Demonstrate to the satisfaction of the CM that the effects of the forces and stresses imposed in the structure during erection of the space frame shall not exceed the originally allowed for in the design of the structure.
TEMPORARY SUPPORTS
Allow for the provision and the CM's consent of all necessary temporary bracing and supports prior to final fixing.

FIXINGS
Provide installation details of all anchorages/anchor bolts, that must avoid conflicting with the reinforcement of supporting elements.

PROTECTION
Allow for taking necessary precautions to prevent damage to the existing structure and finishes thereof if applicable, during erection. Protect floors when cranes or other plant are to be used internally for erection.

CONTRACTOR'S SUPERVISION
Provide a suitable experienced engineer full time on Site to supervise the erection of the space frame structure until physical completion of the works. The engineer must have previous experience in space frame construction. Submit for Approval the name and qualifications of the engineer who may be the employee of the Specialist Sub-contractor.

DESIGN OF PEDESTRIAN FOOTBRIDGES

GENERAL
Design steel footbridges using structural steelwork to Code of Practice for the Structural Use of Steel 2011, BS 5400 and the Structure Design Manual for Highways and Railways issued by the Highways Department unless otherwise particularly specified.

DRAWINGS AND DETAILS
Submit to the CM, at least 42 days before fabrication, two copies of all detailed working drawings and calculations for the erection and for temporary works and, where applicable, the following information:

1. Specification of materials used in the temporary works;
2. Locations, sizes, lengths and form of joint, angle between fusion faces, gap between parts of all welds. Symbols conforming to Code of Practice for the Structural Use of Steel 2011 should be used for standard weld forms, but full details must be given of any non-standard welds;
3. Where welds are to be made in the shop or elsewhere;
4. Details of stress relieving;
5. Details of testing and inspection methods.

FABRICATION APPROVALS
Do not commence fabrication until Approval to the proposals has been received. Such Approval does not relieve the Contractor of any obligation under the Contract.

APPROVED FIRMS
1. Select a specialist contractor from the Development Bureau's "List of Approved Suppliers of Materials and Specialist Contractors for Public Works" in the category of Structural Steelwork for CM's approval;
2. Employ the Approved specialist contractor and accept all normal obligations under the Contract including responsibility for works carried out by the specialist contractor.

STR1.D750.8  ERECTION APPROVALS

Before commencing erection of footbridges:

1. Obtain approvals from Highways Department, Commissioner of Police, and Commissioner for Transport for proposed method of erection of footbridges;
2. Comply with all requirements of the Highways Department and the Commissioners at Contractor's own expense and without any claim for extension of time.

STR1.D760.8  ERECTION PROPOSALS

1. Prepare and submit the erection proposal at an appropriate time having regard to the programme of work and the time taken for checking by the CM, obtaining replies and Approvals from the Highways Department and the Commissioners, and making any necessary amendments as required by the Highways Department, the Commissioners and the CM. Details of the erection proposal submitted must include:
   a. A method statement including the type of plant and equipment to be used;
   b. Drawings and calculations of any proposed temporary falsework system;
   c. All drawings properly numbered, fully detailed and dimensioned. All calculations and drawings submitted certified and signed by a Registered Structural Engineer, stating that the design is adequately safe.
2. Amend details as necessary to meet the CM's requirements and then submit through the Authority, to the aforesaid authorities for obtaining their approvals;
3. The giving of consent by the CM to the proposal does not relieve the Contractor of any of his duties or responsibilities under the Contract including his responsibility to obtain the necessary approvals from the aforesaid authorities. Allow a minimum of four weeks for comments from various Government Departments on the erection proposal.

STR1.D770.8  ERECTION PROCEDURE

1. Ensure that all falsework used does not interfere with normal traffic flow, and not reduce the width of the traffic lanes. Comply with the minimum clearance restriction imposed by relevant authorities for falsework spanning across carriageways and footways;
2. Assemble, fit and temporarily bolt or tack weld members to Approval prior to final riveting or welding;
3. Submit records of inspection of the completed formwork and falsework to the CM for information before carrying out any further works that may affect the stability of the formwork and falsework. Such records are to be certified by a contractor's superintendent holding qualification equivalent to TCP Grade T4 in civil or structural engineering discipline;
4. Monitor falsework levels and make any necessary adjustments for settlement, or other deflection or movements.

STR1.D780.8  BRIDGE BEARINGS

1. Prepare bearing surfaces for bridge bearings by removing all oil and grease by use of a suitable solvent all mill scale, rust and dirt removed by shot blasting;
2. Protect the proposed surface by covering with tape or similar material. The surfaces must not be primed or painted at any time prior to application of the bonding agent.
MATERIALS

GENERAL

STR1.M020.8 MATERIALS AND WORKMANSHIP
Ensure that all structural steelwork is in accordance with the Code of Practice for the Structural Use of Steel 2011 for building and general work and in accordance with BS 5400 and the Structure Design Manual for Highways and Railways issued by the Highways Department for bridge works except where specified otherwise.

STR1.M030.8 APPROVALS
Prior to commencing construction, submit for Approval any details required of the welding plant, techniques and procedures, jigs, workshop facilities and construction devices e.g. cranes, scaffolding etc, which the Contractor proposes using for the fabrication and erection of the steelwork. The information must be in sufficient detail to enable the CM to approve or otherwise.

STR1.M040.8 SAFETY
Comply with safety recommendation contained in BS EN 1011-1:2009 and with the Factories and Industrial Undertakings Ordinance throughout the fabrication, transport, handling and erection of structural steelwork.

STR1.M050.8 METHOD OF MANUFACTURE
Do not use the following method of steel manufacture:
1. Steel made by the Bessemer process;
2. Rimming steel.

STR1.M060.8 STEEL GRADES
Structural steelwork to comprise weldable structural steel in accordance with the following standards as appropriate:
1. Hot rolled sections (excluding hollow sections) and plates:
   BS EN 10025 Part 1-6:2004 Grade S275, S275JR, S355JR, S355J0, S450J0;
2. Hot finished hollow sections:
   BS EN 10210-1:2006, Grade S275J0H, S355J0H, S450J0;
3. Cold formed hollow sections:
   BS EN 10219-1:2006: Grade S275J0H, S355J0H;
4. Cold rolled galvanized sections:
   either BS 2989:1992 Grade Z35, coating type G600, surface finish N, or Hot dipped coated steel sheets to BS EN 10147:1992 Grade FE E3509, coating type G600, surface finish N.

STR1.M070.8 HOT ROLLED SECTIONS
Dimensions, mass, tolerances and rolling margins for:
1. Universal beams, columns, joists, tees and channels to BS 4:Part 1:2005;
2. Hollow sections to BS EN 10210-2:2006;

**STR1.M080.8 COLD ROLLED SECTIONS**
1. Dimension, mass and tolerances of cold rolled sections to BS 2994:1976 (1987);
2. Do not use cold rolled sections without Approval.

**STR1.M090.8 COLD ROLLED HOLLOW SECTIONS**
1. Dimension, mass and tolerances of cold rolled hollow sections to BS EN 10219-2:2006;
2. Do not use as substitute for hot finished hollow sections.

**STR1.M100.8 PLATES, FLATS AND BARS**
1. Comply with the standards as follows:
   a. For plates dimensions and mass tolerances to BS EN 10029:2010;
   b. For wide flats dimensions and mass tolerances to Euronorm 91 Class II thicknesses tolerances;
   c. For bars dimensions and mass tolerances to Euronorm 59 - Square bars, Euronorm 60 - Round bars, Euronorm 61 - Hexagonal bars.
2. Ensure tolerances on thickness are wholly over that shown on the drawings unless otherwise specified.

**STR1.M110.8 SURFACE QUALITY**
Surface quality of steel to be in accordance with the following:
2. Plates and wide flats: BS EN 10163 Part 2:2004 Class A.

**STR1.M120.8 SURFACE DEFECTS AND REPAIR**
1. Steel with surface defects within the limits of the following may be repaired and used:
   b. Plates and wide flats: BS EN 10163 Part 2:2004 Class A.
2. Obtain Approval to carry out surface defect repairs by welding.

**STR1.M130.8 SURFACE RUSTING**
Use only steel with Grade A, B or C surface rusting in accordance with BS 7079: Part A1:1989 (1994).

**STR1.M140.8 MAXIMUM CARBON EQUIVALENT**
Steel used in built-up welded assemblies or at welded connections must have a carbon equivalent value not exceeding that appropriate to the grade of steel given in Annex D1.1 of the Code of Practice for the Structural Use of Steel 2011 where this may be required for the avoidance of hydrogen cracking in welds unless the Contractor's proposed welding procedures are such to make this requirement unnecessary.
MARKING STEELWORK

Clearly mark all steelwork for identification and erection purposes as follows:

1. Identification: ensure that all steel elements are identified in accordance with BS EN 10025:2004, indicating grade, cast number and manufacturer's identification mark. Where indicated on the Drawings as being unmarked, tag steelwork and leave free of all other marking or hard stamping;

2. Grade S355 and S450 steel: in addition to marking in accordance with BS EN 10025:2004 mark steel with a continuous pale blue water paint line. Mark immediately, with light blue water painting any part cut from S355 and S450 steel which does not have a light blue marking;

3. Cold work steel: mark cold worked areas of member with orange water paint;

4. Marking for erection purposes: tag, hard stamp or pencil weld each member with an individual identification mark, which can not be obliterated by surface coatings. Prepare a marking drawing identifying markings and indicating position of member in structure;

5. Permanent identification: supply and fix to structure after erection, a brass identification plate. Plate to indicate with lettering not less than 15 mm high, etched or punched to a depth not less than 1.5 mm, the following:
   a. Steelwork Contractor's name;
   b. Grade of steel in structure;
   c. Date of fabrication.

NON-AVAILABLE MATERIALS

Obtain Approval for any equivalent alternative required when the specified material is not available.

MANUFACTURERS CERTIFICATES

Provide the manufacturer's certificates for all steel sections, rivets, bolts, screws, nuts and washers delivered to Site.

CLASS OF STEEL

Use only the Class of steel as stated in the Project Specific Specification, unless otherwise shown on the Drawings and/or Approved.

BOLTS, ACCESSORIES, CONNECTIONS AND FITTINGS

STEEL GRADE FOR CONNECTIONS AND FITTINGS

Use Grade S275 steel as a minimum, subject to design suitability, unless otherwise specified.

HIGH STRENGTH BOLTS AND NUTS

1. To BS 3692:2001:Grade 8.8;
2. To the strength of BS 3692:2001:Grade 8.8 and the tolerances of BS 4190:2001;
**STR1.M230.8  BS 4190 HOLDING DOWN BOLTS AND NUTS**

Holding down bolts and nuts to BS 4190:2001:Grade 4.6. Unless otherwise agreed by the CM, holding down bolts shall be encased in concrete or grout and with either one of the following:

1. Normal bolt head at the exposed end;
2. Screwed ends with two nuts at the exposed end.

**STR1.M240.8  BS 3692 HOLDING DOWN BOLTS AND NUTS**

Holding down bolts and nuts to BS 3692:2001:Grade 8.8. Unless otherwise agreed by the CM, holding down bolts shall be encased in concrete or grout and with either one of the following:

1. Normal bolt head at the exposed end;
2. Screwed ends with two nuts at the exposed end.

**STR1.M250.8  BLACK BOLTS AND NUTS**

To BS 4190:2001:Grade 4.6.

**STR1.M260.8  DRIVE SCREWS**

Use self-tapping metallic drive screws to BS 4174:1972.

**STR1.M270.8  PLAIN WASHERS FOR BLACK BOLTS**

Round washers to be to BS 4320:1968, Form A made from cold rolled strip in the hardened condition to BS 1449:Part 1:1991:Section 1.15, Grade CS4 chamfered on one outside edge.

**STR1.M280.8  SPRING WASHERS FOR BLACK BOLTS**

Washers to be single coil square or rectangular steel spring washers to BS 4464:1969 (1990).

**STR1.M290.8  TAPERED WASHERS**

Made from cold formed strip in the hard condition to BS 1449:Part 1:1991:Section 1.15, Grade CS4 to similar dimensions and tolerances as shown in BS EN 14399:2005.

**STR1.M300.8  BOLT LENGTHS**

Ensure threaded portion of each bolt projects through the nut by at least one thread.

**STR1.M310.8  HIGH STRENGTH FRICTION GRIP BOLTS**

Use bolts and associated nuts and washers to BS EN 14399:2005 unless otherwise specified.

**STR1.M320.8  RIVETS**

**STR1.M330.8  TURNBUCKLES OR SIMILAR**

Obtain Approval for specially made elements and components such as turnbuckles.
STR1.M340.8 MARKING BOLTS AND ACCESSORIES
Clearly mark all bolts, screws, nuts and washers by either embossed or indented markings identifying the relevant British Standard. (See also STR1.W040).

WELDING CONSUMABLES

STR1.M410.8 QUALITY OF ELECTRODES, RODS AND WIRES
Select to give weld metal properties not less than the minimum specified for the grade of steel being welded.

STR1.M420.8 CONSUMABLES FOR WELDING STEELS TO BS EN 10025
To BS EN 1011-1:2009.

STR1.M430.8 ELECTRODES FOR WELDING GRADE S355 AND S450 STEELS
To be capable of depositing no more than 15 ml of diffusible hydrogen per 100 g of deposited weld metal, as defined in BS EN ISO 2560:2009.

STR1.M440.8 COVERED ELECTRODES FOR MANUAL METAL ARC WELDING
To BS EN ISO 2560:2009.

STR1.M450.8 FILLER WIRES FOR GAS-SHIELDED WELDING
To BS EN ISO 14341:2011.

STR1.M460.8 CORED ELECTRODES
To BS EN ISO 17632:2015.

STR1.M470.8 FILLER WIRES AND FLUXES FOR SUBMERGED ARC WELDING
To BS EN ISO 14171:2010.

STR1.M480.8 CONTINUOUS COVERED ELECTRODES
Of an Approved manufacture.

STR1.M490.8 MANUFACTURER'S TEST CERTIFICATES
Provide CM with relevant manufacturer's certificates for each batch of electrodes/rods/coils of wire.

STR1.M500.8 STORAGE OF ELECTRODES
Keep electrodes in unbroken packets in accordance with BS EN 1011-1:2009. Any drying or baking of consumables before issue shall be carried out in accordance with the manufacturers recommendations.
WORKMANSHIP

TRANSPORTATION AND STORAGE

STR1.W010.8  GENERAL
Make all necessary arrangements for transport of steel from the fabrication yard to the site.

STR1.W020.8  HANDLING
Carefully load, stack, and unload to avoid damage of any description. Replace damaged items at Contractor's own expense unless the CM permits rectification of damage.

STR1.W030.8  SPECIAL HANDLING
1. Where necessary; use, special slings or lifting points or both for handling, loading and unloading in fabrication shops, during transit and on Site;
2. Provide special supports, packings and lashings on vehicles, trucks and on ship (if appropriate) to prevent chafing;
3. Ensure small components receive special handling and stacking;
4. Ensure unpainted components, e.g. high strength friction grip bolts and associated nuts and washers are adequately protected against corrosion.

STR1.W040.8  BOLTS, NUTS, WASHERS, AND SCREWS
1. Transport and store in sealed or wire clipped bags labelled to identify:
   a. Contents;
   b. Number;
   c. Grade;
   d. Standard;
   e. Manufacturer;
   f. Batch or cast number.
2. Store in a dry area dedicated to the purpose;
3. Do not mix contents of opened bags.

STR1.W050.8  EXPOSURE TO POLLUTANTS
1. Take precautions to minimise exposure of steelwork to atmospheric or chemical pollution before and after fabrication;
2. Store and stack steel members in such a manner that markings are clearly visible;
3. Either one of the following:
   a. For superstructure works:
      i. Store steelwork awaiting erection clear of a levelled, well-drained and maintained hard-standing ground and keep different members separate. Lay or stack to avoid accumulation of water or dirt on or against any of the surfaces. Provide suitable packings between layers of stacked steelwork. Ventilate covered steelwork sufficiently to preclude condensation.
b. For works other than that in sub-clause (3)(a):
   i. Store steelwork awaiting erection clear of the ground and keep different members separate. Lay or stack to avoid accumulation of water or dirt on or against any of the surfaces. Provide suitable packings between layers of stacked steelwork. Ventilate covered steelwork sufficiently to preclude condensation.

**STR1.W060.8 ROAD TRANSPORT**

1. Use vehicles long enough to carry components with permitted overhang at either end;
2. Provide intermediate supports to which a component can be tied with strops to prevent oscillation;
3. Sit components on softwood supports covered with soft clean pads;
4. Ensure buckles to strops do not touch components.

**STR1.W070.8 SEA TRANSPORT**

1. Containerise steelwork destined to be shipped overseas;
2. Do not ship steelwork as deck cargo unless in containers;
3. Ensure containers can be handled at ports of exist and entry if vehicle cannot be ferried;
4. Pack containers so that no components touch. Use softwood with soft padding and man-made fibre ropes and strops to prevent movement and contract;
5. Bag fasteners and accessories;
6. Bundle small components and prevent contact;
7. Chromate dip galvanized steel, which is not to be overcoated, when it is to be containerised for longer than three weeks or when going to go through the tropics.

**STR1.W080.8 REPAIR OF DAMAGE INCURRED IN TRANSPORT**

1. Inspect steelwork after transportation;
2. Set aside components with damage to steel or coatings;
3. Report damaged steel to the CM;
4. If damaged component is not rejected by the CM repair by agreed method;
5. Repair coatings as specified immediately.

**FABRICATION**

**STR1.W110.8 ACCESS**

Provide access for the CM at all reasonable times to all places where work is being carried out, with all necessary facilities for inspection during fabrication and off-site assembly.

**STR1.W120.8 GEOMETRIC FORM**

Keep all material, before and after fabrication, straight unless required to be of curvilinear form. Keep free from twists. Avoid excessive stack-up of sections to prevent damage and distortion.
STR1.W130.8 **IDENTIFICATION**
Identify at all stages of fabrication, structural steel as described in STR1.M150.

STR1.W140.8 **SURFACE PREPARATION**
Before fabrication remove all oil and grease by use of a suitable solvent from all bare surfaces and remove all mill scale, rust and dirt by either:

1. Shot blasting to surface finish designation Sa 2 to BS 7079:Part A1:1989 (1994);

STR1.W150.8 **POST CLEANING**
After cleaning adopt one of the following methods:

1. Apply a coat of blast primer, not greater than 20 microns DFT. Where subsequent welding is to be carried out ensure that a weld through blast primer is used which will not give off noxious fumes during welding. Ensure compatibility with final protective system; or
2. Fabricate steelwork within four hours of cleaning and apply protective system primer (See STR1.W1220); or
3. Reclean steel after fabrication by shot blasting or mechanical wire brushing to standard required for protective coating and apply protective system primer (See STR1.W1220).

STR1.W160.8 **EXECUTION**
1. Carry out all fabrication to:
   a. The Code of Practice for the Structural Use of Steel 2011 for hot rolled sections and cold formed sections in building;
2. Conform with the requirements for accuracy of construction with respect to levels, dimensions, alignment and fabrication tolerances of members and joints given in the above Code of Practice and British Standard.

STR1.W170.8 **SETTING OUT**
Set out all holes and cuts along the length of a member from one datum line perpendicular to its longitudinal axis. Mark centres of all holes at standard back marks/cross centre unless otherwise shown on the Drawings.

STR1.W180.8 **TEMPORARY ATTACHMENTS**
Design and fabricate all temporary attachments for use as assembly/erection aids to ensure their use will not damage the structure or its surface protection.

STR1.W190.8 **END PLATES**
1. For flexible end plate connections:
   a. To be not less than 12 mm thick;
   b. To extend across, but not be connected to the top flange;
2. For sealing hollow sections:
   a. Suspend suitable desiccant (Silica-gel) in bags in each void prior to sealing up;
b. Weld sealing plate over end.

**STR1.W200.8 JIGS**
Use jigs for repetitive, interchangeable or complicated work.

**STR1.W210.8 MEASUREMENT AND SETTING OUT MARKS**
Make all measurements by steel tape or bands calibrated at 20°C and used at the correct tension.

**STR1.W220.8 CONTINUOUS STRUCTURES**
Make allowance in setting out continuous structures for dimensional variations due to temperature variations.

**STR1.W230.8 STRAIGHTENING BENDING AND CAMBERING OF STEEL SECTIONS**
Submit proposals to the CM where steel sections are required to be straightened, bent to a specified radius or precambered and methods to be adopted to perform these operations, for his approval in each case. Ensure that the adopted method does not weaken or deface the member.

**STR1.W240.8 POST FABRICATION MAKING GOOD**
Clean and prepare all mechanical damage, weld burns and welded surfaces as follows:
1. By shot blasting; or
2. Mechanical or hand wire brushing;
3. All bare and welded surfaces must also be made good and primed in accordance with STR1.W150;
4. Plates over 25 mm that are to be connected by high strength friction grip bolts and found to be bowed or rippled must be machined flat before the steel leaves the fabrication works.

**STR1.W250.8 CUTTING STEEL**
1. Cut by sawing, shearing, cropping, nibbling, laser or machine flame cutting, unless otherwise Instructed. Do not use manual gas cutting without Approval;
2. Shearing must not distort steelwork;
3. Saw cut slightly oversize to allow for machining and/or grinding;
4. Flame cut oversize where necessary to allow for removal of notches by machining.

**STR1.W260.8 CUT EDGES**
1. Remove burrs, sharp arrises and slag from edges of all cut members;
2. Dress machine sheared or cropped edges to a neat finish, free from distortion.

**STR1.W270.8 MACHINING GENERALLY**
1. Grind stiffeners, plates and the like to fit the profile of the parent member with diagonal cuts to clear the root radius;
2. Machine stanchion splices and butt joints of compression members true and square;
3. Splay cut projecting corners of cleats, plates, etc and machine the edges and ends of all flanges and end plates of girders or other members except where Universal beams or flats with reasonably square edges are used;

4. Machine the edges of all web and flange plates of welded girders square unless specified otherwise. Where plates are specified to be planed, cut to sufficient size to permit 3 mm to be planed off all edges. The edges of floor plates, gutter plates, and trough flooring may be sheared;

5. Machine square all butt ends of compression members and those in close contact throughout so that applied loads are evenly transmitted over the entire area of the section.

STR1.W280.8  **FLAME CUTTING**

Grind off heat affected metal or notches where gas cutting is used. Where gas cutting is applied to Grade S275 steel over 25 mm thick or to Grade S355 & S450 steel of all thicknesses, machine any gas cut edge which is to be subject to fluctuating stresses along its length but not subsequently incorporated in a weld so as to remove not less than 3 mm of the flame cut profile.

STR1.W290.8  **FORMING HOLES FOR BOLTS AND RIVETS**

1. Form holes by any of the following methods:
   a. Drilling full size;
   b. For plate less than 15 mm thick: punching 2 mm less in diameter than the required size and subsequently reaming out to the required diameter;
   c. Punching full size and meeting the following conditions:
      i. The punching operations must not in the opinion of the CM unduly distort the material;
      ii. The holes must be free from burrs which would prevent solid seating of the parts when tightened;
      iii. The thickness of the material through which the hole is punched must not exceed the diameter of the hole;
      iv. The thickness of the material must not be greater than 12 mm unless Approved;
      v. In spliced connections the holes in the mating surfaces must be punched from the same direction.
   d. Holes must not to be punched full size in any of the following conditions:
      i. In tension flanges at locations where plastic hinges have been assumed in the design analysis;
      ii. In elements of rigid connections in which local yield lines have been assumed;
      iii. Where repetition of loading makes fatigue critical in the member design.

2. Comply with clause 14.2.5 of the Code of Practice for the Structural Use of Steel 2011.

STR1.W300.8  **BUILT-UP SECTIONS**

1. Drill after the members have been assembled and tightly clamped together;
2. Where not practicable, drill the holes to a diameter at least 2 mm less than the required size and ream after assembly to the full diameter.

**STR1.W310.8  REMOVING BURRS**

Remove all burrs from holes from assembly. Parts which have been drilled to receive black bolts need not be separated to remove burrs. Parts drilled to receive HSFG bolts to be separated and the surfaces cleaned of all burrs and drilling fluid to ensure the coefficient of friction is not compromised.

**STR1.W320.8  HOLES FOR BLACK BOLTS**

Finished holes for black bolts must not be more than 2 mm in diameter larger than the diameter of the bolt passing through them for bolt diameters up to 24 mm, and not more than 3 mm larger than the diameter of the bolts for bolt diameters over 24 mm, unless otherwise specified or required by the design.

**STR1.W330.8  HOLES FOR HIGH STRENGTH FRICTION GRIP BOLTS**

Use hole sizes specified in **STR1.W320** where the number of plies in the grip does not exceed three. If the number of plies exceed three, form the holes in the two outer plies as before and the diameter of the hole in the inner plies not more than 3 mm larger than that of the bolt.

**STR1.W340.8  FITTED BOLTS, PINS OR RIVETS**

1. Holes for rivets:
   a. All matching holes for rivets to register with each other so that a gauge 2 mm less in diameter than the diameter of hole will pass freely through the assembled members in a direction at right angles to such members;
   b. Finished holes to be more than 2 mm in diameter larger than the diameter of the rivet passing through them, for rivet diameters up to 24 mm, and not more than 3 mm greater than the diameter of the rivet for rivet diameters over 24 mm, unless otherwise specified;
   c. Holes for rivets must not be formed by a gas cutting process.

2. Holes for fitted bolts:
   a. Drill holes for fitted bolts to a diameter equal to the nominal diameter of the shank subject to a tolerance of +0.15 mm and -0 mm;
   b. Use tacking bolts or cramps on parts connected together with fitted bolts. Drill through all the thicknesses at one operation and ream to size;
   c. All holes not drilled through a thicknesses at one operation are to be drilled to a smaller size and reamed out after assembly. Where this is not practicable, drill and ream the parts separately through hard bushed steel jigs.

**STR1.W350.8  SLOTTED HOLES**

Drill first then ream out smooth to required size.

**STR1.W360.8  PREVENT MOISTURE INGRESS**

Make provision to prevent moisture ingress to sealed hollow members where these are holed for bolts.
MECHANICAL JOINTING

STR1.W410.8  SURFACE PREPARATION
Prepare and prime the contact surfaces at riveted, bolted and screwed joints. If the contact surfaces are specified to be coated or otherwise treated, e.g. machined surface finish, obtain Approval to the joint before assembly.

STR1.W420.8  USE OF HIGH STRENGTH FRICITION GRIP BOLTS
1. Clean the interface of members jointed with high strength friction grip bolts to the specified surface preparation and leave unpainted;
2. Use high strength friction grip bolts in accordance with BS 4604:Part 1:1970. Tighten the bolts and nuts by the torque-control method using a calibrated power-operated or a hand-operated torque wrench to achieve the proof loads set out below:

<table>
<thead>
<tr>
<th>Nominal size</th>
<th>Proof Load, kN (minimum shank tension)</th>
</tr>
</thead>
<tbody>
<tr>
<td>M12</td>
<td>49.4</td>
</tr>
<tr>
<td>M16</td>
<td>92.1</td>
</tr>
<tr>
<td>M20</td>
<td>144</td>
</tr>
<tr>

<td>207</td>
</tr>
<tr>
<td>M27</td>
<td>234</td>
</tr>
<tr>
<td>M30</td>
<td>286</td>
</tr>
</tbody>
</table>
3. Use tapered washers on surfaces with a slope >3°.

STR1.W430.8  WRENCH CALIBRATION
1. Maintain the wrench in a proper working condition in accordance with the manufacturer's recommendations. Calibrate the wrench regularly using a calibrated bolt load meter and using a bolt from the batch of bolts to be used in the works as follows:
   a. At the commencement of each new working day or shift;
   b. With each change of bolt diameter;
   c. With each change of bolt grip length in excess of 1/5th of the length used in the calibration of the wrench in accordance with BS 4604:Part 1:1970.
2. Re-apply the wrench to bolts previously tightened in a multi-bolt connection to ensure all bolts have the correct torque;
3. Ensure that the bolt used in the calibration is, as far as is practicable, representative of bolts to be used in the works. No additional lubrication should be applied unless it is to be applied to bolts incorporated in the permanent works.

STR1.W440.8  CALIBRATION OF BOLT LOAD METER
The bolt load meter for measuring bolt shank tension must be calibrated by an Approved laboratory before tightening of bolts and nuts commences and at regular intervals agreed by the CM. During re-calibration, a replacement calibrated bolt load meter must be provided on the Site. Submit calibration results to the CM at least one week before the bolt load meter is used.
**STRUCTURAL STEEL**

**STR1.W450.8 BLACK OR PRECISION BOLTED CONNECTIONS**

1. Keep all bolts, nuts and washers free from rust and dip in linseed oil immediately before connections;
2. Provide each bolt with at least one steel washer placed under the nut or bolt head, whichever element is to be rotated during the tightening operation;
3. Tighten all bolt heads and nuts against surfaces normal to the bolt axes. Use tapered washers as necessary to meet this requirement. Where bolted connections are subject to vibration provide the nuts with lock nuts or castle nuts and split pins.

**STR1.W460.8 ALIGNMENT, TEMPORARY CONNECTIONS AND PERMANENT FIXINGS**

1. Do not distort holes or members during alignment;
2. Do not enlarge holes without prior Approval;
3. Drifts used during the fabrication or erection of the steelwork must be of such shape and dimensions as to locate the work accurately. Drifts must not cause any damage to or deformation of the component parts, nor alter in any way the sizes of the holes provided for the permanent bolts;
4. Temporary bolts used for the initial or trial assembly of any part of the steelwork must have the same hole clearances as the permanent bolts;
5. Tighten all bolts securely in the finished work so that the length of each bolt after tightening projects at least one thread beyond the other face of the secured nut.

**STR1.W470.8 BOLTED CONNECTIONS WITH PROVISION FOR SLIDING**

Provide slotted hole through one member and a round hole in the other. Connect with shouldered bolts, spring washers, flat washers, castle nuts and splits pins. Form round holes with a diameter less than the width of the slot and place the shoulder of the bolt against the faying surface of the unslotted member enabling the bolt to be tightened on this member. Locate the spring washer under the head of the bolt and the flat washer under the castle nut.

**WELDING**

**STR1.W510.8 GENERAL**

1. Prior to fabrication of bridgework carry out welding and flame cutting trials using representative samples of materials to be used in the work in accordance with BS 5400:Part 6:1980;
2. Provide an experienced and competent operative to supervise welding. Submit evidence that all welders are capable in accordance with STR1.T080;
3. When directed by the CM, keep a site record that identifies the welders responsible for major welds.

**STR1.W520.8 USE OF WELDING EQUIPMENT AND ACCESSORIES**

1. Use welding plant, equipment and accessories that comply with the requirements of BS 638;
2. Use individual transformers or motor generator that are fitted with a current density control and situated close to the welder so that he may adjust the current;
3. Store and use welding consumables in accordance with BS EN 1011-1:2009, BS EN ISO 2560:2009 and the manufacturers recommendations;
4. Store electrodes in dry conditions and where necessary keep in heated quivers while in use;
5. Use covered electrodes to BS EN ISO 2560:2009;
6. Regularly calibrate, using an ammeter, the transformers or motor generators to ensure that current is kept within the range specified by the manufacturers for electrodes;
7. Do not open packets except for sampling or when electrodes are to be used;
8. Reject electrodes with broken, damp or damaged coatings.

**STR1.W530.8**

**PREPARATION FOR WELDING**
1. Submit in writing, for Approval, details of proposed welding procedure for each type of welded connection in accordance with STR1.T100;
2. Keep the surfaces to be welded free from all scale, grease, paint, rust and other matter. Prepare all parts to be welded in a manner that ensures a close fit;
3. Prepare fusion surfaces to BS EN 1011-1:2009. Dry surfaces and warm as necessary, to remove any condensation.

**STR1.W540.8**

**ADDITIONAL REQUIREMENTS FOR SITE WELDING**
1. Surfaces to be welded must be clean, free from paint, grease, contaminants dry and free from condensation. Where the steel is damp or the temperature is low then warming with a low temperature flame may be used. Thermal indicating crayons may be used to determine the plate temperature and the area pre-heated;
2. Protection from the weather: provide adequate protection to shield the welding from the weather. Tent type structures made from fireproof and waterproof material may be used to shield the weldment from the wind and rain. Such temporary structures to be mounted on stable scaffolding supports, and a stable platform to be provided for the welder. Where welding to hollow sections is required ensure draughts are prevented from blowing through the section;
3. Electrodes: bake on site at a temperature between 100°C and 150°C and where necessary store in heated quivers for use at the welders convenience;
4. Power supply: may be from a transformer or generator to provide a three phase power supply of the required voltage. Locate the generator or transformer as close as possible to the welder to prevent a drop in voltage along the cables length. Ensure all the cables are as short as possible, routed away from the path of construction vehicles, and adequately protected;
5. Earth run: adequately earth all electrical plant. Ensure the welding return from the weldment is adequate in cross section and correctly connected and earthed;
6. Weld detail: ensure the welded joint is of the correct profile and fit up. As a general guide do not carry out welding where the gap is less than 1 mm or more than 3 mm unless a backing strip is provided. Where a backing strip is provided the weld gap is not to exceed the greater of 5 mm or the thickness of the material being welded. Adequately support all welded joints with props or restraints that ensure relative movement of the fusion faces is prevented;
7. Work in confined spaces: provide adequate ventilation and formulate plans of evacuation and escape before the work commences.

**STR1.W550.8**

**METHOD OF WELDING**
1. Carry out welding in accordance with the requirements of BS EN 1011-1:2009. Manual metal-arc weld unless otherwise specified;
2. Execute welding in a flat or horizontal position wherever possible. Do not weld overhead without Approval;

3. Ensure electrodes used in conjunction with fluxes give a weld deposit having mechanical properties at least equal to the minimum specified for the parent metal. Use electrodes and fluxes strictly in accordance with the manufacturer's recommendations.

**REMOVAL OF SLAG**

Remove welding slag by chipping before depositing subsequent runs, and thoroughly wire brush the surfaces.

**TACK WELDS**

Do not use tack welding unless Approved. Tack welds to be minimum 50 mm long. Form location welds, where Approved, of the same quality and size as the first run of the main weld which when completed, fuse completely with the ends of the location welds and form a reasonably regular finished profile. Do not weld temporary attachments to principle joints. Obtain Approval of the position of welds for temporary attachments.

**WELD DEFECTS**

1. Welds will be rejected if they do not meet the acceptance criteria of welds stipulated in clause 14.3.6.7 of the Code of Practice for the Structural Use of Steel 2011;

2. Take particular care when welding hollow sections, plates and angles to avoid distortion by using correct sequences and speeds.

**FILLET WELDS**

Deposit fillet welds to the required length, throat thicknesses and with partial or full penetration as specified.

**BUTT WELDS**

1. Form butt welds as full penetration welds between prepared fusion faces, unless otherwise directed;

2. Carry out back chipping, grinding or gouging of the deposited weld as required to obviate imperfections in the root run such that the root edges or root faces are not out of alignment by more that 1/8 of the thickness of the thinner material for material up to 12 mm thick or by more than 1.5 mm for thicker material;

3. Grind butt welds flush without loss of parent metal;

4. In the fabrication of built-up assemblies ensure, all butt welds in each component are completed, wherever possible, before the final assembly.

**STUD SHEAR CONNECTORS**

Weld stud shear connectors by automatic stud welding gun strictly in accordance with the manufacturer's recommendations unless specified otherwise.

**ERECTION OF STEELWORK**

**ERECTION**

1. Carry out all erection to:
a. The Code of Practice for the Structural Use of Steel 2011 for hot rolled sections and cold formed sections in building;

2. Conform with the requirements for accuracy of construction in respect of levels, dimensions and alignment given in the above Code of Practice and British Standard and those contained in the “Schedule of Tolerances” in Appendix H to this Specification.

**STR1.W720.8 ERECTORS**

Carry out all work employing trained and experienced erectors. Provide evidence of the erector’s competence when directed by the CM.

**STR1.W730.8 SAFETY**

Comply with the relevant regulations on safety including the ‘Factories and Industrial Undertakings Ordinance’, the recommendations of BS 5531:1988 as applicable and:

1. Use only recently tested equipment for lifting and remove from site any damaged equipment;

2. Do not carry out complex operations at a height except from safe platforms large enough to take operators and equipment. Maintain platforms and safe access until work has been accepted and any added protection completed.

**STR1.W740.8 STABILITY**

Ensure stability of structure at all stages of construction.

**STR1.W750.8 SEQUENCE OF OPERATIONS**

Prepare and submit details of the proposed method of erection for the CM's consent. Details submitted must include type of plant and equipment to be used and if necessary drawings and calculations of any temporary work. The giving of consent by the CM will not in any way relieve the Contractor of his responsibility for safe erection of permanent work or the safe erection and subsequent dismantling of temporary work.

**STR1.W760.8 PLANT AND EQUIPMENT**

Do not employ any plant or equipment which is, or in the CM's opinion likely to be, unsuitable, unsafe, or likely to cause damage to the structure during erection or damage to existing buildings etc.

**STR1.W770.8 PREVENTION OF DISTORTION**

Do not distort steelwork or exceed the stresses specified in the Code of Practice for the Structural Use of Steel 2011 or BS 5400:Part 3:1982 for bridgework during erection.

**STR1.W780.8 APPROVED SEQUENCE**

Erect structural steel according to the sequence agreed with the CM.

**STR1.W790.8 FALSEWORK**

When specified, design, construct and dismantle falsework to BS 5975:1982. Supply all staging and all labour, tools, erection plant, lifts, services, nuts and washers and other necessary materials. Provide temporary bracings and guys to ensure adequate resistance to wind and stability against collapse during construction.
1. Submit records of inspection of the completed formwork and falsework to the CM for information before carrying out any further works that may affect the stability of the formwork and falsework. Such records are to be certified by a contractor's superintendent holding qualifications equivalent to TCP Grade T4 in civil or structural engineering discipline;

2. Monitor falsework levels and make any necessary adjustments for settlement, or other deflection or movements.

**STR1.W800.8**  
**SETTING OUT, LEVELLING AND LOCATION**

Set out, level and position:

1. Using steel tapes or bands for setting out that are calibrated at 20°C and used at the correct tension;

2. To a level that is levelled to a datum point and aligned to a base line during erection. Agree both datum point and setting out lines before commencement;

3. That ensures all steelwork is accurately and securely located to the correct profile and camber, if any, before assembly;

4. That ensures the structural steelwork is not subjected to stresses in excess of those for which it was designed.

**STR1.W810.8**  
**ERECITION OF STEELWORK**

1. Do not erect fabricated steelwork until all welded joints and specified protective coatings have been inspected, tested where required, and Approved;

2. Align structural members accurately to the specified tolerances and obtain Approval before any permanent welding or tightening of bolts is carried out;

3. Do not bed stanchion bases or grout anchor bolts until the steelwork has been plumbed, levelled, aligned and Approved.

**STR1.W820.8**  
**STEELWORK BY SUB-CONTRACTOR**

1. Take responsibility for checking all the work prepared by others that may be incorporated into the work or the dimensions of any structure affecting steel erection. As a result of the check report any discrepancies or shortfalls to the CM immediately;

2. Ensure that the Sub-contractor supplies any items required to be cast into concrete. Cast in such items using templates provided by the Sub-contractor where these are necessary.

**CLEANING, SURFACE PREPARATION AND PROTECTION (POST FABRICATION)**

**STR1.W910.8**  
**CLEANING AND COATING IN THE SUPPLIERS WORKSHOP**

Ensure that the supplier provides sufficient covered and enclosed workshop space to enable blast cleaning, priming coat and undercoat painting to be carried out in close sequence. The blast cleaning section of the workshop must be fitted with extractors and filters to prevent and deposition of dust on metal surfaces to be painted.
STR1.W920.8  CLEANING SURFACES OF BARE METAL

Thoroughly clean down to remove all dirt, grease and the like, using a suitable solvent and thoroughly chip, scrape, wire-brush flame clean or grit blast to remove all loose scale back to clean metal.

STR1.W930.8  CONTAMINATED SURFACES

1. Weld spatter: clean of all surfaces, keep paint films free of embedded foreign metallic particles;
2. Concrete deposits etc: wash or clean off immediately they occur and if necessary make the surfaces good to the satisfaction of the CM;
3. Oil or grease: clean with white spirit.

STR1.W940.8  PAINTED AND OTHER COATED SURFACES

Unless otherwise directed by the CM clean the final workshop applied coating to the external surfaces on site by:
1. Washing with a solution of an Approved liquid detergent followed by rinsing with clean fresh water and allowed to dry thoroughly before overcoating;
2. Thoroughly cleaning rivet heads, bolts heads and the surfaces surrounding them;
3. Removing all loose particles, dust and debris immediately prior to application of paint.

STR1.W950.8  ATMOSPHERIC CORROSION

Do not apply protective coating to surfaces bearing atmospheric corrosion products or other chemicals which may be harmful to the coating or succeeding coating. Clean off these contaminants, which may include any remaining after surface preparation as specified in this Worksection and any produced by welding, to an Approved extent that is compatible with the specified protective system.

STR1.W960.8  BLAST CLEANING

1. Carry out blast cleaning in accordance with BS 7079:Part A1:1989 (1994) and that produces surface qualities as follows:
   a. For surfaces to be galvanized to 140 microns: Sa 2 (prior to pickling).
      Note: Surfaces to be galvanized to 85 microns do not require blast cleaning;
   b. For surfaces to be metal sprayed: as specified in BS EN ISO 2063:2005;
   c. For surfaces to be painted: Sa 2½.
2. Non-metallic abrasive should be free from contamination and recovered material is to be cleaned to the satisfaction of the CM before re-use;
3. Do not exceed a maximum amplitude (peak to trough) of the blast-cleaned surface of 0.1 mm;
4. Clean blasted surfaces by brush or vacuum. Do not touch by hand. Do not contaminate in any other way;
5. Apply protective coating within 4 hours of blast cleaning;
6. Before commencing any follow on operations submit, for Approval, a sample blast cleaned steel panel measuring not less than 150 mm x 150 mm x 6 mm thick adequately protected by sealed clean polythene wrapping. The Approved sample will be retained by the CM for comparison with the prepared steelwork.
STR1.W970.8 MECHANICAL CLEANING

Carry out mechanical cleaning to surface quality designation St 2 of BS 7079:Part A1:1989 (1994) by power driven tools, such as carborundum grinding discs, chipping hammers and needle guns, followed by steel-wire brushing and dusting to remove all loosened material. Avoid excessive brushing of the metal through prolonged application to rotary wire brushes. Protect surfaces within 48 hours of mechanical cleaning.

STR1.W980.8 PICKLING

Carry out pickling of steel by the "Footner" process as specified in BS 5493:1977. Apply the first priming coat of paint as soon as the steel has dried and is still warm.

STR1.W990.8 FLAME CLEANING

Plan and control the sequence of operations for flame cleaning steelwork to avoid the risk of distortion and buckling. Clean the flame cleaned surfaces of all loosened material. Apply priming coat while the steel is still warm. Control the heat input so that no harmful distortion of the steelwork occurs.

STR1.W1000.8 NEW GALVANIZED SURFACES

Thoroughly clean to remove all dirt, oil and grease and pre-treat with either an etching primer or Approved etching compound.

STR1.W1010.8 PREVIOUSLY PAINTED GALVANIZED SURFACES

Thoroughly degrease previously painted galvanized surfaces. Where corrosion has spread under the paint film, remove old paint with an organic solvent type paint remover.

STR1.W1020.A CLEANED OR COATED MEMBERS

1. Ensure that, unless specified otherwise, exposure times for blast cleaned, wire brushed or coated surfaces (other than at joints) are not longer than those given in the following table:

<table>
<thead>
<tr>
<th>Surface</th>
<th>Enclosed Workshop</th>
<th>Outside</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Blast cleaned</td>
<td>4 hours</td>
<td>Nil</td>
</tr>
<tr>
<td>b. Metal Sprayed</td>
<td>4 hours</td>
<td>Nil</td>
</tr>
<tr>
<td>c. Mechanically Cleaned</td>
<td>48 hours</td>
<td>Nil</td>
</tr>
<tr>
<td>d. Blast Primer on 'a'</td>
<td>Maximum exposure of 8 weeks with up to 2 weeks of this time outside</td>
<td></td>
</tr>
<tr>
<td>e. Etch primer on 'b'</td>
<td>24 hours</td>
<td>Nil</td>
</tr>
<tr>
<td>f. Primer on 'c'</td>
<td>48 hours</td>
<td>Nil</td>
</tr>
<tr>
<td>g. 1st Undercoat on 'd', 'e' or 'f'</td>
<td>48 hours</td>
<td>Nil</td>
</tr>
<tr>
<td>h. Subsequent Undercoats</td>
<td>As agreed by the CM</td>
<td></td>
</tr>
</tbody>
</table>

Note: 'Outside' refers to any area outside a fully enclosed workshop.

2. The tabulated exposure times refer to any part of the surface being blast or mechanically cleaned, metal sprayed or painted;

3. For surface condition 'd' where blast primed steelwork is exposed outside, the minimum dry paint film thickness over the peaks of the blast cleaned steel must not be less than 13 microns;
4. Zinc rich coated steelwork may only be exposed outside for the minimum period to allow movement at the fabricator's works. Such movement to be under the supervision of the CM or his representatives and unless the weather conditions are favourable the sections are to be covered;

5. Where it is necessary to overcoat two pack paints of the epoxide or polyurethane type, re-coat within 48 hours of application. Where it is not possible to overcoat within this time the paint film to be abraded to produce a roughened surface, given a flash coat of suitable primer, and allowed to dry for at least 4 hours before application of the next coat of the system;

6. No steelwork to be loaded for transport until the paint system has been Approved as being sufficiently dry for handling;

7. Keep steelwork to be site painted clean and dry. Where necessary provide temporary shelters to simulate, as far as is practicable, workshops conditions.

APPLICATION OF METAL COATINGS

STR1.W1110.8 HOT DIP GALVANIZING

1. To BS EN ISO 1461:2009: minimum mean coating thickness of 45 microns to 85 microns depending on thickness of steel sections as stipulated in Table 3 of BS EN ISO 1461:2009, unless otherwise specified;

2. Apply metal coatings to BS EN ISO 1461:2009 only to components of a tensile strength up to and including that of general grade high strength friction grip bolts unless otherwise specified;

3. Make good small areas of galvanized coating damaged by welding, cutting or by rough treatment during transit or erection either by the use of low melting point zinc alloy repair rods, powders made specifically for this purpose, or by the use of at least two coats of zinc rich paint to BS 4652:1995. Apply sufficient material to provide a zinc coating at least equal in thickness to the galvanized coating.

STR1.W1120.8 SPRAYED METAL COATING

To BS EN ISO 2063:2005. The nominal thickness of coating to be 100 microns. Apply one flood coat of polyurethane (or similar approved) sealer immediately after spraying.

STR1.W1130.8 ELECTROPLATING

1. To BS 3382:Parts 1 and 2:1961;

2. Coating thickness: 5 microns minimum.

STR1.W1140.8 CHROMIUM PLATING

To BS 4641:1986 (1996). Ensure that the protection offered is at least the same as that provided for the adjacent main structural steel element.

STR1.W1150.8 METAL COATING ON PART ONLY OF ASSEMBLED SECTION

Apply the metal coating before the remainder receives its priming coat.
PROTECTION OF HSFG BOLTED JOINTS

1. Zinc or aluminium sprayed steelwork: where the metal spray is carried over the interfaces of the HSFG bolted joints, take the etch primer on the parent metal between 10 mm and 20 mm inside the perimeter of the joint area. The outer surfaces and edges of the joint material may also be given a coat of the same primer in order to reduce surface preparation required after the joint has been made;

2. Painted steelwork: where metal spray is specified only at the interfaces of HSFG bolted joints, carry the metal spray between 10 mm and 20 mm outside the perimeter of the joint area and the blast primer taken between 10 mm and 20 mm inside the perimeter. If the outer surfaces and edges of the joint materials are metal sprayed, these may be given a coat of etch primer in order to reduce subsequent surface preparation;

3. Painted steelwork: where the interfaces of HSFG bolted joints are bare steel, take the blast primer between 10 mm and 20 mm inside the perimeter of the joint area. The outer edges and surfaces of the joint material may also be given a coat of blast primer in order to reduce subsequent surfaces preparation.

PROTECTION OF OTHER BOLTED JOINTS

1. Shop joints: apply metal spray plus etch primer or blast primer alone to parent and joint material. Assemble the joint immediately after the first undercoat of the parent system has been applied to the contact surfaces;

2. Site joints: apply to all surfaces, excepting those of fasteners, the same painting system in the shop as is to be applied to the parent metal surfaces, unless otherwise specified.

PROTECTION OF NON-BOLTED JOINTS

1. Riveted joints: shop and site joints: apply metal spray plus etch primer or blast primer alone, to parent and joint material. Assemble the joint immediately after the first undercoat of the parent system has been applied to the contact surfaces;

2. Welded joints: unless otherwise specified, treat welds and surfaces which have been affected by welding with the protective system which is applied to the parent surfaces.

SURFACES ADJACENT TO TREATED JOINTS

1. Keep metal spray at least 15 mm clear of areas to be welded and mask off these areas during spraying;

2. Where paints other than blast primers are to be applied to the parent surfaces before the making of a joint they must be stepped back at 30 mm intervals commencing at 80 mm from welded joints and at 10 mm from the perimeter of all other joints.

PAINTING AND SEALING OF JOINTS

1. As soon as possible after joints have been Approved, paint the parent and joint material, exposed parts of bolts, nuts and washers, weld and affected areas to bring them up to the same state of preparation and painting as the adjoining surfaces;

2. Seal all bolted joints against the ingress of water. Before painting commences and, subject to Approval, plug gaps at joints with an Approved filler. Seal the perimeter of all joints with subsequent coats of paint.
STR1.W1210.8  APPLICATION OF PAINT

1. Types of paint and painting generally to be as specified at STR1.W1220 and STR1.W1230 as appropriate for application to steelwork;

2. Only apply to surfaces which have been prepared and cleaned in accordance with this Worksection;

3. Do not apply in the following conditions:
   a. When the ambient temperature falls below 4°C or the relative humidity rises above 90%;
   b. For external works: during period of inclement weather, e.g. rain, fog or mist or when condensation has occurred or is likely to occur on steel;
   c. When the surface temperature of the metal to be painted is less than 3°C above the dew point of the ambient air;
   d. When, in the opinion of the CM, the amount of dust in the atmosphere and/or on the surface of the material is such that the application of the paint would be unsatisfactory;
   e. For two pack paints of the epoxide resin type: when the temperature is below 5°C or as recommended by the paint manufacturer, nor when the temperature is likely to fall below the specified minimum during the curing period.

STR1.W1220.8  PAINTING STEELWORK

Apply the appropriate paint system as detailed in the following table at the locations as specified in the Project Specific Specification.

<table>

### ACCURACY AND TOLERANCES

**STR1.W1310.8 GENERAL**

Refer to Chapter 15 of the Code of Practice for the Structural Use of Steel 2011 and Appendix H, "Schedule of Tolerances" to this Specification.
OFF-SITE FABRICATION

STR1.W1410.8 SUBMISSIONS
Where structural steelwork is to be fabricated off-site, submit the following items for Approval within a period from the notified date for commencement of Works as specified in the Project Specific Specification:

1. The name, fabrication yard address with street maps and job reference of the fabricator and the following:
   a. A quality assurance (QA) scheme and testing regime on fabrication of the structural steelwork with the items as stipulated in STR1.W1420; and
   b. A fabrication and delivery schedule.
2. An RSE appointed by the Contractor/fabrication yard who shall carry out the duties as stipulated in STR1.W1430;
3. A laboratory for carrying out the tests and issuing test certificates in the QA scheme (except for those tests specified in STR1.T520 (2)), which shall be accredited either by Hong Kong Accreditation Scheme (HKAS) under the Hong Kong Laboratory Accreditation Scheme (HOKLAS), or an equivalent organization which has signed a mutual recognition agreement with HOKLAS.

STR1.W1415.8 SUBMISSIONS FOR MINOR STEEL STRUCTURES FABRICATED OFF-SITE
1. Prior to fabrication, submit for Approval proposal of a laboratory for carrying out tests and issuing test certificates for minor steel structures excepting the following tests:
   a. Tests specified in STR1.T520 (2);
   b. Tests concerned are not applicable to minor steel structure as stated in STR1.G040 (2).
2. The laboratory proposed in sub-clause (1) above shall be accredited either by Hong Kong Accreditation Service (HKAS) under the Hong Kong Laboratory Accreditation Scheme (HOKLAS), or an equivalent organization which has signed a mutual recognition agreement with HKAS.

STR1.W1420.8 QUALITY ASSURANCE (QA) SCHEME
Ensure that the steelwork is fabricated under a quality assurance scheme which covers the following items and is certified under ISO 9001:

1. Organisation chart of the fabrication yard with the qualification and experience of key technical personnel clearly stated;
2. Responsibility of the management in respect of the fabrication process;
3. Material purchasing and delivery procedures;
4. Material / product identification, traceability process and control;
5. Fabrication and inspection process;
6. Designated welders who shall be tested to and comply with the requirements of this Specification;
7. Quality control testing regime including welding procedural test and chemical analysis for welding consumables used for temporary or permanent structural steelworks on Site of steel grade as stated in STR1.M060 and shown in the structural working drawings;
8. Control on non-compliant materials and works;

9. Transportation and storage process.

**STR1.W1430.8 REGISTERED STRUCTURAL ENGINEER**

1. Appoint an Registered Structural Engineer (RSE) registered under Buildings Department for ensuring and certifying the fabrication works are in compliance with the drawings and Specification;

2. The duties and roles of the RSE include but not limited to:
   a. Pay regular site visits for proper control of the works and submit reports after each visit;
   b. Carry out inspection on all activities which, in his professional judgement, are critical and require close supervision;

3. The frequency of RSE's visits shall be a minimum of two visits per month.
TESTING

GENERAL REQUIREMENTS

STR1.T010.8 GENERAL
Allow sufficient time in the Works programme for the testing specified below. Do not incorporate materials until relevant tests have been carried out and Approval obtained.

STR1.T020.8 TESTING BY MANUFACTURER
Carry out inspection and testing on BS EN 10025:2004 products by cast and documentation supplied in accordance with Euronorm 21. Specific testing and documentation to include chemical analysis; tensile tests and impact tests.

STR1.T030.8 TESTING OF BOLTS, NUTS AND WASHERS
1. Testing arrangement:
   Provide test specimens and carry out testing of bolts and associated nuts and washers in accordance with the relevant BS in an Approved Laboratory employed and paid for directly by the Contractor, when so directed by the CM;

2. Testing samples:
   Rate of sampling to be one bolt per identifiable batch or 1% whichever is the lesser unless otherwise specified.

STR1.T040.8 TEST CERTIFICATES
Submission requirements:
1. Submit a manufacturer's certificate of tests in accordance with the appropriate standard for each steel batch relating to steel to be used in the works. Documentation to include chemical analysis impact test and tensile test.

STR1.T050.8 TESTING OF SECTIONS
Testing samples:
1. Provide specimens for testing which shall be in accordance with the requirements stipulated in the Code of Practice for the Structural Use of Steel 2011. In addition, provide further specimens for testing when otherwise stated in the Project Specific Specification or as Instructed. For minor steel structures, further test specimens for Class 1 Steel are not required. Test specimens to be taken from sections selected at random on Site by the CM;

2. Prepare the test specimens to BS EN 10025:2004 or BS EN 10210:2006 as directed and appropriately mark and deliver them to a Direct Testing Contractor employed and paid direct by the Authority for testing. Testing and documentation to include tensile tests and impact tests;

3. For steel sections used for construction of hoardings and associated covered walkways and gantries, the frequency of sampling stated in the sub-clauses (1) above may be reduced at the discretion of the CM.

STR1.T060.8 FAILURE OF TESTS
Non-compliance:
1. If any test specimens do not comply with the relevant BS, the CM may require further tests at the Contractor's expense or reject the whole or part of the particular consignment, which must be removed from Site forthwith.

**STR1.T070.8 ULTRASONIC TESTING**

When plates are subjected to through thickness tension by virtue of the type of connection, test quality grade steel plates and flats which may, as a result of welding be subject to lamellar tearing, using ultrasonic testing using equipment as described in Section 2 of BS 5996:1993 and, unless otherwise specified or agreed, be of quality LC3 as defined in Section 3 of that document.

**STR1.T080.8 ABILITY OF WELDERS**

1. All welders must be capable of passing the training tests to BS 1295:1987;
2. Where specified, carry out approval testing of welders by either one of the following:
   a. For welds where welding procedure approval is required to BS EN ISO 15614-1:2004: carry out approval testing of welders to BS EN 287: Part 1:2004 for steel and stainless steel and to BS EN 287:Part 2:1992 for aluminium as appropriate;
3. Submit evidence to show that all welders satisfy the requirements as stated in sub-clause (1) above.

**STR1.T090.8 PARTICULARS OF INSPECTING AUTHORITY**

Submit to the CM the name of the proposed inspecting authority endorsing welder certificates and records of approval tests for welding procedures. The proposed inspecting authority must be accredited by the Hong Kong Accreditation Service (HKAS) under the Hong Kong Inspection Body Accreditation Scheme (HKIAS) for welding inspection or by other accreditation bodies which have reached mutual recognition agreement for inspection body accreditation with HKAS. The name to be submitted at least 3 weeks before approval tests start or, if approval tests are not required, at the same time as the welder certificates are submitted.

**STR1.T093.8 BATCH OF WELDING CONSUMABLE**

In this Specification, a batch of welding consumables is the quantity of welding consumables of the same type and size, which may include one or multiple standard lot(s) as defined in the manufacturer’s quality assurance programme, delivered to the Site, or the off-site fabrication yard as one consignment that is covered by the manufacturer’s certificate(s) and under one delivery order, and shall not exceed five tonnes and twenty tonnes respectively.
TESTING OF WELDING CONSUMABLES

For each batch of welding consumables used for temporary or permanent structural steelworks on Site of steel grade as stated in STR1.M060 and shown in the structural working drawings, prepare 2 test specimens for each standard lot and carry out the chemical analysis in accordance with BS EN ISO 2560:2009 or BS EN ISO 14341:2011 or BS EN ISO 14171:2010 or BS EN ISO 17632:2015 as appropriate, except for the standard lot(s) where complying chemical analysis results have been attained from the first chemical analysis under which circumstance no further chemical analysis is required for the same standard lot(s) in subsequent batches of welding consumables. The chemical analysis shall be carried out by an Approved laboratory, accredited either by the Hong Kong Accreditation Service (HKAS) under the Hong Kong Laboratory Accreditation Scheme (HOKLAS) or an equivalent organization which has signed a mutual recognition agreement with HKAS and is employed and paid for directly by the Contractor. Allow sufficient time for testing of welding consumables in the programme.

ACCEPTANCE CRITERIA - WELDING CONSUMABLES

A standard lot in a batch of welding consumables is deemed to comply with the requirements of the Specification if the test results meet the requirements of BS EN ISO 2560:2009 or BS EN ISO 14341:2011 or BS EN ISO 14171:2010 or BS EN ISO 17632:2015 as appropriate. If the test results of the first chemical analysis of a standard lot complied with the requirements of the Specification, further chemical analysis on the same standard lot in all subsequent batches of welding consumables delivered to the same Site or the same off-site fabrication yard is not required.

FAILURE OF TESTS

Non-compliance:

If any test specimen of the welding consumables does not comply with BS EN ISO 2560:2009 or BS EN ISO 14341:2011 or BS EN ISO 14171:2010 or BS EN ISO 17632:2015, the Contractor may choose to carry out further test(s) and take further test samples from the same lot of welding consumables at the Contractor’s expense or remove the whole lot of the particular batch from Site and / or the fabrication yard for off-site fabrication if appropriate. If further test(s) is chosen, the number of further test(s) is to be calculated by the application of the formula given below and no extension of time will be allowed for the said further test(s). Bear the cost of such further test(s).

\[
\text{number of further test(s)} = \left( n^2 - 2n + 3 \right)
\]

where \( n \) = total number of unsuccessful inspection(s) / test(s) progressively until all inspection(s) / test(s) is / are successful.

Typical example of calculating the number of further inspections / tests is given in Appendix I to this Worksection, for illustration purposes only.

Acceptance criteria and further actions arising from the further test(s) shall be in accordance with STR1.T095.

For a standard lot with any non-compliant chemical analysis results, chemical analysis shall be carried out for the standard lot of welding consumables, as defined in the manufacturer’s quality assurance programme, subsequently delivered to the same Site or the same off-site fabrication yard regardless of the results of the further test(s).
STANDARD FOR REJECTION
If the result of any test or any further test does not comply with the specified requirements in the Specification for any particular property, the standard lot in a batch of welding consumables is deemed failing to comply with the specified requirements for that property. Then:

1. The non-compliant standard lot in a batch of welding consumables shall be removed from Site;
2. The non-compliant standard lot in a batch of welding consumables shall be removed from the off-site fabrication yard if appropriate.

STANDARD OF WELD PROCEDURE TESTING
Testing arrangement:
1. Unless acceptable documentation relating to the welding of similar connections is available, carry out approval testing of each welding procedure in accordance with BS EN ISO 15614-1:2004 for steel and BS EN ISO 15614-2:2005 for aluminium.

ADDITIONAL DESTRUCTIVE WELD TESTS AS SELECTED BY THE CM
Testing arrangement:
1. Prepare specimen welds and subject to one or more of the following tests as required:
   a. Butt welds:
      i. Transverse tensile test to BS EN 895:1995;
      ii. Transverse bend tests to BS EN 910:1996 or BS 709:1983 as appropriate with the root of the weld in tension and compression respectively;
      iii. Side bend tests to BS EN 910:1996 or BS 709:1983 as appropriate;
      iv. Macro-examinations to BS 709:1983 or BS EN 1321:1997 as appropriate.
   b. Fillet welds:
      i. Fracture tests to BS 709:1983;
      ii. Macro-examinations to BS 709:1983 or BS EN 1321:1997 as appropriate.
   c. For destructive weld test, comply with the same hold time as stipulated in clause 14.3.6.4 of the Code of Practice for the Structural Use of Steel 2011;
   d. If any test specimens do not comply with the relevant BS, the CM may require further tests at the Contractor's expense or reject the whole or part of the particular consignment, which must be removed from Site forthwith.

2. Strictly follow the procedures of welding established in the successful Approval test for the Works. Carry out further Approval tests if either the material or procedure changes.

ADDITIONAL NON-DESTRUCTIVE TESTING OF STEEL, STAINLESS STEEL AND ALUMINIUM
1. Testing arrangement:
   a. Arrange for a percentage of each welder work to be selected by the CM and subjected to non-destructive testing as follows:
      i. Visual inspection in accordance with BS EN 970:1997;
ii. Ultrasonic in accordance with BS EN 1714:1998; or magnetic particle inspection in accordance with BS EN 1290:1998. (Not for stainless steel and aluminium);

iii. The scope and frequency of test shall be in accordance with clause 14.3.6.1 of the Code of Practice for the Structural Use of Steel 2011;

iv. For welds on steelworks of hoardings and associated covered walkways and gantries, the percentages of tests stated in the sub-clause (1)(a)(iii) above may be reduced at the discretion of the CM.

b. Comply with clause 14.3.6.4 of the Code of Practice for the Structural Use of Steel 2011 for hold time before final non-destructive testing.

2. Non-compliance:
   Where any weld is judged to be unsatisfactory by the CM, a further 10% of that welder's work is to be tested. If further defects are found, then all weld in the group should be tested by the same method.

**STR1.T130.8 ACCEPTANCE CRITERIA**

Non-compliance:

1. Welds on steel will be rejected if they do not meet the acceptance criteria for welds stipulated in clause 14.3.6.7 of the Code of Practice for the Structural Use of Steel 2011;

2. Welds on aluminium will be rejected if they do not meet the acceptance level for welds stated in BS 8118:Part 2:1991.

**STR1.T140.8 WELD REPAIR**

Cut out and repair all defective welds in accordance with the Code of Practice for the Structural Use of Steel 2011 for steel or BS 8118:Part 2:1991 for aluminium.

**STR1.T150.8 ENGAGEMENT OF SPECIALIST TESTING CONTRACTOR (FOR FABRICATION ON SITE)**

1. Carry out tests required to satisfy the requirements of BS 4872, BS EN 287-1:2004 and BS EN ISO 15614-1:2004 by an Approved Laboratory employed and paid for directly by the Contractor;

2. Provide samples required by the CM (STR1.T050, STR1.T110, STR1.T120 and STR1.T140) for tests by a Direct Testing Contractor employed and paid for directly by the Authority.

**TESTING OF PAINTS**

**STR1.T210.8 SAMPLING AND TESTING**

Permit authorized sampling of materials on site. Set aside unopened sealed containers of materials for testing when directed by the CM.

**STR1.T220.8 PAINT SAMPLES**

Testing samples:

STR1.T230.8 TESTING PAINTS

Testing method:

1. Carry out the following tests on each sample as directed by the CM in STR1.T240:

<table>
<thead>
<tr>
<th>Specification</th>
<th>Test Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BS 3900: Part C2:1994</td>
<td>Surface drying test;</td>
</tr>
<tr>
<td>BS 3900: Part C3:1990</td>
<td>Through dry test;</td>
</tr>
<tr>
<td>BS 3900: Part E1:1970</td>
<td>Bend test;</td>
</tr>
<tr>
<td>BS 3900: Part E2:1992</td>
<td>Scratch test;</td>
</tr>
<tr>
<td>BS 3900: Part F8:1993</td>
<td>Resistance to humid atmospheres containing sulphur dioxides.</td>
</tr>
</tbody>
</table>

STR1.T240.8 TESTING LABORATORY

Submission requirements and testing arrangement:

1. Test certificates to be submitted to the CM before painting starts;
2. Where manufacturer's test certificates are available these may be accepted in lieu of a retest at the CM's discretion;
3. Tests for paints in STR1.T230 to be carried out by an Approved Laboratory employed and paid for directly by the Contractor.

STR1.T250.8 GLOSS FINISH

Prepare a sample panel to indicate the standard of gloss finish and obtain Approval. Ensure application matches agreed sample.

SPACE FRAMES - WARRANTIES AND TESTING

STR1.T310.8 SUITABILITY WARRANTY

If required, submit a warranty as specified in the Project Specific Specification.

STR1.T340.8 TESTING OF SECTIONS

Testing arrangement:

1. Undertake testing of steel and aluminium sections as clauses STR1.T010, STR1.T030, STR1.T050 and STR1.T060 except as specified at sub-clause (2) below;
2. Provide at least two full length samples for every aluminium section of same thickness to be used in the Works for testing to BS EN 10002-1:2001, as appropriate.

STR1.T350.8 WELDING TESTS

1. Testing of welds for steel and aluminium will be required;
2. Clauses STR1.T080 to STR1.T140 apply equally to welding of aluminium.
STR1.T360.8 PROOF LOAD TESTING

1. If in the opinion of the CM the relevant British Standards are not appropriate for the welding configuration proposed, the CM may order not more than 10% of the welded components for proof load tests at the Contractor's expense;

2. Provide suitable equipment to carry out proof load tests on welded components. Apply a tensile load uniaxially in opposite directions of a magnitude equal to the resultant of the worst combination of factored design loads multiplied by a factor of 1.3. and on removal of the test load, the deflection shall be reduced by at least 20%;

3. The weld shall be deemed to comply the requirements of this Specification when under the proof load test the weld shall exhibit no sign of crack. If any one test of a group of welded components fails to meet this Specification, then 2 additional welded components for the same group are to be subject to load proof tests. If any of these two further welded components continue to fail the test, then each welded component of the group is to be subject to proof load tests. Any cracks identified in any stage of the test are to be repaired and retested until they all satisfy the requirements;

4. A group of welded components is defined as the welds done by the particular welder within a specified period of time as decided by the CM.

STR1.T370.8 NODAL JOINTS OF SPACE FRAMES

Testing samples:

1. Provide one test specimen for every 100 or part thereof of each type of nodal joint for tensile test. The test load shall be a tensile load applied uniaxially in opposite directions of a magnitude equal to the resultant of the worst combination of factored design loads of the possible heaviest connecting member multiplied by a factor of safety of 1.3 acting on the nodal joints.

STR1.T380.8 ACCEPTANCE CRITERIA FOR NODAL JOINT TESTS

The test specimen in STR1.T370 is deemed to comply with the requirement of this Specification under the test loading if there is no sign of crack, no deformation at thread, buckling or rupture of any part of the nodal joint. On removal of the test load the deflection should reduce by at least 20%.

STR1.T390.8 FAILURE AND RE-TESTING OF NODAL JOINTS

Non-compliance:

1. The CM will reject any test specimens which do not comply with the requirements. In addition, the CM may require further tests at the Contractor's expense or reject the whole or part of the particular consignment, which must be removed from Site forthwith;

2. Carry out further tests if directed, provided the results of these further tests fulfil the test requirements, all the nodal joints represented by these tests are deemed to comply with this Specification;

3. If the result of any of these additional tests fail to fulfil the test requirements, the part of the particular consignment represented by these nodal joints must be removed from Site forthwith.
STR1.T400.8 LOADING TESTS

If in the opinion of the CM that loading tests on parts of the space frame are necessary, the CM may order proof tests in accordance with the Code of Practice for the Structural Use of Steel 2011, by an Approved Laboratory employed and paid for directly by the Contractor.

OFF-SITE FABRICATION

STR1.T510.A TESTING AND SURVEILLANCE VISITS AT FABRICATION YARD

For off-site fabrication in Guangdong province of China, comply with the following:

1. Provide all necessary facilities and attendance required by the CM and Consultant employed for inspection and surveillance visits and the Direct Testing Contractors for carrying out the tests as stated in STR1.T520 (2) at the fabrication yard;

2. Make all necessary arrangement including providing transportation to the CM and Consultant employed for inspection and surveillance visits to the fabrication yards. Take the staff of each of the Direct Testing Contractors to the locations of the testing and / or parallel testing works for the first visit to the fabrication yards, and the Direct Testing Contractors shall arrange their own transportation for subsequent visits to the same locations of the fabrication yard.

STR1.T520.A ENGAGEMENT OF SPECIALIST TESTING CONTRACTOR (FOR OFF-SITE FABRICATION)

For off-site fabrication, testing arrangement shall comply with the Approved quality assurance scheme and testing regime submitted in accordance with STR1.W1410. The engagement of specialist testing contractor shall comply with the following requirements:

1. Except for the testing arrangement as stated in sub-clause (2) below, all testing shall be carried out by the Approved laboratory proposed in STR1.W1410 (3), employed and paid for directly by the Contractor;

2. For off-site fabrication carried out in Guangdong province of China, comply with the following:

a. The following tests shall be carried out by the Direct Testing Contractor employed and paid for directly by the Authority:
   i. Tensile tests and impact tests of steel sections;
   ii. Visual inspection of welds;
   iii. Ultrasonic inspection of welds;
   iv. Magnetic particle inspection of welds.

b. Provide specimens for testing as specified in 2(a)(i) above, which shall be selected from sections at random either in the fabrication yard by the Direct Testing Contractor or on the Site by the CM or his representatives. The preparation and delivery of the test specimens from the fabrication yard or the Site to the laboratory for testing shall be carried out by the Direct Testing Contractor;

c. Welds for testing shall be selected and tested by the Direct Testing Contractors in the fabrication yard.
APPENDIX STR1/I

STR1.APPEND1.8 CALCULATION OF NUMBER OF FURTHER INSPECTIONS / TESTS

Typical Examples for Illustrative Purposes Only

1. Chemical analysis shows 2 samples failing to meet the requirements in the Specification.

2. The Contractor can either remove the standard lot of the particular batch of welding consumables from the Site and / or the fabrication yard for off-site fabrication or at his own expense, carry out further test(s) in accordance with the formula of:

\[
\left( n^2 - 2n + 3 \right) = 2^3 - 2 \times 2 + 3
\]

= 3 further tests

3. If one of the above 3 further tests fails, the Contractor may order further tests to be carried out at the Contractor's own expense by re-applying the formula and taking into account the total number of failed samples. Altogether and based on the formula, the number of total retesting required:

= 3^2 - 2 \times 3 + 3

= 6

As 3 tests have already been carried out by the Contractor, the Contractor shall carry out:

6 - 3 = 3 further tests

4. If the next 3 further tests show further failed samples, the formula will be re-applied as before until all the tests results are satisfactory.

APE1 SCOPE OF APPENDIX

APE1.A010.8 APPLICATION

1. All terms and requirements set out in this Appendix shall only be applicable to contracts with the construction of superstructure of domestic blocks.
2. All terms and requirements set out in this Appendix shall be applicable to permitted modifications or proposals for modifications to design and/or Specification for the domestic blocks.
3. Where any terms and requirements in Worksection APE4 of this Appendix are at variance with those in Worksections APE2 and APE3 of this Appendix, the terms and requirements of Worksection APE4 shall prevail.

APE1.A020.8 TERMS AND REQUIREMENTS ON PERMITTED MODIFICATIONS PROPOSED IN TENDER STAGE

Terms and requirements applicable to permitted modifications to design and/or Specification for the domestic blocks proposed by the Contractor in tender stage are specified in Worksection APE2 of this Appendix.

APE1.A030.8 TERMS AND REQUIREMENTS ON PROPOSALS FOR MODIFICATIONS IN POST-CONTRACT STAGE

Terms and requirements applicable to modifications to design and/or Specification for the domestic blocks proposed by the Contractor in post-contract stage after the notified date for commencement of the Works are specified in Worksection APE3 of this Appendix.

APE1.A040.8 ACCEPTANCE CRITERIA FOR PROPOSED MODIFICATIONS

The acceptance criteria for permitted modifications to design and/or Specification proposed by the Contractor in tender stage and for modifications to design and/or Specification for domestic blocks proposed by the Contractor in post-contract stage after the notified date for commencement of the Works are specified in Worksection APE4 of this Appendix.
APE2  TERMS AND REQUIREMENTS ON PERMITTED MODIFICATIONS PROPOSED IN TENDER STAGE

GENERALLY

APE2.A010.8  APPLICATION
All terms and requirements included in Worksection APE2 hereunder apply to permitted modifications to design and/or Specification for domestic blocks proposed by the Contractor in tender stage.

SCOPE OF MODIFICATIONS

APE2.A020.8  LIMITATIONS
1. Only modifications to design and/or Specification for domestic blocks arising as a result of complying with Items APE2.A030 to APE2.A070 inclusive are permitted in tender stage.

2. Permitted modifications proposed and submitted by the Contractor with the tender shall be in accordance with the Special Conditions of Tender and shall comply with all the requirements as specified in Worksections APE2 and APE4 of this Appendix.

APE2.A030.8  LARGE PANEL FORMWORK SYSTEM
The further use of large panel formwork system for constructing the structural walls (see CON2.D310 to CON2.D450).

APE2.A040.8  NON-MANDATORY PRECAST EXTERNAL FACADES
The use of precasting method for constructing the external facades of the domestic flat units (see Worksection CON5).

APE2.A050.8  NON-MANDATORY SEMI-PRECAST SLABS
The use of semi-precasting method for constructing the slabs to areas other than domestic flat units (see Worksection CON7).

APE2.A060.8  NON-MANDATORY PRECAST STAIRS
The use of precasting method for constructing the stairs of the domestic blocks (see Worksection CON7).

APE2.A070.8  MECHANISED CONSTRUCTION METHODS
The use of any Approved mechanised method of construction.
SUBMISSIONS

APE2.A110.8 SUBMISSIONS - GENERALLY
Submit a schedule listing any permitted modifications to the design and/or Specification for domestic blocks proposed by the Contractor in a letter attached to the Form of Tender.

APE2.A120.8 CONFLICT WITH SPECIFICATION
Submit with the tender a list of all items contained in the Specification which may conflict with the tenderer's design, and full details of proposals for any amendments or additions to the Specification.

APE2.A130.8 MECHANISED CONSTRUCTION METHODS
Submit with the tender details of any mechanised method of construction that it is intended to use.

APE2.A140.8 PROPOSED STRUCTURAL MODIFICATIONS
Submit details with the tender showing:

1. The principles of any incidental structural design modifications proposed which shall be prepared by a Registered Structural Engineer registered with the Buildings Department; and

2. Proposals for supervision of all aspects of the concrete work by Contractor's own staff and the CM.

APE2.A150.8 PROGRAMME FOR FURTHER SUBMISSIONS IN POST CONTRACT STAGE
Agree programme for submission of design calculations, framing plans, reinforcement details, etc. with the CM prior to the notified date for commencement of the Works. No change to the design principles submitted with the tender documents will be permitted.

DESIGN RESPONSIBILITY

APE2.A210.8 DESIGN RESPONSIBILITY
Notwithstanding Clause 5.15 of the General Conditions of Contract, the Contractor shall, with respect to the Contractor’s proposed modification to the design and / or Specification, be responsible for the satisfactory performance of the Works as modified by the Contractor's proposed modifications to the design and / or Specification and shall guarantee the same to the Employer. The Contractor shall indemnify and keep indemnified the Employer, his agents and employees against any liability, claims, demands, proceedings, damage, costs, charges and expenses whatsoever in respect thereof or in relation thereto, and shall compensate the Employer for any loss or expense arising therefrom.
BILLS OF QUANTITIES

APE2.A310.8 AMENDMENTS
1. Subject to compliance with sub-clause (2) of this clause, the Contractor may, at time of tender, insert, delete or revise the description and / or quantity of the measured items within the Bills of Quantities to suit any modifications to design and / or Specification for domestic blocks proposed by him. Such insertion, deletion or revision shall be made in accordance with the Method of Measurement stated in the Preliminaries to the Bills of Quantities. The Contractor shall include a schedule in his tender showing all such revisions to the Bills of Quantities;

2. 
   a. No insertion, deletion or revision shall be made to the Preliminaries to the Bills of Quantities;
   b. No insertion, deletion or revision to any provisional quantities contained in the Bills of Quantities shall be allowed to be made, although the work or works to which the provisional quantities refer may be modified by the Contractor in accordance with Worksection APE2 of this Appendix.

APE2.A320.8 PREPARATORY WORKS FOR FINISHES
Where items, such as plastering, rendering and screeding, have been deleted from the Bills of Quantities as a result of the operation of sub-clause (1) of Item APE2.A310, the cost of all preparatory work, including keying, or the use of special bonding agent, etc., as required by the CM, to receive any subsequent finish is deemed to have been included in the tender.

PRELIMINARIES ITEMS

APE2.A410.8 ON-SITE PLANT AND EQUIPMENT
1. For domestic blocks, where the precast concrete facade system involves early capital cost of major and necessary items of on-Site plant and equipment which are used intimately in association with the precast facade construction, the Contractor may make a request for special terms of payment in respect of these items and is advised to make known to the Employer at time of tender, by submitting proposals in a separate letter with his tender.

2. In this connection, the Contractor is to note that any special terms of payment proposal must be restricted to only the on-Site items of plant and equipment as described in Clause SCT10 of the Special Conditions of Tender and the amounts of these items must have been tendered in Bill No 1 - Preliminaries. The acceptance of any special terms of payment proposals shall be at the discretion of the Employer.

3. All other Preliminaries items not related to the special terms of payment proposal shall be paid in accordance with the provisions set out in Bill No 1 Preliminaries.
INFORMATION TO TENDERERS FOR NOMINATED SUB-CONTACT AND SPECIALIST WORKS

APE2.A510.8 INFORMATION TO TENDERERS FOR NOMINATED SUB-CONTACT AND SPECIALIST WORKS

1. The Contractor shall give full information and assistance to tenderers tendering for any Nominated Sub-contract or Specialist Works on any permitted modifications to design and/or Specification for domestic blocks which may affect the submission of a tender for any such Nominated Sub-contract or Specialist Works.

2. The Contractor shall be responsible for any additional costs, claims or expenses whatsoever and howsoever arising on Nominated Sub-contracts or Specialist Works as a result of any permitted modification to design and/or Specification for domestic blocks and the Final Contract Sum shall not be adjusted in respect of any such claims.
APE3  TERMS AND REQUIREMENTS ON PROPOSALS FOR MODIFICATIONS IN POST-CONTRACT STAGE

GENERALLY

APE3.A010.8  APPLICATION

All terms and requirements included in Worksection APE3 hereunder apply to modifications to design and/or Specification for domestic blocks proposed by the Contractor in post-contract stage after the notified date for commencement of the Works.

APE3.A020.8  TERMS AND CONDITIONS

1. Any modifications proposed by the Contractor in post-contract stage after the notified date for commencement of the Works shall be submitted to the CM in accordance with Clause 11.8 of the General Conditions of Contract. Such proposals shall be treated as Requested Variation Proposals and subject to the CM’s agreement under Clause 11.8 of the General Conditions of Contract.

2. The proposed modifications shall comply with all the requirements as specified in Worksections APE3 and APE4 of this Appendix.

SUBMISSIONS

APE3.A110.8  SUBMISSIONS - GENERALLY

Any modifications proposed by the Contractor shall be submitted in accordance with Clause 11.8(2) of the General Conditions of Contract. Submit with the proposal a report identifying the principles of any proposed structural modifications which shall be prepared by a Registered Structural Engineer registered with the Buildings Department.
APE4  

ACCEPTANCE CRITERIA FOR PROPOSED MODIFICATIONS TO DESIGN AND/OR SPECIFICATION FOR DOMESTIC BLOCKS

DESIGN AND/OR SPECIFICATION

APE4.A010.8  
COMPLIANCE WITH REGULATIONS

1. Any permitted modifications to design and/or Specification for domestic blocks including any incidental structural design modifications proposed by the Contractor in tender stage, and any modifications to design and/or Specification for domestic blocks proposed by the Contractor in post-contract stage after the notified date for commencement of the Works shall comply with the Hong Kong Buildings Ordinance and its subsidiary Regulations.

2. The structural design of any modifications to domestic blocks shall comply with the Building (Construction) Regulations, Codes of Practices, Practice Notes for Authorized Persons, Registered Structural Engineers and Registered Geotechnical Engineers (PNAPs), and the Hong Kong Housing Authority Specification Library, currently in use.

3. In the event that any element of the design of modifications is not covered by the requirements in the Ordinance, Regulations and documents specified in sub-clauses (1) and (2) above or any British Standards, when instructed by the CM, the Contractor shall demonstrate by design calculation or experiment at his own expense the suitability of any such element to comply with any other proposed standard.

CONSTRUCTION

APE4.A110.8  
INSPECTION OF WORK

Any proposal that may require the CM or his representative to carry out inspection of any work outside normal office hours will not be considered.

APE4.A120.8  
OPENINGS THROUGH STRUCTURAL MEMBERS

Ensure that all proposed modifications allow for all openings, sleeves, etc., through structural members as shown in the Contract drawings or where necessary.

APE4.A130.8  
INSTALLATION OF CONCEALED SERVICES

Ensure that all proposed modifications allow for installation of all concealed building services provisions in concrete, brickwork and blockwork where required under the Contract.
ACCEPTABILITY OF STRUCTURAL MODIFICATIONS

APE4.A210.8 CONDITIONS OF ACCEPTABILITY
The following clauses in this sub-section are subject to all the conditions stated elsewhere in the Appendix.

APE4.A220.8 REDESIGN OF FOUNDATIONS
Redesign of the foundation is not permitted.

APE4.A230.8 STRUCTURAL MEMBER SIZES
Reduction to structural member sizes is not permitted. Increase to structural member sizes shall be subject to Approval.

APE4.A240.8 CONCRETE DESIGN
Change to lower concrete grades and/or smaller concrete covers to reinforcing bars are not permitted.

APE4.A250.8 REINFORCEMENT DESIGN
Modification to reinforcement design, except to suit any permitted modification to structural concrete design, is not permitted.

APE4.A260.8 USE OF FABRIC REINFORCEMENT
Fabric reinforcement may be substituted for bar reinforcement providing that the fabric reinforcement complies with all requirements of the Specification. In the event that a change to design is required to suit a proprietary mesh, the cross sectional area of the reinforcement in the fabric shall not, in any location, be less than the designed area of steel/m² for bar reinforcement for that location.

APE4.A270.8 PRECAST CONCRETE STAIRS
Where a staircase flight is required to be constructed as precast concrete, a redesign of the staircase flight to insitu concrete is not permitted. However, modifications to the joints between the precast concrete flight and the insitu concrete landing may be made but such modifications will be subject to Approval.

APE4.A280.8 NON-STRUCTURAL CONCRETE ELEMENTS
In accordance with CON4.M010 to CON4.M030, non-structural concrete elements which are not shown on the Structural Framing Plans may be substituted with precast concrete providing that such precast concrete complies with all requirements of the Specification.

ACCEPTABILITY OF ARCHITECTURAL MODIFICATIONS

APE4.A310.8 CONDITIONS OF ACCEPTABILITY
The following clauses in this sub-section are subject to all the conditions stated elsewhere in this Appendix.
APE4.A320.8  FLOOR LAYOUTS AND ELEVATIONS

Unless otherwise specified in the Contract, modification to floor layouts and elevations is not permitted.

APE4.A330.8  MODIFICATIONS TO BUILDING STRUCTURE

Internal non-structural walls may be constructed as a later separate operation, and may be constructed of precast concrete, or solid concrete blocks plastered both sides. For any proposed design changes to internal non-structural walls provide at least the same performance standards as the walls shown on the tender drawings.

APE4.A340.8  UTILITY SERVICE ROOMS

Notwithstanding the provisions of Item APE4.A330 above, no modification or change to utility service rooms will be permitted.

APE4.A350.8  RENDER COAT TO WALLS

For domestic blocks, all walls receiving a tile or paint finish include a 10 mm render coat unless otherwise specified. Under no circumstances is this render coat to be omitted. Pay special attention to spatterdash in accordance with the Specification to ensure adequate key for this render coat.

APE4.A360.8  CONCEALMENT OF ELECTRICAL WIRING

For domestic blocks, electrical wiring is all by concealed conduit in walls and slabs and shall comply with the requirements of the Code of Practice for the Electricity (Wiring) Regulations published by the Electrical and Mechanical Services Department. No modifications to the layout will be permitted without prior Approval.

APE4.A370.8  EXTERNAL BUILDING FEATURES

Do not omit any external building features. Any non-structural external elements may be constructed later as a separate operation.

APE4.A380.8  DIMENSIONS OF OPENINGS

Do not vary the dimensions shown on the tender drawings for all doors, windows and other openings.

APE4.A390.8  MONOLITHIC SLAB AND SCREED FINISH

Monolithic slab and screed finish is acceptable subject to the following conditions:

1. Floor level and falls being maintained as shown on the tender drawings;

2. The removal of any stains, marks, scratches or foreign matter left on the cast floors and making good to the satisfaction of the CM. Should there be any floors which, in the opinion of the CM, were not properly prepared or which were left with a bowed floor surface with a surface which is excessively marked, cut back the entire floor surface by 25 mm and lay a 25 mm cement sand screeding at no extra cost; and

3. Permission to use a monolithic floor finish will be withdrawn should the CM consider, at any time, that the general standard of floor finish is unacceptable. No monetary claims whatsoever will be entertained or extensions of time granted in the event of such a withdrawal of permission.

INTRODUCTION

1. FORMAT: This Schedule is prepared as an Appendix so that it is in a convenient form to use as a reference document by those concerned with site quality control during the construction stage of HKHA projects. However the Schedule is divided into the same Worksections as those used in the main body of the Specification; this facilitates easy division and attachment to Specification Worksections by main contractors for sub-contract tendering purposes;

2. PRECEDENCE: This Schedule shall not take precedence over any conflicting or variation tolerances given in other parts of this Specification or shown on the Drawings;

3. DEFINITIONS: The following are definitions of terms used in this Schedule of Tolerances:
   a. MASTER BENCH MARK (MBM): The level datum from which all levels on site are derived;
   b. TRANSFERRED BENCH MARK (TBM): Subsidiary level datum derived from the master bench mark;
   c. BOW: Curvature of the length or width of the component expressed as a deviation from a straight line connecting the extremities;
   d. DEVIATION: Difference between a size or position (actual, limit etc) and a specified size or position;
   e. PERMISSIBLE DEVIATION (PD): Specified limit(s) of deviation;
   f. TOLERANCE: Difference between the limits within which a size or position must lie. The tolerance is an absolute value without sign but the dimension or axis is to which it applies must be stated.
TOL.BRI - BRIDGE WORKS

TOL.BRI.010.8  BRIDGE BEARINGS

1. The centreline of bridge bearings shall be within 3 mm of the specified position;
2. The level of bridge bearings shall be within 0.0001 times the adjacent span or the lesser of the adjacent spans or with 5 mm of the specified level, whichever is less;
3. The inclination of bridge bearings shall be within 1 in 200 of the specified inclination;
4. The horizontal axis of bridge bearings shall be within 0.005 radian of the specified alignment;
5. Departure from the common plane between twin or multiple bridge bearings shall be within the tolerances stated on the Drawings.

TOL.BRI.020.8  VEHICULAR PARAPETS

Vehicular parapets shall be within 10 mm of the specified position and height.

TOL.BRI.030.8  FABRICATED MOVEMENT JOINTS

The surface of fabricated movement joints shall be at least 1 mm, and not more than 3 mm, below the surrounding road surface.
TOL.BSW - WORK FOR ELECTRICAL AND MECHANICAL INSTALLATIONS

TOL.BSW.010.8  FLOORS OF SWITCHGEAR ROOMS
The tolerance in floor levels for switchgear rooms shall be as follows:
1. ±2 mm in 1000 mm for high voltage switchgear rooms;
2. ±4 mm in 1000 mm for medium voltage switchgear rooms.

TOL.BSW.020.8  LAMP STANDARDS
Lamp standards shall be within 0.1 degrees of the vertical.

TOL.COM2 - ALUMINIUM WINDOWS AND LOUVRES

TOL.COM2.010.8 DIMENSION

1. PD for peripheral dimensions:
   a. Length < 2 m: ±1.0 mm
   b. Ditto ≥ 2 m < 3.5 m: ±1.5 mm
   c. Ditto ≥ 3.5 m < 5 m: ±2.0 mm
   d. Ditto ≥ 5 m: ±3.0 mm

2. PD for step joint: +0.5 mm : 0 mm

3. PD for diagonal dimensions:
   a. Length < 2 m: ±1.5 mm
   b. Ditto ≥ 2 m < 3.5 m: ±2.5 mm
   c. Ditto ≥ 3.5 m:

4. Aluminum wall thickness:
   a. Structural members: +0.16 mm : 0 mm
   b. Non-structural members: +0.16 mm : 0 mm
   c. Glazing bead ±0.1 mm

TOL.COM2.020.8 VERTICALITY

PD from plumb in any 1.2 m length ....................... ±3 mm
TOL.COM5 - TIMBER DOORSETS

NOTE: 1. Read the tolerances given in this section in conjunction with the dimensional requirements specified in BS 4787:Part 1:1980 unless otherwise specified on the Drawings. Dimension references given in brackets relate to these used in this BS;
2. Where smoke seals are to be used, other clearance sizes and related permissible deviations between door leaf and jamb, head, transom and sill may be specified.

DOORSETS

TOL.COM5.010.8 WORKSIZES
PD from doorset worksizes specified in BS 4787:Part 1:1980:
1. Height (A2 and G2) ........................................... +2.5 mm : -2.5 mm
2. Width (B2) ..................................................... +2.5 mm : -2.5 mm

DOOR LEAVES

TOL.COM5.110.8 HEIGHT
PD for leaves in all doorsets (d3) ......................... +2.5 mm : -2.5 mm

TOL.COM5.120.8 WIDTH
PD for leaves in single or double equal leaf doorsets (e3) ................................................................. +2.5 mm : -2.5 mm

TOL.COM5.130.8 THICKNESS
PD for all leaf thicknesses (f3):
1. Internal doorsets ............................................. +1.0 mm : -2.0 mm
2. External doorsets ............................................ +1.5 mm : -1.5 mm

TOL.COM5.140.8 DOORSTOP WIDTH
1. Internal doorsets ............................................. +2.0 mm : -2.0 mm
2. External doorsets ............................................ +2.0 mm : -0 mm

TOL.COM5.150.8 REBATE DEPTH
PD (f2) ...................................................................... +1.0 mm : -1.0 mm

TOL.COM5.160.8 CLEARANCES
PD from clearances specified in BS 4787:Part 1:1980 or shown on drawings for:
1. Non fire resisting doors ...................................... +2.0 mm : -1.0 mm
2. Fire resisting doors without smoke seals ............ +1.0 mm : -0.5 mm
3. Fire resisting door with smoke seals ............... See Note 2 Above
TOL.COM5.170.8 SQUARENESS
PD when measured in accordance with BS 5278:1976 at a point 500 mm from any corner ........................................ 2.0 mm

TOL.COM5.180.8 FLATNESS
PD when measured in accordance with BS 5278:1976, due to:
1. Bending:
   a. Measured horizontally ........................................ 2.0 mm
   b. Measured vertically ........................................ 4.0 mm
2. Twisting of any corner in relation to the other three:
   a. Doors of type '2' construction .............................. 6.0 mm
   b. Doors of types '1' and '3' construction .............. 3.0 mm

TOL.COM5.190.8 SMOOTHNESS
For any door type:
1. PD in any position:
   a. When measured with a 50 mm bridge .............. 0.2 mm
   b. When measured with a 200 mm bridge ........... 1.0 mm
2. PD for doors of type '2' construction, when measured with a 200 mm bridge, at not more than 3 points along the 4 horizontal lines and 3 points along the 2 vertical lines of each face ........ 0.5 mm
3. PD for doors of type '1' and '3' construction, when measured with a 200 mm bridge, at not more than 4 points along the 2 vertical lines and 4 points along the 4 horizontal lines of each face ........................................................................................................ 0.5 mm

DOOR FRAMES

TOL.COM5.210.8 BOW
PD in the thickness of hardwood framing members in any 2 m length:
1. Member thickness ≤50 mm ................................. 2.0 mm
2. Member thickness >50 mm ................................. 6.0 mm

TOL.COM5.220.8 SPRING
PD in the width of hardwood framing members in any 2 m length:
1. Member thickness ≤100 mm ............................... 4.0 mm
2. Member thickness >100 mm ............................... 6.0 mm
## INSTALLATION OF FRAMES AND SUB-FRAMES

</tr>
<tr>
<td>&gt;3000 mm</td>
<td>±30 mm</td>
</tr>
</tbody>
</table>
TOL.CON1.130.8 VERTICALITY OF WALL AND COLUMNS

1. Plumbness in height ≤500 mm: ...................... ±10 mm
2. Ditto >500 mm ≤3000 mm: ...................... ±15 mm
3. Ditto >3000 mm ≤30 m: ...................... ±20 mm
4. >30 m: Pro-rata on ±20 mm per 30 m to the nearest 5 mm.

Note: When separated by another plane or member use the thickness of the plane or member for checking verticality.

TOL.CON1.140.8 SURFACE PROFILE OF WALLS AND SLAB SOFFITS

PD from mean of surface profile across the whole element (from extremities):

1. Surface profile ≤3000 mm: ...................... ±10 mm
2. Ditto >3000 mm ≤15 m: ...................... ±15 mm
3. Ditto >15 m: ............................................ ±20 mm

Notes: Measure deviations in two directions.

TOL.CON1.150.8 GRADUAL IRREGULARITIES

PD from 3000 mm straight edge:

1. Formwork type A: Rough board .................. ±10 mm
2. Formwork type B: Fairfaced ..................... ±10 mm

TOL.CON1.160.8 ABRupt IRREGULARITIES

Abrupt changes of a continuous finished concrete surface:

1. Formwork type A: ................................. ±4 mm
2. Formwork type B: ................................. ±3 mm

Note: This also applies to displacement of successive lifts for columns and walls within one storey height.

TOL.CON1.170.8 TWIST

The distance of any one corner from the plane containing the other three corners, i.e. a variation from the target plane:

1. For diagonal ≤3000 mm:
   a. Formwork type A: ............................... 10 mm
   b. Formwork type B: ............................... 5 mm
2. For diagonal >3000 mm ≤15 m:
   a. Formwork type A: ............................... 20 mm
   b. Formwork type B: ............................... 10 mm
3. For each further 10 m of diagonal:
   a. Formwork type A: ............................... 10 mm
   b. Formwork type B: ............................... 5 mm
TOL.CON1.180.8  SQUARENESS OF CORNERS

Where the longer of two adjacent sides is taken as the base line and the PD of the shorter side, from a perpendicular to the base line, is related to the length of the shorter side:

1. Short side ≤250 mm: .................................. ±10 mm
2. Ditto >250 mm ≤500 mm: .................................. ±10 mm
3. Ditto >500 mm ≤3000 mm: ................................. ±20 mm
4. Ditto for every additional 2500 mm (to nearest 5 mm): .................................. ±20 mm x L/3

TOL.CON1.200.8  LEVEL

PD from designed level with reference to the nearest TBM of the upper or lower surface, as may be specified of any slab or other element or component:

1. Length ≤8 m: ............................................. ±10 mm
2. Length >8 m ≤15 m: ....................................... ±15 mm
3. Length >15 m ≤30 m: .................................... ±20 mm

TOL.CON1.210.8  ITEMS CAST IN

The position of, or provision for, components fixings and holes cast in: PD from its designed position of centre line of component, fixing or hole: .......................................................... ±15 mm

LIFTWELLS

TOLERANCE

TOL.CON1.310.8  POSITION ON PLAN

Position on plan at bottom of well of any point of each wall. PD of internal face from the designed position in relation to the nearest parallel reference line at the same level (distance between the two points being not more than 15 m): .......................................................... ±10 mm

TOL.CON1.320.8  STRUCTURAL LIMITS OF WELL ACCURACY AT ANY LEVEL

Comply with Section 3 of BS 5655:Part 6:1990 including Table 1 which is extended as follows:

<table>
<thead>
<tr>
<th>TABLE 1 Limits of accuracy of well plumb dimensions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Well height (m)</td>
</tr>
<tr>
<td>-----------------</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>1.  ≤30</td>
</tr>
<tr>
<td>2.  &gt;30 ≤60</td>
</tr>
<tr>
<td>3.  &gt;60 ≤90</td>
</tr>
</tbody>
</table>
Read Table 1 in conjunction with figure 1 of Section 3 of BS 5655.

TOL.CON1.330.8 LANDING DOOR OPENINGS

1. Position of landing door openings in relation to design position: ........................................... ±15 mm

Note: It is important that landing doors come one above another PD of actual centre line of structural opening (to receive lift doors) from the design position.

2. Plumbness of jamb: PD from the vertical:
   a. For every 1000 mm of height: ..................... ±5 mm
   b. Up to a maximum of: ......................... ±15 mm

TOL.CON1.340.8 ABRUPT IRREGULARITIES OF WALLS

Abrupt changes of inner surfaces of walls: ......................................................... Not to exceed 5 mm

INSITU STAIRS (FLIGHT FROM LANDING TO LANDING)

TOL.CON1.410.8 POSITION ON PLAN

PD on plan of any point in relation to the nearest reference point at the same level, the distance between the points being no more than 15 m:

................................................................. ±15 mm

TOL.CON1.420.8 LENGTH

Length on plan of clear span (excluding landings): ........................................... ±15 mm

TOL.CON1.430.8 WIDTH OF FLIGHT

................................................................. ±10 mm

TOL.CON1.440.8 HEIGHT

Vertical height measured between either top surfaces or soffit surfaces of any flight of stairs: ........................................... ±15 mm

TOL.CON1.450.8 WAIST THICKNESS

Thickness of waist measured at right angles to the slope of the flight: ......................... ±10 mm

TOL.CON1.460.8 RISE

Difference in the rise of two consecutive steps:

................................................................. ±5 mm
### APPENDIX H - SCHEDULE OF TOLERANCES

## OPENINGS (EXCLUDING LIFT OPENINGS) - BLOCK TYPES EXCEPT HARMONY

### TOL.CON1.710.8 DOOR, WINDOW AND OTHER OPENINGS

Width and height:

1. $\leq 500$ mm: .................................................. ±15 mm
2. $>500$ mm $\leq 3000$ mm: .................................. ±20 mm

### TOL.CON1.720.8 PLUMBNESS OF JAMBS

PD from the vertical:

1. For every 1000 mm of height: ......................... ±5 mm
2. With a maximum of: ........................................ ±15 mm

### TOL.CON1.730.8 LEVEL OF SILL OR SOFFIT

PD:

1. For every 1000 mm of length: ......................... ±5 mm
2. With a maximum of: ........................................ ±15 mm

### OVERALL DIMENSIONS OF A CONCRETE FRAMED BUILDING

#### TOL.CON1.810.8 LENGTH AND WIDTH

1. $\leq 15$ m: .......................................................... ±25 mm
2. $>15$ m $\leq 30$ m: ............................................... ±50 mm
3. Each subsequent 30 m: ........................................ ±20 mm

Note: Measure dimensions at lowest floor level or, if not practicable, as otherwise specified or agreed.

#### TOL.CON1.820.8 HEIGHT

To structural roof level with reference to the TBM:

1. $\leq 30$ m: .......................................................... ±40 mm
2. Each subsequent 30 m: ........................................ ±15 mm
TOL.CON2 - FORMWORK

# TOL.CON4 - PRECAST CONCRETE

## TOL.CON4.010.8 ALL ELEMENTS (UNLESS OTHERWISE SPECIFIED)

1. Length up to 2000 mm: ............................................... ±6 mm
2. Width or height up to 250 mm: ......................... ±4 mm
3. Thickness or depth up to 500 mm: ...................... ±6 mm

## STAIRS TO STANDARD DOMESTIC (FLIGHT FROM LANDING TO LANDING)

### TOL.CON4.110.8 POSITION ON PLAN

PD on plan of any point in relation to the nearest reference point at the same level, the distance between the points being not more than 15 m: ...

................................................................. ±10 mm

### TOL.CON4.120.8 LENGTH

Length on plan of clear span (excluding landings): .................................................. ±12 mm

### TOL.CON4.130.8 WIDTH OF FLIGHT

................................................................. ±6 mm

### TOL.CON4.140.8 HEIGHT

Vertical height measured between either top surfaces or soffit surfaces of any flight of stairs:

................................................................. ±10 mm

### TOL.CON4.150.8 WAIST THICKNESS

Thickness of waist measured at right angles to the slope of the flight: .............................. +6 mm : -3 mm

### TOL.CON4.160.8 RISE

Difference in the rise of two consecutive steps:

................................................................. ±5 mm

### TOL.CON4.170.8 GOING

Difference in width of tread of two consecutive steps:

................................................................. ±8 mm

### TOL.CON4.180.8 TREAD LEVEL

Difference in level of tread:

1. Across the going: .............................................. ±4 mm
2. Across width of stair: ........................................... ±5 mm
TOL.CON5 - PRECAST FACADE UNITS

CASTING FACADE UNITS

TOL.CON5.010.8 DEVIATIONS FROM DESIGN DIMENSIONS

Manufacture the facade units within the dimensional tolerances set out below:

1. Length and height:
   a. Up to 2 m: ................................................. +0 : -3 mm
   b. 2 m to 3 m: ................................................. +0 : -6 mm
   c. 3 m to 4.5 m: ............................................. +0 : -9 mm
   d. 4.5 m to 6 m or more: ................................. +0 : -12 mm

2. Thickness:
   a. Up to 500 mm: ........................................... +6 mm : -3 mm
   b. 500 mm to 750 mm: ...................................... +8 mm : -5 mm

3. Straightness or bow (deviation from intended line):
   a. Up to 3 m: ............................................... 6 mm
   b. 3 m to 6 m: ............................................... 9 mm
   c. 6 m to 12 m: .............................................. 12 mm

TOL.CON5.020.8 SQUARENESS

When assessing the squareness of a corner:

1. Take the longer of the two adjacent sides being checked as the base-line;

2. Ensure that the shorter side does not vary in its distance from a perpendicular so that the difference between the greatest and shortest dimensions exceeds:

   Length of shorter sides:
   a. Up to and including 1000 mm: ......................... 3 mm
   b. Over 1000 mm to 2000 mm: ............................. 5 mm
   c. Over 2000 mm: .......................................... 6 mm

TOL.CON5.030.8 TWIST

Ensure that no corner is more than the dimension stated from the plane containing the other three corners:

1. Up to and including 3 m: ...................... 6 mm
2. Over 3 m to 6 m: .................................. 9 mm
3. Over 6 m to 12 m: ............................. 12 mm
TOL.CON5.040.8  POSITION OF CAST-IN WINDOW FRAMES
PD from design dimensions on plan:  ..................  ±6 mm

INSTALLING FACADE UNITS

TOL.CON5.110.8  ERECTION TOLERANCES

1. Install the facade units within the erection tolerances set out below:
   a. Horizontal position:  In x and y directions:
      ..........................................................  ±5 mm
   b. Plumb: per element:  ..................................  ±6 mm
   c. Width of joint:  On a nominal joint of 20 m:
      ..........................................................  ±5 mm

2. In addition, respect the prescribed dimensions for height, width and length, of the completed building to within 0.1%;

3. Respect the theoretical line, both horizontal and vertical, with the same tolerance of 0.1%, for each storey when seen from the front. Deviations in profile must not exceed ±10 mm.
TOL.CON7 - PRECAST CONCRETE COMPONENTS

CASTING FACADE AND PRECAST CONCRETE WALL UNITS

TOL.CON7.010.8 DEVIATIONS FROM DESIGN DIMENSIONS

Manufacture the facade and precast concrete wall units within the dimensional tolerances set out below:

1. Length and height:
   a. Up to 2 m: ........................................ +3 mm : -3 mm
   b. 2 m to 3 m: ........................................ +6 mm : -6 mm
   c. 3 m to 4.5 m: ........................................ +9 mm : -9 mm
   d. 4.5 m to 6 m or ore: .............................. +10 mm : -12 mm

2. Thickness:
   a. Up to 500 mm: ................................. +6 mm : -3 mm
   b. 500 mm to 750 mm: ......................... +8 mm : -5 mm

3. Straightness or bow (deviation from intended line):
   a. Up to 3 m: ........................................ 6 mm
   b. 3 m to 6 m: ........................................ 9 mm
   c. 6 m to 12 m: ..................................... 12 mm

TOL.CON7.020.8 SQUARENESS

When assessing the squareness of a corner:

1. Take the longer of the two adjacent sides being checked as the base-line;

2. Ensure that the shorter side does not vary in its distance from a perpendicular so that the difference between the greatest and shortest dimensions exceeds:

   Length of shorter sides:
   a. Up to 1000 mm: ....................... 3 mm
   b. Over 1000 mm to 2000 mm: .............. 5 mm
   c. Over 2000 mm: ............................... 6 mm
APPENDIX H - SCHEDULE OF TOLERANCES

TOL.CON7.030.8 TWIST

Ensure that no corner is more than the dimension stated from the plane containing the other three corners:

1. Up to and including 3: ........................................... 6 mm
2. Over 3 to 6: .............................................................. 9 mm
3. Over 6 to 12: ......................................................... 12 mm

TOL.CON7.040.8 POSITION OF CAST-IN WINDOW FRAMES

PD from design dimensions on plan: ................. ±6 mm

TOL.CON7.110.8 ERECTION TOLERANCES

1. Install the facade and precast concrete wall units within the erection tolerances set out below:

   a. Horizontal position: In x and y directions: ............................................................ ±5 mm
   b. Plumb: per element: ...................................................... ±6 mm
   c. Width of joint: On a nominal joint of 20 mm: ................................................... ±5 mm

2. In addition, respect the prescribed dimensions for height, width and length, of the completed building to within 0.1%;

3. Respect the theoretical line, both horizontal and vertical, with the same tolerance of 0.1%, for each storey when seen from the front. Deviations in profile must not exceed ±10 mm.

TOL.CON7.210.8 STAIRS TO STANDARD DOMESTIC (FLIGHT FROM LANDING TO LANDING)

1. POSITION ON PLAN

PD on plan of any point in relation to the nearest reference point at the same level, the distance between the points being not more than 15: .......................................................... ±10 mm

2. LENGTH

Length on plan of clear span (excluding landings): .................................................... ±12 mm

</tr>
<tr>
<td>3. Ditto &gt;15 m:</td>
<td>±20 mm</td>
</tr>
</tbody>
</table>

Note: Measure deviations in two directions.
TOL.CON8.060.8 TWIST

The distance of any one corner from the plane containing the other three corners, i.e., a variation from the target plane:

1. For diagonal \( \leq 15 \text{ m} \): ........................................ 20 mm
2. For each further 10 m of diagonal: ........................................ 10 mm

TOL.CON8.070.8 SQUARENESS OF CORNERS

Where the longer of two adjacent sides is taken as the base line and the Permissible Deviation (PD) of the shorter side, from a perpendicular to the base line, is related to the length of the shorter side:

1. Short side \( \leq 3000 \text{ mm} \): ........................................ \( \pm 20 \text{ mm} \)
2. Short side for every additional 2500 mm (to nearest 5 mm): ........................................ \( \pm 20 \text{ mm} \times \text{L/3} \)

TOL.CON8.080.8 LEVEL

Permissible Deviation (PD) from designed level with reference to the nearest Transferred Bench Mark (TBM) of the upper or lower surface, as may be specified of any slab or other element or component:

Length \( \leq 8 \text{ m} \): ........................................ \( \pm 10 \text{ mm} \)
Length \( >8 \text{ m} \leq 15 \text{ m} \): ........................................ \( \pm 15 \text{ mm} \)
Length \( >15 \text{ m} \leq 30 \text{ m} \): ........................................ \( \pm 20 \text{ mm} \)

OVERALL TOLERANCES - LIFTWELLS

TOLERANCE

TOL.CON8.110.8 POSITION ON PLAN

Position on plan at bottom of well of any point of each wall. Permissible Deviation (PD) of internal face from the designed position in relation to the nearest parallel reference line at the same level (distance between the two points being not more than 15 m): ........................................ \( \pm 10 \text{ mm} \)

TOL.CON8.120.8 STRUCTURAL LIMITS OF WELL ACCURACY AT ANY LEVEL

Comply with Section 3 of BS 5655:Part 6:1990 including Table 1 which is extended as follows:

<table>
<thead>
<tr>
<th>Well height (m)</th>
<th>Limits of accuracy (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>+</td>
</tr>
<tr>
<td>1. ( \leq 30 )</td>
<td>25</td>
</tr>
<tr>

<td>35</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>3.</td>
<td>&gt;60 ≤90</td>
</tr>
<tr>
<td>4.</td>
<td>&gt;90</td>
</tr>
</tbody>
</table>

Read Table 1 in conjunction with figure 1 of Section 3 of BS 5655.

**TOL.CON8.130.8 LANDING DOOR OPENINGS**

1. Position of landing door openings in relation to design position: .......................................................... ±15 mm

   Note: It is important that landing doors come one above another Permissible Deviation (PD) of actual centre line of structural opening (to receive lift doors) from the design position.

2. Plumbness of jamb: Permissible Deviation (PD) from the vertical:
   a. For every 1000 mm of height: .................... ±5 mm
   b. Up to a maximum of: .............................. ±15 mm
TOL.DRA1 - DRAINAGE ABOVE GROUND

TOL.DRA1.010.8 VERTICALITY

PD of pipes from plumb when measured with a 1.2 m straight edge ................................................. ±3 mm
TOL.DRA2 - DRAINAGE BELOW GROUND

PIPETINES (EXCLUDING TERMINATION PIPES)

TOL.DRA2.010 GRAVITY PIPELINES
PD from lines and levels shown on the Drawings:
1. Line ................................................................. ±20 mm
2. Invert level (providing there is no backfall at any point) ........................................... +6 mm : -6 mm

TOL.DRA2.020 PRESSURE PIPELINES
PD from lines and levels shown on the Drawings:
1. Line ................................................................. ±50 mm
2. Invert level ........................................................ ±20 mm

TERMINATION PIPES

TOL.DRA2.110 TERMINATION PIPES
PD for termination pipes which are designed to connect to pipes and fittings laid by others from the positions, gradients and levels shown on the Drawings:
1. Position of the centre of the termination face in the longitudinal direction ................. ±10 mm
2. Position of the centre of the termination face in the lateral direction .......................... ±3 mm
3. Gradient ............................................................ ±0.5°
4. Invert level of the termination face ............ ±3 mm

MANHOLES

TOL.DRA2.210 MANHOLE COVERS
PD from specified level unless a more accurate level is defined for adjacent surfaces in this schedule:
1. Concrete road ..................................................... +10 mm : -0 mm
2. Bituminous paving ............................................... +5 mm : -0 mm
3. Paving blocks, tiles or granolithic finish on soft base ...................................................... +10 mm : -0 mm
4. Paving blocks, tiles or granolithic finish on hard base .................................................... +5 mm : -0 mm
TOL.EAR1 - EXCAVATION AND FILLING

EARTHWORKS FINAL SURFACE TOLERANCES

TOL.EAR1.010.8  GENERAL
1. Keep earthworks final surfaces and formations within the tolerances of the specified lines and levels tabulated in TOL.EAR1.020, TOL.EAR1.030 and TOL.EAR1.040 below;
2. The tolerances for formations do not apply to pipes or preformed structures which require to be supported over their complete length or area;
3. Excavation: A positive (+) tolerance refers to insufficient excavation and a negative (-) tolerance refers to excess excavation;
4. Filling: A positive (+) tolerance refers to excess fill material and a negative (-) tolerance refers to insufficient fill material.

TOL.EAR2 - BLASTING

PRE-SPLIT BLASTING

TOL.EAR2.010.8 FINAL SURFACE TOLERANCES

A tolerance of +100 - 200 mm from the design profile.

Notes:
1. Redrill any pre-split hole which, before firing, is found to be outside this tolerance;
2. A positive (+) tolerance refers to insufficient blasted material and a negative (-) tolerance refers to excess blasted material.
APPENDIX H - SCHEDULE OF TOLERANCES

TOL.EXT1 - SUB-BASES, BITUMINOUS ROADWAYS AND RELATED FOOTPATHS

TOL.EXT1.010.8 ALIGNMENT
PD of edgelines from the dimensions indicated on the Drawings:
1. Generally ................................................................. +25 mm : -25 mm
2. Adjacent edges of structure ......................................... +6 mm : -6 mm

TOL.EXT1.020.8 MEASUREMENT OF LEVELS
Determine the levels of the surface of each layer of sub-base, roadbase, base course, wearing and friction courses on a grid at 10 m centres in the longitudinal direction and at 2 m centres in the transverse direction.

TOL.EXT1.030.8 TOLERANCES IN LEVELS FOR EACH TYPE OF LAYER
PD from the level of the surface of each layer of sub-base, roadbase base course, wearing and friction courses:
1. Sub-base .......................................................... +10 mm : -20 mm
2. Road-base course ............................................... +8 mm : -15 mm
3. Base course ...................................................... +6 mm : -6 mm
4. Wearing course .................................................. +6 mm : -6 mm
5. Friction course ................................................... +6 mm : -6 mm

TOL.EXT1.040.8 SURFACE LEVELS AT JOINTS
PD in level of the surface of wearing course and friction course across joints ........................................ 3 mm

TOL.EXT1.050.8 COMBINATION OF TOLERANCES
Maximum reduction in thickness from specified thickness:
1. Pavement (excluding sub-base) ......................... 15 mm
2. Bituminous wearing course ................................. 5 mm

TOL.EXT1.060.8 LEVELS OF GULLY GRATINGS
PD of gully frame from level of adjacent finished surface .......................................................... +0 mm : -5 mm

TOL.EXT1.070.8 LEVELS OF COVERS, FRAMES AND OTHER HARDWARE
PD of hardware from level of adjacent finished surface ................................................................. +5 mm : -0 mm
<table>
<thead>
<tr>

**APPENDIX H - SCHEDULE OF TOLERANCES**

**TOL.EXT1.080.8  SURFACE REGULARITY**

Limits of irregularity as specified in EXT1.T610 and EXT1.T620 ................................................................. - : -
TOL.EXT2 - CONCRETE CARRIAGeways

**TOL.EXT2.010.8 STRAIGHT ALIGNMENT**

1. PD of best fit straight line of straight joints and of straight edges from that shown on the Drawings
   ........................................................................................................... +25 mm : -25 mm
2. PD of line of straight joints and straight edges from the best fit straight line ..................... +10 mm : -10 mm

**TOL.EXT2.020.8 CURVED ALIGNMENT**

1. PD of the best fit curved line of curved joints and of curved edges from that Approved and shown on the Drawings ........................................ +25 mm : -25 mm
2. PD of line of curved joints and curved edges from the best fit curved line ......................... +10 mm : -10 mm

**TOL.EXT2.030.8 ALIGNMENT OF JOINTS**

PD of joint continuity across intersections of joints from the best fit straight lines or best fit curved line of each joint ............................................................... +5 mm : -5 mm

**TOL.EXT2.040.8 LEVEL OF SUB-BASE**

PD from level shown on Drawings ......................... +10 mm : -20 mm

**TOL.EXT2.050.8 FORMWORK**

1. PD of line of formwork from that shown on Drawings .................................................................. +10 mm : -10 mm
2. PD of level of formwork from that shown on Drawings .................................................................... +3 mm : -3 mm
3. PD of abrupt irregularities in line and level of formwork .......................................................... 3 mm

**TOL.EXT2.060.8 COVER TO REINFORCEMENT**

PD from cover specified or shown on Drawings ........................................................................... +10 mm : -10 mm

**TOL.EXT2.070.8 DOWEL BARS**

1. PD of dowel bars at joints from mid-depth of slab ........................................................................ +20 mm : -20 mm
2. PD of half the length of dowel bars from parallel to:
   a. The longitudinal joint or axis of the carriageway where there is no longitudinal joint ................................................................. 3 mm
   b. The top surface of the slab .................................................. 3 mm
   c. Adjacent dowel bars .................................................. 3 mm
**APPENDIX H - SCHEDULE OF TOLERANCES**

**APH > TOL.EXT2 - CONCRETE**

**TOL.EXT2.080.8 GROOVE DEPTH**

PD of groove depth from that shown on the Drawings unless otherwise recommended by the sealant manufacturer ........................................... +3 mm : -3 mm

**TOL.EXT2.090.8 LEVELS**

When the levels of the concrete carriageway are determined 200 mm from the edges of each bay, at 10 m centres in the longitudinal direction and 2 m centres in the transverse direction:

1. PD of surface fall from that shown on Drawings .......................... (Providing that falls shall always be in the specified direction without backfall). +6 mm : -6 mm $3$ mm

2. Maximum difference in level across joint ............

**TOL.EXT2.100.8 SLAB THICKNESS**

PD from specified thickness ........................................... - : -10 mm

**TOL.EXT2.110.8 LEVEL OF COVERS, FRAMES AND OTHER HARDWARE**

PD from surface of adjacent carriageway ............... +0 mm : -3 mm

Surface regularity: The tolerances specified in this section should be read in conjunction with the compliance criteria for surface regularity specified in EXT2 TESTING.
TOL.EXT3 - PATHS AND PAVED AREAS

MATERIALS

TOL.EXT3.010.8 INTERLOCKING CONCRETE BLOCKS
PD on size .................................................. +3 mm : -3 mm

TOL.EXT3.020.8 PRECAST CONCRETE PAVING SLABS
PD as defined at 11.2.1 of BS 7263:Part 1:1994 measured in accordance with Annex A to this BS:
1. Thickness .................................................. +3 mm : -3 mm
2. Length and width ....................................... +2 mm : -2 mm
3. Squareness on plan (difference between diagonals) according to flag type defined in BS:
   a. Flag types A, B, C and D; 6 mm
   b. Flag types E, F and G. 3 mm
4. Flatness, winding and bowing:
   a. Measured over 550 mm to 850 mm; +2 mm : -2 mm
   b. Measured over 250 mm to 400 mm. +1 mm : -1 mm

TOL.EXT3.030.8 CLAY PAVERS
Limits of overall measurement defined in Table 2 of BS 6677:Part 1:1986. - : -

WORKMANSHIP

TOL.EXT3.110.8 INTERLOCKING CONCRETE BLOCKS, PRECAST CONCRETE PAVING SLABS AND CLAY PAVERS
1. PD from surface level specified ......................... +3 mm : -3 mm
2. PD between adjacent slabs ................................ 2 mm
3. PD of drainage channels and gratings from level of adjacent finished surface ............................ +0 mm : -5 mm
4. PD of covers, frames and other hardware from level of adjacent finished surface ....................... +5 mm : -0 mm

TOL.GIN - GROUND INVESTIGATION, INSTRUMENTATION AND SOIL TESTING

TOL.GIN.010.8 DEPTHS OF EXPLORATION

1. A tolerance of ±100 mm in length will be permitted on the drilled length of a drill hole;

TOL.GIN.020.8 VERTICAL TOLERANCE

1. No nominally vertical hole shall deviate from the vertical direction by more than 1% of the vertical depth below ground level except that in underwater boreholes or underwater drillholes the tolerance shall be 5%;

2. For inclined drillhole, the inclination shall not deviate from the instructed inclination by more than 2° throughout the length of the hole;

3. Where required by the CM, the verticality and inclination of any hole shall be measured by an approved method.
TOL.GWD - GROUND WATER DRAINAGE AND CONTROL

TOL.GWD.010.8 DRILLING

1. The drillhole entry point shall be positioned within a tolerance of ±75 mm. Deviation in alignment shall not exceed 1 in 20. Deviation from straight shall not exceed 20 mm in any 3 m length of drillhole.
TOL.MAR - MARINE WORKS

TOL.MAR.010.8 DREDGING
The final surface of dredging shall be within 300 mm of the specified surface.

TOL.MAR.020.8 DEPOSITION OF FILL MATERIAL
1. The final surface of deposition and compaction of fill material, measured perpendicular to the specified surface, shall comply with the following requirements:
   a. Top surfaces to receive levelling stones shall not be more than 75 mm above, and not more than 250 mm below, the level shown on the Drawings;
   b. Top surfaces of levelling stones shall be within 25 mm of the specified surface for foundations of structures and shall be within 50 mm of the level shown on the Drawings for submarine outfalls;
   c. Other top surfaces shall be within 250 mm of the level shown on the Drawings;
2. There shall be no abrupt change in level of the finished surface of reclamation and levelling stones.

TOL.MAR.030.8 PRECAST CONCRETE SEAWALL BLOCKS AND COPINGS
Precast concrete seawall blocks and copings shall be within 25 mm of the position shown on the Drawings. The gaps between adjacent blocks and between successive layers of blocks shall not exceed 20 mm.

TOL.MAR.040.8 TIMBER FENDERING SYSTEMS
1. The dimensions of members of timber fendering systems shall be within 5 mm of the dimensions shown on the Drawings;
2. The levels and positions of timber fendering systems shall comply with the following requirements:
   a. The top level of blocks for landings and steps shall be within 5 mm of the level shown on the Drawings;
   b. The top level of other members shall be within 10 mm of the level shown on the Drawings;
   c. The horizontal position perpendicular to the berthing face of the fendering system shall be within 10 mm of the position shown on the Drawings;
   d. The horizontal position parallel to the berthing face of the fendering system shall be within 25 mm of the position shown on the Drawings.

TOL.MAR.050.8 RUBBER FENDERS
1. The dimensions of rubber fenders and bolt holes shall comply with the following requirements:
   a. The bolt hole diameter shall be within 2 mm of the diameter shown on the Drawings;
   b. The bolt pitch shall be within 4 mm of the pitch shown on the Drawings;
   c. The height, length and width of rubber fenders shall be within +4% and -2% of the dimensions shown on the Drawings;
d. The thickness of fender sections shall be within +8% and -5% of the thickness shown on the Drawings;

2. The positions of rubber fenders shall comply with the following requirements:
   a. The centrelines shall be within 25 mm of the positions on the face of the supporting structures shown on the Drawings;
   b. The inclination shall not deviate by more than 1 in 50 from the inclination shown on the Drawings.

TOL.MAR.060.8 SUBMARINE OUTFALLS

1. The horizontal alignment of submarine pipelines shall be within 250 mm of the alignment shown on the Drawings;

2. The invert level of submarine outfalls shall be within 50 mm of the level shown on the Drawings;

3. There shall be no abrupt change in alignment or level of the submarine outfall.
# TOL.MAS1 - BRICKWORK, BLOCKWORK AND PANEL PARTITIONS

## BRICKWORK

APPENDIX H - SCHEDULE OF TOLERANCES

TOL.MAS1.180.8 SETTING-OUT OF PRE-INSTALLED JUNCTION/BS 4662 BOXES ON WALLS

The deviation of the installed position of pre-installed junction/BS 4662 boxes from the specified position as shown on the Drawings with the following considerations:

1. In general, the sockets outlets and lighting switches etc. shall be at the same level in the same room. PD for vertical levels of boxes designed at the same level on the same panel wall: .............................. ±3 mm

2. The installed position of boxes after taking the above tolerance into consideration shall not contravene the requirements of the position of switches/sockets as stipulated in the Design Manual - Barrier Free Access 1997; nor have conflict with other installations such as skirting, door frame, etc.;

3. Deviations exceeding the tolerance under special site condition shall be subject to the approval of the CM.

OPENINGS IN BRICKWORK, BLOCKWORK AND PANEL PARTITIONS

TOLERANCE

TOL.MAS1.210.8 OPENINGS FOR DOORS, WINDOWS ETC.

PD in height and width .............................. ±10 mm

MANUFACTURING OF PANEL WALL PARTITIONS

Note: The tolerance on the verticality is measured in relation to the true vertical from the base of the wall and is not cumulative.
TOL.MAS2.370.8  WINDOW AND DOOR OPENINGS

1. Width along wall: PD up to 3 m .......................... ±6 mm
2. Height: PD up to 3 m ........................................... ±6 mm
TOL.MEW - METALWORK

TOL.MEW.010.8  GENERAL

Handrailing, ladders, stairs and flooring shall comply with the following requirements:

1. The position and height of handrailing shall be within 10 mm of the specified position and height;

2. The level of the top rung of ladders and the top tread of stairs shall be within 75 mm of the specified level;

3. The level of flooring and curbs shall be within 3 mm of the specified level.
TOL.MRY - MASONRY WALLING

TOL.MRY.010.8 GENERAL

1. Rubble stone walling shall comply with the following requirements:
   a. The position on plan shall be within 25 mm of the specified position;
   b. The length shall be within 25 mm of the specified length;
   c. The height shall be within 25 mm of the specified height;
   d. The level of bed joints shall be within 25 mm of the specified level in any 5 m length;
   e. The walling shall be straight to within 25 mm in any 5 m length;
   f. The walling shall be vertical to within 20 mm in any 3 m height.

2. Ashlar stone walling shall comply with the following requirements:
   a. The position on plan shall be within 15 mm of the specified position;
   b. The length shall be within 15 mm of the specified length;
   c. The height shall be within 10 mm of the specified height;
   d. The level of bed joints shall be within 10 mm of the specified level in any 5 m length;
   e. The walling shall be straight to within 15 mm in any 5 m length;
   f. The walling shall be vertical to within 15 mm in any 3 m height.
TOL.PIL1 - PILING AND FOOTINGS

ALL PILE TYPES

TOL.PIL1.010.8 POSITION ON PLAN
Except Type 5 Piles, PD in plan of piles from their designed positions measured at the working level of the piling rig: 75 mm

TOL.PIL1.020.8 VERTICALITY
Except Type 5 Piles, PD from the vertical axis of the pile through the centroid of the cross-sections at the cut-off level to any level of the finished pile: 1 in 75

TOL.PIL1.030.8 OUT OF EXACT INCLINATION
PD from exact inclination, where specified, measured from the centre of pile: 2°

TOL.PIL1.040.8 CUT-OFF LEVELS
PD from specified top level of pile heads: +20 mm : -20 mm

TOL.PIL1.050.8 DIAMETER OF CAST INSITU PILES
Minimum proportion of specified diameter: 97%

PILE TYPES 1A AND 1B

TOL.PIL1.110.8 DIMENSIONAL ACCURACY FOR SOLID NON-CIRCULAR SECTION
PD: +6 mm : -6 mm

TOL.PIL1.120.8 DIMENSIONAL ACCURACY FOR HOLLOW CYLINDRICAL SECTION
1. External diameter: +10 mm : -6 mm
2. Internal diameter: - : -6 mm
3. Thickness: +25 mm : -6 mm

TOL.PIL1.130.8 STRAIGHTNESS
PD: 1 in 500
APPENDIX H - SCHEDULE OF TOLERANCES

TOL.PIL1.140.8 SUPERFICIAL CRACKS

Limits which may be tolerated at the discretion of the CM provided that the Contractor can prove that the cracks will not develop further:

1. Crack depth: Not deeper than: ................. 1 mm
2. Crack width: Not wider than: ................. 0.2 mm

PILE TYPE 3

TOL.PIL1.160.8 DIAMETER OF PERMANENT LINERS

Minimum proportion of specified diameter: ........

................................................. 99%

PILE TYPE 4

TOL.PIL1.210.8 STRAIGHTNESS OF COMPLETE PILE

PD from straightness of the complete pile:

1. Along a 3 m straight edge: ...................... 3 mm
2. Overall limit: .................................... 1 in 1000

PILE TYPE 5

TOL.PIL1.310.8 BORING

Do not drill holes oversize by more than: .............. 20 mm

TOL.PIL1.305.N POSITION ON PLAN

PD in plan of piles from their designed positions measured at the working level of the piling rig:

.......................................................... 15 mm

Subject to justification and Approval, the value may be increased to a value not exceeding 75 mm.

TOL.PIL1.330.8 VERTICALITY

PD from the vertical axis of the pile through the centroid of the cross-section at the cut-off level to any level of the finished pile:

1 in 100
### TOL.PLU2 - SANITARY APPLIANCES

**TOLERANCE**
TOL.PSC - PRESTRESSING CONCRETE

TOL.PSC.010.8  TOLERANCES

The lines of prestressing sheaths shall be within 5 mm of the specified line.
TOL.SLO - SLOPE TREATMENT WORKS

SOIL-CEMENT FILLING

TOL.SLO.010.8  COMPACTION

1. The tolerance on the optimum moisture content percentage shall be ±3.

SOIL NAILING

TOL.SLO.110.8  GENERAL

The installation of soil nails shall comply with the following dimensional tolerances:

1. The permitted deviation of drillholes shall be within ±2° to the specified vertical and horizontal alignments;

2. The nominal diameter of the centralizers shall not differ from the specified diameter of the drillhole by more than 10mm.
**TOL.STR1 - STRUCTURAL STEEL**

**FABRICATION OF STEELWORK**

**TOL.STR1.010.8 CRITICAL DIMENSIONS AFFECTING REPETITION OR INTERCHANGEABILITY OF UNITS**

Carry out fabrication so that the critical dimensions, when measured by a tape calibrated at 20°C, comply with the tolerances given in the Table below:

<table>
<thead>
<tr>
<th>Dimension Measured</th>
<th>Tolerance for Single Element</th>
<th>Tolerance on overall dimension of assembled system of more than one</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not exceeding 5 m</td>
<td>±3 mm</td>

<td>Exceeding 10 m but not exceeding 15 m</td>
<td>±5 mm</td>
<td>±10 mm</td>
</tr>
<tr>
<td>Exceeding 15 m</td>
<td>±10 mm</td>
<td>±10 mm</td>
</tr>
</tbody>
</table>

**TOL.STR1.020.8 DETAILED DIMENSIONS**

Comply with the fabrication tolerances in the following British Standard and Code of Practice:

1. BS 5400:Part 6:1980 for plates and sections in bridgework;
2. The Code of Practice for the Structural Use of Steel 2011 for hot rolled sections and cold rolled sections in building.

**ERECTION OF STEELWORK**

**TOL.STR1.110.8 CAST-IN FOUNDATION BOLTS**

Tilt of bolts to be not more than 1 in 40 from specified line.

**TOL.STR1.120.8 ERECTION TOLERANCES**

After lining, levelling, plumbing and making the permanent connections:

1. Level of the top of base plates and level of the lower end of vertical or raking components in a pocket: PD from specified levels: .......................... ±10 mm
2. PD from line of vertical or raking components other than portal frames:
   a. ................................................................. 1 in 600
   or
   b. From specified line in every direction: ........... 10 mm
3. PD from line of vertical or raking components in portal frames:
   a. ................................................................. 1 in 600
   or
   b. From specified line normal to the plane of the frame: ........................................  ±10 mm

4. The position and level of components connected with other components: PD from the specified position and level at point of connect: ................. 5 mm

5. The difference in level between adjacent sloping or horizontal components connected by a deck slab: PD from specified difference in level: ........  ±10 mm
TOL.STW - STEELWORK

TOL.STW.010.8  FABRICATION TOLERANCES GENERALLY
Fabrication tolerances for steelwork shall comply with BS 5950:Part 2:1992, Sub-section 7.2 as appropriate.

TOL.STW.020.8  FABRICATION TOLERANCES FOR BRIDGEWORKS
Fabrication tolerances shall comply with BS 5400:Part 6:1980, Clause 4.2.

TOL.STW.030.8  FOUNDATION BOLTS
The position of cast-in foundation bolts at the top of base plates shall be within 3 mm of the specified position. The position of foundation bolts in bolt pockets at the top of base plates shall be within 5 mm of the specified position. The line of bolts shall not be tilted from the specified line by more than 1 in 40.

TOL.STW.040.8  ERECTION TOLERANCES
After lining, levelling, plumbing and making the permanent connections, steelwork shall be erected to within the following tolerances:

1. The position in plan of vertical components at the base shall be within 10 mm of the specified position;
2. The level of the top of base plates and the level of the lower end of vertical or raking components in a pocket based shall be within 10 mm of the specified level;
3. The thickness of bedding shall be within one-third of the nominal thickness or 10 mm, whichever is less, of the specified nominal thickness;
4. The line of vertical or raking components other than in portal frames shall be within 1 in 600 and within 10 mm of the specified line in every direction;
5. The line of vertical or raking components in portal frames shall be with 1 in 600 and within 10 mm of the specified line normal to the plane of the frame;
6. The position and level of components connected with other components shall be within 5 mm of the specified position and level relative to the other components at the point of connection;
7. The position of components supported on a bearing shall be within 5 mm of the specified position relative to the bearing along both principal axes of the bearing;
8. The difference in level between adjacent slopping or horizontal components connected by a deck slab shall be within 10 mm of the specified difference in level.
TOL.WSP - WATER SUPPLY PIPEWORK

TOL.WSP.010.8 LINE AND LEVEL

The line and level of pipelines for water supply pipeworks shall be within 25 mm of the specified line and level.

DEMOLISHING STRUCTURES

GENERAL

DEMOLITION SUB-CONTRACTOR

INFORMATION ON DEMOLITION SUB-CONTRACT

In the event that parts of the demolition works are to be sub-contracted in accordance with PRE.B6.035, submit with the tender the following information:

1. Letter of intent from the proposed sub-contractor whom the tenderer intends to employ for the Contract should the tenderer be awarded the Contract, indicating his willingness to carry out the proposed parts of the demolition works;
2. The names of the directors or sole proprietor and site representatives of the proposed sub-contractor;
3. The activity and the scope of the proposed sub-contract.

CONDITIONS ON DEMOLITION SUB-CONTRACT

1. In the event that parts of demolition works are to be sub-contracted in accordance with PRE.B6.035, incorporate the following conditions into the sub-contract:
   a. The activity and the scope of the sub-contract;
   b. The sub-contractor is not allowed to sub-contract the demolition works;
   c. The sub-contractor is not allowed to sub-contract more than one tier the following works:
      i. Scaffolding;
      ii. Mechanical handling and lifting (for tower crane only);
      iii. Mechanical plant and equipment for demolition works.
   d. A probity clause shall be included in the sub-contract such that:
      "If the sub-contractor or any of his agents or employees are found to have offered or given advantage, gratuity, bonus, discount, bribe or loan of any sort to any agent or employee of the Contractor, Hong Kong Housing Authority or Housing Department, the Contractor shall at liberty forthwith terminate the employment of the sub-contractor under the sub-contract. The Contractor, Hong Kong Housing Authority or Housing Department shall hold the sub-contractor liable for any loss or damage which the Contractor, Hong Kong Housing Authority or Housing Department may thereby sustain."
2. Before execution of the sub-contract works, submit to the CM a signed copy of the sub-contract or written confirmation signed by the Contractor and the sub-contractor confirming that the conditions stated in sub-clause (1) above have been included into the sub-contract.
DESIGN

GENERAL

DEM1.D010.8 EXISTING INFORMATION
1. The information on the structure to be demolished as contained in the Contract is given in good faith and without prejudice to the Contractor's liability under the Contract;
2. The demolition plan for the preparation of the method statements, which is issued as a reference for adoption or proposed deviation as per DEM1.D220, is specified in Project Specific Specification.

DEM1.D020.8 CONTRACTOR'S RESPONSIBILITY
Accept sole responsibility for the execution of the demolition works including but not limited to the preparation of the method statements as specified in DEM1.D220 notwithstanding that such method statements may have followed the demolition plan which is for reference only.

DEM1.D030.8 STANDARDS AND STATUTORY REQUIREMENTS
1. Comply with all requirements relevant to demolition works issued by the Government of HKSAR and/or statutory authorities;
2. Where this Specification includes provisions additional to, or more stringent than those of the Building Regulations, the provisions of this Specification will prevail overall.

DEM1.D040.8 NON-COMPLIANCE
1. In the event of non-compliance with the restrictions specified regarding the method of demolition to be employed and the sequence of operations to be followed, an Instruction to cease work may be issued by the CM;
2. Bear any extra time or cost compensation in respect of or resulting from such Instruction to cease work.

DEM1.D050.8 REGISTERED STRUCTURAL ENGINEER & REGISTERED GEOTECHNICAL ENGINEER
1. Appoint a Registered Structural Engineer (RSE) registered under Buildings Department for the preparation and endorsement of the method statements, with drawings and design calculation, and any other submissions as required by this Specification;
2. The duties and roles of the RSE include but not limited to:
   a. Take up the full design responsibility for method statements and all related drawings and calculation as required under this Specification;
   b. Take up the role of Contractor's Representative and the highest grade TCP in the Contractor's Stream under SP;
   c. Check that assumptions made in the design of temporary works and method statements are validated on Site;
d. Prepare a risk assessment report with the Safety Officer including an inspection schedule for all staff such as RSE, site engineer, Safety Officer, site agent, site supervisor / foreman on all critical activities in demolition work;

e. Pay regular site visits for proper control of the works and submit reports after each visit to certify the work is safe;

f. Carry out inspection on other activities which, in his professional judgement, are critical and require close supervision.

3. The frequency of RSE's visits shall be a minimum of two visits per each month;

4. In case of change of RSE, the new RSE has to endorse and re-submit the method statements prepared by the former RSE and take up the role of Contractor's Representative and the highest grade TCP in the Contractor's Stream under SP;

5. Appoint a Registered Geotechnical Engineer (RGE) registered under Buildings Department for the preparation and endorsement of the geotechnical report / supporting documentation for the submissions as per above sub-clause (1).

SURVEY AND PREPARATORY WORK

DEM1.D110.8 SURVEY

Prior to commencement of Work,

1. Visit the Site and inspect the appropriate drawings and demolition plan as issued by the CM to ascertain the extent and scope of the demolition works required;

2. Identify demolition procedures for any unconventional structural elements.

DEM1.D120.8 EXISTING SERVICES

Before commencement of demolition works,

1. Locate and identify position of existing services affected by the works;

2. Ensure all statutory authority's installations have been safely disconnected and associated fittings and equipment have been removed;

3. Be responsible for liaison with the relevant Government Departments and utilities companies for disconnecting existing utilities and services within the Site. Allow sufficient time in the programme for the utilities and services disconnections.

DEM1.D130.8 SURVEY ON MATERIALS WITH POTENTIAL DANGER

1. Within 14 days following the notified date for the commencement of the Works, carry out survey on the presence of wastewater, hazardous materials, matters arising from toxic chemicals, etc. and possible presence of materials which can contribute to contaminations on the environment;

2. Submit method of removal for CM's approval within 14 days in case of any of these materials being identified.

DEM1.D140.8 SURVEY ON MATERIALS TO BE COLLECTED/RECYCLED

1. Carry out a survey before the demolition process to ascertain the types and quantities of materials to be collected/recycled as specified in DEM1.M025;

2. Identify also the recovery/recycling companies or organizations for recovery and recycling of the materials other than those specified in DEM1.M025;

3. Submit the survey record for CM's approval within 21 days from the notified date for the commencement of the Works.
SUBMISSIONS

DEM1.D210.8 SUBMISSIONS PRIOR TO CONSENT APPLICATION
1. Submit three sets of the following documents to CM for approval at such date which shall be a date within 14 days after the notified date for commencement of the Works and minimum 42 days before application for consent of demolition works under DEM1.D230:
   a. SP for the Contractor's Stream as specified in DEM1.W110;
   b. Method statements as specified in DEM1.D220.
2. Allow a minimum of 42 days for the first submission and a minimum of 37 days for any subsequent re-submission required for obtaining the Approval;
3. Allow sufficient time in the programme of Works for obtaining the said Approval and subsequent re-submissions.

DEM1.D220.8 METHOD STATEMENTS
1. Submit the method statements prepared and endorsed by the RSE and RGE according to DEM1.D050 for CM's approval. Details of the method statements shall be as specified in Project Specific Specification;
2. The method statements shall comply with this Specification and all statutory requirements relevant to demolition works;
3. The method statements shall also comply with the following codes:
   a. Code of Practice for Demolition of Buildings 2004 (CoPDem) issued by Buildings Department;
   b. Code of Practice for Bamboo Scaffolding Safety (CoPScaffold) issued by Labour Department;
   c. Code of Practice for Site Supervision 2009 (CoPSS) issued by Buildings Department.

DEM1.D230.8 CONSENT TO COMMENCE DEMOLITION WORKS
1. Submit the supporting documents specified in Project Specific Specification and allow a minimum of 21 days for granting the consent to commence demolition works;
2. Do not commence demolition works without a written consent from the CM and until all precautionary measures as stated in DEM1.W210 are complete.

DEM1.D240.8 COMMENCEMENT OF DEMOLITION WORKS
Notify the CM and submit Form ICU 10 after obtaining the consent and before commencing the demolition works.

DEM1.D250.8 COMPLETION OF DEMOLITION WORKS
1. For Contract without phased completion, submit Form ICU 14A to notify the CM of the completion of the demolition works as detailed in the demolition plan at least 18 days prior to the completion of the demolition works;
2. For Contract with phased completion and for each Section as per PRE.B4.080, submit Form ICU 14A to notify the CM of the completion of the demolition works as detailed in the demolition plan at least 18 days prior to the completion of the demolition works in that Section.
MATERIALS

MATERIALS ARISING FROM THE DEMOLITION WORKS

DEM1.M010.8 MATERIALS NOT REQUIRED FOR RE-USE
Unless otherwise specified at DEM1.M020, all materials arising from demolition including electric light fittings, fans, water heaters etc. and all playground equipment, which are to be removed from Site as work proceeds, are property of the Contractor.

DEM1.M020.8 MATERIALS REQUIRED BY THE AUTHORITY
Materials which are remained the property of the Authority are specified in the Project Specific Specification.

DEM1.M025.8 MATERIAL TO BE COLLECTED/RECYCLED
Materials to be collected/recycled are specified in the Project Specific Specification.

DEM1.M030.8 HARDCORE
Brick rubble or other hard materials as sub-clause (2) of EAR1.M240 arising from the demolition may be re-used as hardcore.

DEM1.M040.8 EXCAVATED MATERIALS SUITABLE FOR FILLING
1. Unless certified otherwise by the CM, all materials excavated are deemed suitable for filling purposes;
2. The CM’s decision regarding the suitability of excavated materials for filling purposes applies only to this Contract and only to the extent that such opinion is not subsequently changed.
WORKMANSHIP

GENERAL

DEM1.W010.8 SEQUENCE

1. Do not proceed with the demolition of the building and associated structures before all reusable and recyclable materials as specified in DEM1.M025 are removed from the building or the structure;

2. Unless otherwise approved by the CM, carry out demolition work on a floor to floor basis commencing at roof/top floor level as applicable;

3. Do not dismantle any existing steel props forming part of the structural strengthening works in a floor prior to the demolition of that floor;

4. Ensure all operators and workers involved understand clearly the method and sequence of demolition. Draw sketches with explanation in Chinese illustrating the work sequences and post them in a conspicuous position on Site.

DEM1.W020.8 METHODS OF DEMOLITION

1. Use only hand held equipment for the salvage of reusable and recyclable materials from structures;

2. Use of the following demolition methods will not be permitted:
   a. 'Swinging ball';
   b. 'Drop ball';
   c. 'Blasting'.

SUPERVISION

DEM1.W110.8 SUPERVISION PLAN

1. The SP shall comply in all respects with the requirements stated in the TMSP and CoPSS;

2. Complete and submit Form ICU206 for the SP for demolition works under the Contractor's Stream in accordance with TMSP, and the CoPSS;

3. The submitted SP shall include the following additional safety supervision requirements at critical stages of the works unless otherwise approved by the CM:

<table>
<thead>
<tr>
<th>Critical Stages of the Works</th>
<th>Contractors Stream</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>AS</td>
</tr>
<tr>
<td>Cantilevered Structures</td>
<td>Bi-weekly</td>
</tr>
<tr>
<td>Factory Block</td>
<td>Bi-weekly</td>
</tr>
</tbody>
</table>

Note: As specified in DEM1.D050, the RSE shall take up the role of Contractor's Representative (CR) and the highest grade TCP in Contractor's Stream under SP.
DEMOLISHING STRUCTURES

DEMI > WORKMANSHIP

DEMI.W120.8 TECHNICALLY COMPETENT PERSONS

1. Appoint TCPs under the Contractor's Stream for demolition works as per the submitted Supervision Plan required in DEMI.W110 for the duration of the Contract;

2. The appointed TCP shall oversee the entire process of demolition works and whose duties include but not limited to:
   a. Inspect precautionary measures;
   b. Ensure effectiveness of propping system;
   c. Prevent overloading of floors.

3. Post details of appointed TCPs in the specified Form ICU20 in a prominent position adjacent the Works.

DEMI.W130.8 FLAGMAN

During removal of demolition material arrange for a flagman to be in attendance at each site entrance and exit used for this purpose.

DEMI.W140.8 SITE VIDEO RECORDING SYSTEM

1. Provide, operate and maintain, including all necessary cables, wirings, lightings and other accessories, a video recording system to record the entire demolition process with the following essential features:
   a. The video cameras used in the system should be of high resolution, lowlight and colour type;
   b. Power backup should be provided to cater for accidental breakdown of the power supply to the system;
   c. Videos captured by the system shall be recorded continuously without break unless agreed by the CM; and
   d. Videos shall be captured in a format acceptable to CM.

2. Install a minimum number of video cameras per block at strategic locations as specified in Project Specific Specification. Re-locate the video cameras from time to time to suit the progress of the demolition works as instructed by the CM;

3. Securely protect the video cameras from being damaged or blocked so that the entire demolition process including movement of debris and the overall sequences of demolition can be recorded;

4. Design and construct all necessary temporary works, including any supporting frames and protections, for the video cameras and their accessories, even at high level;

5. Provide the software and hardware for CM's viewing the recorded videos and keep the videos for at least 14 days;

6. Post sufficient notices at conspicuous positions to notify the workers and staff about the purpose of video recording system in accordance with Data Protection Principles set out in the Personal Data (Privacy) Ordinance.
SAFETY AND PROTECTION

DEM1.W210.8 PRECAUTIONARY MEASURES

1. Carry out necessary surveys as the demolition proceeds to detect hazards resulting from the activities and inform the CM forthwith;

2. In the salvage of reusable and recyclable materials, do not use cutting torches until the work area is cleared of flammable materials. Maintain portable fire-suppression devices during flame-cutting operations, and maintain adequate ventilation when using cutting torches;

3. Do not commence demolition works until the following procedures and works are complete:
   a. Removal of the reusable and recyclable materials as specified in DEM1.M025 from structures;
   b. Granting of written consent by the CM as specified in DEM1.D230;
   c. Erection of hoardings, covered walkways, etc as specified in PRE.B10.710 to PRE.B10.730;
   d. Erection of shoring, strutting, protective screening etc as specified in PRE.B8.875, DEM1.W220 and DEM1.W230;
   e. Removal of all asbestos containing materials and provision of associated protective works as specified in Worksection DEM2 in individual building blocks or structures prior to the demolition of those individual building blocks or structures;
   f. Provision of water supply at points of demolition works action as specified in PRE.B8 and to CM's satisfaction;
   g. Installation of debris chutes outlet enclosures as specified in PRE.B8 and to CM's satisfaction;
   h. Disconnection and termination of all utility services as specified in DEM1.D120;
   i. Sealing all sewers and drainage connection to prevent building debris, soil and etc. from entering public sewers and drains.

DEM1.W220.8 SHORING AND STRUTTING

1. Provide, maintain, alter and adapt all temporary supports and strutting of adequate strength to support walls, floors, roofs etc and ensure safety of the public, operatives and adjoining property;

2. Submit details of the proposed methods of support designed by Registered Structural Engineer for CM's approval unless specified otherwise by the CM;

3. Remove all temporary supports on completion and make good to works disturbed.

DEM1.W230.8 PROTECTION OF ADJOINING AREAS

1. Protect adjoining areas from the risk of falling debris with a protective screen enclosure encasing the whole building to be demolished;

2. Protect adjoining areas from the risk of fire by the following:
   a. Provide and properly maintain a sufficient number of portable fire fighting appliances during the course of demolition works: minimum 1 fire extinguisher and 2 buckets of sand in each staircase on each floor;
b. Provide and maintain the water supply including the installation of water tank, pump or apparatus as necessary for sprinkling the working floor continually to suppress risk of fire when flame cutting is carried out within 5 m from the scaffolding; and

c. Provide full time supervision by a competent supervisor when flame cutting is carried out within 5 m from the scaffolding.

3. Employ a Registered Structural Engineer to prepare design and method statement for scaffolding, catch platform, covered walkway with steel catch platform, protective canopy, etc. for submission to CM's approval. Their design and construction shall include but not limited to:

a. Unless otherwise specified in Project Specific Specification, construct screen with ordinary tarpaulin sheets supported by adequately sized bamboo scaffolding or other framework and erected according to the Construction Sites (Safety) Regulations and the Code of Practice for Bamboo Scaffolding Safety (CoPScaffold);

b. i. Unless otherwise specified in Project Specific Specification, construct bamboo scaffolding in single row;

ii. Construct bamboo scaffolding in double row for the faces of the blocks as specified in Project Specific Specification.

c. Maintain height of screen at a minimum level of 1000 mm above the structure being demolished;

d. Construct screen in 3 layers, with minimum overlapping width of 300 mm, and fix screen to the frame at regular intervals - the innermost net of minimum 3.5 mm diameter heavy duty nylon (maximum mesh grid opening 50 mm), tarpaulin sheet and the outermost nylon net of minimum 1.0 mm diameter (maximum mesh grid opening 20 mm), all materials use shall resist ultra-violet light deterioration;

e. For scaffoldings higher than 15 m above the ground floor level, provide steel brackets anchored to the existing structure or other support system at interval of not more than 15 m to support the scaffolding;

f. Tie scaffolding to the buildings at intervals of not more than 4 m in both horizontal and vertical directions to firm supports to guard against storms / typhoon. Check ties effectively restraining scaffolding at all times, particularly before and after storms / typhoons;
g. Dismantling of the scaffolds shall coincide with the demolition progress. When the wall ties are disconnected due to the demolition of the building structure, the unsecured section of the scaffoldings shall be removed accordingly. In all times, the unbraced sections shall not be higher than 2 m from the nearest anchor;

h. Inspect and reinstate the ties for scaffolding if any of the ties are fixed onto materials or fixtures specified in DEM1.M025.

4. Provide additional protective canopy for blocks close to the streets as specified in Project Specific Specification;

5. Carry out vibration monitoring at locations specified by the CM during demolition and the peak particle velocities at these locations specified shall not exceed 15 mm/sec for prolonged vibration caused by mechanical demolition;

6. Maintain safe ingress and egress for adjoining properties at all the times.

DEM1.W240.8 CATCHFAN

1. Construct catchfan as specified in Project Specific Specification to prevent fall of demolition debris around perimeter of building under demolition;

2. Construct catchfan at a vertical distance of not more than 10 m below the working floor;

3. Erect sloping catchfan with a horizontal extension of at least 1500 mm from the exterior face of the scaffold;

4. The typical angle of inclination shall be 20° to 45° from the horizontal plane.

DEM1.W250.8 SUPPORTING EXISTING STRUCTURES

1. Support existing structures as necessary during cutting of new openings or replacement of structural members;

2. Prior to commencement of works, submit details of all intended arrangements for structural support designed by Registered Structural Engineer for CM's approval;

3. Do not remove supports until new work is capable of carrying all loads.

DEM1.W260.8 PARTLY DEMOLISHED STRUCTURES

Leave the Site and partly demolished structures in a safe condition at the end of each day's work. No accumulation of debris, particularly at working floors and at ground floor, which causes excessive pressure on the floors, slopes, retaining structures, hoardings/covered walkways and walls of adjoining buildings.

DEM1.W270.8 WEATHERPROOFING RETAINED AREAS OF PARTIALLY DEMOLISHED BUILDINGS

1. Protect retained building structure and interiors exposed during course of demolition works with a temporary weather-tight screen erected 1000 mm back from perimeter edge of floor;

2. Construct screens with close boarding fixed to framing and faced outside with roofing felt of an Approved type;

3. Cover the exposed floor beyond the screening with roofing felt of similar type to that used to face screens;

4. Form a waterproof seal between floor and screen;

5. Construct doors in the screens and fix with secure fastenings and hanging devices as necessary to provide authorised access.
DEMOLISHING STRUCTURES

**PREVENTION OF OVERLOADING**

1. Do not overload the structure under demolition with the reusable and recyclable materials, demolition plant and/or resulting debris;
2. Provide temporary shoring and strutting in accordance with the demolition plan or Approved method statement;
3. Bear all costs of temporary shoring or strutting required;
4. Maximum weight of mobile equipment on suspended floors is not to exceed 11,600 kg. The use of plants heavier than 11,600 kg are subject to the requirements of sub-clause (2) above and CM's approval;
5. Unless approved by the CM, the minimum number of consecutive floors required to distribute mobile equipment loading through popping is 5;
6. Unless approved by the CM, the minimum number of consecutive floors required to distribute localize loading from temporary ramp through propping is 5;
7. Maximum spacing of steel props in each direction is 1.2 m;
8. Use steel props of minimum bearing capacity 25 kN (45 kN for local area under temporary ramp);
9. Secure and wedge tight top and bottom supports of props. Fix bracings/ties to the props to provide lateral restraints in at least two directions;
10. Do not allow mobile equipment to move to within 2 m of the building edge, 1 m of any floor opening or on to any cantilevered structures;
11. Provide adequate spreader for props bearing on ground, where necessary, to avoid any undue settlement.

**OVERHEAD WIRES**

Prevent damage to overhead wires during demolition operations.

**RISK OF FIRE OR EXPLOSION**

Take precautions to prevent fire or explosion from gas or vapour release, electricity or any other source, especially when removing tanks or pipes which may have contained flammable liquids or gases.

**DAILY SITE INSPECTION IN THE MORNING**

1. Do not commence any demolition works on each day unless the daily morning site inspection has been carried out by the Safety Officer and the TCP(s) specified in the SP;
2. Submit to CM a plan, including the inspection route(s), check list(s) and the name of Safety Officer and TCP(s), for carrying out the daily morning site inspection;
3. Revise the plan from time to time to suit the actual site progress and resource.

**INDUCTION TRAINING**

1. Implement a site specific induction training system to ensure that all workers and machine operators fully understand the demolition sequences and precautionary measures before allowing them to work on Site;
2. Keep a proper record of the trained workers/operators and submit to CM monthly.
CLEAR EMERGENCY ACCESS
Maintain at all times at least one clear emergency access at the working floor during demolition for the safe passage of all personnel.

ROUTINE DAILY SITE INSPECTION BY CM
During demolition works, CM may carry out routine site inspection at any time during each working day. For safety reason, the demolition works, in particular those on working floors, may be required to be temporarily suspended if instructed by CM. Allow time and cost for the routine site inspection of CM. No claim whatsoever will be entertained for the interruption, if any, of the demolition works.

DEMOLITION WORKS

SORTING PROCESSING AND REMOVAL OF DEMOLITION MATERIAL
1. Submit a method statement to the CM indicating proposed sorting and processing method;
2. Unless specified otherwise, sort and process the materials to be collected or recycled arising from the demolition works;
3. Separate out all timber, steel, rubbish, materials to be collected/recycled as specified in DEM1.M025 and other decomposable material;
4. Arrange for collection and removal of the materials to be collected/recycled off site in accordance with their types as specified in DEM1.M025;
5. Break down large sized demolition fragments of building debris to 250 mm maximum size all round;
6. Remove materials arising from demolition from site as work proceeds; and
7. Submit the name of recycle collection companies and their collection receipt for record.

DISMANTLING AND STORAGE OF MATERIALS REQUIRED BY THE AUTHORITY
Carefully dismantle and remove to store materials specified at DEM1.M020.

UNDERGROUND FEATURES
Report to CM details of any underground tanks, wells etc discovered during demolition works and await his Instructions.

DISUSED DRAIN AND MANHOLES
Allow disused drains to vent built-up gases before proceeding with works below ground level as follows:
1. Pipework: plug ends of disused drains by filling bore with 15/20 grade concrete 150 mm or diameter of pipe if greater;
2. Manholes: plug ends of pipes as sub-clause (1) above. Break up top 300 mm of chamber and fill void with hardcore.

SORTING AND REMOVAL OF EXCAVATED MATERIAL
1. Sort suitable and unsuitable materials into separate temporary spoil heaps in locations agreed with the CM;
2. Remove unsuitable materials from site as work proceeds.

**DEMI.W460.8**  
**FILLING VOIDS**

1. After excavation, backfill and compact voids with suitable material such as Approved excavated material and/or general filling material as specified in EAR1;
2. Level to adjacent paving level with compacted hardcore 100 mm thick;
3. Do not use unsuitable materials such as salvaged materials or debris arising from demolition for backfilling;
4. The opinion of the CM as to the suitability of filling materials applies to the Contract only and only to the extent that such opinion is not subsequently changed.

**DEMI.W470.8**  
**LEVELLING**

Unless otherwise Instructed, level off the site to the satisfaction of CM on completion of the work.

**DEMI.W480.8**  
**REQUIREMENT FOR STUDIES DURING CONTRACT PERIOD**

1. Carry out as instructed structural monitoring, non-destructive testing, concrete cores extraction, concrete sampling and exposures, and partial or full cutting of reinforcement bars;
2. Provide adequate water, electricity supply and temporary falsework;
3. Construct temporary falsework capable of sustaining the self-weight of the canopy for designated area underneath first floor canopy, as instructed by CM.

**DEMI.W490.8**  
**STRUCTURE SUPPORTING GROUND**

1. Where adjacent land or building may be affected, submit temporary support details prepared by Registered Structural Engineer for CM's approval;
2. Submit detailed temporary support system prepared by Registered Structural Engineer for CM's approval where the retaining structure is:
   a. Higher than 3 m in height; and
   b. Liable to affect any road, building, structure, slope steeper than 30° or water mains 75 mm in diameter or greater, the affected area being defined as within the 45° line up from the retaining wall base to the ground surface at wall crest.

**DEMI.W500.8**  
**OPERATION OF POWERED MECHANICAL PLANT OR EQUIPMENT**

1. Operate mechanical plant or equipment for demolition work by competent operators under the immediate supervision of a TCP as specified in DEM1.W120;
2. Submit full details including names, addresses, qualifications and experience of these operators for applying the consent to commence demolition works under DEM1.D220;
3. The operators of powered mechanical plant or equipment used in demolition works shall meet the requirements as specified in Building (Demolition Works) Regulations, Clause 9 (3);
4. The operators shall have completed a training course in "Demolition of Building Course for Plant Operators" organized by the Construction Industry Training Authority (CITA) and obtained the relevant certificate and shall have at least three years experience in operating the particular plant or equipment. Equivalent training and certificates issued by a recognised examining body may also be favourably considered by the CM for meeting the requirement;
5. Notify the CM within 7 days of the change in the appointment of the operator and provide the personal particulars, qualifications and experience of the new operator.

**DEM1.W510.8**  
**REMOVAL OF PART OF A BUILDING**

Where the removal of a part of a building or structure may result in another part of the building, adjoining slope, retaining wall or land becoming unsafe, submit a temporary support proposal prepared by Registered Structural Engineer. Support external features, enclosure walls, parapets and cantilevered construction such as canopies, cornices and balconies before the anchorage or holding down load is removed.

**DEM1.W520.8**  
**DISPOSAL OF MATERIALS TO BE COLLECTED/RECYCLED OFF SITE**

1. Provide sufficient space within the Site for the storage of the materials to be collected/recycled specified in DEM1.M025 before removing them from the Site;

2. Produce a Material for Salvage Form (MSF) for each and every vehicular trip transporting reusable and recyclable materials as follows:
   a. Propose the format of the MSF for CM's agreement;
   b. The MSF shall contain the following information:
      i. Contract title, Name of Contractor, Contract No.;
      ii. Location of Site;
      iii. The name of the recovery/recycling company;
      iv. The vehicle registration number;
      v. Approximate load;
      vi. Type of salvaged materials;
      vii. Time of departure.
   c. Complete the MSF in duplicate except for the entry of the "time of departure" before leaving the Site.

3. Prior to the vehicle leaving the Site, present to the site supervisory staff of the CM the completed Form for inserting the time of departure and signing. Forward a copy of the MSF to the site supervisory staff for record;

4. Employ a contractor, who shall be a recovery/recycling company listed in the "Directory of Recovery/Recycling Companies in Hong Kong" maintained by the Environmental Protection Department of the Government of the Hong Kong Special Administrative Region, to salvage the reusable and recyclable materials; and

5. All materials to be collected/recycled shall become the property of the Contractor when they are removed from the site.
DEM2 ASBESTOS REMOVAL

MATERIALS

DEFINITIONS

DEM2.M010.8 GENERAL
Where used in this Worksection the following definitions apply. Words in upper case italics within the definitions indicate that a separated definition is provided.

DEM2.M020.8 DEFINITIONS AND EXPLANATORY NOTES
1. ABATEMENT: all procedures taken to control fibre release during removal, encapsulation, enclosure and repair of ASBESTOS CONTAINING MATERIALS;
2. AGGRESSIVE SAMPLING: method of sampling in which the individual collecting the air sample uses mechanical equipment to stir settled dust and simulate normal activity in the sample area;
3. AIRLOCK: a system permitting entrance and exit whilst restricting air movement between contaminated and uncontaminated areas. Consisting of two curtained doorways at least 1 m apart to allow the doorway sheeting to overlap and close off the opening before proceeding through the second doorway, thereby preventing flow-through contamination. (See also HYGIENE UNIT);
4. AIR MONITORING: the measurement or determination of airborne ASBESTOS fibre concentrations in the air at specific locations;
5. AIR MOVER: a portable exhaust system equipped with HEPA filter capable of creating a negative pressure differential of at least 15 Pa and 6 air changes per hour between the outside and inside of the CONTAINMENT;
6. AIR SAMPLING: the process of measuring the fibre content of a known volume of air during a specific period of time, complying with the NIOSH Standard Analytical Method, the UK EH10 coupled with MDHS 39/3 or an updated method specified by the Authority; or methods accredited under HOKLAS which are laid down in the laboratory manual;
7. AMBIENT AIR MONITORING: the measurement or determination of airborne ASBESTOS fibre concentrations within the vicinity of the Site;
8. AMENDED WATER: water to which a saturated solution of a WETTING AGENT has been added;
9. AREA AIR SAMPLING: the method of AIR SAMPLING where the sampling equipment is situated at a stationary location within the contaminated WORK AREA;
10. ASBESTOS CONTAINING MATERIAL (ACM): ASBESTOS or any material/product containing greater than 1% asbestos by weight;
11. ASBESTOS CONTAINING WASTE MATERIAL: ACM or materials contaminated with asbestos which requires disposal;
12. ASBESTOS: the minerals chrysotile,amosite, crocidolite, fibrous tremolite, fibrous anthophyllite and fibrous actinolite or substances containing such minerals;
13. BACKGROUND MONITORING: the measurement or determination of airborne ASBESTOS fibre concentrations within the Site and outside the building prior to commencement of the work as follows:
   a. Sampler: an air sampling pump fitted with an Approved type cowl;
   b. Filter: 25 mm cellulose ester filter of pore size 0.8 - 1.2 µm;
   c. Sampling pump: a battery-run or mains-run pump capable of maintaining a low rate of at least 2 litres per minute for at least 4 hours;
   d. Sampling point:
      i. A minimum of 2 samples, or as specified in the individual air monitoring strategy (depending on the size of the site), taken on different sides of the contained/segregated work area;
      ii. Samples taken as close to the work site as possible, of the area where those not involved in the abatement works are likely to pass or occupy;
      iii. Sampling locations shall be as far as possible the same as the ENVIRONMENT SAMPLES.
   e. Sampling rate: a minimum of 2 litres per minute taken with a calibrated pump and checked with a calibrated rotameter equivalent flow measurement device regularly during the sampling period;
   f. Sampling time: not less than 4 hours.
14. BACKGROUND SAMPLE: a sample taken prior to commencement of the asbestos removal works;
15. CLEAN ROOM/END: an uncontaminated area or room within the HYGIENE UNIT with the provision for storage of personal clothing and protective equipment;
16. CLEARANCE AIR MONITORING: the employment of AGGRESSIVE SAMPLING techniques with a volume of air, collected to determine the airborne concentration of residual fibres, performed as the final abatement activity, using the following:
   a. Sampler: an air sampling pump with an Approved type of cowl;
   b. Filter: 25 mm cellulose ester filter of pore size 0.8 - 1.2 µm;
   c. Sampling pump: battery-run or mains-run pump capable of maintaining a flow of at least 4 litres per minute for 4 hours;
   d. Sampling point:
      i. Static;
      ii. A minimum of 1 sample for an area up to 8 m² and 2 samples for an area between 8-25 m²;
      iii. One further sample for each additional 25 m²;
      iv. If the enclosure is higher than 2 m, the above should be converted to a volume criteria e.g.:
         2 samples for the first 75 m³ and one further sample for each additional 75 m³;
      v. If the contained space is further subdivided by larger pieces of equipment or walls take more samples than specified above;
      vi. Position sampler 1-2 m above the floor with the cowl pointing downwards;
      vii. Sampling is to be aggressive, see item (2) above;
viii. Do not proceed with air sampling if debris is visible within the work area.

(The sampling point and number of samples required are dependent upon the site layout and the Air Monitoring Strategy agreed by the CM. The Guidelines on Air Monitoring included in each removal method of the ACM's are for reference only.)

e. Sampling rate: minimum of 4 litres per minute taken with a calibrated pump and checked, with a calibrated rotameter equivalent flow measurement device, regularly during the sampling period;

f. Sampling time: to be set to give a total sampling volume of a minimum of 480 litres;

g. Reporting: if more than 1 sample is taken, obtain results by pooling a minimum of 2 samples of at least 240 litres each, taken within 4 m of each other. Results may be taken simultaneously or one after another. At the evaluation state the same number of graticule areas are inspected on each filter and the counts combined to give one measurement based on at least 480 litres. If the total volume is 480 litres for two or more samples, 200 graticule areas must be examined on each filter. For larger volumes reduce the number of graticule areas to be counted proportionally.

17. CLEARANCE TEST SAMPLE: a sample taken after ASBESTOS has been removed to ascertain whether WORKING ZONE has been thoroughly decontaminated. A visual inspection to detect gross contamination must be carried out before one or more static samples are taken to establish the fibre level in the WORKING ZONE. Disturbance of surface dust is essential during the sampling period. When the clearance indicator shows a fibre level of 0.01 fibre/ml or below, the Working Zone can be declared fit for re-occupation. Where results exceed the clearance indicator, thoroughly re-clean the Working Zone and re-sample;

18. CONTAINMENT: a temporary timber or metal framed structure lined with 3 layers of 0.15 mm thick polythene sheeting to floors and walls, completely sealing off the work area. All sheet joints to be overlapping and properly sealed, with the innermost floor sheeting extending at least 500 mm up each wall surface;

19. CURTAINED DOORWAY: a device consisting of a minimum of 3 overlapping plastic sheets over an existing or temporarily framed doorway. The first sheet is fixed at the top and left side, the second at the top and right side and the third at the top and left side. Weights are to be attached to the bottom of all sheets to ensure that the sheets hang straight and maintain a seal over the doorway when not in use;

20. DECONTAMINATION FACILITIES: a series of connected rooms, separated from the WORK AREA and from each other by AIRLOCKS, used for the decontamination of operatives, materials, waste containers and equipment;

21. DEMOLITION: the dismantling or razing of a building, including all incidental operations (except asbestos removal);

22. DIRECT TESTING CONTRACTOR: a laboratory appointed by the CM and paid by the Authority to carry out asbestos associated tests;

23. DIRTY END: a contaminated area or room, which is part of the HYGIENE UNIT, with the provision to store contaminated clothing and equipment;

24. DISTURB: any action taken which may alter, change or stir, such as, but not limited to, the removal, encapsulation, enclosure or repair of any ASBESTOS CONTAINING MATERIAL;
25. **ENCAPSULANT (SEALANT) OR ENCAPSULATING AGENT:** a material applied to the ACM which temporarily controls the possible release of asbestos fibres from the material either by creating a membrane over the surface (bridging encapsulant) or by penetrating into the material and binding its components together (penetrating encapsulant). This may also be used to seal surfaces from which the ACM has been removed;

26. **ENCAPSULATION:** concealing the ACM either with a sealant, by cementitious rendering or by cladding, to prevent the release of asbestos fibres;

27. **ENCLOSURE:** the construction of airtight walls and ceilings between the ACM and the facility environment, around surfaces coated with ACM or any other appropriate procedure which prevents the release of asbestos fibres;

28. **ENVIRONMENTAL SAMPLE:** a sample taken in the vicinity of the asbestos work area, especially within occupied areas where the fibre levels may be higher than the general ambient level as a consequence of a failure of precautionary measures taken in the asbestos work area. Without any established ambient level standard, environmental samples are often compared to the clearance indicator in deciding whether significant environmental pollution has occurred around the work site. A flow rate of up to 8 litre/min may be used to achieve the desired fibre density on the filter:
   a. **Sampler:** an air sampling pump with an Approved type of cowl;
   b. **Filter:** 25 mm cellulose ester filter of pore size 0.8-1.2 μm;
   c. **Sampling pump:** battery-run or mains-run pump capable of maintaining a flow rate of 2 litres per minute for a minimum of 4 hours;
   d. **Sampling point:**
      i. A minimum of 2 samples, or as specified in the individual air monitoring strategy, taken on different sides of the contained/segregated work area;
      ii. Samples taken, as close to the work site as possible, of the area where those not involved in the abatement works are likely to pass or occupy.
   e. **Sampling rate:** minimum of 2 litres per minute taken with a calibrated pump and checked, with a calibrated rotameter equivalent flow measurement device, regularly during the sampling period;
   f. **Sampling time:** not less than 4 hours.

29. **EQUIPMENT ROOM:** see **DIRTY END**;

30. **FIBRE:** an acicular single crystal or a similarly elongated polycrystalline aggregate which displays resemblance to organic fibres, with properties such as flexibility, high aspect ratio, silky lustre, axial lineation and which has attained its shape primarily through growth rather than cleavage;

31. **FIXED OBJECT:** equipment or furniture within the **WORK AREA** which may not be removed;

32. **FOAM METHOD:** a method, used by the Housing Department, to remove asbestos-containing balcony grilles where the grilles are sandwiched between two plywood boards, the space between the two boards is injected with quick setting polyurethane foam allowing the grille to remain intact whilst being removed by chiselling the surrounding concrete;

33. **FRIABLE ASBESTOS MATERIAL:** any **ASBESTOS** or **ACM** which can be crumbled, pulverized or reduced when dry, by hand or a similar mechanical pressure;
34. **GLOVE BAG METHOD**: a method for removing friable asbestos-containing material from heating, ventilation and air conditioning ducts, short piping runs, valves, joints, elbows and other non-planar surfaces in a non-contained work area. The glove bag assembly is a manufactured device consisting of a glove bag (constructed of at least 0.15 mm thick transparent plastic), two inward-projecting long-sleeve gloves, one inward-projecting waterwand sleeve, an internal tool punch and an attached labelled receptacle for asbestos waste. The glove bag is constructed and installed in such a manner that it surrounds the object or area to be decontaminated and contains all asbestos fibres released during the removal process;

35. **GLOVE METHOD**: any method whereby a transparent, soft PVC structure equipped with integral gloves is used as mini-containment for small-scale asbestos removal. The glove method can be applied in the removal of balcony grille panels;

36. **HEPA FILTER**: a High Efficiency Particulate Air filter capable of trapping and retaining particles (asbestos fibres) with an efficiency complying with BS 3928:1969 or US Military Standard No. 282 in association with Army Instruction Manual 136-300-175 or Approved equivalent;

37. **HEPA VACUUM EQUIPMENT**: vacuuming equipment with HEPA;

38. **HYGIENE UNIT**:
   a. A 3 compartment, air-locked chamber comprising a **DIRTY END**, a shower area and a **CLEAN END**, constructed with timber frames, 0.15 mm thick opaque polythene sheeting and sealed with 75 mm adhesive tape;
   b. The Dirty End is separated from the shower area by a door. A further door separates the entry point. The Dirty End may be used as a temporary store for soiled equipment and footwear;
   c. The Clean End is separated from the shower area by a door. A further door separates the exit. The Clean End may be used as a temporary store for personal clothing. A mirror should be provided to ensure workers obtain a good facefit with the Respiratory Protective Equipment;
   d. All waste water must pass through an approved aquarium type or similar filter for removal of particles down to 5 microns in suspension before being discharged into the soil and waste drainage system;
   e. An induced draft should be introduced inside the Hygiene Unit to achieve an air flow from the Clean End to the Dirty End;
   f. A pre-fabricated Hygiene Unit may also be used to perform the same function;
   g. The Hygiene Unit and **AIRLOCK** are similar, although their names are derived from their different specific functions.

39. **ISOLATION BARRIER**: the construction of partitions, the placement of solid materials and the sealing of apertures to isolate the **WORK AREA** from the surrounding area, containing asbestos fibre release;

40. **LEAK SAMPLE**: static samples taken immediately outside the contained **WORK AREA** to ensure that dust generated within the contained area is not released into the surrounding environment. Criterion for leakage detection is generally the same as for the **CLEARANCE INDICATOR** and immediate remedial action must be taken should a leakage occur:
   a. **Sampler**: air sampling pump with an Approved type of cowl;
   b. **Filter**: 25 mm cellulose ester filter of pore size 0.8-1.2 µm;
   c. **Sampling pump**: battery-run or mains-run, capable of maintaining a minimum flow of 4 litres per minute for up to 4 hours;
d. Sampling point: to be located in at least one of the following:
   i. 2 area samples outside *CONTAINMENT* in uncontaminated area of the premises but remote from the decontamination unit;
   ii. 1 area sample inside the clean room of the decontamination unit;
   iii. 1 area sample within 1500 mm from the unobstructed exhausted of the HEPA air mover.

e. Sampling rate: 1 to 4 litres per minute taken, with a calibrated rotameter or equivalent flow measurement device, regularly during the sampling period;

f. Sampling time: set to give a total sample volume of at least 480 litres.

41. LOG: a record of all activities that have occurred during the project also identifying the building owner, agent, Contractor, operatives and other information such as equipment malfunctions, contamination beyond the work area etc;

42. MATERIAL LOCK: a compartment attached to the *CONTAINMENT* provided for temporary storage and transit of asbestos abatement equipment and asbestos waste;

43. NEGATIVE AIR PRESSURE EQUIPMENT: see *AIR MOVER*;

44. NEGATIVE PRESSURE MONITOR: a monitoring device with an alarm setting and continuous print-outs and permanent record facility for monitoring of the negative pressure inside the *CONTAINMENT*;

45. OCCUPIED AREA: an area of the work site where no abatement work is taking place and where the use of *PERSONAL PROTECTIVE EQUIPMENT* is not required;

46. PENULTIMATE TEST SAMPLE: take air sample after final cleaning, when the innermost plastic layer, upon drying from the spraying of PVA, is removed and the second plastic sheeting HEPA vacuumed and wet-wiped. Employ an aggressive sampling technique and the acceptance limit is 0.01 fibre/ml;

47. PERSONAL AIR MONITORING: a method used to determine employees' exposure to airborne fibres. Samples are collected outside the respirator in the operative's breathing zone:
   a. Sampler: air sampling pump fitted with an approved cowl;
   b. Filter: 25 mm cellulose ester filter of pore size 0.8-1.2 µm;
   c. Sampling pump: battery-run, sampling pump to be carried on the operatives belt;
   d. Sampling point: sampler, fixed to operative's clothing and within the breathing zone (200 mm from nose and mouth). The cowl of the sample must point downwards;
   e. Sampling rate: 1 - 4 litres per minute checked, with a calibrated rotameter or equivalent flow measurement device, regularly during the sampling period;
   f. Sampling time: to be set according to the following criteria:
      i. To be a period of 4 hours. Where the level is higher, a shorter period must be used to avoid filter over-loading. This period must be long enough to be representative of the 4 hour period. Samples taken over several separate periods may also be used to calculate the 4 hour TWA value;
      ii. Minimum sampling time: 10 minutes; adjust the sampling time such that fibre density on the filter lies within 100 - 400 fibre/m²;
iii. In order to test the respiratory protective equipment is adequate for the asbestos dust exposure, liaise with the Direct Testing Contractor to conduct the personal samples to measure the representative asbestos dust exposure, including the periods when the asbestos dust exposure are expected to be maximum.

48. PERSONAL PROTECTIVE EQUIPMENT: appropriate protective clothing e.g. gloves, eye protection, footwear, headgear and Approved respiratory equipment acceptable to the CM;

49. PERSONAL SAMPLES: an air sample taken as close to the breathing zone of an operative as possible, to indicate the ambient level of exposure. An appropriate amount of the work period should be covered either by continuous sampling or by short term samples. For known procedures which have been thoroughly evaluated before, such extensive sampling is not required but minimal batch samples can be taken to ensure that the levels of fibre release are indeed comparable:

   Sampling rate: 1 litre per minute;

50. RE-ASSURANCE SAMPLE: a sample taken in areas where Containment is not required or where it has been removed. See also CLEARANCE TEST;

51. REMOVAL: the stripping of any ACM from surfaces or components of a facility or taking out structural components;

52. REPLACEMENT MATERIAL: any material used to replace an ACM that does not contain ASBESTOS;

53. SECURE STORE: a buffer store for asbestos waste used prior to transportation to a dumping site. The store must be located close to the asbestos removal works, be weather-proof and structurally strong enough to withstand strong winds and accidental disturbances, with a lockable door/cover and posted with appropriate warning labels. It is preferable that a permanent space inside a building be converted into the Secure Store e.g. a refuse room, empty flat, empty bay with a temporary lockable door free of debris, dirt, objects and water accumulations. If located externally it may be a lockable metal skip adjacent to the building block and covered with tarpaulin sheets to keep water out or an area hoarded with plywood of at least 18 mm thick with no floor clearance and a water-proof slanting canopy where practicable; or use tarpaulin sheets as the cover for large hoarded area;

54. SHIFT: an operative's daily term of work;

55. SHOWER ROOM: a room between the CLEAN END and the DIRTY END in the HYGIENE UNIT, equipped with controllable hot and cold water for showering purposes, a shower tray and of a minimum size of 2000 mm (height) x 1000 mm (width) x 1000 mm (length). Provide at a ratio of 1 Shower Room for every 6 operatives engaged in asbestos removal works;

56. SMOKE TEST: a test carried out using non-toxic smoke to ensure airtightness of the CONTAINMENT before commencement of work. Following a successful test, switch on the AIR MOVER to exhaust smoke from the CONTAINMENT and check the absolute filter to ascertain whether the smoke has been screened effectively. The CM must be notified of test and be present whilst the test is carried out;

57. SPECIALIST ASBESTOS REMOVAL CONTRACTOR: any Sub-contractor employed by the Contractor to execute the asbestos removal works chosen from the Approved list;

58. SURFACTANT: a chemical wetting agent added to water to improve penetration;
59. VIEWING PANEL: a 2 mm thick, clear acrylic sheet, size 600 mm x 600 mm per layer of polythene sheeting built into the CONTAINMENT at a designated area to enable work inside the Containment to be viewed. A hinged wooden door may be installed for the Viewing Panel should the Containment be housed within a hoarding;

60. VISIBLE EMISSIONS: any emissions containing particulate material which can be visually detected without the aid of instruments;

61. WASHROOM: a room between the WORK AREA and the holding area in the equipment decontamination enclosure where equipment and waste containers are WET CLEANED and/or HEPA vacuumed prior to disposal;

62. WASTE DECONTAMINATION ENCLOSURE SYSTEM: an area designated for the controlled transfer of materials and equipment, consisting of a buffer zone and a holding area;

63. WET CLEANING: the removal of ASBESTOS fibres from building surfaces using cloths or cleaning tools dampened with water;

64. WET METHODS: AMENDED WATER or removal encapsulants used to minimize the generation of fibres during disturbance of ACM;

65. WETTING AGENT: a chemical to be added to water to improve penetration;

66. WORK AREA: designated rooms, spaces or areas of the building or structure where asbestos abatement activities are taking place;

67. WORKING ZONE: the zone where asbestos removal is being, or has been, undertaken which includes the WORK AREA and all access routes (before passing the CLEARANCE TEST). All operatives, equipment and bagged waste withdrawing from the Working Zone must undergo thorough decontamination through a MATERIAL LOCK. Only in the event of it being impracticable to install a Material Lock may a HYGIENE UNIT be used.

ASBESTOS REMOVAL PLANT AND EQUIPMENT

DEM2.M110.8 GENERAL

1. Ensure all plant, including scaffolding and mechanical hoisting equipment, tools and vehicles to be used during the asbestos removal works is uncontaminated, well maintained and in good working order;

2. Provide for the inspection of the CM certified records that all plant and equipment including HEPA filters and respirators have been regularly maintained;

3. Decontaminate all plant, scaffolding and equipment prior to removal from site.

DEM2.M120.8 PROVISION

Provide all plant, equipment and materials, including the following, for the execution of the asbestos removal works. Ensure their suitability for the particular application and of sufficient quantity for the scope and extent of the asbestos removal works:

1. Hygiene unit (as defined in DEM2.M020);

2. Heavy duty vacuum cleaner: an Approved type suitable for use on asbestos removal and fitted, on site, with a HEPA filter (as defined in DEM2.M020);

3. Small vacuum unit for personal cleaning:
   a. Fitted on site just prior to use, with a HEPA filter;
b. Located at exit to asbestos removal work area or dirty end (as defined in DEM2.M020) where the hygiene unit is attached to exit of the asbestos removal work area;

4. Negative pressure monitor (as defined at DEM2.M020): for use when full containment approach is adopted to give a continuous, permanent record of the negative pressure measured. An audible alarm must be fitted to give warning of insufficient pressure differential;

5. Asbestos waste containers: complying with the Code of Practice on the Handling, Transportation and Disposal of Asbestos Wastes issued by the Environmental Protection Department. Nylon woven sacks may be used as the innermost bag (i.e. triple bagging) when the debris contains sharp edges and/or proves to be too heavy for the plastic waste bags;

6. Air movers: (as defined in DEM2.M020):
   a. An Approved type;
   b. Fitted with a pre-filter and HEPA filter;
   c. With a negative pressure of at least 15 kPa;
   d. Capable of performing at least 6 air changes per hour;

7. Polyvinyl acetate emulsion adhesive (PVA): aqueous solution and expanded foam in aerosol cans;

8. Cleaning and personal hygiene consumables;

9. Water spray equipment for damping the asbestos element to minimize the release of airborne particles;

10. Wetting agent: 50% polyoxyethylene ester and 50% polyoxyethylene ether at a ratio of 1:1 or equivalent;

11. Amended water (as defined in DEM2.M020).

DEM2.M130.8 VIEWING PANEL

1. Location: within the screening to the work area and in a position where all or most of the asbestos removal works can be viewed;

2. Size: 600 mm x 600 mm;

3. Construction: 2 mm thick clear acrylic sheet per layer of polythene sheeting with 50 mm minimum lap affixed and sealed with 50 mm wide vinyl tape to sheeting.

PERSONAL PROTECTIVE EQUIPMENT AND CLOTHING

DEM2.M210.8 CLOTHING

1. Provide the following protective clothing for use by operatives:
   a. Disposable, impervious protective overalls with zipper fastening, integral hoods, elasticated cuffs and ankles;
   b. Rubber knee length boots with non-slip soles, or shoe covers;
   c. Eye protection and hard hats, where their use is appropriate;
   d. Disposable gloves.

2. Provide the above protective clothing for use by the Authority's staff;
3. Use of other items of disposable clothing e.g. woven fabric overalls, or shorts and hair covers may be permitted where heat stress or discomfort are factors. Prior approval must be obtained from the Labour Department.

DEM2.M220.8 RESPIRATORS

1. Provide for all persons on site the appropriate respiratory protective equipment:
   a. Type approved under the Factories and Industrial Undertakings (Asbestos) Special Regulations for the specific use;
   b. Ori-nasal half face mask type fitted with HEPA filter: for use under all circumstances;
   c. Full face positive pressure respirator: for use when required by this Specification.

2. Provide each operative with own face piece. Ensure face piece is cleaned before each re-use as a minimum requirement.

DEM2.M230.8 RESPIRATOR FILTERS

Ensure that:

1. Filters are removed from respirators under wet conditions and are treated as contaminated waste;
2. New filters are placed in the respirator prior to re-use;
3. Sufficient spare filters are held on site at all time.
WORKMANSHIP

GENERAL

DEM2.W010.8 ASBESTOS REMOVAL WORK
1. Carry out the asbestos removal work as specified in Project Specific Specification;
2. The information provided on the extents of asbestos removal work are known to be in existence to the best knowledge of the Housing Authority but may not be exhaustive.

DEM2.W020.8 SPECIALIST ASBESTOS REMOVAL CONTRACTOR
1. Employ a firm whose name is included in the Register of Asbestos Contractors kept by Environment Protection Department to carry out the asbestos removal works;
2. Such firm shall be a Sub-contractor to the Main Contractor and employed at his own expense;
3. Submit with tender a letter of intent from the Specialist Asbestos Removal Contractor indicating their willingness to carry out the asbestos removal works, which includes a Method Statement as specified.

DEM2.W030.8 SITE VISIT AND INSPECTION
Before tendering, visit the site and inspect the appropriate drawings to ascertain the full extent of the asbestos removal work and the conditions affecting its execution.

DEM2.W040.8 SURVEY AND REPORT
Within 14 days of notification of the start of the contract, a confirmatory survey for the whole site is carried out by a Registered Asbestos Consultant employed by the Contractor under Air Pollution Control Ordinance to Submit the Asbestos Investigation Report to CM and Environmental Protection Department. The survey covers the whole site and materials, rubbish lying on the ground to establish the presence of asbestos containing materials other than those already identified in this Specification or shown on the drawings.

DEM2.W050.8 SUPERVISION BY REGISTERED ASBESTOS CONSULTANT
If asbestos containing materials which are to be removed are not materials under the exemption list published by Environmental Protection Department (EPD), employ a Registered Asbestos Consultant:
1. To submit Asbestos Abatement Plan to EPD for the planned removal of ACM and / or an Operation and Maintenance Plan for deferred treatment, e.g. encapsulation, enclosure, of the same; and
2. To control and supervise the abatement of all asbestos containing materials, all in accordance with Air Pollution Control Ordinance.

DEM2.W060.8 METHOD STATEMENT
Submit for Approval, 2 weeks prior to commencement of the asbestos removal works, a Method Statement containing:
1. Details of the ACM to be removed and the proposed zoning and sequence of the asbestos removal works;
2. Method of removal of ACM and control of air-borne dust to be employed;
3. Method of disposal of contaminated materials from the point of action to the secure store;
4. Description of the hygiene unit and decontamination facilities, including waste water treatment to be used, prior to discharge off site.

**DEM2.W070.8 SITE SUPERVISOR**

Submit to the Authority within 7 days of notification of commencement of the asbestos removal works, details of the Site Supervisor to be employed, including name, qualifications and experience:

1. Site Supervisor to:
   a. Register with Environmental Protection Department;
   b. Posses at least 2 years relevant supervisory experience, capable to make decisions in case of emergency;
   c. Be conversant with the Authority's requirement for the removal of ACM. Hold a relevant certificate issued by the Occupational Safety and Health Council, or equivalent, indicating competence in the safe handling of asbestos and be trained in asbestos removal work;
   d. Be present full time on site every day during the course of asbestos removal work;
   e. Ensure that the asbestos removal work complies with the requirements of this Specification and oversee all safety procedures;
   f. Liaise with the Direct Testing Contractor and ensure the works continue with the DTC in attendance at a suitable time.

**DEM2.W080.8 PREVENTION OF NUISANCE**

1. Occupied premises: proceed with the minimum of inconvenience and nuisance to occupants of premises in the vicinity of the asbestos removal works;
2. Prevent dust arising by frequent water spraying, or other Approved methods;
3. Erect dust barriers where directed by the CM to prevent air borne dust affecting adjacent, occupied blocks.

**DEM2.W090.8 SITE ORGANISATION CHART**

Post a site organisation chart identifying the Specialist Asbestos Removal Contractor in a prominent location adjacent to the asbestos removal works.

**DEM2.W100.8 NOTIFICATIONS**

At least 28 days prior to asbestos removal, give notice to the Environmental Protection Department (EPD) and the Labour Department (LD).

**DEM2.W110.8 INSPECTION OF PREPARATORY WORKS**

24 Hours prior to commencement of the asbestos removal works, notify the CM that air monitoring arrangements and preparatory works are made and precautionary measures are ready for inspection and request consent from the CM before proceeding with removal.
STATUTORY OBLIGATIONS, CODES OF PRACTICE
AND OTHER REQUIREMENTS

DEM2.W310.8  SAFETY, HEALTH AND WELFARE
Comply with the provisions of the following:

1. Factories and Industrial Undertakings (Asbestos) Regulation made under the Factories and Industrial Undertaking Ordinance (CAP 59);

2. Construction Sites (Safety) Regulations made under the Factories and Industrial Undertaking Ordinance (CAP 59);

3. Factories and Industrial Undertakings (Notification of Occupational Diseases) Regulations made under the Factories and Industrial Undertaking Ordinance (CAP 59);

4. Code of Practice on Safety and Health at Work with Asbestos, issued by the Labour Department;

5. Code of Practice on Handling, Transportation and Disposal of Asbestos Waste, issued by the Environmental Protection Department;

6. Guidance Notes on Health Hazards in Construction, issued by the Labour Department;

7. Health Hazards of Asbestos, issued by the Labour Department;

8. Guide to Occupational Diseases Prescribed for Compensation Purposes, issued by the Labour Department;

9. Air Pollution Control Ordinance (CAP 311);

10. Pneumoconiosis and Mesothelioma (Compensation) Ordinance (CAP 360);

11. Waste Disposal Ordinance (CAP 354);

12. Code of Practice on Asbestos Control: Safe Handling of Low Risk Asbestos Containing Material, issued under Section 37 of the Air Pollution Control Ordinance (CAP 311);

13. Code of Practice on Asbestos Control: Asbestos Work Using Full Containment or Mini Containment Method, issued under Section 37 of the Air Pollution Control Ordinance (CAP 311);

14. Code of Practice on Asbestos Control: Asbestos Work Using Glove Bag Method, issued under Section 37 of the Air Pollution Control Ordinance (CAP 311);

15. Code of Practice on Asbestos Control: Preparation of Asbestos Investigation Report, Asbestos Management Plan and Asbestos Abatement Plan, issued under Section 37 of the Air Pollution Control Ordinance (CAP 311);

16. 3 Leaflets published by EPD:
   a. Environmental Asbestos Control;
   b. Asbestos Removal of Unauthorised Building Works;
   c. Banning Asbestos.

17. Practice Note 2/97 Handling of Asbestos Containing Materials in Buildings issued by the Professional Persons Environmental Consultative Committee;

PROTECTIVE ENCLOSURES

DEM2.W410.8 ERECTION OF TARPAL LIN ENCLOSURE

1. Erect tarpaulin enclosure in accordance with the following requirements:
   a. Prior to commencement of asbestos removal work;
   b. Constructed from tarpaulin sheeting supported by substantial bamboo scaffolding or similar;
   c. Enclosure to encase entire block, extending from ground level to 1000 mm above roof parapet of block being demolished;
   d. Overlap tarpaulin sheets on all four sides by 200 mm minimum. Ensure airborne dust is retained within enclosure during asbestos removal;
   e. Do not disturb or damage asbestos containing material during erection of enclosure.

2. Submit details of protective enclosure to CM prior to erection. Do not disturb asbestos containing materials. If disturbed, stop work and propose remedial actions.

DEM2.W420.8 DAMAGE TO ENCLOSURE

1. Upon discovery of any damage to enclosure, immediately make good to the satisfaction of the CM;

2. Allow for time and additional costs incurred for repairing any damage to enclosure.

ASBESTOS REMOVAL

DEM2.W510.8 METHODOLOGY

The removal and disposal of asbestos containing materials are from top down on a zone by zone basis unless otherwise approved by the CM. Consider the following methods and procedures for asbestos removal as minimum requirements. Adoption does not release the Contractor from any responsibilities or liabilities under the terms of the Contract. Alternative methods of working may be employed, subject to Approval and submission of details provided that all regulations and restrictions imposed by the Environmental Protection Department and the Labour Department are complied with.

DEM2.W520.8 GENERAL PREPARATION PROCEDURES

1. Ensure all access points between the working zone and non-working zone are sealed with 2 sheets of polythene sheet or similar;

2. Post warning notices on the non-working zone side prohibiting access to the works of non-authorized personnel;

DEM2.W530.8 GENERAL PRECAUTIONARY PROCEDURES

Where the presence of amosite or crocidolite asbestos fibres is known or discovered in the asbestos containing materials being removed, ensure operatives wear full-face positive pressure respirators as at DEM2.M220 and DEM2.M230.
1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520:
   a. Access balconies from the living room area of each domestic unit through a designated route and a hygiene unit;
   b. Removal operators in the working zone are to wear ori-nasal half face masks fitted with Approved air filters, Approved disposable coveralls and knee length rubber boots with non-slip soles. Wear gloves if it is considered necessary;
   c. Ensure operatives working on the external face of the balcony panel use a safety harness attached to a secure anchorage or life line;
   d. Ensure operatives on the external face secure all tools and equipment to a safety line;
   e. Remove all existing metal guard grilles, glazing, toilet walls and bases, cooking benches and other fittings or furniture which may obstruct access to the balcony grille panels. Transport all debris from the removal works by an Approved route.

2. Removal:
   a. Clear up as work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed;
   b. During the removal operation, continuously spray panels and surrounding concrete surfaces with water containing a wetting agent;
   c. Place a primary, 5 mm thick, pre-cut and drilled plywood panel against the external face of each grille panel. Fit in position by four set screws retained by locknuts protruding through the grille panel. If panels are encapsulated on one side, the plywood board on the encapsulated side may be waived if approved by CM;
   d. Position a secondary, 5 mm thick, plywood panel against the internal face of the grille panel, fixed in position by the wing nuts on the bolts from the primary panel;
   e. Fix a third 5 mm thick, plywood panel against the external face of the balcony. Fit with non-intercellular nitrile, neoprene rubber seals, contoured to ensure no leakage of debris or dust occurs during removal of the grille panel. Cover the internal face and seals of the panel with a double layer of 0.15 mm polythene, secured by waterproof self-adhesive vinyl tape;
   f. Where panels are encapsulated on one side, the use of plywood board on the encapsulated side may be waived if Approved;
   g. Fill the cavity space between the primary and secondary boards with high density polyurethane foam to encapsulate the grille panels. If isocyanate foam is used provide an appropriate respirator for use by operatives;
   h. Cover the balcony floor with a double layer of 0.15 mm thick polythene sheeting, secured by waterproof self-adhesive vinyl tape;
   i. Install a screen in the space above the spandrel beam and the underside of the upper balcony beam. Construct frame using a timber framework supporting a woven, nylon tarpaulin sheet;
j. Using a powered, low voltage chisel or hand chisel, chip away concrete spandrel beams and posts to the top and sides of the grille panel to expose the full extent of grille panel reinforcement bar fixings, leaving the grille panel unrestrained. Cut all exposed grille panel reinforcing bars with bolt cutters. Ensure eye protectors are worn by operatives during this operation;

k. Remove the base ledge of the balcony wall adjoining the panel with a hand chisel;

l. Free the grille panel from the surrounding concrete and reinforcing bars and lift clear of the balcony wall cavity. Secure a tie wire fitted with a turnbuckle to the exposed spigot and the nearer floor-mounted eye bolt;

m. Vacuum and wet clean the encapsulated grille panel after removal from the wall cavity;

n. Secure the exposed edges of the grille panel with 2 layers of 0.15 mm thick polythene, secured in place by waterproof, self-adhesive tape.

DEM2.W550.8 REMOVAL OF BALCONY GRILLE PANELS (ENCAPSULATED ON BOTH SIDES)

1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520:

   a. Access balconies from the living room area of each domestic unit through a designated route and a hygiene unit;

   b. Removal operatives in the working zone are to wear Approved ori-nasal half face masks fitted with air filters, Approved disposable coveralls and knee length rubber boots with non-slip soles. Wear gloves if it is considered necessary;

   c. Ensure operatives working on the external face of the balcony panel use a safety harness attached to a secure anchorage or life line;

   d. Ensure operatives on the external face secure all tools and equipment to a safety line;

   e. Remove all existing metal guard grilles, glazing, toilet walls and bases, cooking benches and other fittings or furniture which may obstruct access to the balcony grille panels. Transport all debris from the removal works by an Approved route.

2. Removal:

   a. Clear up as work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed;

   b. During the removal operation, continuously spray panels and surrounding concrete surfaces with water containing a wetting agent;

   c. Fix a 5 mm thick, plywood panel against the external face of the balcony wall. Fit with non-intercellular nitrile neoprene rubber seals, contoured to ensure no leakage of dust. Cover the internal face and seals of the panel and the floor of the balcony with a double layer of 0.15 mm thick, polythene sheeting, secured by waterproof, self adhesive vinyl tape;

   d. Install a screen in the space above the spandrel beam and the underside of the upper balcony beam. Construct screen using a timber framework, supporting a woven, nylon tarpaulin sheet;
e. Using a powered, low-voltage chisel or hand chisel, chip away the concrete on the spandrel beams and posts to the top and sides of the grille panel to expose the full extent of grille panel reinforcement bar fixings, leaving the grille panel unrestrained. Cut all exposed grille panel reinforcing bars with bolt cutters. Ensure eye protectors are worn by operatives during this operation;

f. Remove the base ledge of the balcony wall adjoining the panel with a hand chisel;

g. Free the grille panel from the surrounding concrete and reinforcing bars and lift clear of the balcony wall cavity. Secure a tie wire fitted with a turnbuckle to the exposed spigot and the nearer floor-mounted eye bolt;

h. Vacuum and wet clean the encapsulated grille panel after removal from the wall cavity;

i. Secure the exposed edges of the grille panel with 2 layer of 0.15 mm thick polythene, secured in place by waterproof, self-adhesive tape.

DEM2.W560.8 REMOVAL OF STAIRCASE GRILLE PANELS

1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520:

a. Access staircases from the inside of the building through the designated route and a hygiene unit as DEM2.W540;

b. Removal operators in the working zone are to wear ori-nasal half face masks fitted with Approved air filters, Approved disposable coveralls and knee length rubber boots and non-slip soles. Wear gloves if it is considered necessary;

c. Position a full height screen across the staircase landing and linking lobby to prevent the escape of debris. Construct screen using a timber framework supporting 0.15 mm thick polythene sheeting. The timber frame if well-covered and cleaned up can be re-used. Erect partial screening where necessary to avoid cross contamination of other work areas;

d. Remove any demolition debris from stairwells or lobbies prior to commencement of asbestos removal work;

e. Cover the floor areas between the grille block panels and the screen with a double layer of 0.15 mm thick polythene sheeting secured by waterproof, self adhesive vinyl tape;

f. Secure, using direct fastening anchor bolts, a purpose made plywood screen, maintained in good condition for re-use, to cover the external face of the grille block panel. Fix a double layer of 0.15 mm thick polythene sheeting to the internal face of the screen.

2. Removal:

a. Clear up as work proceeds. Prevent debris accumulating on the floor where it may be further broken or crushed;

b. Prior to removal, spray working area and panels with water containing a wetting agent;

c. Use hand tools to remove panels. Spray water containing a wetting agent to working area and exposed edges of the panel;

d. Chase out grooves in the panel openings to remove all visible traces of the panels;
e. Position a vacuum cleaner (as DEM2.M120) near the panel, enabling the suction hose to be as near as is practical to the work area. Ensure that during the asbestos removal works the vacuum unit is in continuous operation;

f. Remove panels block by block, avoiding fragmentation;

g. Place blocks inside 0.15 mm thick polythene disposal sacks and seal with waterproof, self adhesive tape. Additional sacks may be required if deemed necessary by the CM;

h. Remove all remaining debris at the end of each work shift.

DEM2.W570.8 REMOVAL OF ROOF INSULATION TILES

1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520:

   a. Access asbestos removal work area through a designated route and the hygiene unit;

   b. Isolate asbestos removal work area from internal spaces with 0.15 mm thick polythene sheeting;

   c. Exclude all personnel not directly involved with the work. Post warning notices prohibiting access and alert others not involved in the work of the presence of asbestos;

   d. All removal operatives are to wear Approved ori-nasal half masks fitted with Approved air filters, Approved disposable coveralls and knee length rubber boots with non-slip soles. Wear full face positive pressure respirator if asbestos other than chrysotile is present. Wear gloves if it is considered necessary;

   e. Take full account of prevailing weather conditions, and the following, to avoid dispersion of asbestos fibres to adjoining buildings:

      i. Under normal conditions: schedule asbestos removal works on a daily basis to allow for preparation, removal, bagging and cleaning up of debris;

      ii. During windy conditions: seek Approval to continue prior to commencement of the asbestos removal works. Erect a suitable 1000 mm high wind break of tarpaulin sheeting supported on a substantial bamboo framework;

      iii. Special circumstances (e.g. working immediately adjacent adjoining residential accommodation): prevent entry of asbestos dust by erecting a 2000 mm high screen, fabricated from tarpaulin sheets supported on a bamboo frame. Extend the screen on both sides by 2000 mm minimum beyond the edge of the block to be demolished. Ensure all screens are secured against the wind.

2. Removal:

   a. Clear up as asbestos removal works proceed bagging all resulting debris on removal of tiles. Prevent debris accumulating on the floor and becoming further broken or crushed. Remove all remaining debris at the end of each workshift;

   b. Spray amended water using a low pressure water spray onto the roof tiles during the course of the removal works;

   c. Use hand tools for the removal operation. Take care whilst lifting the tiles to ensure breakage is kept to a minimum;
d. Use hand chisels to remove all the remaining portions of tiles from the cement screed.

**DEM2.W580.8 REMOVAL OF REFUSE CHUTES**

1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520:
   a. Be aware of the potential high risk to nearby residents of this type of removal work and pay particular attention to minimizing the release of dust from the asbestos removal works;
   b. Removal operators in the working zone are to wear ori-nasal half faced masks fitted with Approved HEPA filters, Approved disposable coveralls and shoe covers. Full face positive pressure respirators fitted with HEPA filters are worn if amosite or crocidolite are present;
   c. Carry out removal under total containment and negative pressure of 15 Pa and 6 nos. of air changes per hour minimum. Reliance on air monitoring outside the containment will not be considered sufficient;
   d. Ensure the construction of the containment conforms to the following:
      i. Unless a two floor containment zone is Approved, each floor constitutes a separate containment zone;
      ii. Each zone, including the chute aperture at each zone boundary, is completely sealed from the next. No debris is allowed to fall to the zone below the rough chute opening;
      iii. The vent pipe at roof level and the portion at ground level are included within the containment;
      iv. Removal work commences from the top working downwards;
      v. Each containment is treated as a separate entity, with a hygiene unit, an air mover and a viewing panel for external inspection of the asbestos removal works. Leave a sufficient clear space from the flue to enable the whole section of flue to be removed and manoeuvred inside the containment zone;
      vi. Construct using a timber framework faced with 2 layers of 0.15 mm thick polythene sheeting. Make airtight by sealing all joints with Approved foam sealant, spray glue and tape.
   e. Prior to commencement of asbestos removal work:
      i. Carry out a visual inspection and a smoke test with non-toxic smoke to ensure air-tightness of the containment;
      ii. On completion of successful test: switch the air-mover to exhaust smoke from the containment and carry out a visual test to ensure that the absolute filter screens out the smoke effectively and the pressure gauge indicates normal.
   f. If the test is unsuccessful: seal the air-mover and remove from site for servicing.

2. Removal:
   a. Run air movers continuously throughout the removal works and until satisfactory clearance test results are obtained;
b. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed. Minimize fibre release by wetting with amended water and HEPA vacuuming to remove debris as it is created;

c. Take down chute sections within the work zone using non-power hand tools. Do not disturb the seal between the zone below;

d. Cover and seal both sides of the short chute section passing through floor. Construct seal from timber framing faced both sides with polythene sheeting;

e. Carry out visual inspection and clearance test in the containment zone of that part of the chute removed; then

f. Repeat removal operations in next zone down, removing small section left in the upper zone from the zone below without disturbing the enclosure. The inside of the enclosing structure left on the upper zone must be decontaminated from below.

DELM2.W590.8 REMOVAL OF INTERNAL CHIMNEY FLUES

1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520:

a. Carry out removal of asbestos lagging under total containment and a negative pressure of 15 Pa minimum. Make efforts to minimize fibre release within the containment, reliance on air monitoring outside the containment will not be considered sufficient;

b. Ensure the construction of the containment conforms to the following:
   i. Each floor constitutes a separate containment zone. Provide separate containments for the portions at the roof and kitchen level (ground floor level);
   ii. Removal work commences from the top working downwards;
   iii. Each containment is treated as a separate entity, with a hygiene unit, an air mover and a viewing panel for external inspection of the asbestos removal works. Leave a clear space of 1500 mm minimum from the flue to enable the whole section of flue to be removed and manoeuvred inside the containment zone;
   iv. Construct using a timber framework faced with 3 layers of 0.15 mm thick polythene sheeting. Make airtight by sealing all joints with an approved foam sealant, spray glue and tape.

c. Prior to commencement of asbestos removal work:
   i. Carry out a smoke test with non-toxic smoke to ensure air-tightness of the containment;
   ii. On completion of successful test: switch the air-mover to exhaust smoke from the containment and carry out a visual test to ensure that the absolute filter screens out the smoke effectively and the pressure gauge indicates normal;
   iii. If the test is unsuccessful: seal the air-mover and remove from site for servicing.

d. Removal operators are to wear Approved full face positive pressure respirators fitted with HEPA filters, Approved disposable coverall and shoe cover.

2. Removal:
a. Run air movers continuously to provide at least 6 air changes per hour throughout the removal works and until satisfactory clearance tests are obtained;

b. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed. Minimize fibre release by wetting with amended water and HEPA vacuuming to remove debris as it is created;

c. Carry out asbestos removal to a maximum of two adjoining vertical zones at any one time. Treat each horizontal as a separate zone;

d. Where only surface lagging is to be removed from the chimney flue, apply wetting agent in accordance with the manufacturer's recommendations to all surfaces of the internal chimney flue lagging as the works proceed. Ensure complete penetration of the lagging material before removing. Completely de-lagg the section of the flue within a zone using non-power hand tools, decontaminate and carry out a clearance test prior to commencing asbestos removal work on any further zone;

e. Where the flues are of asbestos cement or in a poor condition carry out the following:

   i. Within each containment zone: double wrap flue section in polythene sheeting and remove with the lagging using non-power hand tools. Double wrap flue sections in polythene sheeting before removal from containment;

   ii. Remove the portion of the flue that passes through the floor slab once the containment zone on the floor below has been constructed and its air mover has been switched on. The holes left are completely sealed;

   iii. Removal work in 2 adjoining zones may be carried out at one time if containment zone has been built below and its air mover switched on.

---

DEM2.W600.8 REMOVAL OF EXTERNAL CHIMNEY FLUES WITH SURFACE LAGGING

1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520:

   a. Carry out the removal of asbestos lagging under total containment and a negative pressure of 15 Pa minimum. Make efforts to minimize fibre release within the containment, reliance on air monitoring outside the containment will not be considered sufficient;

   b. Design and construct containment in a manner which minimizes risk of exposure;

   c. When designing and constructing the external containment structure, consider the following:

      i. Asbestos removal work method to be employed;

      ii. Safety aspects of working at height;

      iii. Maintaining the weatherproof integrity of the structure.

   d. Erect a suitable double scaffolding, comprising the following:

      i. An access staircase outside the containment. Where the staircase is constructed of bamboo or similar, ensure gaps between steps do not exceed 300 mm and landings have supports at 300 mm maximum centres, sturdy enough to support a fully laden man plus equipment;

      ii. A work platform every two floors inside the containment;
ASBESTOS REMOVAL

iii. A safe internal access within the containment;

iv. A hoist system for transportation of waste;

v. A tarpaulin cover to encase the structure externally, securely fixed to withstand wind conditions.

e. Dismantle existing installations including ventilation ducts that obstruct access to the flue. Do not disturb the flue during this operation and the erection of the scaffolding;

f. Ensure the construction of the containment conforms to the following:

i. Line the platform inside the containment with 18 mm thick plywood covered with 2 layers of 0.15 mm thick polythene sheeting. Support all joints in the plywood lining;

ii. Construct using a timber framework faced with 3 layers of 0.15 mm thick polythene sheeting securely fixed to battens tied to the scaffolding structure. Make airtight by sealing all joints with an Approved foam sealant, spray glue and tape;

iii. Install fluorescent tubing or similar non-heat producing lighting inside the containment to provide adequate illumination;

iv. Treat each containment zone as a separate entity, with a hygiene unit, an air mover and a viewing panel for external inspection of the asbestos removal works.

g. Prior to commencement of asbestos removal work:

i. Carry out a smoke test with non-toxic smoke to ensure air-tightness of the containment;

ii. On completion of a successful test: switch the air-mover to exhaust smoke from the containment and carry out a visual test to ensure that the absolute filter screens out the smoke effectively and the pressure gauge indicates normal;

iii. If the test is unsuccessful: seal the air-mover and remove from site for servicing.

h. Removal operators are to wear Approved full face positive pressure respirators fitted with HEPA filters, Approved disposable coverall and shoe cover.

2. Removal:

a. Run air movers continuously throughout the asbestos removal works and until satisfactory clearance tests are obtained;

b. Clear up asbestos proceeding from top to bottom zone by zone as the removal work proceeds. Each zone is approximately 2 floors in height. Prevent debris accumulating on the floor and becoming further broken or crushed. Minimize fibre release by wetting with amended water and HEPA vacuuming to remove debris as it is created;

c. Carry out asbestos removal to a maximum of two adjoining vertical zones at any one time. Treat each horizontal section as a separate zone;

d. Keep fibre release to a minimum by wetting with amended water and a HEPA vacuum to remove debris as it is created. Completely de-lagg the section of the flue within a zone using non-power hand tools, decontaminate and carry out a clearance test prior to commencing asbestos removal work on any further zone;
e. Where the external flue is in a poor condition, remove flue section with lagging to a maximum of 2000 mm in length, using non-powered hand tools. Double wrap flue sections in polythene sheeting prior to removal from containment.

**DEM2.W610.8 REMOVAL OF SANDWICHED FLUES**

1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520:
   a. Carry out the asbestos removal work under total containment and a negative pressure of 15Pa minimum. Make efforts to minimize fibre release within the containment. Ensure containment is large enough to allow manoeuvring of the floor sections but not greater than eight floors in height;
   b. Remove the whole flue to get rid of asbestos lagging. Ensure fibre release within the containment is minimized. Reliance on air monitoring outside the containment will not be considered sufficient;
   c. Design and construct the containment to minimize the risk of exposure to asbestos containing materials;
   d. When designing and constructing the external containment structure, consider the following:
      i. Asbestos removal work method to be employed;
      ii. Safety aspects of working at height;
      iii. Maintaining the weatherproof integrity of the structure.
   e. Erect a suitable double scaffolding, comprising the following:
      i. An access staircase outside the containment.
      ii. A work platform every two floors inside the containment;
      iii. A safe internal access within the containment;
      iv. A hoist system for transportation of waste;
      v. A tarpaulin cover to encase the structure externally, securely fixed to withstand wind conditions.
   f. Dismantle existing installations including ventilation ducts that obstruct access to the flue. Do not disturb the flue during this operation and the erection of the scaffolding;
   g. Ensure the construction of the containment conforms to the following:
      i. Construct using a scaffolding framework, faced with 2 layers of 0.15 mm thick polythene sheeting fixed to battens. Make airtight by sealing all joints with an Approved foam sealant, spray glue and tape.
   h. Treat each containment zone as a full height separate entity, with a hygiene unit, an air mover and a viewing panel for external inspection of the asbestos removal works;
   i. Prior to commencement of asbestos removal work:
      i. Carry out a smoke test with non-toxic smoke to ensure air-tightness of the containment;
      ii. On completion of successful test: switch the air-mover to exhaust smoke from the containment and carry out a visual test to ensure that the absolute filter screens out the smoke effectively and the pressure gauge indicates normal;
iii. If the test is unsuccessful: seal the air-mover and remove from site for servicing.

2. Removal:
   a. Run air movers continuously throughout the asbestos removal works to provide at least 6 air changes per hour and maintain a negative pressure of at least 15 Pa and until satisfactory clearance tests are obtained;
   b. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed. Minimize fibre release by wetting with amended water and HEPA vacuuming to remove debris as it is created;
   c. Remove whole flue complete to ensure removal of all asbestos lagging;
   d. Treat each horizontal section as a separate zone. Commence removal work from the top working downwards. Wet exposed lagging and insulation with Amended Water and keep them damp all the time;
   e. Dismantle the flue in sections by unbolting the flanged joints, preventing where possible damage to the flue walls. Seal both ends of the flue with PVC tape before transferring by hoist to ground level.

**DEM2.W620.8 REMOVAL OF ASBESTOS-CONTAINING CORRUGATED SHEET ROOFING**

1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520:
   a. Access the asbestos removal work area through a designated route and the hygiene unit;
   b. Clean area beneath the roofing and lay 2 layers of plastic sheeting over the floor area to collect debris;
   c. Treat asbestos cement sheets being removed as asbestos waste;
   d. Fix suitable signs;
   e. All workers must wear Approved half-face or nasal respirators and disposable coveralls with a hood during the removal work.

2. Removal:
   a. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor or ground and becoming further broken or crushed;
   b. During the asbestos removal operation continuously spray roofing sheets and surrounding roof surface with amended water to keep them wet all the time;
   c. Remove and dispose of asbestos cement roofing sheets with care, avoiding free fall of asbestos containing debris from a height above 500 mm;
   d. Remove sheets intact as far as is practicable using non-power hand tools. Keep unavoidable breakage to a minimum;
   e. Wrap all removed sheets in 2 layers of 0.15 mm thick polythene and label as asbestos waste. Collect the debris into the labelled asbestos waste bags and seal securely with PVC tape.

**DEM2.W630.8 REMOVAL OF CEMENT COVERED CORRUGATED ASPHYTES SHEET ROOFING**

1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520;
a. Access the asbestos removal work area through a designated route and the hygiene unit;

b. All workers must wear Approved half face ori-nasal respirators and disposable coveralls during the removal work.

2. Removal:
   a. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed;
   b. During the removal operation continuously spray roofing sheets and surrounding roof sheets with amended water;
   c. Remove and dispose of asbestos cement roofing sheets with care, avoiding free fall of asbestos containing debris from a height above 500 mm. Where a hazard of falling debris above this height exists, carry out the following, or similar Approved operation ensuring no free falling of asbestos debris:
      i. Securely connect a steel lifting frame of sufficient strength onto and across the underside for subsequent lifting of the roof;
      ii. Fix four wire slings of sufficient strength to the four upturns of the steel beams with the free ends fixed to a crane. Avoid staying directly below;
      iii. Once the complete roof is suspended from above by the crane, cut and remove all supports lower down onto the floor and disconnect the wire slings.
   d. Remove sheets intact as far as is practicable using non-power hand tools. Keep unavoidable breakage to a minimum;
   e. Wrap all removed sheets in 2 layers of 0.15 mm thick polythene and label as asbestos waste.

DEM2.W640.8 REMOVAL OF CHALKBOARDS CONTAINING ASBESTOS

1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520;
   a. Access the asbestos removal work area through a designated route and the hygiene unit. Fix a suitable sign;
   b. Removal operators in the working zone are to wear ori-nasal half face masks fitted with Approved air filters, Approved disposable coveralls and knee length rubber boots with non-slip soles. Wear gloves if it is considered necessary;
   c. Dispose contaminated clothing and used respirator filters after each shift;
   d. Line the floor of the classroom within 2000 mm of the chalkboard with 2 layers of polythene sheeting.

2. Removal:
   a. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed;
   b. Remove the chalkboard in one piece using hand tools, wrap in 2 layers of 0.15 mm thick polythene sheeting and seal with PVC tape and label;
   c. Use a mist spray during the removal process to suppress dust release. Remove any dust or debris generated immediately by vacuuming and wet-wiping;
   d. Wet wipe and clean walls and floors within 2 metres with HEPA vacuum cleaner.
DEM2.W650.8  REMOVAL OF BUILDING SERVICES INSTALLATION

1. Preparation procedures: comply with the general preparation procedures as DEM2.W520:
   a. Removal operators in the working zone are to wear ori-nasal half face masks fitted with Approved air filters, Approved disposable gloves.

2. Removal:
   a. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further broken or crushed;
   b. Do not disturb the ACM whilst dismantling or dismounting any building services installation;
   c. Where part of an installation containing asbestos is required to be detached, carefully remove in tact;
   d. Continually spray amended water onto the installations during the whole period of the removal;
   e. Wrap the removed installation in 2 layers of 0.15 mm thick polythene sheeting, seal with PVC tape and label.

DEM2.W660.8  REMOVAL OF BUSBAR RISER TRUNKING

1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520:
   a. All Workers must wear Approved half face ori-nasal respirators fitted with Approved air filters, Approved disposable coveralls and gloves;
   b. Use polythene sheeting to line the floor around the busbar riser trunking to collect any scattered debris;
   c. Line caulking on the ceiling of the floor below with a polythene bag or sheet, fitted with a HEPA vacuum cleaner to draw any fibre generated in the removal of caulking from above. Dispose of as asbestos waste.

2. Removal:
   a. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further crushed or broken;
   b. Carefully chisel off all caulking with minimum generation of dust. Remove all asbestos fibres by thoroughly vacuuming and wiping with a clean, dry cloth the outside of the busbar riser trunking, the concrete kerb and the ceiling of the floor below;
   c. Remove the whole section of busbar riser trunking without disturbing the fire barrier or breaking the concrete kerb and wrap in 0.15 mm thick polythene sheeting, seal with tape and dispose of as asbestos waste. Wrap both ends of the trunking to prevent dropping any accessory of the fire barrier;
   d. Handle caulking for underground cable, conduit or trunking through floor slab in a similar manner.

DEM2.W670.8  REMOVAL OF FLEXIBLE JOINT OR CAULKING TO CONDUIT OR TRUNKING THROUGH FLOOR SLABS

1. Preparation procedures: in addition to the general preparation procedures as DEM2.W520:
   a. Use polythene sheeting to line the area of floor adjacent to caulking removal works to collect any scattered debris;
b. Wet the flexible joint/gasket or caulking with wetting agent.

2. Removal:
   a. Clear up as asbestos removal work proceeds. Prevent debris accumulating on the floor and becoming further crushed or broken;
   b. Vacuum clean the flexible joint/gasket or caulking and the adjacent ducting with HEPA vacuum cleaner;
   c. Wet the flexible joint/gasket or caulking with wetting agent and wrap it with 2 layers of plastics;
   d. Carefully chisel off all caulking. Spray the flexible joint with amended water to keep it wet. Remove all asbestos fibres by thoroughly vacuuming and wiping with a clean, dry cloth the outside of the trunking;
   e. Wrap the flexible joint/gasket or caulking in double layers of 0.15 mm polythene sheets for disposal.

WORK ON COMPLETION

DEM2.W710.8 GENERAL
Carry out the following operations on completion of the asbestos removal work:

1. Designate a secure area located at ground level to use as a secure area to receive bagged asbestos waste;

2. Install a closed hoist to transport the bagged asbestos waste to ground level;

3. Collect debris into labelled asbestos waste bags and seal securely with PVC tape;

4. Double bag all labelled asbestos waste in an airlock before transferring to the hoist area. Take care at all times when handling the bags to avoid damage;

5. Remove all plastic, protective sheeting and timber framing and dispose of as contaminated waste. Where permitted by the CM, well covered and cleaned timber frame and external cover panels may be re-used;

6. Wrap all items too large to fit normal waste disposal sacks using 0.15 mm thick polythene sheeting, secured by vinyl tape and label clearly as asbestos waste;

7. Take all sacks and wrapped debris to a designated collection point through an Approved route, vacuum and wet clean and place in a further 0.15 mm thick polythene bag or wrap in a second layer of 0.15 mm thick polythene, sealed using waterproof, self adhesive vinyl tape;

8. Metal drums may be used as an alternative to polythene bags, provided the following is complied with:
   a. Conform with EPD disposal requirements;
   b. Do not place or roll drums directly onto asbestos roof tiles, or cause crushing of tiles;
   c. Make available a cleared area for the storage of drums containing asbestos debris;
   d. Seal and remove all drums, whether or not filled, from the work area to the storage area at the end of each day's work and ensure that the drums undergo decontamination prior to removal;
   e. Sack barrows may be used in the Work Area for transportation of drums;
   f. Take steps to prevent dust releasing from drums.
9. Vacuum and wet clean nylon tarpaulin screen, and all tools and equipment for re-use after a satisfactory re-assurance test has been carried out. Tools and equipment are secured inside polythene bags before taken off the site;

10. Ensure each asbestos removal working zone/containment is clean and dust free before the workmen leave site at the end of each day's work;

11. Remove all dust and debris from operators’ clothing and footwear after a work shift or on leaving the site;

12. Arrange for a clearance/reassurance test and an inspection by the CM to be carried out for the whole working zone after the area is vacuumed and wet cleaned. If the test result indicates fibre levels in excess of 0.01 fibres per ml, reclean the working zone and carry out a further test, at the Contractor's own expense and with no claim for any extension of time;

13. Number all bags containing asbestos waste using a waterproof pen. The Authority's site staff will keep a record of the waste;

14. Pass all waste water through an Approved filter to remove all particles to a level of 5 microns in suspension before discharging into the drainage system.

**DEM2.W720.8 BALCONY AND STAIRCASE GRILLE PANELS**

In addition to the relevant general requirements as DEM2.W710 carry out the following:

1. Vacuum and wet clean walls and floor of the balcony and any areas within the asbestos removal working zone. The polythene sheeting on the floor of the balcony is placed in asbestos disposal bags and disposed of as contaminated waste;

2. Vacuum and wet clean the area surrounding the grille panel cavity;

3. Seal filled sacks with waterproof, self adhesive vinyl tape. Large or unwieldy items may be wrapped in 0.15 mm thick polythene sheet, secured by vinyl tape and labelled as asbestos waste;

4. On satisfactory completion of the clearance test, spray PVA on polythene covering to the panels at the external face of the balcony wall and the polythene sheeting before dismantling the containment and dispose as contaminated waste;

5. At the end of each day's work, allow for the complete removal of the grille panel and the clearing up of the debris in a flat.

**DEM2.W730.8 ROOF INSULATION TILES**

In addition to the relevant general requirements as DEM2.W710 carry out the following:

1. Thoroughly clean the roof screed, all containmented surfaces and equipment with a vacuum cleaner and wet cloths as soon as debris is produced;

2. Transfer labelled asbestos waste bags to a clean area outside the Work Area where they are wiped clean and double-bagged.

**DEM2.W740.8 REFUSE CHUTES**

In addition to the relevant general requirements as DEM2.W710 carry out the following:

1. Double wrap chute sections in polythene sheets before passing out of the containment;

2. On satisfactory completion of the clearance test, spray PVA on the polythene sheeting before dismantling the containment;
3. Remove timber frame and dispose of as asbestos waste. Re-use timber shuttering if it has been well covered during the asbestos removal works and has been thoroughly cleaned;

4. Number bags and wrapped chute sections and provide record to HD site staff. Provide a certificate from the dump site to HD site staff.

DEM2.W750.8  INTERNAL CHIMNEY FLUES

In addition to the relevant general requirements as DEM2.W710 carry out the following:

1. Double bag all asbestos waste bags in the middle chamber of the airlock before transferring to the ground level secure store;

2. On completion of removal of the lagging, wire brush the surfaces of the flue to remove any remaining debris;

3. Arrange for a Penultimate Tests after inspection by CM that the area is free of debris and dust. If test results exceed 0.01 fibres/ml, reclean the area and carry out further Penultimate Test. If test results satisfactory, wet wipe and vacuum the area and arrange for a final clearance test;

4. Number bags and wrapped flue sections and provide record to HD site staff. Provide a certificate from the dump site to HD site staff;

5. On satisfactory completion of the final clearance test, spray PVA on the polythene sheeting before dismantling the containment.

DEM2.W760.8  EXTERNAL CHIMNEY FLUES WITH SURFACE LAGGING

In addition to the relevant general requirements as DEM2.W710 carry out the following:

1. On completion of removal of the lagging, wire brush the surfaces of the flue to remove any remaining debris;

2. Install a hoist system within the tarpaulin enclosure for transportation of the bagged asbestos waste to ground level. The hoist is closed cage type;

3. Arrange for a Penultimate Tests after inspection by CM that the area is free of debris and dust. If test results exceed 0.01 fibres/ml, reclean the area and carry out further Penultimate Test. If test results satisfactory, wet wipe and vacuum the area and arrange for a final clearance test;

4. Number bags and wrapped flue sections and provide record to HD site staff. Provide a certificate from the dump site to HD site staff;

5. On satisfactory completion of the clearance test, spray PVA on the polythene sheeting before dismantling the containment.

DEM2.W770.8  SANDWICHED FLUES

In addition to the relevant general requirements as DEM2.W710 carry out the following:

1. Wipe clean flue sections and wrap in polythene before removing from the containment;

2. Install a hoist system within the tarpaulin enclosure for transportation of the bagged asbestos waste to ground level. The hoist is closed cage type;

3. Arrange for a Penultimate Tests after inspection by CM that the area is free of debris and dust. If test results exceed 0.01 fibres/ml, reclean the area and carry out further Penultimate Test. If test results satisfactory, wet wipe and vacuum the area and arrange for a final clearance test;
4. Number bags and wrapped flue sections and provide record to HD site staff. Provide a certificate from the dump site to HD site staff;
5. On satisfactory completion of the clearance test, spray PVA on the polythene sheeting before dismantling the containment.

DEM2.W780.8 CORRUGATED SHEETS AND CEMENT COVERED CORRUGATED SHEETS
In addition to the relevant general requirements as DEM2.W710 carry out the following:
1. Thoroughly clean by wet wiping, HEPA vacuuming and manual scraping any debris adhering to the floor, the steel structure and the steel runners etc.;
2. Clean Work Area before the end of the day;
3. Number bags and wrapped flue sections and provide record to HD site staff. Provide a certificate from the dump site to HD site staff.

DEM2.W790.8 BUSBAR RISER TRUNKING AND BUILDING SERVICES INSTALLATION
In addition to the relevant general requirements as DEM2.W710 carry out the following:
1. Vacuum and wipe with clean, dry cloth all surfaces within the rooms to both floors to remove any asbestos fibres. Only contaminated tools may be cleaned with a damp cloth;
2. Wet wipe outer surface of the bagged waste and wrapped ACM. Wrap in another polythene sheet or bag and label outside the working area.

DEM2.W800.8 CHALKBOARDS
In addition to the relevant general requirements as DEM2.W710 carry out the following:
1. Vacuum and wipe clean the area adjacent to the asbestos removal works to a distance of 2000 mm;
2. Wet wipe outer surface of the bagged waste and wrapped ACM. Wrap in another polythene sheet or bag and label outside the working area.

DEM2.W810.8 DISPOSAL OF WASTE
1. Dispose of all asbestos waste in a designated site and in strict accordance with the 'Code of Practice on the Handling, Transport and Disposal of Asbestos Waste', issued by the Environmental Protection Department (EPD);
2. Temporarily store all asbestos waste in sealed bags in a secure Approved store. Remove waste from store commencing from the top working downwards unless otherwise Instructed;
3. On completion of asbestos removal to an entire floor invite the CM to inspect the works and check the number of waste bags for that zone prior to removing the bags to the secure store;
4. To avoid over accumulation of waste at the appointed site, provide information to EPD stating the proposed schedule for disposal of asbestos waste;
5. Provide transport and all necessary equipment required for disposal of asbestos waste;
6. Collect all water used within the asbestos removal works, including that used in washing facilities, by means of sumps and pumps and pass through an aquarium type filter or similar Approved to remove particles down to 5 microns in suspension before discharging into the drainage system;
7. Inform the CM at least 7 days prior to disposal of waste from site. Inform the CM the type of waste and the number and location of packages to be disposed prior to removing from site. Submit a signed copy of each delivery note to the CM;

8. Asbestos removal work will not be permitted to proceed to more than two floors below a level if provisional acceptance of the asbestos removal work has not been obtained from the CM;

9. Upon satisfactory visual inspection of the works by the CM on completion of one entire floor, arrange for Clearance/Reassurance Tests to be carried out by the Direct Testing Contractor.

**EMERGENCY PROCEDURES**

**DEM2.W910.8** **GENERAL**

If during the course of the asbestos removal works any of the following situations occur, inform the CM and carry out the following specified procedures immediately. Any stoppage or reduction in output resulting in compliance with this clause will not result in any extension of time for completion or to any additional costs claimed.

**DEM2.W920.8** **SPILLAGE OF ASBESTOS DEBRIS**

1. Stop all processes which may result in the production of asbestos dust;
2. Spray all surfaces and debris within the asbestos removal work area with amended water in a fine mist spray, using airless spray equipment;
3. Bag all loose asbestos debris present in the asbestos removal work area and remove to a secure store. Wipe clean and vacuum all surfaces when the surface is dry;
4. Prepare the site of the remedial work for inspection by the CM and air testing prior to recommencing removal work.

**DEM2.W940.8** **FIRE**

1. Spray all surfaces and debris within the asbestos removal work area with amended water in a fine mist spray, using airless spray equipment once the fire has been extinguished and the Site is safe for re-entry;
2. Bag all loose asbestos debris present in the asbestos removal work area and remove to a secure store. Wipe clean and vacuum all surfaces when the surface is dry;
3. Prepare the Site for inspection by the CM and air testing prior to recommencing removal work.

**DEM2.W950.8** **ACCIDENT**

1. Stop all work and if necessary remove worker(s) to a safe area;
2. If a worker has collapsed remove face mask (in all other cases the face mask should be left in place), carry out normal emergency first aid procedures and arrange to transfer the worker to hospital. Personal decontamination should be carried out if possible;
3. Where it is impossible to carry out decontamination procedures on the worker, inform the medical team to enable them to take the appropriate safety measures;
4. Bag all loose asbestos debris present in the asbestos removal work area and remove to a secure store. Wipe clean and vacuum all surfaces and any adjoining area contaminated during the emergency;
5. Prepare the Site for inspection by the CM and air testing prior to recommencing removal work.

DEM2.W960.8  TYPHOON SIGNAL NUMBER 3 AND ABOVE

1. Stop all processes which may result in the production of asbestos dust;
2. Spray all surfaces and debris within the asbestos removal work area with amended water in a fine mist spray, using airless spray equipment;
3. Bag all loose asbestos debris present in the asbestos removal work area and remove to a secure store. Wipe clean and vacuum all surfaces;
4. Cut off all power and water supplies and secure all loose equipment against typhoon damage;
5. Arrange a revised inspection by the CM before the workers leave Site;
6. Recommence the removal works once the No 3 typhoon signal has been lowered, the necessary cleaning up work and repairs to containment have been completed and permission has been given by the CM.

DEM2.W970.8  PERSONAL PROTECTION DECONTAMINATION

Prior to leaving the site ensure all operatives:

1. Are provided with showering facilities and all items including sponge and brush necessary to clean respiratory equipment and protective clothing;
2. Wet and remove all dust and debris from working clothing and footwear using an Approved vacuum cleaner before going out of the working area;
3. Follow the designated route to the hygiene unit. On entering the dirty end wet their respirators and protective clothing, contaminated equipments are stored in labelled waste disposal receptacle in the dirty area;
4. Remove clothing after wetting thoroughly in the dirty area of the hygiene unit, and place into a labelled disposal bin. Remove footwear and leave for cleaning and decontamination;
5. Pass into the shower area, wash thoroughly particularly hair and finger nails, discarding the respirator filter in a designated bin;
6. Do not remove respiratory protective equipment until in the shower and the respirator has been washed;
7. Place respirators in a drying compartment of the clean area of the unit after washing, change cloths in the clean area;
8. Vacuum, wet clean and secure inside polythene bags all tools and equipment prior to removal from the asbestos removal work site.

DEM2.W980.8  ACCEPTANCE OF ASBESTOS REMOVAL WORK

1. Provisional acceptance is based on visual inspection by the CM together with air test results of Penultimate Tests within the acceptance limit;
2. Upon completion of asbestos removal and clearance of asbestos waste and equipment, the CM conducts a final inspection;
3. Final acceptance is based on visual inspection by the CM together with Final Clearance Test results within the acceptance limit;
4. After final acceptance, the site is safe to continue with demolition work.
TESTING

AIR MONITORING TEST

DEM2.T010.8   AIR MONITORING TESTS BORNE BY EMPLOYER

The Authority will employ at its own expense a Direct Testing Contractor to carry out air monitoring test as follows to measure the asbestos fibre content in the air outside and within the site during the asbestos removal works. The Authority will keep a record of all air monitoring test results for tests carried out by the Direct Testing Contractor on Site for inspection by the Contractor:

1. Prior to commencement of the asbestos removal work: air sampling tests (environmental test) shall be carried out to ascertain the background level of air quality in the vicinity of the block at locations outside the hoarding in a convenient open area, within the adjacent blocks and on the edge of the estate, and at other locations as agreed;

2. During asbestos removal work: air sampling tests (environmental test) shall be carried out daily at regular sampling points to establish the fibre level of airborne dust at the closest sensitive receptor and around the demolition site;

3. On completion of the asbestos removal works: air sampling tests shall be carried out to ascertain the air quality for clearance and reassurance (clearance test and reassurance test) in accordance with the following table:

<table>
<thead>
<tr>
<th>Items</th>
<th>Clearance/Reassurance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Balcony grille</td>
<td>1 in 10 flats (min. 2 per zone)</td>
</tr>
<tr>
<td>Stair grille</td>
<td>1 in 5 grille (min. 1 per zone)</td>
</tr>
<tr>
<td>Roof tile</td>
<td>min. 3 per roof</td>
</tr>
<tr>
<td>Refuse chute</td>
<td>1 per zone (3 for the first 10 m³ of containment size)</td>
</tr>
<tr>
<td>Chimney</td>
<td>1 per zone (3 for the first 10 m³ of containment size)</td>
</tr>
<tr>
<td>Corrugated sheet</td>
<td>1 per zone</td>
</tr>
<tr>
<td>Chalk board</td>
<td>1 per 10 nos. (min. 1 per zone)</td>
</tr>
</tbody>
</table>

DEM2.T020.8   AIR MONITORING TESTS BORNE BY CONTRACTOR

Appoint an Approved independent asbestos laboratory registered under Air Pollution Control Ordinance to carry out air monitoring tests, except those tests stated in DEM2.T010 which are to be carried out by the Direct Testing Contractor, to ensure conformity with the requirements of this Specification.

DEM2.T030.8   SURVEILLANCE TESTS BY DIRECT TESTING CONTRACTOR

For air monitoring tests that are carried out by the Approved independent laboratory, CM may employ Direct Testing Contractor to carry out parallel tests.
AIR MONITORING TESTS

1. Testing arrangements:
   a. Comply with the air monitoring requirements in the Asbestos Abatement Plan as approved by EPD;
   b. Arrange and allow for coordination of the air monitoring operations within the programme for the asbestos removal works;
   c. Arrange a representative to present at all stages of the air monitoring tests if possible. Non-attendance at test will not invalidate test results.

2. Testing methods:
   a. As DEM2.M020;
   b. Do not exceed the following levels during and on completion of the asbestos removal works and provide the appropriate respiratory protective equipment for personnel involved:
      i. During asbestos removal works:
         - Amosite or crocidolite: 0.2 fibre per millilitre;
         - Other types of asbestos: 0.5 fibre per millilitre.
      ii. On completion of asbestos removal works (final clearance test / reassurance test) when no visible debris is apparent: 0.01 fibre per millilitre. If the limit is exceeded, re-clean the working zone and repeat final clearance / reassurance test after 24 hours, all extra time and costs are to be borne by the contractor;
      iii. Environmental air level outside tarpaulin / hoarding must not differ significantly from background level and in any case must not exceed Environmental Control Level of 0.01 fibre per millilitre.

3. Non-compliance:
   a. Where the fibre count exceeds the acceptable limit:
      i. Stop all processes which may result in the production of asbestos dust;
      ii. Spray all surfaces and debris within the asbestos removal work area with amended water in a fine mist spray, using airless spray equipment;
      iii. Bag all loose asbestos debris present in the asbestos removal work area and remove to a secure store. Wipe clean and vacuum all surfaces;
      iv. Together with the CM, investigate the integrity of the containment, identify the cause of the limit exceedance and take immediate measures, as directed by the CM, to rectify the situation.
   b. In the event of air monitoring test result failures resulting from the Contractor's non-compliance with the workmanship requirements of this Worksection, bear all costs in relation to tests carried out and those tests required subsequent to rectification of the works to confirm compliance.

GENERAL

DEFINITIONS

PIL1.G010.8 DEFINITIONS
In this Worksection, the following definitions are used:

1. "Piling Contract" shall mean a foundation contract for which the scope of works includes construction of foundation and does not include the construction of superstructure;
2. "Combined Piling and Building Contract" shall mean a contract for which the scope of works includes the construction of both the foundation and the superstructure;
3. "Contractor's Design Piling Contract / Combined Piling and Building Contract" shall mean a Piling Contract / Combined Piling and Building Contract for which the scope of works includes design of piles and/or pile caps and/or footings;
4. "Engineer's Design Piling Contract / Combined Piling and Building Contract" shall mean a Piling Contract / Combined Piling and Building Contract for which the scope of works does not include design of piles and/or pile caps and/or footings and the design of such works is provided by the CM.

PIL1.G20.8 CODE OF PRACTICE FOR FOUNDATIONS 2017
In this Specification, the Code of Practice for Foundations shall mean the Code of Practice for Foundations 2017 issued in April 2017 by the Buildings Department of the Hong Kong Special Administrative Region, and its subsequent amendment(s).

DESIGN RESPONSIBILITY

PIL1.G110.8 DESIGN RESPONSIBILITY
The design responsibility for piles, pile caps and footings is to be specified in the Project Specific Specification.

STANDARDS

PIL1.G210.8 PILING
Comply with the Code of Practice for Foundations and the relevant Building Regulations of Hong Kong.

PIL1.G220.8 PILE CAPS AND FOOTINGS
Comply with the 'Concrete Works' Worksection of this Specification in respect of all materials and workmanship for footings, reinforced concrete pile caps and for structural concrete above piles, unless otherwise specified.

PIL1.G230.8 STATUS OF THE SPECIFICATION
Where this Specification includes provisions additional to, or more stringent than those of the aforementioned British Standards, Code of Practice for Foundations or Building Regulations, the provisions of this Specification shall prevail overall.
OTHER WORKSECTIONS
Comply with the relevant provisions of other Worksections of this Specification and in particular with the following:

1. EAR1 Excavation and Filling;
2. CON1 Insitu Concrete;
3. CON2 or FOR Formwork;
4. CON3 Reinforcement;
5. STR1 Structural Steel.
6. CON9 Off-site Reinforcement Prefabrication Yard

CONTRACTOR'S DESIGN FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
In the event of any conflict, contradiction or ambiguity between the Contractor's design and this Specification, the provisions of this Specification shall prevail.

PILE TYPES

GENERAL

1. This Specification applies to pile types 1 to 7 as defined in clauses PIL1.G320 to PIL1.G375 below;
2. Where relevant, this Specification applies equally to any other type of pile.

TYPE 1 PILES

1. Type 1a piles shall mean precast reinforced concrete piles complying with the requirements stated in clause 5.4.3 of the Code of Practice for Foundations;
2. Type 1b piles shall mean precast prestressed spun concrete piles complying with the requirements stated in clause 5.4.4 of the Code of Practice for Foundations;
3. Type 1c piles shall mean driven cast-in-place concrete piles complying with the requirements stated in clause 5.4.5 of the Code of Practice for Foundations.

TYPE 2 PILES

Driven steel tube with detachable toe and precast concrete pile insert (steel tube to be withdrawn).

TYPE 3 PILES

Large diameter bored cast insitu concrete piles:

1. Cast with inserted precast concrete annuli; or
2. Cast with left-in-place lining; or
3. Cast with temporary steel casing.

TYPE 4 PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Driven steel H-piles of sizes, masses, grades and material properties to the standards as specified in the Drawings.

TYPE 4 PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Driven steel piles of types and brands recognized by BD. Submit the recognition documentation of the proposed piles issued by BD with the tender.
PILING AND FOOTING

PIL1.G360.8  TYPE 5 PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Minipiles, being defined as piles consist of a number of steel reinforcing bars encased by grout inside drill hole and comply with the requirements stated in clause 5.4.8 of the Code of Practice for Foundations, derive the structural capacity solely from the steel reinforcing bars.

PIL1.G365.8  TYPE 5 PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Minipiles, being defined as piles consist of a number of steel reinforcing bars encased by grout inside drill hole and comply with the requirements stated in clause 5.4.8 of the Code of Practice for Foundations, derive the structural capacity solely from the steel reinforcing bars.

PIL1.G370.8  TYPE 6 PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Socketed steel H-piles, being defined as piles installed by inserting steel H-piles, which their sizes, masses, grades and material properties are to the standards as specified in the Drawings, in pre-bored holes sunk into bedrock as defined in PIL1.G450 and subsequently grouting the pre-bored hole.

PIL1.G372.8  TYPE 6 PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Socketed steel H-piles, being defined as piles installed by inserting steel H-piles of types and brands recognized by BD in pre-bored holes sunk into bedrock as defined in PIL1.G450 and subsequently grouting the pre-bored hole. Submit the recognition documentation of the proposed piles issued by BD with the tender.

PIL1.G375.8  TYPE 7 PILES

Pakt-In-Place (PIP), Continuous Flight Auger Pile (CFA) as stated in clause 5.4.6(2) of the Code of Practice for Foundations or piles formed by similar techniques, being defined as non-percussive cast in-situ concrete piles with diameters not exceeding 610 mm and formed by boring with a continuous flight auger without temporary steel casing. The bored hole is filled with grout placed by pumping through the hollow orifice of the auger pipe at the pile base while withdrawing the auger from the hole.

PIL1.G380.8  ALTERNATIVE TYPES OF PILE - FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Where the Contractor proposes a type of pile other than the types specified in clauses PIL1.G320 to PIL1.G375, he must submit, with his tender, the testing regime and the acceptance standard of the quality of the piles for Approval.

SITE INVESTIGATION

PIL1.G410.8  PRELIMINARY INVESTIGATIONS

1. Tenderers may make preliminary investigations or sink test piles as they require and at their own cost. Arrangements for access to the Site can be made, on application to the CM, at least seven days in advance;

2. The period for carrying out site investigation by tenderers is scheduled to be between .................. and ..............................
PILING AND FOOTING

PIL1.G420.8 EXISTING BOREHOLE INFORMATION
Certain logs of exploratory boreholes made on Site and reports of laboratory soil test results are available for inspection by appointment at the CM's office during normal working hours. Copies of the drillhole logs and reports may also be made available to tenderers who have previously applied to the CM in writing and subject to payment of a charge for photocopying. Such information as is contained in the drillhole logs and reports is given in good faith and without prejudice to the Contractor's liabilities under the Contract.

PIL1.G430.8 CONTRACTOR'S RESPONSIBILITY
The onus is on the Contractor to satisfy himself as to the nature of the Site sub-soil conditions and to make any site investigation to obtain all information which may affect the Works.

PIL1.G440.8 ADDITIONAL INVESTIGATIONS
1. The Contractor may make such other site investigations during the Contract as he deems necessary and at his own expense;
2. The CM may order such other site investigation during the Contract as he deems necessary.

PIL1.G450.8 DEFINITION OF "BEDROCK"
1. In this Specification, "bedrock" is defined as:
   a. Rock mass of at least 5 m thick measured downwards from the pile base for Types 1, 2, 3 and 4 piles;
   b. Rock mass of at least 5 m thick or of thickness not less than the designed length of the rock socket, whichever is the greater, measured downwards from the rockhead of the specified category of rock for Type 5 and 6 piles.
2. The 'rock mass' used in sub-clause (1) shall refer to the following category of rock:
   a. For Types 1, 2, 3 and 4 piles: Rock not inferior to category 1(d) or 2 rock as described in Table 2.1 of the Code of Practice for Foundations;
   b. For Types 5 and 6 piles: Category 1(a), 1(b) or 1(c) rock as described in Table 2.1 of the Code of Practice for Foundations.
3. The Uniaxial Compressive Strength (UCS) and point load index strength stated in Table 2.1 of the Code of Practice for Foundations shall be determined by the following tests:
4. Refer to EAR1.W940 sub-clause (2) for definition of "bedrock" for footings;
5. In this Specification, the definition of "total core recovery of the designated grade" shall follow Notes (4) and (5) of Table 2.1 of the Code of Practice for Foundations.

PIL1.G460.8 WORKS REQUIRED TO BE CARRIED OUT BY A RSC(GIFW) UNDER THE CONTRACT
1. All works required to be carried out by a RSC (GIFW) under the CoPSS, including the sampling and testing founding levels to pile Types 3 to 7 inclusive as described in PIL1.T210 to PIL1.T240 inclusive and PIL1.T260 and confirmatory core testing of founding strata of Type 3 piles as described in PIL1.T1710 to PIL1.T1750 inclusive, shall be considered as ground investigation works under the contract;
2. Comply with the requirements of clause PRE.B9.250 for all works stated in sub-clause (1) of this clause.
PILING AND FOOTING

PIL1.G470.8 BACKFILLING OF DRILLHOLES
1. Unless otherwise instructed by the CM or unless the method or materials of backfilling of drillholes is specifically stated in other parts of the Specification, fill all drillholes with granular material (or with 4:1 cement bentonite grout where Instructed) and compact to the original density of the ground or a higher density;
2. Fill in and compact any subsequent depression of the ground;
3. Do not fill drillholes without the CM's permission.

APPROVED CONTRACTORS AND SUBCONTRACTORS

PIL1.G510.8 APPROVED CONTRACTORS FOR PILING WORKS - FOR ENGINEER'S DESIGN PILING CONTRACT
1. a. Contractor must be on the following Category of Housing Authority List of Piling Contractors:
   i. Type 1, 2, & 4 Piles - Percussive Piles Category;
   ii. Type 3 Pile - Large Diameter Bored Piles Category;
   iii. Any acceptable pile types other than Type 1, 2, 3 & 4 Piles - Large Diameter Bored Piles Category or Percussive Piles Category.
   b. In the event that more than one type of piles are used in the Contract, the Contractor must be on the appropriate Categories of Housing Authority List of Piling Contractors for all the pile types used.
2. In the event that the Contractor employ a Piling Sub-contractor to carry out the following piling activities, select the Piling Sub-contractor from the list given in sub-clause (3) below:
   a. Pile driving of Type 1, 2, & 4 Piles;
   b. Excavation and concreting of Type 3 Pile;
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles.
3. The Piling Sub-contractor must be on the following list:
   a. Appropriate Category of Housing Authority List of Piling Contractors; or
   b. Buildings Department List of Registered Specialist Contractors (Foundation) who has undertaken in the past five years at least three contracts in relevant piling works under ICU’s procedures or BD’s control and of contract value not less than $20M in one of the contracts and in aggregates total of not less than $40M.
4. Piling Sub-contractor for pile types other than Type 3 not on the lists in sub-clause (3) above may be considered and subject to CM's approval.

PIL1.G512.8 APPROVED CONTRACTORS FOR PILING WORKS - FOR CONTRACTOR'S DESIGN PILING CONTRACT
1. a. Contractor must be on the following Category of Housing Authority List of Piling Contractors:
   i. Type 1, 2, & 4 Piles - Percussive Piles Category;
   ii. Type 3 Pile - Large Diameter Bored Piles Category;
   iii. Any acceptable pile types other than Type 1, 2, 3 & 4 Piles - Large Diameter Bored Piles Category or Percussive Piles Category.
b. In the event that more than one type of piles are used in the Contract, the Contractor must be on the appropriate Categories of Housing Authority List of Piling Contractors for all the pile types used.

2. In the event that the Contractor employ a Piling Sub-contractor to carry out the following piling activities, select the Piling Sub-contractor from the list given in sub-clause (3) below:
   a. Pile driving of Type 1, 2, & 4 Piles;
   b. Excavation and concreting of Type 3 Pile;
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles;
   d. Foundation design.

3. The Piling Sub-contractor must be on the following list:
   a. Appropriate Category of Housing Authority List of Piling Contractors; or
   b. Buildings Department List of Registered Specialist Contractors (Foundation) who has undertaken in the past five years at least three contracts in relevant piling works under ICU’s procedures or BD’s control and of contract value not less than $20M in one of the contracts and in aggregates total of not less than $40M.

4. Piling Sub-contractor for pile types other than Type 3 not on the lists in sub-clause (3) above may be considered and subject to CM's approval.

PIL1.G515.8  
APPROVED CONTRACTORS FOR PILING WORKS - FOR ENGINEER’S DESIGN COMBINED PILING AND BUILDING CONTRACT

1. The Contractor must employ a Piling Sub-contractor to carry out the following piling activities unless the Contractor is on the relevant Category of the Housing Authority List of Piling Contractors and takes up the role of Piling Sub-contractor in carrying out the respective piling activities:
   a. Pile driving of Type 1, 2, & 4 Piles;
   b. Excavation and concreting of Type 3 Pile;
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles.

2. Requirements on Piling Sub-contractor:
   a. The Piling Sub-contractor must be on the following Category of the Housing Authority List of Piling Contractors:
      i. Type 1, 2, & 4 Piles - Percussive Piles Category;
      ii. Type 3 Pile - Large Diameter Bored Piles Category;
      iii. Any acceptable pile types other than Type 1, 2, 3 & 4 Piles - Large Diameter Bored Piles Category or Percussive Piles Category.
   b. In the event that more than one type of piles are used in the Contract, the Piling Sub-contractor must be on the appropriate Categories of Housing Authority List of Piling Contractors for all the pile types used.

3. In the event that the Piling Sub-contractor employ a Piling Sub-sub-contractor to carry out the piling activities stated in sub-clauses (1)(a) to (1)(c) above, the Piling Sub-sub-contractor must be on the following list:
   a. Appropriate Category of Housing Authority List of Piling Contractors; or
   b. Buildings Department List of Registered Specialist Contractors (Foundation) who has undertaken in the past five years at least three contracts in relevant piling works under ICU’s procedures or BD’s control and of contract value not less than $20M in one of the contracts and in aggregates total of not less than $40M.

4. Piling Sub-sub-contractor for pile types other than Type 3 not on the lists in sub-clause (3) above may be considered and subject to CM’s approval.
PILING AND FOOTING

PIL1.G517.8 APPROVED CONTRACTORS FOR PILING WORKS - FOR CONTRACTOR'S DESIGN COMBINED PILING AND BUILDING CONTRACT

1. The Contractor must employ a Piling Sub-contractor to carry out the following piling activities unless the Contractor is on the relevant Category of the Housing Authority List of Piling Contractors and takes up the role of Piling Sub-contractor in carrying out the respective piling activities:
   a. Pile driving of Type 1, 2, & 4 Piles;
   b. Excavation and concreting of Type 3 Pile;
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles;
   d. Foundation design.

2. Requirements on Piling Sub-contractor:
   a. The Piling Sub-contractor must be on the following Category of the Housing Authority List of Piling Contractors:
      i. Type 1, 2, & 4 Piles - Percussive Piles Category;
      ii. Type 3 Pile - Large Diameter Bored Piles Category;
      iii. Any acceptable pile types other than Type 1, 2, 3 & 4 Piles - Large Diameter Bored Piles Category or Percussive Piles Category.
   b. In the event that more than one type of piles are used in the Contract, the Piling Sub-contractor must be on the appropriate Categories of Housing Authority List of Piling Contractors for all the pile types used.

3. In the event that the Piling Sub-contractor employ a Piling Sub-sub-contractor to carry out the piling activities stated in sub-clauses (1)(a) to (1)(d) above, the Piling Sub-sub-contractor must be on the following list:
   a. Appropriate Category of Housing Authority List of Piling Contractors; or
   b. Buildings Department List of Registered Specialist Contractors (Foundation) who has undertaken in the past five years at least three contracts in relevant piling works under ICU’s procedures or BD’s control and of contract value not less than $20M in one of the contracts and in aggregates total of not less than $40M.

4. Piling Sub-sub-contractor for pile types other than Type 3 not on the lists in sub-clause (3) above may be considered and subject to CM's approval.

PIL1.G520.8 SUB-CONTRACTOR FOR CONSTRUCTION OF FOOTING - FOR BUILDING CONTRACT WITH FOOTING CONSTRUCTION

1. In the event that the Contractor employs sub-contractor to carry out construction of footings, the sub-contractor must be on the following list:
   a. Buildings Department List of Registered General Building Contractors; or
   b. Buildings Department List of Registered Specialist Contractors (Foundation).

2. In this specification, construction of footing shall mean construction of spread and/or raft footing and include fixing of starter bars, if any.

PIL1.G530.8 DEFINITION OF "PILING SUBCONTRACTOR" FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. In this specification, Piling Subcontractor shall mean the subcontractor employed by the Contractor for the following piling activities:
   a. Pile driving of Type 1, 2, & 4 Piles; and/or
   b. Excavation and/or concreting of Type 3 Pile; and/or
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles.
2. Such contract between the Contractor and the Piling Subcontractor shall be termed the Piling Subcontract.

**PIL1.G535.8** DEFINITION OF "PILING SUBCONTRACTOR" FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. In this specification, Piling Subcontractor shall mean the subcontractor employed by the Contractor for the following piling activities:
   a. Pile driving of Type 1, 2, & 4 Piles; and/or
   b. Excavation and/or concreting of Type 3 Pile; and/or
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles; and/or
   d. Foundation design.
2. Such contract between the Contractor and the Piling Subcontractor shall be termed the Piling Subcontract.

**PIL1.G540.8** DEFINITION OF "PILING SUB-SUBCONTRACTOR" FOR ENGINEER'S DESIGN COMBINED PILING AND BUILDING CONTRACT ONLY

1. In this specification, Piling Sub-subcontractor shall mean the subcontractor employed by the Piling Subcontractor for the following piling activities:
   a. Pile driving of Type 1, 2, & 4 Piles; and/or
   b. Excavation and/or concreting of Type 3 Pile; and/or
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles.
2. Such contract between the Piling Subcontractor and the Piling Sub-subcontractor shall be termed the Piling Sub-subcontract.

**PIL1.G545.8** DEFINITION OF "PILING SUB-SUBCONTRACTOR" FOR CONTRACTOR'S DESIGN COMBINED PILING AND BUILDING CONTRACT ONLY

1. In this specification, Piling Sub-subcontractor shall mean the subcontractor employed by the Piling Subcontractor for the following piling activities:
   a. Pile driving of Type 1, 2, & 4 Piles; and/or
   b. Excavation and/or concreting of Type 3 Pile; and/or
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles; and/or
   d. Foundation design.
2. Such contract between the Piling Subcontractor and the Piling Sub-subcontractor shall be termed the Piling Sub-subcontract.

**PIL1.G550.8** RESTRICTION ON PILING SUBCONTRACT

The number of Piling Subcontractor shall be limited to one per each type of piles unless otherwise approved by the CM.

**PIL1.G560.8** RESTRICTION ON PILING SUB-SUBCONTRACT - FOR COMBINED PILING AND BUILDING CONTRACT ONLY

The number of Piling Sub-subcontractor shall be limited to one per each type of piles unless otherwise approved by the CM.

**PIL1.G570.8** INFORMATION ON PILING SUBCONTRACT

Submit with the tender the following information:
1. Letter of intent from the proposed Piling Subcontractor whom the tenderer intends to employ for the Contract should the tenderer be awarded the Contract, indicating his willingness to carry out the proposed Piling Subcontract;

2. The names of the directors or sole proprietor and site representatives of the proposed Piling Subcontractor;

3. The piling activity and the scope of the proposed Piling Subcontract;

4. The minimum numbers of self owned piling plants and directly employed piling plant operators to be provided by the tenderer;

5. The minimum numbers of self owned piling plants and directly employed piling plant operators to be provided by the proposed Piling Subcontractor.

**PIL1.G580.8 INFORMATION ON PILING SUB-SUBCONTRACT - FOR COMBINED PILING AND BUILDING CONTRACT ONLY**

Submit with the tender the following information:

1. Letter of intent from the proposed Piling Sub-subcontractor whom the proposed Piling Subcontractor intends to employ for the subcontract should the proposed Piling Subcontractor be awarded the subcontract, indicating his willingness to carry out the proposed Piling Sub-subcontract;

2. The names of the directors or sole proprietor and site representatives of the proposed Piling Sub-subcontractor;

3. The piling activity and the scope of the proposed Piling Sub-subcontract;

4. The minimum numbers of self owned piling plants and directly employed piling plant operators to be provided by the proposed Piling Subcontractor;

5. The minimum numbers of self owned piling plants and directly employed piling plant operators to be provided by the proposed Piling Sub-subcontractor.

**PIL1.G590.8 CONDITIONS ON PILING SUBCONTRACT - FOR ENGINEER'S DESIGN PILING CONTRACT ONLY**

Incorporate the following conditions into the Piling Sub-contract:

1. The piling activity and the scope of the Piling Sub-contract;

2. The Piling Sub-contractor is not allowed to subcontract the following piling activities:
   a. Pile driving of Type 1, 2, & 4 Piles; and / or
   b. Excavation and / or concreting of Type 3 Pile; and / or
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles.

3. For the types of plants listed below which are required to be used on Site for piling works, the Piling Sub-contractor shall deploy and use only his self-owned plants save when necessary, he may use Contractor's self-owned plants deployed in accordance with **PIL1.W380**:
   a. Crawler crane;
   b. Oscillator or rotator;
   c. Reverse circulation drill (RCD);
   d. Pile driving hammer;
   e. Pile driving rig.

4. The Piling Sub-contractor shall comply with the following in deploying self-owned plants listed in sub-clauses (3)(a) to (3)(e) above:
   a. Self-owned plants of the Piling Sub-contractor shall mean plants owned by the Piling Sub-contractor or by the Piling Sub-contractor's parent, sister or subsidiary company for the exclusive use of the Piling Sub-contractor;
   b. All the plants deployed to Site shall be in good working conditions;
c. Deploy at least one number of self-owned plant that are required to be used on Site;

d. Submit documents to prove his ownership of the plants and, if applicable, the relationship between the Piling Sub-contractor and the Piling Sub-contractor's parent, sister or subsidiary company;

e. Submit document to confirm no further subcontracting of his part of the works.

5. The Contractor shall supply piling materials, which form whole or part of permanent works, to the Piling Sub-contractor;

6. A probity clause shall be included in the Piling Sub-contract such that:

"If the Piling Sub-contractor or any of his agents or employees are found to have offered or given advantage, gratuity, bonus, discount, bribe or loan of any sort to any agent or employee of the Contractor, Hong Kong Housing Authority or Housing Department, the Contractor shall at liberty forthwith terminate the employment of the Piling Sub-contractor under the Piling Subcontract. The Contractor, Hong Kong Housing Authority or Housing Department shall hold the Piling Sub-contractor liable for any loss or damage which the Contractor, Hong Kong Housing Authority or Housing Department may thereby sustain."

PIL1.G595.8 CONDITIONS ON PILING SUBCONTRACT - FOR CONTRACTOR'S DESIGN PILING CONTRACT ONLY

Incorporate the following conditions into the Piling Sub-contract:

1. The piling activity and the scope of the Piling Sub-contract;

2. The Piling Sub-contractor is not allowed to subcontract the following piling activities:
   a. Pile driving of Type 1, 2, & 4 Piles; and / or
   b. Excavation and / or concreting of Type 3 Pile; and / or
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles; and / or
   d. Foundation design.

3. For the types of plants listed below which are required to be used on Site for piling works, the Piling Sub-contractor shall deploy and use only his self-owned plants save when necessary, he may use Contractor's self-owned plants deployed in accordance with PIL1.W380:
   a. Crawler crane;
   b. Oscillator or rotator;
   c. Reverse circulation drill (RCD);
   d. Pile driving hammer;
   e. Pile driving rig.

4. The Piling Sub-contractor shall comply with the following in deploying self-owned plants listed in sub-clauses (3)(a) to (3)(e) above:
   a. Self-owned plants of the Piling Sub-contractor shall mean plants owned by the Piling Sub-contractor or by the Piling Sub-contractor's parent, sister or subsidiary company for the exclusive use of the Piling Sub-contractor;
   b. All the plants deployed to Site shall be in good working conditions;
   c. Deploy at least one number of self-owned plant that are required to be used on Site;
   d. Submit documents to prove his ownership of the plants and, if applicable, the relationship between the Piling Sub-contractor and the Piling Sub-contractor's parent, sister or subsidiary company;
   e. Submit document to confirm no further subcontracting of his part of the works.
5. The Contractor shall supply piling materials, which form whole or part of permanent works, to the Piling Sub-contractor;

6. A probity clause shall be included in the Piling Sub-contract such that:
   "If the Piling Sub-contractor or any of his agents or employees are found to have offered or given advantage, gratuity, bonus, discount, bribe or loan of any sort to any agent or employee of the Contractor, Hong Kong Housing Authority or Housing Department, the Contractor shall at liberty forthwith terminate the employment of the Piling Sub-contractor under the Piling Subcontract. The Contractor, Hong Kong Housing Authority or Housing Department shall hold the Piling Sub-contractor liable for any loss or damage which the Contractor, Hong Kong Housing Authority or Housing Department may thereby sustain."

PIL.G600.8 CONDITIONS ON PILING SUBCONTRACT - FOR ENGINEER'S DESIGN COMBINED PILING AND BUILDING CONTRACT ONLY

Incorporate the following conditions into the Piling Sub-contract:

1. The piling activity and the scope of the Piling Sub-contract;

2. The Piling Sub-contractor is not allowed to subcontract the following piling activities to more than one Piling Sub-subcontractor:
   a. Pile driving of Type 1, 2, & 4 Piles; and / or
   b. Excavation and / or concreting of Type 3 Pile; and / or
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles.

3. For the types of plants listed below which are required to be used on Site for piling works, the Piling Sub-contractor shall deploy at least one number of self-owned plant for each type of the plants, unless otherwise allowed by the CM:
   a. Crawler crane;
   b. Oscillator or rotator;
   c. Reverse circulation drill (RCD);
   d. Pile driving hammer;
   e. Pile driving rig.

4. The Piling Sub-contractor shall comply with the following in deploying self-owned plants listed in sub-clauses (3)(a) to (3)(e) above:
   a. Self-owned plants of the Piling Sub-contractor shall mean plants owned by the Piling Sub-contractor or by the Piling Sub-contractor's parent, sister or subsidiary company for the exclusive use of the Piling Sub-contractor;
   b. All the plants deployed to Site shall be in good working conditions;
   c. Submit documents to prove the plant ownership and, if applicable, the relationship between the Piling Sub-contractor and the Piling Sub-contractor's parent, sister or subsidiary company;
   d. For piling works undertaken by Piling Sub-subcontractor, deployment of self-owned plants of the Piling Sub-subcontractor to Site shall comply with the requirements stated in PIL.G610;
   e. The self-owned plants deployed to Site according to sub-clauses (3)(a) to (3)(e) may be used by the Piling Sub-subcontractor when necessary.

5. A probity clause shall be included in the Piling Subcontract such that:
"If the Piling Sub-contractor or any of his agents or employees are found to have offered or given advantage, gratuity, bonus, discount, bribe or loan of any sort to any agent or employee of the Contractor, Hong Kong Housing Authority or Housing Department, the Contractor shall at liberty forthwith terminate the employment of the Piling Sub-contractor under the Piling Subcontract. The Contractor, Hong Kong Housing Authority or Housing Department shall hold the Piling Sub-contractor liable for any loss or damage which the Contractor, Hong Kong Housing Authority or Housing Department may thereby sustain."

PIL1.G605.8 CONDITIONS ON PILING SUBCONTRACT - FOR CONTRACTOR'S DESIGN COMBINED PILING AND BUILDING CONTRACT ONLY

Incorporate the following conditions into the Piling Sub-contract:

1. The piling activity and the scope of the Piling Sub-contract;

2. The Piling Sub-contractor is not allowed to subcontract the following piling activities to more than one Piling Sub-subcontractor:
   a. Pile driving of Type 1, 2, & 4 Piles; and / or
   b. Excavation and / or concreting of Type 3 Pile; and / or
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles; and / or
   d. Foundation design.

3. For the types of plants listed below which are required to be used on Site for piling works, the Piling Sub-contractor shall deploy at least one number of self-owned plant for each type of the plants, unless otherwise allowed by the CM:
   a. Crawler crane;
   b. Oscillator or rotator;
   c. Reverse circulation drill (RCD);
   d. Pile driving hammer;
   e. Pile driving rig.

4. The Piling Sub-contractor shall comply with the following in deploying self-owned plants listed in sub-clauses (3)(a) to (3)(e) above:
   a. Self-owned plants of the Piling Sub-contractor shall mean plants owned by the Piling Sub-contractor or by the Piling Sub-contractor's parent, sister or subsidiary company for the exclusive use of the Piling Sub-contractor;
   b. All the plants deployed to Site shall be in good working conditions;
   c. Submit documents to prove the plant ownership and, if applicable, the relationship between the Piling Sub-contractor and the Piling Sub-contractor's parent, sister or subsidiary company;
   d. For piling works undertaken by Piling Sub-subcontractor, deployment of self-owned plants of the Piling Sub-subcontractor to Site shall comply with the requirements stated in PIL1.G610;
   e. The self-owned plants deployed to Site according to sub-clauses (3)(a) to (3)(e) may be used by the Piling Sub-subcontractor when necessary.

5. A probity clause shall be included in the Piling Subcontract such that:

"If the Piling Sub-contractor or any of his agents or employees are found to have offered or given advantage, gratuity, bonus, discount, bribe or loan of any sort to any agent or employee of the Contractor, Hong Kong Housing Authority or Housing Department, the Contractor shall at liberty forthwith terminate the employment of the Piling Sub-contractor under the Piling Subcontract. The Contractor, Hong Kong Housing Authority or Housing Department shall hold the Piling Sub-contractor liable for any loss or damage which the Contractor, Hong Kong Housing Authority or Housing Department may thereby sustain."
PILING AND FOOTING

PIL1.G610.8 CONDITIONS ON PILING SUB-SUBCONTRACT - FOR ENGINEER'S DESIGN COMBINED PILING AND BUILDING CONTRACT ONLY

Incorporate the following conditions into the Piling Sub-subcontract:

1. The piling activity and the scope of the Piling Sub-subcontract;
2. The Piling Sub-subcontractor is not allowed to subcontract the following piling activities:
   a. Pile driving of Type 1, 2, & 4 Piles; and / or
   b. Excavation and / or concreting of Type 3 Pile; and / or
   c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles.
3. For the types of plants listed below which are required to be used on Site for piling works, the Piling Sub-subcontractor shall deploy and use only his self-owned plants save when necessary, he may use the Piling Sub-contractor's self-owned plants deployed in accordance with PIL1.G600:
   a. Crawler crane;
   b. Oscillator or rotator;
   c. Reverse circulation drill (RCD);
   d. Pile driving hammer;
   e. Pile driving rig.
4. The Piling Sub-subcontractor shall comply with the following in deploying self-owned plants listed in sub-clauses (3)(a) to (3)(e) above:
   a. Self-owned plants of the Piling Sub-subcontractor shall mean plants owned by the Piling Sub-subcontractor or by the Piling Sub-subcontractor's parent, sister or subsidiary company for the exclusive use of the Piling Sub-subcontractor;
   b. All the plants deployed to Site shall be in good working conditions;
   c. Deploy at least one number of self-owned plant that are required to be used on Site;
   d. Submit documents to prove his ownership of the plants and, if applicable, the relationship between the Piling Sub-subcontractor and the Piling Sub-subcontractor's parent, sister or subsidiary company;
   e. Submit document to confirm no further subcontracting of his part of the works.
5. The Piling Sub-contractor shall supply piling materials, which form whole or part of permanent works, to the Piling Sub-subcontractor;
6. A probity clause shall be included in the Piling Sub-subcontract such that:

   "If the Piling Sub-subcontractor or any of his agents or employees are found to have offered or given advantage, gratuity, bonus, discount, bribe or loan of any sort to any agent or employee of the Piling Sub-contractor, the Contractor, Hong Kong Housing Authority or Housing Department, the Piling Sub-contractor shall at liberty forthwith terminate the employment of the Piling Sub-subcontractor under the Piling Sub-subcontract. The Piling Sub-contractor, the Contractor, Hong Kong Housing Authority or Housing Department shall hold the Piling Sub-subcontractor liable for any loss or damage which the Piling Sub-contractor, the Contractor, Hong Kong Housing Authority or Housing Department may thereby sustain."

PIL1.G615.8 CONDITIONS ON PILING SUB-SUBCONTRACT - FOR CONTRACTOR'S DESIGN COMBINED PILING AND BUILDING CONTRACT ONLY

Incorporate the following conditions into the Piling Sub-subcontract:

1. The piling activity and the scope of the Piling Sub-subcontract;
2. The Piling Sub-subcontractor is not allowed to subcontract the following piling activities:
   a. Pile driving of Type 1, 2, & 4 Piles; and / or
b. Excavation and/or concreting of Type 3 Pile; and/or

c. Construction of any acceptable pile types other than Type 1, 2, 3 & 4 Piles; and/or

d. Foundation design.

3. For the types of plants listed below which are required to be used on Site for piling works, the Piling Sub-subcontractor shall deploy and use only his self-owned plants save when necessary, he may use the Piling Sub-contractor's self-owned plants deployed in accordance with PIL1.G600:

a. Crawler crane;
b. Oscillator or rotator;
c. Reverse circulation drill (RCD);
d. Pile driving hammer;
e. Pile driving rig.

4. The Piling Sub-subcontractor shall comply with the following in deploying self-owned plants listed in sub-clauses (3)(a) to (3)(e) above:

   a. Self-owned plants of the Piling Sub-subcontractor shall mean plants owned by the Piling Sub-subcontractor or by the Piling Sub-subcontractor's parent, sister or subsidiary company for the exclusive use of the Piling Sub-subcontractor;

   b. All the plants deployed to Site shall be in good working conditions;

   c. Deploy at least one number of self-owned plant that are required to be used on Site;

   d. Submit documents to prove his ownership of the plants and, if applicable, the relationship between the Piling Sub-subcontractor and the Piling Sub-subcontractor's parent, sister or subsidiary company;

   e. Submit document to confirm no further subcontracting of his part of the works.

5. The Piling Sub-contractor shall supply piling materials, which form whole or part of permanent works, to the Piling Sub-subcontractor;

6. A probity clause shall be included in the Piling Sub-subcontract such that:

   "If the Piling Sub-subcontractor or any of his agents or employees are found to have offered or given advantage, gratuity, bonus, discount, bribe or loan of any sort to any agent or employee of the Piling Sub-contractor, the Contractor, Hong Kong Housing Authority or Housing Department, the Piling Sub-contractor shall at liberty forthwith terminate the employment of the Piling Sub-subcontractor under the Piling Sub-subcontract. The Piling Sub-contractor, the Contractor, Hong Kong Housing Authority or Housing Department shall hold the Piling Sub-subcontractor liable for any loss or damage which the Piling Sub-contractor, the Contractor, Hong Kong Housing Authority or Housing Department may thereby sustain."

PIL1.G620.8 SUBMISSION OF CONTRACT DOCUMENTS OF PILING SUB-CONTRACT

1. Before execution of the Piling Sub-contract works, submit to the CM a written confirmation signed by the Contractor and the Piling Sub-contractor confirming that the conditions stated in PIL1.G590 or PIL1.G600, as appropriate, have been included into the Piling Sub-contract;

2. In the event that the Contractor takes up the role of Piling Sub-contractor as allowed in PIL1.G515 for Combined Piling and Building Contract, submit to CM a written confirmation signed by the Contractor confirming that he shall take up the role of Piling Sub-contractor and act as if he is the Piling Sub-contractor in addition to his capacity.
PIL1.G630.8  SUBMISSION OF CONTRACT DOCUMENTS OF PILING SUB-SUBCONTRACT - FOR COMBINED PILING AND BUILDING CONTRACT ONLY

Before execution of the Piling Sub-subcontract works, submit to the CM a written confirmation signed by the Piling Sub-contractor and the Piling Sub-subcontractor confirming that the conditions stated in PIL1.G610 have been included into the Piling Sub-subcontract.
DESIGN

GENERAL

PIL1.D010.8 GENERAL
All specification clauses in this section shall be applied to Contractor's Design Piling Contract / Combined Piling and Building Contract only unless otherwise stated.

PIL1.D020.8 ACCEPTABLE PILE TYPES
1. Only the type or types of piles specified in the Project Specific Specification shall be acceptable to be used in this Contract unless otherwise proposed by the Contractor and subsequently Approved by the CM in accordance with sub-clause (2) below;
2. Notwithstanding sub-clause (1) above, the Contractor may propose any other alternative types of pile as in clause PIL1.G380. The proposed alternative types of pile must be accepted by the Buildings Department of the Hong Kong Special Administrative Region;
3. Do not base the design on a system of hand dug caissons.

PIL1.D030.8 ACCEPTANCE OF THE DESIGN
Acceptance of the Contractor's design, whether prior to or during the contract period, will not relieve the Contractor's responsibility to comply with this Specification.

PIL1.D040.8 DESIGN CERTIFYING CONSULTANT
A director of the Design Certifying Consultant, who must be a Registered Structural Engineer registered with the Building Authority, must certify and sign all layouts, details and calculations submitted to the CM, including those for tendering purposes.

INFORMATION TO BE SUPPLIED WITH TENDER

PIL1.D110.8 SUBMISSIONS
Submit three copies of each of the following with the tender:
1. Fully detailed design and specification proposals for the Works;
2. Complete set of calculations;
3. Drawings showing the number and positions of the piles;
4. The estimated average, maximum and minimum net lengths of the piles below cut-off level;
5. Drawings showing the layout, details and founding levels of footings, if any;
6. Any other requirement as detailed elsewhere in this Specification.

PIL1.D120.8 ADDITIONAL REQUIREMENTS FOR TYPES 5, 6 AND 7 PILES
Submit also:
1. Details of grout mix as PIL1.M410 and PIL1.M420;
2. Sequence and timing of grouting, including details of secondary pressure grouting;
3. Details of drilling method and equipment;
4. Details of reinforcement (including area of reinforcement at root of screw to coupler), pipe section, spacers, couplings and related test reports for Type 5 piles only;
5. Fabrication details of steel reinforcement cage (including installation details of single sonic access tube) for Type 7 piles only.

**DESIGN SUBMISSIONS**

**PIL1.D210.8**  
**SUBMISSIONS OF PILING AND/OR FOOTING DESIGN AT COMMENCEMENT OF THE WORKS**  
Submit four copies of drawings, calculations and any other relevant documents related to piling and/or footing design for Approval not later than 7 days from the notified date for commencement of the Works. The submissions shall include relevant foundation plans and supporting documents as described in clause 2.7 and clause 5.4.1, as appropriate, of the Code of Practice for Foundations. Any submission not to the satisfaction of the CM shall be re-submitted. Allow 37 days for each submission and re-submission for the checking of the CM.

**PIL1.D220.8**  
**SUBMISSIONS OF AMENDMENT OF PILING AND/OR FOOTING DESIGN**  
In the event that amendment of piling and/or footing design is required, submit four copies of drawings, calculations and any other relevant documents related to the amendment for Approval. Any submission not to the satisfaction of the CM shall be re-submitted. Allow 42 days for each submission and re-submission for the checking of the CM.

**DESIGN PARAMETERS**

**PIL1.D320.8**  
**DESIGN LOAD**  
All loads shown on the CM's drawings are deemed dead loads and imposed loads as defined in the Building (Construction) Regulations, irrespective of whether they are indicated on the drawings as characteristic or designed loads. Such loads have not been multiplied by the partial safety load factors.

**PIL1.D330.8**  
**TYPES OF PILE IN ONE CAP**  
Allow only one type of pile in each pile cap.

**PIL1.D340.8**  
**PILE SPACING**  
Comply with clause 5.1.3 of the Code of Practice for Foundations.

**PIL1.D350.8**  
**STRESS IN STEEL FOR PILING DESIGN**  
1. For Type 4 piles, comply with clause 2.5.5(4) of the Code of Practice for Foundations;
2. For Type 5 piles, comply with clauses 5.4.8(2)(a) and 5.4.8(2)(c) of the Code of Practice for Foundations;
3. For Type 6 piles, comply with clause 2.5.5(4) of the Code of Practice for Foundations;
4. For the combined effects of dead, imposed and wind loads, the allowable stress in sub-clauses (1), (2) & (3) above may be increased by not more than 25% where such increase is solely due to wind loads.

**PIL1.D360.8**  
**STRESS IN CONCRETE FOR PILING DESIGN**  
1. For Types 1a and 2 piles, comply with Regulation 26 of Building (Construction) Regulations and clause 2.5.5(2) of the Code of Practice for Foundations;
2. For Types 1c and 3 piles, comply with Regulation 27 of Building (Construction) Regulations and clause 2.5.5(2) of the Code of Practice for Foundations.
PILING AND FOOTING

PIL1.D370.8 WIND EFFECT
Design the foundations to comply with the "Code of Practice on Wind Effects in Hong Kong 2004 " issued in December 2004 by the Buildings Department of the Hong Kong Special Administrative Region.

PIL1.D380.8 RESISTANCE TO SLIDING, UPLIFT, OVERTURNING AND BUOYANCY
1. Design the foundations to comply with Section 15 of the Building (Construction) Regulations of Hong Kong and clauses 2.5.4 and 5.1.6 of the Code of Practice for Foundations;
2. Comply also with clause 5.3.3 of the Code of Practice for Foundations regarding uplift resistance of piles.

PIL1.D390.8 SAFE LOAD CARRYING CAPACITY
1. The combined effects of dead, imposed and wind loads including negative skin friction shall not exceed the safe load carrying capacity of an individual pile times the group reduction factor, if necessary, in accordance with PIL1.D400;
2. The safe load carrying capacity of an individual pile shall not exceed the allowable structural capacity of the pile based on the allowable stresses in steel and concrete stipulated in PIL1.D350 and PIL1.D360, respectively;
3. The compressive safe load carrying capacity of an individual Type 3 pile founded on Category 1(a), 1(b), 1(c), 1(d) or 2 rock defined in PIL1.G450 shall not exceed the sum of:
   a. the area of the designed pile base times 10 MPa, 7.5 MPa, 5 MPa, 3MPa or 3 MPa respectively; and
   b. the bond or frictional resistance of the pile in a rock socket as allowed in clause 5.4.7 of the Code of Practice for Foundations.
4. The safe load carrying capacity of an individual Type 5 and Type 6 pile shall be derived according to the design principles stated in clause 5.4.8 and 5.4.2 respectively of the Code of Practice for Foundations;
5. For piles in compression designed not to rest on bedrock defined in PIL1.G450, base the pile design, in addition to the driving formula if the pile is a driven pile, on static formulae to achieve the required embedded length of the piles in the bearing stratum by using one of the following references:
6. Propose the driving formula and the associated parameters for the CM's approval. Where hydraulic hammers are used, adopt the modified Hiley formula:
   \[
   Q = \frac{K_h E}{2s + c_1 + c_2 + c_3}
   \]
   where
   Q = safe compressive load carrying capacity (kN);
   E = Driving energy of the hammer immediately before impact (KNmm);
   s = set per blow (mm);
   \(c_1\) = temporary compression allowance for pile head and cap (mm);
   \(c_2+c_3\) = elastic rebound (mm); and
   \(K_h\) = Hydraulic Hammer Factor that, in any event should not be greater than the following values:
K_h = 0.6 where a pile cushion is used; and
K_h = 0.7 where no pile cushion is used; and
Appropriate adjustment should be made to the Kh value if a lower value is obtained from load testing results as stated in sub-clause (7) below;

7. Demonstrate the adequacy of the proposed driving formula or the modified Hiley formula and the associated parameters stated in sub-clause (6) in the determination of safe load carrying capacity of the pile by conducting load test(s) stipulated in PIL1.T810 to PIL1.T880. Verify the value of E in the modified Hiley formula by a method agreed by the CM;

8. The overall length of each pile must be the greater of those derived from the following formulae:
   a. The driving formula or the modified Hiley formula as stated in sub-clause (6) above; or
   b. The static formula as stated in sub-clause (5).

9. Adopt an installation method that will ensure that the required embedded length is achieved;

10. For the purpose of design calculations for the safe load carrying capacity of piles in compression, the design soil parameters (bulk unit weight, effective cohesion and effective friction angle) of different soil type shall not exceed the values given in the Project Specific Specification;

11. Design ground water level shall be as given in the Project Specific Specification;

12. Make a detailed submission to the CM to substantiate any proposed modification to the soil parameters stated in sub-clause (10) above and:
   a. Verify the proposed values by carrying out necessary Approved laboratory tests. The CM reserves the right to reject any proposed modification which is not to his entire satisfaction;
   b. Submit, with the tender, details of the proposed tests all to the CM's satisfaction. Arrange for a sufficient number of laboratory tests to establish the lower bound design values for each major stratum with sufficient independent results for that stratum. Have all laboratory tests for this purpose carried out at own cost and without any extension of time.

13. Notwithstanding sub-clause (10) above, in relation to the design, the Contractor may establish unit side resistance and unit tip resistance of the driven piles to be used in the Contract for various ground conditions and depths by preliminary pile loading tests in addition to those described in PIL1.T110 or separate side resistance and tip resistance tests. If design parameters derived from loading tests are to be used, submit the locations and instrumentation details of the proposed preliminary piles for such verification purpose, and a testing programme all to the satisfaction of the CM with the tender. The number of preliminary piles shall be sufficient to establish the lower bound design value for each major stratum with sufficient independent results for that stratum. Carry out all loading tests for this purpose at own cost, without any extension of time and complete them within two months of the notified date for the commencement of the Works. In the event of any failure to complete the above loading tests within two months of the notified date for the commencement of the Works, then no piling work, except for the loading tests, will be permitted to proceed any further until the completion of the loading tests, unless otherwise Approved. Bear the cost of any delay in this connection. No claim for additional costs or any extension of time will be considered by the CM;

14. In checking the allowable buckling capacity of Types 5 and 6 piles, the lateral restraints from the grout, steel casing if permanent and the surrounding soil may be allowed. Do not apply sub-clause (5) above to Types 5 and 6 piles.
PILING AND FOOTING

PIL1.D395.8  SAFE LOAD CARRYING CAPACITY - TYPE 7 PILES FOR CONTRACTOR'S DESIGN

1. The theoretical safe compressive load carrying capacity \( (Q_p) \) in kN of Type 7 pile shall be the sum of allowable skin friction capacity \( (q_s) \) along the whole pile shaft and allowable end bearing capacity \( (q_b) \) of the pile base:

\[
Q_p = q_s + q_b = \mu \sum N_{av} P L_i + 5 N A
\]

where

\[
\mu = \text{designed friction coefficient in kN/m}^2 \text{ per SPT "N" value and to be verified by trial pile (maximum value to be used is limited to 1.6)};
\]

\[
N_{av} = \text{average SPT "N" value along the pile shaft in blows / 300 mm (maximum value to be used is limited to 40)};
\]

\[
P = \text{perimeter of the pile in m};
\]

\[
L_i = \text{length of the pile shaft section } i \text{ in m};
\]

\[
N = \text{SPT value at the pile base in blows / 300 mm (maximum value to be used is limited to 200)};
\]

\[
A = \text{bearing area of the pile base in m}^2;
\]

Shaft friction in filling materials and marine deposits shall be ignored;

2. Notwithstanding sub-clause (1) above, the Contractor shall build in a greater margin of safety in his design where necessary and subject to the CM's approval, having regard to the sub-soil conditions of the site and his method of pile installation;

3. The allowable compressive stress of grout shall be 5 N/mm² and may be increased by 25% where such increase is solely due to wind loads;

4. For axially loaded piles designed to take tension, provide reinforcement with tension lap length along the full length of the pile. For piles designed to take vertical and lateral loads, provide sufficient reinforcement to resist all actions including bending moment. Allow a minimum cover of 75 mm to reinforcement.

PIL1.D400.8  GROUP REDUCTION FACTOR

Allow for the reduction of bearing capacity of individual piles in a group in accordance with the requirements stated in clause 5.1.2 of the Code of Practice for Foundations.

PIL1.D410.8  PILES FOUND ON BEDROCK

Do not apply any group reduction factor where the piles are designed to found on bedrock defined in PIL1.G450. Submit details indicating the levels of pile bases for safe bearing of the proposed piles with the tender. For Type 4 Piles driven to bedrock, comply with clause 5.4.11 of the Code of Practice for Foundations.

PIL1.D420.8  CASING THICKNESS

Ensure that the thickness of casing to pile shaft for piles types 2 and 3 is sufficient to withstand soil and water pressure. If directed by the CM, increase the thickness of the casing at no extra cost to the Authority.

PIL1.D430.8  BOND STRENGTH IN TYPES 5 AND 6 PILES

The rock socket must be founded in bedrock as PIL1.G450 and:

1. Design bond strength between rock and grout: not exceeding the value of the presumed allowable bond or friction between rock and concrete or grout for piles as stated in Table 2.2 of clause 2.2.2 of the Code of Practice for Foundations;
2. Design bond strength between grout and steel H-pile for Type 6 piles or grout and steel bars for Type 5 piles: not exceeding the allowable value stated in clause 2.5.5(4) or 5.4.8(2) respectively of the Code of Practice for Foundations;

3. If a different bond strength value is proposed, submit with the tender, details of the proposed founding method, design parameters, proposed testing methods to be applied to the trial pile (including loading test), design calculations, testing programme and proof of the validity of the parameters to the CM's satisfaction before applying them to the design. Establish the proposed value of bond strength between grout and rock with a sufficient number of tests or test piles. Carry out all the tests for this purpose without any extension of time and bear all associated costs;

4. Ignore the contribution of the grout to the structural capacity of the piles.

PIL1.D440.8 UNDERGROUND OBSTRUCTIONS IN TYPE 7 PILES FOR CONTRACTOR'S DESIGN

1. For the underground obstruction encountered in the top few metres of the ground, subject to the CM's approval, remove the underground obstruction by some suitable forms of excavation and re-install the pile at its design location. Ignore the positive shaft friction above the bottom level of the obstruction in calculation of the allowable skin friction capacity of the pile;

2. For the underground obstruction encountered at greater depths causing auger refusal, such as the rate of penetration of the drilling is less than 300mm per minute, follow the procedures below:
   a. If the pile is closer than 6 pile diameters from any completed Type 7 pile, the drilling hole shall be backfilled with cement grout and the pile shall be relocated;
   b. For a pile with a centre to centre distance greater than 6 pile diameters from any completed pile, subject to the CM's approval, remove the obstruction by a method approved by the CM, backfill the bored hole with sand before re-installation of the pile. Ignore the positive shaft friction above the bottom level of the obstruction in calculation of the allowable skin friction capacity of the pile.

SETTLEMENT ANALYSIS

PIL1.D510.8 REQUIREMENT

Design piles and/or footings which are not to be completely resting on bedrock to include settlement calculations based on the design layout and depths of piles to be installed and/or footings to be constructed.

PIL1.D520.8 BLOCK SETTLEMENT AND DIFFERENTIAL SETTLEMENT

1. Comply with the requirements stated in clause 2.3.2 of the Code of Practice for Foundations;

2. Consider the effects of block and differential settlements on the performance of buildings or structures in the design;

3. Design the foundation to satisfy the following requirements:
   a. The maximum angular rotation of the horizontal load-bearing surface of the pile cap and / or footing at any location under wind or other transient loads will not exceed the value given in the Project Specific Specification throughout its design life; and
   b. The differential settlement between columns / vertical elements within the same building or structure under working loads will not exceed the value given in the Project Specific Specification throughout their design life; and
   c. The maximum total settlement will not exceed the value given in the Project Specific Specification throughout their design life.
SCOPE OF CALCULATIONS
Clearly show in the calculations, the total and differential settlement at the end of the construction period of building structures and also in the long term. Demonstrate also in the design calculations, that the differential settlement criterion for the structure, set out in PIL1.D520 above, will not be exceeded. The following may be considered in the design to minimize differential settlement:
1. Stiffness and layout of pile cap;
2. Pile location and pile size;
3. Any additional factors which the Contractor considers appropriate.

BASIS OF ANALYSIS
Base the settlement analysis in clause 2.3.1 of the Code of Practice for Foundations and/or on one of the following publications:

SCHEDULE
Include, in the design, a separate schedule of basic principles, procedures and assumptions citing the source reference, page numbers and, in addition, the method of deriving rock mass and/or soil mass properties used in the design.

ELASTICITY MODULUS
For the assessment of foundation settlement, do not choose an elasticity modulus of soil greater than FN and in no case greater than 200 MN/m²:

where:

\[ E = \text{elasticity modulus of soil in MN/m}^2; \]
\[ N = \text{Standard Penetration Test (SPT) results prior to pile installation}; \]
\[ F = 0.8 \text{ for } N \text{ less than } 100, \text{ and } 1.0 \text{ for } N \text{ equal to or greater than } 100. \]

SUBMISSION - ACTUAL CONDITIONS OF INSTALLATION
Submit a settlement analysis based on the actual conditions of piles installed before commencement of construction of pile caps and:
1. Consider the effect of block settlement;
2. Verify the assumed parameters and bear the cost of such verification.

RESISTANCE TO HORIZONTAL FORCES

GENERAL
1. Piles (either vertical or raking), or pilecaps or both may be designed to resist horizontal forces and tenderers must submit with their tenders, detailed calculations which demonstrate that the design is both structurally and geotechnically acceptable. Make calculations in accordance with the criteria set out in PIL1.D620 to PIL1.D670;
2. Footings may be designed to resist horizontal forces and tenderers must submit with their tenders, detailed calculations which demonstrate that the design is both structurally and geotechnically acceptable;
3. The formulae and publications given in this sub-section are for reference only. The designer may use data from other publications, but in this event, he must demonstrate that the publication proposed is applicable to the loading, building structures and founding material in this Contract. The publication proposed must be wholly compatible with the basic source data of this site. If the references in the publication proposed are derived from overseas, produce precedent cases to demonstrate that the design methods and procedures have been successfully applied in Hong Kong. No matter what publication is used in the Contractor's design, the Contractor will not be relieved of his design responsibilities under the Contract.

PIL1.D620.8 TYPE 5 PILES
Do not design Type 5 piles to resist horizontal loads unless they are designed as raking piles.

PIL1.D630.8 HORIZONTAL RESISTANCE BY PILE CAPS ONLY
1. Maximum horizontal displacement of pilecaps: 25 mm;
2. Design piles to resist any effect of pile cap movement due to horizontal forces;
3. Do not permit the allowable stresses in the piles to be exceeded.

PIL1.D640.8 HORIZONTAL RESISTANCE BY PILES ONLY WITH PILE TOPS FIXED AGAINST ROTATION
1. Use the following formulae to determine the deflections and moments of the piles:
   a. \[ T = \frac{E I}{n_h} \]
   b. \[ M_p = F_m(P T) \]
   c. \[ D_p = F_d\left(\frac{P T^3}{E I}\right) \]

where:
- \(E\) = elastic modulus of pile material in kN/m².
- \(I\) = moment of inertia of pile cross section in m⁴.
- \(n_h\) = coefficient of variation of sub-grade reaction in kN/m³. For the purpose of calculation, a suggested value of \(n_h\) is given in the Project Specific Specification. Take responsibility to ensure that the assumed value of \(n_h\) on which the design is based is adequate for this Contract. Carry out boreholes, soil tests and other tests to verify to the satisfaction of the CM, the assumed value of \(n_h\). Should the values of \(n_h\) so verified require more piles and/or pile cap quantities, carry out any necessary redesign, extra piling work etc. at own expense and without any extension of time.
- \(T\) = relative stiffness of pile soil system, m.
- \(M_p\) = moment at depth \(z\), KNm.
- \(D_p\) = deflection at depth \(z\), m (25 mm maximum).
- \(F_m\) = moment coefficient at depth \(z\), as given in page 7.2 - 239 Fig. 12 of "FOUNDATIONS AND EARTH STRUCTURES, DESIGN MANUAL 7.2", May 1982 Edition, published by the Department of the Navy, Naval Facilities Engineering Command.
- \(F_d\) = deflection coefficient at depth \(z\) as given in page 7.2 - 239 Fig 12 of "FOUNDATIONS AND EARTH STRUCTURES, DESIGN MANUAL 7.2", May 1982 Edition, published by the Department of the Navy, Naval Facilities Engineering Command.
- \(P\) = horizontal load in kN.
2. Check the combined effect due to horizontal forces and vertical forces;
3. For a group of piles, reduce the coefficient of variation of sub-grade reaction \( (n_h) \), which is a function of pile spacing in the direction of loading, as below:

<table>
<thead>
<tr>
<th>Spacing</th>
<th>( n_h ) group</th>
<th>Spacing</th>
<th>( n_h ) group</th>
</tr>
</thead>
<tbody>
<tr>
<td>8D</td>
<td>1.00( n_h )</td>
<td>4D</td>
<td>0.40( n_h )</td>
</tr>
<tr>
<td>6D</td>
<td>0.70( n_h )</td>
<td>3D</td>
<td>0.25( n_h )</td>
</tr>
</tbody>
</table>

Notes:
(1) \( D \) = pile diameter or diagonal width. Pile spacing normal to the direction of loading has no influence provided it is greater than 2.50\( D \).
(2) Subgrade reaction is to be reduced in the direction of loading.

PIL1.D650.8 HORIZONTAL RESISTANCE BY PILES ONLY WITH FLEXIBLE PILE CAPS OR HINGED END CONDITIONS

All as PIL1.D640 above, except that the coefficients symbolized by the terms \( F_m \) and \( F_d \) are as given in page 7.2 - 238, Fig 11 of "FOUNDATIONS AND EARTH STRUCTURES, DESIGN MANUAL 7.2", May 1982 Edition, published by Department of the Navy, Naval Facilities Engineering Command.

PIL1.D660.8 HORIZONTAL RESISTANCE BY PILES AND PILE CAPS TOGETHER

1. Utilise a rational soil mechanics approach in the design and demonstrate the compatibility of the method chosen with the sub-soil conditions and the method and result of testing. The derivation of parameters and the method of computations must be mutually compatible and consistent;
2. Maximum design displacement of pile caps and piles: 25 mm;
3. The following publications may be used for reference:
   a. Section 4.2, chapter 4 of "ELASTIC SOLUTIONS FOR SOIL AND ROCK MECHANICS" by H.G. Poulos and E.H. Davis, 1974 for relating the displacement and forces in the cap:
      Maximum values for \( E \) (Young's Modulus for soil) shall be as given in the Project Specific Specification.
      Suggested values of \( V \) (Poisson's ratio for soil) shall be as given in the Project Specific Specification.
      It is the Contractor's responsibility to ensure that the values of \( E \) and \( V \) taken are adequate. The Contractor is to carry out boreholes, soil tests and other tests as necessary to verify his assumed values of \( E \) and \( V \). If the values of \( E \) and \( V \) so verified require more piles and/or pile cap quantities, then the Contractor is to carry out any necessary redesign, extra piling work etc at his own expense and without any extension of time;

PIL1.D670.8 HORIZONTAL RESISTANCE BY ROCK SOCKET

Check for any additional stresses induced in the rock socket when the piles are designed with rock socket to resist horizontal loads. Comply with the requirements stated in clause 5.3.4 of the Code of Practice for Foundations.

NEGATIVE SKIN FRICTION

PIL1.D710.8 GENERAL

Make allowance in design calculations for negative skin friction and comply with clause 5.2 of the Code of Practice for Foundations.
PILING AND FOOTING

PIL.1.D720.8 BASIC FORMULA
1. The negative skin friction (NSF) caused by the settlement of the soil mass, is estimated by means of the equation in clause 5.2.2 of the Code of Practice for Foundations;
2. The minimum depth of the consolidation strata, \( l \), for different blocks / structures shall be as given in the Project Specific Specification;
3. Take responsibility to ensure that the assumed value of \( l \) on which the design is based is adequate for this Contract. Carry out boreholes, to the satisfaction of the CM, to verify the assumed value of \( l \). Should the values of \( l \) so verified be greater than those on which the design is based, carry out any necessary redesign, extra piling work etc based on the greater values of \( l \) so verified at own expense and without any extension of time. Should the values of \( l \) so verified be less than the minimum values stated above, use the minimum values stated above in the design. In no case must \( l \) be longer than the length of the pile, measuring from ground level;
4. Water table level shall be as given in the Project Specific Specification;
5. Ground level shall be as given in the Project Specific Specification;
6. The at-rest earth pressure coefficient, \( K_0 \), shall be as given in the Project Specific Specification;
7. Make allowance for the effect of NSF between ground level and the soffit of the pile cap.

PIL.1.D730.8 AVERAGE SOIL PROPERTIES
For the purposes of calculating negative skin friction, apply the average soil properties below ground as given in the Project Specific Specification.

PIL.1.D740.8 GROUPING EFFECT
Calculate the effect on negative skin friction of grouping effect based on the proposed design and the principles stated in clause 5.2.2 of the Code of Practice for Foundations. Submit all calculations with the tender.

PIL.1.D760.8 REDUCTION OF NEGATIVE SKIN FRICTION
The design negative skin friction may be reduced in the case of tenders based on piles coated with a bitumen slip layer, provided that such material is acceptable to BD and provided that the proposed reduction in the design negative skin friction can be substantiated by reliable full scale field tests, preferably carried out locally under similar soil conditions. No reduction in negative skin friction due to grouping and boundary effects is permitted for bitumen coated piles. Tenders on this basis must include:
1. Proposed methods for proving that the slip layer is undamaged during pile driving and for determining the design reduction;
2. A guarantee that sufficient quantity of the material proposed for the slip layer will be available to enable the Works to be executed within the Contract period and that if it is not, the Contractor will redesign the piling system and execute it at no extra cost to the Authority and with no extension of time claimed.

PILE CAP DESIGN

PIL.1.D810.8 STANDARDS
Comply with Code of Practice for Structural Use of Concrete 2013 and Code of Practice for Foundations issued by the Buildings Department in respect of all design for reinforced concrete pile caps and for structural concrete above piles.
PILING AND FOOTING

PIL1 > DESIGN

---

**PIL1.D820.8** **SUBMISSIONS (CONSTRUCTION OF PILE CAP IS NOT PART OF THE CONTRACT)**

1. Prepare and submit a layout design of the pile caps with the tender, together with the schedule of pile cap quantities required by the Special Conditions of Tender;

2. Within two months following the notified date for commencement of the Works, complete the design of pile caps and submit four copies of working drawings and design calculations for Approval. Submit for further Approval any revisions made subsequent to this Approval within fourteen days following the completion of all piling works to each block/structure. Submit to the CM a complete set of the negatives for all working drawings of pile caps within fourteen days after the certified completion of the Contract;

3. Submit, with the tender, design calculations and details of reinforcement for pile caps for structural members specified in the Project Specific Specification.

---

**PIL1.D830.8** **SUBMISSIONS (CONSTRUCTION OF PILE CAP IS PART OF THE CONTRACT)**

Submit the following:

1. With the tender: drawings showing the layout and details of all the pile caps, together with all design calculations etc;

2. Within two months following the notified date for the commencement of the Works and before the commencement of any pile cap works on Site: four copies of working drawings for the pile caps for Approval. Submit, for Approval, any revisions made subsequent to this Approval.

---

**DESIGN GUIDELINES**

**PIL1.D910.8** **MANDATORY GUIDELINES**

Comply with the mandatory design guidelines as given in the Project Specific Specification.

**PIL1.D920.8** **RECOMMENDED GUIDELINES**

Recommended design guidelines which are considered suitable for the purpose of this Contract are included in the Project Specific Specification but the Contractor may propose a different design method for this part of the work.

**PIL1.D930.8** **CONTRACTOR'S RESPONSIBILITY**

The provision of the mandatory and/or recommended guidelines in PIL1.D910 and PIL1.D920 above does not relieve the Contractor of any of his design responsibilities under the Contract.
MATERIALS

GENERAL

PIL1.M010.8 INFORMATION TO BE SUPPLIED WITH TENDER
Submit information of major materials proposed to be used in the piling works with the tender.

PIL1.M020.8 SAMPLES
Test representative samples of all materials being incorporated into the permanent works to show compliance with this Specification.

PIL1.M030.8 TEST CERTIFICATES
On Site delivery verification:
1. Submit to the CM the manufacturer's test certificates for each batch of piles delivered to Site;
2. Where piles Types 1(a), 1(b) and/or 2 are used in this Contract, and when the piles are not cast on the Site, submit the manufacturer's certificate signed by the manufacturer's engineer who should hold the qualification of MICE or MIStructE or MHKIE for each delivery of piles to Site stating:
   a. That the piles have been manufactured in accordance with the manufacturer's standards Approved by the Authority;
   b. That the piles are satisfactory for the purpose intended;
   c. What mix proportion and admixtures have been used in the concrete;
   d. The results of all cube and core tests.
3. Where piles Types 4 and/or 6 are used in this Contract, submit the test certificates endorsed by the manufacturer for each delivery of steel H-piles to Site stating the results of chemical composition analysis, tensile tests and impact tests in accordance with the requirements of BS EN 10025 Part 1-6:2004.

PIL1.M040.8 QUALITY ASSURANCE
Carry out and conduct quality assurance on the production of pile Types 1a, 1b and 2 and/or Approved special proprietary types of piles under an Approved quality assurance scheme. The scheme must be inspected and certified by an independent engineer who should also hold the qualification as MHKIE, MICE or MIStructE.

PIL1.M050.8 COLOUR CODE SYSTEM OF STEEL PILE SECTIONS
Colour Code System:
1. Submit for Approval a colour code system in the Quality Control System as stipulated in PRE.B8.1425 for identification of steel pile sections for Types 4 and 6 Piles;
2. A batch of steel pile sections is defined as each delivery of steel pile sections to Site under one delivery order. Upon delivery of the steel pile sections to Site and before the material test results are known, apply colour markings (other than red and green) at both ends of the pile sections in accordance with the Approved colour code system submitted in sub-clause (1) above;
3. Upon material test results (including retest as permitted under the Specification) being available, change the colour at both ends of the pile sections as follows:
   a. Green colour: for steel pile sections conforming to the Specification;
   b. Red colour: for steel pile sections not conforming to the Specification.
PILING AND FOOTING

STEEL PILES

PIL1.M110.8 'H' PILES AND PLATES
Quality requirements:
1. Complying with BS EN 10025 Part 1-6:2004; and
2. Use steel H-piles of types and brands recognized by BD. Material properties shall comply with the requirements stated in the recognition documentation issued by BD. Each section shall contain manufacturer’s identification marked on it by means of engraving or similar techniques approved by the CM.

PIL1.M120.8 STEEL PIPE PILES
Quality requirements:
1. Complying with BS 3601:1987 or BS 6323:Parts 1 and 2:1982, except as regards the requirements of hydraulic pressure tests.

PERMANENT CASINGS

PIL1.M210.8 TYPE 5 PILES
1. Material: Grade S275 to BS EN 10210 Part 1-2:2006 for Hot-Finished Hollow Section and BS EN 10219 Part 1-2:2006 for Cold-Formed Hollow Section;
2. Minimum thickness: 5.0 mm;
3. Internal diameter: not less than the finished pile diameter shown or scheduled on the Drawings;
4. Free from:
   a. Significant distortion and of uniform cross-section throughout the whole length;
   b. Internal projections which might prevent the proper formation of the piles.

PILE SHOES

PIL1.M310.8 GENERAL
1. Submit full details of pile shoes together with the tender when specified in the Project Specific Specification;
2. Take all necessary precautions including, where appropriate, or if required in the Project Specific Specification, the provision of specially designed pile shoes to protect the ends of the piles during driving.

PIL1.M320.8 TYPES 1A AND 1B PILES
Provide flat or pointed co-axial shoes and:
1. Steel pile shoes: manufactured from steel complying with Grade S275 to BS EN 10025:2004;
2. Cast steel pile shoes: manufactured from steel complying with BS 3100:1991, grade A;
3. Cast steel pile shoes: manufactured from chill hardened iron, as used for making grey iron castings, complying with BS 1452:1996, grade 150 and free from major blow holes and other surface defects.

PIL1.M330.8 STRAPS AND FASTENINGS FOR CAST PILE SHOES FOR TYPES 1A AND 1B PILES
Manufactured from steel complying with Grade S275 to BS EN 10025:2004, cast into the point of the shoe to form an integral part of the shoe.
PILING AND FOOTING

PIL1.M340.8  TYPE 1c PILES
1. Manufactured from durable materials Approved by the CM and capable of withstanding driving stresses without damage;
2. Designed to provide a watertight joint with permanent casings.

PIL1.M350.8  TYPE 4 PILES
Fit piles with Approved toe protection. The protection must be adequate to resist the driving stress.

GROUT AND CONCRETE

PIL1.M410.8  GROUT
Consisting of ordinary Portland cement and water and:
1. Containing sand, PFA and admixtures only when Approved;
2. With a minimum cementitious content of 600 kg/m³;
3. When used to fill core holes, having a minimum characteristic compressive strength at 28 days of not less than the specified grade strength of the concrete surrounding the core hole;
4. With a maximum amount of bleeding of 2% in the first 3 hours and not exceeding 4% in total. The water must be reabsorbed by the grout during the 24 hours after mixing;
5. With a maximum free expansion of 10% at the nominal temperature;
6. With any Approved admixtures being chloride-free;
7. With a maximum total chloride content, expressed as a percentage relationship between the chloride ion and the cementitious content by mass in the grout, of 0.1%.

PIL1.M420.8  GROUT FOR TYPES 5, 6 AND 7 PILES
In addition to the requirements of PIL1.M410 above, ensure that grout for Types 5, 6 and 7 piles complies with the following:
1. Water used in the grout must be clean and fresh with a temperature not exceeding 30°C nor less than 5°C;
2. Additives and admixtures complying with BS 5075:1982 and only used with the prior agreement of the CM;
3. Non-shrink and having a minimum characteristic compressive strength of 30 N/mm² at 28 days;
4. For Type 7 piles,
   a. Maximum grout temperature shall not exceed 38°C;
   b. Sample each truckload of grout by using a 225 to 350 ml capacity disposable glass or cup to evaluate premature setting or initial set of the grout mix. Reject the use of the grout if the initial set has occurred under the condition of the grout starting forming the shape of the container when tilted.

PIL1.M430.8  FILLING TO STEEL PIPE PILES
Fill for:
1. The uppermost 3 m from cut off level: concrete grade 10/20;
2. The remainder: Approved decomposed rock fill.

PIL1.M440.8  CONCRETE FOR PILE CAPS AND FOOTINGS
1. For Contractor's Design Piling Contract / Combined Piling and Building Contract: use Grade 30/20;
2. For Engineer's Design Piling Contract / Combined Piling and Building Contract: concrete grade is specified in Drawings;

ANCILLARY MATERIALS

PIL1.M510.8 PAINT FOR STEEL PILES AND STEEL OR CAST IRON COMPONENTS
Approved proprietary epoxy based paint.

PIL1.M520.8 WELDING ELECTRODES
As Worksection STR1.

PIL1.M540.8 EARTH FILLING
General Fill Material and Special Fill Material as EAR1.M220.

MECHANICAL COUPLER FOR TYPE 5 PILES

PIL1.M610.8 TYPE OF MECHANICAL COUPLER
The quality requirements of mechanical coupler shall be in accordance with CON3.M310.

PIL1.M620.8 SUBMISSION
Submission of the details of the mechanical coupler shall be in accordance with CON3.M320.

PIL1.M630.8 QUALITY ASSURANCE SCHEME FOR MECHANICAL COUPLER
Details of quality assurance scheme for mechanical coupler shall be in accordance with the Project Specific Specification.
WORKMANSHIP

GENERAL

PIL1.W010.8 REQUIREMENTS OF THE CONTRACT
Construct the works in a manner such as to satisfy the requirements of the Contract. In the event of any failure to comply with this requirement, rectify as necessary, until the requirements of this Specification are met.

PIL1.W020.8 REQUIREMENTS OF THE CONTRACTOR'S DESIGN
For Contractor's design piling contract / combined piling and building contract, the specification for design applies equally to construction. In the event of any failure to comply with this requirement, redesign and construct as necessary, until the requirements of this Specification are met.

PIL1.W030.8 DELIVERY, HANDLING AND STORAGE OF PILES
Carry out delivery, handling and lifting with due care and to Approval. Stack piles neatly, off the ground.

PIL1.W040.8 COLOUR MARKINGS OF STEEL PILE SECTIONS BY STOCKISTS OR SUPPLIERS PRIOR TO DELIVERY
1. Obtain steel pile sections from stockists / suppliers for Types 4 and 6 Piles preferably without red and / or green colour markings at either end of the steel pile sections;
2. If steel pile sections with red colour marking, or with other colour marking covering a previous red colour marking, or with green colour marking at either end of the steel pile sections are to be supplied:
   a. Provide in advance of delivery of steel pile sections to Site an explanation of the presence of the said colour marking(s) to the satisfaction of the CM. In addition, for steel pile sections with red colour marking or other colour marking covering a previous red colour marking, provide to the CM before delivery to Site a written confirmation each from the Contractor and the stockist / supplier that the steel pile sections have not been rejected by other project(s);
   b. The CM may refuse entry of steel pile sections to Site if:
      i. No explanation is provided in advance; or
      ii. The provided explanation is not satisfactory.

PIL1.W055.8 CONTOUR PLAN SUBMISSION FOR TYPE 4 PILES
1. Within 14 days from the notified date for commencement of the Works, submit a location plan showing the existing ground investigation drillholes and include any proposed additional ground investigation drillholes in accordance with the Specification for the approval of the CM before drilling work commences on Site;
2. Within two months from the notified date for commencement of the Works, complete the proposed additional drillholes, draw up a plan showing the contours of soil material with SPT N-value equal to or greater than 200 and submit to the CM for approval. The contours shall depict the highest level where SPT N-value is equal to or greater than 200 for at least the next 5m below;
3. Within 14 days after completion of the additional drillholes in the sub-clause (2) above, submit a plan showing the minimum depth of each pile, based on the Approved contour plan. The minimum depth shall in all cases be deeper than or equal to the depth as estimated from the Approved contour plan;
4. The contour plan in sub-clause (2) above shall be prepared and certified by the Design Certifying Consultant as provided in PRE.B6.060 and submit to the CM for approval;

5. Failure to comply with the above requirements may cause delay in the commencement of driving piles to final set. The Contractor shall be responsible for any time and cost implication in connection with such failure in complying with the above requirements.

PIL1.W070.8 SUBMISSION OF DRIVING FORMULA FOR TYPE 4 PILES

1. Within 14 days from the notified date for commencement of the Works, submit for Approval by the CM a proposed driving formula with the appropriate choice of parameters for the Contractor’s own plant and machinery, taking into account the complexity of the ground conditions and the tentative founding level of piles;

2. Include in the proposal a testing regime and acceptance criteria to ascertain the validity, applicability and reliability of the driving formula. The testing regime shall include test driving on pile(s) and any other additional tests to substantiate the driving formula. Bear cost and time for such additional tests. Allow 30 days for the CM to give comments on the proposal. Only implement the testing regime on Site after a written permission to commence is granted by the CM;

3. Substantiate the validity, applicability and reliability of the driving formula with the results of the test driving on pile(s) and any other tests proposed by the Contractor to the satisfaction of the CM. Review, modify and re-execute the testing regime as the case requires;

4. Submit final set tables based on the Approved driving formula and in a format to the satisfaction of the CM;

5. Do not commence driving without written permission from the CM, except for the implementation of the testing regime stated in sub-clause (2) above. Allow 42 days for the CM to approve the final set tables in sub-clause (4) above. Allow a further 22 days for obtaining the CM's written permission to commence driving using the Approved final set tables;

6. Ensure that the allowable pile capacity of the piles is achieved and developed after the final set driving with the use of the Approved driving formula. The ultimate pile capacity shall have such a safety factor as the proposed driving formula requires but the safety factor on design capacity of pile shall be not less than 2;

7. All submissions in relation to the proposed driving formula shall be prepared and certified by the Design Certifying Consultant as provided in PRE.B6.060;

8. During the progress of works, the Contractor may submit for Approval by the CM an alternative driving formula in accordance with the above sub-clauses (1) to (7).

9. Make due allowance in the programme for the time required for the above requirements. The Contractor shall not be entitled to any claim for extension of time and additional cost in relation to submission of driving formula or alternative driving formula;

10. Approval for the use of the driving formula or alternative driving formula shall not relieve the Contractor of any responsibility with respect to the required pile capacities under the Contract.
PROTECTION

PIL1.W110.8 COATING STEEL PILES AND COMPONENTS
Protect all steel piles from cut off level to a level as given in the Project Specific Specification and all steel and cast iron components in contact with soil of all other types of pile from corrosion by coating with at least two coats of an Approved coal tar epoxy paint. Apply the paint to a sufficient thickness to be suitable for resistance to damage during the driving process and be durable without deteriorating in the substrata environment. Prepare steel or metal surfaces and apply paint in accordance with the manufacturer's instructions.

ACCURACY AND TOLERANCES

PIL1.W210.8 GENERAL
1. Carefully set out the foundations, locate the piles in the correct positions and spacing and install the piles either plumb positions or to exact inclinations all in accordance with Drawings;
2. For manufacturing and installation tolerances, refer to Appendix H "Schedule of Tolerances" to this Specification and clause 7.5 of the Code of Practice for Foundations;
3. The permissible deviation shall not result in any part of the foundation element extending outside the site boundary.

PIL1.W220.8 EXCESSIVE DEVIATION
In the event of any pile varying from its correct position by more than either of the permitted tolerances for out of plumb and eccentricity, the CM may, if he deems it necessary, require the Contractor, to drive an additional pile or piles or to provide beams or other such works as are necessary to make good this or any other deviation.

PLANT AND EQUIPMENT

PIL1.W310.8 APPROVAL
Obtain Approval for plant and equipment before use.

PIL1.W320.8 SUBMISSIONS
1. Submit full details of plant, driving rig and hammer proposed to be used, with the tender;
2. For Type 7 piles, submit full details of plant, piling rig and auger proposed to be used, with the tender.

PIL1.W330.8 PILE HAMMER
1. Use a steel pile hammer capable of driving the pile to the required depth without overstressing or damage. For driven piles, ensure the weight of the hammer is at least half that of the pile and sufficient to achieve the required efficiency;
2. Where hydraulic hammers are used, submit technical details of both the hammer mechanism and instrumentation system. All hydraulic hammers should have on-board instrumentation capable of reporting the following data both for individual blows and for variable-sized groups of blows:
   a. Hammer model and serial no. (header only);
   b. Time and date (header only);
   c. Blow number;
   d. Blow-rate;
e. Impact energy;  
f. Stroke height (single-acting only).

PIL1.W340.8 FOLLOWERS  
Where followers are used, make allowance for a reduction of the efficiency of the pile hammers and the followers when calculating the driving resistance.

PIL1.W350.8 VERIFICATION OF EFFICIENCY  
Verify the efficiency of the pile hammers and the followers by calculation and insitu demonstration.

PIL1.W360.A VIBRATION CONTROL  
1. Measure the peak particle velocity arising from piling and rock excavation machines and processes for foundation work;  
2. Provide Approved equipment for measuring peak particle velocity for the exclusive use of the CM or his representatives and provide any necessary attendance during the course of the Contract;  
3. Unless otherwise specified in the Project Specific Specification, comply with the requirements regarding peak particle velocity stated in Appendix A of PNAP APP-137 and clause 7.2.6 of the Code of Practice for Foundations;  
4. Comply with any other requirements specified in the Project Specific Specification.

PIL1.W370.8 EXCESSIVE VIBRATION  
Where the peak particle velocity is found to exceed the limits given in PIL1.W360 above, stop the machines or piling operations immediately:  
1. Do not recommence work so suspended until effective means, or replacement machines, have been employed to reduce the peak particle velocity to within the acceptable limits;  
2. Bear the cost of any stoppage under the terms of this clause and complete the Works without any consequent extension of time.

PIL1.W380.8 DEPLOYMENT OF SELF-OWNED PILING PLANTS FOR PILING CONTRACT  
1. For the types of plants listed below which are required to be used on Site for piling works, deploy at least one number of self-owned plant for each type of the plants, unless otherwise allowed by the CM:  
   a. Crawler crane;  
   b. Oscillator or rotator;  
   c. Reverse circulation drill (RCD);  
   d. Pile driving hammer;  
   e. Pile driving rig.  
2. Comply with the following in deploying self-owned plants listed in sub-clauses (1)(a) to (1)(e) above:  
   a. Self-owned plants shall mean plants owned by the Contractor or by the Contractor's parent, sister or subsidiary company for the exclusive use of the Contractor;  
   b. All the plants deployed to Site shall be in good working conditions;  
   c. Submit documents to prove the ownership of the plants and, if applicable, the relationship between the Contractor and the Contractor's parent, sister or subsidiary company;  
   d. The self-owned plants deployed to Site in accordance with sub-clauses (1)(a) to (1)(e) may be used by the Piling Sub-contractor when necessary.
3. For piling works undertaken by Piling Sub-contractor, deployment of self-owned plants of the Piling Sub-contractor to Site shall comply with the requirements stated in PIL1.G590.

**PIL1.W390.8** DEPLOYMENT OF SELF-OWNED PILING PLANTS FOR COMBINED PILING AND BUILDING CONTRACT

For piling works undertaken by Piling Sub-contractor, deployment of self-owned plants of the Piling Sub-contractor to Site shall comply with the requirements stated in PIL1.G600.

### DRIVING

**PIL1.W410.8** LENGTH OF DRIVEN PILES

Drive to a minimum net length below cut off level of 4500 mm.

**PIL1.W420.8** PROXIMITY TO CAST INSITU PILES

Do not carry out driving within 3 m radius of any cast insitu pile within 48 hours of its being concreted.

**PIL1.W430.8** DRIVING STRESSES FOR STEEL PILES

Do not exceed calculated driving stresses of 0.9 × yield stress unless Approved.

**PIL1.W440.8** TEMPORARY BRACING FOR DRIVEN PILES

Provide such temporary bracings as may be required during construction that are capable of keeping each pile accurately in its correct position. The method of bracing must be acceptable to the CM and must not be removed without prior Approval.

**PIL1.W450.8** BITUMEN SLIP LAYER FOR DRIVEN PILES

Choose from either of the following methods and submit, with the tender, details of the method it is intended to adopt:

1. Case driven piles with bitumen slip layer for the depth over which the bitumen slip layer is to be provided; or

2. Excavate the ground within the depth over which the bitumen slip layer is to be provided prior to piling, and return and well ram the excavated material to a density not less than that of the surrounding soil on completion of the piling.

**PIL1.W460.8** PROPRIETARY PILES WITH PROTECTIVE COATING

Proprietary pile types incorporating a protective coating without the requirement of casing or excavation, may be accepted subject to demonstration of the coating’s effectiveness under site conditions and to spot checks on site.

**PIL1.W470.8** DRIVING PILES DESIGNED NOT TO REST ON BEDROCK - FOR CONTRACTOR’S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Drive each pile to such layer or level as may be determined by a pile driving formula or static formula as PIL1.D390, whichever is the deeper, proposed by the Contractor and Approved by the CM.

**PIL1.W480.8** DRIVING PILES DESIGNED NOT TO REST ON BEDROCK - FOR ENGINEER’S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. Drive each pile to the level as may be determined by either sub-clause (1)(a) or (1)(b) as follows:
a. The proposed minimum pile length based on agreed SPT-N ≥ 200 contours as required in PIL1.W055 plus ....... m, unless otherwise accepted by the CM;

   ii. Satisfying the Approved pile driving formula as required in PIL1.W070.

or

b. A pile depth greater than that required by sub-clause (1)(a) if considered necessary by the CM, after taking into account the ground conditions and other relevant information, and satisfying the Approved pile driving formula as required in PIL1.W070.

2. Adopt a pile installation method, including but not limited to pre-boring, to ensure the required depth of pile is achieved without any damage, dislocation in position, out of plumb and reduction of its load carrying capacity;

3. Do not drive a pile beyond the level as determined by sub-clause (1)(a)(i) unless it has been substantiated that the pile has not reached its design capacity at the level as determined by sub-clause(1)(a)(ii) by either final set measurements as specified in PIL1.W520 using the Approved pile driving formula as required in PIL1.W070, or the set measurements using hydraulic hammer as specified in sub-clause (5), as appropriate;

4. Unless otherwise approved by the CM, drive the pile to reach the level as determined by sub-clause (1)(a)(ii) progressively at an interval of not more than one metre beyond the level as determined by sub-clause (1)(a)(i) to avoid excessive driving of the pile. At the beginning of each of these intervals, take final set measurements as specified in PIL1.W520 using the Approved pile driving formula as required in PIL1.W070, or set measurements using hydraulic hammers as specified in sub-clause (5), as appropriate;

5. For any pile pitched by using hydraulic hammers and then driven to final sets by using drop hammers or other Approved types of hammers as allowed in PIL1.W520, establish a set of proposed hammer switching criteria for the CM’s approval prior to installation of working piles to avoid excess pitching of the pile. The hammer switching criteria shall include but not be limited to a correlation between the final set measurements using drop hammers or other Approved types of hammers and the corresponding set measurements using hydraulic hammers, the results of pile driving analyser tests including CAPWAP analyses where appropriate, and the results of available static load tests;

6. Review the proposed hammer switching criteria as specified in sub-clause (5) in respect of their accuracy, reliability and applicability from time to time when more measurements and testing data are available, and submit any necessary revisions of the proposed hammer switching criteria to the CM for approval. No extra cost and extension of time shall be entertained in the establishment of the proposed hammer switching criteria including their subsequent revisions;

7. Bear the cost for any pile length driven beyond the level as determined by sub-clause (1)(a)(i) if the Contractor fails to take the final set measurements and / or the set measurements as specified in sub-clauses (4) and (5). The Contractor shall only be paid for the pile length to the level as determined by sub-clause (1)(a)(i);

8. Where a pile depth greater than that required by sub-clause (1)(a) is considered necessary by the CM as mentioned in sub-clause (1)(b) above, the full length of pile up to the depth as instructed by the CM shall be measured and paid accordingly;

9. Final set measurements and set measurements mentioned in the Specification shall include but not be limited to the measurements of set per blow, and temporary compression of pile and quake (elastic rebound) for determination of load carrying capacity of the pile.
PILING AND FOOTING

PIL1.W490.8  DRIVING PILES DESIGNED TO REST ON BEDROCK
Drive piles designed without allowance for group reduction factor and based on founding on bedrock as defined in PIL1.G450 to refusal or to a final set not less than 10 blows per 10 mm with a hammer capacity adequate to allow twice of the safe load carrying capacity of the piles to be developed. Propose a pile hammer with details of the hammer, hammer efficiency and hammer capacity to be used, support the proposed hammer efficiency and hammer capacity by pile driving analyser tests and obtain approval from the CM before pile driving commences. For Type 4 piles designed to rest on bedrock, comply with clause 5.4.11 of the Code of Practice for Foundations and carry out test driving on at least two numbers of piles selected by the CM prior to commencement of pile installation.

PIL1.W500.8  FOUNDING LEVEL OF DRIVEN PILES
For foundation designed to rest on bedrock, carry all foundations down to the insitu decomposed rock or bedrock as defined in PIL1.G450, and do not allow founding on boulders.

PIL1.W510.8  PENETRATION OF DRIVEN PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
In addition to the requirements specified elsewhere in this Specification, ensure penetration of driven piles into insitu decomposed rock is adequate to allow the pile to develop twice the allowable bearing capacity specified in the Drawings.

PIL1.W515.8  PENETRATION OF DRIVEN PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
In addition to the requirements specified elsewhere in this Specification, ensure penetration of driven piles into insitu decomposed rock is adequate to allow the pile to develop twice the safe load carrying capacity stipulated in PIL1.D390.

PIL1.W520.8  FINAL SETS OF DRIVEN PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
Use either of the following methods to drive the piles to final sets:
1. Use hydraulic hammers to drive the piles to final sets according to the modified Hiley formula specified in the Drawings;
2. Use drop hammers or other Approved types of hammers to drive the piles to final sets according to an Approved driving formula.

PIL1.W525.8  FINAL SETS OF DRIVEN PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
Use either of the following methods to drive the piles to final sets:
1. Use hydraulic hammers to drive the piles to final sets according to the modified Hiley formula stated in PIL1.D390;
2. Use drop hammers or other Approved types of hammers to drive the piles to final sets according to an Approved driving formula.

PIL1.W530.8  STEEL SET CHAIR
Propose a steel set chair with a slot for CM’s agreement to restrict the vertical movement of pencil for recording the final set:
1. A schematic sketch of a conceptual design of the steel set chair is given by Drawing No. CPT/SC/S/SK001 in Appendix C to this Specification;
2. The sketch is for reference only and given in good faith without prejudice to the Contractor's responsibilities and liabilities under the Contract.
INSTALLATION OF TYPE 3 PILES

PIL1.W610.8 BELL-OUT
1. Form bell-out, if any, using an expandable drill bit mounted onto a reverse circulation drill rig or other means approved by CM;
2. Ensure that the size of the bell-out tools is checked and calibrated on ground before construction of the bell-out;
3. For Contractor's Design Piling Contract / Combined Piling and Building Contract, size of bell-out shall comply with clause 5.4.7 of the Code of Practice for Foundations.

PIL1.W620.8 RISK MANAGEMENT PLAN FOR TYPE 3 PILE
Submit to the CM a risk management plan for Type 3 Pile within 21 days from the notified date for commencement of the Works. The risk management plan shall include, but not be limited to, identification of possible risks arising from or in connection with the following which may affect the quality of pile and or delay concreting work of pile beyond the statutory permitted working hours:
1. Extraction of temporary steel casing;
2. Concrete supply;
3. Concreting equipment;
4. Complex geotechnical conditions.
The plan shall also include analysis, assessment and evaluation of the risks identified and measures or action plans for avoiding, reducing or eliminating the risks.

INSTALLATION OF TYPES 5, 6 AND 7 PILES

PIL1.W710.8 GENERAL
Install piles without the use of bentonite slurry or other drilling muds.

PIL1.W720.8 TRIAL PILES
1. For Types 5 and 6 piles, install one vertical trial pile:
   a. At a location agreed by the CM before the installation of any pile;
   b. To demonstrate that the Contractor's proposed installation method will produce piles complying with this Specification; and
   c. To carry out loading test according to the load testing requirements for working piles as and when Instructed.
2. For Type 7 piles, install at least two trial piles:
   a. Of such length as calculated using two μ values agreed by the CM, taking into account the Contractor's capability and equipment to be used in pile installation, for the safe load carrying capacity;
   b. At a location agreed by the CM before the installation of any pile;
   c. To demonstrate that the Contractor's proposed installation method will produce piles complying with this Specification; and
   d. To carry out loading test according to the load testing requirements for working piles as and when Instructed in order to validate the design and method of construction and to determine an appropriate μ value for the design of piles.
3. Subject to the CM's approval, a working pile may be selected as the trial pile;
4. For Types 6 and 7 piles, prior to installation of any other piles, submit a trial pile test installation report including but not be limited to the anticipated rates of advancement of boring operation in different soil/rock strata for the remaining piles upon satisfactory completion of trial pile installation.
PILING AND FOOTING

PIL1.W730.8 INCLINATION OF PILES
1. For Types 5 and 6 piles, check the inclination of piles, during installation, at every pile location. Arrange for a number of piles, as directed by the CM, to be checked by the use of an inclinometer or other Approved method before grouting and record the inclinations and orientations of the holes;

2. For Type 7 piles, check the inclination of piles, during installation, at every pile location. Arrange for a number of piles, as directed by the CM, to be checked by the use of an Approved method before grouting and record the inclinations and orientations of the holes.

PIL1.W740.8 CHANGE IN SUB-SOIL CONDITIONS FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
If, during the installation of the piles, the excavated materials are found to be different from those specified in this Specification / the Drawings, or if such a situation is suspected, notify the CM.

PIL1.W745.8 CHANGE IN SUB-SOIL CONDITIONS FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
If, during the installation of the piles, the sub-soil conditions prove to be different from those in the submitted design, or if such a situation is suspected, notify the CM and submit proposals to cope with the revealed sub-soil conditions.

PIL1.W750.8 PREBORED HOLE AND COVER FOR TYPE 6 PILES
Ensure that the prebored hole shall be large enough to enable the installation of the steel H-pile and to allow a minimum cover of 40 mm to the steel H-pile (except at the base). Before inserting the steel H-pile in the prebored hole, ensure that the hole shall be cleaned and free from debris and soil.

PIL1.W760.8 TEST BORING PROPOSAL FOR TYPE 6 PILES
Provide test boring proposal giving details of the actual boring system to be used on Site, operating mechanism of the drill bit, maximum volume of air supply and pressure to be applied in different soil and rock strata, minimum rate of advancement of drill bit, ground and piezometer monitoring arrangement, criteria for satisfactory performance of the boring operation, monitoring procedures for checking the rates of boring operation and any necessary precautionary measures to prevent excessive overbreak or ground loss and undue disturbance to sub-soil.

PIL1.W770.8 TEST BORING PROPOSAL - TYPE 7 PILES FOR CONTRACTOR'S DESIGN
Prior to installation of trial piles and working piles, submit test boring proposal for the installation of Type 7 piles, which shall include but not be limited to the following information for the CM's approval:

1. Full technical details of the piles including grout strength, reinforcement details, cover to reinforcement, pile diameters and lengths;

2. Method statements for pile installation including equipment to be used, sequences of operation, drilling method, grouting method and installation of reinforcement cage;

3. All temporary works and precautionary measures required for prevention of settlement of adjacent ground during piling operation;

4. Ground settlement monitoring proposal;

5. Method of overcoming underground obstructions;

6. Grout mix and admixture;

7. Grout rate and pressure;

8. Minimum grout head to be maintained;
9. Testing regime and quality control for grouting;
10. Contingency plan for inclement weather during grouting and back-up plant and grout pump in case of breakdown.

**PIL1.W775.8 TEST BORING PROPOSAL - TYPE 7 PILES FOR ENGINEER'S DESIGN**

Prior to installation of trial piles and working piles, submit test boring proposal for the installation of Type 7 piles, which shall include but not be limited to the following information for the CM's approval:

1. Method statements for pile installation including equipment to be used, sequences of operation, drilling method, grouting method and installation of reinforcement cage;
2. All temporary works and precautionary measures required for prevention of settlement of adjacent ground during piling operation;
3. Ground settlement monitoring proposal;
4. Method of overcoming underground obstructions;
5. Grout mix and admixture;
6. Grout rate and pressure;
7. Minimum grout head to be maintained;
8. Testing regime and quality control for grouting;
9. Contingency plan for inclement weather during grouting and back-up plant and grout pump in case of breakdown.

**PIL1.W780.8 INSTALLATION PROCEDURES FOR TYPE 7 PILES**

1. In this clause, the following definitions are used:
   a. Incremental grout factor for 1.5 m increment - Actual grout volume placed divided by theoretical grout volume for the 1.5 m increment;
   b. Total grout factor - Actual grout volume placed divided by theoretical grout volume of pile;
   c. Grout-return depth - The depth of the auger tip when the grout on the auger flight reaches the ground surface;
   d. Auger refusal - The rate of auger penetration is less than 300 mm per minute of drilling.
2. Ensure that the size of the auger is checked and verified on ground before excavation of the piles. Advance the auger at a continuous rate preventing removal of excessive soil. Stop advancement after reaching the required embedment depth;
3. Prior to raising the auger, maintain a minimum grout head of 2 m. Determine the grout quantity by counting pump strokes and using the pre-determined grout volume per pump stroke. Maintain positive (clockwise) rotation of the auger at all times during placement of the grout. Coordinate the rate of grout injection and auger withdrawal so as to maintain:
   a. Sufficient grout head at all times;
   b. The incremental grout factor for each 1.5 m increment shall be not less than the smallest value obtained in the trial pile installation and in no case less than 1.15;
   c. The total grout factor shall be not less than the value established in the trial pile installation and in no case less than 1.4;
   d. The grout-return depth shall be equal to or greater than the grout head pumped at the bottom of the pile and shall be at least 2 m.
4. If grout pumping is interrupted for any reason, or if discontinued grout or slurry return at the ground surface is observed, or when grout pumping is interrupted or discontinued during pumping each truckload of grout, lower the auger at least 1.5 m below the level where the interruption occurred while pumping grout continuously;
5. If the volume of grout placed in any 1.5 m increment resulting in the incremental grout factor less than the minimum value observed in the trial pile installation, lower the auger 1.5 m or to the bottom of the pile if that is less, followed by controlled auger withdrawal while maintaining grout injection;

6. Provide auger turning and hoisting equipment enabling the auger to be rotated continuously in a positive (clockwise) direction while being withdrawn at a steady and continuous rate while pumping grout;

7. Clear away promptly the excess spoil accumulated around the auger due to the drilling process and grout injection;

8. Reinforcement cages to be free of soil, auger spoil or other deleterious materials prior to insertion into the grouted shafts;

9. Upon completion of the grouting operation and before the grout reaching its initial set, install the reinforcement cage immediately by lowering the reinforcement cage under its own weight to the specified level within the pile shaft. Prohibit vibrating or pushing the cage with equipment;

10. Pile excavation shall not be carried out within a centre to centre distance of 6 pile diameters from any pile under excavation or any newly cast pile with completion time elapsed not more than 24 hours.

REVIEW LOADING TEST RESULTS AND PROPOSED PILE LENGTHS - TYPE 7 PILES FOR CONTRACTOR'S DESIGN

1. After completion of loading tests of trial piles with satisfactory results, review and revise the method statements and proposed pile lengths submitted under PIL1.W770 as necessary. Prior to commencement of working piles, submit the revised method statements and proposed lengths of working piles with technical justifications to the CM for approval;

2. The proposed pile lengths in sub-clause (1) above shall in no case be less than the design pile lengths specified in the Contract. Bear all costs and time so incurred for any extra pile lengths installed beyond those specified in the Contract.

REVIEW LOADING TEST RESULTS - TYPE 7 PILES FOR ENGINEER’S DESIGN

After completion of loading tests of trial piles with satisfactory results, review and revise the method statements as necessary. Prior to commencement of working piles, submit the revised method statements with technical justifications to the CM for approval.

FOUNDING OF BORED PILES

1. Comply with the following requirements for Contractor's Design Piling Contract / Combined Piling and Building Contract:

   a. Excavate to form foundation for Type 3 piles so that the pile bases are socketed into bedrock as previously described in PIL1.G450 and the socket depth shall comply with Note (3) of Table 2.1 of the Code of Practice for Foundations, or such other depths specified by the CM;

   b. If the centre to centre spacing of two adjacent Type 3 piles is less than 2.5 times the diameter of the larger pile base and the difference in founding levels of these two piles is greater than the clear distance between their bases on plan, justify to the CM's satisfaction by an elastic analysis that:
i. The compressive stress in the longer pile, including any additional stress induced by the shorter pile and/or any additional stress induced by any unfavorable ground conditions, will not exceed the limiting value set in PIL1.D360; and

ii. The bearing stress on the founding material supporting the longer pile, including any additional stress induced by the shorter pile and/or any additional stress induced by any unfavorable ground conditions, will not exceed the safe load carrying capacity set in PIL1.D390;

iii. When Instructed, carry out additional ground investigation works to justify the subsurface conditions assumed in his analysis to the CM's satisfaction at no additional cost and time.

c. Notwithstanding the requirements of sub-clause (b) above, comply also the requirements stated in the last paragraph of clause 5.4.7 of the Code of Practice for Foundations, where steep bedrock profile is identified;

2. Comply with the following requirements for Engineer's Design Piling Contract / Combined Piling and Building Contract:

   Excavate to form foundation for Type 3 piles so that the pile bases are socketed into bedrock as previously described in PIL1.G450 and the socket depth shall comply with Note (3) of Table 2.1 of the Code of Practice for Foundations, or such other depths specified by the CM.

**PIL1.W820.8 FOUNDING OF TYPES 5 AND 6 PILES**

Found the rock socket in bedrock as PIL1.G450.

**PIL1.W830.8 PROVING BEDROCK**

1. See PIL1.T220 for Type 3 piles; and
2. See PIL1.T230 and PIL1.T250 for Types 5 and 6 piles.

**UNDERGROUND OBSTRUCTIONS**

**PIL1.W910.8 OBSTRUCTIONS TO PILES FOR CONTRACTOR'S DESIGN**

1. When underground obstructions are encountered at any depth during piling operations, propose full details of the intended means of overcoming underground obstructions (the "intended means") for Approval prior to the works being put in hand, which Approval shall not relieve the Contractor of the responsibility for designing, constructing and completing the Works in accordance with the Contract;

2. The intended means shall not cause any adverse impact including, but not limited to, considerations of lateral stability, safe load carrying capacity and/or structural integrity, on the pile to be constructed and the piles already constructed; and

3. The Approved intended means shall be implemented and the obstructions shall be overcome by the Contractor at his own risk in respect of cost and time including the cost and time necessary to obtain Approval.

**PIL1.W915.8 OBSTRUCTIONS TO PILES FOR ENGINEER'S DESIGN**

1. When underground obstructions are encountered at any depth during piling operations, propose full details of the intended means of overcoming underground obstructions (the "intended means") for Approval prior to the works being put in hand, which Approval shall not relieve the Contractor of the responsibility for constructing and completing the Works in accordance with the Contract; and

2. The intended means shall not cause any adverse impact including, but not limited to, considerations of lateral stability, safe load carrying capacity and/or structural integrity, on the pile to be constructed and the piles already constructed.
PILING AND FOOTING  PIL1 > WORKMANSHIP

PIL.W920.8 INTENDED MEANS OF OVERCOMING UNDERGROUND OBSTRUCTIONS TO PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Subject to Approval, the intended means stated in PIL.W910 may include, but are not limited to, the following:

1. For Type 1, 2 and 4 piles,
   a. Re-design of piles and/or pile caps;
   b. Extraction and re-driving of piles;
   c. Abandonment of piles and provision of replacement piles; and/or
   d. Removal of underground obstructions by excavation and/or pre-boring through the underground obstructions.

2. For Type 3 piles,
   a. Re-design of piles and/or pile caps;
   b. Abandonment of piles and provision of replacement piles; and/or
   c. Removal of underground obstructions by excavation and/or chiseling.

3. For Type 5, 6 and 7 piles,
   a. Re-design of piles and/or pile caps;
   b. Abandonment of piles and provision of replacement piles; and/or
   c. Removal of underground obstructions by excavation and/or coring through the underground obstructions.

PIL.W930.8 INTENDED MEANS OF OVERCOMING UNDERGROUND OBSTRUCTIONS TO PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Subject to Approval, the intended means stated in PIL.W910 may include, but are not limited to, the following:

1. For Type 1, 2 and 4 piles,
   a. Extraction and re-driving of piles; and/or
   b. Removal of underground obstructions by excavation and/or pre-boring through the underground obstructions.

2. For Type 3 piles, removal of underground obstructions by excavation and/or chiseling;

3. For Type 5, 6 and 7 piles, removal of underground obstructions by excavation and/or coring through the underground obstructions.

PIL.W940.8 DESIGN CHANGES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Where the intended means of overcoming obstructions involve any changes to the design of the piles and pile caps accepted by the Employer at the date of acceptance of the Tender, any reduction in cost as may have resulted from the changes shall be subject to reduction in accordance with the provision of the Contract.

PIL.W950.8 EXCAVATION OR PRE-BORING

Where underground obstructions are removed by excavation or pre-boring, cart away the excavated materials and backfill the boreholes or voids with Special Fill Material or other materials approved by the CM, well compacted, all to Approval.

PILING AND FOOTING
Specification Library 2018 Edition (Batch 2) PIL1.W955.8
SUBMISSION ON OVERCOMING ANTICIPATED UNDERGROUND
OBSTRUCTIONS BEFORE PILE DRIVING OPERATION FOR TYPE 4
PILES
1. Within 14 days from the notified date for commencement of the Works and before
pile driving operation, submit a detailed proposal for overcoming anticipated
underground obstructions to the CM for approval, taking into account the
Contractor’s own resources of labour, plant and equipment. The proposal shall not
cause any adverse impact to, including but not be limited to, lateral stability, bearing
capacity, and / or structural integrity of the pile to be constructed and the piles
already constructed;
2. In the event that pre-boring is proposed to be adopted for overcoming anticipated
underground obstructions as per sub-clause (1) above, the proposal shall also
include detailed planning of locations and depths of wash bored holes and / or other
methods acceptable to the CM to identify the extent, locations and depths of the
anticipated underground obstructions;
3. Subject to no adverse comment by the CM, carry out the investigation as in sub-
clause (2) above at the Contractor’s own time and cost to identify the extent,
locations and depths of the anticipated underground obstructions. In case wash
bored holes are proposed, they shall be conducted by a RSC(GIFW) as specified in
PIL1.G460;
4. Within 7 days upon completion of the investigation, prepare and submit to the CM
for agreement a layout plan showing the number, locations and depths of the
proposed pre-bored holes, which shall be reviewed and resubmitted when more
information about the anticipated underground obstructions is available. The CM
will consider available ground investigation, wash-boring results, other
investigation findings, and other supporting documents as he considers relevant in
approving or disapproving the proposed pre-boring requirements. The CM shall
have sole discretion on the location and depth of pre-bored holes;
5. Subject to the approval by the CM, carry out the pre-bored holes to remove the
anticipated underground obstructions. The Contractor shall make due allowance in
his programme and pricing to comply with this requirement;
6. The Contractor shall be entitled to payment for the cost of Approved pre-boring
work valued at the rates priced in the Bills of Quantities, but not be entitled to any
claim for extension of time or any other cost claim. For the avoidance of doubt,
irrespective of the repetitive operations of Approved pre-boring work done for the
installation of a pile due to multi-layers of obstructions, the Contractor is only
entitled to payment for one pre-bored hole based upon the deepest depth of pre-
boring, subject to the requirement that the pile is successfully installed eventually;
7. When the pre-boring proposed by the Contractor for a specific pile location was
disapproved by the CM, but subsequently underground obstructions are encountered
during installation of the pile and pre-boring is further proposed by the Contractor
and Approved by the CM, the Contractor is entitled to payment for the cost of pre-
boring as per sub-clause (6) above but not entitled to any claim for extension of time
or any other additional cost;
8. When no ground investigation and no pre-boring as in sub-clause (2) above are
proposed by the Contractor for a specific pile location, but underground
obstructions are encountered during installation of the pile and pre-boring is
proposed by the Contractor and Approved by the CM, the Contractor is not entitled
to payment for the cost of pre-boring and any claim on extension of time. The
Contractor shall bear the risk in respect of cost and time to overcome the
underground obstructions for that pile;
9. Other than the payment as per sub-clauses (6) and (7) above, the Contractor shall
not be entitled to any other additional costs or claim for extension of time in
connection with overcoming underground obstructions;
10. Bear all responsibility in the planning, executing and completing the Works and allow sufficient time in programme of the Works for the above requirements.

**PILE SHAFT CASINGS**

**PIL1.W1010.A LININGS TO INSITU PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**

1. Provide left-in steel linings when cast insitu piles are used and:
   a. Extend the lining from cut-off level down to a level as given in the Project Specific Specification;
   b. Ensure that the length of the lining is adequate for the purpose;
   c. Increase the depth of the lining to suit actual site conditions, to prevent necking and bear the cost and time of such lengthening; and
   d. Ensure that the lining does not protrude above the cut-off level or down into the bell-out and/or the designed rock socket.

**PIL1.W1015.N LININGS TO INSITU PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**

1. Provide left-in steel linings as given in the Project Specific Specification.

**PIL1.W1020.8 PILE TYPE 2**

Until insertion of precast concrete units, case the pile shafts for their entire length or for such length acceptable to the CM. Ensure casing is watertight and of sufficient strength to withstand soil pressure. Obtain Approval for details of casing.

**PIL1.W1024.8 TEMPORARY CASING FOR TYPE 3 PILES**

1. Provide temporary casing to the pile shaft for its entire length down to the inferred rockhead level of bedrock or such other depths acceptable to the CM;
2. Ensure casing is watertight and of sufficient strength to withstand soil pressure. Obtain Approval for details of casing;
3. Carry out all measures as considered necessary to prevent collapse of the bored hole during excavation and concreting;
4. Bear all responsibility in planning, executing and completing the Works and allow sufficient time in the programme of the Works for the above requirements; and
5. Bear all additional costs, including the cost of any temporary casing inevitably left in the ground in the course of pile construction for whatever reason by Contractor and no extension of time will be entertained for complying with the requirements of this clause.

**PIL1.W1027.8 LEFT-IN TEMPORARY CASING FOR TYPE 3 PILES**

1. When specified in the Drawings or as Instructed, leave the temporary casing behind to such depth as determined by the CM;
2. The Contractor may adjust the left-in temporary casing in sub-clause (1) above to a lower depth as considered necessary to suit the proposed method and sequence of construction. In this case, the Contractor shall bear all additional costs and no extension of time will be entertained for the adjustment.

**PIL1.W1030.8 TYPE 5 PILES**

Case pile shafts for their entire length except for that section in bedrock and ensure:
1. Casings are joined, where necessary, with watertight joints;
2. Casings are clean and free of any material adhering to them when first inserted into the pile position;
3. Dents in the casings do not exceed 5 mm in depression;
4. The gap between the casing and soil is filled with grout or other Approved material.

**TEMPORARY CASING FOR TYPE 6 PILES**
1. Ensure that temporary casing shall be lowered at the same time when the hole is made and that the casing must be seating on rock head or top of rock socket before the rock socket hole is formed;
2. Ensure also that the temporary casing shall be free from distortion, internal projection and hardened grout.

**GROUTING PILE TYPES 2 AND 3**

**PRESSURE GROUTING**
Where pressure grouting is required for the type of piling system proposed for this Contract, submit proposals for and details of the grouting with the tender.

**BASE OF TYPE 3 PILES**
Grout the base of large diameter bored piles if soft material, debris, mud etc is found between the bottom of the concrete and the bearing stratum by test and:
1. Obtain Approval for the proposal and details of the grouting.

**GROUTING TYPES 5, 6 AND 7 PILES**

**BATCHING**
1. Batch dry materials by weight;
2. Measure the amount of water used by use of a calibrated flowmeter or a measuring tank.

**USE OF ADMIXTURES**
State the use of admixtures prior to the commencement of trial piling and give evidence that the admixtures:
1. Will allow pumping to be carried out successfully;
2. Will yield concrete or grout of the required strength and durability;
3. Have been used successfully in previous practice.

**MIXING AND SIEVING**
1. Mix grout by adding approximately two thirds of the cement to the water, followed by the additive, if any, then followed by the remaining third of the cement;
2. Use a high speed colloidal grout mixer with a minimum speed of 1000 rpm and mix for a sufficient time to produce a grout of uniform consistency;
3. Obtain Approval for the use of any alternative mixing procedures;
4. After mixing, keep the grout continuously agitated and, prior to injection, pass the grout through a nominal 2.36 mm sieve;
5. Use the grout as soon as possible after mixing and, in any case, within 30 minutes of the addition of cement unless special retarding agents are used.

**TESTING**
Test after mixing and sieving and before injection as PIL1.T330.
**PREPARATION (FOR TYPES 5 AND 6 PILES)**
Before steel reinforcement and/or steel H-pile is inserted in the pre-bored hole, clean the hole to ensure that it is free from debris and soil by a method approved by the CM.

**INJECTION**
Obtain prior Approval for the method of placing the grout and:
1. Use an injection pump of the positive displacement type;
2. Measure the grout intake volume by a method agreed by the CM. Calibrate the measuring device and submit a calibration report to the CM 7 days before trial mix of grout is made;
3. Fill the entire shaft, inside the casing, solidly with grout, without voids, honeycombing or other defects; and
4. Cast each pile in one continuous operation and under no circumstances leave a pile partially grouted even if this involves working beyond normal hours and rates are to allow for such circumstances.

**CONCRETING**

**GENERAL**
1. Obtain Approval for the method of placing concrete;
2. Ensure that the entire shaft is solidly filled with concrete without voids, honeycombing or other defects.

**TYPE 3 PILES**
For Type 3 piles, concrete may be placed under water subject to Approval and on submission of details. Clean the base of the excavation by using air lifting equipment or other Approved method, all subject to Approval.

**CONTINUITY FOR TYPES 1c, 3 AND 5 PILES**
1. Cast each pile in one continuous operation. In no case will it be permissible for a pile to be left partly concreted;
2. Submit a concreting plan for each Type 3 pile to the CM at least one week prior to commencement of concreting works to the respective pile for agreement. The concreting plan shall include an hourly concreting schedule and contingency measures to be taken for any slippage in concreting which may affect the timely completion of the scheduled concreting works. The contingency measures shall include, but not limited to, abandoning the retraction of part or entire length of the temporary casing to shorten the concreting time.

**REINFORCEMENT TO PILE TYPES 1 AND 2**
Distribute reinforcement for pile types 1 and 2 uniformly. Ensure reinforcement is sufficient to withstand handling and driving stresses without fracture or cracking of the concrete.

**REINFORCEMENT TO TYPE 5 PILES**
Lengthen the reinforcement by staggering the couplers using Approved methods. Separate each reinforcement bar by spacers at regular intervals.

**FINISHING OFF PILE HEADS**

**CAST INSITU PILES**
Cast insitu piles to a level of 750 mm above cut off levels.
**PILING AND FOOTING**

**PIL1.W1420.8 CUT OFF LEVELS**
The top of pile cap levels shown on tender Drawings are provisional and may be altered if so required by the CM. It follows that the cut off levels of piles may also be varied. However, the extent of the variations will be limited to ±1 metre of the levels shown on the tender Drawings.

**PIL1.W1430.8 CUTTING AND TRIMMING**
1. For Type 7 pile, a minimum period of 7 days has to elapse after completion of pile casting prior to cutting and trimming of pile head;
2. Excavate to expose, cut off and trim pile heads to the required levels, backfill with General Filling Material and import Special Filling Material to make up voids, and remove debris from Site.

**PIL1.W1440.8 PRELIMINARY AND ABANDONED PILES**
Excavate to expose, cut off and trim pile heads of any non-working preliminary piles to 2000 mm below finished ground level and of any abandoned piles to a level as given in the Project Specific Specification and backfill with General Filling Material, importing Special Filling Material to make up voids, and remove debris from Site.

**PIL1.W1450.8 DOWEL BARS**
For concrete piles, provide dowel bars. Straighten dowel bars subsequent to trimming pile head.

**PIL1.W1460.8 CUTTING OFF STEEL PILES**
For steel piles, execute cutting by Approved means. In the event of damage being done to the head of the pile, cut off the defective parts and make good the pile to the satisfaction of the CM.

**PIL1.W1470.8 BEARING PLATES FOR STEEL PILES FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**
1. Weld a bearing plate to the top of each steel pile and ensure bearing plates are installed in accordance with the Drawings so that the imposed loads on bearing plates do not exceed the capacities of bearing plates as allowed in the Code of Practice for the Structural Use of Steel 2011.

**PIL1.W1475.8 BEARING PLATES FOR STEEL PILES FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**
1. Weld a bearing plate to the top of each steel pile, sufficient to transfer the required load all to Approval;
2. Ensure bearing plates are proportioned so that the imposed loads on bearing plates do not exceed the capacities of bearing plates as allowed in the Code of Practice for the Structural Use of Steel 2011.

**PIL1.W1480.8 ALTERNATIVE LOAD TRANSFER DETAILS FOR STEEL PILES**
Obtain Approval for alternative load transfer details.

**PIL1.W1490.8 WORK AT COMPLETION (WHERE CONSTRUCTION OF PILE CAP DOES NOT FORM PART OF THE CONTRACT)**
At completion of the Works, where the method of working gives rise to changes in the levels from those agreed at the commencement of the Works, level off the Site to remove all high spots and fill in all hollows.
PILING RECORDS

PIL1.W1510.8  GENERAL
Keep accurate and comprehensive records of each pile installed and submit daily a copy of these records signed by the site representative, to the CM, of each pile installation to its final position.

PIL1.W1520.8  STANDARD FORM
Keep each record on standard forms as shown in Appendices III and IV to this Worksection showing, as appropriate to pile type, the following:
1. Pile reference number;
2. Date pile driven or installed;
3. Position of pile in the works and ground level at pile position;
4. Type and size of hammer and stroke;
5. Set throughout penetration of pile including the set for the last ten blows;
6. Measurements of temporary compression in the pile;
7. Details of any interruption in driving of the pile;
8. Details of obstructions and delays;
9. Level of tip of pile after completion of driving;
10. Length of pile;
11. Volume of concrete or grout placed in pile;
12. Length and toe level of casing;
13. Drilling rate and materials encountered;
14. Inclination of pile as installed per metre depth of pile;
15. Any other data requested by the CM;
16. Penetration of pile into bedrock.

PIL1.W1525.8  PILING RECORDS FOR TYPE 7 PILES
Keep each pile installation record in an approved format for the following:
1. Pile reference number;
2. Weather conditions and temperature;
3. Date pile installed;
4. Position of pile in the works and ground level at pile position;
5. Grout truck number, arrival time on-site, batch time and batch volume;
6. Grout sampling time and time of initial set;
7. Grout cubes made by the Contractor;
8. Flow cone test results;
9. Auger diameter (actual diameter each time measured in field);
10. Time period for drilling of pile;
11. Rate of penetration of auger (revolution per auger pitch);
12. Abnormal drilling behaviour;
13. Details of obstructions and delay;
14. Pile drilled length/pile tip and top elevation;
15. Theoretical pile volume;
16. Time period for grouting of pile;
17. Range in pressure observed during grouting;
18. Grout return depth;
19. Grout volume pumped per 1.5 m increment of pile length;
20. Total number of pump strokes to complete pile (actual grout volume);
21. Total grout factor;
22. Reinforcing steel cage installed in the pile;
23. Special remarks (e.g. time of and reason for interruptions during grouting, extra grout cubes made);
24. Any other data requested by the CM.

PIL1.W1530.8 RECORDS OF TEMPORARY COMPRESSION FOR DRIVEN PILE
Keep and submit to the CM records of field measurements of temporary compression during the driving of the piles to the final set stages by recording same on a card or graph paper attached to the face of the pile.

PIL1.W1540.8 SUBMISSION OF RECORD PLAN
After completing all piling works of a block/structure or part of a block/structure as agreed by the CM, furnish to the CM four copies of a piling record plan showing, as appropriate, the position, identity number, length and final set of all the piles installed for that block/structure or that part of the block/structure. The piling record plan should not contain any amendments which have not been Approved. Submit four copies of a record plan showing offset of piles, if any. In addition, submit electronic copies of the record plans in a format as required by the CM.

PIL1.W1550.8 FOUNDING LEVEL RECORD
Provide a record of the founding level of the bedrock, for Approval.

PIL1.W1560.8 BORING RECORDS FOR TYPES 6 AND 7 PILES
Provide boring records in accordance with PIL1.W1510, PIL1.W1520, PIL1.W1525, PIL1.W1540 and PIL1.W1550 and including the advancement rate of drill bit, air/grout pressure used, volume of air/grout supply, flushing medium, settlement and groundwater drawdown records, as appropriate to pile type.

REMEDIAL MEASURES

PIL1.W1610.8 PILES DESIGNED TO REST ON BEDROCK FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
When piles originally designed in accordance with PIL1.D410 do not satisfy the founding conditions stated in that clause or the workmanship requirement stated in PIL1.W490, the original design would be rejected. In this case, redesign the pile(s) in the same pile cap already installed and to be installed, as piles not found on bedrock in accordance with all the requirements for piles not found on bedrock.

PIL1.W1620.8 RISING PILES (FOR DRIVEN PILE)
1. Measure the top level of each pile immediately after driving to such a layer or level as is required;
2. Carry out further levelling checks for pile rising as and when directed by the CM;
3. Re-drive piles which have risen for any reason, to the original level (or to such other level as the CM may determine) unless otherwise directed by the CM.
DEFECTIVE PILES
If in the opinion of the CM, any pile is defective because of the pile having been constructed or driven outside the specified tolerances or having been damaged during driving or by the construction of another pile nearby or otherwise failing to conform to this Specification:
1. Pull out and replace the pile with a sound pile complying in all respects with the requirements of this Specification;
2. If the pile cannot be pulled out, carry out Approved remedial measures.

NON-COMPLIANCE (FOR TYPE 7 PILES)
For Type 7 piles not complying with the specified requirements stated in PIL1.W780:
1. Lower the auger to the bottom of the pile while the grout is still fluid and re-grout the bored hole; or otherwise,
2. Demonstrate to the CM by tests that the piles in doubt can sustain the design loading. Bear all costs and no extension of time is allowed for such tests as a consequence of the above non-compliance; and
3. If the test results indicate that the piles in doubt fail to sustain the design loading, bear all costs and no extension of time is allowed for the execution of remedial measures, including but not limited to the installation of additional piles and modifications of tie beams and pile caps.

SPLICING PILES

GENERAL
Where lengthening of a pile becomes necessary, or is directed by the CM, carry it out by the method directed or by any other Approved method. Do not resume the driving of a lengthened pile without the permission of the CM.

STRENGTH OF SPLICES
Whenever necessary to splice a pile, the strength of the pile at the splice must be no less than the strength of pile at any normal section of the pile. Submit full details of proposed splicing methods with the tender.

WELDING

TESTING OF WELDERS
As Worksection STR1.

ADVERSE WEATHER CONDITIONS
Do not carry out welding under adverse weather conditions as determined by the CM.

WELDED JOINTS
Joint all piles by butt-welding in such a manner that the full strength of the original section is developed and:
1. Provide adequate facilities for supporting and aligning piles prior to welding;
2. Ensure that the joints are waterproof in the case of pipe piles.

TACK WELDS
Keep tack welds to a minimum.

STANDARDS
Weld by electric arc welding:
1. Comply with Worksection STR1 for welding Standards;
2. Where grade S450 steel H-piles are used, ensure that welding procedures is carried out on Site and Approved.

PIL1.W1860.8 PREPARATION
Ensure the surface to be welded is free from all scale, grease, paint and rust and other matter.

PIL1.W1870.8 PILE SHOES
Ensure welding is:
1. Adequate to transmit the ultimate pile load and to prevent the detachment of the points in the case of withdrawal to remove obstructions;
2. In accordance with the manufacturer's recommendations.

PIL1.W1880.8 FINISHING
After every run of weld, chip out slags, and thoroughly wire brush surfaces.

PIL1.W1890.8 DEFECTS
Make good any defects in a weld, such as distortion, spatter, cracks, undercut, slag holes, unequal width of bead, irregular ripple etc to the satisfaction of the CM.

PIL1.W1900.8 ETCHED SECTIONS
Submit etched sections to the CM for examination when required.

RECORDS AND CERTIFICATES

PIL1.W2010.8 REPORT ON COMPLETION OF PILING WORKS FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
1. After all piles of a block or part of a structure as agreed by the CM have been installed, submit four copies of a report on completion of the piling works for that block or that part of the structure. The report shall be signed by the Authorized Signatory and the TCP Grade T4 as specified in the SP for foundation works and include the following:
   a. Scope of the Works and foundations adopted;
   b. General description of the geology of the Site, including an assessment report with rockhead contour plans as appropriate and at least one geological cross-section of the ground beneath that block or that part of the structure indicating the inferred soil layers' SPT - N values, bedrock and pile tip levels;
   c. Piling records as PIL1.W1510 to PIL1.W1560;
   d. Schedule and summary of all pile test results excluding the proof tests specified in PIL1.T030;
   e. As-built piling design certified by the Design Certifying Consultant;
   f. Details of laboratory tests, instrumented pile tests and other load tests if the soil parameters given in this Specification have been modified;
   g. Settlement analysis as PIL1.D510 to PIL1.D570 certified by the Design Certifying Consultant;
   h. Final ground investigation reports prepared by the Ground Investigation Contractor;
   i. Authorized Signatory's certification confirming that the completed piling works are satisfactory for the purpose intended and the piles, as installed, are properly penetrated into insitu decomposed rock or onto bedrock as approved by the CM;
j. Report of remedial work, if any;
k. Any other relevant information;
l. Conclusion.

2. After submitting the report specified in sub-clause (1) above, request the CM to select piles for proof tests. The Contractor may, however, seek the CM's agreement to select piles for proof tests after submitting part of the report; in such an event, submit the outstanding part of the report not later than the time of submitting Form ICU14 as specified in sub-clause (3) below. Allow the CM 21 days to select piles for proof tests in accordance with PIL1.T030. If resubmission of the report is required, allow the CM another 21 days to select piles for proof tests after resubmission;

3. Upon satisfactory completion of the proof tests, complete and submit Form ICU14 and report of further remedial work, if any, to the CM on block by block basis, unless otherwise agreed by the CM.

PIL1.W2020.8 REPORT ON COMPLETION OF PILING WORKS FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. After all piles of a block or part of a structure as agreed by the CM have been installed, submit four copies of a report on completion of piling works for that block or that part of the structure. The report shall be signed by the Authorized Signatory and the TCP Grade T4 as specified in the SP for foundation works and include the following:
   a. Scope of the Works and foundations adopted;
   b. General description of the geology of the Site, including an assessment report with rockhead contour plans as appropriate and at least one geological cross-section of the ground beneath that block or that part of the structure indicating the inferred soil layers' SPT - N values, bedrock and pile tip levels;
   c. Piling records as PIL1.W1510 to PIL1.W1560;
   d. Schedule and summary of all pile test results excluding the proof tests specified in PIL1.T030;
   e. Final ground investigation reports prepared by the Ground Investigation Contractor;
   f. Authorized Signatory's certification confirming that the completed piling works are satisfactory for the purpose intended and the piles, as installed, are properly penetrated into in situ decomposed rock or onto bedrock as approved by the CM;
   g. Report of remedial work, if any;
   h. Any other relevant information;
   i. Conclusion.

2. After submitting the report specified in sub-clause (1) above, request the CM to select piles for proof tests. The Contractor may, however, seek the CM's agreement to select piles for proof tests after submitting part of the report; in such an event, submit the outstanding part of the report not later than the time of submitting Form ICU14 as specified in sub-clause (3) below. Allow the CM 21 days to select piles for proof tests in accordance with PIL1.T030. If resubmission of the report is required, allow the CM another 21 days to select piles for proof tests after resubmission;

3. Upon satisfactory completion of the proof tests, complete and submit Form ICU14 and report of further remedial work, if any, to the CM on block by block basis, unless otherwise agreed by the CM.
PILING AND FOOTING

PIL1.W2030.8  CERTIFICATION FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. Submit the following prior to serving notice in writing to the CM on completion of the Works in accordance with GCC Clause 8.7:
   a. Authorized Signatory’s certification confirming that the completed job is satisfactory for the purpose intended and the piles, as installed, properly penetrate into insitu decomposed rock or onto bedrock as approved by the CM;
   b. Four copies of the as-built pile cap design and drawings based on the as-built piling layout and/or four copies of the as-built footing design and drawings; the as-built pile cap and/or footing design and drawings should be certified by the Design Certifying Consultant and should not contain any amendments which have not been Approved;
   c. Four copies of report listing the date of casting of concrete, the quality and quantity of materials used and the excavation record of each pile cap and/or footings;
   d. Four copies of final test reports on the pile caps and/or footings not carried out by the Direct Testing Contractors;
   e. Completed Form ICU 14;
   f. Any other relevant information.

2. Any submission not to the satisfaction of the CM shall have to be re-submitted. Allow 21 days for each submission and re-submission for the checking of the CM.

PIL1.W2040.8  CERTIFICATION FOR ENGINEER’S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. Submit the following prior to serving notice in writing to the CM on completion of the Works in accordance with GCC Clause 8.7:
   a. Authorized Signatory’s certification confirming that the completed job is satisfactory for the purpose intended and the piles, as installed, properly penetrate into insitu decomposed rock or onto bedrock as approved by the CM;
   b. Four copies of the as-built pile cap drawings based on the as-built piling layout and/or four copies of the as-built footing drawings;
   c. Four copies of report listing the date of casting of concrete, the quality and quantity of materials used and the excavation record of each pile cap and/or footings;
   d. Four copies of final test reports on the pile caps and/or footings not carried out by the Direct Testing Contractors;
   e. Completed Form ICU 14;
   f. Any other relevant information.

2. Any submission not to the satisfaction of the CM shall have to be re-submitted. Allow 21 days for each submission and re-submission for the checking of the CM.

PILE CAPS AND FOOTINGS

PIL1.W2110.8  GENERAL

Execute the work described in this Sub-section in accordance with the provisions of the other relevant Worksections in this Specification.

PIL1.W2120.8  APPROVED DESIGN FOR CONTRACTOR’S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Construct the pile caps and/or footings in accordance with the Approved, submitted design.
PILING AND FOOTING

PIL1 > WORKMANSHIP

PIL1.W2130.8  **STARTER BARS FOR ENGINEER’S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**
Apart from the execution of the pile caps and/or footings, provide and execute starter bars shown on the Drawings.

PIL1.W2135.8  **STARTER BARS FOR CONTRACTOR’S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**
Apart from the design and execution of the pile caps and/or footings, provide and execute starter bars shown on the Drawings.

PIL1.W2140.8  **BACKFILLING EXCAVATIONS**
Backfill excavation with Suitable Material up to the top level of the pile caps and/or footings and:
1. Form and maintain the sides of the backfill adjacent to the pile caps and/or footings to an angle of inclination as given in the Project Specific Specification;
2. Deposit surplus excavated Suitable Material on Site in stockpiles in Approved locations;
3. Remove Unsuitable Material from Site.

PIL1.W2150.8  **ALTERNATIVE PROPOSAL FOR CONCRETE COMpressive STRENGTH TEST**
Where it is anticipated that the specified 28-day compressive strength tests for concrete of any pile caps / tie beams / footings cannot be completed upon the date for completion of the Works or the latest extended date for completion of the Works, whichever is the later, the CM may consider and approve at his own discretion without prejudice to the Contractor’s responsibilities and liability under the Contract any proposal raised by the Contractor for earlier achievement of concrete strength for the completion of the Works after taking into account the timing of other tests of the Works, including but not limited to the use of a higher grade of concrete to that specified for the pile caps / tie beams / footings concerned, subject to the following:
1. Assess the results of these cube tests and core tests on basis of the grade of the concrete specified for the pile caps / tie beams / footings, but at the age less than 28 days in accordance with:
   a. Clauses CON1.T620 to CON1.T650 inclusive for cubes;
   b. Clause CON1.T760 for cores; and
   c. Do not make any adjustment to the measured strength in respect of the age of the cubes and cores when tested;
2. For the purpose of Clause 8.7(1) of the General Conditions of Contract, the tests on a date before the 28th day after casting which showed the achievement of the specified 28-day compressive strength shall be regarded as an alternative to the tests for compressive strength of concrete for pile caps / tie beams / footings to be carried out on the 28th day after casting as prescribed by the Contract. If the test results under the Approved proposal, assessed in accordance with sub-clause (1) above show that the strength of concrete have achieved the specified 28-day compressive strength and the results of all other tests also satisfied with the requirements as prescribed by the Contract, the Contractor may notify the CM the completion of the Works in accordance with Clause 8.7 of the General Conditions of Contract provided that the Contractor shall provide an additional undertaking stating that:
"If the results of tests for compressive strength of concrete for pile caps / tie beams / footings as carried out on the 28th day after casting, received by the CM on a date after the issue of the certificate of completion, fail to comply with the specified 28-day compressive strength tests requirements for concrete of the pile caps / tie beams / footings prescribed in the Contract, the Contractor shall carry out further tests and / or remedial works, all at the Contractor's expenses, and shall bear all costs, expenses and loss of the Employer due to failure of the tests. Irrespective of whether the Site or the concerned part thereof be handed over to others at a later date, or if the Site or the concerned part thereof has been handed to others before the commencement of the remedial works, the Employer shall be at liberty to carry out such remedial works by his own workers or by other contractors or allow the Contractor to carry out the whole or remaining part of the remedial works. In any case, the Contractor shall indemnify the Employer against all losses, liabilities, damages, costs, legal costs, professional fees and other expenses of any nature whatsoever the Employer may suffer, sustain or incur, whether direct or consequential, arising out of or in connection with the carrying out and completion of the whole or remaining part of the remedial works."

3. The Contractor shall bear all the additional costs and time for complying with the requirements of this clause.

PIL1.W2160.8 FOUNDING AND PROVING BEDROCK FOR FOOTINGS
Refer to EAR1.W930 and EAR1.W940.

MECHANICAL COUPLER FOR TYPE 5 PILES

PIL1.W2210.8 QUALIFIED SUPERVISION
Qualified supervision for mechanical coupler shall be in accordance with CON3.W310.

PIL1.W2220.8 INSPECTION LOG BOOK
1. Record the details in an inspection log book as per CON3.W320.
2. Keep the inspection log book on Site for CM’s inspection when required and submit the inspection log book to CM upon completion of the mechanical splice works.
TESTING

TESTING GENERALLY

PIL1.T010.8 NUMBER AND DISPOSITION OF TEST PILES
The number and disposition of the piles to be tested will be as Instructed. Make allowance for testing one preliminary pile early in the Contract to provide reasonable assurance that the Specification will be met.

PIL1.T020.8 REQUIRED MINIMUM NUMBER OF TESTS
1. Unless otherwise specified, the required minimum number of tests in this Worksection shall be calculated based on the testing frequency or sample size stated and the total number of piles installed in the whole Site. In case the calculated number of tests is not a whole number, any fraction of test shall be construed as one test;
2. Request the CM to select locations or piles for testing when all the piles have been installed and are ready for testing;
3. Upon agreement with the CM, the Contractor may request the CM to select locations or piles for testing when a portion of the piles have been installed and are ready for testing. In such an event, the required minimum number of tests for the portion shall be calculated based on the testing frequency or sample size stated and the total number of piles of that portion. In case the calculated number of tests is not a whole number, any fraction of test shall be construed as one test. As a consequence, the total number of tests carried out for all the portions may be more than the required minimum number of tests for the whole Site. Bear all additional costs and no extension of time is allowed.

PIL1.T030.8 PROOF TEST
1. After receiving the report on completion of piling works as specified in PIL1.W2010 or PIL1.W2020, the CM shall select piles for proof test accordingly;
2. In this Specification, proof test shall mean:
   a. Loading test of working piles as specified in PIL1.T610 and PIL1.T1010 to PIL1.T1130 for Type 1, 2, 4, 5, 6 and 7 piles;
   b. Core test as specified in PIL1.T1210 to PIL1.T1250 for Type 1c piles and Type 3 piles.
3. Notwithstanding the samples size specified in PIL1.T610 for loading test and PIL1.T1220 for core test, the CM shall select at least 1 pile per block for each type of proof test. For Type 4 piles driven to bedrock, the CM may select samples more than the sample size specified in PIL1.T610;
4. Allow the Direct Testing Contractor the number of working days as specified in the Project Specific Specification to carry out each proof test commencing after special attendance as stipulated in Worksection PRE.B12 or PRE.C12 as appropriate has been satisfactorily provided.

PIL1.T040.8 BATCH OF MECHANICAL COUPLER FOR TYPE 5 PILES
A batch of mechanical coupler is as specified in CON3.T025.
PRELIMINARY DRIVEN PILES

PIL1.T110.8 PRELIMINARY PILES - TYPES 1, 2 AND 4 FOR CONTRACTOR'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Before driving any pile, install at least one preliminary additional pile, for each of the proposed pile types to verify the proposed design methods and parameters and as follows:

1. Install the pile at a location outside the building structure and to a design depth, all as Approved;
2. Refer to PIL1.T130 for details of instrumentation;
3. Install a borehole adjacent to the preliminary pile and before it is driven to determine the geotechnical conditions;
4. Test the preliminary pile by Pile Driving Analyser with CAPWAP analysis after installation to the Approval founding depth;
5. Carry out a loading test on the preliminary pile as PIL1.T810 to PIL1.T880, immediately after driving to determine the ultimate side resistance and tip resistance of the pile;
6. Unless otherwise instructed by the CM, the Contractor may choose to pitch the first sections of working piles before the test result is known but in the case of a test failure, the Contractor must revise the design parameters and submit them for Approval. Any piles driven on the basis of the original proposal will be deemed to be unacceptable;
7. Carry out Approved remedial measures for such unacceptable piles including extracting and disposing, off Site, of any abandoned piles, where necessary, without any claim for extension of time;
8. Install a preliminary pile for the revised Approved design, repeating the procedure described above as necessary until a successful test result is achieved;
9. No claim for an extension of time will be allowed in connection with the provisions of this clause;
10. Trim down the preliminary pile to two metres below the finished ground level, or as directed, after completion of the loading test.

PIL1.T120.8 PRELIMINARY PILES - TYPES 1, 2 AND 4 FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Before driving any pile, install a preliminary additional pile, for each pile type to verify the driveability and the design assumptions as follows:

1. Install the pile at a location outside the building structure and to a design depth, all as Approved;
2. Refer to PIL1.T130 for details of instrumentation;
3. Install a borehole adjacent to the preliminary pile and before it is driven to determine the geotechnical conditions;
4. Test the preliminary pile by Pile Driving Analyser with CAPWAP analysis after installation to the Approval founding depth;
5. Carry out a loading test on the preliminary pile as PIL1.T810 to PIL1.T880, immediately after driving to determine the ultimate side resistance and tip resistance of the pile;
6. Unless otherwise instructed by the CM, the Contractor may choose to pitch the first sections of working piles before the test result is known. If any of the loading tests fail, the CM may order the installation of additional piles and the repetition of the procedures specified in this clause until a successful result is achieved.
**INSTRUMENTATION**

1. Instrument the preliminary pile with calibrated strain gauges to determine the distribution of side resistance in each major soil stratum down the pile and tip resistance in the bearing stratum during the loading test;

2. Propose, for the above purpose, the type, number and locations of strain gauges to be installed in each preliminary pile as well as the method of installation and protection of the strain gauges;

3. Acceptance of the Contractor's proposal by the CM shall not relieve the Contractor from the responsibility for ensuring the proper installation of the strain gauges and their satisfactory performance during load testing of the piles;

4. Check the performance of the strain gauges installed in the preliminary pile before and after installation of each segment of the pile into the ground, and before and during load testing of the pile;

5. The preliminary pile will be deemed unacceptable should there be more than 20% of the required total number of installed strain gauges not functioning properly during load testing of the pile;

6. Install an additional preliminary pile as PIL1.T110;

7. No claim for an extension of time will be allowed in connection with the provisions of this clause;

8. Take strain gauge reading at each incremental change of test load during the load test;

9. Present the strain gauge results by an Approved personal computer compatible spreadsheet software in both tabular and pictorial forms agreed by the CM;

10. Submit two copies of the data stored on floppy diskettes to the CM within one week after completion of the loading test.

**FAILURE OF PRELIMINARY PILES**

A preliminary pile is deemed to have failed the loading test when any of the following conditions occur in loading stage 2 as defined in PIL1.T830:

1. The settlement of the pile head reaches the magnitude of settlement at failure as defined in PIL1.T910;

2. The permanent settlement after removal of stage load 2 exceeds the permitted value specified in PIL1.T920.

**SAMPLING AND TESTING FOUNDING LEVELS TO PILE TYPES 3, 4, 5, 6 AND 7**

**PROVING BEDROCK BEFORE INSTALLATION OF TYPE 3 PILES**

1. Testing arrangements and testing samples:
   a. At every Type 3 pile location, carry out pre-drilling and take cores of minimum NX size to a minimum depth of 5000 mm into bedrock below the proposed pile base before commencement of excavation for the pile, when Instructed.

2. Testing methods:
   a. Extract rock core samples from the core holes in the presence of the CM or his representatives and provide records of bores for CM's inspection;
   b. When Instructed, carry out laboratory compression tests or field point load tests on recovered cores to determine rock strength;
   c. Submit to the CM ground investigation reports within 3 days after completion of coring and not less than 10 days prior to the commencement of pile excavation;
d. Take further cores at any location as the Contractor deems necessary and at his own expense as stated in PIL1.G440;
e. Keep the rock samples and a copy of the ground investigation reports in the container store rooms;
f. Backfill the drillholes with cement grout or Approved material.

3. Test on bearing strata:
   a. Carry out the uniaxial compressive strength test or equivalent point load index test on the founding material for piles founded on Cat 1(c) or better rock in accordance with the testing methods stated in sub-clause (2)(b) above. Perform a minimum of 1 such test on rock specimen obtained at the location of each installed pile.

---

**PIL1.T220.A**  PROVING BEDROCK BEFORE REACHING FOUNDING LEVEL FOR TYPE 3 PILES

1. Testing arrangements and testing samples:
   a. When Instructed, upon excavation for Type 3 pile reaching bedrock as previously described in PIL1.G450, or the tentative founding level as specified in the Drawings or pile base, take an NX size core to a minimum depth of 5000 mm or such other depth as instructed by the CM into the bedrock below the proposed pile base. In order to ascertain bedrock profile within a pile, the CM may order more than one core per pile.

   2. Testing methods:
      a. Extract rock core samples from the core holes in the presence of the CM or his representatives and provide records of bores for CM's inspection;
      b. When Instructed, carry out laboratory compression tests or field point load tests on recovered cores to determine rock strength;
      c. Submit to the CM ground investigation reports within 3 days after completion of coring;
      d. Take further cores at any location as the Contractor deems necessary and at his own expense as stated in PIL1.G440;
      e. Keep the rock samples and a copy of the ground investigation reports in the container store rooms; and
      f. Backfill the drillholes with cement grout or Approved material.

---

**PIL1.T230.8**  PROVING BEDROCK DURING INSTALLATION OF TYPES 5 AND 6 PILES AND OF TYPE 4 PILE DRIVEN TO BEDROCK

1. Testing arrangements and testing methods:
   a. Before the commencement of piling, carry out pre-drilling and take cores of minimum NX size down to at least 5 m deep into the bedrock below the rock head of the specified grade of rock, or to the bottom level of the designed rock socket length of the nearest pile, whichever is the deeper. Provide rock core samples and records of the bores for the CM's inspection. Backfill the drillholes with cement grout or Approved material. Submit to the CM ground investigation reports within 3 days after completion of the coring.

   2. Testing samples:
      a. The number of drillholes required shall be such that the pile tip of every pile shall be within 5 metres from a drillhole and there shall be at least a drillhole at every pile cap location.

---

**PIL1.T240.8**  PROVING BEDROCK DURING INSTALLATION OF TYPES 5 AND 6 PILES AND OF TYPE 4 PILE DRIVEN TO BEDROCK

1. Testing arrangements:
When Instructed, provide equipment for obtaining disturbed and undisturbed soil and rock samples in accordance with BS 5930:1981 from ground in the vicinity of the pile shaft during installation.

2. Testing methods:
   a. When Instructed, carry out the following tests on Site or in the laboratory as directed by the CM:
      i. The standard penetration test in accordance with BS1377:1975 (Test 19), modified by "Geoguide 2: Guide to Site Investigation", Hong Kong Government, 1987;
      iii. Uniaxial compression strength test in accordance with ASTM Designation: D2938 – 86.
   b. When the drillhole reaches the rockhead, recover continuous rock cores to at least 5 m deep into the bedrock below the rock head of the specified grade of rock, or to the bottom level of the designed rock socket length of the nearest pile, whichever is deeper. Log all rock cores to ensure the quality of the rock socket;
   c. Provide suitable containers for samples of soil and ground water, ensuring that containers for cohesive material are airtight;
   d. Arrange for the testing of the samples in an Approved laboratory; and
   e. Backfill the drillholes with cement grout or Approved material.

3. Test on bearing strata for Types 5 and 6 Piles:
   a. Carry out the uniaxial compressive strength test or equivalent point load index test on the founding material for piles socketed in Cat 1(c) or better rock in accordance with the testing methods stated in sub-clause (2)(a)(ii) and (iii) above. Perform at least 1 such test on rock specimen taken within 5m of each installed pile.

4. Submit to the CM ground investigation reports within 3 days after completion of the coring and test in sub-clause (2)(a)(i) above and test reports within 3 days after completion of the tests in sub-clause (2)(a)(ii) or (2)(a)(iii) above.

PROVING BEDROCK AFTER INSTALLATION OF TYPES 5 AND 6 PILES AND OF TYPE 4 PILE DRIVEN TO BEDROCK

1. Testing arrangements:
   a. After installation of the piles, the CM will order a Direct Testing Contractor to take cores of minimum NX size in accordance with the requirements stated in clause 7.4.4 of the Code of Practice for Foundations. The drillholes shall be in the vicinity of the piles;
   b. Provide attendance on the Direct Testing Contractor as described in Worksection PRE.B12 or PRE.C12, as appropriate; and
   c. Backfill the drillholes with cement grout or Approved material.

2. Testing samples:
   a. The number of drillholes required shall be at least 2 or 1% of the total numbers of piles, whichever is the greater.

FOUNDING LEVEL FOR TYPE 7 PILES

1. Testing arrangements and testing methods:
a. Before the commencement of piling, carry out pre-drilling down to at least 5 m below the tentative founding level of the specified category in accordance with the Code of Practice for Foundations. Carry out standard penetration tests at maximum interval of 2 m along the drillholes from cut-off levels down to 5 m below the tentative founding levels. Provide records of the bores for the CM's inspection. Backfill the drillholes with cement grout or Approved material. Submit to the CM ground investigation reports within 3 days after completion of the coring.

2. Testing samples:
   a. The number of drillholes required shall be such that the pile tip of every pile shall be within 5 metres from a drillhole.

TESTING GROUT FOR TYPES 3, 5, 6 AND 7 PILES

PIL1.T310.8 DEFINITION OF 'BATCH'
1. For the tests specified in PIL1.T320 and PIL1.T330, a 'batch' of grout is any quantity of grout used for grouting in one continuous operation in one day;
2. For the test specified in PIL1.T340, a 'batch' of grout is the quantity of grout as stipulated in Clause 1.2 of CS1:2010.

PIL1.T320.8 TEST FOR BLEEDING AND FREE EXPANSION
1. Testing arrangements and testing samples:
   a. Provide one sample of grout from each batch not more than 30 minutes after mixing and protect from changes in moisture content before tests are carried out.
2. Testing methods:
   a. Divide each sample into three specimens and place a portion of each specimen in a covered cylinder with a diameter of 100 ±10 mm to a depth of 100 ±5 mm;
   b. Measure the amount of bleeding and free expansion by a scale fixed to the outside of the cylinder.
3. Non-compliance:
   a. If the result of any test for the amount of bleeding or free expansion of the grout does not comply with the specified requirements, submit particulars of proposed changes to the materials, grout mix or methods of production to the CM and carry out further grouting trials unless otherwise permitted by the CM;
   b. For Type 7 piles, the acceptance criteria for the result of any test for the amount of bleeding or free expansion of the cement sand grout shall be reviewed, established and subject to the CM's agreement after conducting the trial mix of the grout.

PIL1.T330.8 FLOW CONE EFFLUX TEST
1. Testing samples:
   a. After mixing and sieving and prior to injection, take one sample from each batch.
2. Testing methods:
   a. Test the grout in accordance with ASTM C939-94 to determine the Flow Cone Efflux time;
   b. For Type 7 piles, a 19 mm diameter flowcone shall be used. Flow rates shall be within 15 to 25 seconds.
3. Non-compliance:
   a. Except with the CM's prior agreement for grout mixes containing additives and admixtures, grout having an efflux time of less than 15 seconds will be rejected.
PIL1.T340.8 TEST FOR CRUSHING STRENGTH

1. Testing samples:
   a. Provide one sample (Type 3 Pile) from every 25 m³ or every 25 batches, whichever is the smaller volume. At least one sample shall be provided from grout produced on any one day;
   b. Provide one sample (Types 5, 6 and 7 Piles) from every 10 m³ or every 10 batches, whichever is the smaller volume. At least one sample shall be provided from grout produced on any one day;
   c. Each sample provided in sub-clauses (a) and (b) above shall not be taken at a time more than one hour after the grout is mixed and shall be protected from weather before test cubes are made.

2. Testing methods:
   a. The DTC shall prepare two cubes of 100 mm size from each sample, cure and test the cubes for crushing strength at 28 days in accordance with CS1:2010;
   b. The average of the two crushing strengths shall be taken as the test result. The criteria C1 and C2 shall be adopted as appropriate for assessing compliance stipulated in CON1.T640 and CON1.T660 of Worksection CON1;
   c. The test result shall comply with the following requirements:
      i. Individual test results: comply with the strength determined from limits given in Column A of the Table specified in CON1.T650 of Worksection CON1;
      ii. Average strength determined from any group of four consecutive test results: comply with the strength determined from limits given in Column B of the Table specified in CON1.T650 of Worksection CON1. Where there are less than four available test results, treat the average of the first two or first three consecutive test results in the same manner as groups of four consecutive test results.

VISUAL INSPECTION

PIL1.T410.8 REQUIREMENT
When Instructed, open up for inspection any piles covered up as specified in the following clauses in this sub-section.

PIL1.T420.8 METHOD
Excavate to expose piles for a minimum of 750 mm from face of the pile all round and:
1. Plank and strut and shore all faces of the excavation and keep the excavation free from water by pumping or baling;
2. Wash surfaces of piles to be inspected clean of all silt, mud or other adhering material;
3. Deposit excavated material in temporary spoil heaps on Site;
4. After inspection, fill in and well ram to the entire satisfaction of the CM, around the piles with Special Filling Material suitable for the piling system adopted. If necessary, remove excavated Unsuitable Filling Material from site and make up voids with Special Filling Material.

PIL1.T430.8 CRITERIA FOR FAILURE
Piles that upon inspection are found to be honeycombed, necked or cracked are deemed to be defective.
DESTRUCTIVE TESTS ON SAMPLES OF TYPES 4 AND 6 PILES

PIL1.T510.8 GENERAL
Testing arrangements:
1. Allow for providing additional piles for testing, making samples of steel plates and their delivery.

PIL1.T520.8 SAMPLES
Testing samples:
1. The CM will order approximately 1% of the number of the steel piles delivered to Site to be subjected to testing in accordance with this sub-section before driving;
2. Take two samples from the steel plates at both ends of each of the chosen piles for tensile testing;
3. Tensile tests on steel samples will be carried out by Direct Testing Contractor.

PIL1.T530.8 NON-COMPLIANCE
In the event that the tensile test results fail to comply with this Specification, all piles delivered on the same date will be deemed unacceptable and must be removed from the Site.

PIL1.T540.8 PREMATURE INSTALLATION
Where piles are installed before test results are known, submit, for Approval, proposals for remedying any unacceptable piles already installed.

LOADING TESTS GENERALLY

PIL1.T610.8 REQUIREMENT FOR TESTING
1. Test the preliminary pile(s) in accordance with this sub-section but do not test pile(s) before the concrete and/or grout has attained sufficient strength to withstand the test loads;
2. Loading tests for working piles of each type of Types 1, 2, 4, 5, 6 and 7 Piles:
   a. Unless otherwise specified by the CM, the sampling rate for loading tests shall be in accordance with the following table:

<table>
<thead>
<tr>
<th>Type of loading test</th>
<th>Category of pile</th>
<th>Sampling rate for loading tests</th>
</tr>
</thead>
<tbody>
<tr>
<td>i. Compression Test</td>
<td>Pile designed to take compression only.</td>
<td>1% of or 1 number from the total number of piles under both categories, whichever is the greater</td>
</tr>
<tr>
<td></td>
<td>Pile designed to take reversed tension and compression with tensile load resistance less than 50% of the compressive load resistance.</td>
<td></td>
</tr>
<tr>
<td>ii. Tension Test</td>
<td>Pile designed to take tension only.</td>
<td>2% of or 1 number from the total number of piles under both categories, whichever is the greater</td>
</tr>
<tr>
<td></td>
<td>Pile designed to take reversed tension and compression with tensile load resistance equals to or greater than 50% of the compressive load resistance.</td>
<td></td>
</tr>
</tbody>
</table>

   b. For loading tests in compression, the CM will order the Direct Testing Contractor to carry out the tests in accordance with this Worksection;
c. For loading tests in tension, submit details of tests for CM's approval and carry out the tests according to the Approved procedures.

3. Testing arrangements:
   a. Piles will not be tested before the concrete and/or grout has attained sufficient strength to withstand the test loads and selection of piles for testing shall be in accordance with PIL1.T030;
   b. Allow sufficient time in the programming of the Works for the CM to order the piles to be load tested and for performing the number of tests stated before completion of the Works or the respective Section thereof;
   c. Provide attendance on the Direct Testing Contractor as Worksection PRE.B12 or PRE.C12 as appropriate;
   d. Pave the area around the test pile with chunam or other materials approved by the CM immediately after the pile has been selected for load test. The extent of the paved area to be determined by the CM. Keep the paved area from being damaged prior to the load test;
   e. Provide adequate site safety to cater for the possible failure of the piles during testing;
   f. For Type 7 piles, the pile shall be loaded at cut-off level. When the loading test is carried out before trimming the pile to cut-off level, the additional shaft friction above the cut-off level shall be taken into consideration for the test loading. The loading test proposal shall be submitted to the CM for approval at least 14 days before commencement of the loading test.

LOADING TESTS OF PRELIMINARY PILES

PIL1.T710.8 TESTING EQUIPMENT
1. Supply suitable platforms, hydraulic and other equipment together with four deflectometers reading to 0.025 mm and all other appliances necessary to record the settlement of the pile to Approval;
2. Ensure that the support of the reference beam is at least 2000 mm or 3 times the pile diameter, whichever is the greater, from the test and anchor piles.

PIL1.T720.8 CALIBRATION OF HYDRAULIC EQUIPMENT
Before commencement of the testing, submit to the CM, calibration test certificates from an independent laboratory in respect of all hydraulic equipment. Carry out the calibration:
1. In the period between the notified date for commencement of the Works and commencement of testing; or
2. Whenever the equipment has been adjusted.

PIL1.T730.8 MEASUREMENT OF TEST LOADS
Measure test loads by the use of a calibrated load cell and a calibrated pressure gauge included in the hydraulic system and:
1. Ensure that the load cell is axially loaded throughout the test;
2. Use the values given by the load cell for the interpretation of the test result, the pressure gauge readings being required as a check for gross error.

PIL1.T740.8 TEMPERATURE VARIATIONS
Provide suitable protection to minimise the effect of temperature variations on the test.
PROCEDURE FOR LOAD TESTS OF PRELIMINARY PILES

PIL1.T810.8 ANCHORAGES
1. Apply the load by jacking against suitable reactions provided by kentledge, anchor piles, or other anchorages to Approval;
2. Provide the centre of such reactions at a minimum distance of 2000 mm or three times the pile diameter, whichever is the greater, from the centre of the pile to be tested and from the centre of any adjacent pile.

PIL1.T820.8 PILE CAP TO TEST PILE
Extend the pile to be test loaded from its original level to a suitable level for the carrying out of the test and design and construct a suitable pile cap to the test pile.

PIL1.T830.8LOADING OF A PRELIMINARY PILE
Apply and remove the test loading of a preliminary pile at cut off level or at other level agreed by the CM in three stages as follows:

<table>
<thead>
<tr>
<th>Stage</th>
<th>Test Loading</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>100% P</td>
</tr>
<tr>
<td>2</td>
<td>200% P</td>
</tr>
<tr>
<td>3</td>
<td>360% P (for pile types 1 &amp; 2) or 330% P (for pile type 4)</td>
</tr>
</tbody>
</table>

P = safe load carrying capacity as defined in PIL1.D390 for Contractor’s Design Piling Contract / Combined Piling and Building Contract; or

P = safe load carrying capacity as specified by the CM for Engineer’s Design Piling Contract / Combined Piling and Building Contract.

PIL1.T840.8 SEQUENCE
Adopt the following sequence of testing of preliminary pile unless otherwise instructed:
1. Apply the load in increments of 50%P up to the stage 1 test loading;
2. Do not apply increments of loading until the rate of settlement of the pile is less than 0.05 mm in 10 minutes;
3. Remove the test load and determine the recovery of the pile before resuming loading;
4. Repeat procedures in sub-clauses (1) and (2) above for the stage 2 test loading;
5. Maintain the full stage 2 test loading for 72 hours before removal;
6. Remove the test load and record the recovery of the pile;
7. Apply the load in increments of 50%P up to the stage 2 test loading allowing 20 minutes between load increments;
8. Maintain the stage 2 test loading for 20 minutes;
9. Apply the load in increments of 10%P until the stage 3 test loading or the failure load as defined in PIL1.T910 is reached, allowing 20 minutes between load increments;
10. Maintain the stage 3 test loading for 2 hours if failure of the pile does not occur;
11. Remove the test load in four equal decrements allowing 20 minutes between decrements, and record the recovery of the pile.
PILING AND FOOTING

PIL1.T850.8 RECORDING AND CHECKING DATA
1. Carefully record the settlement of the pile under each increment of loading and the exact time at which such increment is applied or removed, in the presence of the CM;
2. Throughout the period of the test, make check observations of the settlement of the pile being tested by a suitable surveyor’s level.

PIL1.T860.8 CONTRACTOR’S REPRESENTATIVE
Have a representative in attendance continuously throughout the period of the test to take and record all specified data hourly or at such other intervals as may be stipulated by the CM.

PIL1.T870.8 COMPLETION
On completion of the test, remove all testing equipment etc, demolish the test pile cap, make good the test pile and the Site back to their original condition and remove all debris arising from the test from the Site.

PIL1.T880.8 RECORDS AND SUBMISSION OF REPORT TO THE CM
Keep records of load tests on piles on the Site and submit a report to the CM within 12 hours of the test being completed. Keep the records on standard forms as shown in Appendix PIL1/V to this Worksection and available to the CM for inspection at all times. The records must include graphs showing load and settlement versus time, plotted in the format as agreed by the CM.

LOAD TEST RESULTS OF PRELIMINARY PILES

PIL1.T910.8 FAILURE LOAD
Keep records during loading and unloading. The ultimate or failure load of the pile is that load which produces a settlement of the pile head exceeding:
\[ f = D_e + D/120 + 4 \text{ mm} \]
where:
- \( f \) = settlement at failure in mm.
- \( D \) = least lateral dimension of the pile in mm.
- \( D_e \) = elastic deformation of the pile shaft and is defined as:
  - \( D_e = 3.7PL_p/AE \) for stage 3 test loading for preliminary pile of pile types 1 & 2; or
  - \( 3.3PL_p/AE \) for stage 3 test loading for preliminary pile of pile type 4; or
  - \( 2PL_p/AE \) for all other stages of test loading for preliminary pile.

where:
- \( P \) = as defined in PIL1.T830; unit in kN
- \( L_p \) = pile length in mm
- \( A \) = cross sectional area of pile in mm\(^2\)
- \( E \) = Young's Modulus for pile material in kN/mm\(^2\)

PIL1.T920.8 RESIDUAL SETTLEMENT
When the rate of recovery after the removal of the maximum test load is less than 0.1 mm/hour observed in a period of not less than 15 minutes, the residual settlement at the head of the pile exceeding the greater of \( D/120 + 4 \text{ mm} \) or 25% of the maximum pile head settlement during the test, will be deemed a failure of the pile.
LOADING TESTS OF WORKING PILES

PIL1.T1010.8 GENERAL
The Direct Testing Contractor will carry out load tests of working piles in accordance with the requirements of the Specification.

PIL1.T1020.8 LOADING OF A WORKING PILE
As ordered by the CM, the Direct Testing Contractor will apply and remove the test loading of a working pile at cut off level or at other level agreed by the CM, in two stages as follows:

<table>
<thead>
<tr>
<th>Stage</th>
<th>Test Loading for Pile Types 1, 2, 4, 5, 6 &amp; 7</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>100% P</td>
</tr>
<tr>
<td>2</td>
<td>200% P</td>
</tr>
</tbody>
</table>

P = safe load carrying capacity as defined in PIL1.D390 for Contractor's Design Piling Contract / Combined Piling and Building Contract; or
P = safe load carrying capacity as specified by the CM for Engineer's Design Piling Contract / Combined Piling and Building Contract.

PIL1.T1030.8 LOADING TYPES 5, 6 AND 7 PILES
The Direct Testing Contractor will not carry out the test until the grout has reached the 28-days characteristic compressive strength.

PIL1.T1040.8 SEQUENCE
The Direct Testing Contractor will adopt the following sequence of testing of working pile unless otherwise instructed:
1. Apply the load in increments of 50%P up to the stage 1 test loading;
2. Do not apply increments of loading until the rate of settlement of the pile is less than 0.05 mm in 10 minutes;
3. Remove the test load and determine the recovery of the pile before resuming loading;
4. Repeat procedures in sub-clauses (1) and (2) above for the stage 2 test loading;
5. Maintain the full stage 2 test loading for 72 hours before removal;
6. Remove the test load and record the recovery of the pile.

LOAD TEST RESULTS OF WORKING PILES

PIL1.T1110.8 FAILURE LOAD AND RESIDUAL SETTLEMENT
1. Keep records during loading and unloading. The ultimate or failure load of the pile is that load which produces a settlement of the pile head exceeding:
   \[ f = D_e + D/120 + 4 \text{ mm} \]
   where:
   \[ f = \text{settlement at failure in mm.} \]
   \[ D = \text{least lateral dimension of the pile in mm.} \]
   \[ D_e = \text{elastic deformation of the pile shaft and is defined as:} \]
   \[ D_e = 2P/m/AE \text{ for all other stages of test loading for working pile.} \]
   where:
   \[ P = \text{as defined in PIL1.T1020 as appropriate; unit in kN} \]
Lp = pile length in mm (For pile with rock sockets, Lp should be measured to the centre of the rock socket. For pile without rock sockets, Lp should be taken as the entire length of the pile)

A = cross sectional area of pile in mm²

E = Young's Modulus for pile material in kN/mm²

2. Consider the following in calculating the Dₑ:
   a. For Type 5 pile, the contribution from steel bars, cement grout and steel casing along the whole pile length, Lp; and
   b. For Type 6 pile, the contribution from cement grout within the length of the rock socket.

3. When the rate of recovery after the removal of the maximum test load is less than 0.1 mm/hour observed in a period of not less than 15 minutes, the residual settlement at the head of the pile exceeding the greater of D/120 + 4 mm or 25% of the maximum pile head settlement during the test, will be deemed a failure of the pile.

REMEDIAL WORKS TO RECTIFY FAILED PILES

PIL1.T1120.8 FAILED PILES FOR CONTRACTOR’S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

Where a pile fails, install additional piles in accordance with the remedial proposal Approved and carry out all necessary tests to comply with the requirements of this Specification. The Contractor may be required to carry out all necessary tests as stated in PIL1.T210 to PIL1.T260 as appropriate in order to provide information for designing and positioning the additional piles to the CM’s satisfaction. Carry out the extended/revised pile caps consequent upon the installation of the additional piles to an Approved design and in an Approved manner. Bear all additional costs and no extension of time will be entertained for complying with the requirements of this clause.

PIL1.T1130.8 FAILED PILES FOR ENGINEER’S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT

1. In the event that a pile fails, carry out investigation and report to the CM the causes of failure. The CM may further investigate the cause of failure and carry out any tests he deems necessary. Provide all necessary attendance to the CM’s investigation and to the Direct Testing Contractor for execution of any tests as required by the CM for the investigation;

2. If the failure is due to poor workmanship or faulty materials, carry out remedial works, including but not limited to the carrying out of investigation and all necessary tests as stated in PIL1.T210 to PIL1.T260 as appropriate, submission of remedial proposal, construction of additional piles, extension/revision of pile caps and all associated tests, as follows:
   a. Rectify such non-compliance in accordance with this Specification;
   b. Where additional piles or extended/revised pile caps are required, carry out such works to an Approved design and in an Approved manner. Do not commence any remedial works until the remedial proposal is Approved; and
   c. Bear all time and costs associated with the remedial works.

3. If the failure is not due to poor workmanship or faulty materials, carry out remedial works, including but not limited to the carrying out of investigation and all necessary tests as stated in PIL1.T210 to PIL1.T260 as appropriate, construction of additional piles, extension/revision of pile caps and all associated tests, as may be Instructed to rectify such non-compliance all in accordance with this Specification, as follows:
a. Mobilize within 7 days after issue of the instruction by the CM all necessary plant and equipment, and commence the remedial works that are considered necessary by the CM;

b. When Instructed, submit for CM’s agreement the method statement and programme for the remedial works; and

c. Bear all costs and time due to any late mobilization of plant and equipment, delay in commencement of the remedial works and failure to execute the remedial works diligently.

CONCRETE CORE TESTING (FULL-LENGTH CONCRETE CORE) FOR TYPE 1C AND TYPE 3 PILES

PIL1.T1210.8 GENERAL

Testing arrangements:
1. Core tests of piles as described in this sub-section will be carried out by Direct Testing Contractor(s) and selection of piles for testing shall be in accordance with PIL1.T030;
2. Provide attendance to the Direct Testing Contractor(s) as Worksection PRE.B12 or PRE.C12, as appropriate;
3. Allow sufficient time in the programming of the Works for the CM to order the piles to be tested and for performing the number of tests stated before completion of the Works or the respective Section thereof.

PIL1.T1220.8 CORE DIMENSIONS AND SAMPLE SIZE

The following works will be carried out by Direct Testing Contractor:
1. Testing samples
   a. Take full-length concrete core specimens of minimum NX size for Type 1(c) piles or 100 mm diameter for Type 3 piles;
   b. Take cores of minimum NX size down to not less than 600 mm, or one half of the diameter of the pile base, whichever is the larger, into the rock below the pile base;
   c. Sample size: minimum 2 number or 5% of the total number of piles, whichever is the greater.
2. Testing methods:
   a. Laboratory compression tests on 3 core samples selected from the full length concrete core; acceptance criteria for concrete core compression tests are given in PIL1.T1240.

PIL1.T1230.8 REINSTATEMENT OF CORE HOLES

Fill core holes solid with non-shrinkage grout of at least the same crushing strength as the pile cored.

PIL1.T1240.8 CRITERIA FOR FAILURE OR NON-COMPLIANCE OF PILE IN CONCRETE CORE TESTING

1. Concrete of the respective piles is considered failed if:
   a.
   i. The estimated in-situ cube strength of any core specimen is less than 75% of the specified grade strength or the average estimated in-situ cube strength of the three core specimens is less than 85% of the specified grade strength, for cases other than that stated in sub-clause (1)(a)(ii) below;
ii. The estimated in-situ cube strength of any specimen is less than 60% of the specified grade strength or the average estimated in-situ cube strength of the three core specimens is less than 70% of the specified grade strength for the case where a reduction factor of 0.8 is applied to the design stresses of concrete placed under water; or

b. The concrete cores show evidence of honeycombing or segregation of individual constituent materials; or
c. In the opinion of the CM, the concrete fails to meet the specified requirements in any other respect.

2. The interface of concrete and rock of the respective pile is considered failed if, in the opinion of the CM, the concrete and rock of the core specimen is not in good contact;

3. The rock below the pile base is considered not complying with the requirements of this Specification if, by visual examination, the rock core obtained does not conform to the rock material specified in the design;

4. The respective pile will be considered not complying with the requirements of this Specification if any one of the failure or non-compliance criteria stated in sub-clause (1), (2) or (3) above is met; in such event:
   a. Comply with the requirements stated in PIL1.T1120 or PIL1.T1130 as appropriate; and
   b. The CM may order the Direct Testing Contractor to carry out further tests on other piles, the number of piles to be tested for failure criteria as stated in sub-clause (1) shall be in accordance with PIL1.T1410 unless otherwise Approved.

PIL1.T1250.8

REQUIREMENT FOR FURTHER TESTS

Non-compliance:

1. Cube test results
   a. When concrete cube compressive test result does not comply with CON1.T630 to CON1.T660, the CM will order the Direct Testing Contractor to extract full length concrete core from each pile cast on the same concreting day and further select 3 core samples from each pile according to instruction of CM for compression test (the cores taken in this case are not included in the core sample specified in PIL1.T1220). Acceptance criteria and further actions arising from such tests shall be in accordance with PIL1.T1240.

2. Core test results
   a. When the concrete of a pile fails according to sub-clause (1)(a) of PIL1.T1240, no further test on concrete core of this pile is allowed.

3. Bear all costs and no extension of time is allowed for testing, remedial works and installation of additional pile(s) as a consequence of the above non-compliance.

DESTRUCTIVE TESTING OF SAMPLES OF PRECAST CONCRETE PILES

PIL1.T1310.8

GENERAL

Testing arrangements:

1. Allow for providing additional materials of piles for testing;

2. Arrange for the taking and testing of concrete cores by a Direct Testing Contractor employed direct by the Authority;

3. Provide attendance on the Direct Testing Contractor as PRE.B12.530 or PRE.C12.240 as appropriate and remove the tested piles from Site on completion of the tests.
PILING AND FOOTING

**SAMPLE SIZE**

Testing samples:
1. Where precast concrete piles (Types 1(a) and 2) are proposed for the Contract, the CM will order approximately 1% of the number of piles delivered to Site to be subjected to the tests as specified in the following clauses in this sub-section, prior to driving;
2. Where precast prestressed spun concrete piles (Type 1(b)) are proposed for the Contract, the CM will order at least 2% of the number of piles with a minimum of one pile per batch per delivery to Site to be subjected to the tests as specified in the following clauses in this sub-section, prior to driving.

**CORING**

Testing methods:
1. For Types 1(a) and 2:
   a. Direct Testing Contractor will take cores in accordance with CON1.T710 to CON1.T760 from each of the chosen precast concrete piles for core test.
2. For Type 1(b):
   a. Direct Testing Contractor will take 3 sets of 3 cores (total 9 nos.) of 76 mm diameter taken normal to the length and from 3 transverse sections of a chosen precast prestressed spun concrete pile in accordance with CON1.T710 and CON1.T720 for core test;
   b. Where the estimated insitu cube strength of any individual core is less than 85% of the specified grade strength, comply with any instruction of the CM for the taking of additional core samples to make up a total of 12 numbers of core samples in the same concreting day for further tests. Allow the time without any claim for extension of time and bear all the costs for such extra work;
   c. Assess the coring test results in accordance with CON1.T760.
3. Do not apply the provisions of CON1.T770 to precast concrete piles generally nor those of CON1.T740 to precast prestressed spun concrete piles.

**TEST FAILURE**

In the event that the coring test results fail to comply with the Specification, all piles concreted on the same day will be deemed to be unacceptable and must be removed from the Site.

**PREMATURE DRIVING**

Where driving is carried out before test results are known, submit remedial proposals for those unacceptable piles, as described above, which have already been driven, for Approval.

**FURTHER INSPECTION AND TESTING**

**REQUIREMENT**

If inspection, loading tests, core tests (for Type 3 piles) or weld tests show that any pile is not in accordance with the Specification or the Drawings, the CM may order further inspection/tests, the number to be calculated by the application of the formula given below and no extension of time will be allowed. Bear the cost of such further inspection/tests.

\[
\text{number of further inspections/tests} = \left( n^2 - 2n + 3 \right)
\]

where \( n \) = total number of unsuccessful inspections/tests progressively until all inspections/tests are successful.
SAMPLE EVALUATIONS
Typical examples of evaluations of number of further inspections/tests are given in Appendix II to this Worksection, for illustrative purposes only.

NON-DESTRUCTIVE TESTS ON WELDS

TESTING ARRANGEMENTS:
1. Non-destructive tests on welds will be carried out by Direct Testing Contractor(s). Allow 3 working days for the execution of each weld test by the Direct Testing Contractor(s) commencing after special attendance as stipulated in Worksection PRE.B12 or PRE.C12 as appropriate has been satisfactorily provided;
2. Allow sufficient time in the programming of the Works for the CM to order the piles to be tested and for performing the number of tests stated before completion of the Works or the respective Section thereof.

TYPES OF TEST AND SAMPLE SIZE
1. Testing methods and testing samples:
   a. During the progress of the works, the CM will require testing of the butt and fillet welded joints to all types of piles to be examined by non-destructive tests as follows:
      i. In accordance with the requirements stated in STR1.T120;
      ii. For full penetration butt weld, the testing frequency shall be 100%, in accordance with clause 14.3.6.1 of Code of Practice for the Structural Use of Steel 2011. The CM may, at his discretion, reduce such testing frequency to a minimum of 10%.
   b. In addition, the CM will order another Direct Testing Contractor to carry out the same test on 5% of the tested welds again.
2. Non-compliance:
   a. In the event that the result of test carried out by either one of the Direct Testing Contractors failed, the tested weld shall be deemed not complying with the requirement of the Contract.

NON-DESTRUCTIVE TESTS ON PILES

GENERAL
1. Testing methods and test samples:
   a. In addition to the normal requirements for testing of the piles, a proportion of the installed piles will be tested by Direct Testing Contractor(s), using non-destructive tests which include the following types of test:
PILING AND FOOTING

<table>
<thead>
<tr>
<th>Type of Test</th>
<th>Number of Piles to be Tested</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pile driving analyser</td>
<td>i. Minimum 5% of the total number of all driven piles excluding Type 4 piles driven to bedrock and driven concrete piles</td>
</tr>
<tr>
<td></td>
<td>ii. Minimum 10% and 20% to verify the capacity and the integrity respectively of the total number of all Type 4 piles driven to bedrock in accordance with clauses 5.4.11(5)(c) and 5.4.11(5)(d) of Code of Practice for Foundations.</td>
</tr>
<tr>
<td></td>
<td>iii. Refer to sub-clause (1)(b) for driven concrete piles</td>
</tr>
<tr>
<td>Pile Integrity Test</td>
<td>i. Minimum 15% of the total number of all Type 7 piles for compliance with ASTM D5882 or other Approved standard</td>
</tr>
<tr>
<td></td>
<td>ii. Refer to sub-clause (1)(b) for driven concrete piles</td>
</tr>
<tr>
<td>Sonic logging</td>
<td>i. 100% of the total number of all Type 3 piles</td>
</tr>
<tr>
<td></td>
<td>ii. 100% of the total number of all Type 7 piles</td>
</tr>
</tbody>
</table>

b. The total number of driven concrete piles tested by pile driving analyser and Pile Integrity Test, taken together, will be minimum 5% of the total number of all driven concrete piles;

c. In addition, the CM will order another Direct Testing Contractor or the Housing Department Materials Testing Laboratory to carry out the same tests on 5% to 10% of the tested piles again.

2. Testing arrangements:

a. Inform the CM in writing at least 7 working days before all piles of each individual pile cap or every 20% of the total numbers of piles of the same block, whichever is less, are ready for the non-destructive test; allow at least 7 working days for the execution of non-destructive test on each pile by the Direct Testing Contractor(s);

b. Provide attendance on the Direct Testing Contractors and / or Housing Department Material Testing Laboratory as Worksection PRE.B12 or PRE.C12 as appropriate;

c. Allow sufficient time in the programming of the Works for the CM to order the piles to be tested and for performing the number of tests stated before completion of the Works or the respective Section thereof.

3. Preparation works for sonic logging (for Type 3 piles):

a. Install sonic access tubes of mild steel with thickness not less than 2.5 mm for Type 3 pile of number as given in the following table:

<table>
<thead>
<tr>
<th>Pile Diameter</th>
<th>No. of Sonic Access Tube</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 2 m diameter</td>
<td>4</td>
</tr>
<tr>
<td>Equal to or exceeding 2 m diameter</td>
<td>6</td>
</tr>
</tbody>
</table>

b. Half of the number of the sonic access tubes installed in a Type 3 pile shall be used for both sonic logging test and confirmatory core testing. These tubes shall be of 150 mm internal diameter. The remaining half number of the sonic access tubes shall be used for sonic logging test only in accordance with the following table.
PILING AND FOOTING

<table>
<thead>
<tr>
<th>Pile Diameter (Pile Length)</th>
<th>Remaining half number of the Sonic Access Tube</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 2 m diameter (Length less than 50 m)</td>
<td>2 nos. of internal diameter not less than 42 mm</td>
</tr>
<tr>
<td>Less than 2 m diameter (Length equal to or longer than 50 m)</td>
<td>2 nos. of 150 mm internal diameter</td>
</tr>
<tr>
<td>Equal to or exceeding 2 m diameter (Length less than 50 m)</td>
<td>3 nos. of internal diameter not less than 42 mm</td>
</tr>
<tr>
<td>Equal to or exceeding 2 m diameter (Length equal to or longer than 50 m)</td>
<td>3 nos. of 150 mm internal diameter</td>
</tr>
</tbody>
</table>

(Pile Length = length of bored pile measured from cut off level to founding level)

c. Install sonic access tubes for both sonic logging test and confirmatory core testing and those for sonic logging test only in alternate positions along the perimeter inside the pile shaft;

d. Fit all tubes with screw-on steel watertight shoes or other Approved means at both ends. Fix all tubes securely to the interior of the reinforcement cage of the pile by method to be approved by the CM;

e. All sonic access tubes to be watertight including any joints, evenly spaced, parallel to each other and to the axis of the pile, free from corrosion with clean internal and external faces so as to allow free and unobstructed passage of the testing probes;

f. Plug or cap all sonic access tubes before concreting. Extend the tubes along the depth of the pile from 300 mm approximately above the pile top level down to 1 m above the pile base for the 150 mm diameter tubes used for both sonic logging test and confirmatory core testing, and down to 500 mm above the pile base for the remaining half number of the sonic access tubes used for sonic logging test only;

g. Fill up the sonic access tubes with water prior to concreting of pile and during testing;

h. Cut off all tubes flush with the concrete surface of pile and fill up the tubes with non-shrinkage grout of at least the same crushing strength as the concrete of the pile upon completion of all testing.

4. Preparation works for sonic logging (for Type 7 piles):

a. Install a single sonic access tube of uPVC with closed bottom end and internal diameter of 40 mm;

b. Fix the single tube securely to the centre of the reinforcement cage of the pile by method to be approved by the CM;

c. The single tube to be watertight including any joints, parallel to the axis of the pile, clean internal and external faces so as to allow free and unobstructed passage of the testing probe;

d. Plug or cap the single tube before inserting the reinforcement cage into the grouted shaft. Extend the single tube along the depth of the pile from 300 mm approximately above the pile top level down to the bottom level of the reinforcement cage for sonic logging test;

e. Fill up the single tube with water prior to installation of reinforcement cage and during testing;

f. Cut off the single tube flush with the grout surface of pile and fill up the tube with non-shrinkage grout of at least the same crushing strength as the grout of the pile upon completion of all testing.
PILING AND FOOTING

PIL1 > TESTING

PIL1.T1620.8 RELATIONSHIP TO LOAD TESTING OR CORE TESTING
The results of this testing will, in conjunction with other considerations, be used in selecting piles for load testing or core testing as appropriate.

PIL1.T1630.8 TEST REPORT
A report of these tests will be prepared by the Direct Testing Contractor(s) and will include the following:
1. Date of testing;
2. Pile reference number;
3. Measured pile length;
4. Record test data;
5. Defects such as cracks, fractures or other dis-continuities;
6. Pile stiffness for pile driving analyser.

PIL1.T1640.8 TESTING OF PILES DRIVEN BY HYDRAULIC HAMMERS FOR ENGINEER'S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT
1.
   a. For piles pitched by using hydraulic hammers, the pile driving analyser tests as stipulated in PIL1.T1610 shall be performed with CAPWAP analysis in accordance with the following table:

<table>
<thead>
<tr>
<th>Pile Type (Type of Hammer Used for Final Set)</th>
<th>Number of Piles to be Tested by the Pile Driving Analyser (Number of Tests with CAPWAP Analysis)</th>
</tr>
</thead>
<tbody>
<tr>
<td>All driven piles excluding Type 4 piles driven to bedrock and Type 1b piles (drop hammers or other types of hammers as allowed in PIL1.W520)</td>
<td>Minimum 5% of the total number of piles (at least half of the pile driving analyser tests)</td>
</tr>
<tr>
<td>Type 4 piles driven to bedrock (drop / hydraulic hammers or other types of hammers as allowed in PIL1.W520)</td>
<td>Minimum 10% and 20% to verify the capacity and the integrity respectively of the total number of all Type 4 piles driven to bedrock in accordance with clauses 5.4.11(5)(c) and 5.4.11(5)(d) of Code of Practice for Foundations. (all the pile driving analyser tests to verify the capacity)</td>
</tr>
<tr>
<td>Type 1b piles (drop hammers or other types of hammers as allowed in PIL1.W520)</td>
<td>Minimum 5% of the total number of piles (all the pile driving analyser tests)</td>
</tr>
<tr>
<td>All driven piles excluding Type 4 piles driven to bedrock (hydraulic hammers)</td>
<td>Minimum 10% of the total number of piles (all the pile driving analyser tests)</td>
</tr>
</tbody>
</table>

   b. Unless otherwise agreed by the CM, use only hydraulic hammers to carry out the tests.

2. Prepare and submit a report of hydraulic hammer performance which should include particularly the following:
PILING AND FOOTING  

PILING AND FOOTING

**PIL1 > TESTING**

---

**PIL1.T1645.8**  
**TESTING OF PILES DRIVEN BY HYDRAULIC HAMMERS FOR CONTRACTOR’S DESIGN PILING CONTRACT / COMBINED PILING AND BUILDING CONTRACT**

1.  
   a. For piles pitched by using hydraulic hammers, the pile driving analyser tests as stipulated in PIL1.T1610 shall be performed with CAPWAP analysis in accordance with the following table.

<table>
<thead>
<tr>
<th>Pile Type (Type of Hammer Used for Final Set)</th>
<th>Number of Piles to be Tested by the Pile Driving Analyser (Number of Tests with CAPWAP Analysis)</th>
</tr>
</thead>
<tbody>
<tr>
<td>All driven piles excluding Type 4 piles driven to bedrock and Type 1b piles (drop hammers or other types of hammers as allowed in PIL1.W525)</td>
<td>Minimum 5% of the total number of piles (at least half of the pile driving analyser tests)</td>
</tr>
<tr>
<td>Type 4 piles driven to bedrock (drop / hydraulic hammers or other types of hammers as allowed in PIL1.W525)</td>
<td>Minimum 10% and 20% to verify the capacity and the integrity respectively of the total number of all Type 4 piles driven to bedrock in accordance with clauses 5.4.11(5)(c) and 5.4.11(5)(d) of Code of Practice for Foundations. (all the pile driving analyser tests to verify the capacity)</td>

<tr>
<td>Type 1b piles (drop hammers or other types of hammers as allowed in PIL1.W525)</td>
<td>Minimum 5% of the total number of piles (all the pile driving analyser tests)</td>
</tr>
<tr>
<td>All driven piles excluding Type 4 piles driven to bedrock (hydraulic hammers)</td>
<td>Minimum 10% of the total number of piles (all the pile driving analyser tests)</td>
</tr>
</tbody>
</table>

b. Unless otherwise agreed by the CM, use only hydraulic hammers to carry out the tests.

2. Prepare and submit a report of hydraulic hammer performance which should include particularly the following:
   a. Correlation of the results of final sets measurement, the results of pile driving analyser tests with or without CAPWAP and the results of static load tests;
   b. Back calculate the values of the Hydraulic Hammer Factor, “K_h”, of the modified Hiley formula specified in the Drawings by using appropriate test results.

**PIL1.T1650.8**  
**CHECKING OF SIZE OF PILE SHAFT AND BELL-OUT OF TYPE 3 PILE**

1. Testing sample and method:
a. Prior to installation of permanent lining and steel reinforcement of each Type 3 pile, check the correctness of the size of the pile shaft and the bell-out by using Ultrasonic Echo Sounder Test or other approved tests and submit the test report to the CM.

2. Testing method:
   a. Unless otherwise agreed by the CM, the testing equipment shall fulfil the following minimum quality and capability:
      i. Comply with the requirements of clause 8.12 of the Code of Practice for Foundations;
      ii. Be able to generate ultrasonic wave of suitable frequency and energy for reflection of the pile shaft and casing surface within 0.5 m to 8 m in distance;
      iii. Have four sensors each mutually perpendicular to one another and be able to provide two cross sectional profiles of the pile simultaneously in one go;
      iv. Have measurement accuracy within ±0.5% in horizontal distance;
      v. Be able to measure up to a depth as stated in the Project Specific Specification;
   b. The test report shall include the following:
      i. The profile of the pile;
      ii. The verticality of the pile – besides the verticality of the whole pile, the verticality of the pile from cut off level down to intermediate depths of maximum 10 m intervals shall be reported;
      iii. The original electro-sensitive paper records which shall be endorsed by the QCM or SQCC of the Contractor and the field technician of the laboratory;
      iv. Interpretation of the test results with respect to the acceptance criteria.

3. Testing arrangement:
   a. Employ a HOKLAS accredited laboratory to carry out the tests;
   b. Prior to the tests, seek the CM's agreement on the following:
      i. Testing procedures and equipment;
      ii. Acceptance criteria of the tests other than those stated in the Specification;
      iii. Test report format;
      iv. Submission arrangement of the test reports.
   c. In addition, the CM will order a Direct Testing Contractor to carry out the same tests on 5% of the total number of Type 3 piles; allow at least 7 working days for the execution of each test by the Direct Testing Contractor(s); provide attendance on the Direct Testing Contractor as specified in PRE.B12.520 or PRE.C12.260 as appropriate;
   d. Carry out investigation and rectify any defect or irregularities identified by the test and carry out further tests, all to the CM's satisfaction, before proceeding to the next stage of work;
   e. Allow sufficient time in the programming of the Works for the CM to order the piles to be tested and for performing the number of tests stated before completion of the Works or the respective Section thereof. No claim for additional cost and any extension of time as a result of complying this clause will be entertained by the CM.
**CONFIRMATORY CORE TESTING OF FOUNDING STRATA OF TYPE 3 PILES**

**PIL1.T1710.8 REQUIREMENT FOR CONFIRMATORY CORE TESTING**

1. Testing samples:
   a. Take core of minimum NX size down the concrete/rock interface through one of the sonic tubes with its end installed 1 m above the bottom of the pile; the core taken shall include the 1 m of concrete above the interface and at least 1 m of rock below the interface. Use triple-tube core-barrels to extract cores;
   b. Sample size: 100% of the total number of Type 3 piles.

2. Testing methods:
   a. Laboratory compression tests and/or field point load tests on core specimens to determine the concrete or rock strength when ordered.

3. Testing arrangement:
   a. Submit three copies of each of the reports of the confirmatory core tests within three working days after completion of each test;
   b. In addition, the CM will order a Direct Testing Contractor to carry out confirmatory core tests on 5% of the total number of Type 3 piles; allow at least 7 working days for the execution of each confirmatory core testing by the Direct Testing Contractor(s); provide attendance on the Direct Testing Contractor(s) as Worksection PRE.B12 or PRE.C12 as appropriate;
   c. Allow sufficient time in the programming of the Works for the CM to order the piles to be tested and for performing the number of tests stated before completion of the Works or the respective Section thereof.

**PIL1.T1720.8 EQUIPMENT AND METHOD**

Obtain Approval for the coring equipment and the method of executing the work.

**PIL1.T1730.8 TREATMENT OF SPECIMENS**

Deal with the concrete core specimens in accordance with CS1:2010 all as set out in Worksection CON1 of this Specification.

**PIL1.T1740.8 REINSTATEMENT OF CORE HOLES**

Fill core holes and sonic tubes solid with non-shrinkage grout of at least the same crushing strength as the pile cored.

**PIL1.T1750.8 CRITERIA FOR FAILURE OR NON-CONFORMITY OF PILE IN CONFIRMATORY CORE TESTING**

1. Concrete of the respective piles is considered failed if:
   a. The concrete cores show evidence of honeycombing or segregation of individual constituent materials; or
   b. In the opinion of the CM, the concrete fails to meet the specified requirements in any other respect.

2. The interface of concrete and rock of the respective pile is considered failed if, in the opinion of the CM, the concrete and rock of the core specimen is not in good contact;

3. The rock below the pile base is considered not complying with the requirements of this Specification if, by visual examination, the rock core obtained does not conform to the rock material specified in the design;
4. The respective pile will be considered not complying with the requirements of this Specification if any one of the failure or non-compliance criteria stated in sub-clause (1), (2) or (3) above is met; in such event, comply with the requirements stated in PIL1.T1120 or PIL1.T1130, as appropriate.

MECHANICAL COUPLER FOR TYPE 5 PILES

PIL1.T1810.8 RATE OF SAMPLING
Provide test specimens as per CON3.T510.

PIL1.T1820.8 METHOD OF TESTING
Testing for splicing assemblies without ductility requirement shall be in accordance with CON3.T520.

PIL1.T1830.8 COMPLIANCE CRITERIA
1. Compliance criteria for mechanical coupler without ductility requirement shall be in accordance with CON3.T530;
2. Any non-complying batch is to be removed from Site.

PIL1.T1840.8 TIME REQUIRED FOR TESTING
1. Allow time for the availability of test results as per CON3.T540;
2. Do not use the mechanical couplers until the relevant test specimens have passed all tests.
APPENDICES

PIL1.APPEND2.8 CALCULATION OF NUMBER OF FURTHER INSPECTIONS/TESTS

APPENDIX PIL1/II - CALCULATION OF NUMBER OF FURTHER INSPECTIONS/TESTS

Typical Examples for Illustrative Purposes Only

1. Loading test shows 2 piles failed to meet the requirements of the Contract.

2. The Contractor when required, at his own expense, is to carry out further tests in accordance with the formula of:
   \[ n^2 - 2n + 3 \]
   \[ = 2^2 - 2 \times 2 + 3 \]
   \[ = 3 \text{ further tests} \]

3. If one of the above 3 further tests fails, the CM may order further tests to be carried out at the contractor's expense by re-applying the formula and taking into account the total number of failed piles. Altogether and based on the formula, the number of total retesting required:
   \[ = 3^2 - 2 \times 3 + 3 \]
   \[ = 6 \]
   As 3 tests have been carried out the Contractor therefore when ordered by the CM is to carry out:
   \[ 6 - 3 = 3 \text{ further tests} \]

4. If the next 3 further tests show further failed piles, the formula will be re-applied as before until all the tests are successful.
